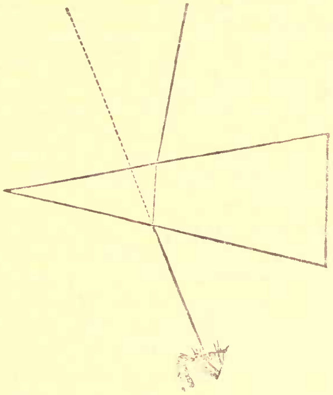
From what is above stated, it is easy to see that when a ray is transmitted through a sheet or plate of any substance (as a window-glass) with parallel surfaces, its course after emergence will be parallel to its original direction, so that though displaced laterally, its direction in space is unchanged, which is the reason we see objects in their proper directions through a window. If the surface at which it emerges be not parallel to that through which it enters, this exact restoration of the original direction will not take place; and as we judge of the situation of an object only by the direction in which its light ultimately enters the eye, anything seen through a transparent substance whose surfaces are so inclined, will appear shifted in angular position. Any transparent substance so formed of polished plane surfaces inclined to each other, is called in optics "*a prism;*" and the angle at which the two planes in question meet, or would meet if extended, its "refractive angle." If such a prism—of glass, for instance—be held before the eye with its refractive angle vertical, and to the left, an object seen through it will appear deviated or shifted to the left of its true situation, the ray (as a slight consideration will show) being bent *towards the* thicker part of the prism; *thus* (see fig. on next page). And thus by a very simple calculation, with which we shall not trouble our readers, from the angular amount of deviation caused by a prism of any medium whose refracting angle is measured, can the "refractive index" of that medium be ascertained.

When refraction takes place out of *any one* transparent medium into *any other* in close and perfect contact with it—such contact as exists, for instance, between a fluid and a solid *that it wets*, or between two fluids of different specific gravities, which do not mix, resting the one on the other—experiment shows that, so far as *the mere direction* of the refracted ray is concerned, it is the same as if the two media were separated by an exceedingly thin film of air. In that case, the same perpendicular being common to both surfaces at the point of contact, the angle of refraction out of the first medium is the same with that of incidence on the second. And from this it results that the proportion of the sine of internal incidence on the surface of the first to that of internal refraction at that of the second, or the "relative index of refraction," is constant for the same media, and is equal to the quotient of their respective *absolute* refractive indices. Thus, if the first medium be water, and the second be plate-glass, whose respective absolute indices are $\frac{4}{3}$ and $\frac{3}{2}$, the relative index, or that out of water into glass, will be $\frac{3}{2}$ divided by $\frac{4}{3}$ or $\frac{9}{8}=1·125$.



A very curious result follows from what has been said—viz: that though light can pass out of a rarer medium into a denser, whatever be the obliquity of incidence, even when the incident ray but just as it were grazes the surface, yet the converse is not the case. For every denser medium, there is a limit of obliquity beyond which transmission into a rarer, cannot take place. The ray is *wholly reflected* without undergoing any diminution of brightness whatever; observing the same law of equality between the angles of incidence and reflexion, as in the case of ordinary reflexion on a mirror. The brightness of the reflexion, however, far surpasses anything that can be obtained from the most brilliant looking-glass or metallic mirror, being equal to that of the object directly seen. The effect is very striking, and is easily seen by immersing a small rod obliquely in a glass tumbler of water, and viewing the *under* surface of the water from below upwards at a moderate obliquity. The reflexion of the rod is seen without the smallest diminution of brightness. It is thus that fishes see the bottom of their pond reduplicated by internal reflexion on the distant parts of its surface. The *rationale* is simple enough. If two angles always have their sines in a fixed proportion, the greater may increase up to a right angle, but the less cannot; since the contrary would require the sine of the greater to exceed the radius of the circle.

Within this limit, when the angle of incidence is such as to admit of the transmission of the ray, the reflexion is less than total. The incident beam is subdivided; a part only is transmitted, the rest undergoes reflexion. The total amount of incident light is divided between them, but very unequally, and *the more* so *the less* the difference between the refractive indices of the media; or in optical language, between their "refractive densities." Thus, when light passes at a perpendicular incidence out of air into water, only 2 per cent. of the whole incident beam is reflected; when into plate-glass, about 4 per cent., but when out of water into such glass, the amount of reflected light is less than $\frac{1}{3}$ per cent. At oblique incidences, the reflexion is more copious, increasing in intensity as the obliquity increases, until the incident light but just grazes the surface.

The laws of reflexion and refraction being known, it is the part of geometry to follow them out in the several cases where light is incident on plane, spherical, or any other curved surfaces, reflecting or refracting, and thus to deduce the various theorems and propositions which the practical optician has need of for the construction of his mirrors, lenses, prisms, telescopes and microscopes. All these, as beside our present purpose, we pretermit, confining ourselves entirely to the physical properties of light, and the theories which have been advanced for their explanation. This need not prevent us, however, from appealing to the effects produced by such instruments, especially such as are in most common use, and as can hardly be other than familiar to most of our readers, such as magnifying glasses (or lenses), telescopes, &c. It requires no knowledge of geometry, for instance, or any acquaintance with its application to theoretical optics, to enable any one to form a perfectly just conception of the mode in which the eye enables him to see, when his attention is called to a photographic picture, and he sees it impressed on its ground by the rays of light collected and brought to a focus by that assemblage of convex and concave lenses in a *camera obscura* which the photographer uses for the purpose. The dissection of an eye shows it *to be* such an assemblage, and the picture it produces may be actually seen at the back of the eye of an animal recently killed, by removing the opake leathery coat which envelopes it, and disclosing the retina. How the nerves of that tissue indeed convey to the mind *the perception* of colour and form, is, and will probably ever remain, a mystery; but is no more so in the case of vision than of any other of the senses, from which vision differs only in its transcendent refinement and the elaborate structure of that most wonderful of all optical instruments by which *form*, as well as colour and brightness, is brought within its range.

The latter qualities are probably *perceived* by animals unprovided with eyes, such as the *proteus anguinus*, which inhabits dark caves, and whose delicate skin is evidently and painfully affected by the light; but to convey the perception of form, a picture must be produced, and in its own peculiar manner.

We are now prepared to understand the mode in which colour originates. This, to the ancients was always a mystery. The light of the sun, and of ordinary daylight, which is only that of the sun dispersed and reflected backwards and forwards among the clouds, is white, or nearly so. Nevertheless, when we look through a red glass, or view a green leaf, it conveys to the mind the perception of those colours. How is this? If it be by light only that we see, and if that light convey to us *absolutely none* of the material elements of the bodies from which we receive it, how comes it that it excites in us such various and perfectly distinct sensations? The light itself must have either acquired or parted with something in its passage through or reflexion from the coloured body. Supposing, for instance, light to be a substance; it may have taken up some excessively minute portion of the object and introduced it to the direct contact of our nerves. In that case the sense of colour would be assimilated to those of taste or smell. Or it may have undergone *analysis*, and colour would then arise from a *deficiency* of something existing in the sun's light, and the *relative redundancy* of some other portion. In this view, light would be regarded, not as a simple, but a compound substance, or a mixture of so many simple ones as would suffice to explain all the observed differences of tint. On the other hand, if light be a movement, or an influence, we must admit in that movement or influence a similar capacity for analysis or composition, or else have recourse to some unknown modification of the one or the other, leaving the phænomenon as unexplained as before. There may, for instance, be a great variety of such movements, all *luminiferous*, but not all *alike;* and some may be destroyed, or some exaggerated, in the act of reflexion or transmission.

The key to this mystery, up to a certain point, was furnished by Newton, in his analysis of white light by prismatic refraction. A full account of the manner in which that analysis is performed, of the phænomena it presents, and of the nature and subdivisions of the "Prismatic spectrum," is given in our article on "The Sun" in GOOD WORDS for 1863, pp. 278, 279, to which, to avoid repetition, we refer our readers. Let us, however, consider what kind of general theoretical interpretation we are entitled to put on this analysis. Now, the first and most obvious conclusion is, that the phænomenon we have to deal with, is not what in the accuracy of modern scientific language is understood by the term "analysis." It is the separation and redistribution *(according to degrees* of a certain quality common to all its elements—viz., that of REFRANGIBILITY) of a *mixture*, rather than the *dialysis* of a true *compound*. The simile by which we there illustrated it is so far exact. A glacier moraine might be redistributed by tidal action over the floor of the Ocean; the great blocks left *in situ*, or little moved—the smaller forming shingle, gravel beds, sandstones, or incoherent muddy deposits, with every possible intermediate gradation of size. But if in all this series any particular size were found entirely and universally deficient, throughout the whole series of formations traceable to that source, we should conclude, not that a mass of that size is an impossibility *in rerum naturâ*, but that owing to some unknown cause in the nature of a previous sifting, every pebble or grain of that size had been already separated, or otherwise arrested *in limine*, and might expect elsewhere to find it in the case of some other series of geological formations. So it is with the sun's light. Certain definite and marked degrees of *refrangibility* are wanting in its spectrum, indicated by the dark lines which cross it. But if absent in solar light, they exist in the light of flames, and of other luminous sources, which in their turn are again deficient in other degrees which yet abound in the solar rays. Refrangibility, then, taken as a property of light generally, is a quality susceptible of indefinite *gradation*, from the one extreme of the spectrum to the other.

If we limit our consideration to some one medium—glass, for instance,—we find each particular degree of refrangibility associated, first, with a determinate and invariable index of refraction, which determines its place in the spectrum by determining the amount of deflexion it shall undergo in passing through the prism; and secondly, with an equally determinate and invariable tint in the scale of "prismatic colour," the red corresponding to the least and the violet to the greatest refractive index. The truth of these propositions is easily tested on any one ray of the spectrum insulated from the rest by intercepting all the others. The ray so insulated, whatever its tint, is no longer separated or "dispersed" by subsequent refraction into a new spectrum. It preserves its tint unaltered, and conforms to the "rule of the sines" in its flexure, as if no other colour or refrangibility existed. Hence we might be led to conclude, as Newton himself did, that between these two qualities,—refrangibility and colour,—an absolute and invariable connection exists. This, however, is not the case. The propositions in question cannot be generalized. When different media are examined, we find that not only does the same colour correspond to different degrees of refrangibility, or to different *absolute* values of the refractive index in each, but that the same *change* of colour does not correspond in different media to the same *proportionate* change of the refractive index; and that, in short, taking the "scale of colour" in all its gradations, from red, through orange, yellow, green, blue, and indigo, to the last perceptible violet, and that feeble tint beyond the violet which can hardly be called a colour, but which is most nearly expressed by the term *lavender*, as a guide,—each particular medium distributes these rays through its spectrum, though always in the same *order* of succession, yet in other respects according to a law peculiar to itself: thus indicating both a total amount of *dispersion* and a *scale of action* dependent on the physical properties of the medium, and in some sort as it were personal to each. This power which a transparent medium has of separating the differently coloured rays and spreading them over an angular space greater or less in proportion to the total deviation of some one ray, taken as a standard, from its former course, is called in optics the "dispersive power" of the medium. It differs very widely in different media, and in consequence, the lengths of the spectra which they produce, corresponding to one and the same mean or average refraction, differ accordingly. Thus, for example, the total lengths of the spectra produced by prisms of fluorspar, water, diamond, flint glass, and oil of cassia (the mean refractions being the same), are to each other in the proportions of the numbers 22, 35, 38, 48, and 139.

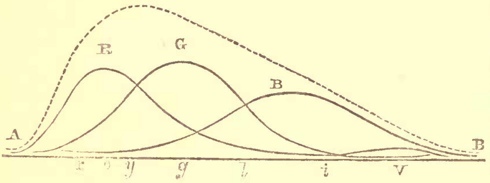
This quality of dispersion stands in very distinct relation to the chemical constitution of the refracting medium. Thus it is found that all the compounds of lead, whether in liquid solution, natural or artificial crystals, or glasses into which that metal enters largely, possess very high dispersive powers; while those into which strontia enters exhibit remarkably low ones. It is on this property of lead that the formation of highly dispersive glasses, to imitate the brilliant colours of gems, and to give the vivid prismatic colours of the pendants of chandeliers by candle-light, depends, as well as that far more important application which, by the combination of two glasses of different dispersive powers, the one containing lead, the other none, enables the optician to effect refraction without producing colour, and so to construct that admirable instrument, *the achromatic telescope*.

Not only are the *total lengths* of the spectra produced by different media different for the same mean amount of refraction, but within those lengths the distribution of the several colours differs, the spaces occupied by the several tints differing very considerably in proportion to each other and to the whole. Thus, in the spectrum formed by flint glass, and most other of the highly dispersive media, the green is situated nearer to the red than to the violet end of the spectrum, while in that formed by muriatic ("hydrochloric") acid the reverse is the case.

By the reunion of all the coloured prismatic rays (which may be effected by an equal and contrary refraction of the whole spectrum through a prism of the same material reversely placed), white light is reproduced. And hence we conclude that *colour is not a superinduced but an inherent quality of the luminous rays*. Again, if we exclude from this reunion any portion of the spectrum, the reconstituted beam is coloured, and if the rays so excluded be not *extinguished*, but diverted aside, and themselves collected and reunited into another and separate beam (which may easily be effected, with a little management, by one skilled in experimental optics), this will also be coloured, but with a tint *complementary* to that of the first. Between the tints so arising is always found to prevail that beautiful and, so to speak, *harmonious contrast* which is so effective in the ornamental arts, where one colour is said to *set-off* another, or show it to the greatest advantage. Thus crimson or pink is complementary to green, scarlet or orange to blue, yellow to purple, &c. The relation to each other of these complementary colours is curiously and strikingly illustrated by the spontaneous production within the eye itself of the tint complementary to any vivid colour which takes place when, after gazing stedfastly on an area so coloured, on a white ground, and strongly illuminated, the gaze is suddenly transferred to a uniformly white surface. There is seen on it, though only for a few moments, a picture or optical image of an area similar in form and size, but tinted with the complementary hue, which fades quickly away. This curious and beautiful experiment, which requires no apparatus to exhibit, and which any one may try in a moment, is exceedingly illustrative of the mode in which the *sensation* of colour is produced. It proves that in the nervous tissue which receives and feels the picture within the eye, there are nerves individually and exclusively sensitive to each of the coloured rays, or at all events to each of those primary colours (if such there be) by whose mixture all colours are compounded. When white light falls on a portion of the retina wholly or partially deadened or fatigued by the excitement of the nerves appropriate to one set of rays, the sensibility of the others being left unexhausted, that other portion will be for a time proportionably more sensitive to the remaining rays; so that under the stimulus of white light an undue preponderance is temporarily given to their influence, and the sensation of the complementary tint is conveyed to the mind. This is only one of innumerable instances of the wonderful adaptation of that most astonishing organ to the performance of its office of conveying to us information not only of the forms and situations of objects, but of all that multitude of their physical properties which stand in relation to colour, both those which ordinary experience teaches and which science reveals.

Lastly, by thus reuniting into one beam those going to form distant portions of the spectrum, and excluding the rest, we find that it is possible to produce a compound beam which shall excite directly in the eye, or illuminate a screen with, any one of the innumerable varieties of tint which we observe in nature; and what is especially remarkable, the same tint, or one undistinguishable from it *to ordinary eyes*, is producible by very different combinations of the prismatic rays; while yet there exist individuals, and these not unfrequent, who are perfectly capable of discriminating (in many cases) between such compound tints, and who even declare them to be widely different. To such cases of what is called, though improperly, "colour-blindness," we shall presently have occasion to recur.

The consideration of these facts has given rise to a speculation which, if not demonstrable, has at least a high degree of plausibility, and which at all events has never yet been *dis*proved—viz., that there is no real connexion between COLOUR and REFRANGIBILITY, but that there exist three inherently distinct *species of light*, each competent *per se* to excite the sensation of one of three PRIMARY COLOURS, by whose mixture all compound tints are produced, white consisting of their totality, and black being the exponent of their entire absence. That, moreover, each of them has a spectrum of its own, over the whole length of which it is distributed according to its own peculiar *law of intensity*, and from whose superposition on the same ground results the *prismatic* spectrum, coloured as we see it. The annexed figure will convey a better conception of this than any lengthened description, where A B represents the length of the total spectrum wherewith each of the three is coextensive, and where the curved lines marked R, G, B, severally express, by the height to which they rise on any one point in A B, the intensity in its own spectrum of each of the primary colours; while the dotted curve, whose *ordinate* or height corresponding to any point is the sum of those of the other curves, will of course express the joint intensity or degree of illumination in the visible spectrum.



In this view of the subject, the prismatic colours, with the exception of the extreme red, are all more or less mixed tints, and this agrees well with its general aspect, in which the red and indigo-blue are the only full and pure tints, the green being by no means a *saturated* or full green, and the violet having a strong dash of purplish red in it.

The three primary colours assumed in the above figure are red, green, and blue, each in its highest degree of purity and *undilution*, for it will be readily apprehended that while the admixture of any one, in however small a proportion, will produce a rich though a mixed tint, that of *both* the others tends to dilution. The only three colours which answer all the experimental conditions, are these three. This may seem contrary to the experience of the artist, who from his habitual practice in mixing the colours he uses (all of them without exception compound tints), would name yellow, in place of green, as the intermediate primary. The reason is obvious. In all the yellows which he uses there is a large admixture of red with green, and in all his blues more or less green. When mixed, then, there is sure to be a preponderance of green, while the red goes to neutralize a portion of the other two, and so to dilute the outstanding green. On the other hand, *the direct mixture of the prismatic yellow and blue, in whatever proportions, can nohow be made to produce green*, as Professor Maxwell's, M. Helmholz's, and my own experiments have distinctly proved, while that of the prismatic green and red *does* produce yellow.* This will be better understood when we come to speak of the *absorption* of coloured light.

Since at each point of a compound spectrum so constituted, all the three primary elements, in whatever proportion mixed, have one and the same degree of refrangibility, it is evident that the compound tint arising from their mixture cannot be separated by any subsequent refraction into its components.

In persons who are what is called "colour-blind," the eye is sensible to all the rays of the prismatic spectrum *as light*, though even in that respect the red rays appear comparatively *deficient in power* to stimulate the nerves of vision, so that all colours into which a large proportional admixture of primary red enters are described by them as sombre tints. But besides this, two of the primary coloured rays, the red and the green, appear to excite in their nerves sensations of *colour* nearly or exactly similar. Their vision is therefore, in fact, *dichromic*; all their compound colours are resolvable into two elements only instead of three. Red they do not distinguish from green. The scarlet coat of the soldier and the turf on which he is exercised—the ripe cherries and the green leaves among which they hang, are to them undistinguishable by colour, though from constantly hearing them so spoken of, they habitually speak of the fruit as red and the leaves as green. Their sensation of blue is *probably* the same as in normal vision, though whether that excited by their other colour be such as a normal-eyed person would call red, yellow, green, or something quite different from either, we have no means of ascertaining, nor can they give us any information. The face of nature must appear, however, to them far inferior in splendour and variety to that which we behold; and if there be, as is asserted, here and there an individual totally destitute of the sensation of difference of colour, it must present to his eyes what we should be disposed to call a hideous monotony—light and shade only revealing the forms of objects as in an engraving. Yet what we never knew we never miss. There may, and not improbably do, exist beings in other spheres, if not here on earth, whose vision is sensitive to those rays of the spectrum which extend far beyond the violet or its *lavender* prolongation, and which we know at present only by their powerful photographic activity, and by their agency in producing that singular species of phosphorescence in certain media to which Professor Stokes has given the name of Fluorescence. By these properties, the solar spectrum is proved to be prolonged far beyond its visible limits at its most refracted extremity; as it is by *other invisible rays* OF HEAT, which have been traced up to nearly an equal distance beyond the extreme red in the opposite direction.* All, however, whether of heat or chemical influence, conform each for itself, and according to its own special "refractive index," to the same general *law of the sines*, as well as to every other of those singular and complicated relations of the luminous rays, we shall hereafter have to describe, and both the one and the other extending into and thinning out as it were in the luminous region, just as we have described the spectra of the primary colours into those of each other. Such, and so wondrously complex a compound is a sunbeam!

---

* See "Notices of the Royal Society," vol. x. p. 52.

The analysis into its prismatic elements of the colour of any natural object, is readily performed by examining through the refracting angle of a prism of perfectly colourless glass a rectilinear band or strip of the colour to be analysed, so narrow as to have scarcely any apparent breadth, and to appear as little more than a coloured line. Placing this on a perfectly black ground, parallel to the refracting edge of the prism, and illuminating it as strongly as possible, it will be seen dilated into a broad riband of colour or spectrum, exhibiting of course those coloured rays only which belong to the composition of the tint examined. An exceedingly convenient arrangement for this purpose is to fasten across one end of a hollow square tube of metal or pasteboard blackened within, of about an inch square and twelve or fourteen inches long, a metal plate having in it a very narrow slit parallel to one side, quite straight, and very cleanly and sharply cut. At the other end within the tube is to be fixed a small prism of highly dispersive colourless flint glass, having its refracting angle parallel to the slit, and so placed that when the tube is directed to the sky, or rather to a white cloud, the slit shall be seen dilated into a clear and distinct prismatic spectrum. In this, of course all the prismatic colours will be seen in their due order. But if, instead of this, any coloured object,—as the leaf of a flower, for instance, or a coloured paper, strongly illuminated by direct sunshine (if necessary, concentred on it by a lens, so, however, as not to *scorch* the object by the heat of its focus),—be placed so near to the slit as completely to occupy its whole area and suffer no ray to enter it which does not come from some part of the coloured surface; the spectrum will be seen deficient in all those rays which the object does not reflect, and which belong to its complementary colour. The use of this little instrument, at once simple, portable, and inexpensive, will be found to afford an inexhaustible source of amusement and interest. To the florist, on a bright sunny morning, the analysis of the tints of flowers and leaves, or the hues of a butterfly's wing, and of every variety of coloured object;—to the water-colour painter, the study of the prismatic composition of his (so fancied) simple washes of colour and the effects of their mixture and superposition;—to the oil painter, that of the various brilliantly coloured powders which mixed with oil form the material of his artistic creations, are all replete with interest and instruction.

If instead of a reflected colour we would examine a transmitted one, as in the case of a coloured glass, or some natural transparent coloured product,—if in the form of a plate or lamina, it may be laid over the slit, and when directed to any bright white light (as that of a white cloud), its spectrum will be exhibited—if a coloured flame, the slit may be placed close to it, but if a liquid, it will be preferable to make it its own prism by inclosing it in a hollow prism formed of plates of glass cemented together, when the differences arising from difference of the thickness of the medium traversed by the refracted rays will be more easily studied.

The colours of transparent media—such as coloured glasses, crystals, resins and liquids—depend upon the greater or less facility with which the several coloured rays are transmitted through their substance. There is no medium known, not even air or the purest water, which allows all the coloured rays to pass through it with equal facility. Independent of the partial reflexion which takes place at the surfaces of entry and emergence, a portion greater or less according to the nature of the medium, is always stifled, or as it is called in optical language, "*absorbed:*" and this absorptive action is exerted unequally on the differently refrangible rays; so that when a beam of white light is incident on any such medium, it will be found at its emergence deficient in some one or more of the elements of colour, and will therefore have a tint complementary to that of the absorbed portion. Supposing, as is most probable in itself, and agrees with the general tenor of the facts, that an *equal per-centage* of the light of any specified colour which arrives at any depth within the medium is absorbed in traversing an equal *additional* thickness of it, the intensity of the coloured ray so circumstanced would diminish in geometrical, as the thickness traversed increases in arithmetical progression. The more absorbable any prismatic colour, then, the more quickly will it become so much reduced in proportion to the rest as to exercise no perceptible colorific action on the eye. And thus it is found that in looking through different thicknesses of one and the same coloured glass or liquid, the tint does not merely become *deeper and fuller*, but changes its character. Thus a solution of sap-green, or of muriate of chromium, in small thicknesses is green—in great ones red; tincture of violets, and that species of rich blue glass which is coloured with cobalt, in like manner are red when we look through a great thickness, but beautifully blue when thin; and so in a multitude of other cases. Those who paint in water colours are well aware of what importance it is to effect the tint they aim at by a single wash of their colour. A second application of the very same liquid, after allowing the first to dry, does not simply heighten the colour, *but changes the tint*, a circumstance which those who practise that fascinating art will do well to bear in mind.

---

* See my paper in the Phil. Trans. R. S. 1842, "On the Action of the Solar Rays on Vegetable Colours."

When white light is transmitted successively through two or more coloured media whose scales of absorption differ materially, the residual beam, or that which struggles through after passing their successive ordeal, will consist of those rays only whose transmission is favoured by all the media. Hence it will follow, first, that the final *tint*, or that of the beam ultimately emergent, will most probably be very different not only from that exhibited by either of them separately, but from that which *might be expected to arise* from a union or blending of their tints, and which *would arise* were we to *unite together* distinct luminous beams having those tints; and, secondly, that all such successive transmissions tend to produce sombre tints, and ultimately complete blackness, inasmuch as each successive transmission destroys (or absorbs) a greater or less proportion of the total illuminating power of the original beam. Thus when colour is produced on white paper by the laying on of successive washes of *different* transparent colours, the tendency is to produce, first, a tint very remote from that *expected* to result from their union, and secondly, becoming more and more muddy and sombre, the greater the number of such heterogeneous layers of colour. Hence the maxim in water-colour painting, to secure brilliancy by using only a single wash of colour if possible to produce the required effect. The painter should never forget that his notion of colour (as compared with that of the photologist) is *a negative one*. He operates solely by the *destruction* of light, and his aim should always be to destroy as little as possible. His direct action (unknown to himself) is upon the tint complementary to that which he aims at producing.

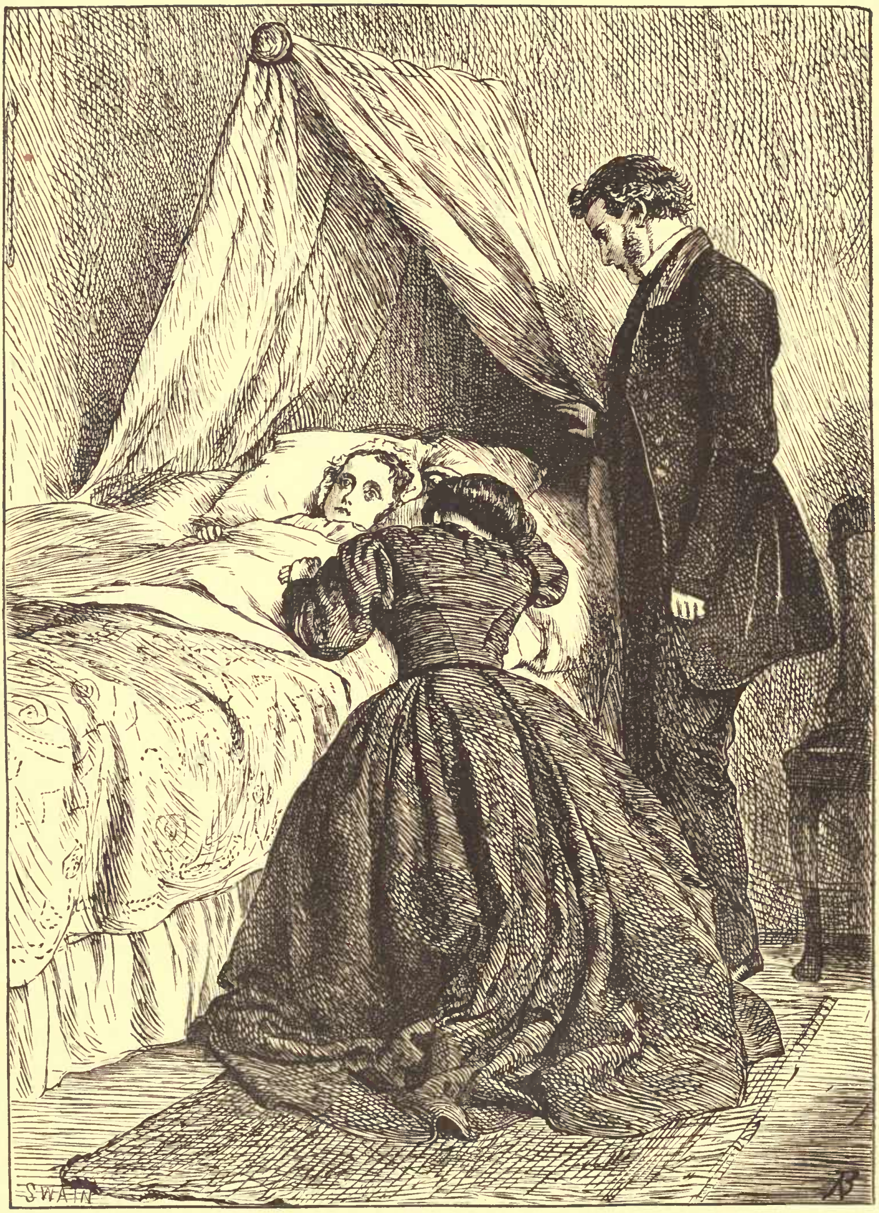
Each particular coloured medium has its own peculiar and specific scale of absorptive action, differing *inter se* in the most singular and capricious manner. In many, indeed in most cases, the spectrum viewed through such a thickness as to give a strong colour to common daylight, in place of being seen as a continuous band of graduating colour, is broken up into distinct coloured spaces more or less intense, and more or less well defined, separated by dark intervals. This is particularly the case with coloured gases or vapours. Thus the red vapour of nitrous gas, especially when its absorptive action is intensified by heat, breaks up the spectrum into a succession of narrow spaces, alternately dark and bright, from one end to the other.

When coloured flames are examined with such a "spectroscope" as above described, the phænomena are no less varied, and in the highest degree characteristic. The presence in the flame of *each particular chemical element* determines the presence in its light of some one or more coloured rays of *definite* refrangibility and colour, producing often in its spectrum the appearance of a definite line of coloured light out of all proportion brighter than the rest. Thus the presence of soda in any flaming body is characterized by a narrow and exceedingly vivid line of yellow light. So completely characteristic are these lines of the chemical elements to which they bear relation, that no less than three new metals, Thallium, Rubidium, and Cæsium, owe their first discovery to the observation of definite spectral lines of their appropriate colour, produced by their presence in quantities too minute to be rendered sensible in any other manner.*

It is impossible in the compass of an article like the present, to do more than notice with extreme brevity these remarkable classes of phænomena, and that only as bearing upon the general object we have in view. They prove in the most convincing manner the close and intimate relation in which LIGHT stands to MATTER. It enters into the interior of the hardest and least penetrable bodies, and thereout brings us information of an almost infinite variety of particulars as to their intimate nature and constitution (and, as we shall see further on, of their internal structure, and the mechanism by which they are held together as bodies), which by no other means we can obtain: information which at present we are only imperfectly able to interpret, but whose import, from year to year, and almost from week to week, is becoming better understood. Its language in this respect bears no distant similitude to that of a series of ancient inscriptions in some unknown tongue and character. A single sentence once developed by some happy and unmistakeable concurrence of evidence, affords a clue to others, which in their turn become the stepping-stones of further progress. By the one are revealed the histories of ages long buried in oblivion, and of the phases of human thought and action under circumstances bearing little analogy to anything we now see around us: by the other we are admitted a step nearer to the perception of the intimate working of those powers which maintain the material universe as it stands, and the laws they observe.

---

* In reference to what is now called "Spectrum-Analysis" in a chemical point of view, I may be here allowed to call attention to a passage in my "Treatise on Light," published in 1827 (Encyc. Metrop., vol. iv.): "The colours thus communicated by the different bases to flame, afford in many cases a ready and neat way of detecting extremely minute quantities of them. But this rather belongs to chemistry than to our present subject."—(Article, "Light," § 524.)



"AT THE WORD 'HEAVEN,' MRS. HAGART PRESSED HER FACE DOWN UPON THE BED-CLOTHES."

ALFRED HAGART'S HOUSEHOLD.

By ALEXANDER SMITH, Author of "A Life Drama," &c.

CHAPTER XI.

Whether Hagart's scheme of establishing a connection with the celebrated Parisian pattern-designers, and of redacting their works to suit the Greysleyan artisans, was likely to succeed, there could be no manner of doubt that employment at the rate of four guineas per week, with no anxiety, with no weary trudges to Spiggleton and back with a sore heart and an empty pocket, was a comfortable thing. So he felt at least, on the first Saturday afternoon after his engagement with the Wedderburn Brothers, as he walked home with that sum in notes and silver safely deposited in his breeches pocket. He felt that he had secured for himself a quiet haven, and he looked back on his past life as the passenger in port looks back upon his recent tossings on a stormy sea. He hoped that he would not be forced to leave the haven, and go out on the rough water for yet awhile. He shuddered at the weary tugging at the hopeless oar; he felicitated himself on present quiet and comfort, and he would have been entirely happy were it not for anxiety on his daughter's account. For Katy was not recovering—in truth, and this he could no longer conceal from himself, she was fast losing strength, and had for the last day or two been appreciably worse. Dr. Crooks's prescriptions had failed entirely of effect, and Dr. Crooks, he could see, began to consider the crisis a grave one.

The forces of the household being much engaged, as household forces are sure to be in times of sickness, Hagart, before he went out, had undertaken to perform certain little offices in Greysley, and to deliver messages to grocer, butcher, and baker. When he reached home, somewhat late on Saturday afternoon, he found his wife crying, and Jack dispatched to summon Dr. Crooks. An hour or two previously, Mrs. Hagart, being in attendance at Katy's bedside, had asked a question, and in reply, the child had begun to babble in an incoherent fashion, about the canal banks, and the beautiful birds, that flew about and fed on the scarlet hips and haws in the hedges; about the wonderful bridge across the river, and the red castle against the sky with birds flying above and over it, and the gray horse, Smiler, and the long passage-boat, and all the other incidents of the wonderful journey. At this patch-work prattle, the uneasy mind playing with vivid images, Mrs. Hagart had become seriously alarmed, and sent off Jack to bring Dr. Crooks with him at once if he was disengaged, and if engaged to wait for him.

The doctor was out—was in point of fact occupied in bringing a little Greysleyan stranger into the world, but was expected home every minute. So Jack was popped into the library, where he sat and stared at the stucco busts painted a drab colour, which were standing on the top of the bookcase, much considering whom they might represent, and thinking that the originals must have been extremely ill-favoured; and at the rows on rows of books, and puzzling himself whether the doctor had read through the whole of them, and if he had, where in the world he could stow away all the learning and wisdom; and then all of a sudden, his thoughts would fly off at a tangent to the little face in the little white bed at home, and then something rose in his throat, and the ugly drab busts and the wonderful rows of books would all disappear in a mist, through which they slowly glimmered back in a minute or so. Meanwhile Hagart had come, and had gone in with his wife to see Katy. The child lay on her back, her eyes open, and her fingers twitching at the bed-clothes at intervals. As he entered she turned slightly round, steadied on him her wandering eyes, but in them there was no look of pleased recognition.

"Don't you know papa?" he asked softly, while bending over her.

And then the strangest smile crept into the little peaked face, lighting it up, but if possible, with its unfamiliarness, making it sadder than before. "Why do you wear that funny bonnet, and that great white tippet? and what a number of rings you have." Then out of the face the smile slowly died, and a sort of cloudy recognition took its place: "And yet you are not like Aunt Kate I saw at the station house!"

"I am not Aunt Kate," said poor Hagart, "I am your own papa!"

"Papa has gone to Spiggleton, and will have to walk home all the way again. Isn't it hard? Here is the sixpence you gave me on the chain! I wear it always under my dress when I go to school. You kissed me, and said I was your namesake."

"Papa has come back from Spiggleton; he is at your side."

"Don't speak, don't! See the robin! How pretty it is. Don't frighten away the robin!" And then recognition came back fully. "Mamma," said Katy, wearily, "Where am I? what have I been saying? who has been here?"

"No one, save papa and mamma, darling, and you are in your own bed at home," said the mother, kneeling down by the bed-side, and tenderly putting aside a wisp of auburn hair which had strayed from under the white cap on to her forehead.

"I thought Aunt Kate was here—surely she has been here! You have been crying, mamma! Were you crying because the pretty birds were frightened away? Don't cry! Will there be birds in heaven, mamma?"

And at the word "heaven," Mrs. Hagart pressed her face down upon the bed-clothes.

"I am tired with my long walk, and wish to sleep. Jack will show me the old pit some other Saturday. Kiss me, mamma. Good-night."

And Katy turned wearily round, and fell on slumber, and the bed-clothes were tenderly tucked in around her shoulders, and the twain looked in one another's faces silently.

Dr. Crooks came home at length, and found Jack waiting for him. It was Saturday night, and the worthy man would gladly have rested from his week's labour, have had a little supper, a quiet chat with his maiden sister who kept house for him, or have accompanied her piano with his flute, or lost all weariness and care for an hour or two in a pleasant book before he went to bed. He had been thinking of these mild pleasures before he came in, and it was with a smothered sigh he beheld the boy. He heard the message, asked one or two questions about Katy, and went into the lobby to procure a heavier stick and a warmer coat, for the late autumn evenings had become chill. He then took Jack's hand in his own, and chatting at intervals they proceeded through the streets, which, being Saturday night, were more crowded than usual. Shop windows were in a blaze of light; butter, hams, and eggs, were seen for a moment in the provision-merchant's; bonnet-frames, pink and white ribbons, and festoons of many-coloured gloves, in the mercer's. All kinds of humble marketings were going on—housewives with baskets on their arms, and accompanied by their husbands, were laying in weekly stores, and a special luxury for to-morrow's dinner when they returned from church. Now a crowd gathered round a hoarse ballad-singer, blocking up the way; now a tipsy operative lurched across the pavement, bringing himself up sharp on the kerbstone—a policeman on the other side of the street eyeing him suspiciously, not yet finding cause to interfere, but expecting cause every moment. Holding still the doctor's hand, Jack threaded his way through all this, and still chatting, they got out of the lights and bustle of the streets, and pacing along the bank they heard the dull thunder of the river as it tumbled over the rocks. At last they reached the upper road which ran along the front of the distilleries—great masses of gloom now against the light gray sky, with a stray light or two twinkling in the windows. By this time, probably from having exhausted all the topics which he fancied would interest a boy, perhaps from immersion in thoughts appertaining to the errand on which he was engaged, the doctor became quite silent—and so still held by the hand, Jack trudged on in considerable awe. When they reached the gate and had rung the bell, the doctor turned his back on the house, inspected the light gray sky, over which the tender light of the moon was spreading, and hummed absently one of the tunes which his sister played on the old-fashioned piano of an evening—when he was disengaged, and in loose coat and slippers—and which he delighted to accompany on the flute. From this conduct on the doctor's part, Jack was drawing his own conclusions—consolatory for the most part as regarded his sister—when Martha opened the door. The doctor immediately dropped his tune, withdrew his eyes from the sky, entered at once without asking a question, opened the door of the room in which the invalid lay, where Hagart and his wife were and, indeed, had been all the evening, and closed it softly behind him. Jack went into the kitchen and sat down on his accustomed seat. Martha's face he noticed was serious, and by her violent absorption in scrubbing it was evident that she did not care for conversation. For conversation Jack himself had not sufficient spirits, and so he sat before the fire silently leaning his face on his hands. Everything was quiet in Katy's room, he would have given worlds to have known what was going on within, but there was no sound, no one came out, message of no kind reached the kitchen. He had sat beside the fire for half an hour; everything was strangely quiet, and in the strange quiet of the house, he began to fear and be pained by the monotonous ticking of the clock which stood at the head of the lobby, at the back of the kitchen door—like a spy or a robber, Jack thought to-night.

An hour passed, the silence began to be intolerable, and the slow regular tick of the clock to rule despotically over everything, and to beat like hammers on his excited nerves. From the room in which his sister lay there had come no sound, once only the door softly opened, and he heard a low murmur of voices, and then it softly closed. He waited and waited staring into the fire. He would have crept to the door and listened, but he was afraid he would thereby acquire some terrible knowledge, and perhaps in coming out Dr. Crooks would find him playing the eavesdropper. At last he thought he would go to bed—perhaps he would be able to sleep—at all events he would escape the horrible tyranny of the clock. He took off his shoes and went quietly. The room was full of warm brown light from the fire which had been kindled some time before, and which had burned down now. He curiously noted chair and table, his little white bed with the clothes partly turned down, and his nightgown on the pillow. He undressed slowly and mechanically, his mind wandering into the strangest places and among the strangest objects—places and objects with which at the moment he had not the slightest concern. He got his clothes off, was dressed in his white nightgown, and was buttoning the wristband, when the door of the room opened. A light came in, and Jack saw his shadow run up the wall, hit the ceiling, and disappear. Then the door closed, his father came forward, put the candle on the little table and sat down on the chair beside the bed. Jack noticed that his father's face was grave, and that there was a solemnity in his manner which he had never witnessed before. Hagart drew the boy to his knee and put his arm tenderly round him.

"You love your sister very much, John?"

"Yes," said Jack.

"You must be very brave. She is going to leave us—you won't go to school with her, or play with her any more."

"What is it? I don't understand you! Say it again!" cried the boy, in whose ears the words had made but a confused ringing and murmuring, like water in the ears of a drowning man.

"She is going away from us. Dr. Crooks says there is no hope—she is dying, John."

This time the words delivered their meaning, but not in sharp outlines, only in a bewildering way. Some deadly stupor had got into his brain. He stared at the candle which his father had brought and laid on the table, and noticed that in the flame a tall pillar of a wick was standing like a black martyr.

"The doctor says she is dying. She is to be prayed for in the church to-morrow."

Jack, staring still at the candle, noticed that the wick had split in the centre, and was overlapping and hanging over, and that one of the overlapping portions had become red; and then he noticed that the red portion dropped off, and fell down on the tallow at the foot of the flame, and that the melted tallow had begun to run down on a great smear on the candlestick.

"God is going to take her to Himself, and we must be resigned. Pray for her to-night, John, and for yourself, and your mother, and me—that we may all be good, and that when we come to die, we may all meet her in heaven."

"Yes," said Jack, taking involuntary note that the fallen portion of the wick had become black, and that the tallow had ceased to melt and run.

"My boy," cried Hagart impetuously, and clutching Jack to his breast, "if Katy dies, you are the only thing left to us," and then Jack felt big tears dropping upon his face.

"Go to bed now, John," he said after a while, and in a low voice, "go to bed, and don't forget to say your prayers—don't forget to-night, nor any other night."

Jack said he would not forget, and standing in the same place, he saw his father take out the light with him, and his shadow come across the ceiling and down the wall to him, and then the door closed, and he was standing again in the warm brown light of the sinking fire.

What was it he had heard? The words lingered in his ears, he knew their meaning perfectly, but he was in sore stupor and bewilderment. He was told that Katy was dying, but somehow the knowledge did not frighten him, did not even vex him. He had shrieked out, he remembered, when he saw Katy once cut her finger, and now, when he was told that she was dying, that his only sister and playfellow and closest companion was to be taken away for ever, he was conscious only of unnatural calmness. He could not make it out. It was like being struck, and feeling no pain. He had no sharp sense of sorrow. He was astonished that he did not break out crying. And standing in his white nightgown beside the dying fire, he heard the outer door close. That is Dr. Crooks going home, he thought.

Then he went to the window and looked out. The night was calm, and right above him in a great field of blue-gray sky a crescent moon and star were reposing peacefully,—like celestial ewe and lamb. Underneath he saw a tree or two, and bulks of darkness, which he knew to be outhouses. The star, and the pure silver of the thin slip of moon, had for him, at the moment, a wonderful fascination; and thinking of their distance, their silence, their solitude, suddenly, as if some sluice had been opened, some obstruction had been taken away, the pent-up tears and sorrow came at length. "Katy, Katy! don't leave me!" he cried out, wringing his hands, and throwing himself down on the rug before the fire, and then he thought how hard it was that he could not die also, and go with her, it would be so much easier, he thought, to die with her, than to live without her; and after a while, his weeping took away the sharp edges of his sorrow, and a calmness came back, like the calmness after the thunder-shower has fallen, and with this serenity there became gradually mixed an inexpressible sweetness and balm, and he fell asleep on the rug, and Katy and he were wandering, hand in hand, along the canal bank, and around them were hopping, and feeding, and singing, a multitude of birds—more beautiful than any that Jack had ever seen before.

Next day was Sunday, and in the morning Dr. Crooks called, and found his patient in the same condition, weak, sleepy, uncomplaining, and muttering incoherent sentences at intervals. He spoke what words of comfort he could, but held out no hopes of recovery. Mrs. Hagart was in constant attendance, Alfred would not leave her, and consequently, Jack was deputed to represent the family at the afternoon service in church. He walked into Greysley, while bells were ringing, and well-dressed people were flocking to their places of worship; he took his place in the pew, he heard the psalmody, and the prayer, and the sermon, with a mind pre-occupied; and when, just before the concluding prayer, the precentor drawled out, "The prayers of this congregation are requested for a child apparently near death," and when the good clergyman prayed that the child's life might be spared, if in accordance with the Divine will; if not, that she might pass into the presence of the Saviour who said, "Suffer little children to come unto me, and forbid them not," and that the bruised hearts of the parents might be bound up, and comforted—when he heard all this, and, remembering that it was Katy at home who was thus mentioned, his sister, his playfellow, his companion, Jack pressed his face down on the book-board before him, and sobbed aloud.

Service was over, and Jack had hardly got himself free from the stream of worshippers, when the little schoolmaster who was walking on the other side of the street, recognised him, and came across to make inquiries. He liked the boy, and was sincerely sorry when he heard that Katy—of whose prolonged absence from school he was of course cognisant—was seriously ill. The schoolmaster listened to Jack's relation with a serious face. "Poor child," he said, "I am deeply grieved. So young too, and so gentle. Give my sympathy to your father and mother—although *that* won't do much good. Good-bye, John." And he shook his pupil's hand, thinking of all the boys and girls who had gone silently out of his little flock—of that other school of his that made no sound—of their other schoolmaster. Jack had not left the schoolmaster long, when he was picked up by Mrs. Graves on *her* way from church, and in company with that notable lady he was forced to march. To her, he had to tell, over again, the whole story of Katy's illness, and her pertinacious questioning—for she was anxious to obtain the best information—was to him sheer pain, like the rough and unskilful handling of bruised limbs. Still, to do the lady justice, her intention was kind, and she was as little rudely inquisitive as it was in her nature and the circumstances of the case to be. When she reached her own door, she shook hands with him formally, desired to be remembered to his dear mother, wished that Dr. Bowdler had been called in, or one of Dr. Macnamara's prescriptions had been tried, and regarded him with eyes of authentic concern. Jack went home conscious, that both by Mrs. Graves and his schoolmaster he had been treated with a respect and consideration of which he had hitherto no experience, and he was at no loss to discover whence that strange new respect and consideration arose.

He got home from church, but there was no change when he entered Katy's room. Mrs. Hagart was sitting by the bed-side, and Hagart, who was standing with his face to the window, turned round. Jack went up to the bed, the eyes wandered to his face and stayed there, and were then withdrawn. Mr. Hagart asked if Katy had been prayed for, and when Jack answered in the affirmative, there was silence, and Hagart turned to the window again. Jack then slipped into the kitchen, where, at Martha's request, he read aloud those chapters of St. John relating to the sisters at Bethany, and how Christ wept at the grave of Lazarus, and brought him—the secret of the other world in his eyes—to them from the grave.

That night in dream the boy's brain wove the strangest fantasies. He had lost Katy; she had gone away from him utterly: she was dead, and yet he felt no sorrow. He knew that she was gone away, separated from him by immeasurable spaces. His voice could not reach hers, between them there could be no message, and no messenger. And then there came upon him supernatural power of volition, and he thought he would go to her. He thought he had himself died, and that he was standing in an immense solitude; in an instant father and mother, school companions, and all the items which had hitherto composed his life, were left behind—distant as by thousands of miles, distant as by hundreds of years. And without fear or any trembling, but filled with a solemn expectancy, filled with the sense of an unimagined and inconceivable something about to break upon him, he was wandering over a land in which there was no land-mark, covered with the twilight of Eternity, opaque, black, formless as a midnight moor. And the land rose up before him to a black level line, and above that black level line, there lay a bar of livid dawn, such as we see on earth, when the June midnight has just turned and before a bird has twittered; and above that black level line of land, underneath that livid bar of dawn, lay the inconceivable secret that might in a moment leap upon him. And he stood gazing straight before him, marvelling into *what* the solemn images would resolve themselves. He knew that Katy was somewhere and would come—but how? And suddenly, behind him, in that immense solitude, in that land of death, where never was known sound of human voice, or fall of human footstep, he heard a stealthy rustling, and out of the darkness he felt that a hand was stretched out over him, and the awe instantly flew into the sharpest terror, and with a cry he awoke——

It was morning, and his father was standing by his bed-side. "You have been dreaming, John," he said.

In a moment the dream fell in ruins around him, but he had not yet escaped from its influence. He saw his father standing by. "What is it?" he asked.

"Put on your clothes," said Hagart in a voice which was almost a whisper, and Jack noticed now that his eyes were strange, "and come into Katy's room—that you may see her once again."

Jack was on the floor in an instant; he dressed hastily and followed. When he entered the room his mother was sitting by the bed-side with Katy's hand in hers, while Martha was standing back with her apron to her eyes. Hagart led the boy to the bed-side.

"Bid her farewell," said he, and Jack went close up.

Katy was yet conscious. She turned her head, and recognised him, life's last sunbeam playing on her lips. "Jack, Jack, poor Jack!" she said, and the sunbeam vanished.

"Oh Alfred, pray for her, pray for her!"

And with the exception of Mrs. Hagart, who still held Katy's hand, they all knelt down, and with a feeling of awe almost as great as the awe in his dream, Jack heard his father pray. Not that it was the first time he had heard him so engaged; but on occasions of family worship—and in the household such occasions occurred every Sunday morning and evening—Hagart was wont to read from a book of prayers prepared by some pious divine, and the matter and manner were as a consequence comparatively commonplace. But this morning Hagart prayed from his own heart and used his own language, and the boy was struck and subdued. The room was still, there was nothing heard but Hagart's voice and a sob at intervals from Martha.

"Alfred!" cried Mrs. Hagart, suddenly, as she rose from her seat and leaned over her daughter.

They all came forward: a shadow fell over Katy's face, the tiny grasp relaxed in Mrs. Hagart's hand, and the eyes glazed. The sufferer had passed.

"Rin roon to Mrs. Graves an' tell her to come," whispered Martha; "yer mother canna be left to hersel' the noo."

Jack slipped out, but the houses, and the road, and the barge passing along the canal, were strange and foreign-looking. He stared on them as if to assure himself that he was not walking in a dream. Up till this time he had shed no tear, but before he had reached Mrs. Graves's house his sorrow had found its natural outlet.

CHAPTER XII.

An unwonted silence settled down on the Hagart household now. In a room, the white curtain of which was always down, Katy lay in her white garments, and the silence of *that* room crept into parlour and kitchen. Mrs. Hagart was always low-toned and quiet, but now her step was almost unheard, and her voice hardly rose above a whisper. Martha would sing at her work at times, and go through with it after a somewhat noisy fashion, scrubbing the dresser impetuously in her own proper sphere, making the fire-irons clash in the sitting-room; but now her voice was silent and her duties were accomplished without any noise. Hagart carried the silence of the dwelling with him into Greysley when he went to labour for the behoof of the Wedderburn Brothers, and he brought it back with him from the Wedderburn Brothers' in the evening. Jack, usually noisy as a summer beck, became silent as a winter one which the frost has locked up. Into the prosaic household Death had come, like an angel beautiful and terrible, making changes; and the changes he had made were yet visible, and the members of the household were still with the remembrance. In the hearts of all there was sharp grief—grief which found plenteous vent in solitude and out-of-the-way corners; but the unwonted silence of the dwelling did not spring so much from grief, as from an obscure sense of sacredness and awe. It issued as from a fountain from the still face in the room in which the blind was constantly down. With *that* in the house there could be no uttered impatience, no sharp retort, no unmeaning speeches, no ungentleness, no pride. Something of a Sabbath-day had flowed over into the week, something of the sacredness of Sabbath psalms, something of the hush that follows Sabbath prayers. And if Death is always painful, it solemnises even the wildest, and that solemnisation—refined or rude—we all need at times. Were it not for Death we should become hard, self-sufficient, sensual, prosaic. Death makes life dearer by a sense of insecurity. It comes to us immersed in our twopenny ambitions, and in its chilly spiritual radiance we see how poor the wealth is, or the place, or the reputation which we strive after. It takes away from this world and gives to the other, and year by year this world darkens and the other brightens. Death is a greater Poet far than Love; and but for Death, Love would lose its beauty, its eternal youthfulness, and that ineffable something which never can be fully known, and become familiar, full-fleshed, pursy, and wear in due time crow's feet about the eyes.

But even with the dearest person dead in the house it would never do to devote oneself entirely to grief. In a household made suddenly unprosaic, there are a hundred prosaic things to be attended to. Let people grieve ever so much, they must eat, have their boots brushed, have shaving-water brought them of a morning. Martha had to perform her household duties just the same—and it was better for her, poor girl, that it was so. Mrs. Hagart had a black dress to procure: and, smitten to the heart as she was, she could yet, in the mercer's shop in High-street, choose one dark fabric out from a dozen others, think of cost, of becoming trimmings even; and, when the dressmaker came to the house of mourning to work, she was able to assist, to glance with moist eyes in the looking-glass, and to suggest a change here, the addition of a plait there, to make it sit all the more becomingly. As for Hagart himself, he was busy enough; he had his Parisian patterns to redact, to make arrangements for the interment, to provide a resting-place for Katy in the cemetery which stood high above the town, and looked out on the great valley, through which the river from Hawkhead flowed—a sheltered place, which the winds would not visit roughly, where trees in Summer would fling cool shadows, and keep up a constant murmur, and where the Spring flowers would come earliest and linger latest. Of all the household, Katy's death told most on Jack—not that he loved her more than the others, but simply because he had nothing to do, that foreign matters did not come betwixt him and the great impression: and so the strangeness and wonder of it had time to sink deep into his imagination, and to make an abiding home there. At this present writing, Jack has become John Hagart, Esq.—a personage of some importance in his own and others' eyes; he has children around his knees, has lost one or two; but although these losses are, by comparison, recent, he cannot recall the circumstances of their illnesses and deaths—perhaps not even their features—so vividly as he can the circumstances of the illness and death of his little sister thirty years ago. This he has told me himself: and we have talked the whole matter over, in serious mood, twice or thrice by dying Autumn fires.

When, on Monday morning, Jack, at Martha's instigation, came crying to Mrs. Graves's door, with the request that she should go to his mother in her extremity, that lady lost no time in sallying forth. The duty before her was one for which she had a liking. Her nature was neither fine nor delicate, but the occasion was one to draw out whatever she possessed of sympathy and womanliness. She was profuse of consolation. She proffered scraps of comfort. So far as her lights went she made herself useful. Left to herself, Mrs. Hagart would never have sent for her; but, having come, her presence and companionship did actually soothe in the first bitter rush of feeling. Of the two, Mrs. Graves was much the more noisy in grief, much the more plenteous in tears. At first, Mrs. Hagart was touched and grateful, but unhappily her visitor did not know when to draw rein. Remembering she was a McQuarrie, Mrs. Hagart did not much care to receive Mrs. Graves on the ground of mere acquaintanceship, and when that lady's sympathy became officious, when she intruded herself on the new sorrow, made a sort of common property of it, Mrs. Hagart chilled at once. "I have just come to sit with you, to talk to you, and be a comfort to you," said Mrs. Graves, as next day she entered the sitting-room in which Mrs. Hagart was sewing.

Mrs. Hagart looked up quickly with a troubled face. "Oh, don't! I really don't wish—you will pardon me, I am sure—but I would rather be left alone. I appreciate your kindness, but I would rather see no one just at present."

This rebuff was unprecedented in Mrs. Graves's experience. It was utterly and entirely unexpected. A whole world of consolation and death-bed experience was trembling on her tongue, but at the hearing, her mouth closed suddenly with a snap—like a miser's purse against the pleading of a poor relation. Mrs. Hagart noticed the change.

"I am sure you will understand me," she said. "I am in great distress, and with that a stranger cannot intermeddle. I am really unable to endure company. I don't wish to be rude, but——"

"And I certainly don't wish in the least to intrude," said the other, in considerable dudgeon. "My visit, I assure you, was meant in the purest kindness."

"I know that," said Mrs. Hagart, placing her hand on the handle of the door, to which her visitor had withdrawn. "I am certain you meant kindly, but I really wish to be left alone," and, after the ordinary parting civilities, the discomfited Mrs. Graves sailed off.

It was arranged that as few people as possible should be asked to the funeral. Letters of invitation were sent to Mr. Stavert, the elder Wedderburn Brother—Hagart thought that if there was anything to choose *he* was the more amiable, and he had a family of his own besides—Dr. Crooks, and the clergyman; and all immediate neighbours were excluded. And this resolution gave rise to much heart-burning and ill-natured remark. In the little clump of suburban houses in which the Hagarts lived, in which every one knew the other, this exclusiveness was taken in bad part. In that clump of houses the Hagarts—Mrs. Hagart more especially—were not popular. Her neighbours she seldom or never visited; she had resisted all temptations to be coaxed out to tea; she gave no quiet parties in the little sitting-room. She was considered proud in consequence; her airs were voted perfectly insulting and unendurable. And this unpopularity was increased by Mrs. Graves going the round of the neighbourhood—with all the families of which she was on intimate terms—and relating how uncivilly she had that morning been treated by Mrs. Hagart. "Just think, my dear Mrs. Bounderby! turned out of her door, actually turned out, and after I had been sent for, too, on the former day when she was in her distress!" And Mrs. Bounderby thought such conduct atrocious, and that Mrs. Graves was the worst-used woman in the world. "Actually snubbed, Mrs. Hislop," said Mrs. Graves in that lady's sitting-room, and before her grown-up daughters, who opened round eyes of horror at the relation; "told I wasn't wanted! that I could not intermeddle with her distress—I who have buried so many darlings!" And Mrs. Hislop and the Misses Hislop expressed their decided opinions that Mrs. Hagart was the rudest, most hard-hearted, most inhuman of her sex. In the parlour indignation was expressed, and, as is always the case, the indignation found its way to the kitchen. This indignation burst on Martha in a meeting with Mrs. Bounderby's maid-of-all-work, who had a hard time of it with cooking, brushing boots, mending clothes, and washing the faces of a thriving family of six.

"An' so yer gaun to hae a gran' fun'ral," said this Abigail, as she encountered Martha.

"Just a few frien's—frien's o' the fam'ly," said Martha.

"I suppose there's naebody about here guid eneuch to be asked! Yer mistress is a gey prood madam, an' we're a' dirt aneath her feet."

At this the faithful Martha fired, as she was clearly in duty bound to do. "If my mistress is prood, she's a guid richt to be. It's mair than——"

"Hoity toity!" cried the other, with a scornful toss of the head. "My maister could buy and sell yours ony day, an' we'll maybe hae a fun'ral o' oor ain or lang, and then ye'll see wha'll be asked. We'll be upsides wi' you then, I'm thinkin'." And with this little combat in behalf of their respective households the Abigails separated. Not in Verona alone, it would seem, do the dependents of Montague and Capulet take the wall, bite thumbs, and draw rapiers on each other!

No black-bordered, black-sealed epistle was sent to Miss McQuarrie, for the reason that she already knew what had occurred. And her knowledge came about in this wise. Mrs. Graves had hardly retired when the front-door bell rang, and on Martha's going out she found the gray-haired serving-man, with whom she had some little conversation on a former occasion, standing at the gate with a small basket in his hand. The girl went up to him with a tremor. "Miss McQuarrie sends her compliments," he said, "and desires to know how Miss Katy is;" then he put the basket in Martha's hand, saying that it had been sent by Miss McQuarrie from Hurlford, had been packed by her own hands, and that it contained certain delicacies for the use of the invalid—delicacies which it was thought would be acceptable and would tempt appetite. Martha took the basket mechanically, stared at the man in a pained bewildered way for a moment or so, and then burst into tears.

"What is the matter?" said the man, unable to comprehend the cause of Martha's sudden emotion.

"Yer ower late, sir. Miss Katy has nae need o' onything noo. She dee'd yesterday mornin'."

"Died!" said the man, looking grave all of a sudden. "Miss McQuarrie will be very sorry."

"She dee'd yesterday mornin' at nine, an' her mother's like to gang distracted. O man! couldna ye hae come sooner! Couldna Miss McQuarrie hae thocht—? An' what am I to dae wi' this?" she continued, looking at the basket in a despairing manner. "It's kindly meant, but it'll jist mak' matters waur—jist rip up wounds again. Sendin' jellies and comforts for them that's deid an' streekit! O man, couldna ye hae come sooner, or no come at a'!"

The man looked puzzled. "I was to leave the basket," he said "and there is no use in taking it back. Miss McQuarrie told me to leave it here, and she mustn't be disobeyed. Perhaps," continued he after a pause, "you had better take it in, and as I am going back to Hurlford at once, your mistress may like to send a message or letter by me. I would rather the news went in a letter than have to carry it myself."

"What will my mistress say?" cried Martha, ruefully. "It'll clean break her heart! Couldna ye hae come two days sooner. But I'll tak' it in. Jist wait there a wee, and I'll see if my mistress has a letter to send or onything."

Martha went in and the man waited at the gate. He leaned for awhile with his back to the railings, his white gloved hands folded before him, thinking of the child who had died so unexpectedly, and of the too tardy basket he had brought. His meditations on this subject were broken by a string of drays laden with empty barrels passing in to the distilleries. Then he saw a man ride past rapidly, and following with his eye he took notes of the nag's condition. Then he whistled right through a tune. Then he wondered what they were about inside. Then he thought waiting was weary work, and began to pine for release. No wonder he pined, he had been waiting for nearly an hour, and had gone through all the postures of which the human frame is capable, and found that, after a time, one was as tiresome as the other.

Had the waiting serving-man been able to have looked into the house he would have seen two women crying over some oranges, a pot or two of preserves, and a bunch of grapes, Martha telling her story between whiles. The things were carefully put away at last, and then Mrs. Hagart went into the still room for a little, and when she came out she sat down to her writing desk in the parlour, laying a tiny tress of brown hair down on the table beside her. She wrote a note to her sister, plenteous tears falling on the page as she did so. When done she folded it up and enclosed the tress of hair.

The serving-man was nursing his knee when the door opened, and Mrs. Hagart came towards him with the letter in her hand. He gave but one glance at her face and his head was uncovered in a moment.

"I am sorry to have kept you waiting," said she. "You will give this letter to my sister—to Miss McQuarrie I mean. Take care of it—it is very precious."

The man took the letter. "Miss McQuarrie will be shocked to hear of this," he said respectfully, and still standing uncovered. "I am very sorry myself, ma'am."

Into Mrs. Hagart's eyes the tears again started, a stranger's commiseration could even touch her. "It will be sad news for her, indeed. But take care of the letter. Have you children of your own?"

"Yes, ma'am."

"And lost any?"

"Ah, yes, ma'am. Two fine boys as ever——"

"Then you will understand, and take care of the letter. It contains a lock of my daughter's hair."

"You may depend on me, ma'am! Good afternoon, ma'am," and putting his hat on his head the gray-haired serving-man went on his way.

GRATITUDE.

O Thou that rul'st the storm, and wisely rein'st
The war-steed Desolation, rescuing
From his raised hoof the poor;
Who marked with life our door,
And saved us,—God of every good!
Let us before Thee pour our gratitude.

Forgive, O God, the discontent which rose
Within our sinking hearts when we had seen
The idle plough fast bound
In the snow-mantled ground,
From weary week to week, and saw
No sign which told us of the coming thaw.

Forgive our lack of faith—the thoughts which, oft,
In murmuring speech expressed, told all who heard,
That we had ceased to see
Omniscience in Thee,
And dared to turn our eyes above,
Doubting Thy goodness and preserving love.

We saw a happier race speed daily forth
To pleasure on the lakes—returning thence
The evening to prolong
With feasting, cups, and song:—
That made our little nothing less,
But all our thoughts were thoughts of bitterness.

We saw no beauty in the snow-robed hills,
Nor in the curvèd wreath, and when the moon
Down on the white earth shone,
And, like the starry zone,
The crusted snow was sparkling, we
Saw in Thy handiwork no trace of Thee.

The robin sat upon our sill, and sang
Like one that hoped though hungry; but in us
His heaven-taught melody
No hope inspired, for we,
The while we listened to his strain,
Thought of our wants, and of the snow-hid drain.

But suddenly Thou bad'st the warm winds blow,
And down the flood came sweeping. Tiny streams
The storm-chained plough unbound;
And coltsfoot flowers were found;
And larks the showery morning hailed;
And all the hills appeared again unveiled;

And the green fields were softened; and our spades
Were labour-polished; glowed our hands with toil;
And plenteous, though poor,
The morning meal was sure;—
Our children answered to our call,
A little thinner each, but living all.

DAVID WINGATE.

SOME THOUGHTS ON STRIKES AND LOCK-OUTS.

By J. M. LUDLOW.

Thanks in great measure to the good sense of both masters and men in the North of England, by the time these pages will appear, England will, no doubt, have witnessed the close (and Scotland, I trust, will not have seen the resumption) of one of the most gigantic struggles which have yet convulsed our labour-market—the lock-out in the iron trade, arising out of the North Staffordshire strike. According to the *Times* (March 22), 33,730 workers must have been thereby thrown out of employ in Staffordshire and East Worcestershire alone, representing a population of 133,000; 14,782 hands, representing 59,128, in the North of England. The estimate does not apparently include one or two smaller locked-out districts; and if the lock-out had extended, as originally threatened, to the whole trade, or had been universal in the districts where it existed, there can be no doubt that the figures put forth by the *Beehive* newspaper of 70,000 as the number of men virtually involved in it, would have been under the mark; so that, by a stroke far more sudden than that of the stoppage of the American cotton trade, more than a quarter of a million of men, women and children would have been deprived of their livelihood.

Did this event stand alone in our contemporary history, it would deserve to fix the attention of all of us who are not absolutely callous to the well-being of their fellow-countrymen. But it is only the other day that the building trade in the Midland Counties was paralysed by a similar contest. A very few years separate this latter from the London building strike of 1859-60. The coal strike and lock-out of 1858 is still fresh in West Yorkshire memories; the Preston strike of 1853 in those of Lancashire. The lock-out of engineers in 1851-2 is remembered as the first instance of a hostile stoppage of works throughout the country. Disputes formerly confined to a single town now spread over whole districts, or cover the whole country. The persons engaged in them have risen in number, as we see by the last instance, to tens of thousands; their immediate victims, to hundreds of thousands. There is a system in them. The men strike against a single master or in a single district, by way of testing their strength, with the view of carrying out the process in other cases if they succeed. The masters seek to anticipate their tactics by a general lock-out. And although I am perfectly satisfied, as every one must be who looks into the facts, that trade disputes are far less mixed up with violence than formerly, so that it is only in a few localities, and almost exclusively in a few of the lowest and worst-paid trades, that outrages formerly common in all may be still expected, still I am bound to say that in my opinion the frequency and magnitude of these disputes have not yet reached their *maximum*, but we are likely to see hereafter strikes and lock-outs of a more gigantic character, and more fruitful in suffering, than any we have seen hitherto.

It would indeed be easy, but too long for me here, to show in detail that the growth of these crises of the labour-market is in part only apparent; and again, that so far as it is real, it is in great measure owing to our social progress itself: just as the increased destructiveness to life and property of a railway accident, compared with a coach accident, is in great measure owing to the same cause.

To say nothing yet of changes in the law, the railroad, the penny post, the electric telegraph, the enlargement and multiplication of newspapers, the general cheapening of the press, the spread of education, amongst other influences, have brought us closer together, enabled us—nay, compelled us to see and know more of each other; and this material approximation between man and man has been accompanied with and promoted by, whilst it has in turn favoured, the growth of larger and more varied sympathies. Compare any number of the *Times* in 1865 with any newspaper whatever of the last century, and however offensive may still be the temper of the "leaders" in the former, yet the very size of the two sheets, still more their contents, will prove that—putting aside all foreign and colonial questions—the various parts of these British Isles care and want to learn much more about each other than they did then; that Manchester and Glasgow, Leeds and Dublin, have much more hold upon the thoughts and feelings of London than they had. And this increase of knowledge and mutual sympathy has not been only superficial: it has grown in depth as well as in breadth. The general public hear more about trade disputes, because they care more about both classes involved in them.

Again, the progress of population, the accumulation of capital, the development of mechanical invention, have enormously multiplied the number of workers in almost any given trade, and in almost any given establishment, so that the cessation of labour in any single workshop, still more in any single trade, throws ever-increasing numbers of workers out of employment. And as each portion of our country becomes less and less a little realm of its own, differing in customs, prices, speech, feelings from all others, the labour market for each calling tends more and more to become that of the whole country. When thousands of men can be transferred from London to Leeds or Manchester in a few hours at a trifling cost, any cessation of trade in one labour mart affects every other far more vitally than when the same number must have taken days and even weeks to perform the journey at a greater expense. This again tends necessarily to draw both the employers and the employed respectively into closer relations among themselves; to enlarge their respective combinations, to give intensity to their disputes.

But because strikes and lock-outs have grown with the growth of society, does it follow that they are to be looked upon as its necessary products? that we are to stand tamely by and let them work havoc at their will? You might as well say that railway accidents must be accepted as the necessary consequence of the railway system, and railway companies be allowed to smash trains and passengers as they please.

The parallel, of course, is not exact. It is true as to third parties—workmen in connected trades, shopkeepers who supply the wants of the combatants, &c.—victims of the contest, as helpless and as innocent as any passengers whom a railway accident knocks to pieces. It is not sufficient as to the parties actually engaged. For indeed there is this difference between the cases, that rail and wheel here have in a manner wills of their own; and third parties are smashed because the rail won't carry the wheel, or the wheel won't run on the rail. A struggle of will with will lies always at the bottom of all the ruin—a struggle which now-a-days assumes all the proportions of a social war, and thus, to be fairly judged and adequately dealt with, I believe strikes and lock-outs require always to be considered alternately in their two-fold aspect—first, that of a social warfare between class and class; second, that of a destructive interruption of the commercial welfare of the country. The distinction must be kept clear, between the rights of the parties engaged in the contest as towards each other, and those of its victims as towards both.

Now, so long as we do not go the full length of absolute non-resistance as a policy of practical and present application, I have no hesitation in saying that, as between the parties, a strike or a lock-out appears to me justifiable precisely to the same extent as any other war; that is to say, it may be carried on for a just cause, and where no other means are available for attaining its ends.

Into the ethics of the question generally I have no space here to enter; but one or two points connected with the late struggle I may venture to touch upon. I must say at once that—quite admitting that a lock-out stands, in principle, on the same footing as a strike—it appears to me always to demand stricter investigation, a fuller justification. The employer almost invariably claims to be superior, not only in wealth, position, and credit, but in intelligence and education, to his work-people. In his relations to other classes he has almost invariably in his favour the *primâ facie* arguments of a good coat, a clean face, and very generally also of grammatical speech and an intelligible handwriting. All these are advantages of which he must bear the responsibilities. He really claims to be in the position of a more highly civilised nation opposed to a less civilised one. Surely he is bound to be all the more judicious, magnanimous, and patient. Nor can we forget, that when the workman ventures upon a strike, whatever may be the consequences to others, he begins himself by staking generally his all; whereas, when the employer locks out, he seldom risks much more than the temporary profits on his capital, which never can be very high at the time. And when he stops work altogether, on account of a dispute with only one set of workers employed by him, he is really carrying on the social war like a general who should expel all the inhabitants of a friendly city, in driving out a party of the enemy.

Still worse is it, I must say, when the masters close their doors upon thousands of men, all working at the wages and under the conditions of labour which their employers themselves had fixed, because those men, and even only a comparative few of them, are subscribing out of their wages for the support of a strike elsewhere, even though it should be with a view of repeating the same process, if successful, on the spot. Surely the employer can have no right to fix the way in which his workmen lay out their wages? To do so is to assume, no longer commercial authority, but political power. It is to imitate and justify the example of the Emperor of the French, or the Emperor of Russia, when they forbid subscriptions in favour of some political champion or victim. Suppose the case reversed. Suppose the men to strike against their masters when giving them their own rate of wages, because these chose to support certain other masters struck against elsewhere, and what an outcry would arise throughout the country! Yet the two cases are exactly parallel. And if I am told that there is no other way than such lock-outs of preventing the employers from being worsted in detail, I will answer that such a fact would amount to a sad confession of moral weakness on their behalf; for it would simply show that they cannot stand by one another as their men. If their longer purses were as free to their brethren as the men's shorter ones to theirs, it is impossible that any partial strike should succeed.

I must go further, and say that a lock-out to put down a trade-society, either directly, or by means of a "declaration" such as that imposed by the master engineers in 1852, and by the Leeds and Low Moor Ironmasters last year, appears to me always unjustifiable. It cannot be too often repeated that the combination of numbers amongst the men is but the counterpoise and parallel to the accumulation of capital in the hands of the employers; since every large employer is in fact as many employers in one as he can employ men, with a unity of direction which the combination of the latter can never possess, and resources to back him which they very seldom enjoy. Moreover, the employers' attempt to put down such combinations never in fact succeeds. When a "declaration" is imposed, the usual result is that the most conscientious society-men leave the district or the country, the remainder sign the declaration, as they deem it, under compulsion, either violating their engagement while they take it, or meaning to do so the next day. And the employers know this, as the conduct of the iron-masters in the late dispute well shows. As I have heard it well observed, they required last year the men engaged in the Low Moor Strike to pledge themselves against their union. This year they punish the union for not being strong enough. For what else was the threat to keep up the lock-out until the North Staffordshire men went in, but an attempt to force the men into doing, by some organisation of their own, that which the employers themselves were powerless to do?

Injudicious strikes have often destroyed trade-societies. A lock-out, I believe, never has. And it requires but common sense to see that it cannot, especially when attempted, as in the case of the iron-trades, in a business employing many other classes of workers than those in dispute with the employer. For whether a society's purse be long or short, it is always seen, when work is stopped, to be better than none; the unionists must fare better than the non-unionists. Hence the natural effect of a lock-out, or even of a tolerably well-conducted strike, is to create new trade-societies, and to strengthen old ones, very often now-a-days by amalgamation between trade and trade. The master engineers' declaration hangs up still, I believe, in some workshops; but the Amalgamated Society of Engineers, which they thought to have defeated, had a balance of £67,000 in January, 1864, in place of the £22,000 with which it met the lock-out. The iron-masters will have, I believe, to take credit for themselves for the rise of several labourers' unions through their late proceedings. The Amalgamated Society of Carpenters and Joiners, a five-year-old bantling, so far from having been ruined by the London Building Strike of 1861-2, has now a balance in hand of upwards of £4,000. I know very well that in many instances trade-societies are becoming more and more exacting. I can fully sympathise with employers smarting under their interference. I am quite ready to believe that the puddlers (men, be it observed, not only generally very ill-educated, but who fill, in fact, the place of small masters, and not of the mildest, to their under-hands and boys) have been often especially tyrannical. But it is idle for the employers to suppose that they can simply beat down trade-societies by any organisation of their own. The employers in any given trade may be stronger than the workmen in that trade, but not than in all trades. The more extensive their lock-outs, the wider will be the combinations among working men which they will evoke.*

---

* I must add, moreover, as an outsider, that the working-men's present policy of partial strikes, repeated if need be, appears to me far less objectionable from a public point of view, not only than the general strikes of old, but than the employers' retort of a general lock-out. The

I have the less hesitation in speaking as I have done of the late lock-out, as from the first I suspected, and am now pretty well convinced, that the North Staffordshire men who struck were in the wrong all through; that—although there may possibly be some difference in the nature of the material they have to work up—they have established no sufficient case for the difference in wages claimed by them over their fellow-workers in other districts, many of whom (in South Wales and Scotland, for instance) have, I fear, to labour under much worse disadvantages, that of "truck," for one. Few strikes, I believe, have ever aroused less sympathy in trades more immediately connected with them. The "Millmen's Association" has openly condemned it; the Staffordshire miners, and the Amalgamated Engineers, have shown it no favour. And even if the men had been originally justified in claiming an enhanced rate of wages, it seems to me that, from the working man's own point of view, the North Staffordshire men grievously sinned against their fellows by persisting in subjecting them to all the hardships of a lock-out for the sake of their own paltry bit of coin, and in setting at defiance the authority of their own trade-society—a conduct which, they may rest assured, has inflicted a worse blow on trade-societies generally than any conceivable number of lock-outs. And lastly, by their refusal of a fair proposal of arbitration when accepted by their masters, they seem to me to have shown their own consciousness of the badness of their case.

Now whence do strikes and lock-outs proceed? Like all other quarrels, from either ignorance or selfishness. Those which flow from the former source may be put a stop to, for all ignorance may be cured by knowledge. But we must distinguish between that ignorance which arises from imperfect education of the man, and that which arises from the imperfect knowledge of the facts of labour and trade. I will not dwell on the former kind of ignorance, which concerns the rest of the community as well as the employers and the employed, and which tends to disappear through the spread of education. But ignorance of the facts of labour and trade, *i.e.*, of the true conditions under which a given labour or trade can for the time being be carried on, may consist with a large amount of general knowledge. This ignorance is often mutual. Under that divorce in ownership between capital and labour which is characteristic of our social state, each party is trained to look only to its own interests, and thereby naturally to exaggerate the inconveniences under which it may suffer, without often considering that those which it imposes on the other may be greater still, at least in the estimation of that other party. This kind of ignorance can only be remedied by a better understanding and a friendly frankness between both parties. It is not for me to say how far an employer is to disclose his business and position to his work-people; but I feel certain, first, that workmen invariably know far more about their employers than the latter are aware; secondly, that this partial knowledge, being pieced out by surmises, leads, I believe, to many difficulties and disputes which a frank statement of the truth would avoid. Nor must it be forgotten that when ignorance is coupled with suspicion, as it unfortunately is in most cases between employer and employed, the dispelling of it may depend in great measure not only on a knowledge of the truth, but on the manner of telling it. "The Millmen's Association," in an address issued by them in reference to the late disputes in the iron trades, I believe most truly tells us that strikes "could ofttimes be avoided, were the employers a little more to unbend themselves, and the men to be more susceptible to reason in such cases. Were the employers and the employed, through their representatives, to meet and discuss questions of this nature, with absence of hauteur on the one hand, and frankness and willingness to hear and to learn on the other, we think ere long such things would belong to the past."

But although the establishment of mutual confidence and friendly relations between employers and employed will always prevent many a trade-dispute, such relations, unfortunately, become more and more difficult, in proportion to the scale on which manufacturing operations are carried on, and to the enlargement of the sphere of trade questions. The same facts cannot often be published to the many, which could be safely trusted to the few. For the employer of half a thousand men to be really on friendly terms with all, implies peculiar gifts, considerable exertion, the sacrifice, it may be said, of all his leisure. And the man who conquers this difficulty will probably be the very one who on the occurrence of a collective trade-dispute, will be apt to look at any strange workman, representative of a men's union, as a born enemy. Conversely, workmen who may have the utmost confidence in their immediate employer, will often look at the masters' association to which he belongs as the incarnation of all evil. And there is an ever increasing number of cases in which the employer himself is a collective entity, leaving the employed in personal contact only with hired managers. I fear the mutual confidence and friendly personal relations between masters and men, however efficacious where available, especially in individual cases, are but a broken reed to trust to in these large differences which involve the well-being of a whole trade.

Moreover, if a quarrel once breaks out, even though through simple mutual ignorance, the parties to it are often not the most likely to come

---

former tends to minimise, the latter to maximise the mischiefs of a dispute; since, at the worst, partial and successive stoppages convulse a trade far less than a general one; whilst, if one or two partial contests are accepted as decisive, an economic problem—to use a friend's words—has been solved in a really scientific manner by experiments on a small scale.

to a direct understanding. The intervention of a third party, impartial between if not friendly towards both, may often help much to this effect. To yield to his judgment, instead of to an opponent, saves the self-love even of a disputant dimly conscious of being in the wrong. His mere mediation—like that of Lord Lichfield between the Staffordshire disputants—may help to calm down passions, even when not at once successful. Hence the swelling cry for arbitration in trade-disputes, practically justified in several instances already. Arbitration stopped, some years ago, the strike of the Leeds stone-masons. It stopped last year the strike in the Manchester building-trades. Proposals for arbitration, in one shape or other, were bandied about like shuttlecocks in the late dispute in the iron-trades. The addresses to the employers, both of the "National Association of Ironworkers," and of the "Millmen's Association," urge it. The former hopes "that you will consider the advisability of laying down some plan, so that all disputes may be settled by arbitration." The latter cautiously says: "Arbitration, we think, would have a tendency to almost, if not quite abolish strikes."

But here we must distinguish between two things, often confounded in the cry; voluntary, and legal arbitration. Very seldom, I think, will employers be found to go beyond the former; to accept the idea of being bound by an arbiter's sentence in the conduct of their business. Looking on themselves as independent potentates, they are willing to accept arbitration so far, and so far only, as it is at present available between nation and nation, *i.e.*, as a mere declaratory sentence, sanctioned by no penalty, without other efficacy than that which the honour of the parties in difference allows to it. Grant, however, that voluntary arbitration might well terminate such trade disputes as arise from the source hitherto considered, ignorance. Of what avail will it be against those which arise from that other source which I have not yet dwelt on, selfishness,—the desire of either party to pursue its own advantage, regardless of the other's rights and welfare? Of as much avail as a wisp of straw to bind a tiger. There is no use in dwelling here upon this class of trade-disputes. As between the contending parties, they have no solution but to be fought out "to the bitter end." And when we consider how many trade-contests do and must spring from this source, I fear we must come to the conclusion that there is no hope of seeing them extinguished, so long as they are dealt with only from the point of view of the disputants.

But now let us take up the other point of view, that of the bystander, the victim. It is no question for him whether a quarrel arise out of ignorance or out of selfishness, which party is in the right, which in the wrong. His right is not to have his head broken, his windows smashed by either. *They* may only claim a ring—a fair field and no favour. What *he* needs is the police. They may have their respective rights, and so much the better for them. But they have no right, according to the old legal adage, to use that which is their own so as to injure another. His title to earn his living undisturbed cannot be affected by their quarrels. The only question for him is, how these quarrels are to be put down or prevented.

A firm of iron-merchants writing to the *Times* some time ago, and looking only to the fact that trade-disputes now-a-days are carried on by large organised bodies, proposed for simple remedy the putting down all such associations of masters and men alike. They might as well have proposed that rivers should run up to their source. *That* policy was honestly practised by this country for centuries, from the reign of Edward III., at least, to that of George IV.—and with what result? That trade societies, however illegal, multiplied as secret unions, wielding in some cases a power to which the great amalgamated societies of the present afford no parallel, as when the Liverpool shipwrights, although combined nominally as a mere friendly society, not only held in their hands the patronage of one of the seats for the borough, but were able on one occasion to carry their candidate against those of both contending political parties; that strikes were habitually carried on with an amount of intimidation and outrage, only exceptional at the present day, and that finally, after passing an infinite number of acts in the direction of repression, Parliament, upon the report of two committees in 1824 and 1825, swept away the whole mass of the combination laws, by the 5 Geo. IV., c. 95. If any one wishes to see a *bonâ fide* revolution in this country, let him do his best to restore them.

But we must make a great distinction between the putting down of trade combinations, which every man acquainted with the past history and the present social condition of our country must deem impossible, and the putting down of strikes and lock-outs, which, although they owe their importance to such combinations, yet exist in principle quite apart from them, since, in their essence, they are nothing but a simple refusal to sell or to buy a given commodity. The trade-society is no doubt the machinery used to carry on the strike or resist the lock out. But so far from the strike being the normal object and purpose of the trade-society, it will generally be found that the older and more prosperous a trade-society becomes, the fewer strikes it is found engaged in. And conversely, the more strikes a trade-society encourages, the sooner it comes to grief. Sometimes indeed Jeshurun waxes fat and kicks; large accumulated funds, coming into the hands of a new executive, like a rich inheritance to a young spendthrift, may tempt it to a conflict. But the reverse is usually the case, the possession of property brings with it as a rule prudence to trade-societies as well as to other people; witness, for instance, the line taken up by the wealthy Amalgamated Society of Engineers in the iron trades' dispute, in opposition to Mr. George Potter.

For myself, I have no hesitation in saying that strikes and lock-outs will, in my opinion, have to be put down sooner or later, just as private wars had to be put down, then street-fights between noblemen's retainers,—just as faction fights and Irish rows have to be put down nowadays,—by the law. But neither private wars nor any other shape of open conflict can ever be so put down, until the law shows itself capable of grappling with whatever title or pretext of right lies at the bottom of them; nor can it ever put down strikes or lock-outs, until it has devised means of taking cognisance of the subjects of trade disputes, and created tribunals for deciding them.

What means? The usual suggestion is still, Arbitration; but arbitration in a very different sense from that in which we viewed it before; legal arbitration, compulsory arbitration, not voluntary. Within certain narrow limits, indeed, it is too much forgotten that, since the beginning of this century at least, the law of England has been ineffectually endeavouring to apply this very remedy. By an Act of 1800 (39 & 40 Geo. III., c. 90), "for settling disputes that may arise between masters and workmen, engaged in the cotton manufacture in that part of Great Britain called England," a system of arbitration was sought to be introduced in the cotton trade. In another Act of the same year and session (c. 106), is contained a section (18) enacting general provisions to the same effect. Besides various intermediate statutes (1801, 1803, 1804, 1813), the 5 Geo. IV., c. 96, which repealed all previous Acts, and is still in force, has for title "an Act to consolidate and amend the laws relative to the arbitration of disputes between masters and workmen." How far such statutes may have been found available in individual cases, I cannot say; how little they have effected in putting an end to trade disputes, the enormous strikes and lock-outs of our day sufficiently show. Something more then is evidently needed. This something has been thought to be found in the creation of regular courts of arbitration, elected by masters and men, more or less after the type of the French "Conseils de Prudhommes."

These latter, I cannot doubt, have saved many a strike to France. Although they can only deal with individual cases, they are thus able, at least, to dispose of those numerous instances (as that of the London building strike), in which a quarrel between a single master and one or two of his men spreads first to the whole workshop, then to the whole trade. But the "Conseils de Prudhommes" have not suppressed strikes in France. The Parisian working men delegates to the Great Exhibition, in that remarkable series of reports, of which I have ere this spoken in Good Words,* mention strikes repeatedly; sometimes declare that only by means of them have they been able to improve their condition hitherto; and tell of a Parisian carpenters' strike in particular (spring of 1862), in which more than 2000 workmen were arrested.

I should be the last person to decry courts of arbitration for trade disputes, seeing that I have advocated them in print for the last thirteen years. I greatly regret that Mr. Mackinnon should this year abstain from bringing forward his bill for the purpose. But the more I reflect upon the subject, the more satisfied I am that to make such courts, or any arbitration of trade disputes, really efficacious, the first thing required is to legalise trade organisations, both of masters and men. At present, be it observed, these bodies, though not illegal, are yet practically shut out from taking any legal binding form. Until this is given to them the law cannot face, cannot grapple with, the practical conditions of trade-disputes. They are almost invariably carried on by societies. It is these which the law must get into its grip, so as to be able to use their machinery, to lay hold of their funds for the ends of justice. It is too often supposed that legalisation is only claimed for them as a boon. No doubt it would be an advantage to them to obtain a legal control over their members, to be able to enforce payment of subscriptions (protection against embezzlement they may have already, under a special clause of the Friendly Societies Act); but such a measure would be, above all, a guarantee to the public. Nothing is more dangerous than the existence of huge organisations of thousands of men, of which the law takes no account—than their being able to reckon balances by the 10,000*l.*, of which the law cannot touch a penny. What is needed to make the arbitration of trade disputes a reality, in cases of collective strikes and lock-outs, is to bring trade societies as such before the arbitrator, and enable his award to be enforced, with costs if need be, against their corporate funds, through the medium, if need be, of their corporate powers.

Yet when all is said and done, I should be very sorry if either employers or employed, or the bystanding public, were to run away with the notion that arbitration alone, even if backed by the most stringent legal remedies, can be a panacea for strikes and lock-outs. Arbitration is no doubt a very wise, judicious, excellent thing; but its very adoption implies a certain amount of wisdom and judgment in those who adopt it; requires a still larger amount of both in those who submit to it when applied. A contested arbitration, as any lawyer knows, is more tedious and expensive often than a lawsuit. Of all legal documents an award is often the most difficult to draw, so that it shall really "hold water." In practice, perhaps the greater number of arbitrations which take place are imposed by courts of justice. A very considerable amount of legislation has taken place to render both submissions to arbitration and awards binding and enforceable. And yet any one may see that arbitration has not suppressed hostile litigation;

---

* See Good Words for 1864, pp. 728, 874.

that more quarrels perhaps are fought out in all manner of ways than are settled by a third party.

Excellent, therefore, as is the idea of settling trade disputes by arbitration—certain as it is to bear fruit in many instances—it is idle to suppose either that it can be realised generally without considerable difficulty, or that it will, as a rule, fulfil its purpose. But the legalisation of trade organisations would bring with it consequences of its own. In giving responsibility towards the arbitrator it would give it towards the world.

Considerable steadiness might be added to the labour market through agreements by the trade society, enforceable at least in damages, that work should be carried on for a given time under certain conditions; by its guaranteeing in like manner, for certain periods, the contracts for labour of particular workmen; perhaps by its contracting itself for a supply of labour. Virtually, indeed, in all trades where strongly-organised trade societies exist, this takes place already. Though the employer may choose absolutely to ignore the society, it is really this which, through the medium of individuals, agrees to let him have his labour, at a certain price and under certain conditions; and he would enjoy far greater security if he could treat with it openly for the purpose, as with a legally responsible party. Again, let the rules of a trade society forbid strikes, those of an employers' society lock-outs (none should be allowed which at least make provision for such purposes), and any application of their funds to the forbidden purpose would give grounds for a suit in equity against the peccant executive. Nay, I believe it would not be impossible to devise some legal remedy for outsiders aggrieved by trade disputes, analogous to compensation for accidental injuries. If iron-masters and their men, by mismanaging their trade, choose to ruin a coal owner and his workmen, there seems no reason why they should not be as responsible to their victims as any Jehu who, by furious or careless driving, runs over a fellow-creature. The injury done to a non-society man kept a given number of weeks out of work by a society's strike, in which he had no part, is as measurable in damages as if he had been laid up by a broken leg.

I have only had space here to glance at one condition of the legal settlement of trade disputes, viz., the providing effectual means of reaching the parties. I am of course not ignorant that many persons hold almost as a tenet of faith, that the questions in dispute themselves are incapable of legal decision. I have given reasons elsewhere (see *Macmillan's Magazine* for March 1861, pp. 367, ff.), from a purely scientific point of view, for holding this view erroneous, even as respects wages. I will only insist here that a rate of wages is merely the price of labour, and that the prices of all manner of things are continually determined through the agency of courts of justice,—by juries, by judges, by masters, or other officers of the courts, by arbitrators under their sanction,—and that I know of no other instance in which a question of price would be allowed, as this one is, to convulse society without legal intervention. Suppose, for instance, that all the railways of England were carried on under a system of divided ownership, similar to that which obtains in trade, so that all the permanent ways should be in one set of companies, and all the rolling stock in another; would it be tolerated that the whole traffic between London and Liverpool, or even between Glasgow and Edinburgh, should be stopped for as long a time as the permanent way company and the rolling stock company chose to remain quarrelling as to the terms of carrying on the line and sharing the receipts? Would not means be very soon applied or devised for compelling them to come to an agreement, for determining somehow the figure in dispute? Yet such a case would be almost exactly analogous to that of any ordinary trade contest. And if I am told that when a question of price comes to be judicially determined it is very often very badly decided, my answer is that this is rather an advantage, as leading to more settlements of the question out of court,—the bad judicial determination acting as a penalty upon obstinacy, and with the deterrent effect of any other penalty.

Not arbitration merely, therefore, but the means of legally enforcing responsibility for trade disputes against those who carry them on, is what is wanted; to subjugate those disputes, in short, like every other kind of civil difference, thoroughly and absolutely to the law. And I have seen no reason for varying the opinion, which I expressed in print some years ago, that competent tribunals can be devised for the settlement of trade disputes, and that when this takes place, the public will be entitled to insist on measures of penal legislation against strikes and lock-outs as social nuisances—making them perhaps indictable, like other nuisances, at the common law.

But is coercion then the be-all and end-all of such questions? Coercion, which is seldom a cure, but only a punishment? Surely what is needed in mischiefs of this kind, as in all others, is, beyond punishment, cure where practicable—but above all and in all things, prevention. Now the only social prevention I know against strikes and lock-outs lies in combining the characters, and thereby identifying the interests, of the employer and the employed, either by admission of the latter to profits, with a right of account at least, if not with some share in the management, or by their finding themselves the capital for carrying on the business; in other words, by the application to production of the co-operative principle, so successfully applied already in this country to consumption.

Nothing seems to me more singular than the fact that such combination of the two characters should seem to many new and strange, to some still dangerous and revolutionary. All production starts from it. The first workman in any given trade must always have been his own master. The second, whom he taught, no doubt became such as soon as he had learnt his trade. There were no strikes or lock-outs then, for men do not strike against or lock-out themselves. To the present day, the individual worker who is his own capitalist offers peculiar guarantees to a customer. A cab-driver who owns his cab is always a more responsible man than he of the "next cab" who does not. The most satisfactory work in any handicraft is to be looked for from a good workman working on his own account; the next, from a shop where the master takes himself a hand in the work. Thus, in the most ordinary cases, the more closely the two characters of employer and employed are combined in production, the more orderly and satisfactory is the result; and the only question is really as to the best means of combining them on a large scale. I must say, indeed, that although I believe the true principle of co-operation in production—viz., that of attributing profits to labour as such—has been discovered, it is quite possible, notwithstanding the success of a few co-operative productive associations, that the true form of applying that principle has not yet been worked out. And I am glad, therefore, of any efforts in this direction, whether in the shape of mere joint-stock companies, in which the workpeople of the establishment take shares, or of mere distribution of profits beyond a given amount among the workers. Believing as I do that the work of production will become more and more difficult, until it reverts to what I deem its normal condition, combining the characters of capitalist and worker, I know well the difficulties of the attempt. The admission of the worker to a participation in profits retains in presence two classes, the one accustomed to rule, the other too often grudgingly and distrustfully to obey, and both of which carry into their new relation their old jarring habits of thought and action, their old mutual prejudices and misunderstandings. Co-operation amongst workers alone involves the effort, enormous to men of any class, still more so to the comparatively uneducated, of taking up the place of another class, and that one to which they have been habitually opposed, and taking it up under difficulties still comparatively unknown to the very class which they replace, viz., those of a numerous proprietary.

Participation in profits, or co-operation, can thus be but slow remedies for trade disputes such as now convulse society. Still, the latter especially must be an effectual one; and both have this further advantage, that their preventive effects are not confined to those of successful experiments. The most miserable failure of a co-operative workshop, by placing the wages-receiver for a time in the position of a profit-receiver, compelling the most ignorant and wrong-headed trades-unionist of the old school for a time to realise in his own person the puzzles and responsibilities of an employer, may do more in the long run to avert strikes and lock-outs than the most affectionate self-devotion of a particular employer to the interests of his workpeople. The one must make the worker more of a man; the other may end by making him little more than a happy child. And valuable as must be even co-operative failure, co-operative success must be far more so. For a flourishing co-operative establishment in any given trade must, over and above the comfort and means of self-improvement which it supplies to individuals, tend to give steadiness to the whole trade, by affording a standard of wages. The worker-capitalists, whom no class interest can induce to exaggerate the margin of profit, will be sure not to lower their own wages, whilst they can afford to keep them up; nor to keep them up when they cannot afford to do so.

But before the devising and carrying out of co-operative production on any general scale, years and generations may go by. In the meanwhile, let this at least be borne in mind, by employers,—by us all. Within a very few years, with the close of the American contest,—when the Southern States have at last, in fact for the first time, to be really settled and civilised,—a drain of labour, both skilled and unskilled, will surely commence from the Old World to the New, such as has never been seen yet in history. If between this and then really satisfactory relations cannot grow up between employers and employed—if the condition of our working man does not become in his own eyes a more than tolerable one, both economically and morally, employers may some day find themselves compelled to yield to the least efficient and least worthy of their workpeople that which now they often refuse to the best and worthiest. Already the trade-societies of the English-speaking race have far outstripped the dreams of politicians. Whilst these are timidly conceiving the possibility of an imperial federation between Great Britain and her dependencies, our trade-societies have actually restored England's union with her great lost empire of the West. The Amalgamated Society of Engineers has its branches in the United States, as well as in Malta, Canada, Australia, and New Zealand. The Executives of the National Society of Ironworkers, the other day, warned their masters that Pittsburgh was in union with Gateshead and Brierley Hill.

The present is surely a most favourable time for considering this momentous question. Strikes are denounced by the very bodies which have to carry them on. The address issued to the masters in the course of the late dispute in the iron-trades, by the Joint Executives of the "National Association of Ironworkers," declares: "We shall do all in our power to hasten the time when strikes and lock-outs will be abandoned." That of the "Millmen's Association" speaks more strongly still: "Our views in regard to strikes are, that they are one of the abominable things which we hate, and ought never to be attempted except in extreme cases." Surely it is worth while to take these men at their own words, even if they are not sincere—as I believe they are.

ESSAYS, THEOLOGICAL AND PHILOSOPHICAL.

By HENRY ROGERS, Author of "The Eclipse of Faith."

V.—REASONS FOR *SCEPTICISM* AS TO CERTAIN SPECULATIONS OF MODERN SCIENCE: ADDRESSED TO A *BELIEVER*.

(*Continued from page 303.*)

To M. D.—IV. I said in my last communication that I should endeavour to show that you are hasty in concluding from the recent discoveries the immense antiquity of man; that is, I added, of the "*genus Homo* to which you and I belong." I made use of that expression because I by no means deny that there *may* have been, (for aught you and I know,) and it may be hereafter proved that there *was*, a species of animal amidst the numberless varieties that have appeared, still more like man than any of the existing ape tribes; more like him in general organisation, and with keener instincts and more intelligence than any of those tribes now possess; and yet not *man*,—having none of man's higher intellectual nor a vestige of his distinctive moral endowments. Such a discovery, if it were made, certainly need not very much surprise us; nor is there a word in Scripture (which is silent on all such Pre-Adamite matters) against it.

In demanding my assent to the doctrine of the unlimited antiquity of our race, you require me, on a very hasty summons, to abandon a conclusion which *seemed* to be established by a great convergence of evidence; and amongst other evidence, by the decided opinion of many of the greatest zoologists and geologists, both of the last and the present generation, that man is of comparatively recent appearance on our globe. You call upon me to do this principally on the strength of the renowned flint instruments, bearing a resemblance (though often rude enough) to spear-heads, arrow-heads, knives or axes. These have been found in certain localities in which it is presumed the strata have been undisturbed for periods long anterior to all trace of authentic history. In one or two cases also, a few remains of those who have been *presumed* to be the accomplished artificers of these not very artificial instruments have been supposed to be discovered. But as some of these last seem to prove the ingenuity of the moderns in providing the scientific world with such evidence, far more conclusively than the instruments do the skill of the Pre-Adamites in making them; and as in other cases they merely indicate juxtaposition, and not contemporaneousness, of the flints and the human relics, this momentous point is still *sub judice.*—But the flint instruments are supposed to be conclusive; they are as old, you say, as the drifts in which they are found. Now, in these drifts are also found, it seems, the remains of some species of animals now and long since extinct. There is no proof, you argue, that this drift has been disturbed within historic times; therefore, man is of unlimited antiquity, perhaps lived hundreds of thousands of years ago!

I am far from saying that the scientific men who have expounded this argument have pledged themselves for its absolute validity, or that they would affirm that it is more than probable; though I think they may be justly charged with favouring it on too slender grounds, certainly with considering too exclusively the arguments on one side only; and that they would have done better to wait for further light.

But in this, as in other cases, multitudes, (especially of the young,) who would fain find the doctrine true and feel the influence of that rather prevalent *idolum tribus* by which "the wish is father to the thought," have accepted it without hesitation, as if it were already demonstrated, and raised their pæan over the prostrate and utterly futile Mosaic history and chronology. Not a few of these assume all the airs of infallible knowledge, express mingled pity and contempt for those purblind and prejudiced souls who still profess to doubt, and attribute it to the usual bigotry of theology, and a determination *not* to see! Yet let us calmly consider, without at all pronouncing on the ultimate issues of the controversy, how many alternatives the advocate of such a theory is bound to set aside, and how many objections he may fairly be called upon to meet and remove, before he can logically call on any sober man to acquiesce in his conclusions.

Of course I lay no stress on what has been sometimes said, that it is a matter of doubt whether fancy may not have played false with the admirers of those rude instruments, and in many instances given to man what is due to the freaks of nature; or, in a far greater number of instances, given to *Pre-Adamite* men what is too surely due to the astute modern *manufacturer* of these same antiquities. Cases of the former kind *may* have occurred: an immense number of the latter we know have occurred. Flint instruments of *truly* fabulous antiquity have followed the too modern law of "demand and supply:" so extensively indeed as to have covered the whole subject in the minds of many with undeserved suspicion. But I concede at once that many of these flint implements are genuine, and the work, if not of human, yet of *some* intelligence: though here I cannot but pause for a moment just to express admiration at the sudden quickness in seizing "proofs of design" which some of you evince, who, being thorough disciples of M. Comte, laugh at the idea of "design" when the term is applied to the works of God! You can see nothing *there*—nothing in the exquisite harmonies and homologies with which heaven and earth are filled; nothing in the exquisite construction of plants and animals, or in that of an eye or a hand; nothing in any of these, or in the relations which bind them all into a permanent system; you can see nothing, I say, in all these that indicates *design*: no: they are mere "adaptations" of one thing to another, though no Mind "adapted" them! But no sooner do you see one of these clumsy flint implements, though the by-standers are ready to swear that, if a work of art at all, it would disgrace anybody but a Troglodyte to have turned out such an implement, than you at once pronounce that it is not only clearly a work of art, but distinctly and exclusively of *human* art. However, I grant for argument's sake, that many of these flint implements are genuine, and ancient, and works of art, whether that art be human or not. Still, as an advocate for the theory of the immense antiquity of man, deduced from thence, you have fairly to get rid of the following alternatives:—

1. The localities being rare in which these relics are found under *such* conditions as fairly suggest your argument, you are bound to prove that the drifts which contain them have never, owing to local causes, been disturbed; that the flints and the animal remains are not only in juxtaposition, but were contemporaneously deposited there; and that both have been as they are, even from those remote periods to which you refer them: a conclusion in which some eminent geologists are by no means as yet prepared to acquiesce.

2. On the supposition that this is got over, and that these relics are really to be referred to *some* intelligence that existed in those remote ages in which also existed those now extinct animals, the remains of which are found with them, you are bound to prove that *that* intelligence was *human*. To myself, I confess, it would not be at all surprising to find that among the other strange animals, (now extinct,) which the vast geological periods reveal; among those varied forms of life, which on *any* theory pass by such gradual and scarcely perceptible differences into one another, there had existed a species of animal still nearer the human type, than any of the existing species of the ape; and who, without man's reason or conscience, might have had intelligence enough (it does not seem to require much) to form these uncouth flint weapons, by which they might be the better enabled to take their prey, or defend themselves from those huge and formidable animals by which, in the Pre-Adamite world, they may be supposed to have been surrounded. Indeed, it is somewhat hard to imagine that beings who could only do the feats of skill, which these implements reveal, and who left in *them* the sole memorials of their art, could be (without far other proof) allied to the race who, during the brief historic period, have filled the earth with the monuments of their versatile ingenuity. While I (though of course asserting nothing) have no difficulty in a supposition of this kind, acknowledging, as I must, by how fine a gradation the various classes of animated beings pass into one another; sure I am, that you, as an advocate of the theory of "the transmutation of species," ought not only to admit the plausibility of such a solution, but to welcome it as a valuable auxiliary; since it would afford a fragment of evidence of a kind very much in request by you. You contend that in "the struggle for life," which has led to the existing species, innumerable varieties have perished; and though you acknowledge that you do not find their fossil remains, you also confess, that you *ought* by rights to do so. It is a trivial difficulty, which I think would stagger a less docile faith than yours. But now, on the supposition of some creature more than ape, but less than man, there would be a case of "variety" made to your hands! If you will have a simious progenitor, here would be one who could make flint implements at least. Meantime, that there might have been such a creature is equally possible on your theory or on any other.

3. But again; you are bound to produce not only these sparse and equivocal traces of a Pre-Adamite humanity, but the very fossil remains of those who are supposed to have manufactured and made use of these implements; just as you *can* produce the remains of the animals, (of species now extinct,) with which they are supposed to have been contemporaneous. It was the very want of this evidence which made the illustrious Cuvier speak so confidently of the comparatively recent appearance of man upon the earth; and until the argument can be shown to be fallacious by discovering the fossil *human* remains, and that as plentifully (at all events as generally) as of the other animals, that argument can hardly be thought refuted. As Cuvier justly observed, there is no reason why men's remains should have all perished while the remains of other animals have been preserved. It is very suspicious, surely, that there should be such multitudinous flint implements (such a profusion in so small a space, as the gravels of Acheul and Hoxne), and nobody to use them. The whole race seems to have manufactured little else, and then vanished, body and soul together! In the present lack of proof you content yourself, I see, with the strong consolation that these human remains will be found. And if you are as confident that they will be found, as some of you are that the stone-hatchets and arrow-heads you have bought are all genuine, and are willing to give as good a price for them, I have no doubt they *will* be found after some fashion or other. But whether, in undoubted genuineness or in quantity, they will satisfy the keen eyes of scientific criticism, is yet to be seen.

4. Meantime if these fossil remains were "as

plentiful as blackberries," another alternative is yet to be set aside. Many geologists, and those too of large knowledge, experience, and just reputation for both, affirm that it is not so clear that the extinct animals with whose remains these relics of man's supposed skill have so long slumbered, (even supposing that the juxtaposition is not accidental,) have been extinct so long as has been hastily imagined. They think that mammoths and other extinct mammalia may have survived for very many ages later than commonly supposed, and may have existed far into historic times. With regard to the mammoth in particular, they appeal to an instance of one discovered in the last century in Siberia, so well preserved in ice that its very flesh and hair were in perfect preservation; the dogs fed upon it, and if those who found it had happened to be fond of mammoth flesh, they would in all probability have eaten it too, perhaps only finding it (as some geologist says) "rather high." At all events, it is hard to suppose that it belonged to some extremely remote epoch in the pre-historic period.

This view is taken by many geologists of eminence. Instead of carrying man indefinitely far back, these geologists would bring the mammoth and other animals proportionably forward. And if this be the true view, the phenomena may be equally accounted for without ascribing to man an unlimited antiquity.

5. And in addition to showing that none of these alternatives can be taken, you are bound to give some plausible answer to the *objections* which have been hitherto thought (pretty reasonably) opposed to the idea of man's indefinite antiquity. Among them, is the immense duration of that low condition of barbarism in which all these poor monuments of his skill reveal him. Tell us how it is that man—such as we know his nature to be—who, in these few thousands of years, during which he has had a history, has filled the earth with the trophies of his power and intelligence, should have existed for scores of thousands, perhaps for hundreds of thousands of years, and yet done nothing but make these wretched Troglodyte instruments! How is it he did not strike a little more light out of his flint, with which he seems to have been so everlastingly busy? For those of us indeed who cherish the views of God which are disclosed to us in Genesis—who believe that He originally created man for a happier destiny than that of living, perhaps for a thousand centuries of years, in the condition of the lowest savage—it would be very hard by any means to reconcile ourselves to the conclusion to which your hypothesis drives us; namely, that not only did man enter the world as a very inferior sort of beast—not having been provided for as well as other beasts, having neither wings, feathers, talons, nor a natural suit of clothes to his back—but that he actually passed through a 100,000 years' curriculum or so, and then only graduated into a savage who could chip flints! But,—not to look at it as a *moral* question,—I certainly think it requires at least to be explained how man, having within him the capacities which he now has, came to be no more, and to do no more, and to leave no more behind him, than these wretched specimens of Pre-Adamite art evince. If it be objected that barbarous nations *now* pass many generations without any great progress in art, the answer is, *first*, that in the present case the whole race is supposed to have done so; and, *secondly*, not for a few generations, but for an immense duration; whereas in that short period which we call historic, and during the whole of that period, so far as we have any records, we find populous nations in possession of all the arts of prime importance. How is it that many nations should have done a thousand times more in 5000 years, than the whole of the race before in the unlimited past of their duration? Nor would it be easy to match, even in the monuments of our rudest tribes, such specimens as comprise the whole civilisation of this exquisite race of Pre-Adamites!

And yet to complete the paradox, it is supposed—as one of our *savans* expressly affirms—that each of these immemorially barbarous tribes had performed the most difficult task of all—that of *inventing* a language for itself! If so, one would think it might have invented anything.

But if man did exist for unnumbered centuries without emerging from the pleasant aboriginal condition in which this hypothesis places him, and then in 5000 years has filled the world with the proofs of his power and sagacity; has invented and lost, and invented again many of the arts, blossomed into high civilisation in many different nations, (on this theory spontaneously,) scanned and measured the heavens, and run round the whole circle of science, I think you must acknowledge that, whether there have been "convulsions" in the physical world or not, the revolutions in the intellectual condition of mankind have certainly exhibited the most startling suddenness, and the most determined breaches of the "law of continuity."

It has been well said by an able critic, "What must we think of the *human* animal who, in nine times ten thousand years, left no better monuments of his ingenuity? This immensity of time, with nothing to show for it, is a heavy incumbrance on the hypothesis."*

Nor is it unworthy of remark, that whereas during the whole historic period we find great nations of the earth in possession of those arts of civilisation which bespeak an advanced race, we then come suddenly, as it were, on a dead wall, and can follow no further. We plunge at once from light into utter darkness. Though man had existed for so long a period, even its traditions had perished!

Never was an immense duration, of which you are so lavish, of so little worth. An unlimited time is demanded in which to do nothing. It is the old fig-seller at Constantinople come again,—"In the name of the Prophet, figs!"

---

* "Quarterly Review," vol. cxiv., p. 117.

6. I think you are bound, before you so confidently affirm the immense antiquity of man, to answer the objections which used to be directed against the old-fashioned Atheists, who maintained that man had not only been for an *unlimited* time on the earth, but from all eternity! It was answered, that if so, then, according to the law of increase of population, the world ought long since to have been over-peopled. It seems to me that, on similar grounds, one may reasonably doubt whether man has been an inhabitant of the earth for anything like the duration you would assign, or even beyond the 6000 or 7000 years to which the Mosaic chronology (however liberally interpreted) restricts us. Of course it is impossible to obtain more than a rude approximation to the rate at which, on an average, the whole race may have increased; but that there has been a perpetual progress, we have every reason to infer from the intensity with which the law of increase acts, from the known facts of history, and from the recent statistical results of investigation as to the rate of increase exhibited by many most variously conditioned nations. Imperfect though these be, we see that we are brought face to face with a law as stable and constant in its operation, (though its activity may not be uniform,) as any of those which geologists are busy in investigating. The abstract intensity of the law of increase is such, that if it operated unchecked, it would double population in the course of every twenty-five years; and though, of course, nothing like this rate, except for short periods, and limited and very exceptionally favoured nations, is maintained, (otherwise the earth would have been over-peopled long ago,) yet the rapidity with which expansion takes place the moment any temporary checks are removed, the ease with which the sudden wastes of war, pestilence, and emigration are repaired; the steady increase which many nations (our own, for example) have made, though at varying rates, for nearly a thousand years together, and that in spite of checks of the most formidable kind, prove the intense pressure of the law in question. It is impossible, as I have said, to give anything more than an approximate solution of the question,—How long a time, on an average, does it require to double the race? but this, I think, may be said—that let that limit be much wider than that to which any rational induction from all the *facts we know* would restrict us, it will be still such as to give a very moderate duration for men on earth, compared with your calculations of "thousands of centuries at least." It may however be conjectured, on not unplausible grounds, and from some rather large calculations as to particular nations, traced through their whole history, that this doubling in general may have taken place somewhere between 180 and 230 years. This last-named rate is, on an *average*, about that of our own country, dating from the Norman Conquest, if we may depend at all on the calculated population at that period. According to Sharon Turner, and other learned investigators, the population of our own island at the date in question was probably about 1,700,000. Now our country has not been less subject to disturbing causes and all the ordinary checks than most others; it has had plenty of wars, domestic and foreign; pestilence, the "black death," famine, extensive emigrations, not less than the generality of other countries, ancient and modern.

In the later and more civilised periods, of course, the increase has been more rapid: the population rather more than doubled between 1700 and 1811: but also doubled between 1740 and 1821, and is now doubling at a still more rapid rate. France, since 1700, has, in spite of all her wars and revolutions, been increasing in about the ratio of $\frac{1}{200}$ annually: being 20,000,000 in 1700, and 35,000,000 in 1850. Russia, (in which, if the checks have been very great, her conquests have probably compensated them,) is computed to be doubling at the present period at the rate of about 115 years. Of course the recent rate of increase, in all these cases would, for obvious reasons, be greater than in the less civilised periods and nations; but assuming, for a moment, that the average rate of doubling would be anywhere between 180 and 230 years, it is clear that we should soon get to an end of the problem; in fact, beginning with such a term as Noah's family, consisting "of eight souls," they would, if doubled every 180 years, amount in 5000 years to nearly the present population of the globe, or about 1,000,000,000.

Of course the more rapid the period of doubling, the stronger is my argument.

But it may be admitted that in relation to most of these nations, for the last century at all events, in spite of wars, pestilence and famine, the conditions have been more favourable to fecundity than in more remote ages.*

Of course I do not mean to affirm that the doubling of the race has gone on at the actual rate of 180 or 230 years continuously, or even at any such *precise rate* on an average. If I did I should subject myself to the rebuke which (as I observed in my last paper) some geologists have incurred for inferring that because a deposit has increased so many inches in 10 years, so it may have increased at the same rate for 100,000; namely, that it is much as if they had inferred that, because a man six feet high has grown half an inch in the last year, therefore he must be 144 years old! My argument depends on no such chronometric accuracy. I merely affirm that if there be any period of doubling fixed upon, at all approximating to any rational interpretation of *the facts we know;* if any limit be assigned that is in the smallest degree probable from those *facts;* then there is no reason to believe that man has existed on the earth during the enormous periods demanded by your recent geological speculators. If the law of increase has been perpetually in operation in any measure approaching the above ratios, then, take what limit you will that is at all rationally presumable from the data, and you will see that man cannot have been on the earth for anything like the 1000 centuries which you modestly assume as your minimum. Take if you will not 250 years for the time of doubling, but 300, or even 500, and the duration of man on the earth will still have been but moderate.

---

* I perceive by a note in Dr. Pusey's recent able work on Daniel, that an argument somewhat similar to the above has been put forth by Moigno in "Les Mondes." This paper I have not seen, nor had Dr. Pusey; but it is to be hoped that some of our journals will give us an account of it. The rate of annual increase is assumed in that paper to be $\frac{1}{227}$.

Nor is it any answer to say, that in many mountainous and barren regions, the population will be sparse, and may be nearly stationary for ages. For the tendency of that mighty law above-mentioned, impels man to occupy by preference the regions which oppose no such restrictions; and the stationary population of such districts being sparse, can, for that very reason, but little affect the general problem. The great masses of the earth's population will, in virtue of the great law of increase, be found elsewhere. Nor is it any satisfactory argument to say that barbarous and poverty-stricken nations may have been for many ages stationary; it is by no means always so; the population of some poor countries, if they be but ordinarily fertile, (as Ireland, for example,) will often be more dense than that of far more favoured countries.

And although Hume and Gibbon have long since shown that many of the statements of the populousness of the nations of antiquity are greatly exaggerated, yet certainly the tribes that overran the Roman Empire, and subdued all Europe, must have maintained the full average of human fecundity.

We shall doubtless know more of this by means of statistics by-and-by: meantime, you are certainly bound to wait the course of these investigations, and to remember that you are in face of a law as imperious and as stable as any other. As a recent writer in the *Quarterly Review* well observes: "If indeed we were to admit and confide in any such computation," (speaking of certain geological conjectures,) "how could we refuse to credit the deduction from *another* law, which has at least a more plausible foundation, the law of augmenting population? For by an easy computation it is possible to show that from a single pair, the population of the globe, increasing by only $\frac{1}{200}$, or even $\frac{1}{300}$ every year, which has been taken as a fair average, would reach its actual amount of more than 1000 millions in less than 5000 years."*

V. I cannot but smile at the high-handed way in which (in common with many a writer of our day) you endeavour to settle the question of miracles. You lay it down, as an *axiom*, a thing not to be disputed, but simply to be taken for granted, that the *supernatural* never did occur in the history of the universe, and never will; and you consequently make it a fundamental position of historical criticism, that any relation of that kind in any documents whatever,—no matter what the strength of testimony which sustains it,—is at once to be rejected as *per se* incredible! Strauss and Renan both avow this as the foundation-stone of their criticism of the Gospels; and by this, and the kindred principle, that all prophecy is, for similar reasons, incredible, make short and easy work of the claims of Christianity to be considered a divine revelation. One (so-called) philosopher in France has even gone the length of saying, that so plain is it that a miracle is utterly incredible, that he will not consent even to argue the point with any one who contends for the opposite hypothesis: that he regards any such person as one not to be reasoned with! I fancy most of his opponents would feel justified in returning the compliment, and think themselves well rid of the necessity of debating any matter whatever with a disputant who begins by saying that he will take for granted the whole matter in debate; and that, too, a matter in which the bulk of mankind in all past ages, and the bulk of them at this very moment, (including so many of the most illustrious names in philosophy and science, as well as in theology,) are arrayed against him.

But why this violent prepossession against all miracles, so that it shall pass as nothing less than a fundamental principle of all historic criticism, not only that a miracle is not to be seen now, (on which philosophers and theologians are pretty well agreed,) but that there has never been, or will be, such a thing? It cannot be said that we see it from the essential relations of "cause and effect," or from the connection of antecedents and consequents, that such a thing is impossible; for it is an axiom of modern philosophy, and not least among those who contend against the credibility of a miracle, that we know nothing at all of the *nexus* between antecedent and consequent in any two events; nay, many of you contend that the whole controversy about "cause and effect" is unprofitable rubbish? It cannot be because we see by the light of an innate or intuitive principle of belief, that a miracle is impossible; for though one gentleman, not much famed for metaphysical acumen, appears almost to hint at some such thing, it would be an "*intuition*" unluckily contradicted by the immediate consciousness of the great majority of mankind, who have notoriously had no difficulty in believing miracles, and indeed have believed them only too greedily!

It cannot be because we see, by direct consciousness, that all control, by the exercise of *will*, of any of the ordinary laws of nature is impossible *per se;* for, as has been well said by Dr. Mansel in one of the essays entitled "Aids to Faith," we can, to a certain extent, do this very feat ourselves; it is done in effect when any voluntary act of *mind* controls, modifies, arrests, contradicts the ordinary course of the laws of *matter*. The phenomenon, of course, is not a miracle; but it is at least sufficiently analogous, both in the mode and in the result, to make any assertion of the incredibility of a miracle on *such a ground*, utterly unreasonable. As regards the *mode*, the influence by which mind acts upon matter, is perfectly inscrutable; as inscrutable as any miracle can possibly be: and the *fact* is equally indisputable,—that the ordinary course of the laws of the material world is altered, suspended, contradicted, modified, violated by such acts: as when we arrest, by an act of will, a stone which would otherwise fall, or take the life which would otherwise be prolonged; a sort of violation of the laws of nature, to which unhappily man in all ages has been only too prone. If it be said that these arrests of the material laws, though contradictory to those laws, are yet also according to law, it may be replied, "No otherwise than the miracles by which God may suspend or violate *His* laws will also be according to law;" that is, that if He work them, there will be good reason for so doing; and that His intervention, like that of a wise man, when *he* intercepts the ordinary course of the laws of matter, will be a *wise* intervention. If man, by his feeble mind, can do thus much by merely willing it, then, *à priori*, there would seem no sufficient reason for any peremptory decision of modern rationalism about the incredibility and impossibility of miracles on *this* ground. If human will can do thus much among the phenomena of matter, it certainly seems hard to deny that the Divine Will can easily do much more.

---

* "Quarterly Review," 1863, p. 383.

What then is it, I inquire again, which makes you so confident of the absolute truth of this principle, or rather, I should say, has suggested this obstinate "turn of thought,"—that a miracle is impossible, either *per se*, or because it is *certain* God has never wrought one, and never will? I apprehend that the reason, and the sole reason, when matters are searched to the very bottom, is just the reason given by Hume, and by all the Deists of the last century; namely,—that *we* have not witnessed any such event; that it is contrary to *experience*, that is, is contrary to *our* experience. In our little day, and in our little sphere, (it is freely admitted,) such phenomena have not been presented to us.

This, I say, in spite of the attempts to evade the refutation of Hume's principle, by stating it in other forms, is the ground of the presumption; that is, it is a pure assumption founded on the contracted views which man gains from his present experience, and which, as usual, he is inclined "to make the measure of all things." In other words, it is an *idolum tribus*—the prejudice of a particular class of minds, and of the habits engendered by their pursuits.

But since the principle, as nakedly stated by Hume, has been so often refuted, no wonder that strenuous attempts are made to get rid of the difficulties with which its reception is embarrassed. For if, in reply to the assertion, that a miracle is "contradictory to experience," it is asked, What is meant by that "experience?" the fallacy is at once detected. If we ask the objectors, "Whose experience do you mean? is it that of yourselves? that of the generality of men? that of all mankind?" then, whichever answer be returned, (and one of them must,) the reply is equally conclusive. If the objector says he means his *own* experience, the answer is, "Did we ever say that *you* had seen a miracle? We neither thought nor said that your experience ever had any contact with the miraculous, any more than we suspected you of 'setting the Thames on fire:' so far from being at issue with you, we agree with you." If he answer, "I mean the experience of the *generality* of mankind in all times," still the answer must be, "We quite agree with you. By the very definition of a miracle, it *must* be a rare event; if common, it were none. It will therefore *not* be consonant with the general experience of mankind." If the objector says, lastly, "I mean the experience of every man that ever was or will be born into the world," then the simple answer is, "That is plainly begging the question. Neither you, nor we, can answer for the experience of every man that has been born into the world. That is clearly to make your 'experience the measure of all things.'"

But supposing the objector be permitted to say that a miracle is incredible, because *uniform* and *universal experience* pronounces against it: still, he is completely refuted if he be only allowed to have his own way. For all that it is needful to say is: "Stick to that then; declare that the world never had a beginning, and will never have an end; that the time never was when our globe did not exhibit that same aspect—that same series of antecedents and consequents—which it does at this hour; that there was no *first* man; that man has been an eternal series." But *that*, with the facts of modern science before him, or even the fancies of modern science,—with the truths of geology, or the errors of the Transmutationists,—he cannot and dare not say. Then what can prevent his admitting that which, by his own definition, is tantamount to miracle? Why, he begins to endeavour to show that though the world has existed in *totally different* states from the present, though totally different species of animals from those now seen have lived and have passed away, yet all this is by a gradual law of natural development, by slow secular changes which are *analogous* to changes going on now! And thus it is that a late writer thinks it would have been much better if Hume had used the word "*analogy*" instead of "*experience*." But where is the "analogy" any more than the "experience?" If there ever was an *origin* of the universe; or if your three or four "primordial forms" ever *began to be*; if they have been the humble larvæ out of which the infinite varieties of animated beings have been evolved; if in accordance with that theory man was first developed out of a monkey, and perhaps may in due time be developed into a winged animal with ten senses and a head on each shoulder, what have we seen in *analogy*, any more than in *experience*, consonant with all this? If all our experience may be thus turned upside-down; if anything may become anything; if fishes may become birds, and birds monkeys, and monkeys men; in a word, if by any change, however small at each step, and through whatsoever length of time, a revolution ten times more wonderful than anything Ovid's Metamorphoses describe may really have taken place in the world; if all this may be according to law, and because according to law, *not* contradictory to experience, or (if you will) to analogy; then, as before, it is hard to say what *is* contradictory to experience or analogy, and why we may not believe a miracle to be not contrary to experience or analogy, as well as anything else. It is in vain to attempt to refine, as many have done, about the term "law." A law which thus admits of all sorts of unknown consequents from all sorts of unknown antecedents, is surely rather the absence of all law; and an experience which supposes all our *present* experience to be nullified or reversed, is not the same as, but the contrary of, our experience.

If the origination of all things, or the transmutation of species, be consonant to experience or analogy, what miracle can possibly violate them?

It is impossible to deny that the phenomena in which you yet profess to believe, as completely set at defiance all the uniformities of experience or analogy, as any miracle in the world. It is in vain to say, as you do, "Oh! these changes were wrought by infinitesimal steps through millions of millions of years." Not to repeat what I have just said, that your antecedents and consequents are as completely antipodal to all the "uniformities" we observe, as it is possible to imagine in the case of any miracle in the world; not to mention that the postulate by which it is sought to give some plausibility to these assumptions,—namely, that millions of ages have perhaps been employed in effecting the results, and that each step has been infinitesimal and the whole course continuous,—is a pure imagination, and a flagrant departure from the sobriety of the inductive philosophy; not to urge that it is just saying, "I believe this, not from observed facts or experience, but because I do not know but such things might be effected by unknown causes operating through indefinite duration;" not to insist on all this, I would particularly urge on your attention that this question of the *time* required for these wondrous changes has really nothing to do with the nature and character of the events themselves; the real, the vital question is, whether the events do not altogether transcend the sphere of all known "uniformities" and the entire range of the present laws of nature, as known to observation and experience. *That* is the real question; and as to *that*, I presume that the metamorphose of a tadpole into a man, whether it be ten years or a thousand or a million in being brought about, is quite as transcendental to all experience as any miracle of the New Testament. It is in this incompatibility with experience that the supposed incredibility of a miracle consists; and if it be incredible, then I contend that the phenomena in question are incredible also. Yet you believe them *credible*. Then you do in fact believe that which is of the essence of a miracle, as much as I do.

It is futile to say that the edge of this is taken off by the very *gradual* operation of laws,—by the supposition of their working through unnumbered ages; for, according to that, the miracle of Lazarus might be supposed credible, if our Saviour had only been ten thousand years about it! If it be said, that in the former case certain unknown intermediate changes may be supposed to have been wrought in that long succession of time, I reply, "And for anything you know, some unknown intermediate changes might be wrought by Omnipotence in an indefinitely brief time in the case of a miracle." In either case, we suppose unknown forces producing effects which transcend all experience; which stand opposed to all the uniformities of present observation: only in the one case, these forces operate more quickly, in the other more slowly; but both phenomena are alike beyond the sphere of our experience. It is the *character* of the event that constitutes the miracle, and not the time occupied in producing it."

I observe that, in common with many writers of the present day, you speak of Time as if it were some efficient cause, or agent, in producing any change. It is merely one of the conditions of it, and will be longer or shorter, where the change is just the same, according to the variation of the force. A flower may slowly expand in the open air, or unfold in half the time in a hothouse: it is not the time, but something else that makes the difference.

I observe that you naturally fight shy of the idea of the *origin* of the universe, and strive to get rid of the question by saying it is a transcendental notion, — as undoubtedly it is; or by hiding it away in such exceedingly remote abysses of time, that the imagination as well as the reason shall be deterred from going in search of it! But it will not do. However transcendental the idea of origination may be, (as I freely acknowledge it is,) still I apprehend your "primordial forms" must bring you to it at last. And if the universe ever began, then though it may have been enclosed in a germ no bigger than the millionth part of a pin's head, and all the plants and animals may have grown out of it by the efficacy of the "invariable cosmical" laws, still I suppose that the *origination* of the first living organism, with all these possibilities of infinite results enclosed in it, was something as wonderful as any miracle can be. It cannot be called, indeed, a violation or suspension of the laws of nature, because there happened to be no laws of nature to suspend; but it would be hard to say that the origination of all such laws was less contradictory to, or incompatible with, all experience and analogy than the suspension or violation of any one of them.

In a word, it is utterly vain for you (turn and twist and wind as you will) to say, that creation or origination, or those stupendous transmutations just alluded to, (though antipodal to all experience,) are "not the same as miracles." Both the one and the other are (and this is the real point in the argument) directly transcendental to all our experience; and by Hume's definition therefore must be equally *incredible*, whether you choose to call them "miraculous" or not. And if you admit the *former*, I may well ask with Paul—"*Why* should it be thought a thing incredible with you, that God should raise the dead?"

When I come, therefore, to analyse the reasons for this extraordinary assertion of yourself and so many others, that a miracle is *per se* utterly incredible, I find it possible to account for it only by saying that it is the "turn of thought," derived from that *present* experience, which we are disposed to make the measure of all things; a prejudice of philosophy, but not the less unreasonable for all that, and really as shallow as any prejudice of the vulgar.

VI. Another singular article in your scientific creed, as in that of many others in these times, is an anticipation, not merely of the indefinite progress of man in the knowledge of the physical world, but that he is destined to know all its mysteries; to penetrate every secret, and account for every phenomenon, however subtle or complex; analyse every compound, ascertain every law and all combinations of laws; and arriving at last at the knowledge of the necessary and inevitable relations of all antecedents and consequents, predict the future, as well as record the past; and so pretty nearly regulate for himself a world of which perfect science will have then given him the mastery. Some few indeed have even gone so far as to say, that there being no presiding Deity at present, this is the way in which the world will at last be provided with one: that a God is gradually a-making, and will in *time* (of which, as we have seen, our scientific speculators are so lavish) vindicate his title to be considered such, in virtue of his unlimited knowledge of the universe, and his power over it. And even if there are few who go this length, yet many confidently believe from the progress of modern discovery, that, to adopt the words of one of them, "Everything will at last be found out;" or as another says, "Everything will be known."

Now, in the name of common sense, what is there in the history of the past, or the condition of the present, to sanction such a notion, except an *idolum tribus* of a doting philosophy? I believe with you that man's knowledge (if he but pursue it in the modes, and within the limits which his Creator has prescribed) will be indefinite; but I see no proof whatever that he will ever exhaust the field of physical science any more than any other; or that there are not limits here as in every other department, though we cannot so easily assign them. Assuredly everything in experience and analogy point to this conclusion.

First, the strict limits within which most of these very speculators would confine even the *possibilities* of knowledge; the number of subjects on which they say it is in vain for man to speculate at all; the large domains in which they themselves say science can never set a foot, (though it is precisely in these, by the way, that man has been most prone to speculate in all ages, and in which he chiefly desires to know,) ought to suggest a different lesson. Granting the absolute impossibility, as you affirm, of knowing anything of "causes," or of "essences," the utter vanity of all speculation and discussion touching the constitution of matter or of mind, or the relations of cause and effect; granting the impossibility of attaining certitude on these and kindred subjects, and that these are "tabooed" to the whole race, should it not suggest the probable fallacy of these predictions of man's ultimate perfect knowledge of all the mysteries of physical nature? Surely it would seem more natural, reasoning from analogy, to expect there are limits here also.

Again: this would seem not unlikely, if we consider the limitations of our senses and our faculties of all kinds;—that they limit us in the field of physical investigation, as in every other. In every other direction, man soon reaches the tether of his powers and faculties; why should you suppose that there is no limit here? Go in what direction he will, man soon finds himself reminded,—if he be not lost, as he is too apt to be, in self-adoration,—that he is shut up in impassable barriers, and by adamantine bars. As his strength is absolute weakness, confronted with the mighty forces of nature; why should he imagine his intellect in any greater ratio to the mysteries which lie enshrouded in her depths? or his knowledge of the secrets he has penetrated more than infinitesimal compared with his ignorance of the mysteries she conceals? Nor is the consideration of his physical limits without instruction on this very point. Even if he had intellectual powers equal to the task you propose, his physical nature soon imposes an effectual limit on his knowledge. He cannot descend into the depths of the earth or the ocean, nor soar into the heavens; he can but guess at the mysteries of the subterranean world, and would be shrivelled up like a leaf if he could only descend a few miles from the surface; he can guess still more feebly at the mysteries of the myriads of shining worlds that surround him. It is doubtful whether he will ever be able *absolutely* to decide the question, recently so strongly debated, whether the planets be inhabited or not; still less, by what beings, and on what conditions. If it be said that these are vast and distant fields, and it is their vastness and distance that seclude them from man's knowledge, this is true; but still they are among the mysteries of the physical universe. But, in point of fact, we have similar limits in the minute as in the vast. We stand, as Pascal says, between the two infinitudes,—the infinitely great, and the infinitely little; and the telescope and the microscope alike reveal to us a series of wonders, of which, whether we take the ascending or the descending scale, we see no prospect of coming to the end.

When we get beyond a certain degree, whether of subtlety or complexity or rapidity of movement in the phenomena, the power of our senses, of our observation, of all our faculties, and of every appliance by which we can aid them, desert us: and we are just as completely baffled as we are in other departments. Subtlety and complexity in the phenomena as effectually restrict us here, as in other departments the inscrutable *nature* or the inaccessible remoteness of the phenomena. Thus, for example, if we are asked, whether matter is indefinitely divisible, or if not, what is the ultimate configuration of its particles, or what the constitution of matter itself (strictly, not metaphysical, but purely physical problems,) no one would pretend that he has any ground to hope that the time will come when we shall be able to give the answer. Similarly, however far science may analyse the composite, it does not know when it has reached the limit: and what at last seems absolutely simple, may be but a more subtle compound that evades all our research and escapes us in forms of still greater tenuity. Similarly, in the structure of living organisms there are a thousand mysteries which we in vain attempt to explain, and many of which palpably lie beyond us. The natural sciences seem only too certain to overload all memory by their accumulations before a thousandth part of their realms is fully explored.

From all that man does know, we can only infer that all his discoveries but open fresh mysteries to be explored. Continual enlargement of his knowledge is attended with a proportionate enlargement of the knowledge of his remaining ignorance. Nothing yields any sign or suspicion that we are coming to the end of all that is *knowable* in this or any other domain.

In a word, if we compare the position and faculties of man with the boundless fields of God's universe, we shall no longer wonder at the simplicity of Newton's beautiful confession, so worthy of the humility as well as aspirations of true science,—"I seem to have been only like a boy playing on the sea-shore, and diverting myself with finding now and then a smoother pebble or a prettier shell than ordinary, whilst the great ocean of truth lay all undiscovered before me;"—a speech conceived in the spirit of the still sublimer language of the Patriarch, who after his magnificent eulogium of some of the chief wonders of God's handiwork, adds—"These are but a whisper of his ways; but the thunder of his power who can understand?"

The faculties of man are exquisitely adapted to his position, and consequently to his well-being; and they provide no doubt for his indefinite progress in knowledge; but they evidently have no proportion or relation to his absolute mastery of nature. Well says Pascal; "Manque d'avoir contemplé ces infinis, les hommes se sont portés témérairement à la recherche de la nature, comme s'ils avaient quelque proportion avec elle."

And again: "Notre intelligence tient dans l'ordre des choses intelligibles le même rang que notre corps dans l'étendue de la nature."

While you are anticipating that science will master all the secrets of the universe, and imagining that you are only indulging a vision authorised by the bold language of Bacon, it would be well to reflect on what that same great genius, equally daring and cautious, also admits; that whatever the triumphs which may be anticipated for man, "the subtlety of Nature far transcends the subtlety of either sense or intellect."

PETERMANN'S LAND.

A.D. 1870.

["Dr. Petermann believes that an isolated Norse population will be found at the Pole."]

INTERPRETER.

HUNGER hath wasted them and they are few,
They say, because of strife among their gods—
Ghosts of the old Norse, fighting, drinking crew,
One groans, another nods.

EXPLORER.

All things are ghostlike in this ghostly land—
A land of silence and the shades of death:
In presence of a spectral race we stand,
And speak beneath our breath.

Out of the darkness ice-built cities rise,
And glow and sparkle in unearthly light;
Veil'd stars, in these phantasmagorean skies,
Gleam through a rosy night.

And the long twilight passes like a dream,
A dream of many days that dimly change,
In which the things, the most familiar, seem
Through muffled senses strange.

White is each ghostly thing that runs or flies;
The white bear steals; the white hare's shadow fleets;
The owls that flit, and stare with hollow eyes,
Are white as winding-sheets.

The sun comes up o'er the horizon's rim,
Shorn of his rays, and red, and round and blear'd;
And in his dotage bald and old and dim
Apollo seems unsphered.

Still at his touch, on sudden, the dumb show
Stirs, wakes, and lives; snows melt; the valleys green;
The birds begin to build; the springs to flow;
The deer with young are seen.

CAPTAIN.

I'd rather hear the icebergs splitting crack
(So they kept clearish of my good ship's side),
Or grinding thunder of the breaking pack,
Than round these dead shores glide.

INTERPRETER.

They hold traditions of descent from Heaven:
From out another Eden, long since lost,
Their heroes, by the adverse gods, were driven,
Who broke the bridge they cross'd.

CAPTAIN.

Come let us take the poor souls with us back
To England—there's an Eden to my mind!—

EXPLORER.

Tell them beyond that southward shining track
Their Eden they will find.

INTERPRETER.

This from of old was held by all their race—
Whose souls in passing made the water burn—
And many have gone forth to find the place,
But none, they say, return.

EXPLORER.

From thence are we: tell them of flower and tree,
Of lands of summer, and of corn and vine.

INTERPRETER.

How shall I paint for eyes that cannot see—
They have no word for wine.

EXPLORER.

Tell them with us the sun shines every day,
And like a brother goes with us to sleep.

INTERPRETER.

The dread of darkness in their souls alway,
They ask if watch we keep.

EXPLORER.

None die of cold or hunger in our land—
May God forgive the lie—at least none need.

INTERPRETER.

With wistful eyes, they say they understand,
But all in vain I plead.

EXPLORER.

Then ere we leave them in this land of night,
Which Christian feet may never tread again;
Let us impart to them the living light
We hold as Christian men.

Tell them the Father made the things we see,
Though Him we see not; that the living Son
Was seen of men, and died that we might be,
Like Him, with God at one;

And that the Spirit, guiding us alway,
Hath sent us here—yea—this we must believe.

INTERPRETER.

I say the words as simply as I may,
And they the words receive.

And lo! they will leave all with us to fare
Through fire and ice, the dark and the abyss;
That they the guiding Spirit too may share—
They will brave death for this.

EXPLORER.

God help them! if we reach our promised land
(What of the much required where all is given?)
How shall we teach these souls to understand,
That they must wait for Heaven?

ISA CRAIG.

EASTWARD.

By THE EDITOR.

V.—NEBY SAMWIL.

I HAVE already stated that there are two great thoroughfares from Jaffa to Jerusalem—the one by Ramleh, and the other by the Beth-horons and Gibeon—and that we chose the latter. We did so that we might traverse the scene of Joshua's great battle with the "five kings," and also obtain our first general view of Palestine, including Jerusalem, from Neby Samwil.

But before bringing the reader to this famous spot, and picturing to him, as best we can, what we saw from it, we must begin, like most gossips, at the beginning, which in this case is our early start from the tent, when there is a scene common to all mornings in a Palestine tour.

The tents and baggage precede the travellers, in order that everything may be ready on their arrival at the end of the day's journey, which implies the tents pitched, the luggage arranged, the candles lighted, and the dinner ready. "Where shall we encamp?" is therefore the first question for the day which must be discussed with the dragoman. It is is one not always easy of solution; for various matters must be taken into account—such as the distance to be travelled, the probability of pitching among civil neighbours, or of finding a Sheik who may be known to the dragoman; the supply of water, good shelter, and the chance of procuring provisions. The camping-ground being settled, preparations are made for the start. It is obviously most conducive to comfort to "break the back of the day" in the cool of the morning and before noon. It is therefore in vain that a lazy or sleepy man wishes to enjoy "a little more sleep and a little more slumber;" in vain may he, in the weakness of the flesh and for the credit of his conscience, assert, half asleep, half awake, that he had a restless night, for his companions testify to a continued snore from him like the burst of waves on a stony beach. Of course their testimony he indignantly rejects as incompetent,—still he *must* rise! At such moments—I write feelingly—the most sacred memories of holy places, the most eager desire to acquire knowledge, the poetry of Palestine travel, "Robinson," "Stanley," and "Eothen," lose their power to rouse. The whole being seems concentrated into a jelly, like the blood of St. Januarius.

South of Palestine. (From Stanley's "Sinai and Palestine," by permission of the Publisher.)

But in the meantime the pins of the tent are being pulled up. The ropes slacken, the tent-pole quivers, and to your horror you discover that your canvass dwelling is being taken down, and that in a few minutes, unless you start up and get dressed, you will be exposed in bed in open daylight, to the gaze of a crowd of grinning Arabs with piercing eyes and white teeth, who are watching for you as the tag-rag of a town for the removal of the canvass which conceals the wild beasts at a show. Move you must, therefore move you do. Very soon thereafter the beds are rolled up, the baggage packed, and everything stowed away on horse or mule's back, except the breakfast-table and camp-stools around it, where the moveable feast is served up. But that packing! It was always a study to us, and never failed to excite remark and laughter. On such an occasion Meeki, the master of the horse, came out in the full strength of his power and passion. He reigned triumphant. His spirit seemed to inspire all the muleteers and the Arabs who assisted him, so that a common hysterical vehemence seized the whole group. They shouted, screeched, yelled, without a moment's pause. All seemed to be in a towering passion at every person and everything, and to be hoarse with rage and guttural vociferation. Every parcel was strapped with a force and rapidity as if life depended on it. The heavy packages were lifted with starting eyeballs and foaming lips on to the backs of the mules. One heard ever and anon a despairing cry as if from a throat clutched by a garotter, "Had—ji A—li!" which after a while drew forth the Chief with a calm and placid smile to decide the question in dispute. As the dread turmoil drew to a conclusion, the cook, the packing of whose utensils our breakfast necessarily retarded, became the great object of attention, and "Mo—ham—med!" was syllabled with intense vehemence by the impetuous Meeki or one of his aids, whose pride and dignity prompted a careful imitation of the master. At last the long line of our baggage animals moved, with trunks of crockery, rolls of bedding, and piles of portmanteaus and bags. Off the loaded animals went at a trot, with the bells tingling round their necks, the muleteers following on foot, and driving them along the rough path at a far more rapid pace than we could follow. Meeki then took off his turban, dried his head, lighted his narghilé, sat sideways on his dot of an ass, and brought up the rear of our cavalcade with a calmness and peace which had no traces of even the heavy swell that generally follows a hurricane by sea or land. Foaming and raging seemed to be the stereotyped way of doing business here, just as it is sometimes with preachers, who appear to think that vehemence, even in commonplace, is necessary as a guarantee of earnestness.

One or two other characteristics of every spring morning in Palestine may be here mentioned. Nothing can exceed the buoyant, exhilarating atmosphere. The dews of night, which are so heavy that any garments left out become saturated with moisture as if soaked in a tub of water, seem to invigorate the air as well as the vegetation. There is consequently a youth, life, and fragrance in these mornings which cannot be surpassed even in the higher valleys of Switzerland, where the air is such that one can breathe it as a positive luxury. It is at these times, when the grass is heavy with dew, and the flowers give out their odour, and the air is cool and clear as crystal, and the body is refreshed with sleep—and, let us add, with breakfast—and the mind is on the *qui vive* for sights, and the memory full of the past, and our horse up to the mark, and the path tolerable, and the whole party well, hearty, and agreeable—it is at these times that one most rejoices in existence, feels it to be all "May from crown to heel," and blesses Providence for the great mercy of being in the Holy Land. As the day advances, and the sun begins to pour down his heat, and the flesh becomes weak, the tents somehow appear to be too far off.

The cavalcade generally rides along in single file. There is seldom a path, or a bit of meadow, which permits of two jogging on together. But there is, after all, no great disadvantage in this limitation of riding space or of social conference, as there is no country in which silent thought and observation during a journey are more congenial than in Palestine.

The deliberate choosing of a Scripture scene for a place for lunch, at first sounded as if it were an irreverence. Hadji rides up and inquires—"Where shall we *lonch*, Hakeem Basha?" adding with a humble smile: "Where *you* please! All same to me." Where shall it be? At Bethlehem? Bethel? Shiloh? Nain? is discussed by the party. At first thought, it seems out of place to propose such a carnal thing as lunching on hard eggs and cold lamb at such places. Yet at these places one lunches or dines, as the Patriarchs did before them.

The path by which we ascended the Judean hills from the plain to the ridge at Gibeon is not, I believe, so rugged as the other leading from Jaffa to Jerusalem by Ramleh, but it is nevertheless one of the worst traversed by us in Palestine. With few exceptions, indeed—as when crossing a plain, or some rare bit of tolerably level country—the so-called roads are as rough as the bridle-paths across the Swiss or Highland hills. They are either covered with loose stones, which act as hollows for the horses' feet; or are worn down, by the travelling over them since the days of the Canaanites, into narrow ditches cut deep into the living rock; or they go across slippery limestone ledges; or over a series of big stones with deep holes between; or are the channels of streams, which have the one advantage of being supplied with water to cool the hoofs of the floundering quadrupeds. But the horses are remarkably sure-footed, and the only danger arises from their riders checking them with the bridle, rather than letting them take their own way, and step with judicious thoughtfulness, as it often seemed to us, from stone to stone, picking their way with marvellous sagacity. Their pace is very slow. Not but that a rider with a "noble Arab steed" can manage to dash along and make "the stony pebbles fly" behind him; but this requires a good horse familiar with the ground, and a good rider as thoroughly acquainted with his horse. Ordinary mortals who like safety, not to speak of ease, take it quietly at the rate of three or four miles an hour. The length of the day's journey varies; but it is seldom under seven, and hardly ever above ten hours, including the time consumed at lunch and rest in the heat of the day (which is generally more than an hour), and in examining objects of interest *en route*.

We paced slowly upwards over polished limestone or marble rocks, in some places actually up artificial steps. One hour from Jimsû brought us to the lower Beth-horon, now called Beitur El Talita; another hour to the upper Beth-horon, or Beitur El Foca.* In two hours more we reached the upland plateau, and after crossing the ridge saw Gibeon (El Jib) before us. Passing it on its eastern side, near which our tents were pitched, we ascended Neby Samwil.

I shall return to some features of the ascent, and the story of this famous road, but must in the meantime ask the reader to accompany me, with open eyes and heart, not forgetting fancy, to the height which we have reached in our journey Eastward.

There is not, I venture to affirm, in all Palestine, nor, if historical associations be taken into account, in the whole world, such a view as that seen from Neby Samwil. This is not because of its height (2650 feet)—though it is the highest point in Palestine, Hebron excepted—but from its position in relation to surrounding objects. This makes it a sort of centre, commanding such views of the most illustrious spots on earth, as no other place affords.

---

* The view from the roof of the Sheik's house at the *upper* Beth-horon should be seen by every traveller.

It was from this summit—so at least it is said—that Richard Cœur de Lion first beheld Jerusalem, and exclaimed, as he covered his face: "Ah! Lord God, I pray that I may never see thy Holy City, if so be that I may not rescue it from the hands of thine enemies." From hence also the great mediæval poet Juda Halevi is supposed to have first beheld the sacred city, and to have had those glowing memories and passionate sorrows awakened which he has embodied in a poem yet famous among his people, and which pours forth a wailing lament that finds an echo in the heart of all the outcast children of Israel. I know it only through a German translation read to me nearly twenty years ago by my very learned friend Dr. Biesenthal, of Berlin, himself of the seed of Abraham. The sentiment in one of the verses has clung to me. The poet as he gazes at Jerusalem cries out of a depth of sorrow which is "past feeling," and turns the heart into stone. He wishes to feel and consciously to realise the misery which the spectacle of his "mother, dear Jerusalem," and the triumph of the heathen over her, ought to inspire. And so he sings to this effect:—

O God! my cup of sorrow is too full!
I cannot feel the grief I wish to feel.
Take from it one drop—another—yet another—
Then shall I drink it to the very dregs!

I mention these associations, for they were those that came to me at the time, with many others, like tumultuous waves from the past, mingled too with much that was painfully trivial:—the common effect of that strange reaction from the tension of the mind, experienced on such occasions as the present, when approaching a moment in life that is to divide for ever what has been longed for from what is to be realised, and become henceforward only a memory. We have all experienced at such times the choking at the heart, the suppressed emotion, as the dream of years is about to become a reality. In a few minutes, when that height is gained, we shall have seen Jerusalem! So I felt, but in a less degree, when approaching Niagara, and when I was led blindfolded to the edge of the Table-rock, in order that the whole glory of the ocean of water pouring into the seething abyss might at once be revealed. But what was any scene on earth in comparison with the one which we were about to gaze on!

The summit was reached in solemn silence. There was no need of a guide to tell us what to look at first. Every face was turned towards Jerusalem. The eye and heart caught it at once, as they would a parent's bier in the empty chamber of death. The round hill dotted with trees, the dome beneath, the few minarets near it,—there were Olivet and Jerusalem! No words were spoken, no exclamations heard; nor are any explanations needed to enable the reader to understand our feelings when seeing, for the first time, the city of the Great King.

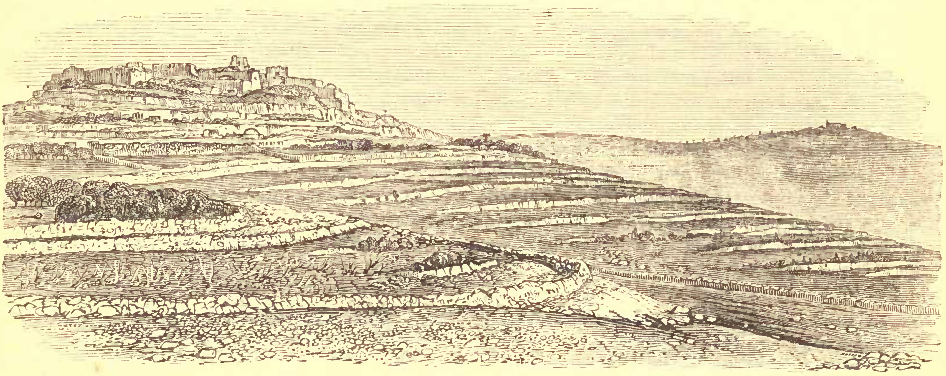
After a time we began with suppressed eagerness to search out other objects in the landscape, and the curiosity became intense to identify its several features; and then we heard words breathed quietly into our ears, as an arm was stretched out directing us to several famous spots whose names were holy, and which summoned up the most illustrious persons and events in the memory of the Christian. But I must patiently consider the panorama more in detail, that we may learn something from it, for we cannot stand on any spot in Palestine from which we can see or learn more.

After Jerusalem, the first object that arrested me was the range of the hills of Moab. There are many places in Palestine that when first seen are to us as old friends. Previous reading, and illustrations, have made them familiar. But though I was in some degree prepared to recognise the range of Moab as a remarkable feature in the landscape, and as *telling* on the scenery of "the land"—yet somehow the reality far surpassed my expectation. These mountains reared themselves like a straight unbroken wall, not one peak or point breaking the even line along the eastern sky from north to south. They were not higher above the level of the sea than the place on which we stood; yet they seemed to form a gigantic barrier between us and the almost unknown country beyond, and their effect on the character of the landscape was decided. They were a frame—or setting—to it, giving it a dignity, elevation, strength, and majesty, without which it would have been flat, tame, and comparatively uninteresting. No doubt we saw the range in the most advantageous circumstances. It was towards evening. The setting sun fell upon it, and upon the wild eastern shores of the Dead Sea at its base, the sea itself being hidden in its deep hollow grave. The light was reflected from every scaur and precipice, with such a flush of purple, mingled with delicate hues of amethyst and ruby, as produced a glory not exaggerated in Holman Hunt's picture of "The Scape Goat." The atmosphere, too, was so transparent, that we distinctly saw beyond the Dead Sea what appeared to us a white building, situated on a point, in a straight line, over or near Jerusalem. Was this Kerak? There are no other human habitations in that direction.

The next thing that impressed me standing here, was the smallness of the land. We saw across it. On one side was the great sea, on which sails were visible; on the other the range of Moab, which is beyond the eastern boundary of Palestine. To the south we saw within a few miles of Hebron; while to the north we discovered the steep promontory of Carmel plunging its beak into the sea. It is difficult to conceive that the Palestine of the Patriarchs—that is, the country from the inhabited "south" to the great plain of Esdraelon, which like a green strait sweeps past Carmel to the steeps above the Jordan, and separates the old historical land of

Canaan from Galilee—does not extend further than the distance between Glasgow and Perth, and could be traversed by an express train in two or three hours. But so it is. The whole land, even from Dan to Beersheba, is not larger than Wales. We saw not only the entire breadth but almost the entire length of the Palestine of the Patriarchs from the height of Neby Samwil.

To some extent the general structure of the country was also visible. We had to the west the dead flat Philistine plain skirting the Mediterranean, and spreading itself about ten miles inland, where it, like a sea, formed green bays at the foot of the Judean hills. We were standing on one of the rugged sides of that central mountain ridge of Palestine, which, like a capsized flat-bottomed boat of corrugated iron, lay between the sea and the Jordan. We were looking down from the keel of this boat, a few hundred feet above the undulating, rough tableland with its small hills, which, to carry out the rude simile, were stuck, like huge limpets, over the boat's bottom. The other side of the gunwale, rolled over out of sight, and rested on the plain of the Jordan, which rushed along its outer edge, while the wall of Moab rose beyond. One end of this same capsized boat descended to the plain of Esdraelon, the other to the desert beyond Hebron. Its corrugated sides are the Wadies that cut deep towards the Philistine plain on the west, and the plain of the Jordan on the east.



El-Jib (Gibeon), with Neby Samwil in the distance.

And how did the land look? Was it picturesque? Had it that romantic beauty of hill and dale, that look of a second Paradise which one has sometimes heard in descriptions of it from the pulpit? Well, it did not give me this impression,—but what then? What if it is not to be compared with a thousand spots in our own island—which by the way includes within its rocky shores more scenes of varied beauty than any other portion of the earth;—what if Westmoreland and Wales, not to speak of the Scotch Highlands, contain landscapes far more lovely than are to be found in Palestine? Still Palestine stands alone;—alone in its boundaries of seas and sandy deserts and snow-clad mountains; and alone in the variety of its soil, climate, and productions. I do not claim for it either beauty or grandeur—which may be found in almost every region of the globe—but I claim for it peculiarities and contrasts to which no other region can afford a parallel. Grant its present poor condition, its rocks without a covering, its streams dried up, its tillage neglected, its statuesque scenery unsubdued by the mellowed and softening influences of a moist atmosphere, its roads rough, its hills bare, and its limestone rocks unprotected by soil, its villages wretched hovels, its towns extinct, its peasantry slaves or robbers—what then? Is there no poetry in this desolation which, if it does not represent the past, is yet the picture which flashed before the spiritual eye of the mourning prophets? Is there no poetry either in the harmony between the rocky sternness of the land and the men of moral thews and sinews which it produced; or in the contrast between its nothingness as a land of physical greatness and glory, and the greatness and glory of the persons and events which were cradled in its little Wadies and its small rocky eminences? Is there no poetry, nothing affecting to the imagination, in the physical structure of a country which is without a parallel on earth? For within a space so small that the eye can take it in from more than one point, there are heights, like Hermon, covered with eternal snow, and depths like the Jordan valley with a heat exceeding that of the tropics; there is on one side the sea, and on the other a lake whose surface is 1300 feet lower down, with soundings as deep again. Where is there such a river as the Jordan, whose turbulent waters never gladdened a human habitation, nor ever irrigated a green field,—which pursues its continuous course for 200 miles within a space easily visible, and ends at last in the sea of death never to reappear? Where on earth is there such a variety of vegetation, from the palm on the sultry plain to the lichen beside the glacier?—

where such howling wildernesses, such dreary and utterly desolate wastes, with such luxuriant plains, fertile valleys, pasture lands, vineyards, and corn-fields?—where such a climate, varying through every degree of temperature and of moisture?

Of a truth the beautiful is not necessarily associated with what stirs the human mind to wonder and admiration. Who thinks of the beautiful when visiting a church-yard, where the great and good lie interred; or a battle-field, where courage and self-sacrifice have won the liberties of the world; or a spot like the bare rough rock of the Areopagus on which stood the lowly, unknown, despised Jew revealing truths to Athens such as Plato the heavenly and Socrates the God-fearing had never discovered? Or who thinks of the beautiful in thinking about Paul himself, "whose bodily presence was weak," although he was the greatest man as a teacher that ever lived?

Not for one moment then did I feel disappointed with Palestine. It was the greatest poem I ever read, full of tragic grandeur and sweetest hymns. I did not look for beauty, and therefore was not surprised at its absence; but I did look for the battle scenes—for the Marathon and Thermopylæ—of the world's civilisation, and for the earthly stage on which real men of flesh and blood, but full of the spirit of the living God, played out their grand parts, and sung their immortal songs, which have revolutionised the world, and I found it no other than I looked for, to my ceaseless joy and thanksgiving.

Excuse, good reader, these digressions; and let us once more attend to the details of the landscape.

Look with me towards the west. Our backs are consequently to the hills of Moab, and our faces towards the "great sea," which stretches as an immense blue plain, ending in the horizon, or rather in a drapery of luminous cloud no one can exactly say where. The shore you see is a straight line running north and south; and we can distinguish at this distance of, say twenty miles, the long sandy downs that separate the blue sea from the green sea of plain. Look southward along the shore—that protruding point of the Judean hills conceals Askelon from us, that confused looking mound on the plain, marks the site of Ashdod: another smaller Tel, scarcely visible, a little to the left of Ramleh, is Ekron. We are already acquainted with Ramleh and Lydda, so distinctly seen beneath us on the plain. Beyond them is Jaffa, our old friend, like a grey turban on its hill. Now, carrying the eye along the sea from Jaffa northward, you perceive, over the low spurs of the hills which conceal the rest of the sea-shore, that headland—it is Carmel!

This view gives us an excellent idea of the relationship between the uplands of Judea, on which we stand, and the alluvial plain of Philistia and Sharon, whose rich soil, rich pastures, and rich corn-fields, its harbours and access to the sea, and its adaptedness to war chariots, accounts to us for the numbers and power of its bold and unscrupulous inhabitants.

Now let us turn in the opposite direction, from the sea to the west, with the range of Moab along the skyline opposite to us, and the table-land of Judea, a few miles broad, at our feet. Looking to the right, southward, we see the undulating hills around and beyond Bethlehem, which is itself unseen, being nestled lower down. That marked summit rising beyond Bethlehem, like a mound between us and the golden hills of Moab, is Jebel Fureidís, where Herod lies buried. Nearer, but in the same direction, and about six miles off, are Jerusalem and Olivet. Right under us, the eye slowly passing northward, we see the conical hill of Jebel Ful, or Gibeah of Saul: onwards, to the north, on our left is the country round Bethel, with El-Ram, Geba, and Micmash: while further beyond, the mountains of Ephraim cluster on the horizon, and shut in our view. Beside us is Gibeon, and the scene of the great battle of Beth-horon, which completes our circle and carries us back to the point from which we started.

The slightest idea of this panorama, the faintest impression which words (assisted by the map) can convey, will suggest to the reader what we realised in gazing upon it—that, on the whole, it is the most interesting view in the world.

But we are not yet done with Neby Samwil, if our readers will have patience and tolerate us and our geography a little longer. The hill is a great teacher—a comment on Scripture—a light to its sacred pages—a photographer of its stories. For the history of Palestine cannot be separated from its geography. What a confused idea of the history of Great Britain, for instance, would a man have, if to him Edinburgh was at Land's End, and London near Aberdeen; the Highland hills in Hampshire, or the midland counties in Skye or Caithness? What would be the history of modern Europe to him, if his Waterloo was in the Danubian Provinces, and Moscow at Inverness? Yet such an arrangement of places is not more incongruous than are the ideas of many tolerably intelligent people whom I have met, with regard to the geography of Palestine.

Now we see "with our own eyes," from Neby Samwil, the scenes, as I have said, of several Scripture narratives.

As we look down on the maritime plain, we see Azotus (Ashdod), where Philip was found, and follow his track along the sea-shore as he passed northward to Cæsarea.* In Ashdod and Ekron, both visible, abode the ark of God for seven months. We see Lydda, where Paul healed Eneas; Joppa, from which they sent for him when Dorcas died, and from which he afterwards journeyed to meet Cornelius, also at Cæsarea.† Here we trace for the first time the footsteps of St. Paul, for down this path by the Beth-horons he probably descended twice from Jerusalem to Cæsarea—in both cases to save his life.*

---

* "But Philip was found at Azotus: and passing through he preached in all the cities, till he came to Cæsarea."

† "And it came to pass, as Peter passed through all

Standing here, we understand also the great battle which Joshua waged against the petty, yet, in their own place and amongst their own numerous tribes, powerful chiefs of the heathen people of the land. For at our feet is the hill on which the village of El-Jib is now built, but which, as I have said, represents the old city of Gibeon, the capital of a numerous though not very valiant clan, and which commanded this great pass from the plain to the Jordan. From this spot went those cunning diplomatists, the Gibeonites, to deceive Joshua, their want of truth all the while arising from a practical faith in Joshua as a great general and a veritable conqueror of the land. And out of those as yet to us unseen depths which plunge from the table-land of Judea towards the Jordan, Joshua and his host made that wonderful march by night up 3000 feet and for about twenty miles, until he reached Gibeon, his army in the morning rising like the sudden flood of a stormy sea, column after column pouring over the ridge into the upland plain round El-Jib, on which the heathen host were encamped, then dashing among them, and sweeping them over the western ridge down the wild steeps that lead to the Philistian plain. The battle-field explained the battle. The rout must have been terrible! I have visited many battle-fields, but except those where Suwarrow fought in the high Alps, or those in the Pyrenees where Wellington encountered Soult, I never saw any so wild as this. From the dip of the strata, rocks clothe the sides of the hills like the scales of a huge monster, overlapping each other, yet leaving deep interstices between. Steep gorges and narrow valleys cleave the hills as with deep gashes on every side of the road. After riding up the ascent to the plain of Gibeon, we understood how a demoralised army would in flight become utterly powerless, and, if panic-stricken, be hurled over each succeeding range of rocks.†

Down beneath us was a green bay running from Philistia into the bosom of the hills. It was Ajalon! The Arabs call it *Yalo*.

But it is time to withdraw our gaze from the distant landscape, and our thoughts from what it suggests, and come back once more to Neby Samwil. The spot itself calls up many memories of the past. Here probably was the famous "High Place" of Gibeon, where the tabernacle constructed by Moses, and which had been the moveable temple throughout the wilderness journey, was pitched, after many wanderings, until Solomon's Temple was built at Jerusalem.* Here public worship was conducted, by a staff of priests appointed by David, around the brazen altar of Moses;—for "he left there before the ark of the covenant of the Lord Asaph and his brethren, to minister before the ark continually, as every day's work required: and Obed-edom with their brethren, threescore and eight; Obed-edom also the son of Jeduthun and Hosah to be porters: and Zadok the priest, and his brethren the priests, before the tabernacle of the Lord in the high place that was at Gibeon, to offer burnt-offerings unto the Lord upon the altar of the burnt-offering continually morning and evening, and to do according to all that is written in the law of the Lord, which he commanded Israel; and with them Heman and Jeduthun, and the rest that were chosen, who were expressed by name, to give thanks to the Lord, because his mercy endureth for ever; and with them Heman and Jeduthun with trumpets and cymbals for those that should make a sound, and with musical instruments of God. And the sons of Jeduthun were porters. And all the people departed every man to his house: and David returned to bless his house." It was the scene, too, of one of the most imposing pageants ever witnessed in Judea, when Solomon, with all that show, splendour, and magnificence which are associated with his name, "went to Gibeon to sacrifice there, for that was the great high place; a thousand burnt-offerings did Solomon offer on that altar." Here, too, "in Gibeon, the Lord appeared to Solomon in a dream by night, and God said, Ask what I shall give to thee?" and he asked wisdom, and got it.

I left the top of Neby Samwil with devoutest thanksgiving, feeling that, if I saw no more, but were obliged to return next day to Europe, my journey would have been well repaid. As the sun set, we descended the steep and rugged hill to our tents. We fully enjoyed the comfort and repose which they afforded. Nubi was busy with

---

quarters, he came down also to the saints which dwelt at Lydda. . . . And all that dwelt at Lydda and Saron saw him, and turned to the Lord. . . . And forasmuch as Lydda was nigh to Joppa, and the disciples had heard that Peter was there, they sent unto him two men, desiring him that he would not delay to come to them."

* "And he spake boldly in the name of the Lord Jesus, and disputed against the Grecians: but they went about to slay him. Which when the brethren knew, they brought him down to Cæsarea, and sent him forth to Tarsus."

"And when it was day, certain of the Jews banded together, and bound themselves under a curse, saying that they would neither eat nor drink till they had killed Paul. . . . And he called unto him two centurions, saying, Make ready two hundred soldiers to go to Cæsarea, and horsemen threescore and ten, and spearmen two hundred, at the third hour of the night. . . . And provide them beasts, that they may set Paul on, and bring him safe unto Felix the governor."

† See Note at end of article.

* It is, I think, extremely unlikely that the lower hill of Gibeon, on the northern portion of which El-Jib is built, and which is almost concealed in an upland flat fenced off by an encircling ridge, should, as some suppose, have been the high place of Gibeon, instead of Neby Samwil, which stands up like a high altar, visible from the surrounding country. I agree with Dr. Stanley in believing that neither was Mizpeh the high place. The mere fact of the stones of Ramah having been brought to Mizpeh makes it, to say the least of it, extremely improbable that they were carried to this high place. Scopus meets the whole requirements of the case.

the dinner; Meeki was enjoying his narghilé, while all around were kneeling camels, belonging to some travelling Arabs, chewing their evening meal of chopped straw, in which the horses and mules of our cavalcade heartily joined them. "With one stride came the dark"—yet a dark illumined by those clear stars which we never grew weary of looking at in this glorious sky. By-and-by the chatter of the Arabs from Gibeon grew less, and the crowd dispersed. Even Meeki seemed to be dozing. The camel-drivers wrapped themselves in their cloaks and lay curled up on the ground, like brown snails, beside their meek-eyed beasts. The quadrupeds, too, after paying off a few private grievances with sundry kicks and sharp cries, sank into silence: at least I supposed they did so, for I, with my companions, soon fell into deep sleep on ground where Hivite and Perizzite had slept before me, and which had thundered to their tread as they rushed along before the storm of Joshua's fierce attack.

Next morning we visited Gibeon (El-Jib) and its immediate neighbourhood. The view of it from the plain to the west which accompanies this paper will give an idea of its limestone ledges and general appearance.* The most remarkable thing about it belonging to the past is a spring in a large cave, to which worn steps cut out of the rock descend. Near this is a large pool, as large as that of Hebron, but dried up. It was most probably the scene of the battle *à l'outrance* between the men of Judah and Benjamin.† Here, too, Johanan fought the traitor Ishmael.‡

As we descended from Gibeon, we saw the top of the hill of Gibeah of Saul, rising over the low eastern ridge. If the sons of the miserable, broken-hearted, but loving mother Rizpah, were hung up for months on the top of Gibeah, they could be seen from Gibeon by those who had demanded their cruel execution—a horrid sight between them and the eastern sky!

When but a few minutes on our journey, and as we passed round the plain by the road which leads to Jerusalem, we were attracted by a huge stone lying horizontally among others in a low rocky ridge close to the path on the left. Was this the "great stone of Gibeon?"* We could not decide whether it was *in situ* or placed there by the hands of man—or, even if it was *in situ*, whether it was *the* stone. There ever and anon occur in Bible history notices of great stones, rocks, caves, wells, &c. --permanent objects in nature—which, if travellers had only time and patience to examine, would be to a large extent discoverable.

We descended to the tableland of Judah before noon, and entered upon a broad, rough, stony path, the great northern road from Jerusalem to Galilee. We knew now that we were, for the first time, on the highway along which priests and kings, prophets and apostles, the holy men of old, and the One above all, had passed to and fro. We slowly came nearer Jerusalem. We passed over a grey ridge, like a roll of a sea wave, and saw the Damascus Gate before us. We turned down to the left, towards the north-east corner of the wall, and got among Mahommedan tombs, which for some reason or other were being visited by a number of women draped and veiled in white. We descended a hundred yards or so until we reached the road that passes from Anathoth to the city; travelled along it, with the Kedron valley to our left, and Olivet rising beyond,—the city wall crowning the slope to our right,—and then rode up to St. Stephen's Gate, entered it, took off our hats as we passed the portal, but spoke not a word, for we had entered Jerusalem!

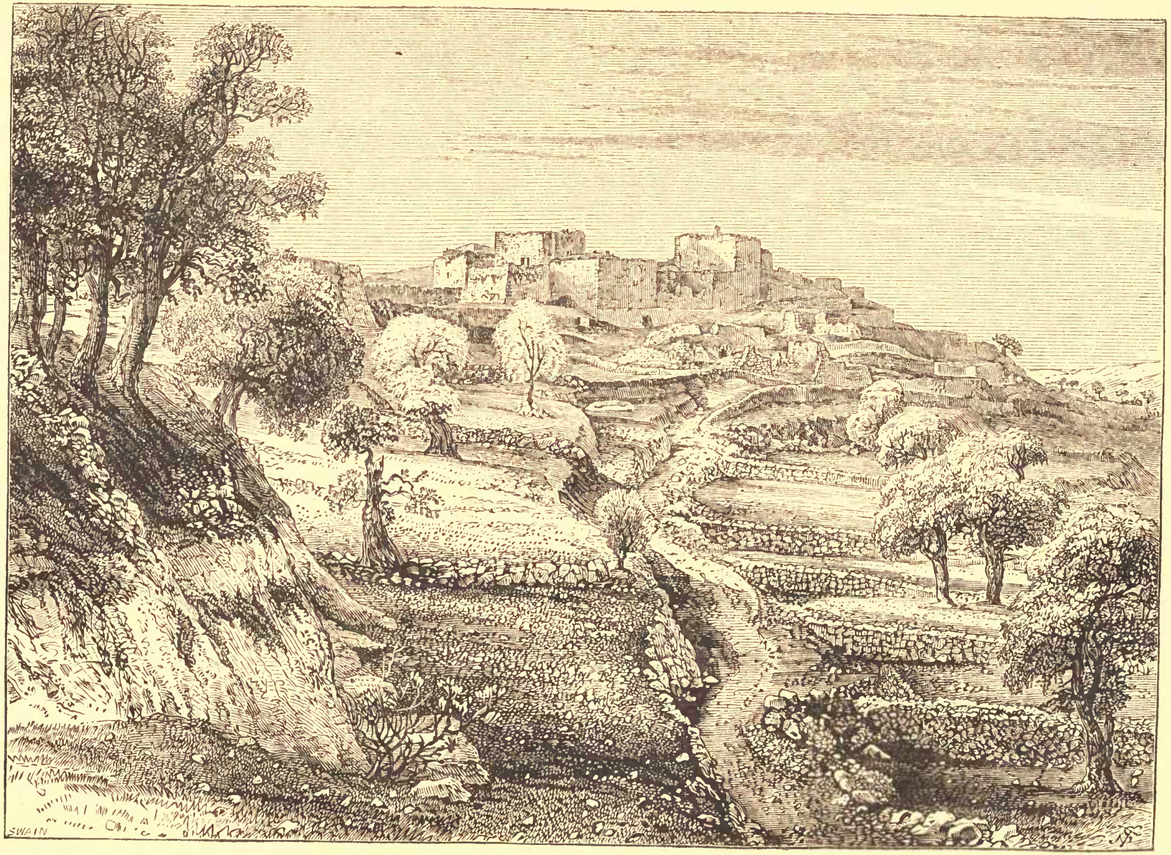
---

* The illustration of El-Jib (Gibeon) is copied from a photograph by Mr. Francis Bedford, taken during the tour of H.R.H. the Prince of Wales, and published by Messrs. Day and Son. I have pleasure in directing attention to this magnificent series of photographic views.

† "And Abner the son of Ner, and the servants of Ish-bosheth the son of Saul, went out from Mahanaim to Gibeon. And Joab the son of Zeruiah, and the servants of David, went out, and met together by the pool of Gibeon: and they sat down, the one on the one side of the pool, and the other on the other side of the pool. And Abner said to Joab, Let the young men now arise, and play before us. And Joab said, Let them arise. Then there arose and went over by number twelve of Benjamin, which pertained to Ish-bosheth the son of Saul, and twelve of the servants of David. And they caught every one his fellow by the head, and thrust his sword in his fellow's side; so they fell down together: wherefore that place was called Helkath-hazzurim, which is in Gibeon. And there was a very sore battle that day; and Abner was beaten, and the men of Israel, before the servants of David."

‡ "But when Johanan the son of Kareah, and all the captains of the forces that were with him, heard of all the evil that Ishmael the son of Nethaniah had done, then they took all the men, and went to fight with Ishmael the son of Nethaniah, and found him by the great waters that are in Gibeon. Now it came to pass, that when all the people which were with Ishmael saw Johanan the son of Kareah, and all the captains of the forces that were with him, then they were glad. So all the people that Ishmael had carried away captive from Mizpah cast about and returned, and went unto Johanan the son of Kareah. But Ishmael the son of Nethaniah escaped from Johanan with eight men, and went to the Ammonites."

* "When they were at the great stone which is in Gibeon, Amasa went before them. And Joab's garment that he had put on was girded unto him, and upon it a girdle with a sword fastened upon his loins in the sheath thereof; and as he went forth it fell out. And Joab said to Amasa, Art thou in health, my brother? And Joab took Amasa by the beard with the right hand to kiss him. But Amasa took no heed to the sword that was in Joab's hand: so he smote him therewith in the fifth rib, and shed out his bowels to the ground, and struck him not again; and he died. So Joab and Abishai his brother pursued after Sheba the son of Bichri."



GIBEON.

NOTE.

The following is Dr. Stanley's account of the Battle of Beth-horon, extracted from his "Lectures on the Jewish Church—Part I." which many readers, who have not access to the volume, will read with interest:—

"The Battle of Beth-horon or Gibeon is one of the most important in the history of the world; and yet so profound has been the indifference, first of the religious world, and then (through their example or influence) of the common world, to the historical study of the Hebrew annals, that the very name of this great battle is far less known to most of us than that of Marathon or Cannæ.

"It is one of the few military engagements which belong equally to Ecclesiastical and to Civil History—which have decided equally the fortunes of the world and of the Church. The roll will be complete if to this we add two or three more which we shall encounter in the Jewish History; and, in later times, the battle of the Milvian Bridge, which involved the fall of Paganism; the battle of Poitiers, which sealed the fall of Arianism: the battle of Bedr, which secured the rise of Mahometanism in Asia; the battle of Tours, which checked the spread of Mahometanism in Western Europe; the battle of Lepanto, which checked it in Eastern Europe; the battle of Lutzen, which determined the balance of power between Roman Catholicism and Protestantism in Germany.

"The kings of Palestine, each in his little mountain fastness,—like the kings of early Greece, crowded thick together in the plains of Argos and of Thebes, when they were summoned to the Trojan war,—were roused by the tidings that the approaches to their territory in the Jordan valley and in the passes leading from it were in the hand of the enemy. Those who occupied the south felt that the crisis was yet more imminent when they heard of the capitulation of Gibeon. Jebus, or Jerusalem, even in those ancient times, was recognised as their centre. Its chief took the lead of the hostile confederacy. The point of attack, however, was not the invading army, but the traitors at home. Gibeon, the recreant city, was besieged. The continuance or the raising of the siege, as in the case of Orleans in the fifteenth century, and Vienna in the seventeenth, became the turning question of the war. The summons of the Gibeonites to Joshua was as urgent as words can describe, and gives the key-note to the whole movement. 'Slack not thy hand from thy servants; come up to us quickly, and save us, and help us; for all the kings of the Amorites that dwell in the mountains are gathered together against us.' Not a moment was to be lost. As in the battle of Marathon, everything depended on the suddenness of the blow which should break in pieces the hostile confederation. On the former occasion of Joshua's visit to Gibeon, it had been a three days' journey from Gilgal, as according to the slow pace of eastern armies and caravans it might well be. But now, by a forced march, 'Joshua came unto them suddenly, and went up from Gilgal all night.' When the sun rose behind him, he was already in the open ground at the foot of the heights of Gibeon, where the kings were encamped (according to tradition) by a spring in the neighbourhood. The towering hill at the foot of which Gibeon lay, rose before them on the west. The besieged and the besiegers alike were taken by surprise.

"As often before and after, so now, 'not a man could stand before' the awe and the panic of the sudden sound of that terrible shout—the sudden appearance of that undaunted host, who came with the assurance not 'to fear, nor to be dismayed, but to be strong and of a good courage, for the Lord had delivered their enemies into their hands.' The Canaanites fled down the western pass, and 'the Lord discomfited them before Israel, and slew them with a great slaughter at Gibeon, and chased them along the way that *goeth up* to Beth-horon.' This was the first stage of the flight. It is a long rocky ascent, sinking and rising more than once before the summit is reached. From the summit, which is crowned by the village of Upper Beth-horon, a wide view opens over the valley of Ajalon, of 'Stags' or 'Gazelles,' which runs in from the plain of Sharon. Jaffa, Ramleh, Lydda, are all visible beyond.

"'And it came to pass, as they fled before Israel, and were in the *going down* to Beth-horon, that the Lord cast down great stones from heaven upon them unto Azekah.' This was the second stage of the flight. The fugitives had outstripped the pursuers; they had crossed the high ridge of Beth-horon the Upper; they were in full flight to Beth-horon the Nether. It is a rough, rocky road, sometimes over the upturned edges of the limestone strata, sometimes over sheets of smooth rock, sometimes over loose rectangular stones, sometimes over steps cut in the rock. It was as they fled down the slippery descent, that, as in the fight of Barak against Sisera, a fearful tempest, 'thunder, lightning, and a deluge of hail,' broke over the disordered ranks; 'they were more which died of the hailstones than they whom the children of Israel slew with the sword.'

"So, as it would seem, ended the direct narrative of this second stage of the flight. But at this point, as in the case of the defeat of Sisera, we have one of those openings, as it were, in the structure of the Sacred history, which reveal to us a glimpse of another, probably an older, version, lying below the surface of the narrative. In the victory of Barak we have the whole account, first in prose and then in verse. Here we have, in like manner, first, the prose account; and then, either the same events, or the events immediately following, related in poetry—taken from one of the lost books of the original canon of the Jewish Church, the book of Jasher.

"On the summit of the pass, where is now the hamlet of the Upper Beth-horon, looking far down the deep descent of the Western valleys, with the green vale of Ajalon stretched out in the distance, and the wide expanse of the Mediterranean Sea beyond, stood, as is intimated, the Israelite chief. Below him was rushing down, in wild confusion, the Amorite host. Around him were 'all his people of war and all his mighty men of valour.' Behind him were the hills which hid Gibeon—the now rescued Gibeon—from his sight. But the sun stood high above those hills, 'in the midst of heaven,' for the day had now far advanced, since he had emerged from his night march through the passes of Ai; and in front, over the western vale of Ajalon, may have been the faint form of the waning moon, visible above the hailstorm driving up from the sea in the black distance. Was the enemy to escape in safety, or was the speed with which Joshua had 'come quickly, and saved and helped' his defenceless allies, to be rewarded, before the close of that day, by a signal and decisive victory?

"It is doubtless so standing on that lofty eminence, with outstretched hand and spear, as on the hill above Ai, that the Hero appears in the ancient song of the Book of Heroes.

Then spake Joshua unto JEHOVAH
In the day 'that God gave up the Amorite
Into the hand of Israel,' (LXX.)
When He discomfited them in Gibeon,
'And they were discomfited before the face of Israel.' (LXX.)
And Joshua said:
'Be thou still,' O Sun, upon Gibeon,
And thou, Moon, upon the valley of Ajalon!
And the Sun was still,
And the Moon stood,
Until 'the nation' (or LXX. 'until God') had avenged them upon their enemies.
And the sun stood in 'the very midst' of the heavens
And hasted not to go down for a whole day.
And there was no day like that before it or after it,
That JEHOVAH heard the voice of a man,
For JEHOVAH fought for Israel.
And Joshua returned, and all Israel with him, unto the camp in Gilgal."

OUR INDIAN HEROES.

By JOHN WILLIAM KAYE.

V.—CAPTAIN ARTHUR CONOLLY.

If the reader, who has followed me through my two last chapters of Indian biography, remembering what I have written about the characters and the careers of Alexander Burnes and Henry Martyn, can conceive the idea of a man combining in his own person all that was excellent and loveable in both, and devoting his life to the pursuit of the objects which each in his turn sought to attain, the image of Arthur Conolly will stand in full perfection before him. For in him the high courage and perseverance of the explorer were elevated and sublimed by the holy zeal and enthusiasm of the apostle. Ready to dare everything and to suffer everything, in a good cause; full of faith, and love, and boundless charity, he strove without ceasing for the glory of God and for the good of his fellow-men; and in little things and in great, in the daily interests of a gentle life, in which the human affections were never dormant, and in the stern necessities of public service, which for the honour of the nation, for the good of the human race, and for the glory of the religion which he professed and acted, demanded from him the surrender even of that life itself, manifested all the noblest self-abnegation of the Hero and the Martyr.

Arthur Conolly was the third of the six sons of a gentleman, who, in the latter part of the eighteenth century, went out to India, made a rapid fortune, and returned to spend it in ease and comfort at home. He was born in Portland Place, London, in the year 1807; and received his education at Rugby. He was not much happier there than was Henry Martyn at the Truro Grammar School. Shy and sensitive, and of a nature too refined to cope successfully with the rough realities of public school life, he was fagged and bullied; and he often spoke in after-life of the sufferings he endured at "Mother Bucknell's." In good time, however, deliverance came. He was removed from Rugby in 1822, and sent to the Military Seminary of the East India Company. His father had large "interest at the India House," especially with the Marjoribanks family; so in due course, one after the other, he sent all his boys to India. Arthur, in the first instance, was designed for one of the scientific branches of the Indian army; but whilst at Addiscombe, an offer having been made to him of a commission in the Bengal Cavalry, he accepted it, or it was accepted for him. He left the military seminary on the 7th of May, 1823, and on the 16th of June he quitted England in a vessel bound for Calcutta. There was so much of incident crowded into the latter years of his life that it is necessary to pass briefly over the chapter of his boyish years.

The ship in which he sailed for India was the Company's ship "Grenville," which carried Reginald Heber, then newly consecrated Bishop of Calcutta, to his diocese. In those days, the first voyage to India of a young writer or a young cadet often exercised an important influence over his whole after-career. Life-long friendships were often made or abiding impressions fixed upon the mind by the opportunities of a life on board ship. It was no small thing for a youth of sixteen, ardent, imaginative, with a vast capacity for good in his nature, to sit daily at the feet of such a man as Bishop Heber. The Bishop has recorded, in one of his letters, the fact that when he was studying the Persian and Hindostanee languages, "two of the young men on board showed themselves glad to read with him." Arthur Conolly was one of the two. But he derived better help than this from his distinguished fellow-passenger. The seed of the Word, which then came from the Sower's hand, fell upon good ground and fructified a hundred-fold. In a letter to a friend Heber wrote, some five weeks after the departure of the "Grenville"—"Here I have an attentive audience. The exhibition is impressive and interesting, and the opportunities of doing good considerable." Among his most attentive hearers was young Arthur Conolly, who took to his heart the great truths which were offered to him, and became from that time rooted and grounded in the saving faith.

The first years of his residence in India did not differ greatly from those of the generality of young military officers, who have their profession to learn in the first instance, and in the next to qualify themselves for independent employment. He was attached, as a cornet, to the 6th Regiment of Bengal Cavalry, and in 1824 and two following years appears to have been stationed at Keitah and at Lohargong. In 1825, he obtained his lieutenancy; and in 1827, he fell sick, and was compelled to obtain a furlough to England on medical certificate.

After a year and a half spent in Europe, he was sufficiently recruited to think of returning to India. In those days, it was the ordinary course for an officer, "permitted to return to his duty," to take a passage in a sailing vessel, steering round the Cape of Good Hope. What is now called somewhat inappropriately the Overland Route, was not then open for passenger-traffic; and if it had been, it would not have held out much attraction to Arthur Conolly. He desired to return to India really by the Overland Route—that is, by the route of Russia and Persia; and, as he has himself declared, "the journey was undertaken upon a few days' resolve." "Quitting London," he has recorded in the published account of his travels, "on the 10th of August, 1829, I travelled through France and the North of Germany to Hamburg, and embarking on board a steam-vessel at Travemunden on the 1st of September, sailed up the Baltic and the Gulf of Finland in four days to St. Petersburg." Such is the first sentence of the two volumes of travels which Arthur Conolly has given to the world. It was his original intention after having reached the capital of Persia, to strike down thence to the shores of the Persian Gulf, and there to take ship for Bombay. But the spirit of adventure within him grew stronger as he proceeded on his journey; and he determined to explore at least some portions of Central Asia. There was little known, in those days, about Afghanistan. He might do good service by acquiring information respecting the countries lying between Persia and India, and it suited his humour at that time to make the effort. It was the enterprise of the Englishman more than anything else, which carried him forward in those early days. He was very young when he started on his journey. He had numbered only twenty-two years; but he had courage and self-reliance of the highest order; and ever as he went, the desire to see more impelled him forward to new fields of adventure. Perhaps there was even then obscurely taking shape within him some previsions of the "great game in Central Asia," which he afterwards believed it was the especial privilege of Great Britain to play.

From Teheran, Arthur Conolly made his way to Herat—the frontier city which afterwards became so celebrated in Eastern history. Upon all with whom he was associated there the young English officer made a most favourable impression. Another young English officer—Eldred Pottinger—who visited the city some years afterwards, found that Arthur Conolly's name was great in Herat, and that many held him in affectionate remembrance. "I fell in," says the former in his journal, referring to the year 1838, "with a number of Captain Conolly's acquaintances. Every person asked after him, and appeared disappointed when I told them I did not know him. In two places, I crossed Mr. Conolly's route, and on his account received the greatest hospitality and attention—indeed, more than was pleasant, for such liberality required corresponding liberality upon my part, and my funds were not well adapted for any extraordinary demand upon them. In Herat, Mr. Conolly's fame was great. In a large party where the subject of the Europeans who had visited Herat was mooted, Conolly's name being mentioned, I was asked if I knew him, and on replying, 'Merely by report,' Moollah Mahomed, a Sheeah Moollah of great eminence, calling to me across the room, said, 'You have a great pleasure awaiting you. When you see him, give him my salutation, and tell him that I say he has done as much to give the English nation fame in Herat, as your ambassador, Mr. Elphinstone, at Peshawur,' and in this he was seconded by the great mass present."

This was, truly, a great distinction for one so young; and it was earned, not at all as some later travellers in Mahommedan countries have earned distinction, by assuming disguises and outwardly apostatising, but by the frankest possible assertion of the character of a Christian gentleman. Moreover, he appeared before the Heratees as a very poor one. He did not go among the Afghans as Elphinstone had gone among them, laden with gifts; but as one utterly destitute, seeking occasional small loans to help him on his way. Yet even, in these most disadvantageous circumstances, the nobility of his nature spoke out most plainly; and the very Moollahs, with whom he contended on behalf of his religion, were fain to help him as though he had been one of their sect. He had many warm disputations with these people, and they seem to have honoured him all the more for bravely championing his faith. Young as he was, he felt that our national character had suffered grievously in the eyes of the people of the East by our neglect of the observances of our religion. "I am sure," he said, "the bulk of the Mahommedans in this country do not believe that the Feringhees have any real religion. They hear from their friends, who visit India, that we eat abominations, and are never seen to pray; and they care not to inquire more about us. . . . It is, therefore, greatly to be desired that such translations of our Scriptures as may invite their study should be sent among these people, in order first to satisfy them that we have a religion, and secondly that they may know what our religion is; in order that they may learn to respect us, which they do not now, and gradually to regard us with kindlier feelings; for until they do, we shall in vain attempt to propagate the Gospel among them;" and then he proceeded to discourse very shrewdly and intelligently on some of the principal errors which had been committed by our people in their efforts to propagate the Christian faith—errors principally arising from our ignorance or disregard of the national characters of those whom we had endeavoured to instruct in the truths of the Gospel.

From Herat, Arthur Conolly proceeded, by the route of Ghirisk, to Candahar; and thence by the valley of Pisheen, in which he halted for some time, to Quettah, and through the Bolan Pass to the country of the Ameers of Sindh. He then journeyed to Bahwalpore and across the great Indian desert, to the British frontier, which he crossed in the month of January, 1831. At Delhi, he met the Governor-General, Lord William Bentinck, to whom he gave an account of his wanderings, and afterwards dropped down to Calcutta by the river route. At the Presidency, he drew up an interesting paper on the subject of the "Overland Invasion of India," which he printed in one of the Calcutta journals, and afterwards appended to his published travels. In those days, a paper on such a subject showing any real knowledge of the countries traversed was a novelty; but it was reserved for a later generation to discern the large amount of sagacity that informed it.

It was now time for Lieutenant Conolly to return to his military duties. So he rejoined his regiment at Cawnpore. At that station, he made the acquaintance of the famous missionary traveller, Joseph Wolff. "They took sweet counsel together, and they walked in the House of the Lord as friends." With what deep emotion has Wolff recorded his recollections of that meeting. "From Delhi," he says, "I passed to Agra, and thence to various places until I reached Cawnpore. HERE I MET WITH LIEUTENANT CONOLLY." The words are printed in Wolff's book in capital letters, as I have printed them here. "When I travelled first in Khorassaun, in the year 1831," he continues, "I heard at Meshed by the Jews, that an English traveller had preceded me there, by the name of Arthur Conolly. They described him as a man who lived in the fear of God and of religion. The moment I arrived he took me to his house, and not only showed me the greatest hospitality, but, as I was at that time short of money, he gave me every assistance in his power—and not only so—he revised my journal for me with the most unaffected kindness. He also collected the Mahommedan Moollahs to his house, and permitted me not only to discuss with them the subject of religion, but gave me most substantial aid in combating their arguments. Conolly was a man possessed of a deep scriptural knowledge; a capital textuary. Various enemies are always found to attack the lone missionary. Nobly and well did this gallant soldier acquit himself in the church militant, both in deeds of arms and deep devotion to the cause of Christ." What Arthur Conolly on his part thought of his friend may be gathered from a letter written by him shortly after his departure from Cawnpore. "Wolff has left us," wrote the young Christian enthusiast on the 19th of February, 1833, "and has taken with him the esteem and best wishes of all who knew him. As you will shortly see him in Calcutta, I need not enter into much detail of his sayings and doings here, but let me again assure you that he is neither crazy, vain, nor fanatical, but a simple-minded, humble, rational, and sound Christian. His chief desire is, to preach to all people, Jesus Christ *crucified*, the God, and only Saviour of mankind: he is naturally most anxious that his own brethren should turn to the light that has shone upon him, and therefore he seeks them in all parts of the earth where God's wrath has scattered them, but ever as he goes, he proclaims to the Mahommedan, and to the idolater, the great object of his mission. . . . Judging by the benefit we have reaped from his conversation here, we may hope that he will be made the means of doing much good wherever he goes. You will be delighted with his company in private society, for he is full of varied and most interesting anecdote, but above all I hope you will hear him, when he appears to the greatest advantage, in the pulpit, for, understanding the Hebrew meanings of words in Scripture, he throws new light upon passages that are familiar to us, but chiefly he preaches truth *from* the heart, and therefore, generally, *to* the heart."

In 1834, Arthur Conolly was stationed with his regiment at Mhow; and in the following year he was transferred to that great outlet for the energies of aspiring young soldiers, kept down by the seniority system—the Political (or diplomatic) Department. He was appointed an assistant to the Governor-General's agent in Rajpootana. Over this epoch of his career I must pass hastily. After a little space, he obtained a furlough to England, not because he was sick, or because he was weary of Indian life; but because he was drawn thither by the attractions of one to whom he had given the best affections of his heart. He had ever, in words which I find in one of his own letters, with reference to the character of a friend, a great *besoin d'aimer*—and he had found one worthy to fill the void. He had met in India a young lady, the daughter of a man in high position there, a member of a noble family; and he had given to her all the love of his warm passionate nature. But she had returned to England with her parents; and so he followed her thither, believing, as he had good reason to believe, that their reunion would soon be followed by their marriage.

They met again, under her father's roof; and for awhile he was supremely happy. But the fond hopes which he had cherished were doomed to bitter disappointment. The blight, which fell upon the life of Henry Martyn, fell also upon the life of Arthur Conolly. The whole history of it lies before me as written by himself, but it is not a history to be publicly related. There was no fault upon any side. Nothing more is to be said of it than that it was God's will. And no man ever bowed himself more resignedly or reverentially to such a dispensation. He had been resolved for her sake to sacrifice his career; never to return to India, but to go into a house of business—to accept any honourable employment, so that he might not take her from her family and her home. But when this hope was unexpectedly prostrated, he turned again to the career which lay before him, and went back into the solitude of public life. He went back, chastened and subdued, full of the deepest love for the one and of boundless charity for the many; not at all exasperated, not at all embittered, but with a softer and more loving heart than before; with an enlarged desire to benefit the human race, and a stronger faith in the boundless mercy of God. The refined tenderness and delicacy of his nature could be fittingly expressed only by the use of his own words. I know nothing more beautiful—nothing more touching than his letters on this subject. The entire unselfishness of his nature was manifest in every word that he wrote. It was all over. Thenceforth Humanity became his bride.

Happily for him there was something, in the great world, of becoming magnitude to fire his imagination, to absorb his mind, and invite him to energetic action. The contemplated invasion of Afghanistan was at this time occupying to no small extent the minds of those members of the Cabinet, whose duty it was to shape our policy in Asia, as seen both from our Western and our Eastern dominions. The information of any intelligent Englishman who had actually visited the countries, or any part of the countries, which were about to become the scene of our operations was, therefore, eagerly sought. Alexander Burnes had returned to India, leaving behind him, however, some rich Oriental legacies; and it was no small thing in such a conjuncture, for a Secretary of State for Foreign Affairs, or a President of the India Board, whose experiences did not lie much in that direction, to be able to converse with a British officer, who had visited Herat—the famous frontier city to which the Persians were laying siege. Whether Arthur Conolly were altogether the kind of man best suited to their purpose may admit, perhaps, of a doubt. They thought him perhaps a little over-enthusiastic—a little too wild and visionary. But sober-minded practical men were not very likely, in those days, to make such hazardous journeys as Arthur Conolly had made. The man who did these things had necessarily a dash of romance in his nature, and you might be sure that he would not expound his views in a very cold-blooded manner. One thing, however, must have satisfied them. He was delighted with the idea of an advance into Afghanistan. Seeing, as he did, in the distance such grand results to be attained by British intervention, he did not scan very narrowly the means to be immediately employed. His view of the matter was rather that of a grand Anti-slavery Crusade than of a political movement, intended to check-mate the designs of another great European power. He grasped, in very singleness of heart, the idea of a band of Christian heroes entering the remote regions of Central Asia as Champions of Humanity and Pioneers of Civilization. Full of this thought he drew up a memorandum for the Home Government, in which he expounded his views, saying: "Now both the Russians and Persians have the most legitimate plea for invading Toorkistan, especially Kharasm, where numbers of their countrymen are held in abject slavery — a plea last to be disallowed by England! How, then, can we frustrate the designs of ambition which our rival will so speciously cover? Possibly, by persuading the Oosbegs themselves to do away the grievance which gives the Russians and Persians a pretext for invading them. Let the British Government send a properly accredited envoy to Khiva, in the first place, and thence, if advisable, across the Oxus, at once to explain our present acts in Afghanistan, and to try this only open way of checking a Russian approach, which will entail far greater trouble upon us."

He proposed that the British authorities should also negotiate with the other Oosbeg chiefs, and represent to them that if they would undertake to restrain the Turcoman tribes from carrying off into slavery the subjects of Russia and Persia, the British would use their influence with the governments of those countries to persuade them to fix their boundaries at limits which would inspire our Government with confidence, and ensure peace to the Oosbegs themselves. On the other hand, in treating with Russia, he contended that we should best consult our interests by basing all our arguments on the one broad principle of humanity. "It might not be amiss," he wrote, "frankly to put it to the Court of St. Petersburgh whether they, on their part, will not desist from a jealousy which is injuring us both and many people connected with us. Whether, ceasing from an unworthy policy, which seeks to keep alive a spirit of disaffection among the thousands whom it is our high aim to settle and enlighten, they will not generously unite with us in an endeavour peaceably to abolish rapine and slavery. . . . The cost of our mission would be well exchanged for increased knowledge of countries, in which, sooner or later, we shall be obliged to play some part, and for more positive notions than we now possess of the danger against which we have to provide; while it is probable that though the Oosbegs might desire to be left to fight their own battles with the Russians and Persians, they would accept overtures of a generally amicable nature from us that might have some way for the extension of our commercial relations beyond Afghanistan, which we hope to settle."

These were suggestions not to be lightly regarded, at a time when the designs of Russia in the East were disturbing the serenity of the English Cabinet, and a British army was about to march into Central Asia. There might be more ardour and enthusiasm in Arthur Conolly than were likely to recommend him to official men; but there was a good substratum of sound sense at the bottom of his recommendations, and the authorities were not disinclined to avail themselves of the services of a man so eager to do anything and to suffer anything in so great a cause. At first, they were minded to send him directly from England to Hindostan, with credentials from the Home Government; but afterwards they determined only to recommend such a mission to the Governor-General, and therefore they sent him to India, with letters to Lord Auckland, and with 500*l.* in his pocket for the expenses of his journey. He was to travel by the way of Vienna, Constantinople, Armenia and the Persian Gulf, and, by certain passing inquiries and diplomacies, acquire information that might be useful to his Government and smooth the way for his future operations on the banks of the Oxus and the Jaxartes.

On the 11th of February, 1839, Arthur Conolly left London, and made for the Austrian capital. There he had an interview with the great minister and arch-diplomatist, Metternich, to whom he explained in detail our Central-Asian policy, and thereby removed some erroneous impressions which had been made upon his mind. It happened, also, that at that time an envoy from the Shah of Persia (Hoossein Khan by name) was halting at Vienna on his way to England. It was obviously a great thing that Conolly should hold frequent communication with the El-chee, and it was desirable, at the same time, that it should be as little formal and ceremonious as possible. So the English officer quartered himself at the hotel where the Persian minister was residing, and they soon established familiar intercourse with each other. This Hoossein Khan appears to have been a shrewd fellow, with some sense of humour in him. At one of the interviews, the details of which Conolly afterwards noted down, the English officer hinted that the Persian minister was prejudiced against Mr. McNeill. "Not at all," said Hoossein Khan. "We have always been the best of friends. He has lived at my house for days together. Indeed, I owe him my highest appointment. When it was proposed to send me as envoy to England, McNeill represented that I had not rank enough. 'Why,' replied the Shah, 'Hoossein Khan is of a very ancient family. He is Adjutant-General and he is my foster-brother. Moreover, we received the other day Mr. Ellis from your Crown. Now, I'll engage that the sovereign of England has at least three hundred subjects equal in station to Mr. Ellis, whilst I have not ten equal to Hussein Khan.' 'Your Majesty forgets,' said McNeill, 'that Mr. Ellis was a Privy Councillor.' 'Very well,' said the Shah, 'we will add this dignity to Hoossein Khan's titles,' and I was made a *Preevy Koonsillah* from that day."

The case was well argued upon both sides, but with no result. The Persian was as tenacious of his opinions as the Englishman; and it must be admitted that he had a way of stating the case in favour of his master, which, if not always truthful, had a very plausible appearance of truth. It is instructive to see the different glosses which two men can put upon the same event, as seen from the side of their respective nationalities. Thus the well-known story of the seizure of the British Courier, which did so much to embitter our relations with Persia, as seen from the Persian side was rather a wrong suffered by them—a wrong done to that State. Again, taking a comprehensive view of the whole question, Hoossein Khan said: "You talk of our acting against your interests, and our own real interests; but are we ever to sacrifice what we think to be ours, to your notions for us, or to your precautions for yourselves? The question of Persian policy lies in a small space, and the sooner it is reduced to its essence the better. We are situated between you and Russia, being weaker than either of you; we therefore want support from one or the other. If you will give it, good; if not, we must just take to those whom we like least, and make the most of them, whether it pleases you or no. The Shah will never give up his claims upon Afghanistan: why should he resign what he can take with ease, purely to soothe a fear of the British Government? The whole country up to Caubul was ready to submit to him when he left Herat, and will prove so whenever he advances his standard again. You misinterpret his Majesty's generosity in retiring at your request, and think you gained your wish by sending troops to Karrak; you encourage revolt in the South; does it not strike your acute penetration that we can play the last game, if need be, in Hindostan? we can; and if you provoke us too far, we will." To this Conolly replied,—"Your admissions now go far to justify our proceedings in Afghanistan. Your very threat of using your political influence against our repose in India, is quite reason enough for us to prevent your establishing it any nearer, by the fair way that your hostile conduct has opened to us." It was no empty threat that the Persian uttered: but a clear declaration of the settled policy of his Government. We had not to wait twenty years to see how effectually it could be converted into a fact.

From Vienna Arthur Conolly made his way to Constantinople. There most propitiously it happened that he found an envoy from Khokund—one of the very Oosbeg States which he desired to wean from their inhuman habits. The Chiefs of Central Asia had, and still have, unbounded faith in the Sooltan. They believe that his power is unlimited, and that he can rescue them from all their difficulties and dangers. As I write, the Khan of Khokund has an envoy, if not two, at Constantinople. To Conolly, this circumstance of the presence of the Khokundee at the Ottoman Capital was one of happy augury; and he determined to turn it to the best possible account. So he soon made the acquaintance of the envoy; and began to expound to him his views of the situation in Central Asia;—"One of the Shah's pretexts for invading Herat," he observed, "was that the people of that state used to carry off his subjects into slavery; but this plea was proved false by his refusing to accept our guarantee to Kamran's promise that such should not again occur. I don't think that there were many real Heratees engaged in this work. The Huzarchs perhaps did it occasionally, in concert with the Toorkmans, and it was against the latter tribes that the Shah of Persia should have directed his arms, if he wished to put down the evil as his father Abbas Meerza did at Serria. People say that there are now in Khiva, Bokhara, and other parts of your country up there, as many as 30,000 Persians taken one time or other from the villages and high road of Irân, by the Toorkmans. Is it so?" "Thirty?" was the reply, with a hearty laugh; "thirty! say a hundred thousand, or two, if you will; we've no end of those scoundrels; upon our parts we find them very useful." "And other people also? Russians! have you many of those?" "We haven't many.

nor the Bokhara people either; at Khiva there are a great many." "What do they do there?" asked Conolly. "They do everything; work in the field—work in the houses." "We English, perhaps your Excellency knows, do not approve of slavery at all. Our Government, the other day, gave forty millions of ducats to buy off the slaves of its own subjects." "How? What do you mean?" asked the astonished Envoy. "Why, in former times, many English subjects possessed of estates in foreign provinces of England, had been the owners of negro slaves, who used to till their lands for the cultivation of sugar, spices, &c. Now the rule in England itself is that no foot which touches its dust can remain for a moment longer enslaved against its will. The free people at home all cried to the throne that no English subjects should have a slave anywhere, so the Government, not to be unjust, bought off all the negroes from its own people, and declared them free for ever." "You wish men not to be slaves of each other, but only *bundayan khoda*, slaves of God. Good for you, if you do well. Our habits are different." "Yes," said Conolly, "as I learned in my endeavours to reach Khiva."

A few days later Arthur Conolly again visited the Envoy, and plunged deeply into the politics of Central Asia; the depths which he sought to fathom ever being those in which he touched with his foot the abominations of that vile traffic in human flesh, which he was eager to root out from the land. They talked about the complications that had recently arisen—of the movements of the Persians, the Russians, and the English; and of the dangers which beset the Oosbeg States. The Envoy asked what was to be done—what was to be the remedy? This was the opportunity which Conolly desired. "I've no certain remedy," he answered; "but there is one which may be tried. The Russians will invade Khiva, and take other Oosbeg States, on the ground that they have a right to liberate their people enslaved among you. We could not say a word against this, nor would we; for to be frank with you, if any of our people had been in the condition that theirs are, we should long ago have done what they threaten to do. You must send every Russian slave out of your territories, and never capture any more." "We and the Bokharians haven't many Russians," said the Envoy; "but the Khiva Khan wouldn't find it easy to do what you propose. He has a great many." "How many?" "More than a thousand, certainly. There's only one way in which I can see a likelihood of your plan being accomplished, by the Russians *buying* all their people. They are dispersed among many masters; so the Khan could not give them up if he wished." "I don't think the Russians would condescend to this," returned Conolly. "Perhaps, however, an arrangement might be made, if you promised never to capture any more. What would it cost to buy the thousands you speak of?" "Not less than fifty or sixty thousand ducats. Perhaps you would buy the whole, and make the Russians a present of them. This would not be a great thing after your millions of ducats." "Well, we'll discuss all practicable means when the plan is agreed to. And the Persians! Will you let them go also, and cease from your forays?" "Oh, you must not think of the Persians," rejoined the Envoy, "in such an arrangement. There are too many of them by hundreds of thousands. Besides, we want them. For the Russians, perhaps, we might come to an arrangement."

Again and again the Envoy pressed Conolly to wait until he himself had received from the Sooltan his orders to depart, that they might travel to Khokund together; but the English officer pleaded the instructions of his own Government and declined the invitation. In truth, he had already made a longer halt at Constantinople than was consistent with the wishes of the authorities in England, who censured him for his delay. But he had been doing good work. His conferences with the Envoy from Khokund had done much to detach that worthy from the grasp of Russian diplomacy, which would have had it all its own way, if Conolly had not been at Constantinople to exercise that benign influence which few men could resist. He parted on the best possible terms from the Oosbeg agent, carrying with him all sorts of friendly assurances and some pledges; and on the 22nd of August, he left Constantinople, *en route* to Baghdad, intending to reach Jamsom as the first stage in his journey. But learning that the road thence to Diarbekir was infested with bands of plunderers, and scarcely passable, he landed at Trebizonde, and, by the Consul's advice, proceeded to Erzeroum, where he arrived early in September. After a halt of two days, he resumed his journey furnished with letters for his safe protection to the authorities of the province, and before the end of October, he had reached Bushire in the Persian Gulf, where Major Hennell, the British resident, not having immediately at his command a Government vessel, sent Conolly forward in a fast-sailing merchant-ship to Bombay, which place he reached on the 13th of November, 1839.

From Bombay he made his way to Calcutta, saw the Governor-General, expounded his views, and received the confidences of Lord Auckland. Nothing could have been more propitious than the conjuncture. There was a bright flush of success over all our policy in Afghanistan. In Arthur Conolly's words we had to all outward seeming "built up" the Douranee Empire again. We had accomplished a great revolution. The *de facto* ruler of Afghanistan was beaten and a fugitive. The nationality of the country was stunned and bewildered by the roar of the British guns. More than all, the great magician, who had accomplished this mighty change, was a near relative of Conolly himself. The Envoy and Minister at the court of Shah Soojah-ool-Moolk was his cousin William Macnaghten, about soon to have the prefix of *Sir* to his name—a name not to be mentioned without a respectful and a tender regret, for he was a brave and an able man, who sacrificed his life in the service of his country. The Governor-General, therefore, had no very difficult part to play. As the Home Government had left it to him to find a field of adventure for Arthur Conolly, he also in his turn left it to the representative of British interests in Afghanistan, to indicate the particular service on which his enthusiastic relative might most advantageously be employed. So Conolly proceeded to Caubul, and in the spring of 1840, was immersed, breast-high, in the troubled stream of Afghan politics. What was then stirring in his warm heart and in his active brain may be gathered from the letters, which at this time he addressed, to an old and very dear friend—a man high in place and deservedly high in honour. After much that—profoundly touching as is the interest of it—I cannot bring myself to make public, he proceeded to say: "Those feelings have more force with me than ever now, because I am about to undertake a journey, which is not without risks to life, and if mine should end in Tartary, I would not have her fancy it shortened or carelessly ventured in consequence of my disappointed love for her. You will be able, if necessary, to explain that the cause I go upon, is one which every man must be proud and eager to peril his life for—the noblest in which he could fall; and you may without hesitation assure her, that I have regained a cheerful mind, and only hope that the same unfailing Spirit of goodness who has surrounded me with objects to make life a great blessing will give her the best gifts of earth, and make her eternally happy in heaven, where all separations and disquietudes will be healed. I meant but to say a few words on this subject when I began it, and yet after a whole sheet was not half satisfied with what I had written. You will divine my thoughts more clearly than I have expressed them, and will forgive my prolixity. It was like your kindness to answer for my motive in halting at Constantinople. I only got reproof for setting aside Talleyrand's motto,* but I acted honestly, and the more the politics of Toorkistan open upon us, the more am I satisfied that my conduct was wise. I trust that I shall prove it by gaining all that you kindly wish me to obtain on the Jaxartes. . . . I feel very confident about all our policy in Central Asia, for I think that the designs of our Government there, are honest, and that they will work with a blessing from God, who seems now to be breaking up all the barriers of the long closed East, for the introduction of Christian knowledge and peace. It is deeply interesting to watch the effects that are being produced by the exertions of the European powers, some, selfish and contrary, others, still selfish, but qualified with peace and generosity; all made instrumental to good. See the French in Africa, the English, Austrians, and Russians on the Bosphorus, forcing the Turks to be Europeans under a shadow of Mohammedanism, and providing for the peaceful settlement of the fairest and most sacred countries in the world. Will you turn aside when you go home at the end of next year to see 'those blessed acres which our Saviour trod.' Syria, it seems, is to revert to the Porte. . . . If we treat the Toorkistan question liberally, we shall, I think, secure the great position which we have now gained, and make our jealousy of Russian advance in this direction the means of purifying and enriching to our future advantage, the whole of Oosbeg Tartary. You will have heard that my route has been changed, and that I and Major Rawlinson are to proceed in the first instance to the head quarters of General Perofski, there to see that he does not exceed the Emperor's declarations, and I hope, quietly to commence the arrangement which it is proposed to base upon Khokund."

It had been arranged that Captain Conolly and Major Rawlinson should proceed together to the Russian camp at Khiva, but the failure of General Perofski's expedition had caused this plan to be abandoned; and Lord Auckland was growing more and more distrustful of the benefits of extending the "great game" all over Central Asia. Eager for action as Captain Conolly was, the folding up of a scheme which, according to his perceptions embraced nothing less than a grand Anti-slavery Confederation, was a heavy disappointment to him. "I was greatly disappointed," he wrote to a dear old friend at the end of May, "when Lord Auckland's prohibitory letter arrived, for I had set my heart upon this nobly stirring employment, and when the chance of it seemed removed, I felt the blank that a man must feel who has a heavy grief as the first thing to fall back upon; but then, this very sorrow operated to compose me, showing that I ought to sit loose to lesser disappointments. Now things look more promising. I am ashamed of the first page now that I read its murmuring tenor, but it is dark and just post-time, and you will forgive my groans. I never utter them to anybody else."

Whilst this question of the mission to the Oosbeg States was still in abeyance, about the middle of July, Conolly wrote to Major Rawlinson, at Candahar, saying:—"I think it *must* end in my going to Khokund, probably *viâ* Khiva, with the Envoy thence, Yakoob Bai, with whom I have established great croneyism, in order that I may communicate Sir William's last instructions to Shakespear. Perhaps I may come round by Bokhara, if the Ameer relents upon the last forcible appeal that Sir William is about to make to him through two Sahibzadehs, whom Shah Shoojah sends with a letter recapitulating all that he and his allies, the English, have done to disabuse the Commander of the Faithful of unjust notions and unnecessary apprehensions, religious and political, and of all the insults and injuries that the said allied governments have received in return. I should have mentioned this first, but my brain has got muddled with much copying and original scribbling, this being a very busy day, and John* having shirked clerk's work for the organization of more Jan-Bazes."

---

* "Surtout, Monsieur, point de zèle."

That the mission, which he so longed to undertake, was a perilous one, was not to be disguised. Captain Abbott had gone to Khiva, and had fought for his life. Colonel Stoddart had gone to Bokhara, and had been thrown into hopeless captivity. The liberation of poor Stoddart was one of the many beneficent objects which Conolly hoped to accomplish by his embassy. It was with much grief and disappointment, therefore, that he saw the efforts of our Government to obtain the release of their officer limited to the dispatch of a letter from Shah Soojah to the Ameer of Bokhara. Even this was a slow process. "At last," wrote Conolly on the 24th of July, "we have got the letter to the Ameer of Bokhara, through the Shah's *dufter* (office), and the two Sahibzadehs propose starting with it to-morrow, which their calendar shows to be a remarkably fortunate day. May their errand be successful! Poor Stoddart's health was drunk last night at the Ghuzni anniversary dinner, among absent English friends, after a briefly-eloquent speech by Sir Alexander Burnes." A few days afterwards he wrote again to the same correspondent, saying, "If I ever cool my parched brow in the Jaxartes, I'll drink a goblet of its waters to the extension of your shadow in every direction. You've a great game, a *noble* game before you, and I have strong hope that you will be able to steer through all jealousy, and caprice, and sluggishness, till the Afghans unite with your own countrymen in appreciating your labours for a fine nation's regeneration and advancement. These are not big words, strung for sound or period. I didn't know that I could well express my desire more simply, certainly not when writing at a long canter to reach the post bag ere it closes for the night. I've been rendering English into Persian, and Persian into English, till I feel quite addled, and every half hour brings one of Sir William's comprehensive requests in a pencil note."

But the month of August dawned auspiciously, and the clouds began to disappear. On the 4th he wrote, in the highest spirits, to Major Rawlinson, at Candahar, saying, "Hip, hip, hurrah! I do believe that I am fairly going now, so accept my best thanks for your congratulations. I receive them with a pang of real regret that you are not going with me; but Todd bids me be comforted with the thoughts of your realised important elevation, so I'll utter no vain words. Nothing can be done ahead, unless Afghanistan is properly settled, and I have confident hope of your being highly instrumental to this desirable end."

The fact was that help had come to him from an unexpected quarter. His old friend Syud Zahid, the Khokund Envoy, with whom he had discussed the politics of Toorkistan in Constantinople, had written him a letter reminding him of their past acquaintance, stating that it had sufficed to keep him out of the hands of Russia, and adding that he had been to Khiva, where he had seen Richmond Shakespear, but that he was disappointed by not having heard from or seen Conolly. This seemed to decide the question. The long-delayed sanction was obtained. The precise objects of the mission were, as officially noted, the establishment of a correct impression, at every place which Conolly might visit, of British policy and strength, with reference especially to our interference in Afghanistan; the strengthening of amicable arrangements with the principal Oosbeg Powers, which had shown a friendly disposition towards us, and endeavouring to persuade them to help themselves and enable us to help them, by doing prompt justice to their enemies, and forming an agreement with each other to prevent or to redress future injuries done by any one party among them to Russia, so as to deprive the latter power of all pretext for interfering with their independence. Either at Khiva or Khokund Conolly was to learn the result of Shah Soojah's mission to Bokhara to obtain the release of Colonel Stoddart. If by the influence thus exerted, or by other means, the Ameer should be induced to exhibit a decided disposition to atone for his past conduct, and to resume friendly relations with us and the Afghan king, Conolly was authorised to return to Afghanistan *viâ* Bokhara. Otherwise his course was to be regulated by circumstances.

The general scheme of the mission having been settled and detailed instructions issued—which, after the manner of diplomacy generally, were drafted by Conolly himself—preparations were made for the journey, not the least of which was the selection of a fitting Afghan Envoy to accompany the British officer. This gave rise to some ridiculous intrigues and complications, which Conolly described with much humour in his correspondence. But at last everything was ready for a start; and on the 22nd of August, Conolly wrote to Rawlinson at Candahar:—"We are just on the wing, and I shall make the best of my way to the two capitals for which I carry credentials. Shakespear has really done wonders, and if we can follow up the good impressions which he and Abbott have made, if the British Government will give pecuniary aid, we may keep the Russians out of Toorkistan altogether, and bring about a fine order of things there for every party concerned; and I only wish again that you were to be of the party to accomplish it; but, as I said before, you occupy a high and useful station, and can't be at two places at once. If the British Government would only play the grand game—help Russia cordially to all that she has a right to expect—shake hands with Persia—get her all possible amends from the Oosbegs, and secure her such a frontier as would both keep these men-stealers and ravagers in wholesome check—take away her pretext for pushing herself in, letting herself be pushed on to the Oxus; force the Bokhara Ameer to be just to us, the Afghans, the other Oosbeg States, and his own kingdom. But why go on, you know my—at any rate in one sense—enlarged views. Inshallah! the expediency, nay the necessity of them will be seen, and we shall play the noble part that the first Christian nations of the world ought to fill." This, however, was only a false start. September found him still at Caubul, "bothered and detained;" but on the 3rd, he reported that he was at last fairly off—"King's and Company's and Oorgunjee men" commencing their first march.

---

* His brother John Conolly, who was an attaché to the Caubul Mission.

It happened that at this time, great events were taking shape in Afghanistan. The deposed Ameer of Caubul, who had for some time been an exile and a fugitive, was now returning to the land of his fathers and raising the tribes of the Hindoo Koosh in a last despairing effort to recover his lost dominions. A slender detachment of troops, principally of Shah Soojah's army, posted at Bameean, was threatened by the advancing levies of the ex-Ameer, and it was necessary to send a regiment of the Company's troops as a reinforcement. They started from Caubul at the very time of Conolly's departure; so he accompanied them, and was present in Brigadier Dennie's action with Dost Mahomed and the Wullee of Khooloom on the 18th of September. The victory then gained cleared the way for the advance of the British mission; so Conolly and his party pushed on through the country of the Hazarehs, without any remarkable adventures by the way. Ever as he went there rose up before him fresh evidences of the ubiquity of the detestable traffic in human flesh, which it was the darling object of his soul to suppress. "The articles," he wrote in his journal, "which the Hazarehs and Imauks take to market are *men and women*, small black oxen, cows, sheep, &c. &c." In the neighbourhood of Maimunah he found that slaves were the representatives of value in that part of the country. One man offered him a good horse, in exchange for a pony and a young male slave. When Conolly asked him if he were not ashamed of dealing in God's creatures, he apologised by saying that he did not mean a slave in the flesh, but the money-value of a slave— "showing," said Conolly, "that men are here a standard of barter, as sheep are among the Hazarehs."

There was a war then raging between the Imauks and Hazarehs, which greatly increased the difficulties and the dangers of the journey, but after some adventures, Conolly and his companions reached Merv, which is the head-quarters of the slave trade of Toorkistan. Here the things which he saw filled his soul with measureless compassion, and excited the keenest indignation. And he suffered all the more in the presence of so much iniquity, because he felt that he was condemned to silence. "I have found it necessary," he said, "to repress even the expression of our sympathies for the strangers who are so unhappily enslaved in this country, for the interference of Abbott and Shakespear for the release of the Russian captives has given rise to an idea which has spread like wild-fire through Toorkistan, that the English have come forward as deliverers of all who are in bondage there—a notion, which, grateful as it may be to our national reputation, required to be corrected by all who come to Oosbeg Tartary in any political character, lest it should excite the enmity of slave-owners against all our efforts for good among them, as well as increase the unhappiness of the enslaved. To you, however, I may mention that the state of affairs here is pitiable in the extreme, and such as to make every Englishman who witnesses it most earnestly reprobate the idea of our consenting to its continuance for the sake of any political contingency whatever." Determined, as he said, to examine into all the sins of the place, he rode into the slave-market, and saw "enough to shame and sicken the coarsest heart." Slaves of both sexes and all ages were exposed for sale, and intending purchasers were going about, from one group to another, "handling them like cattle." But other feelings than these were raised by the sight of the desolate grandeur of the ruins of Merv. His eager imagination grasped the idea of its restoration to its pristine glories; and he exclaimed "Shall we not, some of these days, exert the influences, which our grand move across the Indus has gained for us, to make Merv once more 'a King of the Earth' by fixing its borders in peace between the destructively hostile parties, who now keep up useless claims to it, and by causing the desolate city to rise again, in the centre of its national fruits, as an emporium for commerce, and a link in the chain of civilising intercourse between Europe and Central Asia."

When Arthur Conolly reached Khiva, the Khan was absent; but on his Majesty's return he received the English Envoy with becoming courtesy and respect. Conolly described him as a dignified and gentleman-like person, about fifty years of age, gentle in his manners, kindly and affable in his address, with a low, pleasant voice, and a habitual smile upon his face. In the presence of such a man, Conolly soon felt himself at ease, and several lengthened conferences took place in the Khan's tent. Conolly spoke in Persian, and the Khan in Toorkish, and a native official interpreted between them. The Khan was altogether in a war-like frame of mind, and not a little boastful in his speech. "He was determined," he said, "to punish the Khokundees, and as to the Persians and the Russians, let them come." When Conolly pointed out the danger of this, he said, "If the Persians obtain European aid to invade me, I will employ your aid to repel them." "The British Government," replied Conolly, "will doubtless do its utmost in every case to prevent the borders of Kharasm from being broken up; but it cannot take part against any of your Majesty's enemies, who may come with a just ground for invasion." "What just ground," asked the Khan, "can the

Persians assert?" "One," replied Conolly, "which no third nation can disallow—that your Majesty's subjects carry off their men, women and children, and sell them like four-footed beasts." But nothing could persuade the Khan Huzrut that any real dangers beset him. He was obdurate and unimpressionable; and even, when Conolly told him that in the event of a Persian advance into Toorkistan, the whole slave population would rise against him, he still smiled at the picture that was placed before him. It was doubted in the Council Chamber of Calcutta whether Arthur Conolly, in these conferences with the Khan Huzrut, had diplomatically played his part well. But diplomacy and philanthropy are too often divorced. It was said that British influence at Khiva was "based on his (the Khan's) looking on us as helpers to get out of difficulties he does see. If we point out and preach about difficulties he does *not* see, he will think we create them." But whatever may be the soundness of this—and in good truth, I do not dispute it—on the whole, perhaps, it is pleasant to think of that eager, ardent humanity, which would not suffer him for a moment to forget the foul traffic in human flesh, which was the shame of the Oosbeg States, and, as he believed, of every nation that passively permitted it. But it was plain that Arthur Conolly was drifting into danger; and one who was at the same time his relative, his dear friend, and his honoured political chief, wrote to him in the hope of saving him. "I have told you in several of my late letters," urged Sir William Macnaghten, "that I feared your zeal would lead you into difficulties, and I have implored you not to attempt too much either in the cause of Policy or Humanity. Inveterate habits are not to be got rid of by any sudden exertion of diplomatic skill. You are considered as being a great deal too high in your language and too visionary in your views. You must adapt yourself to the sober and unambitious tone of the Council Board." And then came an extract, to the effect indicated above, from the letter of a member of the Supreme Council. But Macnaghten's letter never reached Arthur Conolly. By what process it came into my hands I know not; but it lies before me as clean and as little travel-stained as if it had been written yesterday in Belgravia.

Indeed, Arthur Conolly had, ere the letter could reach him, passed out of the way of all communication with his friends in Afghanistan or in India. From Khiva he went to Khokund, and at the latter place he received a letter from Colonel Stoddart, written at the request of the Khan of Bokhara, inviting him to that city. The exigencies of time and space compel me to pass briefly over this part of the history, the records of which have been nearly all lost. After receiving this summons, Conolly hastened to Bokhara. "The Khan," he wrote in one of his last letters, "treacherously caused Stoddart to invite me here on his own *Imayut-nameh;* and after Stoddart had given him a translation of a letter from Lord Palmerston, containing nothing but friendly assurances, which he could have verified with our entire consent at the Russian Embassy, he pent us both up here to pay him, as a kidnapper, for our release, or die by slow rot." This must have happened a few days before the Christmas of 1841. At that time all Afghanistan was in a blaze. The "great game" had exploded. The Afghans had risen as one man against their deliverers, and the news of the discomfiture of the English had travelled to Bokhara. Sekundur Burnes, who had visited Bokhara some years before, had been killed, and all his countrymen were in deadly peril. What then could the Feringhees, who were plainly at their last gasp, do either to liberate Stoddart and Conolly, or to avenge their deaths? So it happened that the same week in which Sir William Macnaghten was slain by the hand of Akbar Khan, saw his kinsman, Arthur Conolly, cast into hopeless and most miserable captivity.

January passed and February passed, and there were occasional gleams, and the captives bore up right manfully, in spite of all their sufferings; but in the second week of March Arthur Conolly's powers of physical endurance gave way. Fever seized upon him, and believing that his days were numbered, he wrote to his brother John at Caubul, saying:—"From our Prison in the Bokhara Citadel, 11th of March, 1842.—This will probably be my last note hence, so I dedicate it to you, who now, alas! stand next to me. We both dedicate everything we feel warmest to William, whom may God bless in all belonging to him, for his long and untiring brotherly affection to us all. Send my best love to Henry and to all our dear sisters. This is the eighty-third day that we have been denied the means of getting a change of linen from the rags and vermin that cover us; and yesterday, when we begged for an amendment in this respect, the Topshee-Bashee, who had before come occasionally to our host to speak encouragingly, set his face like a flint to our request, showing that he was merely a vane to the withering wind of his heartless master, and could not help us thus, so that we need not ask him to do so. This, at first, astonished and defeated us; we had viewed the Ameer's conduct as perhaps dictated by mad caprice; but now, looking back upon the whole, we saw instead that it had been just the deliberate malice of a demon, questioning and raising our hopes, and ascertaining our condition, only to see how our hearts were going on, in the process of breaking. I did not think to shed one warm tear among such cold-blooded men, but yesterday evening, as I looked upon Stoddart's half-naked and nail-lacerated body, conceiving that I was the special object of the King's hatred, because of my having come to him after visiting Khiva and Khokund, and told him that the British Government was too great to stir up secret enmity against any of its enemies, I wept on entreating one of our keepers, the gunner's brother, to have conveyed to the Chief my humble request that he would direct his anger upon me, and not further destroy, by it, my poor brother Stoddart, who had suffered so much and so meekly here for three years. My earnest words were answered by a 'Don't cry and distress yourself;' he also could do nothing. So we turned and kissed each other, and prayed together, and then said, in the words of the Khokundees, "My-bish!"* Let him do as he likes! he is a demon, but God is stronger than the devil himself, and can certainly release us from the hands of this fiend, whose heart he has, perhaps, hardened to work out great ends by it; and we have risen again from bed with hearts comforted, as if an angel had spoken to them, resolved, please God, to wear our English honesty and dignity to the last, within all the filth and misery that this monster may try to degrade us with."

But the sufferings which he endured, great as they were, did not cause him for a moment to forget the sufferings of others. Ever as he lay there rotting in that loathsome well, his heart was stirred to its depths by a great compassion for the thousands who were pining in captivity around him, and his imagination was tracing grand schemes for their redemption, and for the eventual civilisation of those barbarous Oosbeg States. After writing much, in the letter above quoted, on the true policy to be pursued in Central Asia, he concluded by saying, "England and Russia may then agree about immutable frontiers for Persia, Afghanistan, Kharasm, &c., in a spirit which becomes two of the first European nations in the world, in the year 1842 of Jesus Christ, the God incarnate of all peace and wisdom. May this pure and peaceable religion be soon extended over all the world." And in a postscript he added:—"Stoddart and I will comfort each other in every way till we die, when may our brotherhood be renewed in heaven through Jesus Christ our Saviour. Send this assurance to all our friends, and do you, my dear John, stand in this faith. It is the only thing that can enable a man to bear up against the trials of this life, and lead him to the noblest state of existence in the next. Farewell—farewell!"

Ten days afterwards, having somewhat recovered his strength, he wrote another long paper on our Central Asian policy, in the smallest possible characters, as indeed was everthing which he then wrote, so that it might be conveyed in the hollow of a quill or the tube of a pipe, to Caubul, without risk of detection. The unvarying tenor of all these papers, was that of a most earnest remonstrance against the great abomination of the slave-trade of Toorkistan. He sent this last document to his brother John, accompanied by a letter, in which he says:—"I wrote you a longish letter on the 11th of this month, when I was in a high state of excitement from fever and several nights of sleepless anxiety. The burden of it was an entreaty to the last effect regarding my poor people, and a hope that the British Government would seize the opportunity which the Ameer's faithlessness had given them, to come forward with Persia to put him down, and give his country to Kharasm and Khokund, on condition of the entire suppression of the Persian and Afghan slave trade in Toorkistan. If that paper (which I shall endeavour to recover) should reach you, compress its words into this purport and destroy it, reserving my last good wishes for the friends to whom I addressed them, thinking that I might not live much longer. I am now, thank God, almost well in health again, and the news regarding our people has set my mind at rest. Stoddart, also, who was suffering awhile from severe cold, is, I rejoice to say, convalescent. We are both in a very uncomfortable state, as you may imagine, having been ninety-nine days and nights without a change of clothes; but we are together. Stoddart is such a friend as a man would desire to have in adversity, and as our searchers have missed the little Prayer-book which George Macgregor gave us (tell him), we are able to read and pray, as well as to converse together. God bless you, my dear John. Send my love to everybody."

For nearly three months more did these good and brave men sustain and comfort each other, as only Christians can. During that time the Ameer of Bokhara had been carrying on hostile operations, vigorously and with a grand success, against the Khan of Khokund. It seems that in the month of June he returned to his capital, flushed with triumph, and that one of his first acts was to order out the English gentlemen for execution. The last scene of this sad tragedy is believed to have been performed on the 17th of June. The scene has been described by different persons. When Joseph Wolff, afterwards, moved more than aught else by the strength of his love for Arthur Conolly, journeyed to Bokhara to learn the history of his fate, if dead, or to endeavour to rescue him from captivity, if alive, he was told that "both Captain Conolly and Colonel Stoddart were brought with their hands tied, behind the ark, or palace of the king, when Colonel Stoddart and Captain Conolly kissed each other, and Stoddart said to Makram Saadut, 'tell the Ameer that I die a disbeliever in Mahomet, but a believer in Jesus—that I am a Christian, and a Christian I die.' And Conolly said, 'Stoddart, we shall see each other in Paradise, near Jesus.' Then Saadut gave the order to cut off, first the head of Stoddart, which was done; and in the same manner the head of Conolly was cut off." And so Arthur Conolly, pure of heart, chastened by affliction, the most loving and unselfish of men, passed out of great tribulation with his garments washed white in the blood of the Lamb.

HEREWARD, THE LAST OF THE ENGLISH.

By CHARLES KINGSLEY.

CHAPTER XIX.

HOW HEREWARD CLEARED BOURNE OF FRENCHMEN.

It may have been well a week after, that Hereward rode from the direction of Boston, with Martin running at his heels.

As Hereward rode along the summer wold the summer sun sank low, till just before it went down he came to an island of small enclosed fields, high banks, elm trees, and a farm inside; one of those most ancient holdings of the South and East Counts, still to be distinguished, by their huge banks and dykes full of hedgerow timber, from the more modern corn-lands outside, which were in Hereward's time mostly common pasture-lands.

"This should be Azerdun," said he; "and there inside, as I live, stands Azer getting in his crops. But who has he with him?"

With the old man were some half dozen men of his own rank; some helping the serfs with might and main; one or two standing on the top of the banks, as if on the look out: but all armed cap-a-pie.

"His friends are helping him to get them in," quoth Martin, "for fear of the rascally Normans. A pleasant and peaceable country we have come back to."

"And a very strong fortress are they holding," said Hereward, "against either Norman horsemen or Norman arrows. How to dislodge those six fellows without six times their number, I do not see. It is well to recollect that."

And so he did; and turned to use again and again, in after years, the strategic capabilities of an old-fashioned English farm.

Hereward spurred his horse up to the nearest gate, and was instantly confronted by a little fair-haired man, as broad as he was tall, who heaved up a long "twybill," or double axe, and bade him, across the gate, go to a certain place.

"Little Winter, little Winter, my chuck, my darling, my mad fellow, my brother-in-arms, my brother in robbery and murder, are you grown so honest in your old age that you will not know Hereward the wolf's-head?"

"Hereward!" shrieked the doughty little man. "I took you for an accursed Norman in those outlandish clothes;" and lifting up no little voice, he shouted—

"Hereward is back, and Martin Lightfoot at his heels!"

The gate was thrown open, and Hereward all but pulled off his horse. He was clapped on the back, turned round and round, admired from head to foot, shouted at by old companions of his boyhood, naughty young housecarles of his old troop, now settled down into honest thriving yeomen, hard working and hard fighting, who had heard again and again, with pride, his doughty doings over sea. There was Winter, and Gwenoch, and Gery, Hereward's cousin—ancestor, it may be, of the ancient and honourable house of that name, and of those parts; and Duti and Outi, the two valiant twins; and Ulfard the White, and others, some of whose names, and those of their sons, still stand in Domesday-book.

"And what," asked Hereward, after the first congratulations were over, "of my mother? What of the folk at Bourne?"

All looked each at the other, and were silent.

"You are too late, young lord," said Azer.

"Too late?"

"The Norman" (Azer called him what most men called him then) "has given it to a man of Gilbert of Ghent's—his butler, groom, cook, for aught I know."

"To Gilbert's man? And my mother?"

"God help your mother, and your young brother too. We only know that three days ago some five-and-twenty French marched into the place."

"And you did not stop them?"

"Young sir, who are we to stop an army? We have enough to keep our own. Gilbert, let alone the villain Ivo of Spalding, can send a hundred men down on us in four-and-twenty hours."

"Then I," said Hereward in a voice of thunder, "will find the way to send two hundred down on him;" and turning his horse from the gate, he rode away furiously towards Bourne.

He turned back as suddenly, and galloped into the field.

"Lads! old comrades! will you stand by me if I need you? Will you follow Hereward, as hundreds have followed him already, if he will only go before?"

"We will, we will."

"I shall be back ere morning. What you have to do, I will tell you then."

"Stop and eat—but for a quarter of an hour."

Then Hereward swore a great oath, by oak and ash and thorn, that he would neither eat bread nor drink water, while there was a Norman left in Bourne.

"A little ale, then, if no water," said Azer.

Hereward laughed, and rode away.

"You will not go single-handed against all those ruffians," shouted the old man after him. "Saddle, lads, and go with him, some of you, for very shame's sake."

But when they galloped after Hereward, he sent them back. He did not know yet, he said, what he would do. Better that they should gather their forces, and see what men they could afford him, in case of open battle. And he rode swiftly on.

When he came within the lands of Bourne it was dark.

"So much the better," thought Hereward. "I have no wish to see the old place till I have somewhat cleaned it out."

He rode slowly into the long street between the overhanging gables. At the upper end he could see the high garden walls of his mother's house, and rising over them the great hall, its narrow windows all ablaze with light. With a bitter growl he rode on, trying to recollect a house where he could safely lodge. Martin pointed one out.

"Old Viking Surturbrand, the housecarle, did live there; and maybe lives there still."

"We will try;" and Martin knocked at the door.

The wicket was opened, but not the door; and through the wicket window a surly voice asked who was there.

"Who lives here?"

"Perry, son of Surturbrand. Who art thou who askest?"

"An honest gentleman and his servant, looking for a night's lodging."

"This is no place for honest folk."

"As for that, we don't wish to be more honest than you would have us; but lodging we will pay for, freely and well."

"We want none of your money:" and the wicket was shut.

Martin pulled out his axe, and drove the panel in.

"What are you doing? We shall rouse the town," said Hereward.

"Let be; these are no French, but honest English, and like one all the better for a little horse-play."

"What didst do that for?" asked the surly voice again. "Were it not for those rascal Frenchmen up above, I would come out and split thy skull for thee."

"If there be Frenchmen up above," said Martin, in a voice of feigned terror, "take us in for the love of the Virgin and all the saints, or murdered we shall be ere morning light."

"You have no call to stay in the town, man, unless you like."

Hereward rode close to the wicket, and said in a low voice, "I am a nobleman of Flanders, good sir, and a sworn foe to all French. My horse is weary, and cannot make a step forward; and if you be a Christian man, you will take me in and let me go off safe ere morning light."

"From Flanders?" And the man turned and seemed to consult those within. At length the door was slowly opened, and Perry appeared, his double axe over his shoulder.

"If you be from Flanders, come in for mercy; but be quick, ere those Frenchmen get wind of you."

Hereward went in. Five or six men were standing round the long table, upon which they had just laid down their double axes and javelins. More than one countenance Hereward recognised at once. Over the peat fire in the chimney-corner sat a very old man, his hands upon his knees, as he warmed his bare feet at the embers. He started up at the noise, and Hereward saw at once that it was old Surturbrand, and that he was blind.

"Who is it? Is Hereward come?" asked he with the dull dreamy voice of age.

"Not Hereward, father," said some one, "but a knight from Flanders."

The old man dropped his head upon his breast again with a querulous whine, while Hereward's heart beat high at hearing his own name. At all events he was among friends; and approaching the table he unbuckled his sword and laid it down among the other weapons. "At least," said he, "I shall have no need of thee as long as I am here among honest men."

"What shall I do with my master's horse?" asked Martin. "He can't stand in the street to be stolen by drunken French horseboys."

"Bring him in at the front door, and out at the back," said Perry. "Fine times these, when a man dare not open his own yard-gate."

"You seem to be all besieged here," said Hereward. "How is this?"

"Besieged we are," said the man; and then, partly to turn the subject off, "Will it please you to eat, noble sir?"

Hereward eat and drank: while his hosts eyed him, not without some lingering suspicion, but still with admiration and some respect. His splendid armour and weapons, as well as the golden locks which fell far below his shoulders, and conveniently hid a face which he did not wish yet to have recognised, showed him to be a man of the highest rank; while the palm of his small hand, as hard and bony as any woodman's, proclaimed him to be no novice of a fighting man. The strong Flemish accent which both he and Martin Lightfoot had assumed prevented the honest Englishmen from piercing his disguise. They watched him, while he in turn watched them, struck by their uneasy looks and sullen silence.

"We are a dull company," said he after awhile courteously enough. "We used to be told in Flanders that there were none such stout drinkers and none such jolly singers as you gallant men of the Danelaw here."

"Dull times make dull company," said one, "and no offence to you, Sir Knight."

"Are you such a stranger," asked Perry, "that you do not know what has happened in this town during the last three days?"

"No good, I will warrant, if you have Frenchmen in it."

"Why was not Hereward here?" wailed the old man in the corner. "It never would have happened if he had been in the town."

"What?" asked Hereward, trying to command himself.

"What has happened," said Perry, "makes a free Englishmen's blood boil to tell of. Here, Sir Knight, three days ago, comes in this Frenchman with some twenty ruffians of his own, and more of one Taillebois', too, to see him safe; says that this new king, this base-born Frenchman, has given away all Earl Morcar's lands, and that Bourne is his; kills a man or two; upsets the women; gets drunk, ruffles and roysters; breaks into my lady's bower, calling her to give up her keys, and when she gives them, will have all her jewels too. She faces them like a brave Princess, and two of the hounds lay hold of her, and say that she shall ride through Bourne as she rode through Coventry. The boy Godwin,—he that was the great Earl's godson, our last hope, the last of our house,—draws sword on them; and he, a boy of sixteen summers, kills them both out of hand. The rest set on him, cut his head off, and there it sticks on the gable spike of the hall to this hour. And do you ask, after that, why free Englishmen are dull company?"

"And our turn will come next," growled somebody. "The turn will go all round; no man's life or land, wife or daughters, will be safe soon for these accursed Frenchmen, unless, as the old man says, Hereward comes back."

Once again the old man wailed out of the chimney-corner: "Why did they ever send Hereward away? I warned the good Earl, I warned my good lady, many a time, to let him sow his wild oats and be done with them; or they might need him some day when they could not find him! He was a lad! He was a lad!" and again he whined, and sank into silence.

Hereward heard all this dry-eyed, hardening his heart into a great resolve.

"This is a dark story," said he calmly, "and it would behove me as a gentleman to succour this distressed lady, did I but know how. Tell me what I can do now, and I will do it."

"Your health!" cried one. "You speak like a true knight."

"And he looks the man to keep his word, I'll warrant him," spoke another.

"He does," said Perry, shaking his head; "but if anything could have been done, sir, be sure we would have done it: but all our armed men are scattered up and down the country, each taking care, as is natural, of his own cattle and his own women. There are not ten men-at-arms in Bourne this night; and what is worse, sir, as you know, who seem to have known war as well as me, there is no man to lead them."

Here Hereward was on the point of saying, "And what if I led you?" On the point too of discovering himself: but he stopped short.

Was it fair to involve this little knot of gallant fellows in what might be a hopeless struggle, and have all Bourne burned over their heads ere morning by the ruffian Frenchmen? No; his mother's quarrel was his own private quarrel. He would go alone and see the strength of the enemy; and after that, may be, he would raise the country on them: or—and half-a-dozen plans suggested themselves to his crafty brain as he sat brooding and scheming: then, as always, utterly self-confident.

He was startled by a burst of noise outside—music, laughter, and shouts.

"There," said Perry bitterly, "are those Frenchmen, dancing and singing in the hall with my Lord Godwin's head above them!" And curses bitter and deep went round the room. They sat sullen and silent it may be for an hour or more: only moving when, at some fresh outbreak of revelry, the old man started from his doze and asked if that was Hereward coming.

"And who is this Hereward of whom you speak?" said Hereward at last.

"We thought you might know him, Sir Knight, if you come from Flanders, as you say you do," said three or four voices in a surprised and surly tone.

"Certainly I know such a man, if he be Hereward the wolf's head, Hereward the outlaw, as they call him. And a good soldier he is, though he be not yet made a knight; and married, too, to a rich and fair lady. I served under this Hereward a few months ago in the Friesland War, and know no man whom I would sooner follow."

"Nor I neither," chimed in Martin Lightfoot from the other end of the table.

"Nor we," cried all the men-at-arms at once, each vieing with the other in extravagant stories of their hero's prowess, and in asking the knight of Flanders whether they were true or not.

To avoid offending them, Hereward was forced to confess to a great many deeds which he had never done: but he was right glad to find that his fame had reached his native place, and that he could count on the men if he needed them.

"But who is this Hereward," said he, "that he should have to do with your town here?"

Half-a-dozen voices at once told him his own story.

"I always heard," said he dryly, "that that gentleman was of some very noble kin; and I will surely tell him all that has befallen here as soon as I return to Flanders."

At last they grew sleepy, and the men went out and brought in bundles of sweet rush, and spread them against the wall, and prepared to lie down, each his weapon by his side. And when they were lain down, Hereward beckoned to him Perry and Martin Lightfoot, and went out into the back yard, under the pretence of seeing to his horse.

"Perry Surturbrandsson," said he, "you seem to be an honest man, as we in foreign parts hold all the Danelager to be. Now it is fixed in my mind to go up, and my servant, to your hall, and see what those French upstarts are about. Will you trust me to go, without my fleeing back here if I am found out, or in any way bringing you to harm by mixing you up in my private matters? And will you, if I do not come back, keep for your own the horse which is in your stable, and give moreover this purse and this ring to your lady, if you can find means to see her face to face; and say thus to her—that he that sent that purse and ring may be found, if he be alive, at St. Omer, with Baldwin, Count of Flanders; and that if he be dead, as he is like enough to be, his trade being nought but war, she will still find at St. Omer a home and wealth and friends, till these evil times be overpast?"

As Hereward had spoken with some slight emotion, he had dropped unawares his assumed Flemish accent, and had spoken in broad burly Lincolnshire; and therefore it was that Perry, who had been staring at him by the moonlight all the while, said, when he was done, tremblingly—

"Either you are Hereward, or you are his fetch. You speak like Hereward, you look like Hereward. Just what Hereward would be now, you are. You are my lord, and you cannot deny it."

"Perry, if you know me, speak of me to no living soul, save to your lady my mother; and let me and my serving man go free out of your yard-gate. If I ask you before morning to open it again to me, you will know that there is not a Frenchman left in the Hall of Bourne."

Perry threw his arms round him, and embraced him silently.

"Get me only," said Hereward, "some long woman's gear and black mantle, if you can, to cover this bright armour of mine."

Perry went off in silence as one stunned—brought the mantle, and let them out of the yard-gate. In ten minutes more, the two, slipping in by well-known paths, stood under the gable of the great hall. Not a soul was stirring outside. The serfs were all cowering in their huts like so many rabbits in their burrows, listening in fear to the revelry of their new tyrants. The night was dark: but not so dark but that Hereward could see between him and the sky his brother's long locks floating in the breeze.

"That I must have down, at least," said he, in a low voice.

"Then here is wherewithal," said Martin Lightfoot, as he stumbled over something. "The drunken villains have left the ladder in the yard."

Hereward got up the ladder, took down the head and wrapped it in the cloak, and ere he did so kissed the cold forehead. How he had hated that boy! Well, at least he had never wilfully harmed him—or the boy him either, for that matter. And now he had died like a man, killing his foe. He was of the true old blood after all. And Hereward felt that he would have given all that he had, save his wife or his sword-hand, to have that boy alive again, to pet him, and train him, and teach him to fight at his side.

Then he slipped round to one of the narrow unshuttered windows and looked in. The hall was in a wasteful blaze of light—a whole month's candles burning in one night. The table was covered with all his father's choicest plate; the wine was running waste upon the floor; the men were rolling at the table in every stage of drunkenness; the loose women, camp-followers, and such like, almost as drunk as their masters; and at the table-head, most drunk of all, sat, in Earl Leofric's seat, the new Lord of Bourne.

Hereward could scarce believe his eyes. He was none other than Gilbert of Ghent's stout Flemish cook, whom he had seen many a time in Scotland. Hereward turned from the window in disgust: but looked again as he heard words which roused his anger still more.

For in the open space nearest the door stood a gleeman, a dancing, harping, foul-mouthed fellow, who was showing off ape's tricks, jesting against the English, and shuffling about in mockeries of English dancing. At some particularly coarse jest of his, the new Lord of Bourne burst into a roar of admiration.

"Ask what thou wilt, fellow, and thou shalt have it. Thou wilt find me a better master to thee than ever was Morcar, the English barbarian."

The scoundrel, say the old chroniclers, made a request concerning Hereward's family which cannot be printed here.

Hereward ground his teeth. "If thou livest till morning light," said he, "I will not."

The last brutality awoke some better feeling in one of the girls—a large coarse Fleming, who sat by the new lord's side. "Fine words," said she, scornfully enough, "for the sweepings of Norman and Flemish kennels. You forget that you left one of this very Leofric's sons behind in Flanders, who would besom all out if he was here before the morning's dawn."

"Hereward?" cried the cook, striking her down with a drunken blow; "the scoundrel who stole the money which the Frisians sent to Count Baldwin, and gave it to his own troops? We are safe enough from him at all events; he dare not show his face on this side the Alps, for fear of the gallows."

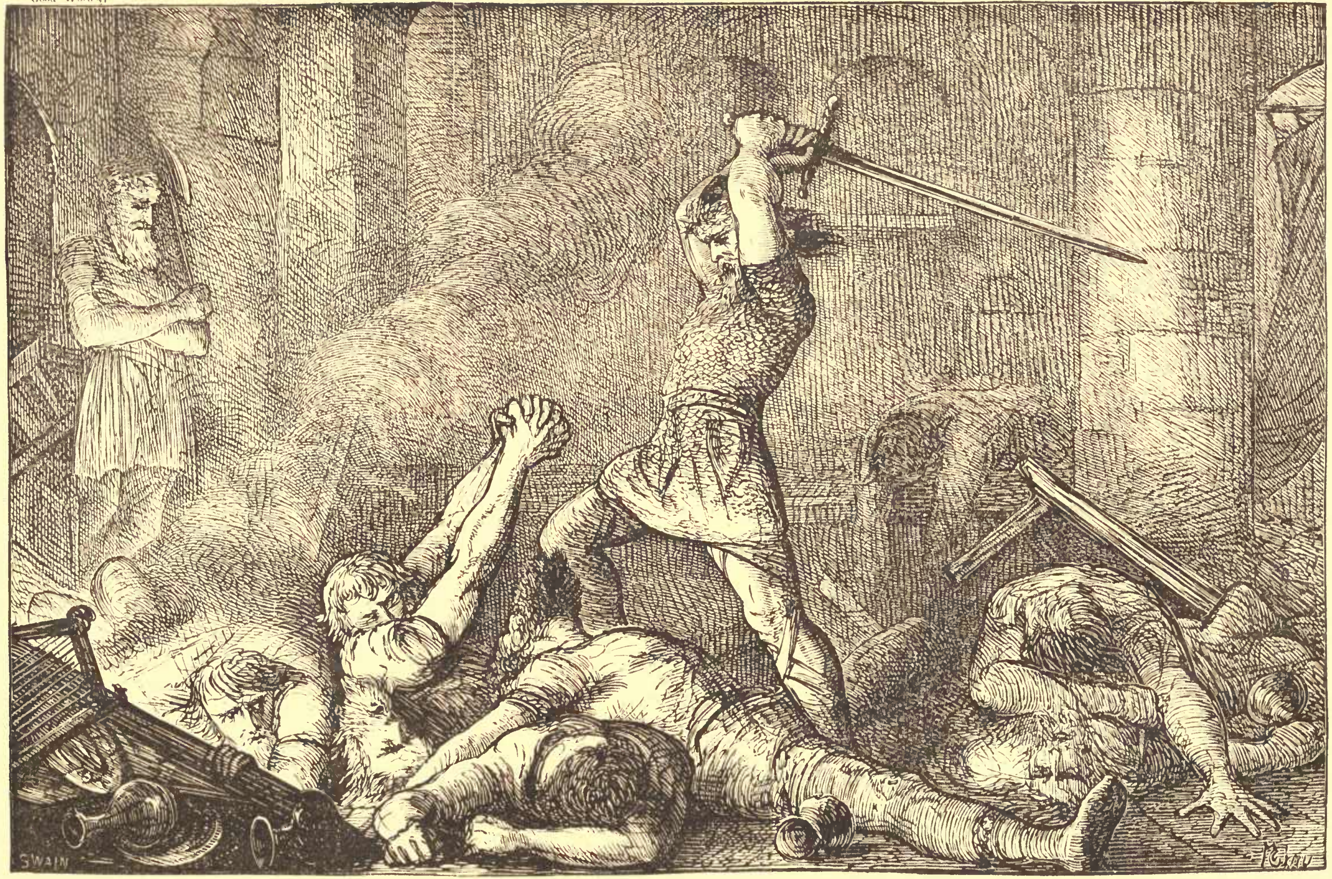
Hereward had heard enough. He slipped down from the window to Martin, and led him round the house.

"Now then, down with the ladder quick, and dash in the door. I go in: stay thou outside. If any man passes me, see that he pass not thee."

Martin chuckled a ghostly laugh as he helped the ladder down. In another moment the door was burst in, and Hereward stood upon the threshold. He gave one war-shout—his own terrible name—and then rushed forward. As he passed the gleeman, he gave him one stroke across the loins; the wretch fell shrieking.

And then began a murder, grim and great. They fought with ale-cups, with knives, with benches: but, drunken and unarmed, they were hewn down like sheep. Fourteen Normans, says the chronicler, were in the hall when Hereward burst in. When the sun rose there were fourteen heads upon the gable. Escape had been impossible. Martin had laid the ladder across the door; and the few who escaped the master's terrible sword, stumbled over it, to be brained by the man's not less terrible axe.

Then Hereward took up his brother's head, and went in to his mother.



"AND THEN BEGAN A MURDER, GRIM AND GREAT."

Page 412.

The women in the bower opened to him. They had seen all that passed from the gallery above, which, as usual, hidden by a curtain, enabled the women to watch unseen what passed in the hall below.

The Lady Godiva sat crouched together, all but alone—for her bower-maidens had fled or been carried off long since—upon a low stool beside a long dark thing covered with a pall. So utterly crushed was she, that she did not even lift up her head as Hereward entered.

He placed his ghastly burden reverently beneath the pall, and then went and knelt before his mother.

For awhile neither spoke a word. Then the Lady Godiva suddenly drew back her hood, and dropping on her knees, threw her arms round Hereward's neck, and wept till she could weep no more.

"Blessed strong arms," sobbed she at last, "around me! To feel something left in the world to protect me; something left in the world which loves me."

"You forgive me, mother?"

"You forgive me? It was I, I who was in fault—I, who should have cherished you, my strongest, my bravest, my noblest—now my all."

"No, it was all my fault; and on my head is all this misery. If I had been here, as I ought to have been, all this might have never happened."

"You would only have been murdered too. No: thank God you were away; or God would have taken you with the rest. His arm is bared against me, and his face turned away from me. All in vain, in vain! Vain to have washed my hands in innocency, and worshipped Him night and day. Vain to have builded minsters in his honour, and heaped the shrines of his saints with gold. Vain to have fed the hungry, and clothed the naked, and washed the feet of his poor, that I might atone for my own sins, and the sins of my house. This is his answer. He has taken me up, and dashed me down: and nought is left but, like Job, to abhor myself and repent in dust and ashes—of I know not what."

"God has not deserted you. See, He has sent you me!" said Hereward, wondering to find himself, of all men on earth, preaching consolation.

"Yes, I have you! Hold me. Love me. Let me feel that one thing loves me upon earth. I want love; I must have it: and if God, and his mother, and all the saints, refuse their love, I must turn to the creature, and ask it to love me, but for a day."

"For ever, mother."

"You will not leave me?"

"If I do, I come back, to finish what I have begun."

"More blood? Oh God! Hereward, not that! Let us return good for evil. Let us take up our crosses. Let us humble ourselves under God's hand, and flee into some convent, and there die praying for our country and our kin."

"Men must work, while women pray. I will take you to a minster—to Peterborough."

"No, not to Peterborough!"

"But my Uncle Brand is abbot there, they tell me, now this four years; and that rogue Herluin, prior in his place."

"He is dying: dying of a broken heart, like me. And the Frenchman has given his abbey to one Thorold, the tyrant of Malmesbury—a Frenchman like himself. No, take me where I shall never see a French face. Take me to Crowland—and him with me—where I shall see nought but English faces, and hear English chants, and die a free Englishwoman under St. Guthlac's wings."

"Ah!" said Hereward, bitterly, "St. Guthlac is a right Englishman, and will have some sort of fellow-feeling for us; while St. Peter, of course, is somewhat too fond of Rome and those Italian monks. Well—blood is thicker than water; so I hardly blame the blessed Apostle."

"Do not talk so, Hereward."

"Much the saints have done for us, mother, that we are to be so very respectful to their high mightinesses. I fear, if this Frenchman goes on with his plan of thrusting his monks into our abbeys, I shall have to do more even for St. Guthlac, than ever he did for me. Do not say more, mother. This night has made Hereward a new man. Now, prepare"—and she knew what he meant—"and gather all your treasures; and we will start for Crowland to-morrow afternoon."

CHAPTER XX.

HOW HEREWARD WAS MADE A KNIGHT AFTER THE FASHION OF THE ENGLISH.

A WILD night was that in Bourne. All the folk, free and unfree, man and woman, out on the streets, asking the meaning of those terrible shrieks, followed by a more terrible silence.

At last Hereward strode down from the hall, his drawn sword in his hand.

"Silence, good folks, and hearken to me, once for all. There is not a Frenchman left alive in Bourne. If you be the men I take you for, there shall not be one left alive between Wash and Humber. Silence, again!"—as a fierce cry of rage and joy arose, and men rushed forward to take him by the hand, women to embrace him. "This is no time for compliments, good folks, but for quick wit and quick blows. For the law we fight, if we do fight; and by the law we must work, fight or not. Where is the lawman of the town?"

"I was lawman last night, to see such law done as there is left," said Perry. "But you are lawman now. Do as you will. We will obey you."

"You shall be our lawman," shouted many voices.

"I! Who am I? Out-of-law, and a wolf's head."

"We will put you back into your law,—we will give you your lands in full husting."

"Never mind a husting on my behalf. Let us have a husting, if we have one, for a better end than that. Now, men of Bourne, I have put the coal in the bush. Dare you blow the fire till the forest is a-flame from south to north? I have fought a dozen of Frenchmen. Dare you fight Taillebois and Gilbert of Ghent, with William, Duke of Normandy, at their back? Or will you take me, here as I stand, and give me up to them as an outlaw and a robber, to feed the crows outside the gates of Lincoln? Do it, if you will. It will be the wiser plan, my friends. Give me up to be judged and hanged, and so purge yourselves of the villainous murder of Gilbert's cook—your late lord and master."

"Lord and master! We are free men!" shouted the holders, or yeomen gentlemen. "We hold our lands from God and the sun."

"You are our lord," shouted the socmen, or tenants. "Who but you? We will follow, if you will lead!"

"Hereward is come home!" cried a feeble voice behind. "Let me come to him. Let me feel him."

And through the crowd, supported by two ladies, tottered the mighty form of Surturbrand, the blind Viking.

"Hereward is come," cried he, as he folded his master's son in his arms. "Hoi! he is wet with blood! Hoi! he smells of blood! Hoi! the ravens will grow fat now, for Hereward is come home!"

Some would have led the old man away: but he thrust them off fiercely.

"Hoi! come wolf! Hoi! come kite! Hoi! come erne from off the fen! You followed us, and we fed you well, when Swend Fork-beard brought us over the sea. Follow us now, and we will feed you better still, with the mongrel Frenchers who scoff at the tongue of their forefathers, and would rob their nearest kinsman of land and lass. Hoi! Swend's men! Hoi! Canute's men! Vikings' sons, Sea-cocks' sons, Berserkers' sons all! Split up the war-arrow, and send it round, and the curse of Odin on every man that will not pass it on! A war-king to-morrow, and Hildur's game next day, that the old Surturbrand may fall like a freeholder, axe in hand, and not die like a cow, in the straw which the Frenchman has spared him."

All men were silent, as the old Viking's voice, cracked and feeble when he began, gathered strength from rage, till it rang through the still night-air like a trumpet blast.

The silence was broken by a long wild cry from the forest, which made the women start, and catch their children closer to them. It was the howl of a wolf.

"Hark to the witch's-horse! Hark to the son of Fenris, how he calls for meat! Are ye your fathers' sons, ye men of Bourne? They never let the grey beast call in vain."

Hereward saw his opportunity, and seized it. There were those in the crowd, he well knew, as there must needs be in all crowds, who wished themselves well out of the business; who shrank from the thought of facing the Norman barons, much more the Norman king; who were ready enough, had the tide of feeling begun to ebb, of blaming Hereward for rashness, even though they might not have gone so far as to give him up to the Normans; who would have advised some sort of compromise, pacifying half-measure, or other weak plan for escaping present danger, by delivering themselves over to future destruction. But three out of four there were good men and true. The savage chant of the old barbarian might have startled them somewhat, for they were tolerably orthodox Christian folk. But there was sense, as well as spirit, in its savageness; and they growled applause, as he ceased. But Hereward heard, and cried:

"The Viking is right! So speaks the spirit of our fathers, and we must show ourselves their true sons. Send round the war-arrow, and death to the man who does not pass it on! Better die bravely together than falter and part company, to be hunted down one by one by men who will never forgive us as long as we have an acre of land for them to seize. Perry, son of Surturbrand, you are the lawman. Put it to the vote!"

"Send round the war-arrow," shouted Perry himself; and if there was a man or two who shrank from the proposal, they found it prudent to shout as loudly as did the rest.

Ere the morning light, the war-arrow was split into four splinters, and carried out to the four airts, through all Kesteven. If the splinter were put into the house-father's hand, he must send it on at once to the next freeman's house. If he were away, it was stuck into his house-door, or into his great chair by the fire-side, and woe to him if, on his return, he sent it not on likewise. All through Kesteven went that night the arrow-splinters, and with them the whisper, "Hereward is come again." And, before mid-day, there were fifty well-armed men in the old camping-field outside the town, and Hereward haranguing them in words of fire.

A chill came over them, nevertheless, when he told them that he must return at once to Flanders.

"But it must be," he said. He had promised his good lord and sovereign, Baldwin of Flanders, and his word of honour he must keep. Two visits he must pay, ere he went; and then to sea. But within the year, if he were alive on ground, he would return, and with him ships and men, it might be with Sweyn and all the power of Denmark. Only let them hold their own till the Danes should come, and all would be well. And whenever he came back, he would set a light to three farms that stood upon a hill, whence they could be seen far and wide over the Bruneswold and over all the fen; and then all men might know for sure that Hereward was come again.

"And nine-and-forty of them," says the chronicler, "he chose to guard Bourne," seemingly the lands which had been his nephew Morcar's, till he should come back and take them for himself. Godiva's lands, of Witham Toft and Mainthorpe, Gery his cousin should hold till his return, and send what he could off them to his mother at Crowland.

Then they went down to the water and took barge, and laid the corpse therein; and Godiva and Hereward sat at the dead lad's head; and Winter steered the boat, and Gwenoch took the stroke-oar.

And they rowed away for Crowland, by many a mere and many an ea; through narrow reaches of clear brown glassy water; between the dark-green alders; between the pale-green reeds; where the coot clanked, and the bittern boomed, and the sedge-bird, not content with its own sweet song, mocked the song of all the birds around; and then out into the broad lagoons, where hung motionless, high over head, hawk beyond hawk, buzzard beyond buzzard, kite beyond kite, as far as eye could see. Into the air, as they rowed on, whirred up the great skeins of wild fowl innumerable, with a cry as of all the bells of Crowland, or all the hounds of Bruneswold; and clear above all the noise, sounded the wild whistle of the curlews, and the trumpet-note of the great white swan. Out of the reeds, like an arrow, shot the peregrine, singled one luckless mallard from the flock, caught him up, struck him stone dead with one blow of his terrible heel, and swept his prey with him into the reeds again.

"Death! death! death!" said Lady Godiva, as the feathers fluttered down into the boat and rested on the dead boy's pall. "War among man and beast, war on earth, war in air, war in the water beneath," as a great pike rolled at his bait, sending a shoal of white fish flying along the surface. "And war, says holy writ, in heaven above. Oh Thou who didst die to destroy death, when will it all be over?"

And thus they glided on from stream to stream, until they came to the sacred isle of "the inheritance of the Lord, the soil of St. Mary and St. Bartholomew; the most holy sanctuary of St. Guthlac and his monks; the minster most free from worldly servitude; the special almshouse of the most illustrious kings; the sole place of refuge for any one in all tribulations; the perpetual abode of the saints; the possession of religious men, especially set apart by the Common Council of the kingdom; by reason of the frequent miracles of the most holy Confessor, an ever fruitful mother of camphire in the vineyards of Engedi; and, by reason of the privileges granted by the kings, a city of grace and safety to all who repent."

As they drew near, they passed every minute some fisher's log canoe, in which worked with net or line the criminal who had saved his life by fleeing to St. Guthlac, and becoming his man henceforth; the slave who had fled from his master's cruelty; and here and there in those evil days, the master who had fled from the cruelty of Normans, who would have done to him as he had done to others. But all old grudges were put away there. They had sought the peace of St. Guthlac; and therefore they must keep his peace, and get their living from the fish of the five rivers, within the bounds whereof was peace, as of their own quiet streams; for the Abbot and St. Guthlac were the only lords thereof, and neither summoner nor sheriff of the king, or armed force of knight or earl, could enter there.

At last they came to Crowland minster: a vast range of high-peaked buildings, founded on piles of oak and hazel driven into the fen—itself built almost entirely of timber from the Bruneswold; barns, granaries, stables, workshops, stranger's hall, fit for the boundless hospitality of Crowland; infirmary, refectory, dormitory, library, abbot's lodgings, cloisters; and, above, the great minster towering up, a steep pile, half wood, half stone, with narrow round-headed windows, and leaden roofs; and, above all, the great wooden tower, from which, on high days, chimed out the melody of the seven famous bells, which had not their like in English land. Guthlac, Bartholomew, and Bettelm were the names of the biggest, Turketul and Tatwin of the middle, and Pega and Bega of the smallest. So says Ingulf, who saw them a few years after pouring down on his own head in streams of melted metal. Outside the minster walls were the cottages of the corodiers, or labouring folk; and beyond them again the natural park of grass, dotted with mighty oaks and ashes; and beyond all those, cornlands of inexhaustible fertility, broken up by the good Abbot Egelric some hundred years before, from which, in times of dearth, the monks of Crowland fed the people of all the neighbouring fens.

They went into the great courtyard. All men were quiet, yet all men were busy. Baking and brewing, carpentering and tailoring, in the workshops, reading and writing in the cloister, praying and singing in the church, and teaching the children in the schoolhouse. Only the ancient sempects—some near upon a hundred and fifty years old,—wandered where they would, or basked against a sunny wall, like autumn flies; with each a young monk to guide him, and listen to his tattle of old days. For, said the laws of Turketul the good—"Nothing disagreeable about the affairs of the monastery shall be mentioned in their presence. No person shall presume in any way to offend them: but with the greatest peace and tranquillity they shall await their end."

So while the world outside raged, and fought, and conquered, and plundered, they within the holy isle kept up some sort of order, and justice, and usefulness, and love to God and man. And about the yards, among the feet of the monks, hopped the sacred ravens, descendants of those who brought back the gloves at St. Guthlac's bidding; and overhead, under all the eaves, built the sacred swallows, the descendants of those who sat and sang upon St. Guthlac's shoulders; and when men marvelled thereat, he the holy man replied, "Know that they who live the holy life draw nearer to the birds of the air, even as they do to the angels in heaven."

And Lady Godiva called for old Abbot Ulfketyl, the good and brave, and fell upon his neck, and told him all her tale; and Ulfketyl wept upon her neck, for they were old and faithful friends.

And they passed into the dark cool church, where in the crypt under the high altar, lay the thumb of St. Bartholomew, which old Abbot Turketul used to carry about, that he might cross himself with it in times of danger, tempest, and lightning; and some of the hair of St. Mary, Queen of Heaven, in a box of gold; and a bone of St. Leodegar, of Aquitaine; and some few remains, too, of the holy bodies of St. Guthlac, and of St. Bettelm, his servant, and St. Tatwin, who steered him to Crowland, and St. Egbert, his confessor, and St. Cissa the anchorite, and of the most holy virgin St. Etheldreda, and many more. But little of them remained since Sigtryg and Bagsac's heathen Danes had heaped them pell-mell on the floor, and burned the church over them and the bodies of the slaughtered monks.

The plunder which was taken from Crowland on that evil day lay, and lies still, with the plunder of Peterborough, and many a minster more, at the bottom of the Nene, at Huntingdon Bridge. But it had been more than replaced by the piety of the Danish kings and nobles; and above the twelve white bearskins which lay at the twelve altars, blazed, in the light of many a wax candle, gold and jewels inferior only to those of Peterborough and Coventry.

And there in the nave they buried the lad Godwin, with chant and dirge; and when the funeral was done, Hereward went up toward the high altar, and bade Winter and Gwenoch come with him. And there he knelt, and vowed a vow to God and St. Guthlac and the Lady Torfrida, his true love, never to leave from slaying while there was a Frenchman left alive on English ground.

And Godiva and Ulfketyl heard his vow, and shuddered: but they dared not stop him, for they too had English hearts.

And Winter and Gwenoch heard it, and repeated it word for word.

Then he kissed his mother, and called Winter and Gwenoch, and went forth. He would be back again, he said, on the third day.

Then those three went to Peterborough, and asked for Abbot Brand. And the monks let them in; for the fame of their deed had passed through the forest, and all the French had fled.

And old Brand lay back in his great arm-chair, his legs all muffled up in furs, for he could get no heat; and by him stood Herluin the prior, and wondered when he would die, and Thorold take his place, and they should drive out the old Gregorian chants from the choir, and have the new Norman chants of Robert of Fécamp, and bring in French-Roman customs in all things, and rule the English boors with a rod of iron.

And old Brand knew all that was in his heart, and looked up like a patient ox beneath the butcher's axe, and said "Have patience with me, brother Herluin, and I will die as soon as I can, and go where there is neither French nor English, Jew nor Gentile, bond or free, but all are alike in the eyes of Him who made them."

But when he saw Hereward come in, he cast the mufflers off him, and sprang up from his chair, and was young and strong in a moment, and for a moment.

And he threw his arms round Hereward, and wept upon his neck, as his mother had done. And Hereward wept upon his neck, though he had not wept upon his mother's.

Then Brand held him at arms' length, or thought he held him, for he was leaning on Hereward, and tottering all the while; and extolled him as the champion, the warrior, the stay of his house, the avenger of his kin, the hero of whom he had always prophesied that his kin would need him, and that then he would not fail.

But Hereward answered him modestly and mildly:

"Speak not so to me and of me, Uncle Brand. I am a very foolish, vain, sinful man, who have come through great adventures, I know not how, to great and strange happiness, and now again to great and strange sorrows; and to an adventure greater and stranger than all that has befallen me from my youth up until now. Therefore make me not proud, Uncle Brand, but keep me modest and lowly, as befits all true knights and penitent sinners; for they tell me that God resists the proud, and giveth grace to the humble. And I have that to do which do I cannot, unless God and his saints give me grace from this day forth."

Brand looked at him, astonished; and then turned to Herluin.

"Did I not tell thee, prior? This is the lad whom you called graceless and a savage; and see, since he has been in foreign lands, and seen the ways of knights, he talks as clerkly as a Frenchman, and as piously as any monk."

"The Lord Hereward," said Herluin, "has doubtless learned much from the manners of our nation which he would not have learned in England. I rejoice to see him returned so Christian and so courtly a knight."

"The Lord Hereward, Prior Herluin, has learnt one thing in his travels—to know somewhat of men and the hearts of men, and to deal with them as they deserve of him. They tell me that one Thorold of Malmesbury,—Thorold of Fécamp, the minstrel, he that made the song of Roland—that he desires this abbey."

"I have so heard, my lord."

"Then I command,—I, Hereward, Lord of Bourne!—that this abbey be held against him and all Frenchmen, in the name of Swend Ulfsson, king of England, and of me. And he that admits a Frenchman therein, I will shave his crown for him so well, that he shall never need razor more. This I tell thee; and this I shall tell your monks before I go. And unless you obey the same, my dream will be fulfilled; and you will see Goldenbregh in a light low, and burning yourselves in the midst thereof."

"Swend Ulfsson? Swend of Denmark? What words are these?" cried Brand.

"You will know within six months, uncle."

"I shall know better things, my boy, before six months are out."

"Uncle, uncle, do not say that."

"Why not? If this mortal life be at best a prison and a grave, what is it worth now to an Englishman?"

"More than ever; for never had an Englishman such a chance of showing English mettle, and winning renown for the English name. Uncle, you must do something for me and my comrades ere we go."

"Well, boy?"

"Make us knights."

"Knights, lad? I thought you had been a belted knight this dozen years?"

"I might have been made a knight by many, after the French fashion, many a year agone. I might have been knight when I slew the white bear. Ladies have prayed me to be knighted again and again since. Something kept me from it. Perhaps" (with a glance at Herluin) "I wanted to show that an English squire could be the rival and the leader of French and Flemish knights."

"And thou hast shown it, brave lad," said Brand, clapping his great hands.

"Perhaps I longed to do some mighty deed at last, which would give me a right to go to the bravest knight in all Christendom, and say, Give me the accolade, then! Thou only art worthy to knight as good a man as thyself."

"Pride and vain-glory," said Brand, shaking his head.

"But now I am of a sounder mind. I see now why I was kept from being knighted—till I had done a deed worthy of a true knight; till I had mightily avenged the wronged, and mightily succoured the oppressed; till I had purged my soul of my enmity against my own kin, and could go out into the world a new man, with my mother's blessing on my head."

"But not of the robbery of St. Peter," said Herluin. The French monk wanted not for moral courage, no French monk did in those days. And he proved it by those words.

"Do not anger the lad, Prior; now, too, above all times, when his heart is softened toward the Lord."

"He has not angered me. The man is right. Here, Lord Abbot and Sir Prior, is a chain of gold, won in the wars. It is worth fifty times the sixteen pence which I stole, and which I repaid double. Let St. Peter take it, for the sins of me and my two comrades, and forgive. And now, Sir Prior, I do to thee what I never did for mortal man. I kneel and ask thy forgiveness. Kneel, Winter! Kneel, Gwenoch!" And Hereward knelt.

Herluin was of double mind. He longed to keep Hereward out of St. Peter's grace. He longed to see Hereward dead at his feet: not because of any personal hatred, but because he foresaw in him a terrible foe to the Norman cause. But he wished, too, to involve Abbot Brand as much as possible in Hereward's "rebellions" and "misdeeds," and above all, in the master-offence of knighting him; for for that end, he saw, Hereward was come. Moreover, he was touched with the sudden frankness and humility of the famous champion. So he answered mildly:

"Verily, thou hast a knightly soul. May God and St. Peter so forgive thee and thy companions as I forgive thee, freely and from my heart."

"Now," cried Hereward; "A boon! A boon! Knight me and these my fellows, Uncle Brand, this day."

Brand was old and weak, and looked at Herluin.

"I know," said Hereward, "that the French look on us English monk-made knights as spurious and adulterine, unworthy of the name of knight. But, I hold—and what churchman will gainsay me?—that it is nobler to receive sword and belt from a man of God, than from a man of blood like one's-self; the fittest to consecrate the soldier of an earthly king, is the soldier of Christ, the King of kings." *

"He speaks well," said Herluin. "Abbot, grant him his boon."

"Who celebrates high mass to-morrow?"

"Wilton the priest, the monk of Ely," said Herluin, aloud. "And a very dangerous and stubborn Englishman," added he to himself.

"Good. Then this night you shall watch in the church. To-morrow, after the Gospel, the thing shall be done as you will."

That night two messengers, knights of the Abbot, galloped from Peterborough. One to Ivo Taillebois at Spalding, to tell him that Hereward was at Peterborough, and that he must try to cut him off upon the Egelric's road, the causeway which one of the many Abbots Egelric had made, some thirty years before, through Deeping Fen to Spalding, at an enormous expense of labour and of timber. The other knight rode south, along the Roman road to London, to tell King William of the rising of Kesteven, and all the evil deeds of Hereward and of Brand.

And old Brand slept quietly in his bed, little thinking on what errands his prior had sent his knights.

Hereward and his comrades watched that night in St. Peter's church. Oppressed with weariness of body, and awe of mind, they heard the monks drone out their chants through the misty gloom; they confessed the sins—and they were many—of their past wild lives. They had to summon up within

---

* Almost word for word from the "Life of Hereward."

themselves courage and strength henceforth to live, not for themselves, but for the fatherland which they hoped to save. They prayed to all the heavenly powers of that Pantheon which then stood between man and God, to help them in the coming struggle; but ere the morning dawned, they were nodding, unused to any long strain of mind.

Suddenly Hereward started, and sprang up, with a cry of fire.

"What? Where?" cried his comrades, and the monks who ran up.

"The minster is full of flame. No use, too late, you cannot put it out. It must burn."

"You have been dreaming," said one.

"I have not," said Hereward. "Is it Lammas night?"

"What a question! It is the vigil of the Nativity of St. Peter and St. Paul."

"Thank heaven; I thought my old Lammas night's dream was coming true at last."

Herluin heard, and knew what he meant.

After which Hereward was silent, filled with many thoughts.

The next morning, before the high mass, those three brave men walked up to the altar; laid thereon their belts and swords; and then knelt humbly at the foot of the steps till the Gospel was finished.

Then came down from the altar Wilton of Ely, and laid on each man's bare neck the bare blade, and bade him take back his sword in the name of God and of St. Peter and St. Paul, and use it like a true knight, for a terror and punishment to evil doers, and a defence for women and orphans, and the poor and the oppressed, and the monks the servants of God.

And then the monks girded each man with his belt and sword once more. And after mass was sung, they rose and went forth, each feeling himself—and surely not in vain—a better man.

At least this is certain, that Hereward would say to his dying day, how he had often proved that none would fight so well as those who had received their sword from God's knights the monks. And therefore he would have, in after years, almost all his companions knighted by the monks; and brought into Ely with him that same good custom which he had learnt at Peterborough, and kept it up as long as he held the isle.

So says the chronicler Leofric, the minstrel and priest.

It was late when they got back to Crowland. The good Abbot received them with a troubled face.

"As I feared, my Lord, you have been too hot and hasty. The French have raised the country against you."

"I have raised it against them, my Lord. But we have news that Sir Frederick——"

"And who may he be?"

"A very terrible Goliath of these French; old and crafty, a brother of old Earl Warrenne of Norfolk, whom God confound. And he has sworn to have your life, and has gathered knights and men-at-arms at Lynn in Norfolk."

"Very good; I will visit him as I go home, Lord Abbot. Not a word of this to any soul."

"I tremble for thee, thou young David."

"One cannot live for ever, my Lord. Farewell."

A week after a boatman brought news to Crowland, how Sir Frederick was sitting in his inn at Lynn, when there came in one with a sword, and said, "I am Hereward. I was told that thou didst desire greatly to see me; therefore I am come, being a courteous knight," and therewith smote off his head. And when the knights and others would have stopped him, he cut his way through them, killing some three or four at each stroke, himself unhurt; for he was clothed from head to foot in magic armour, and whosoever smote it, their swords melted in their hands. And so gaining the door, he vanished in a great cloud of sea-fowl, that cried for ever "Hereward is come home again."

And after that the fen-men said to each other, that all the birds upon the meres cried nothing save "Hereward is come home again."

And so, already surrounded with myth and mystery, Hereward flashed into the fens and out again, like the lightning brand, destroying as he passed. And the hearts of all the French were turned to water; and the land had peace from its tyrants for many days.

CHAPTER XXI.

HOW IVO TAILLEBOIS MARCHED OUT OF SPALDING TOWN.

A PROUD man was Ivo Taillebois, as he rode next morning out of Spalding town, with hawk on fist, and hound at heel, and a dozen men-at-arms at his back, who would, on due or undue cause shown, hunt men while he hunted game.

An adventurer from Anjou, brutal, ignorant, and profligate—low-born, too (for his own men whispered, behind his back, that he was no more than his name hinted, a wood-cutter's son), he still had his deserts. Valiant he was, cunning, and skilled in war. He and his troop of Angevine ruttiers had fought like tigers by William's side at Hastings; and he had been rewarded with many a manor, which had been Earl Algar's, and should now have been Earl Edwin's, or Morcar's, or, it may be, Hereward's own.

"A fat land and fair," said he to himself; "and, after I have hanged a few more of these barbarians, a peaceable fief enough to hand down to the lawful heirs of my body, if I had one. I must marry. Blessed Virgin! this it is to serve and honour your gracious majesty, as I have always done according to my poor humility. Who would have thought that Ivo Taillebois would ever rise so high in life, as to be looking out for a wife—and that a lady, too?"

Then thought he over the peerless beauties of the Lady Lucia, Edwin and Morcar's sister, almost as fair as that hapless aunt of hers—first married (though that story is now denied) to the wild Griffin, prince of Snowdon, and then to his conqueror, and (by complicity) murderer, Harold, the hapless king. Eddeva faira, Eddeva pulcra, stands her name in Domesday-book even now, known, even to her Norman conquerors, as the Beauty of her time, as Godiva, her mother, had been before her. Scarcely less beautiful was Lucia, as Ivo had seen her at William's court, half-captive and half-guest: and he longed for her; love her he could not. "I have her father's lands," quoth he; "what more reasonable than to have the daughter, too? And have her I will, unless the Mamzer, in his present merciful and politic mood, makes a Countess of her, and marries her up to some Norman coxcomb, with a long pedigree—invented the year before last. If he does throw away his daughter on that Earl Edwin, in his fancy for petting and patting these savages into good humour, he is not likely to throw away Edwin's sister on a Taillebois. Well. I must put a spoke in Edwin's wheel. It will not be difficult to make him, or Morcar, or both of them, traitors. We must have a rebellion in these parts. I will talk about it to Gilbert of Ghent. We must make these savages desperate, and William furious, or he will be soon giving them back their lands, beside asking them to Court: and then how are valiant knights like us, who have won England for him, to be paid for their trouble? No, no. We must have a rebellion, and a confiscation, and then when English lasses are going cheap, perhaps the Lady Lucia may fall to my share."

And Ivo Taillebois kept his word; and without difficulty, for he had many to help him. To drive the English to desperation, and get a pretext for seizing their lands, was the game which the Normans played, and but too well.

As he rode out of Spalding town, a man was being hanged on the gallows there permanently provided.

That was so common a sight, that Ivo would not have stopped, had not a priest, who was comforting the criminal, ran forward, and almost thrown himself under the horse's feet.

"Mercy, good my Lord, in the name of God and all his saints."

Ivo went to ride on.

"Mercy!" and he laid hands on Ivo's bridle. "If he took a few pike out of your mere, remember that the mere was his, and his father's before him; and do not send a sorely tempted soul out of the world for a paltry pike."

"And where am I to get fish for Lent, Sir Priest, if every rascal nets my waters, because his father did so before him? Take your hand off my bridle, or par le splendeur Dex" (Ivo thought it fine to use King William's favourite oath), "I will hew it off."

The priest looked at him, with something of honest English fierceness in his eyes, and dropping the bridle, muttered to himself in Latin: "The bloodthirsty and deceitful man shall not live out half his days. Nevertheless my trust shall be in Thee, O Lord."

"What art muttering, beast? Go home to thy wife" (wife was by no means the word which Ivo used), "and make the most of her, before I rout out thee and thy fellow canons, and put in good monks from Normandy in the place of your drunken English swine. Hang him!" shouted he, as the bystanders fell on their knees before the tyrant, crouching in terror, every woman for her husband, every man for wife and daughter. "And hearken, you fen-frogs all. Who touches pike or eel, swimming or wading fowl, within these meres of mine without my leave, I will hang him as I hanged this man; as I hanged four brothers in a row on Wrokesham bridge but yesterday."

"Go to Wrokesham bridge, and see," shouted a shrill cracked voice from behind the crowd.

All looked round; and more than one of Ivo's men set up a yell, the hangman loudest of all.

"That's he, the heron again! Catch him! Stop him! Shoot him!"

But that was not so easy. As Ivo pushed his horse through the crowd, careless of whom he crushed, he saw a long lean figure flying through the air seven feet aloft, with his heels higher than his head, on the further side of a deep broad ditch; and on the nearer side of the same, one of his best men lying stark, with a cloven scull.

"Go to Wrokesham!" shrieked the lean man, as he rose, and showed a ridiculously long nose, neck, and legs (a type still not uncommon in the fens), a quilted leather coat, a double-bladed axe slung over his shoulder by a thong, a round shield at his back, and a pole three times as long as himself, which he dragged after him, like an unwieldy tail.

"The heron, the heron!" shouted the English.

"Follow him, men! heron or hawk!" shouted Ivo, galloping his horse up to the ditch, and stopping short at fifteen feet of water.

"Shoot, some one. Where are the bows gone?"

The heron was gone two hundred yards, running, in spite of his pole, at a wonderful pace, before a bow could be brought to bear. He seemed to expect an arrow; for he stopped, glanced his eye round, threw himself flat on his face, with his shield, not over his body, but over his bare legs; sprang up as the shaft stuck in the ground beside him, ran on, planted his pole in the next dyke, and flew over it.

In a few minutes he was beyond pursuit, and Ivo turned, breathless with rage, to ask who he was.

"Alas, sir! he is the man who set free the four men at Wrokesham bridge last night."

"Set free! Are they not hanged and dead?"

"We—we dare not tell you. But he came upon us—"

"Single-handed, you cowards?"

"Sir, he is not a man, but a witch or a devil. He asked us what we did there. One of our men laughed at his long neck and legs, and called him heron. 'Heron I am,' says he, 'and strike like a heron, right at the eyes,' and with that he cuts the man over the face with his axe, and laid him dead, and then another, and another."

"Till you all ran away, villains!"

"We gave back a step—no more. And he freed one of those four, and he again the rest; and then they all set on us, and went to hang us in their own stead."

"When there were ten of you, I thought?"

"Sir, as we told you, he is no mortal man, but a fiend."

"Beasts, fools! Well, I have hanged this one, at least!" growled Ivo, and then rode sullenly on.

"Who is this fellow?" cried he to the trembling English.

"Wulfric Raher, Wulfric the Heron, of Wrokesham in Norfolk."

"Aha! And I hold a manor of his," said Ivo to himself. "Look you, villains, this fellow is in league with you."

A burst of abject denial followed. "Since the French—since Sir Frederick, as they call him, drove him out of his Wrokesham lands, he wanders the country, as you see; to-day here: but heaven only knows where he will be to-morrow."

"And finds, of course, a friend everywhere. Now march!" and a string of threats and curses followed.

It was hard to see why Wulfric should not have found friends; as he was simply a small holder, or squire, driven out of house and land, and turned adrift on the wide world, for the offence of having fought in Harold's army at the battle of Hastings. But to give him food or shelter was, in Norman eyes, an act of rebellion against the rightful King William; and Ivo rode on, boiling over with righteous indignation, along the narrow drove which led toward Deeping.

A pretty lass came along the drove, driving a few sheep before her, and spinning as she walked.

"Whose lass are you?" shouted Ivo.

"The Abbot's of Crowland, please your lordship," said she, trembling.

"Much too pretty to belong to monks. Chuck her up behind you, one of you."

The shrieking and struggling girl was mounted behind a horseman, and bound; and Ivo rode on.

A woman ran out of a turf-hut on the drove side, attracted by the girl's cries. It was her mother.

"My lass! Give me my lass, for the love of St. Mary and all saints!" and she clung to Ivo's bridle.

He struck her down, and rode on over her.

A man cutting sedges in a punt in the lode alongside, looked up at the girl's shrieks, and leapt on shore, scythe in hand.

"Father! father!" cried she.

"I'll rid thee, lass, or die for it," said he, as he sprang up the drove-dyke, and swept right and left at the horses' legs.

The men recoiled. One horse went down, lamed for life; another staggered backwards into the further lode, and was drowned. But an arrow went through the brave serf's heart, and Ivo rode on, cursing more bitterly than ever, and comforted himself by flying his hawks at a covey of patridges.

Soon a group came along the drove which promised fresh sport to the man-hunters: but as the foremost person came up, Ivo stopped in wonder at the shout of—

"Ivo! Ivo Taillebois! Halt and have a care! The English are risen, and we are all dead men!"

The words were spoken in French; and in French Ivo answered, laughing:

"Thou art not a dead man yet it seems, Sir Robert; art going on pilgrimage to Jerusalem, that thou comest in this fashion? Or dost mean to return to Anjou as bare as thou camest out of it?"

For Sir Robert had, like Edgar, "reserved himself a blanket, else had we all been shamed."

But very little more did either he, his lady, and his three children wear, as they trudged along the drove, in even poorer case than that

Robert of Coningsby,
Who came out of Normandy,
With his wife Tiffany,
And his maid Manpas,
And his dog Hardigras.

"For the love of heaven and all chivalry, joke me no jokes, Sir Ivo: but give me and mine clothes and food. The barbarians rose on us last night—with Azer, the ruffian who owned my lands, at their head, and drove us out into the night as we are, bidding us carry the news to you, for your turn would come next. There are forty or more of them in West Deeping now, and coming eastward, they say, to visit you, and what is more than all, Hereward is come again."

"Hereward!" cried Ivo, who knew that name well.

Whereon Sir Robert told him the terrible tragedy of Bourne.

"Mount the lady on a horse, and wrap her in my cloak. Get that dead villain's clothes for Sir Robert as we go back. Put your horses' heads about and ride for Spalding."

"What shall we do with the lass?"

"We cannot be burdened with the jade. She has cost us two good horses already. Leave her in the road, bound as she is, and let us see if St. Guthlac her master will come and untie her."

So they rode back. Coming from Deeping two hours after, Azer and his men found the girl on the road, dead.

"Another count in the long score," quoth Azer. But when, in two hours more, they came to Spalding town, they found all the folk upon the street, shouting and praising the host of heaven. There was not a Frenchman left in the town.

For when Ivo returned home, ere yet Sir Robert and his family were well clothed and fed, there galloped into Spalding from the north, Sir Ascelin, nephew and man of Thorold, would-be Abbot of Peterborough, and one of the garrison of Lincoln, which was then held by Hereward's old friend, Gilbert of Ghent.

"Not bad news, I hope," cried Ivo, as Ascelin clanked into the hall. "We have enough of our own. Here is all Kesteven, as the barbarians call it, risen, and they are murdering us right and left."

"Worse news than that, Ivo Taillebois"—"Sir," or "Sieur," Ascelin was loth to call him, being himself a man of family and fashion; and holding the nouveaux venus in deep contempt. "Worse news than that. The North has risen again, and proclaimed Prince Edgar King."

"A king of words! What care I, or you, as long as The Mamzer, God bless him, is a king of deeds?"

"They have done their deeds, though, too. Gospatric and Merlesweyn are back out of Scotland. They attacked Robert de Comines* at Durham, and burnt him in his own house. There was but one of his men got out of Durham to tell the news. And now they have marched on York; and all the chiefs, they say, have joined them—Archill the Thane, and Edwin and Morcar, and Waltheof too, the young traitors."

"Blessed Virgin!" cried Ivo, "thou art indeed gracious to thy most unworthy knight!"

"What do you mean?"

"You will see some day. Now, I will tell you but one word. When fools make hay, wise men can build ricks. This rebellion—if it had not come of itself, I would have roused it. We wanted it, to cure William of this just and benevolent policy of his, which would have ended in sending us back to France, as poor as we left it. Now, what am I expected to do? What says Gilbert of Ghent, the wise man of Lic—nic—what the pest do you call that outlandish place, which no civilised lips can pronounce?"

"Lic-nic-cole?" replied Ascelin, who, like the rest of the French, never could manage to say Lincoln.

"He says, 'March to me, and with me to join the king at York.'"

"Then he says well. These fat acres will be none the leaner, if I leave the English slaves to crop them for six months. Men! arm and horse Sir Robert of Deeping. Then arm and horse yourselves. We march north in half-an-hour, bag and baggage, scrip and scrippage. You are all bachelors, like me, and travel light. So off with you!"

"Sir Ascelin, you will eat and drink?"

"That will I."

"Quick, then, butler: and after that pack up the Englishman's plate-chest, which we inherited by right of fist—the only plate, and the only title-deeds I ever possessed."

"Now, Sir Ascelin"—as the three knights, the lady, and the poor children ate their fastest—"listen to me. The art of war lies in this one nut-shell—to put the greatest number of men into one place at one time, and let all other places shift. To strike swiftly, and strike heavily. That is the rule of our liege lord, King William; and by it he will conquer England, or the world, if he will; and while he does that, he shall never say that Ivo Taillebois stayed at home to guard his own manors while he could join his king, and win all the manors of England once and for all."

"Pardieu! whatever men may say of thy lineage or thy virtues, they cannot deny this—that thou art a most wise and valiant captain."

"That am I," quoth Taillebois, too much pleased with the praise to care about being tutoyé by younger men. "As for my lineage, my lord the king has a fellow-feeling for upstarts; and the woodman's grandson may very well serve the tanner's. Now, men! is the litter ready for the lady and children? I am sorry to rattle you about thus, madame, but war has no courtesies; and march I must."

And so the French went out of Spalding town.

"Don't be in a hurry to thank your saints!" shouted Ivo to his victims. "I shall be back this day three months; and then you shall see a row of gibbets all the way from here to Deeping, and an Englishman hanging on every one."

CHAPTER XXII.

HOW HEREWARD SAILED FOR ENGLAND ONCE AND FOR ALL.

So Hereward fought the Viscount of Pinkney, who had the usual luck which befel those who crossed swords with him, and plotted meanwhile with Gyda and the Countess Judith. Abbot Egelsin sent them news from King Sweyn in Denmark; soon Judith and Tosti's two sons went themselves to Sweyn, and helped the plot and the fitting out of the armament. News they had from England in plenty, by messengers from Queen Matilda to the sister who was intriguing to dethrone her husband, and by private messengers from Durham and from York.

Baldwin, the *débonnaire* marquis, had not lived to see this fruit of his long efforts to please everybody. He had gone to his rest the year before; and now there ruled in Bruges his son, Baldwin the Good, "Count Palatine," as he styled himself, and his wife Richilda, the Lady of Hainault.

They probably cared as little for the success of their sister Matilda, as they did for that of their sister Judith; and followed out—Baldwin at least—the great marquis's plan of making Flanders a retreat for the fugitives of all the countries round.

At least, if (as seems) Sweyn's fleet made the coast of Flanders its rendezvous and base of operations against King William, Baldwin offered no resistance.

So the messengers came, and the plots went on. Great was the delight of Hereward and the ladies when they heard of the taking of Durham and York: but bitter their surprise and rage when they heard that Gospatric and the Confederates had proclaimed Edgar Atheling king.

---

* Ancestor of the Comyns of Scotland.

"Fools! they will ruin all!" cried Gyda. "Do they expect Swend Ulfsson, who never moved a finger yet, unless he saw that it would pay him within the hour, to spend blood and treasure in putting that puppet boy upon the throne instead of himself?"

"Calm yourself, great Countess," said Hereward, with a smile. "The man who puts him on the throne will find it very easy to take him off again when he needs."

"Pish!" said Gyda. "He must put him on the throne first. And how will he do that? Will the men of the Danelaw, much less the Northumbrians, ever rally round an Atheling of Cerdic's house? They are raising a Wessex army in Northumbria; a southern army in the north. There is no real loyalty there toward the Atheling, not even the tie of kin, as there would be to Swend. The boy is a mere stalking-horse, behind which each of these greedy chiefs expects to get back his own lands; and if they can get them back by any other means, well and good. Mark my words, Sir Hereward, that cunning Frenchman will treat with them one by one, and betray them one by one, till there is none left."

How far Gyda was right, will be seen hereafter. But a less practised diplomat than the great Countess might have speculated reasonably on such an event.

At least, let this be said, that when historians have complained of the treachery of King Swend Ulfsson and his Danes, they have forgotten certain broad and simple facts.

Swend sailed for England to take a kingdom which he believed to be his by right; which he had formerly demanded of William. When he arrived there, he found himself a mere cat's-paw for recovering that kingdom for an incapable boy, whom he believed to have no right to the throne at all.

Then came darker news. As Ivo had foreseen, and as Ivo had done his best to bring about, William dashed on York, and drove out the Confederates with terrible slaughter; profaned the churches, plundered the town. Gospatric and the earls retreated to Durham; the Atheling, more cautious, to Scotland.

Then came a strange story, worthy of the grown children who, in those old times, bore the hearts of boys with the ferocity and intellect of men.

A great fog fell on the Frenchmen as they struggled over the Durham moors. The doomed city was close beneath them; they heard Wear roaring in his wooded gorge. But a darkness, as of Egypt, lay upon them: "neither rose any from his place."

Then the Frenchman cried: "This darkness is from St. Cuthbert himself. We have invaded his holy soil. Who has not heard how none who offend St. Cuthbert ever went unpunished? how palsy, blindness, madness, fall on those who dare to violate his sanctuary?"

And the French turned and fled from before the face of St. Cuthbert; and William went down to Winchester angry and sad, and then went off to Gloucestershire; and hunted—for whatever befel, he still would hunt—in the forest of Dean.

And still Swend and his Danes had not sailed; and Hereward walked to and fro in his house, impatiently, and bided his time.

In July Baldwin died. Arnoul, the boy, was Count of Flanders, and Richilda, his sorceress-mother, ruled the land in his name. She began to oppress the Flemings; not those of French Flanders, round St. Omer, but those of Flemish Flanders, toward the north. They threatened to send for Robert the Frison to right them.

Hereward was perplexed. He was Robert the Frison's friend, and old soldier. Richilda was Torfrida's friend; so was, still more, the boy Arnoul; which party should he take? Neither, if he could help it. And he longed to be safe out of the land.

And at last his time came. Martin Lightfoot ran in, breathless, to tell how the sails of a mighty fleet were visible from the Dunes.

"Here?" cried Hereward. "What are the fools doing down here, wandering into the very jaws of the wolf? How will they land here? They were to have gone straight to the Lincolnshire coast. God grant this mistake be not the first of dozens!"

Hereward went into Torfrida's bower.

"This is an evil business. The Danes are here, where they have no business, instead of being off Scheldtmouth, as I entreated them. But go we must, or be for ever shamed. Now, true wife, are you ready? Dare you leave home, and kin, and friends, once and for all, to go, you know not whither, with one who may be a gory corpse by this day week?"

"I dare," said she.

So they went down to Calais by night, with Torfrida's mother, and all their jewels, and all they had in the world. And their housecarles went with them, forty men, tried and trained, who had vowed to follow Hereward round the world. And there were two long ships ready, and twenty good mariners in each. So when the Danes made the South Foreland the next morning, they were aware of two gallant ships bearing down on them, with a great white bear embroidered on their sails.

A proud man was Hereward that day, as he sailed into the midst of the Danish fleet, and up to the royal ships, and shouted:

"I am Hereward the Berserker, and I come to take service under my rightful lord, Sweyn, king of England."

"Come on board, then; we know you well, and right glad we are to have Hereward with us."

And Hereward laid his ship's bow upon the quarter of the royal ship (to lay alongside was impossible, for fear of breaking oars), and came on board.

"And thou art Hereward?" asked a tall and noble warrior.

"I am. And thou art Swend Ulfsson, the king?"

"I am Earl Osbiorn, his brother."

"Then, where is the king?"

"He is in Denmark, and I command his fleet; and with me are Canute and Harold, Sweyn's sons, and Earls and Bishops enough for all England."

This was spoken in a somewhat haughty tone, in answer to the look of surprise and disappointment which Hereward had, unawares, allowed to pass over his face.

"Thou art better than none," said Hereward. "Now, hearken, Osbiorn the Earl. Had Swend been here, I would have put my hand between his, and said in my own name, and that of all the men in Kesteven and the fens, Swend's men we are, to live and die! But now, as it is, I say, for me and them, thy men we are, to live and die, as long as thou art true to us."

"True to you I will be," said Osbiorn.

"Be it so," said Hereward. "True we shall be, whatever betide. Now, whither goes Earl Osbiorn, and all his great meinie?"

"We purpose to try Dover."

"You will not take it. The Frenchman has strengthened it with one of his accursed keeps, and without battering-engines you may sit before it a month."

"What if I asked you to go in thither yourself, and try the mettle and the luck which, they say, never failed Hereward yet?"

"I should say that it was a child's trick to throw away against a paltry stone wall the life of a man who was ready to raise for you in Lincolnshire and Cambridgeshire, five times as many men as you will lose in taking Dover."

"Hereward is right," said more than one Earl. "We shall need him in his own country."

"If you are wise, to that country you yourselves will go. It is ready to receive you. This is ready to oppose you. You are attacking the Frenchman at his strongest point, instead of his weakest. Did I not send again and again, entreating you to cross from Scheldtmouth to the Wash, and send me word that I might come and raise the Fen-men for you, and then we would all go north together."

"I have heard, ere now," said Earl Osbiorn, haughtily, "that Hereward, though he be a valiant Viking, is more fond of giving advice than of taking it."

Hereward was about to answer very fiercely. If he had, no one would have thought any harm, in those plain-spoken times. But he was wise; and restrained himself, remembering that Torfrida was there, all but alone, in the midst of a fleet of savage men; and that beside, he had a great deed to do, and must do it as he could. So he answered—

"Osbiorn the Earl has not, it seems, heard this of Hereward: that because he is accustomed to command, he is also accustomed to obey. What thou wilt do, do, and bid me do. He that quarrels with his captain, cuts his own throat and his fellows' too."

"Wisely spoken!" said the Earls; and Hereward went back to his ship.

"Torfrida," said he bitterly, "the game is lost before it is begun."

"God forbid, my beloved! What words are these?"

"Swend—fool that he is with his over-caution—always the same—has let the prize slip from between his fingers. He has sent Osbiorn instead of himself."

"But why is that so terrible a mistake?"

"We do not want a fleet of Vikings in England, to plunder the French and English alike. We want a king, a king, a king!" and Hereward stamped with rage. "And instead of a king, we have this Osbiorn—all men know him, greedy, and false, and weak-headed. Here he is going to be beaten off at Dover; and then, I suppose, at the next port; and so forth, till the whole season is wasted, and the ships and men lost by driblets. Pray for us to God and his saints, Torfrida, you who are nearer to heaven than I; for we never needed it more."

And Osbiorn went in; tried to take Dover; and was beaten off with heavy loss.

Then the Earls bade him take Hereward's advice. But he would not.

So he went round the Foreland, and tried Sandwich—as if, landing there, he would have been safe in marching on London, in the teeth of the *élite* of Normandy.

But he was beaten off there, with more loss. Then, too late, he took Hereward's advice—or, rather, half of it—and sailed north; but only to commit more follies.

He dared not enter the Thames. He would not go on to the Wash; but he went into the Orwell, and attacked Ipswich, plundering right and left, instead of proclaiming King Sweyn, and calling the Danish folk around him. The Danish folk of Suffolk rose, and, like valiant men, beat him off; while Hereward lay outside the river mouth, his soul within him black with disappointment, rage, and shame. He would not go in. He would not fight against his own countrymen. He would not help to turn the whole plan into a marauding raid. And he told Earl Osbiorn so, so fiercely, that his life would have been in danger, had not the force of his arm been as much feared as the force of his name was needed.

At last they came to Yarmouth. Osbiorn would needs land there, and try Norwich.

Hereward was nigh desperate: but he hit upon a plan. Let Osbiorn do so, if he would. He himself would sail round to the Wash, raise the Fen-men, and march eastward at their head through Norfolk to meet him. Osbiorn himself could not refuse so rational a proposal. All the Earls and Bishops approved loudly; and away Hereward went to the Wash, his heart well-nigh broken, foreseeing nothing but evil.

CHRIST THE LIGHT OF THE WORLD.

By C. J. VAUGHAN, D.D.

VI.—THE GOSPEL OF THE FALL.

"It shall bruise thy head."—Genesis iii. 15.

THIS third chapter of the Bible is the basis and groundwork of Revelation. It tells us where we are and how we came here; tells us, if not of the origin, yet at least of the human beginning, of evil; tells us of man's Fall, and lifts up the curtain (in part at least) from the scene of man's ruin.

Speaking upon it at this time, in words, I trust, plain and clear to all, warranted by Holy Scripture and true to human experience, we shall find three great topics demanding our notice: The Fall as a history; The Fall as a type; and The Fall in its reversal.

May the Spirit of God move upon the record, and make it life-like and life-giving to some humble and waiting souls!

I. The Fall as a history.

What could be so worthy a subject for Divine Revelation, as the explanation (so far as man can receive it) of the strange complexities of man's present condition?

Surely it becomes an intelligent being, with whom God has begun to deal, ever so remotely, in the way of information as to the mysteries of his existence, to ask and to expect some light upon the fact that he is a sinner.

The fact that he is a sinner. Does any one of us gainsay that fact? Is any one amongst us ready to stand up before God and plead "Not Guilty" at the bar of his heart-searching judgment?

God forbid! Account for it as you may or as you will, the fact of your being a sinner is impressed upon you by memory, by experience, by conscience, as well as by Revelation; proved by the testimony of an accuser within, whom you have not yet succeeded in drugging or bribing into silence: you know that, if there be a God, and if He be a God of infallible insight and of spotless holiness, you will never be able to feel in the hour of death, or to say in the day of judgment, I have not sinned: I am altogether clean and clear and pure from evil.

And yet, on the other hand, no reverent or even rational mind will be satisfied to believe that God made us sinful. Reason says, as much as Revelation, "In the beginning it was not so." In the beginning, when God created the heavens and the earth, He "saw everything that He had made, and, behold, it was very good." That is what we feel must have been; and Scripture says that it was so.

Therefore the question meets us again, and will meet us at every turn till God answers it, How did I get into that condition in which I find myself? How did man become what he is? a sinner by inclination and by propensity; a sinner in disposition and a sinner in act?

Read, in the face of that question, this third chapter of the Bible. Read it first as a history, and what is its epitome?

"The man, whom God had appointed lord of the earth and its inhabitants, was endowed with everything requisite for the development of his nature and the fulfilment of his destiny. In the fruit of the trees of the garden he had food for the sustenance of his life; in the care of the garden itself, a field of labour for the exercise of his physical strength; in the animal and vegetable kingdom, a capacious region for the expansion of his intellect; in the tree of knowledge, a positive law for the training of his moral nature; and in the woman associated with him, a suitable companion and help. In such circumstances as these he might have developed both his physical and spiritual nature in accordance with the will of God." *

In this most favourable position for maintaining his integrity, a tempter comes to him. The name given to that tempter in Holy Scripture seems to indicate that a spirit already fallen assumed the form of a serpent in his approach to the human being still upright. It is not for us either to explain or to dispute the possible agency of spirit over animal life. We see the same dark hint of such a connection in the miracle of the demoniac, out of whom the unclean spirits pass at the word of Jesus to enter with destructive frenzy into a herd of swine. The spiritual tempter must embody himself if he is to speak to man. The very fact of speech from the speechless, of reasoning from the irrational, of counsel from the inferior and direction from the subject, should have sufficed to put man on his guard; to prepare him for mischief, and to warn him against compliance.

Choosing in his subtlety the weaker and more dependent of the two human beings, the tempter addresses to her the first suggestion of evil. In the form of enquiry—enquiry with a view to satisfaction—on the subject of the Creator's regulations, he insinuates the intended doubt as to his equity and benevolence. "Yea, hath God said?" Instead of repelling the question, the woman enters upon it; engages in the discussion, though it be in the first instance but to state the truth. The very next utterance of the tempter is an open denial of the veracity of God. "Ye shall not surely die." The threat is an empty sound. On the contrary, the effect of eating of the forbidden tree shall be—and God knows it—that your eyes shall be opened to mysteries as yet concealed from you; your subject position will be instantly raised into independence, and you yourselves "shall be as gods, knowing good and evil."

---

* Keil and Delitzsch on the Pentateuch, vol. i, p. 91 (Clark's Foreign Theological Library).

Curiosity thus stimulated, pride irritated, and lust awakened, what should follow but the act of rebellion? Having once listened to the tempter, as he arrayed before her the advantages of disobedience, she began to view everything with his eyes; ran over in her mind the beauty and the sweetness and the mysterious properties of the prohibited fruit—and what matters it whether the trial of obedience be made in the matter of an empire or of an apple? the principle is the same in each—"She took of the fruit and did eat, and gave also to her husband with her, and he did eat."

The deed was done: easily done, soon done: a moment may accomplish the ruin of a soul or of a world: and now for its consequences.

The pleasure expected, the dignity predicted, the wisdom promised, where are these? True, the eyes are opened, but to what? Only to a sense of shame, to the consciousness of nakedness: they do know evil—and whose evil? Their own: their own fall, their own uncleanness, their own misery and degradation. The first consequence of sin is shame.

Presently the voice of the Lord God is heard, in the delightful hour of evening, when perhaps his creatures had heretofore been privileged to draw nigh to Him with something of a more immediate and intimate converse: but how does that voice sound now? The sinners are afraid. They dread the sight of Him. They hide themselves from the presence of the Lord God amongst the trees of the garden. The dread of God has taken possession of the souls which He had formed in his own image and admitted into his own communion. The second consequence of sin is fear.

But, though they might hide themselves, there is an eye which pierces all darkness, and there is a voice which summons all offenders to the bar of justice. "The Lord God called unto Adam, and said unto him, Where art thou?" And now a third effect of sin begins to unfold itself. Excuses come in, to aggravate the transgression which they seek to palliate. The man hid himself because he was naked. And when that excuse condemned him—inasmuch as their knowledge of evil could only have come through sin—he then throws the blame upon his weaker companion in transgression, careless if in doing so he even implicate God Himself. "The woman, whom Thou gavest to be with me, she gave me of the tree." The woman, in her turn, charges the serpent; and the Judge, in passing sentence, begins with the tempter. The third consequence of sin is self-excusing.

Thus then the fourth result of transgression begins to appear: and that is punishment. Every sin finds out its doer. So was it with the first sin. Each agent in that transaction stands separately and alone at the bar of God.

First the tempter, in that animal form which he had chosen. The serpent shall crawl for ever upon the ground, and eat dust mingled with all its food. There shall be war for ever between man and it. And so also with the spiritual foe who lurks behind it. The whole history of earth shall be that of an incessant warfare between man and his seducer. Bitter shall be the injuries done to the human being in the course of it. The devil shall have great power, and many an agonizing and many a deadly wound shall he inflict upon him who has now listened of his own free will to his lying voice. But in the end victory shall lie with man. At last he shall bruise the serpent's head. Just thus far was the darkness of the Fall lighted up by Revelation. All the rest was dark. Man's utter ruin shall have one glimmering light in heaven left to it: one hope, obscure and enigmatical in the present, but to be evermore cleared and brightened, as centuries of conflict and suffering run their weary course, by new gleams of intelligence, and at length revealed in all its beauty and in all its strength in the Person of One "born of a woman" that He may redeem the fallen and save the lost. Thus the serpent's curse is darkly interwoven with man's blessing.

Meanwhile, all else is left in dim darkness. The woman shall have a destiny all sorrow. On her way to that mysterious "childbearing" which shall reveal the promised seed and bring in an everlasting righteousness, she shall know nothing but pain and anguish. "In sorrow thou shalt bring forth children;" and the tenderness of woman's love shall but subject her more entirely to the rule, often arbitrary, often capricious, of the husband whom she led into the transgression.

And the man: what shall be his future? A life of toil; often excessive, often fruitless: a long struggling with a ground stubborn and barren as implicated in his curse: an eating of his bread in labour and sorrow, until he return to the very dust from which he was taken. Henceforth, according to the primeval warning, death should work in him until it be accomplished: an immortal sinner—a sinner, that is, immortal in his sinfulness—cannot be, and must not be, upon the earth: henceforward, if there is to be an immortality for man, it must be entered upon through the grave and gate of death; entered as a new gift of God, given only through a propitiation and a resurrection.

And so, finally, a fifth consequence is brought into view in the closing verses: an exclusion from the original Paradise, and from the tree of immortal life within it. "So He drove out the man: and He placed at the east of the garden of Eden Cherubims, and a flaming sword which turned every way, to keep the way of the tree of life."

I cannot close this part of our subject without calling you to notice one feature, not always sufficiently dwelt upon, in the history of the Fall of Man: namely, how God, while punishing sin, is yet seen to be still the God of the sinner; still opening to him a hope, however indistinct, of eventual restoration; still presiding over his steps, however rugged the path by which He must lead him; still providing for necessities which sin itself has created—Himself (as it is written) making for him—strange and wonderful words—those "coats of skins" with which shame must now clothe him; still therefore, in all ways, owning, though in displeasure, the souls which He had created, and evermore, according to his own most glorious attribute, "in wrath remembering mercy."

I have sought to present to you, with as little comment as possible, the sacred narrative of Adam's sin and Fall. A thousand questions might be asked upon it, which we cannot answer. It is doubtless one part of our discipline in this life, to be kept humble by a painful ignorance of things high and heavenly. The origin of evil, on the one hand, and the manner in which Adam's sin has affected his children, on the other, are two points upon which the wisest of men can tell us little or nothing. What we know not now, we may perhaps—certainly, if it concerns us—know hereafter.

But in the meantime there is this one thing rendered certain by the inspired record on which we have dwelt: that our condition as it now is, a condition of infirmity, conflict, and sin, was not our original condition: and if not our original condition, then neither our final condition: that evil which is no part of us, but a superadded circumstance of our being, may yet be cast out of us, shall yet be cast out of us, so that there shall be no trace, and no spot, and no stain of it left. God hasten it in his time!

II. But now I would look at the history, for a few moments, in its typical and representative character; and thus show how we ourselves act over and over again the sin of our ancestor, and render ourselves personally liable to that punishment which we speak of (in a certain sense) as hereditary and derived.

Was there ever a truer or a livelier representation than that which is here given us, of the course, progress, and end of temptation as it is now daily acted over again upon this earth?

I would speak plainly here, and commend the words to every man's conscience in the sight of God.

Yes, I address in these pages many who have sinned; sinned personally, repeatedly, and in manifest ways; manifest, I mean, to themselves, however veiled and secret from the eyes of others.

Now I would ask them whether the record of Adam's sin is not also the record of theirs.

You have noticed how the temptation opens. Something is presented just for consideration. Is there any harm—can there be anything really wrong—in doing this or that? Can God really have forbidden it? Yes, the mind makes answer to itself—or, which is the same thing, to the tempter within—it certainly is forbidden: I know it is wrong. I should like it, but I suppose I must not do it.

The words are most of all appropriate to the case of gross sins: but they have their application to all sin; if it be that of speech, or of temper, of imagination, or of omission.

I must not do it. Still the thought is lodged there. It comes up again and again. I should like it, but it is forbidden.

Now here, my young friends—for to you would I speak, who have not yet crossed the boundary line of actual known sin—here is the vital matter. These ponderings of sin, these parleyings with the temptation, these discussions with yourselves of forbidden indulgences, these are the things which you must resist, which by God's grace you must put down in yourselves, if you would keep yourselves unspotted and pure in the great matter of the soul's life.

For see how bold the tempter becomes, who has just got a hearing. It is true you told him that God had said this or that; that such or such a thing was wrong. But the very answer has emboldened him. He sees that you would like to do it if you could: and in that wavering of the inclination he sees an eventual triumph. He ventures now upon challenging the prohibition; says out, "Ye shall not surely die;" tells how many have done the same thing, and not suffered for it; how many have stepped just so far out of the right way, and have soon and easily returned to it; or, if not, have been still prosperous, still successful, still happy: "Ye shall not surely die:" depend upon it, God knows that you will not: God knows that this act which you call sin would make you happier, more manly perhaps, more knowing, more independent of foolish scruples and unnecessary restraints: God knows this, and if He still forbids it, it is unreasonable, it is hard, it is arbitrary: break loose—disobey this once—it will make a man of you.

Such are the thoughts, more or less realized, which pass rapidly, sometimes with the quickness of lightning, through a soul under temptation: and O, for once that they are resisted, how often are they yielded to! yielded to by those who know better, by those who half regret it at the moment, who in the retrospect will repent of it bitterly!

And then how does sin spread itself! It cannot rest till it has drawn others in. The woman must make her husband eat: the friend corrupts his friend, the brother entices his brother: and so a deluge of misery enters the world in one drop of sin.

What shall we say of consequences? Man, even fallen man, differs from the evil spirit in this: that he still, at least in the early days, is conscious to himself of his own sin; is but half its friend; has many misgivings and many self-reproaches, even though his life is defiled and spoilt with transgression: and herein, just in this one thing, lies for man a possibility of redemption, which for fallen Angels is not. A man is of two minds: sensual, yet also perceptive of good: he approves the law of God after the inward man, even when how to perform that which is good he finds not.

Hence shame; hence fear: shame when he sees himself naked; fear when he meets his God at evening, and at the voice, "Where art thou?" must come forth and show himself to his Maker.

O how many young men know the truth of this description! men who cannot quite give up all pretence of belief, cannot shake off the habit of evening prayer, even though they can overbear conscience, and do, and do again, the thing which they know is wrong! Yet even they know the bitterness of that after-shame, which makes them blush before themselves in secret; of that after-dread which haunts and oppresses the soul, when it drags itself back at night just to say its prayers! "Adam and his wife hid themselves from the presence of the Lord God amongst the trees of the garden."

And then those excuses. What sin has not its excuse ready? Sometimes, its commonness: every one commits it. Sometimes the force of individual example: I could not stand alone. Sometimes the influence of a warm affection: my own heart, my own kindliness and love, led me into it. Sometimes, O how often, circumstances—which are God's Providence; or what we call temperament—which is God's creation! Who has not often charged God Himself with the authorship of his sins? Why hast Thou made me thus? so impetuous, so passionate, so hot in impulse and in appetite? Or, why hast Thou placed me thus? under influences so strong, so resistless, and in my case all for evil? Where, in short, is he, who, when he has fallen, throws himself on his face before God, takes all the blame, confesses his own wickedness and his own desert of punishment, and cries aloud for mercy to One whom he cannot make his debtor? May it not be said of that man, that, "though he fall, he shall not be cast away?"

III. We have just touched, though with a faint and light hand, the second topic; that of the Fall as a type: and now let us, in conclusion, say one word upon the remaining point; the Fall in its reversal. What does Holy Scripture reveal to us concerning the undoing of this fatal deed, this deed of our first parents, of which not only have we all reaped the bitter fruit, but which we ourselves have done over again, making it our own choice and act, till certainly we, like them, are without excuse?

The reversal of the Fall is in the work of our Lord Jesus Christ: in his perfect obedience; in his personal victory over every assault of the tempter; in his sufferings voluntarily undergone in working out for us also an eternal redemption; in that death by which He "destroyed him that had the power of death, that is, the devil," and opened, for us men and for our salvation, the gates of the grave and the gates of hell. These things had in them the virtue and power of an entire reversal of the Fall of Adam. Though not yet rendered availing, by a personal appropriation, to the whole race of man; though waiting for a consummation not yet seen, and a result not yet realized; yet they have in them virtue sufficient for the perfect work; they communicate that virtue already to those who truly believe; and they point onward to a time when sin shall be utterly destroyed and cast out of God's creation, and when there shall be "new heavens and a new earth, wherein dwelleth only righteousness."

Read, in this light, as a reversal of Adam's Fall, the record of our Lord's temptation. How the tempter came to Him, as he came of old to the "mother of all living," and bade Him turn the stone into bread for the support of his sinking exhausted frame. There was no sin in that: no prohibition like that trampled upon in the Fall. And yet the Saviour would not. Why? Because He knew the voice; knew it for an enemy's voice, and would none of it: because He saw in the suggestion the hint of faithlessness and self-seeking, and would lean, in entire self-renunciation, upon the all-supporting, all-providing hand of God. Then was the Fall reversed. Then did "the strong man armed" meet a stronger than himself, and retire from the encounter foiled and vanquished. This temptation was in the same region as the earliest of all: it had to do with the body, and with its support by food: it came in the most refined of all forms, suggesting an act not wicked: and yet it was repelled; it was refused and overborne by a stronger sense of duty and of the will of God.

Thus has it been, in a lower degree, with all who in Christ's name have gone forth to the conflict with temptation. Read in this light the lives of saints. See how they have been enabled, by a mightier strength within, to conquer where Adam fell; to say No to appetite, passion, and lust, and wage a successful warfare with "hosts laid against them."

And read in this light the lives of saints still living. What is a saint? He is one of God's consecrated ones. Not a man of different mould from other men; but one on whom the anointing oil of the Holy Spirit has been poured from on high, enabling him to go forth in God's strength to the common occupations and common trials of life, having within him One greater than all that are in the world. There are saints amongst us, in this Scriptural sense; though alas! fewer and feebler than they ought to be. There are men who in the busiest or the humblest callings of this restless and troublous world are striving to maintain a consistent Christian conduct, and whom no force of authority or of example can drive or constrain into immorality or dishonesty. In them also we see a reversal of Adam's Fall. In them also we see how the grace of God through Jesus Christ, earnestly sought and carefully fostered, is able to bring strength out of weakness, and to enable men of no peculiar talent, address, or courage, to stand upright and stedfast in that hour of fiery trial which tries every man's soul of what sort it is.

And read, finally, in this light, the latest chapters of the Book of God. Read, especially, how in the last chapter of all, the 22nd chapter of the Revelation of St. John, it is expressly said that in the heavenly city there stands in the very midst of its street that tree of life from which the fallen Adam was banished, bearing twelve manner of fruits, and yielding her fruit every month, so that the leaves of the tree are for the healing of the nations. And read too that benediction which stands later still in that latest utterance of Christ to the Churches: "Blessed are they that do his commandments, that they may have right to the tree of life, and may enter in through the gates into the city."

Miss not, beloved friends, your share in that glorious promise! Fight now the good fight of faith! "Put on the whole armour of God, that ye may be able to withstand in the evil day, and having done all to stand!" So shall your last end be peace. So shall an entrance be ministered to you abundantly into the everlasting kingdom of our Lord and Saviour Jesus Christ.

HYMNS.

Angels twain were sitting
In the empty tomb;
Lights of day were flitting
Through the silent gloom—
Heavenly angels shining,
Lights of common day,
Blending and entwining
Where the Saviour lay.

Often in our sorrow
Angels may be seen,
When we look to-morrow
Where our griefs had been;
And the angels holy
Comfort us, and say,
"Lo! the Meek and Lowly
Pluck'd the sting away."

Often, as we languish,
Comes the sunshine calm,
Changing all the anguish
Which we would embalm;
And its common beauty
Bids the soul away
To the common duty
Of our every day.

So the angels sitting
In the vacant tomb,
And the daylight flitting
Through the silent gloom,
Grace and duty blending
In a faithful word,
Send us, gladly wending,
On to meet the Lord.

O Pearl of price! my treasured hoard!
O riches righteously adored!
My Christ, my King, my glorious Lord!
The way to God, we all must go;
The truth of God, we all should know;
The only Life in God below!

My faithful Friend, whate'er befall,
My Hope when terrors dark appal,
My resurrection, and mine all!

Lo! all the Love of God is Thine,
And all the wealth of grace divine,
And all Thy riches now are mine.

In Thee my sins are all forgiven,
And sorrows are but shadows driven
Across the sunshine sweet of heaven;
In Thee is Life divine and pure,
And holy joy, and peace secure,
And light that shall for aye endure.

Redeemer, Saviour, Christ divine,
Let all else perish, all is mine,
For Thou art God's, and I am thine;
And all besides is empty loss,
And filthy rags, and wasteful dross,
To know Thee and Thy saving cross.

I filled me with the fear of Hell,
And thought it was the fear of God;
I did not seek to love Him well,
I only trembled at his rod.

The burning fire, the smoking pit,
The worm undying in the breast,
And Dives with his torment smit,
Forbade my trembling heart to rest.

O dreary time, without a gleam
Of Love divine to gild its wrath!
O weary time, without a stream
Of joy in God to cheer my path!

But Christ in mercy did disclose
His grace and love unsearchable;
And from my bondage I arose,
Triumphing o'er the fear of Hell.

And then I knew the fear of God
Sweet hope and joy and peace imparts,
And walks in light along the road
With heaven unfolding in our hearts.

O blessed Christ! O blessed Cross!
O blessed Spirit! that show'd to me
How terror is Eternal loss,
And trust is Immortality.

ORWELL.

PILGRIMAGE TO OLD-SERBIA.—ANCIENT CHURCHES AND MODERN SCHOOLS.

After long travelling through the brigand-haunted mountains, the neglected plains, and the disorderly townlets of that part of Turkey-in-Europe called by Mussulmans the land of the Arnaout, one day we halted before a noble church. Its walls were built of marble, red, white, and grey, ranged in alternate layers, and some of the slabs so highly polished that the country people take them for crystal; its doors and windows were surmounted by sculptured arches of rich design; its interior was adorned by frescoes traceable rather to an early Italian than to a Byzantine hand. We exclaimed, "Who would have thought to find such a church in *Arnaout-luk!*" A Christian priest who was acting as our cicerone, drew nearer and said in a low voice, "*We* call this country *Old-Serbia.*"

Map of Stara (Old) Serbia.

Principal Places on the Map:—*Field of Kossovo*—Scene of the Battle in which the Serbian Empire was overthrown by the Turks, 1389. *Prizren and Skopia*—Ancient Serbian Capitals. *Mileshevo, Gratshanitza, Sapochani, Giurgevi Stupovi, Dechani*—Ancient Churches and Monasteries. *Ipek*—Former Seat of Serb Patriarchs. *Novo Brdo*—Town in neighbourhood of Silver Mines.

The name tells its own tale, at least to any one conversant with the history of that portion of Europe which lies between the Danube and the frontiers of ancient Greece. The district designated by its Mahometan inhabitants as Arnaout-luk, and by the Christians as Old or Stara Serbia, is situated north-west of Macedonia, and until the end of the fourteenth century formed part of a powerful Christian monarchy extending from the Danube to the Adriatic. This monarchy was called Serbia,* and what remains of its manuscripts, paintings, and architecture, together with its code of laws, shows it to have been fairly on a level with contemporary Christian states. Its sovereigns assumed the style first of King and then of Czar, and were addressed and treated with as such by the great republic of Venice; its chief ecclesiastic received the title of Patriarch, and was acknowledged by Constantinople. The residence of the Czar was the town of Prizren, the seat of the Patriarch was the town of Ipek; between the two, stretches a fertile plain, in old time called Metochia, and there, among protected villages and peaceful monasteries, stood a church, whereof the king who founded it was so proud that its name has become his surname, and he has gone down to posterity as King Urosh of Dĕchānĭ. Prizren, Ipek, Metochia, and the great neighbouring plain of Kōssŏvŏ, which has given its name to that decisive battle in which the power of Serbia was broken by the Turks—all are included in the tract of country called Old-Serbia. Immediately to the north lies another tract, about one-fifth smaller than Scotland, and with the Danube for its frontier; it rejoices in the name of Serbia, minus the qualificative *old*. For in the beginning of this century the Serbs on the Danube drove out the Turks and established native government, but those farther inland were unable to join them, for reasons which we must shortly detail before proceeding to the recital of our adventures.

---

* Ser*b*ia—not Ser*v*ia, the Greek form of a Slavic name, retained by our geographers, but long since disused by the Germans and French.

When the Serb people first were obliged to admit the sovereignty of the Sultan, he promised them self-government, with absolute religious toleration; their civil rulers were indeed gradually expelled, but their Patriarch lived at Ipek as before. No sooner, however, did the Mussulmans get a sure footing in the country, than they began to persecute and trample the Christians, to seize the town-churches for mosques, to interdict the open observance of Christian worship, to carry away Christian children; at last they seized the Patriarch himself, took him off to Asia, and had him hanged. On this the Serbians felt that the Mahometan yoke was no longer to be borne; 30,000 families resolved to leave their country, and a newly-elected religious chief offered to lead the emigration. At that time the Emperor of Germany was at war with the Turks, who had fearfully ravaged the eastern portion of his empire; so he invited the Christian emigrants to pass into his dominions, to repeople and cultivate the north bank of the Danube, and to help to defend it against the Infidel; at the same time he promised that they should return to their own country as soon as he could conquer it back. Unluckily, it has not been conquered back yet, nor is it likely ever to be so, as far as the Germans or other foreigners are concerned.

The Serbian emigrants still remain on the wrong side of the river, but during more than two centuries they have preserved their own language, their fidelity to the Oriental Church, and a certain measure of self-government; while they still speak of the countries south of the Danube as their real fatherland, to which they shall some day return. One part of their present territory they have in a manner dedicated to the memory of their old home—viz., a hilly peninsula, called the Frusca Gora, between the rivers Danube and Save. Here they have built churches, and called them after the names of those they left behind; hither they have transported part of their treasures and the bones of some of their kings. Their most sacred relic is the body of their last Czar, which is shown to the people in an open coffin, dressed in the robes in which he fell in the great battle against the Infidel. On the anniversary of his death the inhabitants of the Serbian lands north of the Danube and Save make pilgrimages to the church where he lies, and on this and similar festivals their bards sing to them of the deeds of their ancestors, and the old men hand down descriptions of their fathers' land. They are told how many of the grand old churches have been turned into mosques or utterly destroyed, and how in various places the Christian people hold their worship among moss-grown ruins; but it is related also that one or two of the said churches have been spared, inasmuch as the Christians will pay almost anything to save them, and thus they prove to the conquerors a constant means of extracting bribes. Among the churches thus preserved are, it is said, those of the Patriarchate at Ipek and of the monastery of Dechani, and the description given of them in the Frusca Gora is enough to send anyone on pilgrimage to visit these Old-Serbian shrines.

But to such pilgrimages there exist obstacles in the habits and dispositions of those who now tenant the Old-Serbian land; for when the 30,000 families emigrated they left behind them comparatively few to cultivate and defend the fertile plains of Metochia and Kossovo, and these soon found rude settlers in the Albanians, Skipetars or Arnaouts, who came down on them from the surrounding hills. In old times the Northern Albanians and the Serbians appear sometimes as under one government, sometimes allies, and generally, as it seems, good friends; and to this day many of the Arnaouts speak, in addition to their own language, Serbian, whereas they do not and will not speak Turkish; but most of the Serbs belonged to the Oriental Church, while the Albanians were chiefly Roman Catholics, or, as they say, *Latins*. So long as these Roman Christians kept to their mountains, the Sultan could get no more out of them than a nominal recognition, which is all that is yielded to this day by such of their tribes as remain in the hills. But when the Albanians came down to the plains, they became subject to the same oppressions as had driven away so many Serbs. Only a few of the Arnaouts could bear this, and even now some of them appear to change their faith backward and forward, according as they are most alarmed at the prospect of purgatory wherewith their priests threaten them, or by that of temporary torments at the hands of the Mussulmans. As for the greater number of those who seized upon the plains of Old-Serbia, they apostatized and went over to Islam. On this, the government of the Porte, having laid pressure on them till they renegaded, ceased to exert the degree of authority which might have reduced them into peaceable subjects. Wild mountaineers as they were, they continued their family feuds and blood feuds unrestrained, while they hugged their new creed for the excuse it afforded them to plunder the Christians they found in the plain. The country from end to end became a den of robbers, and was appropriately named after its new lords,—Arnaout-luk.

Even to such officers as the Porte does send among them, the Mahometan Albanians offer scant homage. "Fear God little," say they; "and as for the Sultan, do not know that he lives." Just before our visit, the Kaimakan (governor) of Ipek having gone so far as to raise taxes from Mussulmans as well as from Christians, was shot by the former in the very act. As it happened, this incident turned out to our advantage, for a direct attack on the Sultan's representative roused even the sluggish Turkish authorities, and a neighbouring Pasha, with a body of regular troops, was sent to restore order in Arnaout-luk. His progress left behind it little or no permanent benefit, but for the time being it infused such a degree of scrupulousness into the brigand-inhabitants as served for the protection of travellers, at least of travellers who were also Franks.

One word more to depict the present state of Old-Serbia. Although, as we have said, the emigration of its Christian inhabitants disabled this part of the country from driving out the Turks when they were driven out of the districts nearer the Danube, yet many of the Old-Serbians have tasted of freedom and native government in visits to their countrymen in the so-called Principality of Serbia. It may be wondered that they do not emigrate thither entirely; and many do so as soon as they can earn money to transport their families, while young men who cross the border unmarried, can scarce ever be induced to return; but the Turkish authorities do all in their power to hinder the departure of their only quiet cultivators, and the Government of the Principality of Serbia does not encourage people to leave the old country, since, should they all depart, there will be no chance of ever restoring it to Christian rule. It is those of the Old-Serbians who visit the Principality, and then return to their homes in Arnaout-luk, who do the most to serve the nation, for they bring back with them the ideas of liberty and of progress, sometimes they even bring back school-books hidden in bales of merchandise. The seed falls in prepared soil, for the old monasteries with their stores of MSS. have at least served to keep up the memory of national culture and to identify it with the memory of national freedom. "Let us have schools," say their elders one to another, "such as you and I saw in Free Serbia. Our sons ought to know more than we do, if they are to bring the good time nearer." The proposition finds favour, and the idea spreads even to the weaker sex. In Ipek, the old seat of the Patriarchate, there was found a good and brave woman, who said, "Let us have schools for our daughters as well as for our sons."

Hence comes it, that on our pilgrimage to Old-Serbia we found not only ancient churches, but several small modern schools.

It was on a beautiful evening in July that we issued from the northern passes on the plain where stands the town of Ipek. In spite of the neighbourhood of the Pasha and his soldiers, it was not judged prudent for us to cross the mountains with a guard of less than twenty men, and on our way we met a second troop, the leader of which was the greatest villain in the country, and as such had been made responsible for our safety. During the first part of the way our escort scampered about at will, but presently we came to the Streta Gora or gorge of the river Bistritza, a bridle-road across the face of the rock, narrow and without parapet. Here our cavalcade had to march single file, and a lengthy and wearisome procession it proved. At last we came to the key of the pass, the so-called "Grad of Irene," which for lack of standing room on the face of the cliff has turned the rock itself into a castle, connecting and fortifying a series of caves. Here you pass out as through a gateway, and the rocks close behind you as folding portals; soon after you find yourself under the white walls of a monastery, and the Arnaout leader clapping spurs to his horse, whoops out, "Here we are!"

The foot soldiers filled the court, the Arnaouts clattered in on their prancing steeds; in vain we returned with all imaginable cordiality the salutation of the monks—evidently they were frightened to death. At first they declared they had no room fit for us, but taking them apart we addressed them in their own tongue, told them we were Christians, that we could send away our guards, and would pay for all we used. Thus reassured, they showed us up-stairs to a large empty chamber, wherein we spread our carpets, and set up our camp beds and table. When we entered the windows were without glass, but on the departure of the Arnaouts, glazed frames were brought, and, with much ado, fitted in.

Next morning we received visits, or rather deputations, from Ipek—the Turkish governor's son, a fat red-faced man in uniform; the plausible and loquacious Roman Catholic Albanians; the stalwart and reserved elders of the Serbs. Our most interesting visitor was the Serbian schoolmistress—Katerina Simitch, a grave intelligent woman in the dress of a nun. All gave a sad account of the state of matters at Ipek—quarrels, robbery, and murder among the Arnaouts,—destruction overtaking every prosperous Rayah, insults to the point of flinging stones at the Christian dead when carried forth for burial.

When the monks had satisfied themselves that we were friendly, and further, that except our own cavass, every Mussulman had left the monastery, they invited us to come and see their church, and whispered that they had ancient things to show. A wall, passing through the court of the monastery, parts off the sacred building, and to some extent hides it; and only on entering the inner inclosure we saw anything to remind us that we stood within the venerable Patriarchate* of Ipek.

The original church, built in the thirteenth century by the successor of St. Sava, the first Serbian metropolitan, was afterwards almost destroyed by the Turks, and the present building is a structure of the sixteenth and seventeenth centuries, when art in Serbia had sensibly declined since the days of freedom. Hence this church is far less beautiful, both as regards form and frescoes, than some others; on the other hand, it is richer than any in relics and tombs. The central edifice and two large side chapels are each surmounted by a dome. Seen from without, three leaden cupolas in a row look heavy and tasteless enough; but their windows throw an effective and unusual flood of light on the interior, and in the two side chapels the windows have coloured glass, a great rarity in Serbian churches.

The nave is low in proportion to its length, and is full of monuments. On the right side, near the altar-steps, stands the marble throne of the patriarchs. The south chapel contains a miraculous icon of the Virgin, adorned with a necklace of old gold coins. We were shown the mitre of the Archbishop Nicodemus; also an ancient patriarch's staff, with an inscription, partly Greek, and partly in characters unknown.

There are still MSS. and some articles of value belonging to the church at Ipek; but to save the conscience of the Hegoumon a useless burden of "Neima's," ("There is not") a monk told us frankly that they dared not draw these treasures from their hiding-place.

We were hurried in our examination of the church by the appearance of our cavass, doing what he could to prevent the Arnaout leader from following him into it. The Mussulmans had come to conduct us to the town, and that they might have no excuse for remaining, we hastily took leave of the monks, and set out.

From the Patriarchate to the town of Ipek is scarce a quarter of an hour's ride. On a green plot outside the town, the Serb mistress had drawn up her school—pretty little girls, glowing with health and excitement, smooth-haired, and dressed in their holiday garb; the grey figures of the nun and her assistants marshalled their white and crimson ranks. Next day, we visited the Serbian schools. That of the boys was small and low, but filled with handsome sturdy children. They received us singing at the top of their voices, and accompanying themselves on pieces of metal, which they struck into a jingling like that of small bells. The school-books were, as usual, from the printing press in Belgrade in Free Serbia; maps they had not, so we promised them a supply. The female school was still humbler than that of the boys, for the Arnaouts tol-rate no display; and as it is, have twice forced an entrance, and robbed it of all they could find. Twenty-seven children could read Serbian and the old or church Slavonic, and write a little. "That is all," quoth Katerina, "that we can teach them, for it is all we know ourselves; but those who can read have it in their power to learn more." From the school-room we were conducted into Katerina's parlour, and there introduced to her grown pupils and their mothers. Several wore a sort of monastic garb; for although Katerina was the only one among them regularly professed, the rest had dedicated themselves to a single life, good works, teaching, and prayer. The story of Katerina is this:—She was the wife of a priest, who taught her to read. After the death of her husband, and her only daughter, she set herself to teach the daughters of others. The bishop passing through Ipek, heard of her, and proposed to her to take religious vows. She answered, "I am willing to do so if, as a nun, I can continue to teach children." Those only who know how hard it is in these countries to find a Slavonic female teacher, and how hard, when found, to retain any schoolmistress, the usual object of her engagement being merely to earn a marriage portion—will be able adequately to appreciate the seed of usefulness in the Serb school at Ipek.

A red-tunicked Arnaout, with his Bashi-bazouks; an officer of Nizam, with six troopers carrying flags; mounted citizens, among whom we recognised the Latin elder, and a Serb pope—these formed our escort out of Ipek. On the way we stopped to pay a visit to what is called the Arnaout girls' school. It was not the first we had seen, but for long these so-called schools had seemed to us an unfathomable mystery, since the women who frequented them could neither read nor write, and assured us that they learned their sewing at home. At last it was explained that the course of instruction consisted in teaching them to hum over what they call Turkish prayers—*i.e.*, prayers in a language they understand not, and respecting which they are quite uncertain whether it be Turkish or Arabic. In most places we had found great reluctance to admit us into Mussulman girls' schools, but the Arnaouts of Ipek were now on good behaviour, and our present visit was paid by special invitation.

A door in the garden-wall was opened by its turbaned keeper, and as we entered it, each was seized by a Hodgia, or teacher, but more like a harpy. We were embraced, dragged, carried through the court into the house, and finally deposited on a low divan in the corner of a close room stuffed with females. The harpies began tearing off our riding things, and fanning us: the first was enormously fat, and red-faced; the second I forget; but the third, haggard and vulture-beaked, was coifed with a pale green veil. The noise they made was stunning, and among their outcries we distinguished, "Are you Mussulmans? Are you

---

* We call this monastery and church the "Patriarchate," because the people of the country call them so, not giving themselves the trouble to distinguish between the jurisdiction of the Patriarch and his former residence.

Mussulmans?" At first, not feeling sure of consequences, we took no notice of this query; but rendered desperate by their civilities, at last cried out, "No, we are Christians." These words acted like a spell. The three Hodgias fell back, the crowd closed on them, even the voices underwent a lull; we, profiting by the result, contemplated the tenants of the school-room. Except a few puzzled-looking children, all were grown up, and many were past their prime—evidently an assembly of the Arnaout ladies of Ipek. Presently we asked, in Serb, if they would kindly show us their books.

Thereupon the harpies-in-chief reappeared. "What did we want? Coffee was coming." Suddenly a voice sounded behind us, and we perceived outside the low window a woman holding a baby, who looked into the room over our shoulders. She spoke Serb, and said, "You wish them to read, do you not?" Then, lifting up her voice, shouted, "They want you to teach. Teach, I say." General hubbub, everyone with a different outcry. "What do you want?"—"Books!"—"Coffee!"—"Teach!" At this juncture, the fat Hodgia leant over us, and with hospitable intent to make our seat more comfortable, began clawing up the fusty cushions behind us, and clapping them. Stifled, we sprang to our feet, and, as courteously as the crisis permitted, dived and waded through the squatting forms. At the door we met the coffee; but as it had been brewed since the discovery of our Giaourism, we were not tempted to do more than put our lips to it. The turbaned keeper laughed good-naturedly at our suffering aspect, and hastened to undo the garden-door. Once without, the red-coated Arnaout, the Nizam, Serbs and Latins, all seemed as saints and angels after the crew within the school.

The Patriarchate of Ipek and the Monastery of Vissoko Dechani are divided by a distance of three hours. Each lies at the point where a stream called Bistritza* flows from the mountain gorges into the plain. This plain, lying between the great monasteries of Prizren, Dechani, and Ipek, was almost all Church land, and hence its name Metochia (μετόχιον); but since the emigration of the Serb inhabitants, and the descent of the Arnaout from the hills, the latter have called it, from their former home, Dukadjin. These two names express the change that came over this once favoured region, for of all the haunts where the cowardly brigand, firing from his ambush, plunders the industrious and defenceless, none is more notorious than the northern corner of Dukadjin.

Our way lay along the base of a wooded range, shooting up into high fantastic crags, now peaked as an obelisk, now crenelated like the battlements of a castle. Beneath the grey cliff the mountain forest showed an emerald verdure these lands but seldom see; and from the forest downward stretched fields and pastures dotted with groves and fragrant with fresh hay. Nor did the picture lack its foreground, but instead of patient oxen and labourers wending home, we had the flags of cavalry and their prancing steeds, the gold and crimson tunic and long gun of the Arnaout.

It was evening ere we caught our first view of Dechani. At the opening of a dark glen at the foot of wooded hills, the clear-cut outlines of those marble walls streamed through the twilight with pearly brightness. After a day spent among the savageries of Arnaout-luk, night brought with it the witness that this was once a Christian land.

At the great gate of the monastery stood the abbot, with the priests carrying banners, and clad in scarlet, white, and crimson. As we alighted, the priests turned about, and marched before us towards the church; the abbot signed to follow in procession. From the clear summer evening we passed into the shadow of the marble nave, and stood before the gate of the sanctuary. A short prayer was chanted by the priests, a silent prayer followed, and then the abbot welcomed us to Dechani.

The monastery is built on the north side of the church, the whole being surrounded by a court. To keep the Arnaouts out of those places where they can do most mischief, a second wall has been raised through the court, and joins the church at the west end. Within this inner enclosure are the guest chambers, with large windows opening on a front gallery, and small ones opposite looking on the Bistritza. The room assigned to us was spacious and painted, and contained, besides the divan, a table and chairs. It was built and furnished with money from Serbia; a tablet laid in the wall records the gift of Prince Milosh. Cool and shady in the midst of summer, the traveller will at first pronounce this chamber delightful; but let him not rejoice too soon. The absence of glass in the windows, the draught that pierces through and through, the chill night air on stream and hill, are highly suggestive of rheumatism and fever to the frame of a new-comer from the Ipek plain. We suffered so much that Hadgi Cyril, the second Hegoumon, in whose chamber the windows were glazed, kindly gave it up to us; still, illness did much to impede a full use of the ten days we spent in the convent.

The church and monastery of Dechani were founded by the sainted King of Serbia, Urosh III., thence called "Kralj Dechanski." In his time the monastery was a royal residence, and there is still to be seen the old kitchen with its central fireplace; also the rooms, now renovated from their foundations, where the royal saint, when on a visit to the monastery, entertained his numerous guests. The higher room is for the richer sort, the lower for the poor. The latter has a board long enough to accommodate a hundred persons, and at its upper end are the small stone table and chair where the good king sat and looked on.

After the battle of Kossovo, the Turks sacked the monastery; and when Czaritza Militza, the widow of Czar Lazar, came thither, she found, in the words of the charter, "This lovely spot, the resting-place of the sainted King Urosh III., so laboured and cared for by its pious benefactor, now, on account of our sins, by the permission of God, burnt and destroyed of the evil tribe of Ishmael." Militza restored the convent from its ashes, and granted a new charter. Since then, however, it has been ravaged by a barbarian known only by the indefinite appellation "Tartar Khan," and it was probably in this last calamity that the campanile perished which used to stand over the court gateway.

---

* The name "Bistritza" signifies clear, and is very common among Slavonic streams. In this neighbourhood there are three Bistritzas, tributaries of the Drina.

Fortunately, the ravagers of the monastery have hitherto spared the church of Dechani, a beautiful structure of the fourteenth century, which, some broken carving excepted, is still as perfect as when it issued from the hand of the founder. In outline the church is cruciform, and consists of narthex, nave, and sanctuary, with two small side-chapels; unlike some other Serbian churches, it is not cumbered with an extra porch. A cross of massive silver surmounts its single dome. The monks declare this cupola was to have been only one of twenty-four, and that the interior is vaulted to correspond with that number. But as the end of the royal founder drew nigh, it became unlikely he could complete twenty-four domes; so St. Nicolas, appearing in a dream, desired him to finish the church with one, and dedicate it to the One God in Trinity. On high festivals the dome of Dechani is illuminated, and can then be seen as far as Prizren —cheery light for the Christian in these plains!

The east end has five round apses, the full wave of the centre receding in two smaller ones on either side. In the principal apse, and over the west door, are large three-light windows, divided by slender columns, and surmounted by a projecting arch resting on richly carved pillars. Similar arches adorn each of the three doors, which are all in the narthex.

All round the walls runs a stone bench for the repose of weary pilgrims. On this bench, of a sunny afternoon, you are sure to find the Archimandrite Seraphim, waiting for the vesper-bell. Under his guidance we will enter the church.

The narthex is panelled with red and white marble, and its vaulted roof rests on four marble columns, of which the capitals and pedestals are ornamented variously with birds, beasts, and flowers. The walls are covered with frescoes of sacred and historic subjects, and on the north side of the door leading into the nave are the figures of the founder and his son. On the wall behind the font is painted the genealogy of the royal race of Nemania. The door into the nave has an elaborate round arch, supported on pillars of red and of white marble, in rows of six on each side. The nave has four columns, like those in the narthex; and besides these, eight painted pillars. Entering from the narthex, your eye falls on two tombs covered with red velvet, which stand side by side to your right. These are in memory of the royal founder, and of St. Ielena, his sister, a wife of the Bulgarian Czar Michael.

Opposite the altar-screen are two stalls—one the bishop's, and the other the old marble seat of the Serbian kings. On the left side of the altar-screens are the relics of the "Sainted King." The body lies in a painted and gilt coffin, clad in silken garments. Within the holy place is a stone synthronus, and the altar, which is of marble, apparently modern. There are but few valuables to be seen in the sanctuary; the most remarkable are several crosses, and a so-called model of the church, well-bejewelled, but clumsy and unlike.

The wonders of Dechani do not terminate with those to be found in the precincts of the convent. Behind it lies the glen of the Bistritza, of which the cliffs contain no less than 200 rock hermitages, wherein were written great part of the MSS. now stored in a chest within the church. We saw among them an illuminated copy of the Gospels.

Since the Arnaouts have taken leave to feed their flocks on convent ground, and to range about the hills with their guns, the hermitages (*Slav*, postionitze) have no longer been safe for the monks; but in old times they were in high favour, and were tenanted by illustrious personages, among others by king Urosh, and his sister the czarine. During our stay at the convent we explored several of them, but they are not very easy to get at without the ladder or plank which their whilom inhabitants used to extend to visitors. Persons not addicted to scrambling may be glad to know that a good view may be obtained of the two principal hermitages from a path on the south side of the Bistritza, about a quarter of an hour from the convent. Hence we see the hermitage of the king, like a high narrow house with windows and a door, and a rock for its back wall. Lower down on the bare face of the cliff is the hermitage of St. Ielena. Denuded of its front, it gives to view two arched clefts, with a rose-bush between them. We were bent on gaining a near inspection, and therefore crossed the Bistritza, and clambered up the steep bank on the other side. The destruction of wall in St. Ielena's hermitage has left scarce footing across the face of the cliff, and even when you have gained the first cell, there is nothing to be seen. But pushing through the rose-bush you get to the second, and there find traces of the sanctuary of the hermit's chapel. A slab cut in the rock represents the altar, and the icons are painted on a stucco coating.

Between the hermitage of St. Ielena and that of the royal saint, we passed a fountain called Kralieva Chesma. Arrived at the cell, the monk was about to lead us in, when, with a cry of dismay, he pointed to the traces of fire. "They have burnt the staircase, all is destroyed." Too true, the Arnaouts, finding shelter in the entrance, had lit their fire, using the stair for a chimney, and thus was burnt not only the means of ascent, but the very floor of the upper room—after lasting five hundred years! Imagine our feelings when a moment later we found one of the perpetrators of the mischief nonchalantly looking on at our side—Arnaout, of course, a half-naked, stunted savage, by way of herding goats, but duly carrying his gun.

However, the monks would easily forgive the Arnaouts for destroying the hermitages, if only they would cease to prey on the convent itself. By the edict of its founder, Dechani was to be a "Royal House," where every poor man might be sure of a piece of bread, and fields and pastures were assigned from which to provide its hospitality. The order is now changed. To sustain the convent, Christian peasants give of their poverty; while the lazy Mussulman, having taken away most of the pastures and fields, yet demands at his pleasure food, lodging, provender for his horses, raki for his feasts, and when all is supplied, regards it only as a tribute for his forbearance in letting the convent stand. Travelling Pashas, and their locust suites frequently quarter themselves in the monastery for days; and during the Montenegrin war, parties of Nizam, Bashi-bazouks, sick, wounded, all found quarters there in turn, all devoured, no one paid. We ourselves saw how of an evening any number of Arnaouts would stalk in, and demand supper and a night's lodging, giving no better reason for their intrusion than that they were tired, and did not wish to walk to their homes that night. After supper, there is often a brawl, and the Zaptieh paid by the monks to protect them, has ere this been wounded in his attempts to keep order; while nothing but the consideration that they would thus lose their free hostelry, deters these wild guests from burning the convent any day. Again, when the Mussulmans hold a feast, they scruple not to borrow the dishes, clothes, vessels of the monastery, wherewith to make a show; nay, at their weddings, they dress the bride in the gorgeous gold-heavy ecclesiastical vestments which have descended to the monks from ancient times. Profanation apart, this is the least of grievances, for the Arnaouts keep strict watch upon each other, and every article thus borrowed is returned, in order that it may be forthcoming when next wanted.

It is remarkable that the Mahometan Albanians, when sick, ask prayers from Christian priests, and on occasion of some festivals crowd to church and attend service, hoping thus to propitiate certain saints whose power they still fear. The old Prior of Dechani hinted to us with grim satisfaction, that the saints would take no account of their attendance, since they never pay the priest his due. On other feasts, the same Albanians repair to a chapel in the neighbourhood, where on certain days, Christians assemble to take the sacrament; there the Mahometans surround the doors, and allow no one to go out or in without paying toll.

To supply the constant demand of the Mussulmans, and yet keep up the church and monastery, the monks must eke out the produce of their few fields, and the contributions of the Christian neighbourhood, by begging journeys through Austria, Russia, Serbia. All in all, their life is a hard one, and it is not surprising that every day it becomes harder to find monks for Dechani. Perhaps not even their proud faithfulness to a noble monument of their nation's empire would retain the present guardians at their post, were it not for the expectation that they shall yet deliver over their precious charge to a free Serbian people. This hope gains strength, for—among other signs of the times—the attempt lately made by the Porte to introduce the conscription and foreign officials has so disgusted the Arnaouts, that they have begun to ask themselves if they might not do better as citizens of self-governing Serbia. Their present profession of Mahometanism is, even by their own account, no obstacle; once they were all Christians, and if anything is to be gained, they will profess Christianity again. Three years ago, during the war with Montenegro, it was very generally expected that a Serbian army would cross the border and co-operate with the kindred tribes of the hills. Accordingly, the Albanian chiefs and elders of the settlements in Old-Serbia held assemblies and reasoned thus:—"We have been long fighting with the Montenegrins, and know that they are good heroes, but they have not European arms, and we can always hold our own against them. But it is said that the Serbs have cannon, and their officers are taught in Frankish schools. If they join the Montenegrins we shall just fight one battle and be beaten—then we must make terms. Let us seek those who have been in Serbia, and ask what taxes are there paid." They were told the Serbian government asks two ducats of every house-father. "Two ducats! we will give *three*, if they will swear not to take us for the conscription!" Answer, "The Serbs do not care for Nizam, their soldiers are militia (narodni)." "Good, good," cried the Arnaouts; "why, we should be better off under the Prince of Serbia than we now are under the Sultan. Let but the Serbs march over the border, we will negotiate with them through the Abbot of Dechani."

But no Serbian army crossed the frontier, and the antagonism between Turkey and the Slavonic Christians remains a smothered fire. Throughout Old-Serbia the authority of the Porte is still strong enough to obstruct the introduction of anything better, and crafty enough to set tribe against tribe, but powerless to restrain evil, and careless to protect the peaceful and diligent. Yet the more thoughtful and confident among the Christians steadfastly look for a "good time coming." The priests plead before the altar of the ancient churches, and in the new schools the children are taught to pray that the light of Christ's freedom may soon penetrate these "dark places of the earth, full of cruelty."

A. P. IRBY AND G. MUIR MACKENZIE.

ALFRED HAGART'S HOUSEHOLD.

By ALEXANDER SMITH, Author of "A Life Drama," &c.

CHAPTER XIII.

FRIDAY was the day of Katy's funeral, and Friday was now come. Had Hagart been a rich man, and the keeper of a considerable establishment, the ceremony would have been much more imposing. He would have had a hearse and a string of mourning coaches. His wife in the midst of consoling female friends would have been weeping in her interior privacies; he would have stood at the door of his dining room in sable garments and flowing white cravat, receiving his friends, as they passed in, with a silent shake of the hand. And when his friends were seated, and contemplating their hats before them on their knees, a solemn waiter would have gone round the company with a silver salver containing cake and wine, followed by a second with cards for the near relatives, containing instructions as to the order in which they were to file out of the house, and to arrange themselves round the grave, and by a third bearing bundles of black kid-gloves. As it was, when the couple of mourning coaches at two o'clock drove up and took their stations at the gate, Hagart sat with his wife and Jack in the little sitting room waiting arrivals. On the table were some bits of cake, a few glasses, and a bottle of sherry of unknown antecedents, supplied by the grocer. The three sat in silence, occupied with their own thoughts. Mrs. Hagart, whose heart was in the next room, wiped her eyes at intervals. Hagart was wondering inwardly whether Miss McQuarrie and the elder Wedderburn Brother would come. He was anxious that his employer should do him that honour—with Miss McQuarrie's presence he felt he could gladly dispense. Jack was lost in a vague sea of excitement, out of which he occasionally emerged to stare with a sense of wonder, not unmixed with pride, on his black dress and white cambric cuffs. At five minutes after two o'clock, the bell rang, and by Martha—who was decently attired in a plain black gown and white collar—Mr. Stavert was admitted. Hagart rose at once, shook hands, and expressed in a low voice his satisfaction at seeing him on such an occasion—especially as he had a considerable distance to come. Stavert pressed the hand in return. "You are one of the family, Hagart, and I would have come a greater distance on an occasion like this." He then went up to Mrs. Hagart, bowed, muttered a sentence or two of sympathy, and sat down in a chair in a corner. The silence which had been scared for a moment, settled down on the company. Hagart wished some one would speak, he was unable to utter a sentence himself, and then he found himself staring at his guest, and marvelling what Miss McQuarrie would think if she knew that the sable dress he then wore had been slipped into his portmanteau—to be at hand in case of accidents—when he was summoned by his wife and daughter to that indomitable lady's sick-bed. This thought took curious possession of him, and his sense that it would violate all the proper solemnities made it all the more difficult to restrain a smile. A peal of the bell came to his relief; and then Dr. Crooks and the clergyman entered, the doctor brisk, clean-shaved and self-possessed as ever; the clergyman tall, gaunt, kindly-eyed, and seventy, a ragged fringe of silver hair around his temples, and with a didactic or hortatory pitch in his voice that made his simplest sentences impressive. The good man had preached so long, had dwelt so long amongst sacred subjects, that his ordinary speech was coloured by scriptural phraseology, and his simple "good morning" sounded like a text, or a practical application. Jack, who had never seen the clergyman save in the pulpit, regarded him with much interest as he sat there in his father's house—up till now he had associated a clergyman with gown and bands, as rustics associate kings and queens with robes and crowns, and if the truth must be told he was a little disappointed—the venerable man being in his opinion a great deal too like ordinary mortals. Again the bell rang, and to Hagart's just pride and gratification the elder Wedderburn Brother came—a big bland man, with thin florid hair and gold spectacles—who shook his hand cordially, saluted Mrs. Hagart respectfully, and then sat down beside Jack, patting him on the head as he did so. There was a kindly light in his blue eye, there was a persuasive tone in his voice—evidently a man who would be a prime favourite with children, for the reason amongst others that his pockets would be stuffed with sweetmeats. The elder Wedderburn Brother had no sooner taken his seat than the carriage from Hurlford drove up—to the amazement and disgust of Mrs. Graves, the entire Bounderby family, Mrs. Hislop and her two grown-up daughters, all of whom had their noses flattened against their respective window-panes at that particular moment—and Miss McQuarrie came out, supporting herself on her stick, but looking much stronger than when Jack saw her first at the station-house on the canal bank. The arrival of this formidable lady caused some little stir. Martha's imagination had been excited on the matter, she had heard a great deal about her, she had always maintained that Miss McQuarrie would appear in person, and here sure enough was Miss McQuarrie at last. Martha stared, and the sharp falcon-like features, the masterdom of the keen eye, the rich dress with its depth of crape, fairly took away her breath. When the sitting-room door was opened for her, she made an old-fashioned obeisance or courtesy as she entered, took Hagart's hand carelessly, who rose to receive her, while her eyes went into him like skewers; pressed her lips to Mrs. Hagart's cheek—over whom a wave of old remembrance came at the moment, filling her eyes—and sat down on an unoccupied chair by her side. She nodded to Jack, glanced sharply round the room, and then, as if satisfied with her scrutiny, folded her arms in her dress, while Hagart stole a furtive glance at her countenance, and thought to himself that—however much both should wish it—they could never get on.

Mr. Stavert sat in a corner; and if one had taken notice they might have seen that gentleman colour slightly and his eyebrows rise in an arch of pure astonishment when Miss McQuarrie entered. It was plain that to him at least her appearance was unexpected; plain also that in that room and on that occasion her appearance was far from being a pleasure. He shifted in his seat for a second or so, and then with a tentative smile on his face, a smile in embryo, that might come into complete existence if sufficient encouragement would be given, he rose, came out of his dusk, and stretched out his hand. Miss McQuarrie rose to meet him.

"I am delighted to see you looking so well and hearty," said the lord of Cuchullin Lodge, with the uneasy smile still on his visage, as he took her hand in both of his, and drew a palm tenderly across her rings. "You are much stronger than when I saw you last—younger-looking by twenty years in fact."

"Am I?" said Miss Kate, grimly. "Give my love to your wife and daughter, and be sure to tell them how much I have improved. They will be so glad to hear it, poor dears!"

"Eliza and Flora have thought of calling often," went on Stavert; "but after that painful, that unfortunate misunderstanding as I may call it, they have a certain delicacy. They have kept themselves to themselves, although they are thinking of you continually; and as you have shown no sign of relenting, they are very unhappy."

Miss Kate dropped her voice to a whisper. "Don't talk stuff, Stavert. This is no place or time for it. I know you—you know me. Go back to your seat now."

Stavert's palm slid off the rings as if they had burned him, and he went back to his corner while Miss Kate resumed her seat. In a little while the ladies left the room—doubtless to have a last look of her who was to be carried away.

Martha came in and handed round wine and cake, then the clergyman prayed, and after the prayer was over, a man came and whispered in Hagart's ear. Hagart then took Jack by the hand and went out, the others following him. When they took their seats, Miss McQuarrie's carriage moved off and drew up on the side of the road next the canal bank. They then drove away, and the last thing that Jack saw was his mother standing at the window of the sitting-room with a handkerchief at her eyes.

Mrs. Hagart stood at the window after the coaches had gone. Miss Kate sat on a chair a little removed; at last she rose and placed her hand on her sister's shoulder. "Cry your fill, Margaret, it will do you good! I wish I could cry like that."

"O Kate," sobbed the poor mother, "this is a sore hour. The Lord giveth and the Lord taketh away. My prayer is that He will give me grace to say at length, 'Blessed be His name.'"

"He will comfort you," said the other. "But cry your fill now." And the room was silent for a little while.

"Margaret," said Miss Kate at length, "come and sit down beside me and let me see you!" And Mrs. Hagart sat down beside her sister and took her hand.

And Miss Kate kissed her again on the cheek. "Katy will always be with you. There will always be a child in the house. That seems poor comfort to-day, Margaret; but the thought will gather sweetness year by year. You are much changed, Margaret—changed almost as much as I have been. Do you remember the old times?—the white house above the rocks with the pine woods behind?—the cottages along the shore with the herring-nets drying in the wind? Do you remember how we stood at sunset, and saw the red islands rise out of a gold-leaf sea? Do you remember your father?" And as she spoke there was a far-away look in her eyes.

But one word had touched a bitter and long-concealed pang. "Kate," said Mrs. Hagart, in a low tremulous voice that shook with apprehension of what it was about to bring on itself, "you were with papa when he died. Did he say hard things of me? Did he forgive me before the close?"

"We both said hard things of you in our blindness. I have forgiven you in this world—he has forgiven you in the other."

"Then he died in anger?"

"He died in anger, Margaret. But I was more wicked than he—I lived in anger for years. That is all over now."

"I knew he had not forgiven me," said the other with a sort of moan, while her head dropped, and she drew herself together. "I knew it. Oh, I have been so unhappy, Kate—so unhappy."

"Unhappy, Margaret? Has Hagart——"

At some suspicion as to how the sentence would end, or at some implied blame in the tone, a faint colour came into Mrs. Hagart's face. "Sister," she said, and she lifted her head and looked her sister full in the eyes, "I know what you were going to say; at all events I know what is in your mind. We are friends at last, after a long, and, to me, a bitter separation; and this friendship, which I value almost above everything, I did not seek. It came to me as it was taken away from me. And it can only exist on one condition: there must be no mistrust of my husband. Anything said against him I shall consider as said against myself. He has always been good, gentle, and kind. He never willingly gave me a moment's pain. I love him more entirely to-day than when I married him. But for this—this dreadful sorrow, and the knowledge that I was disowned by my family, I have been happy—happier than most women. You'll try and like Hagart, Kate, for my sake?"

"I said nothing against Hagart, child; and if I did, there's no necessity for eating me up. I'll try and like him, of course. I don't say that I shall be able quite—but I'll try. In any case, you will never hear me say a word against him. I did not marry him, you know, and cannot be expected to admire him so much as you do."

"We have been poor, we have had hardships—hardships which you never knew anything about. Yet I dare say," and here a smile came into Mrs. Hagart's eyes as she looked up, "we have been happier even than you with all your wealth and absence from care."

"Happier than me! you might well be! Look at me," cried Miss Kate almost fiercely. "Have I a happy face? You think no one has known sorrow but you. Girl, I have carried a sorer heart than yours is now for years and years; have gone to bed with it at night, have risen up with it in the morning. It began to ache before you were born. It aches now."

Mrs. Hagart looked up at her sister in wonder, and saw a sudden excitation in her face.

"Although you can't remember it, and perhaps won't believe it," Miss Kate went on, "I had once as smooth a cheek and as round a form as yours. The blood that has become cold and bitter once danced over neck and temple to the music of a voice and the sound of a step. My hair was beautiful then, he said, and when he caressed it curled to his touch. My lips were red then, and they returned his kisses. He was a soldier and a gentleman, Margaret—a man a gentlewoman had no reason to be ashamed of loving—tall, brave, merry-hearted. We were to have been married, but we quarrelled—about a wretched trifle, some hasty word. We were both to blame, perhaps I most of all. I forgave him in my heart, but I was too proud to *say* that I forgave him. It is only lately I have been able to say I could forgive. You have not the same kind of blood in your veins that I have. Your mother's, which was soft as ewe's milk, has mixed with it and sweetened it. That is fifty years ago. He was a young man then. I wonder if he will recognise me when we meet?"

"Where is he now?"

"In Heaven, if brave men are there. He fell in an American battle. We parted in anger. There was no reconciliation, although it would have been so easy. I have carried the misery with me ever since, no one knowing it. It has clung closer to me than ever did infant to your breast, Margaret. My pride sent him across the sea to meet the backwoodsman's bullet. But for that he would now have been an old man, weak, feckless, and frail. So much for my happiness!"

Miss Kate stopped here, and her sister looking up saw a strange moisture in her eyes. At the look, which had something of awe in it, Miss Kate brushed the tears hastily away. "You are wondering," she said, "to see an old woman of seventy crying for a young man of twenty-five. His bones will have turned into dust by this."

Mrs. Hagart remained silent with astonishment and pity. After a little while Miss Kate went on. "You spoke of my money. Well! I have neither been hungry nor thirsty, nor have I been cold for lack of clothing—and that is all money has brought me. When he went out of my life he took all pleasure with him. To bring him back, to have even some portion of him, some shred of his hair, some letter that he had written, I would have thrown all my money in the fire, have worked my hands off, have gone down on my knees and scrubbed cellar-floors and fed on a crust. What good has my money done me? What had I to love? What had I to care for? What interest had I in life? People professed friendship for me, but I knew their motives. Relations who had hardly a drop of my blood in their veins encumbered me with services. They lied on each other if so be they might creep into my favour—and my will. Their greedy eyes I could see sparkling over my trinkets, hoping they would be theirs when my breath was out. They ate dirt before me. Meekly smiling, they allowed me to storm at and insult them. If I had kicked them, they would have told me they liked to be kicked. I knew they hated me, as much as I hated them. I took pleasure, it was almost the only pleasure I had, in tearing away their hypocrisies, and confronting them with themselves. I knew they grudged every hour I lived, every breath I drew. With all their professed affection, they would have wrangled around my death-bed, and quarrelled outright over my coffin."

The wistful, far-away, sorrowful expression had died out of the face now, and Miss Kate looked like an angry hawk, its head stretched out, its plumage ruffled, just as out of the bed-clothes she had flashed on the Staverts when she was ill.

"I was angry with you, Margaret, as you know, and you accepted my anger, perhaps, with a feeling quite as keen. You did not whimper at my feet. You did not drink insult with a seeming relish. You did not flatter me, nor fawn on me. Had you done so—God forgive me—I think I should have actually hated you, and then the whole world would have been mean and rotten. When I saw your children at the station-house, I knew them at once, as I wrote you. I spoke to them, but they did not seem ever to have heard of me, so I was unable to discover whether you hated me or no. Did you never speak to them about me, Margaret?"

"They knew nothing about you from me. When your letter came to me in London, Hagart threw it in the fire, and made me promise that I should never again mention your name: and I never did."

"Did he?" cried Miss Kate, sharply, and the ruffled hawk-like look came back for a moment. "Perhaps he was right," she went on with a slight smile. "That's the best thing I have ever heard of him. It shows spirit at least. At any rate, looking into your children's faces, I resolved that, if possible, I should make up the breach. It is made up now. I wish this had happened earlier. I would have known my little namesake better then, and perhaps I could have cried with you to-day."

Mrs. Hagart at this point, if she had yielded to her impulses, would have broken out into tears afresh, and flung her arms around her sister's neck. She was tempted to do so as it was, and she could hardly resist the temptation. But as with all her tenderness she had a considerable strain of worldly wisdom in her, she checked the springing tears, and restrained the opening arms. Many thoughts were nimble in her brain. We know what she had been planning for Jack, and as the iron was hot she resolved to strike it. The wind was blowing, and she thought, wisely enough, that it might, as well as waste itself, sit in the sail of her intent, and carry it on towards fulfilment. She resolved to venture, but, being afraid somewhat, blurted out awkwardly enough:

"Your namesake has been taken from us, but Jack still remains."

"Yes," said Miss Kate, absently, as if thinking of something else.

"He is a good boy," said the mother: "warm-hearted, gentle, obedient—" going over the catalogue of his virtues.

"I don't care much for goody people, men or women, girls or boys," said Miss Kate, with a slight spice of contempt. "And gentleness and obedience, if he has nothing else, won't make him much a favourite of mine. But I like Jack," she went on, as she noticed disappointment rising in his mother's face. "When I frightened his sister on the canal bank by thrusting my old face into her bonnet, he flushed all over, and told me to let her alone, that I had no right to touch her. The McQuarrie look came out on his Hagart face, and I liked him for that. Yes, I like Jack: I think he'll do."

"He mustn't be brought up to his father's profession——"

"Upon my soul, I am glad to hear it!" put in Miss Kate, with a sincerity that made the mother's heart jump.

But Mrs. Hagart was not to be deterred by bluntness, and she went on: "He has always been attentive to his lessons, and the schools here can do little more for him. He is almost always dux in everything. I should like to send him for a year or two to the High School in Hawkhead; and after that to the University. I am sure he will be clever."

"But what will you make of him?"

"I don't know yet. There is plenty of time——"

"He must be a gentleman, of course! And as he has no fortune of his own, he must adopt some profession. There are only two or three courses open to him. I don't think the Hagarts have ever been much of a warlike race, my dear, and to make him ensign in a marching regiment, is simply to make him get into debt—which I would have to pay—and to run away with the first pretty face he sees—which I could never forgive. It's hard enough to swallow one runaway marriage in one's life-time, you know. No! I don't think soldiering will do. Then a doctor's life is hard work—routed out of bed at all hours to bring into the world the brats of cheesemongers and tallow-chandlers—and often indifferently paid. A clergyman, again, is the slave of his congregation, and he is liable, moreover, to be asked out to tea by the leading grocer——"

"But the noblest and happiest life a man can lead, Kate, if his heart is in his work."

"Perhaps. But if you make Jack a clergyman, and if his heart should *not* be in his work, it must surely be the unhappiest life of all. Make him a lawyer, Margaret. It's a gentlemanly profession, and, if a man is clever and secures practice, a lucrative one. Hook & Crook, I know, have got a good deal of my money at times—thanks to my friends."

"The question of profession may be left open in the meantime. But if he goes to Hawkhead—do you know—I have been thinking—I should like him to stay with you!" Mrs. Hagart got it out at last, and was a good deal astonished at her own temerity when she did so.

"But what if his dinner should disagree with him, my dear? or if he should tear his trousers? or come to me boo-hooing after a fight with the butcher's boy in the street?" said Miss Kate with a smile, which betokened anything but displeasure at the proposal. "But would you really give him up to me?"

"I think I could," said Mrs. Hagart, somewhat scandalised by her sister's levity—the subject under discussion being serious enough in her thinking. "It would be for his benefit; and I would not be so selfish as to allow any fondness of mine to stand in his way. Besides, I know he would be taken care of, and I could see him often, you know."

"But what will Hagart say? Will he give the boy up to me?"

"O, never mind Hagart. I'll manage *him*."

"I shall be glad to have Jack under my charge. I thought of proposing something of the kind to you, but did not know how you would take it. I leave Hurlford in a day or two for Hawkhead, and when I get home I shall write and make arrangements. And now," said Miss Kate, whipping out a curious old-fashioned gold watch which her father had worn, and which for years Mrs. Stavert had regarded as her own by right of inheritance, "I must be going. When one lives in other people's houses, one must conform to their rules. I shall just be in time for dinner. Kiss me, Margaret! I have spoken to you to-day as I never before spoke to human being. Don't pine after Katy, she is in the best hands. Happier days are perhaps dawning for all of us, although it is not many that I can expect to see. Perhaps for me, as the Bible says, 'at eventime there will be light.'"

And attended by Mrs. Hagart and Martha, Miss Kate went to the gate, and entered her carriage and drove off; Mrs. Graves, the entire Bounderby family, with the zealous and much-enduring maid-of-all-work, Mrs. Hislop and her two grown-up daughters, watching the departure with much speculation and comment.

Mrs. Hagart returned to the sitting-room which seemed so desolate and empty, but she was not left long alone, for in a few minutes Hagart and Jack came in. "Miss Kate has just gone," she said.

"I know," said Hagart, as he laid down his hat. "We saw her carriage at the door as we came up, and have been walking up and down, and going round the corner till once it drove off. I did not like to come in till once she had gone."

CHAPTER XIV.

THE coffin had been lowered into the grave, Hagart had thanked his friends, and he and Jack were walking along the gravel walk of the cemetery, when Stavert, who had been talking for a little with the clergyman and Dr. Crooks, came hurrying after them. "This is your son, sir," he said as he came up, and they were passing out of the cemetery gate. "A very fine boy indeed! I have not been introduced yet. Let me shake hands with you! you are one of the family branches—one of the twigs, perhaps, I should rather say. What is your name?" he asked, while the process of hand-shaking was going on.

"John!"

"And a very good name too. And you are a very fine fellow. Surely tall for his age, Hagart! How these younkers grow up, to be sure! How old are you?"

"He has just turned twelve," said his father, "and he is tall for his age."

"Exactly co-ages with my fellow Norman, and a shade taller perhaps. You have never, John, seen your cousin at Cuchullin Lodge, I think?"

John said he never had.

"The members of a family should be known to each other," Stavert went on, "and the next time you are in Hawkhead you must really take a run out to Cuchullin Lodge and see us. You will find a lot of young people there. You really must, John! Mrs. Stavert will be delighted to see you, I am sure."

"I have never been in Hawkhead in all my life," said Jack.

"And I don't think there is much chance of his being in Hawkhead soon," said his father, thinking of a certain scheme which his wife had proposed, and resolving that if said scheme again turned up, it would meet with his most strenuous opposition. He had ideas in his head concerning Jack's future career, and he did not in the least care about sending him to Hawkhead to live with Aunt Kate, although she had money and rode about in her grand friends' carriages. He had no objections to the carriage in itself, in fact he was extremely pleased that the carriage was waiting at his door, and that the elder Wedderburn Brother had seen it as he stepped into the mourning coach. This was in the highest degree gratifying to him. But that Jack, especially now that the family prospects had so much improved, should reside at Hawkhead with Miss McQuarrie, was quite foreign to his notions. He had a scheme in his head worth a dozen of that. "Suppose," he had been thinking, "I take him across to Paris and apprentice him to one of the most eminent of the pattern designers there? Why, in a few years—for he does not want brains—he will be able to produce patterns as novel and tasteful as any of the French fellows. And as, in order to supply Greysley, Spiggleton, and Hawkhead, I shall require large monthly parcels of the newest Parisian productions, what's to hinder me taking them from my own son? I will naturally take them from him in preference to any one else. I'll make a noble opening for him," and so after some such fashion as this Hagart went on thinking and planning; and with all a father's fondness he mentally pursued Jack's Parisian career until that young fellow became lost in a golden glory—in a thick radiance of guineas.

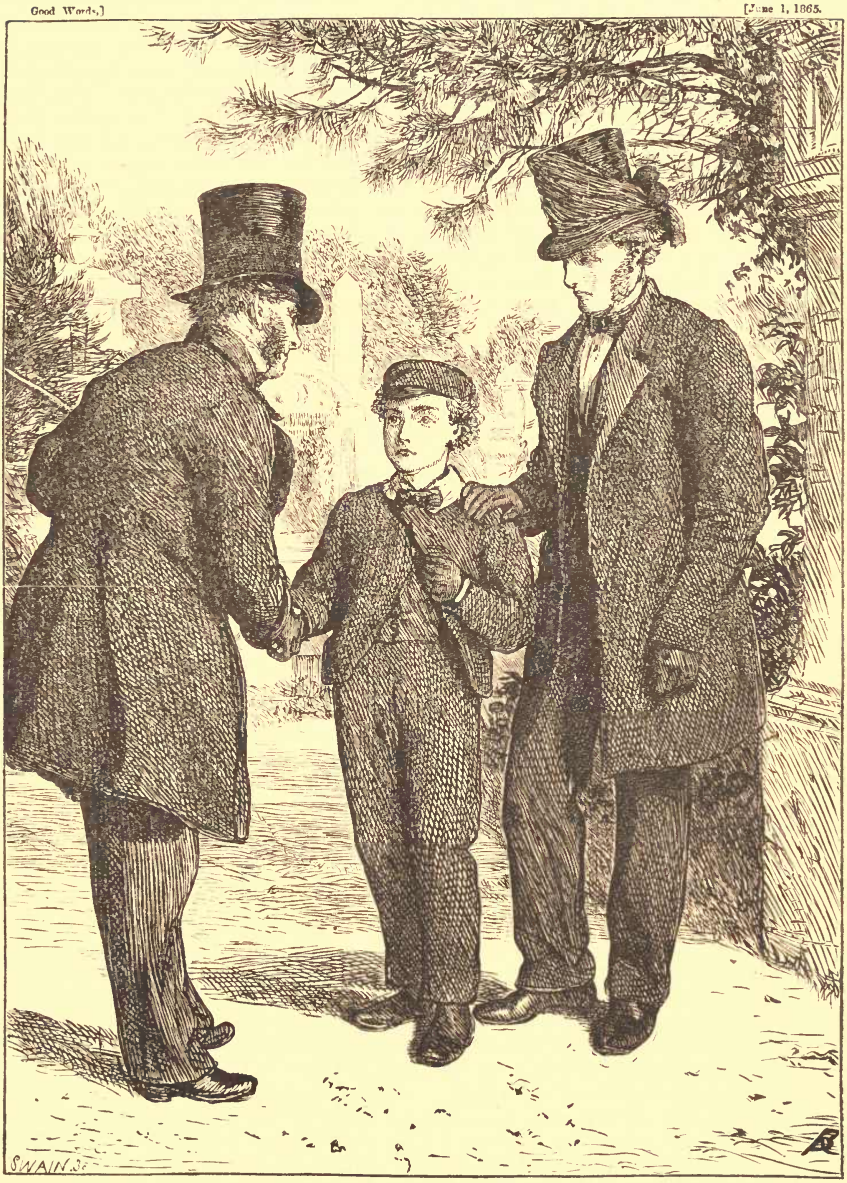
Accordingly Hagart said with some little emphasis, "I don't think there is much chance of his being in Hawkhead soon."

"Nonsense!" said Stavert, and he slipped his arm confidentially into Hagart's right, while the knowing smile came to his lips, and his eyes—the better to watch the effect on his companion—went into their left-hand corners, his head all the while remaining immovable. "Nonsense! he will be visiting Aunt Kate, won't he? Perhaps he has been there already!"

Our friend was not a little startled by the appearance of the obnoxious idea in this unexpected quarter. "He won't visit Aunt Kate—if I can help it," he said, something stiffly.

"Don't drive so fast!" said Stavert, the smile and the eyes still fixtures. "When I saw you on the coach you remember, you had never seen Aunt Kate—you have seen her now. Then she had never been in your house—she has been in it to-day; has been in it perhaps more than once. She had not then spoken to your wife—she has spoken to your wife now; is perhaps speaking to her at this very moment. What will you give for your chance now, eh? A good deal more than when I saw you last, I dare say! Ah," continued Stavert, tapping with his fingers the arm he held, "you are a deep one! You have been playing your cards well!"

At this Hagart got very angry and red in the face. "I am not deep—at all events," hurriedly correcting himself, as he thought he had gone a little too far; he did not wish to own he was a simpleton—"I am never underhand, or tortuous in



"THE MEMBERS OF A FAMILY SHOULD BE KNOWN TO EACH OTHER."

Page 440.

my dealings. I have played no cards, for the reason that I had none to play. Miss McQuarrie was in my house to-day for the reason that you were. My wife has not seen her till to-day; I have not seen her till to-day, and I don't much care although I should never see her again. As for her money and my chance—I really wish you would never speak to me after that fashion again. I am not rich, Heaven knows! but I am independent of every one. I don't wish Miss McQuarrie's money; I have never seen—" and here a sudden remembrance of Miss Kate's twenty-pound note nearly choked our friend, and brought his eloquence to a stop.

The smile died away from Stavert's mouth, and his eyes came out of their corners, and returned to their normal positions. Whatever his purpose may have been in so moving Hagart, he was satisfied. "My good friend!" he said, "you speak my sentiments exactly. There is no feeling in the world so pleasant as the feeling of being independent, of holding straight on one's course, of being indebted to nobody. I don't think you and Miss Kate would get on, at any rate. You are spirited and high-minded. She is exacting, bad-tempered, and crotchety. She has treated me and my wife badly, she has treated you and your wife shamefully. You don't know what things she used to say of you."

"And I don't wish to know."

"Do you think I would hurt your feelings by telling you? That would not be the part of a friend. I think, on the whole, you are better quit of her. If you have a proper spirit you will not encourage her visits. She says the cruelest things about people behind their backs."

"I won't encourage her. But she may come and go as it pleases herself. I can't shut my door in her face."

"You can't quite do that, of course. But keep an eye on her." And as by this time they had reached the centre of the town, Stavert came to a stop. "I have some business to do down the street here, and shall say good-bye. Give my love and sympathy to your wife—I know what a trial her daughter's death must be. And so, John, as you are not likely to be in Hawkhead soon, your cousins won't see you at Cuchullin Lodge?"

"No!"

"Well, then, good-bye too. I am pleased to have made your acquaintance;" and, after shaking hands with Jack in the most friendly manner, Mr. Stavert walked off.

Much pondering this conversation, Hagart marched along in silence with Jack at his side, and when they drew near the house, there was Miss McQuarrie's carriage still waiting. This brought them to a full stop. "We'll just linger about till your aunt goes—your mother and she will have a good deal to say to each other, and we would only disturb them," said Hagart, putting the best face upon it he was able. And so they lingered, walked up and down, and went round the corner till once the coast was clear. Hagart had no desire to encounter Miss Kate again that day.

That evening the Hagart household was quiet and subdued. Katy's name was not mentioned, but she filled the thoughts of each one. Hagart did not ask what Miss McQuarrie talked about, but his wife gave him to understand that the conversation had been friendly in the highest degree—that, in fact, the family breach had been entirely made up. After the sad interruption, matters went on in the house very much as formerly. The strange stillness died away. Martha began to sing, to scrub the dresser impetuously, and to clash the fire-irons in the sitting-room. Jack returned to school, and learned his lessons in the kitchen in the evenings. Hagart went punctually into Greysley and as punctually returned. Mrs. Hagart's old look came back to a certain extent, and but for a certain hurry and excitement when the postman came in sight, no superficial observer would have guessed that she had recently passed through any very severe ordeal of sorrow.

About a week after the funeral, one forenoon the postman rang the bell, and Martha running out received a letter; and Mrs. Hagart, who had been standing at the window, went into the lobby and took it from her with a somewhat tremulous hand. As it was, as she had guessed, in her sister's handwriting, she immediately carried it with her into the sitting-room, and, after shutting the door, broke open the seal. It ran as follows:—

"HAWKHEAD, *Friday.*

"MY DEAR MARGARET,—Here's been a pretty to-do! When I got home here from Hurlford, tolerably late, I noticed the drawing-room lighted, and entering with my pass-key—which I carry with me always—and hurrying up-stairs, I found my two maids entertaining their sweethearts very comfortably. Mary, with cherry ribbons in her cap, was pouring out tea; Henrietta, in her Sunday frock, was handing about bread-and-butter. One of the fellows was lolling in my best chair with his legs hanging over the arm, and whistling; the other was beating time to the air with a tea-spoon on a saucer. Extremely comfortable indeed! Of course I sent the fellows out with a flea in their ears, and next morning I packed my crying huzzies off with their trunks and without a character. Ann—the girl who was with me at Hurlford—was loud in abuse against her friends, although I suspect that if I had left her at home I should have seen her sweetheart there also. I told her so in fact. I came home unexpectedly and caught them nicely. I always come home unexpectedly. Servants—good ones, I mean—are not to be had now. I suppose we must thank cheap books and cheap schools for that. By the way, that seemed a very nice girl of yours. Keep her ignorant, Margaret, if you would have her not speak back.

"Of course, in the mess I am in, I cannot receive

John quite so soon as I hoped. The more I think of John's coming to live with me, the more I am pleased. I have acted harshly towards you, and what I mean to do for your son will make up for that I hope, not only in your eyes, but in the eyes of Him who has regarded my conduct as more blameworthy than ever you regarded it. And if in your marriage you suffered any social declination, *what I mean to do for your son* will make him rise to the old family level, if not higher. So that you see his coming here will make wrong right, and odd even, for all of us.

"I'll write again when I have got settled. Jack can then be sent by the passage-boat, and Ann will be in waiting for him when he arrives.

"Your affectionate sister,
"CATHERINE MCQUARRIE.

"*P.S.*—One of Stavert's maids—who had heard of the stramash—has just been here to see if I would engage her. She says that, if I take her, she would be allowed to leave her present place at once. I dare say Mrs. S. would like very well to have a SPY in my house. But she *won't succeed.*"

Although there was too much about the maids and too little about Jack in the letter, still, on the whole, Mrs. Hagart thought it extremely satisfactory. Her sister had been thinking over the proposed scheme, apparently, and had come to the conclusion that if something could be done for that young fellow, it would be a sort of reparation for all mistakes and wrong-doings on her own part and on the part of others. Mrs. Hagart was entirely satisfied with the conclusion arrived at. Her only fear now was that her husband would prove recalcitrant. He had waxed fat on the Wedderburn Brothers' four guineas a week, and he might kick in consequence. If recalcitrant, she resolved to bend and conquer him. Meantime she kept the letter to herself, saying nothing about it to her husband, against whom she was innocently conspiring.

JEWISH SECTS A WARNING AGAINST MODERN TENDENCIES.

"BEWARE of the leaven of the Pharisees and of the Sadducees." This warning does not strike upon *our* ears as a caution against buying bread from any one who might offer to supply it. But it was not very strange that it should be so understood by the disciples to whom it was addressed. The suspicion it awakened in them throws a sudden light upon the circumstances in the midst of which Jesus and his companions were living. They had forgotten on some occasion to take bread with them; and whilst they were discussing the means by which they might supply the want, Jesus warned them to beware of a certain leaven. "He is bidding us," they at once thought, "be on our guard against loaves which might be offered us from any suspicious quarter. We are to take care that we are not all poisoned by the treacherous malice of the Pharisees or of the Sadducees."

The unscrupulous bitterness of the Jewish sects against their Reprover might have warranted the suspicion. But this was not what Jesus sought to infuse into the minds of his followers. He was using leaven as an image. He had been endeavouring to train his disciples into the recognition and understanding of images, and He was disappointed that they now supposed Him to be instructing them in the precautions of a timid prudence. "How is it," He asked, with something of complaint in his manner, "that ye do not understand?" They then felt at once to what the image of the leaven must apply. They understood that He was speaking to them of "the doctrine" of the Pharisees or of the Sadducees.

It is of the nature of leaven to pervade the lump of dough into which it is inserted, and to change its character. Its power to do this, apart from its tendency to make the lump the better or the worse, is the property which our Lord uses for his illustrations. He had before used this leavening power to describe a *good* influence. "The kingdom of heaven," He had said, "is like unto leaven, which a woman took and hid in three measures of meal till the whole was leavened." The power and principles of that kingdom which He opened upon the earth, were to steal through society and its institutions so as gradually to change their character. In the case before us, our Lord uses leaven in a bad sense. It represents an ingredient which corrupts the pure mass. St. Paul applies it in the same way in 1 Cor. v. He there makes the unleavened bread of the Passover represent the purity or holiness of the Church. Not that this was the original intention of the Paschal symbol. The Jews ate none but unleavened food during "the feast of unleavened bread," in remembrance of the *haste* with which they went out of Egypt, having no time to leaven the dough. But the insidious corrupting power of an evil element in a body was naturally illustrated by the effect of leaven upon the lump; and this is the chief Scriptural application of the image.

The leaven then, of which the disciples were to beware, was "the doctrine" of the Pharisees and of the Sadducees. The word *doctrine* is rightly used here, in its older sense. But the modern usage of it is apt slightly to mislead us, both here and elsewhere in the New Testament. Its meaning is more exactly expressed now by the word "teaching." Thus the effect of our Lord's sermon on the Mount is described by saying, "The people were astonished at his doctrine or *teaching*: for he taught them as one having authority, and not as the Scribes," the difference which struck them being as much in his manner as in the *doctrines* which He delivered. Similarly, we read that Jesus taught the multitudes many things by parables, "and said unto them in his *doctrine*,"—that is to say, in the course of his teaching. It is well to make the mental substitution of the word "teaching" whenever we meet with "doctrine" in the Scriptures.

The teaching, then, of the Pharisees, and the teaching of the Sadducees, was as evil leaven, pervading and spoiling a wholesome lump. Can we give any distinct application to the lump thus spoilt? We might do so by taking it to represent the body of the Jewish traditions held in common by Pharisees, Sadducees, Herodians, and the rest of the Jews. The commandments and ordinances of the Law, speaking generally, were received by all the Jews as Divine. Whatever secret unbelief might be entertained, consciously and unconsciously; whatever one party might feel bound to add to the Law and the Prophets, and whatever another party might feel justified in detracting from them, there was a common faith and a common worship to which every Jew professed allegiance. With regard to these, Jesus of Nazareth was at one with the Pharisees and the Sadducees. To Him also the Law and the Prophets spoke with the voice of the Father in heaven. To Him, as to all his countrymen, the Temple was the House of Him who had called out the seed of Abraham, and the worship offered in it was the appointed service of the God of heaven. He was come to fulfil that promise, "unto which," in St. Paul's language, "our twelve tribes, instantly serving God day and night, hope to come."

It was this common inheritance of the Jews, we may assume, which was pervaded by the Pharisaic and by the Sadducean teaching, so as to have its original character altered. The disciples of Jesus, who were to be no less loyal than Scribes and Pharisees to the faith and worship of their fathers, were to beware of those mixtures by which Pharisees and Sadducees in different ways corrupted the truths and customs handed down from former generations. We must now endeavour to see what these mixtures were.

1. Let us take the leaven of the Pharisees first.

The Gospels explain to us sufficiently what the Pharisees were. We learn very little about them from other sources. They were a sect or party which had arisen during the interval between the last of the Prophets and the coming of the Saviour, and which had its origin in a scrupulous regard for the Law. They included all those persons who were distinguished by religious observances from their neighbours. They were, in fact, the class of the professedly religious; and some of them, we may be sure, were sincerely devout men.

Let me touch cursorily upon the principal characteristics of the Pharisees which the Gospels disclose to us. They had a great knowledge of the Law, or of the Scriptures, and prided themselves upon that knowledge. When their officers returned to them, having been unable to fulfil their commands by apprehending Jesus, because "never man spake like this man," the Pharisees exclaimed indignantly, "Are ye also deceived? Have any of the rulers or of the Pharisees believed on him? But this people *who knoweth not the law* are cursed." Nicodemus having timidly remonstrated, "Doth our law judge any man before it hear him and know what he doeth?" they turned upon him with a taunt supported by an appeal to Scripture: "Art thou also of Galilee? Search and look: for out of Galilee ariseth no prophet." But whilst they thus cherished the letter of Holy Writ, they had added the comments and inferences of their learned doctors, so that the very letter of Scripture was smothered by their traditions. One of our Lord's rebukes to them was expressed in the words, "Why do ye also transgress the commandment of God by your tradition? . . . Thus have ye made the commandment of God of none effect by your tradition." The observances they thus taught were very burdensome: "they bind heavy burdens, and grievous to be borne, and lay them on men's shoulders." Their own religious observances were minute and conspicuous. They made long prayers, standing in the synagogues and at the corners of streets. They were especially jealous of the observance of the Sabbath-day. They had increased the strictness of the Mosaic Law with regard to the prohibition of work on that day by adding many vexatious and unreasonable rules, which had no sanction in the Law. Acts done by Jesus when He healed on the Sabbath-day, or by those whom He healed, were declared to be violations of the Law of Rest. The general spirit and conduct of a Pharisee are expressed in our Lord's parable concerning the Pharisee who went up into the Temple to pray, and who stood and prayed thus with himself: "God, I thank Thee that I am not as other men are—extortioners, unjust, adulterers, or even as this publican: I fast twice in the week, I give tithes of all that I possess."

Now it was possible for a man to go through much of the outward practice of a Pharisee, and yet to be a pious God-fearing man. But the vehemence of our Lord's assaults upon the ways of the Pharisees, and his terrible denunciations of their spirit, prove that this great and proud class—then the ruling class of the country—had on the whole become utterly corrupt and godless. The great charge of Jesus against them is, that they were hypocrites; that they did all their works to be seen of men; that they were the people who justified themselves before men; but that God saw their inward falseness. There is something awful in the sight, if we could realise it, of this humble Galilean standing up in the name of the Father in heaven before the rich and the powerful, and the learned and the religious, and pouring out against them his almost fierce invectives and threatenings, whilst they in all their greatness writhed under his lash: "Woe unto you, Scribes and Pharisees, hypocrites! ye are like unto whited sepulchres, which indeed appear beautiful outward, but are within full of dead men's bones, and of all uncleanness. . . . Fill ye up the measure of your fathers! Ye serpents, ye generation [or brood] of vipers! how can ye escape the damnation of hell?" We do not understand half of our Lord's character, if we think of Him only as mild and gentle, and find in his words and teaching precedents for nothing but mildness and gentleness, and forget those threatenings, the concentrated indignation of which no human effort could surpass.

It is said expressly in St. Luke that the *leaven* of the Pharisees was "hypocrisy." What was their teaching? They taught a formal system of religion. They took the wholesome ordinances of the Law, and imposed them upon men as a means of propitiating the favour or of averting the anger of a tyrant in heaven. Regarding the ordinances of the Law in this light, they naturally added to them extra efforts which they thought might render them still more efficacious. And the arbitrary Being who was thus to be propitiated was not likely to be cherished in their hearts. Their relations with Him became very uncertain to them: their relations with their fellow-men who might look up to them and pay them homage, and with the good things of the visible life, were much more real to them. And so they grew exclusive, hard, insincere, covetous of praise and covetous of money, despisers and oppressors of their fellow-men. The root from which all this evil sprang, was the spirit of *a mercenary religion*, the notion that by doing so much in the way of religion so much favour might be purchased. The trafficking spirit had expelled the childlike spirit, and made the whole of religion its own.

Let us say then that the teaching of the Pharisees, of which the disciples were to beware, was mainly the inculcation of a mercenary self-seeking spirit in religion.

2. The Sadducees were very different from the Pharisees, but they also corrupted by their party-teaching the common inheritance. We learn much less of them in the Gospels. They were not dominant in the life-time of our Lord, and they did not excite his indignation to the same degree as the Pharisees. We are informed that they disbelieved in a resurrection, as well as in angels or spirits, and that they sought to perplex Jesus by difficult questions. They believed in *reason* and *morality* rather than in religion. No doubt good men were to be found amongst them. A just contempt for the Pharisaic religion may have driven many into their ranks. But they appear to have been distinguished by a vain conceit of superior enlightenment. They were as ready to boast of their philosophy as the Pharisees were of their religion: and their philosophy was negative and shallow, based rather upon *not* believing what they thought irrational, than upon apprehending any positive truths. *They* would mock at the Pharisees as superstitious and bigoted. The Pharisees would denounce *them* as infidel and godless.

Pride in their own reason, a disposition to set up their reason above the truths revealed to it, was probably the leaven of the Sadducees.

3. A third party amongst the Jews is not mentioned here, but it is named in the parallel passage in St. Mark, and it is instructive to add them to the other two parties. These are the Herodians or Herod-party, who represented the principle of political expediency. They would look upon the religion of the Pharisees, and the philosophy of the Sadducees, as alike unpractical. The question, according to them, would be: How were the interests of the country to be secured? They would set political movements and intrigues above either religion or philosophy.

Their leaven was the worship of political interests, subordinating other ends to the object of keeping certain persons in power, with the professed aim of securing the peace or aggrandisement of the country.

Against all these sources of corruption Jesus warned his disciples. The danger from the Pharisaic influence was the greatest. Those who appeal to the religious instincts and wield the powers of the unseen world can do much to bring even the best persons—the most humble and devout—under the sway of their teaching. It was hard for a Jew who wished to be loyal to the Revelation of his fathers *not* to join the Pharisees. But there was danger from the other quarters as well. Minds which would revolt from the oppressive formalism of the Pharisees might be attracted by the show of reasonableness on the part of the Sadducees, of practical knowledge of the world on the part of the Herodians. And therefore the Good Shepherd warned his flock of these various temptations which beset them.

The interest of these parties, and of the warnings of Jesus against them, to us, arises from the fact that they are so manifestly *typical*. We cannot discuss those ancient tendencies, which wrought their mischief in Judea eighteen centuries ago, without feeling all the time that we are still vexed by similar dangers here in England or in Scotland in the nineteenth century.

It would be unjust to our own generation to assume that it is as corrupt and as deserving of the censures of our Lord, as the Jewish world of his day. The darkness was very thick when the Light of the World showed Himself in a visible human form to dispel it. The decay and corruption of society were very deadly at the moment when the element of the life-giving Gospel was infused into it. But we may observe amongst ourselves the clearest signs of those same tendencies which bore the names of Pharisee, Sadducee, and Herodian, amongst the Jews—signs of even startling clearness.

1. The Pharisees, we have seen, were the religious class. And we also have a religious class. It seems so natural for a minister of religion to side with the religious class and to endeavour to enlarge it, that many will think it paradoxical to apply to this class, in the plain and common sense of the word religious, the warnings addressed to the Pharisees. But all who have had any experience know that those who profess religion are not necessarily the best in God's sight,—the most humble, the most sincere, the most earnest for truth, the most loving. A large proportion of the religious class belong to it from the influence of their education: others have adopted its habits from conviction: but they all know, or ought to know, that religious observances, such as frequenting the worship of God, reading the Bible and good books, private devotion, keeping the Sabbath-day, are no security for inward innocence or for a healthy spiritual life. And there are many symptoms of an evil like the leaven of the Pharisees amongst us. We must do justice to the Pharisees of old. They were the most zealous persons ever known for the authority of Scripture, and for the keeping of the Sabbath. Do not these characteristics bring them into exact resemblance with the most forward exclusive part of the religious world amongst ourselves? There are those amongst us to whom jealousy for the prerogative of the Bible and for the holiness of the Sabbath-day represents the highest godliness of which they have any conception; who are as ready to say now, as the Pharisees of old were, "This man is not of God, because he keepeth not the Sabbath-day." And with these and other external symptoms, such as making long prayers in synagogues and at the corners of streets, have we not something of the intolerant and angry spirit, something of the hypocrisy, of the Pharisees? The very theory of religion which is widely current amongst us is that of the Pharisee: it is the *mercenary* theory. It represents the relations between God and man as those of buyers and sellers rather than of a Father and his children. It represents God as requiring so much in exchange for his favour and pardon. It sets men upon the way of religionized self-seeking. It bids them think of their happiness in the next world and in this as that which they are to live for. Self-interest, only be it far-sighted enough, is proclaimed without disguise or shame as the one necessary motive-power of human action. My friends, as we think of them, do not signs of Pharisaism force themselves alarmingly upon our notice? Is there not great need for English Christians to be upon their guard? and is not the need greatest for those who, because they are the most religious, are the most within the range and scope of religious exhortation? But I must not dwell at length upon these dangers. Let me only remind you that, even of the Pharisaic observances, our Lord said, "These things ought ye to have done," and "The Scribes and Pharisees sit in Moses' seat. Whatsoever therefore they command you, that observe and do; but do not after their works."

2. For when we think of the leaven of *the Sadducees*, we are reminded that there is no safety in merely making light of religious observances, and in being superior to fanaticism. We also have our Sadducean dangers. If we have a religious class, we have also the class which is too enlightened to be religious. This class is not eager or obtrusive; it does not compass sea and land to make one proselyte. But it gives itself great airs of wisdom. And it does so for the most part very cheaply. It rests, like the Sadducees, chiefly on its *non*-belief. "We are not so ignorant as to believe this: of course, between ourselves, we do not believe that. We can see through the claims of the Bible and of the Church. We hold to a certain Christianity, but it is of a kind reformed and adapted to the knowledge of the age." These are ordinary boasts: and those who make them are generally content with the credit of *not* believing particular things, whilst they are afraid to renounce the profession of believing something in general. Our Sadducees do not trouble themselves much to make out what it is they *do* believe, and what their fellow-men ought to believe with them. Their leaven, with which they corrupt the life of any genuine Christianity which they profess to retain, is the pride of superior wisdom. They do not so much try to discriminate between the true and the false, bowing down with reverence before the true, standing up and defying the false: but they set themselves up complacently above both the true and the false; patronizing both in a way, hardly knowing them as true and as false, but flattering themselves that there is something indefinite which the educated and enlightened may hold, that there are many more definite things which the ignorant may believe and be despised.

3. There may have been some sympathy and agreement between the Sadducees and Herodians of our Lord's day. So we may find a third class, not very distinct from the last, of which the ruling consideration is practical expediency. They ask, What do social or political exigencies require? They are tempted to make light of principles, whether of religion or of reason: their thought is, how to get the social machine to work. And the result is that they pay homage to the meaner considerations which influence mankind,—to the passions which sway multitudes, to the prejudices of the moment. Their god is "public opinion."

The three classes are not marked out by definite lines. They blend with one another throughout our society. The tendencies indeed are real and distinct, and often manifest themselves with singular precision. Amongst organs of opinion they might be identified without difficulty; those who are acquainted with them might easily find genuine Pharisee, Sadducee, and Herodian newspapers. But for ourselves, it may be needful to guard not so much each against one tendency, but against all in their turn. All have their plausible arguments. It is right to be religious, it is right to be reasonable, it is right to be practical. The counterfeit of each tendency is what we have to beware of,—the counterfeit of religion, the counterfeit of reason, the counterfeit of practical expediency. They are dangerous in this order, the order of their natural dignity. It is worst of all to be a hypocritical Pharisee, next to be a self-complacent Sadducee, least evil, but still evil, to be a vulgar Herodian.

How then are we to be protected against these dangers which invade us all round? Only by letting the *true* leaven, the leaven of Christ's Kingdom, pervade all our opinions and customs and acts. This is what is most important for us to understand. We are not taught where danger is to be apprehended, without being shown where safety is to be found. And our safety against the corruption of our belief and our ways,—our only real and lasting safety,—is in receiving the Kingdom of Heaven and entering it as little children.

Our blessed Saviour came down to reveal his Father and to make us children of the same Father. Let us come to the Father of our Lord Jesus Christ as his reconciled children. Let us bow our hearts in humility and penitence and grateful love before Him. Let us see in God such a Being as Jesus of Nazareth proved Him to be, a Being of infinite equity, and sympathy, and desire for our welfare. Let us believe that we and the whole world are in the hands of this God of Truth and Love, who is in an especial manner the Father of our own spirits in the Son of his Love. In his reign is the Kingdom of Heaven established. To submit to Him is to enter into that Kingdom. The open childlike heart is the true subject of it: the eternal Spirit of sonship and brotherhood is the spirit of Christ's Kingdom.

Let that blessed Spirit leaven our thoughts and words and acts, and we shall be kept from the evil leaven which threatens to corrupt them. Looking upon God as just and gracious in Himself, apart from any deservings in any of his creatures, we shall not be inclined to separate ourselves off with any others as objects of his exclusive favour: we shall not think that it is either necessary, or possible, to purchase his favour by anything we can do or feel in ourselves, or by anything we can present that is another's. We shall worship God's grace as a free, diffusive, fatherly grace, which yearns over all his children, and withdraws its help from none, and seeks a perfect and universal peace. Being knit to God in this fellowship, we shall not hope for light or progress for ourselves or for the world apart from Him and from the knowledge of Him. To know the Father and the Son whom He sent into the world, this, we shall believe, is our life. Whilst, therefore, we shall be confident that He will not leave without nourishment the mind which He has given us, that He will more and more enlighten us with his own light, we shall not trust to that enlightenment which dispenses with the knowledge of God, with faith in his teaching, with the hope of his glory. And lastly, whilst we are persuaded that the world is of God's making, and that He has not abandoned it to find its own way to perfection or to ruin, we shall be sure that Faith in God will best manage all things for practical success: that there is nothing expedient which is not in accordance with the mind and will of the Almighty Ruler; that those who are most loyal to God are in the long run the most useful to mankind.

J. LL. DAVIES.

OUR CONVICTS.

PROBABLY the first impulse of most persons in taking up an article on Convicts, is to put it down again. There is a very general feeling of strong distaste to the subject,—a compound sentiment made up partly of an impression that it is no concern of ours, that plenty of people are busy about it, and apparently to very little purpose; partly of a vague but deep dissatisfaction with the present state of the question, and a disquieting doubt whether there is not some inherent difficulty in it, which precludes the possibility of its attaining any real solution. There is a sort of floating opinion that the convict population of England is increasing; that the men who have passed through the discipline of our prisons always turn out the most daring criminals afterwards; and that this is owing chiefly to the too lenient treatment they have met with there at the hands of theorising philanthropists who have been trying unpractical schemes of reformation on them. We have heard of an "Irish System," which is said to have been wonderfully successful in Ireland; but its opponents pronounce it not adapted to England, and, as we all think Englishmen very different from Irishmen, this reason appears sufficient. And so one half the world passes the matter by as hopeless, while the other half has a strong but indefinite feeling that "something must be done" in the way of additional severity.

To all persons in this very common state of mind, we would recommend the work whose name we give below,* which furnishes just the sort of information which ordinary intelligent men and women need on this subject, and shows them where to procure more if they wish for it. It comes to us guaranteed by the name of a lady whose own disinterested and successful labours in one department of convict treatment, entitle her opinions and statements to respect and confidence.

---

* "Our Convicts." By Mary Carpenter. 2 vols. Longman & Co. 1864.

All we propose to do here is to lay before our readers as concisely as possible the results of some different systems of Convict Treatment,—results differing so widely that they indicate conclusively some fundamental difference in the principles from which they spring. In these results, as they affect our own country, we have all the very strong practical interest, that we have to find the money for the system which brings them about, and are its victims in our own persons or property whenever it fails; while they possess another and still deeper interest for the student of the philosophy of morals and religion. It is but seldom that we can have so good an opportunity of trying experimentally the working of different systems of morals as is afforded by a convict establishment, where the life of large masses of men is, for the time being, completely moulded by the will of a few directors; and the conclusions we are thus enabled to attain, appear to us to be of the highest value for our speculative theories.

Without going into these theories now, we may assume that legal punishment has for its object to exhibit the indignation of society against wrong-doing, and to *minimise crime.* This it may do by deterring the criminal and others from a repetition of the crime; by incapacitating the criminal from injuring society, either temporarily or permanently, by imprisonment or death; and by reforming the criminal so as to deprive him of the will to injure society, and render him a useful member of it. It is clear that the last means is the most effectual, as regards society, no less than the criminal himself, *where it can be carried out.* But it may fail, and then we have to fall back on the other means of protecting society.

The deterrent principle is so easily apprehended that it is sure always to be a prominent one in the public mind. On the Continent, as far as we have the means of knowing, the punishments have almost entirely a deterrent aspect. The punishments of chains, being fastened to a ring, or kept in irons, are frequent; hard fare—one warm meal and a pound of bread daily, and on Sundays a little meat—is provided; a straw mattress and pillow are thought sufficient. Some of the graver secondary punishments even involve a sort of civil death, which shuts out all possibility of regaining the lost position. But in the more enlightened of these countries people have learnt to see that the offence of the criminal does not acquit society of all its duties towards him; and moreover the practical necessity, that each State should absorb its own criminals, prompts the desire to change these dangerous members into useful ones. In most of the German States care is taken by the authorities that a convict on his liberation should have the means of immediate subsistence provided for him; and he is placed for a probationary term under more or less surveillance from the local magistrates, with a view at once to render his relapse into crime more hazardous, and to afford him assistance in his efforts to gain an honest living. In Prussia, Wurtemburg, and also in Tuscany, voluntary societies co-operate with the governments in this work; and their labours, we are told, have effected a marked diminution in the amount of crime. In Russia, on the other hand, the punishments are of the severest kind; and no attempt is made to reform the criminal or assist him on liberation.

In Spain we have a very curious instance of the amount of good achieved by one individual who struck out the right path for himself, and also of the mode in which the best organization may be frustrated by the introduction of a wrong principle.

"In the city of Valencia," we quote from a charge of Mr. Recorder Hill, "there has long been a penitentiary gaol under the government of Colonel Montesinos. This gentleman acted upon the prisoners by urging them to self-reformation. He excited them to industry, by allowing them a small portion of their earnings for their own immediate expenditure, under due regulation to prevent abuse. He enabled them to raise their position, stage after stage, by perseverance in good conduct. When they had acquired his confidence he entrusted them with commissions which carried them beyond the walls of the prison, relying on the moral influence which he had acquired over them to prevent their desertion. And, finally, he discharged them before the expiration of their sentences, when he had satisfied himself that they had acquired habits of patient labour, moderate skill in some useful occupation, and the inestimable faculty of self-denial. . . . His success was answerable to the zeal and wisdom of his administration, and the Spanish government appointed him Inspector-General of all the prisons in Spain. Under his system, the prisons became models of order, cleanliness, and cheerful industry; plots or desertions were almost unknown; and during the twenty years that he was at Valencia he never required the presence of any armed force, not even to guard the bands of prisoners, numbering sometimes 400 men, who worked outside the walls. The annual recommitments, which had averaged thirty-five per cent., sank to two per cent. Unhappily the legislature was minded to introduce a new penal code, which converted sentences of imprisonment for a long term of years into imprisonment for life, and deprived the governor of all power of alleviating the condition of the convict. Unconsoled by the hope of improving their lot, Colonel Montesinos observed that the convicts lost their energy. A feeling of despair spread among them, indeed that they continued to work at all was the result of discipline and consequent subordination; but they laboured without zeal, without any love of work. Finding no means by which he could counteract this terrible evil, which utterly destroyed his system, Colonel Montesinos resigned his appointment. . . . The same material organization remains in the prison of Valencia, but the spirit of his internal arrangements has disappeared since the Colonel departed, to such a degree that in the workshops hardly any work is done, and what is accomplished is badly performed; the remarkable order and cleanliness formerly observed have disappeared; desertions, then so exceedingly rare, even of those who worked outside the walls, now amount to a most disgraceful number, so that there have been as many as forty-three convicts at once under heavy punishment for attempting to escape."

One of the first attempts to introduce a somewhat similar mode of treatment among English convicts was made by Captain Machonochie, from 1840 to 1844.

The scene of his labours was the lowest of our penal settlements—the notorious Norfolk Island, to which prisoners were sent who had been reconvicted afresh in Australia or Van Diemen's Land. Among these miserable wretches,—incorrigible offenders as they were deemed, and living in a state of degradation not to be described,—Captain Machonochie nevertheless achieved remarkable results. A degree of good order and safety was established which had been utterly impossible before, and this with little more than half the garrison of soldiers that was found necessary under other treatment. Many circumstances, however, prevented the complete carrying out and full success of his system, either here, or in a subsequent partial experiment in the Birmingham Gaol. But his general principles of Convict Treatment, and certain features of his practice, especially the dividing the men into small parties, and the system of Marks for good conduct, have gradually worked their way into general acceptance among those best qualified to judge of these subjects.

Our English system of convict treatment dates only from the year 1852, when the relinquishment of transportation led to the introduction of sentences to penal servitude for three years and upwards. It then became necessary for the Government to provide establishments—in addition to the county gaols and other places where shorter sentences are passed—to contain large masses of men whose employment should be chiefly on some kind of public works. Few persons are aware of the numbers who annually pass into these places; but it appears from the tables given by Miss Carpenter that nearly three thousand persons are annually sentenced to penal servitude. To contain these criminals, Government has in England seven large prisons, besides penal establishments at Gibraltar and the Bermudas. The first year of sentence is spent at Pentonville or Millbank, and a considerable part of it, varying according to circumstances, is passed in separate confinement. Thence the prisoner is transferred to Chatham, Portland, Woking, or Dartmoor, where the men are employed in association on public works, Dartmoor being intended for those whose health is considered to be unequal to the hard work of Chatham or Portland. At Broadmoor there is a large prison-asylum, where criminal lunatics are confined. In each of these places a competent staff is maintained, about one officer to every ten prisoners, exclusive of the governors, chaplains, and medical officers; the diet, clothing, work, in fact the whole method of life is regulated with the utmost minuteness, and with the most careful attention to the health of the prisoners; gratuities and remissions of sentence are granted, according to a certain graduated scale, to prisoners who are not guilty of any marked offence; a certain amount of schooling and attendance on the services of religion is enforced; and finally the convict is allowed a probationary term of conditional liberty, or a ticket-of-leave. We may well be inclined to ask, what more can be done, at any rate for the convict? Yet what are the results of twelve years of this system?

We all hear, from time to time, of terrible mutinies breaking out among these men; we notice that there "has been an outbreak at Dartmoor;" we remember the one at Chatham in 1862, which was only repressed by a charge from seven hundred troops from the garrison; perhaps we observe a paragraph, like one that appeared very recently in the papers, telling us that two or three hundred convicts had broken loose at Portland and were roaming over the island, but the military had been called in, and no doubt order would soon be restored. But we do not see the entries in the prison books, which reveal a startling amount of violence that never meets the public eye, and which, to judge from its lenient punishment in many cases, must be of very common occurrence. From the evidence of the prison governors and doctors given before the commissioners, we learn that savage assaults upon the warders are sufficiently common to place the officers to some extent in fear of the men, and to induce them sometimes to refrain from reporting their offences. These assaults are most common in the invalid prisons, least so in the close prisons; in those of public works they occur from time to time like an epidemic, six or seven at once; and then there will be a temporary cessation, as at Chatham after the mutiny. The prisoners have also other ways of annoying their officers: insisting on having their rations weighed, simply to give trouble, and sending unnecessarily for the governor, doctors, or chaplain, are among the most common. The amount of work to be got out of these men is very small. Of course forced labour cannot be expected to equal willing industry, but it might be supposed that the hope of regaining his liberty or improving his position by diligence would supply the place with a convict of those happier incentives to toil which nerve the arm of the free labourer. It does not seem to be so here, however; shamming illness to escape work is frequent; one free quarryman will do more than two convicts; and the slow "government stroke" of the convicts has become a byword among the free labourers who work with them. The schooling, after the prisoner has quitted Pentonville or Millbank, amounts to three or four hours a week, and the religious instruction to the daily prayers and Sunday services,—a strong opinion being expressed by the directors, and by the governor of one prison, that even this is too much, and that it would be a positive advantage morally to the prisoners to dispense with any evening prayers, from the bad use they make of the time.

On liberation a prisoner leaves the prison with a certain sum of money in his pocket, the accumulated gratuities earned while undergoing his sentence, and with a ticket-of-leave, which was originally intended to keep the convict under some slight degree of restraint on his first return to society. Practically, however, it operates precisely in the opposite manner. From a humane wish not to interfere with any efforts they may make to obtain honest employment, no sort of supervision has been exercised over these men; the police have had no means of recognising them; if they do so, they have had orders to abstain from watching or noticing them, thus actually ensuring them greater immunity from observation than is enjoyed by any other "suspected characters." Under this system we find that there is a startling increase both of the amount and in the atrocity of crime in England. It is very difficult to estimate the number of recommitments accurately, because no means are taken to register criminals or keep account of a man's antecedents; whether or not he is known as a previous offender depends therefore on whether any police-officer happens to recognise him. According to the official reports, these relapses into crime amount to 20 per cent. But where the local magistracy have taken pains to trace out a convict's previous history, as has been done for some years in the West Riding of Yorkshire, it appears that about 50 per cent. would be nearer the mark. Sir Richard Mayne speaks of the anxiety with which he watches the increasing accumulation of skilful and hardened offenders in London. Police-sergeant Lorme tells us that, as far as the police can judge, ten out of twelve return to crime as soon as liberated. The governors of Edinburgh and Holloway gaols testify that many convicts come under their hands who were not sentenced as previous offenders, but whom they find to be such from their own conversation or from their companions; and that such men, so far from seeming deterred by their experience of penal servitude, boast of its comparative comfort, and announce their intention of getting themselves recommitted sooner than stop in a county prison.

All this would sound very hopeless—the more so, as there can be no doubt that the English system was carefully devised for the reformation of the criminal, and has been administered by men of character and ability who devote their best efforts to its success,—were it not that certain points of error in principle can be easily detected. First, the too abundant dietary and too light work. There is no doubt a depressing influence in confinement which requires some counteraction by food; but the English dietary is higher than that of the Irish or Scotch prisons, and much better than that of the workhouses. The convict has more food, more warmth, better clothing, lighter toil, and immensely more attention to his bodily ailments than a large proportion of free labourers can enjoy.

Next, the gratuities and remissions of sentence, which ought to be the rewards of positive exertion, have come to be regarded by the convict as a right, unless forfeited by unusual misconduct, and therefore no longer answer their original purpose.

Then, the absence of any system of registration, and of supervision on leaving prison, diminishes unwisely the hazards of a life of crime.

And lastly, the machine-like regularity and minute coercion of a prison life are found positively to weaken the prisoner's powers of forethought and self-government.

A man comes out of the prison improved in physical health; so much fatter, Sir Richard Mayne tells us, that it is difficult for the police to recognise him; his head full of the schemes of crime he has heard from his fellow-prisoners; the old craving for excitement quickened by the monotony of the last two or three years; his power of self-control weakened for want of exercise; his old associates flock round him, the police take no notice of him, and he returns to his old habits. It seems a very comprehensible process!

But the change of system which affected England in 1852, also affected Ireland, and we will now see what mode of treatment was introduced there, in consequence of the discontinuance of transportation. The state of the Irish prisons in 1853 and 1854 was very bad. They were extremely overcrowded. There was no proper organization in them, and the mental and physical condition of the convicts was such that when sent to the colonies nothing could be done with them. It was felt necessary to issue a Commission of Inquiry in 1853, and in the following year, one of its members, Sir Walter, then Captain Crofton, was placed at the head of a new board of directors, to carry out a fresh system of management.

Captain Crofton brought to his task a conviction that a large proportion of these miserable men might be redeemed from their bondage to crime, but that it must be done by steadily carrying out two principles: first, that the prison organization should be so arranged as to admit of minute classification of offenders, and as far as possible to individualize each case; and, secondly, by providing some intermediate stage of partial freedom, in which the convict's powers of self-control should be at once trained and tested, before his complete restoration to liberty.

The general outline of a convict's career, under this system, is the following:—He begins with a period of separate confinement in Mountjoy prison, which cannot be less than eight months, and may be nine, or more, if his conduct is deemed to require it. The dietary during the first four months is very low, afterwards it is raised, to prepare the prisoner for the harder work of the second stage. During this period, much time is devoted to his religious and secular instruction: in particular the whole system in which he finds himself is carefully explained to him; he is made to see that within certain limits he is the arbiter of his own fate, and to feel that the moment his own will is set towards improvement, he will find ready and kindly cooperation from all around him. The police system of the country is also expounded to him, and he is shown how the introduction of the process of photographing and registering every prisoner, and the use of the telegraph, increase the hazards of a relapse into crime: a piece of knowledge that generally seems to make a deep impression on the prisoner. In most cases the spirit of sullen antagonism to all authority with which a man enters prison disappears under the influence brought to bear upon him in this stage. At its expiration, a convict in Dublin is sent, if a labourer, to Spike Island prison, to work on the fortifications; if an artisan, to Phillips Town prison, to work at his trade. Here he labours in association with others; his dietary is improved, though it is still much below that of an English prison; and he has the opportunity of earning certain gratuities by extra labour, which accumulate against the time of his release. The whole amount he can gain in this manner, is about half what an English convict may gain in the same length of time, though the weekly gratuity, 2*s.* 6*d.*, in the last stage of all, is higher than in any single stage in England; and there is this marked difference between the systems—an Irish convict is considered to owe his labour to society, and all gratuities and remissions of sentence are made to depend, not on abstinence from offences, but on accomplishing more than a certain amount of work. It is here that the Mark system comes in. This stage is divided into four classes, and the time of the convict's release depends, within certain limits, on the regularity with which he passes from one to another of the classes. But he only becomes entitled to a remove by earning a certain number of marks, which are given for general orderly demeanour, for industry at school, and industry (not previously acquired skill) at work. They are assigned according to certain fixed rules which are fully known to the men; and trivial as this arrangement may appear, it is really found to be of immense importance. It enables each man to realize his own progress in self-control, and the prisoners are invariably found to keep an account of their marks for themselves, with the most intense interest. Misconduct is punished by loss of marks or of rank, diminished dietary, or, in the worst cases, return to Mountjoy. Dangerous men are completely separated from the others, and placed on a very low dietary; idlers are placed in a class apart, and on a lower dietary, without meat, until they give signs of improvement. No doubt it is this minute classification which has rendered it unnecessary for a long time past to resort to flogging.

From these the convict passes to the Intermediate Prisons, which constitute a distinguishing feature of the Irish system. As the object now is to test the results of the previous course of discipline, the system of marks is discontinued, very little restraint is exercised over the convicts, and a man has the opportunity offered him of showing what power of self-government and industry he has really acquired. A strong moral and religious influence is brought to bear on the men in this stage by separating them into small bodies, never more than a hundred—and, if possible, fewer—being massed in one place; by the organization of these parties, and by the direct teaching and personal intercourse of the chaplain and lecturer. The principal of these establishments are at Lusk, about twelve miles from Dublin, and at Smithfield, in the city itself: the former for labourers, and the latter for artisans.

At Lusk the convicts have been employed in reclaiming waste land on an open common. From fifty to a hundred men at a time are placed here, living in two large iron huts, and superintended by from five to nine warders, who work with them. There is no military guard, no police, no fences or boundaries, no prison dress, or appearance of coercion. The labour of draining a very wet common is very hard, yet the men toil as willingly as free labourers, and have sometimes voluntarily given their assistance at over hours to save the harvest. They have sixpence a-week here from their gratuities to spend, within certain limits, as they please, intoxicating drinks being prohibited; and once a-week some of the men who are nearest their discharge are allowed to go out, to lay out the money for the rest. Not unfrequently it goes to buy bread, a sufficient proof that the dietary, though a good deal raised above the prison standard, is not too high for men working hard. One halfpenny a-week is voluntarily subscribed to the library, the rest is generally spent on little variations in dress, or sometimes books and papers. Not a single case of desertion among the men thus permitted to go out has ever occurred, even from Smithfield—in the centre of a city's temptations. In a very few cases a man has been induced to "stop and have a drink" with some old friends, but he has invariably returned looking penitent and foolish.

At both places lectures are delivered in the evenings by the lecturer, Mr. Organ, on such subjects as are likely to be most useful to the men in their subsequent career. Every Saturday evening there is a competitive examination, conducted by the men themselves: they divide into two parties, each of which proposes questions on the lectures to the other, and very eager debates frequently ensue.

From these establishments the convict, if his conduct has entitled him to a remission of sentence, is released on a ticket-of-leave. He is allowed to choose his own place of residence, but wherever he goes a photograph and report of him is sent to the local police. He is placed under their supervision, and obliged to report himself to them once a fortnight. Should any symptoms of a return to his old habits and associates be observed, his licence is revoked for a time. When he obtains employment his employer is made aware of his position, but it is carefully concealed from the men with whom he works. Convicts liberated in Dublin and its neighbourhood are visited every fortnight by Mr. Organ.

What, then, has been accomplished by all these agencies? First: there has been a steady decrease of crime in Ireland since the introduction of this system, the annual convictions falling from 710 in 1854 to a little over 300 in the four years preceding 1862. In that year they rose to 500, no doubt from the same causes that increased the number of paupers in the workhouses, but they have again somewhat diminished in 1863. The recommitments, under a system where every possible pains is taken to ascertain previous convictions, averaged, up to 1862, 9·9 per cent., and including that year are barely 12 per cent. Secondly: the great problem of the re-absorption of the criminals into the honest and industrious population has been satisfactorily solved. Employers are found willing to take these men into their service, and the convicts are willing to encounter the comparative poverty and steady toil of a working-man's life who has to begin at the bottom of the scale. Not that this state of things has been brought about without much persevering effort in the first instance, chiefly by Mr. Organ, who set himself systematically to find places for these men. The same difficulty, however, no longer exists, not because employers as a class are more philanthropic in Ireland than in England, but because they have found by experience that men who come with a good character from Lusk or Smithfield have given some guarantee there for their industry and power to resist temptation; while the fact that they are still under the supervision of Mr. Organ or the police during the most perilous period of their first return to society is felt to be an important safeguard. The men have undergone a discipline of the will and a cultivation of the mind which in many cases positively raises them above the level of their class, and the testimonials voluntarily given by employers to their honesty, industry, and willingness are most striking; many have even risen to positions of trust, and have proved themselves worthy of the confidence placed in them.

It has been frequently said that the Irish system owes its remarkable success to the personal character of the men who have organized it, and could not be expected to produce the same results in other hands. No doubt this is so far true that Sir Walter Crofton, and Mr. Organ in particular, have displayed singular qualifications for their respective posts, and we have many testimonials to the excellent and zealous spirit which has pervaded all who have taken part in it. But a system founded on sound principles, and carefully explained to all who have to carry it out, has a direct tendency to mould its own instruments, and Sir Walter Crofton had often asserted that, once launched, his work would prove independent of himself. And so it has done, for it is still going on with success in other hands, since Sir Walter was compelled to retire in 1862, from overwork and consequent failure of health.

The legislation of the last session has introduced some important modifications into the English system, which tend on the whole to make it approximate more closely to the one we have been considering in Ireland. The increase of crime within the last few years, and the accumulation of skilled criminals in our large towns, had grown to be a question of imperative urgency, and a Royal Commission was appointed to deal with it. Among the causes of this increase the Report includes "defects in the system of punishment now in force, and the fact that penal servitude appears not to be sufficiently dreaded either by those who have undergone it, or by the criminal class at large;" but adds, rather curiously, that this "want of sufficient efficacy in the present system does not arise from any error in principle, nor from its general arrangements being injudicious." Nevertheless, very important changes are recommended, which may be summed up as follows:—The severity of the earlier stages of punishment is increased: all sentences to penal servitude must be for not less than five years, the shorter terms of three and four years being abolished, and in cases of previous conviction of a felony the term of penal servitude must be not less than seven years: the dietary is restricted: the system of gratuities is rearranged, and the whole amount lowered: and it is made imperative that the separate confinement of the first stage should be carried out for not less than nine months. Practically this period had been much reduced by the want of sufficient accommodation in the prisons. Those who most desire the wellbeing of the criminal will be least inclined to quarrel with this severity, for "a well-arranged adversity," as Captain Machonochie used to call it, is undoubtedly the first requisite towards improvement.

The mark system is recommended for adoption; and the gratuities and remissions of sentence are to be made the rewards of positive industry and self-control, not of mere passive submission to the prison regulations. The whole amount of remission that may now be obtained by a prisoner under the best circumstances, is rather less than one-fourth of the whole term of sentence for men, and about one-third for women.

The mode of classification in use in the Irish prisons, which avoids the danger of parading together a large army of convicts, and the Irish system of schooling in the evening, are also recommended.

A system of supervision over the ticket-of-leave men is introduced. A convict liberated on licence is obliged to report himself personally within three days to the police of any place he may go to; he must afterwards appear before them once a month;

he must produce his licence on demand; and a police-officer may arrest without warrant any licence-holder whom he may reasonably suspect of having broken any of the conditions of his licence, and detain him until the matter has been inquired into by a magistrate. To effect this latter change, and also that in the length of sentences, a new Act of Parliament was required, which was obtained towards the close of the last session.

The Commissioners also recommend the appointment in London of a special officer to fulfil the same functions towards the released convicts that are discharged by Mr. Organ in Dublin.

While these alterations are undoubtedly a movement in the right direction, there are still some important points which they do not embrace. The great principle in the Irish system is the gaining of the convict's own will towards reform, by every possible means of coercion, of instruction, and of encouragement; and especially by making both officers and men fully understand that this is the object aimed at throughout, and that short of its attainment the whole amount of penalty must be inflicted. The complete and frank recognition of this principle involves no changes in the material arrangements of a prison, but it makes the whole difference in the manner in which those arrangements are carried out by all concerned in them, and in the moral agencies brought to bear on the prisoner.

Again, the absence of any stage of partial freedom answering to the Intermediate Prisons is a most serious omission. Part of the Commission was in favour of this system, but it was finally negatived, from the belief that the men now in the English prisons were not in a condition in which they could be safely trusted in such establishments. But if they cannot be trusted not to abuse the partial freedom of this position, are they fit to be turned loose on society again? The want of some such place where a man may show what is in him, will no doubt add greatly to the difficulty of obtaining employment for ticket-of-leave men; for it will inevitably be felt that a good prison character without this training is but small guarantee of what a man will be when thrown once more on his own resources.

And lastly, it is much to be desired that the hazards and penalties of a life of habitual crime, as contrasted with the casual commission of an offence, should be increased. This would be best accomplished by the introduction of a complete registration of criminals, aided by photography, and of the principle of cumulative sentences; that is, enacting that a frequent repetition of sentences not in themselves serious should be made an indictable offence and punished accordingly. At present there is a large class of persons who live for many years by crime, and are frequently summarily sentenced for short terms; but who for a long period, and sometimes for life, manage to escape conviction for any offence which would render them liable to penal servitude. Some of them have been as often as thirty or forty times in prison for a month or two, and it is precisely this class which furnishes the most hardened of our criminals. If a certain number of convictions for minor offences was made to constitute in itself a cause for a long detention under reformatory discipline, these persons, whose present comparative immunity is a great temptation to others, would be effectually reached.

There is a work, too, for society at large in this matter; not only in the formation of a correct public opinion on the question, but in the important point of co-operation with Government in the finding employment for released convicts who, under a better system of treatment, may have given reason to believe them reformed. This may be done either by individual employers, or by the formation of Prisoners' Aid Societies. There are also various legislative acts for the suppression of houses of ill-fame, receiving-houses for stolen goods, &c., which remain almost a dead letter, from the ignorance or apathy of the general public. To a considerable extent this is the case even with those most important agencies for checking the spread of crime among the juvenile population—the Reformatories and Certified Industrial Schools. The former are intended for juvenile criminals, are under Government inspection, and a magistrate has power to sentence a child to them instead of to prison. The latter are also under Government, and are meant for children under fourteen, as yet unconvicted, but who are found beggars or vagrants, or in the company of thieves. In both cases the parents can be obliged to pay a certain weekly sum towards the maintenance of the child. The latter class of schools, however, are by no means so common as they ought to be; and even in the case of the Reformatories, numbers of children are constantly sent to prison whose proper place would be in these schools. So far as their operation has extended, it has been most successful, and has had a marked effect in the diminution of juvenile crime. But much remains to be done in the establishment of schools of both these kinds in our large towns. Nor must we fail to remind our readers, though it is unnecessary to do more in GOOD WORDS, of those Ragged Schools which catch the children most exposed to temptation, and by God's blessing have saved many from being swept into the vortex of crime. On the whole subject of these preventive agencies we would again refer our readers to Miss Carpenter's excellent work, especially to its concluding chapters.

On the whole it does not appear that we have any reason to despair. If Irishmen and Spaniards and Norfolk Island convicts may be reclaimed, Englishmen may surely be also restored to society. But if we may pass for a moment from results to principles, it can only be by making our human discipline copy, so far as we may, the method of the Divine government; by making a man feel that the law is just and inflexible, and in every collision will prove stronger than he is; that nothing can be gained by resistance, but that submission is instantly met with kindness and willing co-operation. And he must recover his lost ground, as we are all trained to virtue, by the slow process of personal effort, stimulated by hope, but with the continual possibility, and sometimes the reality, of failure. Merely to remove occasions of offence does not answer. In former years we simply tried to get rid of our criminals, sent them to the other side of the world; and if they gave trouble there, coerced them with merciless severity. The end was a state of things so bad, that the society where it existed could not have gone on, had not the conscience of this country, once aroused, refused to permit its longer existence. Then we tried to manage our convicts by placing them under a routine of the most carefully contrived circumstances at home, and we have failed there too, because these alone could not get at the men's *will.* We shall have to fall back on that very ancient principle, which our modern efforts only illustrate, that it is only when, in the strictest sense of the words, "we seek the kingdom of God and His righteousness," "that all these things are added unto us."

CATHERINE WINKWORTH.

ESSAYS, THEOLOGICAL AND PHILOSOPHICAL.

By HENRY ROGERS, Author of "The Eclipse of Faith."

VI.—SOME THOUGHTS ON PROSE COMPOSITION.

If "prose" be, according to the lucid definition which the *Maître de Philosophie* gives to "Le Bourgeois Gentilhomme," "all that is not verse," we need not wonder at the surprise or the rapture with which M. Jourdain found that "he had been talking prose for more than forty years without knowing it." But if by "prose" be meant a "species of literary composition," demanding, no less than poetry, the apt expression of continuous thought and feeling, then he enormously flattered himself in this conclusion.

In truth, the "art of prose composition" is a phrase quite as intelligible, as the art of painting or music: or if it be thought that prose seems a more natural use of language, and verse a more artificial, the difference is still only one of degree.

Both are natural, and both are artificial. There are conditions of the human mind in which the outbursts of lyric song, though in one sense artificial, are as natural as the warbling of the nightingale; while it is also true that the most natural eloquence will be none the less natural, but rather the more so, that there has been a designed and skilful application of means to ends. In fact, the words Nature and Art, where the latter means no more than this, are but complements of one another, and can never be opposed.

So far from prose, as a species of literary composition, being so simple an affair as M. Jourdain supposes, it is a somewhat curious fact that in the literature of all nations it has been preceded by verse. Of course it is not meant that there was not plenty of prose like M. Jourdain's extemporaneous specimen,—who asks whether, "if he orders his servant to bring him his slippers, that is prose?" and is happy to find it is. Language was always sufficient no doubt for colloquial purposes, before composition was thought of. Men could always buy and sell, and get gain, and cheat, and wrangle, and rail, and quarrel, and make it up again, without invoking any one of the Sacred Nine.

I have said it is a curious fact, that in the development of literature in general, poetry has preceded prose. Yet poetry under some form or other, in metre or without, would naturally be the elder-born of genius; for in the history of a community, not less than in that of the individual, the imagination is developed earlier than the reason. Hence in part (though also from the necessities of a scanty vocabulary) the language of barbarous nations generally abounds in bold metaphor; it has even been observed that their very laws—what will not imagination do?—are tinctured by it. Very beautiful certainly are those expressions in the Scandinavian laws which forbid trespass on the open and unguarded field, "inasmuch as the field hath the hedge for its wall, and heaven for its roof;" or as expressed in another law against trespassers, "because it is under God's lock."

But it is also true that the poetry, with which all literature commences, is not poetry in substance merely, but in form; it is metrical. It is as if young fancy, revelling in happy sensation and stimulated by natural passion, broke out like the birds into spontaneous melody; or that, to use the language of Milton, she

"——fed on thoughts, which voluntary moved
Harmonious numbers."

For this priority of verse to prose, many other reasons might be assigned, if this were the place for it. In the infancy of civilisation, and especially in the absence, not merely of the printing-press, but of any generally understood methods of fixing and transmitting thought, composition would be a rarity and luxury; copies (even if letters were known) would be few, and few could read them; it must, therefore, be in such a form as would aid memory and make transmission possible; and verse is the best expedient that can be devised for attaining both these objects. Again; as poetry would be in some form or other the earliest species of composition for the reasons already assigned, and as the end of poetry considered as a species of composition is *delight*, it was natural to combine upon it all the elements of delight; to invest it with every possible attraction; and amongst these must be reckoned a metrical arrangement. This also more easily admitted the superadded charm of Music.

The degree of distinction between poetry and prose, as two species of *composition*, has varied in different ages and amongst different nations, though it has of course always been great.

If we compare the interval between them as exemplified respectively in classical and modern literature, it would seem, contrary at first sight to obvious fact, as if the chasm was yet wider amongst the ancients than with us;—seemingly contrary to fact, because our poets generally submit to *one* restraint, and that a very onerous one, of which the Ancients knew nothing,—that is, *rhyme*. Notwithstanding, either from the notions they entertained of the very different qualifications of mind which the two severally required, or from the refined laws which their taste imposed on verse, or from both, it would seem that the two species of compositions were thought even wider apart than with us. And this would appear to be confirmed by a curious circumstance, which has perhaps hardly received sufficient attention from the literary historian, that there is hardly a name in Greek or Roman literature which has in any considerable degree distinguished itself in both forms of composition; as if the Ancients had either formed the conclusion that the two were so totally distinct that each required a genius exclusively adapted to it, or that the difficulties of obtaining the mastery of both were so great, that he who should attempt it must content himself with less than the fame he might promise himself by undivided devotion to either alone. If Cicero wrote a few verses, they assuredly added nothing to his reputation, and one luckless jingling line, provokingly immortalised in the satire of Juvenal, has been a standing joke against him in all ages.* Though Plato's writings overflow with the *essence* of poetry, and though his earliest compositions were poetical even in form, history does not record that he wrote anything in that way (except perhaps a single epigram) which satisfied his contemporaries, and certainly *does* record that he did not satisfy himself. In general the prose writers and the poets of Antiquity seem to have been as distinct as the poets and the painters, and for the most part punctiliously avoided invading each other's province.

Amongst the moderns the case is altered. We have numerous examples of men who have almost equally distinguished themselves both in prose and verse. Some diminution of power there may be—we may almost say, except in the rarest cases, must be—in such feats, so long as it remains true that man will do *that* best which he makes his single and paramount object; as long as it is true that he cannot achieve many things so well as he can achieve one. But it must be confessed, in the present case, that many instances may be specified wherein that diminution of power is so slight as to be scarcely appreciable.

The contrast between ancient and modern literature in this respect is indeed partly accounted for by the fact that, for those capacities and tendencies of our nature which most appropriately find their expression in poetry, we have whole classes of imaginative compositions unknown to the ancients—as, for example, the prose-romance and novel—and in which therefore it is not so wonderful that a poet, if he attempts them, should excel. Still the instances of authors who have written poetry of a high order, and at the same time earned themselves much fame in departments of prose literature less allied to poetry than those I have just specified, are sufficiently numerous to show us that the Greeks and Romans entertained very different notions on the subject from our own; different, either because the two species of composition—unlike as they always are—were separated by a still wider interval then than now; or because precedent and custom had restricted the ancient writers to the one or the other; or because they more rigidly applied the principle of the "division of labour," for the purpose of securing the most perfect results in every branch of intellectual effort.

Some critics have made it a question whether it is possible for a poet to write good prose at all;—and one very able one, who does not go quite this length, asks, "Whence, then, the fact that few great poets have succeeded as prose writers?" Yet a glance at the history of modern literature would suggest more than a doubt as to whether this can be said to be a *fact*. It is true that we may here and there see a mind, not merely of so poetical a temperament in general, but so exclusively adapted to some special branch of the art,—the lyrical, for example,—that it cannot comply gracefully with the severe requirements of prose; or one whose imagination is so fertile or so sublime that poetry forms at all events the most appropriate vehicle of its conceptions; or one so accustomed to write in metre that even its ordinary prose style partakes of a sort of measured movement and cadence,—just as we may see persons so accustomed to a certain movement of body, that even in their ordinary gait they may be said rather to dance than to walk. But these are exceptions to the rule. In general, the most splendid powers of invention and imagery may not only find ample scope in the more refined or elevated species of imaginative prose-composition, but are so imperatively required there in order to attain the highest excellence, that if there be but conjoined with them that strong sense which the great Roman critic represents as the basis of all good writing, the poet need not be afraid that he shall not "succeed as a prose-writer."

---

* Tacitus (or the author, whoever he be, of the treatise "De Oratoribus"), while speaking with deserved contempt of Cicero's poetic efforts, slyly says that Cæsar also had composed verses, but that he had had better luck, inasmuch as few people had ever seen them!

At all events, it is futile to speculate in the face of facts. The prose of Cowley and of Dryden—that of the one better than his poetry, that of the other equal to it; the prose of Milton, which though it has palpable defects, yet has also transcendent excellences; the prose of Cowper and of Gray, whose letters justly rank amongst the finest specimens of composition in the whole compass of English literature; the prose of Southey, Walter Scott, and Byron, all of whom have written prose admirably; Goethe, Schiller, Herder, and others in Germany, —can hardly leave a doubt that poetry and prose may flow from the same pen: and that though it may be true that there is usually some one thing which genius will do better than any other, and will do that one thing all the better for doing that alone, yet that it is not impossible that it may excel in two.

While it may be doubted whether there are not structural differences of mind which would in some cases limit a great genius to either the one or the other, these examples are surely sufficient to show that it is not impossible to excel in both; and that there must have been other reasons for that sheer line of demarcation which the ancients made between them. Michaelis, indeed, in one of his acute notes on "Lowth's Lectures on Hebrew Poetry," doubts whether it is possible for a truly great poet ever to become a truly great orator, or *vice versa.* He who reads the speech which Shakspeare puts into Mark Antony's mouth over the dead body of Cæsar, may perhaps be disposed to doubt, with Whately, whether he who was the greatest of dramatists, might not also have proved, under other circumstances, the greatest of orators; while those who are familiarly acquainted with the prose writings of Milton, need not be told that he possessed that great element of the highest style of oratory which is called by the Greeks "δεινότης," but for which our language wants a name,—consisting of intellect glowing and molten in passion. On the other hand, it is impossible to read Jeremy Taylor without feeling that he might have been a great poet. To borrow an expression I have used elsewhere, he speaks the language of poetry by a sort of necessity of his nature. He resembles those full clouds of spring which shake out their fertilising showers with every breath of wind that stirs them; the slightest movement of his mind seems enough to detach the images from his ever-teeming fancy. No matter what his subject, he is sure to adorn it. Even over the most bleak and wintry wastes of casuistry or metaphysical theology, he passes like the very spirit of the spring, and all that is rich and beautiful in foliage and flower puts forth at his bidding.

Nature everywhere exhibits exhaustless variety in her products; and it is not the least singular example of this that we find endless diversities of style and manner amongst prose writers, though it requires a keen analytic skill always to determine in what the difference consists. Not only are there the distinctions of schools: no two individuals, of any considerable originality, can be found in whose styles there is not as distinct a character as in their handwritings. It seems, at first sight, marvellous. Though the points in which any two great prose-writers resemble one another, must be unspeakably more numerous and important than those in which they differ; though from the writings of either, the critic can extract exemplifications of all the laws of his art,—yet there are never two indistinguishably alike. It is with minds as with faces; obvious in their general resemblance, the diversities by which one is discriminated from another are as obvious. Such is the miracle which nature has everywhere achieved—that of reconciling essential unity with infinite variety. Minute original diversities of mind, whatever the general similarity,—minute differences of education, though its general system may be the same,—and the circumstances of external life, which are never the same, give to the fruits of every mind a tinct of the soil and the clime which produced them. There are great resemblances between certain kinds of handwriting; family resemblances, and resemblances which result from unconscious imitation; but they are all distinguishably different, and are in effect as unlike as they are alike. The diversities referred to, are indeed somewhat less obvious in prose than in poetry; and sometimes, in purely didactic composition, require a practised ear and much analytic skill, to detect and express them. Sometimes they cannot be expressed—so minute and subtle are they; but, where the compositions have any signal merit, they exist, and are felt, even if too refined to admit of being characterised in language. It is much the same as in music, where every one feels and acknowledges the different style of composition in Handel, Haydn, and Mozart, though not one in a thousand could specify those differences, or give expression to them in language. Yet the difference is *felt* so strongly that an accomplished musician will scarcely mistake their compositions, even on a first hearing. Nor is the difference between their strains greater than that between the prose of Milton and that of Johnson, between the prose of Burke and that of Addison; and the critic who hears them will be as little liable to mistake in referring their compositions to their proper authors.

A novice is apt to suppose that the interval between different compositions in prose is less wide than it really is; he is apt to think that "plain prose," as he calls it, is much alike in all cases; standing always on much the same level; that it may be considered a sort of *any-how* mode of expressing our thoughts, or that it is simply a mode of expression which is *not* metrical. Many readers are little aware what a highly complex and artificial thing the best prose is, after all. They little dream of the toil and thought usually expended on composition before it assumes even an approximation to the ideal of the author, or before the artist will permit a stranger to enter his studio. Apt thoughts will usually,—that is, in a great number of cases,—suggest apt words; but how often, on reconsideration, are those words exchanged for words which are found to be still more apt; how many changes of construction have been submitted to, in order to secure greater harmony or greater compactness; how many blottings and interlineations, and substitutions, have intervened between the first rough copy and the last printer's-revise; how many corrections have been made in successive transcripts and successive proofs; how long has been the chase after a fugitive synonym; how have the cells of memory been ransacked and their contents tumbled out for a forgotten word! There is scarcely any limit to which a correct ear and a delicate taste, if time be given, cannot carry improvement; scarcely any point at which an author will acknowledge that he can suggest no more. Johnson, when he had elaborately revised his early and often hasty papers in the "Rambler,"—and it must be acknowledged that they stood in need of it,—said to a lady who asked whether he could *now* improve any of them, "Yes, madam, I could make even the best of them still better." Burke, it is said, used to cover his manuscript with interlineations and alterations; and of some parts of his celebrated "Reflections" saw half-a-dozen proofs before he could satisfy himself. And he might have seen as many more before he failed to detect anything which he wished unsaid, or to suggest something he would still like to say. Pascal, it is said, employed not less than twenty days on the perfecting and revisal of some of his immortal "Provincial Letters;" justifying the language of his editor, M. Faugère, that revision with him was, as it were, a "second creation."

The celebrated Junius was almost as fastidious, and Robert Hall gave as one reason for his writing so little, that he could so rarely approach the realisation of his own ideal of perfection in style. Few things are more suggestive or instructive to a young writer than the inspection of *fac-similes* of the blotted and interlined originals of some of the celebrated passages of the greatest masters of style.

While it is true that prose is not metrical,—nay, while one of its very excellences consists in the entire absence of anything that shall even suggest the thought of it, yet it has its characteristic music no less than poetry itself; not that, indeed, of the lyre or the lute—of measured cadence and artificial harmony; but the wild and free, yet ever-pleasant and ever-varied, music of nature; of whispering winds or rolling floods; the pathetic wail or passionate gusts of the Æolian harp; such music as is heard by the mountain streams or in the leafy woods of summer. Not less than poetry, it has its sweet and equable or its impetuous and rapid flow; its full and majestic harmonies; its abrupt transitions; its impressive pauses; its graceful, though not regularly recurring, cadences.

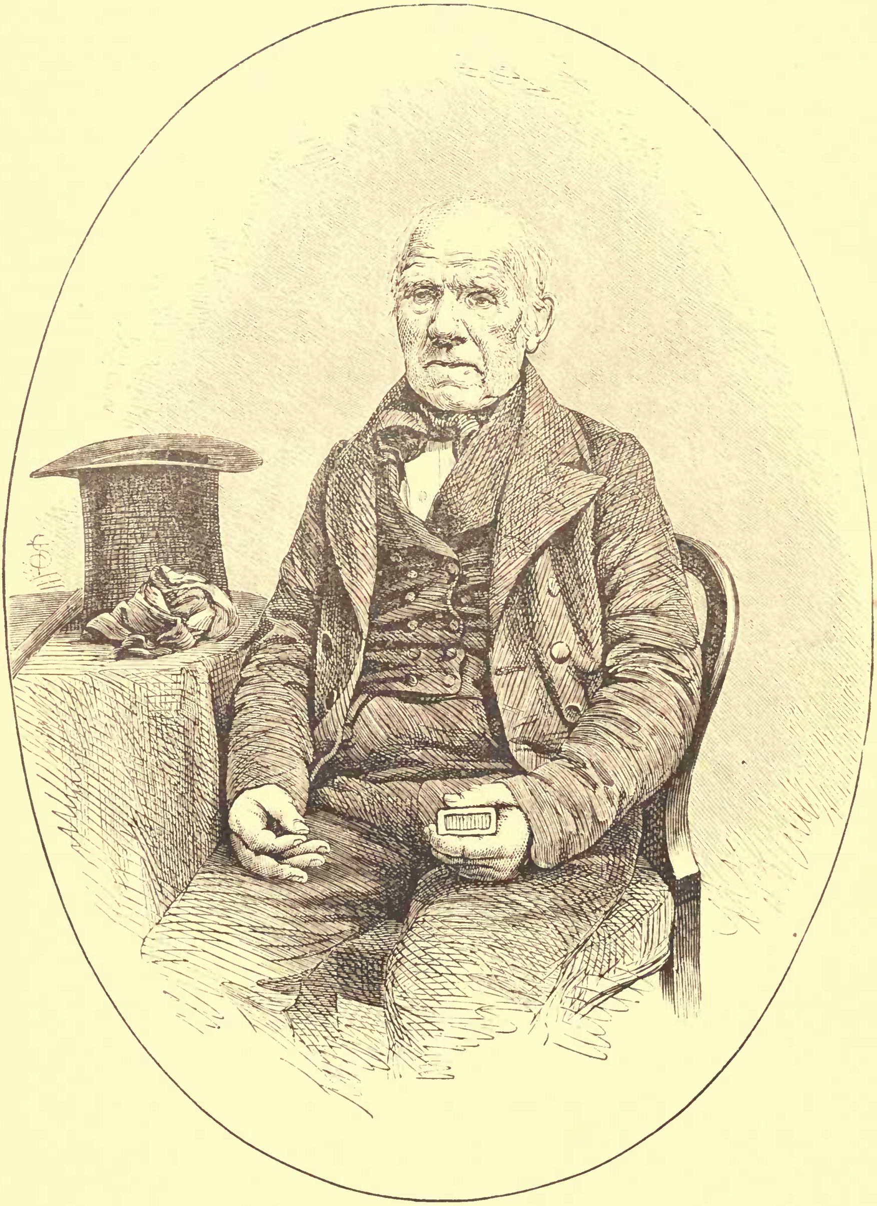
Such are the abstract capabilities of prose, though they are not always exhibited or often demanded from it. In general there can be no doubt that we demand in poetry a more exact attention to harmony of expression and a more elaborate and exquisite adaptation of the words to the thoughts. And, in fact, the connection between them is more indissoluble. Alter the words or the arrangement ever so little, and half the charm of a fine stanza is gone. It is true that this is partially the case with harmonious prose; but it is not the case to anything like the same extent, or in half so many instances. The poet's thoughts—to employ an expression of Milton's, descriptive of the union between music and poetry—are

"Married to immortal verse."

It is indeed a sacred, an indissoluble union. The strain of the poet may be compared with the strain of the musician, which cannot exist apart from the instrument which awakes it. The lay of the minstrel is spoilt, if but a chord of the lyre be broken.

Though the connection between thought and expression is not so close in prose as in poetry, it is still, in prose of a high order, most intimate; and the contrast between the best and the feeblest prose-compositions may be aptly illustrated by the image which Campbell, in his *Philosophy of Rhetoric*, has employed, to show the distinction between compositions in the classical languages and in our own. Speaking of the want of inflections in English, which forbids that varied collocation of words allowed in the languages of Greece and Rome, and also necessitates that abundant employment of particles—for example, of prepositions and conjunctions, which so often loads our style, he remarks, "Our modern languages may be compared to the art of carpentry in its rudest state, when the union of the materials employed by the artisan could be effected only by the help of those external and coarse implements, pins, nails, and cramps. The ancient languages resemble the same art in its most improved state, after the invention of dovetail joints, grooves, and mortices; all the principal junctions being effected by forming properly the extremities or terminations of the pieces to be joined." The similitude is certainly as apt when applied to examples of the best and worst prose in the *same* language.

In the instructive and amusing papers inserted in these pages, on "The Queen's English," we were warned of the danger, in these days of universal authorship and extensive international communication, of corrupting our noble language by incautiously taking up, and suffering to obtain currency, (after which there is no effectual appeal), the impurities of diction, construction, and idiom, which are extensively afloat in the literature of the day.



JAMES BEATTIE.

(From a Photograph.)

The same theme was instructively dilated upon in an admirable article in the *Edinburgh Review*, July, 1864. Perhaps it may not be superfluous to remind the young writer, that if he would attain more than correctness, or even a fluent facility, and impress upon his compositions that individuality without which they cannot live, he must remember that prose may be possessed of nearly as various excellence as poetry; and as much requires sedulous self-culture, profound meditation of the subject-matter, familiar acquaintance with the best models (models sufficiently numerous and varied, to prevent that mannerism which results from unconscious imitation of one), and that "limæ labor," that patient revision, which is the condition of all excellence, literary or otherwise. Perhaps, considering the immense mass of written matter which is every day given to the world, (and annually covering, if it were spread out, *horribile dictu!* thousands of acres of printed thought,) we ought rather to wonder that so much rises above mediocrity, than that so much falls below it.

The periodic press has been from time immemorial the arena in which the young literary athlete has trained himself for more important efforts. In it, most of our principal writers have exercised their young strength, and developed their sinew and muscle. To him, however, who wishes the highest development of which his nature is susceptible, there are disadvantages as well as advantages, in this sort of school. It too often encourages contentment with a fatal facility; the hurry in which most articles must be composed, encourages faults of negligence, and leaves no leisure to correct them; and too often the seductive "anonymous" allows a man to let that pass which he would not suffer to go under his own name.

Hence, as well as for other reasons, it is that we may often read articles exhibiting much talent, much learning, and much facility, on which there is yet so little individuality impressed, that we may read fifty of them, and feel that they might all have been written by the same hand. It is the tendency of a high civilisation, (say some,) to obliterate the distinctions between different minds, and to reduce them to the same level. This theory may, I think, be doubted, or at least is only very partially true; and one is as little willing to believe it true in literature as anywhere. But it can be confuted in this case, only by the strenuous efforts of every writer to impress upon his work the indelible marks of his own thought, and to let the fruits of his mind bear traces of the soil which produced them.

THE GRAVE OF THE HEART.

THERE is in every heart a grave,
  A secret holy spot,
Fill'd with the memory of one
  This busy life knows not.

Low down, and deeply dug it lies,
  This cherish'd grave unseen;
And years of blighting care that pass
  Make not this grave less green.

With jealous love we keep it fresh
  Through many wint'ry years;
And when the world believes us gay,
  We water it with tears.

Not for one cause alike do each
  Their secret sorrow bear;
Perchance some mourn a living-death—
  Yet still a grave is there.

There is within my heart a shrine,
  All wholly given to him;
No dearer treasure e'er could make
  Its lights burn low or dim.

Oh! there are things within this life
  Which strangely, deeply thrill;
In music's softest, sweetest notes,
  We hear a voice long still.

We deem the act a wanton one
  Upon a grave to tread;
We pass in silent reverence
  The resting of the dead—

Then on the sacred hidden spot
  Let us not press too near,
Remembering that to every heart
  Its secret grave is dear.

S.

MR. JAMES BEATTIE.

We have now much pleasure in presenting our readers with a Portrait of MR. JAMES BEATTIE, *whose remarkable work as a teacher of children formed the subject of the article, "Lessons from a Shoemaker's Stool," in our April Part. We have also pleasure in giving publicity in* GOOD WORDS *to the following Advertisement, which appears in the Elgin newspapers:—*

"TESTIMONIAL TO MR. JAMES BEATTIE.

"A suggestion having been made by several persons in different parts of the country, that a Testimonial should be presented to MR. JAMES BEATTIE, Gordonstown, the story of whose life, as it appeared in the April number of GOOD WORDS, seems to have excited a strong desire that he should receive some tangible proof of how the public in general appreciate his thoroughly disinterested and very important services, the Bankers in Elgin have kindly consented to act as a Committee in the matter, and to take charge of Subscriptions, which may be forwarded to Messrs. A. & W. BRANDER, British Linen Company's Bank, Elgin; A. MACKENZIE, Esq., Commercial Bank, Elgin; WM. MACDONALD, Esq., Caledonian Bank, Elgin; Messrs. MURDOCH and FORSYTH, Royal Bank, Elgin; P. CHRISTALL, Esq., North of Scotland Bank, Elgin; GEO. LESLIE, Esq., City of Glasgow Bank, Elgin; JOHN CRAN, Esq., Union Bank, Elgin."

THE CLIMATE OF THE BRITISH ISLANDS.

CLIMATE is the term in general use to signify the average weather of a country or district. Thus, if the prevailing weather be cold, it is called a cold climate; if wet, a wet climate; if the changes of temperature are few and gradual, it is an equable climate; and if great and sudden, an extreme climate. The two principal elements of climate are temperature and rain, considered specially with reference to the way in which they are distributed through the seasons. There are no doubt other circumstances tending to modify it, but they are either of little practical importance, or are only modifications of these two elements.

In describing the climate of a country, the first place must be given to the temperature of the various seasons,—we say the temperature of the various seasons, for it is this, and not the mean temperature of the whole year, which portrays its principal features. The climate of one country may be characterised by mild winters, moderately warm summers, and an equable temperature; while in another, the winters may be intensely cold, the summers very warm, and the temperature fluctuating; but yet the mean annual temperature flowing out of these widely different or opposite elements may be the same in both. In Orkney the mean temperature of July is 54° and of January 39°, the highest temperature yet recorded is 71° and the lowest 15°; while at Thirlestone, in Berwickshire, 558 feet high, the temperature of July is 57°, of January 34°, and it has risen as high as 85° and fallen 9° below zero. And yet these places, whose climates are nearly as much opposed to each other as those of any two places in Great Britain, have the same mean annual temperature of 45°. The climates of London, Vienna, and Pekin illustrate this point even more forcibly. For while their mean annual temperature is 51°, the January temperatures are respectively 37°, 29°, and 25°, and the July temperatures, 64°, 69°, and 84°. The climate of London is therefore equable, the difference between the summer and winter temperature being 27°, and the climate of Pekin very extreme, the difference being 59°.

In presenting a view of the climate of the British Islands we shall limit our remarks on temperature to the months of January, April, July, and October, these being types or representatives of the different seasons. The accompanying four small charts of the British Islands (see p. 464), on which are traced the lines of equal heat for these months, are here given as a ready means of presenting the climatic phases of temperature in a graphic and handy form.*

THE TEMPERATURE OF THE BRITISH ISLANDS.

The Winter Temperature, Chart I.—The chief feature of the lines of winter temperature is their north and south direction, lying, at least as regards Great Britain, mostly parallel to the meridians. In Ireland they seem to envelope the island with their folds, increasing in warmth from the centre outwards to the ocean. Another remarkable feature is the crowding together of the high temperatures in the south-west of Ireland and England, showing that the influence to which our high winter temperature is due is there most powerfully felt.

From the direction of the lines it is evident that the peculiar distribution of the winter temperature is not determined by the sun, but by the ocean which flows around and imparts its greater warmth to the climate by the intervention of the winds. The Atlantic may in truth be conceived as a vast repository of heat, in which the warmth of the summer months, and most probably the warmth of more southern regions also, is treasured up and reserved against the rigours of winter. In addition to this the sea to a great degree checks the encroachments of the cold, especially in all places in its immediate neighbourhood, by drawing off a considerable portion of the cold arising from radiation during calm and cloudless nights.

If the Shetland Isles received no more heat than is due to their position on the globe in respect of latitude, the winter temperature would be only 3°. Owing, however, to the heat given out by the ocean, and carried thither by the winds, the actual temperature is 39°. The former of these is the normal, the latter the actual temperature. The following are the excesses of the actual over the normal temperatures for a few British and Irish stations, and may be regarded as measuring the advantage each place enjoys in winter, from its proximity to the ocean:—Shetland 36°, Inverness 31°, Edinburgh 28°, Durham 26°, Liverpool 26°, London 20°. Bristol 24°, Isle of Wight 23°, Land's End 26°, Belfast 28°, Dublin 28°, Galway 28°, and Cork 27°. But for the enormous quantity of heat stored up in the ocean, our winters would be from 20° to 36° colder than they actually are,—or, in other words, the intense cold which commemorates the Christmas of 1860 would be our usual winter weather.

These figures suggest two considerations of some interest, as bearing on the Gulf Stream, the existence of which, in opposition to popular belief, some meteorologists deny. The first is that the north of Britain receives more benefit from the adjacent ocean than the south of Britain, Shetland being advantaged 36°, and Inverness 31°, while the Land's End is only advantaged 26°, and London 20°. Thus, during the winter season, the north draws daily from the Atlantic storehouse of heat 10° more heat than the south of Great Britain. The second consideration is that the west of Ireland has a higher winter temperature than the corresponding parts of Great Britain in the same latitudes. It would be difficult to account for the decrease of the temperature of places on the shores of the Atlantic as we proceed from west to east, unless on the supposition of a slow and gradual translation of its whole waters eastward under a cold wintry sky; and it would be equally difficult to account for the increased benefit the climate derives from the ocean as we proceed northward, unless we suppose the same oceanic current having impinged on the shores of Ireland and Cornwall from the south-west to be thereafter deflected northward along the coast, parting no doubt with its heat as it goes, but at a much slower rate than the latitude requires. This current is no doubt part of the Gulf Stream, that mighty ocean river, which, issuing from the Gulf of Mexico, spreads itself eastward over the Atlantic.

---

* They have been reduced from the charts published in the *Journal of the Scottish Meteorological Society*, to which periodical we would refer for further information regarding the subject of this article.

The eastern parts of Great Britain derive the least benefit from the warm waters of the ocean; for while the temperature of the west is 39° from Shetland to Wales, rising to 43° in the south-west of England and Ireland, that of the east is uniformly 37° from Kinnaird Head to the mouth of the Thames. Hence the winter climate of the west is from 2° to 6° warmer than that of the east. The benefit accruing to the western districts is much greater than these figures at first sight seem to indicate, for the increase of the temperature is chiefly due to the greater warmth maintained during the nights and during periods of great frosts, when the powerful and beneficial influence of the Gulf Stream on the climate of the west is most felt.

Since the temperature of the nights in the west are from 3° to 5° warmer than in the east, and that of the days only from 1° to 2° warmer, it follows that the higher temperature of the west is chiefly caused by the greater warmth of the nights. This higher temperature of the west, as compared with the east, depends on the following causes:—(1) The S.W. winds charged with the warmth they bring from the Atlantic, lose a great part of it before arriving in the east, because at this season the surface of the ground over which they pass is considerably colder than the ocean. (2) The larger amount of rain precipitated in the west, being nearly double that in the east, liberates a larger quantity of latent heat, and thus a higher temperature is maintained. (3) The greater amount of vapour in the west in the form of clouds arrests the fall of the temperature by obstructing radiation. And a similar result also follows when, in a clear and transparent sky, the air is loaded with water dissolved invisibly through it; for even then the invisible watery particles offer a powerful obstruction to the free escape of the caloric of radiation in much the same way as stones in the channel of a river oppose its course; so that in a moist though perfectly clear atmosphere, the cooling of the air is very slowly accomplished. Let, on the contrary, all, or nearly all, the moisture be squeezed out, then the escape of heat by nocturnal radiation would be swift and great, and the temperature would fall so low that the whole living creation would be blighted and destroyed by its withering touch; and the power of the sun's rays during the day would be so intense that everything would be scorched and burned up by the fierceness of the heat. The earth would

> "Feel by turns the bitter change
> Of fierce extremes, extremes by change more fierce,
> From beds of raging fire to starve in ice."

(4) The lower temperature of the North Sea, partly caused by its greater shallowness, and partly by its position removing it out of the current of the Gulf Stream, also tends to reduce the temperature of east Britain.

The Spring Temperature, Chart II.—The most remarkable feature of the lines of equal spring heat is their general direction, or *lie*, from north-west to south-east, a feature most marked in the north, and least in the south. The general direction of the winter lines is north and south, and of the summer lines, east and west. In April they may be regarded as holding an intermediate position, inclining more to the winter lines in the north, and to the summer lines in the south. This peculiarity is owing to the circumstance that as it is to the sun the summer lines owe their east-and-west direction, so its dominating influence being earlier felt in the south, it is there where they first begin to assume their summer direction. The high temperature of the west, and especially of Ireland, deserves particular attention. Little difference obtains in the temperature of the eastern districts between the Moray Firth and the Wash, but from this point round the coast to Brighton it increases rapidly. The convergence of the lines there may be regarded as marking a contest between the returning heat of spring and the accessions of cold transported from the Continent to these parts by the E. and S.E. winds, which are frequent at this season.

The Summer Temperature, Chart III.—The general direction of the lines of summer temperature, from a little south of west, to a little north of east, shows that the summer temperature of the east is greater than that of the west. This arises from the prevalence of S.W. winds, bringing clouds in their train, which as they go eastward they leave behind in the hilly country of the west, partially screening it from the sun's rays. And further, as the temperature of the land is warmer than that of the ocean in summer, the S.W. winds acquire heat in their progress, and from this cause, together with the brighter skies, the whole temperature of the eastern districts is raised.

The curving northward of the lines in the central parts of England from Yorkshire to the South Downs, is caused by the circumstance that it is only in this portion of the island that the land is of sufficient breadth, from west to east, to impart somewhat of a Continental character to the summer climate, and thus give a decidedly northern flexure to the lines. The southern district included within 64°, possesses the warmest summer climate in the British Islands, and consequently is best suited for the cultivation of exotics requiring a high temperature for their growth.

The cooler climate of the south coast, as compared with London to the north, is brought about by the moderating influence of the sea; and it is to be remarked, that in times of unusually warm weather, the mid-day temperature of the coast, whither crowds from London resort, is many degrees cooler, as compared with the heat of London, than the lines of mean summer temperature on the chart indicate.

The Autumn Temperature, Chart IV.—The waning influence of the sun begins now to be markedly felt, particularly in Scotland, where the greatest annual fall of temperature occurs in October, whereas in England the greatest fall of the temperature does not occur till November. Hence, the widening of the lines in Scotland and the crowding of them together in the south of England. It is interesting to note that the autumn temperature of London and Bristol is 53°, being as high as the summer temperature of Shetland.

The general correspondence of the October lines with the parallels of latitude, shows that the causes which contribute to give its peculiar character to our winter climate are only just coming into operation. This arises from the consideration that, though in October easterly winds acquire their average frequency, yet as the temperature on the Continent has fallen little below that of Great Britain, there are so to speak no importations of cold into any part of the country, and consequently the temperature of the whole island falls in a comparatively equable manner.

The curving southward of the lines in the central districts, particularly in the north, is a striking feature, and may be thus accounted for. The temperature of the ocean is from 3° to 4° higher than the mean temperature of Scotland in October, and hence the temperature of the seaward districts is higher than the inland, and more so in the north than in the south. The loss of heat arising from the sun's falling more aslant, as its altitude decreases, is necessarily less rapid on sea than on land; for as the surface of the ocean falls in temperature, the cold water descends by gravity, and its place is taken by the warmer particles which rise from below. This circumstance, together with the more truly east-and-west direction of the October as compared with the July lines, may be regarded as an indication that the ocean has begun—though little more than begun—to exercise its beneficial influence in opening its great storehouse of heat to moderate and genialise our winter climate.

THE RAINFALL OF THE BRITISH ISLANDS.

The rainfall is determined by all causes whatever tending to lower the temperature of the air below the point of saturation,—the chief of these being, the march of temperature through the year, the character of the winds as regards moisture or dryness, and the physical configuration of the land over which they pass. Since with a rising temperature the capacity of the air to retain its moisture is increased, and with a falling temperature diminished, the smallest amount of rain may be expected in spring and early summer, and the heaviest and most frequent rains in autumn. Though observations confirm this expectation in a general way, yet, in respect of particular months, the rainfall by no means follows the temperature, owing to the interference of the seasonal changes of the winds.

Our S.W. wind, or equatorial current, comes loaded with the moisture it has taken up from the Atlantic on its way; and losing heat as it goes, has consequently to part with some of the moisture with which it is charged. It is therefore a rainy wind. On the contrary, the N.E., or polar current, is a dry and generally rainless wind; because it is dry at the outset, and getting warmer as it goes, its dryness is still further increased.

Taking the year as a whole, we have nearly twice as much wind from the S.W. as from the N.E., but the proportions vary greatly in the different months. The warm moist S.W. winds prevail most during July, August, September, and October, and during December, January, and February; and it is in these months therefore that most rain falls. It is worthy of remark, that these two periods are the summer and the winter portions of the year, and one important result of their prevalence during the seasons which mark the annual extremes of temperature, in addition to their influence on the rainfall, is to imprint a more strictly insular character on the British climate, by moderating the heat of summer and the cold of winter. In March, April, May, June, and November, we find the cold N.E. wind acquiring its greatest frequency. These accordingly are the driest months of the year, except March, the stormy period of the vernal equinox, and November, which is usually remarkable for storms, ushering in and following in the wake of the great November wave.* It is to the cold dry winds that the extremes of heat and cold, and general unhealthiness of spring weather, may be ascribed.

If the physical configuration of the British Islands was level, the rainfall would everywhere, on an average of years, follow the temperature and prevailing winds,—increasing with the S.W. winds and a falling temperature, and diminishing with N.E. winds and a rising temperature. But the surface is on the whole mountainous, the chief mountain ranges in Great Britain approaching the west, from which the valleys and plains spread out eastward to the sea. Hence, when the S.W. winds arrive on our coasts they are diverted from their horizontal course by the hills in the west, and being thus forced up into the colder regions of the atmosphere become chilled and form into clouds, or deposit in rain the water which from the lowering of the temperature they can no longer hold in suspension. It is thus that the climate of the western districts of Great Britain is wet. On the other hand the climate of the east is dry, because the land there is more level and the clouds borne thither by the S.W. winds have been deprived of most of their superabundant moisture in passing over the western hills. In Ireland, on the contrary, the hills do not oppose such a continuous barrier to the onward progress of the S.W. winds, but are broken up and distributed in isolated groups in the north and south. From this arrangement it follows that the sky is more clouded and rain falls in general more frequently in Ireland than in Great Britain. Its climate is thus rendered more genial and fostering to vegetation, and hence the appropriateness of the name "*Emerald Isle.*" This remark does not apply with such force to the south-east of the island, which is sheltered from the S.W. winds by the hills of Killarney.

---

* For a description of this wave, see GOOD WORDS for 1864, p. 57.

In the eastern parts of England, where hills do not interfere, the annual rainfall is from 20 to 25 inches; and in similar parts of Scotland and Ireland, from 23 to 28 inches; and in the western districts, from 40 to 50 inches. This larger rainfall of the west is occasioned chiefly by the heavier autumn and winter rains. The manner of the distribution of the rainfall during the seasons may be thus explained:—As none of the western hills are high enough to drain the S.W. winds of their moisture in summer, they arrive in the east still loaded with a considerable quantity of water; and thus the summer rainfall in the east is nearly as large as it is in the west, where no hills interfere to increase it. But during the great fall of temperature in autumn and in winter it is quite different, for then the clouds, being low, owing to the low temperature, comparatively low hills, and even the surface of plains whose temperature is now lower than that of the winds, condense their vapour into rain, and thus the winter rainfall of the west is considerably greater than in summer. But in the east the rainfall is less in winter than in summer, because the higher hills of the west more completely squeeze out their moisture as the winds pass over them, leaving little to be precipitated in the east. From the autumnal equinox to the end of October, and during the three winter months, nearly twice as much rain falls in the west as in the east.

The above figures, which may be regarded as representing the least falls of the different districts, are variously increased in the neighbourhood of hills. The rainfall in the immediate vicinity of hills differs greatly according as the situation is south-west or north-east of the hill. In the British Islands the heaviest rainfalls occur all on the north-east side of high hills facing the south-west, for thus the rain-bringing winds being forced up into the higher regions of the atmosphere, copious condensation follows, and most of the rain being borne over the summit falls in torrents immediately to the leeward or north-east side of the hills. The comparatively small amount of snow left on the windward side of a wall after a snow storm, and the ridge of snow piled up a few feet to the leeward, may serve to illustrate this point. It is on this principle that the truly tropical rainfalls of certain places in the Lake District of England, and the Scottish Highlands, is to be explained. They are peculiar to very limited localities, situated chiefly in narrow gorges, immediately on the north-east side of precipitous summits, which cause copious condensation, and a mechanical crowding of the raindrops by the wind.

At Seathwaite, Borrowdale, the mean annual rainfall is 127 inches; but in rainy years it is much greater, being 182 inches in 1861, 170 inches in 1862, and 174 inches in 1863. In the same district in 1860 and 1861 respectively, 102 and 116 inches fell at the How, Troutbeck, and 105 and 123 inches at Langcragg, Grasmere. At Portree, in Skye, 139 inches fell in 1861, 111 inches in 1862, and 152 inches in 1863; at Glen Quoich, in the south-west of Inverness-shire, six miles from the coast, 136 inches fell in 1856, 121 inches in 1861, and 137 in 1863; and at Drishaig, near Loch Awe, 173 inches fell in 1863. At a few places among the Moffat and Lead Hills the annual rainfall is occasionally from 70 to 75 inches. At Valencia, in Kerry, it amounted to 73 inches in 1861, 62 inches in 1862, and 65 inches in 1863; but this large rainfall was no doubt greatly exceeded at many places among the higher Irish hills. Monthly falls of 15, 20, and even 30 inches have lately been observed at Sligachan, near the Cuchullin hills in Skye, and at different places in Argyll, which are likely from their situation and notoriety for rain to have enormous rainfalls. As some of these repeatedly exceed the rainfall at Portree, it is probable that in a year or two several Scottish rivals to Seathwaite will appear, claiming the unenviable prerogative of being considered the wettest part of Great Britain.

INFLUENCE OF IRELAND ON THE CLIMATE OF GREAT BRITAIN.

From the principles laid down in this paper, it is evident that Ireland, in respect of its position, may be expected to exercise a marked influence on the climate of those parts of Great Britain which it shields from the S.W. winds. The districts so protected are bounded on the south by a line drawn from Plynlimmon to Scarborough, and on the north from Arran to St. Andrew's Bay. But as the mountain systems of Ireland cluster more in the north and south, the central parts being comparatively level, thus allowing free space for the S.W. wind to sweep through unimpeded, it is obvious that the Cumberland Hills, which lie in the line of this plain, will not be so much influenced by the interposition of Ireland, as are Wales and the south of Scotland. Hence, as these hills really present the first barrier to the rain-bringing winds, the rainfall of the Lake District finds its counterpart in that of the Scottish Highlands, and not in the higher parts of Wales and the south of Scotland, which are better sheltered by the hilly parts of Ireland opposite. But the temperature of Great Britain, as well as the rainfall, bears evidence of the influence of Ireland on its climate. Thus the winter temperature of 39° (Chart I.), extends from the Shetland Isles along the west coast as far as Wales. It is extremely probable that if Ireland had not lain to the west, the temperature of the coast from Wales to the Clyde would have been higher from the moister and more clouded atmosphere which would have prevailed along these western districts; in which case the lines of 41° and 40° would probably have stretched north into Scotland.

But, again, Chart III. shows a remarkable widening of the lines of summer heat in that part of Great Britain protected by Ireland, and a crowding of the lines in the north. This widening of the isothermals is caused by Ireland partially draining the south-west winds of their vapour, by which, the skies being clearer and brighter, the day temperature is higher than otherwise it would be, and thus the mean temperature is raised. The crowding of the summer lines in the north depends on the more northerly position of 58° brought about by Ireland, and in the more southerly position of 53°, 54°, and 55°, by the delayed summers of the islands.

It follows, then, that the climate of the west coast, from the Clyde to Wales, differs from that of any other part of Great Britain in having peculiar qualities of its own. It differs from the climate of the rest of the west coast and the climate of the east coast, in combining the advantages of both climates without many of their disadvantages. And it differs from the climate of the interior of the island in its more equable temperature, and in the sea breezes which refresh it in summer and bring warmth in winter.

THE CLIMATE OF THE BRITISH ISLANDS IN RELATION TO AGRICULTURE.

The Finer Cereals, Wheat and Barley.—Wheat requires 8248° from the time it begins to grow in spring, in order to ripen it properly. This heat must be so distributed as to secure a mean summer temperature of at least 58° on the continent of Europe; but in North Britain, where the day is longer in summer, 56° is sufficient. Since wheat requires a high temperature and a dry climate for its successful growth, it follows that these conditions are best fulfilled in the extensive plains which stretch eastward to the North Sea. The best wheat-growing districts, therefore, are the Eastern Plain, the Great Central Plain, the Vale of the Severn, the Plain of York, the Merse, Strathmore, the low grounds shelving down to the Moray Firth, and the south-eastern parts of Ireland. To this list may be added, though less suited because not so well sheltered from the south-west winds by ranges of hills, the great central plain and eastern parts of Ireland, the shores of the British Channel, Ayrshire, and a few other western districts not immediately bounded to the south-west by hills.

In ordinary years, owing to the moist and wet climate, the crops in the west run rapidly into straw, and being weak from a deficiency of silica are more easily beaten down and "lodged" by the rains and high winds which occur there with greater frequency; the grain, besides, is not generally so fine in quality as that grown in the east. But in dry seasons, the crops attain a bulk and a weight in the west rarely seen in the east.

Barley requires a climate very similar, except that its cultivation may be carried to greater heights and into lighter soils. On this account much of the land in Scotland is adapted to the growth of this grain.

Investigations into the subject of climate become of vital importance to the British farmer, when it is considered that the mean summer temperature of even the warmest parts of England and Ireland is only 6° above the minimum summer heat necessary for the proper ripening of wheat; whilst Scotland is only 2° above this point, and in Caithness the extreme northern limit of wheat cultivation is reached. Hence the grave and disastrous effects of such a cold summer as 1862.

Since the day temperature in summer, which chiefly determines the ripening of the grain, does not follow the law of the mean annual temperature in falling 1° for about every 300 feet of elevation, but is, on the contrary, in many situations of favourable exposure, as high as what prevails some hundreds of feet lower down in the plains, it will excite no surprise to be told that the finest quality of wheat has been grown in East Lothian by the Marquis of Tweeddale at a height of 750 feet. It is probable that in many years it might be successfully cultivated in England as high as 1000 feet. But before giving way to the temptation which one or two good years in succession may hold out, to pursue wheat cultivation at such heights, the additional risk ought to be well considered; for a summer temperature not more than one degree below the average, an event of not unfrequent occurrence, will be quite sufficient to cause bad crops. In England this is especially the case, for in cold, wet, and cloudy seasons its temperature is lowered to a greater extent than that of Scotland,—an obvious consequence of its more southern latitude.

The Coarser Cereals, Oats and Bere.—As these crops succeed with a wetter and colder climate and poorer soil than wheat and barley, the western, northern, and highland districts are best suited for their cultivation. In the higher and wetter parts of the country they take the place of the finer cereals, and hence, considering the climate and soil, they are more peculiarly Scottish grains.

The comparative advantages of the western or wet climate and the eastern or dry climate, with respect to the grain crops, may be thus briefly stated :—The heavier rains in the west in the earlier part of spring often seriously interfere with the preparing of the soil for seed. From this time to the middle of July, the two climates are about equally good; but during the following four weeks, the warmer climate of the east gives it an advantage over the west. In August, and September to the equinoctial gales, the rains in the west continue steadily to increase in frequency and amount over those in the east. After these gales, there occur six rainy days in the west for five in the east, and the quantity of rain which falls in the west is nearly double what falls in the east. These harvest rains sum up the agricultural disadvantages of western climates; indeed, but for them, all other disadvantages would be as nothing.

Green Crops and Pasture.—These objects of agriculture thrive best with a wet rather than with a dry climate, and with mild warm temperatures, particularly during the night. The climates of Scotland and Ireland, therefore, are better suited to their growth than that of England. Since winter falls some weeks earlier in Scotland than in England and Ireland, the growth of turnips and grass will be prolonged to a later period in these two countries. Frost makes its appearance a week or two later in the west than in the east: its occurrence there is also much less frequent and severe.

From these principles it follows that the climate of England is best suited to the production of the "bread-stuffs," owing to its greater warmth and dryness; the climate of Scotland to the rearing of stock, owing to its more copious and frequent rains, and to the certain failure of the wheat crop whenever the summer temperature happens to fall 2° below the average; while the climate of Ireland may be characterised as intermediate and more equable over the whole island than in England and Scotland, combining to some extent the advantages of both. As regards heat, the climate of Ireland is quite sufficient for the successful cultivation of the finer cereals, being subject to less risk in backward seasons than in Scotland; and considering its remarkably open winters, which lengthen out the period of grazing, its mild and genial climate through all the seasons, and its comparative freedom from drought, it possesses superior advantages for the rearing of stock. These considerations, combined with the fertility of its soil, open up for Ireland, as far as the physical conditions are concerned, a prospect of great prosperity, based on most remarkable, though as yet only partially developed, agricultural resources.

THE CLIMATE OF THE BRITISH ISLANDS IN RELATION TO HEALTH.

The relations of temperature and mortality are close and intimate. In some climates the deaths increase as the temperature rises, in others as the temperature falls. When it rises above 60° the deaths from diarrhœa and similar complaints increase, and as it falls below 50° the deaths from diseases of the respiratory organs are proportionably augmented. Since the temperature falls much more below 50° than it rises above 60°, we see how it happens that by far the greater proportion of deaths occur in winter in the British Isles.

It may be here remarked, in passing, that as the temperature ranges between these critical points during six months of the year, and, as compared with most other countries on the globe, neither rises much above 60°, nor falls very much below 50°, we are blessed with one of the healthiest climates in the world; and as it admits almost every day of out-door exercise, and can scarcely ever be said to interrupt the ordinary avocations of the people by excessive heat or excessive cold, it may without partiality be characterised as one of the best in the world. The intimate relations of temperature to mortality are best shown in the six coldest months, when the temperature falls below 50°. During this time the deaths are in inverse ratio to the temperature. This law receives striking and even startling illustration during periods of intense cold. Thus, the deaths were greatly increased during the severe frost of Christmas, 1860, being about forty above the daily average—an excess greater than happens when cholera or any other epidemic is raging in the country.

It follows from these considerations, that the districts distinguished for the lowest percentage of deaths are those whose temperature is maintained for the longest time within or nearest 60° and 50°. Scotland may thus be expected, from its more insular character and less fluctuating temperature, to exhibit a lower rate of mortality than England. Accordingly, while the average number of deaths in England is 222 for every 10,000 of the population, in Scotland it is only 207 for every 10,000. Such being the case, it becomes a question of great public importance to ascertain the healthiest localities of the British Islands during each of the seasons. Fortunately, from the abundant materials placed at our service by the Meteorological Societies of England and Scotland, there will be no great difficulty in pointing out those places which claim attention as suitable residences during the different seasons.

1. *Winter Residences.*—There is no locality in Great Britain or Ireland where the winter climate combines the two qualities of warmth and dryness. For if the climate be dry, it must, on account of the latitude, be cold. Hence southern climes must be resorted to in winter when a climate both dry and warm is required. As the temperature of the whole of the eastern slope of Great Britain is the same, it is evident that to those in search of a milder winter climate, a journey southward is followed by no practical advantage unless directed to the west coast. And as the temperature is uniform as far south as Wales, Scotland is as favourable to health in winter as a great part of the west of England. The temperature of the south-west of England and Ireland, however, being 4° higher, the places most suitable for winter resorts, as having

the mildest climates, are to be found from the Isle of Wight westward round the Cornish peninsula to the Bristol Channel, and from Carnsore Point in Ireland to Galway Bay.

Charts of the British Islands, showing the Lines of Equal Temperature for January, April, July, and October.

2. *Spring Residences.*—The best spring residences are those, generally speaking, at the greatest distance from the Continent, unless, as in the case of the Bridge of Allan, they are protected by hills or rising grounds from the penetrating and enervating east wind. Since the deaths from consumption, that dreaded scourge of the race, reach the annual maximum in the dry months of spring, and since they occur chiefly during the prevalence of that "horrid east wind," Kent, Essex, and the other parts of the south-east of Great Britain have probably the least healthy climate during this season. The south-west of Ireland, on account of its great distance from the Continent, as well as its southern

position, possesses no doubt the best spring climate of the British Islands, being in this respect preferable to the south-west of England, where the keen, cold east wind is oftener felt.

3. *Summer Residences.*—The consideration of the different summer climates is of more general interest, since it enables us more satisfactorily to answer the question, Where, with most benefit to our health, shall we go to spend our summer vacation? Seeing the unhealthiness of a climate increases as the temperature rises above 60°, it is obvious that the southern half of Ireland and nearly the whole of England, except the higher districts, are of all parts of the British Islands the least conducive to health at this season. And since their summer temperature does not rise to 60°, the Highlands of Scotland, in addition to grouse, magnificent scenery, and other attractions, offer to the Saxon the substantial advantages of a healthier and more invigorating climate.

The healthiest localities are either in the higher districts, where the temperature is lowered by the height; or on the coast, where the heat is moderated by the sea. Except in the quality of dryness, the east coast must yield to the west in summer, for then the Atlantic being colder than the North Sea, the sea-breezes in the west are more cooling and refreshing; and the prevailing winds from the south-west at this season are refreshing breezes in the west, while in the east they are dry and warm.

But, again, western localities may be divided into two totally distinct groups according to their physical features. Thus, wherever hills rise immediately on the south-west or west, there the rains are heavy and frequent, pouring down in such deluges as none but veteran Waltonians care to encounter. On the other hand, at places lying open to the west, or, better still, sheltered from the sweep or stroke of the south-west winds by swelling eminences, too low to condense the clouds into rain as they pass over them, the rainfall is only moderate in amount, and does not occur oftener than in the east; at least until the autumnal equinox. The position of Ireland, and its influence on the summer climate of the west, in moderating the rainfall, drying and clearing the atmosphere, and thus increasing the warmth, ought not to be lost sight of; for from this cause the climates of Ayrshire, Silloth, and the other districts sheltered by Ireland, are the least relaxing of all the western climates of the British Islands.

The above remarks on the influence of hills are only applicable to the western division of the island. The distinction thus pointed out between eastern and western districts, similarly circumstanced with respect to hills, must be carefully kept in mind, as it makes all the difference between a wet and a dry climate. Thus, if the Braemar hills had been situated near the west, the summer climate, instead of being one of the driest, would beyond doubt have been the wettest in the country. Since, then, the rainfall is moderate at places in the east, especially if high hills intervene between them and the Atlantic, the driest, coolest, and consequently most bracing summer climates in the British Islands are to be found in the high districts on the eastern slope of the island. Of these the first place must unquestionably be assigned to the upper districts of Deeside and Donside in Aberdeenshire, on account of their elevated position, and the high and wide platform of hills over which the south-west winds pass before arriving there, and their consequent dryness. Indeed, so superior is the climate, that grain is cultivated 1600 feet above the sea, or 500 feet higher than anywhere else in North Britain. It is thus obvious that Balmoral, Her Majesty's Highland residence, enjoys for these reasons what may be justly considered the healthiest summer climate anywhere to be found in the British Islands. Crieff, Blairgowrie, and other parts of Perthshire, the high districts of the Lammermoors, Upper Tweeddale and Teviotdale, Moffat, the west of Yorkshire, Malvern, and the eastern parts of Wales, may be referred to as possessing, though in a less marked degree, the same bracing and invigorating summer climate.

4. *Autumn Residences.*—Each side of the island is equally circumstanced as regards temperature during this season. The rainfall, however, is very different, being twice as much in the west as in the east, owing to the heavy rains consequent on the great annual fall of temperature. Hence eastern districts are the most desirable in autumn, particularly those which have long stretches of high hills to the south-west, because, the rains being least heavy and least frequent, the climate invites to more out-door exercise than is practicable elsewhere. It would be difficult to name a more delightful locality where to spend this season than the well-wooded valley of the Dee, from Banchory to Braemar, where the heavy "trouble of the rains" of late autumn falling comparatively light; the wild rugged mountains; the splendid and ever-varying panorama of the skies; and the solemn and gorgeous pomp of the October woods, offer a combination of attractions rarely paralleled.

ALEXANDER BUCHAN.

THE TIME WHAN WEE JEANIE CAM:

A SHEPHERD'S WIFE'S EXPERIENCE.

I AYE mind the time. I hadna been sae weel. I was low in spirits, and dreaded her coming much. It was wi' a sad heart therefore I had to raise John suddenly to send for the Doctor. He lived many miles off in Jedburgh. But a kind farmer near, knowing what was coming, insisted on sending for him, when he was wanted. So John had only to go down the burn about a mile. Hew the hind was soon on the road, wi' the chestnut meere that the maister rode wi' every Sabbath to the meeting-house,—a clean-legget fell beast, which went owre the hills wi' great spirit.

When John came back wi' Hew's wife, they found Peggy, our auldest lassie, up and working away like a little woman. She had kindled up the fire, and got me a warm drink o' gruel, for I was sae cauld that my teeth chattered in my head.

I had a sair time, but the Lord carried me through, and added anither wee lamb to our flock. But monie a day had I to lie in bed. Often I was low in spirits, but aye somehow I got a lift, and got cheerie again. When they were a' out, I would lie thinking about a' our straits, and things looked black enough, for we had had much trouble.

John's mother lay lang bedfast wi' us, and we wadna have a haapenny frae the parish. No a week for many months that the Doctor wasna out seeing her. Then she was scarce taen away, when our wee Johnnie took ill o' fever, and after a month's sair fecht between life and death, was also ca'd away. We were deep in the Doctor's debt, and I thought o't a' the time the kind man waited on me. The miller also had an account standing against us, that we couldna settle last term. Then, to make things waur, the spring had been very brashy and cauld, and monie o' the lambs deed, and those that lived were but smally.

Weel, one afternoon, as I lay thinking about a' thae things which seemed sae sair against us, I couldna help greeting, and I was sae weary and sad, that I thought if it wasna for John, and the bairns, and this wee lammie in my bosom, I wad like to dee and be at rest. As I lay wi' the tears running owre my cheeks, I could hear John away out on the hill-side crying to Rover the dog, and it minded me o' the happy time when he cam courting me, when the sound o' his voice made me sae glad; and I thought how wrang it was to wish to leave him, puir man, to fecht on alane. Somehow also the distant cry o' the whaups, and the purling o' the bit burn at the bottom o' the yard, running doon amang the rocks, cheered me. I thought the bird-cries coming away owre the muir, and that purling o' the burn, very sweet music. And my mind wandered away to heaven, and I thought o' the saved a' safe there sounding their golden harps. Then the wund cam whushing and whushing round by the house corner, between the house and the auld thorn tree; and the lang branch that the last storm nearly broke away, cam tapping and tapping at the window beside my bed, and this did me maist guid o' a', for I was minded o' the last sermon I heard our Minister preach, on our Lord's words, "Behold, I stand at the door, and knock: if any man hear my voice, and open the door, I will come in to him, and will sup with him, and he with me." And I thought surely the Lord was knocking at my door, in a' this trouble, and wanting to have a constant place in my heart.

Then I got a wonderful outgate, and the Lord Himsel cam in, and I found sweet rest in Him. He calmed my sair troubled heart in a way I never felt before. And He brought to my mind the texts my auld grandfather taught me, when I was a bit lassie: "Cast thy burden upon the Lord, and He shall sustain thee." "I will never leave thee, nor forsake thee. So that we may boldly say, The Lord is my helper." Weel, I have read in Boston's Life, and in Elizabeth West's, and in those of ither believers in Jesus, o' the happy times they sometimes had, and how they were feasted at the King's table, and saw His kind face, and heard His words o' love, but I never could say that I kend onything o' such an experience till then. It was to me a real time o' love. The Lord surely cam very near, and sae lifted up my heart, that I got aboon the thought o' a' my troubles, and I cried out, like David, "I will go in the strength of the Lord God."

My heart was made glad, and it was better to me than a' medicine. I soon got weel, and the Doctor wadna hear o' sending in his account for monie a day, but we aye sent him something as we could. The lambs also brought a higher price in the market than we expected. Wee Jeanie also has thriven nicely, and looks up, the wee lamb, in my face and laughs in such a happy way, that she makes me laugh wi' joy, and aye leads me to think of the Lord's love to me when I was sae low and sad.

We may hae much o' life yet before us, and I ken that this life is full o' trials, but I learned a lesson then which I can never forget, which will carry me through a': no to fecht wi' trials in our ain strength; far less to lie down and greet, as if a' hope were gaen, but to carry them a' to *Him* who will never desert His people in the time o' their need. Yes, the time when Jeanie cam was a time when I had to sow in tears, but the harvest soon cam, when I reaped wi' joy. Weel may I mind it then, a' through this life, until I get where poortith and sorrow never come.

J. BARBOUR JOHNSTONE.

OUR INDIAN HEROES.

By JOHN WILLIAM KAYE.

VI.—GENERAL NEILL.

Of the heroic lives which I have hitherto endeavoured to illustrate in these pages, not one has represented the career of a soldier pure and simple. I have written of men, soldiers by profession, bearing military rank; men who had learned the theory and practice of war; who had seen great armies in motion; who had faced the danger of battle and had died by the hand of the enemy; but who, since the days of their youth, had been but little surrounded by the ordinary accompaniments of regimental life. They were diplomatists, indeed, rather than soldiers. But diplomacy is rougher work in the East than in the West. It exposes a man to all the dangers of military life, and often without its protections. It sends him on detached and dangerous service, to face, alone and unsupported, a barbarous enemy, and at all times renders him a conspicuous mark for the malice of revengeful antagonists. In such diplomatic—or, as in India it is called, "political"—employment as this, the servants of the East India Company were enabled, when in the early vigour of their years, before their health had been wasted or their energies broken by long exposure to the severities of the climate, to attain to high and responsible office. But in the purely military service, the inexorable necessities of the seniority system seldom permitted men to rise to high command, until they had lost their capacity for it. Exceptions there were; but this was the rule. So it has happened that the names most distinguished in Indian history are the names of men who, reared as soldiers, have divested themselves of the trammels of military life, and sought service altogether independent of the chances of regimental promotion.

But I am about now to write of one who was all in all a soldier—who, not wanting capacity for the performance of these other duties, clung resolutely to the "great profession" of arms; one, who so loved that profession, that he suffered no allurements to detach him from it; and who lived and died with its harness on his back. Strong in the faith that his time would come, he waited patiently for his opportunity; and it came at last.

James George Neill, the eldest son of a Scotch gentleman of good family—Colonel Neill of Barnweill and Swindridgemuir in Ayrshire—was born on the 26th of May, 1810, in the neighbourhood of Ayr. From his very childhood he evinced a fearlessness and independence of spirit which promised well for his future career. He was not yet five years old, when he absented himself one morning from home, and excited considerable alarm in the household by his disappearance. He had been absent for many hours, when his father observed him coming with leisurely composure homeward, across a long dangerous embankment which confined the water of Barnweill Loch. His father went to meet him, and anxiously asked, "Where have you been, Jamie?" "Well," replied the boy, "I just thought I'd like to take a long walk and look at all things as I went on, see, and see whether I could get home by myself! *And I have done it*," he added proudly, "and now I am to have no more nursery-maids running after me—I can manage myself." His father said that he was right; and from that day the surveillance of nurses was withdrawn; and it was felt that Jamie might safely be left to look after himself.

He received his education at an academy in his native town, until at the age of fifteen he was removed to the Glasgow University. It was then intended that he should be trained for the law; but young Jamie had no taste for such a profession, or indeed for a sedentary life of any kind. He was active and robust; a stout walker, an intrepid horseman, a sure marksman; and he was eager to be a soldier. At that time, the Burmese war was attracting no little attention in Great Britain; and our youngsters, inspired by the marvellous pictures of grand battles upon elephant-back in a country of magnificent pagodas, which were widely diffused at the time, burned to take part in the affray. James Neill, among others, was hot for Indian service. He said that India was the only country in which distinction could be won. So his father wisely resolved to gratify his wishes, and obtained a cadetship for him. He was not yet seventeen, when, in January, 1827, he sailed for Madras. Sir Thomas Munro, who was then Governor of that Presidency, had married a relative of Colonel Neill. He took the boy by the hand, and caused him to be appointed to the First European Regiment.

Having quickly learned the elements of his profession, young Neill devoted himself to his regimental duties, not only as one who was resolute to do what was demanded from him, but as one also who took the deepest interest in his work. The regiment to which he had been posted, was one which had earned distinction on many fields, and which, being one of the very few European corps in the Company's service, was wellnigh sure to go to the front in any new operations on that side of India. But for awhile there was profound peace in all parts of the country, and the strenuous realities of active service were only to him as dreams of the future. In the details of regimental duty, however, he found abundant occupation. The Madras European Regiment was stationed, during his first years of service, at Masulipatam; and the young subaltern acquitted himself so well, that he was made Fort-Adjutant—a post which he held until the corps marched to Kamptee. There the zeal and ability he displayed soon recommended him for employment on the regimental staff, and he was appointed Quartermaster, and afterwards Adjutant, of the Madras Europeans. In the latter situation his fine soldierly qualities had much scope for exercise and development. It is hard to say how much not only the discipline but the happiness of a regiment depends upon the personal character of the Adjutant. Lieutenant Neill was not a man to look upon the soldier merely as an animated machine. He had the tenderest regard for the best interests of his men; and strove with all his might to reform their habits by instituting a better system of internal economy than that which in those days commonly obtained in our army. He did, indeed, almost all that, in these latter times, our Sanitary Commissions are wont to recommend, for the improvement of the health, the happiness, and the moral character of the soldier. Whilst subjecting to proper regulations the sale of intoxicating liquors to the European soldier, he endeavoured to withdraw the ordinary inducements and temptations to hard drinking which too commonly beset him. By providing him with healthy occupation and harmless amusement he did much to improve the morality and the efficiency of the regiment. Adult schools and workshops were established; athletic exercises of different kinds were promoted; and in all these things the personal encouragement and example of Lieutenant Neill did much to secure their success.

Whilst still in the zealous performance of these duties, sustained and cheered by the thought of the good he was doing, Adjutant Neill took to himself a wife. In the course of the year 1835, he married Isabella, daughter of Colonel Warde, of the 5th Regiment of Bengal Cavalry, then employed in the "Political Department," as Assistant to the Resident at Nagpore. A soldier's daughter, she was fit to be a soldier's wife. And from that time forth, for more than twenty years, in war or in peace, in storm or in sunshine, he had not a thought which was not in some way associated with his "dearest Isy." Emphatically it may be said of him that he was a man

> "who though thus endued as with a sense
> And faculty for storm and turbulence,
> Is yet a soul whose master-bias leans
> To homefelt pleasures and to gentle scenes;
> Sweet images, which wheresoe'er he be,
> Are at his heart; and such fidelity
> It is his darling passion to approve,
> More brave for this, that he hath much to love."

But the climate of India and the work—for he was one, who never spared himself—were beginning to make themselves felt; and Neill felt that the time was approaching, when it would be necessary for him to seek renovated health from the fresh breezes of his native country. Two years after his marriage (1837) he obtained leave of absence to Europe for three years, and soon recovered all the strength and elasticity, which he had lost beneath the Eastern sun. But the peace, in which India had for some years been lapped, was now again about to be disturbed. There were rumours of the great movement into Central Asia, which afterwards took the substantive shape of the Afghan war. Panting for active service, and unwilling to lose even a remote chance of employment (and remote it ever was, for the Bengal and Bombay regiments were wellnigh certain to be those engaged with the enemy), Neill determined, as soon as our measures were fairly shaped, to return to India, long before the expiration of his leave. He returned in 1839, volunteered more than once for service in Afghanistan—but could not obtain the great boon that he so eagerly sought. But he had a fast friend in Sir Robert Dick, who was most desirous of serving him, and who eventually obtained for him an appointment on the General Staff, as "Assistant-Adjutant-General of the Ceded districts."

This appointment he held for some years, during the earlier portion of which he devoted his leisure to the work of writing a history of the distinguished regiment to which he was attached. It was published in 1843, under the title of an "Historical Record of the Madras European Regiment." It is an excellent example of the class of literature to which it belongs—an elaborate monogram, exhaustive and complete—following the regiment from its very cradle up to the time in which he wrote. But his official duties were ever his first care; and they were so well performed that he received the repeated thanks of the General commanding the circle to which he was attached; and he would probably have risen in time to the highest place in his department, if he had not sought rather opportunities of serving in the field.

An opportunity came at last. The second Burmese war commenced. Neill hastened to rejoin his regiment, which had been ordered on service; but on his way he was met by the announcement that he had been appointed Adjutant-General of the Madras troops under Sir Scudamore Steele. That war nearly cost him his life. Of some of his Burmese experiences he has given an interesting and characteristic account in a letter to his cousin, Mr. Andrew Brisbane Neill. It exhibits in a striking point of view the independence and self-reliance of his nature, the resolute determination at all hazards to do what was right. For the good of the soldiers under him he was prepared even to face the frowns of superior military authority. "I was left at Rangoon to look after the Madras troops," he wrote on the 8th of April, 1854. "There was much to be done putting down these insurrections near Thurygyeen, Bassein, &c. There was no time to refer matters, and no one who could act; so I set to work, and did everything, issuing the usual orders as from Sir John Cheape, and he was very much pleased that everything was well done. I went on the plan to go at any fellow who showed his nose or a tip of it. . . . At Bassein we tried another dodge, which is the best. Small parties were sent out. Shuldham of the 24th had ten artillerymen doing duty as infantry, and eight 'Lambs' and a Company of the 19th. The Burmese met him and caught it handsomely—the plan is to encourage them to stand, by sending there few men. Nga Pyo had again shown his nose, and a Company of the 30th Native Infantry, and some fifteen or twenty Europeans, were ordered by me, before I left, to go at him from Thurygyeen. I expect to hear they have done for him. Backed in this way, our Sepoys will fight the Burmese well, but by themselves they have no chance. Jack Burmah is a superior animal, thoroughly despises the Sepoy—the Bengal most, on account of his giving himself airs about caste. A parcel of Bengal Sepoys are cooking their rice, the circle described all right and proper, a few Burmese looking on at a distance laughing and cracking their jokes; when the Bengalee has all but got the food ready, up walks one or two in a promiscuous manner, and down they squat with their sterns right in the circle. The row commences, and the Sepoys get well thrashed. Our Madras fellows get on better, as they have no caste compared with the others. I go home on the new regulations. . . I have had a shindy with the Commissariat Department, who are attempting to dodge our European soldiers out of European boots and blankets. . . I have had a wigging from the Commander-in-Chief expressing his Excellency's disapprobation of my reflecting on the Commissariat. However, as the want of the European boots and blankets—both of which have been ordered by the Government, and have not been supplied by their servants—will cause sickness and mortality among our European troops (indeed, has already caused it), and destroys their efficiency, and as the Governor-General is most anxious for the comfort and welfare of the European soldiers, I have taken the liberty of handing up the whole matter to his lordship, and I have no doubt 'he will know the reason why' these things are not supplied. I have been thoroughly disgusted with the indifference evinced on these important subjects, and have not as yet stuck at a trifle in obtaining redress and getting things put to rights."

But constant work and exposure, in a bad climate, nearly destroyed Neill, as it utterly destroyed others. Some of our finest officers were killed by strokes of the sun, and he well-nigh shared the same fate. He was struck down; the fall shattered him greatly, and for some time he was so torn by brain-fever that there was small hope for his life. But by God's good providence he recovered sufficiently to be placed on board a screw-steamer then proceeding to England.

"It would have been better," he wrote in the letter above quoted, dated from the Elphinstone Hotel, Madras, "if I had left Burmah and gone home some time since; however, I hope yet on the voyage home, when I shall be free from all bother, to make up for all the injury I may have sustained. I have been very fortunate in all my proceedings in Burmah, have given satisfaction to the Governor-General, and have been much flattered by his conduct towards me. Had it been possible for me to remain there, I should have either been at the head of the staff or in some important appointment. I have fortunately had much to do, requiring me to act at once and with decision during the absence of Sir J. Cheape, and I have been lucky enough to do what was right. . . . I owe my recovery and life to the extreme care, attention, and kindness of Dr. Davidson. Had I been his brother he could not have done more for me."

He reached England in the month of June, and was soon making rapid strides towards the complete recovery of his health. But the rest which he had promised himself was not in store for him. The war with Russia commenced. England was alive with the bustle and excitement of preparation for a great campaign. The formation of an Anglo-Turkish contingent—a Turkish force disciplined and commanded by English officers—was one of the auxiliary measures decreed by the British Government. Then the services of officers of the East India Company—men who had done work in their day, who were skilled in the discipline and command of Irregular Levies, capable of enduring hardships and privations, rough and ready fellows of the best kind—came suddenly into demand. And not only was there need of these, but need also of men who had seen in India large bodies of all arms in combination, and who had within them, seeking opportunity of development, the faculty of military organisation. General Vivian,* who had been Adjutant-General of the Madras Army, was selected to command the Anglo-Turkish force, and Colonel Neill was appointed his second-in-command. The opportunity was one for which he had longed. It was the desire of his soul to break through the trammels of the seniority system, which had kept him down, and to have full scope for the exercise of the power which he knew was within him—the power of successfully commanding large bodies of troops in the field. For this he was willing to resign the pleasures of home and the delights of domestic life; so he at once placed his services at the disposal of Government, and prepared himself to embark for Constantinople. "You will be not a little surprised to hear from me here *en route* to the Crimea," he wrote to a friend on the 3rd of April, 1855. "On the formation of the Turkish Contingent, I was asked if I wished to serve. I lost no time in saying 'yes,' leaving rank, pay, &c., entirely to the Government. I have never bothered them on the subject. My only request has been, 'Give me the highest command my rank will admit of.' I stand next to General Vivian on the list of Company's officers. There is, I believe, great play making on the part of the Madras men for commands, and I have no influence or interest. I go out as a Colonel on the Staff. I had my passage as senior officer ordered in the 'Victory' steamer, from Portsmouth; but they were so dilatory in getting her ready, that I applied on Saturday afternoon to be allowed to go *viâ* Marseilles in order to get to Constantinople sooner. The reply was from the War Office: 'As Colonel Neill is General Vivian's second-in-command, it is of importance he should be at Constantinople as soon as possible: he is to go *viâ* Marseilles.' This I saw in writing; but it is strange none of us are yet gazetted, nor can we find out what commands we are to have. I asked one man in office: he let out inadvertently, 'Oh, you are to have a division,' but I can get nothing more. . . . I shall be about the first man out at my post, and if spared, you may depend upon it, I will do something. I consider myself most fortunate. . . It is an opportunity of seeing service and acquiring professional knowledge that will stand me in good stead hereafter."

---

* Now Sir Robert Vivian, K.C.B., Colonel of the Royal Madras Fusiliers, and Member of the Council of India.

On his arrival in Turkey, Colonel Neill was appointed to command a division stationed in camp at Bayukdere on the Bosphorus, where he remained some time, reducing his men to a state of efficiency and discipline, and his efforts were crowned with success. He spoke of the Turkish soldiers as being "good and steady, very smart under arms, and painstaking to a degree." But from the performance of these congenial duties he was soon called away. In another part of the Turkish force, for the discipline of which English officers were responsible, there was a chronic state of irregularity of the worst kind. The Bashi-Bazouks, commanded by General Beatson, were displaying all the violence and rapacity of their class, little, if at all, restrained by the presence of their English officers. When intelligence of their excesses reached Lord Stratford de Redcliffe, our ambassador at Constantinople, he determined to inquire into them; and on the 27th July, Neill was directed to repair to the Embassy, to receive instructions relative to the coming investigation. I have not space, if I had inclination, to enter into the history of General Beatson and the Bashi-Bazouks, which elicited a vast mass of official correspondence, and a bundle of controversial pamphlets. Neill was eager to return to his division; but his hope of seeing active service in the field was doomed to disappointment. Sebastopol was taken. The war was brought to a close; and there was no further need of the services of the Anglo-Turkish Contingent. "The play is now up," he wrote from Yenikale on the 9th of April, 1856, "and it has certainly been provoking that we have been kept back and thrust out of the way; however, we have the satisfaction of knowing that we have succeeded admirably in organising this Contingent.* . . . I have seldom seen men who move better, and are more easily handled in the field; at ball practice they are first rate. During the winter, when we were several times threatened, the fellows turned out in the highest possible spirits. Whether the force will be kept up remains to be seen. The French will be averse to it, as giving us so much more influence. The Sultan is anxious to have British officers to organise his army, and the report is that they will be lent to him. I, of course, will stay, if the Government and Company will allow it. It is a grand thing for me to have the rank and position, and if—as they all say—it will be confirmed, I may return to India for a short time, only to some high command. My object has been, in coming out here, to gain rank, and if I have been debarred getting it in front of the enemy it is no fault of mine."

The Anglo-Turkish Contingent ceased to be, and Colonel Neill returned to England. Then came a brief, happy period of home-life. The entries in his journal, short but regular, exhibit him in the full enjoyment of tranquil domestic pleasures. He resided with his wife and children in Scotland—sometimes paying visits, with the former, to his friends and neighbours; sometimes attending national gatherings; and when the shooting season commenced, going out with his gun—perhaps more for exercise than for sport. During this period he was in frequent correspondence with the official authorities on the trouble-business of General Beatson and the Bashi-Bazouks; but any annoyance that this might have occasioned him was more than compensated by the kindness of some of the Directors of the East India Company, who on public grounds expressed their willingness to provide for his sons. Mr. Mangles gave him a cadetship for one of his boys, and Mr. Prinsep for another.

Early in November he went to London, visited the India House about his leave, and after a few busy days there set out with his wife on a round of visits to friends in the home counties. From Westerham, where they were the guests of Mrs. Neill's cousin, Mr. Warde, of Squeries, they went to Reading, thence to Bath and Cheltenham. From the latter place he went to Neath in South Wales, where he spent some pleasant days with some members of his wife's family, and on the 10th of December returned to town. After a few days, he left London with his family, by the North-Western Railway, *en route* for the North, parting from them at Warrington; and whilst they journeyed on to Carlisle, he struck off to Liverpool, thence to visit some friends in the Isle of Man, thence to Whitehaven by water, and thence on to Carlisle to rejoin his family at

---

* One great secret of Neill's success in the organisation and management of his force, was the firm adherence to a determination to have as officers "none but men fit for the work." "I have," he wrote in one of his letters, "got, no doubt, into great disgrace by being too strict. Twelve officers have been obliged to leave my division. I went at high game, for 1 Brigadier-General, 3 Lieut.-Colonels, and 3 Majors were among those who went very soon."

Swindridge. On Christmas Day he dined very happily, with all his family about him—"a happy family gathering," he wrote in his journal, "of every member of it. Can we ever expect to meet again on another Christmas Day?" Never. But there were still a few more happy weeks for him. January passed, and the first half of February, and he was still surrounded by his family. On the 16th of the latter month the bitter hour of parting came; and Neill tore himself from his family. There was some necessary business to be done in London, and the steamer was to leave Southampton on the 20th.

The voyage to India was not an eventful one. Early on Sunday the 29th of March the steamer entered the Madras Roads. "Go to Mount-Road Chapel with Gillilian" is the first record in his journal after his arrival; the next is, "Find that I can get off to Bushire soon." His regiment had gone to the Persian Gulf, where the British expedition under Sir James Outram was operating with successful vigour; and Neill was eager to join without a moment of unnecessary delay. He was vexed that he had not received information at Galle that it would be better for him to stop there and proceed thence to Bombay. But on the 6th of April, telegraphic intelligence arrived to the effect that the war was at an end. It was then well-nigh certain that the Madras Fusiliers would return to the Presidency. So this chance of service was gone. Another week, and there is the first mention in his journal of "the bad feeling in the Bengal Army." Then on the 20th of April, "The Fusilier vessels signalled this morning." It was an exciting moment for him; for he was to take command of the regiment on its arrival, as the senior officer was compelled to proceed to England in broken health. "I find," he wrote in his journal, "that I shall have some work in hand to keep all square in the Fusiliers. I shall require to exercise great discretion, keep my own counsel, always act honestly, fairly, and for the good of the service only, and all will be right." "Go down to beach and see Fusiliers land—a very fine healthy body of men, fully equal to any regiment I have ever seen." On the 28th, Colonel Stevenson made over to him the command of the regiment; and he began his business with all earnestness at once.

And so he went on, for a fortnight—taking the utmost pains to explain to all the officers under him the system upon which he intended to proceed; wisely counselling the younger officers, and in one especial instance, in which he more than suspected a dangerous addiction to strong drink, endeavouring to reclaim the offender by inviting him to live with him in the same house. By kindness blended with the firmest resolution, in all his dealings both with officers and men, he was rapidly gaining an ascendency over the regiment, when news came from Calcutta that Northern India was in a blaze. Colonel Neill had just made his arrangements for a permanent residence in Madras, when he was summoned to proceed immediately to Bengal. "Receive from Spurgin," he wrote in his journal, under date May 16, "accounts that he has secured me a house. At 11 P.M. receive orders from Adjutant-General to hold the regiment in readiness to embark, fully equipped—for service. Warn regimental staff and heads of companies to set to work early in the morning. Hear that a telegraph is in from Calcutta giving bad accounts from Meerut and Delhi, that our Bengal Native Army is in a state of mutiny." The opportunity, so long and patiently waited for, had come at last.

And Neill knew that it had come. There was something within him which told him clearly and distinctly, beyond the reach of all inward questionings and misgivings, that much was demanded of him, and that he was equal to the occasion. He was so sure of this, that he did not hesitate to express his conviction that no responsibility could descend upon him, however heavy, the burden of which he was not capable of bearing; and this not boastfully, but with a quiet, assured feeling of self-reliance, and something of a prophetic insight into the future. "He was sitting with me," writes a friend, "in my little office room shortly before he left for Bengal, talking over sundry professional matters, when he incidentally, and as it were half meditatively, remarked on the great service his Crimean experience had been to him professionally. He said, 'It has been the making of me, for I now feel fully equal to any extent of professional employment or responsibility which can ever devolve on me.' Thinking the speech savoured somewhat of self-esteem, I looked up inquiringly at him, but was speedily convinced that nothing was further from his thoughts than boasting. His expression was calm and thoughtful, and his eyes fixed, as if peering into that future which was so soon to verify the justice and sincerity of his estimate of his own character. I never saw him again to speak to, but I never forgot the deep impression his words made on me, strengthened as it subsequently was by his too short but brilliant career in Bengal—not too short for his own fame and his country's good."

"We embarked in excellent order," wrote Neill from Calcutta at the end of May, "early on the morning of the 18th, and arrived here on the afternoon of the 23rd. . . . Our passage up was very favourable, until one of the boilers burst; but with no harm to any one, though it brought us down to half-speed at once. I landed soon, and saw the Military Secretary to Government and the Deputy Quartermaster-General, and made all arrangements to start off the men I had brought up by steamers to Benares. However, next day there was a change. Only 130 men went up the country by steamer, and the rest I am starting off by train."

But this was not accomplished without an incident which soon proved to the people of Bengal that the Madras officer had the right stuff in him, and that he was eminently the man for the crisis. The story has been often told before. It shall be told here in his own words. "The terminus," he wrote, "is on the bank of the river, almost opposite the fort, at Howrah. There is a landing-place and jetty. The train was to start at 8·30 P.M. My men were all on board flats in the river, where they were cool and comfortable, and out of the way of mischief. When a party of 100 men were intended to go by train, the flat on which they were was hauled into the jetty. On the night on which the second party left, the flat was hauled in, but there was a squall and consequent delay. The railway people on shore gave no assistance. As we neared the jetty, a jack-in-office station-master called out to me very insolently that I was late, and that the train would not wait for me a moment. He would send it off without me. A little altercation ensued. Our men were landed by their officers and went, making the best of their way up to the carriages. The fellow was still insolent, and threatened to start the train; so I put him under charge of a sergeant's guard, with orders not to allow him to move, until I gave permission. The other officials were equally threatening and impertinent. One gentleman told me that I might command a regiment, but that I did not command them; they had authority there, and that *he* would start the train without my men. I then placed a guard over the engineer and stoker, got all my men safely into the train, and then released the railway people. Off went the train—only ten minutes after time. . . . I told the gentlemen that their conduct was that of traitors and rebels, and fortunate it was for them that *I* had not to deal with them. The matter has been brought to the notice of Government. I have heard nothing more than that Lord Canning thinks I did what was right; and the railway people are now most painfully civil and polite. It is given out that there was never an instance known of the railway officials being interfered with, far less made prisoners, except once in Ireland, in the Smith O'Brien affair, by Sir E. Blakeney."

Having started the whole of his regiment, Colonel Neill made all haste, by horse dawk, to Benares, which he reached on the 3rd of June. He found that, in addition to the men of his own regiment who had arrived, there were 120 men of Her Majesty's 10th Foot, thirty European artillerymen, with three guns. The native force consisted of the 37th Sepoy Regiment, a regiment of irregular cavalry, and the Sikh regiment of Loodhianah. In all the country, perhaps, there was not a spot to which more anxious eyes were turned; for it was the very nursery and hot-bed of Hindooism, the great home of the Brahmin priesthood. The British authorities were alive to the danger by which they were surrounded, but it seemed to them that the safest course was to appear not to suspect it. Even when news came of the mutiny of the 17th Regiment at Azimgurh, only some sixty miles distant, the Brigadier hesitated to disarm at once the 37th Regiment, whose fidelity, in this juncture, was doubtful. Against delay Neill vigorously protested; and succeeded in obtaining the consent of the Brigadier to an immediate afternoon parade. Soon after five o'clock the European troops were assembled. What followed is one of the saddest incidents in the history of a war sparkling with deeds of the brightest heroism and self-devotion. Colonel Neill was not the senior officer present on that parade; but he was soon compelled to take the command. It was intended to surprise the suspected regiment in their lines, and compel them to give up their arms. "We were," wrote Neill in a private letter, "to have been joined by the Sikhs and cavalry, on the parade-ground of the 37th; but they were not up, so we pushed on. The 37th let us come close, keeping within their huts and places of arms, and fired a volley into us. There was some confusion at first. . . . I was nearly cut off, but got back again among my men, and got the lads into order. The artillery fired grape, and the 37th were nearly silenced. Colonel Gordon had brought his Sikhs up; the guns were in the centre, our men protecting them; the 10th Foot on their right; the Sikhs on their left. I had arranged to clear the Sepoys' lines; that is, to drive them out, and follow them up to prevent mischief to the unprotected in the cantonment. I was just doing so, and had got my men into the Sepoys' huts, when there was an alarm about the guns. I was out of sight of them at the moment, but hastened towards them to see the Sikhs firing on our three guns, and our small protecting party of Fusiliers advancing to charge them. You may imagine my delight on seeing the artillerymen bringing their guns to bear, and our lads firing steadily with effect. The Sikhs did not stand two rounds of grape, but broke and fled. . . . I continued the fight until all had fled, followed them up as far as I could, fired round shot into them, and set fire to their lines. The consequence is that not a woman or a child has been touched."

Having made all possible provision for the safety of the women and children and the general security of the place, Colonel Neill turned his thoughts with anxious forebodings of evil towards Allahabad, which lay some eighty miles in advance—an important civil and military station, situated at the confluence of the Jumna and the Ganges, and often described as the "key of the lower provinces" of Hindostan. Beyond a few men attached to the general staff, there were no European soldiers in the place. The temper of the native soldiery was doubtful. The 6th Regiment of Sepoys had volunteered, with apparent enthusiasm, to march against the insurgents at Delhi. On the afternoon of the 6th of June, the regiment was assembled to hear a letter of thanks from the Governor-General read to them on parade. "The men," says the official account of these transactions, "seemed highly pleased and cheered loudly. The European officers were more than confirmed in their implicit reliance on the fidelity of their men; yet in three hours and a half this loyal cheer was changed for the shout of mutiny and murder." On that night they rose upon their officers. There was a large gathering at the mess-house; and among the diners a number of cadets, recently arrived from England, mere schoolboys in age and manners. The mutineers fell suddenly upon them and massacred nearly the whole party. Next morning the gates of the great gaols were thrown open, and three thousand ruffians let loose to aid in the "work of blood and destruction." The fort still, however, remained in our hands; but it was threatened both from within and from without, for the fidelity of the Sikh troops was doubtful, and the mutineers outside were preparing to invest the place.

But it was saved by the foresight and promptitude of Neill. Whilst yet the accounts from Allahabad were that "all was well," he had despatched a party of fifty men of the Fusiliers under Lieutenant Arnold, with orders to proceed by forced marches to Allahabad. On the morning of the 7th of June, they arrived wearied and exhausted at Jhoosee, where the road from Benares met a bridge of boats by which the river was crossed to Allahabad. The bridge was in the hands of the enemy, but there was a steamer off the fort, which after some unaccountable delay, was sent to bring in the Fusiliers. On the 9th, another detachment which Neill had sent forward made its timely appearance; and on the 11th, Neill himself, having made over the command of Benares to Colonel Gordon, appeared, with further reinforcements, under the walls of Allahabad.

But it was difficult to effect an entrance into that beleaguered fortress, and the exposure to the fierce sun in the burning month of June almost killed him. "I had," he wrote to a friend, "to make my way in by getting a boat by stealth from the rebel side; into this got my men. Fancy my walking, at least a mile, through burning river sand; it nearly killed me. I only lived by having water dashed over me. When I got into the open boat, my umbrella was my only covering: two of our lads died of sunstroke in the boat: how I escaped is one of the greatest mercies. I found all wrong here: the Europeans almost cheered me when I came in. The salute of the sentries at the gate was, 'Thank God, sir, you'll save us yet.' I set to work, and thrashed the fellows from about the place; the heat was terrific. I could only send my troops, for I could not accompany them, though much required, but I sat more dead than alive in a choultry, where I could see and direct. God prospered us, and after four days the fellows took alarm. . . . Cholera then suddenly attacked us, and the result was fearful.

In another letter, written to his wife, he dwelt still more forcibly upon what he endured at this time. Only the strong resolute will sustained him, under a burden of suffering, which would have pressed down and utterly incapacitated another man. "I was quite done up," he said, "by my dash from Benares, and getting into the fort, in that noon-day heat. I was so exhausted for days, that I was obliged to lie down constantly. I could only stand up for a few minutes at a time, and when our attacks were going on, I was obliged to sit down in the batteries and give my orders and directions. I had always the greatest confidence in myself, and although I felt almost dying from complete exhaustion, yet I kept up heart, and here I am, God be praised, as well as ever, only a little thinner. For several days I drank champagne and water to keep me up."

The energetic measures of Colonel Neill saved Allahabad. His first step was to recover the bridge of boats, and to secure a safe passage for another party of the Fusiliers, which was pressing forward under Major Stephenson. This was on the 12th of June, the day after his arrival. On the 13th, he swept the enemy out of the adjacent villages, where they were clustering in strength; and on the following day, a further body of Fusiliers having arrived, the Sikh corps was removed from the fort, and with it all remaining danger. "At Allahabad," wrote Lord Canning, to the chairman of the East India Company, "the 6th regiment has mutinied, and fearful atrocities were committed by the people on Europeans outside the fort. But the fort has been saved. Colonel Neill with nearly 300 European Fusiliers is established in it; and that point, the most precious in India at this moment, and for many years the one most neglected, is safe, thank God!"

"A column," added the Governor-General, "will collect there (with all the speed which the means of conveyance will allow of), which Brigadier Havelock, just returned from Persia, will command." Havelock did not reach Allahabad before the beginning of July; and during the latter fortnight of June that terrible visitation of Providence—the "pestilence which walketh in the darkness," of which Neill wrote in the letter last quoted—had assailed the Europeans in the fort. Still, ever mindful of his peril-surrounded countrymen higher up the country, he made arrangements to detach a large portion of his force to Cawnpore, and appointed his second-in-command, one altogether worthy of the post—Major Renaud—to lead it to the relief of Sir Hugh Wheeler. But when Havelock arrived, almost the first intelligence which reached him made him too certain that that terrible tragedy, which cannot even now be named without a shudder, had been acted, and that our miserable people in Cawnpore had passed beyond the reach of all human help. So the General halted Renaud's column, and determined to join it, with reinforcements, as soon as a sufficient number of carriage-cattle could possibly be obtained.

But at the very commencement of the mutiny and rebellion at Allahabad, the Commissariat bullocks had been carried off or let loose by the insurgents; and the means of conveyance for Havelock's advance could not, therefore, be brought together with the promptitude desired. He moved, however, on the 7th of July; and on the 16th, Neill, having been relieved of the command of Allahabad, pushed on also by horse-dâk. Before he started, he had received news of the successful actions which Havelock had fought with the enemy, and forwarded the glad tidings to the Government at Calcutta. "On the 15th of July," he wrote to a friend, "I received a telegram from the Chief praising General Havelock for his victories at Futtehpore, &c., which I was requested to communicate to him. With this came also the following:—'But his health is not strong, and the season is very trying; it is urgently necessary, therefore, that provision should be made for placing the command of the column in tried hands of known and assured efficiency, in whom perfect confidence can be placed, in case Havelock should become from any cause unfit for duty. You have been selected for the post, and accordingly you will proceed with every practicable expedition to join Havelock, making over the command of Allahabad to the next senior officer.' . . . I had hardly seen General Havelock before he said to me:—'Now, General Neill, let us understand each other: you have no power or authority here whilst I am here, and you are not to issue a single order.' . . I was placed in command at Cawnpore on his quitting. Well, off he went at last, and I assumed command."

One of Neill's first acts was to inquire into the circumstances of the ghastly tragedy of Cawnpore. The ascertained truth exceeded in horror all that his worst fears had suggested. He was a tender-hearted, impressionable man, whom such a story as this was sure to fill with measureless compassion on the one side, and indignation on the other. The horrors of Cawnpore might be repeated at Lucknow. When he thought of this—that even then in our beleaguered position, delicate women and innocent children were every day becoming more and more at the mercy of our remorseless enemies, there was a great conflict within him, and he asked himself, in doubt and perplexity, what was to be done. He was not one of those who would have executed indiscriminate vengeance on the nation which had sent forth these cruel and cowardly assassins. A black face was not an abomination in his eyes. He had, throughout the whole of his march, regarded scrupulously the rights and interests of the innocent people. He had suppressed with a strong hand every impulse to pillage and plunder. He had never suffered his men to take anything in the way of carriage or provisions from the people which was not paid for to the last farthing. He had hanged many murderers and mutineers, but never without fair trial and full evidence of their guilt. Nor, even with all the heart-breaking manifestations of that foul massacre at Cawnpore before him, did a thought of sweeping and confounding vengeance ever take possession of him. But he was eager to inflict upon the miscreants themselves what he felt would be, both for our own people and for our enemies, a just and merciful retribution. What he thought and what he did, at that time, shall be told in his own words:—"I saw that house," he wrote, "when I first came in. Ladies and children's bloody torn dresses and shoes were lying about, and locks of hair torn from their heads. The floor of the one room they were all dragged into and killed was saturated with blood. One cannot control one's feelings. Who could be merciful to one concerned? Severity at the first is mercy in the end. I wish to show the natives of India that the punishment inflicted by us for such deeds will be the heaviest, the most revolting to their feelings, and what they must ever remember. I issued the following order, which however objectionable in the estimation of some of our Brahminised infatuated elderly gentlemen, I think suited to the occasion or rather to the present crisis:—'25th July, 1857.—The well in which are the remains of the poor women and children so brutally murdered by this miscreant, the Nana, will be filled up, and neatly and decently covered over to form their grave: a party of European soldiers will do so this evening, under the superintendence of an officer. The house in which they were butchered, and which is stained with their blood, will not be washed or cleaned by their countrymen; but Brigadier-General Neill has determined that every stain of that innocent blood shall be cleared up and wiped out, previous to their execution, by such of the miscreants as may be hereafter apprehended, who took an active part in the mutiny, to be of selected according to their rank, caste, and degree guilt. Each miscreant after sentence of death is pronounced upon him will be taken down to the house in question, under a guard, and will be forced into cleaning up a small portion of the blood stains; the task will be made as revolting to his feelings as possible, and the Provost-Marshal will use the lash in forcing any one objecting to complete his task. After properly cleaning up his portion the culprit is to be immediately hanged, and for this purpose a gallows will be erected close at hand.' The first culprit was a Subadar of the 6th N. I., a fat brute, a very high Brahmin. The sweeper's brush was put into his hands by a sweeper, and he was ordered to set to work. He had about half a square foot to clean; he made some objection, when down came the lash, and he yelled again; he wiped it all up clean, and was then hung, and his remains buried in the public road. Some days after others were brought in—one a Mahomedan officer of our civil court, a great and one of the leading men: he rather objected, was flogged, made to lick part of the blood with his tongue. No doubt this is strange law, but it suits the occasion well, and I hope I shall not be interfered with, until the room is thoroughly cleaned in this way. . . . I will hold my own with the blessing and help of God. I cannot help seeing that His finger is in all this—we have been false to ourselves so often. . . . Charlie, my boy, I expect out the first mail. I have applied for him to come up here to do duty, and I hope to belong to the Lambs, or as the Nana and the enemy call them, the Neel-topee-wallahs. They wear light blue cap covers; the enemy say those fellows' muskets kill at a mile off before they are fired: so much for Enfields." It was, doubtless, a terrible sentence that he executed, in the eyes of the people of India; but he was fully convinced, in his own mind, that only by such severity could he check the atrocities which, in their blind fury, the rebels and mutineers were committing upon the Christian people. Those upon whom the punishment fell, and their own countrymen who looked on, believed that the terrors of the sentence would pursue them beyond the grave; but this, in the eyes of a Christian, was only an idea which added further bitterness to the cup of death upon this side of Eternity. There were many humane men at that time who believed that real mercy required the judge to do violence to his own tenderness of heart.

On the 20th of July, General Havelock commenced the passage of the river, which was the first step towards his advance into Oude. After a week of labour and difficulty, the whole column was assembled on the Oude bank. "Some of the General's staff," says Havelock's biographer, Mr. Marshman, "were anxious that General Neill should accompany the column to replace him, if he were disabled by any casualty; but the General, after carefully weighing the importance of the position at Cawnpore, the necessity of receiving, equipping, and forwarding reinforcements and completing the establishment of a communication between the two banks of the river, and generally of maintaining our authority on the right bank of the Ganges, felt himself constrained to leave General Neill in charge of the entrenchments, with the sick and wounded, there being no other officer to whom he could entrust these responsibilities with equal confidence." On the morning of the 29th, the force advanced upon the town of Onao, where Havelock encountered a large body of the enemy, and routed them with heavy loss. After this he advanced to Busseerutgunje, where he gained another victory; then halted in his career of glory and fell back upon Mungulwar, the place in which he had assembled his troops for the advance, only six miles distant from the banks of the river.

It would be out of place in such a narrative as this to discuss at length the strategical considerations which induced General Havelock to make this retrograde movement. Right or wrong, it created bitter disappointment in Cawnpore. To Neill, burning as he was with an eager desire for the immediate relief of Lucknow, and who with such an object ever before his eyes, believed that all difficulties should have been overcome, and all ordinary rules of war disregarded, this retrogression, in the hour of victory, appeared to be so startling and unintelligible, that he chafed under his mortification, and could not restrain himself from writing a letter of remonstrance to his superior officer:—"My dear General," he wrote on the 1st of August, "I late last night received yours of 5 P.M. yesterday. I deeply regret that you have fallen back one foot. The effect on our prestige is very bad indeed. Your camp was not pitched yesterday, before all manners of reports were rife in the city—that you had returned to get some guns, having lost all that you took away with you. In fact the belief among all is, that you have been defeated and forced back. It has been most unfortunate your not bringing back any of the guns captured from the enemy. The natives will not believe that you have captured one. The effect of your retrograde movement will be very injurious to our cause everywhere, and bring down upon us many, who would otherwise have held off or even sided with us. . . . You talk of advancing as soon as the reinforcements reach you. You require a battery and a thousand European Infantry. As regards the battery, half of Olpherts's will be in this morning. The other half started yesterday or to-day from Allahabad. This will detain you five or six days more. As for the Infantry you require, they are not to be had, and if you are to wait for them Lucknow will follow the fate of Cawnpore. Agra will be invested. This place also. The city will be occupied by the enemy. I have no troops to keep them out, and *we* shall be starved out. You ought not to remain a day where you are. When the iron guns are sent to you—also the half battery of artillery, and the company of the 84th escorting it, you ought to advance again and not halt until you have rescued, if possible, the garrison of Lucknow."

Looking at it from a strictly military point of view the reader will, doubtless, say that this letter ought not to have been written. Discipline stands aghast at it. No junior officer has the privilege of thus criticising the conduct of his senior. An apology, however, is to be found in the extraordinary character of the times, and the magnitude of the interests at stake. It was an unexampled crisis, and one in which the best men were moved at times to disregard all considerations of rank and station, and to assume an independence of tone which at other times would have been an unwarrantable breach of duty. There were, indeed, moments, in that terrible autumn of 1857, when under the strongest sense of what was due to the nation they represented, men, moved by the irresistible manhood within them, were prepared to trample down all the laws of discipline, and to assert irresistibly the rights of the stronger will and the more resolute courage. The words and actions of men in such a crisis as this, must not be estimated by the measuring-rod of the army-list and the order-book. Neill thought, on that August morning, of the despairing cries of the beleaguered garrison of Lucknow, and of the safety of the Great Empire, which was then threatened as it had never before been threatened; and he forgot for a while that it was the duty of Brigadier-General Neill not to remonstrate against the measures of Brigadier-General Havelock, but to accept them in silence as those of superior military authority.

But it was to this masculine energy of mind—to this irresistible activity of body—to the voice within him, which was ever crying, "Forward, forward!" that England owed at that time the safety of the great cities of Benares and Allahabad. If he had been a man of a colder, and less eager nature,—if he had had more caution and more patience, he would not have earned for himself the place that he has earned in the hearts of the people. Let us forget then the question of discipline for a time. Havelock responded, and Neill sent in a rejoinder, which the highest military authority in India declared to be "perfectly unexceptionable;" and, a day or two afterwards, the General again pushed forward in advance. But, again, there was disappointment throughout the force, throughout the whole country, for Havelock, assured that he could not make good his advance to Lucknow, fell back, after more successes in the field, and waited for reinforcements. Of the necessity for this, Neill himself was after a time convinced,—"Call on General Havelock," he wrote in his journal on the 14th of August, "and show him telegram from the Commander-in-Chief, and give him my opinion, that his men are not in a state to advance on Lucknow—that they must be taken care of for a time, and saved all unnecessary exposure. . . General Havelock talks a great deal about my administrative powers, wishing to take me with him out fighting, and participating in his victories. I reply to this, that however much I may feel at not having participated in them, and however anxious I may be to be in front, all private feelings should be sacrificed at such a time as this, and that I wished to be employed where I could do most for the public good. Besides, what I did not tell General Havelock, there is a farce in two Generals being with a handful of men, and one of them allowed to do nothing."

I have neither time nor space to write in detail of the events of the next month, during which the force waited, but not idly, at Cawnpore, for the reinforcements, which were to enable Havelock to advance. On Friday the 11th of September, an officer at Cawnpore wrote in his journal, "We were made happy to-day by General Neill being informed by General Havelock that he intended him to command the right wing of the force on the advance on Lucknow." On the 15th he wrote, "The first division of reinforcements arrived this morning. Orders are out to-day for the force to cross into Oude to-morrow,—hurrah! hurrah! General Neill to command the right wing, consisting of the 1st Madras Fusiliers, H.M.'s 5th and 84th regiment, Maude's battery of artillery." The hour so long and eagerly looked for, had come at last. Troops were pouring into Cawnpore, and everything was now in readiness for those operations for the relief of Lucknow, which seemed now to be placed beyond the reach of all human accidents. Sir James Outram had now arrived at Cawnpore, and Neill's heart had warmed to him at once.

On the 19th of September, everything was in readiness for an advance into Oude. The story of the march is so well told by an officer on Neill's staff, that I give it in the words of the writer. "I shall commence my narrative from the 19th September, the day on which we crossed into Oude. The kind and thoughtful General, who was always thinking what he could do for others, without a thought for himself, had taken great pleasure in laying in a little store of arrowroot, sago, candles, and wine, to take to the poor ladies who had been suffering for so long in Lucknow, and he took his palkee carriage to place at the disposal of some of them for their journey back to Cawnpore. He took one small tent which he intended Spurgin and me to share with him, but it so happened that we only used it once all the way over. Well, on the morning of the 19th, we got up at two o'clock and crossed over the bridge of boats with the troops. and his brigade was at first formed up on the left, and while halted there, we each took such breakfast as we happened to have in our pockets, and then the brigade was ordered to move off to the right, which was done under a fire from two of the enemy's guns, and some Sepoys who had taken up a position behind some sand-hills. The General, however, pushed forward his skirmishers and drove off the Sepoys, and halted his brigade in a capital position, close behind the said sand-hills. We had to remain out in the sun the whole of that day, as the baggage was much delayed in getting across the bridge and three creeks that had to be forded between the bridge and the mainland. He sat on the ground with his white umbrella over his head, but he did not feel the sun much. We remained in that same position all the 20th (Sunday). He slept in his little tent by himself that night."

The incidents of the two next days must be passed over, reluctant as I am to exclude even a line of this touching narrative. On the 23rd Neill's brigade came upon the advanced posts of the enemy. The writer narrates, that "close to the side of the road there was a very deep ditch of water, and while the poor General's horse was plunging through it, a round shot passed within a few inches of his back, an escape for which he and we all felt most thankful at the time. We were exposed to a heavy fire of round shot, grape, and musketry in this advance, and he was quite delighted with his troops, and the way in which he managed and led them won their admiration. I have him in my mind's eye now, mounted on his charger in front of the Madras Fusiliers, waving his helmet, and joining in the cheers of the brigade to Captain Olpherts' Horse Battery and the Volunteer Cavalry, who were passing along our front at a gallop to follow up the enemy, whose retreat had become too rapid to be followed very effectually by the infantry. We lost a good many men that afternoon... We drove the enemy back to about a mile beyond the Alumbâgh, and as it was then getting late, and it was evident that the force could not enter Lucknow that evening, we retired and took up a position close to and in the Alumbâgh. The dear General's brigade was on the Lucknow side of the Alumbâgh, and close to the enclosure wall. The whole ground was ankle-deep in mud; and now, to complete our *comforts* for the night, the rain, which had kept off the whole day, now came down in a perfect deluge, but the shower did not last more than an hour. We had no baggage up and nothing to eat. After taking up our position for the night, the kind General's first thought was for the comfort of his men, and he sent me to General Havelock to ask for orders for the issue of an extra dram, which was accordingly served out. . . . About seven or eight o'clock some of our things began to arrive, and a chair and a small charpoy had been got out of a few huts that were near; but the General's servant did not come up with a change of clothes for him and Spurgin, and I could not persuade him to take some of our dry things which had come up. He would not use the charpoy either, but insisted on my having it, and I did occupy one end of it (it was only about five feet long), and left the other for him in case he should change his mind. Some one lent him a good thick blanket, and he sat on the chair with his feet up on the charpoy, and the blanket over his head and shoulders, and spent the whole night in that way. . . To our disappointment an order came about seven o'clock on the 24th that the force was to halt that day and retire to a place about a thousand yards in the rear, where it would be more out of range of the enemy's guns. . . . We dined in the open air outside the General's tent, and were all in high spirits at our bright prospects for the morrow. . . Although so confident of success, he was fully impressed with a sense of the danger of the enterprise we were about to undertake, and in talking of anything that he would do after arrival at Lucknow, never failed to add, 'if it be God's will that I should get there!' . . . About eight o'clock on the 25th we marched, the 1st Brigade in advance. The dear General was near the head of the 5th Fusiliers. The road was lined with trees on either side, whose branches met across, and there was such a crush and confusion in the road caused by men and bullocks and horses, and branches of trees struck down by the round shot and grape and musketry, in a perfect storm of which we now were, that there was difficulty in making one's way to the front. . . The General immediately saw that the enemy's guns must be captured at all hazards, and with his own lips he gave the order for the Madras Fusiliers to charge them. This they did in the most splendid way; they were accompanied by some of the 84th, who happened, at the time, to be in the street of the village when the order to charge was given. The General himself headed the charge, which nothing could resist, and after mowing down a good many of our number with two discharges of grape, during the charge, and under a shower of musket bullets, the guns were in our possession. It was here that poor Arnold had his leg carried off, from the effects of which he died a few days afterwards, and many others got dreadful wounds, but all were happy and proud. From this point we diverged off to the right, and wound round the outskirts of the city with very trifling opposition, until we got on to the road which leads along the bank of the Goomty, and straight towards the Residency. We had stopped once or twice on our way round the outskirts to let the heavy guns close up, and at one of these halts the General was repeatedly cheered by his men and the artillerymen, which made him very happy, and he laughed so, when Captain Olpherts (who is a splendid officer) called out to his men, 'The sound of your guns is music to the ladies in Lucknow.' Soon after we had got on to the road along the Goomty, and little dreaming of the opposition which we had yet to meet, the General several times said: 'How very thankful we should feel for having been preserved through the dangers of the day (it was now between two and three in the afternoon), and I for having escaped when my horse was killed under me!' We were riding quietly along the road at the head of the men, admiring the beauty of some of the buildings, and of the country on the other side of the Goomty, when some guns from that very side suddenly opened on us, and at the same time a sharp fire of muskets from the building known as the 'Mess House,' and from the Kaiser Bagh walls on our left, and two or three guns also kept firing at us from one of the gates of the Kaiser Bagh. The Mess House was within one hundred yards of us. It is an upper storied house with a turret at each corner, and shots poured out at every window and opening, and our musketry fire could not keep down theirs, and we had not time to wait and storm the house, for it was most essential that relief should reach the garrison that very night, so we were just obliged to push on. The General had two or three rounds fired into the house from one of the guns, which caused their musketry fire to cease for a short time. We then got into a walled enclosure, and rested for a little, and allowed the troops to close up. The General dismounted and sat down, and we had a cigar, I think, and some tea or something to drink. We then started again, and had to go along a lane, and then through what had been the compound of an officer's bungalow. All this time we were concealed from the enemy's view, but at the end of the compound we had to come out on to one of the main roads, fully exposed to the Kaiser Bagh, and several large mosques and buildings, and for about two hundred yards we had to go through an incessant storm of bullets, grape, &c., to which, what we had been exposed to in the morning, was not to be compared in fierceness. Men were cut down on all sides, and how any single one escaped was perfectly miraculous. At the end of the two hundred yards, we got behind the shelter of a large house, which was immediately occupied by the Madras Fusiliers, who, by the General's order, tried hard to keep down the musketry fire from the mosque behind, but it wasn't until after repeated discharges from our guns that it was even partially silenced." After further interesting details, which I reluctantly omit, the writer proceeds to relate: "It was now getting dusk, and our infantry were marching through the court-yard, which had flat-roofed houses on either side and at the far end, with an archway in the middle of the far end, under which we had to go. . . The General was sitting on his horse quite coolly, giving his orders and trying to prevent too hasty a rush through the archway, as one of the guns had not yet been got out of the lane where we had been halting. He sent me back to see what was the delay in getting the gun on; and these were the last words I heard him utter, as I rode off immediately to the lane, and in about three minutes returned with the gun, when, to my great grief and horror, I was told that he was no more. He, sitting there quietly on his horse, had formed too prominent an object for the sure aim of the mutineer Sepoys, who fired at him through a loophole above the archway, and the fatal bullet performed its mission but too truly, and in one instant closed the earthly career of our greatest and most noble soldier and beloved General, our only consolation being that he was at peace and had died a soldier's death, and passed from a short-lived earthly career of glory into one of glorious immortality. . . He must have had his head turned towards the lane, watching probably for the gun to make its appearance round the corner, for the bullet entered the side of his head behind, and a little above the left ear.

"When the fatal bullet took effect," continues the narrator, "the body fell forward on the horse's back, and the animal, through fright, galloped off towards the lane, and the body fell off near the corner of the lane. Spurgin had gone to the very place where he had seen the body fall off the horse, and was fortunate enough to have it put on to a gun-waggon, on which it was brought into the Residency. We were out all that night, and I followed the gun on which the dead remains were into the Residency compound at daybreak on Saturday morning, the 26th. It was then taken off the gun and put into a doolie. . . . It was unsafe to enter the churchyard during the day, it was so much exposed to the enemy's fire, although our good clergyman, Mr. Harris, offered to go at any hour during the day; but as the garrison custom was to have funerals in the evening, we thought it best not to cause unnecessary exposure to the men by having it during the day. He was left just as he was, with a ruzaie wrapped round him, and was committed to the earth at dusk in the churchyard, the funeral service having been performed by Mr. Harris, and many a tear shed and prayer offered up on the occasion. It would have been some little consolation if you could have heard the sorrow expressed by the whole brigade, and more especially by his own Fusiliers. His death was so unexpected by every one. He seemed to move about with a charmed life, and he had been so long looked on as the master-mind and stay of our force by those around him, that his being suddenly cut off came upon us with a terrible shock."

And upon all his countrymen, both in India and in England, fell the news of his death as a "terrible shock," from which they did not soon recover. In the course of a few months he had made a great reputation. He had waited long and patiently for his opportunity; it had come at last, and he had suddenly developed into a great military commander. In an unexampled crisis, he had displayed all the finest soldierly qualities; and there was not among the brave men who were pushing forward to the rescue, one in whom greater confidence was felt than in James Neill. All said of him, that he was "the man for the occasion." Like the two Lawrences, like Outram, and like Nicholson, he had wonderful self-reliance; and there was no responsibility so great as to make him shrink from taking upon himself the burden of it. When Lord Canning said of him, that "in the great struggle in which the best and bravest of men of any age or country would have been proud to bear a part, there was no leader more reliable, no soldier more forward than Neill," the sentiment was echoed by his countrymen all over the world. But only those who knew him well, who had lived in familiar intercourse and taken sweet counsel with him, knew how truly good and great he was. These were times, as we have seen, when the good old Covenanter spirit glowed within him, and he smote with an unsparing sword at the persecutors of our race. But in all the ordinary transactions of life, he was tender and gentle as a woman; he was one of the most unselfish and considerate of men, unceasingly watchful for opportunities of serving others, and ever forward in the performance of deeds of charity and love. The delight of a happy home, and the bright example of a devoted family, he was an upright and a God-fearing man, walking ever humbly with that God, and recognising in all the vicissitudes of life, the hand of an Almighty Providence. His career was short, but it has been truly said, "not too short for his fame;" for in the great muster-roll of Indian heroes, there is scarcely a name more cherished by their comrades than that of JAMES GEORGE NEILL.

* * *

THE MARTYRED PRESIDENT.

WITHIN the last few weeks a common sorrow has spread throughout our land, such as has never befallen it since the day when England's Prince was stricken down in the fulness of his manhood. And yet it is for no prince, noble, statesman, patriot, whom we have been accustomed to see among us, to look up to, or to follow. He never trod the soil of our islands; not one in many thousands among us ever saw his face. An ocean separated us from him; he ruled over another State. And yet, at such an hour as this, we feel that ABRAHAM LINCOLN was indeed bone of our bone and flesh of our flesh—that the great race which reads the Bible in the same mother-tongue on both sides of the Atlantic, whatever differences of polity may separate its various fractions, is yet but one people. Strange workings of a Hand mightier than man's! The pistol of an assassin—born, it would seem, of an English father on American soil—has done more to bring this country and America together than all the years which have elapsed since a monarch's obstinacy tore them asunder. O! how blessedly different from those times of bitter fratricidal strife are these, when a widowed English Queen, anticipating the almost universal instinct of her people, could of her own accord address at once in her own hand to that other widow across the Atlantic the expression of her deep sympathy for the murder of the chief magistrate of the United States!

It were waste of time here to express horror at a crime which, taking it with all its circumstances, stands unexampled in political history. The wrath of man worketh not the righteousness of God. Let us be content with awe to remember those words: "Vengeance is mine, saith the Lord; I will repay." Yea, He will repay! The blood of the innocent was never shed before His eyes in vain. A deed as hideous as any, since the Son of God hung between heaven and earth on the slave's cross, has been perpetrated on His lowly follower, whom the Pharisees of this world mocked as a "rail-splitter," a "bargee," a "village attorney." He who is higher than the highest regardeth. The Judge of all the earth shall do right.

But God's vengeance is not as man's vengeance. His justice is shown by sparing the many guilty for the sake of the few righteous. His doom for sin was the sending of a Saviour. The revenge of martyrdom is never fulfilled but by the conversion of the world, which slew the martyrs, to the truths for which they bore witness. ABRAHAM LINCOLN, Freedom's last and greatest martyr, can only be avenged by the conversion to freedom of the slave-world. Already we have heard of the grief of Lee, of the tears of Ewell. Who can tell in how many bosoms horror of the crime will not ripen into abhorrence of the evil root from which it sprang? Who can tell how many gallant but hitherto misguided Southerners it will not rally to the cause of that Union which their fathers loved, worked for, fought for? By the thrill of sympathy which it has awakened amongst ourselves, may we not judge how much mightier should be that which it will awaken in men not only speaking the same language, but long united as one nation by a thousand ties of neighbourhood, interest, kinship, fellow-help and fellow-work? Take that simple record of ABRAHAM LINCOLN's last-recorded hour of statesmanship: "He spoke very kindly of Lee." Oh, what a revenge was there already by anticipation for Booth's pistol-shot, over all Secessionists who bore yet a human heart within their bosom! And let us remember that it is not only an American that has fallen, but a Southerner born, a child of the Slave-State of Kentucky, and one who in youth had largely mingled with the men of the South, and worked for his bread among them; and that this it is which gave such weight to that testimony of his against slavery, which he has at last sealed with his blood. Let us rest assured, that to many a truly gentle and chivalrous heart at the South that blood will henceforth appeal in tones no longer to be resisted. Most remarkable is it indeed that the great witnesses for Union alike and for Freedom have in

America almost always been Southern men. Jefferson the Virginian gives for first utterance to American nationality that Declaration of Independence which proclaims the natural freedom and equality of all mankind; Washington, and the other great Virginian Presidents who follow him, establish the Union; Jackson the South Carolinian, with his Secretary of State, Livingstone of Louisiana, arrests for awhile its destruction, when threatened by the hotheaded "Nullificationists" of the South. And now, in the fulness of the time, the Kentuckian LINCOLN spends his life in the earnest endeavour to restore the Union on the ground of universal freedom, leaving his high office and the fulfilment of his task to another Southerner, the North Carolinian Andrew Johnson. Will not the South understand at last that Secession is treason against its own purest glories, against the fair fame of its greatest men?

We indeed must see that the cause of that Slave-Power, which declared that slavery was to be the corner-stone of its Government, has now melted away for ever in the blood of its latest victims. Acquit, as we most willingly should, the leaders of Secession of all complicity in the foul deed, yet it is the accursed spirit of slavery which spoke in the deed, in the words of the assassin. "Thus be it always to tyrants!" cried the frantic ruffian as he escaped across the stage, after having shot an unarmed man through the back of the head, by his wife's side, and in the midst of his countrymen. An utterance which would be ludicrous, if it were not ghastly,—if it did not indicate that utter perversion of man's spirit which the mere tolerance of slavery engenders, making him call evil good and good evil, and to mistake for a tyrant the man whose proud privilege throughout all time shall be, that he proclaimed freedom to four millions of his fellow-men. What superstructure the corner-stone of slavery may bear, the whole world should see henceforth.

The great American people, could we have understood the facts of a struggle, long shamefully misrepresented by a too large portion of our press, has been from the beginning, is doubly henceforth, entitled to our fullest sympathies whilst engaged in its present gigantic task of self-purification and self-reform. That God's blessing has rested upon it throughout that struggle,—in the arts of peace and in the arts of war,—in the reverses which it has known how to bear, and in the triumphs which it has known how to wait for, and when achieved, how to use,—in the valour of its generals, in the wisdom and gentleness of its rulers,—above all, in the stedfast self-devotion of its masses, we cannot doubt. The clash of warfare may be well-nigh over, but a vast work yet remains to be done. Let us hope and pray that it may be worthily fulfilled, and that upon a basis of large forgiveness for the errors of the past, but at the same time of equal rights and equal duties for all classes of citizens of whatever colour, a renewed Union may be built up, free from many of the political imperfections of the old, more truly worthy of the admiration of the world; and that the name of LINCOLN may inaugurate a series of rulers, who shall endear themselves even more to their countrymen than Washington and his great contemporaries did to their forefathers.

To the martyred President, such a Union will be the only true earthly monument; to his bereaved family, it will be the highest earthly consolation. *He* stands far above all puny pity of ours. That Lord whom he acknowledged in all his acts, and in none more signally than in that second Inaugural Message of his,—one of the noblest state-papers, because one of the lowliest, that ever dropped from the pen of an earthly ruler,—has called him to Himself. Shall we rebel, and say that it was too soon? It is written: "When the fruit is brought forth, IMMEDIATELY He putteth in the sickle, because the harvest is come." Immediately,—whether that sickle take the shape of disease, or old age, or accident, or the assassin's pistol-shot; immediately,—for the Lord of the harvest knows without fail when the fruit is brought forth. Let us rest assured that for that brave and gentle spirit the suddenness of death had no terrors, and that to the voice of Him who is saying for ever, "Surely I come quickly," his only answer would be, "Even so, come, Lord Jesus."

HEREWARD, THE LAST OF THE ENGLISH.

By CHARLES KINGSLEY.

CHAPTER XXIII.

HOW HEREWARD GATHERED AN ARMY.

THE voyage round the Norfolk coast was rough and wild. Torfrida was ill, the little girl was ill; the poor old mother was so ill that she could not even say her prayers. Packed uncomfortably under the awning on the poop, Torfrida looked on from beneath it upon the rolling water-waste, with a heart full of gloomy forebodings, and a brain whirling with wild fancies. The wreaths of cloud were grey witches, hurrying on with the ship to work her woe; the low red storm-dawn was streaked with blood; the water which gurgled all night under the lee was alive with hoarse voices; and again and again she started from fitful slumber to clasp the child closer to her, or look up for comfort to the sturdy figure of her husband, as he stood, like a tower of strength, steering and commanding, the long night through.

Yes; on him she could depend. On his courage, on his skill. And as for his love, had she not that utterly? And what more did woman need?

But she was going, she scarce knew whither; and she scarce knew for what. At least, on a fearful adventure, which might have a fearful end. She looked at the fair child, and reproached herself for a moment; at the poor old mother, whining and mumbling, her soft southern heart quite broken by the wild chill northern sea-breeze; and reproached herself still more. But was it not her duty? Him she loved, and his she was; and him she must follow, over sea and land, till death; and if possible, beyond death again for ever. For his sake she would slave. For his sake she would be strong. If ever there rose in her a home-sickness, a regret for leaving Flanders, and much more for that sunnier South where she was born, he at least should never be saddened or weakened by one hint of her sadness and weakness. And so it befel that, by the time they made the coast, she had (as the old chronicler says) "altogether conquered all womanly softness."

And yet she shuddered at the dreary mud-creek into which they ran their ships, at the dreary flats on which they landed shivering, swept over by the keen north-east wind. A lonely land; and within, she knew not what of danger, it might be of hideous death.

But she would be strong. And when they were all landed, men, arms, baggage, and had pitched the tents which the wise Hereward had brought with them, she rose up like a queen, and took her little one by the hand, and went among the men, and spoke:

"Housecarles and mariners! you are following a great captain, upon a great adventure. How great he is, you know as well as I. I have given him myself, my wealth, and all I have, and have followed him I know not whither, because I trust him utterly. Men, trust him as I trust him, and follow him to the death."

"That will we!"

"And, men, I am here among you, a weak woman, trying to be brave for his sake—and for yours. Be true to me, too, as I have been true to you. For your sake have I worked hard, day and night, for many a year. For you I have baked, and brewed, and cooked, like any poor churl's wife. Is there a garment on your backs which my hands have not mended? Is there a wound on your limbs which my hands have not salved? Oh, if Torfrida has been true to you, promise me this day that you will be true men to her and hers; that if —which Heaven forbid—aught should befal him and me, you will protect this my poor old mother, and this my child, who has grown up among you all—a lamb brought up within the lions' den. Look at her, men, and promise me, on the faith of valiant soldiers, that you will be lions on her behalf, if she shall ever need you. Promise me, that if you have but one more stroke left to strike on earth, you will strike it to defend the daughter of Hereward and Torfrida from cruelty and shame."

The men answered by a shout which rolled along the fen, and startled the wild fowl up from far-off pools. They crowded round their lady; they kissed her hands; they bent down and kissed their little playmate, and swore—one by God and his apostles, and the next by Odin and Thor—that she should be a daughter to each and every one of them, as long as they could grip steel in hand.

Then (says the chronicler) Hereward sent on spies, to see whether the Frenchmen were in the land, and how folks fared at Holbeach, Spalding, and Bourne.

The two young Siwards, as knowing the country and the folk, pushed forward, and with them Martin Lightfoot, to bring back news.

Martin ran back all the way from Holbeach, the very first day, with right good news. There was not a Frenchman in the town. Neither was there, they said, in Spalding. Ivo Taillebois was still away at the wars, and long might he stay.

So forward they marched, and everywhere the landsfolk were tilling the ground in peace; and when they saw that stout array, they hurried out to meet the troops, and burdened them with food, and ale, and all they needed.

And at Holbeach, and at Spalding, Hereward split up the war-arrow, and sent it through Kesteven, and south into the Cambridge fens, calling on all men to arm and come to him at Bourne, in the name of Waltheof and Morcar the Earls.

And at every farm and town he blew the war-horn, and summoned every man who could bear arms to be ready, against the coming of the Danish host from Norwich. And so through all the fens came true what the wild fowl said upon the meres, that Hereward was come again.

And when he came to Bourne, all men were tilling in peace. The terror of Hereward had fallen on the Frenchmen, and no man had dared to enter on his inheritance, or to set a French foot over the threshold of that ghastly hall, over the gable whereof still grinned the fourteen heads; on the floor whereof still spread the dark stains of blood.

Only Geri dwelt in a corner of the house, and with him Leofric the Unlucky, once a roystering housecarle of Hereward's youth; now a monk of Crowland, and a deacon, whom Lady Godiva had sent thither that he might take care of her poor. And there Geri and Leofric had kept house, and told sagas to each other over the beech-log fire night after night; for all Leofric's study was, says the chronicler, "to gather together for the edification of his hearers all the acts of giants and warriors out of the fables of the ancients, or from faithful report, and commit them to writing that he might keep England in mind thereof." Which Leofric was afterwards ordained priest, probably in Ely, by Bishop Egalwin of Durham; and was Hereward's chaplain for many a year.

Then Hereward, as he had promised, set fire to the three farms close to the Bruneswold; and all his outlawed friends, lurking in the forest, knew by that signal that Hereward was come again.

So they cleansed out the old house: though they did not take down the heads from off the gable; and Torfrida went about it, and about it, and confessed that England was after all a pleasant place enough. And they were as happy, it may be, for a week or two as ever they had been in their lives.

"And now," said Torfrida, "while you see to your army, I must be doing; for I am a lady now, and mistress of great estates. So I must be seeing to the poor."

"But you cannot speak their tongue."

"Can I not? Do you think that in the face of coming to England, and fighting here, and plotting here, and being, may be, an Earl's Countess, I have not made Martin Lightfoot teach me your English tongue, till I can speak it as well as you? I kept that hidden as a surprise for you, that you might find out, when you most needed, how Torfrida loved you."

"As if I had not found out already! Oh, woman, woman! I verily believe that God made you alone, and left the devil to make us butchers of men."

Meanwhile went round through all the fens, and north into the Bruneswold, and away again to Lincoln and merry Sherwood, that Hereward was come again. And Gilbert of Ghent, keeping Lincoln Castle for the Conqueror, was perplexed in mind, and looked well to gates, and bars, and sentinels; for Hereward sent him at once a message, that forasmuch as he had forgotten his warning in Bruges street, and put a rascal cook into his mother's manors, he should ride Odin's horse on the highest ash in the Bruneswold.

On which Gilbert of Ghent, inquiring what Odin's horse might be, and finding it to signify the ash-tree whereon, as sacred to Odin, thieves were hanged by Danes and Norse, made answer:

That he Gilbert had not put his cook into Bourne, nor otherwise harmed Hereward or his. That Bourne had been seized by the king himself, together with Earl Morcar's lands in those parts, as all men knew. That the said cook so pleased the king with a dish of stewed eel-pout, which he served up to him at Cambridge, and which the king had never eaten before, that the king begged the said cook of him Gilbert and took him away; and that after, so he heard, the said cook had begged the said manors of Bourne of the king, without the knowledge or consent of him Gilbert. That he therefore knew nought of the matter. That if Hereward meant to keep the king's peace, he might live in Bourne till Doomsday, for aught he Gilbert cared. But that if he and his men meant to break the king's peace, and attack Lincoln city, he Gilbert would nail their skins to the door of Lincoln Cathedral, as they used to do by the heathen Danes in old time. And that, therefore, they now understood each other.

At which Hereward laughed, and said, that they had done that for many a year.

And now poured into Bourne from every side brave men and true, some great holders dispossessed of their land; some the sons of holders who were not yet dispossessed; some Morcar's men, some Edwin's, who had been turned out by the king.

To him came "Guenoch and Alutus Grogan, foremost in all valour and fortitude, tall and large, and ready for work," and with them their three nephews, Godwin Gille, "so called because he was not inferior to that Godwin Guthlacsson who is preached much in the fables of the ancients," and Douti and Outi,* the twins, alike in face and manners; and Godric, the knight of Corby, nephew of the Count of Warwick; and Tosti of Davenesse, his kinsman; and Azer Vass, whose father had possessed Lincoln Tower; and Leofwin Moue †—that is, the scythe, so called, "because when he was mowing all alone, and twenty country folk set on him with pitchforks and javelins, he slew and wounded almost every one, sweeping his scythe among them as one that moweth;" and Wluncus the Black-face, so called because he once blackened his face with coal, and came unknown among the enemy, and slew ten of them with one lance; and "Turbertin, a great-nephew (surely a mistake) of Earl Edwin;" and Leofwin Prat (perhaps the ancestor of the ancient and honourable house of Pratt of Ryston), so called from his "Prat" or craft, because he had oft escaped cunningly when taken by the enemy, having more than once killed his keepers; and the steward of Drayton; and Thurkill the outlaw, Hereward's cook; and Oger, Hereward's kinsman; and "Winter and Linach," two very famous ones; and Ranald, the butler of Ramsay Abbey—"he was the standard bearer;" and Wulfric the Black and Wulfric the White; and Hugh the Norman, a priest; and Wulfard, his brother; and Tosti and Godwin of Rothwell; and Alsin; and Hekill; and Hugh the Breton, who was Hereward's chaplain, and Whishaw, his brother, "a magnificent" knight, which two came with him from Flanders;—and so forth:—names merely, of whom nought is known, save, in a few cases, from Domesday-book, the manors which they held. But, honour to their very names. Honour to the last heroes of the old English race.

---

* Named in Domesday-book (?).

† Probably the Leofwin who had lands in Bourne.

These valiant gentlemen, with the housecarles whom, more or fewer, they would bring with them, constituted a formidable force, as after years proved well. But having got his men, Hereward's first care was, doubtless, to teach them that art of war, of which they, like true Englishmen, knew nothing.

The art of war has changed little, if at all, by the introduction of gunpowder. The campaigns of Hannibal and Cæsar succeeded by the same tactics as those of Frederic or Wellington; and so, as far as we can judge, did those of the master-general of his age, William of Normandy.

But of those tactics the English knew nothing. Their armies were little more than tumultuous levies, in which men marched and fought under local leaders, often divided by local jealousies. The commissariats of the armies seem to have been so worthless, that they had to plunder friends as well as foes as they went along; and with plunder came every sort of excess—as when the northern men, marching down to meet Harold Godwinsson, and demand young Edwin as their Earl, laid waste, seemingly out of mere brute wantonness, the country round Northampton, which must have been in Edwin's earldom, or at least in that of his brother Morcar. And even the local leaders were not over-well obeyed. The reckless spirit of personal independence, especially among the Anglo-Danes, prevented anything like discipline, or organised movement of masses, and made every battle degenerate into a confusion of single combats.

But Hereward had learned that art of war, which enabled the Norman to crush piecemeal with inferior numbers, the vast but straggling levies of the English. His men, mostly outlaws and homeless, kept together by the pressure from without, and free from local jealousies, resembled rather an army of professional soldiers than a country *posse comitatus*. And to the discipline which he instilled into them; to his ability in marching and manœuvring troops; to his care for their food and for their transport, possibly also to his training them in that art of fighting on horseback in which the men of Wessex, if not the Anglo-Danes of the East, are said to have been quite unskilled,—in short, to all that he had learned as a mercenary under Robert the Frison, and among the highly civilised warriors of Flanders and Normandy, must be attributed the fact, that he and his little army defied for years the utmost efforts of the Normans, appearing and disappearing with such strange swiftness, and conquering against such strange odds, as enshrouded the guerilla captain in an atmosphere of myth and wonder, only to be accounted for, in the mind of Normans as well as English, by the supernatural counsels of his sorceress wife.

But Hereward grew anxious and more anxious, as days and weeks went on, and yet there was no news of Osbiorn and his Danes at Norwich. Time was precious. He had to march his little army to the Wash, and then transport it by boats—no easy matter—to Lynn in Norfolk, as his nearest point of attack. And as the time went on, Earl Warren and Ralph de Guader would have gathered their forces between him and the Danes, and a landing at Lynn might become impossible. Meanwhile there were bruits of great doings in the north of Lincolnshire. Young Earl Waltheof was said to be there, and Edgar the Atheling with him: but what it portended, no man knew. Morcar was said to have raised the centre of Mercia, and to be near Stafford; Edwin to have raised the Welsh, and to be at Chester with Alfgiva, his sister, Harold Godwinsson's widow. And Hereward sent spies along the Roman Watling Street—the only road, then, toward the north-west of England—and spies northward along the Roman road to Lincoln. But the former met the French in force near Stafford, and came back much faster than they went. And the latter stumbled on Gilbert of Ghent, riding out of Lincoln to Sleaford, and had to flee into the fens, and came back much slower than they went.

At last news came. For into Bourne stalked Walfric the Heron, with axe, and bow, and leaping-pole on shoulder, and an evil tale he brought.

The Danes had been beaten utterly at Norwich. Ralph de Guader and his Frenchmen had fought like lions. They had killed many Danes in the assault on the castle. They had sallied out on them as they recoiled, and driven them into the river, drowning many more. The Danes had gone down the Yare again, and out to sea northward, no man knew whither. He, the Heron, prowling about the fenlands of Norfolk to pick off straggling Frenchmen and looking out for the Danes, had heard all the news from the landsfolk. He had watched the Danish fleet along the shore as far as Blakeney. But when they came to the isle, they stood out to sea, right north-west. He, the Heron, believed that they were gone for Humber Mouth.

After a while, he had heard how Hereward was come again and sent round the war-arrow, and thought that a landless man could be in no better company; wherefore he had taken boat, and come across the deep fen. And there he was, if they had need of him.

"Need of you?" said Hereward, who had heard of the deed at Wrokesham Bridge. "Need of a hundred like you. But this is bitter news."

And he went in to ask counsel of Torfrida, ready to weep with rage. He had disappointed—deceived his men. He had drawn them into a snare. He had promised that the Danes should come. How should he look them in the face?

"Look them in the face? Do that at once: now: without losing a moment. Call them together and tell them all. If their hearts are staunch, you may do great things without the traitor Earl. If their hearts fail them, you would have done nothing with them worthy of yourself, had you had Norway as well as Denmark at your back. At least, be true with them, as your only chance of keeping them true to you."

"Wise, wise wife," said Hereward, and went out and called his band together, and told them every word, and all that had passed since he left Calais Straits.

"And now I have deceived you, and entrapped you, and I have no right to be your captain more. He that will depart in peace, let him depart, before the Frenchmen close in on us on every side and swallow us up at one mouthful."

Not a man answered.

"I say it again: He that will depart, let him depart."

They stood thoughtful.

Ranald, the Monk of Ramsay, drove the White-Bear banner firm into the earth, tucked up his monk's frock, and threw his long axe over his shoulder, as if preparing for action.

Winter spoke at last.

"If all go, there are two men here who stay, and fight by Hereward's side as long as there is a Frenchman left on English soil; for they have sworn an oath to Heaven and to St. Peter, and that oath will they keep. What say you, Gwenoch, knighted with us at Peterborough?"

Gwenoch stepped to Hereward's side.

"None shall go!" shouted a dozen voices. "With Hereward we will live and die. Let him lead us to Lincoln, to Stafford—where he will. We can save England for ourselves without the help of Danes."

"It is well for one at least of you, gentlemen, that you are in this pleasant mind," quoth Ranald the monk.

"Well for all of us, thou valiant purveyor of beef and beer."

"Well for one. For the first man that had turned to go, I would have brained him with this axe."

"And now, gallant gentlemen," said Hereward, "we must take new counsel, as our old has failed. Whither shall we go? For stay here, eating up the country, we must not do."

"They say that Waltheof is in Lindsay, raising the landsfolk. Let us go and join him."

"We can at least find what he means to do. There can be no better counsel. Let us march. Only we must keep clear of Lincoln as yet. I hear that Gilbert has a strong garrison there, and we are not strong enough yet to force it."

So they rode north, and up the Roman road toward Lincoln, sending out spies as they went; and soon they had news of Waltheof. News, too, that he was between them and Lincoln.

"Then the sooner we are with him, the better, for he will find himself in trouble ere long, if old Gilbert gets news of him. So run your best, footmen, for forward we must get."

And as they came up the Roman road, they were aware of a great press of men in front of them, and hard fighting toward.

Some of the English would have spurred forward at once. But Hereward held them back with loud reproaches.

"Will you forget all I have told you in the first skirmish, like so many dogs when they see a bull? Keep together for five minutes more, the pot will not be cool before we get our sup of it. I verily believe that it is Waltheof, and that Gilbert has caught him already."

As he spoke, one part of the combatants broke up, and fled right and left; and a knight in full armour galloped furiously down the road right at them, followed by two or three more.

"Here comes some one very valiant or very much afeared," said Hereward, as the horseman rode right upon him, shouting:

"I am the king!"

"The king?" roared Hereward, and dropping his lance, spurred his horse forward, kicking his feet clear of the stirrups. He caught the knight round the neck, dragged him over his horse's tail, and fell with him to the ground.

The armour clashed; the sparks flew from the old grey Roman flints; and Hereward, rolling over once, rose, and knelt upon his prisoner.

"William of Normandy! yield or die!"

The knight lay still and stark.

"Ride on!" roared Hereward from the ground. "Ride at them and strike hard! You will soon find out which is which. This booty I must pick for myself. What are you at?" roared he, after his knights. "Spread off the road, and keep your line, as I told you, and don't override each other! Curse the hot-headed fools! The Normans will scatter them like sparrows. Run on, men-at-arms, to stop the French if we are broken. And don't forget Guisnes field and the horses' legs. Now, king, are you come to life yet?"

"You have killed him," quoth Leofric the deacon, whom Hereward had beckoned to stop with him.

"I hope not. Lend me a knife. He is a much slighter man than I fancied," said Hereward, as they got his helmet off.

And when it was off, both started and stared. For they had uncovered, not the beetling brow, Roman nose, and firm curved lip of the Ulysses of the middle age, but the face of a fair lad, with long straw-coloured hair, and soft blue eyes staring into vacancy.

"Who are you?" shouted Hereward, saying very bad words, "who come here aping the name of king?"

"Mother! Christina! Margaret! Waltheof Earl!" moaned the lad, raising his head and letting it fall again.

"It is the Atheling!" cried Leofric.

Hereward rose, and stood over the boy.

"Ah! what was I doing to handle him so tenderly? I took him for the Mamzer, and thought of a king's ransom."

"Do you call that tenderly? You have nigh pulled the boy's head off."

"Would that I had! Ah!" went on Hereward, apostrophising the unconscious Atheling, "ah, that I had broken that white neck once and for all! To have sent thee feet foremost to Winchester, to lie by thy grandfathers and great grandfathers, and then to tell Norman William that he must fight it out henceforth not with a straw malkin like thee, which the very crows are not afraid to perch on, but with a cock of a very different hackle, Sweyn Ulfsson, King of Denmark."

And Hereward drew Brain-biter.

"For mercy's sake! you will not harm the lad?"

"If I were a wise man now, and hard-hearted as wise men should be, I should—I should—" and he played the point of the sword backwards and forwards, nearer and nearer to the lad's throat.

"Master! master!" cried Leofric, clinging to his knees; "by all the saints! What would the Blessed Virgin say to such a deed?"

"Well, I suppose you are right. And I fear what my lady at home might say: and we must not do anything to vex her, you know. Well, let us do it handsomely, if we must do it. Get water somewhere, in his helmet. No, you need not linger. I will not cut his throat before you come back."

Leofric went off in search of water, and Hereward knelt with the Atheling's head on his knee, and on his lip a sneer at all things in heaven and earth. To have that lad stand between him and all his projects, and to be forced, for honour's sake, to let him stand!

But soon his men returned, seemingly in high glee, and other knights with them.

"Hey, lads!" said he, "I aimed at the falcon and shot the goose. Here is Edgar Atheling prisoner. Shall we put him to ransom?"

"He has no money, and Malcolm of Scotland is much too wise to lend him any," said some one. And some more rough jokes passed.

"Do you know, sirs, that he who lies there is your king?" asked a very tall and noble-looking knight.

"That do we not," said Hereward sharply. "There is no king in England this day, as far as I know. And there will be none north of the Watling Street, till he be chosen in full husting, and anointed at York, as well as Winchester or London. We have had one king made for us in the last forty years, and we intend to make the next ourselves."

"And who art thou, who talkest so bold of king-making?"

"And who art thou, who askest so bold who I am?"

"I am Waltheof Siwardsson, the Earl, and yon is my army behind me."

"And I am Hereward Leofricsson, the outlaw, and yon is my army behind me."

If the two champions had flown at each other's throats, and their armies had followed their example, simply as dogs fly at each other they know not why, no one would have been astonished in those unhappy times.

But it fell not out upon that wise; for Waltheof, leaping from his horse, pulled off his helmet, and seizing Hereward by both hands, cried:

"Blessed is the day which sees again in England Hereward, who has upheld throughout all lands and seas the honour of English chivalry!"

"And blessed is the day in which Hereward meets the head of the house of Siward where he should be, at the head of his own men, in his own earldom. When I saw my friend, thy brother Osbiorn, brought into the camp at Dunsinane with all his wounds in front, I wept a young man's tears, and said, 'There ends the glory of the White-Bears' house!' But this day I say, the White-Bears' blood is risen from the grave in Waltheof Siwardsson, who with his single axe kept the gate of York against all the army of the French; and who shall keep against them all England, if he will be as wise as he is brave."

Was Hereward honest in his words? Hardly so. He wished to be honest. As he looked upon that magnificent young man, he hoped and trusted that his words were true. But he gave a second look at the face, and whispered to himself, "Weak, weak. He will be led by priests: perhaps by William himself. I must be courteous: but confide I must not."

The men stood round, and looked with admiration on the two most splendid Englishmen then alive. Hereward had taken off his helmet likewise, and the contrast between the two was as striking as the completeness of each of them in his own style of beauty. It was the contrast between the slow-hound and the deer-hound: each alike high bred; but the former, short, sturdy, cheerful, and sagacious; the latter tall, stately, melancholy, and not over wise withal.

Waltheof was a full head and shoulders taller than Hereward—one of the tallest men of his generation, and of a strength which would have been gigantic, but for the too great length of neck and limb, which made him loose and slow in body, as he was somewhat loose and slow in mind. An old man's child, although that old man was as one of the old giants, there was a vein of weakness in him, which showed in the arched eyebrow, the sleepy pale blue eye, the small soft mouth, the lazy voice, the narrow and lofty brain over a shallow brow. His face was not that of a warrior, but of a saint in a painted window; and to his own place he went, and became a saint, in his due time. But that he could out-general William; that he could even manage Gospatric and his intrigues, Hereward expected as little, as that his own nephews Edwin and Morcar could do it.

"I have to thank you, noble sir," said Waltheof, languidly, "for sending your knights to our rescue when we were really hard bestead—I fear much by our own fault. Had they told me whose men they were, I should not have spoken to you so roughly as I fear I did."

"There is no offence. Let Englishmen speak their minds, as long as English land is above sea. But how did you get into trouble, and with whom?"

Waltheof told him how he was going round the country, raising forces in the name of the Atheling, when, as they were straggling along the Roman road, Gilbert of Ghent had dashed out on them from a wood, cut their line in two, driven Waltheof one way, and the Atheling another, and that the Atheling had only escaped by riding, as they saw, for his life.

"Well done, old Gilbert!" laughed Hereward. "You must beware, my Lord Earl, how you venture within reach of that old bear's paw?"

"Bear? By-the-by, Sir Hereward," asked Waltheof, whose thoughts ran loosely right and left, "why is it that you carry the white bear on your banner?"

"Do you not know? Your house ought to have a blood-feud against me. I slew your great-uncle, or cousin, or some other kinsman, at Gilbert's house in Scotland long ago; and since then I sleep on his skin every night, and carry his picture in my banner all day."

"Blood-feuds are solemn things," said Waltheof, frowning. "Karl killed my grandfather Aldred at the battle of Settrington, and his four sons are with the army at York now——"

"For the love of all saints and of England, do not think of avenging that! Every man must now put away old grudges, and remember that he has but one foe, William and his Frenchmen."

"Very nobly spoken. But those sons of Karl—and I think you said you had killed a kinsman of mine?"

"It was a bear, Lord Earl, a great white bear. Cannot you understand a jest? Or are you going to take up the quarrels of all white bears that are slain between here and Iceland? You will end by burning Crowland Minster then, for there are twelve of your kinsmen's skins there, which Canute gave forty years ago."

"Burn Crowland Minster? St. Guthlac and all saints forbid!" said Waltheof, crossing himself devoutly.

"Are you a monk-monger into the bargain, as well as a dolt? A bad prospect for us, if you are," said Hereward to himself.

"Ah, my dear Lord King!" said Waltheof, "and you are recovering?"

"Somewhat," said the lad, sitting up, "under the care of this kind knight."

"He is a monk, Sir Atheling, and not a knight," said Hereward. "Our fen men can wear a mail-shirt as easily as a frock, and handle a twybill as neatly as a breviary."

Waltheof shook his head. "It is contrary to the canons of Holy Church."

"So are many things that are done in England just now. Need has no master. Now, Sir Earl and Sir Atheling, what are you going to do?"

Neither of them, it seemed, very well knew. They would go to York if they could get there, and join Gospatric and Merlesweyn. And certainly it was the most reasonable thing to be done.

"But if you mean to get to York, you must march after another fashion than this," said Hereward. "See, Sir Earl, why you were broken by Gilbert; and why you will be broken again, if this order holds. If you march your men along one of these old Roman streets—— By St. Mary, these Romans had more wits than we; for we have spoilt the roads they left us, and never made a new one of our own——"

"They were heathens and enchanters,"—and Waltheof crossed himself.

"And conquered the world. Well—if you march along one of these streets, you must ride as I rode, when I came up to you. You must not let your knights go first, and your men-at-arms straggle after in a tail a mile long, like a scratch pack of hounds, all sizes but except each others'. You must keep your footmen on the high street, and make your knights ride in two bodies, right and left, upon the wold, to protect their flanks and baggage."

"But the knights won't. As gentlemen, they have a right to the best ground."

"Then they may go to —— whither they will go, if the French come upon them. If they are on the flanks, and you are attacked, then they can charge in right and left on the enemy's flank, while the footmen make a stand to cover the waggons."

"Yes—that is very good; I believe that is your French fashion?"

"It is the fashion of common-sense, like all things which succeed."

"But, you see, the knights would not submit to ride in the mire."

"Then you must make them. What else have they horses for, while honester men than they trudge on foot?"

"Make them?" said Waltheof, with a shrug and a smile. "They are all free gentlemen, like ourselves."

"And, like ourselves, will come to utter ruin, because every one of them must needs go his own way."

"I am glad," said Waltheof as they rode along, "that you called this my earldom. I hold it to be mine of course, in right of my father: but the landsfolk, you know, gave it to your nephew Morcar."

"I care not to whom it is given. I care for the man who is on it, to raise these landsfolk, and make them fight. You are here: therefore you are Earl."

"Yes, the powers that be are ordained by God."

"You must not strain that text too far, Lord Earl; for the only power that is, whom I see in England—worse luck for it—is William the Mamzer."

"So I have often thought."

"You have? As I feared!" (To himself) "The pike will have you next, gudgeon!"

"He has with him the Holy Father at Rome, and therefore the blessed Apostle St. Peter of course. And—is a man right in the sight of Heaven, who resists them? I only say it. But where a man looks to the salvation of his own soul—he must needs think thereof seriously, at least."

"Oh, are you at that?" thought Hereward. "Tout est perdu. The question is, Earl," said he aloud, "simply this. How many men can you raise off this shire?"

"I have raised—not so many as I could wish. Harold and Edith's men have joined me fairly well: but your nephew, Morcar's——"

"I can command them. I have half of them here already."

"Then—then we may raise the rest?"

"That depends, my Lord Earl, for whom we fight!"

"For whom?—I do not understand."

"Whether we fight for that lad—Child Edgar—or for Sweyn of Denmark, the rightful king of England."

"Sweyn of Denmark! Who should be the rightful king, but the heir of the blessed St. Edward?"

"Blessed old fool! He has done harm to us enough on earth, without leaving his second-cousins' aunts' malkins to harm us after he is in Heaven."

"Sir Hereward, Sir Hereward, I fear thou art not as good a Christian as so good a knight should be."

"Christian or not, I am as good a one as my neighbours. I am Leofric's son. Leofric put Harthacanute on the throne, and your father, who was a man, helped him. You know what has befallen England, since we Danes left the Danish stock at Godwin's bidding, and put our necks under the yoke of Wessex monks and monk-mongers. You may follow your father's track, or not, as you like. I shall follow my father's, and fight for Sweyn Ulfsson, and no man else."

"And I," said Waltheof, "shall follow the anointed of the Lord."

"The anointed of Gospatric and two or three boys!" said Hereward. "Knights! Turn your horses' heads. Right about face, all! We are going back to the Bruneswold, to live and die free Danes."

And to Waltheof's astonishment, who had never before seen discipline, the knights wheeled round: the men-at-arms followed them; and Waltheof and the Atheling were left to themselves on Lincoln Heath.

CHAPTER XXIV.

HOW ARCHBISHOP ALDRED DIED OF SORROW.

In the tragedies of the next few months Hereward took no part; but they must be looked at near, in order to understand somewhat of the men who were afterwards mixed up with him for weal and woe.

When William went back to the South, the confederates, Child Edgar the Atheling, Gospatric, and their friends, had come south again from Durham. It was undignified; a confession of weakness. If a Norman had likened them to mice coming out when the cat went away, none could blame him. But so they did; and Osbiorn and his Danes, landing in Humber-mouth, "were met (says the Anglo-Saxon chronicle) by Child Edgar and Earl Waltheof and Merlesweyn, and Earl Gospatric with the men of Northumberland, riding and marching joyfully with an immense army;" not having the spirit of prophecy, or foreseeing those things which were coming on the earth.

To them repaired Edwin and Morcar, the two young Earls, Arkill and Karl, "the great Thanes," or at least the four sons of Karl—for accounts differ—and what few else of the northern nobility Tosti had left unmurdered.

The men of Northumberland received the Danes with open arms. They would besiege York. They would storm the new Norman Keep. They would proclaim Edgar king at York.

In that Keep sat two men, one of whom knew his own mind, the other did not. One was William Malet, knight, one of the heroes of Hastings, a noble Norman, and chatelain of York Castle. The other was Archbishop Aldred.

Aldred seems to have been a man like too many more—pious, and virtuous, and harmless enough, and not without worldly prudence: but his prudence was of that sort which will surely swim with the stream, and "honour the powers that be," if they be but prosperous enough. For after all, if success be not God, it is like enough to Him in some men's eyes to do instead. So Archbishop Aldred had crowned Harold Godwinsson, when Harold's star was in the ascendant. And who but Archbishop Aldred should crown William, when his star had cast Harold's down from heaven? He would have crowned Satanas himself, had he only proved himself king *de facto*—as he asserts himself to be *de jure*—of this wicked world.

So Aldred, who had not only crowned William, but supported his power north of Humber by all means lawful, sat in York Keep, and looked at William Malet, wondering what he would do.

Malet would hold it to the last. As for the new Keep, it was surely impregnable. The old walls—the Roman walls on which had floated the flag of Constantine the Great—were surely strong enough to keep out men without battering-rams, balistas, or artillery of any kind. What mattered Osbiorn's two hundred and forty ships, and their crews of some ten or fifteen thousand men? What mattered the tens of thousands of Northern men, with Gospatric at their head? Let them rage and rob round the walls. A messenger had galloped in from William in the Forest of Dean, to tell Malet to hold out to the last. He had galloped out again, bearing for answer, that the Normans could hold York for a year.

But the Archbishop's heart misgave him, as from north and south at once came up the dark masses of two mighty armies, broke up into columns, and surged against every gate of the city at the same time. They had no battering-train to breach the ancient walls: but they had—and none knew it better than Aldred—hundreds of friends inside, who would throw open to them the gates.

One gate he could command from the Castle tower. His face turned pale as he saw a mob of armed townsmen rushing down the street towards it; a furious scuffle with the French guards; and then, through the gateway, the open champaign beyond, and a gleaming wave of axes, helms, and spears, pouring in, and up the street.

"The traitors!" he almost shrieked, as he turned and ran down the ladder to tell Malet below.

Malet was firm, but pale as Aldred.

"We must fight to the last," said he, as he hurried down, commanding his men to sally at once *en masse* and clear the city.

The mistake was fatal. The French were entangled in the narrow streets. The houses, shut to them, were opened to the English and Danes; and, overwhelmed from above, as well as in front, the greater part of the Norman garrison perished in the first fight. The remnant were shut up in the Castle. The Danes and English seized the houses round, and shot from the windows at every loophole and embrasure where a Norman showed himself.

"Shoot fire upon the houses!" said Malet.

"You will not burn York? Oh, God! is it come to this?"

"And why not York town, or York Minster, or Rome itself, with the Pope inside it, rather than yield to barbarians?"

Archbishop Aldred went into his room, and lay down on his bed. Outside was the roar of the battle; and soon, louder and louder, the roar of flame. This was the end of his timeserving and king-making. And he said many prayers, and beat his breast; and then called to his chaplain for blankets, for he was very cold. "I have slain my own sheep," he moaned, "slain my own sheep!"

His chaplain hapt him up in bed, and looked out of the window at the fight. There was no lull, neither was there any great advantage on either side. Only from the southward he could see fresh bodies of Danes coming across the plain.

"The carcass is here, and the eagles are gathered together. Fetch me the holy sacrament, Chaplain, and God be merciful to an unfaithful shepherd."

The chaplain went.

"I have slain my own sheep," moaned the Archbishop. "I have given them up to the wolves—given my own Minster, and all the treasures of the saints, and—and—I am very cold."

When the chaplain came back with the blessed sacrament, Archbishop Aldred was more than cold; for he was already dead and stiff.

But William Malet would not yield. He and his Normans fought, day after day, with the energy of despair. They asked leave to put forth the body of the Archbishop; and young Waltheof, who was a pious man, insisted that leave should be given.

So the Archbishop's coffin was thrust forth of the Castle-gate, and the monks from the Abbey came and bore it away, and buried it in the Cathedral church.

And then the fight went on, day after day, and more and more houses burned, till York was all aflame. On the eighth day the Minster was in a light low over Archbishop Aldred's new-made grave. All was burnt, Minster, churches, old Roman palaces, and all the glories of Constantine the Great and the mythic past.

The besiegers, hewing and hammering gate after gate, had now won all but the Keep itself. Then Malet's heart failed him. A wife he had, and children; and for their sake he turned coward and fled by night, with a few men-at-arms, across the burning ruins.

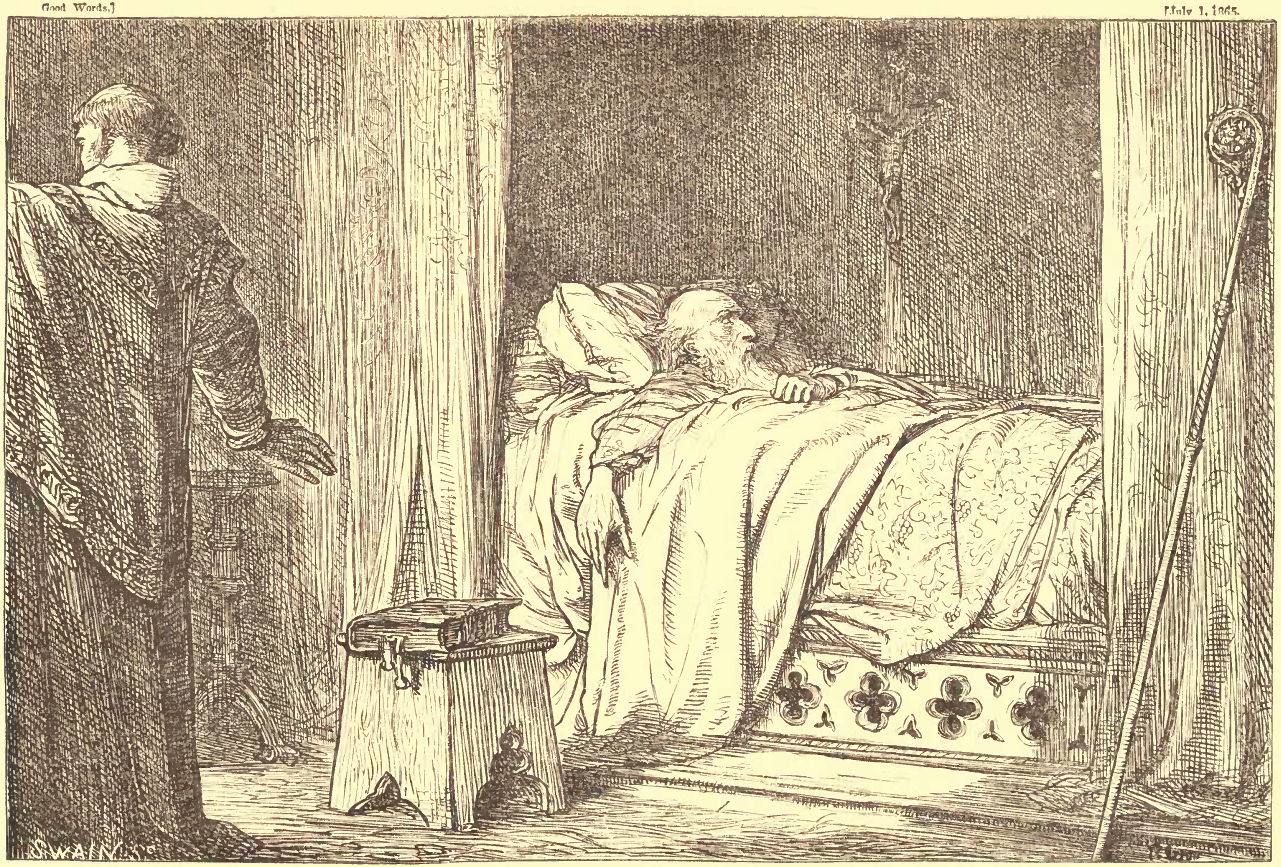
Then, into what once was York, the confederate Earls and Thanes marched in triumph, and proclaimed Edgar king—a king of dust and ashes.

And where were Edwin and Morcar the meanwhile? It is not told. Were they struggling against William at Stafford, or helping Edric the Wild and his Welshmen to besiege Chester? Probably they were aiding the insurrection, if not at these two points, still at some other of their great earldoms of Mercia and Chester. They seemed to triumph for awhile: during the autumn of 1069 the greater part of England seemed lost to William. Many Normans packed up their plunder and went back to France; and those whose hearts were too stout to return showed no mercy to the English, even as William showed none. To crush the heart of the people, by massacres, and mutilations, and devastations, was the only hope of the invader: and thoroughly he did his work whenever he had a chance.

CHAPTER XXV.

HOW HEREWARD FOUND A WISER MAN IN ENGLAND THAN HIMSELF.

There have been certain men so great, that he who describes them in words—much more pretends



"HIS CHAPLAIN HAPT HIM UP IN BED, AND LOOKED OUT OF THE WINDOW AT THE FIGHT."

Page 488.

to analyze their inmost feelings—must be a very great man himself, or incur the accusation of presumption. And such a great man was William of Normandy,—one of those unfathomable master-personages, who must not be rashly dragged on any stage. The genius of a Bulwer, in attempting to draw him, took care, with a wise modesty, not to draw him in too much detail: to confess always, that there was much beneath and behind in William's character, which none, even of his contemporaries, could guess. And still more modest than Bulwer is this chronicler bound to be.

But one may fancy, for once in a way, what William's thoughts were, when they brought him the evil news of York. For we know what his acts were; and he acted up to his thoughts.

Hunting he was, they say, in the forest of Dean, when first he heard that all England, north of the Watling Street, had broken loose, and that he was king of only half the isle.

Did he—as when, hunting in the forest of Rouen, he got the news of Harold's coronation—play with his bow, stringing and unstringing it nervously, till he had made up his mighty mind? Then did he go home to his lodge, and there spread on the rough oak board a parchment map of England, which no child would deign to learn from now, but was then good enough to guide armies to victory, because the eyes of a great general looked upon it?

As he pored over the map, by the light of bog-deal torch or rush candle, what would he see upon it?

Three separate blazes of insurrection, from north-west to east, along the Watling Street.

At Chester, Edric, "the wild Thane," who, according to Domesday-book, had lost vast lands in Shropshire, Algitha, Harold's widow, and Blethwallon and all his Welsh—"the white mantles," swarming along Chester streets, not as usually, to tear and ravage like the wild cats of their own rocks, but fast friends by blood of Algitha, once their queen on Penmaenmawr.* Edwin, the young Earl, Algitha's brother, Hereward's nephew—he must be with them too, if he were a man.

Eastward, round Stafford, and the centre of Mercia, another blaze of furious English valour. Morcar, Edwin's brother, must be there, as their Earl, if he too was a man.

Then in the fens and Kesteven. What meant this news, that Hereward of St. Omer was come again, and an army with him? That he was levying war on all Frenchmen, in the name of Sweyn, King of Denmark and of England? He is an outlaw, a desperado, a boastful swash-buckler, thought William, it may be, to himself. He found out, in after years, that he had mistaken his man.

And north, at York, in the rear of those three insurrections, lay Gospatric, Waltheof, and Merlesweyn, with the Northumbrian host. Durham was lost, and Comyn burnt therein. But York, so boasted William Malet, could hold out for a year. He should not need to hold out for so long.

And last, and worst of all, hung on the eastern coast the mighty fleet of Sweyn, who claimed England as his of right. The foe whom he had part feared, ever since he set foot on English soil, a collision with whom had been inevitable all along, was come at last: but where would he strike his blow?

William knew, it may be, that the Danes had been defeated at Norwich: he knew, doubt it not, for his spies told him everything, that they had purposed entering the Wash. To prevent a junction between them and Hereward was impossible. He must prevent a junction between them and Edwin and Morcar's men.

He determined, it seems—for he did it—to cut the English line in two, and marched upon Stafford as its centre.

So it seems; for all records of these campaigns are fragmentary, confused, contradictory. The Normans fought, and had no time to write history. The English, beaten and crushed, died and left no sign. The only chroniclers of the time are monks. And little could Ordericus Vitalis, or Florence of Worcester, or he of Peterborough, faithful as he was, who filled up the sad pages of the Anglo-Saxon Chronicle—little could they see or understand of the masterly strategy which was conquering all England for Norman monks, in order that they, following the army like black ravens, might feast themselves upon the prey which others won for them. To them, the death of an abbot, the squabbles of a monastery, the journey of a prelate to Rome, are more important than the manœuvres which decided the life and freedom of tens of thousands.

So all we know is, that William fell upon Morcar's men at Stafford, and smote them with a great destruction; rolling the fugitives west and east, toward Edwin, perhaps, at Chester, certainly toward Hereward in the fens.

At Stafford met him the fugitives from York, Malet, his wife, and children, with the dreadful news that the Danes had joined Gospatric, and that York was lost.

William burst into fiendish fury. He accused the wretched men of treason. He cut off their hands, thrust out their eyes; threw Malet into prison, and stormed on north.

He lay at Pontefract for three weeks. The bridges over the Aire were broken down. But at last he crossed and marched on York.

No man opposed him. The Danes were gone down to the Humber. Gospatric and Waltheof's hearts had failed them; and they had retired before the great captain.

Florence of Worcester says that William bought Earl Osbiorn off, giving him much money, and leave to forage for his fleet along the coast, and that Osbiorn was outlawed on his return to Denmark.

---

* See the admirable description of the tragedy of Penmaenmawr, in Bulwer's "Harold."

Doubtless William would have so done if he could. Doubtless the angry and disappointed English raised such accusations against the Earl, believing them to be true. But is not the simpler cause of Osbiorn's conduct to be found in this plain fact?—He had sailed from Denmark to put Sweyn, his brother, on the throne. He found on his arrival that Gospatric and Waltheof had seized it in the name of Edgar Atheling. What had he to do more in England, save what he did?—go out into the Humber, and winter safely there, waiting till Sweyn should come with reinforcements in the spring?

Then William had his revenge: he destroyed, in the language of Scripture, "the life of the land." Far and wide the farms were burnt over their owners' heads, the growing crops upon the ground; the horses were houghed, the cattle driven off; while of human death and misery there was no end. Yorkshire and much of the neighbouring counties lay waste for the next nine years. It did not recover itself fully till several generations after.

The Danes had boasted that they would keep their Yule at York. William kept his Yule there instead. He sent to Winchester for the regalia of the Confessor; and in the midst of the blackened ruins, while the English for miles around wandered starving in the snows, feeding on carrion, on rats and mice, and at last upon each other's corpses, he sat in his royal robes, and gave away the lands of Edwin and Morcar to his liegemen. And thus, like the Romans, from whom he derived both his strategy and his civilization, he "made a solitude and called it peace."

He did not give away Waltheof's lands; and only part of Gospatric's. He wanted Gospatric; he loved Waltheof, and wanted him likewise.

Therefore through the desert he himself had made he forced his way up to the Tees a second time, over snow-covered moors; and this time St. Cuthbert had sent no fog, being satisfied presumably with William's orthodox attachment to St. Peter and Rome; so the Conqueror treated quietly with Waltheof and Gospatric, who lay at Durham.

Gospatric got back his ancestral earldom from Tees to Tyne; and paid down for it much hard money and treasure;—bought it, in fact, he said.

Waltheof got back his earldom, and much of Morcar's. From the fens to the Tees, was to be his province.

And then, to the astonishment alike of Normans and English, and it may be, of himself, he married Judith, the Conqueror's niece; and became once more William's loved and trusted friend—or slave.

It seems inexplicable at first sight. Inexplicable, save as an instance of that fascination which the strong sometimes exercise over the weak.

Then William turned south-west. Edwin, wild Edric the dispossessed Thane of Shropshire, and the wilder Blethwallon and his Welshmen, were still harrying and slaying. They had just attacked Shewsbury. William would come upon them by a way they thought not of.

So over the backbone of England, by way, probably of Halifax, or Huddersfield, through pathless moors and bogs, down towards the plains of Lancashire and Cheshire, he pushed over and on. His soldiers from the plains of sunny France could not face the cold, the rain, the bogs, the hideous gorges, the valiant peasants—still the finest and shrewdest race of men in all England—who set upon them in wooded glens, or rolled stones on them from the limestone crags. They prayed to be dismissed, to go home.

"Cowards might go back,' said William; "he should go on." If he could not ride, he would walk. Whoever lagged, he would be foremost. And, cheered by his example, the army at last debouched upon the Cheshire flats.

Then he fell upon Edwin, as he had fallen upon Morcar. He drove the wild Welsh through the pass of Mold, and up into their native hills. He laid all waste with fire and sword for many a mile, as Domesday-book testifies to this day. He strengthened the walls of Chester, and trampled out the last embers of rebellion; he went down south to Salisbury, King of England once again.

Why did he not push on at once against the one rebellion left alight, that of Hereward and his fen-men?

It may be that he understood him and them. It may be that he meant to treat with Sweyn, as he had done, if the story be true, with Osbiorn. It is more likely that he could do no more; that his army, after so swift and long a campaign, required rest. It may be that the time of service of many of his mercenaries was expired. Be that as it may, he mustered them at Old Sarum—the Roman British burgh which still stands on the down side, and rewarded them, according to their deserts, from the lands of the conquered English.

How soon Hereward knew all this, or how he passed the winter of 1070—71, we cannot tell. But to him it must have been a winter of bitter perplexity.

It was impossible to get information from Edwin; and news from York was almost as impossible to get, for Gilbert of Ghent stood between him and it.

He felt himself now pent in, all but trapped. Since he had set foot last in England ugly things had risen up, on which he had calculated too little, namely Norman castles. A whole ring of them in Norfolk and Suffolk cut him off from the south. A castle at Cambridge closed the south end of the fens; another at Bedford, the western end; while Lincoln Castle to the north cut him off from York.

His men did not see the difficulty; and wanted him to march towards York, and clear all Lindsay and right up to the Humber.

Gladly would he have done so, when he heard that the Danes were wintering in the Humber.

"But how can we take Lincoln Castle without artillery, or even a battering ram?"

"Let us march past it, then, and leave it behind."

"Ah, my sons," said Hereward, laughing sadly, "do you suppose that the Mamzer spends his time—and Englishmen's life and labour—in heaping up those great stone mountains, that you and I may walk past them? They are put there just to prevent our walking past, unless we choose to have the garrison sallying out to attack our rear, and cut us off from home, and carry off our women into the bargain, when our backs are turned."

The English swore, and declared that they had never thought of that.

"No. We drink too much ale this side of the Channel, to think of that—or of anything beside."

"But," said Leofwin Prat, "if we have no artillery, we can make some."

"Spoken like yourself, good comrade. If we only knew how."

"I know," said Torfrida. "I have read of such things in books of the ancients, and I have watched them making continually—I little knew why, or that I should ever turn engineer."

"What is there that you do not know?" cried they all at once. And Torfrida actually showed herself a fair practical engineer.

But where was iron to come from? Iron for catapult-springs, iron for ram-heads, iron for bolts and bars?

"Torfrida," said Hereward, "you are wise. Can you use the divining-rod?"

"Why, my knight?"

"Because there might be iron-ore in the wolds; and if you could find it by the rod, we might get it up and smelt it."

Torfrida said humbly that she would try; and walked with the divining-rod between her pretty fingers for many a mile in wood and wold, wherever the ground looked red and rusty. But she never found any iron.

"We must take the tires off the cart-wheels," said Leofwin Prat.

"But how will the carts do without? For we shall want them if we march."

"In Provence, where I was born, the wheels of the carts are made out of one round piece of wood. Could we not cut out wheels like them?" asked Torfrida.

"You are the wise woman, as usual," said Hereward.

Torfrida burst into a violent flood of tears, no one knew why.

There came over her a vision of the creaking carts, and the little sleek oxen, dove-coloured and dove-eyed, with their canvas mantles tied neatly on to keep off heat and flies, lounging on with their light load of vine and olive-twigs beneath the blazing southern sun. When should she see the sun once more? She looked up at the brown branches overhead, howling in the December gale, and down at the brown fen below, dying into mist and darkness as the low December sun died down; and it seemed as if her life was dying down with it. There would be no more sun, and no more summers, for her upon this earth.

None certainly for her poor old mother. Her southern blood was chilling more and more beneath the bitter sky of Kesteven. The fall of the leaf had brought with it rheumatism, ague, and many miseries. Cunning old leech-wives treated the French lady with tonics, mugwort and bogbean, and good wine enow. But, like David of old, she got no heat; and before Yule-tide came, she had prayed herself safely out of this world, and into the world to come. And Torfrida's heart was the more light when she saw her go.

She was absorbed utterly in Hereward, and his plots. She lived for nothing else; and clung to them all the more fiercely, the more desperate they seemed.

So that small band of gallant men laboured on, waiting for the Danes, and trying to make artillery and take Lincoln Keep. And all the while—so unequal is fortune when God so wills—throughout the Southern Weald, from Hastings to Hind-head, every copse glared with charcoal-heaps, every glen was burrowed with iron diggings, every hammer-pond stamped and gurgled night and day, smelting and forging English iron, wherewith the Frenchmen might slay Englishmen.

William—though perhaps he knew it not himself—had, in securing Sussex and Surrey, secured the then great iron-field of England, and an unlimited supply of weapons: and to that circumstance, it may be, as much as to any other, the success of his campaigns may be due.

It must have been in one of these December days that a handful of knights came through the Bruneswold, mud and blood bespattered, urging on tired horses, as men desperate and foredone. And the foremost of them all, when he saw Hereward at the gate of Bourne, leaped down, and threw his arms round his neck and burst into bitter weeping.

"Hereward, I know you, though you know me not. I am your nephew, Morcar Algarsson; and all is lost."

* * * * *

As the winter ran on, other fugitives came in, mostly of rank and family. At last Edwin himself came, young and fair, like Morcar; he who should have been the Conqueror's son-in-law; for whom his true-love pined, as he pined, in vain. Where were Sweyn and his Danes? Whither should they go till he came?

"To Ely," answered Hereward.

Whether or not it was his wit which first seized on the military capabilities of Ely is not told. Leofric the deacon, who is likely to know best, says that there were men there already holding theirs out against William, and that they sent for Hereward. But it is not clear from his words, whether they were fugitives, or merely bold Abbot Thurstan and his monks.

It is but probable, nevertheless, that Hereward, as the only man among the fugitives who ever showed any ability whatsoever, and who was, also, the only leader (save Morcar) connected with the fen, conceived the famous "Camp of Refuge," and made it a formidable fact. Be that as it may, Edwin and Morcar went to Ely; and there joined them a Count Tosti (according to Leofric), unknown to history; a Siward Barn, or "the boy," who had been dispossessed of lands in Lincolnshire; and other valiant and noble gentlemen—the last wrecks of the English aristocracy. And there they sat in Abbot Thurstan's hall, and waited for Sweyn and the Danes.

But the worst Job's messenger who, during that evil winter and spring, came into the fen, was Bishop Egelwin of Durham. He it was, most probably, who brought the news of Yorkshire laid waste with fire and sword. He it was, most certainly, who brought the worse news still, that Gospatric and Waltheof were gone over to the king. He was at Durham, seemingly, when he saw that; and fled for his life, ere evil overtook him: for to yield to William that brave bishop had no mind.

But when Hereward heard that Waltheof was married to the Conqueror's niece, he smote his hands together, and cursed him, and the mother who bore him to Siward the Stout.

"Could thy father rise from his grave, he would split thy craven head in the very lap of the Frenchwoman."

"A hard lap will he find it, Hereward," said Torfrida. "I know her—wanton, false, and vain. Heaven grant he do not rue the day he ever saw her!"

"Heaven grant he may rue it! Would that her bosom were knives and fish-hooks, like that of the statue in the fairy tale. See what he has done for us! He is Earl not only of his own lands, but he has taken poor Morcar's too, and half his earldom. He is Earl of Huntingdon, of Cambridge, they say—of this ground on which we stand. What right have I here now? How can I call on a single man to arm, as I could in Morcar's name? I am an outlaw here, and a robber; and so is every man with me. And do you think that William did not know that? He saw well enough what he was doing when he set up that great brainless idol as Earl again. He wanted to split up the Danish folk, and he has done it. The Northumbrians will stick to Waltheof. They think him a mighty hero, because he held York-gate alone with his own axe against all the French."

"Well, that was a gallant deed."

"Pish! we are all gallant men, we English. It is not courage that we want, it is brains. So the Yorkshire and Lindsay men, and the Nottingham men too, will go with Waltheof. And round here, and all through the fens, every coward, every prudent man even—every man who likes to be within the law, and feel his head safe on his shoulders—no blame to him—will draw each from me for fear of this new Earl, and leave us to end as a handful of outlaws. I see it all. As William sees it all. He is wise enough, the Mamzer, and so is his father Belial, to whom he will go home some day. Yes, Torfrida," he went on after a pause, more gently, but in a tone of exquisite sadness, "you were right, as you always are. I am no match for that man. I see it now."

"I never said that. Only——"

"Only you told me again and again that he was the wisest man on earth."

"And yet, for that very reason, I bade you win glory without end, by defying the wisest man on earth."

"And do you bid me do it still?"

"God knows what I bid," said Torfrida, bursting into tears. "Let me go pray, for I never needed it more."

Hereward watched her kneeling, as he sat moody, all but desperate. Then he glided to her side, and said gently:

"Teach me how to pray, Torfrida. I can say a pater or an ave. But that does not comfort a man's heart, as far as I could ever find. Teach me to pray, as you and my mother do."

And she put her arms round the wild man's neck, and tried to teach him, like a little child.

LONGEVITY.

The question of Longevity has of late been well aired in the public press, but it does not appear that much light has been thrown upon the matter: indeed, the only new element observable in the discussion is the one of doubt introduced by the late Sir Cornewall Lewis: and, in such a case, the still more authoritative name of the Registrar-General. That very many old people set themselves down as much older than they really are, may fairly be conceded. When a person's age becomes remarkable, he is vain of its possession, as it is often the only point which distinguishes him from the crowd, and in the majority of instances he makes the most of it. But granted that there have been a great number of sham centenarians, we cannot for all that give up a belief in the power of the human frame to compass more than five score years.

In a vast forest of trees there will be one or two venerable patriarchs that may have seen the lapse of hundreds of years. If then one seed shall have vitality enough to have lived down successions of its fellows, when all the circumstances of climate and soil are identical, it may, we think, readily be conceded that the human *vis vitæ* may be prolonged in some rare instances even to double its ordinary duration. Accidents and diseases cut off the majority of mankind before their time. Some are lucky enough to escape these sources of mortality; and when the original frame is healthy, there is nothing so remarkable in its sustension through a comparatively long period of time. Old Jenkens, the most extreme example of longevity of which we have any authentic account, passed through a measure of time to which others of the race may at long intervals attain. It may be urged that the testimony of an old and illiterate man is not to be depended upon; and possibly, if there were nothing but this to be given in proof of his extreme old age, the case may be looked upon as very doubtful; but even then we can scarcely believe that he merely dreamed a fact which in a great measure settled his high antiquity—namely, that in his boyhood he was employed to take a horseload of arrows from his native place to Northallerton, for the use of the Earl of Surrey at the battle of Flodden Field, which was fought in the year 1513. Old Jenkens must have had a very picturesque memory indeed to invent such a circumstance. Taking for granted, however, that he did make this journey, it was well calculated to make an impression upon his mind which lasted to the latest moment of his life. It must be remembered that the very old recollect with extreme vividness events which have occurred in their boyhood; we may therefore put more trust in their memory of very early events, than in those which have occurred at a later period of their lives. The old man used to say, that, whilst in the service of Lord Conyers of Hornby Castle, he had often seen the Abbot of Fountains, a very jolly priest, at his master's table. Now as this monastery was suppressed in the year 1537, or thereabouts, it gives another indication of his age which seems to be about as trustworthy as any personal testimony well could be. But, independently of this evidence, we have the statement of another person, who, curious to see this animated fossil, went to his cottage for that purpose. Here, in the garden, he met an old man apparently upwards of a hundred years of age, whom he took for the veritable Henry Jenkens, but he was soon undeceived by the old man, who, in reply to his interrogatory, said, "It's my fayther you want, he is yonder;" and true enough, a little farther on, the veritable relic was found. We very much question if such testimony is not of more value than a mere register of birth and death, for we know such evidence is often untrustworthy. Parish clerks of old were not very literate men; and even now what means has a registrar of testing the correctness of entries of births and deaths, which those who make them may have the best possible reasons for falsifying? Again, the dates on tombstones are well known to be unreliable, as they are often falsified either for mischief or through carelessness. The testimony of contemporaries, especially when events have taken place in country villages where everybody is known, is, we think, as good evidence as the mere strokes of the pen made by clerks who have no knowledge of the facts which they record. If, however, sceptics must have documentary evidence of a circumstance which was patent to the whole country-side, we have the best of all such proof in the fact that the registers of the Court of Chancery prove that he gave evidence one hundred and forty years before his death.

Thomas Parr, the Shropshire man, worked as a labourer until his 130th year, and at 152 years of age he made a journey to London. The old Countess of Desmond, again, is another very remarkable instance of the power some persons have possessed of retaining their accustomed vigour up to a period double that of ordinary old age. This very remarkable old lady—a true Geraldine—was born in 1464, and whilst yet in her teens was married to her kinsman, who ultimately became the tenth Earl of Desmond. At her bridal she danced with the Duke of York, afterwards Richard the Third, and described him as a straight and well-formed young man; so much for the "hunchback" history has given him. This remarkable old lady survived all her kinsmen, and was in her latter years reduced to great poverty in consequence of her estate being appropriated by the English settlers. Fynes Morayson, in his "Tour of Ireland," in 1613, describes the old lady, then in her 139th year, as "being able to go on foot four or five miles to the market towne (Youghal), and using weekly so to doe." But she was destined to take a much longer journey than this, for ultimately, being wholly despoiled by the English settlers, she determined to seek redress from the king. In order to do this, being without adequate means for such a journey, she had to beg a passage in a sailing-vessel to Bristol, and when arrived there, to make her way across England—remember, reader, this famous old lady was in her 139th year. She arrived in Bristol with her daughter, a very old woman, and so infirm, that she could not attempt the journey on foot. Consequently a small wheeled vehicle was procured, in which the infirm daughter was placed, and thus along the horrible Great Western Road of those days this sad cavalcade pursued its way—the old countess trudging beside the cart on foot. The wonderful vigour of the old countess was equal to the task, however, which would have killed the majority of her sex even at an early age. The king granted her suit, and she trudged her weary way back as before. Even this journey was not too much for her, as she survived a year afterwards, and then met her death in a perfectly accidental manner, as is thus related in the Earl of Leicester's "Table Book":—"Shee might have lived much longer had shee not mett with a kind of violent death; for shee must needs climb a nutt-tree, to gather nutts, soe, falling down shee hurt her thigh, which brought on a fever, and that brought death." Well might Thomas Moore, in his "Fudge" papers, term her a "frisky old girl!"

The history of these three old people all testify to one fact, the superabundance of life they possessed up to the latest hour of their lives. It must be remembered that when we speak of human life extending over these long periods of time, we must not suppose that the same identical body has enshrined the spirit through all that period. In the early years of life every portion of the human frame is renewed annually. As life progresses, the process of reconstruction becomes more slow and debilitated, and in the last years of the centenarian, reconstruction almost ceases. It will be remembered that the faces of the very old are seamed in every direction by wrinkles. This is owing to the fact that the skin is no longer thrown off as it is in youth—like the outer bark of a tree it becomes tough and consolidated, and by the absorption of the subcutaneous fat this consolidated horn, for it is nothing less, falls into folds. Now as the human machine may be said to wind itself up; just as the original life is strong or feeble will this winding-up process be continued many or few times. There are watches that require winding-up every day, and eight-day clocks that more than see the week out, and clocks with powerful weights descending through long distances which make the circle of the year. The centenarians we have mentioned, worked with these long-descending weights. In the case of two of them, the wheels of life appear to have been stopped by extraneous causes. Indeed it has been observed that in many of these cases of extreme old age, nature has made extraordinary attempts to renew its youth. Hufeland says in several instances of great age it has been remarked that persons in their sixtieth or seventieth year, when others cease to live, acquired new teeth and new hair, and his translator, Erasmus Wilson, adds, "I have mentioned several instances of very old persons in whom the natural colour of the hair returned after they had been for years before grey." This was the case with John Weeks, who lived to the age of 114. Sir John Sinclair reports a similar circumstance in an old Scotchman who lived to be 110; and Susan Edwards when in her 95th year recovered her black hair, but became again grey previously to her death at the age of 105. Thus the fable of old Æson renewing his youth has some foundation in nature after all. Instances of persons living to a very great age are much more numerous than is generally imagined. In the board-room of St. Margaret's workhouse, Westminster, is a portrait of Margaret Patten, a Scotchwoman, who was brought to London to prepare Scotch broth for King James II. She died in the workhouse in 1739, aged 136; and in 1727, a man of the name of Effingham died in Cornwall at the age of 144; and in 1772, a Dane named Draakenberg died in his 146th year. It is remarkable that all the very long-lived persons have been inhabitants of Northern Europe. England, Scotland, and Ireland, Sweden, Norway, Denmark, and Russia have all contributed remarkable examples of longevity.

At the census of 1851, three hundred and nineteen persons (one hundred and eleven men and two hundred and eight women) returned themselves as ranging between 100 and 119 years of age. Of these sixty-nine were described as widows of no occupation (possibly annuitants?) sixteen as agricultural labourers, male and female, and nineteen as farmers.

The census of 1861 gives a list of only 201 centenarians who were born before the conquest of Canada and before George III. was king. It is observable that more women attain to old age than men, but the greater strength of the latter is necessary to attain to the extreme limits of human life.

Haller, who has collected the greatest number of instances of longevity, thus tabularises them:—

Of men who lived from 100 to 110, there have been	1000
110 to 120	60
120 to 130	29
130 to 140	15
140 to 150	6
169	1

Hufeland, generalising from these facts, thinks that the organisation and vital powers of man are able to support a duration and activity of 200 years! This is of course only an individual opinion, which must be taken for what it is worth, but there can be no manner of doubt that as civilisation advances the whole mass of human life is being lifted and lengthened. The causes of disease are slowly being eliminated. As compared with 100 years ago, the present duration of life is as four to three. This being the case, there is every reason to suppose that exceptional lives will tower above the general level of longevity as they did of old.

Sometimes when any old lives are linked together, they are enabled to transmit the memory of events over intervals of time which are perfectly startling. One person conversing with another, has been known to carry us back into the actual presence of circumstances the printed records of which have mainly perished, or at least lived in black-letter or worm-eaten paper only to be found in the library of the antiquary. It seems strange to be told that, as late as the year 1780, there was a Spitalfields weaver alive who had witnessed the execution of Charles I., and of a Cumberland woman alive in 1766 who remembered the siege of Carlisle by Cromwell. If this woman had ever conversed with Dr. Routh, President of Magdalen College, Oxford, who was ten years old at the time of her death, we should have had an old gentleman alive only ten years ago who had been in direct conversation with one of the witnesses of a siege in the Great Rebellion. But perhaps the most extraordinary length of time bridged over by two lives is that mentioned by Mr. Sidney Gibson, F.S.A., who relates that he knew a gentleman who had often heard his father say he had conversed with one Peter Gordon, who died in the year 1786 at the age of 127, who, when a boy, had heard Henry Jenkens give evidence in a court of justice of his having carried arrows to Flodden Field. The imagination almost refuses to believe that the span of life in two persons should have touched the beginning of the sixteenth and the end of the eighteenth centuries—that these two individuals should have ranged over events in our history beginning with a border warfare in the days of bows and arrows, and ending at a time when India had been virtually conquered nine years at the battle of Pondicherry.

When one is asked what are the causes of longevity, it may be pretty safely answered that a good digestion is at the bottom of the whole business. The perfect action of the organ by which the frame is nourished must clearly be of the first moment. Whether the assertion of the cynic that, in addition to a good digestion, a bad heart is also necessary, may perhaps be open to doubt. That insensibility to the sufferings of others relieves us of much mental anguish—a great cause of decay—there can be little doubt; but, on the other hand, the pleasurable emotions that spring from a pure heart are of infinite potency in prolonging life. It is the little worrying cares that nag at the springs of existence. Great natural philosophers, great painters, and great poets have lived long. Galileo, Kepler, and Newton survived to a good old age. So did Herschel and his sister Lucretia, although she spent many years of nights in the observatory assisting her brother in his labours. It may be that the calm contemplation of other worlds so lifts the mind above the petty cares of this, that the body has little cause to grow old. Swift, Corneille, Young, Goethe, Anacreon, Sophocles, and Wordsworth all lived beyond the appointed threescore and ten years; and the longevity of some of the greatest painters has been remarkable. Titian and Michael Angelo both lived to the age of 96. It is also a daily matter of remark that great lawyers attain to a long age. Within our own memory three law lords—Eldon, Stowell, and Lyndhurst—passed their 90th year. We apprehend, however, that much of this connection of great age with great offices is patent enough to life actuaries. Lawyers, for instance, are not appointed to the great offices of state until they have passed all the more dangerous epochs of human life, and when the chances of existence are materially enhanced. At the same time it must be conceded that great fame of an enduring character must be dependent upon prolonged vitality. A man's reputation, if it is sustained with full vigour in popular estimation, increases with his increasing years. The spectacle of Lord Eldon working by his solitary lamp up to the latest day of his life, impressed the public mind with his prodigious powers; and we can understand the almost superstitious veneration with which Michael Angelo and Titian were contemplated by their contemporaries, who beheld them dying almost with their brushes in their hands.

But, after all, these exceptional cases prove but little. They are good examples of the powers of a sound constitution sustained by a vigorous flame of life to keep the human machine going for a very long period, even in the face of great mental and bodily wear and tear; but they say nothing as to the effect of particular occupations on classes. The conclusions all actuaries have arrived at is that the longest lives are those of agricultural labourers whose conditions are favourable enough to enable them to become members of Friendly Societies. Both Jenkens and Parr were children of the soil: thus science and theory are in this matter in accord. On the other hand, kings and princes sink to the lowest place in the scale of life.

The power persons who have lived to a remarkable age have of transmitting longevity to their posterity is also very remarkable. The great-grandson of old Parr died in Cork only a few years ago at the age of 103; and the son of old Jenkens appeared, as we have seen, to have reached to a hundred even in his father's lifetime. The Costello family in county Kilkenny afford remarkable instances of the long life which seems hereditary in some families. Mary Costello, who died in 1824, lived to the age of 102, and her brother to upwards of a hundred; their mother also attained the age of 102, their grandmother a similar age, and their great-grandmother's life was lengthened to the span of 125 years! Sometimes all the members of a family appear to have derived a remarkable stock of longevity from their parent. A lady who died in 1836, in the Edgeware Road, in her 103rd year, had three sisters who lived to the respective ages of 107, 105, and 100 years.

It would be a curious experiment to intermarry the children of families remarkable for longevity, in order to discover if by this means a race could be raised capable of resisting the inroads of time beyond the ordinary length of human life. Peculiarities in the animal and vegetable world are perpetuated in this manner, we know, and there would seem to be no reason why the peculiarity of longevity should not be produced by the careful selection of parents endowed with the gift of long life. We all know that intermarriages between families afflicted with some constitutional taint inevitably tends to shorten the life of its offspring, and we may therefore very fairly assume that a selection of lives possessing presumably a superabundance of vitality would have a tendency to perpetuate a very long-lived stock. Had the children of Jenkens and Parr, for instance, married, we cannot doubt but that they would have transmitted to their descendants no small portion of that gift of longevity for which their sires had been so famous.

Possibly, however, mankind may think that, after all, the gift is of a very doubtful value, and that the passage of human life through this vale of tears is not so happy that we should desire to see it materially prolonged.

ANDREW WYNTER.

ON LIGHT.

By SIR JOHN F. W. HERSCHEL, Bart.

PART II.

THEORIES OF LIGHT.—INTERFERENCES.—DIFFRACTION.

Two theories only, entitled to any consideration as rational and intelligible explanations of the phenomena of Light, have been advanced—the one proposed by Sir Isaac Newton, commonly known as the "Corpuscular;" the other by Christian Huyghens, as the "Undulatory" theory. According to the former, light consists in "Corpuscules" or excessively minute material particles darted out in all directions from the luminous body, in virtue of some violent repulsive power or other energetic form of internal action, acting under such circumstances, and under such laws, as to give them all the same *initial* velocity which they retain unchanged in their progress through space, as well as their initial direction according to the general laws of motion (to all which they implicitly conform), until they meet with some material body by whose action their course is changed. All this and all subsequent changes of direction and velocity are held, on this theory, to be effected by attractive or repulsive powers resident in the bodies on which the light-corpuscules fall (or, which comes to the same thing, in the corpuscules themselves), and from which they are either reflected, if the repulsive powers be too strong to permit their penetration; or in which they are refracted, if they are able to enter and make their way among the particles of the refracting body. Colour, according to this theory, is accounted for by specific diversity among the luminous particles; and difference of refrangibility, by differences in the intrinsic energy of the acting forces as determined by the specific nature of the molecules, or, which comes to the same, by a difference of proportion between their *moving force* and their *inertia*. This is one of the many weak points of the theory. It runs counter to the only analogy which the observation of nature furnishes. It is as if the sun should be supposed to attract a planet of lead and one of cork with different *accelerating* forces; or as if, here on earth, a lump of platina and a lump of iron should be supposed to acquire different velocities in falling through the same space. It runs counter, too, to the original assumption, that when first emitted from a luminous body, in their passage through empty space, all the coloured particles move with equal velocities, and *have* therefore been *equally accelerated* by the emitting forces. That they *do* so we know from astronomical observation. The *Aberration* of all the coloured rays is the same. Were it not so, every star seen through a highly magnifying telescope ought to appear as drawn out into a short, coloured *spectrum* in a certain definite direction. Light requires 42 minutes to reach the earth from Jupiter at its mean distance. Supposing the rays of one end of the spectrum—the violet, for instance—to travel faster than those at the other (the red), a satellite undergoing eclipse by immersion in the shadow of the planet ought to change colour before extinction, from white to red; the last emitted red rays lagging behind the violet on their journey to the earth; while at its reappearance a blue colour ought to be first perceptible.

Among the stars are many which vary periodically in brightness, and some of them undergo complete extinction. As light takes *several years* to travel from the stars, the difference in the times of arrival for any sensible difference of velocity would amount to many days, and would be quite sufficient to tinge the disappearing and reappearing star with the hues belonging to opposite ends of the spectrum. No such thing, however, is observed. Most of them retain their whiteness, and though some *do* assume a deep red colour when undergoing extinction, or when at their minimum of splendour, it is *not* changed to blue at their reappearance, or on their commencing augmentation of brightness.

The reflexion and refraction of light are, as we have stated, accounted for on this theory by supposing the particles of all material bodies, besides the attractive force of gravitation, to be endowed with other forces both attractive and repulsive: the latter extending to a greater distance than the former, so as to constitute an attractive and a repulsive sphere one within the other; the particles of light being repelled while passing through the outer or repulsive sphere, and attracted when arrived within the internal or attractive one. These forces are supposed immensely energetic, and to decrease with such excessive rapidity as to be absolutely insensible at any, the very smallest, distance appretiable to our senses. In virtue of this repulsive force, the surface of any material body may be conceived as coated (metaphorically speaking) with a film of repulsive power, off which, as from an elastic cushion, the luminous particles may be imagined to rebound: in which case, according to the known laws of elastic rebound, the angle of reflexion (perfect elasticity being supposed) would be equal to that of incidence, and the velocities before and after reflexion equal.

Reflexion, then, is easily and readily explained on this theory. In fact, it is explained *too well.* For it will be at once asked, how, on such suppositions, there can be such a thing as *partial* reflexion. Since all the luminous particles of a ray arrive at (suppose) a plane surface in the same direction and with the same velocity; whatever happens to one, *the repul-*

sive force being the same, must happen to all. This is another weak point of the corpuscular theory; and to escape from the difficulty so created, it becomes necessary to supplement the original hypothesis of *luminous particles* with another, converting those particles into mechanisms of a peculiar nature, of which the simplest conception that can be formed is to suppose them as it were *minute magnets* having attractive and repulsive poles, and during their progress through space revolving round their own centres about axes not coincident with the direction of their motion. Under such circumstances it is clear that some might arrive at the reflecting surface with the attractive pole foremost—others with the repulsive. The former would be attracted, and escape the reflective action; the latter repelled, and therefore subjected to it. Or, without making any supposition as to the sort of mechanism by which such a result might be attained, we might content ourselves with assuming, as Newton (the framer of this hypothesis) did, that the particles of light, throughout their whole progress through space, pass periodically through a succession of alternating physical states—or, as he called them, "fits"—"of easy reflexion and easy transmission:" the only objection to such a form of statement being, that it conveys no clear *physical* conception to the mind.

The particles so escaping reflexion are conceived to have penetrated within the limit of the repulsive, and to have entered that of the attractive forces, while yet at some inconceivably minute distance *outside* of the actual surface of the medium. Their movement of approach therefore to the surface is accelerated by the attractive force whose resultant direction is perpendicular to the surface, and when they have arrived *within* the medium so far that all further action ceases (by the counteraction of equal and opposite forces on all sides) each of them will have undergone the total amount of acceleration due to the attractive force—*in the direction of that force, i.e.*, at right angles to the surface. Its velocity estimated in this direction will therefore be greater within the medium than without—while that parallel to the surface remains unchanged: the force in that direction being *nil.* The direction of the motion therefore will be more highly inclined to the surface within the medium than without, in the same manner and for the very same reason, that the path of a projectile shot obliquely downwards from the top of a hill makes a greater angle with the horizon when it reaches the ground than it did in the commencement of its descent. And the conclusion, on strict dynamical principles, is the same in both cases. Supposing the initial velocity of projection the same, the sines of the angles made by the direction of the motion *with the* vertical or perpendicular to the surface, at the beginning, and at the end of the descent (*i.e.* in the case of light, those of the angles of incidence and refraction) will be to each other in an invariable proportion, the total *height* of the descent being the same. Thus we see that the law of refraction is satisfactorily accounted for, on the corpuscular hypothesis; and that, on that theory, the velocity is greater in the interior of a refracting medium than in empty space; and the more so, the greater the refractive power.

Let us now see in what sort of conclusion we are landed as to the intensity of the forces we have pressed into our service. To consider only the reflective force, we have this to guide us—that, supposing the incidence perpendicular, and the light therefore reflected back by the path of its arrival, that force must have been sufficiently great to destroy the whole velocity of the luminous particle, and to generate an equal one in the opposite direction, in the time occupied by the particle in traversing forwards and backwards the thickness of our stratum of reflecting force. Now the velocity of light, as we have seen, is 186,000 miles per second. To destroy and reproduce this velocity in a projectile shot directly upwards, by the force of gravity on the earth, supposed uniform or undiminished by distance, would require its action to be continued for 706 days, or very nearly two years, while the same effect has to be produced by the reflecting force, (also supposed uniform,) in that inappretiable instant of time *in which* the act of reflection is performed—a time which would be extravagantly overrated at the *billionth** part of a second. After this we need hardly trouble our readers with any estimation of the intensity of the refracting forces. The sturdiest philosophy may fairly be staggered at such a postulate as the foundation of a physical theory.

According to the "undulatory theory" light consists in an undulatory or vibratory *movement* propagated through an elastic medium pervading all space, not even excepting what is occupied, or seems to be occupied, by what we call material bodies—that is, such as have *weight*, and which, to us, constitute the visible and tangible universe of things. It therefore resembles sound, which is not a travelling entity, but a propagated motion in the air, analogous to the tremulous movement which runs from end to end of a stretched cord, or to the waves which *appear* to travel along the surface of water; though in reality such a wave is only an *advancing form*, the real movement of the watery particles being vertically up and down. Colour in this view of the subject is analogous to *tone*, or *pitch*, in music (if it be supposed to depend solely on refrangibility). As the *frequency* of the vibrations which reach the ear from a sounding-string determines the pitch of the musical note it yields, so the frequency of the undulations of this elastic medium or luminiferous "*ether*," as it is called, determines to the nerves of the eye the colour of the light. *Or* in that view of colour which considers all but three primary hues composite, it must on this theory be assimilated to a difference analogous to *quality* in a musical tone—as, for instance, between the sounds of a violin, a flute, and a trumpet, only much more decided and strongly characterized.

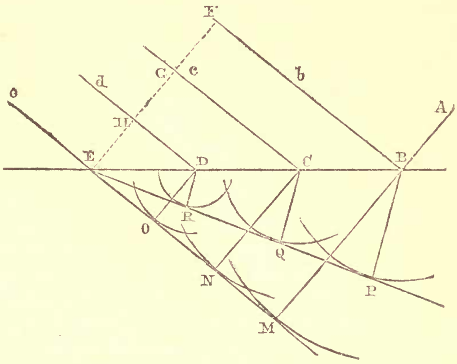
---

* A billion is a million times a million. The French *milliard* is a thousand millions.

As sound spreads through the air with equal rapidity in all directions, and may be considered as propagated from its origin as a spherical shell continually enlarging, so in this theory must light be regarded as the movement of a WAVE in the ether, running out spherically in all directions from the luminous point, whose situation with respect to the eye, or to any other point on which the wave may strike, is judged of as the centre of the sphere —*i. e.*, as lying in a line perpendicular to its surface. A *ray* of light then in this theory is a purely imaginary line from such point, perpendicular to the general surface, or *front* of the wave, and has no other meaning. The *wave*, not the *ray*, is the primary object of contemplation. If the point where the luminous excitement originates be near, the perpendiculars from it to the wave-surface diverge conically; but if so far remote that the portion of that surface at the eye may be regarded as sensibly plane, they are to all sense parallel, as in the case of light emanating from the stars or the sun.

The reflexion of light in this theory is in exact analogy with that of any other undulatory movement. We cannot see the waves of sound, but those on smooth water are easily followed and their reflexion made matter of ocular inspection. Drop a small pebble into still water, and a wave will be seen to spread out in an enlarging ring. Let this be done near the perpendicular and smooth side of any large tank or pond, or near a board held vertically in the water, and the ring will be seen on reaching the board to be reflected, and will thence spread back over the surface, still enlarging, as the segment of another ring whose centre might be supposed as far on the land side of the reflecting surface as the place where the pebble was dropped was in reality on the water side. If several pebbles be dropped in succession, or a regular up and down movement given to the water at that point, a continued series of circular waves will be generated and reflected, the reflected waves running out and intersecting the direct exactly as if they originated in two distinct centres. What in water is seen to be a reflected wave, in air we recognize as an *echo*. And in the fact that a sound, though partially reflected as such from a window, a board partition, or a wall, is heard, though with diminished intensity, on the other side,—we have the analogue to the partial reflexion of a beam of light at a transparent surface; and on the other hand, in the deadening of sound in passing through woolly or puffy substances, while it is transmitted with exceeding sharpness and distinctness through compact solids or through water, we have the parallel to the absorption of light in some media and its copious transmission through others.

The explanation of refraction on the undulatory theory is exceedingly simple. Suppose a plane wave to sweep obliquely along the surface B E of a medium capable of propagating within it the luminiferous undulation, and let it be supposed at equal intervals of time (successive seconds, for instance) to assume successive positions B b, C c, D d, E e, arriving in succession at equidistant points B C D E of the surface. So soon as any point in the surface is struck by the wave it will be set in undulatory motion and propagate from it a movement which will run out spherically from that point in all directions with such (uniform) velocity as belongs to the luminous undulation *in* the medium. When therefore the wave has reached the position E e, E will just have begun to move; the internal wave propagated from D will have travelled during one second, from C two, from B three seconds, and the motion in virtue of these, respectively, will have extended to the surfaces of spheres about those points as centres, having radii in the proportions 1, 2, 3, so that a plane passing through E which touches one of them will touch them all, and the same is true for all points intermediate between these. Such a plane will define *the limit up to which the movement has reached* within the medium when the exterior wave has the position E e, and will therefore be *the front of a plane wave* advancing within it. If the velocity of the undulation within the medium be the same as without, D O, C N, B M, the radii of our spheres will be equal to E H, E G, E F, the spaces run over in one, two, three seconds outside, and the touching plane E O N M will evidently be a continuation of the exterior plane wave e E. In this case, then, there is no *refraction*, the direction of the interior ray B M being the same as A B, perpendicular to the exterior wave. But suppose the velocity within the medium less than that without. In that case the radii of our spheres D R, C Q, B P, will be less than D O, C N, B M, and in a constant proportion. The plane E P touching them all then, or the front of the interior wave will be inclined at a less angle B E P to the surface than B E M, or its equal E B F, and the sines of these angles to a common radius E B are evidently in the proportion to each other of P B to B M, or of the *velocity of light* in the *medium*



to the velocity out of it. Now, as the *ray* is perpendicular to the *wave*, the inclination of the latter to the surface is the same as that of the former to the perpendicular, and thus these angles are respectively identical with those of refraction and incidence.

To such of our readers as may find a difficulty in following out this reasoning, the following familiar illustration will convey a full conception of its principle. Imagine a line of soldiers in march across a tract of country divided by a straight boundary line into two regions, the one smooth, level, and well adapted for marching, the other difficult, rough, and in which from its nature the same progress cannot be made in the same time. Suppose, moreover, their line of front oblique to the line of demarcation between the two regions, so that the men shall arrive at it in succession, and not simultaneously. Each man then, from the moment he has stepped across this line, will find himself unable to make the same progress as before. He will be therefore unable to keep line with that part of the troop which is still on the better ground, but must of necessity lag behind; and that, by the greater space, the longer he travels. Since each man on his reaching the line of division experiences the same difficulty; if they will not break line and straggle, but persist in still marching *in* line and keeping up their connexion, it will follow of necessity that the front of *their* line must to a certain extent fall back and make an obtuse angle at its point of junction with that of the unimpeded line. Thus, in our figure, B E will represent the line of division between the two regions, B b the advancing front of the troop when the first man arrives at that line, E e that of the portion still on the good ground after some time elapsed, and E P that of the other portion who have been unable to keep up to the same rate of march. And as the necessity of keeping step and not crossing each other's line of march will oblige each man to step out *right in front*, (*i.e.*, at right angles to the new frontage,) the progress, B P, made by the first man after crossing the line, will be perpendicular to E P, and will be to what he would have made (B M) had it not been for the retardation, in the proportion of his new to his former velocity of march.

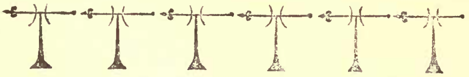
Thus then we see that when light passes (in this theory) out of what is called a rarer medium into a denser, or when the angle of refraction is less than that of incidence, the velocity of propagation of the undulating movement is *diminished*, while on the corpuscular doctrine it is increased, and *vice versâ*. Thus too we see that on the undulatory hypothesis the connexion between refrangibility and velocity within the refracting medium *is immediate and absolute*, and consequently that it being certain, as we have shown, that light of all refrangibilities travels equally fast in *what we call* empty space, (*i.e.*, through the ether alone,) it follows with equal certainty that in material media the more refrangible rays are propagated slower than the less so, and all, more slowly than in free space. In other words, this amounts to supposing the elastic force of the ether either to be enfeebled in the interior of material bodies, or else that the movements of its particles are *in some way or other* clogged or burthened by some sort of connexion with or adhesion to the material molecules among which they are disseminated, and *that* more for the more refrangible rays than for the less so.

Until lately this difference of velocity between the differently refrangible rays had always been considered an insuperable obstacle to the admission of the undulatory hypothesis. All sounds of whatever pitch (it was contended) travel equally fast in one and the same elastic medium. The profounder researches of later mathematicians, however, have shown that this conclusion is not absolute, and that on certain suppositions which are not altogether inadmissible in respect of the vibrations of light, the difference in question is not contradictory to strict dynamical laws.

As we have attempted to form an estimate of the intensity of the forces required to account for observed facts on the corpuscular hypothesis, let us now attempt a parallel estimate on the undulatory. And here the way is equally open and obvious. Starting with the observed facts, that sound travels in air at the rate of 1090 feet per second, while light is propagated through the ether 186,000 miles in the same time (that is to say, 901,000 times as fast), we are enabled to say how many fold the elastic force of the air, or its resistance to compression, would require to be increased *in proportion to the inertia of its molecules*, to give rise to an equally rapid transmission of a wave through it. For it results from the theory of sound that in media of different elasticities (so understood), but similarly constituted in other respects, these forces are to each other as *the squares* of the velocities with which the waves travel: so that the elastic force of the air would require to be increased in the proportion of the square of 901,000 (*i.e.*, 811,801,000,000) to 1, to produce an equal velocity. Even this enormous number must be still further increased, since the velocity of sound is augmented by a peculiarity in the constitution of air which we should hardly be justified in attributing to the luminiferous ether; in virtue of which its elasticity is increased by heat given out in the act of its compression, and without which the velocity of sound would be only 916 feet per second instead of 1090. Thus the number above arrived at has to be further increased in the proportion of the square of 1090 to that of 916, which brings it to 1,148,000,000,000. Let us suppose now that an amount of our ethereal medium equal *in quantity of matter* to that which is contained in a cubic inch of air (which *weighs* about one-third of a grain) were enclosed in a cube of an inch in the side. *The bursting power* of air so enclosed we know to be 15 lbs. on each side of the cube. That of the imprisoned ether then would be 15 times the above immense number (or upwards of 17 billions) of pounds. Do what we will—adopt what hypotheses we please—there is no escape, in dealing with the phenomena of light, from these gigantic numbers; or from the conception of *enormous physical force in perpetual exertion at every point, through all the immensity of space.*

As this is the conclusion we are landed in—(for the evidence for the truth of the undulatory doctrine, or something equivalent, accumulating, as we shall see, in all quarters, and in the most unexpected manner receiving confirmation from facts utterly uncontemplated by its originator, obliges us to look on this result as something more than a scientific rhodomontade)—we shall endeavour to present it to the conception of our readers in a point of view which may enable them to realize it more distinctly. All who know the nature of a barometer are aware that the column of mercury 30 inches in height sustained in its tube, is the equivalent of the pressure of the aërial ocean which covers us, on its sectional area; and is just sufficient to counterbalance the pressure, on an equal area, of an atmosphere five miles in height of air *everywhere of the same density as at the surface of the earth.* This height (five miles) is what is termed in Barometry, "the height of a homogeneous atmosphere," and affords a measure of what may be called the intrinsic elasticity of the air, of an exceedingly convenient nature; and which is received as a kind of natural unit, in Meteorology and Pneumatics. Substituting now light for sound, and for air the luminiferous ether, we should have for the corresponding height of our homogeneous atmosphere (gravity being supposed uniform) 5½ billions of miles, or about one-third of the distance to the nearest fixed star! The measure thus afforded of intrinsic elastic power is of the same kind as that afforded of the intrinsic *tensile strength* of a wire or thread of any material by the statement of how much in length *of itself* it can bear without breaking. It frees us from the necessity of any mental reference to the actual weight or specific gravity of the material, which in this case is the more necessary, as, though we suppose the ethereal molecules to possess *inertia*, we cannot suppose them affected by the force of gravitation.

There is yet another theory of light which might be proposed, in which, still retaining the idea of an ethereal medium, its constitution should be conceived as an indefinite number of regularly arranged equidistant points (mathematical localities) *absolutely fixed and immovable in space*, upon which, as on central pivots, the molecules of the ether, supposed *polar* in their constitution, like little magnets (but each with *three pairs of poles*, at the extremities of three axes at right angles to each other), should be capable of oscillating freely, as a compass needle on its centre, but *in all directions.* Any one who will be at the trouble of arranging half a dozen small magnetic bars on pivots in the *linear* arrangement of the annexed figure, will at once perceive how any vibratory movement given to one, at any point of the chain, will run on, wave-fashion, both ways through its whole length. And he will not fail to notice that the bodily movement of each vibrating element will be *transverse to the direction of the propagated wave*—a condition which, as we shall hereafter see, is essential to be fulfilled in the luminous undulations. As this hypothesis, however, has hitherto received no discussion, and is here suggested only as one not unworthy of consideration, however strange its postulates, we shall not dwell on it; remarking only that every phenomenon of light points strongly to the conception of a solid rather than a fluid constitution of the luminiferous ether, in this sense,—*that none of its elementary molecules are to be supposed capable of interchanging places*, or of bodily transfer to any measurable distance from their own special and assigned localities in the universe. The constitution above suggested would merely superadd to this abstract idea of a solid structure, the further conception of polar forces bearing some general analogy to those which may possibly subsist among the gross particles of a tesseral crystal.



This would go to realize (in however unexpected a form) the ancient idea of a crystalline orb. And it deserves notice that under no conception but that of a solid can an *elastic and expansible* medium be *self-contained.*[*] If free to expand in all directions, it would require a bounding envelope of sufficient strength to resist its outward pressure. And to evade this by supposing it infinite in extent, is to solve a difficulty by words without ideas—to take refuge from it in the simple negation of that which constitutes the difficulty. On the other hand: such a "crystalline orb" or "*firmament*" of solid matter conceived as a hollow shell of sufficient strength to sustain the internal *tension*, and filled with a medium *attractively, and not repulsively elastic*, might realize (without supposing a solid structure in the contained ether) the condition of transverse vibration; by establishing, *ipso facto*, lines of *tension* in every possible direction, along which undulations might be conveyed, like waves along a stretched cord, thus furnishing a fourth hypothesis, which to those fond of such speculations may afford matter, *sui generis*, for consideration.

Interference of the rays of light. There is hardly a more beautiful or a more instructive object in nature than a large well-blown soap-bubble. Whether we consider the perfect regularity of its form, illustrating, as it does, in its exact equilibration the great mechanical laws to which the sun and planets owe their spherical figure—demonstrating, by its resistance to disruption by blasts of wind which distort it, and by its ready and complete resumption of its normal shape on their cessation, the powerful tensile force which holds it together; and proving by the instantaneous collection of its filmy tissue into water-globules, in the act of bursting, the immense intrinsic energy of that force as compared with gravitation;—to the mechanician it is fraught with matter of the highest interest. To the photologist, on the other hand, the vivid colours which glitter on its surface afford at once the simplest and most elegant optical illustration of the "law of interference" of the rays of light: a law we shall now proceed to explain, taking for our first exemplification of it this very phenomenon.

---

[*] From a liquid the extreme particles would be constantly flying off in vapour and dissipating themselves in space.

If a soap-bubble be blown in a clean circular saucer with a very smooth, even rim, well moistened with the soapy liquid,* and care be taken in the blowing that it be single, quite free from any small adhering bubbles, and somewhat more than hemispherical; so that, while it touches and springs from the rim all round, it shall somewhat overhang the saucer: and if in this state it be placed under a clear glass hemisphere or other transparent cover to defend it from gusts of air and prevent its dying too quickly;—the colours, which in the act of blowing wander irregularly over its surface, will be observed to arrange themselves into regular circles surrounding the highest point or vertex of the sphere. If the bubble be a *thick* one (*i.e.*, not blown to near the bursting point) only faint, or perhaps no colours at all will at first appear, but will gradually come on growing more full and vivid, and *that*, not by any particular colour assuming a greater richness and depth of tint, but, by the gradual *withdrawal* of the faint tints from the vertex, while fresh, and more and more intense hues appear at that point, and open out into circular rings surrounding it; giving place as they enlarge to others still more brilliant, until at length a very bright white spot makes its appearance, quickly succeeded by a perfectly black one. Soon after the appearance of this the bubble bursts. During the whole process it has been growing gradually thinner by the slow descent of its liquid substance on all sides from the vertex, till at length the cohesion of the film at that point gives way under the general tension of the surface. The annular arrangement of the colours, and the coincidence of their common centre with this, the thinnest point of the film, evidently go to connect their tints with the thicknesses of that film at their points of manifestation, and to indicate that *a certain tint is developed at a certain thickness*, and at no other. This, we shall presently see, is really the case.

The order of the colours and the sequence of the tints is in all cases one and the same, provided the series be complete, *i.e.* provided time has been given for the black central spot to form. Thus the first series, or order, contained within the first *ring* consists of black, very pale blue, brilliant white, very pale yellow, orange, red; the second of dark purple, blue, imperfect yellow-green, bright yellow, crimson; the third of purple, blue, grass green, fine yellow, pink, crimson; the fourth of bluish-green, pale pink inclining to yellow, red; the fifth pale bluish green, white, pink. After these the colours grow paler and paler, alternately bluish green and pink, and can hardly be traced beyond the seventh order.

None of these tints are *pure prismatic colours*. To see them to the best advantage the bubble with its glass shade should be placed out of direct sunshine, where only dispersed light, such as that of a cloudy sky, shall fall on it. Or, the illumination of the rings may be effected by a thin semi-transparent paper, or a ground-glass screen interposed between them and the incident light. And if, instead of illuminating *this* with the direct light of the sky, the coloured rays of a spectrum, formed by passing a sunbeam through a glass prism, be thrown upon it, the composite nature of their tints will be at once apparent. If all the rays but those at the red end of the spectrum be excluded from the illuminating beam, the rings will appear wholly red, separated by black intervals, and *much more numerous*. And if, now, the colour of the illuminating light be changed, so as to pass in succession through the whole prismatic scale of tints—orange, yellow, green, &c., from the red to the violet—the *colour* of the rings will undergo a corresponding change, the dividing intervals preserving their blackness, but their *number* still continuing greater than in white light. But, besides this, a very remarkable phenomenon will be observed. The rings *contract rapidly in diameter* as the colour of the illumination changes, being a maximum for a red and a minimum for a violet illumination; and if, by a slight movement given to the prism, the spectrum be made to traverse to and fro on the illuminating screen, the rings will appear to open and close in an exceedingly beautiful manner, undergoing at the same time a corresponding change of colour.

The composite nature of the rings, as seen in white light, is now abundantly clear. White light is a mixture of all the prismatic rays, and the set of rings seen in such light is of course a *mixture* of the several individual sets (*concentric, but differing by a regular gradation of size*), of all the several coloured elements of which white light consists. Imagine a painter who could "dip in the rainbow" and lay on, one after another, on the same paper and with the same centre, such a series of rings gradually decreasing in diameter, and each set tinted with the pure prismatic hue which corresponds to its size, from the extreme red to the extreme violet, in their proper degrees of intensity;—he would produce just such a series. If the diameters for all colours were alike, the compound rings would evidently be white and infinite in number, separated by black intervals. If they differed only a little—starting from a common origin—the first ring would be nearly white, but exhibiting a bluish border inwards and a reddish outwards, growing more and more "pronounced," and broken into intermediate tints in those beyond; but if considerable, the rings of different orders for different colours would soon mingle with and confuse each other's tints, creating the sensation of uniform whiteness: thus accounting for the comparative paucity of the mixed series.

---

* M. Plateau gives the following recipé for such a liquid. 1. Dissolve one part, *by weight*, of *Marseilles soap*, cut into thin slices in forty parts of distilled water, and filter. Call the filtered liquid A. 2. Mix two parts, *by measure*, of pure glycerine with one part of the solution A, in a temperature of 66° Fahr., and after shaking them together long and violently, leave them at rest for some days. A clear liquid will settle, with a turbid one above. The lower is to be sucked out from beneath the upper with a siphon, taking the utmost care not to carry down any of the latter to mix with the clear fluid. A bubble blown with this will last several hours even in the open air. Or, the mixed liquid, after standing twenty-four hours, may be filtered.

In order then clearly to understand the nature of this phenomenon, it must be divested of this source of complexity, and studied in reference to light of one single colour or refrangibility—or, as it is called, "homogeneous" light, pure red, or yellow, for instance. But before proceeding further, something more must be said of the whole class of phenomena referable to this head. And first, these colours are not dependent in any way on any colorific quality of the liquid of which the bubbles consist. Any sufficiently thin film, of any kind, suffices to produce them. They are seen in the oily scum on the surface of a stagnant pool. They are seen on the brilliant scales of old glass in stable windows, or on the wings of gaudy-coloured insects, or even on polished steel. Bubbles may be blown of a variety of liquids—nay, even of glass. However highly coloured, their intrinsic colour disappears when reduced to such extreme tenuity as is requisite for the purpose in question. But *all* exhibit *the same hues* in the same invariable order. Nay, more—it requires *no medium at all* to produce them, but only *an interval between two surfaces.* They are seen in the crack of a thick piece of glass which does not extend quite through its whole substance. They are seen when a piece of mica is partially split and one of the laminæ lifted up, following, as a series of coloured lines, the limit of the commencing fissure. It may be said that though no *solid or liquid medium* is here present, there is *air* between the divided surfaces. But under the exhausted receiver of an air-pump, there is no diminution of the colours or alteration of their forms. It is to the *interval between the surfaces* that we have to look for their origin.

Here, then, we have LIGHT brought face to face with SPACE, and no escape! What happens at or between these surfaces? How is it that while a single surface reflects a dispersed beam of light indifferently over its whole extent, this indifference is destroyed by placing another reflecting surface behind it; and the reflexion (at least the *effective reflexion as regards the spectator*) rendered impossible when the second surface is at a certain distance, *or at certain distances*, from the first, while if placed at intermediate distances, it is either not at all affected, or only to a certain extent enfeebled? and *that*, when there is nothing, or at least nothing realizable to any of our methods of observation, between them? This is the problem before us, reduced to its simplest terms,—a problem which the corpuscular theory of light resolves imperfectly and unsatisfactorily, and the undulatory fully and without reserve.

(To be continued.)

ESSAYS, THEOLOGICAL AND PHILOSOPHICAL.

By HENRY ROGERS, Author of "The Eclipse of Faith."

VII.—REPORT OF "A DIALOGUE ON STRIKES AND LOCK-OUTS."

WHO has not often found himself an attentive—though perhaps, as in my own case, a silent—member of one of those little self-elected Parliaments, extemporised at a dinner party after the ladies have retired; in which difficult and profound questions of politics shall be discussed, with almost as much wisdom and eloquence as in St. Stephen's itself!

I was present the other day at such a debate. It was respecting that momentous subject, "Strikes and Lock-outs;" and, as an incidental turn in the conversation (involving the supposition that *other* classes besides working-men and their employers resorted to similar measures), seemed to set not only the measureless absurdity, but, socially considered, even the criminality of all such barbarous methods of settling disputes in a somewhat new light, a tolerably correct "report" of it may not be uninteresting to the reader. The conversation took place at the house of a wealthy merchant, one of the many men among us who by strong native sense and energy of character, have not only compensated some defects of early education, but to a good extent cultivated their own minds in intervals of leisure, and forced their way to opulence and social position. Among the guests were two or three manufacturers of the neighbourhood, one of whom had not only been making money, but learning philosophy also, among the spindles, for some forty years, and who took a principal part in the conversation. There were two clergymen, both intelligent men, one in the established church, the other out of it, and who, however they might have differed touching "Church and State," sang in perfect time and tune the woeful mischiefs which two or three long and memorable strikes had wrought among their respective flocks; while a physician and lawyer who were also of the party expatiated, the one on the increase of disease and the other on the increase of crime, engendered by the dissipation and destitution produced by these same strikes. Add to these an amiable and intelligent young man, the son of our host, who had received an excellent education, was well-read in political economy, and (as it was whispered) was looking forward to attaining one day a seat in Parliament. He was, as young men are apt to be, rather advanced in politics; a strenuous advocate of the *laisser faire* principle, desirous of a large extension of the franchise, and disposed to make the working-classes his clients. He warmly defended their rights, and among the rest to strike as often as the humour seized them; but also, as he frankly added, their "right" to bear the penalty of so doing. Some thought that his zeal was partly influenced by a love of popularity; but I do not believe it. I think it was enthusiasm on behalf of "rights" and hatred of "wrongs," (real or supposed), and zeal for the abstract perfection of a darling theory. The first is always natural and amiable in youth, and the second surely pardonable in a young philosopher, since we usually find it equally obstinate in an old one.

It may be thought a bad omen for the fairness of any such discussion, that while the "Lock-outs" were very abundantly represented, the "Turn-outs" had neither puddler, nor joiner, nor mason, nor tailor "on strike," to represent them. And yet they were well protected too; not only by the general antipathy to lock-outs entertained by the entire company, but by the volunteer championship of the young gentleman last mentioned, who though not liking strikes in the abstract, nor thinking them in general conducive to their professed end, yet distinctly avowed the absolute "right" of men to indulge in this expensive luxury, and the inexpediency, if not impossibility, of any legislation in relation to them. But he also affirmed, as already said, that though the right of men collectively to strike, if they pleased, must be conceded, it was only on the principle that it was also the right of men, if they thought proper, collectively to "ruin themselves."

The company agreed with him as to the almost insuperable difficulty of legislation; but most of them thought that it was worth while to try anything and everything, except the utterly retrograde policy of re-enacting any of the laws against "trade combinations;" some were even in favour of Mr. Ludlow's recent plan of giving the trade-combinations, both of masters and men, a legal *status* and corporate existence, and so making them amenable to the law; all were in favour of trying Courts of Conciliation or Arbitration, and hoped something from the extension of co-operative principles; but they seemed to have most faith in the formation and expression of a much more decided public sentiment in relation to the social wrong both of lock-outs and strikes, except in the rare case where the one is an absolute necessity of self-defence, provoked by the other. They seemed to think that the tone of the press, and of society generally, was much too gentle and tolerant considering the enormity of the evil, which was too often spoken of as an exercise of a "right," unwise indeed, but not deserving any very grave censure. Yet, if strikes and lock-outs are in themselves justifiable, everyone felt, as the discussion proceeded, that the position involved the strangest paradoxes. If justifiable *per se*, still more if they may be resorted to with the frequency and levity with which they are just now; if, by the agency of combinations, they may at any time convulse or paralyze a whole trade, and even indirectly involve many other trades in the consequences; then it would seem that *that* is justifiable which may produce many of the evils of civil war, and disorganise society without society's having any voice in the matter or any means of self-defence; *that* is justifiable which may reverse some of the most important principles of public policy and destroy the best part of each individual's liberty.

The conversation began something in this way. One of the clergymen (the vicar of the neighbouring town) expressed his gratification at the termination of the great strike in the iron trade; "which," said he, "has, as usual, been attended with great loss to everybody, and benefit to nobody. But the lesson seems in vain. There are half-a-dozen strikes going on in different parts of the country at this moment; and I am just now plagued by one myself." He explained, by saying that the repair of his church was standing still, because the masons had struck. His clerical brother told him that they were in the same predicament at the new chapel. The Episcopalian good-humouredly nodded, and said, with a smile, "We can hardly be expected to sympathise with each other in *such* a case, so fully as in others. But it is not the masons only who are on strike; the tailors are out too, as if we were to be deprived at once of houses to live in and clothes to wear, and reduced to naked savages at once. I went yesterday to my tailor to order a suit of clothes which I wanted immediately; he told me, with a long face, that he feared he must disappoint me this time, for that all his men were out on strike, as well as those of every other tailor in the town."

He added, that what with the vexations he had suffered from the masons' strike, and much pondering on the great "Iron Strike and Lock-out," his brain had been so wrought upon, that he had had on the preceding night a curious dream. "I thought," said he, laughing, "that all the learned professions—doctors, parsons, lawyers, journalists, schoolmasters, and professors—had struck for higher fees and better pay, and, like my tailor, refused to do another stitch of work till their just demands were complied with. The journals, methought, all announced the strike simultaneously, and then vanished the next morning, leaving the world in utter darkness as to all that was going on in it,—the great 'professional strike' included. An old gentleman, a friend of mine, was roaring in a fit of the gout, and in vain sent for his doctor, who coolly reported that he was out on strike, and that the 'Doctors' Union' would not allow him to come. Another, an old lady, was *in articulo mortis*, and her distressed heirs in vain implored a lawyer to come and make her will; he told them she might die *intestate*, for him. As for me, with an odd mixture of feelings, —of shame and remorse at the thought of abandoning my sacred duties, and of noble heroism, such as only the martyrs of a strike can comprehend, —I stuck faithfully to our 'Clerical Trades-Union;' sent bride and bridegroom unmarried from the altar, held out with still greater courage against baptising a sick infant, and, to prevent the congregation from assembling to no purpose on the Sunday, ended by locking the church, and riding off with the key in my pocket; thus indulging in a strike and a lock-out at one and the same time. Upon my word," he concluded, "I almost think it would be well for the whole nation to strike together, by way of applying to the system the *reductio ad absurdum*. We should at all events get, what often seems the great object of strikes (with such levity and wantonness are they resolved upon), our fill of idleness for a few weeks."

We made ourselves merry by pursuing the odd dream a little, and fancying some of the incidents which diversify ordinary strikes. We imagined a "non-union" doctor hastening to a patient, but hoaxed into going ten miles in another direction to a pretended case of far greater urgency; or a "union" doctor, slyly stealing to his work, but waylaid and beaten by his indignant brethren, and dosed with his own physic; the horrors of Paterfamilias on finding that all his ten children were to have an enforced holiday for the half year; or if not, that himself must be sole tutor; or a clergyman of the "union" betrayed into the weakness of marrying a fond couple, and then tossed in a blanket in gown and cassock by his irritated brethren; or the case of a lawyer drawing a will for a client *in extremis*, and finding himself reduced almost to the same condition for thus setting the "rules" of the "legal trade-union" at defiance.

The other minister said, "Well, and if such a dream as yours, or something like it, could come true, would not the principles on which strikes are generally justified, justify these classes, *i.e.*, on the supposition that they were conscientiously convinced (as ordinary 'turnouts' are supposed to be) that their just claims are withheld by their niggardly paymasters, the public? I am quite confident," he continued, with a smile, "that there are thousands of poor preachers, as well as doctors, lawyers, and literary men, who are living on less pay than many skilled artisans; nay, to whom some puddler's wages would be a fortune. I am certain also that we are the classes for whom the recent beneficial *fiscal* reforms have done the least. The general effect of recent legislation has been,—and sincerely do I thank God for it,—to relieve the working-classes of all taxes which press on articles of prime necessity, or greatly to reduce them; while they are entirely relieved from the *income-tax* which has so long pressed heavily on many of us. I do not envy them this exemption for a moment: God forbid! but such is the fact.—And the benefit of a reduced or abolished tax, I grant, has not been lost, even where the *consumer* has not gained; but it has not come to *us*. It has gone to the manufacturer, merchant, and trader. Now as the articles thus relieved from taxation have been very various, large classes of the commercial world, (one after another,) have had, in addition to the reduced price of many articles in which they do not deal, (by which of course we too benefit), a separate *bonne bouche*, to sweeten the nauseous taste of the Income Tax. Thus the repeal of the paper duty was a great boon to newspaper proprietors, to booksellers, and to merchants who used large quantities of coarse paper. One of the last assures me that it saved his firm two hundred or more a year, and that he was much obliged to the Government for having thus paid him back, in one lump, more than his Income Tax! But my penny paper is still a penny paper to me; I do not see that the new books I buy are any cheaper; and as to stationery, why, if there be a difference, it is so slight," said he, laughing, "that I do not suppose that, on all the sermons I have written since the paper duty was abolished, I have saved three halfpence. Even if I were as voluminous as Richard Baxter, and scribbled a folio every year, I should hardly be richer by a sixpence."

"But at all events," said Mr. Charles D——, our host's son, "you partake in that *general* prosperity of the nation which flows from just principles of commercial freedom."

"Of course," was the reply; "though not, I think, in the same proportion with those who are engaged in commerce. But do not imagine I am grumbling. I am only mentioning it to show that, if any classes could be justified in a strike, I think it is ours. And what I ask, is just this:—If any of us, or all of us, were to combine on some fine morning, strike for higher wages through the country, and suspend all our functions till we got them, would it be merely the assertion of a *right*, which, because legislation cannot deal with it, is on that account innocent? Or, granting that legislation cannot deal with it, because impossible or inexpedient, would it be still a *crime* against society?"

"Perhaps," said the young man, laughing, "we might be able to bear with equanimity the 'parsons' strike,' and allow him to indulge in a lock-out into the bargain."

"Ah! Mr. Charles," said the other, good-humouredly, but with gravity, "that might do, if men found it as easy to die without religion as to live without it. But I have exercised my function too long not to know that the feelings with which they regard it in the fulness of bread and in the flush of health and youth, are apt to alter very much when poverty or sickness, and especially death, knock at their door. And I fancy you would not deny, that if all who teach the ignorant the truths and duties of morality and religion were 'to cease out of the land,' your servants would hardly be quite so honest or your merchandise so safe as they are now. The Canaanite—including all the varieties of Hittite, Hivite, Perizzite and Girgashite—would soon increase upon you."

"I willingly acknowledge it, sir," said the other; "believe me, it was but a joke, and perhaps not a very courteous one."

"That is well," said the vicar, "and handsomely said. And then you know," he continued, smiling, "there are functions of ours which not even youth thinks tedious. It would not be pleasant to bring your bride to the altar, and lead her away unmarried. And so we return to the question. On the grounds on which you justify the artisans' strikes, would you think such a general strike of the learned professions justifiable, though it produced through the country something much worse than old Pope Innocent's interdict in King John's reign; if none were baptised, buried, or married, and if no doctor would physic his patients, or lawyer advise his clients?"

Our young friend whispered to his right-hand neighbour something which made him laugh. "Come, Charles," said his father, "no *asides*—what were you saying to Mr. N——?"

"I was only saying, sir, that half the nation would be still better pleased with the strike, if the lawyer and doctor turned out with the parsons."

"Take care," said the doctor, laughing, "I may make you recant, when you next send for me."

"And I," said the lawyer, "will certainly torment you, Mr. Charles, by three weeks' needless delay in drawing out your marriage settlements."

"Ay, ay," said the vicar, "make him pay for his jest. But, seriously, these strikes are no jest. If God does not send us trouble, it seems we make it for ourselves. He smote one of our great sources of commercial prosperity—the cotton trade—with the canker, and then, in the iron trade, we must needs do what we could to destroy another with our own hand. They talk about the political right to indulge in strikes and lock-outs; perhaps it is impossible to deny it, but recollecting all the mischief and misery that have flowed from them, and their tendency to produce still greater, I think that to originate or abet them is a downright crime against society."

"Come, come, my dear sir," said Mr. Charles, "be more moderate: crime, it surely cannot be; for those who strike only exercise a right which we all claim, 'to do what we will with our own.' And they exercise that right *together*,—that is all. Recollect, before you call it a 'crime,' that the legislature allows the legitimacy of combinations of workmen (and consequently of the masters also), by having repealed all penalties against them. You surely do not wish to restore those foolish laws?"

"Not I," said the other; "trade-combinations have, no doubt, their legitimate uses, though I do not reckon strikes among them: neither will we quarrel about a word. 'Crime,' in the political sense, these strikes may not be,—as many other things are not, which yet are very properly called grievous sins against society notwithstanding. We must both admit, I suppose, that there are many offences, of which law can and does take no notice, but which are the fruitful sources of the crimes of which it *does* take notice,—as, for example, private intoxication, licentiousness, ingratitude, filial disobedience; all which society can only repress, for the most part, by that frown of abhorrence and contempt, that consignment to a Pariah caste, which the generality of men, not utterly abandoned, feel far more deeply than any moderate legal penalty. It is ever a tendency of a too lenient public morality, to take its measure of what is right or wrong, innocent or criminal, from what the law can reach, or fails to reach; from what can be made the matter of positive statute and definite punishment, or otherwise. This is that subordination of the 'spirit' to the 'letter,' which, though but an unavoidable result of the infirmity of all civil law, and the necessary consequence of its restricted object and aim, is apt to operate unfavourably on our ethical conceptions; and, if it does not impair our theoretical code of morals, makes us view with lenience many actions of the most pernicious character, merely because the law cannot touch them. Such errors it is the part of an enlightened *public sentiment* to correct."

"I cannot admit that strikes are to be accounted crimes even in that sense," said our young friend. "That they are in every case great folly, I fully admit: and it may be shown in a minute, for it lies in a nut-shell. The principal element," said he, clearing his voice a little, and settling himself, as it were, to deliver a little economical demonstration—"the principal element that must determine the relations of capital and labour is the law of demand and supply. If there are a hundred workmen, and you only want fifty, they will by competition bring down wages to the lowest level on which it is possible to subsist. Now, to strike in such a crisis is to refuse the little that can be got, and to resolve that 'half a loaf is *not* better than no bread.' This was the case in many of the earlier strikes, when England was suffering, some forty years ago, from a *plethora* of the labour-market, and political economists were full of alarm as to what was to be done in a few years, when that market should become still more crowded;—so little was human wisdom able to foresee the march of events, and to anticipate that in a generation or so the nation would be likely to suffer from a lack of men rather than from their superabundance, and that wages would be *high*: just on the opposite principle to that mentioned before,—that if you want a hundred workmen, and there are only fifty, they will make you pay in proportion."

"But," said his father, "strikes have not become less frequent in this condition of things; rather they have become more frequent and prolonged."

"Just so, sir," said his son, "for the 'Unions' have better funds to maintain them; but their folly is just as easily shown—nay, it is greater; for you may make allowance for the blindness of a starving artisan, when you can make none for a man who kicks down his full pail. But the *folly* is still clear. The limits within which the capitalist and the labourer co-operate are simply these:—the workman must at least have wages sufficient for his subsistence, the capitalist sufficient profit to induce him to invest his capital; what lies *between*, when these ends are attained, is the prize; and the question is, in what proportions it shall be divided? and it is a larger slice of it that the strike, when wages are good, is designed to secure. But the folly is still equally manifest; for the moment the strike begins, and so long as it continues, the *prize itself* vanishes, and both parties are left with *nothing*! In the one case, it is as if a child would not eat his cake, because it was not as much as would satisfy his appetite; in the other, because, though it was enough, his brother had a cake twice as big."

"Or as if Joseph's brethren sullenly put their plates away, because Benjamin's mess was five times as large!" said his father. "Well, Charles, you may call it folly, as undoubtedly it is; but if committed with eyes open—as I believe it often to be—by the men who *direct* and carry out these strikes, and who often live a very merry life at the expense of their more ignorant victims, I call it a crime against society as well as folly. But then, what do you say to the consequences of these strikes,—the destitution which often follows them, the starving women and children, the increased burdens on the parish and the poor's rates,—the collateral injuries inflicted on connected branches of trade,—do not these things constitute strikes a crime against society?"

"If the folly of the thing be fully seen, and the consequences to which you advert fully seen too, I can hardly deny that they are."

Here Mr. W——, already referred to as one of the chief spokesmen, a sort of Nestor of the Spindles,—who had seen many a long strike during the last forty years, and had gathered much and sorrowful wisdom from his experience,—insinuated himself into the conversation; I say insinuated, for he spoke in a low, gentle, persuasive voice, and with great deliberation.

"Your little speech, Mr. Charles, about the *folly* of strikes and lock-outs is all very well; and, certainly, next to war, they are the most uncouth and barbarous modes of settling differences that men ever contrived; nay, a strike or a lock-out *is* war; or rather it is still more senseless: for in war the soldiers that win don't proceed to commit suicide, whereas here, in nine cases out of ten, both sides must be losers. But now, quite approving of your little speech,—which I hope you will one day enlarge at the hustings,—you have not answered the question of our clerical friends; namely, whether, if such a thing *could* be as that all the professional folks of a whole district, or, for the matter of that, of the whole kingdom, were suddenly to turn out on a strike for higher fees or salaries, you would say it was a *justifiable* step? For my part, I am inclined to think that a strike, or lock-out, is not only a blunder, but a crime."

"Why, Mr. W——," said the young man, "I reckoned confidently on your taking the other side. I have heard you often say that the evil must be left to the correction of the evils produced by it."

"So perhaps I think still; but among those correctives I have often thought that the moral reprobation of society ought to be added, and that it would be well if these things were always thought of and spoken of as crimes as well as blunders."

"But did I not hear you the other day defend the masters in the great lock-out in the iron-trade?"

"You did, and I am still of the same opinion. When the organisation of men against masters became general, an equally extensive organisation of masters against men became necessary: and if the strife must go on, I think so gigantic an exhibition of the evil would in the end be the truest mercy to all parties. For my part, I would rather see the battle in one or other of our great trades fought out to the last, and the whole nation thus roused to a sense of the enormity of these evils, than see the perpetual disturbance of one branch of trade after another, and often of several at the same time, and no end of misery produced in all parts of the kingdom; just as in war, I would sooner have things brought to issue in one great pitched battle, than see guerillas doing fifty times the mischief in detail. But apart from such reasons as these, you never yet heard me, and never will hear me, say one word of good of either strikes or lock-outs. There are only two cases (and they are very rare) in which they can be justified, and then they are a pure necessity. First, when, either from the competition in the labour-market, or scanty capital, or the scantier *humanity* of those who possess it, wages are offered on which the workman cannot subsist; then, of course, he must and ought to strike, if it be only to change his employer or his occupation, or to emigrate; for one of these he *must* do:—and secondly, when the scanty supply of labour in the labour-market leads the labourer to insist on terms which, in fact, would make the trade not worth carrying on,—in which case the master must have a lock-out with a witness, and is very sorry for it; as it is then necessary to 'shut up' his factory as well as 'lock out' his men! But between these limits there never *ought* to be a strike or a lock-out. Words cannot express, as you say, the *folly* of them,—for though either party may, in a particular case and for a little while, be successful, such success never can pay for the loss inflicted on *both* parties by the total suspension of trade. It is not enough to say that such folly is like that of the man who killed the goose that laid the golden eggs—or like that of the harlot in Solomon's judgment, who said of the child, 'Let it be neither mine nor thine'—or like that of the dog that let go the substance and caught at the shadow—or anything else that is most foolish.—In every case, masters and men, as rational creatures, *ought*, by conference and arbitration, to be able to adjust these quarrels without destroying the very thing they are quarrelling about; that they do not, is a great blot on our civilisation; and considering the immense mischiefs, not only to themselves, but to others, which spring from their present courses, these things are not a folly merely, but a grievous wrong to society. But, in order that we may see whether we ought so to call it, I should like to know once more what you would think of a doctors', or lawyers', or parsons' strike, any or all of them?"

"But the very idea is absurd, my dear sir."

"Of course it is; but still it will perhaps serve as an illustration,—and the absurder the better for that purpose: for you acknowledge that a strike is the extreme of folly."

"Well, such a strike would at all events be more deliberately cruel, and on that account, as well as because the men might be supposed to know better, would make society more *angry*."

"I quite agree with you there," said Mr. W——; "but I think you would hardly say that *that* nullifies the principle you have laid down; namely, that everybody is at liberty to set the value he pleases on his skill and services, and that, by parity of reason, any number of men may agree to do so. And as to the inhumanity, or inconvenience to society, it is but a question of degree after all. I am sure you will allow that the sum total of the miseries which many a long strike has occasioned to tens of thousands of starving men, women, and children,—the ruin of many prosperous manufacturers and merchants,—the sufferings involved in the disorganisation of trade, in some cases its transfer to other lands,—and the loss of all that is implied in the loss of millions of wages (to say nothing of the demoralising effects) will hardly admit of computation; and if the suffering produced in this case does not affect the *principle*, neither will it in the other.—But what other objection can you find to this peculiar strike or lock-out, that would not apply to the ordinary ones?"

"Well, I might say that they would involve a breach of contract with society. You know the workman must complete his contract before he strikes, and so must these."

"Let us suppose, then, the doctor to have finished with his patients in hand, and the lawyer with the causes he has begun, and the curate with his year of service, and so on, and then begin their strike,—what objection then?"

"But, from their position, and the reasonable expectations of society, and the nature of the functions they are supposed to perform, may they not be considered under a permanent implied contract to society?"

"I certainly think they may; but in no other sense than are our labourers and capitalists. I deny that any body of men have a right, if they please, to fold their arms, and refuse to employ their time, skill, and strength for the benefit of the community, except on such terms as they may dictate, however extravagant those terms may be. All of us owe duties to the society of which we are members, and from which we expect the protection of our rights; and the collective muscle, sinew, skill, and brains, of the men who have, it may be, little else, are no more simply theirs, to use or not to use, than the coal and iron of the landed proprietor. If they be capriciously wasted or foolishly left idle, (as you admit is the case in strikes), the whole community, and not the men or their masters only, suffer severely, as the history of strikes teaches us full well. The waste, again, of the 'Union' funds, collected for more legitimate purposes,—the waste of the public money, to support those who might have supported themselves,—the waste of private charity, the increase of idleness,—are chargeable upon these strikes; and I once more say, make them not only a blunder, but a crime."

"You spoke just now of the proprietor of coal and iron. Is *he* not allowed to do what he will with his own? To let it lie idle, or to waste it, if he pleases?"

"I think not,—without a *crime;* whether the law regards it as such or not: though I apprehend it soon would do so in an extreme case. The natural riches of a country are intended for the benefit of the nation; and the law of property, in securing to some a special interest in them, does not design that the nation shall be debarred from all beneficial interest in them. 'Property,' as Burke justly says, 'has its duties as well as its rights, and the one are correlative to the other;' and if those duties be wholly neglected, it will not be property long. Take an extreme case. Suppose all the coal and iron through the kingdom were the property of ten persons. Do you think the nation would endure that, because it was their *property*, they should play the part of the dog in the manger, and either seclude it from use, or (if it were possible) destroy it? would not the nation rather resume its rights over what is essentially national wealth and therefore to be used for the benefit of the whole community?"

"I certainly think it would in so extreme a case. But I do not see how it could deal similarly with refractory workmen who should choose to withhold or waste what you truly call *their* part of the 'national wealth.'"

"Neither do I, nor am I now speaking of *that*:—but merely showing that the nation would certainly in the one case regard the supposed conduct as a crime against society; and by parity of reason may do so in the other.—But what other objection have you to apply to the 'professional' strike which does not apply to the rest?"

"Well, if one must reason on so absurd an hypothesis, I should say that it would bring upon us all the evils of a system of monopoly and protection, which the nation has abjured."

"Very well; but is not that just what a strike tends to? Is it not an attempt to affix, by combination, an artificial price upon a certain commodity, and so to bring upon us all the evils of monopolies and protection, though abjured and abandoned by the state? The labourers do it by agreeing that they will not sell their labour under a given price; not that which is determined by the competition of the open market, but by a combination which artificially creates a *monopoly* of the commodity, and vends it on the principles of protection. Nor does it matter at all whether the commodity be skill and labour, or any other,—say, for example, iron or coal. If all the coal and iron masters were to agree that they would not sell either of their commodities under 20*l.* per ton, would it not be just the same thing in effect, as the legislature's fixing an artificial value on corn, and decreeing that it should not be sold under that price?"

"Well, and do not the iron-masters of a whole district meet from time to time to agree on the price at which they will sell that commodity, and bind themselves to adhere to it, though I admit they find it difficult to carry out their object?"

"Do you condemn, or approve that practice?"

"Well, I think it the assertion of a *right*, on the grounds already applied to strikes."

"You are consistent, at all events; *I* believe they are to be condemned on those very grounds; *I* believe that all such attempts are of the nature of strikes and lock-outs, and are unjustifiable for precisely similar reasons. I believe that they are only tolerable; first because, as you say, the attempt can only be partially successful; and secondly because the sellers rarely venture to deviate much from the price which unrestricted competition would produce. But if, by a stringent combination, they agreed to accept nothing under 20*l.* a ton for their commodity, I scarcely think you would consider such an artificial price a *justifiable* use of their rights of property."

"But the very supposition is an absurdity. On the principles of human nature to which a sound political economy appeals, we know that they *would* not act thus, still less throw away their commodities for nothing."

"Quite true; but it is still an *imaginable* case, and I want to know how you think society would designate such conduct, and how, if persisted in, society would act?"

"Well, of course, if such things were done at all, society would naturally attribute it to madness, and shutting up the so-called proprietors, give their possessions to the next heirs, who would know what to do with them. If such conduct *could* be supposed to flow from sane persons, it would certainly, as you say, be regarded as a crime against society, and justly incur the transfer or forfeiture of the national wealth thus rendered useless or destroyed."

"Very well, that admission is sufficient for the application of my argument."

"Excuse me for saying, that, on the contrary, it seems to me that its being a purely imaginary case altogether vitiates it. It seems to me, that we may fearlessly depend on the principles of an enlightened political economy in all such matters, and cling to the *laisser-faire* principle. You know the old laws against speculation in corn, and the indignation expressed against those who stored it up, waited for advancing prices, and sold it (as was complained) in times of scarcity at famine prices. They are now universally admitted to be great public benefactors, who, thus storing it, and selling it at a price in proportion to scarcity, prevent the commodity from being wasted, teach the community thrift in the use of it, and make it thereby last as long and go as far as possible. You surely would not have any laws made to regulate such matters, even in times of the greatest pressure; but would trust to the infallible principles of human nature to regulate them."

"Most assuredly. So far from wishing any laws on the subject, the avaricious man mentioned in some old author, (you know his name, I dare say,—the fact is mentioned in M'Culloch's 'Political Economy,') who, in a siege, sold a rat for 200 shillings, should go untouched for me."

"The story is told in Pliny," said Mr. Charles; "and pray recollect what M'Culloch adds from Valerius Maximus—for it makes for me, and shows that things adjust themselves very well—'that the seller had the worst of the bargain, dying of hunger, while the purchaser was saved by his rat!'"

"Well, Mr. Charles, so far from denying a syllable of what you have said of corn-speculators and the like, I have devoutly believed it all, a score of years before you were born. I heartily agree that the class of which you speak, once so ignorantly libelled, confer immense benefits on society; and I only hesitate to call them in the *fullest* sense of the word Benefactors, because we generally associate *designed* benevolence with the term; in that sense, they are no more benefactors in preserving your corn for you, than the weazel who kills the rats that would eat it; for he does it for his *own* pleasure, and not for your profit. However, I fully grant that the corn-speculator and the owner of coal or iron may be trusted, on the principles of human nature and political economy, not to destroy their commodities, nor to refuse the highest price they can get for them. Still, as before, it is an imaginable case, and that will do for me. Let us suppose, then, —to take the corn-speculator,—that he either set his granaries on fire in a time of scarcity, or refused to sell corn except at such prices as it was impossible to pay, and so multitudes starved with food before their eyes:—a purely imaginary case, I admit, but still imaginable. Now what would society in such a case call such conduct, and how would it act? Would it not take one or other of the two alternatives you have mentioned—lock the man up as mad, or treat him as a criminal, and confiscate his corn to public use?"

"I admit it; but still it is an imaginary case."

"Very good; but if it occurred, you would call it by strong names. Now this, which, I grant, is only an imaginary folly of the possessors of coal-mines or the speculators in corn, is really what is done in that portentous madness or social crime called a strike;—the commodity, while the strike lasts, is simply wasted and destroyed; and at the best, even if after the strike it sells at a little advance, it is as if the corn-factor destroyed part of his corn in hope of getting a better price for the rest! Even if a strike be occasionally successful, (as no doubt it is,) it is not perhaps once in twenty times that the additional gain makes up for the loss entailed in getting it;—and for the frequent loss, *not* in money, but in things far more precious, no money can ever pay at all. And even as regards money, taking what has been lost by all strikes compared with what has been gained, the former probably exceeds the latter in a ratio that can hardly be computed. The late strike in North Staffordshire alone is computed to have cost the iron-workers at least 100,000*l*."

"Very true," replied Mr. Charles; "and even when there is a gain from a strike, it would generally come without the loss entailed by one: for if the labour-market is scantily supplied, if employers want fifty men and can only get ten, these last are pretty sure of being able to make their own terms."

"To resume our argument, then; since the implied breach of contract with society, and the charge of reintroducing monopoly, certainly no more apply to a 'professional' strike than to any other, what other objection have you?"

"I fancy it might be said that if such a thing were possible at all, it could only be effected by some unimaginable *moral compulsion*, operating on the members of such a combination,—attended with the destruction of individual liberty."

"The very thing, I imagine, which may be most reasonably objected to ordinary strikes. It is for that very reason that I argue that strikes are a grave social offence, inasmuch as they necessarily involve a violation of the principles of individual liberty. If there be one thing that Liberty should insure, it should be the power of every one to use his skill, time, toil, and brains to the best advantage; to sell his commodities at the best price he can obtain for them, without having the terms dictated to him by a combination which tells him, if he belongs to it, that he must not work at all, except upon the terms it dictates; and if he does *not* belong to it, too often procures his dismissal from employment, simply because he does not. This is one of the most crying evils of strikes, that they introduce a social tyranny as intolerable as that of the most iron despotism."

"I can quite go with you," said the other, "in admitting the gross social tyranny which strikes too generally engender, and the miseries they bring; but still I do not see how legislation, so long as the combination is purely voluntary, and no overt acts of violence are committed, can possibly deal with them. As soon as any such acts are committed, the law, you know, steps in and asserts, and properly asserts, its rights,—for as Stuart Mill says in his 'Political Economy,' 'No severity, necessary to the purpose, is too great to be employed against attempts to compel workmen to join a Union, or take part in a strike, by threats or violence.' But these acts, though numerous enough in the early history of strikes, are now, as you are aware, very rare in comparison; the old tricks of incendiarism, or of machine-breaking, as directed against obnoxious masters, and of way-laying and beating obnoxious workmen, throwing vitriol on them, or the like gentle methods of suasion, have been pretty well discontinued since the memorable trials between 1838 and 1843. The organisers of strikes have been at least more prudent and cautious, if not more enlightened."

"No doubt, no doubt," said Mr. W——; "but even now it may be said that similar acts have not wholly ceased; even during the last year, most serious outrages by brickmakers and others were committed, which their perpetrators are now expiating in penal settlements. Nay, we had a riot at Dewsbury only the other day. Nor have I the smallest hope, while strikes are in fashion, that it will not be one of their incidental, but still certain, evils, to lead to such deplorable violence. When men's passions are excited, when party-feeling runs high, when anger, malignity, and revenge are inflamed, and there is nothing but ignorance to control them, such results are to be periodically looked for, and will cease only when strikes themselves shall cease."

"Still," said Mr. Charles, "when they *do* take place, the law steps in and avenges them. I do not see what more it can do, so *long* as the combinations in question are purely voluntary, and the intimidation—persecution, if you choose to call it so—of individuals, and the consequent repression of individual liberty, however annoying or pernicious, are effected only by moral influence. I do not see that it admits of any legislative remedy. As to *that*, all you have said seems to me very little to the purpose."

"What I have said," replied Mr. W——, "has been indeed to very little purpose, if it has not shown you that I am not inquiring whether the evils in question admit of any legislative remedy; perhaps on that point I am as doubtful as you can be; but whether the thing be the grave social wrong which I think it is; whether, if it be so, we do wisely, merely because it may be one with which legislation cannot directly grapple, in speaking of it, (as is too often the case,) as if it were a justifiable thing in itself,—an unwise indeed, but still innocent, exertion of a *right;* whether, on the other hand, we shall not do well, if it be a flagrant wrong, nothing less than a social *crime*, in calling it so, and thus endeavouring to bring public opinion to bear upon it. If this can be done; if the nation generally can be got to speak of an organiser or abettor of strikes in the same terms as they would of a mad dog, or any other social plague, it will tend not a little to abate the mischief. It is not the masters only, or society in general, that are to be pitied as the victims in a thousand ways of this social tyranny. Thousands and tens of thousands of the strikers themselves are yet more to be pitied. You have only to go amongst them and talk with them, to see how many there are, who in every strike bitterly complain of their fellow-workmen, as compelling them to join, under the pressure of this moral persecution, in acts which they feel in fact must involve them in present want, and often irretrievable ruin. Often and often, have I heard one and another of these poor creatures say:—'I am very sorry; for my part, I was contented with my employers, and my wages; but the bulk of them resolved to strike, and what could *I* do? I should have been persecuted in a thousand petty ways, or cut off from all share in the funds of the Union' (collected, by the way, for very different purposes), 'and so what could I do but strike with the rest?"

"Very true; the condition of thousands of them is most pitiable; but still, how can you help them? It is the ascendancy of numbers and headstrong passions over a minority with feeble wills; but it is a *voluntary* subserviency, and I do not see how the thing can be remedied."

"Neither, perhaps, do I,—by *legislation:* though, by the way, even the law does not absolutely regard this species of tyranny as beyond its cognisance, when it *can* take hold of it. The spiritual influence which an artful priest sometimes exercises over a weak woman, and which the law, when it can, severely punishes, is precisely of the same nature; neither worse nor better, than that which a tyrannical majority in a thousand cases of strike exercises over a timid minority, who are dragged into months of misery and starvation, because they have not the courage to resist. 'It is truly wonderful,' says one of the best writers on this subject, 'to reflect that scarcely any existing government in Europe, from Constantinople to Petersburg or Paris, would venture to exercise so stringent a rule over its subjects as a large proportion of our working men submit to from other men of their own order.' But it does not make the tyranny less hateful, nor to exercise it the less criminal, that it is of a *moral* character. I may mention an example that recently came under my knowledge of the comprehensive nature of this social tyranny. I had a friend residing in the south of England, who successfully competed for the erection of a certain public building in a northern county. He made contracts with the brickmakers in the neighbourhood, to supply him with bricks. Having in his own employ a gang of men whom he could thoroughly depend upon, and having undertaken to complete his contract in a given time, he thought it would be worth his while to bring them from the south, and did so. He immediately received intimation from the 'Trade Union,' that if he did not dismiss all these workmen, he should not have a single brick! He said he should bring that to the test, and immediately applied to his brickmakers to supply the bricks. But he soon found that the Israelites could as soon complete their tale of bricks without straw, as these men could complete *their* tale of bricks without the consent of their 'Jack Straw,'—the brickmakers' Union. They told him it was out of their power to fulfil their contracts; they could not send him a single brick in the face of that pressure which their own men threatened them with. It was in vain that he urged that they had entered into contracts with him, and were liable to penalties for breach of them. They told him they were very sorry; none could be more strongly aware of the iniquitous tyranny of the 'Trade's Union' than they were; but it was out of their power to supply him, without incurring heavier penalties than that of throwing up their contracts with him, and they must pay the forfeiture! Now I should like to know, whether you can imagine a more complete destruction of all the reality, nay, of all the semblance of liberty, than in this case? The builder could not employ his own known and tried workmen, the men could not work for their own master, the brickmakers could not fulfil their contracts, but had to pay the forfeiture for breach of them! No one was permitted in the whole transaction to dispose of his own brains, time, capital, labour as he judged for his interests, and as individual freedom demanded; and all because the brickmakers determined, in their sovereign will, that if any one of these persons acted as a freeman might and ought, they would indulge in the luxury of revenge in the shape of a strike! Is it possible to imagine any exercise of tyranny more gross or monstrous than this? or any bondage more humiliating or more absolute than that of its victims? Is it not just as tyrannical as if, when the projectors of the said public building had declared that any builder in the country might compete, the architects, contractors, and master-builders of the neighbourhood, had combined in a 'professional' strike, in order to defeat them?"

"I have nothing to say for it. It is not possible to imagine, I admit, a greater social wrong than you have described. But what is the remedy?"

"I don't know," said the other; "only, as before, do not let us refrain from calling things by their right name; nor pretend that such vile conspiracies against freedom as these are the legitimate assertion of rights; or anything else—whether the law can reach them or not—than flagrant wrongs to society. Nor let us venture to boast of our freedom as a nation, while such social tyranny prevails. If these combinations be indeed an example of the fruit of liberty, that fruit has become rotten. Have you read the remarkable pamphlet on this subject of that able architect Mr. Waterhouse, whose beautiful 'Hall of Justice' in Manchester is one of the noblest architectural triumphs of our day?"

"Yes. I see that his men struck, delayed the work for some time, and entailed much loss on all parties, because he refused to dismiss a solitary gang-leader, over whom he had no control. I believe the senseless men have got rid of Mr. Waterhouse instead of the gang-leader! The workmen of other localities will get the benefit."

"But such things are the necessary consequence of the *right* to form these combinations?"

"I cannot deny that," said our young philosopher; "though I have not a word to say for such suicidal selfishness."

"Meantime, you have not mentioned any objection to strikes of the 'professional' class, or indeed any other, which does not equally apply to ordinary strikes; but since the former, if they could exist at all, and were as widely ramified as those of strikes and lock-outs have recently threatened to be, would certainly issue in the utter disorganization and ruin of society, and would be denounced on that ground alone, not simply as monstrous blunders, but enormous wrongs too, I cannot see why you should not apply the term to the latter.—And the remedy for all is, of course, the same in all cases?"

"Certainly; *laissez faire*. You must," said he, laughing, "if your imaginary strike should ever take place, and be as obstinate as some we have known, import your surgeons, doctors, and clergymen from abroad, or you must migrate to find them."

"As to the doctors," said the other, "their patients would be dead before the foreign physician could come; as to the clergyman, we must be content with a few missionaries; as to the lawyers, perhaps the law-suits would often be as soon finished if the suitors waited for foreign help."

"Nevertheless," said Mr. Charles, "it is the only remedy that I see, in the last resort, for either your imaginary or the real cases. In these last, the labour or the commodities (if strikes or lock-outs were obstinate) may and will in the last resort be got from abroad, or the trade and its capital will migrate thither; and so the foolish people will at last burn their fingers."

"Very likely; but the remedy, if not worse than the disease, is scarcely better. In the first place, the remedy cannot be applied at once, and immense loss and suffering will be entailed in the interval; secondly, suppose the commodity—iron or labour, say—can be obtained, it must be at an increased cost to the community, and all incurred in the interest of principles virtually the same with those of Protection; thirdly, the disorganization of trade which attends such a course—even if happily no violence or outrage accompany it—must involve thousands in ruin; fourthly, if, by the introduction of artificial labour, or any commodity from abroad, in consequence of such strikes, many are permanently thrown out of employment and come on the poor's-rates—a case continually happening in ordinary cases of a prolonged strike—a great wrong is done to society. Lastly, as to your *second* remedy,—if indeed it be not rather ruin,—namely, that the ultimate consequence of triumphant strikes and lock-outs would be that your trade, and the capital which supports it, would flow away from a nation, emigrate to a soil where they would not be thus persecuted, would that be no wrong done to society? rather would not a course of action which had that result, be a crime against society of the most heinous character? But, further; it does not follow that you will be able to apply even any such ruinous remedy as this, for if our 'Trade Unions' should be able to carry out the boastful threats they have often uttered, and should organise their conspiracy against capital as effectually abroad as they have often done it at home; 'belt the world round,' as some of them say, in one chain of impregnable Trade Unions; and if the lock-outs should be co-extensive in *their* combinations—the evil would be wide as the world. *That*, indeed, is scarcely to be apprehended; but it is the tendency of such combinations; and shall we not call them, not merely blunders, but wrongs?"

"You need be under no apprehension," said one of the other gentlemen; "if it must come to a general struggle between lock-outs and strikes, the masters are sure to beat the workmen; and though I hate a lock-out as heartily as I do a strike, except as an absolute necessity of self-defence, I have no doubt in the world, that if the workmen are resolved to bring it to such issue, that we shall beat them."

"Perhaps so," said our host. "But I confess that it is a victory which would be only one degree better than defeat. The masters do not combine so readily or so firmly as the men; and by the time some such contest had come to an end, the prize for which both parties contend might have vanished in the conflict, and important branches of our trade have been hopelessly disorganised, or transferred to other lands. Meantime every one seems in doubt whether legislation can do much; and since these disputes between the men and their employers as to whether an equitable share of the conjoint products of capital and labour falls to each, are certain to continue, according to the variations of capital and population, ought not all parties to do their very uttermost to try fairly the proposed 'courts of arbitration,' or 'conciliation,' as they call them in France?"

"I shall be very glad, for one," said the last speaker, "to see the experiment fairly tried, but it must not be an arbitration such as one of the men recently proposed—an 'arbitration,' the sentence of which *must* be acceptable to the workmen. That would be like a 'reciprocity treaty' all the advantages of which should be on one side. It reminds one of the woman who, being exhorted to remember the duty of obeying her husband, said 'Obey? I have no objection to obey him, but I won't be ruled.'"

"Let the method be tried, at all events," said our host, "and I hope something also may be done by the gradual and wise extension of the co-operative system."

"There is the less reason for resorting to such ruinous measures as strikes in our day," said Mr. W——, "and the more for trying rational methods, that both parties can *afford* to reason. Ours are not starvation strikes. Wages are good, and likely to be so from the condition of the labour-market. It is a case, therefore, that ought to admit of the same reasonable course that is taken in other like cases. To destroy at once the present means of subsistence in the hope of enlarging them, is like burning down your house in the hope of improving it. In every other class of people, this method of endeavouring to mend insufficient pay, is usually thought the very extremity of mad imprudence. A man who is receiving less than his due, or what he thinks less (as a clerk in a bank, for example, or a poor curate), naturally endeavours to better his condition, but never dreams of letting go his hold of what keeps him from starving, till he has got something better; any more than a drowning man will quit his plank for nothing. Now and then an individual may act thus; but he is called a fool for his pains. It is only among our workmen that such insanity becomes epidemic. To act as men do in a strike, even if they really have reason to complain of their wage, and to refuse to put up with it without an effort to increase it, is much as if the clerks in a bank, having a strong conviction that they were underpaid, should resolve some fine morning to leave their desks in a body, and take their chance of suddenly finding another berth, wisely hoping in the meantime that their past savings, out of that same insufficient income, may enable them to live in idleness!"

"Try anything and everything," said our host; "but among other things, let us remember the advice of our friend here, to call things by their right names. If the public will but learn to call this evil, which is eating more and more as a canker into our national prosperity, by its right name;—an evil which, even in the judgment of my son, involves at least drivelling folly, since by the very terms of the contest, the entire prize of 'profits,' for which both parties contend, absolutely vanishes the moment they begin to fight for it; an evil which encourages periodic and wholesale idleness in large portions of our population, and in that way leads to the moral ruin of thousands; inflicts long periods of want and suffering on thousands of women and children; fills the workhouse and the pawnbroker's shop; increases the public burdens; wastes the funds which thrift had put by for sickness and age; encourages all kinds of ill-will between class and class; disorganises the relations of one branch of trade after another, and may possibly (if it goes on as it has gone on of late years) lead to gigantic struggles in which important portions of our trade may flit altogether; which restores in another form the evils of protection and monopoly, and destroys in thousands of cases the rights of the individual; if the public, I say, will agree to call this evil by the right name, and look upon every organiser or abettor of strikes or lock-outs as a traitor to society; if the public press will uniformly speak of these things as flagitious as well as absurd, instead of adopting the measured tone it too often does, the frown of society will do much to abate the nuisance, however little the legislature may do."

"And let me tell you, Mr. Charles," said Mr. W., "that if you are really anxious for that extension of the franchise which you advocate,—and I suppose all of us would be glad continually to increase the area of the representation in proportion as knowledge and education descend among the people,—there is no one thing that is so essential, as to show the working classes the folly and wickedness of strikes. Though little might be said about it in the late debates on Reform, the thing that was chiefly running in almost everybody's head, was the lesson taught by the gigantic strikes which have pestered the country of late years. They are an index at once of the ease with which, it is too plain, the masses *might* be moved in any one direction by means of artful leaders, and of the preposterous and mischievous objects to which this immense force might be applied. To give them a vote while their present organizations are so compact, and yet so blindly subservient to the will of a few men who pull the wires, would, in the estimation of the educated classes, be to saddle the country with Sinbad's Old Man of the Sea. As numbers must prevail if the suffrage descends to the masses, so, if the masses have no more wisdom than they display in the matter of strikes, their combined action might end in that simple partition of political privileges, whereby the poor should make all the laws, and the rich pay all the taxes."

* * *

ALFRED HAGART'S HOUSEHOLD.

By ALEXANDER SMITH, Author of "A Life Drama," &c.

CHAPTER XV.

It happened that at dinner one day, shortly after the receipt of Miss M'Quarrie's letter, Alfred expressed his entire approval of the steak set before him, which was the more remarkable that he was difficult to please in the matter of steaks. He was fond of a steak. He admitted that he had sometimes in London before his marriage eaten a steak worthy of the name, but his provincial experience of steaks he averred had been more or less unsatisfactory. He regarded a steak as one of the delights of bachelorhood, and one of the terrors of matrimony.

"It is curious," he said, meditatively surveying a portion stuck on the prong of his fork, "how difficult it is to cook a steak properly, and yet it seems a simple enough matter. I should say it is as difficult to cook a good steak as it is to write a good song. *This* one is all right. Generally speaking, Martha has no more idea of a steak than a Hottentot. Usually she presents you with a piece of leather floating in a sea of extraneous gravy. This one is tender, and it holds the gravy in itself, as an orange holds its juice. The retention of the juice is the great thing," he went on learnedly. "A steak should be, and should not be, like Gideon's fleece. It should not be dry when everything around it is moist; it should be moist when everything around it is dry—as it is to-day. I must tell Martha how pleased I have been."

The artful woman sitting at the other side of the table had been waiting for her opportunity for days. She seized it when it came.

"I suppose," she said, in as careless a tone as she could assume, and as if the matter had been long ago finally concluded, and could admit of no argument now,—"I suppose we will have to be making arrangements for Jack's going to Hawkhead to stay with Aunt Kate?"

"What puts that in your head, Margaret?" said the husband, laying down his knife and fork. "I have not the slightest intention of placing my son under your sister's charge."

"Alfred, dear!" returned Mrs. Hagart, putting on a look of the most innocent astonishment, "you surely forget! You promised, you know, that, if Miss Kate wished it, you would allow Jack to go and live with her. Don't you remember—that last evening you came home from Spiggleton—tired, and wet, and hungry, and with all your sketches unsold?"

Our friend here gave a slight grunt of dissatisfaction. He had no taste for these reminiscences.

"And when you said," his wife went on relentlessly, "that you did not wish Jack to follow your profession, and that you wished you could give it up yourself. You promised me that Miss Kate might have Jack if she liked. Now, I have a letter from her wishing him to come, and saying that she will be ready for him in a few days."

Hagart could not but admit that some such promise had been given, but he urged the unfairness of holding him to it. "I was low that evening, and no wonder. But things have improved since. I have plans of my own with regard to Jack."

"And what may these plans be, Alfred?"

Then Hagart developed the plan he had for some days back been maturing—that he would apprentice Jack to one of the most famous of the pattern designers in Paris; and proceeded to show that in a few years, when Jack had become an adept in his profession, and when he had himself established his depôt for Parisian designs on a sure basis, and was in a position to rule the manufactures of Greysley, Hawkhead, and Spiggleton in matters of taste, he would be able to give Jack constant employment, and explained how they could profitably work into each other's hands: and how, by their united exertions, a handsome fortune could be made as certainly as ever two and four made six. Mrs. Hagart listened patiently till he was done, and then, like a she-falcon, she went at his pet scheme, and tore it into the merest shreds and tatters. Hagart was surprised at her fierceness.

"Well, then," he said, "you have demolished my plan, Mag. May I now ask what great good will accrue from Jack's going to stay with your sister?"

"Well, then, I'll tell you. As Jack is not to follow your profession—we agreed on that before, bear in mind—he must go to Hawkhead at any rate, to attend the High School and the University, and, when he *does* go to Hawkhead, it is surely better for him to live in the house of a relative than in that of an entire stranger. Then, Alfred, my sister has money, and I rather think she means to spend a portion of it on the boy, and that the remainder will come our way in the end—I think this from what she has said to me, and from what she has written. She wishes Jack to come to her, and with his chance it would be foolish in us not to comply with her wishes."

"Chance! that's what Stavert is always talking about. I am not sure about the money. Your sister hates me, and I am told she has said the most shameful things about me."

"Who told you that my sister hates you? that she has said shameful things about you?"

"Stavert told me so, when he walked part of the way home with me the other day."

"And don't you see his motive, Alfred?" his wife went on, with a kindling eye. "The days of the Stavert dynasty are over. He does not wish to see me reconciled to my sister. He does not wish to see my sister coming about the house. Depend upon it, he has been trying to poison your mind."

"He did say," said Hagart, stroking his chin thoughtfully, "that I should not encourage Miss Kate's visits. That I was to keep a sharp eye on her."

"I thought so. You see he has his own purposes to serve. I don't think you have a very sharp eye for character, my dear."

"Perhaps not. I certainly did not see Stavert's talk in that light. But, Margaret, I don't like the idea of giving up the boy, even to your sister."

"But, perhaps, we won't have to give him up for long. We will see him often; and then, of course, he will spend all his holidays with us. Besides, it is not impossible that we may be living in Hawkhead ourselves before many years are over."

"What makes you think that?" asked Hagart, hastily. The idea of going to Hawkhead had a certain mystery and fascination about it. Personally, he could see no probability of such a removal, but his wife could. Meanwhile, the bare suggestion gave ample scope for the exercise of imagination. He was yielding fast to her influence and her ways of thinking.

"Never mind," said Mrs. Hagart, smiling and nodding in a knowing manner. "Leave that to me. I'll manage it all very nicely. I have a great head for planning, and I have been planning a good deal of late. You don't know what a treasure you have got in me. Do you know that my sister and I have been considering what profession would be most suitable for Jack, and we have agreed that he should become a lawyer."

"A lawyer!" said Hagart, with a sort of astonished gasp. He had gone souse over head in a sea of wonder.

"Yes; we must make a gentleman of Jack, and of all the learned professions Miss Kate thinks the law is the most gentlemanly." Mrs. Hagart saw that victory was within her reach, and she resolved to make her victory complete. She knew her husband's weakness, and she resolved to play upon it—as good wives have done since the beginning of the world. "The law is certainly a most honourable profession, and it opens a path to all kinds of advancement. Lawyers go into Parliament, they hold high posts in India, and in the colonies. Lord Brougham was once a plain barrister, and Lord Eldon and his pretty wife—it was a runaway match, too, like one we know about—cooked their breakfasts in Lincoln's Inn with their own hands, before practice and reputation came. If Jack gets on, we may live to see him a sheriff or a judge, perhaps. I don't think that, if you apprenticed him to a pattern designer in Paris, he would ever come to anything like that."

This was, it must be confessed, an adroit stroke of generalship on the part of Mrs. Hagart, and it was completely successful. Hagart's eyes were blinded by the glittering prospect. His objections melted like May hoar-frost before the sun. He consented that Jack should go to Hawkhead at once, consented amply, unreservedly. His excited imagination played prodigious riot with him all the evening. As clearly as Dick Whittington heard Bow-bells ringing, "Turn again Dick Whittington thrice Lord Mayor of London," he, leaning back in his chair, heard ringing in the shining future the music of his son's coming greatness. All sorts of wonderful visions crowded upon him. With sonorous voice and eloquent hand aloft, he saw and heard Jack address a jury of his countrymen; in ermined robe and portentous wig, he saw him in solemn procession entering Hawkhead to hold the assize, while bells rang, and the crowds ran and shouted, "The lords, the lords!" and helmeted dragoons with drawn sabres capered on either side of his carriage. His vivid and excitable imagination conjured up vision after vision of professional success, until at last—perhaps he had some dim notion of Jack on the woolsack, and presiding over the highest council of the nation—he brought his hand down on his thigh with a slap, "He must go to the English bar, Mag! Great legal prizes, like grape bunches, are only to be had in the South. It is England that always crowns genius. I've made up my mind to enter him at the English bar. Westminster, not Edinburgh, must be his field."

"Have you?" said his wife, and there was a slight shade of sadness in her smile. She was victorious; but, like most victors, she was a little remorseful when she thought of the means by which she had obtained victory. "Very well, just as you please. But it will be a long time before he can be called to either bar. We will be getting old people by that time, Alfred!"

"Ah!" said Hagart, with a slight sigh, as he rose up hastily and took a turn or two through the room. "Life's very short when there's anything great to be done in it, or anything great to expect from it. What will be the use of Jack's success, if we are not there to see it?"

And so it was arranged that Jack was to go into Hawkhead and live with Aunt Kate. When Jack was informed of the family decision, he was in a wonderful flutter of spirits. He seemed to have swallowed some astonishing elixir. He trod on air, and no longer on the gross earth. His blood sang through his veins, and made a triumphal drumming in his ears. He would see Hawkhead, and the splendid buildings and the crowds and the ships. He was going into the world—into that strange, remote, wonderful world which he had so often dreamed about, and into which the long, white passage-boat carried happy people from Greysley twice in the day. These people he had often envied. He would be carried by the passage-boat himself now. In a single night he had become older, graver, staider. A single night took him out of all his companionships. Around the clump of houses he no longer rushed with his fellows in the game of "tig" or "I spy." All that kind of thing seemed on a sudden years behind him. He was proof against the importunities of the gamesome lads of his own age. He walked about in the evenings alone, thinking about Hawkhead and the splendid crowded life on which he was to enter. Only one thing vexed him—and that was that he could not pour out all his excitement, thoughts, plans, hopes, and wishes into Katy's ear. He should have liked so much to have done that. His whole mind was crowded, brilliant, excited,—like a Roman street in Carnival time,—but if he had had Katy to talk to, he would have to a great extent got relief from the oppressive unrest and turmoil. But that was not to be, of course. We miss the dead most at seasons of great grief or of great joy. Young as Jack was, he found out that, or at least some portion of it.

As Jack was going to leave home, there were certain necessary preparations to be made; amongst other things it was essential that, in his going forth from the family, he should go forth provided with two suits of clothes. Accordingly one day Mrs. Hagart and Jack walked into Greysley and called on Mr. Moss, the tailor and clothier, in High-street, where they sat for half an hour inspecting various piles of broadcloth—the reign of Tweeds had not begun at the period of which I write, and Galashiels was a quiet village which lived on salmon, and listened to the river babbling ballads as it ran—which that respectable tradesman and his indefatigable assistant brought out of shelves which they reached by means of steps, and laid down before them on the counter. Grave and anxious was the deliberation; Mrs. Hagart anxious about price, durability, and texture, and Mr. Moss putting in an assuring sentence at intervals. At last the matter was settled, the two suits of clothes were ordered, and were promised to be duly delivered before the close of the week. The day before, Hagart, on his way to Wedderburn Brothers, had dropped in on his friend Mr. Moss—paid him a small matter to account—and intimated in a lordly way that his wife and son would call soon and give him an order, that a great stroke of good fortune had come to his family, that his son had become heir to a rich relative, and was going into Hawkhead to stay with the rich relative, and to pursue his studies in that city. In consequence of this visit Mr. Moss, when his customers were retiring, came round the counter rapidly, accompanied them to the shop door, and, to his mother's confusion, felicitated Jack on his good luck, shook hands with him, and cordially wished him success. And after they were gone, in the shop door Mr. Moss remained standing, looking after the retiring figures with a smile on his face and rubbing his dumpy palms together.

When Jack and his mother had walked down High-street, and were approaching the Saracen's Head, they met the little schoolmaster, who stopped, took off his hat gallantly, and shook hands with both in the most cordial manner. "And so you are going to take away my best scholar, Mrs. Hagart!" he said.

"Yes, Mr. Blake. John has told you that he is going to Hawkhead—to the High School and the University. I am sure I am very grateful for the care you have bestowed on—on both my children."

"The care is not worth speaking about—it was nothing more than my duty. And so you are going to don the scarlet cloak? Going to the University, John?"

"Yes, sir!"

"I remember when I wore it too. Those were the happy days! It's a grand thing to be a student when one is full of hope, and in love with knowledge. When I see these lads in scarlet cloaks, I look on the rulers of the next age. As the French soldier carries in his knapsack the bâton of a marshal, the student under his red gown carries a chancellor's wig, the gown and bands of the Moderator of the General Assembly, or,—or the taws of the dominie. I missed the two former, I got the latter. I hope you'll have better luck!"

"I hope he will be industrious and get on well," said the mother.

"I have no doubt he will. You must make a name, John; so that when I am an old man, and when I hear people talking about you, I shall be able to say with pride that you were a scholar of mine. Will you?"

"I'll try, sir!"

"I know you will." And then the rusty black figure shook hands with them again, took off its hat, and went along the street.

When they reached home they found a letter from Miss McQuarrie, to the effect that proper maids had been secured, and that she expected Jack would take up his abode with her on the Saturday following. On that day Ann would be in waiting for the passage-boat when it arrived at the basin at Hawkhead. Although looked for daily, the letter sent a chill into Mrs. Hagart's heart. Jack was actually to go at last! The camp had been busy with preparations for some little time, and now the actual order to march had arrived!

Now that matters were fairly settled, Mrs. Hagart felt inclined almost to draw back from her covenant with her sister, and to keep Jack at home. She knew that the house would be doubly lonely when the boy was gone, and all sorts of unreasonable maternal fears crowded upon her. Not very long before, she had boasted of her faculty for "planning," it repented her now that her "planning" on Jack's account had been successful. Her feelings on this matter she kept, of course, to herself, but she was unusually tender to the lad, hung about him continually, grudged every moment he was out of her sight, and slipped into his room, to look on him in his sleep, and perhaps to cry a little in secret, as is the habit of foolish mothers, when their sons are about to leave them. Hagart—when his early feeling of opposition to the scheme was got over—had no qualms of conscience or regret. He expressed delight at the brilliant prospect opening for his son, and looked forward to Saturday with as much eagerness as did Jack himself.

It was arranged originally that on Saturday morning, Jack, with his slender store of luggage, should be taken into Greysley and deposited in the passage-boat at the canal-basin, and instructed to remain there till Hawkhead was reached, and Ann had made her appearance. But on Thursday, Hagart to some little extent proposed a change in the maternal programme. He thought it but fair that the lad should have some sort of convoy; he would ask the Wedderburn Brothers to allow him a holiday on Saturday; that on the morning of the day of parting, Martha should carry the *impedimenta* to the passage-boat, give it in charge there to the proper authorities; and that he should accompany Jack along the canal-bank to the station-house, and wait there till the boat arrived. By this means, Jack would be enabled to depart with some little *éclat*, and he should have an opportunity as they walked, to speak seasonable words of consolation and advice'; naturally enough, on such an occasion, he should like to be with his son as long as possible. To this scheme Mrs. Hagart made no objection, and it was accordingly adopted.

CHAPTER XVI.

SATURDAY morning came at last. One of those warm, bright, serene, November days—like the mood of a cheerful old man, when the passions have worn themselves out like the grinders, and the cheerfulness is the cheerfulness of reminiscence, and the memory plays with good deeds and happy faces,—one of those bright November days in which summer and winter are curiously mixed; bright, but with a touch of pensiveness in it, and in which everything reminding one of the past season should fitly come to a close—in which the last withered leaf should fall to the ground, and the last hip—with its scarlet skin withered, seamed, and puckered like the face of an old weather-beaten tar—should be plucked by the chattering chaffinch from the hedge—a November day that made you pensive like itself, for it carried the imagination to the past and the future: to the summer that was gone, and to the summer that was coming: to the life that had been, and to the life that was at hand—that touched alike memory and hope.

In his little bed-room, Jack slept soundly enough, but about seven o'clock he awoke, when the daylight was stealing in on the window, and he could not help thinking that it was, perhaps, the last time he should sleep there. Meditating on his approaching removal to Hawkhead, he began to get excited somewhat; his thoughts darted about like a swift on the wing; now it was Katy he was thinking about, now his mother, now the little schoolmaster, but mainly, Hawkhead,—that great, unknown, wonderful city, of which, before the evening, he was to be a denizen. While all this thinking was going on, the window became pure white, and in a short time, Martha tapped at the bed-room door. He got up, and saw his new clothes placed on a chair beside his bed. In a moment, in a more vivid manner they brought all the new life before him. When these were donned the new life would have begun.

The breakfast of the Hagart household was quiet that morning. Hagart was more silent than was his wont. Jack and his mother crumbled only a bit of toast, and drank a cup of tea. When breakfast was over, Hagart in a loud mock-cheery tone of voice, announced that it was time to go, and Mrs. Hagart and Jack rose at once. "Martha," cried he, "you'll take the things to the canal-basin after we start. If you leave this, in half an hour or so, you will be in plenty of time. Don't be late, mind, and be careful to place them in the charge of the boatman. Now then, be a brave fellow, John," he said, as he was pulling on his gloves, and pottering about in the oddest corners in search of his stick. "Come along, come along," he cried, after he had secured the stick, and was standing outside the door, midway between it and the gate, and Mrs. Hagart was hanging over the boy, kissing him and crying. "Bless me," he said, looking back with rather a forced laugh, "you don't look, Margaret, as if John were going to turn out a Lord Chancellor. Come along."

"Go, go, darling!" said Mrs. Hagart, who was holding her son tightly and kissing him all the time.

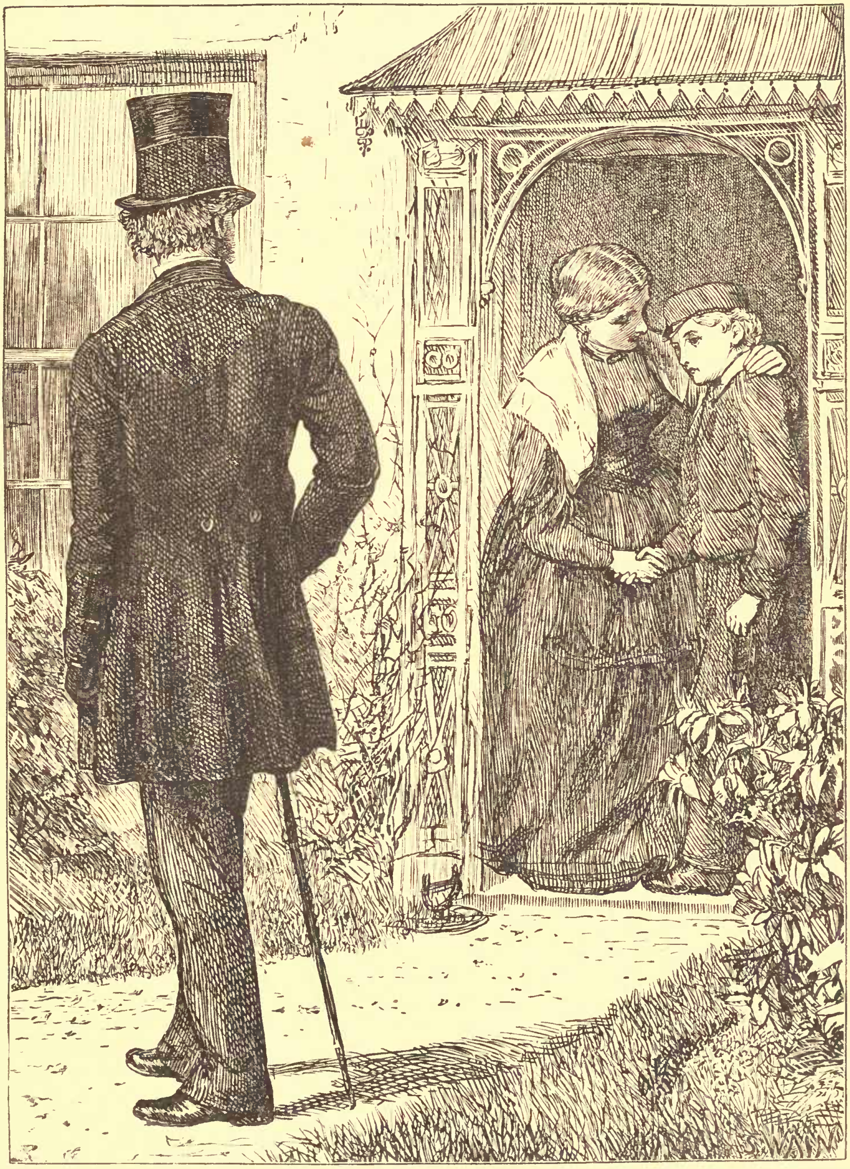
With a lump in his throat as big as an apple Jack got clear of the maternal embrace, and he had no sooner turned out of the gate, when the whizz of an old shoe—which up till now Martha had been keeping in hiding under her apron—came past his ear; and then the girl came running out to have a last look, uttering a sort of hysterical giggle, which was compounded of laughing and crying in pretty nearly equal proportions. Jack knew that his mother would be at the window, as he had seen her once before, but he did not dare to look back.

In silence they marched along the road toward Greysley till they drew near the distilleries, and could hear the roar of the river as it tumbled over the rocks; silently they turned up the little footpath which led along the distilleries, and silently they emerged on the canal bank. Along the bank they had not proceeded far when Hagart said, slackening his pace a little as he did so,—

"And so, John, you are leaving your father's house and going into the world to seek your fortune, like the young people in the story books!"

"Yes," said John, making a brave effort to swallow the apple in his throat, which seemed however to be getting bigger.

His father went on a few paces without speaking, "It's just twenty-five years and a few months since I left my father's house to seek my fortune. Twenty-five years ago, and a few months. I remember it as if it were yesterday. It was a



"COME ALONG."

Page 516.

summer morning and my father walked with me, as I am walking now with you. He's been dead these many years, and perhaps the time will come, John, when you will walk with a son of your own, and say the same of me."

The apple was so big in the throat now that it brought the tears into the boy's eyes.

"My father's farm-house," Hagart went on, "was at Old Rome Forest in Ayrshire—where Burns lived when he was correcting the proof sheets for the Kilmarnock printing-press—and that morning I got up early and took farewell of everything. I saw the hares scudding across the dim fields, and felt in the thickets the fine lines of the gossamer break across my face as I pushed through. I went down to the river in which I used to fish, and stood on the bridge looking down into it, and saw the trout darting about, and I remember that as I looked down, from behind me, the first ray of the sun flashed into the water, and turned the pebbles at the bottom to amber and gold. I climbed to the top of Dundonald Castle, and saw Arran far away with a white cloud on it, and the sea, nearer me, sparkling as with a million of newly minted silver pieces; and a belt of surf white as snow on the yellow Irvine sands, white as snow to the eye, silent as snow to the ear. I went into the garden to have a last look of a thrush's nest, and the mother bird went off with a whirr that made my heart jump, and then I took out the warm eggs one by one, and put them back again. I was very sorry and happy that morning, John. I was going to London. I had dreamed of London before that. Its great roar filled my imagination. I thought of London when I read in my Bible on Sunday evenings about Babylon, Damascus, and Nineveh, and the great cities of old."

"Did you like living in London?"

"Of course! who that ever lived in London could endure to live anywhere else? The English air is softer and warmer than ours. The English earth is fatter, the English trees are taller and greener. The voices of the English women are sweeter and more silvery. England is to Scotland, John, what the rose is to the broom, or the nightingale to the linnet. Everything there is plenteous, gracious, and of soft outline; everything here is harsh, angular, and high-cheek-boned. You must see London, my boy! There is the carved Abbey filled with the dust of kings, statesmen, soldiers, and poets. There is St. Paul's with its dome and its cross of gold standing above the smoke. You must stand on the floor of St. Paul's and see the great roof floating above you like heaven. From the river you must see the dome looming through the sunset. You must see the moon rising over it, as it rises over the shoulder of a mountain. But it's a dreadful city too, John. It's a terrible city. For every one it smiles on, it breaks the hearts of a thousand. It's the brilliant candle that attracts the moths of the three kingdoms—I was attracted like the rest, and singed my wings."

"Then you did not get on in London."

"Has the cab horse that was once entered for the Derby got on well? No, I did not succeed. I went there with a sketch of Britannia weeping over the body of Nelson, and that sketch is in one of my old portfolios. I cannot bear to look at it. I tried art and I was starved into pattern-drawing—I suppose from some inherent weakness—I was too diffident, I know. But *you* must succeed. I don't care about myself so long as you get on; and I think you have very good chances. I have often watched when I was young the waves coming on the Irvine sands. One comes and breaks and dissipates itself a yard from your feet; a second and a third does the like; but the fourth, with higher crest and of greater volume, sweeps over all the others and drenches you to the knee. I am one of the broken and dissipated ones; you are the fourth, I hope, and will reach success."

Here Jack, who was at that time crossing the bridge which carried the canal over the river, said that he would do everything he could to succeed. The engineering difficulty presented itself again to his mind, but he dismissed it summarily.

"To succeed, a man must have constancy as well as hope, he must have bottom as well as spirit. You have, I think, your mother's nature as well as mine. I give you the big sails and the sharp clean cut bows; she gives you the ballast in the hold, the helm, and the hand and eye at the helm. I am sure that you will succeed, and that I shall see you covered with honours before I die."

In a short time they came in sight of the castle on the hill, on the other side of the canal bank. Hagart took no notice of it, but for the moment it absorbed his son's attention to the exclusion of everything else. The trees around its base were bare now, but broken tower and loop hole, and the ragged rents of ruin were even more clearly defined against the soft sky than when he saw it previously. No birds were flying over and across it. The incidents of the day when he went there with his sister came back upon his memory. Katy was again walking by his side in her bonnet and cloak. He remembered how proud he had been as her guide. He remembered the pleased flush on her cheek, and the look of wonder in her eyes. He remembered that she had said she would always remain at home with her mother, and that he had expressed a desire to see foreign countries and to knock about in the world; and thinking how she had gone to that most foreign country of all, and that he was on his road to Hawkhead, the lump rose in his throat again. His father had been talking all the while, but he had not heard a word he was saying.

"What are you thinking about, John. I don't think you are listening to me!"

At this, Jack gave a little start, and the Greysleyan cemetery, to which imagination had wafted him, faded out of his mind. "I was thinking of Katy," he said, "and of the day when we were here together—the day when we met Aunt Kate at the station house."

"Poor Katy!" and Hagart walked on for a little in silence. "The meeting your aunt," he resumed, "one would have supposed was a mere nothing—but it was the beginning of fortune, John. Who could have thought it? Your namesake in the story-book when he planted the bean had no idea what would be the result of his planting. I hope the bean you have planted will grow as well as the one in the story, and that you will find a castle, and carriages, and horses at the top of it."

"And a great wild giant too, who would like to make his supper on Jack," cried the boy, looking up with a half smile.

"Not so bad at all! Very good, indeed! A very neat turn that!" cried the father with a shining face. "In your progress through the world you should study the art of conversation. You will find it extremely useful. The man who can talk well has a great pull over the man who can't. The two may be equally rich, but the one can get his money out of his purse when required, whereas the other can't, and with the onlooker seeing is believing. In this as in other matters a bird in the hand is worth two in the bush. Yes, a great wild giant, as you say, who keeps watch over the castle and the carriages and the horses, and would like to sup on all who come near. Now then, John, what would you call this great wild giant of yours?"

"I don't know."

"*I* would call him Diffidence! I had my chance once too of the castle and the carriages and the horses, but Diffidence ate me up. Don't undervalue yourself, whatever you do. Better over-estimate your abilities than under-estimate them. If you turn tail the world runs after you and smites you hip and thigh. If you charge the world boldly, the chances are *it* runs away and allows you to gather up the spoil at your leisure. It was Mr. Great-heart, you remember, who led the pilgrims through all their troubles. You must be bold, John, and stout-hearted!"

"Yes," said John.

"To-day is your start in life," said Hagart, flowing on copiously. "You are like a newly raised regiment that has taken the field, and whose flag is a plain unadorned sheet of silk. So act, my boy, that when the campaign is over, the maiden sheet, riddled and tattered by bullets—for it is certain to be *that*, mind—shall be heavy with the embroidery of victories—something to be proud of—like one of the banners hanging up in Westminster Abbey."

Jack, rather frightened by the picture, remained silent. Hagart still flowed on.

"Your mother and your aunt are of opinion that you should, when your university course is finished, enter on the study of the law, and I am quite agreeable that you should do so. I looked into a biographical dictionary the other day merely to satisfy myself, and was astonished to find how many of the higher offices of state are open to successful lawyers, and how many of the past and present occupants of those offices have been originally as poor as you are. It's a fine thing to sit on the bench or the woolsack. Lots of poor Scotch boys have risen to distinguished eminence in their several walks of life. Resolve that you shall rise to eminence. Above all things, as I said before, beware of diffidence. That has been my greatest foe—who knows what I might have been to-day but for that! A man once owed me some money in London before I married. My debtor's way to his office and my way to the boarding-school, where I taught the young ladies water-colours—your mother was one of the number, John, and very beautiful she was then—crossed each other. Well, I was afraid to meet him, afraid that he would think, 'Here comes that fellow Hagart with his bill in his face,' and so, to avoid him, I reached the school by the most circuitous routes; if I saw my man coming, I bolted down the next street, or plunged into an opportune entry, or fairly turned on my heel and fled. He was the only debtor I ever had, and I was afraid of him. Creditors don't usually act in that manner—at all events, none of *my* creditors ever did. Of course I never got my money. Yes, John, beware of diffidence!"

By this time they had reached the station-house, and saw several intending passengers lounging about on the wooden wharf. Hagart took out his watch and found that they had hit the time exactly. They sat down on a little bench, and in about ten minutes after the black caps and scarlet jackets of the outriders were seen at a turn above the leafless hedge, and the moment after the long white passage-boat came in sight.

"Now then," said his father, rising and placing his hand on Jack's shoulder, "you are going off at last. When you become a great man, John, you must not forget us, mind!"

Jack's heart was in his mouth, and he could say nothing.

"I don't know that I shall ever get on with Miss Kate, or whether she would care for me coming to her house. Perhaps she wouldn't care to see me there. In any case, John, we must manage to meet and have a talk. You will see your mother in Hawkhead frequently, of course, and you will spend some of your holidays with us. Perhaps you could manage, say every third Saturday, when the weather is fine, to take the boat as far as this, and I'll come out from Greysley to meet you and talk with you. I dare say every third Saturday or so I could take, or make, a holiday. I could talk more freely to you here than at home, or in Hawkhead, and you could take the return boat, you know."

Jack drew his hand swiftly across his eyes and said he would come.

"Very well. I'll write and arrange for our meetings. The walk will do me good, at any rate, cooped up as I am just now. I have not stretched my legs till to-day since I came back from Spiggleton. Now we must get you your seat, and look after your things."

By this time the horses and their riders had drawn up a little beyond the station-house—but Jack had no interest in them to-day, he did not even notice whether they were his favourites, Smiler and Paddy-from-Cork. And the passage-boat came along the wharf with a bump. A seat was procured for Jack: his parcels were placed beside him. "Now, be careful when you arrive, and don't get out till you see Miss Kate's maid. You have seen her before, will you recognise her?"

"O yes, I saw her once before."

"Well, then, you're off now," said Hagart, as he stepped out on the wharf. "God bless you, and hold you in His keeping! Be sure to write, and if you think of coming this length on a Saturday, let me know, and I'll meet you."

Jack tried to say something, but the words would not come. Meanwhile the riders cracked their whips, Smiler and Paddy-from-Cork started at a brisk trot, and the passage-boat glided away with a rippling sound from the wharf. Hagart looked after it till it reached the first bend, about a hundred yards beyond. The boat would be invisible in a few moments, so he took off his hat and waved a farewell, and Jack's eyes were so thick with tears, that it is very doubtful whether he saw the hat waving.

THE NIGHTINGALE AND THE UNSATISFIED HEART.

When in a May-day hush
Chanteth the mistle-thrush,
The harp o' the heart makes answer with murmurous stirs;
If robin redbreast sing,
We chide the tardy Spring,
And culvers, when they coo, are love's remembrancers.

But thou, in the trance of light,
Stayest the feeding night,
And Echo makes sweet her lips with the utterance wise,
And casts at our glad feet,
In a wisp of fancies sweet,
Life's fair, life's unfulfilled, impassioned prophecies.

Her central thought right well
Thou hast the wit to tell,
To take the sense o' the dark and to yield it so,
The moral of moonlight
To set in a cadence bright,
And tell our loftiest dream that we thought none did know.

I have no nest as thou,
Bird, on the blossoming bough,
Yet over thy tongue outfloweth the song o' my soul,
Chanting, "Forbear thy strife,
The spirit out-acts the life,
And MUCH is seldom theirs who can perceive THE WHOLE.

"Thou drawest a perfect lot,
All thine, but, holden not,
Lie low at the feet of beauty that ever shall bide;
There might be sorer smart
Than thine, far-seeing heart,
Whose fate is still to yearn and not be satisfied."

JEAN INGELOW.

CHRIST THE LIGHT OF THE WORLD.

By C. J. VAUGHAN, D.D.

VII.—THE GOSPEL OF THE FLOOD.

"I do set my bow in the cloud."—Genesis ix.

The Creation, the Fall, the Flood, the Call—these are the great landmarks of primeval history.

It is a magnificent record; not more in the marvel of its preservation, than in the character of its facts.

Many things in it are hard to be understood: how could it be otherwise?

Many things in it stimulate curiosity: is it not well?

Many things in it baffle philosophy, irritate scepticism, furnish forth cavils: may not the humble Christian learn a lesson even from this? learn that God's teaching is different from man's? his foolishness (as an Apostle writes) wiser than our wisdom, his weakness stronger than our strength?

We are not indeed to despise the added light which Philology or Science may throw upon the Book of God. Still less are we to tremble at each new discovery, as though it might shake the foundations of Divine Truth. Truth and the Truth must always be at one: if we cannot always see how, we must be patient, we must be trustful, we must wait and pray.

Meanwhile I fear not to say that each one of these four great landmarks of which I have spoken—the Creation, the Fall, the Flood, the Call—is essential to the understanding of all truth and to the consistency of all history. Take any one away, and there is a breach made which you cannot heal. You will have to come back for the discarded item, in order to understand where you are, and what; where you are in God's world, and what you are in God's sight.

Let us take one of these great revelations by itself now, and ask what it says to us.

The Flood. The Deluge. What Prophecy calls "the waters of Noah." Surely there is enough here to instruct and to solemnize, even if there be many things about it which we cannot explain and cannot settle.

Between the Fall and the Flood there lie upwards of sixteen centuries.

A long time, measured by years. Longer than from Abraham to Malachi: longer than from David to Mahomet: longer than from Constantine to us.

But not a long time, when reckoned by generations. The chronology of Scripture tells us that Adam himself lived fifty-six years into the lifetime of Methuselah, and that Methuselah lived till the very year of the Flood. Adam may have known Methuselah, and Methuselah reached to the Deluge.

One bright spot marks the interval. There was a saint of God between Adam and Noah. Mysterious, like the rest of the record, when you begin to ask how: but in itself scarcely mysterious, to those who believe in the grace of God, and know that He is the same yesterday and to-day and for ever. "Enoch walked with God: and he was not: for God took him." "By faith Enoch was translated that he should not see death; and was not found, because God had translated him: for before his translation he had this testimony, that he pleased God. And without faith it is impossible to please him."

Not promise only cheered that dark time: grace too, grace in the heart of man and grace in the life of man, proved, to such as would enquire, that God had not forsaken the race which had gone astray.

And Noah too walked with God. He "was a just man, and perfect in his generations," that is, amongst those of his time; "and Noah walked with God."

These experiences, even more than that one dark hint of Prophecy, given on the day of the Fall, must have given hope and reassurance to the drooping hearts of men.

All else was dark enough around them. The curse had speedily operated: the toil of man, and the suffering of woman: yes, and worse things than pain and weariness; deeds of unnatural bloodshed: a brother's blood crying from the ground, and the murderer driven out, with a mark set upon him, to be a fugitive and vagabond on the earth: these had been the beginnings of sorrows: and what had they grown to!

"The earth itself was corrupt before God, and the earth was filled with violence."

Sin, like leaven, soon spreads; spreads in a soul, spreads in a life, spreads in a community, spreads in a world.

Dark hints are given as to the source of this evil —of its development, I mean—for the root and the germ of it was in the Fall.

We read of "sons of God" taking to themselves wives of the "daughters of men." As though perhaps there was a nobler and a less noble race even among the fallen: the race of Seth, with men "calling upon the name of the Lord;" numbering amongst its descendants the saintly Enoch and the righteous Noah: and on the other hand, the race of Cain, "gone out from the presence of the Lord" eastward from Eden, to dwell in a city of his own building, apart from the repentant Adam and his worshipping household; and counting among his offspring an Enoch and a Lamech of his own; a Lamech marked by a Cain-like bloodshed, even as the other Lamech rejoices with a resigned and pious joy in his son Noah as given to comfort them "concerning their work and toil of their hands, because of the ground which the Lord hath cursed." It may be so: we know not. It may be that the riddles of the sixth chapter of the Bible are to be read by this key; that the race of Seth began to intermarry with the race of Cain; and that, as is usual in such "unequal yokings," the worse rises not to the better, but the better sinks down to the worse.

And although we are to conceive of deeds of strength—of "mighty men" and "men of renown"—marking the fearful period which followed hereupon; yet what is might without right? What is human prowess or human wisdom, divorced from the recollection and from the blessing of God? "God saw that the wickedness of man was great in the earth, and that every imagination of the thoughts of his heart was only evil continually. It repented the Lord"—so speaks He in condescension to our infirmity, adopting the language not only of human sense but of human feeling—"It repented the Lord that he had made man on the earth, and it grieved him at his heart." A scene of lust, rapine, and outrage, occupies (with one exception) the whole face of the earth.

In these soft days we have almost lost the plain name of sin, and the very conception of its hideousness in the sight of God. There is indeed a humanity falsely so called, prevalent enough and to spare amongst us; crying out at the sight of physical suffering, and counting punishment cruel as soon as it becomes painful. But this, so far from being in itself a good sign, is in reality but one expression of the very evil now under notice. We have lost the conception of sin, and therefore we do not see why sin should suffer. So far indeed as sin causes pain to ourselves; when it comes nigh to us in the form of peril to our homes, or wrong to our fortunes; then we demand satisfaction: then we find that sin has inconveniences, and for the moment desire its coercion. But for sin in itself—sin as against another man—still more, sin as against God—who feels as he ought? who in deed and in truth feels at all?

If we would see what sin is, we must read not treatises on morals, not poems of sentiment, not speeches of philanthropists, but another book altogether: the Book of God: the Old Testament, to show us what sin has cost in judgment; the New Testament, to show us what sin has cost in expiation.

Instead of carrying our preconceptions to the Divine Word, and judging it by them; discarding from our Canon of Scripture, or from our system of doctrine, everything in Revelation which squares not with our ideas of what God ought to do and (let me say it plainly) of what God ought to be; let us open the oracles of truth for an opposite purpose: to learn what God has said, and what God has done; what He has judged necessary in the way of retribution, and what He has declared Himself to be in his estimate of the sinfulness of sin.

It may be that the time will yet come, for the Church if not for the world, when it shall be felt that the Old Testament Scriptures, instead of being obsolete and superseded, are of paramount and predominant use. It is they which contain those first lessons of the Divine displeasure against sin, and also those records of the working of the human heart in its deepest agonies of repentance for sin, which, in proportion as they are learnt, give to the Gospel itself its chief value, and in proportion as they are disparaged or set aside, carry away with them all that makes it worth while for a Saviour to have suffered. If these better times should come round again, how will men blush to think that they wasted precious time in discussing the probability of the Deluge—its extent in space, or its compatibility with facts of science—before they had yet laid to heart its solemn lessons, and learnt from it what sin is, in its character and in its consequences!

I. First, then, regard the record before us as a history: a history having a twofold aspect: an aspect of judgment, and an aspect too of mercy.

1. "God," St. Peter says, "spared not the old world." He "brought in a flood upon the world of the ungodly." He who made can destroy. He who in the beginning "divided the waters from the waters" can break up the fountains of the great deep, and open again the windows of heaven at his pleasure. The machinery for so doing is in his hand. The Creator must be the Owner, and the Owner of all things can unmake or remake all things at his will.

The Flood was a judgment. The record of it is "written for our admonition, upon whom the ends of the world are come."

When sin reaches a certain point, it demands the interposition of God. It is so in individual life. "God is provoked every day." He is long-suffering and of great pity. He gives a thousand chances. He calls and calls again. He reproves gently. He rebukes sternly. He chastens tenderly. He smites severely. Every sinful career is marked by such gradations of discipline. At last the cup is full. Long trifled with, "God is not mocked:" and he who would not have Him for his Father must at last know Him as his Judge.

It is so with individual lives, and it is so with the life of communities and of the world.

Long did God strive, by conscience and by his Spirit, with that wicked generation to which Noah testified. Even when judgment was resolved upon, and its coming heralded, an interval (it would seem) of one hundred and twenty years was granted to mankind before its execution. "My Spirit shall not alway strive with man: yet his days shall be an hundred and twenty years." "The long-suffering of God waited," St. Peter says, "in the days of Noah." In the meantime, that sign might be added to prediction, and sight to hearing, a long-continued preparation made ready the Ark which was to save one family. "By it," by the Ark, Noah "condemned the world." By it he proved his faith, and by it he rebuked the obstinate infidelity of his generation. All that time, all those years, whosoever would might "hear and fear" and be saved.

And even when judgment fell; even when it was too late, either for the world or any of its inmates, to escape the punishment; yet a dark hint is given as to the difference between punishment and perdition; and St. Peter says again, that even "spirits in prison," "once disobedient in the days of Noah," received in their place of "safe keeping" a visit from the Saviour, preaching to them that Gospel which had comfort in it even for them, and showing that even a forfeited life, even a death incurred through sin, does not of necessity bring after it an everlasting damnation.

2. Thus the record of judgment passes on into a record of mercy. Like all God's judgments, it was tempered with mercy. St. Paul tells us of some persons in the Church of Corinth, who for a particular sin—that of profaning the Lord's Table—not only were "weak and sickly," but even "slept," were sick even unto death, "that they might not be condemned with the world;" that the destruction of the body might even (under grace) be the saving of the soul. Was it not thus—may not St. Peter's words imply that it was thus—with some at least of those who perished in the great Flood? Brought down at last to penitence and faith, by the very arrival of the mighty waters; crying to God at last in deep contrition as they were swept to ruin; even for them, for some of them, there may have been mercy still, and a life lost here may have been found there.

But certainly towards the one righteous house mercy triumphed over judgment.

How wonderful the record of that Divine tenderness which guided and watched over the seed of the new world! How minute the providence, how strong the protection, how sufficient the provision, how sure the salvation! "Come thou and all thy house into the ark. . . . The Lord shut him in. . . . The waters increased and bare up the ark. . . . And the ark went upon the face of the waters. . . . Noah only remained alive. . . . God remembered Noah. . . . And God made a wind to pass over the earth, and the waters assuaged. . . . And the ark rested in the seventh month, on the seventeenth day of the month, upon the mountains of Ararat. . . . And God spake unto Noah, saying, Go forth of the ark. . . . Bring forth with thee every living thing that is with thee. . . . Be fruitful, and multiply, and replenish the earth." And when Noah builded an altar unto the Lord, and offered burnt offerings on the altar, then the Lord (it is written) "smelled a sweet savour, and said in his heart, I will not again curse the ground any more for man's sake; for the imagination of man's heart is evil from his youth; neither will I again smite any more everything living, as I have done. While the earth remaineth, seed-time and harvest, and cold and heat, and summer and winter, and day and night shall not cease."

And they have not ceased. Four thousand years have set their seal to the promise, and ratified the new charter of the Creator to his restored and renewed earth. We, my friends, live under that charter still, and it has never failed us nor been broken yet!

And thus that mercy which had been shown in preservation was shown also in reconstruction.

No revelation (it has been well said) could have been at that moment so reasonable, as one which renewed to the survivors of the Deluge the possession of Creation gifts. What must have been the misgivings, the right and reasonable misgivings, of that little band, emerging from a year's imprisonment upon a scene desolate and without inhabitant, as to the hopes and prospects of a race once given up to so fearful a judgment? Nothing less than the express word of God Himself could have given them courage to begin again, under circumstances so discouraging, the daily round of toil, and the weary struggle with an earth now doubly barren. That word was not withheld: at that moment it was the best of Gospels. "Be fruitful, and multiply, and replenish the earth: and the fear of you and the dread of you," few and feeble as you may count yourselves, "shall be upon every beast of the earth. . . . Every moving thing that liveth shall be meat for you. . . . Bring forth abundantly in the earth, and multiply therein. . . . And I, behold, I establish my covenant with you, and with your seed after you. . . . Neither shall all flesh be cut off any more by the waters of a flood. . . . When I bring a cloud over the earth, the bow shall be seen in the cloud, and I will remember my covenant." Yes, that secure replanting in a forfeited inheritance was the one first want of the failing spirit of the faithful few.

And now a fresh start is given to the human being. Warned and solemnized and comforted, he is set again to his task, of being God's representative to his lower creation, God's king and God's priest upon the earth given back to him. Who has not had occasion to thank God for such an opportunity, on a humbler scale, in his own little life? When, as children, we have been brought to a due sense of some childish transgression; when we have been made at last to feel that we were in fault, and a parent's forgiveness has set its seal to a parent's correction, and we are taken back into favour, tried again and trusted, loved again and loving, to be as before and to do (we hope) better; who does not look back upon such a moment as one of the purest and tenderest of all his recollections, a very token and glimpse and foretaste of heaven? Such was the mercy shown in the history before us. Alas! how soon to be overcast! how soon to be disappointed, forgotten, and sinned away! O these fresh starts, so often vouchsafed to us; these opportunities of beginning anew and of perfecting reformation; how vain, how profitless, how condemning! even like that departure, from his home in the soul, of the evil spirit, to be followed, after brief pause and respite, by a return in sevenfold force to the merely "swept and garnished" dwelling! The mercy is God's: the loss is ours!

II. We have spoken of the Deluge as a fact in history; having an aspect of judgment, and an aspect of mercy. We have now briefly to think of it in its uses; as a type, as a prophecy, and as a warning.

1. St. Peter, in a passage of his First Epistle, already referred to for a different purpose, speaks thus of the typical character of the event now before us. He speaks of those "who sometime were disobedient, when once the long-suffering of God waited in the days of Noah, while the ark was a preparing, wherein"—or rather, "into which (ark) few, that is, eight souls, were saved through water: the like figure whereunto, even Baptism"—or more exactly, "to which" water, the water of the Deluge, "answering," corresponding, as the antitype to the type, "Baptism doth also now save us; not the putting away of the filth of the flesh, but the answer of a good conscience toward God;" not the mere outward washing, but the confession of a true believing heart; "by the resurrection of Jesus Christ."

That water through which Noah and his family passed into their Ark—for already it was beginning to rise around them when at the last moment they entered its sheltering refuge—was like the water of holy Baptism, through which a Christian, penitent and believing, finds his way into the Church of the living God. Through the water of Baptism, in obedience to our Lord's charge and command, we pass into that Holy Catholic Church which is the house and family of God. Only, St. Peter says to us, rest not in the form—in the outward application of the sacred water—but see that you have the heart of Baptism also. See that you believe in Jesus Christ with all your heart, and confess Him honestly with your lips and in your life. Then shall you be safe in the refuge of a Saviour's body, even as the one chosen family was borne up in its Ark above the surging waters. So shall you pass securely "the waves of this troublesome world," and reach finally "the land of everlasting life, there to reign with Christ world without end."

2. Such is the Flood as a type. The same Apostle exhibits it to us also as a prophecy.

He speaks in his Second Epistle, written at the close of life, of certain scoffers who should come in the last days, walking after their own lusts, and saying, "Where is the promise of Christ's coming? for since the fathers fell asleep all things continue as they were from the beginning of the creation." Now, St. Peter says, it is their own fault if they cannot read more truly the lesson of the Deluge. They ought to know that the heavens and the earth were originally so constituted by the word of God, as to make a Deluge possible. The earth was first brought to consistency out of and by means of the water of Chaos, and by the arrangement then made the same water was ready (as it were) for that work of judgment by which the old world was punished for sin. If they had remembered this, he says, they would have been prepared for that other revelation, which destines the element of fire, in its turn, to be the agent of a final and more fearful judgment. "The heavens and the earth which are now, by the same word are kept in store, reserved unto fire against the day of judgment and perdition of ungodly men." Let them remember that God measures not time as we measure it: "one day is with him as one thousand years, and a thousand years as one day." Delay, as men count delay, is no proof of uncertainty. "The Lord is not slack concerning his promise." Rather He "is long-suffering to us-ward, not willing that any should perish, but that all should come to repentance." But, though it tarry, yet "the day of the Lord will come, as a thief in the night." Then shall the very "elements melt with fervent heat;" "the earth also and the works that are therein shall be burned up."

Such is the prophecy. The Flood of waters becomes in its turn the prediction of a last flood of fire. He who foretold the one—and notwithstanding long delay the word was fulfilled—may be believed when He threatens the other, and no pause or respite can defeat the certainty of the performance.

"Seeing then that all these things shall be dissolved, what manner of persons ought ye to be in all holy conversation and godliness!"

3. Finally, there is one special warning appended by our Lord Jesus Christ Himself to the Scriptural record of the great Deluge.

"As the days of Noah were, so shall also the coming of the Son of Man be. For as in the days that were before the flood, they were eating and drinking, marrying and giving in marriage, until the day that Noah entered into the ark, and knew not until the flood came, and took them all away; so shall also the coming of the Son of Man be." A state of general unconcern is no security against the coming of the day of judgment. On the contrary, it is a predicted sign. The Flood is in this point also a type of the last judgment. The inhabitants of the earth saw no danger. To them, as to us now, all things seemed to be as from the beginning. In one respect even more so: because they had not yet, as we have, proofs of the Almighty power of God to punish. Their fate is written for our admonition. By so much less is our excuse for carelessness than was theirs. But in this we are alike. Everything speaks of security, save just one thing only. Long continuance, uniform experience, this points to safety. Generation after generation has lived out its appointed time, and known no sudden shock of judgment. Nature runs its daily, its monthly, its yearly round: seed-time and harvest, summer and winter, fail not in their revolutions: surely the laws of the universe are constant, and the more we learn of them the more constant?

Yes, all is safe for us in our carelessness—except one thing.

The men of Noah's generation had heard him speak of a threatened destruction: he had called to them in the name of his God and theirs, and nothing had yet come of it.

When they saw him building his Ark, well might they scoff and ridicule his credulity: the laugh was still with them—he was the visionary, he was the enthusiast. Not until the one hundred and twenty years reached their destined end; not until the flood-gates of heaven were actually broken up; did they begin to suspect that there might have been something in it after all! Eating and drinking, buying and selling, planting and building, marrying and giving in marriage—even thus did they spend their last days of reprieve, and knew not until the Flood came and took them all away!

And we, my friends, like them, have everything, save one only, in favour of confidence and of carelessness. That one thing, for us as for them, is just the word of God: his prediction, his solemn warning, of a judgment to come. It speaks to us in a Book which may be disregarded; sometimes in a Sermon which may be criticized or talked away; sometimes in a voice within, echoing the revelation, but still in a tone which can be silenced, which is daily silenced in a thousand hearts. And there is this also: the revelation of judgment, in our case, fixes not the day nor the year; declares it to be indiscoverable; warns us that it may be remote; in the same degree, no doubt, encourages the thoughtless in their thoughtlessness!

Yes, Christian friends; but "in the end it shall speak and not lie." "The vision is yet for an appointed time"—and we know not the time within a century nor within a millennium—"but in the end it shall speak and not lie!"

"Though it tarry," then, "wait for it!"

But we live, as that doomed generation lived of old, in all the occupations of a busy, a distracted, or a tranquil being; carry on the work of life—and we do well to do so; enjoy the pleasures of life—and, if God were in them for us, this too were well; exercise the affections of life, wind them round our very hearts, and scarcely admit the possibility of replacing one of them by that which is Divine. In the midst of all these things, without further notice, will come, for us, as for them of old, the revelation of a searching and a consuming judgment. "As the days of Noah were, so shall also the coming of the Son of Man be." O, my friends, "who shall live when God doeth this?" Which amongst us is ready, either for the summons to go, or for the cry, "He comes?" Which amongst us is ready? Let the question prompt self-examination, quicken prayer, consecrate common duties, and break off (by God's grace) some obstinate sins!

"The Lord shut him in." Then he was safe: and he knew it. Let us seek the same grace, enter the same refuge, and we too shall be found of Him in peace, believing, watching, resting, safe!

DAWN.

In the cool star-glimmer, night's dream of dawn,
When dew-bells blink'd upon the lawn,
I rose ere yet the lark's keen eye
'Twitch'd to the subtlest rift in the sky.
Downward I went by a forest way
Companionless, to an ocean bay:
And all around the stillness hung
Like silence on a prophet's tongue—
Which may not speak the thing it knows
Till God's fire on the altar glows—
And I, alone of human birth,
Seem'd all that walk'd the soundless earth.

In the blanket of her wing the wren
Slept far within the forest ken:
The sinless mouse, in her hollow sod,
Lay safe as in the breast of God:
In honey-golden cell, the bee
Humm'd in a dream of melody:
And other tiny pensioners lay
Under the veiling mists till day.

Nor innocent things alone, but those
That make all living else their foes,
Were caught by the opiate clouds that fall
With the shadowy eve on the eyes of all.
The subtle snake lay coil'd at ease
By the cedar's many-cycled knees,
Acting perchance, in his chamber'd brain,
The drama of Paradise again;
Cheating once more with golden lie
The mother of all humanity:
The tiger slept in his bosky land,
Dark, like an inky smouldering brand,
Which, touch'd by the faintest gleam that came,
Would leap to life like a living flame:
Old eagle, with talons and beak of blood,
Brooded above the plunging flood,
Fix'd as from all eternity,
God of the moaning mystery:
Under the billow, in caverns dark,
Hung suspended the long keen shark,
Till ocean should open his blood-red eye—
To dart at the white ship sailing by.

The forest was pass'd; I reach'd the bay,
Haunted by silence all the way:
The far-borne murmur of the deep
Waked not the sleeping land from sleep:
The music of that tremulent noise
Seem'd audible without a voice,

According sweetly with the chime
That haunts the solemn calms of time.

Low-eastward, where dim ocean flows,
Swift points of glimmering spears uprose,
And up the shadowy lanes of light
Vanish'd the fawn-like stars in fright.
But stilly the forest began to stir,
With stealthy wings in oak and fir;
And round about each wrinkled root
Whisk'd horny claw and woolly foot;
Out of her blanket peep'd the wren,
With eyes like the eyes of fairy men;
The innocent mouse on nature's quest
Crept from her Maker's genial breast;
Forth from his citadel strumm'd the bee
Blowing the trump of industrie:
The tiger, at the lark's sweet note,
Woke with a bloodhound at his throat,
And shot at space with a burning mouth,
And dropt like a star in the sedgy south;
Out of his coils, as from an abyss,
Flash'd the old snake with a startled hiss,
And, chased by the ghost of his vision, fled
As if some heel had bruised his head:
A motion I saw on the motionless sea,
Rushing between the dawn and me,
Silent and black as an upturn'd keel,
Swift as death on an edge of steel—
'Twas the shark who follow'd in hungry joy,
A ship with a death-doom'd sailor boy:
The eagle, melancholy shape,
Fatelike, calm on the shadowy cape,
Oped an unfathomable eye
Full on the dawn's grey-vizor'd spy,
Then rose on wide heroic wing,
Making the cool air quiver and sing,
And upward wheel'd through many a spire,
To bathe in the solar surge of fire.

Morn on the sea! morn on the land!
Light floweth from a fountain'd hand:
We have lain in the grave of the faithful night,
And now we are clothed with the beauty of light.
Lord, when we have lain in Thy Dark and Thy Death,
Vouchsafe us Thy Love, and Thy Light, and Thy Breath!

WILLIAM FREELAND.

EASTWARD.

By THE EDITOR.

VI.—JERUSALEM (WITHIN THE WALLS).

"I SEE your next article is to be about Jerusalem," remarked to me, the other day, a grave and kind friend, who I really believe is benevolent enough to read my papers; "and of course," he continued, "you will be very serious now, and have no more jokes." "It is not my habit," was my reply, "to arrange beforehand when I shall laugh or weep; or at what point in my journey I shall smile or sigh: these emotions must come and go as the soul listeth." "No doubt, no doubt," my friend said; "but——" and he paused as if in difficulty. "But what?" I inquired. "At Jerusalem, you know, one must be cautious. It is a peculiar place—very. Excuse me, but I thought I would take the liberty of giving you the hint. Not that *I* care; but there are people, you know —people who have odd notions—people who—who——" "I understand," I said. "I am glad you do," he continued, as if somewhat relieved; "for there are people who—who—yes, good people, and sensible people too—who do not understand a clergyman if he——but I see you understand what I would be at, and I need say no more." Then turning round, he added, "*I* don't myself object to a joke at all, even in Palestine; but there are people who—you understand? Good bye!"

Yes, I quite understood my friend, as well as the good people whom he described with so much clearness.

I remember a lady, whose mind was engrossed with the question of the return of the Jews to Palestine, being dreadfully shocked by a religious and highly respectable man, who presumed to express the opinion in her hearing, that the time was not far distant when there might be a railway from Jaffa to Jerusalem, and the cry be heard from an English voice of, "Bethlehem Station!" The fair friend of Israel thereupon drew herself up indignantly and exclaimed, "Pray, sir, don't be profane!" The unfortunate friend of progress went home that night under the impression that, unknown to himself, he had hitherto been an infidel. Now who could joke about anything in Palestine with such a fair one as this for his reader?

Again, a relative of mine who visited Jerusalem a few years ago, met there a sea-captain and his wife. The vessel, a collier from Newcastle, which the former commanded, or possibly the latter, from her manifest influence over her husband, had taken refuge at Jaffa, and the captain had been induced by his lady to come up to Jerusalem to see the sights. My friend one day noticed a serious controversy going on, in low whispers, between the worthy pair, and accompanied by most dramatic looks and words, in which the wife seemed to be pleading some point with her husband, in whom signs of suppressed wonder, obstinacy, and anger, were alternately manifested. Thinking they had got into some perplexity from which he might be able to relieve them, my friend meekly offered his services. "Thank you, sir, most kindly," said the lady. "But I am really provoked with the captain; for he is, I am ashamed to say, sir, quite an unbeliever." "Humbug, my dear!" interrupted the captain. "No humbug at all, sir," replied his mate, addressing my friend, "but wery expensive unbelief too, I do assure you; for what is the use, I'd like to know, of one's paying a guide for showing you all them famous places if one does not, like the captain, believe what the guide says?" "Easy, my dear," protested the honest sailor, laying his hand quietly on his wife's arm; "I knows and believes as well as you do the Scripturs, and knows that all them places are in the Bible; but don't let any of them guides come it over me so strong with their lies, and tell me that that hill is the Mount of Holives, and that other place the Holy Sepulchre, and Calvary, and all that sort of thing. I came here to please *you*, Anne Jane, but not to have all those things crammed down my throat; so belay. I'll pay for *your* sake, but I won't believe them Jews: I knows them far too well; you don't!" Whether the captain was ever able to square the actual Jerusalem with his ideal one, I know not.

Now these stories, literally true, only illustrate in a ludicrous form the fact, that many people have, like the captain, a Jerusalem of their own—full of the beautiful, the sacred, the holy, and the good—but which is no more like the real Jerusalem than is the "New Jerusalem;" and hence, when they visit Jerusalem, they are terribly disappointed; or when any traveller who has done so, describes it as he would any other city, and admits that he has felt some of the lighter and more ordinary emotions of humanity in it, it looks to them almost like profanity, or what some people call, with equal wisdom, "irreverence."

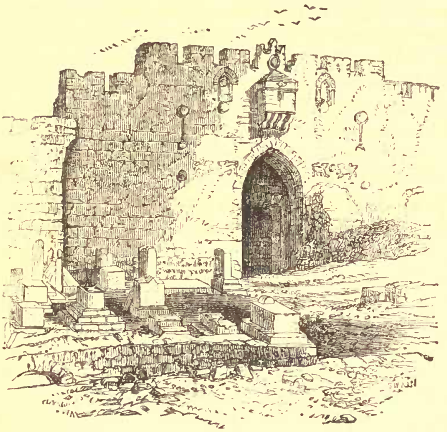
But after all there needs no effort to "get up" feeling in Jerusalem. It has no doubt its commonplace, prosaic features, more so indeed than most cities of the Eastern world; but it has its glory, its waking-dreams, its power over the imagination and the whole spirit, such as no city on earth ever had or can have. Therefore I shall tell what I saw and felt in Jerusalem, how sun and shade alternated there, how smile and tear came and went in it, just as I would when speaking of any other spot on this material earth.

Yet I entered Jerusalem with neither smile nor tear, but with something between the two; for I had no sooner doffed my tabousch in reverence as I passed through St. Stephen's Gate and experienced that queer feeling about the throat which makes one cough, and dims the eyes with old-fashioned tears, than my horse—very probably owing to my want of clear vision—began to slide and skate and stumble over the hard, round, polished stones which pave or spoil the road. I heard some of my companions saying, "Look at the Pool of Bethesda! See the green grass of the Temple Area! We are going to enter the Via Dolorosa!" but how could I take in the full meaning of the words, when with each announcement a fore-leg or a hind-leg of my horse went off in a slide or drew back with a shudder, and when the horrors of broken bones became so present as for a moment to exclude all other thoughts? "Such is life," as the saying is. And such were the prosaic circumstances of my entrance into Jerusalem. I tried, however, to make them more harmonious with my body and mind, by descending from my horse, handing him to Mecki, wiping my brow, and begging my brother to repeat some of his information, while I sat on a portion of an old wall to listen.

Within a few yards of the Gate of St. Stephen, by which we entered, there was a large square space, into which we looked. It is a large tank, about 365 feet long, 30 broad, and 50 deep, with high enclosing walls, and is called the Pool of Bethesda. The bottom is earth and rubbish; but the ledge is sufficient, along its northern slope, to afford room for a half-naked Arab to plough it with a scraggy ass. Its porches and everything like ornament are gone, and nothing remains save the rough walls of this great bath. Some say it was the ditch of the fortress of Antonia; but we do not enter on such questions.



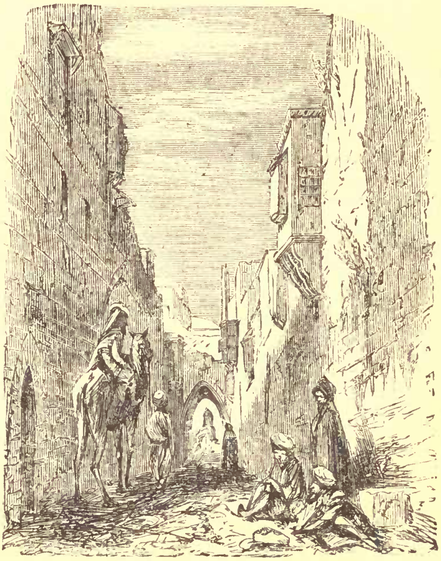
J. Graham, Photo.

St. Stephen's Gate.

Turning the eyes to the left you see, about fifty yards off along the city wall, southward, a narrow gateway opening into bright green grass, looking fresh and cool. That is one of the entrances into the Haram Area, or the wide, open space where once stood the Temple. But we dare not enter it at present, for it is holy ground, and we must get a letter from the Pasha, and pay him a good "backsheesh" to secularize the spot sufficiently to admit us. We shall pay for the privilege, and visit it by-and-by. In the meantime let us walk to the hotel. Our path is along the so-called "Via Dolorosa." This is a narrow street, roughly paved, and hemmed in with ruined walls sadly wanting in mortar. In some parts there are arches overhead, and many delightful studies of old houses and ancient mason work, which, by the way, a young lady was sketching as we passed, seated on a camp stool, with a white umbrella over her head. How one's thoughts went home to the happy English fireside, with Paterfamilias, and brothers and sisters, looking over her drawings!

One repeats to himself as he goes along this street, "The Via Dolorosa!"—words so full of meaning, but which the street does not help to interpret; unless from its being, as seen "in the light of common day," a tumble-down, poverty-stricken, back lane, without anything which the eye can catch in harmony with the past.

Was this the real "Via Dolorosa?" But we must not begin with our scepticism as to places, or encourage those "obstinate questionings" which constantly suggest themselves in Jerusalem. "The Church," no doubt, makes up for the silence of authentic history by supplying, out of her inexhaustible store of traditions, a guide to pilgrims, which enables them to see such holy spots as the following:—"The window in the 'Arch of Ecce Homo,' from which Pilate addressed the people!"—"the place where Pilate declared his innocence,"—"where Jesus stood as He addressed him,"—"where Mary stood near Him as He spoke,"—the several places "where Jesus fell down under the weight of the cross,"—"the spot where Simeon had the cross laid upon him," &c. &c.* All Jerusalem is thus dotted by the Church with fictitious places, "in memoriam," to excite the devotion of the faithful. To their eye of "faith" the Via Dolorosa is necessarily a very different street from what it can possibly be to us whose "faith" is not quite so firm in tradition.



Via Dolorosa.

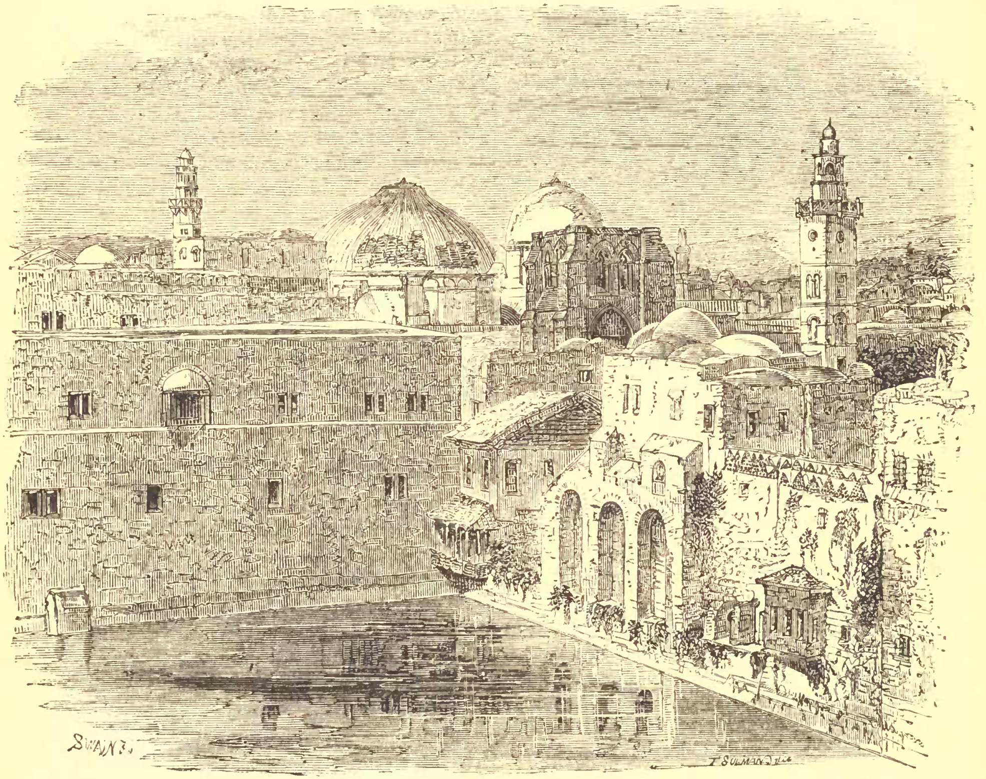
After leaving the Via Dolorosa we passed through the bazaar, but it is poor, squalid, and unworthy of any particular notice, after those of Cairo, or even Alexandria. There was the usual narrow path between the little dens called shops, with the accustomed turbans presiding over the usual wares,—shoes, seeds, pipes, clothes, tobacco, hardware, cutlery, &c., while crowds moved to and fro wearing every shade of coloured clothes, and composed of every kind of out-of-the-way people, Jews,

---

* All such places are carefully noted in the lithographed "Album of Jerusalem," (from photography,) published by Zoeller, Vienna.

Turks, Greeks, Bedaween, with horses, asses, camels, all in a state of excitement.

We then went to an hotel to call for a friend. How shall I describe these so-called hotels? I cannot indeed now separate in memory one hotel from the other—and there are but three in Jerusalem. They are, however, wonderfully confused and picturesque, with their rooms, corners, passages, outside stories from floor to floor, giving endless peeps of open sky, with balconies and flat roofs, all huddled together like a number of hat-cases, or band-boxes, and approached, not as in other countries by an imposing door, over which hangs an enormous gilt sign of the Golden Bull, or Spread Eagle, or by an open court, beyond which drays, gigs, and carriages are seen, but by a steep, narrow trap-stair, which ascends from a door in the street, but which is more a slit in the wall than a door, and might conduct from a condemned cell to the gallows. This sort of architecture is very characteristic of a country where, in a moment's notice, or without it, the orthodox descendants of the Prophet might take it into their turbaned heads to gain heaven by attacking the hotel, under the influence of some fanatical furor. "There is no saying!" as the cautious and timid affirm when they expect some mysterious *doing*. And thus the steep stair rising from the narrow door, would act as a mountain pass for the defenders of the hotel; while the more extended battle-field of the open spaces above, overlooked by upper stories like overhanging precipices, would become strategic points of immense importance. The "travellers' room" in this hotel is not unlike what one finds in small country inns in Britain. The back windows are in a wall which forms one of the sides of the "Pool of Hezekiah!"—so-called. There the old reservoir lay, immediately beneath us, with its other sides formed by walls of houses, their small windows looking into it just as the one did I gazed through. It was an odd association, when one withdrew his head and surveyed the room, to see placards on the wall advertising "Bass" and "Allsopp." No wonder the captain was sceptical as to his being in the Holy City of his early associations!



J. Graham, Photo.

The Pool of Hezekiah.

My first desire on entering the hotel was to ascend to the uppermost roof to obtain a glimpse of the city. I was enabled to gratify my wishes, and to see over a confusion of flat and domed buildings, pleasantly relieved here and there by green grass and trees. The elegant "Dome of the Rock" rose over them all, while above and beyond it was the grey and green Mount of Olives, dotted with trees. To take in this view at first was impossible. One repeated to himself, as if to drive the fact into his brain, or as if addressing a person asleep or half idiotic, "That is the Mount of Olives! that is the Mount of Olives! Do you comprehend what I am saying?" "No, I don't," was the stupid reply; "I see that hill, and hear you repeat its name; but in the meantime I am asleep, and dreaming; yet, as I *know* that I am asleep, perhaps this half-intelligent consciousness hopefully prophesies a waking up."

Before going to our own "khan," we went to the post-office, for letters from home. It was a queer sort of cabin, and was reached by a flight of outside stairs rising from the street leading to the Jaffa Gate. Letters from home! Were you ever abroad, reader? If not, you cannot understand the pleasure of getting letters. It reminds us of the olden days when we left home for the first time. One of the blessings of travel is the new world, or rather series of worlds, into which it introduces us,—worlds no doubt of human beings singularly like ourselves; but yet to whom our whole circle of ordinary thought, and the ten thousand things which we believe, do, suffer from, or hope for,—all are utterly unknown and uncared for, just as the troubles of the landlord of a Jerusalem hotel are unknown to Lord Palmerston, and disturb not his repose. But this feeling of being the inhabitant of another world only enhances the delight of receiving letters from our old world, detailing the characteristic sayings and doings of the circle, smaller or greater, round the warm centre of that blessed spot called our fireside. It is singular how hazy many of our friends become in a few weeks. Old neighbours become myths, and local disputes faint echoes from a pre-existent state of being.

Letters read, and good news received by all, we went to our hotel, which from a small board a foot or so long, nailed over the narrow door, we discovered to be "The Damascus." Hadji Ali had procured for us three rooms on the first landing, which opened on a paved court whose roof was the glorious sky. The rooms were vaulted, clean, and comfortable, and not intolerably muggy. The beds had mosquito curtains, and the floors were flagged. The supply of water from a pump near our doors was unlimited. Our retainers had a space allotted to themselves, where they squatted like gipsies, cooked for us in the open air, and lived very much as they would have done in the desert. Meeki and his muleteers were the only absentees, and where they lived I know not. Very probably it was in the stables with their horses and asses, whose sleep they would no doubt disturb. Hadji and his coadjutors, Nubi the waiter and Mohammed the cook, took the sole charge of us while in this domicile; so that I do not know whether there were any persons in the hotel in the capacity of host or waiters. There were among its inhabitants an English party, whose orthodoxy we can certify from their rising early, sometimes before the sun, to discharge their religious duties in the church of the Holy Sepulchre. Among them was an intelligent, agreeable, and pious High Church clergyman. They were housed in places reached by outside stairs, somewhere among the highest roofs of the many-roofed building. On the evening of our arrival, I climbed over their apartments, ascending to the highest point by a ladder, and from thence I again saw Olivet, just as the last rays of the sun were colouring it with a golden hue, and making the Dome of the Rock sparkle with touches of brilliant light. And from the same spot I saw it immediately before sunrise next morning, when the silence of the city, and the freshness of the air, and the shadows cast from the hill, gave it a quite different, but equally fascinating aspect. And thus slowly, but very surely, I began to *feel* that this was indeed the real Mount of Olives!

Never did I retire to rest with deeper thanksgiving than on my first night in Jerusalem. Ever and anon as the mind woke up, while the body gradually sank into repose, the thought, "I am in Jerusalem!" more and more inspired me with a grateful sense of God's goodness and mercy in having enabled me to enter it.*

Before saying anything of next day's visits, I must declare that I abjure all discussions, with a few exceptions afterwards to be noticed, as to the antiquities of Jerusalem; and shall give no opinion on any of its old walls, first, second, or third, nor upon the value of this or that closed-up archway or crumbling ruin. Like most travellers I had "crammed" to some extent before leaving home, and brought a box of books with me, and sundry articles and pamphlets to "study" on the spot. But finding my time short, and impressed with the utter impossibility of forming a sounder opinion on controverted questions in Jerusalem than in my own room at home, I vowed to separate myself from any of the party who mentioned "the tower Hippicus"—one of the bones, a sort of hip-joint, of great importance, and of great contention, in the reconstruction of the old skeleton. I preferred to receive, if possible, some of the living impressions which the place was fitted to impart; to get, if possible, a good fresh whiff from the past—an aroma, if not from Jerusalem, yet from Nature, unchangeable in her general features, as revealed on the slopes and in the valleys of Olivet, or in the silent recesses around Bethany. I succeeded in doing so, at least to my own satisfaction, from the moment I cut the tower Hippicus.

One word more of preliminary remark. Within the walls—if we except perhaps the Temple Area, that one grand spot of surpassing interest in Jerusalem—there is not a street which either the Saviour or his Apostles ever trod. The present roadways, if they even follow the old lines, are above the rubbish which "many a fathom deep" covers the ancient causeway. There is not one house standing on which we can feel certain that Our Lord ever gazed, unless it be the old tower at the Jaffa Gate. So let us for the present dismiss every attempt to associate *that* past with "the Jerusalem which now is." We may feel disappointed at this, yet I believe that it is so. The heavens above and the hills around, not the streets beneath, are the same.

---

* It may be worth mentioning that the only sound which broke the stillness of the night was the crowing of cocks. This never ceased. It is evident, therefore, that the hour when Peter betrayed our Lord cannot be fixed by the cock crowing.

It is modern Jerusalem, then, which in the meantime we must glance at; and the first place which naturally attracts us is the Church of the so-called "Holy Sepulchre."

We enter an inner court by a narrow doorway. Squatted on every side are rows of Easterns, who are selling, with well-defined profit-and-loss countenances, all the accompaniments of "religious" worship—beads, incense, crucifixes, pilgrim shells, staffs, &c. &c.; while a ceaseless crowd from all lands is passing to and fro. What the outside of this church is like, the accompanying illustration will tell better than any mere description.

Now we must understand, first of all, that this church is a very large one, so that under the one roof are several chapels in which different "communions" worship. These do not of course call themselves "sects," for that would look as if the one true Apostolic Church could be divided. Each church only calls every other a sect. But while there is this one true, Apostolic, Catholic Church, as distinct from the sadly divided Protestant Churches, yet a Protestant, much more an unfortunate Presbyterian, may be pardoned if he does not at once discover the fact when he enters the building—the only one, be it remembered, in universal Christendom where "Apostolic" churches meet under one roof, to find their unity, as some allege, or their differences, according to others, around the tomb of Christ. The Greek Church, "Catholic and Apostolic," representing, as it does, some eighty millions of the human race, has its chapel, adorned with barbaric splendour, in the centre, where it claims the sole privilege and honour of receiving once a year from Heaven, and of transmitting to the faithful—that is to the Greeks—miraculous fire representing the Holy Spirit. The Latins, as they are called in the East, the Catholics, as they call themselves, or the Papists, as some presume to call them, also have a chapel and service, and loudly profess a very supreme contempt for the Greeks and their base superstitions—as if they themselves were perfectly innocent of such infirmities, and as if they had not for centuries, until they lost the privilege by accident, shared in the rites and gains of this Holy Fire! The Greeks retaliate by expressing feelings of dislike and horror at "the image worshippers." The Copts and Armenians, as members of the one undivided Church, have also their chapels, whose size bears a relative proportion to the number of their followers. I have heard, I think, of one or two other "Catholic

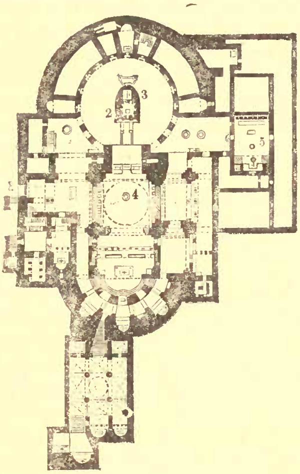
The Old Tower at the Jaffa Gate and the Citadel.

and Apostolic Churches;" but these were not represented here. But, apart from possible ecclesiastical reasons, there is really no room for them. For as the church now stands, there is sufficient space for the worship of those who possess it; but they are sometimes inconvenienced for want of room when a stand-up fight takes place, and a ring cannot be formed. At the entrance of the church, seated on a divan to the right, are a few respectable, quiet-looking Turks, who stroke their beards, smoke their pipes, and are most benevolent, *douce*-looking men. They are ready at any moment to show their kindness, at the risk of their turbans or even their lives, by throwing themselves between the various Orthodox Christians as they fight their fight of faith with each other even unto death.*



Ground Plan of the Church of the Holy Sepulchre.

1. Principal Entrance.
2. Chapel of the Angel.
3. Holy Sepulchre.
4. Greek Chapel, and "Centre of the Earth."
5. Latin Chapel.

Now, whatever amount of real evil may exist from the outward divisions, chiefly as to forms and government, in the Protestant Church, we can hardly conceive it culminating in jealousy, hate, and constant war, ending sometimes in those bloody battles which are witnessed at the only spot on earth where, from close personal contact, the "unity" of the "Holy Orthodox Churches" is fairly tested. We fancy that the "Moderators" of Presbyterian Assemblies, and the "Presidents" of Wesleyan or Congregational conferences, could meet with the Archbishops of the Church of England without giving one another bloody noses, or having a fight with sticks or mitres such as Donnybrook Fair, with all its Bacchanalian orgies, never witnessed. Our principles may not possibly be so orthodox, but our practices are on the whole more Christian. We are constrained, however, to admit that mere Protestantism is no security against the spirit of Popery, and that even Presbyterian may occasionally appear as "Priest, writ large." Yet after all, the amount of real evil resulting from our outward divisions, is immensely exaggerated, while the good arising from that exercise of Christian freedom and personal responsibility essential to true faith is forgotten.

Within this famous church, there are certain places and things shown, about whose authenticity all those witnesses for Catholic truth seem agreed. These are all connected with the last memorable scenes in the life and death of Him "who was the Truth." At the entrance of the church, for example, is a broad marble slab, where He was anointed for His burial. The Duke of Modena was kneeling and reverently kissing it as we went in. Close on the left is the spot "where Mary stood while the body was anointing;" and then upstairs and downstairs, in nooks and corners, amidst the blaze of lamps and the perfume of incense, here, and there, and everywhere, are other noteworthy places. What think our readers of such *real* spots as these:—"where Christ appeared to Mary Magdalene as the gardener;" and "to his mother after the resurrection;" and "where his garments were parted;" and "where He was mocked;" "where He was bound;" where "His friends stood afar off during the crucifixion;" "the prison where He was detained while waiting for the crucifixion;" "the holes in which the three crosses were inserted;" the very "rent made in the rock by the earthquake;" and "the place where the three real crosses were found" 300 years afterwards, the true cross being discovered by its working a miracle? All these "sacred spots" are marked by altars, crosses, &c. There are also to be seen in this marvellous museum the actual tombs of Adam (Eve unknown) and of Melchizedek, and of John the Baptist, and of Joseph of Arimathea; finally, of Our Lord. All these wonders are clustered round a spot which is in its way almost as great a wonder as any of the rest—"the centre of the earth!" One asks, with reasonable curiosity, whether "Protestantism," left to the blind guidance of its own erring private judgment of the Word of God, with the Holy Spirit as its interpreter, ever witnessed in any part of the earth to any falsehood, or any error, to be compared with those palpable lies which the "Orthodox" Churches ask us to accept, and this too beside what they believe to be the tomb of Jesus and the place of His crucifixion!

The Holy Sepulchre is not what many people suppose it to be. It is not a cave, or a hole in a rude rock; but a small marble chapel, which rises up from the flat stone floor.

The *theory* of this sort of sepulchre is, that the mass of the rock out of which it was originally hewn has been all cut away from around the mere slab on which Our Lord's body lay, leaving the slab or *loculus* only, and a thin portion of the original rock to which it adheres; just as we see a pillar of earth rise out of a flat in a railway cutting, marking where the original mass, of which it had formed a part, had been. In its present state, therefore, nothing can be more unlike a sepulchre than this. Not one atom of the original rock,—if it is there at all, which is doubted by not a few,—is visible, all being cased in marble. What a miserable desecration of the original cave, if it ever existed here! What are we to think of the taste, or judgment, of those who dared to apply hammer or chisel to the holy spot? It might with almost equal propriety be transported now to be exhibited in Paris, London, or New York. There is not a trace existing of its original appearance. This chapel of "the Holy Sepulchre" consists of two small apartments, neither of which could hold above half-a-dozen persons. The whole chapel is but twenty-six feet high and eighteen broad. The first small closet, which is entered between gigantic candlesticks, is called the Chapel of the Angel, as being the place where it is alleged the angel rolled away the stone, a fragment of which is pointed out. Within this, entered by a narrow low door, is the sepulchre. It is seven feet long and nine broad. The roof is a small dome supported by marble pillars. The marble slab, which, it is said, covers the place where Our Lord's body lay, occupies the space to the right of the door as you enter. Over it are placed a few most paltry artificial flowers in pots, with some miserable engravings, and votive offerings. Several small candles are always burning. The sale of these candles must yield a considerable revenue to the Church, as every pilgrim offers one, so that tens of thousands must each year be consumed. In addition to these candles, an immense number of gold and silver lamps—forty, I believe—are kept burning inside this small vault.

---

* At the famous Easter fight in the church, some thirty years ago, four hundred lives were lost!

I went on two occasions into the Holy Sepulchre. On the second, I remained in silence beside the attending priest for about a quarter of an hour, and was deeply interested in the pilgrims, who entered in a ceaseless stream to do homage to the sacred spot. They came in, knelt, kissed the stone, prayed for a second, presented their candle, and retired to make way for others. It was impossible not to be affected by so unparalleled a spectacle. These pilgrims had come from almost every part of Europe at least. Greeks from the islands and shores of the Levant; Russians from the far-off steppes of Tartary, clothed in their sheepskin dresses; French, Italians, Germans, and Portuguese, of every age and complexion; old men with white beards, tottering on their pilgrim-staffs; friars and monks, with such a variety of costume and of remarkable physiognomy as could nowhere else be seen;—faces stranger than ever crossed the imagination—some men that might have sat to an artist as his *beau idéal* of cut-throat pirates, and others who might have represented patriarchs or prophets; some women who were types of Martha or Mary, others of the Witch of Endor. The expression of most was that of stolid ignorance and superstition, as if they were performing a mysterious sacred duty; but of others it was that of enthusiastic devotion. I shall never forget one woman who kissed the stone again and again, pressing her lips to it, as if it were the dead face of her first-born. It was a touch of nature which made one's eyes fill, and was the most beautiful thing I saw in the church, except a fair child with lustrous eyes, who, indifferent to the grand spectacle of bishops and priests, was gazing at the light as it streamed through the coloured glass of one of the old windows.

It was strange to think of those people who had come such distances to this one spot. How many had been hoarding their little fractions for years to defray the expense of the long journey; how long they had planned it; how far they had travelled to accomplish it—that old Russian for example, with his big boots and hairy cap. What a thing this will be to them, when they go out of that door, and begin the journey homeward,—to tell all they saw, and to comfort themselves in life and death by the thought of their having made the pilgrimage and kissed the shrine! And stranger far to think of how this stream of superstition, custom, divine love, or call it what we may, poured on through that door for centuries before America was discovered, or the Reformation dreamt of. All thoughts of the more distant past were lost to me in the remembrances of the Crusades, and of old romantic ballads about the mailed men, the lords of many a ruined keep, from the banks of the Scottish Tweed to the castellated Rhine, whose silent effigies in stone, with hands clasped in prayer, have reposed for ages in gorgeous cathedrals, rural parish churches, and far-away chapels on distant islands. My mind was filled with stories that told of how they came to visit this spot, how they parted from their lady love, and travelled over unknown lands encountering strange adventures, and voyaging over unknown seas in strange vessels, with stranger crews; how they charged the Saracens in bloody battles, shouting their war cries, and at last reached—one in twenty perhaps—this spot so full to them of mystery and awe, here to kneel and pray as the great object and reward of all their sacrifices.

Historically, I must confess that I had no faith whatever in this being the true Sepulchre. Had I thought so, it would only have filled me with pain, and with a deeper longing to be able to lift those pilgrims up from the shadow to the substance; to remind them with the voice of a brother, "He is not here, but risen!" even while inviting them to "come and see the place where the Lord lay." Nor did I feel disposed to attach much moral blame to those who had long ago introduced this superstition. It is easy to realise the temptation, when teaching the ignorant masses, and attempting to interest them in an unseen Christ, and in spiritual worship, to supply them with a visible and sensuous religion of symbolism and relics, as a substitute for the reality, which it is assumed is too etherial for ordinary men to sympathise with. We know how

(From a Photograph by James Graham.)

all such human plans utterly fail. But perhaps we know this more from observing their actual results in Roman Catholic countries, than from any wisdom of our own. I do not therefore so much wonder at the original experiment, which was natural at least, as at the obstinate keeping up of it now that it has been found to sensualise instead of spiritualise the mind. But the presence of so much superstition filled me with unutterable pain. And perhaps the more so that it has been too long upheld to be now easily abolished,—lest in shaking the faith of the masses in this foolish dream we might shake their faith in the glorious reality. My displeasure at the spectacle may be thought by some to indicate the "irreverence" of a Presbyterian, unaccustomed to symbols and forms. For irreverence towards lies, I thank God! But even "reverence" has its own peculiar cant. And accordingly the Scotch peasant is often accused of "awful irreverence" merely for keeping on his old, oddly-shaped hat, when he enters a Scotch church—a relic this of an old protest against the folly of holy stone and lime—though he may be a peasant saint, a true temple himself of the Holy Ghost, fearing God, reverencing Him and His Word, guiding his life by its precepts, and drawing daily nourishment from its stores; while, on the other hand, the Italian bandit is thought "reverent" who pauses in drawing the trigger of his pistol because his kneeling victim names his patron saint; and a "Catholic nation," like Spain, is considered "reverent" in comparison with Protestant England, though she baptises her war ships "The Holy Ghost" (Spiritu Santo), or "The Holy Trinity" (Santissima Trinadada)! Reverence results from a sense of God's presence, and is a consequent worshipping of Him in spirit and in truth—and the scenes at the Holy Sepulchre did not impress me with its existence there.

In leaving it, however, I was comforted by the thought, that the Holy Spirit of God, who is perfect love and wisdom, and who dispenses His gifts and graces to every man as He will, can "fulfil Himself" in many ways, can discern and meet the truthful spirit seeking truth, and can impart the truth to it; and that, under wood, hay, and stubble, which are destined to be consumed, many a humble soul may here be building on the true foundation of faith in Christ alone. I also felt the awful responsibility attached to the blessed liberty which in God's gracious Providence Protestants enjoy; for Protestantism is not itself a religion, but is only the most favourable condition for obtaining religion, and for enabling us to *see* the truth, and to know and love God our Father in Jesus Christ our Saviour.

On the Lord's Day, I had the privilege of worshipping in the church presided over by the good Bishop Gobat. How pure, how simple, how true and refreshing was the service! It was not new to me. Though a Presbyterian, I had read it for months, long ago, abroad, to a congregation, and I have used it very often since then, in similar circumstances, while travelling. I have also read its burial service over the dead at sea. I have often communicated at the altar of the Church of England, with gratitude; and, in Jerusalem, I was thankful to worship with my brethren according to their forms. And which, I asked myself, was most in accordance with Apostolic practice—this, or that? the forms of the Church of England (and the same question could be asked by me with at least equal force of those of the Church of Scotland), or those of the Church of the Holy Sepulchre, with its incense, pictures, images, and mummeries? It has been asked which Church "the Fathers" of the earlier and middle ages would recognise as theirs if they rose from the dead and visited the Roman Catholic and Protestant churches? But what, I ask in reply, would have been the judgment of earlier and greater men,—the Apostles? What would St. Paul think? Would he recognise the Church of the Sepulchre as more in accordance with *his* Christianity and his habitual forms of worship, than Bishop Gobat's? Of which would he say, This reminds me of the early Church? It is impossible, I think, to doubt his reply. The Church of the Sepulchre would perhaps remind him of some of the features of the old Temple service which had passed away, with its attractiveness to the eye, and its "carnal ordinances," but not assuredly of *his* Apostolic Church. No, no! Let us have worship in spirit and in truth, freed from all that can hinder, but including all that can assist, the living spiritual man to hold direct communion through Christ with the living God.

There is one other spot within the walls of Jerusalem to which I would conduct the reader—yet with greater awe, with greater fear and trembling, from my feeling as to the unspeakable interest attached to it—and that is the Haram es Sherif, or the site of the old Temple, and, dare I add, of the *real* Holy Sepulchre?

It is but as yesterday—immediately after the Crimean War—that this sacred enclosure could be entered by any except Moslems, or those who cared to pass themselves off as Moslems at the risk of their lives. All, without respect of persons, but only of purse, can enter it now. There must no doubt be a few forms gone through, but these your dragoman manages; and they are not more serious than what travellers are familiar with in most European cities, when "orders" have to be obtained, and signed and countersigned by heads of Police or of Government, while the "guide" or "commissionaire" magnifies the difficulty of getting them, the secret in every case, East and West, being the old golden key—"backsheesh." To see the Temple Area the "backsheesh" is pretty heavy, amounting, as far as I can recollect, though I am not certain, to about 1*l.* for each traveller. But never was money paid with more good will than that which admitted us to the most memorable spot on the face of the whole earth.

The general shape of the Haram, or Temple Area, will be easily understood by the help of the accompanying plan. It is nearly a parallelogram, its greatest length being 1500 feet—rather more than a quarter of a mile—and its greatest breadth about 1000. It is surrounded on all sides by walls; some of them to the north and west serving also as walls of houses, which belong chiefly to civil or ecclesiastical officials. The east and south walls are also a part now of the city walls. Only a comparatively small portion of this great open space is occupied by buildings. About the centre is the Mosque el Sakrah (or "Dome of the Rock"), and at the south end the Mosque el Aksah.

The first thing that strikes one on entering this sacred spot is its profound repose. It is for the most part covered with grass, which is green and beautiful, even at this early season of the year. Various kinds of trees, chiefly the dark, tall cypress, are scattered through it. Oriental figures float about with noiseless tread. No sound of busy traffic from the city breaks the silence. All is quiet as if in the heart of the desert. The spot seems consecrated to meditation and prayer.

Ground Plan of the Haram es Sherif.

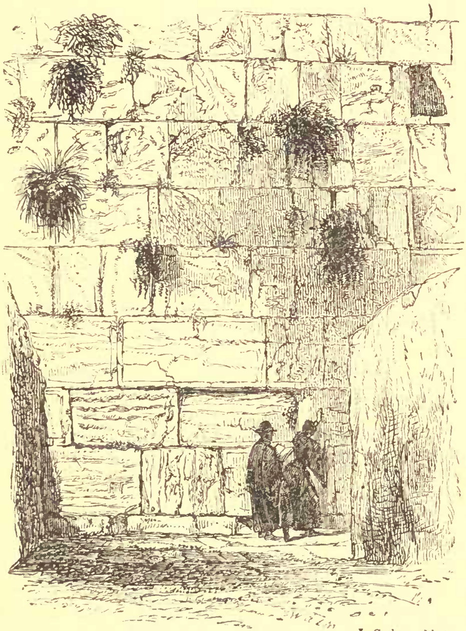
Most probably the first questions which those readers whom I chiefly address will ask is this—What of the old Temple? Can its site be determined? Are there any traces of it? Now I am glad to say that answers perfectly satisfactory—to me at least, and I fancy to all who will pay any attention to the inquiry—can be given.

Let my readers, in the first place, understand that no remains whatever of the old Temple exist above ground. Every atom of its dust, as far as we can discover, has been swept away from the surface of the earth as with the besom of destruction. Literally, not one stone has been left upon another. Nevertheless, its site can with almost perfect accuracy be determined. I will as briefly as possible endeavour to explain how.

There is no question whatever as to the Temple having been built *somewhere* within this space called the "Haram." We know also from Josephus, who is corroborated by other sources of evidence, that the whole area occupied by the Temple of Herod with its surrounding courts was a square of 600 feet. This fact is also, I believe, universally admitted. Now the question is, Can such a square be traced? Can we measure with any degree of certainty such a portion of this wide space as will entitle us to say, within this square of 600 feet once stood the Temple? I presume to affirm that we can do so, without any doubt or difficulty; and I hope that many of my readers, who have hitherto perhaps not paid any attention to this subject, will try to follow me as I endeavour to state the evidences which warrant this interesting conclusion.

We have, then, to search for this square, or for four sides of 600 feet each, which included the Temple.

Let us try if we can get one side first, and that may help us to the others. Now there is one corner of the wall surrounding the whole of the wide area I have spoken of which is an important starting-point in this inquiry. That corner is the south-west, which is marked A in the plan. The portion of the wall from A north to the "causeway" is very ancient. It is about 50 feet high on the outside, and is built of huge stones. There are four courses of these seen above ground, and the lowest corner-stone of them is 30 feet 10 inches, by 6½; while the others vary from 24½ and 20½ in length to 5 feet in depth. This wall is admitted to be old Jewish architecture. It is a portion of this wall, moreover, which is called "the Jews' wailing place;" for here may be seen every day some Jews kneeling in prayer towards the place where they believe their Temple once stood, and kissing those great stones; and so have they done, since the third century at least, and probably since their Temple was destroyed. Again, we know that from the end of one of the grand colonnades, or cloisters of the old Temple, there was a bridge which connected it with the city *to the west.* The site of that bridge is marked in the plan, for on that part of the same old wall Dr. Robinson discovered the spring of a huge arch, which unquestionably is the remains of this bridge. We are also informed by Josephus that the Temple was entered by two gates from the west. One gate in the wall we are describing was long ago discovered, and is known as the Gate of Mahommed. The other, we have no doubt, will soon be brought to light when the excavations are begun. Finally, there are the remains of an old causeway, which crossed the same valley, and *at this point* the old wall with the large stones terminates.

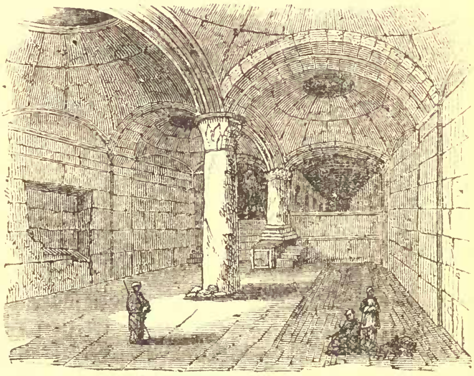


J. Graham, Photo.

The Wailing Wall.

Now let it be noticed that this same old wall, from the corner A to the causeway, including the remains of the old bridge, and the place of the Jews' wailing, and the two gates, is *six hundred feet.* Let this portion of wall in the meantime be assumed to be one side of the square which bounded the site of the old Temple; and let us search for another side.

We begin with the wall which extends from the same corner A along the south from west to east. That this is also a part of the old boundary wall of the Temple is almost certain, for two reasons:—first, that a portion of it is built of the same cyclopean stones (one of them being 23 feet long); and secondly, that there are in it the remains of a noble gateway, described by Josephus as being in *the south wall* of the Temple. To see it one has to enter it from within the Haram, as the gateway is built up from without. There is no monument of antiquity in Jerusalem so interesting as this. We have an entrance-hall about 50 feet long and 40 wide, and in the centre a column of a single block of limestone, 21 feet high and about 18 feet in circumference. The sides of this hall are built with huge stones. A flight of steps at the end leads to a long passage, sometimes horizontal, sometimes a gentle inclined plane, but extending 259 feet, and emerging by another flight of steps into the area above. Now,

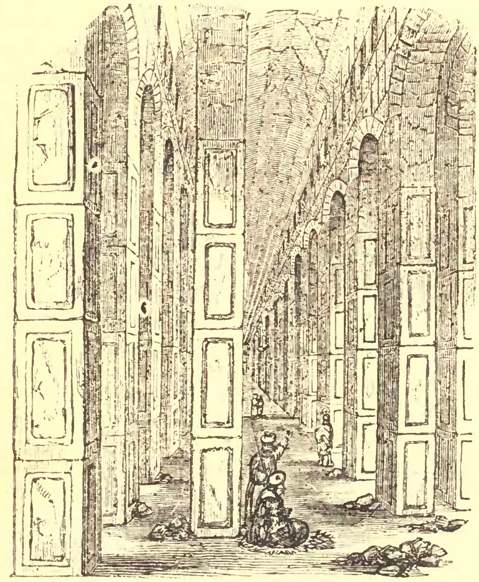


Entrance-hall from Gateway in South Wall of the Temple.

this south wall, marked by its great stones, and the magnificent old entrance, now useless, extends *for six hundred feet* east from the corner A to B. Does not this look like another side of the square we are in search of?

But what of the other two sides? Well then, from the very point which marks the end of the 600 feet east from the corner, there is another wall, underground, running due north for 600 feet to D. The fourth and last side of the square is from D to the causeway, and is now marked by the edge of the platform on which the Mosque el Sakrah is built. Here we have our fourth boundary of 600 feet.

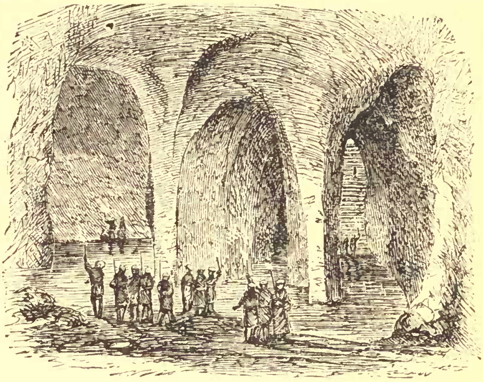
Once more, to complete the proof. We know from Josephus that the Temple was built on both rock and solid earth. Now the whole of the space within the above square of 600 feet is rock and solid earth; while the ground beyond this space to the east (from B to C) is occupied by arches, strong enough to support soil or any light building, and now forming underground structures with high and airy chambers admirably adapted for keeping the cattle required for the Temple service, but too weak to sustain such immense buildings as those of the old Temple.



Underground Buildings in the south-east corner of the Haram es Sherif.

Finally, within the square we have indicated are huge underground cisterns, filled from natural springs, which no doubt supplied the Temple with the water that was constantly required in its services. These cisterns are now got at by an opening like a well or chimney, near the Mosque el Aksah.

Surely these proofs ought to satisfy the reader who duly weighs them, that the site of the Temple was in the south-west of the Haram, being a square of 600 feet, two sides of which are measured from the south-west angle of the old wall. This being settled, we can, within a few yards, or even feet, fix the site of the great altar; and it is a remarkable coincidence that it is opposite the very spot where the Jews now pray and weep for Zion!

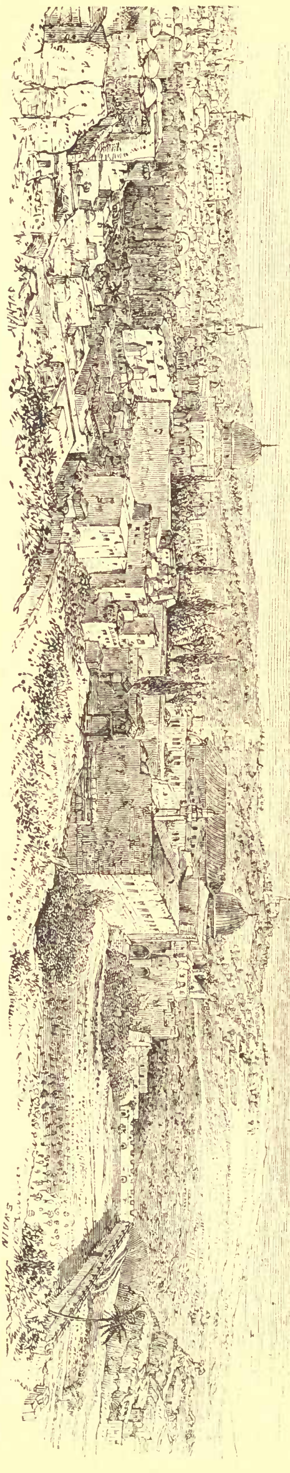


Underground Cisterns.

As I walked over this small green spot once occupied by God's Holy Temple, I cried—"Oh for a voice to utter the thoughts that arise in me!" For who can adequately express the thoughts which here rush upon the mind, wave upon wave in rapid and tumultuous succession, out of the vast and apparently limitless ocean of past history? How profoundly impressive, for example, was the simple fact, that here alone in all the earth was the only living and true God worshipped throughout long ages! Majestic Rome, with all her wisdom, had "changed the glory of the incorruptible God into an image made like to corruptible man, and to birds, and four-footed beasts, and creeping things;" the philosophic and refined Athens had erected an altar "to the unknown God;" but here, in this remote corner of the earth, and in a sequestered spot among the lonely hills, shepherd clans for centuries worshipped Him whom civilised nations still worship as the God of Abraham, of Isaac, and of Jacob.

This green spot is the narrow strait through which the living stream passed 3000 years ago, which is now flooding the whole earth. If we ask *how* this enduring worship came to be established, our inquiry receives a reply from the Books of Moses, in which its origin and establishment are recorded. In these we read a history of Creation, to which, like a spring rising in the far-off hills, can be traced the mighty river of our religious belief and worship. When one thinks of the state of the world, with reference to its knowledge of God, at the time when Moses wrote, and as contrasted with the period when the Temple with its worship was here located, it is impossible not to recognise in the revealed account of Creation the origin of this and of every true temple erected for the worship of God. There may be in Genesis "difficulties" not yet removed, and "questions" relating to science not yet solved; but greater than these, as mountains are greater than the boulders which are scattered over their surface, is the glorious moral teaching of the narrative. What a protest does it contain, for example, against all idolatries!—what a confounding of them by the mere statement of facts, which, from other independent sources, the most thoughtfully devout arrive at! That record tells us, for instance, that God in the beginning made the heavens and the earth; if so, then matter is not eternal, but had a beginning, and it owes that beginning not to itself, nor to a blind fate, but to a personal God. It tells us that light and darkness have no ethical meaning, for *God* divided them, calling the darkness night, and the light day;—that neither sun, moon, nor stars, are to be adored, as they have been, for God made them, and set them in the heavens, not for worship, but, as far as man is concerned, for light. It tells us that the vegetable and the animal worlds owe their origin neither to the air, the land, the sea, nor to any inherent power in themselves or in nature, but to God alone, who said, "Let these be." It tells us that God made the bird, the beast, and creeping thing, and leaves us to infer that *therefore* neither beast (as the bull Apis), nor bird (as the Ibis), nor creeping thing (as the Scarabæus, so honoured in Egypt, and from Egypt in other countries), are to be worshipped, but God only. It tells us, moreover, and very emphatically, that man is made after God's image, and has dominion over the earth and over all mere animal creation; and the inference suggested is obvious, that man is not to turn things upside down, by creating a god after his own image, and worshipping the animals over which he is to rule. It tells us further that woman is of man, and for man, given by God to him, and therefore to be respected and loved, as bone of his bone and flesh of his flesh; and not to be made the occasion—as woman, alas! has been made *in every form of false worship*—of tempting man from God. And, finally, it tells us that God made all things very good, and if so, that *matter* is not evil, nor anything else as made by God; that all evil has come from the creature, and all good from the Creator. This glorious revelation of God as the Creator was given to Moses, and was expressed and embodied in the worship of "the Mosaic economy" upon this green spot. All true religion on earth has sprung from it. O! let us never forget what we owe to it, least of all when "standing here upon this grave."

And from the day in which the old "Tabernacle," or Tent of the Wilderness was enlarged into the grand Temple of Solomon, what events rise up before the memory! In vain we attempt to suggest, in the most hurried form, the incidents which make this the most memorable spot on earth to the Christian—ay, and "to the Jew also." There passes before the inner eye the august founding of Solomon's Temple, with its stately rites, ceremo-



Panoramic View of the Temple Area from Mount Zion.

J. Graham, Phot.

nies, and solemn prayers;—its costly sacrifices, and the presence within it of the mysterious Shekinah. Again, we see the memorable day when the Temple of Zerubbabel was founded, when "the priests and Levites and chief of the fathers, who were ancient men, that had seen the first house, when the foundation of this house was laid before their eyes, wept with a loud voice; and many shouted aloud for joy: so that the people could not discern the noise of the shout of joy from the noise of the weeping of the people: for the people shouted with a loud shout, and the noise was heard afar off." We see the last and greatest Temple of all—that of Herod—of which it was said, "The glory of this latter house shall be greater than of the former, saith the Lord of hosts: and in this place will I give peace, saith the Lord of hosts,"—all this passes before our minds, until the vision of the past is closed by the unparalleled horrors of the destruction of the last Temple by the Roman army, leaving no trace behind except the faded sculptures of some of its holy things on the crumbling Arch of Titus.

But standing here one loves to linger on earlier days, and to recal the holy men and women, the kings, priests, and prophets, who came up to this spot to pray—whose faith is our own, whose sayings are our guide, whose life is our example, and whose songs are our hymns of worship. We seem to hear the majestic psalms of David which have ascended from this spot, and have never been silent since on earth, nor will be until they are absorbed into the worship of the Temple above. Nor can we forget the frightful idolatries, the devilish wickedness, the falsehoods, hypocrisies, murders, blasphemies, which have been here witnessed and punished; the awful denunciations against sin in every form which have been here pronounced; the sieges, famines, destructions, dispersions, weepings, desolations, and restorations, which have here occurred; the prayers which have been addressed, not only from this spot but to it—by Jonah "out of the depths;" by Daniel from Babylon; by Ezekiel from the banks of the Chebar; by the captives who hung their harps on the willows and wept as they remembered Zion; and by every Jew throughout the world since then! What thoughts, longings, tears, hopes, and joys of millions throughout long ages have been thus associated with this Temple.

But what more than absorbs all else into itself as a source of reverential wonder, was the presence here in his own Holy Temple of Jesus Christ, "the desire of all nations." How affecting to recal his teaching, within this spot, his holy and awful works here done, his words of love and power here spoken—the incidents of his boyhood, temptation, and ministry down to his last hours, ending, as the result of all, in the establishment of a Church on earth in which each member is himself a priest, a sacrifice, and a temple of the Holy Spirit.

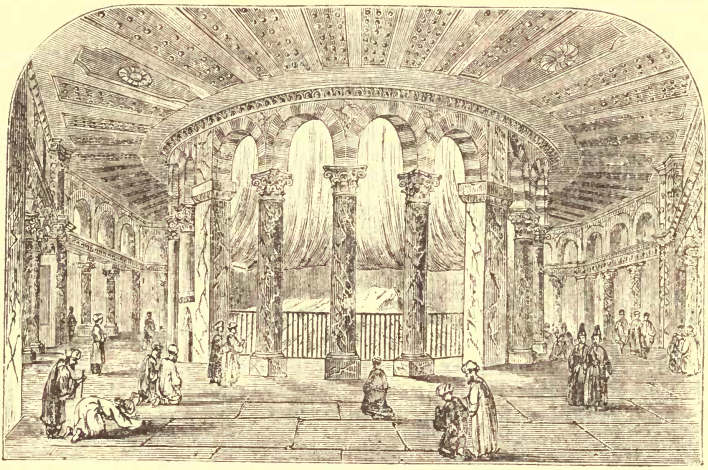
How, we ask, can such associations be adequately expressed? Yet how difficult to be silent when writing about the holy place by which they are necessarily suggested. Again we say, it is the most remarkable spot on earth. It is good for us to think about it; to recal what God has here done for the world; to remember how here, as the very Thermopylæ of the universe, the battle was long fought, and at last gained, which for ever secured to us, if not "the place where the Lord lay," yet the Lord Himself as the living and abiding Saviour of the whole world, and that "kingdom which cannot be moved."

These, and such like thoughts passed through my mind, as I trod on this sacred spot—now so calm, silent, dead. The dust of which man is made alone remains and covers all. Not an object meets the eye on which Kings and Prophets, with Jesus and his Apostles gazed, except the Mount of Olives and the blue sky. Yet it may be those holy feet have trod the steps of that old passage; and his lips may have drunk from the waters that "made glad the city of God," and with reference to which He on the first day of the feast cried, saying "If any man thirst, let him come to me and drink, and the water which I shall give him shall be in him," as the water is within the Temple, "a living fountain springing up into everlasting life!"

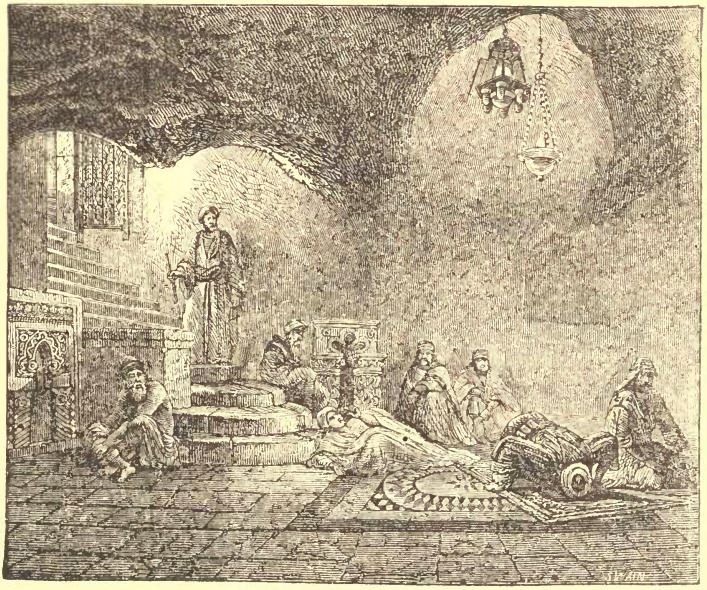
Will the Temple ever be, in any form, restored? Will Jerusalem be again built? Will the tribes go up together once more to this sacred spot, weeping for Him whom they pierced? Will salvation yet once again come out of Zion? Will Jesus be here worshipped, so that it will be said of Him, or of his ministers, "Blessed is he that cometh in the name of the Lord?" I know not. Yet the very *may be* that Jerusalem and the site of the Temple are to be still connected somehow with the future of the Church and of the world, only adds to the solemn and awful interest which already attaches to both. But in whatever way, or in whatever place, the blessing may come, we should earnestly desire that it may come soon, in all its fullness, to those who are "beloved for their fathers' sake." Pray for the peace of Jerusalem!

But we must leave the site of the old Temple, with its solemn memories, and enter El Sakrah, or the "Mosque of Omar"—as it is commonly, though we think erroneously, called—and which occupies nearly the centre of the great Haram enclosure. On entering it, one is immediately and irresistibly impressed by its exquisite proportions, its simplicity of design, and wonderful beauty. Nowhere have I seen stained-glass windows of such intense and glowing colours. Indeed one of the marked features of the interior is the variety and harmony of colour which pervade it, caused by the marbles of the pillars and walls—the arabesque ornaments and Arabic inscriptions—the rich drapery hanging in the sunlight—with the flickering touches everywhere of purple and blue and golden yellow, from the Eastern sun pouring its splendour through the gorgeous windows; while every Oriental worshipper, as he bends in prayer or moves about in silence, displays some bright bit of dress embroidered with gold or silver in the looms of Damascus, or possibly of India, and thus adds to the brilliancy of the scene.

What chiefly attracts the eye and arrests the attention, however, within this holy temple of Mohammedan worship, is an object which one never saw before in any such place, or beneath any roof, except the sky. Immediately under the dome, and within the circle of marble pillars which support it, with silk drapery overhanging it like a banner over the tomb of a hero, lies a huge rock! It is not the work of a cunning artist, shaped to a form of beauty, or to serve any useful or religious purpose, but an unhewn mass, rough as a boulder on a mountain-side or on the sea-shore. This stone is about 60 feet long and 50 broad, and rises about five feet above the level of the floor, or 15 feet above the original surface of the ground. Moreover, it has on the south-east side an open door which leads by a few steps down to a room, cut out of the rock, about eight feet high and 15 feet square. Above is a hole pierced three or four feet through the rock, with a lamp suspended near it. Such is



The Rock under the Dome.



The Cave cut out of the Rock.

the general appearance and position of this famous rock. I may add, that if one stamps on a circular marble stone about the centre of the cave, seen in the accompanying engraving, hollow sounds and echoes are heard beneath, evidencing the existence of considerable underground excavations.

"But what," the reader asks, "means this rock? Why has it been preserved, and preserved *here* as a holy and revered thing?" A question to be asked, verily! but one by no means so easily answered. For this stone has given rise to a great controversy which still rages, though only, of course, with such calm, suppressed, and reticent energy as archæologists and antiquaries are capable of in a case where passion decreases with the square of the distance that, in time, separates them from the subjects of their inquiry.

Without attempting in a few lines to state the arguments which have been brought forward in support of the various conflicting theories, or presuming to give any decided judgment on so complicated a question, let me endeavour, however meagrely, to satisfy, or rather to prompt, the curiosity of those of my readers who may wish to know how this stone has become such a stumbling-block.

(1) The most prosaic account of it is, that it was a draw-well for the fortress of Antonia, the excavations below the cave being but a part of the great natural cisterns which honeycomb the Temple area. But the fortress did not stand here; and even if it did, that would not account for the well of a barracks ever becoming a holy and consecrated spot.

(2) Was it then, as some suggest, the stone on the summit of Mount Moriah on which Abraham offered up Isaac? This is a mere conjecture, without any evidence whatever to support it, and the difficulty of accepting it is increased by the fact that Mount Gerizim is claimed—and that not without weighty and, as Dr. Stanley and others think, conclusive reasons—to be the mountain of Abraham's sacrifice.

(3) A more probable supposition is, that this place was the threshingfloor of Araunah (or Ornan) the Jebusite, which David bought, and on which he erected the great Altar of Sacrifice. The account given in Scripture of this transaction is as follows:—

> "And the angel of the Lord *stood by* the threshingfloor of Ornan the Jebusite. And David lifted up his eyes, and saw the angel of the Lord stand between the earth and the heaven, having a drawn sword in his hand stretched out over Jerusalem. Then David and the elders of Israel, who were clothed in sackcloth, fell upon their faces. . . . Then the angel of the Lord commanded Gad to say to David, that David should go up, and set up an altar unto the Lord in the threshingfloor of Ornan the Jebusite. And David went up at the saying of Gad, which he spake in the name of the Lord. And Ornan turned back, and saw the angel; and his four sons with him hid themselves. Now Ornan was threshing wheat. And as David came to Ornan, Ornan looked and saw David, and *went out of the threshingfloor*, and bowed himself to David with his face to the ground."

We read also that—

> "Solomon began to build the house of the Lord at Jerusalem in Mount Moriah, where the Lord appeared unto David his father, in the place that David had prepared in the threshingfloor of Ornan the Jebusite. And he began to build in the second day of the second month, in the fourth year of his reign."

This narrative, it is alleged, makes all clear. On the summit of this stone, *by* the threshingfloor, stood the angel of the Lord, seen as if between earth and heaven. Beside the stone was the threshingfloor; its top was the place for winnowing the grain, which was poured down through the hole into the cave, that was at once a granary and contained a well. In this cave, moreover, Ornan and his sons hid themselves, and "came out" to meet David. On the summit of the same rock was afterwards erected the great altar, which was reached by steps, or by a gradual ascent, and *through the hole* the remains of the sacrifices and the blood were sent into the cave below to be disposed of by the Levites, and to be carried, by some means or other, without the Temple through its subterranean excavations. So far well. But the great objection to this theory is, that it is impossible to bring the rock within the site of the Temple, as it is 150 feet from the nearest point of its outer wall. It could not, therefore, have been the base of the great altar. For Herod's Temple (within the square of 600 feet) occupied, or rather, from its being much larger, included the site of the Temple of Solomon.

(4) The last, and which will appear to our readers to be the most improbable and astounding theory is, that this cave was the "true sepulchre of our Lord!"

Mr. Fergusson, its propounder and defender, broached this theory fifteen years ago, and has maintained it with great ability and with increasing confidence ever since. He lately visited Jerusalem to test its accuracy still further by an actual inspection of the spot, and has returned more convinced, if possible, than ever!

While this theory is maintained on historical grounds, yet it is based chiefly on architectural. And let no one reject this kind of evidence, as if from its nature inapplicable. The very reverse is nearer the truth. Suppose we find a canoe, embedded in the silt of an English river, and the wreck of a steamer on the shores of an uninhabited island. Every one can understand how it is possible to decide with absolute certainty as to the relative ages of those two specimens of ship-building, and to know that the one was before and the other after a certain historic period. And so in regard to architecture. Mr. Fergusson, one of the first living authorities on the history of this department of art, has endeavoured to prove, and I presume to think successfully, that (1) the so-called Mosque of Omar never was, nor could have been, built for a place of Mohammedan worship;—(2) that it could not have been built either before or after the age of Constantine; (3) and that the present church of the Holy Sepulchre could not have been erected earlier than the time of the Crusades. He concludes that this so-called Mosque of Omar was the church which Constantine built—for that *a* church was built by him all admit—over the sepulchre of Christ.

I cannot enter further into this controversy, but must refer my readers, who may now wish to follow it out, to some of the well-known works which fully discuss it.[*] If I might presume to give any opinion on the subject, it would be briefly this: I cannot accept of the proofs in favour of the authenticity of the tomb in the church of the Holy Sepulchre.

It seems to me to be demonstrated by Mr. Fergusson that "the Dome of the Rock" was built by Constantine, and that, too,—in the absence of any other known motive,—because he believed it to be the tomb of our Lord.[†] I recognise also the strength of the evidence adduced to establish the probability of Constantine having been able, even in the fourth century, to ascertain the real position of the sacred spot, both from the tradition of the Christian Church in Jerusalem, and also from the perfection of the Roman census—an argument brought to bear for the first time on this question by the learned and accurate Mr. Finlay.[*]

Mr. Fergusson has also, I think, satisfactorily disposed of the objection to his theory from the supposed impossibility of our accounting for the change of site from the Dome of the Rock to the present church, without there being any record of such a transaction. For the pilgrims, when shut out of the true one by the Moslems, would most likely be supplied by the priests with a false one—and that, too, with the best intentions on their part. The supposition of such a pious fraud, which appears at first so revolting to our sense of truth, is nevertheless in harmony with what was done in many parts of Europe, and more especially in Italy. Everybody knows that the house of Joseph and Mary was carried by angels from Nazareth to Loretto, where it has been visited every day for centuries by more pilgrims than the Holy Sepulchre. This transference, let it be observed, was rendered expedient by the same causes as might have induced the change of the site of the Holy Sepulchre. It was dangerous under Moslem rule to make a pilgrimage to the church in the Haram, just as it was to make one to Nazareth,—where, however, we may add, another house equally authentic is also now shown.[†]

Admitting all this, then, it may be asked how I can avoid coming to the conclusion that the authentic site has at last been discovered? I must confess my inability to give any reply, beyond the very unsatisfactory one—that I cannot believe! My doubt, I frankly acknowledge, is chiefly derived from the mere force of impressions made on the spot.

To believe that this room, with its hollow excavations beneath, was a tomb at all; that Joseph of Arimathea got possession of the huge rock, occupying so remarkable a position, as his own private property, and was allowed to cut out the *first* tomb in it; that he who was terrified to confess Christ before the Sanhedrim, should have had the boldness to bury Him, or rather should have been permitted to do so, *within one hundred and fifty feet of the Temple wall*, and overlooked by the fanatics who had condemned Him, and the Roman soldiers who had executed Him; and that the resurrection, involving the presence of Roman guards, holy angels, pious women, agitated apostles, and Christ Himself, should have taken place here, nominally indeed at that time without the walls, but practically under the gaze of both the Temple and the fortress—all this I cannot as yet assent to. Moreover, it does not seem to me at all unlikely that the place of Christ's burial should have died out of the memory of the early Church. To the first believers the tomb of the dead Christ would, it appears to me, be soon lost in faith in the living Christ. Golgotha as a place, with its dreadful horrors, would be uncared for in their adoring love of the grand spiritual truths of which it was but the awful threshold. I can therefore quite conceive of St. Paul, for example, when in Jerusalem after his conversion, visiting neither the place of Christ's death nor that of his burial, nor caring thus to "know Him after the flesh," although he held living communion with Him every day in the Spirit. Belief in persons not places, in living realities not mere localities, appears to me as much more likely to have characterised the early than any subsequent age of the Church. And just as in the course of years faith began to grow weak in a living person or in eternal truths, so would it naturally seek to strengthen itself by a visit to places, until it became still weaker by contact with the visible, and the kernel be at last lost in the shell. In the meantime we wait for more light on this interesting subject. The spade and pickaxe, which we hope soon to see vigorously at work in Jerusalem, may help to solve these and many other questions.

---

[*] Among others I would mention Dr. Robinson's great work on Palestine, as containing the most forcible arguments against the present site:—"Williams's Holy City" as its best defence, and also for the reply which it gives to Mr. Fergusson's theory in favour of the Dome of the Rock. Mr. Fergusson's view is given in his article "Jerusalem," in "Smith's Dictionary," and also in his recently published lectures. Lewin's "Siege of Jerusalem" may also be consulted, and Sandie's "Horeb and Jerusalem."

[†] Mr. Fergusson quotes in the Appendix to his recently published Lectures, an extract from a small volume of travels to the Holy Land, by a pilgrim named "Theodericus," in the year 1172, and entitled "Theodericus de Weis Sanctes." It is edited by Dr. Tobler, and was just issued from the German press as Mr. Fergusson's book was being printed. The pilgrim confirms all his views. He states more than once that the "Dome of the Rock" was erected by Constantine and his mother Helena. Some interesting inscriptions are given by him as copied from the church while in the possession of the Christians, who worshipped in it during the whole period of the Latin kingdom, and a few years before it was taken by Saladin. These inscriptions are along each of the eight sides, and some are as follows:—"Pax æterna ab æterno Patre sit huic domui;" "Templum Domini sanctum est. Dei cultura est. Dei sanctificatio est," &c. &c. "Bene fundatus est domus Domini super firmam petram," &c. Inscriptions of the same character were in other parts of the building. We must confess, however, that the omission of any reference to the tomb is remarkable. De Vogne, in his recent great work on the Temple, gives translations in French of some of the Arabic inscriptions, added most probably in the time of Saladin, and which read as a protest against the Christian Church and the known Christian beliefs, and probably displaced the Christian inscriptions of its founders and worshippers. They are such as the following: "Praise be to God, He has no Son"—"He does not share the empire of the universe"—"Jesus is the Son of Mary, sent by God, and his Word"—"Do not say there is a Trinity of God," &c. As Mr. Fergusson remarks, there is not a word in the Arabic inscriptions of David, Solomon, or even Mahomet, but of "Jesus the Son of Maria," whose name appears four times.

[*] "The census was so perfect that throughout the wide extent of the Roman empire every private estate was surveyed. Maps were constructed, indicating not only every locality possessing a name, but so detailed that every field was measured. And in the register connected with the map even the numbers of fruit-trees in the garden were inscribed. Not only every Roman province, and especially every Roman colony, but every municipality was surveyed with this extreme accuracy. A plan of the district was engraven on brass, and deposited in the imperial register office, while plans were placed in the hands of the local administration and in the provincial archives."—("Greece under the Romans," 561.) By this means Mr. Finlay thinks Constantine could have had no difficulty in ascertaining the true site, as a temple to Venus had been erected over it by Hadrian, to profane it.

[†] When in Jerusalem I was assured, on what seemed the best authority, that the Greeks had got up a new Gethsemane of their own, in opposition to the Latins; but on further careful inquiry I found this was not the case. How difficult it is even "on the spot" to ascertain the truth!

But should the sepulchre of Christ never be discovered—if it lies unknown in some lonely recess among the "braes" overlooking the Kedron, we are not disposed greatly to lament it.

"We have a vision of our own—
Ah, why should we undo it?"

A MOTHER'S WAIL.

OH! Jamie, Jamie, let me greet,
Your kindness cheers nae mair;
I canna dry my tears at will,
Nor frae me fling my care.
I ken your ain heart's sad, for she
Was sunshine in your ee;
But your's is but a faither's love,
And ye maun bear wi' me.

Oh! Jamie, let me greet—my heart
Is sad as sorrow's sel';
It seems but yesterday our tears
On Willie's wee face fell.
We thocht our lot was hard, when death
Ae bairn had taen awa',
But oh! how muckle harder noo
When we hae nane ava.

Had Heaven been pleased to warn us
O' the blow that was to fa',
And, lichtly leanin', let her dwine
As Willie dwined awa',
We micht hae schooled our hearts to bide
The fate we couldna' flee,
And waited wi' a patient grief
To close our darling's ee.

But oh! without a gloaming
Fell bereavement's night at last;
Wi' scarce a rustle o' its wings
Awa' her spirit passed.
Though hopefu' seemed her cheek's new bloom,
And hale her ee's blithe licht,
'Twas but the clearness o' the sky
When fa's the April blicht.

She wasna like anither bairn,
Whase prattlin's nocht but din;
For there was wisdom in her words
Far far her years aboon;
And whiles sic startlin' things she speired
That in my heart I've sain,
"An angel watchin' owre our souls
Is speakin' in my wean."

And ance wi' sparklin' een she sat
And at the lift gazed lang,
And speired, when I nae sang could hear,
"Wha sings that bonny sang?"
And yet, alas! we saw nae sign,
For hard were we to learn
That a' our love would fail to shield
Frae death our only bairn.

She aye was at my foot, Jamie,
And whiles I fashed awee,
When aiblins at my thrangest time
She grat to get my knee.
And but and ben, and out and in,
To toddle was her pride—
The dear wee lamb! she couldna bear
To leave her mither's side.

Oh! Jamie, twa lang days I've watched
Her sweet white face in vain;
My longing brings nae warmth—her smile
Will ne'er return again.
'Twas some sad solace on her brow
At times to lay my hauns,
But bleak will be the morning
On a bairnless hearth that dawns.

She'll lie in Willie's grave, Jamie:—
Oh! come nae first awa',
But wait and smooth the turf, and drap
A tear aboon the twa.
For if their spirits—as they may—
Unseen be lingering near,
'Twill cheer them even in heaven to mind
Their faither's parting tear.

DAVID WINGATE.

OUR INDIAN HEROES.

By JOHN WILLIAM KAYE.

VII.—LORD CORNWALLIS.

In this little gallery of Indian worthies, I have hitherto exhibited the portraits only of men, who have held subordinate or, at most, secondary positions—who have executed the work entrusted to them, not taken the supreme direction of affairs, and borne upon their own shoulders the responsibilities of the government of an Empire. Of such, indeed, the collection will mainly consist. But I purpose here to vary the prevailing character of the series by giving some account of the career of a Governor-General; and I have selected Lord Cornwallis, because he was both a soldier and a statesman, and his career was one in which the perilous excitement of the camp, and the more tranquil labours of the council chamber, had alternately possession of his mind. His career was not merely an Indian career. During a long life devoted to the service of his country, he was distinguished on many different fields, in many distant parts of the world, for he lived in eventful times, and he was one in whom all men trusted. But it is as an Indian soldier, and an Indian statesman, that he must be here regarded. He was three times selected to govern the British Empire in the East. Twice, the burden of the Governor-Generalship actually descended upon him, and, the second time, it weighed him down to the grave.

He was the sixth child, and the eldest son, of the fifth baron, but first Earl Cornwallis, by a daughter of the second Viscount Townshend; and was born in Grosvenor Square, on the last day of the year 1738. Of his childhood, there appears to be no record, but at an early age he went as Viscount Brome, (the second title of the family,) to Eton, and ascended, by ordinary gradation to the sixth form. After leaving school, he chose the army as his profession, and entered the Grenadier Guards at the age of eighteen. Obtaining the permission of the Duke of Cumberland to complete his military education, he went to Turin, to study at the military academy there, but learning that a British army was about to be employed in Germany, he volunteered to join the force, and was appointed aide-de-camp to Lord Granby. In this capacity, he was present in several actions, including the battle of Minden. His promotion was very rapid. He was a captain in the 85th in 1759, and two years afterwards, he was lieutenant-colonel of the 12th foot. This latter command he retained till 1765, when he was appointed aide-de-camp to the king. In 1762, he succeeded, by his father's death, to the earldom. In 1766, he was made colonel of the 33rd regiment. Two years afterwards, being then thirty years of age, he married Jemima, daughter of Colonel Jones, of the 3rd Foot Guards,—an union which was productive of the purest, but too short-lived, happiness to both.

The war of American Independence commenced, and Lord Cornwallis was appointed to command a division of the army which was to be employed in the suppression of the "rebellion." This service was extremely distasteful to him. His sympathies were with the so-called rebels; and it touched him to the heart to think of leaving his wife, his children, and his home. But he never hesitated for a moment. There was not in all the country one to whom the voice of duty more overpoweringly appealed. It is stated that his wife made powerful interest to cause his appointment to be rescinded, and the consent of the king was obtained. "But," says his biographer, "he peremptorily declined to avail himself of the permission."* On the 10th of February, 1776, he embarked for America. Of the events of the war I do not purpose to write. His first service in that country extended over a period of nearly two years. In January, 1778, he paid a brief visit to England. In April he again embarked for America; and from that time Lady Cornwallis, who had lived in retirement during his absence, a prey to the deepest melancholy, never recovered from her depression, but died, as she herself said, of a broken heart. Her husband, when he heard that she was dying, threw up his command, and returned to England. But it was too late. She survived his arrival by a few weeks, and then passed away from the world. From that time the public service became everything to Lord Cornwallis. He was eager to return to the seat of war, that he might find relief for his private sorrows in the exciting realities of the great conflict. His wishes were gratified. He was reappointed to the army; and he took an active part in its operations, until the capitulation of October, 1781, when he became a prisoner of war. In December, he embarked for England, and arrived at home in the early part of the following month.

He was then on his parole; and for some time he was kept in a state of painful uncertainty and anxiety respecting the exchanges which were in course of negotiation. The king's government, who had unabated confidence in him, though the "fortune of war" had been adverse, were anxious again to re-employ him, on some service of responsibility, and sounded him as to his willingness to go to India. It was in contemplation to invite him to assume the chief command of the army in that country. But the idea was not an attractive one to him. "The more I turn it in my mind," he said, "the less inclination I feel to undertake it. I see no field for extraordinary military reputation, and it appears to me, in every light, dangerous to the greatest degree. To abandon my children and every comfort on this side the grave; to quarrel with the supreme government in India, whatever it might be; to find that I have neither power to model the army nor correct abuses; and, finally, to run the risk of being beat by some Nabob, and being disgraced to all eternity, which, from what I have read of these battles, appears to be a very probable thing to happen—I cannot see in opposition to this, great renown and brilliant fortune." But when his sentiments were known the king's government, as represented by William Pitt, was willing to place both the civil and the military power in his hand. This changed the complexion of affairs—because it now appeared to him that there were prospects of more extensive usefulness in India. "My mind is much agitated," he wrote in May, 1784, to Colonel Ross. "I can come to no resolution till I know the plan; yet inclination cries out every moment 'Do not think of it; reject all offers; why should you volunteer plague and misery.'—Duty then whispers, 'You are not sent here merely to please yourself; the wisdom of Providence has thought fit to put an insuperable bar to my great degree of happiness; can you tell if you stay at home, that the loss of your son, or some heavy calamity, may not plunge you in the deepest despair? Try to be of some use; serve your country and your friends; your confined circumstances do not allow you to contribute to the happiness of others, by generosity and extensive charity; take the means, which God is willing to place in your hands.' "—In this sentence we see the very key-stone of his character—a prevailing sense that he was not sent into the world only to please himself. Other employment, however, was found for him at this time, and it was not until the beginning of 1786, that the king's ministers finally pressed upon him, and with good success, the joint offices of Governor-General and Commander-in-Chief in India. On the 23rd of February, Lord Cornwallis communicated his willingness "to exchange a life of ease and content, to encounter all the plagues and miseries of command and public station."

---

* "Correspondence of Charles, First Marquis Cornwallis." Edited, with Notes, by Charles Ross, Esq. I am greatly indebted for much valuable matter to these admirably-edited volumes.

The king's ministers had at this time before them the names of two men, either of whom might advantageously succeed Warren Hastings in India—Lord Cornwallis and Lord Macartney. Their preference turned towards the former, not merely because he was a soldier; but it was doubted whether his reluctance could be overcome. Lord Macartney had stickled for a British Peerage, and the Government were not inclined to grant it; so that nobleman was not much more willing to accept it than Lord Cornwallis. "That he had a strong disinclination to accept the appointment," says his biographer, Mr. Barrow, "and that the conditions on which only he could accept it were made solely on public grounds, the following anecdote, obligingly communicated by Lady Macartney, is an unequivocal proof. Her ladyship being one evening at a large party, Lord Macartney came in, and being impatient to communicate some intelligence to her, took out a card and wrote with a pencil on the back of it as follows, '*I am the happiest man in England at this hour. Lord Cornwallis, I hear, is Governor-General of India.*' The card is still in her ladyship's possession, with the pencil writing upon it."

Cornwallis arrived at Calcutta in the autumn of 1786, and wrote home to his son at Eton that he had a great deal more business every day, than the boys had on a whole schoolday, and that he never got a holiday. "I have rode once on an elephant," he added, "but it is so like riding in a cart that you would not think it agreeable." There was little or nothing at that time to distract him from the business of internal administration. In the autumn of 1787 he went up the country, and visited Lucknow; but by the end of the year, he was again in Calcutta.

But peace is never in India very long-lived; and the statesman who proceeds thither brimming over with benevolent desires to devote all the energies of his mind to the great work of improving the administration of the country, and advancing the prosperity of the people, is well-nigh certain, after a year or two, to discover, in bitterness of spirit, that all this is a mistake. Lord Cornwallis, for a time, worked, nobly and successfully, to improve both the revenue and judicial systems in force in the English provinces, and in both respects created a great revolution. But his social reforms were not less distinguished than his administration; for he carried to India what had never gone there before, the pure principles and the blameless life of a high-minded English nobleman. The social morality of the English in India, no less than their official integrity, improved mightily under his rule; and the improvement thus commenced has advanced steadily up to the present time without a symptom of backsliding.

But, as I have said, these dreams of an unbroken career of peaceful beneficence, were doomed to be disturbed. The restless ambition of the great Mahomedan usurper of Mysore, had been stimulated by revolutionary France; and Tippoo had provoked the hostility of the English by an unjustifiable attack upon one of their allies. It was held, therefore, to be equally politic and just, to commence military operations on a grand scale, to curb the power of this unscrupulous aggressor. Sir William Medows had been appointed Governor and Commander-in-Chief of Madras. He was a man of unsullied reputation, brave, chivalrous, idolised by all who had served under him. He had been engaged in the operations of the American war, and few men knew him better or loved him more, than Lord

Cornwallis himself. It was painful, therefore, to the Governor-General to supersede him in the command of the army, which was to check the aggressions of the sultan of Mysore; but, after mature consideration, he conceived that it was his duty to take personal command of the British troops, and it was characteristic of General Medows, that he accepted the subordinate position in a manner, which won the commendation and gratitude of his chief, and threw, as second in command, his whole soul into the work before him.

From Madras, on the 22nd of January, 1791, Lord Cornwallis wrote to Mr. Barlow, after some observations on the civil administration,*—"I have led a life of the greatest anxiety, in the first place from the disappointment in the arrival of our ships, and the total failure of the Monsoon, which has not perhaps occurred for the last forty years, and afterwards from the General's having brought too small a force from Arnee to ensure the safe conveyance of so great a train of artillery and provisions as we must take from hence. The latter is now set right, after its having caused me many sleepless nights, and we have now provided bullocks to enable us to march, even if none should arrive from Bengal. What fools are men, for wishing for power and command; and how much greater a fool am I, for embarking in all these troubles and anxieties without wishing for either. Tippoo in person has gone either against the Mahrattas, or Abercromby; but his numerous horse have committed and still commit the most shocking cruelties in the Carnatic. I shall march from hence on the 4th or 5th of next month for Bangalore and Seringapatam; and everything is so arranged that I do not expect to meet with any great obstructions, either from the want of stores or provisions." A week afterwards, Lord Cornwallis formally took command of the army, and marched into the Mysore country; and in March he struck the first great blow at the power of the Sultan, by capturing Bangalore. His intention was, in the next place, to push into the very heart of Tippoo's dominions, to invest the capital, and to dictate terms of peace under the walls of Seringapatam. Before the middle of May, he was within ten miles of that city; but, although he was strong enough to beat the enemy fairly "in the open," he saw at once that he had not the means of carrying so formidable a place as that which now stood, in proud defiance, before him. Bitter, indeed, was the mortification, which overwhelmed him, when he found that just at what he had believed to be the point of victory, he was compelled to retire. But he had neither stores nor provisions for a long siege; and to have attempted to carry the place with such insufficient means, would have been only to court a strangling failure. So he determined to break up his siege train, and to fall back upon Bangalore.

Then Lord Cornwallis began to experience, in all their bitterness, the horrors of a hot weather campaign in India, with insufficient appliances for the maintenance and protection of his army. An epidemic disorder broke out among his cattle. Numbers fell by the way, and the remainder with difficulty struggled on with their burdens. Grain was so scarce, that the famished camp-followers were compelled to feed on the diseased carcases of the bullocks. The cavalry horses were reduced to such a state that they could not carry their riders, and many were shot as useless incumbrances. The officers, who had given up the greater part of their private carriage for public uses, suffered so severely, that in many cases they were compelled to ask for the rations, which were served out to the privates. The tents were little better than tinder; and the clothes of officers and men were reduced to mere rags. "The ground at Camiambuddy," wrote Major Dirom, the historian of the war, "where the army had encamped but six days, was covered in a circuit of several miles with the carcases of cattle and horses; and the last of the gun-carriages, carts and stores of the battering train, left in flames, was a melancholy spectacle which the troops passed, as they quitted the deadly camp."

It was not strange that, in such distressing circumstances, the spirits of the commander should begin to droop. There was a necessary suspension of operations, for the rains had set in; and there is nothing so wearisome and enervating, as the inactivity of camp-life in an unhealthy season of the year. His constitution on the whole, bore up bravely; but continued anxiety began to tell upon him. "My health," he wrote to his brother on the 13th of July, "has not suffered, although my spirits are almost wore out, and if I cannot soon overcome Tippoo, I think the plagues and mortifications of this most difficult war will overcome me." Six long, dreary weeks of waiting passed away; and he still felt sad and sick at heart. "If Tippoo," he wrote to his son, on the 8th of September, "does not offer reasonable terms before that time, I hope to oblige him to do so by a successful attack on Seringapatam in November next; but however favourable a turn our affairs may take, I cannot now expect, consistently with the duty I owe to my country, to leave India before January, 1793, and I trust that my evil stars cannot detain me longer than that period. I grow old and more rheumatic, and have lost all spirits, and shall only say when I return:—

> 'A soldier, worn with cares and toils of war,
> Is come to lay his weary bones among you.'

"You remember Wolsey's speech, but I shall have an easier conscience than he, probably, had." And on the same day, he wrote to his friend Mr. Grisdale, saying "God knows when our war will end—I hope and trust it will be soon, or it will end me. I do not mean that I am sick. I have stood a burning sun and a cold wind as well as the youngest of them: but I am plagued and tormented and wearied to death."

---

* *Unpublished Correspondence.* The extracts given in the subsequent pages are mostly from original correspondence in my possession. The remainder are from Mr. Ross's valuable work, to which I have already acknowledged my obligations.

But the cold weather, so eagerly looked for, came at last; and the interval of repose, wearisome and dispiriting though it was, had been turned to the best possible account. The army, which was now about to take the field, was very different from the army with which, in the hot weather, Lord Cornwallis had retired from Seringapatam. Great preparations had been made for the renewal of the war. Bengal had been drawn upon for artillery and carriage cattle,—especially elephants. A large supply of specie had come from England. Success was now almost a certainty. The army was set in motion again, and as it advanced, the spirits of Lord Cornwallis rapidly revived. On the 5th of February, Seringapatam was again in sight; on the night of the 6th, it was determined to make an attack on the enemy's camp and the works which they were constructing. General Medows was to command the right, Colonel Maxwell the left, whilst Cornwallis himself took command of the centre division. The left and the centre divisions were completely successful; but the right division under General Medows, "by one of those accidents, to which all operations in the night must be liable," failed to accomplish the work entrusted to it. Medows found himself before a well-defended redoubt, the assault of which was not a part of the intended plan of operations, and before he could carry it, and proceed to support the centre division, day had broken, and Lord Cornwallis had done his work.

The mortification of the good general was extreme. It was an accident, and one that might have befallen the bravest of men, and the best of soldiers. But it preyed tormentingly on his spirits. Seringapatam, however, was not yet taken. There was prospect of a siege, and General Medows sought permission to command the storming party,—a request which was readily granted. This buoyed him up for a time; but only to make more bitter his after-disappointment. Tippoo had begun to think of the expediency of not risking conclusions with the formidable force, which had just routed his best troops, and was now preparing to attack his stronghold. But one despairing effort might yet be made, if not by fair means, by foul, to cast confusion into the ranks of the enemy. In the eyes of an oriental potentate, to destroy the leader of an expedition, is to destroy the expedition itself. If Lord Cornwallis, who, in his own person, represented the supreme military and civil power of the English, could be cut off by any base stratagem, it appeared to Tippoo a certainty that the army would retire, discomfited and despairing, from Seringapatam. He did not think that the foul act would have excited to deeds of still higher daring the irrepressible manhood of the English army, and that Medows would certainly, in such a case, amply avenge the murder of his leader. So he sent a party of Mahomedan horsemen, drugged with *bang*, to the point of fury, to make their way into the English camp, and cut the English leader to pieces in his own tent. A man of simple and unostentatious habits, and ever disinclined for the sake of his own safety or comfort to give trouble to others, the Governor-General and Commander-in-Chief had always been content with a guard consisting of a couple of troopers of his own escort. If then, Tippoo's horsemen, who in such a heterogeneous assembly as that which was composed by the forces of the confederates, might easily have escaped observation, had taken their measures with any calmness and collectedness, they might have accomplished their object. But they went about their work wildly, and they failed. A party of Bombay sepoys turned out against them, and they fled in dismay from the English camp. After this, Lord Cornwallis was reluctantly persuaded to allow a party of English soldiers to mount guard over his tent.

Foiled in this desperate attempt upon the life of the English leader, Tippoo was eager to negotiate a peace. The negotiations extended over many weeks, and there was at least one man in camp, who watched their progress with the deepest interest, hoping that the peace-efforts would break down utterly, and that orders would be issued for the commencement of the siege. This was General Medows, who knew that he would regain all the credit he had lost, and a large measure besides, whether living to bear his honours, or dying in the breach. With bitter anguish of heart did he learn at last, towards the end of February, that the negotiations had so far succeeded, that Tippoo had consented to send two of his sons into the British camp, as hostages for the fulfilment of the terms of peace. What follows is one of the saddest things in Indian history. I tell it, as it was told, on the same day, by an officer on Lord Cornwallis's staff, writing to a friend in Calcutta:—"Tippoo," he said, "has, this afternoon, commenced the execution of the preliminaries of peace, by sending to camp his second and third sons as hostages, conformably with one of the articles, and this act was made particularly interesting and satisfactory to Lord Cornwallis, by Tippoo, without mentioning any of the other confederates, insisting that his children should be carried directly to his lordship's tent, and there delivered into his arms, with a request that he would, during their absence from their father, consider them, and treat them as his own children. It would, at any time, have been impossible to witness such a scene, which marked so great a change in their father's fortunes, without certain reflections on the instability of human grandeur. But all sensations of that nature were almost totally absorbed in the melancholy damp, into which we had been thrown a few hours before by a fatal act that General Medows had committed upon himself. The column that the General commanded on the night of the 6th, did not execute precisely what was allotted to it. But he has, by his uniform conduct through life, established his character with all mankind as the essence of honour and courage, and the mistake on that night was never considered, by any man in the army, in any other light than as one of those errors to which night attacks have been, and ever will be liable. The General, however, notwithstanding every consolation which his lordship could give him, continued dissatisfied with himself, and allowed this unlucky affair to prey continually upon his spirits, till this morning, when it seems he could bear it no longer, and discharged a pistol loaded with three bullets into his body. He is still alive, but there can scarcely be hopes that he will recover. You will be able to judge of the severity of this blow upon Lord Cornwallis, when I tell you that there are few men in the world whom his lordship more esteems and loves. This cruel stroke has poisoned all our enjoyment of the present favourable appearance of public affairs." These gloomy anticipations, however, were not realised. "Most miraculously," as the same officer afterwards wrote, "General Medows recovered, and became perfectly reconciled to himself, and all the world."

On the 18th of March, after much negotiation, and many hitches and obstructions, which every now and then threatened a general break-down, the definitive Treaty was sent out of the Fort, "signed and sealed by Tippoo," and was delivered to his lordship on the following day under a salute from a park of British Artillery and from the guns of Seringapatam booming together. Some considerable accessions of territory to the British Empire in India were the result of this war, but it belongs rather to the historian than to the biographer to write of these things. It is more to my present purpose to state here, that the generosity and humanity of Lord Cornwallis's nature were signally displayed, in many ways, during this campaign, but in none more than in his tender regard for the interests of the soldiery, who looked up to him as their leader. He was a man of a kind heart and a compassionate nature, and the meanest soldier in the camp was in his eyes an object ever worthy of his most thoughtful care. When he first joined the army, he saw to his dismay, that the sepoy regiments of the Madras force had no hospital doolies (litters) attached to them; and that their sick and wounded were carried in the rude blankets or horse-cloths of the country. "It is hardly credible," he wrote from camp to the Governor of Madras, "that so shocking a practice should have existed so long, and that successive generals could, without making the strongest remonstrances, have seen their wretched soldiers, either with a broken bone or a violent fever, squeezed into a blanket and carried by two of their comrades." It was not so in the Bengal army; so Lord Cornwallis at once directed the deficiency to be supplied. Not long afterwards, it happened that an army surgeon was tried by court-martial and convicted of neglecting to dress the wounds and to take proper care of the Europeans, who had been wounded at Seringapatam —"for which heinous breach of duty," said Lord Cornwallis in a general order, "and offence against the strongest and most affecting ties of humanity, which forcibly plead in every generous breast in favour of men who have shed their blood in the cause of their country, he is condemned only to be suspended from his rank and pay in the service for eight months, and to be reprimanded in public orders." "It is incumbent upon Lord Cornwallis," continues the order, "to show that he sets a higher value upon the lives and limbs of the soldiers than to expose them again to the hazard of falling under the charge of a man who has been guilty of such gross neglect. And he, therefore, declares to the army, that he shall recommend it to the Governor of Fort St. George, to continue Mr. ——'s suspension, until the pleasure of the Court of Directors shall be known; and that he shall order the Paymaster to give no share to Mr. —— of that gratuity which was obtained by the blood of those brave men, whom he afterwards suffered either to perish or to languish miserably for several weeks by an inhumanity, which by any person unacquainted with the evidence that was produced against him would be scarcely credible."

It happened that the same court-martial sate in judgment upon an officer of one of the King's regiments, who had acted with great brutality towards a native of the country. The officer owed money to the poor man, and when he was asked for it paid the debt not in coin, but in blows. It is an old story—a common mode of requital, I am afraid, familiar to many generations. The man was sent back again, by order of the commanding officer, accompanied by the adjutant of the regiment, and the debtor received him, "with the money that was due to him and the stick that was prepared to beat him lying on the same table," and administered a second correction to him, which "divided his ear." But the sympathies of the court were all with the white man, and he was acquitted as though this "new way to pay old debts" were quite in consonance with the acknowledged usages of officers and gentlemen. But Lord Cornwallis branded the man's conduct "as partaking both of ferocity and injustice, and no less unworthy of the manners of gentlemen than disgraceful to the character of officers;" and whilst severely censuring the court and reminding it that "true humanity consists not in screening the guilty, but in protecting the innocent and redressing the injured," he told the culprit that if he should "persevere in the shameful practice of beating his creditors instead of paying them, he should not on a future occasion escape the punishment that such conduct deserves." Cruelty, whether active or passive, evincing itself in brutal outrages, or in negligence scarcely less brutal, filled him with measureless indignation.

But it was not only by words such as these, and by the due exercise of his authority, that he manifested his kindly and generous consideration for all who looked up to him for protection. He was a large-hearted man, capable of heroic self-sacrifice for the good of others. To go to India, in those days, was to go in quest of money. Large fortunes were rapidly made; and men returned to England to buy estates, and to found families. There were many ways to wealth, in the last century, lawful and unlawful; honourable and dishonourable. Among the former—among the most lawful and the most honourable means of attaining wealth, the only lawful and honourable way of attaining it *per saltum*—was the acquisition of prize-money. If Lord Cornwallis had at one stroke added 50,000*l.* to his fortune, by receiving his "share" of the booty taken in the war, it would have been simply so much honourable gain, which the world would have said he fairly deserved. He was not a rich man. His estate, indeed, was scarcely adequate to the due maintenance of his title. But when the prize lay before him, he would not touch it. He threw the whole of the large share which belonged to him as Commander-in-Chief of the army into the common fund, to increase the gains of the officers and men who served under him; and General Medows, as second-in-command, with a generosity, equally prompt and earnest, also gave up his share to the army.

Lord Cornwallis returned to Madras, and was detained there some time for the settlement of the affairs of the Carnatic. It was not until the 17th of July, that he was able to write to Mr. Dundas, "I have at length settled everything with the Nabob, and I believe in the best manner that it could have been done, unless we had kept possession of the country; but that point could only have been carried by force, without the least shadow of reason or justice, and consequently was not to be attempted." Soon after this he sailed for Calcutta. It was his duty then to gather up a number of official threads, and to tie them up in safe knots. It would have pleased him much better if the exigencies of war had never drawn him from Bengal, where all the energies of his mind were devoted to the completion of a great scheme of civil administration. I have said elsewhere that "Lord Cornwallis is the first Indian ruler, who can properly be regarded as an administrator. Up to the time of his arrival, the English in India had been engaged in a great struggle for existence. Clive conquered the richest province of India. Hastings reduced it to something like order. But it was not until Cornwallis carried to that country the large-minded liberality of a benevolent English statesman, that our administrative efforts took shape and consistency, and the entire internal management of the country under our rule was regulated by a code of written laws (or regulations) intended to confer upon the natives of India the benefits of as much European wisdom and benevolence as was compatible with a due regard for the character of native institutions." Aided by Mr. Barlow, then secretary to Government—afterwards Provisional Governor-General, and for some years Governor of Madras, he drew up a code of laws, or as he, correcting the language of the secretary called them, "regulations," now known to history as the Regulations of 1793, which have since been the basis of our civil administration of India. Sir William Jones to whom the scheme was submitted, declared that it was worthy of Justinian.

This done, Lord Cornwallis was desirous above all things to lay down the reins of government. Sir John Shore, a civilian on the Company's establishment, who by a career of unsullied integrity, and by the indication of administrative ability of no mean order, had earned the confidence of his employers, was appointed to succeed him; and in the autumn of 1793 he proceeded to Madras, where he was detained for some time, in consequence of the King's ship bearing the admiral's flag, in which he was to have been conveyed to England, having been compelled to go into dock at Bombay. Lord Cornwallis, therefore, as his military secretary wrote, "took his chance in the 'Swallow';" and sailed from Madras, on or about the 10th of October.

He arrived in England, in the early part of February, 1794, and was soon settled in his Suffolk home. But to one who looked for nothing so much as for repose, the times were unpropitious. Europe was in an unsettled state, and the country had need of the services of all her best soldiers and diplomatists. At such a time it was not to be expected that Her Majesty's Ministers would give much time and attention to the affairs of India. They looked upon Lord Cornwallis not as one who had been employed for his country's good in the East, but as one *to be* employed for his country's good in the West. They concerned themselves with the future, not with the past; and very soon resolved to draw him from his retirement. Early in March he wrote to Mr. Barlow:—"Ministers highly approve of all we have done, but in the hurry of such pressing business as must daily occur, and so many urgent avocations, it is difficult to extract from them even a paragraph. Mr. Beaufoy, the Secretary of the Board of Control, who is a very sensible and zealous man, and who knows as much of Indian affairs as most people here (which God knows is very little), has promised to send out by these ships, a complete approval of the judicial regulations and a recommendation to extend them if possible to Benares. Lord Hobart, who goes to Madras, with the provisional succession to Bengal, has abilities and habits of business. I have had many long conversations with him, and have endeavoured to tutor him well. I have not time to enter into European politics. God send that we may do better; but I do not see any flattering prospect." A month later, he wrote to the same correspondent, saying:—"Much as I wish for quiet, I am afraid that I shall be forced from my intended retirement, and be engaged in a very difficult and hazardous situation in the busy scene on the Continent."

These anticipations were soon fulfilled. Before the end of May, Lord Cornwallis had received the expected summons from the King's Government to proceed to Flanders. On the 2nd of June, he landed at Ostend; but his mission was not a successful one. He had interviews with the Emperor of Austria at Brussels, but His Imperial Majesty was obdurate and could not be induced to comply with the wishes of the British Government. Before the end of the month he was recalled to England; and was, on his arrival, in frequent communication with Pitt and Dundas on the subject of the prosecution of the war. "I have taken Lord Hertford's house in Lower Grosvenor Street," he wrote to his brother in July, "completely furnished, for one year, for 600 guineas, which gives me time to look about me. My expedition has not been a profitable one, but my baggage, horses, and wine are returned; and I shall keep everything in readiness till the end of the war, that I may not be subject to another expensive equipment." It was then in contemplation to confer upon him the military command in Flanders, to counteract the incapacity of the Duke of York; but the appointment never took effect, and it was well for him that it did not, for it would have placed him in an anomalous and trying position in which he might have acquitted himself with honour, but scarcely with success. It was, therefore, a great relief to him to find that the scheme was abandoned. "I should have been," he wrote to Mr. Dundas, "in the most embarrassing and dangerous situation possible, with every prospect of ruin to myself, and very little probability of rendering any essential service to my country." Indeed, he feared that the mere suggestion might have done him injury at Court. "I conclude I am now completely ruined at St. James's," he said. "Indeed, I could not be much worse than I was before; but that is a circumstance which will not disturb my rest, nor abate in the smallest degree my attachment and affection for the great personage from whom I have formerly received much favour and kindness."

He was now eager to escape into the country, but the critical situation of affairs on the Continent detained him in London till the beginning of September, when he betook himself to Brome. From this place, he wrote on the 7th to Mr. Barlow:—"The very critical situation of the affairs of Europe, and the part which I have thought it my duty to take in giving every possible assistance to Government, by personal services and military counsel, have a good deal diverted my attention, and still more the attention of those with whom I converse, from the affairs of India; which, however, next to the immediate safety of Great Britain, will be always uppermost at my heart. . . . When I tell you that I have not had ten days' leisure, since my return from India, to attend to my private affairs, and that my situation is now so uncertain that I may be called upon in twenty-four hours to go to Flanders, you will not expect long letters, and it would require a large volume, if I were to attempt to enter into the politics of Europe, and the horrors of France which increase daily, and exceed all power of belief."

At the commencement of the following year, Lord Cornwallis was appointed Master-General of the Ordnance with a seat in the Cabinet. This compelled him, much against his natural inclinations, to spend the greater part of the year in London. In April, he wrote to his Indian correspondent, Mr. Barlow, assuring him that although he had little time to devote to Indian affairs, he had not ceased to take a lively interest in them:—"When I left India," he said, "I thought that I should have nothing to do on my return to this country but to look a little to Asiatic affairs, and to call the attention of Ministers to those points which I knew to be of the most pressing and important nature. The critical situation, however, of all Europe, and of our own country in particular, has entirely engrossed my mind, and the doubt whether we could possibly keep England has almost effaced all ideas of improving our Government in India." The following year (1796) still found him writing in the same strain. The critical state of affairs in Europe so occupied the minds of the King's Ministers, that they gave no heed to Indian affairs, and Cornwallis himself felt that he was powerless to interfere to any advantage. But the time was now approaching when there was to be also a "critical state of affairs" in our Indian possessions. The officers of the Bengal army were on the brink of mutiny. They dreaded a serious invasion of their rights, and were banding, or as it was said "conspiring" together to maintain them. There was a scheme of "amalgamation" afloat, the result of which would have been seriously detrimental to the interests of the Company's officers, and they resisted it, in some instances with an amount of vehemence not consistent with military discipline. Indeed, the excitement at one time was so great that a very little would have stirred the smouldering fire into a blaze. The state of affairs was alarming, and the alarm communicated itself to the Government in England. It was plainly necessary to do something. The something to be done took the shape of a peace mission from home. Some high officer of the Government was to go out to India, conciliatory but resolute, with the olive branch in one hand, and the *fasces* of the law in the other. But who was to proceed on this mission? The choice lay between Mr. Dundas, the President of the Board of Control, and Lord Cornwallis, the sometime Governor-General of India; and for awhile the probabilities of selection oscillated between the two. Mr. Dundas was more willing to go than Lord Cornwallis; but the Government, who probably thought also that the latter was the more fitting agent of the two, declared that the services of Dundas could not be spared in that conjuncture at home; so most reluctantly Cornwallis accepted the mission, and forthwith began to make preparations for his voyage to India. "You will no doubt," he wrote from Culford, to a friend in India, on the 31st of January, 1797, "be much astonished at the news of my return to India, but my earnest solicitude for the welfare of my country, and my particular apprehensions lest our Asiatic possessions should either be torn from us, or rendered a useless and unprofitable appendage to the British Empire, have induced me to sacrifice every personal consideration, and to gratify the wishes of Government, and I may venture to say of the public at large, by coming forward again at this late period of my life, to endeavour to restore our affairs in India to the prosperous state in which I left them." And then he proceeded to give precise instructions regarding the domestic arrangements which he desired should be made for his reception.

But this special mission to India belongs only to the "History of Events that never happened." The danger subsided, and with it the alarm. The officers of the Company's army, under sedative assurances, and satisfying concessions, began to return to their allegiance, and it was not necessary to apply the special remedies, of which I have spoken, to a disease which was dying out by itself. Instead of Lord Cornwallis going out to India as Governor-General, with his successor in his train, Lord Mornington was selected to be Governor-General in succession to Sir John Shore. The change delighted Lord Cornwallis. At the call of his king and his country, he was ready to go to India—as he would have gone anywhere, under a strong sense of duty—but he thankfully withdrew from the mission when he was no longer bound by these loyal considerations to undertake it. He had faith in the young statesman who had been selected for office; and he saw him depart with pleasure.

"When the shameful conduct of the Bengal officers," he wrote to Mr. Barlow, in October, "threatened India with immediate ruin, and it was thought that my services might be of consequence, I did not refuse to come forward. The business of my instructions was ill-managed here, and the favourable turn of affairs in Bengal rendered my presence less necessary. It is not wonderful, therefore that I should avail myself of so fair an excuse to decline an arduous task, which from untoward circumstances I should have undertaken with peculiar disadvantage. Lord Mornington, your new Governor-General, is a man of very considerable abilities, and most excellent character. I have known him from his childhood, and have always lived on the most friendly habits with him. He goes out with the best and purest dispositions. He is an enthusiast for the preservation of that plan of government which, without your powerful assistance, could never have been either formed or maintained. His lordship has no private views, nor a wish to do anything but what is for the public good; and I have taken upon myself to answer that you will have no reserve with him, either in regard to men or measures. Having assured you that Lord Mornington thinks exactly as I do both about India and yourself, I have only to add my sincere good wishes for your health and prosperity, and to express my hopes that when our dangers are over, we may meet happily in this country."

And now we come to an epoch in the great and varied career of Lord Cornwallis which, though to the general student of English history more interesting than any other, is the one of which most has been written by others, and of which I am least called upon to write. In a time of the greatest trouble and difficulty he was appointed Lord-Lieutenant and Commander-in-Chief in Ireland. He had to combat a great rebellion, and in combating it he was as merciful as he was resolute and courageous. But, with India all this has nothing to do—nor has his later mission to the Continent. One passage of a letter will suffice to illustrate both. From Paris he wrote on the 18th of November, 1801,—"I have been so constantly occupied, and my mind has been so much agitated by the critical state of public affairs, and the very important part which I was obliged to take in the great questions of the Union, and the privileges proposed to be granted to the Catholics of Ireland, that I could attend to no other matters. On my return to England, on the change of administration, where I expected, (after winding up the Irish business, and pacifying those who had claims for services in the Union contest) to retire and enjoy some quiet, I was called upon, in consequence of the serious preparations which the French were making to invade us, to accept the command in the Eastern District, and by the date of this letter, you will see that I have now undertaken to put the finishing hand to the work of peace, which was most ardently desired by the nation, and which appeared to me to be necessary for the preservation of our country. . . The Definitive Treaty will, I hope, be concluded in a few weeks. Bonaparte has, for the present, tranquillised France. The people are kept in excellent order: would to God that the discontented in England could see the *state of liberty* which this country, so much the object of their envy, enjoys. All persons here, speak with horror of the Revolution."

At last it seemed that the long-coveted season of repose was really at hand. The peace of Amiens was concluded; and Lord Cornwallis returned to England, and betook himself to the country;—"For a long time past," he wrote from Brome in September, 1802, "I have been out of the way of knowing what was going forward respecting India, and it was not until Lord Castlereagh called on me last week on his way from Ireland, (by Mr. Dundas's house in Scotland) to London, that I had an idea of the style of letters which have of late been sent by the Court of Directors to Lord Wellesley. I most earnestly hope that matters may be so accommodated as to induce his lordship to continue another year in the Government, which either with a view to its immediate or future effects, I conceive to be of the utmost importance to the interests of the British Empire. . . . I have now retired for ever from all public situation, but my feelings are still alive to the honor and interests of my country, and I shall to the end of my life reflect with the most heartfelt satisfaction, that by adopting and patronising your suggestions, I laid the foundation of a system for the prosperity of our Indian Empire, which has so gloriously flourished, and risen to such height, under the splendid administration of Lord Wellesley."

But, brilliant as were these prospects, the time soon came when the territorial acquisitions of Lord Wellesley alarmed Lord Cornwallis. It seemed to him that our empire was growing too large, and that we should find it difficult to administer its affairs with advantage to so immense a population. On this subject he wrote from Culford, in August, 1804, putting the whole case in a few pregnant sentences; —"By the last accounts from India, affairs appear to be in a most prosperous state. You have dictated the terms of peace, and have obtained every possession in India that could be desired. The question here from many persons is, Have we not too much? But I hardly know, when the power was in our hands, what part of our acquisitions we could prudently have relinquished." He little thought, when he wrote this, that out of the state of things that had then arisen in India, there was growing up that which in a very little time would draw him again from his retirement and compel him to go forth once more with the harness on his back. But so it was. Lord Wellesley had been playing the great game with such success that he had brought our Indian Empire to the very verge of bankruptcy. And the game was not yet played out. What then was to be done? Lord Wellesley was ambitious. Lord Wellesley was insubordinate. The advisers in whom he most trusted counselled him not to throw up the cards. But there was no money even to carry on The Trade; for the war engulfed every rupee. To the Directors in Leadenhall Street the crisis of ruin appeared to be imminent. They stood aghast at the prospect before them. It was necessary to do something—and that speedily. Nothing but a change of government would suffice to meet the difficulties of the case. Orders might be sent to India; but it was one thing to draft instructions, another to secure obedience to them. It had been arranged that Sir George Barlow should succeed Lord Wellesley in the Governor-Generalship. But Barlow was a member of Lord Wellesley's government; and the Court of Directors were, therefore, alarmed at the thought of his succession. The King's Ministers concurred in opinion with the Company that it was desirable to send out an English statesman with no leanings towards the prosecution of the war—a safe man, moderate but resolute, and if clothed with the authority of a great foregone career, so much the better. It was only in the common course of things, that the thoughts of the Government should have turned at once to Lord Cornwallis. There was a difficulty—an emergency—and again they turned to the old quarter for help. What followed may be told in his lordship's own words. Writing from Culford on January 6th, 1805, to Sir George Barlow, he said:—"I can hardly figure to myself the astonishment which you must feel at hearing that I am again returning to the station of Governor-General, and lest you should suppose that I can in the smallest degree have altered my sentiments with regard to yourself, and have ceased to think you capable of discharging the duties of that office to your own credit, and to the honour and advantage of the Company and of your country, I take the earliest opportunity that offers to explain to you in a few words the circumstances which have produced this extraordinary event. You will recollect that in the course of last year I informed you that Lord Wellesley's neglect and contemptuous treatment of the Court of Directors was exceedingly embarrassing to the King's Government at home. A line of conduct on his part somewhat similar has of late extended itself to that very Government, and his Majesty's Ministers have been liable to be called upon to account for measures of great importance, of the causes of which they were totally ignorant, although opportunities had offered for communication. I shall enter no further into these matters, but pass over to what immediately concerns yourself and my appointment. A few weeks ago Lord Castlereagh came down to this place, and after some previous conversation about India, informed me that the dissatisfaction of the Court of Directors with the conduct of Lord W. had risen to such a height, that it was absolutely necessary that he should be desired to leave the Government, that Ministers were very uneasy at the present state of matters, and expressed the earnest wish of his Majesty's confidential servants, that I would for a short time take the direction of affairs in that country. I answered, that I had not been in the habit of refusing my services, whenever they might be thought useful, but that I was too old for such an undertaking, and I felt it to be the more unnecessary, as the person named for the succession to the Government was in my opinion more capable of making a satisfactory arrangement than myself. He then informed me that the appointment of any Company's servant to the Government-General was *at this moment* out of the question; and in the particular case alluded to, it was the more impossible, as the Court of Directors could by no means be brought to consent, to the succession of a member of Lord Wellesley's government. After some discussion upon this subject, I proposed to undertake the present mission, provided that on my leaving the country I could be assured that you were to succeed me. Lord Castlereagh declared that an assurance of that kind was not to be expected, and could only say that my going would open the only chance for your succession. Unemployed as I have long been, and appeared likely to remain, in the line of my profession, and, in its present state, useless to my own family, I have consented to take the rash step of returning to India, by which, if I should ultimately be the means of placing the charge of our Asiatic Empire in your hands, I shall feel that I have rendered an essential service to my country."

Truly was it a hazardous duty, which he had thus undertaken at the age of sixty-five. There was nothing for which he longed more than for rest. He had an ample store of honour; he had an ample store of wealth. It was intended that he should sojourn only for a little while in India, and he could add but little, therefore, to either store. The service, indeed, upon which he was going was an unpopular and a thankless one. He was going upon a service of peace and retrenchment. Many private interests were likely to suffer grievously by the course of severe economy on which he was about to enter; and people, in such a case, rarely discriminate between the authors and the agents of the measures, which injuriously affect them. War is always popular in India; and there was scarcely a man in the two services from the veteran warrior Lake, to the boy-civilian Metcalfe, who did not utterly abhor and vehemently condemn the recreant policy of withdrawing from the contest before the great game had been played out. It is scarcely possible to conceive a mission less attractive than that on which the fine old soldier now set out, leaving behind him all that he held most dear, because he felt that it was his duty to go. It has been said that he "caught with the enthusiasm, which belongs to good and great minds, at the prospect of performing one more important service to his country before he died," and that he "listened with avidity to those, who, desirous of the authority of his great name to their plans, represented to him that his presence alone could save from inevitable ruin the Empire which he had before ruled with so much glory."* But I doubt whether he caught with any enthusiasm or any avidity at the proposal, honourable as it was to him and serviceable as it might be to his country. He did not hesitate to accept the charge entrusted to him. He had never hesitated in his life to do, at any cost to himself, that which he believed his country demanded from him. But he would fain have spent the remaining years of his life in repose. It was not enthusiasm or ambition that stirred him, but an irresistible sense of self-denying Duty.

But he soon found that the task which he had set himself was one beyond his powers adequately to perform. The hardships of life on board ship tried him severely. He would not suffer any distinctions, with respect to food and water, to be made in his favour, and the vessel was inadequately supplied with both. The discomforts to which he was subjected might have been nothing to a young man in robust health, but they aggravated the growing infirmities of age, and he arrived in Calcutta in very feeble health. He found things there even in a worse state than he had anticipated. Assuming the reins of government on the 30th of July, 1805, he began at once to perform the ungrateful work which had been assigned to him. "Finding," he wrote two days afterwards, "to my great concern, that we are still at war with Holkar, and that we can hardly be said to be at peace with Scindiah, I have determined to proceed immediately to the Upper Provinces, that I may be at hand to avail myself of the interval which the present rainy season must occasion in the military operations to endeavour, if it can be done, without a sacrifice of our honours, to terminate by negotiation a contest, in which the most brilliant success can afford us no solid benefit, and which, if it should continue, must involve us in pecuniary difficulties, which we shall hardly be able to surmount." At this time Lord Wellesley was in Calcutta; and it devolved upon Sir George Barlow to bridge over the gulf which lay between the old policy and the new, so as to mitigate as much as possible the evils of an abrupt and violent transition, to make the new ruler thoroughly understand the measures of the old, and to reconcile the old to the measures of the new. In this he succeeded with wonderful address. The fact is, that Lord Wellesley had already begun to see plainly that it was wholly impossible to play the great game any longer with an exhausted treasury and with our credit at the lowest ebb.

Attended by some of the chief officers of the Secretariat, and by the members of his own personal staff, Lord Cornwallis embarked on board his state-pinnace and proceeded up the river. But it was very soon apparent that he was breaking down. Day by day, the executive officers who attended him, saw that he was growing more feeble, and that sustained labour was becoming a greater difficulty and a greater pain. There were times when he could converse clearly and forcibly on the state of public affairs, and communicate to his chief secretary, Mr. Edmonstone, the instructions which he wished to be conveyed to the leading functionaries, civil and military, in different parts of the country; but at others, he was wholly incapable of holding the helm, and the orders, which went forth in his name, though based upon the sentiments which he had been able to express at intervals, were never supervised by him. After a few weeks, as they passed up the river, it became only too painfully apparent that the hand of death was upon the brave old man. He made great efforts to overcome his weakness. But the frail flesh succumbed; and, after lying for a while, insensible of all that was going on around him, he died at Ghazepore on the 5th of October, 1805, and was buried there without even a chaplain to perform the funeral service over his remains.

---

* Sir John Malcolm.

HEREWARD, THE LAST OF THE ENGLISH.

By CHARLES KINGSLEY.

CHAPTER XXVI.

HOW HEREWARD FULFILLED HIS WORDS TO THE PRIOR OF THE GOLDEN BOROUGH.

In the course of that winter died good Abbot Brand. Hereward went over to see him, and found him mumbling to himself texts of Isaiah, and confessing the sins of his people.

"'Woe to the vineyard that bringeth forth wild grapes. Woe to those that join house to house, and field to field,'—like us, and the Godwinssons, and every man that could—till we 'stood alone in the land.' 'Many houses, great and fair, shall be without inhabitants.'—It is all foretold in Holy Writ, Hereward, my son. 'Woe to those who rise early to fill themselves with strong drink, and the tabret and harp are in their feasts: but they regard not the works of the Lord.' 'Therefore my people are gone into captivity, because they have no knowledge.' Ah—those Frenchmen have knowledge, and too much of it: while we have brains filled with ale instead of justice. 'Therefore hell hath enlarged herself, and opened her mouth without measure,'——and all go down into it, one by one. And dost thou think thou shalt escape, Hereward, thou stout-hearted?"

"I neither know nor care: but this I know, that whithersoever I go, I shall go sword in hand."

"'They that take the sword shall perish by the sword,'" said Brand, and blessed Hereward, and died.

A week after came news that Thorold of Malmesbury was coming to take the abbey of Peterborough, and had got as far as Stamford, with a right royal train.

Then Hereward sent Abbot Thorold word, that if he, or his Frenchmen, put foot into Peterborough, he Hereward would burn it over their heads. And that if he rode a mile beyond Stamford town, he should walk back into it barefoot in his shirt.

Whereon Thorold abode at Stamford, and kept up his spirits by singing the songs of Roland—which some say he himself composed.

A week after that, and the Danes were come.

A mighty fleet, with Sweyn Ulfsson at their head, went up the Ouse toward Ely. Another, with Osbiorn at their head, having joined them off the mouth of the Humber, sailed (it seems) up the Nene. All the chivalry of Denmark and Ireland was come. And with it, all the chivalry, and the unchivalry, of the Baltic shores. Vikings from Jomsburg and Arkona, Gottlanders from Wisby; and with them savages from Esthonia, Finns from Äland, Letts who still offered, in the forests of Rugen, human victims to the four-headed Swantowit—foul hordes in sheep-skins and primæval filth, who might have been scented from Hunstanton Cliff ever since their ships had rounded the Skaw.

Hereward hurried to them with all his men. He was anxious, of course, to prevent their plundering the landsfolk as they went—and that the savages from the Baltic shore would certainly do, if they could, however reasonable the Danes, Orkneymen, and Irish Ostmen might be.

Food, of course, they must take where they could find it; but outrages were not a necessary, though a too common, adjunct to the process of emptying a farmer's granaries.

He found the Danes in a dangerous mood, sulky, and disgusted, as they had good right to be. They had gone to the Humber, and found nothing but ruin; the land waste; the French holding both the shores of the Humber; and Osbiorn cowering in Humber-mouth, hardly able to feed his men. They had come to conquer England, and nothing was left for them to conquer, but a few peat-bogs. Then they would have what there was in them. Every one knew that gold grew up in England out of the ground, wherever a monk put his foot. And they would plunder Crowland. Their forefathers had done it, and had fared none the worse. English gold they would have, if they could not get fat English manors.

"No! not Crowland!" said Hereward; "any place but Crowland, endowed and honoured by Canute the Great,—Crowland, whose abbot was a Danish nobleman, whose monks were Danes to a man, of their own flesh and blood. Canute's soul would rise up in Valhalla and curse them, if they took the value of a penny from St. Guthlac. St. Guthlac was their good friend. He would send them bread, meat, ale, all they needed. But woe to the man who set foot upon his ground."

Hereward sent off messengers to Crowland, warning all to be ready to escape into the fens; and entreating Ulfketyl to empty his storehouses into his barges, and send food to the Danes, ere a day was past. And Ulfketyl worked hard and well, till a string of barges wound its way through the fens, laden with beeves and bread, and ale-barrels in plenty, and with monks too, who welcomed the Danes as their brethren, talked to them in their own tongue, blessed them in St. Guthlac's name as the saviours of England, and went home again, chanting so sweetly their thanks to Heaven for their safety, that the wild Vikings were awed, and agreed that St. Guthlac's men were wise folk and open-hearted, and that it was a shame to do them harm.

But plunder they must have.

"And plunder you shall have!" said Hereward, as a sudden thought struck him. "I will show you the way to the Golden Borough—the richest minster in England; and all the treasures of the Golden Borough shall be yours, if you will treat Englishmen as friends, and spare the people of the fens."

It was a great crime in the eyes of men of that time. A great crime, taken simply, in Hereward's own eyes. But necessity knows no law. Something the Danes must have, and ought to have; and St. Peter's gold was better in their purses, than in that of Thorold and his French monks.

So he led them across the fens and side rivers, till they came into the old Nene, which men call Catwater and Muscal now.

As he passed Nomanslandhirne, and the mouth of the Crowland river, he trembled, and trusted that the Danes did not know that they were within three miles of St. Guthlac's sanctuary. But they went on ignorant, and up the Muscal till they saw St. Peter's towers on the wooded rise, and behind them the great forest which now is Milton Park.

There were two parties in Peterborough minster; a smaller faction of stout-hearted English, a larger one who favoured William and the French customs, with Prior Herluin at their head. Herluin wanted not for foresight, and he knew that evil was coming on him. He knew that the Danes were in the fen. He knew that Hereward was with them. He knew that they had come to Crowland. Hereward could never mean to let them sack it. Peterborough must be their point. And Herluin set his teeth, like a bold man determined to abide the worst, and barred and barricaded every gate and door.

That night a hapless churchwarden, Ywar was his name, might have been seen galloping through Milton and Castor Hanglands, and on by Barnack quarries over Southorpe heath, with saddlebags of huge size stuffed with 'gospels, mass-robes, cassocks, and other garments, and such other small things as he could carry away.' And he came before day to Stamford, where Abbot Thorold lay at his ease in his inn with his hommes d'armes asleep in the hall.

And the churchwarden knocked them up, and drew Abbot Thorold's curtains with a face such as his who

> "drew Priam's curtains in the dead of night,
> And would have told him, half his Troy was burned;"

and told Abbot Thorold that the monks of Peterborough had sent him; and that unless he saddled and rode his best that night, with his meinie of men-at-arms, his Golden Borough would be even as Troy town by morning light.

"A moi hommes d'armes!" shouted Thorold, as he used to shout whenever he wanted to scourge his wretched English monks at Malmesbury into some French fashion.

The men leaped up, and poured in, growling.

"Take me this monk, and kick him into the street for waking me with such news."

"But, gracious lord, the outlaws will surely burn Peterborough; and folks said that you were a mighty man of war."

"So I am; but if I were Roland, Oliver, and Turpin rolled into one, how am I to fight Hereward and the Danes with forty men-at-arms? Answer me that, thou dunder-headed English porker. Kick him out."

And Ywar was kicked into the cold, while Thorold raged up and down his chamber in mantle and slippers, wringing his hands over the treasure of the Golden Borough, snatched from his fingers just as he was closing them upon it.

That night the monks of Peterborough prayed in the minster till the long hours passed into the short. The poor corrodiers, and other servants of the monastery, fled from the town outside into the Milton woods. The monks prayed on inside till an hour after matin. When the first flush of the summer's dawn began to show in the north-eastern sky, they heard mingling with their own chant, another chant, which Peterborough had not heard since it was Medehampstead, three hundred years ago;—the terrible Yuch-hey-saa-saa-saa—the war-song of the Vikings of the north.

Their chant stopped of itself. With blanched faces and trembling knees, they fled, regardless of all discipline, up into the minster tower, and from the leads looked out northeastward on the fen.

The first rays of the summer sun were just streaming over the vast sheet of emerald, and glittering upon the winding river; and on a winding line, too, seemingly endless, of scarlet coats and shields, black hulls, gilded poops and vanes and beak-heads, and the flash and foam of innumerable oars.

And nearer and louder came the oar-roll, like thunder working up from the northeast; and mingled with it, that grim yet laughing Heysaa which bespoke in its very note the revelry of slaughter.

The ships had all their sails on deck. But as they came nearer, the monks could see the banners of the two foremost vessels.

The one was the red and white of the terrible Dannebrog. The other, the scarcely less terrible white bear of Hereward.

"He will burn the minster! He has vowed to do it. As a child he vowed, and he must do it. In this very minster the fiend entered into him and possessed him; and to this minster has the fiend brought him back to do his will. Satan, my brethren, having a special spite (as must needs be) against St. Peter, rock and pillar of the Holy Church, chose out and inspired this man, even from his mother's womb, that he might be the foe and robber of St. Peter, and the hater of all who, like my humility, honour him, and strive to bring this English land into due obedience to that blessed Apostle. Bring forth the relics, my brethren. Bring forth, above all things, those filings of St. Peter's own chains, the special glory of our monastery—and perhaps its safeguard this day."

Some such bombast would any monk of those days have talked in like case. And yet, so strange a thing is man, he might have been withal, like Herluin, a shrewd and valiant man.

They brought out all the relics. They brought out the filings themselves, in a box of gold. They held them out over the walls at the ships, and called on all the saints to whom they belonged. But they stopped that line of scarlet, black, and gold, as much as their spiritual descendants stop the lava-stream of Vesuvius, when they hold out similar matters at them, with a hope unchanged by the experience of eight hundred years. The Heysaa rose louder and nearer. The Danes were coming. And they came.

And all the while a thousand skylarks rose from off the fen, and chanted their own chant aloft, as if appealing to heaven against that which man's greed, and man's rage, and man's superstition, had made of this fair earth of God.

The relics had been brought out: but, as they would not work, the only thing to be done was to put them back again and hide them safe, lest they should bow down like Bel and stoop like Nebo, and be carried, like them, into captivity themselves, being worth a very large sum of money in the eyes of the more Christian part of the Danish host.

Then to hide the treasures as well as they could; which (says the Anglo-Saxon Chronicle) they hid somewhere in the steeple.

The Danes were landing now. The shout which they gave as they leaped on shore made the hearts of the poor monks sink low. Would they be murdered, as well as robbed? Perhaps not—probably not. Hereward would see to that. And some wanted to capitulate.

Herluin would not hear of it. They were safe enough. St. Peter's relic might not have worked a miracle on the spot: but it must have done something. St. Peter had been appealed to on his honour, and on his honour he must surely take the matter up. At all events, the walls and gates were strong, and the Danes had no artillery. Let them howl and rage round the holy place, till Abbot Thorold and the Frenchmen of the country rose and drove them to their ships.

In that last thought the cunning Norman was not so far wrong. The Danes pushed up through the little town, and to the minster gates: but entrance was impossible; and they prowled round and round like raging wolves about a winter steading: but found no crack of entry.

Prior Herluin grew bold; and coming to the leads of the gateway tower, looked over cautiously, and holding up a certain most sacred emblem—not to be profaned in these pages—cursed them in the name of his whole Pantheon.

"Aha, Herluin? Are you there?" asked a short square man in gay armour. "Have you forgotten the peatstack outside Bolldyke Gate, and how you bade light it under me thirty years since?"

"Thou art Winter?" and the Prior uttered what would be considered from any but a churchman's lips a blasphemous and bloodthirsty curse; but which was, as their writings sufficiently testify, merely one of the lawful weapons or "arts" of those Christians who were "forbidden to fight"—the other weapon, or art, being that of lying.

"Aha? That goes like rain off a duck's back to one who has been a minster scholar in his time. You! Danes! Ostmen! down! If you shoot at that man, I'll cut your heads off. He is the oldest foe I have in the world, and the only one who ever hit me without my hitting him again; and nobody shall touch him but me. So down bows, I say."

The Danes—humorous all of them—saw that there was a jest toward, and perhaps some earnest too, and joined in jeering the Prior.

Herluin had ducked his head behind the parapet; not from cowardice, but simply because he had on no mail, and might be shot any moment. But when he heard Winter forbid them to touch him, he lifted up his head, and gave his old pupil as good as he brought.

With his sharp swift Norman priest's tongue he sneered, he jeered, he scolded, he argued; and then threatened, suddenly changing his tone, in words of real eloquence. He appealed to the superstitions of his hearers. He threatened them with supernatural vengeance.

Some of them began to slink away frightened. St. Peter was an ill man to have a blood feud with.

Winter stood, laughing and jeering again, for full ten minutes. At last—"I asked, and you have not answered: have you forgotten the peatstack outside Bolldyke Gate? For if you have, Hereward has not. He has piled it against the gate, and it should be burnt through by this time. Go and see."

Herluin disappeared with a curse.

"Now, you seacocks," said Winter, springing up. "We'll to the Bolldyke Gate, and all start fair."

The Bolldyke Gate was on fire; and more, so were the suburbs. There was no time to save them, as Hereward would gladly have done, for the sake of the poor corrodiers. They must go:—on to the Bolldyke Gate. Who cared to put out flames behind him, with all the treasures of Golden Borough before him? In a few minutes all the town was alight. In a few minutes more, the monastery likewise.

A fire is detestable enough at all times, but most detestable by day. At night it is customary, a work of darkness which lights up the dark, picturesque, magnificent, with a fitness Tartarean and diabolic. But under a glaring sun, amid green fields and blue skies, all its wickedness is revealed without its beauty. You see its works, and little more. The flame is hardly noticed. All that is seen is a canker eating up God's works, cracking the bones of its prey—for that horrible cracking is uglier than all stage-scene glares—cruelly and shamelessly under the very eye of the great, honest, kindly sun.

And that felt Hereward, as he saw Peterborough burn. He could not put his thoughts into words, as men of this day can: so much the better for him, perhaps. But he felt all the more intensely—as did men of his day—the things he could not speak. All he said was, aside to Winter—

"It is a dark job. I wish it had been done in the dark." And Winter knew what he meant.

Then the men rushed into the Bolldyke Gate, while Hereward and Winter stood and looked with their men, whom they kept close together, waiting their commands. The Danes and their allies cared not for the great glowing heap of peat. They cared not for each other, hardly for themselves. They rushed into the gap; they thrust the glowing heap inward through the gateway with their lances; they thrust each other down into it, and trampled over them to fall themselves, rising scorched and withered, and yet struggling on toward the gold of the Golden Borough. One savage Lett caught another round the waist, and hurled him bodily into the fire, crying in his wild tongue—

"You will make a good stepping-stone for me."

"That is not fair," quoth Hereward, and clove him to the chine.

It was wild work. But the Golden Borough was won.

"We must in now and save the monks," said Hereward, and dashed over the embers.

He was only just in time. In the midst of the great court were all the monks, huddled together like a flock of sheep, some kneeling, most weeping bitterly, after the fashion of monks.

Only Herluin stood in front of them, at bay, a lofty crucifix in his hand. He had no mind to weep. But with a face of calm and bitter wrath, he preferred words of peace and entreaty. They were what the time needed. Therefore they should be given. To-morrow he would write to Bishop Egelsine, to excommunicate with bell, book, and candle, to the lowest pit of Tartarus, all who had done the deed.

But to-day he spoke them fair. However, his fair speeches profited little, not being understood by a horde of Letts and Finns, who howled and bayed at him, and tried to tear the crucifix from his hands: but feared "the white Christ."

They were already gaining courage from their own yells; in a moment more blood would have been shed, and then a general massacre must have ensued.

Hereward saw it, and shouting "After me, Hereward's men! a bear! a bear!" swung Letts and Finns right and left like cornsheaves, and stood face to face with Herluin.

An angry Finn smote him on the hind head full with a stone axe. He staggered, and then looked round and laughed.

"Fool! hast thou not heard that Hereward's armour was forged by dwarfs in the mountain-bowels? Off, and hunt for gold, or it will be all gone."

The Finn, who was astonished at getting no more from his blow than a few sparks, and expected instant death in return, took the hint and vanished jabbering, as did his fellows.

"Now, Herluin the Frenchman!" said Hereward.

"Now, Hereward the robber of saints!" said Herluin.

It was a fine sight. The soldier and the churchman, the Englishman and the Frenchman, the man of the then world, and the man of the then Church, pitted fairly, face to face.

Hereward tried for one moment to stare down Herluin. But those terrible eye-glances, before which Vikings had quailed, turned off harmless from the more terrible glance of the man who believed himself backed by the Maker of the universe, and all the hierarchy of heaven.

A sharp, unlovely face it was; though, like many a great churchman's face of those days, it was neither thin nor haggard: but rather round, sleek, of a puffy and unwholesome paleness. But there was a thin lip above a broad square jaw, which showed that Herluin was neither fool nor coward.

"A robber and a child of Belial thou hast been from thy cradle; and a robber and a child of Belial thou art now. Dare thy last iniquity, and slay the servants of St. Peter on St. Peter's altar, with thy worthy comrades, the heathen Saracens,* and set up Mahound with them in the holy place."

Hereward laughed so jolly a laugh, that the prior was taken aback.

"Slay St. Peter's rats? I kill men, not monks. There shall not a hair of your head be touched. Here! Hereward's men! march these traitors and their French prior safe out of the walls, and into Milton Woods, to look after their poor corrodiers, and comfort their souls, after they have ruined their bodies by their treason!"

"Out of this place I stir not. Here I am; and here I will live or die, as St. Peter shall send aid."

But as he spoke, he was precipitated rudely forward, and hurried almost into Hereward's arms. The whole body of monks, when they heard Hereward's words, cared to hear no more, but desperate between fear and joy, rushed forward, bearing away their prior in the midst.

"So go the rats out of Peterborough, and so is my dream fulfilled. Now for the treasure, and then to Ely."

But Herluin burst himself clear of the frantic mob of monks, and turned back on Hereward.

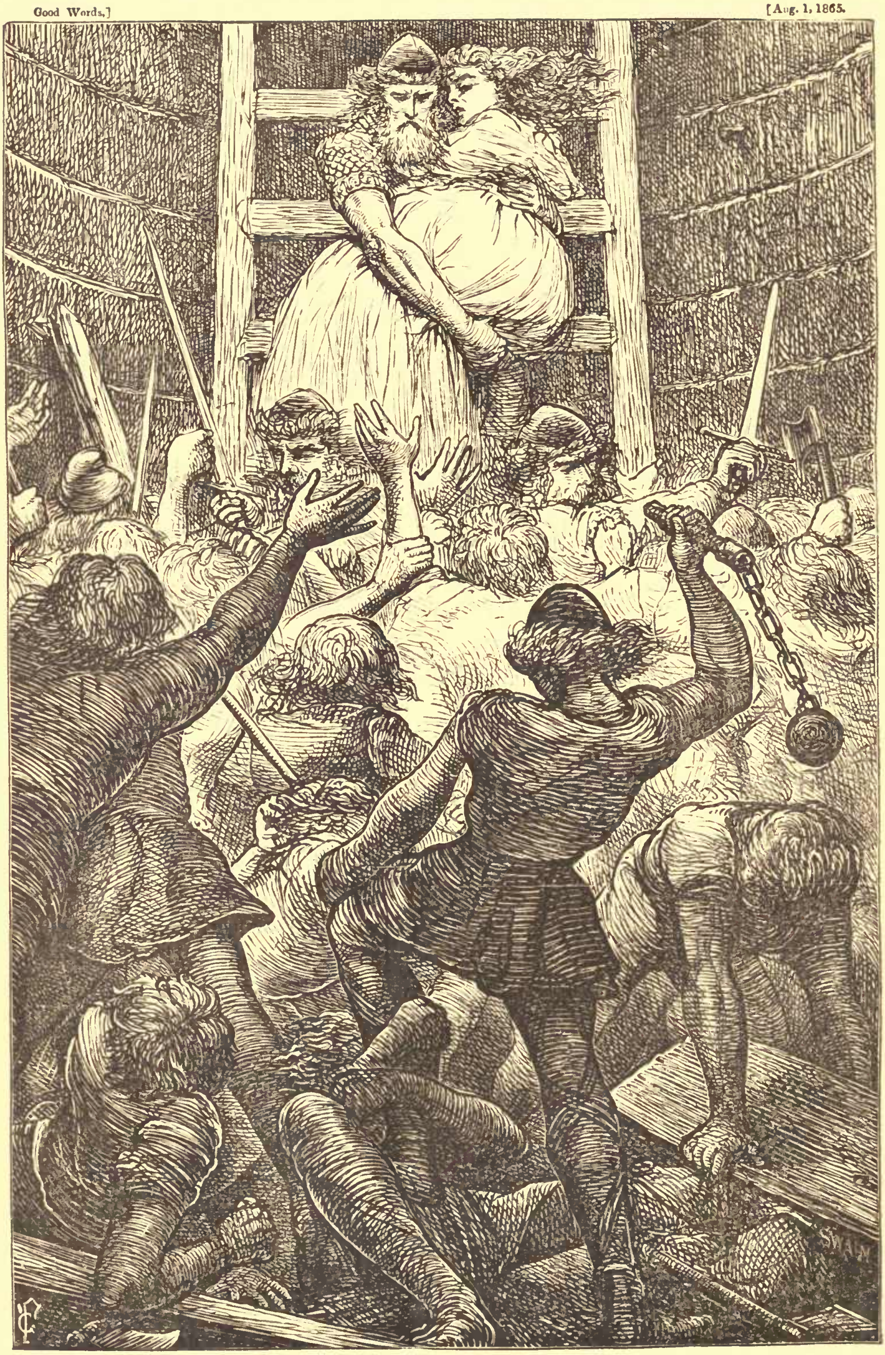
"Thou wast dubbed knight in that church!"

"I know it, man, and that church and the relics of the saints in it are safe therefore. Hereward gives his word."

"That—but not that only, if thou art a true knight, as thou holdest, Englishman."

---

* The Danes were continually mistaken by Norman churchmen for Saracens, and the Saracens considered to be idolators. A maumeet, or idol, means a Mahomet.



"HE CAUGHT HER IN HIS ARMS, AND HURRIED DOWN THE STAIR."

Page 557.

Hereward growled savagely, and made an ugly step toward Herluin. That was a point which he would not have questioned.

"Then behave as a knight, and save, save,"—as the monks dragged him away,—"save the hospice! There are women—ladies there!" shouted he, as he was borne off.

They never met again on earth: but both comforted themselves in after years, that two old enemies' last deed in common had been one of mercy.

Hereward uttered a cry of horror. If the wild Letts, even the Jomsburgers, had got in, all was lost. He rushed to the door. It was not yet burst: but a bench, swung by strong arms, was battering it in fast.

"Winter! Geri! Siwards! To me, Hereward's men! Stand back, fellows. Here are friends here inside. If you do not, I'll cut you down."

But in vain. The door was burst, and in poured the savage mob. Hereward, unable to stop them, headed them, or pretended to do so, with five or six of his own men round him, and went into the hall.

On the rushes lay some half-dozen grooms. They were butchered instantly, simply because they were there. Hereward saw: but could not prevent. He ran as hard as he could to the foot of the wooden stair which led to the upper floor.

"Guard the stair-foot, Winter!" and he ran up.

Two women cowered upon the floor, shrieking and praying with hands clasped over their heads. He saw that the arms of one of them were of the most exquisite whiteness, and judging her to be the lady, bent over her. "Lady! you are safe. I will protect you. I am Hereward."

She sprang up, and threw herself with a scream into his arms.

"Hereward! Hereward! Save me. I am——"

"Alftruda!" said Hereward.

It was Alftruda; if possible more beautiful than ever.

"I have got you!" she cried. "I am safe now. Take me away—Out of this horrible place—Take me into the woods—Anywhere. Only do not let me be burnt here—stifled like a rat. Give me air! Give me water!" And she clung to him so madly, that Hereward, as he held her in his arms, and gazed on her extraordinary beauty, forgot Torfrida for the second time.

But there was no time to indulge in evil thoughts, even had any crossed his mind. He caught her in his arms, and commanding the maid to follow, hurried down the stair.

Winter and the Siwards were defending the foot with swinging blades. The savages were howling round like curs about a bull; and when Hereward appeared above with the women, there was a loud yell of rage and envy.

He should not have the women to himself—They would share the plunder equally—was shouted in half-a-dozen barbarous dialects.

"Have you left any valuables in the chamber?" whispered he to Alftruda.

"Yes, jewels—robes—Let them have all, only save me!"

"Let me pass!" roared Hereward. "There is rich booty in the room above, and you may have it as these ladies' ransom. Them you do not touch. Back, I say, let me pass!"

And he rushed forward. Winter and the house-carles formed round him and the women, and hurried down the hall, while the savages hurried up the ladder, to quarrel over their spoil.

They were out in the court yard, and safe for the moment. But whither should he take her?

"To Earl Osbiorn," said one of the Siwards. But how to find him?

"There is Bishop Christiern!" And the bishop was caught and stopped.

"This is an evil day's work, Sir Hereward."

"Then help to mend it by taking care of these ladies, like a man of God." And he explained the case.

"You may come safely with me, my poor lambs," said the Bishop. "I am glad to find something to do fit for a churchman. To me, my house-carles."

But they were all off plundering.

"We will stand by you and the ladies, and see you safe down to the ships," said Winter, and so they went off.

Hereward would gladly have gone with them, as Alftruda piteously entreated him. But he heard his name called on every side in angry tones.

"Who wants Hereward?"

"Earl Osbiorn—Here he is."

"Those scoundrel monks have hidden all the altar furniture. If you wish to save them from being tortured to death, you had best find it."

Hereward ran with him into the Cathedral. It was a hideous sight; torn books and vestments, broken tabernacle-work; foul savages swarming in and out of every dark aisle and cloister, like wolves in search of prey; five or six ruffians aloft upon the rood-screen; one tearing the golden crown from the head of the crucifix, another the golden footstool from its feet.*

As Hereward came up, crucifix and man fell together, crashing upon the pavement, amid shouts of brutal laughter.

He hurried past them, shuddering, into the choir. The altar was bare, the golden pallium which covered it, gone.

"It may be in the crypt below. I suppose the monks keep their relics there," said Osbiorn.

"No! Not there. Do not touch the relics! Would you have the curse of all the saints? Stay! I know an old hiding place. It may be there. Up into the steeple with me."

And in a chamber in the steeple they found the golden pall, and treasures countless and wonderful.

---

* The crucifix was probably of the Greek pattern, in which the figure stood upon a flat slab, projecting from the cross.

"We had better keep the knowledge of this to ourselves awhile," said Earl Osbiorn, looking with greedy eyes on a heap of wealth such as he had never beheld before.

"Not we! Hereward is a man of his word, and we will share and share alike." And he turned and went down the narrow winding stair.

Earl Osbiorn gave one look at his turned back: an evil spirit of covetousness came over him; and he smote Hereward full and strong upon the hindhead.

The sword turned upon the magic helm, and the sparks flashed out bright and wide.

Earl Osbiorn shrunk back, appalled and trembling.

"Aha?" said Hereward without looking round. "I never thought there would be loose stones in the roof. Here! Up here, Vikings, Berserker, and seacocks all! Here, Jutlanders, Jomsburgers, Letts, Finns, witches' sons and devils' sons all! Here!" cried he, while Osbiorn profited by that moment to thrust an especially brilliant jewel into his boot. "Here is gold, here is the dwarf's work! Come up and take your Polotaswarf! You would not get a richer out of the Kaiser's treasury. Here, wolves and ravens, eat gold, drink gold, roll in gold, and know that Hereward is a man of his word, and pays his soldiers' wages royally!"

They rushed up the narrow stair, trampling each other to death, and thrust Hereward and the Earl, choking, into a corner. The room was so full for a few moments, that some died in it. Hereward and Osbiorn, protected by their strong armour, forced their way to the narrow window, and breathed through it, looking out upon the sea of flame below.

"That was an unlucky blow," said Hereward, "that fell upon my head."

"Very unlucky. I saw it coming, but had no time to warn you. Why do you hold my wrist?"

"Men's daggers are apt to get loose at such times as these."

"What do you mean?" and Earl Osbiorn went from him, and into the now thinning press. Soon only a few remained, to search, by the glare of the flames, for what their fellows might have overlooked.

"Now the play is played out," said Hereward, "we may as well go down, and to our ships."

Some drunken ruffians would have burnt the church for mere mischief. But Osbiorn, as well as Hereward, stopped that. And gradually they got the men down to the ships; some drunk, some struggling under plunder; some cursing and quarrelling because nothing had fallen to their lot. It was a hideous scene; but one to which Hereward, as well as Osbiorn, was too well accustomed to see aught in it save an hour's inevitable trouble in getting the men on board.

The monks had all fled. Only Leofwin the long was left, and he lay sick in the infirmary. Whether he was burned therein, or saved by Hereward's men, is not told.

And so was the Golden Borough sacked and burnt. Now then, whither?

The Danes were to go to Ely, and join the army there. Hereward would march on to Stamford; secure that town if he could; then to Huntingdon, to secure it likewise; and on to Ely afterwards.

"You will not leave me among these savages?" said Alftruda.

"Heaven forbid! You shall come with me as far as Stamford, and then I will set you on your way."

"My way?" said Alftruda, in a bitter and hopeless tone.

Hereward mounted her on a good horse, and rode beside her, looking—and he well knew it—a very perfect knight. Soon they began to talk. What had brought Alftruda to Peterborough, of all places on earth?

"A woman's fortune. Because I am rich—and some say fair—I am a puppet, and a slave, a prey. I was going back to my—to Dolfin."

"Have you been away from him, then?"

"What? Do you not know?"

"How should I know, lady?"

"Yes, most true. How should Hereward know anything about Alftruda? But I will tell you. Maybe you may not care to hear?"

"About you? Anything. I have often longed to know how—what you were doing."

"Is it possible? Is there one human being left on earth who cares to hear about Alftruda? Then listen. You know when Gospatric fled to Scotland his sons went with him. Young Gospatric, Waltheof,* and he—Dolfin. Ethelreda, his girl, went too—and she is to marry, they say, Duncan, Malcolm's eldest son by Ingebiorg. So Gospatric will find himself, some day, father-in-law of the King of Scots."

"I will warrant him to find his nest well lined, wherever he be. But of yourself?"

"I refused to go. I could not face again that bleak black North. Beside—but that is no concern of Hereward's——"

Hereward was on the point of saying, "Can anything concern you, and not be interesting to me?"

But she went on:

"I refused, and——"

"And he misused you?" asked he fiercely.

"Better if he had. Better if he had tied me to his stirrup, and scourged me along into Scotland, than have left me to new dangers, and to old temptations."

"What temptations?"

Alftruda did not answer: but went on—

"He told me in his lofty Scots' fashion, that I was free to do what I list. That he had long since seen that I cared not for him; and that he would find many a fairer lady in his own land."

---

* This Waltheof Gospatricsson must not be confounded with Waltheof Siwardsson, the young Earl. He became a wild border chieftain, then Baron of Atterdale, and then gave Atterdale to his sister Queen Ethelreda, and turned monk, and at last Abbot, of Crowland: crawling home, poor fellow, like many another, to die in peace in the sanctuary of the Danes.

"There he lied. So you did not care for him? He is a noble knight."

"What is that to me? Women's hearts are not to be bought and sold with their bodies, as I was sold. Care for him? I care for no creature upon earth. Once I cared for Hereward, like a silly child. Now I care not even for him."

Hereward was sorry to hear that. Men are vainer than women: just as peacocks are vainer than peahens; and Hereward was—alas for him!—a specially vain man. Of course, for him to fall in love with Alftruda, would have been a shameful sin; he would not have committed it for all the treasures of Constantinople: but it was a not unpleasant thought that Alftruda should fall in love with him. But he only said, tenderly and courteously—

"Alas! poor lady!"

"Poor lady. Too true, that last. For whither am I going now? Back to that man once more."

"To Dolfin?"

"To my master, like a runaway slave. I went down South to Queen Matilda. I knew her well, and she was kind to me, as she is to all things that breathe. But now that Gospatric is come into the King's grace again, and has bought the earldom of Northumbria, from Tweed to Tyne——"

"Bought the earldom?"

"That has he; and paid for it right heavily."

"Traitor and fool! He will not keep it seven years. The Frenchman will pick a quarrel with him, and cheat him out of earldom and money too."

The which William did, within three years.

"May it be so! But when he came into the King's grace, he must needs demand me back, in his son's name."

"What does Dolfin want with you?"

"His father wants my money; and stipulated for it with the King. And beside, I suppose I am a pretty plaything enough still."

"You? You are divine, perfect. Dolfin is right. How could a man who had once enjoyed you, live without you?"

Alftruda laughed, a laugh full of meaning: but what that meaning was, Hereward could not divine.

"So now," she said, "what Hereward has to do, as a true and courteous knight, is to give Alftruda safe conduct, and, if he can, a guard; and to deliver her up loyally and knightly to his old friend and fellow-warrior, Dolfin Gospatricsson, Earl of whatever he can lay hold of for the current month."

"Are you in earnest?"

Alftruda laughed one of her strange laughs, looking straight before her. Indeed, she had never looked Hereward in the face during the whole ride.

"What are those open holes? Graves?"

"They are Barnack stone quarries, which Alfgar my brother gave to Crowland."

"So? That is pity. I thought they had been graves; and then you might have covered me up in one of them, and left me to sleep in peace."

"What can I do for you, Alftruda, my old playfellow; Alftruda, whom I saved from the bear?"

"If she had foreseen the second monster into whose jaws she was to fall, she would have prayed you to hold that terrible hand of yours, which never since, men say, has struck without victory and renown. You won your first honour for my sake. But who am I now, that you should turn out of your glorious path for me?"

"I will do anything—anything. But why miscall this noble prince a monster?"

"If he were fairer than St. John, more wise than Solomon, and more valiant than King William, he is to me a monster; for I loathe him, and I know not why. But do your duty as a knight, sir. Convey the lawful wife to her lawful spouse."

"What cares an outlaw for law, in a land where law is dead and gone? I will do what I—what you like. Come with me to Torfrida at Bourne; and let me see the man who dares try to take you out of my hand."

Alftruda laughed again.

"No, no. I should interrupt the little doves in their nest. Beside, the billing and cooing might make me envious. And I, alas! who carry misery with me round the land, might make your Torfrida jealous."

Hereward was of the same opinion, and rode silent and thoughtful through the great woods which are now the noble park of Burghley.

"I have found it!" said he at last. "Why not go to Gilbert of Ghent, at Lincoln?"

"Gilbert? Why should he befriend me?"

"He will do that, or anything else, which is for his own profit."

"Profit? All the world seems determined to make profit out of me. I presume you would, if I had come with you to Bourne."

"I do not doubt it. This is a very wild sea to swim in; and a man must be forgiven, if he catches at every bit of drift timber."

"Selfishness, selfishness everywhere;—and I suppose you expect to gain by sending me to Gilbert of Ghent?"

"I shall gain nothing, Alftruda, save the thought that you are not so far from me—from us—but that we can hear of you—send succour to you if you need."

Alftruda was silent. At last—

"And you think that Gilbert would not be afraid of angering the king?"

"He would not anger the king. Gilbert's friendship is more important to William, at this moment, than that of a dozen Gospatrics. He holds Lincoln town, and with it the key of Waltheof's earldom: and things may happen, Alftruda—I tell you; but if you tell Gilbert, may Hereward's curse be on you!"

"Not that! Any man's curse save yours!" said she in so passionate a voice that a thrill of fire ran through Hereward. And he recollected her scoff at Bruges—"So he could not wait for me?" And a storm of evil thoughts swept through him. "Would to heaven!" said he to himself, crushing them gallantly down, "I had never thought of Lincoln. But there is no other plan."

But he did not tell Alftruda, as he meant to do, that she might see him soon in Lincoln Castle as its conqueror and lord. He half hoped that when that day came, Alftruda might be somewhere else.

"Gilbert can say," he went on, steadying himself again, "that you feared to go north on account of the disturbed state of the country; and that, as you had given yourself up to him of your own accord, he thought it wisest to detain you, as a hostage for Dolfin's allegiance."

"He shall say so. I will make him say so."

"So be it. Now, here we are at Stamford town; and I must to my trade. Do you like to see fighting, Alftruda—the man's game, the royal game, the only game worth a thought on earth? For you are like to see a little in the next ten minutes."

"I should like to see you fight. They tell me none is so swift and terrible in the battle as Hereward. How can you be otherwise, who slew the bear—when we were two happy children together? But shall I be safe?"

"Safe? of course," said Hereward, who longed, peacock-like, to show off his prowess before a lady who was—there was no denying it—far more beautiful than even Torfrida.

But he had no opportunity to show off his prowess. For as he galloped in over Stamford Bridge, Abbot Thorold galloped out at the opposite end of the town through Casterton, and up the Roman road to Grantham.

After whom Hereward sent Alftruda (for he heard that Thorold was going to Gilbert at Lincoln) with a guard of knights, bidding them do him no harm, but say that Hereward knew him to be a *preux chevalier* and lover of fair ladies; that he had sent him a right fair one to bear him company to Lincoln, and hoped that he would sing to her on the way the song of Roland.

And Alftruda, who knew Thorold, went willingly, since it could no better be.

After which, according to Gaimar, Hereward tarried three days at Stamford, laying a heavy tribute on the burgesses for harbouring Thorold and his Normans; and also surprised at a drinking-bout a certain special enemy of his, and chased him from room to room sword in hand, till he took refuge shamefully in an outhouse, and begged his life.

And when his knights came back from Grantham, he marched to Bourne.

"The next night," says Leofric the deacon, or rather the monk who paraphrased his saga in Latin prose—"Hereward saw in his dreams a man standing by him of inestimable beauty, old of years, terrible of countenance, in all the raiment of his body more splendid than all things which he had ever seen, or conceived in his mind; who threatened him with a great club which he carried in his hand, and with a fearful doom, that he should take back to his church all that had been carried off the night before, and have them restored utterly, each in its place, if he wished to provide for the salvation of his soul, and escape on the spot a pitiable death. But when awakened, he was seized with a divine terror, and restored in the same hour all that he took away, and so departed, going onward with all his men."

So says Leofric, wishing, as may be well believed, to advance the glory of St. Peter, and purge his master's name from the stain of sacrilege. Beside, the monks of Peterborough, no doubt, had no wish that the world should spy out their nakedness, and become aware that the Golden Borough was stript of all its gold.

Nevertheless, truth will out. Golden Borough was Golden Borough no more. The treasures were never restored; they went to sea with the Danes, and were scattered far and wide—to Norway, to Ireland, to Denmark; "all the spoils" says the Anglo-Saxon Chronicle, "which reached the latter country, being the pallium and some of the shrines and crosses; and many of the other treasures they brought to one of the king's towns, and laid them up in the church. But one night, through their carelessness and drunkenness, the church was burned, with all that was therein. Thus was the minster of Peterborough burned and pillaged. May Almighty God have pity on it in His great mercy."

Hereward, when blamed for the deed, said always that he did it "because of his allegiance to the monastery." Rather than that the treasures gathered by Danish monks should fall into the hands of the French robbers, let them be given to their own Danish kinsmen, in payment for their help to English liberty.

But some of the treasure, at least, he must have surely given back, it so appeased the angry shade of St. Peter. For on that night, when marching past Stamford, they lost their way. "To whom, when they had lost their way, a certain wonder happened, and a miracle, if it can be said that such would be worked in favour of men of blood. For while in the wild night and dark they wandered in the wood, a huge wolf met them, wagging his tail like a tame dog, and went before them on a path. And they, taking the grey beast in the darkness for a white dog, cheered on each other to follow him to his farm, which ought to be hard by. And in the silence of the midnight, that they might see their way, suddenly candles appeared, burning, and clinging to the lances of all the knights—not very bright, however: but like those which the folk call candelæ nympharum—wills of the wisp. But none could pull them off, or altogether extinguish them, or throw them from their hands. And thus they saw their way, and went on, although astonished out of mind, with the wolf leading them, until day dawned, and they saw, to their great astonishment, that he was a wolf. And as they questioned among themselves about what had befallen, the wolf and the candles disappeared, and they came whither they had been minded, beyond Stamford town, thanking God, and wondering at what had happened."

After which Hereward took Torfrida, and his child, and all he had, and took ship at Bardeney, and went for Ely. Which when Earl Warrenne heard, he laid wait for him, seemingly near Southery: but got nothing thereby, according to Leofric, but the pleasure of giving and taking a great deal of bad language; and (after his men had refused, reasonably enough, to swim the Ouse and attack Hereward) an arrow, which Hereward, "modicum se inclinans," stooping forward, says Leofric—who probably saw the deed—shot at him across the Ouse, as the Earl stood cursing on the top of the dyke. Which arrow flew so stout and strong, that though it sprang back from Earl Warrenne's hauberk, it knocked him almost senseless off his horse, and forced him to defer his purpose of avenging Sir Frederic his brother.

After which Hereward threw himself into Ely, and assumed, by consent of all, the command of the English who were therein.

CHAPTER XXVII.

HOW THEY HELD A GREAT MEETING IN THE HALL OF ELY.

THERE sat round the hall of Ely all the magnates of the East land and East sea. The Abbot on his high seat; and on a seat higher than his, prepared specially, Sweyn Ulfsson, King of Denmark and England. By them sat the Bishops, Egelwin the Englishman and Christiern the Dane, Osbiorn, the young Earls Edwin and Morcar, and Sweyn's two sons; and, it may be, the sons of Tosti Godwinsson, and Arkill the great Thane, and Hereward himself. Below them were knights, vikings, captains, great holders from Denmark, and the Prior and inferior officers of Ely minster. And at the bottom of the misty hall, on the other side of the column of blue vapour which went trembling up from the great heap of burning turf amidst, were housecarles, monks, wild men from the Baltic shores, crowded together to hear what was done in that parliament of their betters.

They spoke like free Danes; the betters from the upper end of the hall, but every man as he chose. They were in full Thing; in parliament, as their forefathers had been wont to be for countless ages. Their House of Lords and their House of Commons were not yet defined from each other: but they knew the rules of the house, the courtesies of debate; and, by practice of free speech, had educated themselves to bear and forbear, like gentlemen.

But the speaking was loud and earnest, often angry that day. "What was to be done?" was the question before the house.

"That depended," said Sweyn, the wise and prudent king, "on what could be done by the English to co-operate with them." And what that was, has been already told.

"When Tosti Godwinsson, ye Bishops, Earls, Knights, and Holders, came to me five years ago, and bade me come and take the kingdom of England, I answered him, that I had not wit enough to do the deeds which Canute my uncle did; and so sat still in peace. I little thought that I should have lost in five years so much of those small wits which I confessed to, that I should come after all to take England, and find two kings in it already, both more to the English mind than me. While William the Frenchman is king by the sword, and Edgar the Englishman king by proclamation of Danish Earls and Thanes, there seems no room here for Sweyn Ulfsson."

"We will make room for you! We will make a rid road from here to Winchester!" shouted the holders and knights.

"It is too late. What say you, Hereward Leofricsson, who go for a wise man among men?"

Hereward rose, and spoke gracefully, earnestly, eloquently: but he could not deny Sweyn's plain words.

"Sir Hereward beats about the bush," said Earl Osbiorn, rising when Hereward sat down. "None knows better than he that all is over. Earl Edwin and Earl Morcar, who should have helped us along Watling Street, are here fugitives. Earl Gospatric and Earl Waltheof are William's men now, soon to raise the landsfolk against us. We had better go home, before we have eaten up the monks of Ely."

Then Hereward rose again, and without an openly insulting word, poured forth his scorn and rage upon Osbiorn. Why had he not kept to the agreement which he and Countess Gyda had made with him through Tosti's sons? Why had he wasted time and men from Dover to Norwich, instead of coming straight into the fens, and marching inland to succour Morcar and Edwin? Osbiorn had ruined the plan, and he only, if it was ruined.

"And who was I, to obey Hereward?" asked Osbiorn fiercely.

"And who wert thou, to disobey me?" asked Sweyn in a terrible voice. "Hereward is right. We shall see what thou sayest to all this, in full Thing at home in Denmark."

Then Edwin rose, entreating peace. "They were beaten. The hand of God was against them. Why should they struggle any more? Or, if they struggled on, why should they involve the Danes in their own ruin?"

Then holder after holder rose, and spoke rough Danish common sense. They had come hither to win England. They had found it won already. Let them take what they had got from Peterborough, and go.

Then Winter sprang up. "Take the pay, and sail off with it, without having done the work?

That would be a noble tale to carry home to your fair wives in Jutland. I shall not call you niddering, being a man of peace, as all know." Whereat all laughed; for the doughty little man had not a hand's breadth on head or arm without its scar. "But if your ladies call you so, you must have a shrewd answer to give, beside knocking them down."

Sweyn spoke without rising:—"The good knight forgets that this expedition has cost Denmark already nigh as much as Harold Hardraade's cost Norway. It is hard upon the Danes, if they are to go away empty-handed as well as disappointed."

"The King has right!" cried Hereward. "Let them take the plunder of Peterborough as pay for what they have done, and what beside they would have done if Osbiorn the Earl—Nay, men of England, let us be just!—what they would have done if there had been heart and wit, one mind and one purpose, in England. The Danes have done their best. They have shown themselves what they are, our blood and kin. I know that some talk of treason, of bribes. Let us have no more such vain and foul suspicions. They came as our friends; and as our friends let them go, and leave us to fight out our own quarrel to the last drop of blood."

"Would God!" said Sweyn, "thou wouldest go too, thou good knight. Here, earls and gentlemen of England! Sweyn Ulfsson offers to every one of you, who will come to Denmark with him, shelter and hospitality till better times shall come."

Then arose a mixed cry. Some would go, some would not. Some of the Danes took the proposal cordially; some feared bringing among themselves men who would needs want land, of which there was none to give. If the English came, they must go up the Baltic, and conquer fresh lands for themselves from heathen Letts and Finns.

Then Hereward rose again, and spoke so nobly and so well, that all ears were charmed.

They were Englishmen; and they would rather die in their own merry England than conquer new kingdoms in the cold north-east. They were sworn, the leaders of them, to die or conquer, fighting the accursed Frenchman. They were bound to St. Peter, and to St. Guthlac, and to St. Felix of Ramsay, and St. Etheldreda the holy virgin, beneath whose roof they stood, to defend against Frenchmen the saints of England whom they despised and blasphemed, whose servants they cast out, thrust into prison, and murdered, that they might bring in Frenchmen from Normandy, Italians from the Pope of Rome. Sweyn Ulfsson spoke as became him, as a prudent and a generous prince; the man who alone of all kings defied and fought the great Hardraade till neither could fight more; the true nephew of Canute the king of kings: and they thanked him: but they would live and die Englishmen.

And every Englishman shouted, "Hereward has right! We will live and die fighting the French."

And Sweyn Ulfsson rose again, and said with a great oath, "That if there had been three such men as Hereward in England, all would have gone well."

Hereward laughed. "Thou art wrong for once, wise king. We have failed, just because there were a dozen men in England as good as me, every man wanting his own way; and too many cooks have spoiled the broth. What we wanted is not a dozen men like me, but one like thee, to take us all by the back of the neck and shake us soundly, and say, 'Do that, or die!'"

And so, after much talk, the meeting broke up. And when it broke up, there came to Hereward in the hall a noble-looking man of his own age, and put his hand within his, and said:—

"Do you not know me, Hereward Leofricsson?"

"I know thee not, good knight, more pity; but by thy dress and carriage, thou shouldest be a true Vikingsson."

"I am Sigtryg Ranaldsson, now King of Waterford. And my wife said to me, 'If there be treachery or faint-heartedness, remember this—that Hereward Leofricsson slew the Ogre, and Hannibal of Gweek likewise, and brought me safe to thee. And, therefore, if thou provest false to him, niddering thou art; and no niddering is spouse of mine.'"

"Thou art Sigtryg Ranaldsson?" cried Hereward, clasping him in his arms, as the scenes of his wild youth rushed across his mind. "Better is old wine than new, and old friends likewise."

"And I, and my five ships, are thine to death. Let who will go back."

"They must go," said Hereward, half-peevishly. "Sweyn has right, and Osbiorn too. The game is played out. Sweep the chessmen off the board, as Earl Ulf did by Canute the king."

"And lost his life thereby. I shall stand by, and see thee play the last pawn."

"And lose thy life equally."

"What matter? I heard thee sing—

'A bed-death, a priest death,
A straw death, a cow death,
Such death likes not me!'

Nor likes it me either, Hereward Leofricsson."

So the Danes sailed away: but Sigtryg Ranaldsson and his five ships remained.

Hereward went to the minster tower, and watched the Ouse flashing with countless oars northward toward Southrey Fen. And when they were all out of sight, he went back, and lay down on his bed and wept—once and for all. Then he arose, and went down into the hall to abbots and monks, and earls and knights, and was the boldest, cheeriest, wittiest of them all.

"They say," quoth he to Torfrida that night, "that some men have grey heads on green shoulders. I have a grey heart in a green body."

"And my heart is growing very grey, too," said Torfrida.

"Certainly not thy head." And he played with her raven locks.

"That may come, too; and too soon."

For, indeed, they were in very evil case.

CHAPTER XXVIII.

HOW THEY FOUGHT AT ALDRETH.

When William heard that the Danes were gone, he marched on Ely, as on an easy prey.

Ivo Taillebois came with him, hungry after those Spalding lands, the rents whereof Hereward had been taking for his men for now twelve months. William de Warrenne was there, vowed to revenge the death of Sir Frederick, his brother. Ralph Guader was there, flushed with his success at Norwich. And with them all the Frenchmen of the east, who had been either expelled from their lands, or were in fear of expulsion.

With them, too, was a great army of mercenaries, ruffians from all France and Flanders, hired to fight for a certain term, on the chance of plunder or of fiefs in land. Their brains were all aflame with the tales of inestimable riches hidden in Ely. There were there the jewels of all the monasteries round; there were the treasures of all the fugitive English nobles; there were there—what was there not? And they grumbled, when William halted them and hutted them at Cambridge, and began to feel cautiously the strength of the place—which must be strong, or Hereward and the English would not have made it their camp of refuge.

Perhaps he rode up to Madingley windmill, and saw fifteen miles away, clear against the sky, the long line of what seemed nought but a low upland park, with the minster tower among the trees; and between him and them, a rich champaign of grass, over which it was easy enough to march all the armies of Europe; and thought Ely an easy place to take. But men told him that between him and those trees lay a black abyss of mud and peat and reeds, Haddenham fen and Smithy fen, with the deep sullen West water or "Ald-reche" of the Ouse winding through them. The old Roman road was sunk and gone long since under the bog, whether by English neglect, or whether (as some think) by actual and bodily sinking of the whole land. The narrowest space between dry land and dry land was a full half mile; and how to cross that half-mile, no man knew.

What were the approaches on the west? There were none. Beyond Earith, where now run the great washes of the Bedford Level, was a howling wilderness of meres, seas, reed-ronds and floating alder-beds, through which only the fen-men wandered, with leaping-pole and log canoe.

What in the east? The dry land neared the island on that side. And it may be that William rowed round by Burwell to Fordham and Soham, and thought of attempting the island by way of Barraway, and saw beneath him a labyrinth of islands, meres, fens, with the Ouse, now increased by the volume of the Cam, lying deep and broad between Barraway and Thetford-in-the-Isle; and saw, too, that a disaster in that labyrinth might be a destruction.

So he determined on the near and straight path, through Long Stratton and Willingham, down the old bridle-way from Willingham ploughed field;—every village there, and in the isle likewise, had and has still its "field," or ancient clearing of ploughed land,—and then to try that terrible half-mile, with the courage and wit of a general to whom human lives were as those of the gnats under the hedge.

So all his host camped themselves in Willingham field, by the old earth-work which men now call Belsar's Hills: and down the bridle-way poured countless men, bearing timber and faggots, cut from all the hills, that they might bridge the black half-mile.

They made a narrow firm path through the reeds, and down to the brink of the Ouse, if brink it could be called, where the water, rising and falling a foot or two each tide, covered the floating peat for many yards, before it sunk into a brown depth of bottomless slime. They would make a bottom for themselves by driving piles.

The piles would not hold; and they began to make a floating bridge with long beams, says Leofric, and blown-up cattle-hides to float them.

Soon they made a floating sow, and thrust it on before them as they worked across the stream; for they were getting under shot from the island.

Meanwhile, the besieged had not been idle. They had thrown up, says Leofric, a turf rampart on the island shore, and "ante-muralia et propugnacula,"—doubtless over-hanging "hoardings," or scaffolds, through the floor of which they could shower down missiles. And so they awaited the attack, contenting themselves with gliding in and out of the reeds in their canoes, and annoying the builders with arrows and cross-bow bolts.

At last the bridge was finished, and the sow safe across the West water, and thrust in, as far as it would float, among the reeds on the high tide. They in the fort could touch it with a pole.

The English would have destroyed it if they could. But Hereward bade them leave it alone. He had watched all their work, and made up his mind to the event.

"The rats have set a trap for themselves," he said to his men; "and we shall be fools to break it up till the rats are safe inside."

So there the huge sow lay, black and silent, showing nothing to the enemy but a side of strong plank, covered with hide to prevent its being burned. It lay there for three hours, and Hereward let it lie.

He had never been so cheerful, so confident. "Play the man this day, every one of you, and ere nightfall you will have taught the Norman once more the lesson of York. He seems to have forgotten that. It is me to remind him of it."

And he looked to his bow and to his arrows, and prepared to play the man himself; as was the fashion in those old days, when a general proved his worth by hitting harder and more surely than any of his men.

At last the army was in motion, and Willingham field opposite was like a crawling ants' nest. Brigade after brigade moved down to the reed beds, and the assault began.

And now advanced along the causeway, and along the bridge, a dark column of men, surmounted by glittering steel. Knights in complete mail, footmen in leather coats and quilted jerkins; at first orderly enough, each under the banner of his lord: but more and more mingled and crowded, as they hurried forward, each eager for his selfish share of the inestimable treasures of Ely. They pushed along the bridge. The mass became more and more crowded; men stumbled over each other, and fell off into the mire and the water, calling vainly for help, while their comrades hurried on unheeding, in the mad thirst for spoil.

On they came in thousands; and fresh thousands streamed out of the fields, as if the whole army intended to pour itself into the isle at once.

"They are numberless," said Torfrida, in a serious and astonished voice, as she stood by Hereward's side.

"Would they were!" said Hereward. "Let them come on, thick and threefold. The more their numbers, the fatter will the fish below be, before to-morrow morning. Look there, already!"

And already the bridge was swaying, and sinking beneath their weight. The men, in places, were ankle deep in water. They rushed on all the more eagerly, and filled the sow, and swarmed up to its roof.

Then, what with its own weight, what with the weight of the laden bridge, which dragged upon it from behind, the huge sow began to tilt backwards, and slide down the slimy bank.

The men on the top tried vainly to keep their footing, to hurl grapnels into the rampart, to shoot off their quarrels and arrows.

"You must be quick, Frenchmen," shouted Hereward in derision, "if you mean to come on board here."

The Normans knew that well: and as Hereward spoke, two panels in the front of the sow creaked on their hinges, and dropped landward, forming two draw-bridges, over which reeled to the attack a close body of knights, mingled with soldiers bearing scaling ladders.

They recoiled. Between the ends of the draw-bridges and the foot of the rampart was some two fathoms' breadth of black ooze. The catastrophe which Hereward had foreseen was come, and a shout of derision arose from the unseen defenders above.

"Come on, leap it like men! Send back for your horses, knights, and ride them at it like bold huntsmen!"

The front rank could not but rush on: for the pressure behind forced them forward, whether they would or not. In a moment they were wallowing waist deep, trampled on, and disappearing under their struggling comrades, who disappeared in their turn.

"Look, Torfrida! If they plant their scaling ladders, it will be on a foundation of their comrades' corpses." Torfrida gave one glance through the openings of the hoarding, upon the writhing mass below, and turned away in horror. The men were not so merciful. Down between the hoarding-beams rained stones, javelins, arrows, increasing the agony and death. The scaling ladders would not stand in the mire. If they had stood a moment, the struggles of the dying would have thrown them down; and still fresh victims pressed on from behind, shouting "Dex Aie! On to the gold of Ely!" And still the sow, under the weight, slipped further and further back into the stream, and the foul gulf widened between besiegers and besieged.

At last one scaling ladder was planted upon the bodies of the dead, and hooked firmly on the gunwale of the hoarding. Ere it could be hurled off again by the English, it was so crowded with men that even Hereward's strength was insufficient to lift it off. He stood at the top, ready to hew down the first comer; and he hewed him down.

But the Normans were not to be daunted. Man after man dropped dead from the ladder top,—man after man took his place; sometimes two at a time; sometimes scrambling over each other's backs.

The English, even in the insolence of victory, cheered them with honest admiration. "You are fellows worth fighting, you French!"

"So we are," shouted a knight, the first and last who crossed that parapet; for, thrusting Hereward back with a blow of his sword-hilt, he staggered past him over the hoarding, and fell on his knees.

A dozen men were upon him: but he was up again and shouting:—

"To me, men at arms! A Dade! A Dade!" But no man answered.

"Yield," quoth Hereward.

Sir Dade answered by a blow on Hereward's helmet, which felled the chief to his knees, and broke the sword into twenty splinters.

"Well hit," said Hereward, as he rose. "Don't touch him, men! this is my quarrel now. Yield, sir! you have done enough for your honour. It is madness to throw away your life."

The knight looked round on the fierce ring of faces, in the midst of which he stood alone.

"To none but Hereward."

"Hereward am I."

"Ah," said the knight, "had I but hit a little harder!"

"You would have broke your sword into more splinters. My armour is enchanted. So yield like a reasonable and valiant man."

"What care I?" said the knight, stepping on to the earthwork, and sitting down quietly. "I vowed to St. Mary and King William that into Ely I would get this day; and in Ely I am; so I have done my work."

"And now you shall taste—as such a gallant knight deserves—the hospitality of Ely."

It was Torfrida who spoke.

"My husband's prisoners are mine; and I, when I find them such *prudhommes* as you are, have no lighter chains for them than that which a lady's bower can afford."

Sir Dade was going to make an equally courteous answer, when over and above the shouts and curses of the combatants rose a yell so keen, so dreadful, as made all hurry forward to the rampart.

That which Hereward had foreseen was come at last. The bridge, strained more and more by its living burden, and by the falling tide, had parted,—not at the Ely end, where the sliding of the sow took off the pressure,—but at the end nearest the camp. One sideway roll it gave, and then, turning over, engulfed in that foul stream the flower of Norman chivalry; leaving a line—a full quarter of a mile in length—of wretches drowning in the dark water, or, more hideous still, in the bottomless slime of peat and mud.

Thousands are said to have perished. Their armour and weapons were found at times, by delvers and dykers, for centuries after; are found at times unto this day, beneath the rich drained corn-fields which now fill up that black half mile, or in the bed of the narrow brook to which the Westwater, robbed of its streams by the Bedford Level, has dwindled down at last.

William, they say, struck his tents and departed forthwith, groaning from deep grief of heart; and so ended the first battle of Aldreth.

CHAPTER XXIX.

HOW SIR DADE BROUGHT NEWS FROM ELY.

A MONTH after the fight, there came into the camp at Cambridge, riding on a good horse, himself fat and well-liking, none other than Sir Dade.

Boisterously he was received, as one alive from the dead; and questioned as to his adventures and sufferings.

"Adventures I have had, and strange ones; but for sufferings, instead of fetter-galls, I bring back, as you see, a new suit of clothes; instead of an empty and starved stomach, a surfeit from good victuals and good liquor; and whereas I went into Ely on foot, I came out on a fast hackney."

So into William's tent he went; and there he told his tale.

"So, Dade, my friend?" quoth the duke in high good humour, for he loved Dade. "You seem to have been in good company?"

"Never in better, sire, save in your presence. Of the earls and knights in Ely, all I can say is, God's pity that they are rebels, for more gallant and courteous knights or more perfect warriors never saw I, neither in Normandy, nor at Constantinople, among the Varangers themselves."

"Eh? and what are the names of these gallants, for you have used your eyes and ears, of course?"

"Edwin and Morcar, the earls—two fine young lads."

"I know it. Go on," and a shade passed over William's brow, as he thought of his own falsehood, and his fair Constance, weeping in vain for the fair bridegroom whom he had promised to her.

"Siward Barn, as they call him, the boy Orgar, and Thurkill Barn. Those are the knights. Egelwin, bishop of Durham, is there too; and besides them all, and above them all, Hereward. The like of that knight I may have seen. His better saw I never."

"Sir fool!" said Earl Warrenne, who had not yet—small blame to him—forgotten his brother's death. "They have soused thy brains with their muddy ale, till thou knowest not friend from foe. What hast thou to come hither praising up to the king's majesty such an outlawed villain as that, with whom no honest knight would keep company?"

"If you, Earl Warrenne, ever found Dade drunk or lying, it is more than the king here has done."

"Let him speak, Earl," said William. "I have not an honester man in my camp; and he speaks for my information, not for yours."

"Then for yours will I speak, Sir King. These men treated me knightly, and sent me away without ransom."

"They had an eye to their own profit, it seems," grumbled the earl.

"But force me they did to swear on the holy Gospels that I should tell your majesty the truth, the whole truth, and nothing but the truth. And I keep my oath," quoth Dade.

"Go on, then, without fear or favour. Are there any other men of note in the island?"

"No."

"Are they in want of provisions?"

"Look how they have fattened me."

"What do they complain of?"

"I will tell you, Sir King. The monks, like many more, took fright at the coming over of our French men of God to set right all their filthy, barbarous ways; and that is why they threw Ely open to the rebels."

"I will be even with the sots," quoth William.

"However they think that danger blown over just now; for they have a story among them, which, as my Lord the King never heard before, he may as well hear now."

"Eh?"

"How your majesty should have sent across the sea a whole shipload of French monks."

"That have I, and will more, till I reduce these swine into something like obedience to his Holiness of Rome."

"Ah, but your majesty has not heard how one Bruman, a valiant English knight, was sailing on the sea and caught those monks. Whereon he tied a great sack to the ship's head, and cut the bottom out, and made everyone of those monks get into that sack and so fall through into the sea; whereby he rid the monks of Ely of their rivals."

"Pish! why tell me such an old wives' fable, knight?"

"Because the monks believe that old wives' fable, and are stout-hearted and stiffnecked accordingly."

"The blood of martyrs is the seed of the Church," said William's chaplain, a pupil and friend of Lanfranc; "and if these men of Belial drowned every man of God in Normandy, ten would spring up in their places to convert this benighted and besotted land of Simonites and Balaamites, whose priests, like the brutes which perish, scruple not to defile themselves and the service of the altar, with things which they impudently call their wives."

"We know that, good chaplain," quoth William, impatiently. He had enough of that language from Lanfranc himself; and, moreover, was thinking more of the Isle of Ely, than of the celibacy of the clergy.

"Well, Sir Dade?"

"So they have got together all their kin; for among these monks everyone is kin to a Thane, or Knight, or even an Earl: and there they are, brother by brother, cousin by cousin, knee to knee, and back to back, like a pack of wolves, and that in a hold which you will not enter yet awhile."

"Does my friend Dade doubt his Duke's skill at last?"

"Sir Duke—Sir King I mean now, for king you are and deserve to be—I know what you can do. I remember how we took England at one blow on Senlac field: but see you here, Sir King. How will you take an island where four kings such as you (if the world would hold four such at once) could not stop one churl from ploughing the land, or one birdcatcher from setting lime-twigs?"

"And what if I cannot stop the birdcatchers? Do they expect to lime Frenchmen as easily as sparrows?"

"Sparrows! It is not sparrows that I have been fattening on this last month. I tell you, sire, I have seen wild fowl alone in that island enough to feed them all the year round. I was there in the moulting time, and saw them take—one day 100, one 200; and once, as I am a belted knight, a thousand duck out of one single mere. There is a wood there, with herons sprawling about the tree-tops—I did not think there were so many in the world; and fish for Lent and Fridays in every puddle and leat—pike and perch, tench and eels, on every old wife's table; while the knights think scorn of anything worse than smelts and burbot."

"Splendeur Dex!" quoth William, who, Norman-like, did not dislike a good dinner. "I must keep Lent in Ely before I die."

"Then you had best make peace with the burbot-eating knights, my lord."

"But have they flesh-meat?"

"The isle is half of it a garden—richer land, they say, is none in these realms, and I believe it: but, besides that, there is a deer-park there with a thousand head in it, red and fallow; and plenty of swine in woods, and sheep, and cattle: and if they fail, there are plenty more to be got, they know where."

"They know where? Do you, Sir Knight?" asked William, keenly.

"Out of every little island in their fens, for forty miles on end. There are the herds fattening themselves on the richest pastures in the land, and no man needing to herd them, for they are all safe among dykes and meres."

"I will make my boats sweep their fens clear of every head——"

"Take care, my Lord King, lest never a boat come back from that errand. With their narrow flat-bottomed punts, cut out of a single log, and their leaping-poles, wherewith they fly over dykes of thirty feet in width—they can ambuscade in those reed-beds and alder-beds, kill whom they will, and then flee away through the marsh, like so many horse-flies. And if not, one trick have they left, which they never try save when driven into a corner: but from that, may all saints save us!"

"What then?"

"Firing the reeds."

"And destroying their own cover?"

"True: therefore they will only do it in despair."

"Then to despair will I drive them, and try their worst. So these monks are as stout rebels as the earls?"

"I only say what I saw. At the hall-table there dined each day maybe some fifty belted knights, with every one a monk next to him; and at the high table the abbot, and the three earls, and Hereward and his lady, and Thurkill Barn. And behind each knight, and each monk likewise, hung against the wall, lance and shield, helmet and hauberk, sword and axe."

"To monk as well as knight?"

"As I am a knight myself; and were as well used, too, for aught I saw. The monks took turns with the knights as sentries, and as foragers, too; and the knights themselves told me openly, the monks were as good men as they."

"As wicked, you mean," groaned the chaplain. "Oh, accursed and blood-thirsty race, why does not the earth open and swallow you, with Korah, Dathan, and Abiram?"

"They would not mind," quoth Dade. "They are born and bred in the bottomless pit already. They would jump over, or flounder out, as they do to their own bogs every day."

"You speak irreverently, my friend," quoth William.

"Ask those who are in camp, and not me. As for whither they went, or how, the English were not likely to tell me. All I know is, that I saw fresh cattle come every few days, and fresh farms burnt, too, on the Norfolk side. There were farms burning last night only, between here and Cambridge. Ask your sentinels on the Rech-dyke how that came about?"

"I can answer that," quoth a voice from the other end of the tent. "I was on the Rech-dyke last night, close down to the fen—worse luck and shame for me."

"Answer, then!" quoth William, with one of his horrible oaths, glad to have some one on whom he could turn his rage and disappointment.

"There came seven men in a boat up from Ely yestereven, and five of them were monks; they came up from Burwell fen, and plundered and burnt Burwell town."

"And where were all you mighty men of war?"

"Ten of us ran down to stop them, with Richard, Earl Osbern's nephew, at their head. The villains got to the top of the Rech-dyke, and made a stand, and before we could get to them——"

"Thy men had run, of course."

"They were every one dead or wounded, save Richard; and he was fighting single-handed with an Englishman, while the other six stood around, and looked on."

"Then they fought fairly?" said William.

"As fairly, to do them justice, as if they had been Frenchmen, and not English churls. As we came down along the dyke, a little man of them steps between the two, and strikes down their swords as if they had been two reeds. 'Come!' cries he, 'enough of this. You are two *prudhommes* well matched, and you can fight out this any other day;' and away he and his men go down the dyke end to the water."

"Leaving Richard safe?"

"Wounded a little—but safe enough."

"And then?"

"We followed them to the boat as hard as we could; killed one with a javelin, and caught another."

"Knightly done!" and William swore an awful oath, "and worthy of valiant Frenchmen. These English set you the example of chivalry by letting your comrade fight his own battle fairly, instead of setting on him all together; and you repay them by hunting them down with darts, because you dare not go within sword's-stroke of better men than yourselves. Go. I am ashamed of you. No, stay. Where is your prisoner? For, Splendeur Dex, I will send him back safe and sound in return for Dade, to tell the knights of Ely that if they know so well the courtesies of war, William of Rouen does too."

"The prisoner, sire," quoth the knight, trembling, "is—is——"

"You have not murdered him?"

"Heaven forbid! but——"

"He broke his bonds and escaped?"

"Gnawed them through, sire, as we suppose, and escaped through the mire in the dark, after the fashion of these accursed frogs of Girvians."

"But did he tell you nought ere he bade you good morning?"

"He told us the names of all the seven. He that beat down the swords was Hereward himself."

"I thought as much. When shall I have that fellow at my side?"

"He that fought Richard was one Wenoch."

"I have heard of him."

"He that we slew was Siward, a monk."

"More shame to you."

"He that we took was Ayer the Hardy, a monk of Nicole—Licole,"—the Normans could never say Lincoln.

"And the rest were Turstan the Younger; Leofric the Deacon, Hereward's minstrel; and Boter, the traitor monk of St. Edmunds."

"And if I catch them," quoth William, "I will make an abbot of every one of them."

"Sire?" quoth the chaplain, in a deprecating tone.

ON LIGHT.

BY SIR JOHN F. W. HERSCHEL, BART.

PART II.

THEORIES OF LIGHT.—INTERFERENCES.—DIFFRACTION.

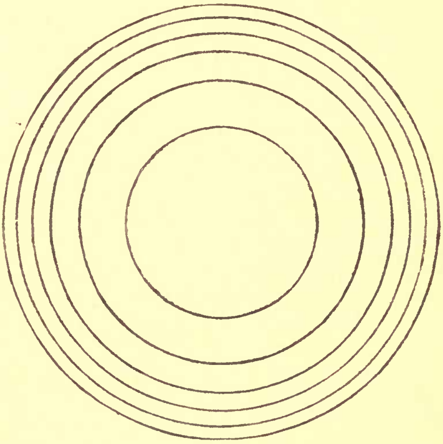
(*Continued from page 502.*)

WHEN instead of using the prismatic spectrum (of which it is next to impossible to insulate from the rest a ray of perfectly definite refrangibility) to illuminate the film, we employ artificial light (such as that of a spirit lamp with a salted wick, which may be considered as almost perfectly homogeneous); the rings are seen with extraordinary sharpness; their central spot and their divisions having the blackness of ink, and absolutely innumerable; being traceable with a magnifier when too close to be otherwise distinguishable, apparently without limit. Thus disembarrassed of the complexity of overlapping rings of several colours, the phenomenon now is studied to greater advantage, and its explanation on either theory is more readily intelligible. That afforded by the corpuscular theory (supplemented by the Newtonian hypothesis of the fits of easy reflexion and transmission) is very simple and obvious. These "fits" or *phases*, it will be remembered, are supposed *periodically* *recurrent—i.e.*, succeed one another, or rather are repeated over and over again, in the same order and intensity, at equal intervals *of time.* The same *phase* then will recur to the corpuscules, at equidistant points *of space* in their progress through any uniform medium (in which the velocity of light is constant). Where the thickness of the film is *nil*, or so very minute as to bear no comparison to the distance which separates two of the equidistant points, it is obvious that having passed one surface they will still be in a state to pass through another, and will therefore *not* be reflected, so that in that case the reflected illumination of the first surface will receive no augmentation from light reflected at the second. The same is true if the thickness of the film be exactly that of two such equidistant points, or its double, triple, &c., for in those cases the corpuscle will arrive at the second surface in the same state and with the same dispositions as to reflexion or transmission as at the first; and therefore, having penetrated the first, will also penetrate the second. On the other hand, for thicknesses of the film exactly intermediate between these, the corpuscle on arrival at the second surface will be exactly in the opposite state or disposition. Having been transmitted then at the first, it will be reflected at the second, and, having in its passage back through *another equal* thickness reassumed its original state in which it first entered, it will there be *transmitted*, and so will reinforce by its light the general reflected illumination of that surface. Since the percentage of the total light reflected at any transparent medium is but trifling, the light so sent back from the second surface will be nearly equal to that reflected from the first. Thus for these exactly intermediate thicknesses, the joint reflected illumination is very nearly doubled, and between these and the former series of thicknesses will increase and diminish alternately and gradually.

Suppose now in the case of our soap-bubble the thickness of the film to increase uniformly outwards from its vertex (where it is nearly *nil*). Then it is evident that when exposed to dispersed light it will appear divided into equivalent circular zones alternately bright, and *comparatively* dark, the centre being also dark. And here we have a representation of our observed rings, with, however, this remarkable and most important difference, viz.: that the central spot and the dark divisions, on this explanation, ought not to appear absolutely black, but *half bright*, when compared with the brightest portions between them. In point of fact, some exceedingly slight reflexion *is* perceivable in the dark centre, but instead of half, it cannot be estimated at the fiftieth part of the illumination of the bright ring which immediately adjoins it.

As the thickness of a soap-bubble cannot be subjected to direct measurement, it is impracticable, in its case, to verify what must be considered the fundamental principle of this explanation—viz., the regular increase, *in arithmetical progression*, of the thicknesses at which the several successive black or bright rings appear. But of this we may satisfy ourselves, by adopting a different mode of producing and viewing them. When a spectacle-glass or any other convex glass *lens* of long focus is laid down upon a plane glass before an open window (both being scrupulously clean and well polished), and a slight pressure applied, the same dark spot, surrounded by the same series of coloured rings, is seen, their centre being at the point of contact of the glasses, where of course their distance is *nil.* If the focal length of the lens be not *very* large, they will require a magnifier to be well seen, their diameters being in that case very small; but with a lens of 20 or 30 feet focal length it is considerable, and the rings may be seen, and their diameters measured, with ease. Now it is found that these *diameters*, for the first, second, third, &c. dark rings in order (reckoned from the centre), are not in the proportion of the numbers 1, 2, 3, &c., but of the numbers 1, 1·414, 1·732, 2·000, &c., which are their exact *square roots*, giving to their system the appearance represented in the annexed diagram; and this is exactly the progression of distances from the point of contact measured on the surface of the plane glass which correspond to the series of *perpendicular distances between it and the convex spherical surface of the upper glass* in the proportion of the arithmetical series, as may be seen in fig. 7.

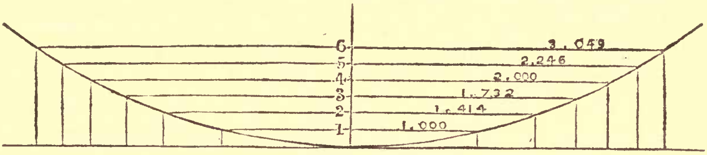
Fig. 6.



So far, then, the Newtonian hypothesis affords a satisfactory account of the facts; in all, that is, but that one particular already adverted to. This, however, must be considered as conclusive against it; while, on a consideration of the whole case, there remains outstanding this strange *fact*—that at certain distances between two partially reflecting surfaces, forming a regular arithmetical progression from *nil* upwards, the portion of a beam of light reflected from the second, after passing back through the first, so far from augmenting the first reflected light, *annihilates it*, and furnishes us with an instance (which is, as we shall see hereafter, not the only one) of *the combination of lights creating darkness!*

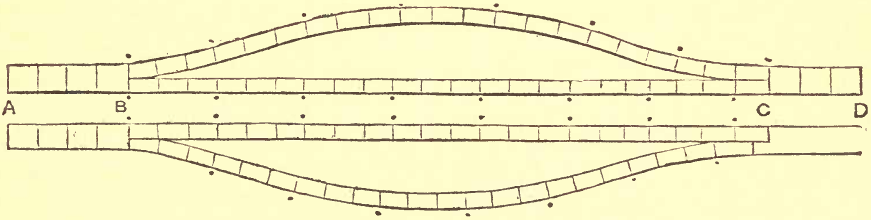
The question now arises, will the undulatory theory help us in this difficulty, while at the same time rendering an equally satisfactory account of the other facts? To this we are enabled to reply in the affirmative. Two equal *sounds* we know, under certain circumstances, *can* produce silence, as when the two strings, which, in a pianoforte, go to produce, when exactly in unison, a uniform and liquid note; if very slightly out of tune, produce what are called *beats*, or a succession more or less rapid (accordingly as the strings are more or less discordant) of sound and silence. The same tide-wave arriving at the same spots in the sea by two courses of different lengths, results in producing *no rise and fall of the water at all* if the difference of path be such that the high water of the one portion shall reach the place at the same moment with the low water on the other. This is the case at a point in the North Sea, midway between Lowestoft and the coast of Holland, in lat. 52° 27′ N., long. 3° 14′ E. Its position was pointed out by Dr. Whewell from theory, and the fact verified by Captain Hewett, R.N.

Fig. 7.



This latter exemplification contains the essential principle of the explanation in question, in nearly its simplest state. If two waves, or rather two regular series of equal waves all exactly like one another, *and all having set out initially from one common origin*, reach the same point by two different channels or lines of communication, differing just so much in length that the *crests* of the one series shall reach it at the same identical moment with the *crests* of the other, the two series of crests conspiring and being superposed on each other will produce crests of double the height of either singly; while, on the other hand, if the difference of channels be such that the crests of the first series shall reach it simultaneously with the troughs (or lowest depressions) of the second, the one will destroy the other, and there will be neither elevation nor depression at their joint point of arrival. In the one case, supposing the two channels thenceforward to unite into one (as in the annexed figures, which require no explanation further than that the series of cross lines represent the *crests* of the waves) the two series when they reunite in a channel C D, the exact size of the initial one, A B, will form a joint series exactly similar to that in A B, which will run on in that channel thenceforward; but in the other there will be produced no waves at all, and the water in C D will (except just close to the point of junction, where some kind of eddy will be formed) remain undisturbed.

Fig. 8.



Accepting the term "wave" in its most general sense, in whatever way we suppose it propagated, whether by alternate up-and-down movements of the successive particles, as in water-waves—by transverse lateral ones, as in a stretched cord *wagged* horizontally—or by direct to-and-fro vibration, as in the air-waves, in which sound consists—or in any more complex manner, the same considerations evidently apply. If two sets of exactly equal and similar waves can by any previous arrangement be made to arrive *simultaneously* at the "entrance" of one and the same "channel" (using these terms also in their most general sense) along which each set, separately, might be freely propagated—*i.e.*, so that the foremost crest of the first set shall strike the mouth of the channel at the same moment with that of the other—they will combine and run on along the channel as a single set or series of waves of double the height or intensity. In this case they are said to arrive "*in the same phase*" (a term borrowed from the phases of the moon which passes periodically through the states of full and new, increase and wane). The same will be the case if the foremost *crest* of the series be so timed (by the previous arrangements) as to reach the mouth of the channel simultaneously with the second, third, or fourth *crest* of the other, in which case the one set is said to be in arrear or advance of the other (as the case may be) by one, two, or more entire "*undulations.*" On the other hand, if the foremost *crest* of the one set be so timed as to arrive simultaneously with the first, second, third, &c., *trough* of the other—up to the time of its arrival indeed the one, two, or three foremost waves which are not contradicted will run forward;—but, from the moment when the others begin to arrive, they will cease to be followed up by any more. In this case the one set is in advance or arrear of the other by exactly one, or three, or five, &c., *semi-undulations*, and the series are said to be *in opposite phases.* In the intermediate "phases" it is easy to see that a combined set of waves *will* be produced, but intermediate in height, intensity, or (as it is called) "amplitude" between these two extremes—viz., *nil* on the one hand, and *reduplication* on the other.

The vibrations by which light and *musical* sounds (*to which light is analogous*) are conveyed are so exceedingly minute, and the shock conveyed by each separately to our nerves, in consequence, so small, that it requires a continued series of them to impress our senses. The first few vibrations therefore which run on "*uninterfered* with" produce no sensation, and are as if they existed not. And thus we see how it may happen, that in the case of a complete *opposition of phase* two equal musical sounds may produce silence, and two equal rays of light *complete and continued darkness;* that a perfect coincidence of phase has the effect of doubling the sensation; and the intermediate states, a greater or less intensity as the case may be, short of that limit.

Let us now proceed to apply our principle (that of "*superposed and* INTERFERING VIBRATIONS") to the matter in hand. Suppose a series of equal and equidistant light-waves (such as *a ray* of homogeneous light is in this theory always understood to mean) to fall perpendicularly upon a plate of any transparent medium. A certain very small percentage of it will be reflected back by the first surface—that is to say, a series of similar undulations, but of much less intensity or "amplitude," will be propagated back from the point of incidence. The remainder of the total movement thus subdivided will pass on, and, arriving at the second surface, again a *very nearly equal* series (the percentage being the same, and the total incident light having suffered very little diminution) will be returned, and, passing back through the first surface (with only the same trifling *percentage* of loss), will, on emerging, *be superposed on the first reflected series*, with which it will be coincident in direction. If then the thickness of the plate be such that in passing to the hinder surface, back again, and out at the first, the second series shall have *lost upon the first* precisely one, three, five, or any odd number of *semi*-undulations, it will begin to emerge in the exact opposite "phase" of its period to that of the undulation of the first reflected series which starts from the same point at the same instant. Here then we have the case contemplated above of two series of equal waves entering the same "channel" in opposite phases. They will therefore destroy each other, or the intensity of the joint ray will be *nil.* The contrary will happen if the thickness be such as to produce a retardation of two, four, or any even number of semi-undulations. In that case the two reflected rays will conspire and produce a joint one of double intensity: and of intermediate in the various cases of intermediate retardation.

Thus we see that the degree of brightness of the reflected light depends on the thickness of the reflecting film—that for a certain series of thicknesses *in arithmetical progression*, the reflection is *nil*, for another series exactly intermediate it attains a maximum of intensity, and that, between these limits, all gradations of illumination will arise according to the intermediate thicknesses supposed to exist. This is so far in general accordance with the phenomena described; but before applying it to the case of our coloured rings, it must be mentioned that in reckoning the number of undulations or semi-undulations by which the second reflected ray actually is in arrear of the first on emergence we have to consider the different modes in which the reflexion of a wave is accomplished at the surface of a medium denser or rarer than that in which it moves and is reflected. To present this clearly, we will take the most familiar illustration—that of the propagation of motion by the collision of elastic balls. Imagine a great number of equal ivory balls (supposed perfectly elastic) *in contact*, but *connected* only by an elastic string passing centrally through each and along the common axis of all; and pinned or fastened to each *at its centre* so that the separation of any two shall stretch only that part of the string between their centres. Suppose now that a shock is given to the extreme ball at one end in the direction of the common axis, by another similar and equal detached ball driven against it. By the received laws of elastic collision it will give up *its whole motion* to that which it first strikes, and be itself reduced to rest. In like manner the motion so communicated to the first will be handed on undiminished to the second; itself resting *and therefore* remaining in contact with the striking ball, and so on. Thus what may be termed a "wave of compression," will run along the series till it reaches the ball at the other end. This, having none in front to communicate its motion to, will start off; and, were it free, would quit the series. But this it cannot do, by reason of the elastic thread, which however it will stretch in its effort to do so, and be ultimately brought back by its pull. But in so doing the same pull will also be communicated to the ball behind it, drawing it forward, and so in succession to those yet behind; and in this manner, a *wave of extension* will run back along the series. If the tension of the string be very violent, (suppose equal to the repulsive elasticity of the balls,) this wave will run back with *the same velocity* as the other. Here we have then a case of the reflexion of a wave, where, *in the very instant* of reflexion, its character is changed *ipso facto* from that of a wave of compression to one of extension—in other words, it starts backwards in *the opposite phase* to that of its arrival; or, again in other words, a *semi-undulation is lost or gained* (for it matters not which) *in the act of reflexion.*

This is the extreme case of reflexion from a denser medium on a rarer—for here there is absolutely nothing to carry on the motion beyond the terminal ball. Such a case never occurs in nature as regards light; since even what we call a vacuum is filled with the luminiferous ether. To assimilate it to such as *do* occur, suppose a second series of *smaller* balls, similarly connected with each other, *but not with the first set*, and brought end to end with it, with just room between for one intermediate, free, ball of the smaller size to play backwards and forwards as a go-between ; and let this in the first instance be placed in contact with the last ball of the first set. When the movement reaches it it will be driven off, and immediately striking the end ball of the second set will propagate along *it* a wave of compression, coming, itself, to rest. In so doing it will carry off *some, but not all* of the motion of the terminal ball of the first set. This will still continue to advance after the blow, but to a much less extent and with much less momentum than in the former case, and, just as in that case will propagate backward a wave, though a much feebler one, *of extension.* Starting then from the same place, at the same moment, the two waves—the reflected portion (or echo) and that which runs forward in the second set of balls, set out each in its own direction *in opposite phases.*

The intensity of the reflected wave or echo will be feebler the nearer the balls of the two sets approach to equality (or less the difference of density in the two media). If they are exactly equal, the go-between ball will carry off all the motion of the ball which strikes it—or there will be *no* reflected wave, no echo. And this agrees with fact. At the common surface of two transparent media of equal refractive power, however they may differ in other respects, there is no reflexion. But suppose the second set of balls, as also the single intermediate one *larger* than the first. In that case (still according to the laws of elastic collision) the last ball of the first set not only will *not advance* after the shock but will be driven back, and the wave which it will propagate backwards will no longer be one of extension, but *of compression.* This being also the case with that propagated onwards in the second series,—in this case both will start on their respective courses from the point of reflexion *in the same phase.*

In the undulatory theory of light the "denser" medium corresponds to the series of larger balls in this illustration. This ought to be so, for the velocity is less in the denser medium as it is in the larger of two balls after their collision ; and because, as already remarked, the ether in such media must be either denser in proportion to its elastic force, or somehow encumbered by their material atoms. And hence we finally conclude that in the act of the reflexion of light on the surface of a rarer medium, the phase of the undulation changes, and a *semi-undulation* is lost (or gained—it matters not which) : but not so when the light is reflected from a denser medium.

To return now to the case of a thin pellucid film. If its thickness, *i.e.*, the interval separating its two surfaces, be any number of *semi*-undulations ; double that number, *i.e.*, an exact number of entire waves, will have been lost by the wave reflected from the second surface at its re-emergence from the first, by reason of its greater length of path, and thus were no part of an undulation lost or gained *in the act of reflexion* it would start thence in exact harmony with the first reflected ray. But the second reflexion being made at the surface of a rarer medium, an additional *semi-undulation* will have been lost, so that the two reflected rays will really start from the first surface in *complete discordance*, and destroy each other. The same is the case if the thickness be *nil*, or so excessively minute as to be much less than the length of a wave, as at the vertex of a soap-bubble when just about to burst. Here also will the same mutual destruction of the reflected waves take place. And thus we have explained the complete or very nearly complete darkness of the central spot, and of a series of rings corresponding to thickness of 1, 2, 3, or more semi-wave-lengths. At the intermediate thicknesses (*i.e.*, of 1, 3, 5, &c. *quarter*-wave-lengths) the exact reverse will happen—the reflected rays will start together in harmony and appear as a ray of double intensity, thus explaining the intermediate bright rings.

In the case of the rings produced between two glasses of the same material, the intermediate film being *air*, it is the reflexion from its *first* surface, not its second, that is effected from a rarer medium ; so that it is at this surface that the additional *semi*-undulation is *gained* by the first reflected ray. In all other respects the reasoning is the same in both cases, and the explanation equally complete in both.

Our readers will perceive that we have not been sparing of words in this explanation. The epigrammatic style is ill-suited to clearness in the exposition of a principle which it is essential to seize with perfect distinctness, and in seizing which considerable difficulty is commonly experienced. If any doubt or misgiving, however, should still linger on the mind as to the *applicability* of the analogy by which the loss of half an undulation necessitated by the blackness of the central spot has been explained, a simple but striking experiment will suffice to dissipate it. Let a set of rings be formed by interposing, between two glasses of very different refractive densities, a film of liquid intermediate in that respect—as for instance oil of sassafras—between a lens of light crown, and a plate of heavy flint glass. In this case the reflexions from the two surfaces are performed either *both* from a denser medium upon a rarer, or *both* from a rarer on a denser according as one or the other glass is uppermost. In the former case *two* semi-(or one entire) undulation will be gained or lost between the reflected rays at emergence, in addition to the entire ones lost *between* the glasses:—in the latter none. At the central spot then, the two reflected rays will start on their backward course in exact harmony, and the spot will be white, not black; and a similar reversal of character will of course pervade the whole series of rings. This result, predicted by theory, has been found confirmed by experiment.

It was a favourite idea of Newton that the colours of all natural bodies are in fact the colours of their pellucid particles of such sizes and thicknesses as to reflect those tints which, in the scale of tints of the coloured rings above described, most nearly correspond to them. This idea we know now to be untenable, if for no other reason than that we are sure the ultimate particles or indivisible atoms of bodies, (if any such there be,) are at all events many hundreds, thousands, or millions of times smaller than even a single wave-length of any homogeneous ray of light. It will of course be asked how we know these wave-lengths. And this we must now explain, in doing which we shall have to develop the most astounding facts in the way of numerical statements which physical science has yet revealed.

In a series of equal waves running along still water, the "wave-length," or "length of an entire undulation," is the linear distance between two consecutive *crests* or two consecutive *troughs*. This is its simplest conception, and it will suffice for our immediate purpose. The waves being equal and similar will all run on with the same velocity, which may be ascertained by noticing how long any one takes to run over a measured distance on the surface, or the distance run over in a determinable time, suppose a second. And if at the same time we note the number of waves whose crests pass a fixed point (a float for instance) in the surface, in a second of time the interval between two consecutive crests will of course become known. And *vice versâ*, if this interval be known, and the velocity of the waves; the number of undulations passing the float per second is easily calculated. Now *this number is necessarily identical with that of the periodically reciprocating movements or vibrations of the first mover* (whatever it be) *by which the waves are originally excited.* This continuing the same, the same number of waves will pass the float, the same time, whatever be their velocity of propagation. Of these three things—the velocity of propagation, the number of alternating movements, waves, or pulses per second, and the linear interval between two consecutive ones—any two being given the third is easily calculated. For example, a string sounding a certain note C in the musical scale makes 256 *complete* oscillations to and fro, per second. As each of these sends forward an air-wave consisting of a semi-wave of *compression* by which the particles of air advance, and another of *expansion* by which they return to their places, these waves, 256 in number, being all comprised in, and exactly filling the distance (1090 feet) run over by sound in that time, each entire wave will occupy 4·254 ft. And, *vice versâ*, if we knew this *à priori* to be the wave-length, we should rightly conclude 256 to be the number of complete vibrations or pulses per second.

Mechanical processes enable us to grind and polish a glass surface into the segment of a sphere of any required radius—as well as to a plane almost mathematically true. Suppose such a glass surface worked, we will say, to a sphere of 100 feet radius, to be laid (convexity downwards) on a truly plane glass. The coloured rings will be formed, as above described, about a central dark spot; and if illuminated, instead of ordinary daylight, by the prismatic rays, in succession, series of simply bright and dark rings of the several colours in their order will be formed whose diameters in different series will correspond to their respective tints. Under these circumstances the linear measurement of these diameters may be performed with ease and with great precision. Now these diameters are the *chords* of arcs of a circle on a radius of 100 feet represented in fig. 7, by the horizontal lines the *versed sines* of which corresponding (represented by the perpendicular lines) are the distances between the glasses at those points, or the thicknesses of the interposed film *of air*, and are easily calculated when the radius and the chords are known. On executing the measurements it is found that these distances, reckoning outwards and commencing with the centre, do actually follow the law of arithmetical progression (as on the above theory they should do), being in the proportions of the numbers 0, 1, 2, 3, &c.

By measuring then the diameter of (say) the tenth dark ring (for the sake of greater precision), calculating the corresponding interval, *or versed sine*, and taking one tenth of the result, we shall get the interval corresponding to the first dark ring—for any particular coloured light—and this, by what has been above shown, is the half of a *wave-length* for such light. Proceeding thus, Newton found for what he considered the most luminous yellow rays, one 89,000th part of an inch for the interval in question, which gives for the length of an entire undulation of such rays, one 44,500th of an inch. This comes exceedingly near to the result which later experimenters have obtained for that purely homogeneous yellow light emitted by a salted spirit-lamp, which is one 43,197th of an inch. For the extreme red and extreme violet rays (as well as their limits can be fixed) the corresponding wave-lengths are respectively one 33,866th, and one 70,555th of an inch.

These, it will be observed, are the lengths of the undulations in air. In water, glass, or other media, they are smaller, in the inverse proportion of the refractive index of the medium; for in such media the velocity of light, as we have seen, is less in that proportion; and the number of undulations per second remaining the same, while the space occupied by them is less, their individual extent must of course be less in the same proportion. This, too, is in accordance with experiment. If water, oil, or any other liquid be introduced between the glasses, the rings are observed to shrink in diameter, and the more so (and to the exact extent required by theory) the greater the refractive power of the liquid.

If the sensation of colour be, in analogy to that of tone or musical pitch, dependent on the frequency of the vibrational movements conveyed to our nerves of sensation, it becomes highly interesting to ascertain their *degree of frequency*, in order to establish the relation between the two senses of hearing and seeing in that respect. The ear, we know, can discriminate tones only between certain limits, comprising about nine octaves, the lowest sound audible as a note making about 16, and the highest about 8,200 vibrations per second. Taking the velocity of light (as above) at 186,000 miles* per second, and reckoning 33,866 wave-breadths to the inch for the extreme red, 43,197 for the soda-yellow, and 70,555 for the extreme violet, we find for the impulses on the retina per second which produce these sensations of colour, respectively, the following enormous numbers:—

Extreme red . . .	399,101,000,000,000
Soda-yellow . . .	509,069,000,000,000
Extreme violet . .	831,479,000,000,000

These extremes are nearly in the proportion of 2 to 1, so that the whole range of visual sensation on this view of the subject is comprised in about one octave. If the ear could appreciate vibrations of this degree of frequency, the sensation corresponding to the middle ray of the spectrum would be that of a note about 42 octaves above the middle C of a pianoforte.

In each of these inconceivably minute intervals of time (compared to which a single second is a sort of eternity), *a process has been gone through by every molecule of the ether concerned in the propagation of the ray:* a process as strictly definite, as exactly regulated, as the movement of a drop of the ocean in its conveyance of the tide-wave. Taking up its motion from the particle immediately behind it (whose movement it exactly imitates), and transmitting it on to that immediately before, it starts from rest, not suddenly, with a jerk, but (under the strict control of those elastic forces already mentioned), increasing gradually in speed to a maximum—then, as gradually, relaxing, coming to a momentary rest, and retreating to its original position by the same series of measured gradations in reverse order, to be ready in its place for the reception of the next impulse. Nor does it seem possible to avoid the conclusion, if we trace up the movement to its commencement—to the source of the light—the *material particle* in whose combustion or incandescence it originates—that such is the actual vibratory movement of that particle itself. And thus we are brought into the presence of the working of that mechanism by which flame and incandescence ("φλογωπον σημα πυρος—the brilliant *miracle* of fire," as the Greek poet* not inaptly terms it) are produced. In the disruption of one chemical combination, and the constitution of another, a movement of mutual approach, more or less direct, is communicated to the uniting molecules, which, under the influence of enormous coercive powers, is converted into a series of tremulous, vibratory, or circulating movements communicated from them to the luminiferous ether, and so dispersed through space. Incandescence without combustion (as in a piece of red-hot iron) must be looked upon, from this point of view, as a result of the continuance of this vibratory movement after the primary exciting cause has ceased, and of its gradual decay by communication to the surrounding ether; as a musical string continues to sound after the blow which set it in motion, till gradually brought to rest by the surrounding air.

This may perhaps appear a digression from our subject. But it will be recollected that our object in this communication is not to write a treatise on optics, but to fix the attention of our readers on the immensity of the forces in action and the minuteness and delicacy of the mechanism which they animate, in the most ordinary operations of Nature, and which the phenomena of light have been the means of revealing to us. We have no means, indeed, of measuring the *actual* intensity of the "coercive forces" so called into action in the excitement of a luminous vibration, but that we are fully justified in applying to them the epithet "enormous," the following consideration will suffice to show. Whatever be the extreme distance of excursion to which a vibratory molecule is carried from its point of repose, or its medium situation, in the act of vibration; the acting or coercive force must suffice to bring it back from that distance in one fourth part of that inconceivably minute fraction of a second by which, as above shown, the period of a complete vibration is expressed. Taking the case, then, of any particular ray (as for instance that between the green and blue rays of the spectrum, corresponding to a wave-length of one 50,000th of an inch, and to a period of one 589 billionth of a second), if we assume the extent of excursion, we can very readily calculate the intensity of the force (as compared with that of gravitation) which, acting uniformly during that time, would urge it through that space. Let us suppose then, that the nerves of the retina are so constituted as to be sensibly affected by a vibratory movement of no greater extent or *amplitude* than one trillionth* part of an inch either way; and the calculation executed, we shall find that a force exceeding that of gravity in the proportion of nearly thirty thousand millions to one must be called into action to keep up such a movement. Our choice lies between two immensities, we had almost said between two infinities. If we would bring the force within the limits of human comprehension, we must in the same proportion exaggerate the delicacy of our nervous mechanism, and *vice versâ.*

---

* Roughly, 1,000 million feet.

* Æschylus.

Connected with the colours of thin plates are several distinct classes of optical phenomena, in which colours of the same kind, and explicable on the same principle, arise in the reflexion and transmission of light through or between pellucid plates of considerable thickness, or through spherical drops of water, examples of which are to be observed in the pink and green fringes which are often seen bordering the interior of a rainbow, and in those similarly coloured fringes (of exceedingly rare occurrence) which sometimes run, like a bordering ribband, just within the contour of a thin white cloud in the near neighbourhood of the sun. Upon this class of phenomena, however, we shall not dwell further than to observe that they prove the law of the periodical recurrence of similar phases at equal intervals, not to be confined to very minute distances in the immediate neighbourhood of reflecting or refracting surfaces, but to extend over the whole course of a ray of light—as, on the undulatory theory, it necessarily must do. We now, therefore, proceed to the next branch of our general subject, that of the Diffraction of Light.

(*To be continued.*)

CHRIST THE LIGHT OF THE WORLD.

By C. J. VAUGHAN, D.D.

VIII.—CHRIST THE LORD OF NATURE.

"And they feared exceedingly, and said one to another, What manner of man is this, that even the wind and the sea obey Him?"—Mark iv. 41.

"On his head were many crowns."

Such is the vision of Christ in his return to judgment.

We are to seek to set before our minds now one of these many crowns.

CHRIST THE LORD OF NATURE.

And what then is Nature?

Christ is a Person, a living Person. God grant that none of us may still need to be taught who and what He is! Nature is a personification: one of those lively figures by which human language sums up under a sort of personal title a vast aggregate of things. Nature is the sum total of those material existences which surround us, and of those agencies which God set going in Creation, and has kept in orderly movement from the first day until now. Nature, in the sense in which we now use it, means the world of matter, and the laws (that is, the habits) of its working.

Now we are to think of Christ to-day as the Lord of this Nature; the Lord and Master of that world of matter in or amidst which man dwells, and of the laws (that is, the habits) of its working.

If Holy Scripture be listened to, He is so of right. For St. John says that "all things were made by Him, and without Him was not anything made that was made." And St. Paul, that "God created all things by Jesus Christ." And again, that "all things were created by Him and for Him, and in Him all things consist;" all things have their coherence and their consistency in the same Person, our Lord Jesus Christ, by whom God made them. And so once more we read in the Epistle to the Hebrews, that "by Him God made the worlds," and that Christ still "upholds all things by the word of his power." There is no lordship like that of creation. He who made, He who upholds, all things, is the Lord of all things by the highest, the alone indefeasible title.

Here then is the root and spring of that dominion which we ascribe to Christ in describing Him as the Lord of Nature.

But our purpose is to assist ourselves in grasping this mighty reality, by seeing what our Lord Jesus Christ in the days of his flesh actually did upon earth in proof of this lordship. We would dwell upon some of those acts by which He claimed and by which He exemplified his ownership of things created.

The recorded miracles of Christ wrought upon what is called external Nature, are altogether nine in number.

(1) There is the first of all his "signs;" the water made wine at the marriage feast of Cana.

(2) There is the miraculous draught of fishes on the sea of Tiberias.

(3) There is the stilling of the tempest on the same waters.

(4) There is the feeding of the five thousand with a few loaves and fishes.

---

* A trillion is a million of billions.

(5) There is the walking on the sea by night, with its marvellous accompaniments of fear and power.

(6) There is the miraculous feeding of the four thousand.

(7) There is the miracle of the piece of money in the fish's mouth.

(8) There is the withering of the fruitless fig-tree on the eve of his Passion.

(9) There is the second miraculous draught of fishes, by which he showed Himself alive to his disciples after his Passion.

All these are works of sovereignty over Nature; over the material world in which man lives, and over its common laws of working.

(1, 4, 6) First, there is a class of miracles (three in number) which had their place in what we may call productive Nature; in those processes which have to do with the supply of food for man's life.

Seated at the marriage feast in Cana of Galilee, Jesus marks a deficiency in the provision of wine. He came, unlike the Baptist, eating and drinking; mingling in human society, and teaching us, by word and example, how therein to abide with God. In Him there was nothing morose, nothing ungenial: with Him there was a time for all things; yes, even for the unbending of the knit brow in cheerful converse with those whom He came to save. Therefore, instead of seizing the opportunity to enforce abstemiousness or abstinence, He rather seized the opportunity to exemplify kindliness; to remove the embarrassment of the host, and to furnish forth his table with miraculous stores. The attendants are bidden to fill a number of large vessels with water—that there might be no pretence afterwards of collusion or deceit—and then from these ample pitchers, newly filled with water, the astonished servants find themselves drawing forth excellent wine. It was a proof of the Lordship of Christ over Nature. Those processes which He, upholding all things by the word of his power, commonly makes the condition of a successful vintage, He here by the same word dispenses with or precipitates. It is one of those proofs of power which the most ignorant and the least spiritual can appreciate. As the Evangelist says, He thus "manifested forth his glory, and his disciples believed on Him."

Surrounded for three long days in the wilderness by a patient and now hungering multitude, He at length bids his disciples to feed them from their scanty stores. With every preparation calmly made for a meal, the orderly arrangement, the reclining posture, the preliminary blessing, He takes the five loaves, one by one, into his hands, breaks them into pieces, and by means of his disciples distributes to the five thousand guests. The satisfying of hunger is a thing which allows of no mistake; and the miracle was wrought in the open air, in broad daylight, and with numberless spectators, upon whose minds it acted with unusual strength. It was repeated afterwards, on another occasion, under circumstances only just less (if less) astounding.

He who bringeth food out of the earth—wine that maketh glad the heart of man, and bread to strengthen man's heart—was here manifestly present in his own world, purposing to attract the attention of his creatures by the works of his hand to the words of his lips.

(2, 7, 9) Next, there is a class of miracles (also three in number) proving the dominion of Christ over animated Nature.

After long discourse to the multitudes who thronged the beach listening, Jesus bids the fishermen of the boat in which He had sat speaking, to launch out into the deep water and let down their nets for a draught. They had toiled all the night, and had taken nothing: it seemed as though daylight and the stir of men promised less still: yet in obedience to a voice which carried authority as well as persuasion in its tones, at his word they will let down the net. This done, they enclose a vast multitude of fishes—and the net breaks. One of the men, afterwards to be a great Apostle, finds his sins brought to remembrance by a Presence so Divine, and even entreats his future Master to depart from him. And when that wrong use of the miracle is corrected, and the fearful soul has been re-assured by the promise of work to be done hereafter, not in his poor calling as a fisherman, but in the souls of men, then he and his friends join themselves finally to the company of Jesus: "when they had brought their ships to land, they forsook all, and followed Him."

The very same sign after his Resurrection was employed to confirm and consolidate the same conviction. "Cast the net on the right side of the ship, and ye shall find. They cast therefore, and now they were not able to draw it for the multitude of fishes."

What was this but the exercise of the same power which still congregates the fishes of the sea here and not there in their season; bids them, by instinct, which the Creator only could have implanted, obey certain laws, and minister in definite ways to man's dominion? What was it but to say, not by word but by infallible signs, "The Lord of Nature is here—and I that speak unto you am He."

Of the same kind was that other, less conspicuous but even more singular miracle, which, at the need of Him who had on earth neither silver nor gold, brought to a particular spot a fish having in his mouth a particular coin; the required offering, for the temple service, of One who might, He said, as the very Son of the Great King, have claimed an exemption from that tribute.

This, too, is an example of the Lordship of Christ over animated Nature.

(3, 5) Thirdly, we have two remarkable examples of the sovereignty of Christ over elemental Nature, over winds and storms, over air and sea.

At the close of a long day's teaching, our Lord craved an interval of seclusion and repose. "Let us go over," He said to his disciples, "to the other side of the lake." As they made the transit, there came on a sudden storm. The wind rose, and the waves beat into the ship, till it was now full of water. Through all the tumult and agitation of the scene, Christ, the Lord of Nature, slept calmly. "He was in the hinder part of the ship, asleep on a pillow." At last, reluctantly (it may be) and reverently, the disciples roused Him; not without something of surprise in their tone, that He should so long have left them to suffer. "Carest Thou not," they said, "that we perish?" "Lord, save us: we perish." Then He rose; stilled first the storm of terror within, by the majestic remonstrance, "Why are ye fearful, O ye of little faith?" and then rebuked the wind and the raging of the water—as though seeing in their violence a token of that disturbing power of evil which had brought havoc and ruin everywhere into God's handiwork—and restored by that word of reproof the sea to its calm and the wind to its silence. Well might they who witnessed that instant change in the most unruly elements of Nature, draw from it the wondering inference "What manner of man is this, that even the wind and the sea obey Him?"

At a later point in the Gospel history, on the night after the feeding of the five thousand, a yet more marvellous proof was given of the dominion of Christ our Lord over the elements which He created. After that weary day of instruction first, and then of bodily ministration to the vast multitudes which surrounded Him, He had for once desired to be left alone even by the disciples. His soul craved a protracted season of Divine communion. "When He had sent the multitudes away, He went up into a mountain apart to pray." Doubtless He foreknew also the lesson by which He was about to discipline his disciples to higher attainments in faith and grace. For the present they were sent without Him across the waters of that same well-known sea. Again they had experience of its liability to sudden tempests. "The ship was in the midst of the sea, tossed with waves." "The wind was contrary." "It was now dark," St. John adds, "and Jesus was not come to them. And the sea arose by reason of a great wind that blew." From his mountain solitude Christ marked them with a considerate eye; marked, and felt for them, but as yet interposed not. He saw here a needful training; a discipline of fear and patience, not for the present joyous but grievous, yet out of which should be perfected afterwards a peaceable fruit of righteousness. "He saw them toiling in rowing;" and yet till the fourth, the latest, watch of the night He came not to their rescue. And when He came, how did He manifest Himself? In a way most unexpected, and most startling. "In the fourth watch of the night Jesus went unto them, walking on the sea." By the power of his own almighty will, He constrained the liquid wavering water to support the footsteps of its Creator. The disciples, seeing Him thus walking on the sea, and apparently (St. Mark adds) purposing to pass by them, thought they saw a spirit, and cried out for fear. But it was his own voice, of power and love, which spake and said to them, "Be of good cheer, it is I; be not afraid." And then, passing with characteristic impetuosity from despondency to over-courage, Peter asks that a proof of his Lord's presence may be given in enabling him also to walk safely upon the deep: and He who afterwards gave a doubting Apostle the sign which he demanded of his risen life, though He seemed to chide him for demanding it—and who is pleased sometimes to vouchsafe to doubters now a token which they ought not to require of his living grace and love—so, here also, for the more confirmation of the faith, bade Peter come to Him, as he desired, upon the water; and when faith failed, and fear led to sinking, and he, who had been so brave to come, yet, seeing the wind boisterous, had to cry out in terror, "Lord, save me," still again that prayer too was heard; "Jesus stretched forth his hand, and caught him, and said unto him, O thou of little faith, wherefore didst thou doubt?" What a parable, my friends, for all time! the sinking of courage through unbelief, and the restoration of safety through reviving faith! "When they were come into the ship, the wind ceased. Then they that were in the ship came and worshipped Him, saying, Of a truth Thou art the Son of God." It was the inference of truth and soberness from the manifestation of the Lordship of Christ over elemental Nature.

(8) In the last place, we have one example—one only amongst all the nine—of the sovereignty of Christ in the domain of what may be called morbid Nature; over those processes of disease and decay by which Nature herself bears testimony to man's sin and fall and ruin.

On the day corresponding to that which we commonly call the Monday in Passion Week, our Lord, passing from his night's sojourn at Bethany to his day's work in the faithless and now doomed city, observed at some distance a fig-tree already (at that early season of the year) clad with leaves, and therefore, much more, promising fruit: for in the fig-tree, it is said, the fruit appears before the leaves. This tree seemed, as it were, to make an unusual profession. Before the regular season it displayed those leaves which were commonly the index of existing fruit. Other fig-trees at that season had neither leaves nor fruit: this single tree had the one, and thereby professed to offer also the other. But when the Saviour approached it, he found leaves only. Not then for being fruitless, but for being false, He took it as the type of a nation and of a soul. Even such was Jerusalem, the holy city: even such was the degenerate house of Israel: full of profession, empty of performance: having a form of godliness, but denying the power thereof. He took then this tree—this *thing*, remember—this *thing*, towards which therefore there could be no cruelty or unkindness done—as a type of what Israel was, and of what should befall it under the hand of God's judgment. "No man," He said to it, "eat fruit of thee hereafter for ever." "His disciples heard it;" and when the next morning they trod again, for the first time afterwards in daylight, the same path from Bethany to Jerusalem, they were eye-witnesses of the fulfilment of that sentence: "they saw the fig-tree dried up from the roots:" they saw, in other words, the divine sovereignty of Christ, as before over the productive, and over the animated, and over the elemental parts of Nature, so here over its morbid workings—over that department of Nature which bears witness to a fall from an original perfection, and to an infection of sin and death which has spread itself over that face of Creation upon which God looked in the beginning and pronounced it to be very good.

"Christ the Lord of Nature."

1. It was necessary, Christian friends—we speak not beyond what is written, for so God ordered it—that the Son of God, coming down from heaven for the redemption and salvation of men, should prove himself to be very God by many infallible and irresistible signs. It was in mercy as well as in wisdom that He furnished this demonstration. If He had not openly asserted, and openly claimed, and openly demonstrated his Divinity, man might have refused the message for the simple want of having his attention turned perforce to the Messenger. What could the simple peasants or fishermen of Galilee have known of a Gospel which offered only philosophical or metaphysical satisfactions as to its authority and its origin? It pleased God, designing to instruct and to bless and to save, to give proofs of that design intelligible to the most ignorant and level to the humblest of mankind. What could be so forcible, to guests seated at a feast, or to multitudes hungering in a desert, as the production before their eyes of a supply of needed wine, or the offering to their distress of an ample provision of bread? What could be more impressive, to a company of hungry fishermen, who had spent their night in fruitless and vexatious efforts after a draught which came not, than the simple direction where to cast, and the instant experience of a superabundant reward for obeying it? What could be more overwhelming, in its simple and direct argument for the Divinity of the Presence in which they stood, than to find a tempest, which had lain heavy all the night upon experienced mariners in those waters, stilled in a moment by the authoritative word of One who in outward appearance was a man like themselves? or to see the uniform experience of long years contradicted, to their very senses, by the unstable element of water being made to support the footsteps of a Person in flesh and blood, corporeal and material, as concerning His human nature, even as they? These things, and such as these, are indications of God's working, such as it was not more wise than merciful to accord in the first instance to an unlettered and unphilosophical, but on that very account the more straightforward and competent tribunal. Without miracle Revelation could hardly have gained its first footing in a busy, preoccupied, and unspiritual world. Miracle is God's call to attention; God's token and signal that He is about to speak.

2. We might go further, and say, that, if Christ was in deed and in truth the very and eternal Son of God, it could scarcely be but that He should assert below his dominion over the works of God's creation, and over the processes of God's providence. We do not ask any one to begin with the miracles; to regard power, and still more the record of power centuries afterwards, as the one irresistible proof of the truth and Divine origin of a Revelation. This has been done—done perhaps too long—done certainly in this age without conviction. But this we say; that, when Christ has been proved to come from God by his words of Divine wisdom and by His character of Divine goodness, then we expect of Him the third seal, which is the seal of Omnipotent strength. Then things which would have been unnatural, and almost indemonstrable, in another, become natural and almost to be expected and anticipated in Him. That Christ, being Divine, showed Himself to be so by visible and sensible evidences below, needs just as much and just as little proof as any fact of history or any the commonest incident of this common human life. He who is God as well as Man will *probably* do God's works—works of creative, of omnipotent, strength—as well as speak God's works and live God's life below.

3. Yet let us be careful how we speak of miracles, such as those on which we have dwelt to-day, as if they were indeed contradictions of God's natural laws, or contraventions of God's providential operations. It has been well and truly urged that, on the contrary, each one of our Lord's miracles was rather the reparation of a broken law than the breach of a law obeyed. With one exception—needing a word by itself—every single miracle now touched upon was the restoration of a harmony impaired, the removal (for the moment) of a discord introduced, by sin. What is want, what is hunger, what is fear, what is a raging sea or a howling tempest, but something which breaks in upon the sweet concord and unity of the mighty universe as God made it? When Christ wrought a miracle upon Nature, it was to give a glimpse of some good thing lost, of some perfect thing deteriorated, of some joyous and glorious thing spoilt and ruined, by reason of the Fall, and to be brought in again and given back to man through the Redemption which is in Him. It was as the Creator that He put aside for the moment one of Nature's bad habits; because that habit itself testified of sin, and because He would promise deliverance for "the creation itself also from the bondage of corruption into the glorious liberty of the children of God." And if there was just one exception to this rule of his miraculous

working; just one instance in which He interposed his Omnipotence, not to heal but to destroy; yet even there, even in the one miracle of the fruitless fig-tree, He was ministering to a spiritual if not to a physical harmony: He was teaching a lesson, in a lifeless object, for the warning and edification of souls, and in the same degree evoking out of a present disarrangement and disorganization the seed of a future and an eternal reconciliation.

4. In the miracles which attest the sovereignty of Christ over Nature we have one of the surest grounds of comfort for Christian souls. And this (1) in their literal and (2) in their parabolical significance.

(1) There can be no greater comfort to Christian persons than to feel that their Lord and Saviour is the Sovereign of the universe in which they dwell. When they are exposed to any of the manifold perils which befall us through the world that is seen; when they are in danger by land or by sea; when tempests shake their homes, or want threatens their families; when they are compelled to ask, "What shall I eat? or what shall I drink?" or when those dearest to them are tossed on a stormy ocean, or left to the cruel mercies of an Indian sun or an Arctic winter; how strong the consolation which tells of a Saviour Omnipotent over Nature herself; without whom not a sparrow falls to the ground, and who can at his pleasure turn the very wilderness into a pasture, or allay the raging of the elements against his people, his chosen!

(2) And surely in those more desolate wants which depress, and in those fiercer storms which agitate the *soul*, they find comfort, neither feeble nor fanciful, in the record of His marvellous working below, who fed famishing thousands with bread from heaven, and said to the tempestuous sea, "Peace, be still!" He who did the less can do the greater: He who found bread for the body, He who stilled the outward storm, can both give Himself by his Holy Spirit for the strengthening and refreshing of the soul, and say to the restless cares, the eager longings, and the raging passions, of the inner being, "It is I: be not afraid"—"It is I: my grace is sufficient for thee"—"It is I: peace, be still!"

5. Finally, that which has comfort in it for the true Christian, has also (is it not ever so?) warning and admonition for the careless and the sinful.

Do not imagine, it says to them, that the power of Christ over you is all future. Do not think only —though it be indeed worthy of all your thought— of a misery and a remorse and a torment to begin when life is ended. Already He whom you are resisting is the Lord of Nature. Already it is in Him and by his daily sustentation that you live and move and have your being. Upon his blessing or upon his curse depends already all that makes it a happiness or a misery for you to possess existence. If He gives not his benediction, food itself, light and air, rest and waking, can bring you no abiding enjoyment. These things too are his: these things, as well as the comfort and the support and the blessedness of a spiritual being. The agencies of Nature as well as of grace, of Providence as of the Spirit, are in the hands of Christ. How fearful, if you be not his—if you be not his, but his enemy! Christ the Lord of Nature—do not those few words of themselves tell us how it is that Christian godliness has the promise of the life that is, as much as of the life to come? Is it not because a Christian can look upwards through all that he has, to a loving heart and to a loving hand in heaven? because a Christian sees in all that he here possesses, the assurance of a Saviour's love and the foretaste of an eternal inheritance? because a Christian, being the servant and the friend of a known and trusted Redeemer, can receive in that which is given an intended blessing, and recognize in all that is withholden a no less intended mark of love?

Yes, my friends, "the earth is the Lord's, and all that therein is:" and therefore they only can be at peace on earth, who are at one with its Owner. God give us all grace so to seek Him now, through the Atonement and the Propitiation, that we may know Him also as the Lord of the living and as the Life of the dead!

RAILWAY ACCIDENTS AND CHIEF SECURITIES AGAINST THEM.

By HENRY ROGERS, Author of "The Eclipse of Faith."

THE enormous stimulus which the Railway has given to travelling, has by no means reached its limit; and yet, considering the alarming accidents, or rather terrible catastrophes, which even now periodically frighten the public when the railway-system is working under a more than usual strain, it is impossible not to look at the future with some apprehension, and to speculate on the best modes of diminishing the increased perils which our increasing mobility must occasion. As the subject is of vital interest to us all, (concerning, as it does, no less than life and limb,) any man who thinks he has any suggestion to offer that may be, in the smallest degree, useful, needs no apology for uttering it, even though it should prove to be of no more significance than the cobbler's criticism on Apelles.

Though it is easy to trace specific "accidents" to specific proximate causes,—a pointsman's forgetfulness, a plate-layer's negligence, the breaking of a coupling-chain, and so on,—yet the *times* at which the most serious of them have occurred—their general periodicity—seems to show that the "cause of causes," that which for the most part involves these proximate causes, is the over-taxing of the powers of the railway in times of pressure, and thus occasioning it, in some point of construction or management, to give way.

That it can never in the *long run* answer the purpose of any company to attempt more than it can do with due regard to the public safety, will perhaps be granted by everybody. *That* railway would ultimately succeed best which, having all the trains it can *safely* run steadily full, kept time like the sun; insured by the utmost regularity of working a *minimum* of accidents, and therefore of losses and "compensations;" in whose history "catastrophes" were remote traditions; and that inspired people with as much confidence when they stepped into its carriages as when they stepped into bed;—just as in the old coaching days, that coach paid best,—not which was stopping at every turn to "tout" for passengers, or offered to take passengers for next to nothing that it might not be empty, or made itself top-heavy by taking half-a-dozen supernumeraries on the roof,—probably only to "spill" them all at the bottom of the next hill,—and became a synonym for irregularity and disaster; but the steady-working four-in-hand, that kept time like the chronometer in the guard's pocket, the clank of whose harness beat like a metronome, and which, inspiring the public with unbounded confidence in its punctuality and *safety*, always came in full, inside and out.

In discussing the best management of the railway system, in prospect of the still indefinite increase of travelling, a preliminary question presents itself, which *ought* to be soon answered, and yet which at present does not seem so much as asked;—namely, "What is the primary object which should be kept in view by all railway companies? Is it to convey as many people and as much merchandise as *can* be conveyed by them, or to attempt to carry the whole world, should the whole world think proper to be set upon wheels on any given day? in other words, to do only what is within possibility, looking at the uttermost limits of the capacities of the rail in relation to the public *safety;* or to resolve never on any occasion to refuse a passenger, or compel him to go by the next train or on the next day, even though the whole human race was crowding on to the platform? One would think it ought not to require much time to answer such a question; and yet from a certain vague notion, contracted from the fact that the system has, (somehow or other,) met the strain made upon it, it seems to be taken for granted that no matter how many millions may demand to go in the same direction on the same day, the railway is bound to extemporize as many trains as may be necessary to convey them, instead of its being restricted (or restricting itself) to taking only so many as with a proper regard to the safety of the public, measured by a liberal construction of the capacities of iron and machinery, the powers of mortal endurance on the part of officers, porters, and drivers, and the inflexible limits of the twenty-four hours, *can* be conveyed on the same day? It must be confessed, that the great facilities for travelling offered by the rail, and the, *in general*, ample supply of locomotive power for everybody,—that is in ninety-nine cases out of a hundred, and perhaps for 300 days out of the 365,—have made Englishmen a little impatient of considering whether there be any limit at all. And yet it is plain that, for certain portions of the year at all events, we are rapidly approaching the point at which it will be necessary to consider the question, and perhaps by and by it will be necessary to consider it at all times in the year; for while the love of travelling may be stimulated without limit, the capabilities of men and metal, and, above all, the hours of the day, are restricted. Within a certain interval, it cannot be safe to dispatch one train after another; and still less to chuck upon the rails (so often and so perilously adventured upon now) any number of *occasional* trains, to take their chance of so dodging the regular trains as neither to cause nor to suffer a breakdown. There is, then, a point, to which in the daily increase of travelling we seem to be approaching, which will compel us to ask, whether railways shall be expected to carry everybody at any given time, so that if he be left behind, he shall have a reasonable right of grumbling; or whether they shall be bound to do only what is *possible?* On those occasions on which the principal pressure is felt,—that is, in times of universal holiday-making,—we have clearly passed the limit in question; and hence chiefly those terrible accidents, which occur with pretty constant uniformity just when the capacities of mind and matter are overtaxed, and the whole system of railway machinery and management is working at high pressure.

As travellers have come to be impatient of supposing that if the whole world wants to move in a particular direction at a particular time, the whole world should not be instantly gratified, so the "Companies," like other mortals sitting "at the receipt of custom," are exceedingly unwilling to refuse anybody's money; and are prone to believe that what it is their interest to do, it is also quite possible for them to do. And this is so natural a state of mind for all directors and shareholders to fall into, that it would perhaps be perfectly idle to say one word on the subject, were it not that there is another side of the question;—namely, whether, as railway travelling still increases, it may not be possible to realize greater, because more secure and less fluctuating profits, by working the railway system up to nearly that *maximum* of its resources which shall be consistent with the conditions of safety and regularity, (running as many trains as it is *possible* to run under these conditions, but always full, and always punctual,) than by extemporizing a number of trains at any moment of pressure,—thus deranging the whole system for the time being, and occasioning accidents so frequently and on such a scale as must dip deeply into the profits of the shareholders to repair the mischief to the railway *plant* and compensate the injured passengers.

Nor is this the only way in which an increasing *per centage* of accidents will tell on railway interests ; they will infallibly check the public disposition to travel. It has been developed by the comparative safety, combined with the rare facilities and conveniences, which the railway offers ; and if the safety be diminished, and in proportion as it is so, the motive to travel will at last adjust itself as exactly to the measure of public confidence as the stock markets to similar causes. It is quite a mistake to suppose that because people travel, probably ten times as much as formerly, therefore they *must* continue to do so, or that nothing can henceforth alter it. It will depend entirely on the guarantees for the safety, and even in a large degree on the continuance of the conveniences, of travelling. At certain times and in certain localities this feeling is already beginning to operate in an appreciable degree. In a large city, where for one week in the year, the whole railway system seems to be given up to a sort of Saturnalia of cheap pleasure trips, it is not uncommon to hear folks say, "We never, if we can help it, travel in that week. It is hardly safe ; and from the general derangement of the railway system, the enormous delays and want of punctuality of the trains, it is anything but pleasant." A great part of the travelling for pleasure will certainly be contracted by any considerable diminution of the advantages which have occasioned its increase ; and even as regards business, people often travel simply because they can transact it a little more expeditiously and effectually in person than by letter ; but in a thousand cases the delays of the post will certainly be preferred to any appreciable augmentation of danger to life or limb.

If then the object be, not to convey absolutely all that may possibly wish to go on a given day and direction, but as many as the capacities of a railway (taxed if you please to near its *maximum* of power) can convey with safety, and, in order to that end, with perfect regularity, the question with railway directors, (or, if they will not entertain it, with Government), should be : "What is the rolling stock of any given railway?—what the staff of officers and porters?—what interval must, at the least, be allowed between any two trains?"—and, viewing these conditions together, "How many trains, and of what magnitude (so as not to endanger a breakdown by the mere enormity of weight, nor, in case of collision, frightful aggravation of mischief by their momentum), can be sent off *punctually* in the day?" Up to this maximum any railway may be permitted to work ; but beyond it, surely none but a madman would wish it to do so, even though half the world were waiting for the means of transit. It does not follow, of course, that a railway should be *always* working up to this point ; though at certain seasons, even now, it may well be expected to do so, and probably the time is not far distant when the amount of travelling will be such as to exact it all the year round. But though they may work sometimes within this limit, they should never be allowed to exceed it. Nor should the variations (as too often now) be sudden and capricious, nor should any movements be improvised for the day. Regularity and punctuality—the making any system work (as we say) like a *machine*—can be attained only by doing the very same things day by day ; any *programme*, therefore, should be, for a certain interval, inflexible as the law of the Medes and Persians, "which altered not." Nor can there be any great difficulty in this matter ; for the times of greatest pressure, as Whitsuntide, Christmas, and Easter, are as well known as the four seasons : so if a railway then work at a *maximum*, duly calculated and provided for beforehand, the trains for those exceptional periods should be duly published, and no deviation in the shape of *occasional* trains allowed. If it be said, "But would it not be hard to allow any people to be left behind?" the answer must be, "Would it not be harder if any were killed to accommodate them? It is supposed that as many trains are permitted to go as the railway rolling stock, plant, and staff, and the inflexible limit of *time*, will allow to go with safety ; that is, the utmost is done that the fairly-computed powers of the railway can perform? Do you wish that it should do more than it can do?"

Supposing it laid down as a principle by any railway that it would allow of no extemporaneous trains or depart from its settled programme ; that only such and such a number of trains, of given magnitude, should depart during the twenty-four hours, then the ambition (as it would be the true glory) of its Directory should be to take the uttermost pains to make the entire machinery work—as it might do under such conditions, adjusted as these would be to its own capacities, and not the possible demands of the public—with something approaching the equable movement of some of the steam engines attached to our great factories ; engines which the engineer takes as much pride in as a captain in his ship, and whose well-oiled joints move with all the regularity of clock-work, all the smoothness of animal mechanism, and almost the noiselessness of an infant's breathing. Then, the same duties having to be performed in the same manner and measure by the same officials day after day, and the daily routine becoming as fixed and familiar to all concerned as in a well-ordered factory or a well-drilled army, we might look for a rarity of accidents and a degree of punctuality which it were utopian to expect now. Then would directors and shareholders boast that for so many years no accident of any kind had taken place on *their* line, and reap well-earned glory and public confidence, and consequently solid profit too, from the proverbial punctuality of their trains. Then we might hope that even those visionary limits of fractions of five minutes, within which Bradshaw promises that we are to start or arrive, but which are felt at present to be myths, might be counted upon. Then we might really expect to arrive or start at 11·58 a.m., or 5·59 p.m., which are now paraded with strange hypocritical *purism* of punctuality,—much as if a man notorious for never keeping his time promised to meet you at three seconds and a half to ten, or between the third and sixth stroke of twelve. Then would officials on the line, and the plate-layers (that source of terrible danger!) know, from the immutable arrangements and perfect punctuality of the trains, (and that within a fraction of a minute,) precisely at what part of the road such and such a train might be expected, and provide accordingly. Then it would be the triumph of two trains, as of two first-rate coaches in the old coaching days, to pass each other daily within a dozen yards of the very same spot, or arrive at the same moment at the same stables to change horses.

It would be well to remember, that it no more follows, because we have "railways," that the whole population can go in the same direction on the same day or hour, than it did in the palmy days of coaches, that all who might desire to travel by the four-in-hand in consequence of its wonderful superiority over the old waggon, could go then. In those days nothing was more common, of course, than for passengers to postpone their journey to the next day, or even in times of pressure, for several days; at all events, to take security against such accident, by bespeaking places long before the time.[*]

And when, in those days, men could not go, they did not think it reasonable to ask that every spavined jade, and every tumble-down vehicle, and every indifferent Jehu, should be pressed into the public service; or that a system should be extemporised, by which twice as many should be carried as the legitimate provision could meet: and certainly they would have been little anxious to press any such course, if every one of the vehicles must have gone in the very same ruts on the same "six-foot" roadway, with no possibility of passing one another except at certain distant spots; the pleasant alternatives being that every one of them, however differing in load, or however miserably horsed, or by whomsoever driven, must either happily reach these harbours of refuge, or miraculously maintain a uniform speed with the best, or submit to be run down by the dashing four-in-hand! Yet this is really no very extravagant image of what takes place when all the world is resolved to be set upon wheels; that is, when the holiday mania is full upon us. Old asthmatic engines, old carriages, hardly good enough for firewood, and which cannot be adequately examined before each journey, are sometimes pressed into the service of the "excursion trains," and remorselessly interpolated in the general traffic; and these, with the swift express, and the jog-trot ordinary trains, and the slow luggage-trains, (all keeping bad time, because the whole system is overtaxed,) are set on the same line of rails, to take their chance of dodging each other through the livelong summer day, till some fatal catastrophe awakes the public mind into common-sense for a moment!

But it may be said, "One inevitable consequence of any attempt to reduce the railway system to that perfection of movement, to which, like every other great machine, it may and ought to be brought, would be, to abolish all special trains, except under circumstances of absolute necessity; as for example, all 'pleasure-trip trains.'"—I fear it must be admitted. Yet such is the popularity of those trains, and such the reputed revenue from them, that it would perhaps be hopeless to touch the subject, were it not (as seems to many of us) very possible to give the public nearly all the advantages of these contrivances, and to secure to the railways probably the same returns, by other means.

In the first place, the system of "excursion-tickets" by the ordinary trains, at a reduction of fare, and for various periods—a system happily more and more acted upon—goes far to meet *one* of the objects of the excursion trains; and with this advantage, that being always to be had during the season, the immense crowds which swarm into ordinary "excursion trains" are broken up into small parties, going at different times, at their own convenience, and (best of all) by the ordinary trains; thus interpolating nothing in the railway machinery. Secondly, we cannot see why the system of ordinary return-tickets at the reduced fares should not be more largely resorted to. If it can pay to grant them from Saturday to Monday, it seems very hard to suppose that they would not be equally profitable between Monday and Wednesday, or for any other three days. Nor would they be without one special advantage to the Companies of competing lines; for it would insure the passengers coming back by the same line. Many a man has gone from Birmingham by the North-Western and returned by the Great Western, for the sole reason that he has happened to be nearer Paddington than Euston at the time of returning; but if he had a return ticket, it would be well worth while to take a little trouble to return by the same line. In these ways, the extension of the system of excursion-tickets and return-tickets, as part and parcel of the ordinary working trains, and not an improvised supplement to them, would in a good degree prove a substitute for the extraordinary excursion trains. Thirdly, there are "excursion trains" proper, which might still be retained; for as they go on certain days, during the season, at a fixed hour, and as regularly as any others, they are, in fact, but part of the regular trains, only charging a lower rate; and the only caution to be observed is that they should not be of undue weight or dimensions. Fourthly, as a yet further means of meeting the difficulty, and without disorganising the regular system, a company might grant to a certain moderate number of excursionists,—say, as many as would fill a couple of carriages, tickets at reduced fares by any one of the ordinary trains, and that too with but little additional expense to themselves. This is beginning to be done on some lines, and I should imagine might be done more frequently. It would be attended with the signal advantage that instead of "monster pleasure-trains," the parties now composing them would necessarily be divided into different groups, and go on different occasions, and (which is the chief point) by the ordinary trains; instead of forming huge separate trains, crawling along, like immense centipedes, dangerous from their bulk, and trebly dangerous, as occasionally introduced into the system. It may not be possible to bring down the fares quite so low as when a thousand go in the same train; nor is it, perhaps, desirable; but the slight difference of price would be amply compensated by the choice of time given to the excursionists, their greater comfort in travelling, and the greater security both to themselves and the public.

---

[*] Nor need it be apprehended that if the number of trains were simply determined by the justly computed capacities of the rail, not by the possible demands of the public at some one moment, any disappointment worth mentioning would accrue to the public; it would be trifling, at all events, as set against the order, regularity, and safety, which would be introduced into the system. In general, all would be able to go; not only those who must, but those who wished to go.

Such, and probably some other methods, might be devised for giving to the public, by the regular trains, many, if not all the advantages, of the extraordinary excursion-trains; but whether the compensations be equivalent or not, it is certain that the public might well accept them as the price of the absolute abolition of these last. It ought to be, and some day will be, thought, as absurd a thing to intercalate an excursion-train among the regular trains, as to let a boy amuse himself with throwing pebbles among the revolving wheels of a steam-engine; or to let anybody suddenly introduce any new extemporised functions in a complicated piece of machinery. The success of any system, (in this case of the last importance, involving the possible issues of life and death, as well as the destruction or safety of a large amount of property,) depends on the smoothness, regularity of movement, and punctuality in the working of the machinery. The management of the railway system necessarily involves its own numerous and most formidable obstacles, which must be encountered whether we will or not. But to add to them all, by every now and then casting on the rails a huge, lumbering, and, from its very nature, crowded and proverbially unpunctual train, will, perhaps, one day be regarded as infinitely more absurd than it would have been to allow the old mail coaches to make a *détour* to any village on either side their route, to "tout" for chance passengers; or to allow the twopenny postman to go out of his beat to deliver parcels on private commission. Vast machinery like that of the Post Office or the Railway, can only be brought to perfection of method and working, by keeping it strictly to its proper business, and letting that become, by the similarity of each day's proceedings, as regular as clockwork.

It may be said that their cheapness is a great recommendation of the excursion-trains; and so it is, but the public safety is a yet higher consideration, even were the compensations on which we have just insisted of less value than they are.—But there is also another aspect of the case. To accommodate the masses by letting them travel a hundred miles for the half, or in some cases the fifth, of what you charge the regular passengers, is all very well; but if the benefit to the first be attended with large diminution of the advantages promised to the last, and still larger increase of their danger, it is in the highest degree unjust. And however desirable it may be to extend to the bulk of the population the opportunity of getting for half-a-crown a commodity of nearly the same kind and value that you are selling to another class for a guinea, it certainly seems nothing less than downright cheating to do this by diminishing the value of that for which you have already charged the higher price. I remember hearing a man plead that no harm is done to the regular traveller who has paid a couple of guineas because five hundred excursionists in front of him are going to the same place for a third of the sum; and that to complain, is to imitate the labourers who complained that the good man in the parable "did what he liked with his own!" But surely a more inept citation of Scripture authority cannot well be imagined. For he did not *diminish* the value of the "penny" he paid to each; whereas the railway company who charges you a guinea for a ticket, and then throws down on the rails before you a monster train which does its best to delay, to hamper, and perhaps upset you, has certainly given others not only the same commodity you have bought, at a much lower price, but has seriously diminished the value of what it sold you at a higher rate. Any accommodation of cheapness to the masses should surely not be attended with *that* consequence.

Certainly none need wonder that accidents occur when such scenes of confusion are possible as some of us saw last Whitsuntide at one of the principal railway centres. Five hundred persons, at least, standing on the platform, and others every moment crowding in; excursionists and such of us as were ordinary travellers all mixed up in hopeless confusion, trains suddenly projected, unknown to Bradshaw or to the officials down the line; contradictory directions from bewildered guards and porters as to which of two trains, standing on parallel lines of rail, was the train for us. After trying in vain to reconcile these discrepancies, several of us seated ourselves in one of these trains, with about as much assurance that it was the right one as if we had cast lots for it; we soon found ourselves sweeping past the station for which we had taken our tickets, and never halted till we had got ten miles past our destination. We were offered, it is true, a free passage back by an up-train, but not till we had had the privilege of waiting an hour for it! We amused ourselves, during the interval, in looking at the numerous trains which stopped or swept by to the amazement of the curious porters in this carnival of Whitsuntide. "What train is this that is coming?" said one of our party. "I don't know, sir," replied the porter; "several trains have come down this evening that we know nothing about; and there are far too few of us to attend to them properly. But it is *holiday* time, sir, and we can't help it." A day or two after the same answer was given by an evidently over-worked and exhausted porter, who had been toiling to get off an express train at another great station. It was just twenty minutes after its time, and was not to stop till it was sixty miles out of town! "There are not enough of us, sir," he gasped, "to get the trains out at the right time; and if folks will travel all together, and each with luggage enough to stock a pawnbroker's shop, they must take their chance."

I was travelling in another express train, only a few days afterwards, which also started twenty minutes after time, but tried to make up for it during the mid passage, though with the same success as that of the good man, who said he had lost a quarter of an hour in the morning, and was running after it all day long, and could not catch it: "This," said a gentleman, who was sitting opposite to me, as he saw the desperate speed at which we were going, "this is one of the ways by which *accidents*, as they call them, are produced; let us hope there are no plate-layers who have neglected their duty to-day!"

It has been suggested by a contemporary that luggage trains should never be permitted on the passenger-line of rails, but always have its own rails. This will indeed be an admirable improvement, if it can be effected; but if it cannot, or till it can, it might be well to consider whether the day might not be given to the passengers, and the night to traffic; whether, for example, after the night-mails had started (say at 12 P.M.), the seven next hours might not be wholly given to the luggage-trains?

It being of such immense importance to *safety* that the utmost precision and punctuality should be attained in the movements of the entire machinery, nothing that embarrasses it and tends to throw it out of gear can be considered trivial. Now there are two things which greatly tend to produce unpunctuality, and which, as it seems to me, might be remedied. I may err in that supposition; but, if not, I am sure reform in these points would not only immensely aid the safe working of the system, but be of incalculable convenience to the traveller in many respects.

The first I shall mention is the tormenting system of "ticket giving," at the little crowded "hatch," where they sell those preliminaries of a journey. You are at the station, I will suppose, in good time; that is, a quarter of an hour before the train starts, before which, indeed, you cannot get a ticket. You leave, it may be, a lady in the crowded station, or (after vainly glancing through the crowd for a porter) a quantity of luggage in a state of orphanage on the platform,—and rush to the little ticket-hole; which, to your great disgust, you find still shut, and besieged by a dozen other claimants. In the rear of these, with sullen impatience, you take your stand, thinking that the train will certainly go without you; or, if not, that in the desperate rush of the last minute you will be separated from your companion, or (what is perhaps as bad) be divorced from your luggage; or that this last will be left behind altogether, or made to take a journey, *not* by rail, with some one on the look out for such strays. Meantime the door continues closed for five, I have often known it for seven, minutes after the appointed time; you hear the clerks talking with provoking coolness behind the scenes, just as if they were not defrauding you and the public of the time the company had promised you, and in utter contempt of the admonitory taps on the portal, given by the foremost in this miserable procession of ticket-victims. At last the door opens, and you are in the stream for the window; but your arms are pinioned close to your sides by the crowd, and you offer the most inviting opportunity to any light-fingered gentleman who may be behind you. To make the matter worse, you hear little dialogues between the seller and the buyer of the ticket, until every moment seems an age; you think it can never come to your turn until the very moment the fatal whistle shall be heard. "Can you tell me," says one to the clerk, "whether this train stops at —— station?" "I will tell you in a *minute*," says the obliging clerk; just as if minutes at that moment were to be so improvidently wasted. Another wants change for a five-pound note, and the clerk begs to know whether he has not enough in smaller money, and the gentleman proceeds to rummage his pockets in search of it. A third is told that he has got to the wrong train; *that* train does not stop at his station at all, and he finds he has been emphatically "the wrong man in the wrong place," both to clerks and passengers. A fourth asks for you know not what, but you impatiently see that you must wait while the clerk gives a written pass; another asks for "seven and four halves, first-class, and two second-class," and then doubts whether the official has computed the value quite right: and so it goes on, till, if you were not hindered by the crowd, you would rush away into the train, and settle with the ticket collectors as you might, at the end of your journey. The only consolation is the entire unanimity of execration with which the long column of victims exclaim against this unreasonable arrangement for getting tickets, but especially against keeping the "hatch" shut after the stipulated time. Let it be at the height of the travelling season (as at Easter or Midsummer), or let there be some interesting affair (such as a Visitation or a fight, a race or a Church-congress) going on in the neighbourhood, and the annoyance often becomes perfectly insupportable; and, what is worse, too often ends in *delaying the train some minutes.*

Now, why should the public be subject to this perpetual inconvenience? Why should it be impossible to get a ticket except during that magic quarter of an hour; of some minutes of which (all too brief as it is) the public is often defrauded, and always of course, in the nature of the case, when it will be attended with the "greatest unhappiness to the greatest number," that is, when the pressure on the railway is heaviest, and the travelling mania at its height. Why should there not be a clerk or clerks with nothing else to do but to sell tickets all day long for the trains that are going during the day, like any other commodity? Nay, some have even asked why the greater Companies should not issue railway "notes," with the company's "promise to pay,"—that is, to convey the holders to the destination specified in the note,—"on demand," but within a given date. But if this be thought too much, why at all events might not the former of these plans be adopted? I have sometimes appealed to influential directors of railways, who have acknowledged that they see no *sufficient* reason why it should not be. There will be a greater risk, it may be said, of forged tickets. Well, of course, some risk of this kind there will be; but it need be no greater than in the case of bank-notes, cheques, or postage stamps. Practically, it is found possible so far to guard against the risk in all these cases as to make forgery a rare occurrence, and an infinitesimal evil compared with depriving the world of the advantages of such things. What would you say if you had to purchase every postage stamp at the very moment you posted your letter, and that *that* moment must be within a quarter of an hour of the post's going out! If the system *can* be altered, it is really discreditable to the railway companies that, for so many years, they have not found a remedy. How pleasant it would be if, instead of the press and the hurry-scurry and the chafing of the present barbarous system, the traveller could get his ticket at any time of the day; if he could do it as he passed, or as his servant passed, the station; and then, when the time came for his journey, have nothing to do but to take his way through the station and into the carriage, just as the train was starting. The present plan is only one degree better than that adopted when the railway system first came in, (but of course soon abandoned,) namely, that of writing out a licence for each individual passenger, just as each was duly entered on the way-bill in the old coaching days!

The second point in which reform (if it can be effected) would greatly facilitate punctuality in the trains, and add to the convenience of the public, respects the management of the luggage. To many, the thought of what may become of *that*, is the great burden of their journey; their souls may be said to be, all along, hovering between their bodies and their portmanteau. The Romans well called luggage "impedimenta;" it is so in a sense never intended by them, for if it does not hinder the traveller's rate of going, it sorely hinders his peace of mind. I have even known those in whom the fond care about it positively destroys all the pleasure of a journey. Many a nervous person in vain tries to maintain magnanimous indifference about it. He diligently inquires as to where it is placed; in what van or on the roof of what carriage; he wants to know where it "shifts;" he takes a reassuring peep at it in the van, at those deceitful "junctions;" and is constantly afraid lest something should happen to that *other* body, to which his soul is continually transmigrating.—And when it is to be ascertained whether it be safe at last, and claimed, (especially if it be at the great centres and in the height of the season,) dire is the scene of scrambling and selfish eagerness. What anxiety in each to be ready to pounce on it the moment it emerges from the van, lest it should be seized in the clutch of some wrongful claimant! What pressing to look into the van, in spite of remonstrance from guard and porter! What peril of having the toes crushed by some descending box of enormous dimensions from the shoot which unlades the roof of the carriages!

They manage these things much better on the Continent; even in many parts of America, nay even in Canada. On the Continent the chief point, the great *desideratum* of an unembarrassed mind, is effectually secured at once; the beneficent despots take your luggage from you altogether, pronouncing an absolute divorce between you and it; so that you see it no more till you have reached your destination, even though you be parted during the perilous passage of half-a-dozen junctions, or even a parenthetical sea voyage. Happy, blissful freedom from the gross encumbrance, the "mortal coil," of box or portmanteau! When shall this be the glorious lot of the traveller on the English railways? When shall he enter the carriage, happily disembodied of his luggage, stripped of his all, and all the richer for it? When shall he be in that *dégagée* state in which he makes a long journey with nothing but his faithful umbrella to take care of?

It is sometimes said that the impatience of Englishmen, their disposition to account time as money, and to consider the loss of every moment as a certain *per-centage* on their gains, would never allow them to submit to a system which would be attended with some irksome delays. To this it might be answered, that if public convenience and safety would be best promoted by a change of system, it is not very complimentary to our countrymen to suppose that they would oppose it; or prefer unnecessary anxiety, confusion, and selfish scrambling, to order and freedom from care, purchased by a few minutes' delay; but a still better answer is, that it is much to be feared that the present want of all method in this matter occasions far greater delay than the methodical and orderly transaction of the luggage-business would do.—But, if the Englishman dislikes the formality of the Continental method, surely a very simple modification of the present plan might be suggested, which would obviate at least the traveller's anxiety about his luggage; and *that* would be no light advantage. The greater part of the railways ticket the luggage, leaving the traveller to claim it, though without any guarantee that he is the right person to claim it, and without any responsibility for its due delivery to the right owner. Now, if it were made a uniform rule by the railway companies that no luggage should be put into the vans or on the roof that had not their ticket of destination affixed; if these tickets were printed in duplicate, and numbered, (say from 1 to 1,000, that they might not be soon exhausted, at least not by any one train); and if, as each was affixed by a porter to a box or portmanteau, he tore off the counterpart, and handed it to the passenger, the latter would have the guarantees in his pocket that his luggage could not be claimed by any improper person, and all he would have to do would be to give them to the guard when his proper number of packages was handed out on the platform. This would, at all events, obviate the plague of thinking about, and taking care of, one's luggage during the transit, and all fear of its passing into any hands but those of the right owner. Those much-to-be-pitied travellers, whose minds are so apt to live in their portmanteaus, might with perfect serenity give themselves up to the newspaper or the scenery, without being troubled at stations or junctions as to whether any wrongful person might be carrying off that deposit for which they had got due security. The possession of these same tickets would enable them, when the train reached its terminus, still to possess their souls in patience, without rudely pressing on others, or being pressed upon, in the attempt to get hold of their luggage at the earliest possible instant; while quiet souls, who hate all scrambling, and would sooner wait half-an-hour than have anything to do with it, would stay till the more impatient crowd had thinned away, without any fear of being thereby defrauded of their own. If it be said that any such more methodical system, and the duplicate tickets, would cause the company some additional trouble and expense, and that they could not be expected to carry it out without some trivial charge, I fancy there are few travellers who would object to some trifle (say a halfpenny or a penny each packet); or who would not feel that it was amply repaid by the transfer of the responsibility of the luggage to the railway authorities, and consequent freedom from all care on the part of the traveller; for myself, I should think that for such a charge I had an ample *quid pro quo.*

Some such system would be attended by two other signal advantages,—more especially if a portion of these trifling fees were spent in an increase of wages to the porters, or in increasing their number when necessary.—One is that it would do away entirely with a practice which the railway companies earnestly and rightly, yet vainly deprecate,—a practice attended with very pernicious consequences to the public,—the clandestine feeing of their servants. In ninety-nine cases out of a hundred this corrupting practice—of which almost every one of us is more or less guilty, in spite of the laws of the companies—originated in extra trouble given about the luggage; now, if a small charge were made on it, and especially if it in part benefited the porters themselves, the public would have neither reason nor inclination to break the companies' laws on this score; and I firmly believe that nothing but some such regulation as I have hinted at will correct the practice.

The second advantage is more particularly connected with the chief subject of the present essay,—namely, the best modes of obviating dangerous delays and unpunctuality in the trains; for, under such regulations, every traveller would naturally endeavour to *minimise* his luggage. Whether, indeed, still more stringent regulations may not be ultimately required as to the *quantity* of luggage, may be a question; for the present tendency to take mountain-loads of it is a perpetual cause of delay and irregularity. But, at all events, such regulations as those just suggested would *pro tanto* tend to diminish it. Each man who could, would content himself with a modest portmanteau, not exceeding in cubical dimensions the space allotted to him under his own seat, and would thus exempt himself from all trouble, as well as all payment in the matter; but, at all events, if he were obliged to have recourse to the van, he would put as little there as possible. At present, from the want of stringent regulations as to the quantity of luggage, and especially from the immunity from any fees, people abuse the indulgence of the rail most unconscionably. The huge pile of luggage looks sometimes as if the good folks who owned it were not merely taking a journey, but moving with all their household gods and goods to a new residence. Packages may often be descried which ought in all fairness to go by the luggage-train,—perambulators, beds, baths, and apparently half the furniture of seaside lodgings or shooting-boxes. The trunks of ladies, again, often assume most alarming proportions, due in part, probably, (if one may profanely speculate on their sacred contents,) to the ample skirts of modern fashion. In height and breadth, and the tremendous arch of the roof, they look more like young churches than boxes.—Let it not be imagined that this excess of luggage is a thing of little consequence; it is largely connected with the want of punctuality in the trains, is often the chief cause of the delay in starting, and occasions slight additional delays at the intermediate stations,—to say nothing of the confusion it often produces on the platform of the principal termini. Anything that would tend, therefore, to contract this ever-expanding volume, and reduce it within narrower limits, would be of appreciable benefit to the public, and materially add to the safety, by increasing the punctuality, of the trains; and even the ladies, who now are apt to abuse this privilege, and take up more than their share of space in the vans, as they do at concerts and in churches, would have a compensation for the diminished luggage in the greater care wherewith it would be treated. I fancy it would go near to break the heart of many a young damsel if she could see the irreverence and violence with which her treasures, the κειμήλια of fashion, are often treated; with which they are thrown in and out of the van or turned topsy-turvy. On peeping into the van, how often may we see the huge tin boxes, with all their sacred contents, reposing on their arched roofs, to the infinite shame of irreverent guards and porters!

It would be another advantage of any arrangement which should reduce the railway system to equable working, and which should get rid both of all *occasional* trains, and of any trains of undue dimensions, that it would divide the crowds, which now, in times of pressure, throng the platforms, throw the whole official machinery of the railway out of gear, and too often stand in each other's way as well as in that of everybody else. "Monster trains" will in time lead, and indeed they have already led, to a variety of mischiefs and evils which gravely threaten the comfort, even where they do not endanger the safety, of passengers. Among them is a rapid development of selfishness, of eager and frantic impatience in each man to secure his own immediate advantage, to the utter neglect of the interests of others. The way in which a "monster" crowd of "excursionists" sometimes rush to secure their places, and thrust, and jostle, and push one another to obtain them, is, as Sam Slick would say, a "caution to behold." It seems as if they had undergone a sudden "transmutation of species," and remind one rather of pigs rushing to their troughs than of civilised creatures. Nor can this eager selfishness be said to be a mere inconvenience; it is often most dangerous. Among the *fatal* railway casualties of last year were those of no less than three persons who were thrown under the wheels, at the very moment of starting, by the crowds rushing into the carriages.

Another evil connected with the present system of taking unlimited numbers by the same train, (and it is a growing one,) is that of confounding the distinction of "classes," and defrauding him who has paid the price of a higher ticket, of the specific advantages for which he purchased it. It is now not uncommon to find, on reaching some meridian where a fair, or a fight, or a race has been going forward, that under the excuse of there not being room enough, third-class passengers are stowed into second-class carriages, and both third and second-class passengers are sometimes thrust into first-class carriages,—the intruders being often not at all the more agreeable for their recent riotous companionship.

Similarly, even on the lines on which "smoking carriages" are allowed, there is so little enforcement of the general laws of the companies, that scores even of the first-class carriages smell like a tap-room. These and many other minor abuses, (which are evidently on the increase,) will require timely watching and correction; otherwise they will infallibly induce a general laxity and slovenliness of management, and disregard of all fixed regulations, that will not only seriously interfere with the comforts of the traveller, but indirectly augment the perils of the rail.

It was recently observed in one of the papers, (the "Times," if I mistake not,) that the railway officials ought to be men not only of superior intelligence, but of education and culture. Nothing can be more true. As to the guards, porters, and subordinate officials, speaking generally, there cannot be a more hard-working civil, obliging set of men. But the chief station-masters, and other principal officials ought, in every case, to be men of superior sense and information, and capable of assuming with their uniforms some of the best qualities of military officers; they should be possessed, in a high degree, of firmness, decision, patience, and self-control, reverence of discipline —even to idolatry; they should be prompt to render obedience to authority where it is due to others, and peremptory in demanding it where it is due to themselves.

Before going outside the city, I must admit that much more could be said about Jerusalem itself, and especially about the old walls, and their bearing on the vexed question of the position of the Holy Sepulchre.* But the reader will please recollect that I only give the impressions of a hurried visit, and do not recapitulate what others have written, and more fully and better than I could do.

On my way out one day I visited the Jews' "wailing place," certainly one of the most remarkable spots in the world. I indicated its locality in my last article. It extends 120 feet along the cyclopean wall, which belongs to the area of the Jewish Temple, and which surrounded the sacred inclosure. It begins about 300 feet from the south-west corner. No familiarity with the scenes enacted at this place made it hackneyed to me. To see representatives of that people met here for prayer—to see them kissing those old stones—to know that this sort of devotion has probably been going on since the Temple was destroyed, and down through those teeming centuries which saw the decline and fall of the Roman Empire, and all the events of the history of Modern Europe—to watch this continuous stream of sorrow, still sobbing against the old wall, filled me with many thoughts. What light amidst darkness, what darkness amidst light; what undying hopes in the future, what passionate attachment to the past; what touching superstition, what belief and unbelief!† I found some slips of paper, bearing prayers written in neat Jewish characters, inserted between the stones of the old wall.

I also took a stroll into the Jews' quarter on Mount Zion. It is a wretched filthy place, squalid as the "liberties" of Dublin, the "slums" of London, or the "closes" of Glasgow or Edinburgh. I may possibly in another chapter give my impressions of the Jews of

---

* Since writing my last article I have got a copy of De Vogüe's splendid work on Jerusalem. The learned author rejects Josephus's measurements of the site of the old Temple, and endeavours to prove that it occupied the whole portion of the present Haram area, with the exception of the north-west corner, on which the fortress of Antonia was built. If his view be correct—a point by no means settled—then the famous rock may turn out after all to be the site of the great altar. He also rejects Mr. Fergusson's argument that the Mosque el Sakrah was built by Constantine, though he admits it to be of Byzantine architecture applied by Moslem builders. And he accepts the present so-called "Holy Sepulchre" as authentic. I am quite prepared for a "counterblast" to his arguments, and am disposed, more than ever, to wait for light until the Palestine Exploration Society—one of the most interesting, most urgently required, and most promising associations of our day—has had time to dig and measure among the *débris* of Jerusalem with skill and patience. I trust the society will meet with the support it deserves.

† Dr. Wilson, in his "Lands of the Bible" (vol. ii. p. 615), quotes a passage from the liturgy of the Sephardim Jews, used when lamenting at the place of wailing. Among its petitions are the following:—"Oh, may their Father in his infinite mercy compassionate his orphans, and gather his dispersed to the pure land! For he is high and exalted; he bringeth down and raiseth up; he

Palestine, and shall say nothing more about them here.*

I saw one sight on Mount Zion which vividly recalled the past, and that was a band of lepers. They inhabit a few huts near one of the gates, and are shut off by a wall with only one entrance to their wretched small court and mud dwellings. Ten of those miserable beings came out to beg from us—as they do from every one who is likely to give them alms. They sat afar off with outstretched arms, directing attention to their sores. There was nothing absolutely revolting in their appearance; but it was unutterably sad to see so many human beings, with all the capacities for enjoying life, thus separated from their kind, creeping out of their mud dens day by day through a long course of years to obtain aid to sustain their miserable existence; and then creeping back again—to talk, to dream, to hope. And for what? No friendly grasp from relation or friend, no kiss from parent or child, from husband or wife. Dying daily, they daily increase in misery and pain. What more vivid symbol of sin could have been selected than this disease, which destroys the whole man from the crown of the head to the sole of the foot, slowly but surely eating his life away, and which is incurable save by the power of God? May He have mercy on all such! The sight of those sufferers in such a place suggested many a scene in Bible history, above all the compassion of Him who "bore our sicknesses," and restored such pitiable objects to the health and joy of a new existence. Nor could one fail to associate the helpless condition of lepers with that of the people who still occupy Zion, whose houses are built over the dust of what was once their own stately palaces, and whose unbelief is now, as it was in the days of the Prophets, like unto a deadly leprosy with wounds that have not yet "been closed, neither bound up, nor mollified with ointment." Their sin has been so visibly punished, that we may truly add:—"Your country is desolate; your cities are burned with fire; your land, strangers devour it in your presence, and it is desolate as overthrown by strangers. And *the daughter of Zion* is left as a cottage in a vineyard, as a lodge in a garden of cucumbers, as a besieged city."

And before passing beyond the walls, I would like to mention one remarkable feature of Jerusalem. It is its power, in spite of its dust and decay, to attract to itself so many forms of religious thought. The fire which once blazed in it with so pure a flame, still flickers amidst smoke and ashes. Moslem, Jew, and Christian, of every sect, reside among its ruins, or make pilgrimages of devotion or of inquiry to its hallowed precincts. Among these are always a few *outré* characters from Britain or America, possessed by a monomania on the second advent or the return of the Jews. I heard of more than one such who took up their abode in sight of Olivet, daily watching for the Saviour's personal return, and daily preparing to receive Him or some of his followers as honoured guests. On every other point they were, I believe, sane and sensible people. One old man had for years lived in eager expectancy of the great event. His hair grew white, but his hopes were ever fresh and young. He lived alone. At last one day he was missed; and when search was made, he was found dead in his solitary room. But his hopes, however false they were as based on an error of judgment, yet sprang from personal attachment to his Redeemer, and would not be put to shame, though fulfilled otherwise and more gloriously than he had anticipated. Those who, longing to see the sun rise, search for it with straining eyes at too early an hour, or in the wrong quarter of the heavens, will yet rejoice in its beams when it does rise, though it be later, and in another point of the horizon. We may apply to such disappointed dreamers what Mrs. Barrett Browning so touchingly says of the poet Cowper:—

"Like a sick child that knoweth not his mother while she blesses,
And drops upon his burning brow the coolness of her kisses;
That turns his fevered eyes around—'My mother! where's my mother?'
As if such tender words and looks could come from any other!

"The fever gone, with leaps of heart he sees her bending o'er him,
Her face all pale from watchful love, the unweary love she bore him!—
Thus woke the poet from the dream his life's long fever gave him,
Beneath those deep pathetic eyes which closed in death to save him.

"Thus? Oh, not *thus!* no type of earth could image that awaking,
Wherein he scarcely heard the chant of seraphs round him breaking,
Or felt the new immortal throb of soul from body parted,
But felt those eyes alone, and knew—'*My* Saviour! *not* deserted!'"

But we must go out of the city and "view the walls of Jerusalem which were broken down."

---

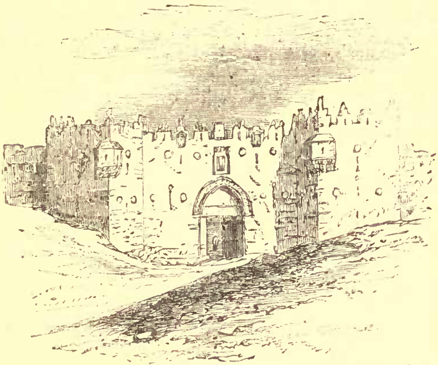
woundeth and he healeth; killeth and restoreth to life. O Lord, return to thy city! build thine holy oracle, dwell in thine house, and gather thy scattered flock. O thou who renewest the months, collect the saints, both men and women, to the erected city. O may this month be renewed for good! and may it please God, who is mighty in works, thus to command!"

* I cannot find any more authentic evidence of the population of Jerusalem than what has been given by "Murray" (1858), which is as follows:—

Moslems	4,000
Jews	6,000
Greeks	1,500
Latins	1,200
Armenians	280
Syrians, Copts, &c. . . .	150
Greek Catholics . . .	110
Protestants	100
	13,340

The best account of the "religions" of Palestine that I am acquainted with, is that given by Dr. Wilson, in his "Lands of the Bible." Finn's account of one sect of the Jews—the Spanish "Sephardim"—is also valuable.

Among the first places I went to was the subterranean quarry, the entrance to which is near the Damascus Gate. The nature of this place will be best understood by supposing an immense excavation, out of which it is highly probable the stones were quarried to build the city, so that Jerusalem may be said to be reared over one vast cavern, the roof of which is supported by huge pillars of rock, left untouched by the workmen. We entered by a narrow hole, through which we had to creep; and after stumbling over *débris* down hill and up hill, we found ourselves in the midst of a labyrinth of vast caves, whose high arches and wide mouths were lost in darkness. On we went tottering after our feeble lights, long after we lost sight of the eye of day at the entrance. With cavern after cavern on the right and left and ahead of us, we got *eerie*, and began to think, in spite of the lucifers—unknown as an earthly reality to the Jews of old—what would become of us if our lights went out. It is difficult to say how far the quarries extend. I have been told by one who has examined into their inner mysteries, that there are walls built up which prevent thorough exploration. But I have no doubt they will, as many incidents in history indicate, be found to extend to at least the Temple Area. It is more than likely that the stones of the Temple were here prepared; for "the house when it was in building was built of stone made ready before it was brought thither, so that there was neither hammer nor axe, nor any tool of iron heard in the house while it was building." The stone is a white limestone, and must have given a pure and bright appearance to the Temple.



Damascus Gate.

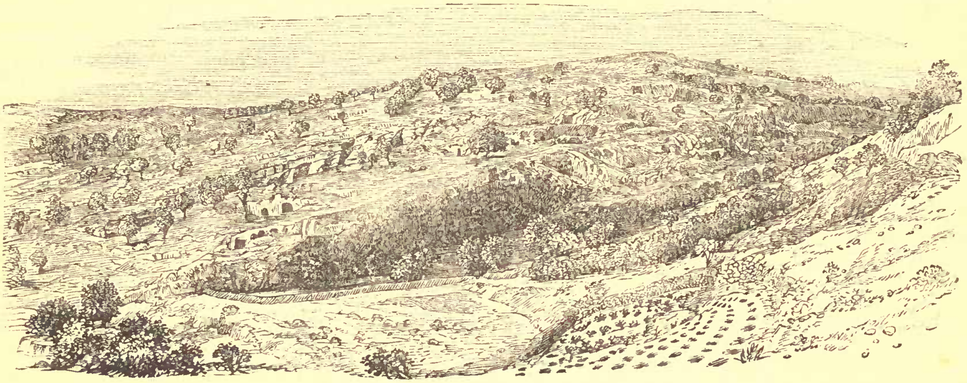
J. Graham, Photo.

We saw some blocks half cut out of the living rock, but never finished. I know not why such unfinished works as those stones, partly prepared yet never used, are so impressive. They are very old—older than any inhabited building on earth, and ages older than most of our modern ruins—yet they look young, like children that were embalmed at birth. They are monuments, not of the past so much as of an expected future—enduring types of designs frustrated, of plans unexecuted, and of hopes unrealised—symbols of the ignorance of man, who plants and builds, until a sudden coming of God revolutionises the world to him. Why, we ask, did not this or that stone fulfil its intended destiny? What stopped the work? What hindered the workman from returning with his mallet and chisel to finish it? What caused the abrupt pause which has not been disturbed for centuries? Was this stone designed for the home of some rich young man, who was so absorbed in it that he could not follow Christ? or was it intended for some one anxious to enlarge his barns? or for some Dives to erect a new banqueting-hall? or for some bridegroom to prepare a home for his bride? Or did the Sanhedrim commission it for the repair of the Temple? Then why did it remain here? Were the workmen called away by the Crucifixion, or by the scenes of the day of Pentecost? Or did strange news come of the army of Titus encompassing the city? and was the work of usefulness, of covetousness, of luxury, of domestic peace, or of piety, put off till a more convenient season? The stones yet wait in silence, and may wait probably till all man's works are burnt up. And still we go on in the old way, planting and building, marrying and giving in marriage, rearing palaces, barns, and churches, as if the earth were firm beneath our feet, and time would never end. But we must not indulge in dreamy meditations lest our lights go out, and the stones at last serve some purpose by covering our skeletons. We reach the daylight, which, first like a brilliant star, and then a sun, pierces through the gloom from the narrow entrance.

Reader, it is no easy task this work of exploration even in a small way, or of sight-seeing in any way, with such a temperature. You can fancy what it is to be obliged to poke through holes like a rat, flit through caverns like a bat, and then come into daylight only to pace along under a glare from white rocks, white stony roads, white walls, the whole man dusty and deliquescent, and inclined to say with Sir John: "Thou knowest, Hal, that a yard of uneven ground is a mile to me." There is no shelter anywhere except under an olive, when there is one, or in the cool recesses of a house, which is not to be thought of until evening. I long to bring the reader to Olivet and Bethany; but let us first take a rapid glance at some of the spots south of the city.

Whoever takes the trouble to examine the accurate plan of the site of Jerusalem and its environs which heads this chapter (reproduced from our last for the convenience of the reader), will notice the prolongation of the hill south of the Haram Area. It is steep, and in some places rocky, though on the whole carefully cultivated in terraces, with many olive and fruit trees. This was the Ophel of the olden time. The valley which bounds it on the west was called the "Tyropœan," which, from the Damascus Gate southward, divided the Temple

Mount from Mount Zion. The valley to the east of Ophel is that of Jehoshaphat, or the Kidron, separating Jerusalem from the Mount of Olives. It attains its greatest depth immediately beneath the south-east angle of the Temple. Another valley, it will be observed from the plan, curves in from the west. This is the valley of Hinnom or Tophet. Perhaps there is no place on earth where so many thoughts of human crime and misery suggest themselves, as among the rocky sepulchres of this valley. It must always have been an out-of-the-way, dark, secluded spot. There is no other like it near Jerusalem. The horrible Moloch fires which consumed many an agonised child, once blazed among these stones. "They have built the high places of Tophet," said the Prophet Jeremiah, "which is in the valley of the son of Hinnom, to burn their sons and their daughters in the fire; which I commanded them not, neither came it into my heart." On the opposite side, on the Hill of Corruption, where the village of Siloam is now built, Solomon set up his idols in the very sight of the Temple; as it is written:—"Then did Solomon build an high place for Chemosh, the abomination of Moab, in the hill that is before Jerusalem, and for Molech, the abomination of the children of Ammon." It was these abominations Josiah cleared away:—for "he defiled Topheth, which is in the valley of the children of Hinnom, that no man might make his son or his daughter to pass through the fire to Molech." "And the high places that were before Jerusalem, which were on the right hand of the mount of corruption, which Solomon the King of Israel had builded for Ashtoreth, the abomination of the Zidonians, and for Chemosh the abomination of the Moabites, and for Milcom the abomination of the children of Ammon, did the king defile." As if to complete the painful associations, there is pointed out among the rocky hills of Hinnom, immediately below the Hill of Evil Counsel, Aceldama, or "the field of blood," where, into a caverned pit, now built over, bodies were cast, with hardly any other burial than to lie there under a little sprinkling of earth until turned into corruption. It has been closed for a century, but will ever be associated with the traitor. No wonder this spot in the valley of Hinnom, with its wickedness, its consuming fires, its vile moral as well as physical corruption, should have become, as Tophet or Gehenna, a type of Hell.



Aceldama and the Valley of the Son of Hinnom, from N.E.

J. Graham, Photo.

The inhabitants in the immediate neighbourhood of these infamous spots do not redeem their character. The villagers of Siloam partly live in houses and partly in the old rock tombs, and are notorious thieves—such a collection of scoundreldom as might be the joint product of gipsies, vagabond Jews, and the lowest Arabs. Their presence in Siloam makes all the Mount of Olives unsafe after nightfall to those who are not protected.

But the name Siloam recalls a very different scene, and one for ever associated with the Saviour's power and love. There is no dispute whatever regarding the site of the old Pool, which has never been challenged.* It is about 53 feet long, 18 feet wide, and 19 feet deep. It is surrounded by an old wall, which, it has been suggested, is the same as that of which it is recorded:—"Shallum built the wall and the pool of Siloam by the king's garden." Above it, as the illustration shows, is an arch, under which a flight of steps descends to the water, that flows past, clear and pure, into the pool. In this the blind man was sent to wash. This one fact sheds a light and glory over the whole place. We can easily picture to ourselves the poor man proceeding with his clay-covered eyes, his anxious and eager faith subduing his doubts and fears, until the water laves his face, and then!—he sees for the first time those very rocks, perhaps that same old wall; and better than all, with the eye of the spirit, as well as of the flesh, he sees Jesus as "the Sent" of God, and as his Saviour. It is not the realising merely of this miracle or of any others as historical

facts that does us good, but it is the realising of the more abiding and life-giving truth that this Saviour ever liveth able and willing to open the eyes of all men, whom sin hath blinded, and to "give light to those who sit in darkness." It has been proved that this Pool of Siloam is fed from sources which extend towards Zion, and possibly Moriah. It is conducted down to the valley opposite the village of Siloam, where it flows out a sparkling stream, round which women were merrily washing clothes, and men giving drink to their horses, as we passed. A conduit also has been traced, which connects it with the Fountain of the Virgin, which is still higher up the valley,* and is reached by a descent of twenty-six steps. It exhibits the curious phenomenon of an intermittent fountain, ebbing and flowing at certain intervals, which is explainable on the principle of the syphon. This stream is no doubt connected with the great reservoirs under the Temple. It cannot, however, be identified with the Pool of Bethesda and the "moving of the waters;" but it is more than likely that that fountain, if ever discovered and cleared out, will exhibit the same phenomenon.

There is no city in the world, certainly not in the East—if we except Damascus—more abundantly supplied with water than Jerusalem, not only from its innumerable private cisterns, but also from its natural springs. Many of these were filled up by Hezekiah with much trouble:—for "he took counsel with his princes and his mighty men to stop the waters of the fountains which were without the city; and they did help him. So there was gathered much people together, who stopped all the fountains, and the brook that ran through the midst of the land, saying, Why should the kings of Assyria come, and find much water?" Hezekiah also "stopped the upper watercourse of Gihon, and brought it straight down to the west side of the city of David."

Earthquakes, which have often shaken these hills and shattered these rocks, must have affected the supply of water, both in Jerusalem and throughout the whole country. The existing supply, notwithstanding, *if properly utilised and distributed*, would be more than sufficient not only for the inhabitants of the city, but also for the irrigation of the neighbourhood; while if wells were dug through the limestone strata, we see no reason why, in a country whose average rainfall is much higher than that of Scotland, water should not yet flow everywhere and bless the arid soil. The overflow of Siloam now gladdens the lower portion of the Valley of Jehoshaphat, near En-Rogel, which was once "the king's gardens." This spot is green and fertile still; and when one has seen what water has done for the gardens of Urtas, he can understand how beautiful those king's gardens must once have been.

But let us to Olivet and Bethany.

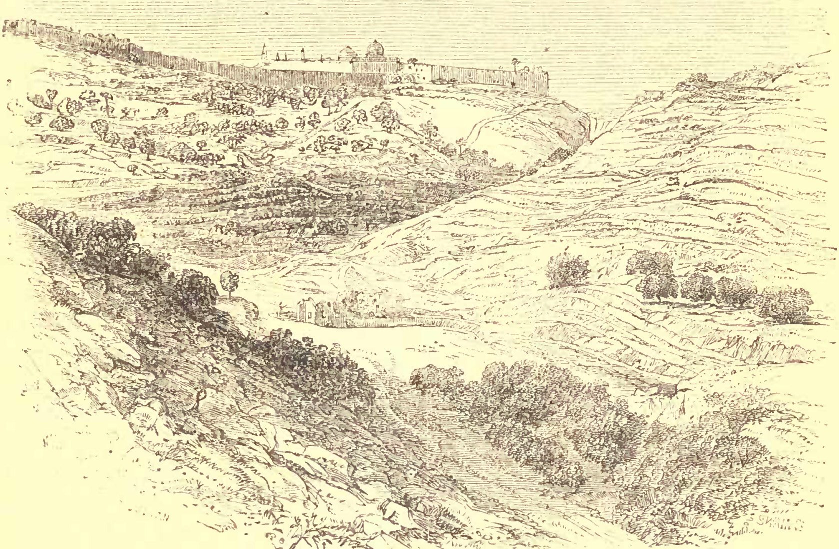
The moment one leaves the gate of St. Stephen which leads down to the Kidron, and thence to Olivet, he is struck with the unartistic roughness of the road. The last thing on earth one would expect to see would be a city gate without a road leading to it. Yet there is no road here but a path steep and rough as one on the face of a Highland hill. A cautious man feels uneasy in riding down it, unless his horse be very sure-footed. He has every reason for fearing a *glissade* over the loose small stones. It has to all appearance been left to take care of itself since history began. But it is nevertheless the old highway to Bethany and Jericho. Fortunately, the descent is only two or three hundred feet. At the bottom, when the dry bed of the brook Kidron is passed, one finds himself in the angle between the road which leads directly over Olivet to Bethany and that which leads to the same point along the side of the hill to the right. At this spot tradition has placed the Garden of Gethsemane,—an unlikely place, in my humble opinion, from its want of seclusion; for those roads must always have met here. How many quiet nooks are there not up the valley! The priests, with their usual taste and their wonderful talent for spoiling every place which they wish to make sacred after their own fashion, have enclosed the fine old olives, which it is assumed mark the spot, within a square of high whitewashed walls, like what might surround a graveyard, and have made an ugly garden with flowerbeds within it! I did not enter the place. Who, were it even the actual spot, could indulge in those feelings it would be calculated to excite, with a monk at hand exhibiting as holy places "the cave of agony," "the spot where the disciples fell asleep," "where Judas betrayed Him," &c. It would have been great enjoyment could I have sat alone, under those patriarchal trees, with the rough hill-side or a bit of greensward beneath my feet. As it was, I preferred an undisturbed and quiet look over the wall at the grand old olives. It was something to think of all they have witnessed during the centuries in which they have been silently gazing at Jerusalem and on passers by.

I ascended Olivet for the first time by the road which rises almost directly from Gethsemane to the mosque on the top of the hill, and which from thence descends to Bethany. This is the road along which David walked in sorrow when he fled from Absalom, to take from the summit of Olivet his last sad look, for a time, of the beloved and holy Jerusalem which he had himself conquered—where he had reigned as the first obedient king "according to God's own heart"—and where he had contributed to the Temple-worship those songs of praise which have been more enduring, more expressive of the sorrows and joys of the Head of the Church and of all its members, than it was given even to himself to know; and which will be sung by generations yet unborn. It is a rough ascent—a commonplace country road—in no way associated with kingly processions of any kind, any more than was David's own humble attire as a shepherd lad in the days of his youth with his splendour as a king or his immortal fame as a man.

---

* Marked 17 on the plan.

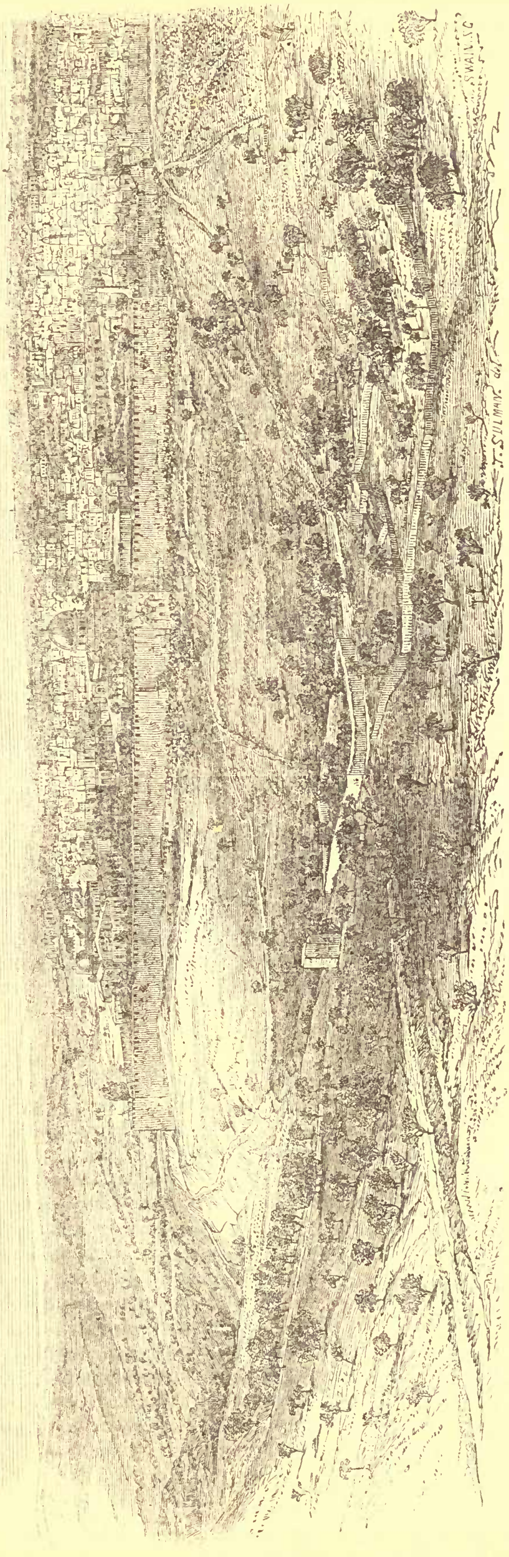
The view from the mosque on the summit of Olivet, or from a Waly a short way beyond it to the east, is famous. All travellers make a point of seeing it. If not the most extensive or commanding in Palestine, it is on the whole the most interesting, although familiarity with Jerusalem takes away from the effect which it would have on any one who could see it as his first great prospect. Towards the east, and between us and the Dead Sea, we see the Wilderness of Judea,—bare, bleak, and desolate, as would be the rocky bottom of the sea if upheaved and left to bleach beneath a burning sun. We see also a bit of the Dead Sea—more than 3000 feet below us—"lying dead in its trough." Though about 12 miles off, it looks very near. It appears hot and steamy, with a misty haze hanging over it. One cannot but associate all that is wild, lonely, and mysterious, with this dismal lake. It does not suggest one noble thought, one act of greatness or goodness, done by man or woman alive or dead, to shed over it a redeeming ray of glory. We can also trace the course of the Jordan, from its line of green vegetation. The memories of the great and good which it recalls are a relief to the mind. Its entrance into the Dead Sea seems like life losing itself in death. There rises also before the eye—bolder and grander than when seen from Neby Samwil—the great eastern wall of the ridge of Moab, the separation between modern civilization and almost unknown Arabia, with its ancient cities, far-spread pasture lands, arid wastes, powerful tribes, and primeval traditions. Standing on Olivet, one fully realises the contrast between East and West, with Palestine as their connecting bridge.



En-Rogel, from the South

J. Graham, Photo.

From this point one also takes in at a glance, informed no doubt by some previous observation, the general topography of Jerusalem. He is struck with the sort of promontory abutting from the general table-land on which it is built; with the wonderful defence against ancient modes of warfare afforded by the valleys that, like deep ditches, surround it on east and south, hindering any enemy from coming near its walls; with the strong military positions which were afforded by the principal eminences within the city—such as the Temple Area, separated from Zion by the valley of the Tyropœan, and the high ground of Acra and Bezetha—eminences distinctly visible. The hills that surround Jerusalem are also visible, not only in the circling sweep of Olivet and its spurs, but further off in the ridge of which Neby Samwil is the highest point, and which is seen as a wall between the city and the heathen tribes dwelling by the sea. One can see how it rested like an eagle's nest on a rocky eminence, or like a lion's lair, visible from every side, yet not to be approached with impunity; and how Jerusalem visibly bore the motto of dear old Scotland:—



J. Graham, Photo.

View showing the relative positions of Gethsemane and Jerusalem.

"Nemo me impune lacessit." The compactness of the city must also have been one of its marked features. There were no human habitations beyond its gates. There it lay like a chess-board, with its men, bishops, knights, and castles, within the walls, while all beyond was painfully empty and bare;—limestone everywhere, with little of green to relieve the eye. The inner eye alone is satisfied.

But if the reader will again take the trouble to look at the small plan of the city and its environs, and then at the views taken from different points, he will have a better idea of Jerusalem than any mere verbal description I could give him.*

I descended to Bethany by the same road as that pursued by David, when Hushai met him, and when Shimei cursed him.

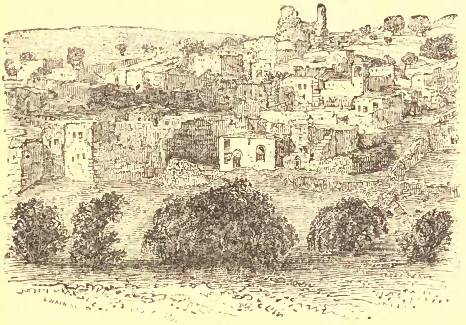
I was not disappointed with the appearance of Bethany. Had it been bare rock it would still have been holy ground. The village consists, as all others in Palestine do, of brown mud hovels with encircling mud walls—dust, confusion, children, dogs, and poverty. Everything is squalid as in Skibbereen, Connemara, or, alas! some villages in the Hebrides.

---

* Let me act as interpreter of these views. The lower of the large panoramic views gives a general idea of the city as seen from the north side of the Mount of Olives. To the left is the Mount of Olives. The round hill-top seen beyond it in the distance is Jebel Fureidis, or the Herodion, that rises immediately above Bethlehem, and where Herod, the murderer of "the Innocents," is buried. The east and north walls of Jerusalem are seen. At the south end of the east wall is the Haram Area, extending from the corner, nearly to St. Stephen's Gate, which is situated about the middle of the long white wall.

The upper panoramic view is of the whole Haram Area, the Mosque of Omar and its platform, and various small Moslem buildings. The open space, with the Mosque el Aksah, the site (as I suppose) of the old Temple, is in the distant corner.

The other views will be understood from my subsequent remarks.



J. Graham, Photo.

Bethany, from the N.E., near the Jericho road.

But yet there are patches of greenery and trees to be seen, and the singing of birds to be heard; while the broken ground, and glens, and "braes," with the glimpses into the deep descent which leads to Jericho, save it from being commonplace, and give to it a certain wild, sequestered, Highland character of its own. When it was well cultivated and well wooded, it must have been of all the places near Jerusalem the most peaceful, as well as the most picturesque.

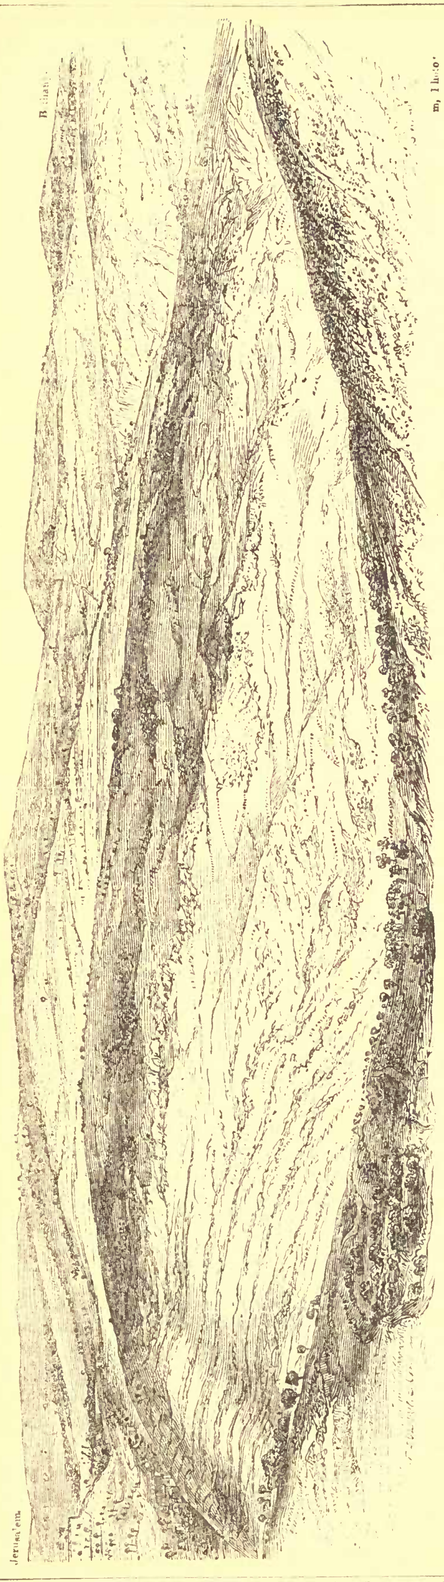
It is not possible, in such a spot, to be silent upon the miracle which will for ever be associated with Bethany. What though all that can be said may have been already said on the subject, still, like an old familiar melody, one loves to repeat it, and tries to re-produce the holy feelings of faith and adoration which it was intended to excite. What a comfort, for example, to the "common people" of all lands, is the thought that "Jesus loved Martha and Mary, and Lazarus,"—that He found rest and repose for his weary heart in the loving responses of this family, who, it may be, were quite unknown to the big and busy world of Sanhedrim and Synagogue in Jerusalem. How strengthening to know that those whom He loved were yet left in the profound mystery of a great sorrow, utterly unexplainable for a season. How strange that their brother Lazarus was permitted to sicken, die, and be buried, without even one word or comforting message from their Friend, their Lord and Saviour, who had nevertheless heard and answered the prayers of the very heathen, and had healed their sick and raised their dead, in some cases without his even being asked to do so,—yet who came not to those He most loved when they most needed Him! This silence was a dark cloud over the home of Bethany, and why then wonder that it has often since brooded over homes as beloved? How full of holy teaching, which ought to lighten us in our sorrow, is it to remember that the Lord, in spite of appearances to the contrary, was all the while solving the intricate problem, how to do most good, not only to Lazarus himself, and to Martha and Mary, but also to the disciples and the Jews!—and that He was during this time pondering the awful question in regard to Himself and the world, whether it was God's will that He should by raising Lazarus bring about his own death! And is it not inexpressibly touching and humiliating to our shortsighted unbelief, to see how Martha and Mary had their faith weakened in his love, as if He could have "overlooked their cause,"—an unbelief which was expressed in their words, "If thou hadst been here our brother had not died," and implied the rebuke, "And why wert thou not here?"

What a revelation too of a Saviour's love are his tears, and his groans within Himself, occasioned by the heart-breaking spectacle, not of death which He was about to change into life, but of faith in Himself dying out in the very bosom of his best beloved. This sorrow of his was love manifested in its deepest, truest, divinest form. For while many can weep with us or for us, because of the death of a friend—a human sorrow which all can understand, and more or less share; yet how few—none, indeed, but those who share the holy sympathies of Jesus—can weep for us because of our sin, or because our faith in God is dying or dead! Twice only did He weep—on this occasion, and when entering Jerusalem a few days after from this same Bethany, on his road to death, through a conspiracy occasioned by his having raised Lazarus to life. And these tears were also shed on account of the same terrible unbelief. Think of it, reader! To be suspected of want of love, as Jesus was, when, to raise his friend from the grave, He had resolved to die Himself, if God so willed it! Mary must have felt this, when, full of unspeakable love, she anointed Him for his burial.

Again, what a *rehearsal* was here, in this otherwise commonplace village, of the glorious time when we and our dead shall hear the same voice and come forth from our graves, to sit down to a glorious feast above, with our happy social life restored.*

---

* The English translator of Renan's "Vie de Jésus" informs us in his preface that "the great problem of the present age is to preserve the religious spirit, whilst getting rid of the superstitions and absurdities that deform it, and which are alike opposed to science and common-sense." The manner in which M. Renan endeavours to get quit of the resurrection of Lazarus, is an illustration of how he would solve this problem. As to the part played by those whom Jesus loved in this supposed miracle, he says:—"It may be that Lazarus, still pallid with disease, caused himself to be wrapped in bandages as if dead, and shut up in the tomb of his family." Jesus acquiesced in this pious fraud; but, as M. Renan observes, "in the dull and impure city of Jerusalem, Jesus was no longer Himself. Not by any fault of his own, but by that of others, his conscience had lost something of its original purity. Desperate and driven to extremity, He was no longer his own Mentor. His mission overwhelmed Him, and He yielded to its torrent." Such was the conduct of Him of whom M. Renan is



Country between Jerusalem and Bethany, showing the three summits of the Mount of Olives.

We returned from Bethany by the old road from Jericho, which first ascends from the village for about 100 yards, then descends along one side of a wady which opens out from the roots of Olivet, and, ascending the opposite side, debouches on the high ground leading across the flank of Olivet to Jerusalem. It there reaches a point opposite the south-east angle of the Temple, and from thence rapidly descends to Gethsemane. The place where Jesus beheld the city and wept over it is unquestionably that point. There Jerusalem suddenly bursts on the sight, but upon descending a short distance further down the hill, the view of it is rapidly concealed by the Haram wall.*

It is impossible to journey along this road without having one's thoughts filled with the scenes of that memorable day. But these, as well as the locality, have been so beautifully and accurately described by Dean Stanley, that I am persuaded those of my readers who have not access to his book will be obliged to me for transcribing his description instead of attempting one of my own:—

"In the morning, He set forth on his journey. Three pathways lead, and probably always led, from Bethany to Jerusalem ; one, a long circuit over the northern shoulder of Mount Olivet, down the valley which parts it from Scopus ; another a steep footpath over the summit ; the third, the natural continuation of the road by which mounted travellers always approach the city from Jericho, over the

---

pleased to say:—"All ages will proclaim that, among the sons of men, there is none born greater than Jesus." We can but hope, for the sake of France, if not of humanity, that M. Renan himself is greater far in common honesty than he represents Jesus to have been. But after reading such sentiments, the tears of Jesus for the unbelief that wounded Him supply some comfort. We remember, too, how the Apostle Paul was once, like M. Renan, "a blasphemer," yet how he obtained mercy: a pattern to all who should hereafter believe in the name of Jesus.

* I think it is quite possible to enable the reader to see clearly where this spot is, if he will again consult the plan and the illustrations. He will in the first place look at the view given of the Country between Jerusalem and Bethany. He will there notice at the right corner, near the top, the line of the road from Bethany ere it descends out of sight into the glen. He can trace it along the bare, open hill-side, until opposite the corner of the Haram wall, which is on the extreme left of the view.

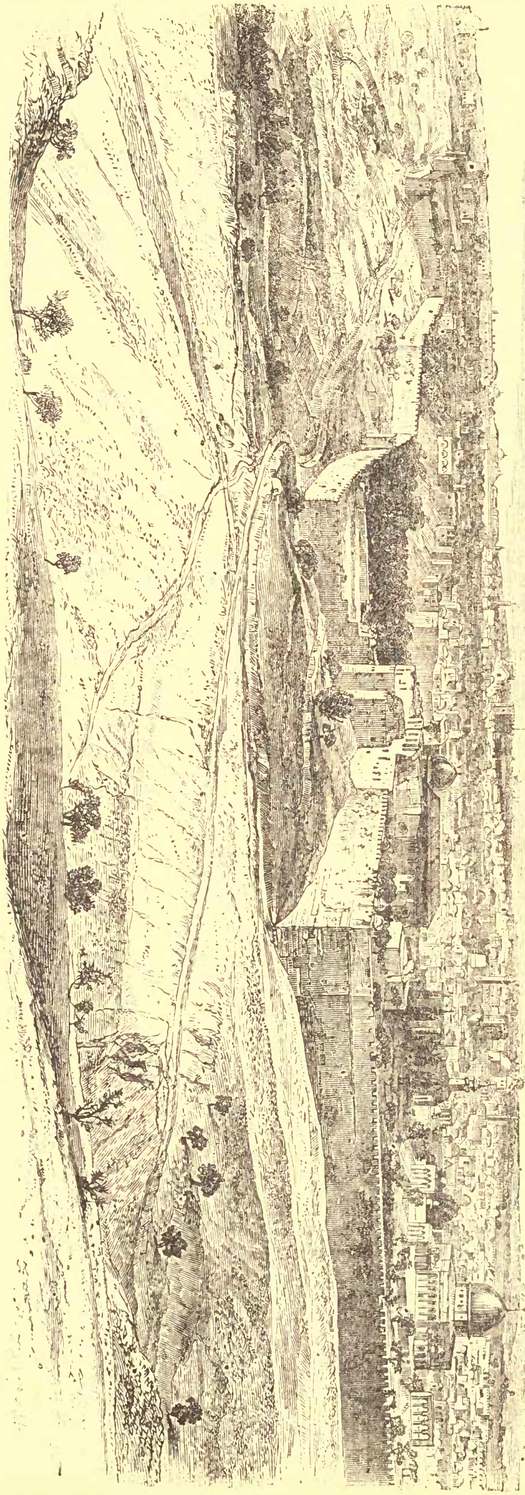
Two other illustrations are given to enable the reader to understand the relative position of this, one of the most profoundly interesting spots in the world.

In the view of the Haram Wall, the Valley of Jehoshaphat, and the Village of Siloam (p. 591), the place of weeping is on the right, in the white road, and about where two trees are seen under the mosque on the top of Olivet. In another illustration, that of the Tombs in the Valley of Jehoshaphat (p. 600), it is above the tomb on the right of the picture. And finally, a view is given of the Haram wall as it appears from *near*, if not from, the illustrious spot (p. 597).

I may add, that the hill-top, the second from the right-hand corner in the illustration of the Country between Jerusalem and Bethany, is probably the scene of that stupendous event which occurred when our Saviour led his disciples out as far as Bethany and ascended in their sight, blessing them, and blessing the earth yet wet with his blood.

southern shoulder, between the summit which contains the Tombs of the Prophets and that called the 'Mount of Offence.' There can be no doubt that this last is the road of the Entry of Christ, not only because, as just stated, it is, and must always have been, the usual approach for horsemen and for large caravans, such as then were concerned, but also because this is the only one of the three approaches which meets the requirements of the narrative which follows.

"Two vast streams of people met on that day. The one poured out from the city, and as they came through the gardens whose clusters of palm rose on the southern corner of Olivet, they cut down the long branches, as was their wont at the Feast of Tabernacles, and moved upwards towards Bethany, with loud shouts of welcome. From Bethany streamed forth the crowds who had assembled there on the previous night, and who came testifying to the great event at the sepulchre of Lazarus. The road soon loses sight of Bethany. It is now a rough, but still broad and well-defined mountain track, winding over rock and loose stones; a steep declivity below on the left; the sloping shoulder of Olivet above on the right; fig-trees below and above, here and there growing out of the rocky soil. Along the road the multitudes threw down the boughs severed from the olive-trees through which they were forcing their way, or spread out a rude matting formed of the palm-branches which they had already cut as they came out. The larger portion—those, perhaps, who had escorted Him from Bethany—unwrapped their loose



View from the spot where Christ beheld the city, and wept over it.

J. Graham, Photo.

cloaks from their shoulders, and stretched them along the rough path, to form a momentary carpet as He approached. The two streams met midway. Half of the vast mass, turning round, preceded; the other half followed. Gradually the long procession swept up and over the ridge, where first begins 'the descent of the Mount of Olives' towards Jerusalem. At this point the first view is caught of the south-eastern corner of the city. The Temple and the more northern portions are hid by the slope of Olivet on the right; what is seen is only Mount Zion, now for the most part a rough field, crowned with the Mosque of David and the angle of the western walls, but then covered with houses to its base, surmounted by the Castle of Herod, on the supposed site of the palace of David, from which that portion of Jerusalem, emphatically 'The City of David,' derived its name. It was at this precise point, 'as He drew near, at the descent of the Mount of Olives,'—may it not have been from the sight thus opening upon them?—that the hymn of triumph, the earliest hymn of Christian devotion, burst forth from the multitude, 'Hosanna to the Son of *David!* Blessed is He that cometh in the name of the Lord. Blessed is the kingdom that cometh of our father *David.* Hosanna . . . peace . . . glory in the highest.' There was a pause as the shout rang through the long defile; and, as the Pharisees who stood by in the crowd complained, He pointed to the 'stones' which, strewn beneath their feet, would immediately 'cry out' if 'these were to hold their peace.'*

"Again the procession advanced. The road descends a slight declivity, and the glimpse of the city is again withdrawn behind the intervening ridge of Olivet. A few moments, and the path mounts again; it climbs a rugged ascent, it reaches a ledge of smooth rock, and in an instant the whole city bursts into view. As now the dome of the Mosque El-Aksa rises like a ghost from the earth before the traveller stands on a ledge, so then must have risen the Temple-tower; as now the vast inclosure of the Mussulman sanctuary, so then must have spread the Temple-courts; as now the gray town on its broken hills, so then the magnificent city, with its background—long since vanished away—of gardens and suburbs on the western plateau behind. Immediately below was the Valley of the Kedron, here seen in its greatest depth as it joins the Valley of Hinnom, and thus giving full effect to the great peculiarity of Jerusalem seen only on its eastern side—its situation as of a city rising out of a deep abyss. It is hardly possible to doubt that this rise and turn of the road, this rocky ledge, was the exact point where the multitude paused again, and He, 'when He beheld the city, wept over it.'

"Nowhere else on the Mount of Olives is there a view like this. By the two other approaches above mentioned, over the summit and over the northern shoulder of the hill, the city reveals itself gradually; there is no partial glimpse, like that which has been just described as agreeing so well with the first outbreak of popular acclamation, still less is there any point where, as here, the city and Temple would suddenly burst into view, producing the sudden and affecting impression described in the Gospel narrative. And this precise coincidence is the more remarkable because the traditional route of the Triumphal Entry is over the summit of Olivet; and the traditional spot of the lamentation is at a place half-way down the mountain, to which the description is wholly inapplicable, whilst no tradition attaches to this, the only road by which a large procession could have come; and this, almost the only spot of the Mount of Olives which the Gospel narrative fixes with exact certainty, is almost the only unmarked spot,—undefiled or unhallowed by mosque or church, chapel or tower—left to speak for itself, that here the Lord stayed his onward march, and here his eyes beheld what is still the most impressive view which the neighbourhood of Jerusalem furnishes, and the tears rushed forth at the sight.

"After this scene, which, with the one exception of the conversation at the Well of Jacob, stands alone in the Gospel history for the vividness and precision of its localisation, it is hardly worth while to dwell on the spots elsewhere pointed out by tradition or probability on the rest of the mountain. They belong, for the most part, to the 'Holy Places' of later pilgrimage, not to the authentic illustrations of the Sacred History."

I spent my last Sunday in Jerusalem on the Mount of Olives. It was a day never to be forgotten; one of those heavenly days which cannot die, but become part of one's life. Alone, with no companion but my Bible, I went along the Via Dolorosa, passed out by St. Stephen's Gate, descended to Gethsemane, and from thence pursued the old road already described, which leads to Bethany and Jericho, by the western slope of Olivet overlooking the valley of Jehoshaphat. At the summit of the short ascent a few ledges of limestone rock, carpeted with greensward, crop out beside the path, and afford a natural resting-place, of which I availed myself. The old wall and the well-known corner of the Haram Area were immediately opposite me, and so visibly near in the pure, transparent atmosphere that the stones could be counted, and the green tufts of the plants among them. The day was of course cloudless and hot, but it was not oppressive, for the air was stirred by a gentle breeze with a mountain freshness in it. Though the city was so near, with most of its people pursuing their usual avocations both within and without the walls, yet no sound disturbed the intense repose except, strange to say, the crowing of cocks, as if at early morn, and the shouts of a solitary peasant who was urging his plough across the once busy but now deserted slopes of Ophel. I gazed on Jerusalem until it seemed to be a dream—a white ghostly city in the silent air. My thoughts took no fixed shape, but were burthened with a weight, almost oppressive, from ages of history; or were lost in the presence of some undefined source of awe, wonder, and sorrow. I was recalled, however, to what was very near when I opened my Bible, and read these words: "*As He went out of the Temple** one of his disciples saith unto Him, Master, see what manner of stones and what buildings are here? And Jesus answering said unto him, Seest thou these great buildings? There shall not be left one stone upon another, that shall not be thrown down. And *as He sat upon the Mount of Olives over against the Temple*, Peter and James and John and Andrew asked Him privately, Tell us, when shall these things be? and what shall be the sign when all these things shall be fulfilled?" And if Jesus on his way to Bethany "sat upon the Mount of Olives *over against the Temple*," there is certainly no place I could discover which was so likely to be the very spot as the one which I occupied. Here, in this holy place untouched by the hand of man, unnoticed, and apparently unknown, I read the prophecies, parables, and exhortations of our Lord uttered in the hearing of his holy Apostles, and recorded for all time in the 24th and 25th chapters of St. Matthew. They include, among others, the prophecies of his first coming at the destruction of Jerusalem, then in her glory, now so desolate—with his second coming at the end of the world; the parables of the ten virgins and of the ten talents, and the trial of love at the last judgment—all ending in the touching announcement, "Ye know that after two days is the feast of the passover, and the Son of Man is betrayed to be crucified!" "All these sayings" I read undisturbed while sitting over against the old wall within which the Temple once rose in its strength and glory, but not one stone of which is now left upon another.

---

* I was surprised to find on one occasion, when standing with my brother at this spot on the Mount of Olives, that other two of our party who stood at the corner of the Haram wall on the other side of the valley, could distinctly hear our words addressed to them when spoken in a loud and clear voice.

The priests in the Temple may have thus heard the very words of the loud and jubilant song of triumph which welcomed the Messias.

While pondering over the words of Christ, I was struck by seeing near me a fig tree, with its branches putting forth leaves, and in some places young figs. And struck with the unexpected illustration of the words I had just read, as here first uttered, "When the fig tree putteth forth leaves, ye know summer is nigh," I began to think that surely these were spoken at the same season of the year as that in which I read them, and was at once reminded that the day was Palm Sunday, the anniversary of the very time when our Lord had wept here over Jerusalem, and had also delivered those discourses.

When in Palestine I felt that there were times in which the past seemed so present, Christ and his words so living and real, that had any one suddenly appeared, and said, "I saw Him, and heard Him," I should not have been surprised; and this day was one of them.

From this spot I went to that other very near, where our Lord wept over Jerusalem. I will not attempt to express here what those human tears seem to me to reveal of "the mind of Christ," the Son of God and the Son of Man, regarding man's sin; what they reveal of man's loss, not only to himself but also to his Saviour; and of the unutterable love that *would* save, as well as of the mysterious wilfulness that would not be saved. For though it is difficult for a minister of the Gospel to refrain from uttering his thoughts on such profoundly interesting topics, yet it is necessary to impose some restraint on their expression, as almost every spot in Palestine is a text for such meditations.

There is one feature of the view from this spot which I was not prepared for, and which greatly impressed me. It is the Jewish burying-ground. For centuries, I know not how many, Jews of every country have come to die in Jerusalem that they might be buried in the valley of Jehoshaphat. Their wish to lie here is connected with certain superstitious views regarding the Last Judgment (which they believe is to take place on this spot), and certain privileges which are to be then bestowed on all who are here interred. And thus thousands, possibly millions, of the most bigoted and superstitious Israelites, from every part of the world, have in the evening of life flocked to this the old "city of their solemnities," that after death they might be gathered to their fathers beneath the shadow of its walls.

I never saw a graveyard to me so impressive. Scutari is far more extensive, and more terribly deathlike. But from its huddled monuments and crowded trees, it is impossible to penetrate its dark and complicated recesses. Here, there are no monuments, and no trees. Each grave is covered by a flat stone with Hebrew inscriptions, and has nothing between it and the open sky. These stones pave the whole eastern slope of the valley. Every inch of ground where a human body can lie is covered. Along the banks of the Kedron, up the side of Olivet, and across the road leading from Bethany to Jerusalem, stretches this vast city of the dead. As a place of burial it differs from almost every other on earth, in being, as no other is, a witness to a faith that is firm, decided, and uncompromising until death. It is not therefore merely the vast multitude who sleep here, but the faith which they held in regard to their Messias, that makes this spectacle so impressive, especially when seen from the spot where He had wept over Jerusalem. Remembering all the wanderings of the lost sheep of Israel, all they had suffered, since the Lord had mourned for them standing here, and their long and dreary night of unbelief in his mission and in his love, his words had, if possible, a deeper and more awful meaning. I seemed to see Him standing again and weeping here, and addressing those who crowded up to the very place where He had stood and wept while on earth, and again saying to them, "O Jerusalem, Jerusalem! how often would I have gathered thy children together, even as a hen gathereth her chickens under her wings, and ye would not." "O that thou, even thou, hadst known the things of thy peace, but now they are hid from thine eyes!"

---

* Was this by the Double Gate in the south wall I have already described, with the great stones all around, and which was, as far as I can judge, the one by which He would pass from the Temple towards Olivet?

And when the question as to the future hope of Israel was here suggested, how vividly did the scene before me realise the vision of the Prophet and at the same time furnish the only answer I could give to the question:—"The hand of the Lord was upon me, and carried me out in the spirit of the Lord, and set me down in the midst of the valley which was full of bones, and caused me to pass by them round about: and, behold, there were very many in the open valley; and, lo, they were very dry. And he said unto me, Son of man, can these bones live? And I answered, O Lord God, thou knowest. Again he said unto me, Prophesy upon these bones, and say unto them, O ye dry bones, hear the word of the Lord. Thus saith the Lord God unto these bones; Behold, I will cause breath to enter into you, and ye shall live: and I will lay sinews upon you, and will bring up flesh upon you, and cover you with skin, and put breath in you, and ye shall live; and ye shall know that I am the Lord. So I prophesied as I was commanded: and as I prophesied, there was a noise, and behold a shaking, and the bones came together, bone to his bone. And when I beheld, lo, the sinews and the flesh came up upon them, and the skin covered them above; but there was no breath in them. Then said he unto me, Prophesy unto the wind, prophesy, son of man, and say to the wind, Thus saith the Lord God; Come from the four winds, O breath, and breathe upon these slain, that they may live. So I prophesied as he commanded me, and the breath came into them, and they lived, and stood up upon their feet, an exceeding great army. Then he said unto me, Son of man, these bones are the whole house of Israel: behold, they say, Our bones are dried, and our hope is lost: we are cut off for our parts. Therefore prophesy and say unto them, Thus saith the Lord God; Behold, O my people, I will open your graves, and cause you to come up out of your graves, and bring you into the land of Israel. And ye shall know that I am the Lord, when I have opened your graves, O my people, and brought you up out of your graves, and shall put my spirit in you, and ye shall live, and I shall place you in your own land: then shall ye know that I the Lord have spoken it, and performed it, saith the Lord."

Tombs in the Valley of Jehoshaphat, with Jews' Burial Ground.

Before I returned to Jerusalem I wandered among the solitudes of Olivet—hardly knowing where. I sat and read my Bible under one tree, and then under another; descended some glen, or unknown and solitary nook, feeling only that this was Olivet, and that the whole hill was consecrated by the Saviour. But one experience which possessed me I remember with gratitude; and it was, of the presence of Christ everywhere, and of the true worship of God not being on this mountain or that, but wherever any child is found to worship Him in spirit and in truth. I was not tempted even to fancy, on that holy day, that Christ was nearer to me, or prayer more real in Jerusalem or on Olivet, than when I entered "into my closet and shut the door" amidst the everyday world of Glasgow. And so, while I thanked God with my whole heart for having permitted me to visit these spots, which shed such a light on the history of the Holy One who in flesh had lived and moved among them, I felt, if possible, still more thankful for the conviction, now deepened, that the poorest in my parish at home—the busy artisan, the man or woman in the dark lane, the crowded alley, or the lonely garret—could through simple faith and childlike love enjoy the presence, the grace, and the peace of Christ, as truly as if they were able to make a pilgrimage to the Holy Land, and to worship, on the Lord's Day, among the recesses of Olivet, or on the spots consecrated of old by the bodily presence of the Saviour. Most thankful was I for knowing that the Person, not the place, was holy—that his love was not local but universal; and that not only among the silent hills of Palestine, in Jerusalem, Nazareth, or Tiberias, but in our crowded cities, common-place villages, Highland glens, and in every nook and corner of the great palace of our Father, Jesus may be known, loved, obeyed, and glorified. With thanksgiving, I repeated on Olivet:—

> "There are in this loud stunning tide
> Of human care and crime,
> With whom the melodies abide
> Of th' everlasting chime,—
> Who carry music in their heart
> Through dusky lane and wrangling mart.
> Plying their daily task with busier feet
> Because their secret souls a holy strain repeat."

LANGLEY LANE.

A LOVE-POEM.

In all the land, range up, range down,
Is there ever a place so pleasant and sweet,
As Langley Lane in London town,
Just out of the bustle of square and street?
Little white cottages all in a row,
Gardens where bachelors'-buttons grow,
Swallows' nests in roof and wall,
And up above the still blue sky
Where the woolly white clouds go sailing by,—
I seem to be able to see it all!

For now, in summer, I take my chair,
And sit outside in the sun, and hear
The distant murmur of street and square,
And the swallows and sparrows chirping near;
And Fanny, who lives just over the way,
Comes running many a time each day
With her little hand's touch so warm and kind,
And I smile and talk, with the sun on my cheek,
And the little live hand seems to stir and speak,—
For Fanny is dumb and I am blind.

Fanny is sweet thirteen, and she
Has fine black ringlets and dark eyes clear,
And I am older by summers three,—
Why should we hold one another so dear?
Because she cannot utter a word,
Nor hear the music of bee or bird,
The water-cart's splash or the milkman's call?
Because I have never seen the sky,
Nor the little singers that hum and fly,—
Yet know she is gazing upon them all?

For the sun is shining, the swallows fly,
The bees and the blue-flies murmur low,
And I hear the water-cart go by,
With its cool splash-splash down the dusty row;
And the little one close at my side perceives
Mine eyes upraised to the cottage eaves,
Where birds are chirping in summer shine,
And I hear though I cannot look, and she,
Though she cannot hear, can the singers see,—
And the little soft fingers flutter in mine!

Hath not the dear little hand a tongue,
When it stirs on my palm for the love of me?
Do I not know she is pretty and young?
Hath not my Soul an eye to see?—
'Tis pleasure to make one's bosom stir,
To wonder how things appear to her,
That I only hear as they pass around;
And as long as we sit in the music and light,
She is happy to keep God's sight,
And *I* am happy to keep God's sound.

Why, I know her face, though I am blind—
I made it of music long ago:
Strange large eyes and dark hair twined
Round the pensive light of a brow of snow;
And when I sit by my little one,
And hold her hand and talk in the sun,
And hear the music that haunts the place,
I know she is raising her eyes to me,
And guessing how gentle my voice must be,
And *seeing* the music upon my face.

Though, if ever the Lord should grant me a prayer,
(I know the fancy is only vain)
I should pray: just once, when the weather is fair,
To see little Fanny and Langley Lane;
Though Fanny, perhaps, would pray to hear
The voice of the friend that she holds so dear,
The song of the birds, the hum of the street,—
It is better to be as we have been,—
Each keeping up something, unheard, unseen,
To make God's heaven more strange and sweet!

Ah! life is pleasant in Langley Lane!
There is always something sweet to hear!
Chirping of birds or patter of rain!
And Fanny my little one always near!
And though I am weakly and can't live long,
And Fanny my darling is far from strong,
And though we can never married be,—
What then?—since we hold one another so dear,
For the sake of the pleasure one cannot hear,
And the pleasure that only one can see?

ROBERT BUCHANAN.

ALFRED HAGART'S HOUSEHOLD.

By ALEXANDER SMITH, Author of "A Life Drama," &c.

CHAPTER XVII.

It must be confessed that Jack felt very downhearted when, looking from the window of the passage-boat, the bend of the canal shut out his father's waving hat from his view. He was beset with a mighty feeling of loneliness; he felt cut away from all his former moorings,—and thinking of his father's lonely walk homewards, of the bare leafless cemetery at Greysley, of the dull day that his mother and Martha would endure on account of his absence, he secretly wiped away certain tears with his bran new cambric handkerchief. The apple had been big in his throat as he walked with his father along the canal bank, but now it was bigger and more intolerable than ever. But although grief is sharpest in youth, youth has a marvellous power of recovering from it. Gradually the boy was weaned from his sorrow by the strange hedges, eminences, bridges, and, where the banks were high, by the far outlooks into the level country. The sorrow died away, and he began to taste the pleasure which was hidden in the feeling of strangeness. Then the talk of the passengers got into his ears, and began to interest him more than even the landscape flitting past. When the passage-boat had proceeded about a mile beyond the station-house, the apple had died as entirely out of his throat as if it had never been there, and he was able to turn from the window and take note of what was going on around him.

The passage-boat was long and narrow, its roof was arched, and covered with white canvas, and on either side a seat ran from end to end for the accommodation of passengers. On the present occasion the boat was more than two-thirds filled, and as its progress through the canal was perfectly silent, Jack could hear all that was going on. Near him sat a couple of Greysleyan weavers—he knew they belonged to that honourable profession by the bundles of yarn wrapped up in red cotton handkerchiefs which they nursed on their knees before them—and these worthies, after discussing the merits of that distinguished friend of the people and hater of potatoes, the late Mr. Cobbett, and agreeing that the British Sovereign and the British House of Peers were anachronisms in a free country, and should be abolished forthwith, and Tom Paine's Rights of Man substituted in their stead, became inextricably involved in political discussion. This was always the case when Greysleyan weavers met at the period of my story. They were staunch Radicals before Messrs. Cobden and Bright and the Corn Law League had been heard of. Each weaver was a Reformer, a political economist, a far-seeing politician—perfectly capable of showing the Premier the way to save the nation any day of the week, if the Premier would only take the trouble to consult him—which, unhappily for the present generation, the Premier never did. Right opposite, a middle-aged man, who wore a Waterloo medal on his breast, was talking earnestly to his neighbour. The discourse was of battle, and Jack pricked his ears at once. Thanks to his father, he was familiar with all the battles and sieges of the great war which closed on the memorable eighteenth of June—the forlorn hope at Badajos, Soult's masterly manœuvre at Albuera which necessitated a change of front on the part of Marshal Beresford, the retreat to Torres Vedras and Massena's close pursuit, the fatal extension of Marmont's line at Salamanca—as Sir Archibald Alison himself. "An' hoo did ye feel at Quarter Braw," asked the soldier's companion, "when ye saw the Keerassers comin' doon on ye? The noise of their galloping horses, an' the shinin' o' their swords and breastplates maun hae been awfu'!" "To tell the truth," said the soldier, "I felt very shaky. I began to think o' my mother and sister at hame—I could see them plain enough, the one peelin' potatoes, the other sweeping the floor, and the scarlet rinners besides shinin' in at the window, an' my gun began to shake in my hauns like that"—here he lifted his stick and made a tremulous motion with it—"but the feelin' went off the moment the firing began. The first volley steadies yer nerves, just as a dram steadies them the mornin' after ye hae been fou." "Ay, man!" said the other, in an admiring tone; he was evidently acquainted with the beneficent effect of a dram in the circumstances alluded to. A passenger near spoke of New York, in which city he stated he had lived for several years—and he made the statement, too, in the quietest way, as if it was the most ordinary thing in the world for a man to leave Britain, live in New York for a couple of years, and come back again! I think the far-travelled man interested Jack more than the political weavers beside him, or the soldier sitting opposite. He regarded him with a certain feeling of awe, and felt disappointed almost that there was nothing in his look which distinguished him from ordinary mortals. All this talk, the appearance of the different passengers, kept Jack's attention alive, and the time slipped past rapidly; and before he knew where he was, the long white passage-boat glode into a wide basin, and gradually came to a stop alongside the stone pier. He got to his feet, while the thought, "This is Hawkhead at last," came upon him with a sort of shock. Then remembering his father's parting injunction, he looked out of the window, and to his comfort beheld Ann waiting. So far everything had gone well with him, and the next thing to be done was to secure his luggage.

Amongst the last of the passengers, he stepped out on the stone pier with his parcels, where he was by Ann very heartily greeted. A porter was then secured, the parcels given into his charge, and then the two, the porter walking behind, passed out from the canal basin and turned into a street, in which Jack noticed a large church in process of erection, a mighty maze of scaffolding around the spire, almost dizzying to look up to. Although this was by no means one of the busy thoroughfares of Hawkhead, the noise and bustle were sufficient to impress the boy. As they passed along, the noise increased; Jack had never seen so many people and so many vehicles in his life. The sudden din, the general haste and eagerness, stunned and bewildered him. Crossing the broad bridge which spanned the river—the causeway a roaring mob of carts and carriages, passengers jostling each other on the pavements—he saw far-extended quays and forests of masts beneath, and asked a question of his conductress, but his voice was lost in the turmoil. Hawkhead Jack had dreamt of often, but his dreams had been of glitter and external splendour—not of the crush and tumult of human beings. Life in Greysley was like the plash of a summer lake—life in Hawkhead had all the energy and thunder of a roller from the Atlantic. After a while they escaped from the multitude of shops, the din of wheels and horses, the pressure of intent crowds, and gained the region of residences, of streets quiet, formal, and sedate. Here Jack found his voice again, and made good use of it in catechising Ann on every topic which the turbulence of Hawkhead had started in his mind. "Now then," said Ann, "we turn up the next street to the right, and then we are at home." Jack was impatient to reach the corner, and when he did reach it, there was the place at last in which his future life was to be led! The street was an eligible street enough—a highly-respectable street—a street decidedly well-to-do in the world; a street which dined and dressed well, and went decorously to church on Sundays. But it was not in the least a beautiful street—on the contrary, it was a street staid and grave, heavy and frowning, stony and cold. Everything was as square and formal as line and plummet could make it. Nowhere could you trace any freak, or vagary, or touch of individual character. There was a dead set and resolved respectability about the street; the houses on the one side glared sternly on the houses opposite, and a mutual petrifaction was the result. If a new pattern of window had crept into the street, it would have been put out of countenance by all the other windows. If a street door of another hue than a dingy olive had appeared in it, all the other dingy olive street doors would have been down on it at once. My young gentleman was a good deal disheartened and appalled when he glanced along; and he thought regretfully for a moment of his father's house at Greysley, its suburban ease and air, and careless disregard of appearances, its country outlook of hills, and trees, and hedges. At Greysley one could do as one pleased. From Miss Kate's street there breathed a stern sense of duty, a resolved constraint, a determination to be dignified or to die in the attempt.

Jack had, as yet, no great experience of Mortimer Street—such being the name of the street in which Miss Catherine McQuarrie lived, as the world was duly informed in the "Hawkhead Post-Office Directory"—seeing that he had merely turned into it, and had trodden its pavements for twenty yards or so,—but such was the impression it made upon him, if at the moment he could have put that impression into words. Meanwhile Ann had stopped, and rung the bell of one of the houses, and of course Jack and the porter stopped too, the latter unslinging the luggage from his back, and laying it down on the pavement.

Now that the boy had fairly arrived, he began to feel nervous, and his heart to thump in his breast in an alarming manner. He was curiously counting these thumps when the door opened, and entering, there was Miss Kate standing in the lobby, the light from the cupola in the roof falling upon her figure. He noticed only at the moment that she was dressed in the same manner as when he had seen her last in his father's house. Miss Kate came forward at once, and kissed him on the forehead—Jack was so fluttered that he did not know whether the salute was cold or warm, cordial or freezing,—and made the ordinary inquiries concerning the Greysleyan household. She then whipped out her purse, advancing to the open door, where the porter was standing with his hat off, learned his fare, paid, and dismissed him. "Now," she said, addressing the maid-servant who had opened the door, "you and Ann will take Mr. Hagart's luggage up to his bedroom. You had better go along with them, John, and wash your hands and face—it will refresh you after your journey. You can then come down to me. Dinner will be served an hour earlier to-day, and I dare say you are hungry."

Jack was conducted by the maids to his bedroom at the top of the house, and left there. It was a small and tidy apartment; the floor was covered with a carpet which had once adorned a room of larger dimensions, and which in its old age had been cut down to suit; there was a small white bed near the door; and the room contained besides, a chest of drawers made of polished birch wood, a washhand-stand, and some three or four chairs. Jack took in the entire furniture at a glance. He performed his ablutions, put his hair carefully to rights, and wondered if any one would come to the door and call him. To kill the time, he looked out of the window, and saw in the fading light of the winter afternoon, a far-stretching wilderness of streets, dim and dingy, as if washed in with China ink. He then opened the door softly, and listened; but hearing no one on the stairs, he closed it again. The little bedroom in which he had remained ten minutes or so had acquired something of a homely and a friendly look, and he still hesitated there, unwilling to adventure into the unknown regions of Miss Kate McQuarrie's dwelling.

He had stood, perhaps, for five minutes with his hand on the open bed-room door, when he suddenly heard a footstep on the carpeted stair. Plucking up heart-of-grace, he descended, and encountered Ann on his way. "Miss McQuarrie will see you in her own room. I was coming for you." And so they went down together. Ann tapped at the door: a voice said, "Come in," and Jack entered.

Miss McQuarrie was sitting up near the window where the wintry light was strongest. "I hope you found your room comfortable, and everything nice?"

Jack, in a somewhat inaudible and incoherent manner, expressed his approval of the arrangements made for him, and hesitated about the middle of the room. If the truth were told, his instinct was to have dropped into a chair near the door.

"Come up here," said the old lady.

Jack advanced to the window; and when he got there, Miss Kate rose, placed her hands on his shoulders, and began to peruse his face as she had perused Katy's on the canal bank. Jack caught the eye bent upon him, and began to tremble almost under the inquisition.

"The eye is the eye of his grandfather, but the mouth is the mouth of Hagart," said Miss Kate, unconsciously speaking to herself, and paraphrasing the words of Isaac. "How the dead look out on us through the windows of a living face. Don't be afraid, John," she went on, as she still gazed on him, "you can't understand me yet, nor is it to be expected that you should. You and your mother are the only things which have been saved to me from the shipwreck of the past. Don't you think me a terrible old woman, John? Aren't you a little afraid of me? Do you think you will ever be able to like me?" and here the light of a smile came into Miss Kate's eyes.

The smile relieved Jack immensely, but withal he was unable to articulate a syllable.

"You are thinking, I dare say, that you never will," said Miss Kate with her withered and heavily-ringed hand still on the boy's shoulder; "but I don't expect that you will like me yet. Liking would be worth little, if it could be got so cheaply. Time will do much for both of us. Now, John, sit down."

John sat down, as he was bid.

"And so," she went on in her everyday tone and manner, "as we have entered into partnership, I'll tell you what I am about to do, and to which I have your mother's consent. On Monday you are to join the High School here, and if you are moderately diligent, you will be able to enter the Hawkhead University in three years from this. Should you like to enter the University?"

"I should like it very much," said Jack.

"Well, you shall enter it then. You are to live with me, and I'll make you as happy as I can. You can spend your holidays at home, you know, and you will see your mother here at times. If you should ever come to like me, you must not like her less, or value her less; and I am sure you never will. I don't think you should keep any secrets from me. Should you ever want anything, let me know at once. Should you ever fall into a scrape, let me know all about it frankly; I can forgive anything but selfishness, cowardice, and evasions of the truth. Keep your own place always. Should a schoolfellow ever insult you, knock him down if you can; and if you can't, hit your hardest;—that was the way the men of my time acted, and one of them at least was nobler than any man of this. I am not afraid of torn clothes and a bloody face, John—a needle and thread, a sponge, and a basin of cold water put these things to rights; but a lie, or a cowardly action, you cannot so wash away; it remains, and eats into the nature as a canker eats into a fruit. I don't wish you to be quarrelsome—I wish you always to stand up for yourself."

Jack remembered that on the occasion of his combat with Thomson at the school in Greysley, his mother had read him a similar homily. He was cudgelling his brains for some proper words of reply, when Ann, opening the door, announced that dinner was on the table.

"And I am sure our traveller is very hungry," said Miss Kate. "Give me your arm, John. Gentlemen should always be attentive to ladies, you know." And so Jack, with Miss Kate on his arm, marched out of the twilight sitting-room and entered the dining-room, which was in a full blaze of light.

The dining-room into which Jack walked with Miss Kate on his arm was the largest, as well as the best furnished, which he had ever seen, and he could not help contrasting it with the little sitting-room at home,—with the shells, and the rejected patterns made into gaudy cylinders, and the dusty peacock's feathers on the mantel-piece, and his father's three water-colour sketches on the walls. Everything at Mortimer Street seemed comfortable in the highest degree: the easy-tempered door did not creak on its hinges, between him and the door there was a screen to prevent draughts, and the foot of the trim maid as she brought in or removed dishes was noiseless on the soft carpet. He observed also that there were portraits on the walls—military men for the most part, with high-collared scarlet coats, which made them look as if nature had forgotten to provide them with necks, and with the most wonderful ruffles on their shirt-fronts, which made their breasts stick out as if they had been the breasts of pouter pigeons. In the intervals of dinner Jack marvelled much who these remarkable personages might be.

One of the portraits began to attract his attention mightily. It was a military gentleman standing with his arm stretched out in an attitude of command, and in the middle distance were elephants, and on the horizon palms and pagodas. This soldier had a stern, rocky countenance, and a quick eye, which seemed to concern itself in the strangest way with Jack's proceedings. He caught the eye bent upon him while he was engaged with the soup, and for a moment the spoon stopped half way. The portrait took note of the mutton he devoured; and when he looked up towards Miss Kate—a half-glassful of sherry in his hand, which the maid had poured out—with a dim idea that some little act of politeness was expected of him, a bow at least perhaps, the eye of the portrait fairly arrested his and fixed it there.

"Why do you look at that picture so?" said Miss Kate.

"I don't know: I suppose because the picture is looking at me."

"That was your granduncle John, General McQuarrie, long the governor of Ceylon. He was my father's elder brother, and to him the General left the whole of his fortune. When my father died, the money was divided between my brother Hector and myself. Your mother got none of it, but she got—Hagart. The old General's money has been well kept by me—almost as well as if he had kept it himself. It has paid for the dinner you are eating, and the wine you are holding in your hand."

"And he looks as if he knew it did," thought Jack, as he put the wine to his lips in defiance of the watchful portrait.

"Did your mother ever tell you about your Uncle Hector?"

"I have heard her mention his name, but not often. He is a farmer in the Hebrides, somewhere, is he not?"

"Yes, and a prosperous farmer too. A sort of Abraham, rich in flocks and herds. I don't see him often. His wife has been dead for some years. He has two daughters—Maggy, the younger, as sleek and gentle and pleased at being fondled as a pet rabbit. Oona, the elder girl, has quick eyes and black curling hair. You can comb out her locks to her waist, and released they spring back to her neck again like coils of steel—a high-spirited girl, but the world will break and tame her."

And so about all the portraits Miss Kate chatted to her new friend; and when dinner was over she took her customary nap in her easy chair beside the fire, while Jack sat opposite with a book, glancing now at his aunt's sleeping face, now at the portraits; but for the most part staring in the fire, and thinking of the strange day he had spent, and wondering what they were all doing at home in Greysley.

Miss Kate awoke when tea was being placed on the table; and after tea was over she produced a curious old marqueterie-box, around which lingered a foreign odour. This box she opened with a small silver key, and producing several miniatures, laid them on the table. "Look at these, John. This is the General—at whom you stared so much during dinner—when he was a young man. It was painted in London, when he went there to join his regiment."

"What strange dresses people wore in those days."

"That is just what people will say seventy years after this, when they look on the pictures of the men and women that are being painted now. Isn't he blooming and handsome! You see the difference between this and the portrait on the wall. That's what time and care, and battle and climate do."

Jack said there was a great difference indeed.

Miss Kate laid down the General's miniature and took up another. She looked at it for a little, and then laying her hand on the boy's head, bade him turn round full to the light. He did so, and Miss Kate looked at him and at the miniature she held in her hand alternately. "This is a picture of your grandfather," she said, at length, "and I think I can trace in you something of the family features. You have something of his trick of eye, and his build of forehead, and sometimes when the light falls on your half-face you put me in mind of him. The other portions of your face are not so like. Your father has given you his mouth, and your mother her smile. It's the McQuarrie part of you that I like best."

"But," said Jack, "although I am like the McQuarries I am still a Hagart," and there was just the slightest tinge of colour on his face when he said so.

Jack felt Miss Kate's eye go into him like a pin, but the next moment she laughed. "Wife and son are alike, I think. They think I wish to meddle with the man. This is your grandfather's portrait. See if you can pick anything of yourself out of it."

When Jack was busily examining the picture, Miss Kate had lifted a third out of the box. "What do you think of this?" and she laid it down on the table before him.

It was the portrait of a girl in a strange fashion of dress, with an incomprehensible waist, and with gloves drawn up almost to her elbows. The face was beautiful—soft and round, with dimples and smiling eyes. A large comb was stuck in the back hair, and brown locks were clustering about the temples. This minature was more attractive than all the others, and Jack gazed upon it with a feeling of pleasure.

"That's me," said Miss Kate.

"This!" and Jack looked up quickly.

"Yes! You can't believe I ever looked like that, can you? And here I am again."

The miniature this time represented a woman in a hat and a scarlet riding jacket. The face was comely enough, but all the smiling vivacity and girlish grace had gone out of it. Jack looked at both for a little while, and then, holding up the last, said in a hesitating tone of voice, "I think this one resembles you most."

"I dare say you do. The first is the portrait of Miss Catherine McQuarrie dressed for her first ball. The second is Captain Kate, with more serious matters than balls to think about."

"But why Captain Kate?"

"That was the name people gave me in the Highlands—behind my back though—they took good care of that. You see I am painted in a scarlet jacket. When they were raising the Fencible Regiments to fight the French, I donned the King's colours, and rode about the country getting recruits. No sergeant at a fair, with plenty of money to spend on drink, and with a knot of ribbons streaming from his hat, brought in such lots of men to head-quarters as I did. Captain Kate! Not a bad name for me many people think, I dare say."

Miss Kate then gathered up the miniatures and locked them in the marqueterie box with the foreign odour. She then went into an ebony cabinet which stood in one corner of the room, and from a drawer therein took out a small old-fashioned French watch, with a black ribbon attached. "This is for you, John," she said, as she placed the ribbon round his neck. "It is stopped at present, but we will have it put to rights next week. It belonged to your grandfather, and I hope it will beat against a heart as true."

"But how can I thank you?" said the boy, his face in a flood of pleasurable colour.

"Don't thank me at all. I don't like being thanked. You cannot take it more willingly than I give it. And now I had better ring for the bedroom candles. You must be tired. I suppose your mother taught you to say your prayers?"

"Yes," said John.

"Very well, then. Good-night!"

"Good-night!"

When Jack got up to his own room he stood admiring his watch for a long while, and thought he had never seen anything so pretty. He then put it under his pillow and began slowly to undress When he had got half through that operation, he sat down on a chair. He had left Greysley that morning, and he thought it wonderful at what a distance it seemed now. He had met Aunt Kate, and found the meeting not nearly so formidable a matter as he had expected. He then went to bed and fell asleep thinking of his mother; and towards morning—Miss Kate's genealogical talk still working in his brain—he dreamed that there was a great pyramid of McQuarries—Governors of Ceylon, sheep-farmers, and what not—and that he was the stone newly laid on the very top of the McQuarrie pyramid which made the pyramid complete.

CHAPTER XVIII.

In the delicious, because stolen, conversations which took place between Miss McQuarrie's maids and the maids of the immediate houses right and left, when the door brasses were being scoured of a morning, or when they crossed each other going messages during the day, or, when tidied up, they gossiped in each other's kitchens for an hour in the evenings when work was over—on such occasions Miss McQuarrie's maids were wont to aver that the arrival of John Hagart was the greatest blessing that had ever befallen them. They stated that he gave them no additional trouble worth speaking about, and that since his coming the temper of their mistress had improved amazingly. She would flame out, of course, if the boy's breakfast was not placed on the table at the very stroke of the clock; if the boy's boots were not polished to the requisite degree of brilliancy, she would hold a household court-martial, and administer sharp rebuke right and left; but, as far as regarded herself, she was unusually meek and forbearing. The maids, of course, were quick enough to see how the land lay. They served Jack assiduously, taking proper care the while that that zeal and assiduity should be brought under the observation of their mistress. They were in no wise inclined to hide their lights of attention under a bushel, when the exhibition of the said lights was likely to be beneficial. Jack had ameliorated the condition of Miss McQuarrie's maids, and to that young gentleman Miss McQuarrie's maids were very properly grateful.

Meanwhile, Jack had become familiar with his new life. On the Monday after his arrival he had been entered at the Hawkhead High School, and being ambitious, and not deficient in natural parts, he contrived to obtain and keep a rather distinguished place in the classes there. He always dined with his aunt, who had changed the hour of dinner to suit the boy's return from school; and after his lessons were prepared, it was his custom to go into her sitting-room, where she was always ready to chat with him. During the winter his mother had come into Hawkhead once or twice; had expressed delight at Jack's improved appearance; had dined and drank tea with him and her sister; had stolen up to his room after Miss Kate had gone to bed, to sit there till all hours of the morning talking of household matters in Greysley and his brilliant prospects. These visits were extremely pleasant to Jack; and, although in the main happy enough, he looked forward to them as the pilgrim trudging across the desert-sand looks forward to the next oasis on his route. During three months he had not seen his father, nor had he had any direct communication from him relative to meetings by the canal-bank or elsewhere, and at this Jack was not astonished. He heard of his father's welfare every time his mother called, and he knew that inclination was not at fault—that a pressure of work at Wedderburn Brothers and the bitter weather deterred him.

April came at length, with fair mackerel morning skies over Hawkhead, with lengthened light and prettier sunsets; and on a certain Thursday morning in that month, while Jack was dressing, Ann tapped at the door and presented him with a letter. At the moment, he had a dim idea that the handwriting was familiar; but it was a dim idea merely. Meanwhile he stared on the address.

"To
John Hagart, Esq.,
Care of Miss Catherine McQuarrie,
47, Mortimer Street,
Hawkhead."

There it stood clearly enough. The receipt of the first letter is an event in a boy's life. First of all he draws a feeling of importance from the fact that some one has been at the trouble of writing to him; secondly, there is the odd feeling with which he sees his own name written for the first time by a strange hand. He sees the name which he has always regarded as an integral portion of himself, removed to a distance from himself, and staring on him from a strange cover. It is like meeting one's own ghost. Hitherto the boy has been a shadowless being, but with the receipt of the first letter, the shadow which will never thereafter leave him, comes to him and clings. "John Hagart, Esq." There it stood plainly enough on the envelope, and very wonderful it seemed to Jack as he stood gazing on it in his own room, with his jacket lying on a chair at hand. "'John Hagart, Esq.'; that's *me*," Jack murmured to himself as he turned it over and broke open the seal. The letter, as he half expected, was from his father, and ran as follows:—

"Wedderburn Brothers, *Wednesday.*

"MY DEAR JOHN,—We promised to meet you, remember, at the station-house every third Saturday if the weather was fine. Hitherto the weather and other matters have prevented us from keeping our tryste. I have heard of you and all your doings from your mother. On Saturday I shall be at the station-house in time for the passage-boat. Come out with it. I have a great scheme to speak to you about, which I trust you will approve. You will be able to get back by the return boat. Be sure and come.

"A blackbird has built in the holly in the garden, and the first egg was laid this morning.

"Your affectionate father,
"ALFRED HAGART.

"To John Hagart, Esq.

"P.S. Don't let any one know of the scheme meanwhile."

Jack read over the letter at least a dozen times, and with every reading it puzzled him more and more. What could his father's wonderful scheme be? Why should he be enjoined to silence relative to this scheme, seeing that he was utterly ignorant of its nature? Why, of all persons in the world, should his father speak to *him* about it? Why not speak to his mother, for instance? He was in grievous bewilderment, and in that bewilderment he thrust the letter in his pocket, put on his jacket and went down to breakfast.

When he got down, Miss Kate, who was at the breakfast table, looked up quickly.

"You have had a letter, John?" she said.

"Yes, aunt; a letter from home."

"I trust it brings no bad news?"

"N—no," said Jack, with a trifle of hesitation in his voice. "When I left home my father wished me sometimes on a Saturday to go out with the passage-boat as far as the station-house—where Katy and I met you, you know—so that we might have a talk. I was to have written, mentioning on what Saturday I would go; but I have not yet done so. The letter this morning wishes me to go out on Saturday—to go by the boat from Hawkhead, and to return with the boat from Greysley."

"But if your father wishes to see you, why can't he come here?"

"I don't know. I rather think he doesn't like."

"Doesn't like! Why doesn't he like! Is the man afraid I am going to eat him?"

At this point the young gentleman thought it prudent to confine his attention to his egg and toast.

"I think it would be far better if your father came here."

"I daresay he will come after a little while. He is very shy, and doesn't quite like yet. But do you object to me going out to the station-house on Saturday, aunt?"

"Object! Heaven forbid! Why should I object to any wish of Hagart's? If I did I should have your mother about my ears like a nest of hornets. No, no! go to the station-house on Saturday if you like, John; and Ann will wait for you on your return."

Miss Kate said nothing more that day at breakfast, and so Jack went off to school highly pleased that he had secured his aunt's consent, although that consent had been accorded with an evident grudge.

Saturday was a brilliant day, and as the long white passage-boat slipped silently through the canal, the soft wind shook the trees on either bank, and every field of brairded wheat sent up its score or so of larks. Through the soft beat of horses' hoofs ahead, and the gentle swish of water at the bows, the larks could be heard distinctly. There were few passengers; there was no talk to absorb attention, and so Jack knelt on the seat and with his face pressed against the windows, saw bridges, and ploughed fields with solemn rooks stalking in the wake of the harrow, and beech hedges, in which the green of the present spring strove with the russets of last autumn, flitting rapidly past. He knew he was near the station-house, and then all at once there was his father on the canal bank—seen but for a moment, yet for a space long enough to allow Jack to wave his hand, and Hagart to lift his stick in recognition. And then the passage-boat slowed, then it bumped once or twice against the wooden wharf, and when Jack stepped out there was his father walking rapidly back towards the station-house.

At the station-house the arrival of the passage-boat always created some little stir. A passenger or two generally left the boat there; two or three passengers were almost always in waiting, and then there were parcels to deliver and parcels to receive. On the present Saturday, however, there was less bustle than usual, and by the time that Hagart, his eyes sparkling with delight, had possessed himself of Jack's hand and was shaking it eagerly, the station-house master and his assistant had gone in, and the passage-boat—after the horses had a drink and the remainder of the pailful of water thrown on their fetlocks—was on its way to Greysley.

"Bless me, how much you have grown," said Hagart. "Your mother has been quite lyrical of late about your improved appearance, and she has had better reason for her delight than I could possibly have believed. And you are going to be a strong fellow, too." Here Hagart gripped Jack by the arm and began to feel the sinew. "A fellow of your bone and thew would be better engaged wielding the axe of the backwoodsman than the pen of the lawyer. There is room for another Cortez yet in the world."

Jack and his father were now walking slowly along the bank, the father's hand still upon the boy's shoulder.

"There must have been a period in my life when I was exactly the age that you at present are—exactly, to the flight of a moment and the beat of a pulse. I should like to know what I was about when I had breathed the precise number of years, months, weeks, hours, minutes, moments, that you have now breathed? Wouldn't it be strange to find out that?"

"What if you should find that you were sound asleep in bed?" said Jack, who, knowing that there was serious matter ahead, thought this kind of talk somewhat wild and fruitless. "I think Miss McQuarrie was vexed that you did not come into Hawkhead and see me in her own house," he said.

"I can't do that, John; I can't. She knows I am poor, and she despises me for my poverty. If I met her she would receive me with all the forms of civility; but all the while she would be thinking in her heart how much bigger her purse is than mine, and how much purer her blood. Blood! Birth! I daresay if the truth were known my blood has come to me from Adam through as reputable veins as her own. It has coursed on its way through cleverer brains, I know."

"I don't think, father, that Miss McQuarrie thinks anything of the kind," remonstrated Jack. "She has always been kind to me."

"Yes, but then you are half McQuarrie, whereas I am pure Hagart—that makes a great difference. A little of the McQuarrie leavens the whole Hagart lump, and makes it palatable to Miss Kate. But we need not talk of Miss McQuarrie just at present, as we have more important matters to discuss. Suppose we sit down here and have it out." And so they sat down on the canal-bank, on which the April sun was shining pleasantly.

"Now, John," said Hagart, very gravely, after they had seated themselves, "I wish you to give the proposal I am about to make your most serious consideration. You will see that if carried into execution it will affect you as well as myself. I think in all matters of this kind it is best to begin at the beginning, and so far as possible to go by documents."

Here Hagart produced a black pocket-book, which he opened with much deliberation, and after taking out a letter he handed it to his son. "Read that," he said.

Jack opened the note and read—

"GREYSLEY, *April* 15.

"DEAR SIR,—Your industry, talent, and taste have, during the comparatively short period you have been in our employment, given us much satisfaction. We have, therefore, pleasure in informing you that we are in a position to increase your salary one hundred pounds per annum—said augmentation of salary to date from the beginning of the present month.

"Yours truly,
"WEDDERBURN BROTHERS.

"A. Hagart, Esq."

"Capital! first-rate!" cried Jack, who knew perfectly well what an additional hundred pounds a year meant. "This is the best news I have heard for a long while."

But lifting a deprecating hand, Hagart checked his son's enthusiasm. "I am cursed with an eye, John. I can see through professions. I can penetrate subterfuges. I can anatomise motives. I always look my gift horse in the mouth, and I always find it a miserable screw. I have done the Wedderburn Brothers yeoman's service. The designs I have produced—well, I shan't say anything about them, but *they* know their worth. They know, too, that trade will be brisker than it has been for years, and they wish to be perfectly prepared. When the British Government resolved to fight Napoleon in Spain, they took care to have Sir Arthur Wellesley there. That is the reason they have increased my salary. I am given to understand that several Greysleyan houses have an eye on me, and are prepared to offer me more than even Wedderburn Brothers."

"But here are the hundred pounds actually given you, whereas you only believe that other houses are prepared to offer you as much. Wedderburn Brothers have been very kind, and I would rather have an additional hundred pounds from them, than an additional hundred and fifty from anybody else."

"But what would you say if I declined both? If I threw up all engagements, and became a free man once more? What would you say to that?"

"I think you would be acting very foolishly," said Jack, without a moment's hesitation.

"Whether such a course of proceeding would be foolish or not is the precise question I wish you to consider. And before you can consider it, it will be necessary for me to produce Document No. 2."

Hagart dived into the recesses of his pocket-book, and brought out a slip which had been cut out of a newspaper. "This is the document, John."

Jack took the slip handed to him, and read—

"A company has recently been established in London for the purpose of colonising the virgin lands of Central America. They have already purchased from the Local Government a district of country comprising 1000 square miles. The climate is delicious (pulmonary complaints being entirely unknown); the region is watered by noble rivers; and as the buffalo in endless herds roams over the prairies, the table of the settler can always be supplied with fresh meat of a quality unknown in Europe. Indian corn, and indeed all the esculents of Europe grow luxuriant in the open, while the wild turkey roosts in the woods. The Company's lands, as they stand, are offered at 2s. per acre; one shilling per acre to be paid to the agents of the Company (who will grant a receipt for the same) before embarkation, and the remaining shilling when the fifth harvest-home has been gathered in; or if the settler chooses, it may remain as a permanent burden on the ground, the interest being 5 per cent., and payable in London. To the small farmer, the ambitious operative, and the reduced gentleman, such an opportunity of securing independence, and even luxury, is not likely to occur again during the present century. Intelligent emigrants should make immediate application at the Company's offices, as the lands are being rapidly disposed of, more particularly to settlers from France and Germany.

"BALSHAZZAR & ABEDNEGO,
"London Docks."

Jack read the glowing prospectus with a very blank countenance, and when he had got to the end of it, his father cried—

"Doesn't that stir your blood like the sound of a trumpet? Don't you see the wild turkey rising from his roosting place on the magnolia bough? Don't you feel the flavour of buffalo hump in your mouth?"

"But you don't intend to go there," said Jack.

"As I said before, the propriety of taking such a step is precisely the question I wished to discuss with you. Let us look on the matter on all sides. I am, as you are aware, offered an hundred pounds a year of additional salary: what then? Even with that can I live in a house like Miss Kate's? Can I go about the country like Stavert, making waterfalls of shillings and half-crowns in my breeches pocket? Can I ask these people to dine with me? Can I meet them anywhere, or at any time, on equal terms? Certainly not! In Central America all would be changed—there I should be independent, there I should call no man master. Now, as regards yourself. You are at present residing with your aunt, and it is your purpose when you have completed your university studies in Humanity and Logic, to devote yourself to the study of law. The law is a noble profession, no one is more inclined to admit that than I am. But then look at the difficulties that stand in your path. Before you can reach legal eminence you must have influence; and influence I have none. If we go to Central America, we shall occupy the place that Adam occupied, in a sense. We shall be the founders of a new race. The Spaniards took horses with them, and at this day there are troops of wild horses on the pampas. We shall take the name of Hagart there, and it will spread even as the Spanish horses did. The name of Hagart will over-run America like a brilliant flower. When I think of it, I almost feel the father of a nation. I am tired, John, of being other people's servant. I wish to be thoroughly independent."

"But who *is* thoroughly independent?" cried Jack, in an excited tone of voice. "The Captain is under the command of the Colonel, the Colonel is under the command of the General, the General must take the orders of the Commander-in-Chief. Every one must obey orders."

"It strikes me that you are flying off at a tangent, John. But now calmly, what do you think of my scheme?"

"I think it madness!"

"Well, there is nothing like having a decided opinion. I had hoped, John, to have received a more favourable verdict."

"But why seek a verdict from me? I am not able to advise on a matter of this kind. Why not speak to mother?"

Hagart rubbed his chin thoughtfully here. "Of course," he said, "I must speak to your mother; but I wished to know your opinion before I did so. Your mother—Heaven forbid that I should say anything against her, for she is the best of women and the best of wives—your mother, John—speaking critically, remember—is not in the least a woman of genius. She does not rise to great ideas. Had she been the wife of Columbus, Columbus would never have discovered America. If she were to meet Mrs. Hemans, she would speak to her about the darning of stockings."

Jack thought he had reached firm ground at last. He knew his mother would set her face against Central America, and he had a tolerably shrewd notion that whatever *she* set her face against would never come to pass. So having lost the greater portion of his terror of the project, he felt inclined to play with it.

"But suppose, father, we should resolve to emigrate, and that we should not be drowned on the way, what are we to do when we arrive in Central America?"

"Why, we should go with a large number of people, and the Company, I have no doubt, will have houses prepared for us. We would cut down trees, and cultivate the ground. In my youth, before I took to art, I was engaged in agricultural pursuits, and I know a good deal about them. We should not go alone, depend upon it. Mr. Moorfields—who brought the project under my notice—

assures me that no less than seventy persons are prepared to emigrate from Greysley alone. That would be a little colony in itself: and in our numbers there would be strength."

"And who is Mr. Moorfields?"

"A new friend of mine. The most talented fellow. He is always making plans for the benefit of others; but somehow he does not seem to succeed in his plans for himself. I suppose he is too unselfish. It was he who brought the project under my notice, and who sent me this prospectus."

"But don't you think his not succeeding in his own plans is proof that he is not likely to succeed in his plans for others? People generally work most sincerely for themselves, do they not?"

Master Jack had imbibed considerable worldly wisdom it will be seen since his residence with Aunt Kate.

The conversation, which ran on till the scarlet-jacketed outriders, and the white roof of the long white passage-boat were seen approaching, need not be detailed at greater length. When the boat had left the station-house, carrying Jack as passenger, Hagart walked homeward toward Greysley, and as he walked he resolved that he should ask Mr. Moorfields to dine with him, and cunningly bring the emigration scheme on the carpet! He expected the most strenuous opposition from his wife: but if any man could talk over Mrs. Hagart his new friend Moorfields was the man to do it.

CHAPTER XIX.

On his way home in the passage-boat Jack was a good deal puzzled as to what course of action it behoved him to take in the circumstances. He had no idea that the emigration scheme would come to anything, but he could see perfectly well that it was calculated to create disturbance and annoyance at home. That his father, on such a matter, should have taken counsel with him appeared the strangest affair. That he should go to his father for advice was natural enough; but that, on such an important matter, his father should come to him, seemed reversing the proper order of things. Of this he thought a good deal. Then the question arose, how should he act in regard to his aunt? On the very night he had arrived at Hawkhead she had desired that there should be no secrets between them. Here was a secret—would it be right to keep it from her? During the remainder of the journey he discussed this question in his own mind, and it was only when he stepped out on the pier at Hawkhead, and found Ann waiting for him, that he resolved to make a clean breast of it.

Miss McQuarrie had prepared supper for the boy, and while he was eating it she sat at the table watching him, and replenishing his plate at intervals. Jack had resolved while in the passage-boat to make the whole matter known, and while engaged with supper he told all—that Wedderburn Brothers had increased his father's salary by one hundred pounds a-year, and that his father meditated emigrating to Central America in pursuit of that independence which he loved, and which he feared could not be realised in the Old World. During certain portions of the recital there was an angry light in the old lady's eye, a good deal of scorn in her face, but through it all she was very quiet and attentive! When he was done she said, "I am very glad you have told me this, John. Many boys would have kept it to themselves, and so caused mischief."

"You desired me, aunt, you remember, the first night I came here to keep no secrets, and you have been too kind to make me think of disobeying you."

Miss McQuarrie was silent for a while, and then she said: "Your father must have given great satisfaction to his employers, else they would not, unasked, have increased his salary one hundred pounds yearly. A hundred pounds is not a vast sum in itself, but a hundred pounds a-year in addition to what one already has is a great thing."

"Of course he has given satisfaction," said Jack, who was delighted with this covert approval. "Father is very clever."

"Yes," said Miss Kate, in an absent tone, as if she was thinking of something else; "so you and your mother are always saying."

And here the matter dropped. A little later in the evening Miss McQuarrie complained of headache, and went off to her own room; and next day being Sunday, and Miss Kate still keeping her room, Jack and Ann went to church alone.

Monday morning is universally disliked by schoolboys, and by that portion of mankind who live in the receipt of fixed salaries. On the Monday morning succeeding the interview with his father on the canal-bank, our young gentleman was late, and when he reached the breakfast-room there was Miss Kate waiting him, and dressed as if she meant to go out. "You are late, John," she said, as she poured out a cup of tea and handed it across.

"Yes," said Jack; "but I'll just take a bit of toast this morning, and be off like a shot."

In a very short time Jack was off; and he had no sooner gone than Miss McQuarrie directed Ann to call a coach. And the coach was no sooner at the door than Miss Kate stepped into it, and directed the jarvie to drive to the business chambers of Messrs. Hook & Crook, Morning-dew Street, and to wait there.

At the business chambers of these distinguished legal practitioners Miss McQuarrie was well known. When she alighted she encountered in the lobby a brisk clerk, with yellow hair brushed high from his forehead, and a pen stuck behind his ear, passing from one room to another with the letter-book, and by the brisk clerk she was informed that Mr. Hook was at that moment in his own room. To this room, knowing the way perfectly well, Miss Kate advanced, and, opening the door, there was Mr. Hook amongst his papers.

Mr. Hook was dressed in sables, and was a grey-haired man of deferential address. He wore a double eye-glass at his breast, suspended by a chain, and this eye-glass was almost in constant use. Mr. Hook without his eye-glass might be circumvented, but to circumvent Mr. Hook *with* his eye-glass you felt to be an impossibility. When he placed his eye-glass on his nose, and began to peruse a deed of conveyance or a balance-sheet, you felt that if there existed in either an obscure flaw or a cunningly concealed quirk, he would be sure to find it out. When he got you in the leather-covered office chair opposite, and, listening to your story, surveyed you through the eye-glass, you felt he was reading your soul. Without his eye-glass Mr. Hook was professionally great—with it he was invincible.

In the leather-covered chair Miss Kate was now seated. Mr. Hook had wheeled his own chair round in her direction and adjusted his eye-glass. His legs were crossed, his elbows rested on the arms of his chair, his fingers were clasped. He was professional attention itself.

Miss Kate lost no time in preliminary fencing.—"You have heard me speak of my sister, Margaret Hagart—of her husband, and of her son; and you know that her son, John, is at present living with me?"

Mr. Hook bowed in acquiescence.

"I have taken these people under my protection. I don't know whether the ground is worth cultivating; but I am resolved to cultivate it. It is the only ground left me now."

Mr. Hook bowed again, this time a little more doubtfully.

"Alfred Hagart—my sister's husband—is a man of some cleverness, and no common sense. He is at present, as I understand, a designer of patterns, in the employment of Wedderburn Brothers, in Greysley."

"Clients of our own," interpolated Mr. Hook.

"Very well—all the better, perhaps. He is at present in their employment, as I was saying; and his services have given so much satisfaction, that, without any seeking of his own, they have increased his salary by one hundred pounds per annum. That's one part of my story,—and the best part of it, too. The remainder is this:—Hagart, who is of a restless and fidgetty disposition,—I suppose a morbid vanity is at the bottom of it,—has never been satisfied with his position in the world; and at this present moment he is talking of going off to Central America. Of course, he won't go,—I don't believe he has pluck enough to go. But then he will talk to my sister about going, and will worry, and annoy, and frighten her. I am anxious that she should be spared as much as possible. The idea of emigrating at all shows me that Hagart is discontented—ill at ease. Now I wish to anchor him firmly."

Hitherto Miss Kate had gone on swimmingly; but at this point the wind went out of the sail of her speech, and she hesitated, and boggled in a very extraordinary manner. Mr. Hook noticed the change, and glanced up at her through his double eye-glasses.

Miss Kate twitched nervously at her gloves, and seemed in a slightly agitated state. "Mr. Hook," she said, when she found her voice, "I wish you to undertake a mission on my behalf to the Wedderburn Brothers:—Go to them with the proposal that, if they will take Hagart into partnership—make him a recognisable member of their firm, place him in the enjoyment of a reasonable share of the profits accruing thereunto, that I shall pay them down two thousand pounds, or such higher sum as you and they may agree upon—provided that an absolute silence is retained now and for ever as to my share in the transaction, and that Hagart is allowed to believe that the partnership is offered him by the Wedderburn Brothers in recognition of his distinguished merits; or, that, having heard of his intention to leave the country, they resolved to retain his valuable services even at that price. If the matter is gone into at all, I must stipulate for this bit of double-dealing. Hagart will suspect nothing. When the stroke of good fortune comes, he will think he has got no more than he deserves; and it will have the effect of putting him on pleasant terms with his own vanity, and with the world. You can tell Wedderburn Brothers from your own knowledge, that if they enter into my plan they can have my cheque for the money at an hour's notice."

Mr. Hook was more startled with this speech of Miss Kate's than with anything which had occurred to him in the whole course of his professional career. "My dear Miss McQuarrie, this is a most extraordinary proposal. Have you given it sufficient consideration? Are you certain the step you suggest is a wise one?"

"Its wisdom or unwisdom depends entirely upon the point of view. In one sense, of course, I might as well thrust the money into that fire; but I have considered it well, and the step, I assure you, is perfectly wise and prudent. My sister will be provided for, as you know, after my death; but I wish to look after her during my lifetime, however short or long that may be now."

"If you have carefully considered the matter, and arrived at the conclusion that it is the right thing to do, Miss McQuarrie, I have little doubt that it will be found the right thing in the end," said the judicious Mr. Hook, who seeing no use in pulling against the stream, let himself float easily down upon it. "When should you wish me to wait on Wedderburn Brothers?"

"At once. To-day if you can, to-morrow at latest. And now I trust you perfectly understand my position. I wish to aid the Hagarts, but I wish to aid them secretly. The most utter silence must be maintained as to my part in the affair. If Hagart ever comes to know the secret history of the partnership, he will fret, and fume, and knock his foolish head against it, as a bluebottle knocks its head against the pane in the parlour. All this you will explain to the Wedderburn Brothers. I saw one of them at Hagart's house on the day of the funeral, and he seemed a pleasant, good-tempered man."

Mr. Hook looked at his repeater. "I have one or two hours' business before me, but I shall be able to leave for Greysley at three o'clock this afternoon. I can see Wedderburn Brothers this evening."

"Very good," said Miss Kate, as she rose out of the leather-covered chair, "and you will of course let me know the result of the interview as soon as you can. It is a somewhat delicate mission, and you must use all your tact in the conduct of it."

"You may depend upon my doing my best," said Mr. Hook, rising also. When he got upon his legs his professional manner slipped off, and he asked in an easy conversational tone, "Have you heard anything of the Stavert people lately?"

"No," said Miss Kate; "have you?"

"Yes, Stavert is always dropping in for one purpose or another. Last time I saw him I told him that John Hagart had gone to stay with you."

A somewhat malicious smile came into Miss Kate's face as she asked, "And what did he say?"

"He expressed the greatest surprise, and declared that your sister's husband was a double-dealing fellow; that he had on the occasion of the funeral hinted at the possibility of your nephew coming to live in Hawkhead, and that Hagart had then solemnly declared that his son never would—at least, if he could help it."

"And I dare say Hagart told the truth. I don't think it was his wish that John should come to live with me."

When they got into the lobby, Mr. Hook said, "By-the-by, I had a letter from your brother Hector last week. His daughters are getting up, he says; and he is anxious that they should come to Hawkhead next winter, to get the benefit of the schools."

"If they do come, I suppose they will live with Stavert?"

"Well, I suppose so. They must be fine girls by this time."

They had now reached the coach which Miss Kate had hired. Mr. Hook handed in his client and shut the door. "Now, Miss McQuarrie," he said while his hand lay on the window, "if you still think of making a lawyer of your nephew, we have always a desk at his service. He can work here and attend the University as well. There is nothing like having a youngster thoroughly grounded. In everything it is important to lay a firm and sure foundation."

"Many thanks; you are very good. I will think about it. You will let me know the result of the interview as soon as you can, for I am naturally anxious. Good morning."

"Good morning."

And then Miss Kate drove home, and Mr. Hook returned to his papers. He would leave for Greysley at three o'clock, and he had a good deal of work to get through before that time.

PRESIDENT LINCOLN JUDGED BY HIS OWN WORDS.

"By thy words thou shalt be justified, and by thy words thou shalt be condemned."

PART I.—TO THE BEGINNING OF THE WAR, APRIL 14-15, 1861.

Before the purely human emotions excited by the murder of the ruler of a great people have entirely passed away, it is well, I think, to consider whether the sudden halo of universal regret which has flashed into being round the memory of the late President of the United States has sprung only from those emotions, and is to pass away like them, or whether it is really the abiding glory of a noble and righteous life. With this view I should like to judge Abraham Lincoln out of his own mouth, by his own recorded words; selecting, moreover, for the purpose almost exclusively those belonging to the period of his presidency,—words which, in fact, under the fires of that terrific crisis which seems only now coming to an end, must have had all the weight and metal of very deeds, if they were not to burn up the utterer himself. Even of these I shall have space but to notice a few; referring my readers for all ampler collections of them, at least up to May, 1864, to Mr. A. J. Raymond's "History of the Administration of President Lincoln" (New York, 1864).

Of Mr. Lincoln's life itself prior to his election as President, the briefest sketch must here suffice. Born 12th of February, 1809, of a poor white family in the slave State of Kentucky,—and Mr. Beecher has said that he knows "nothing lower than that,"—he had at least the blessing of a Christian mother, and of a father who, though uneducated himself, sent his child to school, and migrated from slave into free soil, literally hewing his way for the last few miles to his future home. After earning his livelihood first by manual labour, then (after a bit of soldiering in 1832, and an unsuccessful venture as a store-keeper), like George Washington before him, by surveying, Abraham Lincoln entered the legislature of his adoptive State, Illinois, in 1834, began thereupon the study of law, received his "licence" in 1836, and practised the law as a profession from 1837 to the time of his election to the Presidency. During this period of twenty-four years, besides sitting occasionally in the State Legislature, he was elected in 1847 to the House of Representatives of the United States, where he signalized himself by a motion, by way of amendment, for declaring free, after January 1, 1850 (but with compensation to the owners), all slaves born within the district of Columbia (that small space of fifty square miles carved out of slave-soil, which, by a peculiar provision of the United States Constitution, is under the immediate government of Congress); was twice a candidate for the United States' Senate; and stood in 1856 second on the list of Republican candidates for the Vice-Presidency of the United States. Roughly speaking, his life thus divides itself into two nearly equal portions, the latter of which was spent in the practice of the law. The fact is only worth pointing out by way of rebuke to the puppyism of such would-be gentlemen as, in the barrister-attorney of nearly twenty-five years' standing, who on the 4th of March, 1861, ascended the steps of the Capitol of Washington as first magistrate of the United States, long refused to see anything else but a "rail-splitter" or a "bargee."

It was the lot of Abraham Lincoln to embody in his own person the first signal triumph of the principles which he professed. Up to the time of his election, the United States were ruled by the slave-owners of the South, allied to the so-called "Democrats" of the North. He was, moreover, citizen of a State (Illinois) which, although free, was bordered to the south and partly to the west by two slave States, Kentucky and Missouri, and was as hostile to the slave himself as to his chains (since her "Black Laws," forbidding the sojourn of coloured people upon her soil, &c., have only been repealed within the last few months), and various of whose most prominent citizens were themselves slave-owners beyond her borders. It was under these circumstances that Abraham Lincoln fought his way into public notice as an anti-slavery politician.

The most insidious form in which the slavery question was at this time presented to the people, was that of the doctrine of "squatter sovereignty," as it was termed,—viz., that of the absolute right of emigrants (white emigrants, be it understood) into United States territory not yet organized into States, to introduce or forbid slavery at pleasure; thus contravening not only the known purpose of the chief founders of the Republic, that slavery, whilst suffered to exist where it was already, should not be allowed to extend its limits;* but the later compromise with the slave-holding interest known as the "Missouri Compromise," which expressly prohibited slavery beyond a given parallel of latitude. Of this doctrine of "squatter sovereignty," Mr. Douglas, the "little giant" of Illinois, was the most prominent expounder, and it was generally favoured by the Democratic party at the North. Mr. Lincoln, in the course of his first popular contest with Mr. Douglas in 1854, when the question was that of its applicability to the territories of Kansas and Nebraska, situate in great measure north of the Missouri Compromise line, and from which, according to the terms of that compromise, slavery should so far have been distinctly excluded, met the doctrine with sturdy good sense: "I admit," he said, "that the emigrant to Kansas and Nebraska is competent to govern himself, but I deny his right to govern any other person without that person's consent." But the same question was again at issue in Mr. Lincoln's second contest for the senatorship with Mr. Douglas, in 1858; and again the former took up the broad ground of opposition to slavery in principle. "Slavery is wrong," he said, in a speech at Cincinnati, in the free State of Ohio, but in the immediate neighbourhood of the slave State of Kentucky, and to a mixed audience from both States. He was hissed for the words, and continued:—

> "I acknowledge that you must maintain your opposition just there, if at all. But I find that every man comes into the world with a mouth to be fed and a back to be clothed; that each has also two hands, and I infer that those hands were meant to feed that mouth and to clothe that back. And I warn you, Kentuckians, that whatever institution would fetter those hands from so doing, violates that justice which is the only political wisdom, and is sure to tumble around those who seek to uphold it . . . Your hisses will not blow down the walls of justice. Slavery is wrong; the denial of that truth has brought on the angry conflict of brother with brother; it has kindled the fires of civil war in houses; it has raised the portents that overhang the future of our nation. And be you sure that no compromise, no political arrangement with slavery, will ever last, which does not deal with it as a great wrong."

The above prophetic passage, which the timidity of Mr. Lincoln's party suppressed in the printed records of his speech, was noted down at the time by one who was latterly a political opponent of Mr. Lincoln (Mr. M. D. Conway, who has since reproduced it in the "Fortnightly Review"). But it is not more prophetic than were the opening words of Mr. Lincoln's previous speech to the convention which had nominated him:—

> "A house divided against itself cannot stand. I believe this government cannot endure permanently half-slave and half-free. I do not expect the Union to be dissolved—I do not expect the house to fall; but I do expect it will cease to be divided. It will become all one thing or all the other."

Side by side, however, with passages like the above, which fully prefigure the grander aspects of Mr. Lincoln's career, we must not overlook the indications of an influence which gave to it also occasionally an aspect of hesitancy, and of at least momentary littleness. In the latter half of the history of the United States prior to the Secession outbreak, one of the most prominent names is that of Henry

---

* It should never be forgotten that a proposal to this effect, put forward in 1784 by the Virginian slave-owner, Jefferson, only failed to become law by the accidental absence of a New Jersey delegate.

Clay. A name not to be looked for in the list of American Presidents; for it is a singularity of that history that, after the passing through office of Washington and his great contemporaries, the foremost men—Jackson excepted—do not fill the foremost place, but standing a little behind in official rank, quite overshadow the actual Presidents. During this period, three such men typify three different modes of feeling: Daniel Webster of Massachusetts, the hard Northern feeling, opposed to slavery, caring little for the slave, but devotedly attached to the Union, and scarcely less so to the commercial interests of the North;—John C. Calhoun of South Carolina, the hard and haughty Southern feeling, caring little for the Union, but devoted to Southern supremacy and to slavery, not in itself, but as the main pivot of that supremacy;—Henry Clay of Kentucky, finally, the temper of the Border slave-States, capable from its position of sympathising with both parties, anxious to unite both, convinced of the wrong and mischief of slavery, and yet crushed beneath a sense of the difficulty of meddling with it, and thereby driven into perpetual contradictions between principles and practice, and to the scheming of endless compromises between the fierce opposing interests on both sides. To the distant observer, this last type of character will generally be the least attractive of the three. Each of the others seems to have a unity of purpose which it wants; it seems unstable, shifty, always occupied with small details. But Clay's unswerving faithfulness to the Union, and his never retracted, never qualified condemnation of slavery, together with the purity of his personal character, and his unquestioned abilities as a statesman and an orator, gave him a singularly high place in the estimation of his countrymen. His "Life" had been one of the first books placed in the hands of his young brother-Kentuckian, and in the course of the contest with Douglas we find him speaking of Henry Clay as "my *beau-ideal* of a statesman—the man for whom I fought all my humble life." In this choice of a political hero in one who, though opposed utterly to slavery in principle, yet spent his life in the vain effort to effect compromises between it and freedom, will be found, I think, the explanation of much in Abraham Lincoln's Presidential conduct which has been harshly judged by the out-and-out abolitionist.

Till 1860, however, as we have seen, Abraham Lincoln is mainly known by his defeats. Yet the man knows his worth. He has sat in the great council of his nation, though only in its really *lower* House. But he has deemed himself fit for the higher,—for that Senate which has always been the goal of honourable ambition in the United States,—nay, for the Speakership of that Senate itself, which belongs to the Vice-President, the second officer in the State. The day comes when he is put forward for the very highest office, and he does not shrink from the contest. If the people prefer him to the greatest orator of the day, to the very leader of the Republican party hitherto, Mr. Seward, the Illinois lawyer will accept their confidence. But he remains in his own town of Springfield whilst the Republican Convention of 465 delegates is meeting at Chicago. As he sits in a newspaper office (May 18, 1860), speaking with some friends, a message comes from the Superintendent of the Telegraph Company:—"Mr. Lincoln, you are nominated on the third ballot." His first words are the simplest, homeliest, that ever fell from human lips:—"There's a little woman down at our house would like to hear this—I'll go down and tell her." With those sweet words of a husband's holy love, Abraham Lincoln entered upon that career which in less than five years was to end in a martyr's death. Was ever the highest power received in a gentler spirit?

On the next day his nomination was formally announced to him, together with the resolutions adopted by the Convention, forming what was termed the "Chicago Platform," the main feature of which was a pledge against the extension of slavery to the Territories. After four days' consideration, he accepted both (23rd May) by letter, concluding in words chiefly remarkable for the entire freedom from partizan spirit which they show in this candidate of a party:—

> "Imploring the assistance of Divine Providence, and with due regard to the views and feelings of all who were represented in the Convention, to the rights of all the States, and Territories, and people of the nation, to the inviolability of the Constitution, and the perpetual union, harmony, and prosperity of all, I am most happy to co-operate for the practical success of the principles declared by the Convention."

The nomination was a successful one. On the 6th November, 1860, Mr. Lincoln was elected President of the United States by the unanimous vote of all the free States except New Jersey, which gave him four votes out of her seven, making 180 votes in the "Electoral College," which names the Presidents; the votes cast for all three opposing candidates summing up only 123. Of the popular vote, however, which names the Electoral College, Mr. Lincoln had not obtained an absolute majority, but 1,857,610, against 2,804,560 given to his opponents; but out of this latter number all but 847,953 were cast in favour of candidates professedly supporting the Union. In other words, out of 4,662,170 voters, 3,814,217, or more than three-fourths, were in favour of the Union as a paramount principle; 1,857,610, or nearly two-fifths, were in favour of the Union, and of rigidly restricting slavery from further extension; and 547,953, or not a fifth, for slavery as a paramount principle; but these latter wielded the whole mass of the slave-country, except the Border States of Kentucky, Virginia, and Missouri, and Tennessee, the eastern part of which has long been practically almost free soil. In these figures lies indeed the whole history of the Secession war.

Abraham Lincoln was now President of the

United States. By a curious provision of their Constitution, he was not yet to enter upon the functions of his office. His predecessor, Mr. Buchanan, who had not even been nominated as a candidate, had for four months yet to retain the Presidency in his imbecile hands. During that period, ordinances of secession were passed by conventions in no less than seven States (South Carolina, 20th December, 1860; Mississippi, January 9, 1861; Florida, January 10; Alabama, January 11; Georgia, January 19; Louisiana, January 26; Texas, February 5). Delegates from the seceding States had met in another convention at Montgomery in Alabama (February 4), had adopted a provisional constitution, appointed and inaugurated (February 18) a President and a Vice-President; and the former, Mr. Jefferson Davis, in an address delivered on his arrival at Montgomery, had declared that "the time for compromise has now passed, and the South is determined to maintain her position, and make all who oppose her smell Southern powder and feel Southern steel, if coercion is persisted in." Meanwhile, Mr. Buchanan was advised by his Attorney-General that Congress had no right to carry on war against any State, and remained quiescent accordingly, even while forts, arsenals, and other government property were being seized on all sides by the seceding States: although by the 8th January he had got so far as to declare that it was his right and his duty "to use military force defensively against those who resist the Federal officers in the execution of their legal functions, and against those who assail the property of the Federal Government." Congress, on its side, notwithstanding the withdrawal of most of the senators and representatives from the seceding States, had made almost every conceivable concession to the South, adopting in principle an amendment to the Constitution which should forbid for ever any intermeddling by Federal action with slavery in any State; conceding "squatter sovereignty" so far as to create governments for three new territories without forbiddance of slavery; severely censuring those free States which had passed laws to hinder the recovery of fugitive slaves.

During all this time, till the 11th February, 1861, the new President remained absolutely silent. Not a word fell from him which could hinder Mr. Buchanan from saving the Union in his own way. On the 11th February he opened his lips anew as he left his home; and during his slow progress to Washington, which he reached on the 23rd, not a day passed but what his voice was heard in replies to the addresses of his countrymen. His first words on this triumphal progress to his eventual martyrdom, being his farewell to his fellow-townsmen at Springfield, must be quoted at length:—

> "My Friends:—No one not in my position can appreciate the sadness I feel at this parting. To this people I owe all that I am. Here I have lived more than a quarter of a century; here my children were born, and here one of them lies buried. I know not how soon I shall see you again. A duty devolves upon me which is perhaps greater than that which has devolved upon any other man since the days of Washington. He never would have succeeded except for the aid of Divine Providence, upon which he at all times relied. I feel that I cannot succeed without the same Divine aid which sustained him, and on the same Almighty Being I place my reliance for support; and I hope you, my friends, will all pray that I may receive that Divine assistance without which I cannot succeed, but with which, success is certain. Again I bid you all an affectionate farewell."

Weighty and touching words, surely. The momentary pleasure which he had felt on finding himself chosen as candidate for the highest office in the State by a large body of his fellow-countrymen, and which he could not enjoy without sharing it with the "little woman" at home, has quite vanished away into the sorrow of parting with the quiet memories of so many years of private life, into the awe of the dark future. Not a shot has yet been fired; but he knows that a duty has devolved upon him, greater perhaps than has devolved upon any since Washington. Yet he sinks not crushed beneath that duty, but strengthens himself against it like a man, looking up through the darkness to that Hand which sustained Washington, and which he trusts to sustain himself. And as he thus departs to rule over the many millions of his people, he asks his friends and his neighbours for their prayers. (And clever people in Europe, meanwhile, were saying and writing that God is an idea, and that Christ was an impostor, and that the Christian faith is a delusion; and Mr. Carlyle was trying to puff into a hero, for the special admiration of the nineteenth century, that cross between fox and wolf, Frederic II. of Prussia.) Surely, from that hour the day of shams had for America passed away; the true, honest man had gone forth in the fear of God, conquering and to conquer.

It were idle to attempt recording here all Mr. Lincoln's speeches on this journey to Washington. Without entering into any controversy, into any single detail of policy which could hamper the government, you see him appealing earnestly to the broad principles of patriotism, stirring up, yet without any bitterness, the energies of his countrymen on behalf of the Union. He warns them that it is for them, not for him, to save the country:—

> "In all trying positions in which I shall be placed, and doubtless I shall be placed in many such, my reliance will be placed upon you and the people of the United States. I wish you to remember, now and for ever, that it is your business, and not mine; that if the union of these States, and the liberties of this people shall be lost, it is but little to any one man of fifty-two years of age, but a great deal to the thirty millions of people who inhabit these United States, and to their posterity in all coming time. It is your business to rise up and preserve the Union and liberty for yourselves, and not for me. I, as already intimated, am but an accidental instrument, temporary, and to serve but for a limited time; and I appeal to you again to constantly bear in mind that with you, and not with politicians, not with Presidents, not with office-seekers, but with you, is the question:—'Shall the Union and shall the liberties of this country be preserved to the latest generations?'"—*Speech at Indianopolis, Feb.* 11.

He insists on his own insignificance :—

"I cannot but know what you all know, that without a name, perhaps without a reason why I should have a name, there has fallen upon me a task such as did not rest even upon the Father of his Country ; and so feeling, I cannot but turn and look for the support without which it will be impossible for me to perform that great task. I turn, then, and look to the great American people, and to that God who has never forsaken them."—*Speech at Columbus, Ohio, Feb.* 13.

He appeals to his political opponents for support :—

"I understand myself to be received here by the representatives of the people of New Jersey, a majority of whom differ in opinion from those with whom I have acted. This manifestation is therefore to be regarded by me as expressing their devotion to the Union, the Constitution, and the liberties of the people. I shall do all that may be in my power to promote a peaceful settlement of all our difficulties. The man does not live who is more devoted to peace than I am. None who would do more to preserve it : but it may be necessary to put the foot down firmly. And if I do my duty, and do right, you will sustain me, will you not ? Received as I am by the members of a legislature, the majority of whom do not agree with me in political sentiments, I trust that I may have their assistance in piloting the ship of state through this voyage, surrounded by perils as it is ; for if it should suffer wreck now, there will be no pilot ever needed for another voyage."—*Speech at Taunton, New Jersey, Feb.* 21.

He asserts his unchangeable faith in the principles of that famous Declaration of American Independence, which declared all men to be "created equal," and endowed by their Creator with the "inalienable rights" of "life, liberty, and the pursuit of happiness" :—

"I have never had a feeling, politically, that did not spring from the sentiments embodied in the Declaration of Independence. I have often pondered over the dangers which were incurred by the men who assembled here, and framed and adopted that Declaration of Independence. I have pondered over the toils that were endured by the officers and soldiers of the army who achieved that Independence. I have often inquired of myself what great principle or idea it was that kept this Confederacy so long together. It was not the mere matter of the separation of the colonies from the mother land, but that sentiment in the Declaration of Independence which gave liberty, not alone to the people of this country, but, I hope, to the world, for all future time. It was that which gave promise that in due time the weight should be lifted from the shoulders of all men. . . . Now, my friends, can this country be saved upon that basis? If it can, I will consider myself one of the happiest men in the world if I can help to save it. . . . But if this country cannot be saved without giving up that principle, I was about to say *I would rather be assassinated on this spot than surrender it.*"—*Speech at Philadelphia in 'Independence Hall,' Feb.* 21.

The effort successfully made by Mr. Lincoln, during all this series of speeches, to preserve silence as to all questions of detail, must have been a violent one ; for no stag at bay amidst the unleashed hounds could be more beset than he was by throngs of anxious questioners, whilst he himself must have been often sorely tempted to speak out.

He said at New York (February 19) :—

"I have been in the habit of thinking and speaking sometimes upon political questions that have for some years past agitated the country ; and if I were disposed to do so, and we could take up some one of the issues, as the lawyers call them, and I were called upon to make an argument about it to the best of my ability, I could do it without much preparation. . . . . I have not kept silence since the Presidential election from any party wantonness, or from any indifference to the anxiety that pervades the minds of men about the aspect of the political affairs of their country. . . . . I do suppose that, while the political drama being enacted in this country at this time is rapidly shifting its scenes . . . . it was peculiarly fitting that I should see it all, up to the last minute, before I should take ground that I might be disposed, by the shifting of the scenes afterwards, also to shift. I have said several times upon this journey, and I now repeat it to you, that when the time does come I shall then take the ground that I think is right—right for the North, for the South, for the East, for the West, for the whole country."

But while thus acting in obedience to the promptings of his own sense of duty, we now see that Mr. Lincoln was in fact doing precisely that which was best for his country, displaying the most practical and consummate wisdom. By his every speech, at every stage of his journey, he was lifting men above the sphere of party politics and personal preferences, into that of political duty and of the broadest statesmanship ; compelling them to forget himself, his predecessor yet in office, his late competitors, in the one great question, "How shall our country be saved?" And thus—tearing away as it were by armfuls at every step the thick undergrowth of selfishness and mutual prejudice which was at once choking the good qualities of the American people, and obscuring the massive foundations of the American polity, its pledges of equal right, and freedom, and justice, through mutual help, to all,—he hewed his way, so to speak, like a true backwoodsman, to the national capital at Washington, and to that "White House" or Presidential mansion, from which his murdered body was one day to issue forth amidst the sorrow of the civilized world. Here indeed the series of his unofficial speeches closes (Feb. 28) with expressions of the friendliest nature towards the South :—

"I have reached this city of Washington under circumstances considerably differing from those under which any other man has ever reached it. I am here for the purpose of taking an official position among the people, almost all of whom were politically opposed to me, and are yet opposed, as I suppose. . . . Much of the ill feeling that has existed between you and the people of your surroundings, and that people from among whom I came, has depended, and now depends, upon a misunderstanding. I hope that I may have it in my power to remove something of this misunderstanding, that I may be enabled to convince you, and the people of your section of the country, that we regard you as in all things our equals, and in all things entitled to the same respect and the same treatment that we claim for ourselves ; that we are in nowise disposed, if it were in our power, to oppress you, to deprive you of any of your rights under the Constitution of the United States, or even narrowly to split hairs with you in regard to those rights, but are determined to give you, as far as lies in our hands, all your rights under the Constitution—not grudgingly, but fully and fairly. I hope that by thus dealing with you, we will become better acquainted and better friends."

In the first of his state papers, his "Inaugural Address" (March 4, 1861), Mr. Lincoln begins by disclaiming the purpose and the right "to interfere with slavery in the States where it exists." He admits the constitutional obligation of rendering up fugitive slaves; but he asks whether, in any law upon the giving up of slaves, "all the safeguards of liberty known in civilized and humane jurisprudence," ought not to be introduced, "so that a free man be not in any case surrendered as a slave?" And with an implied censure of that absolute denial of United States citizenship to the coloured man which had been shamefully practised of late years, he asks equally, whether it might not be well "to provide by law for the enforcement of that clause in the Constitution which guarantees that the citizens of each state shall be entitled to all privileges and immunities of citizens in the several States?" The slave-power, in other words, shall have its pound of flesh, but not a drop of blood besides. Whatever legal privileges stand written to its credit, let it enjoy; but the spirit of slavery shall not penetrate into the law itself. The fugitive shall be presumed free until proved a slave; the coloured citizen of free Massachusetts or free New York shall stand on the same legal footing as the white citizen in slave Georgia or slave Mississippi. But it is the preservation of the Union, of the national life, which above all engrosses him, since disruption is now "formidably attempted."

> "I hold that in contemplation of universal law, and of the Constitution, the union of these States is perpetual. Perpetuity is implied, if not expressed, in the fundamental law of all national governments. It is safe to assert that no government proper ever had a provision in its organic law for its own termination. . . . No State, upon its own mere motion, can lawfully get out of the Union. . . . I therefore consider that in view of the Constitution and the laws, the Union is unbroken, and to the extent of my ability I shall take care, as the Constitution itself expressly enjoins upon me, that the laws of the Union be faithfully executed in all the States. Doing this I deem to be only a simple duty on my part, and I shall perform it so far as practicable, unless my rightful masters, the American people, shall withhold the requisite means, or in some authoritative manner direct the contrary. I trust this will not be regarded as a menace, but only as the declared purpose of the Union that it will constitutionally defend and maintain itself. In doing this there need be no bloodshed or violence; and there shall be none, unless it be forced upon the national authority. The power confided to me will be used to hold, occupy, and possess the property and places belonging to the Government, and to collect the duties and imposts; but beyond what may be but necessary for these objects, there will be no invasion, no using of force against or among the people anywhere. Where hostility to the United States in any interior locality shall be so great and universal as to prevent competent resident citizens from holding the Federal offices, there will be no attempt to force obnoxious strangers among the people for that object. . . . So far as possible, the people everywhere shall have that sense of perfect security which is most favourable to calm thought and reflection. The course here indicated will be followed, unless current events and experience shall show a modification or change to be proper, and in every case and exigency my best discretion will be exercised, according to circumstances actually existing, and with a view and a hope of a peaceful solution of the national troubles, and the restoration of fraternal sympathies and affections."

Let us pause for an instant over this passage, for it indicates at the outset a remarkable feature of Abraham Lincoln's mind,—a very fallible appreciation of the immediate consequences of events, coupled with an abiding sense that the future must always be larger than what he saw of it, and that therefore he must not pledge himself irrevocably to any future course of action, even that which seems to himself for the time the wisest and fairest. We all know how utterly his hope of "a peaceful solution of the national troubles" went to wreck. We all know how unprofitable to the South was the season afforded to it of "calm thought and reflection." We all know how soon the Government had to use force for other purposes than that of holding, occupying, and possessing the property and places belonging to it, had to invade State after State, and to force "obnoxious strangers" among the people of each. But an unerring instinct had guarded Abraham Lincoln from mistaking on any of these points his own notions for the realities of things. He had from the first taken into account the possibility of those modifications and changes which "current events and experience" might show to be proper. He had reserved his "best discretion" for "every case and exigency." And thus he went forth to his work free-handed, unfettered by those pledges of self-conceit which can manacle down a giant to a dwarf's weakness.

He now proceeds to plead with those who really love the Union. Has "any right plainly written in the Constitution," been denied? He thinks not. "All our Constitutional controversies" have sprung from the absence of express provisions in the Constitution. "Shall fugitives from labour be surrendered by national or by State authority? The Constitution does not expressly say. May Congress prohibit slavery in the Territories? The Constitution does not expressly say. Must Congress protect slavery in the Territories? The Constitution does not expressly say."

> "Upon such questions we divide into majorities and minorities. If the minority does not acquiesce, the majority must, or the Government must cease. . . . If a minority, in such case, will secede rather than acquiesce, they make a precedent which, in time, will divide and ruin them; for a minority of their own will secede from them whenever a majority refuses to be controlled by such minority. For instance, why may not any portion of a new Confederacy, a year or two hence, arbitrarily secede again, precisely as portions of the present Union now claim to secede from it? . . . Plainly, the central idea of secession is the essence of anarchy. A majority held in restraint by constitutional checks and limitations, and always changing easily with deliberate changes of popular opinions and sentiments, is the only true sovereign of a free people. Whoever rejects it, does of necessity fly to anarchy or to despotism. Unanimity is impossible; the rule of a minority, as a permanent arrangement, is wholly inadmissible . . . One section of our country believes that slavery is right, and ought to be extended; while the other believes it is wrong, and ought not to be extended. This is the only substantial dispute. The fugitive slave clause of the Constitution, and the law for the suppression of the foreign slave-trade, are each as well enforced, perhaps,

as any law can ever be in a community where the moral sense of the people imperfectly suggests the law itself. The great body of the people abide by the dry legal obligation in both cases, and a few break over in each. This, I think, cannot be perfectly cured; and it would be worse in both cases after the separation of the sections than before. The foreign slave-trade, now imperfectly suppressed, would be ultimately revived without restrictions in one section; while fugitive slaves, now only partially surrendered, would not be surrendered at all by the other. Physically speaking, we cannot separate. We cannot remove our respective sections from each other, nor build an impassable wall between them. A husband and wife may be divorced, and go out of the presence and beyond the reach of each other; but the different parts of our country cannot do this. They cannot but remain face to face; and intercourse, either amicable or hostile, must continue between them. It is impossible, then, to make that intercourse more advantageous, or more satisfactory, after separation than before. Can aliens make treaties easier than friends can make laws? Can treaties be more faithfully enforced between aliens than laws can among friends? . . . The chief magistrate derives all his authority from the people, and they have conferred none upon him to fix terms for the separation of the States . . . His duty is to administer the present government as it came to his hands, and to transmit it, unimpaired by him, to his successor. Why should there not be a patient confidence in the ultimate justice of the people? Is there any better or equal hope in the world? In our present differences is either party without faith of being in the right? If the Almighty Ruler of nations, with His eternal truth and justice, be on your side of the North, or on yours of the South, that truth and that justice will surely prevail, by the judgment of this great tribunal of the American people. By the frame of the government under which we live, the same people have wisely given their public servants but little power for mischief, and have with equal wisdom provided for the return of that little to their own hands at very short intervals. While the people retain their virtue and vigilance, no administration, by any extreme of wickedness or folly, can very seriously injure the Government in the short space of four years. My countrymen, one and all, think calmly and well upon this whole subject. Nothing valuable can be lost by taking time. If there be an object to hurry any of you in hot haste to a step which you would never take deliberately, that object will be frustrated by taking time, but no good object can be frustrated by it . . . In your hands, my dissatisfied fellow-countrymen, and not in mine, is the momentous issue of civil war. The Government will not assail you. You can have no conflict without being yourselves the aggressors. You have no oath registered in heaven to destroy the government; while I have the most solemn one to 'preserve, protect, and defend it.' I am loth to close. We are not enemies, but friends. We must not be enemies. Though passion may have strained, it must not break our bonds of affection. The mystic chords of memory, stretching from every battle-field and patriot grave to every living heart and hearth-stone all over this broad land, will yet swell the chorus of the Union, when again touched, as surely they will be, by the better angels of our nature."

To the President's appeals in favour of concord, or at least calm deliberation, the South replied (April 12) by the bombardment of Fort Sumter in Charleston Harbour, which was evacuated on the 14th (others say the 15th). The President now issued (April 15) a proclamation, by which, after stating that "the laws of the United States" had been for some time past and were then "opposed and the execution thereof obstructed in the States of South Carolina, Georgia, Alabama, Florida, Mississippi, and Texas, by combinations too powerful to be suppressed by the ordinary course of judicial proceedings, or by the powers vested in the marshals by law," in virtue of the power vested in him by the Constitution and the laws, he called forth "the militia of the several States of the Union, to the aggregate number of 75,000, in order to suppress said combinations, and to cause the laws to be duly executed," appealing "to all loyal citizens to favour, facilitate, and aid this effort to maintain the honour, the integrity, and existence of our national union, and the perpetuity of popular government, and to redress wrongs already long enough endured;" stating "that the first service assigned to the forces hereby called forth, will probably be to repossess the forts, places, and property which have been seized from the Union; and in every event the utmost care will be observed, consistently with the objects aforesaid, to avoid any devastation, any destruction of or interference with property, or any disturbance of peaceful citizens of any part of the country," commanding the persons composing the combinations aforesaid to disperse and retire peaceably to their respective abodes within twenty days; and finally, convening both Houses of Congress for the 4th of July.

Not a day, it will be seen, had been lost. No lengthened deliberations had been required. Abraham Lincoln had fulfilled the pledge that he had repeatedly given on his journey to Washington,—that when the time did come, he would take the ground which he thought was right. He *had* taken it at once, now that the time was come. And that ground was—law, and the need of enforcing it. It is this which gives so grandly conservative a character to the late war on the Federal side. It has been simply an effort to suppress combinations against the law. The tipstaff, or at best the policeman, ought to have been sufficient for the purpose; it is only because they are not that the President now calls out 75,000 militiamen, and will call into the field army after army, until at last enough has been done "to suppress said combinations, and to cause the laws to be duly executed." From this deep abiding sense of the lawfulness of his position flows that studious moderation, that seemingly impassive dryness of tone, which marks all Mr. Lincoln's state papers, as compared with the subtle yet tumid rhetoric, the heated appeals to the feelings and passions of the South, which characterise those of Mr. Davis. Mr. Lincoln is simply fulfilling a duty himself, in calling upon others to fulfil theirs. *That* bears no rhetoric; *that* appeals to no passion.

Observe again for the second time the prescient caution which qualifies the pledge to avoid devastation, destruction, or interference with property. The day is not very far off when it may become impossible, consistently with the object of suppressing "said combinations," and causing "the laws to be duly executed," not to interfere with, not to impair, not, finally, to destroy the most precious property in the South, that in human flesh. But in doing this, as well as in sanctioning (how reluctantly always is well known) other acts of devastation and destruction which military expediency may seem to command, the President will violate no pledge, he will but yield to what he deems a necessity. If thus only and not otherwise can illegal combinations be put down, and the execution of the laws be restored, he will be but carrying out by different means the object of this his first proclamation.

The great American civil war, then, has begun. The South has flung down the gauntlet; the North, by its chosen President, has taken it up.

J. M. LUDLOW.

NAMING A MEMBER OF THE HOUSE OF COMMONS.

"If the honourable member persists, I shall be compelled to name him."

"And what on earth would happen *then?*" says the reader of the *Times*, who finds the Speaker of the House of Commons using the above formula as a threat, when a member is very much out of order and obstinate in resisting milder attempts to bring him to reason.

The same question—what would happen *then?*—was, we all remember, put some years ago, when a dignitary of the Church of England was told that if he did not do something or other in the inducting way (it was connected with the affairs of a see which need not now be mentioned) to which he was invited in the usual course by Lord John Russell, he would incur the penalties of the statute of *præmunire.*

These things have a very awful sound with them. The gentleman who had in vain tried to keep off poachers by writing up, "Man-traps and spring guns set in these grounds," succeeded in frightening away the bumpkin trespassers when he put up the terrific announcement—"Polyphlosboiozesassees-detesthalassees set in these grounds." A man must, surely, stand in great peril who is threatened with the penalties of *præmunire;* or with being named by the Speaker. What is it that happens, or ought to happen, in the latter case?

We really cannot say. We do not find much light thrown upon the subject in Mr. May's book on parliamentary practice; and, the fact must be confessed, there is not much logic, or necessary consequence of any kind, in the ordinary public proceedings of the enlightened Englishman. In a good many cases, it seems, that the "named" member gets taken into custody by the Serjeant-at-Arms—who, for aught we know, conducts the culprit to a cellar, chains him to a stone, and leaves him with a jug of water, a stale loaf, and a pamphlet of an instructive character. But we cannot (we repeat) discover that there is any *logic* in the process of "naming" a member. There may, or may not be; but there is certainly a peculiar significance about it; which we shall proceed to disclose.

"If the honourable member persists, I shall name him," sounds as idly in modern ears as if the Speaker said, "If the honourable member persists, I shall sneeze;" but in the ears of an ancient Scandinavian, it would have been ominous. *It was a most religious belief of the Northman that if the name of a fighting warrior were spoken out loud, his strength would immediately depart from him.*

In various places and ages, something of cryptical might and meaning has, in the minds of the people, been attached to names. The Furies in Greece and Rome; the Fairies in our own island (and elsewhere); the bear among the Finns and Lapps; the cat and the weasel in Brittany, are all instances of real or unreal beings whose names it is, or was once, unlucky to utter aloud.

Let us, not stopping at the bare facts, make some slight attempt to think out the reason of them.

With ourselves, a name is a mere affair of the Post-Office Directory; an arbitrary matter; an accident of the person to whom it is attached—so much an accident, that it may be changed at will as many times as the person chooses. But it is conceivable that in days when the name was really descriptive (and only indicative in virtue of being so)—was absolutely representative of the man or creature to whom it belonged—it might be felt to have a vital, organic relation to him; to be essential—*i.e.*, to be of his essence, or *esse*—like his ghost, wraith, or double. Now this would be particularly the case with any being to whom was attributed occult virtue or force of any kind—force whose basis or scope was not entirely known or understood. A god, for example, would have a name which was, perhaps, pronounced not at all, or only by selected persons on state occasions.

But why only by selected persons on state occasions? Because to pronounce the Name—a thing so essential and so intimate—was like stripping naked the being to whom it belonged; like tearing down the curtains, or breaking through the cloud by force, or rending the veil which covered the face;—uncovering or dishonouring the possessor of the name by a disrespectful exposure:—

> "Not to unveil before the gaze
> Of an imperfect sympathy
> In aught we are, is the sweet praise
> And the main sum of modesty"—

and conversely, not rudely to compel another to unveil "is the sweet praise and the main sum of" reverence.

Now, in the rudest times, a *successful* warrior was an actual god. Not only so, but, of course, any man engaged in combat *might* be a god; that is to say, he stood, while the fight was undecided, for an unknown quantity of force. Supposing his

Name, then, known among his contemporaries, to have an essential personal significance about it, to contain, as it were, the secret or wraith of his strength,—it would not be fortunate for him to have it uncovered lightly: and, above all, read in the presence of the man who, of all the world, was in the least "sympathy" with him, namely, his enemy.

We have now got these points: 1. It was unlucky, among the Norsemen, to speak out aloud the name of a combatant. 2. A name was once supposed to be of the essence of the man, and to have a cryptical power in it. 3. Tradition kept up the idea of the value (validity, force) of a name, even after it had become more or less an arbitrary thing. Among the vulgar, remnants of the half-superstitious feeling indicated may still be occasionally traced by persons who (by faithfulness to impressions, and by resisting temptations to tyrannise over the minds of others) have kept their minds "sensitive" to whatever image may be thrown upon them. And two more observations will complete the little chain of suggestion which we have ventured to forge: 1. A Member of Parliament, being engaged in debate, is a combatant. 2. He has, as a representative, a veiled, cryptical, impersonal character. In virtue of that character, the honourable member for the enlightened borough of Snobville is always spoken of as "the honourable member for Snobville," and not by his real name of Jobling. In virtue of the same character he enjoys (or enjoyed until lately, for the law may be altered!) a sort of "coverture" (to use the old word applied to married women), which forbids arrest for debt. But what would it be to *name* him? The mind recoils at the thought! It would be *præmunire*—it would be polyphlosboiozesasseesdetesthalassees! It would be to strip him of his armour: to take away his sword and buckler: to place him on the same footing of defencelessness as John Doe and Richard Roe; to change him from an honourable, unnamed warrior into an ignominiously designated Jobling, with not an unknown quantity about him!

Is there, however, anything far-fetched in deriving a practice of the modern House of Commons from an old Scandinavian custom? No. On the contrary, the more one reads and thinks about the ways of the Northmen, the more one is startled with the familiar faces of modern usages—sometimes with *translated* (seldom directly varied) features, but always with exactly the same meanings. An account of an Althing debate, Speaker and all, reads just like a bit of *Times* during the session of Parliament. Some of the most striking of the illustrations which we might quote, our readers would, perhaps, hardly thank us for—they would, we can conceive, rather not have forced upon them the substantial identity of things which they very much admire with things which they would not admire at all; and as we cannot here demonstrate the historic law which, once apprehended, would diminish their annoyance, we will spare their feelings. But we will, nevertheless, venture to ask "muscular" readers (if we have any) if they cannot call to mind having read in their newspapers, or at least having *seen* in their newspapers, a few years ago, a repulsive story of a "ring," which ended in a manner eminently calculated to remind one of something which is told in Eigil's Saga—namely, that Queen Gunhilda, when she was afraid the Thing was going to give a verdict against her, secretly instructed one of her train to *cut the sacred cords* which bound together the hazel-twigs that formed the doom-ring, and so put an end to the proceedings?

R.

THE REALMS OF AIR.

The realms on high—the boundless halls, where sports the wing of light,
And Morn sends forth her radiant guest unutterably bright,
And Evening rears her gorgeous piles amidst the purple ray,—
How glorious in their far extent and ever fair are they!

The dark autumnal firmament, the low cloud sweeping by,
The unimaginable depth of summer's liquid sky—
Who hath not felt in these a power, enduring, undefined—
A freshness to the fevered brow, a solace to the mind?

But most when, robed in nun-like garb, with sober pace and still,
The dun night settles mournfully on wood and fading hill,
And glancing through its misty veil, o'er ocean's depths afar,
Shines here and there, with fitful beams, a solitary star.

Then wearied sense and soul alike receive a nobler birth,
Then flies the kindling spirit forth beyond the thrall of earth;
While lasts that soft and tranquil hour, to thought's high impulse given,
A chartered habitant of space—a denizen of heaven!

Then, seen in those eternal depths, the forms of vanished days
Come dimly from their far abodes to meet the mourner's gaze;
And they the fondly cherished once, and they the loved in vain,
Smile tranquilly, as erst they smiled, restored and hailed again.

And words which, breathed in long-past years, the ear remembers yet,
And sounds whose low endearing tone the heart shall not forget;
The parent speech, the friendly voice, the whispered vow, are there,
And fill with gentle melody the shadowy Realms of Air.

J. F. H.

OUR INDIAN HEROES.

By JOHN WILLIAM KAYE.

VIII.—BRIGADIER-GENERAL JOHN NICHOLSON.

At the close of the year 1830, a physician practising in Dublin died from the effects of a fever caught in the performance of his professional duties. Though only thirty-seven years of age, Dr. Alexander Nicholson had attained considerable reputation in the Irish capital, as a skilful and experienced practitioner; and he was a man of true Christian piety, and spotless integrity of life.

He died, leaving a widow and seven young children; two daughters and five sons. The eldest of the sons, John Nicholson, born in Dublin on the 11th of December, 1821, at the time of his father's death had just completed his eighth year. But, young as he was, at that time he was old enough to be a solace and a stay to his widowed mother.

He was a precocious child, almost from his cradle; thoughtful, studious, of an inquiring nature; and he had the ineffable benefit of good parental teaching of the best kind. In his young mind the seeds of Christian piety were early sown and took deep root. It is still remembered of him that when he was three years old, his mother happening to go suddenly into a room, found John alone there, with a knotted handkerchief in his hand, striking with all his childish force at some invisible object. When asked what he was doing, he answered with a grave earnestness of manner, "Oh! Mamma, dear; I am trying to get a blow at the Devil. He is wanting me to be bad. If I could get him down I'd kill him."

He was exceedingly quick to learn, and when only four years of age, he could read well, and he never shrank from his lessons. On the death of his father, Mrs. Nicholson removed her young family to Lisburne, where her mother resided;* but finding it difficult to obtain there good masters for her children, she transferred them to Delgany, where excellent private tuition was secured for them. But as John advanced in years and intelligence, it seemed expedient to fit him to make his way in the great world by training of a more public kind; so his mother sent him to the college at Dungannon, of which Dr. Darling was then the principal. In after years, he sometimes expressed regret that he had not availed himself more fully of the opportunities then presented to him of increasing his store of learning; but he made very good progress all the same, and at fifteen was probably as good a scholar as the majority of boys at that age. He was, moreover, a fine manly youngster, active and courageous, but withal of a gentle and affectionate nature and very fond of his mother. I have no faith in men who do not love their mothers, from the first day of their lives to the last.

I have not been able to recover any anecdotes of John Nicholson's boyhood, excepting one, which shows that, at an early age, an accident had well-nigh rendered a public career impossible to him. During one of his vacations, he was playing with gunpowder, when a considerable quantity of it exploded in his face and blinded him. He covered his face with his hands and made his way to his mother, saying to her, "Mamma; the gunpowder has blown up in my face." When he removed his hands, it was seen that his face was a blackened mass; his eyes were completely closed, and the blood was trickling down his cheeks. For ten days, during which he never murmured or expressed any concern except for his mother, he lay in a state of total darkness; but when at the end of that time the bandages were removed, it was found that God in his mercy had spared the sight of the boy and preserved him to do great things.

It was plain that there was in such a boy the making of a good soldier; but I do not know that this early promise led in any way to the choice of his profession. I have before observed that the majority of those men who have made for themselves great Indian careers, have gone forth, not because they have had in youth any special liking for the life before them, but because accident or convenience has so directed their ways. Mrs. Nicholson had five sons, and a slender income, derived mainly from the rents of some small estates in Ireland, and it was a matter of serious concern to her how to provide for this fine batch of promising youngsters. It is not strange that ever and anon these grave thoughts expressed themselves in a troubled countenance. When quite a child, John would say sometimes, with a loving kiss to his mother, "Don't fret, Mamma dear; when I'm a big man, I'll make plenty of money, and I'll give it all to you." Words often uttered, before and since, but seldom, as in this instance, so religiously fulfilled! The chance was not very far distant. Mrs. Nicholson's brother, Sir James Hogg, had "large Indian interest." When John had nearly completed his sixteenth year, his uncle obtained a cadetship for him, in the Bengal Infantry. He made all haste to England, and after spending a short time with the same good friend, who helped him both with money and advice to obtain his outfit, embarked on board the *Camden* for Calcutta. He had left home carrying with him the most precious advice. "Never forget to read your Bible," were his mother's last words, given to him with her parting benediction. And he never did forget the pious counsel.

---

* Mrs. Nicholson is sister of Sir James Weir Hogg, Bart., formerly M.P. for Beverley and for Honiton, and now a member of the Council of India.

The voyage to India was not an eventful one. He kept very much aloof from the other youngsters on board, whom he described as, for the most part, of a noisy riotous kind. He read much every day, never forgetting the Book of Books morning or evening, and made by his uniform steadiness of conduct a most favourable impression on the mind of the captain of the ship. Having reached Calcutta in the month of July, he spent a short time in the vice-regal capital, and was then appointed to do duty with the 41st Regiment of Native Infantry at Benares. After a while he was permanently posted to the 27th Sepoy Regiment, which was cantoned at our frontier station of Ferozepore. "I intend setting out on the 1st of January," he wrote to his mother, in December, 1839, "and expect to be rather more than three months on the road. I am afraid it will prove a very unpleasant march to me, as I go alone, and am unacquainted with the language and country." These difficulties were readily overcome. The young Ensign arrived at the remote station, and joined the regiment, which was to be his home. But new difficulties beset him there; he found that there were no houses—that he was compelled to build one, and that he must pass the hot weather in a tent. So, in common course, he was subjected to the process of "seasoning." In the early part of July he wrote to his mother:—"I have not forgot your parting advice to read my Bible daily. . . . . I have just recovered from a severe attack of fever, brought on by the want of proper shelter; but my new house will soon be finished, and then I hope I shall enjoy my usual health. You can have no idea how the hot weather enervates the body, and, if you do not take special care, the mind also. I am just finishing a most interesting work, which, if you have not already read, I strongly recommend you to do so; it is Faber's 'Fulfilment of the Scriptural Prophecies.'" In the following month he wrote to the same beloved correspondent:—"You ask if the climate agrees with me. I think so far it has, considering how much I have been exposed since I came out. I am nearly six feet high now, and expect, if my health continues good, to be three or four inches taller; but I think I am thinner even than I was at home."

In the middle of the month of October the 27th Regiment was warned for service in Afghanistan, which was at that time occupied by British troops, and overrun by British diplomatists. It was a season of delusive calm. Our British regiments were ordered, in ordinary course of relief, into the dominions of Shah Soojah, as if they were going to a British province. But it was not long before the 27th, after having marched into Afghanistan, were excited by the prospect of a brush with the Sikhs:—"Our Brigade," wrote young Nicholson, in July, 1841, to Sir James Hogg, "was sent down to Peshawur, in May, to assist a convoy, on its way up, under Captain Broadfoot, which 10,000 Sikhs of General Avitabile's force, who had mutinied and seized two guns, threatened at the Attock. However, hearing of our approach by forced marches, they made off across the Caubul River, and left the detachment at liberty to proceed. We suffered a good deal from the heat on our return to Jellalabad, and, without halting there, continued our march to Caubul, where the other corps remained; but we proceeded to relieve the 16th at Ghuznee, and are now comfortably settled there." The 27th, under Colonel Palmer, formed the garrison of Ghuznee, the capture of which a year or two before had consummated the revolution which placed Shah Soojah "upon the throne of his ancestors." And there, when the counter-revolution broke out in 1841, it found young Nicholson with his regiment,—a tall, slim stripling of eighteen.

The story of the defence of Ghuznee is full of interest; but it cannot be told here in detail; though then, in the hour of deadly peril, the heroic qualities of John Nicholson manifested themselves in all their nascent strength. How well he fought during the defence has been told by one who fought beside him.* It is recorded, too, that when at last Colonel Palmer entered into terms with the enemy, and engaged to surrender the arms of his force on condition of the Afghan leaders pledging themselves to treat their prisoners honourably, and conduct them in safety to Caubul, "Nicholson, then quite a stripling, drove the enemy thrice back beyond the walls at the point of the bayonet, before he would listen to the order given him to make his company lay down their arms. He at length obeyed, gave up his sword with bitter tears, and accompanied his comrades to an almost hopeless imprisonment."

Now began a time of miserable captivity. In a small room, eighteen feet by thirteen, the prisoners were confined. When they lay down to rest at night they covered the whole floor. From this wretched dungeon after a while even light and air were excluded by the closing of the door and window. Cleanliness even was a blessing denied to them. The linen rotted on their backs, and they were soon covered by loathsome vermin. In this pitiable state, never breathing the fresh air of heaven, the spring passed over them; and then in the middle of May there was a little change for the better, for once a week they were suffered to emerge from their dark and noxious dungeon and look out into the face of day for an hour, from the terrace of the citadel. A month afterwards they were moved into better quarters, and an open court-yard allowed them for exercise. The delight of this was so great after the stifling and pestilential atmosphere of their first prison, that for months they slept in the open court, wrapt in their rude sheepskin cloaks with nothing above them but the canopy of heaven. At last, in the third week of August they were startled by the news that they were to be conveyed to Caubul; and presently they found themselves, slung in camel-panniers, jolting on to the Afghan capital.

---

* Lieutenant Crawford's Narrative published in the Appendix to Vincent Eyre's book.

At Caubul John Nicholson and his companions were taken before the famous Afghan leader, Akbar Khan, who spoke kindly to them, bade them be of good cheer, gave them a good dinner, and then sent them to join the prisoners under his own care. When the Ghuznee party joined Akbar Khan's prisoners, the worst part of their captivity was over; and deliverance was near at hand. The story of their release has been told before. On the 17th of September the prisoners met the party which General Pollock sent out to their rescue, and found themselves free men. "When I joined the force at Caubul," wrote John Nicholson some months later, "Richard Olpherts, of the 40th, was very kind to me. Indeed, but for his kindness, I don't know what I should have done. He supplied me with clothes and other necessaries, and I lived with him till I reached Peshawur."

The victorious army having set its mark upon Caubul, returned to the British provinces. But new trouble was in store for John Nicholson. Whilst he had been suffering captivity in his Afghan prison, his brother Alexander had gone out to India, and had marched with his regiment into Afghanistan. On the way from Caubul, the brothers met; but a few days afterwards the enemy attacked our rear-guard, and Alexander was killed in action. It was John Nicholson's sad duty to communicate this distressing intelligence to his mother: "It is with a sorrowful heart," he wrote on the 6th of November, "that I sit down to write to you now, after a silence of more than a twelvemonth. Indeed, I should scarcely dare to do so now, were I not encouraged by the knowledge that God will enable you to bear your sad loss with Christian resignation, and comfort you with his Holy Spirit. Poor Alexander is no more. He was killed in action, when on rear-guard on the 3rd instant; but I know that you will not sorrow as one without hope, but rather rejoice that it has pleased the Lord to take him from this world of sorrow and temptation. Poor boy, I met him only a few days before his death, and a happy meeting it was. . . . Now, my dearest mother, let me intreat you not to grieve more than you can help. Alexander died a soldier's death, in the execution of his duty, and a more glorious death he could not have died."

There was an ovation on the frontier, and the army was dispersed. John Nicholson then, after the perilous excitement of this his first service, subsided for a time into the quietude and monotony of cantonment life. His regiment was stationed at Meerut, but, although it was one of the largest and most bustling of our military cantonments, the uneventful dreariness of his daily life oppressed him after the excitement of the preceding years. "I dislike India and its inhabitants more every day," he wrote to his mother, in one of those hours of despondency which are common to the careers of all great men, "and would rather go home on 200*l.* a-year than live like a prince here. At the same time I have so much reason to be thankful that I do not grumble at my lot being cast in this country." But the young soldier was not doomed to a lengthened period of inactivity, for he was made adjutant of his regiment, and he had thus the best opportunity that could have been afforded to him for perfecting himself in the practical knowledge of his professional duties. There was peace, but not of long duration. Soon it was plain that another crisis was approaching; and then commenced that great series of events which tested the qualities and made the reputations of so many men now great in Indian history. The Sikh army, no longer restrained by the strong hand of Runjit Singh, invaded the British frontier, and dared us to the conflict. Then the work of the English soldier done for a time, the work of the administrator commenced. The Sikh Empire which the victories of the Sutlej had laid at our feet, was left in the hands of the child-prince who represented the house of its founder; and whilst we fenced him round with British bayonets, we at the same time endeavoured to teach him how to govern. A council of regency was formed, and Colonel Henry Lawrence was placed at its head.

It happened that John Nicholson was then with the army on the frontier. He had been attached to the Commissariat Department, and was present at the battle of Forozshuhur; but his position did not afford the means of personal distinction, and he was little more than a looker on. The time, however, had come for the young soldier to divest himself for a time of the ordinary accompaniments and restraints of military life. A new career was about to open out before him,—a career that had many attractions for one of his ardent, enthusiastic nature, for it was one in which he would no longer be kept down by the dead-weight of a seniority service. As a regimental subaltern, there was little that he could do to distinguish himself; still less, perhaps, to be done in the subordinate ranks of the Commissariat Department. But he had made the acquaintance of George and Henry Lawrence in Afghanistan. With the former he had been a fellow captive, in the hands of Saleh Mahomed; and the latter, who accompanied the Sikh contingent to Caubul, had soon discerned the fine soldierly qualities of the subaltern of the 27th. To such a man as Henry Lawrence, the character and disposition of young Nicholson were sure to recommend him, as one to be regarded with great hope and with tender affection. They parted, but Lawrence never forgot the boy, and when they met again on the banks of the Sutlej, the elder man, then in high place, stretched out his hand to the younger, and his fortune was made.

After the campaign on the Sutlej, Cashmere, which had been an outlying province of the Sikh Empire, was ceded to the English, in part-payment of the expenses of the war; and it was made over by us, or in plain language, sold, to the Maharajah

Golab Singh for a million sterling. At the request of the chief, the British Government consented to send two English officers to instruct his troops in our system of discipline; and Captain Broome of the Artillery and John Nicholson were selected by Lord Hardinge for the duty, in the early part of March, 1846. The Governor-General sent for Nicholson, and offered him the appointment in a manner very pleasing to the young soldier. "I accepted it gladly," he wrote to his mother, "on the condition, that if on trial I did not like it, I might fall back on my old Commissariat office." So he went to Cashmere, ostensibly to drill the infantry regiments of the Maharajah; but Golab Singh really wanted them for no such purpose. Their presence in his country was sufficient to show that he had the support of the British Government. This, however, did not avail him much; for a strong party, under the old Sikh government, resisted the transfer of the territory to a new ruler; and the English officers were in danger of their lives. The story is told by Nicholson himself in a letter to his mother:—"I left Jummoo for Cashmere," he wrote, on the 26th of September, 1846, "towards the latter end of July, and arrived there on the 12th of August, much pleased with the beautiful scenery and fine climate of the mountain range which we crossed to get into the valley. You will remember that the province of Cashmere was made over to Gholab Singh by our Government. At the time of our arrival, however, though he had a few thousand men in the valley, he had by no means obtained possession of the place. The son of the late governor, under the Sikhs, having raised a considerable force, showed an evident disinclination to surrender the government, Gholab Singh, moreover, being very unpopular in the valley, on account of his known character. We had not been many days in the city before we learnt that the governor had made up his mind to drive Gholab Singh's small force out of the valley and seize us. We had great difficulty in effecting our escape, which we did just in time to avoid capture, and marching by one of the southern passes, joined the Maharajah here a few days ago. As we left the valley, the governor did, as we heard he intended to do by the Maharajah's troops, and the task of dispossessing him and making over the province to Gholab Singh now devolves upon our Government."

And the duty was successfully performed. The insurrection was overcome; and in November, Nicholson was again settled at Cashmere. On the 19th he wrote to his mother, saying, "Colonel Lawrence and the rest of the party left this three days ago, and I am now quite alone, and, as you may suppose, feel very lonely, without an European within scores of miles of me. I am for the present officiating in the North-West Frontier Agency, which Colonel Lawrence has recommended my being put permanently into. If his recommendation be attended to, I shall probably be stationed either at Lahore or somewhere in the Jullundur Doab; otherwise, I shall have to return to the Commissariat, as it is not intended to continue my present appointment, it being evident that the Maharajah does not wish our system of discipline introduced into his army. Whatever is done with me, I shall not be sorry to get away from Cashmere, which at this season is anything but a terrestrial Paradise. My fingers are so cold that I can scarcely hold the pen, and glazed windows are unknown here."

A few weeks after this letter was written, Lieutenant John Nicholson was formally appointed an assistant to the Resident at Lahore, and early in the new year (1847) he started for the Sikh capital.* He was now fairly launched into the Political Service, and under the very best of masters. He could have had no brighter example before his eyes than that of Henry Lawrence, nor in any part of India could he have found, in the subordinate agency of the British Government, more fitting associates than those who, though often severed by long distances from each other, were doing the same work with one heart and one hope, "helping the Executive and protecting the People."

The cold weather of 1847-48, passed quietly over. Things seemed to be settling down in the Punjab, and both the Governor-General and the Lahore Resident, encouraged by the general tranquillity, turned their faces towards home. In the part of the country which was the scene of Nicholson's labours, there were no signs of trouble. "Lieutenant Nicholson," so ran the official narrative, "reports that the country around Hassan Abdal and Rawul Pindee, hitherto more or less disturbed, is perfectly quiet, and that the Kardars, for the first time for years, move about without guards."

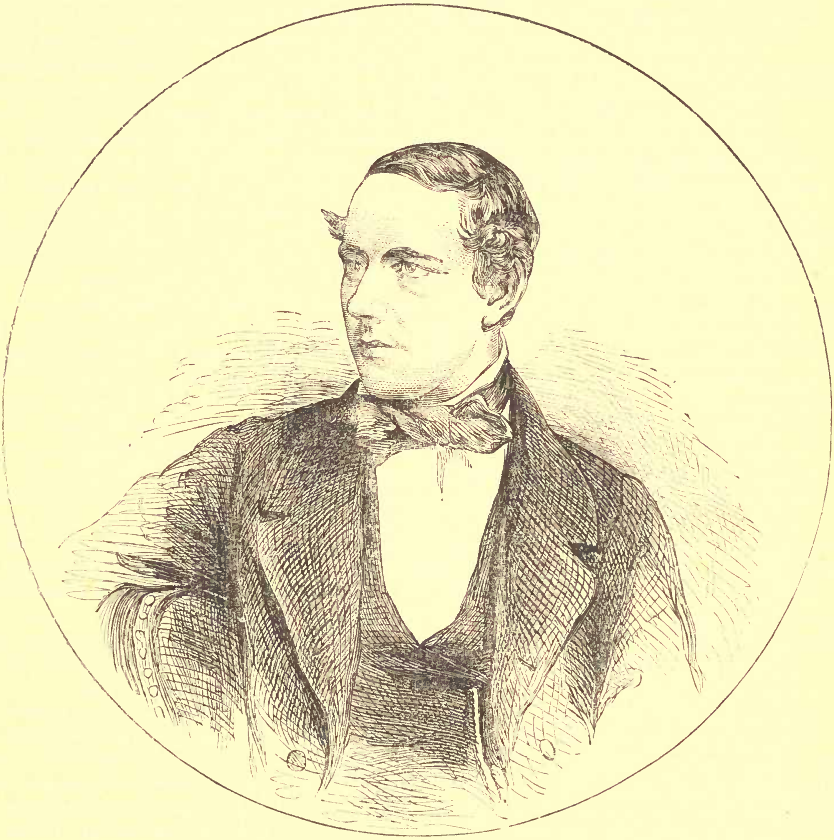
But the calm, like many others before and since, was a delusive on. It promised a season of rest, but it was the precursor of a storm. The nationality of the Sikhs had not been destroyed. The British officers who were governing the country for them were wise after their kind, and overflowing with benevolence. But their presence was hateful to the great chiefs whose power they had usurped; and they determined to rid themselves of it. In the spring, Moolraj had rebelled against the Double Government, and had killed the English officers sent to Mooltan to instal another governor in his place, and the summer saw the whole country seething with "rebellion" of the same kind. At this time John Nicholson was at Peshawur, serving under George Lawrence. A severe attack of fever had prostrated him, and he was lying upon a sick bed when news came that Chuttur Singh, one of the most powerful of the Sikh chiefs, and one whom we most trusted, had thrown off the mask, had raised the

---

* One of his younger brothers, Charles Nicholson, had a short time before arrived in India, and John, to his great joy, had learnt that the youth was now with his regiment in the Punjab; and so they had a happy meeting at Lahore.

Hazareh country, and was about to seize the important fortress of Attock. Lawrence and Nicholson were speedily in consultation. "What do you wish done?" asked Nicholson. "Had you been fit for the work," replied Lawrence, "I should have wished to send you to secure the post; but you are not fit to go on such a service." "Certainly I am," said Nicholson. "The fever is nothing; it shall not hinder me. I will start to-night." Consent was given, and it was arranged that he should take with him an escort of 60 Peshawur horse and 150 men of a newly-raised Mahommedan levy, the men of which were believed to be true and staunch to fight against the Sikhs.

"Never shall I forget him," says a brother officer who was with him at Peshawur, and who has supplied me with particulars of this epoch of Nicholson's career—"never shall I forget him, as he prepared for his start, full of that noble reliance in the presence and protection of God, which, added to an unusual share of physical courage, rendered him almost invincible. It was during the few hours of his preparation for departure that his conduct and manner led to my first knowledge of his true character, and I stood and watched him, so full of spirit and self-reliance, though only just risen from a sick bed, with the greatest admiration."



John Nicholson, from a Photograph taken in 1851.

He made a forced march to Attock, and arrived before the fort just in time to prevent that portion of the garrison which was hostile to us from closing the gate against him. "He had travelled," says my informant, "so fast that but few of his escort had been able to keep up with him; but with these few he at once commanded the submission of all but the most desperate, and these he soon quelled by his personal prowess. A company of Sikhs in command of one of the gates were prepared for resistance, but he at once threw himself among them, made them arrest their own leaders, and in a few minutes was master of the position. This I learnt afterwards from eye-witnesses who served under me. Having made the place secure, placing in charge the persons whom he could best trust, he lost no time in taking the field, and by his rapid movements for a long time checked the troops from Hazareh, preventing them from getting into the open country and proceeding to join Shere Singh's army."

But the history of the eventful days which followed this reinforcement of Attock must be told a little more in detail. From Attock, Nicholson marched with 60 horse and 40 footmen to Hassan Abdal. "On my arrival there," he wrote to the Lahore Resident, "on the 12th of August, learning the 100 Goorchurras of Sirdar Mehtab Sing Majeetia, here, had abused and expelled from camp their Commedan for refusing to join the Hazareh force, I paraded the party, and dismissed and confined the ringleaders on the spot. The remainder begged forgiveness, and having some reason to believe them sincere, and wishing to show that I was not entirely without confidence in Sikhs, I granted it. I shall of course keep a sharp look out on them in future." On the following day he wrote again to the Resident, saying:—"After I had despatched my letter yesterday, I learned that Captain Abbott's regiment, stationed at Kurara, had deserted that post, and arrived, with two guns, at Rawul Pindee, intending to proceed thence to join the Hazarah force. I immediately sent orders to the levies *en route* to join me to concentrate at Margulla, with the view of stopping there the further progress of the mutinous regiment. I rode out myself early this morning and surveyed the position; it is not of any great strength, but I know not a more suitable one for my purpose."

Next morning at break of day, John Nicholson with his levies found himself face to face with the mutinous regiment. The odds were against him, for the mutineers had two guns; but Nicholson, with the cool courage and resolute bearing which even then overawed all opponents, addressed them, saying that he desired nothing more than that they should return to their allegiance, but that if they held out an hour longer he would inflict upon them the punishment due to mutineers. Stormy then was the debate which followed in the enemy's camp. Some were for peace, some were for war; but the advocates of the former prevailed, and before the hour of grace had expired the colonel of the recusant regiment had tendered his submission, and offered to march anywhere at the English officer's commands.

But there was much work to be done after this in the open country; and Nicholson was compelled to pay repeated visits to Attock to see after the safety of the post. "It was during the thirty days' fast of Ramzan," writes the friend and comrade whose words I have already quoted, "that some of his most arduous work was done, a time during which his followers were debarred by strict religious scruples from taking even a drop of water between sunrise and sunset, but yet, so great was the command his example obtained for him over the minds of these men, that they cheerfully endured the terrible sufferings entailed by the long and rapid marches and countermarches he was obliged to call upon them to make. He never spared himself, he was always the first in the saddle, and in the front of the fight. Apparently insensible to the calls of hunger, thirst, or fatigue, and really regardless of danger, his energies never failed, while his life seemed charmed, and the Mahommedan levies whom he commanded seemed to regard him almost as a demi-god. After a time, he found the calls upon him in the field so exacting, that he requested Major Lawrence to send him some trustworthy man to take command of the garrison in Attock; and Nizam-ood-dowlah Mahomed Oosman Khan, the father-in-law and formerly Wuzeer of Shah Soojah, was sent accordingly. Still Nicholson did not feel at his ease regarding the safety of the fort, and at length Sirdar Chutter Singh, making a forced march in the hope of taking the place by surprise, he obtained early information of the Sirdar's intentions, outmarched him by one of his wonderfully rapid movements, and entered the place before the enemy could reach it."

From Attock Nicholson now wrote to Major Lawrence, begging him to send, as governor of the fort, one of the two English officers under him at Peshawur, and the choice fell upon Lieutenant Herbert. A little before midnight of the 31st of August, Major Lawrence awoke him, and placing in his hands Nicholson's letter, expressing a strong wish to be in the open country so as to operate upon the rear of the enemy, told him it was his wish that he should proceed at once to Attock. In less than an hour Herbert was in the saddle, and about nine o'clock the next morning entered the fort, and received over command from Nicholson, who lost no time in leaving the place and getting into the rear of the enemy, and by this means was enabled to reach the Margulla Pass in time to stop Sirdar Chutter Singh and his force, and turn them back once more after the severe struggle which first rendered his name famous.

Not long after this, the whole country was in a blaze, and the English and the Sikhs were contending for the mastery of the Punjab. In the crisis which then arose, wheresoever good service was to be done, there was Nicholson at hand to render it. When, on the first two days of December, the force under Sir Joseph Thackwell crossed the Chenab, it was Nicholson who provided the boats which enabled them to effect the passage, who procured intelligence of the enemy's movements, and supplies for our own troops. At Chillianwallah, he was with Lord Gough, to whom he rendered active services, cheerfully acknowledged in the despatch of the Commander-in-Chief. Again at the crowning victory of Goojerat he earned the thanks of his chief. And when the pursuing force under Sir Walter Gilbert gave chase to the fugitive Afghans, who had come down to aid the Sikhs, Nicholson, with a party of Irregulars, rode with them and was ever at the head of the column.*

Then the Punjab became a British Province; and in the distribution of the administrative agency which was then made, Captain John Nicholson was appointed one of the Deputy Commissioners in the Punjab. But he had now served for nearly ten years in India; there was peace again over the land; he had suffered many times from severe illness; but above all he was anxious to visit and to comfort his widowed mother. Another heavy affliction had fallen upon the family. A younger brother, William Nicholson, had joined the 27th Regiment, which was posted at Sukkur. One night the unfortunate young man rose from his bed, and in a state of somnambulism went out of the house and fell down a steep declivity in the neighbourhood. From the injuries which he then received he died shortly afterwards—the second son whom Mrs. Nicholson had lost in India, within the space of a few years. This catastrophe fixed John's resolution to return to England; and he wrote to his mother that although he would leave his appointment he could not restrain his inclination to visit England, and that perhaps through the kindness of Sir Henry Lawrence he might on his return to India be nominated to the Punjab commission.* But November still found him in the Sikh country. "India is like a rat-trap," he wrote, "easier to get into than out of. However, I think I am pretty sure of getting away on or before the first of next month. I go down the Sutlej by boat to Kurrachee and there take the steamer to Bombay. From Bombay I hope to get a passage in the second January steamer to Cosseir, where I purpose disembarking and marching across to the ruins of Thebes, the oldest and greatest of cities. Thence I shall drop down the Nile by boat to Cairo and the Pyramids. From Cairo I have not yet decided on my further route, but I think that I shall probably visit Constantinople . . . Herbert Edwardes will be my companion as far as Cairo; but as he has two of John Lawrence's little girls with him he will be obliged to go direct to England from thence. I trust to reach home before the end of March." In this, however, he was disappointed; he was detained both at Constantinople and at Vienna longer than he had anticipated, and did not reach England before the latter end of April, 1850.

---

* For these services he obtained a Majority.

I must pass rapidly over this period of his eventful life. He was anxious to turn his furlough to good professional account by visiting the chief cities of continental Europe and studying the military systems of all the great European powers. He attended some gigantic reviews in the French and the Austrian capitals, and carried back with him to India, where he arrived in 1851, a large access of military zeal.

But it was long before an opportunity presented itself for the display of his high qualities as a soldier. Soon after his arrival in India, he was reappointed a deputy commissioner in the Punjab, and for five years he continued to work as an administrative officer, almost it might be said on the very outskirts of civilisation. The people whom he was sent to govern were a wild and lawless race; and in process of time, by the vigour and justice of his rule, he obtained such an ascendancy over them, that they came to fear and to worship him as a divinity. The strange story of his administration has been told so well by John Nicholson's best and dearest friend that I give it in his very words:—"Of what class is John Nicholson?" writes Sir Herbert Edwardes. "Of none: for truly he stands alone. But he belongs essentially to the school of Henry Lawrence. I only knocked down the walls of the Bunnoo ports. John Nicholson has since reduced the *people* (the most ignorant, depraved, and bloodthirsty in the Punjab) to such a state of good order and respect for the laws, that in the last year of his charge not only was there no murder, burglary, or highway robbery, but not an *attempt* at any of these crimes. The Bunnoochees, reflecting on their own metamorphosis in the village gatherings under the vines, by the streams they once delighted so to fight for, have come to the conclusion that the good Mahommedans of historic ages must have been just like 'Nikkul Seyn!' They emphatically approve him as every inch a Hâkim. And so he is. It is difficult to describe him. He must be seen. Lord Dalhousie—no mean judge—perhaps summed up his high military and administrative qualities, when he called him 'a tower of strength.' I can only say that I think him equally fit to be commissioner of a division or general of an army. Of the strength of his personal character, I will only tell two anecdotes. 1. If you visit either the battle-field of Goojerat or Chillianwallah, the country people begin the narrative of the battles thus:—'Nikkul Seyn stood just *there*.' 2. A brotherhood of Fakeers in Hazareh abandoned all forms of Asiatic monachism, and commenced the worship of 'Nikkul Seyn;'—which they still continue! Repeatedly they have met John Nicholson since, and fallen at his feet as their Gooroo (religious or spiritual guide). He has flogged them soundly on every occasion, and sometimes imprisoned them; but the sect of the 'Nikkul Seynees' remains as devoted as ever. 'Sanguis martyrorum est semen Ecclesiæ.' On the last whipping, John Nicholson released them, on the condition that they would transfer their adoration to John Becher;—but arrived at their monastery in Hazareh, they once more resumed the worship of the relentless 'Nikkul Seyn.'"*

When the news of the outbreak at Meerut and the seizure of Delhi reached the Punjab, in

---

* I find the following characteristic passage in one of his letters written at this time:—"What you say about our prosperous days being those of the greatest temptation, is quite true. I have long felt it so, and prayed for grace to resist the temptation. I also fully agree in all you say about earthly distinctions. Believe me, I estimate them at their proper value."

* "Raikes' Notes on the Revolt in the North-Western Provinces of India."

May, 1857, Nicholson was at Peshawur. At the same place, in high position, were two other men, of the true heroic stamp; men equal to any conjuncture, men to look danger of the worst type coolly and steadily in the face. General Sydney Cotton commanded the troops at the station, and Colonel Herbert Edwardes was the commissioner in political charge of the division. A day or two after the outbreak there arrived also at Peshawur a fourth, of whom history will take equal account—Brigadier Neville Chamberlain, who commanded the Punjab Irregular Force. But it was considered advisable that he should proceed to Rawul Pindee, to communicate with Sir John Lawrence respecting the general defence of the province; and the conduct of affairs on the frontier was left in the hands of Cotton, Edwardes, and Nicholson.*

Upon the first receipt of the sad tidings of the revolt of the Sepoy army, John Nicholson, ever a man of fertile resources, recommended as a measure of personal importance, for the general defence of the province, the formation of a moveable column, to traverse the country and to operate upon any point where danger might present itself. The proposal was made to his official chief and beloved friend, Herbert Edwardes, who grasped it with all confidence and cordiality; and then the two went together to Sydney Cotton, and laid the scheme before him. Like a true soldier, he responded at once to the appeal. Then Edwardes sent it on to Sir John Lawrence, saying that either he or Nicholson would be proud to command the column. The measure had the full sanction of the high military authorities, and the chief commissioner accorded to it a hearty approval. The column was formed; and Brigadier Neville Chamberlain was appointed to command it.

But in that month of May, there was no lack of work at Peshawur for the political officers; and it is hard to say how much the safety of the Empire depended, under God's good providence, upon the energies of Herbert Edwardes and John Nicholson, at their peril-girt frontier station. Hand in hand, as close friends, dwelling beneath the same roof, and moved by kindred impulses, they strove mightily, day after day, from morn to night, with wonderful success. "Dark news," wrote Edwardes, some time afterwards, in his official report of these memorable transactions, "kept coming up now to Peshawur, and a rapid change was observed in the Native regiments; precautions began; Colonel Nicholson promptly removed the treasure (about twenty-four lacs) from the centre of cantonments to the fort outside, where the magazine was, and Brigadier Cotton placed a European garrison in it at once. . . . I think it must have been on the 16th of May, that Sir John Lawrence consented to my raising 1000 Mooltanee horse; for, before leaving Peshawur for Pindee that evening, I left the orders with Colonel Nicholson, to be issued in our joint names (for the Khans in the Derajat were as much his friends as mine). On the 18th of May, however, permission was given to raise 2000; matters were growing worse each day, and it was now clearly understood by us, in the council assembled at Pindee,* that whatever gave rise to the mutiny, it had settled down into a struggle for empire, under Mahommedan guidance, with the Mogul capital as its centre. From that moment it was felt that, at any cost, Delhi must be regained. Colonel Nicholson had endeavoured to raise levies through the most promising of the chiefs of the district, to help the European soldiers in the struggle that was coming. But the time had passed, a great danger impended over the cantonment; a profound sensation had been made by the startling fact that we had lost Delhi. Men remembered Cabul. Not one hundred could be found to join such a desperate cause. . . . Colonel Nicholson was living with me at Peshawur, and we had laid down to sleep in our clothes, in a conviction that the night could not pass over quietly. At midnight the news of what had occurred at Nowshera† reached us; and a most anxious council did we hold on it. It was probable that the 55th Native Infantry at Murdan would already be in open mutiny, and in possession of the Fort. But to send a reliable force against them from Peshawur would only have been to give the native regiments a preponderance in the cantonment. Again, the news from Nowshera must soon reach the Sepoys in Peshawur, and probably be the signal for a rise. The advantage, therefore, must be with whoever took the initiative; and we resolved at once to go to the General, and advise the disarming of the native garrison at daylight."

The responsibility of the measure rested with Sydney Cotton; but he was not one to shrink from it. There was, doubtless, in the conjuncture which had then arisen, no small hazard in such a course of action as was now proposed to him; for we had external, no less than internal dangers to face. It was certain that the Afghans were greedy for the recovery of Peshawur, and it was at least probable that they would take advantage of our domestic troubles to come down in force through the Khybar Pass, and to strike a blow for the much-coveted territory. To dispossess himself at once of a large part of the military strength which had been given to him for the purpose of defending the frontier against these possible inroads, at the very time when it seemed to be most required, was a measure which might well demand hesitation. Moreover, the officers of the native regiments believed in the fidelity of their men, and protested against an act which would cast discredit upon them, and turn friends into enemies—strength into weakness—in the hour of need. But Cotton believed that the disarming of the native regiments was the lesser evil of the two, and he determined that it should be done.

---

* General Reed commanded the Peshawur Division of the Army; but he also went to Rawul Pindee to meet Sir John Lawrence.

* Colonel Edwardes had gone to Rawul Pindee for a few days to consult with Sir John Lawrence.

† Outbreak of the 55th and 24th N. I. Regts.

How it was done may be best narrated in the words of Colonel Edwardes's narrative:—"The two European regiments (Her Majesty's 70th and 87th), and the artillery, were got under arms, and took up positions at the two ends of the cantonment, within sight of the parades, ready to enforce obedience, if necessary, yet not so close as to provoke resistance. Colonel Nicholson joined Brigadier Galloway's staff at one rendezvous, and I General Cotton at the other. These prompt and decided measures took the native troops completely aback. Not an hour had been given them to consult, and, isolated from each other, no regiment was willing to commit itself; the whole laid down their arms. As the muskets and sabres of once honoured corps were hurried unceremoniously into carts, it was said that here and there the spurs and swords of English officers fell sympathisingly upon the pile. How little worthy were the men of officers who could thus almost mutiny for their sakes; and as weeks and months passed on with their fearful tale of revelations, there were few of those officers who did not learn, and with equal generosity acknowledge, that the disarming had been both wise and just. For the results of the measure, we had not long to wait. As we rode down to the disarming, a very few chiefs and yeomen of the country attended us, and I remember, judging from their faces, that they came to see which way the tide would turn. As we rode back, friends were as thick as summer flies, and levies began from that moment to come in."

But the work was not yet done. Events followed each other in those days in rapid succession. The 55th Sepoy Regiment mutinied; and again the aid of John Nicholson was called for, and see how it was rendered. "At 11 o'clock of night of the 23rd, a force of 300 European infantry, 250 irregular cavalry, horse levies and police, and eight guns (six of which were howitzers), left Peshawur under command of Colonel Chute of H. M.'s 70th, accompanied by Colonel Nicholson, as political officer, and neared Murdan about sunrise of the 25th, after effecting a junction with Major Vaughan and 200 Punjab infantry from Nowshera. No sooner did this force appear in the distance than the 55th Native Infantry, with the exception of about 120 men, broke from the fort and fled, as Colonel Chute well described it, 'tumultuously,' towards the hills of Suwat. Chase was given with both artillery, cavalry, and infantry, but the mutineers had got far ahead, and bad ground so checked the guns that they never got within range. Colonel Nicholson, with a handful of horsemen, hurled himself like a thunderbolt on the route of a thousand mutineers. Even he (in a private note to me, for he seldom reported officially anything he did himself) admitted that the 55th fought determinately, 'as men always do who have no chance of escape but by their own exertions.' They broke before his charge, and scattered over the country in sections and in companies. They were hunted out of villages, and grappled with in ravines, and driven over ridges all that day, from Fort Murdan to the border of Suwat, and found respite only in the failing light. 120 dead bodies were numbered on their line of flight, and thrice that number must have borne off wounds; 150 were taken prisoners, and the regimental colours and 200 stand of arms recovered. Colonel Nicholson himself was twenty hours in the saddle, and, under a burning sun, could not have traversed less than seventy miles. His own sword brought many a traitor to the dust. . . . Colonel Nicholson, with Colonel Chute's moveable column, returned to cantonments in the second week of June. But we were soon to lose him. The death of Colonel Chester, at Delhi, called Brigadier-General Chamberlain to the high post of Adjutant-General, and Colonel Nicholson was instinctively selected to take command of the Punjab moveable column, with the rank of Brigadier-General."

On the 22nd of June, Colonel Nicholson took command of the column and on the 24th proceeded to Phillour. His first act on joining the force was to free himself from the danger that seemed to be hovering over him in the shape of two suspected Sepoy regiments, which might at any moment break out into open mutiny. It was sound policy to disarm them; but the operation was a hazardous one; for if they had suspected the intention, they would in all probability have broken and fled, after turning upon and massacreing their officers. So Nicholson made a show of confiding in them, and ordered the whole column forward as though it were marching straight upon Delhi. Then there were ominous head-shakings in camp. What could the general mean by taking those two tainted regiments with him to the imperial city, there to fraternise with the mutineers and to swell the rebel ranks of the Mogul? He well knew what he meant, and his meaning was soon apparent. On the morning of the 25th he was early on the camping-ground with all his preparations made. But there was no sign of anything unusual—nothing to excite suspicion. The Europeans and the guns were in advance, and so placed that when the suspected Sepoy regiments came up, one after the other, to the camping-ground, they could completely command them. They had their instructions; but were so disposed, many of the Europeans lying on the ground as though for rest, that they never less assumed a threatening aspect than when the first of the Native regiments came up, and the men were told to pile their arms. Leaning over one of the guns, Nicholson gave his orders as coolly as though nothing of an unusual character were about to happen. "If they bolt," he said to Captain Bourchier of the artillery, "you follow as hard as you can; the bridge will have been destroyed, and we shall have a Sobraon on a small scale." But the Sepoy regiments, entrapped by the suddenness of the order, and scarcely knowing what they were doing, piled their arms at the word of command, and suffered them to be taken to the fort. This done, Nicholson addressed them, saying, that desertion would be punished with death, and that they could not possibly escape, as the fords were watched. Eight men made the attempt but they were brought back, tried, and condemned to death.

On the following day, crossing the Beeas in boats, for the river had risen, the moveable column quitted Phillour, and returned towards Umritsur. They reached that place on the 5th of July, and were greeted by fresh tidings of mutiny in the Native army. A regiment had risen at Jhelum; and soon it became only too certain that there had been a disastrous revolt at Sealkôte, and that the mutineers had murdered many of the Europeans there. It was plain that it would soon be Nicholson's duty to inflict retribution on these offenders. Having cast off their allegiance to the British Government, they were hastening to join the revolutionary party at Delhi; so Nicholson determined to intercept them. Disencumbering himself, as he had done before, of all the remaining Hindostanee troops with him, he made a rapid march, under a burning July sun, to the station of Goordaspore. On the morning of the 12th, news came that the rebels were about to cross the Ravee river at Trimmoo Ghaut. So Nicholson moved the column forward, and about noon came in sight of the mutineers, who had by this time crossed the river with all their baggage. They were well posted, in a high state of excitement, and many of their horsemen drugged to a point of fury with bang. They commenced the battle, and fought well; but the British infantry and artillery gave them such a reception that, in less than half-an-hour the Sepoys were "in full retreat towards the river, leaving between three or four hundred killed and wounded on the fields." Unfortunately Nicholson had no cavalry with him, and was unable to give chase to the mutineers. He therefore withdrew his column to Goordaspore, where he soon heard that the mutineers had re-formed on the other side of the river. So he determined again to give them battle. On the 14th he advanced again to the Ravee, and found that the mutineers had planted themselves on an island in the middle of the stream, and had run up a battery on the water's edge. The river had risen since the first day's conflict, and it was necessary, therefore, to obtain boats to enable our force to strike at the enemy. This occasioned some delay, but on the morning of the 16th everything was ready. So Nicholson advanced his guns to the river's bank, and drawing off the enemy's attention by a tremendous fire of shot and shell, moved his infantry unobserved to one extremity of the island, and placed himself at their head. Galloping in advance with a few horsemen, he came upon the piquets of the enemy; the order was then given for the advance of the 52nd, which moved forward in admirable order upon the battery, bayoneting the gunners, and putting the whole body of the enemy to panic flight. It was all over with the mutineers. They could only take to the water, where numbers of them were drowned, and numbers shot down on the sand-banks or in the stream. The few who escaped were seized by the villagers on the opposite bank, and given up to condign punishment. Never was victory more complete.

The work having been thus effectually done, the moveable column returned to Umritsur; and Brigadier-General Nicholson proceeded to Lahore, to take counsel with the authorities, and "to learn how matters were going on below." He arrived there on the 21st; and on the 24th he rejoined the moveable column, and communicated to his officers that it had been resolved that they should march with all possible speed to Delhi. On the 25th they again crossed the Beeas. On the 27th, he wrote to the Chief Commissioner:—"The troops I have with me here consist of Dawes's Troop, Bourchier's Battery, wing of Umritsur Police Battery, 240 (about), Mooltanee Horse, H.M.'s 52nd is a march in rear, as its colonel reported it knocked up." With these troops he pushed on with all possible despatch. But General Wilson, who commanded at Delhi, was eager to take counsel with Nicholson, so the latter determined to go on in advance of his force. "I am just starting post for Delhi," he wrote on the 6th of August, "by General Wilson's desire. The column would be at Kurnaul the day after to-morrow, and I shall perhaps rejoin it at Paneeput." On the following day he wrote from "before Delhi," "I just write a line to confirm what you will have heard from Wilson. We break ground with No. 1 Heavy Battery at 650 yards to-night. Nos. 2 and 3 to-morrow night at 550 and 350. Batter the 9th, and go in on the 10th. I can't give you the plan of attack, lest the letter should fall into other hands. Wilde came in this morning, and the Jummoo troops will be in to-morrow. I arrived just in time, a few evenings ago, to prevent the despatch of a letter forbidding their nearer approach. . . . Pandy is in very low spirits, and evidently thinks he has made a mistake." Two days afterwards he wrote: "The batteries could not be got ready in time this morning. So we are only silencing the Moree to-day. To-morrow we breach and bombard, and assault on the 11th, which, by a strange coincidence, is the anniversary of our former capture." It was intended that the work here marked out—namely, the capture of the enemy's position near Ludlow Castle—should be intrusted to Nicholson's column; so he returned to his force to bring it into the Delhi Camp with all possible despatch. "Expectation was on tiptoe," wrote an officer of the brigade, "to hear his opinion as to the state of affairs. He told me that the tide had turned, but that we should have some tough work; and that General Wilson had promised our column a little job, to try our 'prentice hands,' to dislodge a body of troops who had taken up their position with some guns in the neighbourhood of the Ludlow Castle." But the little job could not wait for Nicholson and his comrades. The fire of the enemy became so annoying, that it was necessary to carry their position at once; so the work was entrusted to Brigadier Showers, and he did right gallantly and well.

On the 14th of August, Nicholson, at the head of his column—their flags flying and band playing—marched into the camp at Delhi. It was believed by many that the appearance of these reinforcements would be the signal for the assault on Delhi. But it was doubtful whether success could be secured without the aid of a powerful siege-train; so it was resolved that the final measures for the capture of the imperial city should not be taken until after the arrival of the heavy guns which were then coming down to our camp.

But, in the meanwhile, there was other work to be done. It was apprehended that the enemy were about to manœuvre, so as to make their way into our rear. So it was determined to give them battle; and Nicholson was selected to settle their business. It was about four o'clock in the afternoon, when, having crossed the ford, near Nujufghur, he found the enemy in position on his front and left. Their line extended from the canal to the town of Nujufghur, a distance of nearly two miles. They had four guns strongly posted near an old serai on the left centre, and nine others between that point and the bridge. It was there, on the left centre, that Nicholson determined to attack them, and having forced their position, to sweep down their line of guns towards the bridge. Nothing could have been more successful than the operation. A few rounds from the artillery guns prepared the way for the advance of the British infantry, with Nicholson at their head, full upon the serai. The attack was irresistible; the enemy were driven from their position; and then Nicholson changed front to the left, swept along the whole line of guns, captured them, and put the whole brigade to flight.

With reference to this action he wrote a few days afterwards to Sir John Lawrence, "I enclose a rough draft of my report. The field was of such extent, that it was not easy to estimate the Mutineers' loss. I think, moreover, that they suffered more severely from the fire of our artillery, after they had bolted across the bridge, than they did on the actual battle-field. According to all accounts, the Neemuch brigade, (the one I dealt with,) only musters 600 men now. Many of those who fled would appear never to have returned to Delhi. Most of the officers with me in the action rated them at 6000, 7000, and 8000. My own idea is that they were between 3000 and 4000. Except when poor Lumsden was killed, they made little attempt to stand. Most of the killed were Kotah Contingent men. We took the Neemuch troop of artillery complete, three L. F. Battery guns, and four of the King's Own. I wish sincerely they had had as many more, as after their flank was turned, they could not have used them, and must have lost them all. An old Soubahdar, who stuck in a jheel, begged for mercy, on the ground that he had eaten the Company's salt for forty odd years, and would never do it again! The 13th and 14th Irregulars, who were in the action, are talking of asking pardon. I feel very thankful for my success, for had these two brigades succeeded in getting into our rear, they would, undoubtedly, have done much mischief."

He was now becoming very eager for the assault; and ceaseless alike in his protests against delay and in his endeavours to promote the necessary preparations. On the 4th of September he wrote:—"I think we have a right to hope for success, and I trust that ere another week passes our flag will be flying from the palace minarets. Wilson has told me that he intends to nominate me Military Governor, for which I am much obliged; but I had rather that he had told me that he intended to give me command of the column of pursuit." On the 7th he wrote, "Poor Pandy has been in very low spirits since then (the battle of Nujufghur), and please God he'll be in still lower before the end of this week;" and then, after some military details, he added, with that tender regard and affection for those serving under him which is characteristic of all great soldiers: "A poor orderly of mine, named Saadut Khan, died here of cholera the other day. He has a mother and a brother, and I think a wife, in the Ensofzye country. Should I not be left to do it, will you kindly provide for the brother, and give the women a couple of hundred rupees out of my estate?" And again on September 11th, chafing sorely under the procrastination that so vexed him:—"There has been yet another day's delay with the batteries; but I do not see how there can possibly be another. The game is completely in our hands." But busied as he was with military details, and impatient for the assault, there were times when he gave himself up to more serious reflections:—"I do so wish I could have seen Sir Henry [Lawrence] under the circumstances you mention," he wrote to Colonel Edwardes. "If it please Providence that I live through this business, you must get me alongside of you again, and help me in endeavouring to follow his example; for I am so weak and unstable that I shall never do any good of myself."

The hour so anxiously looked for came at last. The assault was ordered; and Brigadier John Nicholson was appointed to lead the storming columns. If the choice had been left to the army, he would have been selected by universal acclamation to fill the post of honour and of danger. On the morning of the 14th of September, the columns, eager to assault, and flushed with the thought of the coming victory, moved out in the grey dawn. They were to move in different directions, in accordance with a preconcerted plan, Nicholson himself leading the first column of attack. At first everything seemed to promise a speedy success. But, after awhile, it became apparent that the defence was more vigorous than had been anticipated. As they were advancing to the attack of the Lahore Gate, a gun was run up by the enemy into the lane along which the column was advancing, and another placed to support it, whilst the windows and roofs of the houses were swarming with riflemen. "Nicholson," we are told, "saw the emergency. He pushed on the 1st Fusiliers, who answered to his call right gallantly. One gun was taken and spiked; twice they rushed at the second; the grape ploughed through the lane; bullets poured down like hail from the walls and houses; Major Jacob fell mortally wounded at the head of his men; Captain Speke and Captain Greville were disabled; the men were falling fast; there was hesitation; Nicholson sprang forward, and whilst in the act of waving his sword to urge the men on once more—alas for the column! alas for the army! alas for India!—he fell back mortally wounded, shot through the chest by a rebel from a house window close by, and was carried off by two of the 1st Fusiliers."* He desired to be laid in the shade, and on no account to be carried back to camp till Delhi had fallen. But it was soon apparent that we were still a long way off from that consummation; so he allowed himself to be placed on a litter and carried back to our camp. He was in fearful agony when he was brought in, and the blood was streaming down his side. But it was not at once discernible that the wound must certainly prove mortal, though small hope of his recovery was entertained by the medical officers who attended him. It was a strange and touching circumstance that about the same time his brother Charles was brought in, with one shattered arm hanging loose in his sleeve, and that they were laid beside each other on contiguous couches.

On that evening Nicholson's old friend and comrade, Nevill Chamberlain, went to see him, and found the suffering hero "breathing with difficulty, and only able to jerk out his words in syllables at long intervals and with pain." He spoke of his mother, and of his friend, Herbert Edwardes; asked Chamberlain to tell him exactly what the surgeons said of his case, and put eager questions regarding the progress of the siege. Next day he seemed to breathe more freely, and there was a change in his face, which promised well, and the more sanguine of his friends began to entertain some hope of his recovery. On the 16th, it appeared that he might be moved with safety into a bungalow, at a little distance from the tent where he lay; and the change was effected without causing him much pain. On that day he asked Chamberlain to write down for him a message which he wished to be sent to Edwardes—"Tell him I should have been a better man, if I had continued to live with him, and our heavy public duties had not prevented my seeing more of him privately. I was always the better for a residence with him and his wife, however short. Give my love to them both."

From the 17th to the 22nd his state varied; he was now better and now worse; but on the latter day he was obviously much weaker, and he himself felt that he was dying. He told Chamberlain, who sat by his bed-side, that the world had no longer any interest for him. He sent another message to Edwardes, saying, "If at this moment a good fairy were to give me a wish, it would be to have him here, next to my mother;" and shortly afterwards said, "Tell my mother that I do not think that we shall be unhappy in the next world. God has visited her with a great affliction, but tell her she must not give way to grief." From this time he sunk gradually, and on the following morning peacefully resigned his soul to his Maker. "He looked so peaceful in his coffin," wrote one who witnessed his last days, "and there was a resignation in the expression of his manly face that made me feel that he had bowed submissively to God's work and closed his eyes upon the world, full of hope." He was buried in the new burial-ground in front of the Cashmere Gate of the city, and not far from the spot where he fell "The funeral *cortège* was comparatively small," writes the clergyman who performed the burial-service; "very few besides personal friends composed the mournful train. Most prominent and most distinguished of all those who best loved and best valued Nicholson was Chamberlain. He had soothed the dying moments of the departed hero, and now that he was dead and concealed from his sight, he stood as long as he well could beside the coffin as chief mourner. The corpse was brought from the General's own tent on a gun-carriage. But no roar of cannon announced the departure of the procession from camp; no volleys of musketry disturbed the silence which prevailed at his grave; no martial music was heard. Thus without pomp or show we buried him."*

But, when it was known that Nicholson was dead, there rose a voice of wail from one end of India to the other. No man was more trusted in life; no man more lamented in death. There was not a tent or a bungalow in all the country in which there was not a painful sense of both a national and a personal loss. Nor was the feeling of grief and dismay confined to his own countrymen. In the great Province where he had served so long, thousands speaking in another tongue bewailed the death of the young hero. Few men have ever done so much at the early age of thirty-five; few men, thus passing away from the scene in the flower of their manhood, have ever left behind them a reputation so perfect and complete.

HEREWARD, THE LAST OF THE ENGLISH.

By CHARLES KINGSLEY.

CHAPTER XXX.

HOW HEREWARD PLAYED THE POTTER; AND HOW HE CHEATED THE KING.

They of Ely were now much straitened, being shut in both by land and water; and what was to be done, either by themselves or by the king, they knew not. Would William simply starve them; or at least inflict on them so perpetual a Lent—for of fish there could be no lack, even if they ate or drove away all the fowl—as would tame down their proud spirits; which a diet of fish and vegetables, from some ludicrous theory of monastic physicians, was supposed to do?* Or was he gathering vast armies, from they knew not whence, to try, once and for all, another assault on the island—it might be from several points at once?

They must send out a spy, and find out news from the outer world, if news were to be gotten. But who would go?

So asked the bishop, and the abbot, and the earls, in council in the abbot's lodging.

Torfrida was among them. She was always among them now. She was their Alruna-wife, their Vala, their wise woman, whose counsels all received as more than human.

"I will go," said she, rising up like a goddess on Olympus. "I will cut off my hair, and put on boy's clothes, and smirch myself brown with walnut-leaves; and I will go. I can talk their French tongue. I know their French ways; and as for a story to cover my journey and my doings, trust a woman's wit to invent that."

They looked at her, with delight in her courage, but with doubt.

"If William's French grooms got hold of you, Torfrida, it would not be a little walnut-brown which would hide you," said Hereward. "It is like you to offer,—worthy of you, who have no peer."

"That she has not," quoth churchmen and soldiers alike.

"But—to send you would be to send Hereward's wrong half. The right half of Hereward is going; and that is, himself."

"Uncle, uncle!" said the young earls, "send Winter, Geri, Leofwin Prat, any of your fellows: but not yourself. If we lose you, we lose our head and our king."

And all prayed Hereward to let any man go, rather than himself.

"I am going, lords and knights; and what Hereward says he does. It is one day to Brandon. It may be two days back; for if I miscarry—as I most likely shall—I must come home round about. On the fourth day, you shall hear of me or from me. Come with me, Torfrida."

And he strode out.

He cropped his golden locks, he cropped his golden beard; and Torfrida cried, as she cropped them, half with fear for him, half for sorrow over his shorn glories.

"I am no Samson, my lady; my strength lieth not in my locks. Now for some rascal's clothes—as little dirty as you can get me, for fear of company."

And Hereward put on filthy garments, and taking mare Swallow with him, got into a barge and went across the river to Soham.

He could not go down the Great Ouse, and up the Little Ouse, which was his easiest way, for the French held all the river below the isle; and, beside, to have come straight from Ely might cause suspicion. So he went down to Fordham, and crossed the Lark at Mildenhall; and just before he got to Mildenhall, he met a potter carrying pots upon a pony.

"Halt, my stout fellow," quoth he, "and put thy pots on my mare's back."

"The man who wants them must fight for them," quoth that stout churl, raising a heavy staff.

"Then here is he that will," quoth Hereward; and, jumping off his mare, he twisted the staff out of the potter's hands, and knocked him down therewith.

"That will teach thee to know an Englishman when thou seest him."

"I have met my master," quoth the churl, rubbing his head. "But dog does not eat dog; and it is hard to be robbed by an Englishman, after being robbed a dozen times by the French."

"I will not rob thee. There is a silver penny for thy pots and thy coat—for that I must have likewise. And if thou tellest to mortal man aught about this, I will find those who will cut thee to ribands; and if not, then turn thy horse's head and ride back to Ely, if thou canst cross the water, and say what has befallen thee; and thou wilt find there an abbot who will give thee another penny for thy news."

So Hereward took the pots, and the potter's clay-greased coat, and went on through Mildenhall, "crying," saith the chronicler, "after the manner of potters, in the English tongue, 'Pots! pots! good pots and pans!'"

But when he got through Mildenhall, and well into the rabbit-warrens, he gave mare Swallow a kick, and went over the heath so fast northward, that his pots danced such a dance as broke half of them before he got to Brandon.

---

* The Cornish—the stoutest, tallest, and most prolific race of the South—live on hardly anything else but fish and vegetables.

"Never mind," quoth he, "they will think that I have sold them. And when he neared Brandon he pulled up, sorted his pots, kept the whole ones, threw the sherds at the rabbits, and walked on into Brandon solemnly, leading the mare, and crying "Pots!"

So "semper marcida et deformis aspectu"—lean and ill-looking—was that famous mare, says the chronicler, that no one would suspect her splendid powers, or take her for anything but a potter's nag, when she was caparisoned in proper character. Hereward felt thoroughly at home in his part; as able to play the Englishman which he was by rearing, as the Frenchman which he was by education. He was full of heart, and happy. He enjoyed the keen fresh air of the warrens; he enjoyed the ramble out of the isle, in which he had been cooped up so long; he enjoyed the fun of the thing—disguise, stratagem, adventure, danger. And so did the English, who adored him. None of Hereward's deeds is told so carefully and lovingly; and none, doubt it not, was so often sung in after years by farm-house hearths, or in the outlaws' lodge, as this. Robin Hood himself may have trolled out many a time, in doggrel strain, how Hereward played the potter.

And he came to Brandon, to the "king's court," —probably Weeting Hall, or castle, from which William could command the streams of Wissey and Little Ouse, with all their fens—and cast about for a night's lodging, for it was dark.

Outside the town was a wretched cabin of mud and turf—such a one as Irish folk live in to this day; and Hereward said to himself, "This is bad enough to be good enough for me."

So he knocked at the door, and knocked till it was opened, and a hideous old crone put out her head.

"Who wants to see me at this time of night?"

"Any one would, who had heard how beautiful you are. Do you want any pots?"

"Pots! What have I to do with pots, thou saucy fellow? I thought it was some one wanting a charm." And she shut the door.

"A charm?" thought Hereward. "Maybe she can tell me news, if she be a witch. They are shrewd souls, these witches, and know more than they tell. But if I can get any news, I care not if Satan brings it in person."

So he knocked again, till the old woman looked out once more, and bade him angrily be off.

"But I am belated here, good dame, and afraid of the French. And I will give thee the best bit of clay on my mare's back—pot—pan—pansion—crock—jug, or what thou wilt, for a night's lodging."

"Have you any little jars—jars no longer than my hand?" asked she; for she used them in her trade, and had broken one of late: but to pay for one, she had neither money nor mind. So she agreed to let Hereward sleep there, for the value of two jars.—"But what of that ugly brute of a horse of thine?"

"She will do well enough in the turf-shed."

"Then thou must pay with a pannikin."

"Ugh!" groaned Hereward; "thou drivest a hard bargain, for an Englishwoman, with a poor Englishman."

"How knowest thou that I am English?"

"So much the better if thou art not," thought Hereward; and bargained with her for a pannikin against a lodging for the horse in the turf-house, and a bottle of bad hay.

Then he went in, bringing his panniers with him with ostentatious care.

"Thou canst sleep there on the rushes. I have nought to give thee to eat."

"Nought needs nought," said Hereward; threw himself down on a bundle of rush, and in a few minutes snored loudly.

But he was never less asleep. He looked round the whole cabin; and he listened to every word.

The devil, as usual, was a bad paymaster; for the witch's cabin seemed only somewhat more miserable than that of other old women. The floor was mud, the rafters unceiled; the stars shone through the turf roof. The only hint of her trade was a hanging shelf, on which stood five or six little earthen jars, and a few packets of leaves. A parchment, scrawled with characters which the owner herself probably did not understand, hung against the cob wall; and a human skull—probably used only to frighten her patients—dangled from the roof-tree.

But in a corner, stuck against the wall, was something which chilled Hereward's blood a little. A dried human hand, which he knew must have been stolen off the gallows, gripping in its fleshless fingers a candle, which he knew was made of human fat. That candle, he knew, duly lighted and carried, would enable the witch to walk unseen into any house on earth, yea through the court of King William himself, while it drowned all men in preternatural slumber.

Hereward was very much frightened. He believed as devoutly in the powers of a witch as did then—and does now, for aught Italian literature, *e permissu superiorum*, shows—the Pope of Rome.

So he trembled on his rushes, and wished himself safe through that adventure, without being turned into a hare or a wolf.

"I would sooner be a wolf than a hare, of course, killing being more in my trade than being killed; but—who comes here?"

And to the first old crone, who sat winking her bleared eyes, and warming her bleared hands over a little heap of peat in the middle of the cabin, entered another crone, if possible uglier.

"Two of them! If I am not roasted and eaten this night, I am a lucky man."

And Hereward crossed himself devoutly, and invoked St. Ethelfrida of Ely, St. Guthlac of Crowland, St. Felix of Ramsey—to whom, he recollected, he had been somewhat remiss: but, above all, St. Peter of Peterborough, whose treasures he had given to the Danes. And he argued stoutly with St. Peter and with his own conscience, that the means sanctify the end, and that he had done it all for the best.

"If thou wilt help me out of this strait, and the rest, blessed Apostle, I will give thee—I will go to Constantinople but what I will win it—a golden table twice as fine as those villains carried off, and one of the Bourne manors—Witham—or Toft—or Mainthorpe—whichever pleases thee best, in full fee; and a—and a——"

But while Hereward was casting in his mind what gewgaw further might suffice to appease the Apostle, he was recalled to business and common-sense by hearing the two old hags talk to each other in French.

His heart leaped for joy, and he forgot St. Peter utterly.

"Well, how have you sped? Have you seen the king?"

"No; but Ivo Taillebois. Eh? Who the foul fiend have you lying there?"

"Only an English brute. He cannot understand us. Talk on: only don't wake the hog. Have you got the gold?"

"Never mind."

Then there was a grumbling and a quarrelling, from which Hereward understood that the gold was to be shared between them.

"But it is a bit of chain. To cut it will spoil it."

The other insisted; and he heard them chop the gold chain in two.

"And is this all?"

"I had work enough to get that. He said, No play no pay; and he would give it me after the isle was taken. But I told him my spirit was a Jewish spirit, that used to serve Solomon the Wise; and he would not serve me, much less come over the sea from Normandy, unless he smelt gold; for he loved it like any Jew."

"And what did you tell him then?"

"That the king must go back to Aldreth again; for only from thence he would take the isle; for—and that was true enough—I dreamt I saw all the water of Aldreth full of wolves, clambering over into the island on each other's backs."

"That means that some of them will be drowned."

"Let them drown. I left him to find out that part of the dream for himself. Then I told him how he must make another causeway, bigger and stronger than the last, and a tower on which I could stand and curse the English. And I promised him to bring a storm right in the faces of the English, so that they could neither fight nor see."

"But if the storm does not come?"

"It will come. I know the signs of the sky—who better?—and the weather will break up in a week. Therefore I told him he must begin his works at once, before the rain came on; and that we would go and ask the spirit of the well to tell us the fortunate day for attacking."

"That is my business," said the other; "and my spirit likes the smell of gold as well as yours. Little you would have got from me, if you had not given me half the chain."

Then the two rose.

"Let us see whether the English hog is asleep."

One of them came and listened to Hereward's breathing, and put her hand upon his chest. His hair stood on end; a cold sweat came over him. But he snored more loudly than ever.

The two old crones went out satisfied. Then Hereward rose, and glided after them.

They went down a meadow to a little well, which Hereward had marked as he rode thither hung round with bits of rag and flowers, as similar "holy wells" are decorated in Ireland to this day.

He hid behind a hedge, and watched them stooping over the well, mumbling he knew not what of cantrips.

Then there was silence, and a tinkling sound as of water.

"Once—twice—thrice," counted the witches. Nine times he counted the tinkling sound.

"The ninth day—the ninth day, and the king shall take Ely," said one in a cracked scream, rising, and shaking her fist toward the isle.

Hereward was more than half-minded to have put his dagger—the only weapon which he had—into the two old beldames on the spot. But the fear of an outcry kept him still. He had found out already so much, that he was determined to find out more. So to-morrow he would go up to the Court itself, and take what luck sent.

He slipt back to the cabin, and lay down again; and as soon as he had seen the two old crones safe asleep, fell asleep himself, and was so tired that he lay till the sun was high.

"Get up!" screamed the old dame at last, kicking him, "or I shall make you give me another crock for a double night's rest."

He paid his lodging, put the panniers on the mare, and went on crying pots.

When he came to the outer gateway of the Court, he tied up the mare, and carried the crockery in on his own back, boldly. The scullions saw him; and called him into the kitchen, to see his crockery, without the least intention of paying for what they took.

A man of rank belonging to the Court came in, and stared fixedly at Hereward.

"You are mightily like that villain Hereward, man," quoth he.

"Anon?" asked Hereward, looking as stupid as he could.

"If it were not for his brown face and short hair, he is as like the fellow as a churl can be to a knight."

"Bring him into the hall," quoth another; "and let us see if any man knows him."

Into the great hall he was brought, and stared at by knights and squires. He bent his knees, rounded his shoulders, and made himself look as mean as he could.

Ivo Taillebois and Earl Warrenne came down and had a look at him.

"Hereward?" said Ivo. "I will warrant that little slouching cur is not he. Hereward must be half as big again, if it be true that he can kill a man with one blow of his fist."

"You may try the truth of that for yourself some day," thought Hereward.

"Does any one here talk English? Let us question the fellow," said Earl Warrenne.

"Hereward? Hereward? Who wants to know about that villain?" answered the potter, as soon as he was asked in English. "Would to heaven he were here, and I could see some of you noble knights and earls paying him for me; for I owe him more than ever I shall pay myself."

"What does he mean?"

"He came out of the isle ten days ago, nigh on to evening, and drove off a cow of mine and four sheep, which was all my living, noble knights, save these pots."

"And where is he since?"

"In the isle, my lords, well-nigh starved, and his folk falling away from him daily, from hunger and ague-fits. I doubt if there be a hundred sound men left in Ely."

"Have you been in thither, then, villain?"

"Heaven forbid! I in Ely? I in the wolf's den? If I went in with naught but my skin, they would have it off me before I got out again. If your lordships would but come down, and make an end of him once for all; for he is a great tyrant, and terrible, and devours us poor folk like so many mites in cheese."

"Take this babbler into the kitchen, and feed him," quoth Earl Warrenne; and so the colloquy ended.

Into the kitchen again the potter went. The king's luncheon was preparing; and he listened to their chatter, and picked up this at least, which was valuable to him: that the witches' story was true; that a great attack would be made from Aldreth; that boats had been ordered up the river to Cotinglade, and pioneers and entrenching tools were to be sent on that day to the site of the old causeway.

But soon he had to take care of himself. Earl Warrenne's commands to feed him were construed by the cook-boys and scullions into a command to make him drunk likewise. To make a laughing-stock of an Englishman was too tempting a jest to be resisted; and Hereward was drenched (says the chronicler) with wine and beer, and sorely baited and badgered. At last one rascal hit upon a notable plan.

"Pluck out the English hog's hair and beard, and put him blindfold in the midst of his pots, and see what a smash we shall have."

Hereward pretended not to understand the words, which were spoken in French; but when they were interpreted to him, he grew somewhat red about the ears.

Submit he would not. But if he defended himself, and made an uproar in the king's Court, he might very likely find himself riding Odin's horse before the hour was out. However, happily for him, the wine and beer had made him stout of heart, and when one fellow laid hold of his beard, he resisted sturdily.

The man struck him, and that hard. Hereward, hot of temper, and careless of life, struck him again, right under the ear.

The fellow dropped for dead.

Up leapt cook-boys, scullions, "lécheurs," (who hung about the kitchen to "lécher," lick the platters,) and all the foul-mouthed rascality of a great mediæval household; and attacked Hereward "cum furcis et tridentibus," with forks and flesh-hooks.

Then was Hereward aware of a great broach, or spit, before the fire; and recollecting how he had used such a one as a boy against the monks of Peterborough, was minded to use it against the cooks of Brandon; which he did so heartily, that in a few moments he had killed one, and driven the others backward in a heap.

But his case was hopeless. He was soon overpowered by numbers from outside, and dragged into the hall, to receive judgment for the mortal crime of slaying a man within the precincts of the Court.

He kept up heart. He knew that the king was there; he knew that he should most likely get justice from the king. If not, he could but discover himself, and so save his life; for that the king would kill him knowingly, he did not believe.

So he went in boldly and willingly, and up the hall, where, on the dais, stood William the Norman.

William had finished his luncheon, and was standing at the board side. A page held water in a silver basin, in which he was washing his hands. Two more knelt, and laced his long boots, for he was, as always, going a-hunting.

Then Hereward looked at the face of the great man, and felt at once that it was the face of the greatest man whom he had ever met.

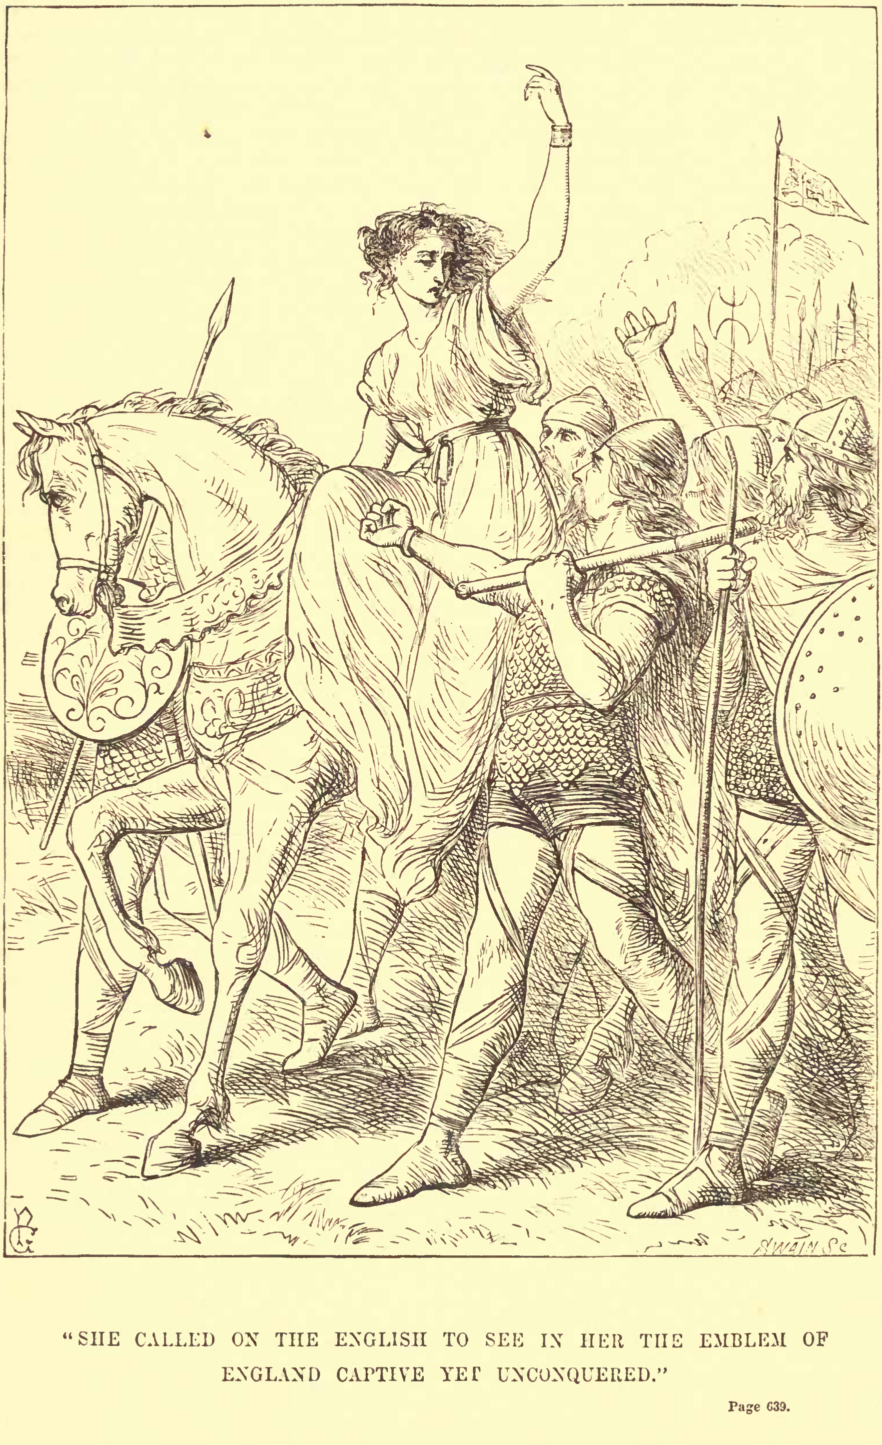
"I am not that man's match," said he to himself. "Perhaps it will all end in being his man, and he my master."

"Silence, knaves!" said William, "and speak one of you at a time. How came this?"

"A likely story, forsooth!" said he, when he had heard. "A poor English potter comes into my court, and murders my men under my very eyes for mere sport. I do not believe you, rascals! You, churl," and he spoke through an English interpreter, "tell me your tale, and justice you shall have or take, as you deserve. I am the King of England, man, and I know your tongue, though I speak it not yet, more pity."

Hereward fell on his knees.

"If you are indeed my lord the king, then I am safe; for there is justice in you, at least so all men say." And he told his tale, manfully.



"SHE CALLED ON THE ENGLISH TO SEE IN HER THE EMBLEM OF ENGLAND CAPTIVE YET UNCONQUERED."

Page 639.

"Splendeur Dex! but this is a far likelier story, and I believe it. Hark you, you ruffians! Here am I, trying to conciliate these English by justice and mercy, whenever they will let me, and here are you outraging them, and driving them mad and desperate, just that you may get a handle against them, and thus rob the poor wretches and drive them into the forest. From the lowest to the highest—from Ivo Taillebois there, down to you cook-boys—you are all at the same game. And I will stop it! The next time I hear of outrage to unarmed man or harmless woman, I will hang that culprit, were he Odo my brother himself."

This excellent speech was enforced with oaths so strange and terrible, that Ivo Taillebois shook in his boots; and the chaplain prayed fervently that the roof might not fall in on their heads.

"Thou smilest, man?" said William, quickly, to the kneeling Hereward. "So thou understandest French?"

"A few words only, most gracious king, which we potters pick up, wandering everywhere with our wares," said Hereward, speaking in French; for so keen was William's eye, that he thought it safer to play no tricks with him.

Nevertheless, he made his French so execrable, that the very scullions grinned, in spite of their fear.

"Look you," said William, "you are no common churl; you have fought too well for that. Let me see your arm."

Hereward drew up his sleeve.

"Potters do not carry sword-scars like those; neither are they tattooed like English thanes. Hold up thy head, man, and let us see thy throat."

Hereward, who had carefully hung down his head to prevent his throat-patterns being seen, was forced to lift it up.

"Aha! So I expected. More fair ladies' work there. Is not this he who was said to be so like Hereward? Very good. Put him in ward till I come back from hunting. But do him no harm. For"—and William fixed on Hereward eyes of the most intense intelligence—"were he Hereward himself, I should be right glad to see Hereward safe and sound; my man at last, and earl of all between Humber and the Fens."

But Hereward did not rise at the bait. With a face of stupid and ludicrous terror, he made reply in broken French.

"Have mercy, mercy, Lord King! Make not that fiend earl over us. Even Ivo Taillebois there would be better than he. Send him to be earl over the imps in hell, or over the wild Welsh who are worse still: but not over us, good Lord King, whom he hath polled and peeled till we are——"

"Silence!" said William, laughing, as did all round him. "Thou art a cunning rogue enough, whoever thou art. Go into limbo, and behave thyself till I come back."

"All saints send your grace good sport, and thereby me a good deliverance," quoth Hereward, who knew that his fate might depend on the temper in which William returned. So he was thrust into an outhouse, and there locked up.

He sat on an empty barrel, meditating on the chances of his submitting to the king after all, when the door opened, and in strode one with a drawn sword in one hand, and a pair of leg-shackles in the other.

"Hold out thy shins, fellow! Thou art not going to sit at thine ease there like an abbot, after killing one of us grooms, and bringing the rest of us into disgrace. Hold out thy legs, I say!"

"Nothing easier," quoth Hereward cheerfully, and held out a leg. But when the man stooped to put on the fetters, he received a kick which sent him staggering.

After which he recollected very little, at least in this world. For Hereward cut off his head with his own sword.

After which (says the chronicler) he broke away out of the house, and over garden walls and palings, hiding and running, till he got to the front gate, and leaped upon mare Swallow.

And none saw him, save one unlucky groom-boy, who stood yelling and cursing in front of the mare's head, and went to seize the bridle.

Whereon, between the imminent danger, and the bad language, Hereward's blood rose, and he smote that unlucky groom-boy: but whether he slew him or not, the chronicler had rather not say.

Then he shook up mare Swallow, and rode for his life, with knights and squires (for the hue and cry was raised) galloping at her heels.

Who then were astonished but those knights, as they saw the ugly potter's garron gaining on them, length after length, till she and her rider had left them far behind?

Who then was proud but Hereward, as the mare tucked her great thighs under her, and swept on over heath and rabbit-burrow, over rush and fen, sound ground and rotten all alike to that enormous stride, to that keen bright eye which foresaw every footfall, to that raking shoulder which picked her up again at every stagger?

Hereward laid the bridle on her neck, and let her go. Fall she could not, and tire she could not; and he half wished she might go on for ever. Where could a man be better, than on a good horse, with all the cares of this life blown away out of his brains by the keen air which rushed around his temples? And he galloped on, as cheery as a boy, shouting at the rabbits as they scuttled from under his feet, and laughing at the dottrel as they postured and anticked on the mole hills.

But think he must at last, of how to get home. For to go through Mildenhall again would not be safe, and he turned over the moors to Icklingham; and where he went after, no man can tell.

Certainly not the chronicler; for he tells how Hereward got back by the Isle of Somersham. Which is all but impossible, for Somersham is in Huntingdonshire, many a mile on the opposite side of Ely Isle.

And of all those knights that followed him, none ever saw or heard sign of him, save one: and his horse came to a standstill in "the aforesaid wood," which the chronicler says was Somersham; and he rolled off his horse, and lay breathless under a tree, looking up at his horse's heaving flanks and wagging tail, and wondering how he should get out of that place before the English found him and made an end of him.

Then there came up to him a ragged churl, and asked him who he was, and offered to help him.

"For the sake of God and courtesy," quoth he, his Norman pride being well-nigh beat out of him, "if thou hast seen or heard anything of Hereward, good fellow, tell me, and I will repay thee well."

"As thou hast asked me for the sake of God and of courtesy, Sir Knight, I will tell thee. I am Hereward. And in token thereof, thou shalt give me up thy lance and sword, and take instead this sword which I carried off from the king's Court; and promise me, on the faith of a knight, to bear it back to King William; and tell him, that Hereward and he have met at last, and that he had best beware of the day when they shall meet again."

So that knight, not having recovered his wind, was fain to submit, and go home a sadder and a wiser man. And King William laughed a royal laugh, and commanded his knights that they should in no wise harm Hereward, but take him alive, and bring him in, and they should have great rewards. Which seemed to them more easily said than done.

CHAPTER XXXI.

HOW THEY FOUGHT AGAIN AT ALDRETH.

Hereward came back in fear and trembling after all. He believed in the magic powers of the witch of Brandon; and he asked Torfrida, in his simplicity, whether she was not cunning enough to defeat her spells by counter spells.

Torfrida smiled and shook her head.

"My knight, I have long since given up such vanities. Let us not fight evil with evil, but rather with good. Better are prayers than charms; for the former are heard in heaven above, and the latter only in the pit below. Let me and all the women of Ely go rather in procession to St. Etheldreda's well, there above the fort at Aldreth, and pray St. Etheldreda to be with us when the day shall come, and defend her own isle, and the honour of us women who have taken refuge in her holy arms."

So all the women of Ely walked out barefoot to St. Etheldreda's well, with Torfrida at their head, clothed in sackcloth, and with fetters on her wrists, and waist, and ankles; which she vowed, after the strange, sudden, earnest fashion of those times, never to take off again till she saw the French host flee from Aldreth before the face of St. Etheldreda. So they prayed, while Hereward and his men worked at the forts below. And when they came back, and Torfrida was washing her feet, sore and bleeding from her pilgrimage, Hereward came in.

"You have murdered your poor soft feet, and taken nothing thereby, I fear."

"I have. If I had walked on sharp razors all the way, I would have done it gladly, to know what I know now. As I prayed I looked out over the fen; and St. Etheldreda put a thought into my heart. But it is so terrible a one, that I fear to tell it to you. And yet it seems our only chance."

Hereward threw himself at her feet, and prayed her to tell. At last she spoke, as one half afraid of her own words:

"Will the reeds burn, Hereward?"

Hereward kissed her feet again and again, calling her his prophetess, his saviour.

"Burn! yes, like tinder, in this March wind, if the drought only holds. Pray that the drought may hold, Torfrida."

"There, there, say no more. How hard-hearted war makes even us women! There, help me to take off this rough sackcloth, and dress myself again."

Meanwhile William had moved his army again to Cambridge, and on to Willingham-field, and there he began to throw up those "globos and montanas," of which Leofric's paraphraser talks, but of which now no trace remains. Then he began to rebuild his causeway, broader and stronger; and commanded all the fishermen of the Ouse to bring their boats to Cotinglade, and ferry over his materials. "Among whom came Hereward in his boat, with head and beard shaven lest he should be known, and worked diligently among the rest. But the sun did not set that day without mischief; for before Hereward went off, he finished his work by setting the whole on fire, so that it was all burnt, and some of the French killed and drowned."

And so he went on, with stratagems and ambushes, till "after seven days' continual fighting, they had hardly done one day's work; save four 'globos' of wood, in which they intended to put their artillery. But on the eighth day they determined to attack the isle, putting in the midst of them that pythoness woman on a high place, where she might be safe freely to exercise her art."

It was not Hereward alone who had entreated Torfrida to exercise her magic art in their behalf. But she steadily refused, and made good Abbot Thurstan support her refusal by a strict declaration, that he would have no fiends' games played in Ely, as long as he was abbot alive on land.

Torfrida, meanwhile, grew utterly wild. Her conscience smote her, in spite of her belief that St. Etheldreda had inspired her, at the terrible resource which she had hinted to her husband, and which she knew well he would carry out with terrible success. Pictures of agony and death floated before her eyes, and kept her awake at night. She watched long hours in the church in prayer; she fasted; she disciplined her tender body with sharp pains; she tried, after the fashion of those times, to atone for her sin, if sin it was. At last she had worked herself up into a religious frenzy. She saw St. Etheldreda in the clouds, towering over the isle, menacing the French host with her virgin palm-branch. She uttered wild prophecies of ruin and defeat to the French; and then, when her frenzy collapsed, moaned secretly of ruin and defeat hereafter to themselves. But she would be bold; she would play her part; she would encourage the heroes who looked to her as one inspired, wiser and loftier than themselves.

And so it befel, that when the men marched down to Haddenham that afternoon, Torfrida rode at their head on a white charger, robed from throat to ankle in sackcloth, her fetters clanking on her limbs. But she called on the English to see in her the emblem of England captive yet unconquered and to break her fetters, and the worse fetters of every woman in England who was the toy and slave of the brutal invaders; and so fierce a triumph sparkled from her wild hawk-eyes that the Englishmen looked up to her weird beauty as to that of an inspired saint; and when the Normans came on to the assault there stood on a grassy mound behind the English fort a figure clothed in sackcloth, barefooted and bareheaded, with fetters shining on waist, and wrist, and ankle—her long black locks streaming in the wind, her long white arms stretched cross-wise toward heaven, in imitation of Moses of old above the battle with Amalek; invoking St. Etheldreda and all the powers of heaven, and chanting doom and defiance to the invaders.

And the English looked on her, and cried: "She is a prophetess! We will surely do some great deed this day, or die around her feet like heroes!"

And opposite to her, upon the Norman tower, the old hag of Brandon howled and gibbered with filthy gestures, calling for the thunderstorm which did not come; for all above, the sky was cloudless blue.

And the English saw and felt, though they could not speak it, dumb nation as they were, the contrast between the spirit of cruelty and darkness, and the spirit of freedom and light.

So strong was the new bridge, that William trusted himself upon it on horseback, with Ivo Taillebois at his side.

William doubted the powers of the witch, and felt rather ashamed of his new helpmate; but he was confident in his bridge, and in the heavy artillery which he had placed in his four towers.

Ivo Taillebois was utterly confident in his witch, and in the bridge likewise.

William waited for the rising of the tide; and when the tide was near its height, he commanded the artillery to open, and clear the fort opposite of the English. Then with crash and twang, the balistas and catapults went off, and great stones and heavy lances hurtled through the air.

"Back!" shouted Torfrida, raised almost to madness, by fasting, self-torture, and religious frenzy. "Out of yon fort, every man. Why waste your lives under that artillery? Stand still this day, and see how the saints of heaven shall fight for you."

So utter was the reverence which she commanded for the moment, that every man drew back, and crowded round her feet outside the fort.

"The cowards are fleeing already. Let your men go, Sir King!" shouted Taillebois.

"On to the assault! Strike for Normandy!" shouted William.

"I fear much," said he to himself, "that this is some stratagem of that Hereward's. But conquered they must be."

The evening breeze curled up the reach. The great pike splashed out from the weedy shores, and sent the white fish flying in shoals into the low glare of the setting sun: and heeded not, stupid things, the barges packed with mailed men, which swarmed in the reeds on either side the bridge, and began to push out into the river.

The starlings swung in thousands round the reed-ronds, looking to settle in their wonted place: but dare not; and rose and swung round again, telling each other, in their manifold pipings, how all the reed-ronds teemed with mailed men. And all above, the sky was cloudless blue.

And then came a trample, a roll of many feet on the soft spongy peat, a low murmur which rose into wild shouts of "Dex Aie!" as a human tide poured along the causeway, and past the witch of Brandon Heath.

"'Dex Aie?'" quoth William, with a sneer. "'Debbles Aie!' would fit better."

"If, sire, the powers above would have helped us, we should have been happy enough to—But if they would not, it is not our fault if we try below," said Ivo Taillebois.

William laughed. "It is well to have two strings to one's bow, sir. Forward, men! forward!" shouted he, riding out to the bridge end, under the tower.

"Forward!" shouted Ivo Taillebois.

"Forward!" shouted the hideous hag over head. "The spirit of the well fights for you."

"Fight for yourselves," said William.

There was twenty yards of deep clear water between Frenchman and Englishman. Only twenty yards. Not only the arrows and arblast quarrels, but heavy hand-javelins, flew across every moment; every now and then a man toppled forward, and plunged into the blue depth among the eels and pike, to find his comrades of the summer before; then the stream was still once more. The coots and water-hens swam in and out of the reeds, and wondered what it was all about. The water-lilies flapped upon the ripple, as lonely as in the loneliest mere. But their floats were soon broken, their white cups stained with human gore.

Twenty yards of deep clear water. And treasure inestimable to win by crossing it.

They thrust out baulks, canoes, pontoons; they crawled upon them like ants, and thrust out more yet beyond, heedless of their comrades, who slipped, and splashed, and sank, holding out vain hands to hands too busy to seize them. And always the old witch jabbered overhead, with her cantrips, pointing, mumming, praying for the storm; while all above, the sky was cloudless blue. And always on the mound opposite, while darts and quarrels whistled round her head, stood Torfrida, pointing with outstretched scornful finger at the strugglers in the river, and chanting loudly what the Frenchmen could not tell: but it made their hearts, as it was meant to do, melt like wax within them.

"They have a counter witch to yours, Ivo, it seems; and a fairer one. I am afraid the devils, especially if Asmodeus be at hand, are more likely to listen to her than to that old broomstick-rider aloft."

"Fair is, that fair cause has, Sir King."

"A good argument for honest men, but none for fiends. What is the fair fiend pointing at so earnestly there?"

"Somewhat among the reeds. Hark to her now! She is singing, somewhat more like an angel than a fiend, I will say for her."

And Torfrida's bold song, coming clear and sweet across the water, rose louder and shriller till it almost drowned the jabbering of the witch.

"She sees more there than we do."

"I see it!" cried William, smiting his hand upon his thigh. "Par le splendeur Dex! She has been showing them where to fire the reeds; and they have done it!"

A puff of smoke; a wisp of flame; and then another and another; and a canoe shot out from the reeds on the French shore, and glided into the reeds of the island.

"The reeds are on fire, men! Have a care," shouted Ivo.

"Silence, fool! Frighten them once, and they will leap like sheep into that gulf. Men! right about! Draw off—slowly and in order. We will attack again to-morrow."

The cool voice of the great captain arose too late. A line of flame was leaping above the reed bed, crackling and howling before the evening breeze. The column on the causeway had seen their danger but too soon, and fled. But whither?

A shower of arrows, quarrels, javelins, fell upon the head of the column as it tried to face about and retreat, confusing it more and more. One arrow, shot by no common aim, went clean through William's shield, and pinned it to the mailed flesh. He could not stifle a cry of pain.

"You are wounded, sire. Ride for your life! It is worth that of a thousand of these churls," and Ivo seized William's bridle and dragged him, in spite of himself, through the cowering, shrieking, struggling crowd.

On came the flame, leaping and crackling, laughing and shrieking, like a live fiend. The archers and slingers in the boats cowered before it; and fell, scorched corpses, as it swept on. It reached the causeway, surged up, recoiled from the mass of human beings, then sprang over their heads and passed onwards, girding them with flame.

The reeds were burning around them; the timbers of the bridge caught fire; the peat and faggots smouldered beneath their feet. They sprang from the burning footway and plunged into the fathomless bog, covering their faces and eyes with scorched hands, and then sank in the black gurgling slime.

Ivo dragged William on, regardless of curses and prayers from his soldiery; and they reached the shore just in time to see between them and the water a long black smouldering writhing line; the morass to right and left, which had been a minute before deep reed, an open smutty pool, dotted with boatsful of shrieking and cursing men; and at the causeway end the tower, with the flame climbing up its posts, and the witch of Brandon throwing herself desperately from the top, and falling dead upon the embers, a motionless heap of rags.

"Fool that you are! Fool that I was!" cried the great king, as he rolled off his horse at his tent door, cursing with rage and pain.

Ivo Taillebois sneaked off, sent over to Mildenhall for the second witch, and hanged her, as some small comfort to his soul. Neither did he forget to search the cabin till he found buried in a crock the bits of his own gold chain and various other treasures, for which the wretched old women had bartered their souls. All which he confiscated to his own use, as a much injured man.

The next day William withdrew his army. The men refused to face again that blood-stained pass. The English spells, they said, were stronger than theirs, or than the daring of brave men. Let William take Torfrida and burn her, as she had burned them, with reeds out of Willingham fen; then might they try to storm Ely again.

Torfrida saw them turn, flee, die in agony. Her work was done; her passion exhausted; her self-torture, and the mere weight of her fetters, which she had sustained during her passion, weighed her down; she dropped senseless on the turf, and lay in a trance for many hours.

Then she arose, and, casting off her fetters and her sackcloth, was herself again: but a sadder woman till her dying day.

CHAPTER XXXII.

HOW KING WILLIAM TOOK COUNSEL OF A CHURCHMAN.

If Torfrida was exhausted, so was Hereward likewise. He knew well that a repulse was not a defeat. He knew well the indomitable persistence, the boundless resources, of the master-mind whom he defied; and he knew well that another attempt would be made, and then another, till—though it took seven years in the doing—Ely would be won at last. To hold out doggedly as long as he could was his plan: to obtain the best terms he could for his comrades. And he might obtain good terms at last. William might be glad to pay a fair price in order to escape such a thorn in his side as the camp of refuge, and might deal—or, at least, promise to deal—mercifully and generously with the last remnant of the English gentry. For himself, yield he would not: when all was over, he would flee to the sea, with Torfrida and his own housecarles, and turn viking; or go to Sweyn Ulfsson in Denmark, and die a free man.

The English did not foresee these things. Their hearts were lifted up with their victory, and they laughed at William and his French, and drank Torfrida's health much too often for their own good. Hereward did not care to undeceive them. But he could not help speaking his mind in the abbot's chamber to Thurstan, Egelwin, and his nephews, and to Sigtryg Ranaldsson, who was still in Ely, not only because he had promised to stay there, but because he could not get out if he would.

Blockaded they were utterly, by land and water. The isle furnished a fair supply of food; and what was wanting, they obtained by foraging. But they had laid the land waste for so many miles round, that their plundering raids brought them in less than of old; and if they went far, they fell in with the French, and lost good men, even though they were generally successful. So provisions were running somewhat short, and would run shorter still.

Moreover, there was a great cause of anxiety. Bishop Egelwin, Abbot Thurstan, and the monks of Ely were in rebellion, not only against King William, but more or less against the Pope of Rome. They might be excommunicated. The minster lands might be taken away.

Bishop Egelwin set his face like a flint. He expected no mercy. All he had ever done for the French was to warn Robert Comyn that if he stayed in Durham, evil would befall him. But that was as little worth to him as it was to the said Robert. And no mercy he craved. The less a man had, the more fit he was for heaven. He could but die; and that he had known ever since he was a chanter-boy. Whether he died in Ely, or in prison, mattered little to him, provided they did not refuse him the sacraments; and that they would hardly do. But call the Duke of Normandy his rightful sovereign he would not, because he was not—nor anybody else just now, as far as he could see.

Valiant likewise was Abbot Thurstan, for himself. But he had—unlike Bishop Egelwin, whose diocese had been given to a Frenchman—an abbey, monks, and broad lands, whereof he was father and steward. And he must do what was best for the abbey, and also what the monks would let him do. For severe as was the discipline of a minster in time of peace, yet in time of war, when life and death were in question, monks had ere now turned valiant from very fear, like Cato's mouse, and mutinied: and so might the monks of Ely.

And Edwin and Morcar?

No man knows what they said or thought; perhaps no man cared much, even in their own days. No hint does any chronicler give of what manner of men they were, or what manner of deeds they did. Fair, gentle, noble, beloved even by William, they are mere names, and nothing more, in history; and it is to be supposed, therefore, that they were nothing more in fact. The race of Leofric and Godiva had worn itself out.

One night the confederates had sat late, talking over the future more earnestly than usual. Edwin, usually sad enough, was especially sad that night.

Hereward jested with him, tried to cheer him; but he was silent, would not drink, and went away before the rest.

The next morning he was gone, and with him half-a-dozen of his private housecarles.

Hereward was terrified. If defections once began, they would be endless. The camp would fall to pieces, and every man among them would be hanged, mutilated, or imprisoned, one by one, helplessly. They must stand or fall together.

He went raging to Morcar. Morcar knew nought of it. On the faith and honour of a knight, he knew nought. Only his brother had said to him a day or two before, that he must see his betrothed before he died.

"He is gone to William, then? Does he think to win her now—an outcast and a beggar—when he was refused her with broad lands and a thousand men at his back? Fool! See that thou play not the fool likewise, nephew, or——"

"Or what?" said Morcar, defiantly.

"Or thou wilt go, whither Edwin is gone—to betrayal and ruin."

"Why so? He has been kind enough to Waltheof and Gospatric, why not to Edwin?"

"Because," laughed Hereward, "he wanted Waltheof, and he does not want you and Edwin. He can keep Mercia quiet without your help. Northumbria and the Fens he cannot without Waltheof's. They are a rougher set as you go east and north, as you should know already, and must have one of themselves over them to keep them in good humour for awhile. When he has used Waltheof as his stalking-horse long enough to build a castle every ten miles, he will throw him away like a worn bowstring, Earl Morcar, nephew mine."

Morcar shook his head.

In a week more he was gone likewise. He came to William at Brandon.

"You are come in at last, young earl?" said William, sternly. "You are come too late."

"I throw myself on your knightly faith," said Morcar. But he had come in an angry and unlucky hour.

"How well have you kept your own, twice a rebel, that you should appeal to mine? Take him away."

"And hang him?" asked Ivo Taillebois.

"Pish! No—thou old butcher. Put him in irons, and send him into Normandy."

"Send him to Roger de Beaumont, sire. Roger's son is safe in Morcar's castle at Warwick, so it is but fair that Morcar should be safe in Roger's."

And to Roger de Beaumont he was sent, while young Roger was Lord of Warwick, and all around that once was Leofric and Godiva's.

Morcar lay in a Norman keep till the day of William's death. On his death-bed the tyrant's heart smote him, and he sent orders to release him. For a few short days, or hours, he breathed free air again. Then Rufus shut him up once more, and for ever.

And that was the end of Earl Morcar.

A few weeks after, three men came to the camp at Brandon, and they brought a head to the king. And when William looked upon it, it was the head of Edwin.

The human heart must have burst up again in the tyrant, as he looked on the fair face of him he had so loved, and so wronged; for they say he wept.

The knights and earls stood round, amazed and awed, as they saw iron tears run down Pluto's cheek.

"How came this here, knaves?" thundered he at last.

They told a rambling story, how Edwin always would needs go to Winchester, to see the queen, for she would stand his friend, and do him right. And how they could not get to Winchester, for fear of the French, and wandered in woods and wolds; and how they were set upon, and hunted; and how Edwin still was mad to go to Winchester: but when he could not, he would go to Blethwallon and his Welsh; and how Earl Randal of Chester set upon them; and how they got between a stream and the tide-way of the Dee, and were cut off. And how Edwin would not yield. And how then they slew him in self-defence, and Randal let them bring the head to the king.

This, or something like it, was their story. But who could believe traitors? Where Edwin wandered, what he did during those months, no man knows. All that is known is, three men brought his head to William, and told some such tale. And so the old nobility of England died up and down the ruts and shaughs, like wounded birds; and, as of wounded birds, none knew or cared how far they had run, or how their broken bones had ached before they died.

"Out of their own mouths they are condemned, says Holy Writ," thundered William. "Hang them on high."

And hanged on high they were, on Brandon heath.

Then the king turned on his courtiers, glad to ease his own conscience by cursing them.

"This is your doing, sirs! If I had not listened to your base counsels, Edwin might have been now my faithful liegeman and my son-in-law; and I had had one more Englishman left in peace, and one less sin upon my soul."

"And one less thorn in thy side," quoth Ivo Taillebois.

"Who spoke to thee? Ralph Guader, thou gavest me the counsel: thou wilt answer it to God and his saints."

"That did I not. It was Earl Roger, because he wanted the man's Shropshire lands."

Whereon high words ensued; and the king gave the earl the lie in his teeth, which the earl did not forget.

"I think," said the rough shrewd voice of Ivo, "that instead of crying over spilt milk,—for milk the lad was, and never would have grown to good beef, had he lived to my age——"

"Who spoke to thee?"

"No man, and for that reason I spoke myself. I have lands in Spalding, by your Majesty's grace, and wish to enjoy them in peace, having worked for them hard enough—and how can I do that, as long as Hereward sits in Ely?"

"Splendeur Dex!" said William, "thou art right, old butcher."

So they laid their heads together to slay Hereward. And after they had talked awhile, then spoke William's chaplain for the nonce, an Italian, a friend and pupil of Lanfranc of Pavia, an Italian also, then Archbishop of Canterbury, scourging and imprisoning English monks in the south. And he spoke like an Italian of those times, who knew the ways of Rome.

"If his majesty will allow my humility to suggest——"

"What? Thy humility is proud enough under the rose, I will warrant: but it has a Roman wit under the rose likewise. Speak!"

"That when the secular and carnal arm has failed, as it is written *—He poureth contempt upon princes, and letteth them wander out of the way in the wilderness, or fens;—for the Latin word, and I doubt not the Hebrew, has both meanings."

"Splendeur Dex!" cried William, bitterly; "that hath he done with a vengeance! Thou art right so far, Clerk!"

"Yet helpeth He the poor, videlicet, his church and the religious, who are vowed to holy poverty, out of misery, videlicet, the oppression of barbarous customs, and maketh them households like a flock of sheep."

"They do that for themselves already, here in England," said William, with a sneer at the fancied morals of the English monks and clergy.†

---

* I do not laugh at Holy Scripture myself. I only insert this as a specimen of the usual mediæval "cant"—a name and a practice which are both derived, not from Puritans, but from monks.

† The alleged profligacy and sensuality of the English Church before the Conquest, rests merely on a few violent and vague expressions of the Norman monks who displaced them. No facts, as far as I can find, have ever been alleged. And without facts on the other side, an impartial man will hold by the one fact which is certain, that the Church of England, popish as it was, was, unfortunately for it, not popish enough; and from its insular

"But Heaven and not the Church does it for the true poor, whom your majesty is bringing in, to your endless glory."

"But what has all this to do with taking Ely?" asked William impatiently. "I asked thee for reason, and not sermons."

"This. That it is in the power of the Holy Father—and that power he would doubtless allow you, as his dear son and most faithful servant, to employ for yourself, without sending to Rome, which might cause painful delays—to——"

It might seem strange that William, Taillebois, Guader, Warrenne, short-spoken, hard-headed, swearing warriors, could allow complacently a smooth churchman to dawdle on like this, counting his periods on his fingers, and seemingly never coming to the point.

But they knew well, that the churchman was a far cunninger, as well as a more learned, man than themselves. They knew well that they could not hurry him; and that they need not; that he would make his point at last, hunting it out step by step, and letting them see how he got thither, like a cunning hound. They knew that if he spoke, he had thought long and craftily, till he had made up his mind; and that therefore he would very probably make up their minds likewise. It was—as usual in that age, the conquest not of a heavenly spirit, though it boasted itself such—but of a cultivated mind over brute flesh.

They might have said all this aloud, and yet the churchman would have gone on, as he did, where he left off, with unaltered blandness of tone.

"To convert to other uses the goods of the Church. To convert them to profane uses would, I need not say, be a sacrilege as horrible to heaven, as impossible to so pious a monarch"——

Ivo Taillebois winced. He had just stolen a manor from the monks of Crowland, and meant to keep it.

"Church lands belonging to abbeys or sees, whose abbots or bishops are contumaciously disobedient to the Holy See, or to their lawful monarch, he being in the communion of the Church and at peace with the said Holy See. If therefore, to come to that point at which my incapacity, through the devious windings of my own simplicity, has been tending, but with halting steps, from the moment that your majesty deigned to hear——"

"Put in the spur, man!" said Ivo, tired at last, "and run the deer to soil."

"Hurry no man's cattle, especially thine own," answered the churchman, with so shrewd a wink, and so cheery a voice, that Ivo, when he recovered from his surprise, cried:

"Why, thou art a good huntsman thyself, I believe now."

"All things to all men, if by any means— But to return. If your majesty should think fit to proclaim to the recalcitrants of Ely, that unless they submit themselves to your royal grace—and to that, of course, of His Holiness our Father—within a certain day, you will convert to other uses—premising, to avoid scandal, that those uses shall be for the benefit of Holy Church—all lands and manors of theirs lying without the precincts of the isle of Ely—those lands being, as is known, large and of great value—Quid plura? Why burden your exalted intellect by detailing to you consequences which it has long ere now foreseen?"

"* * * *" quoth William, who was as sharp as the Italian, and had seen it all. "I will make thee a bishop!"

"Spare to burden my weakness," said the chaplain; and slipt away into the shade.

"You will take his advice?" asked Ivo.

"I will."

"Then I shall see that Torfrida burn at last."

"Burn her?" and William swore.

"I promised my soldiers to burn the witch with reeds out of Haddenham fen, as she had burned them; and I must keep my knightly word."

William swore yet more. Ivo Taillebois was a butcher and a churl.

"Call me not butcher and churl too often, Lord King, ere thou hast found whether thou needest me or not. Rough I may be, false was I never."

"That thou wert not," said William, who needed Taillebois much, and feared him somewhat; and remarked something meaning in his voice, which made him calm himself, diplomat as he was, instantly. "But burn Torfrida thou shalt not."

"Well, I care not. I have seen a woman burnt ere now, and had no fancy for the screeching. Beside, they say she is a very fair dame—and has a fair daughter, too, coming on—and she may very well make a wife for a Norman."

"Marry her thyself."

"I shall have to kill Hereward first."

"Then do it, and I will give thee his lands."

"I may have to kill others before Hereward."

"You may?"

And so the matter dropped. But William caught Ivo alone after an hour, and asked him what he meant.

"No pay, no play. Lord King, I have served thee well, rough and smooth."

"Thou hast, and hast been well paid. But if I have said aught hasty——"

"Pish, Majesty. I am a plain-spoken man, and like a plain-spoken master. But instead of marrying Torfrida or her daughter, I have more mind to her niece, who is younger, and has no Hereward to be killed first."

"Her niece? Who?"

"Lucia as we call her, Edwin and Morcar's sister, Hereward's niece, Torfrida's niece."

"No pay, no play, saidst thou?—so say I. What meant you by having to kill others before Hereward?"

---

freedom, obnoxious to the Church of Rome, and the ultramontane clergy of Normandy; and was therefore to be believed capable—and therefore again accused—of any and every crime.

"Beware of Waltheof," said Ivo.

"Waltheof? Pish. This is one of thy inventions for making me hunt every Englishman to death, that thou mayest gnaw their bones."

"Is it? Then this I say more. Beware of Ralph Guader."

"Pish!"

"Pish on, Lord King." Etiquette was not yet discovered by Norman barons and earls, who thought themselves all but as good as their king, gave him their advice when they thought fit, and if he did not take it attacked him with all their meinie. "Pish on, but listen. Beware of Roger."

"And what more?"

"And give me Lucia. I want her. I will have her."

William laughed. "Thou of all men? To mix that ditch-water with that wine?"

"They were mixed in thy blood, Lord King, and thou art the better man for it, so says the world. Old wine and old blood throw any lees to the bottom of the cask; and we shall have a son worthy to ride behind——"

"Take care!" quoth William.

"The greatest Captain upon earth."

William laughed again, like Odin's self.

"Thou shalt have Lucia, for that word."

"And thou shalt have the plot ere it breaks. As it will."

"To this have I come at last," said William himself, as they parted. "To murder these English nobles; to marry their daughters to my grooms. Heaven forgive me! They have brought it upon themselves, by contumacy to Holy Church."

"Call my secretary, some one."

The Italian re-entered.

"The valiant and honourable and illustrious knight, Ivo Taillebois, Lord of Holland and Kesteven, weds Lucia, sister of the late earls Edwin and Morcar, now with the queen; and with her, her manors. You will prepare the papers."

"I am yours to death," said Ivo.

"To do you justice, I think thou wert that already. Stay—here—Sir Priest—do you know any man who knows this Torfrida?"

"I do, Majesty," said Ivo. "There is one Sir Ascelin, a man of Gilbert's, in the camp."

"Send for him."

"This Torfrida," said William, "haunts me."

"Pray heaven she have not bewitched your majesty."

"Tut, I am too old a campaigner to take much harm by woman's sharpshooting, at fifteen score yards off, beside a deep stream between. No. The woman has courage—and beauty too, you say?"

"What of that, oh Prince?" said the Italian. "Who more beautiful—if report be true—than those lost women who dance nightly in the forests with Venus and Herodias—as it may be this Torfrida has done many a time?"

"You priests are apt to be hard upon poor women."

"The fox found that the grapes were sour," said the Italian, laughing at himself and his cloth—or at anything else, by which he could curry favour.

"And this woman was no vulgar witch. That sort of personage suits Taillebois' taste, rather than Hereward's."

"Hungry dogs eat dirty pudding," said Ivo pertinently.

"The woman believed herself in the right. She believed that the saints of heaven were on her side. I saw it in her attitude, in her gestures. Perhaps she was right."

"Sire?" said both bystanders in astonishment.

"I would fain see that woman; and see her husband too. They are folks after my own heart. I would give them an earldom to win them."

"I hope that in that day you will allow your faithful servant Ivo to retire to his ancestral manors in Anjou; for England will be too hot for him. Sire, you know not this man—a liar, a bully, a robber, a swash-buckling ruffian, who——" and Ivo ran on with furious invective, after the fashion of the Normans, who considered no name too bad for an English rebel.

"Sir Ascelin," said William, as Ascelin came in, "you know Hereward?"

Ascelin bowed assent.

"Are these things true which Ivo alleges?"

"The Lord Taillebois may know best what manner of man he is since he came into this English air, which changes some folks mightily," with a hardly disguised sneer at Ivo; "but in Flanders he was a very perfect knight, beloved and honoured of all men, and especially of your father-in-law, the great marquis."

"He is a friend of yours, then?"

"No man less. I owe him more than one grudge, though all in fair quarrel; and one at least, which can only be wiped out in blood."

"Eh? What?"

Ascelin hesitated.

"Tell me, sir!" thundered William, "unless you have aught to be ashamed of."

"It is no shame, as far as I know, to confess that I was once a suitor, as were all knights for miles round, for the hand of the once peerless Torfrida. And no shame to confess, that when Hereward knew thereof, he sought me out at a tournament, and served me as he has served many a better man before and since."

"Over thy horse's croup, eh?" said William.

"I am not a bad horseman, as all know, Lord King. But heaven save me, and all I love, from that Hereward. They say he has seven men's strength, and I verily can testify to the truth thereof."

"That may be by enchantment," interposed the Italian.

"True, Sir Priest. This I know, that he wears enchanted armour, which Torfrida gave him before she married him."

"Enchantments again," said the secretary.

"Tell me now about Torfrida," said William.

Ascelin told him all about her, not forgetting to say—what, according to the chronicler, was a common report—that she had compassed Hereward's love by magic arts. She used to practise sorcery, he said, with her sorceress mistress, Richilda of Hainault. All men knew it. Arnoul, Richilda's son, was as a brother to her. And after old Baldwin died, and Baldwin of Mons and Richilda came to Bruges, Torfrida was always with her, while Hereward was at the wars.

"The woman is a manifest and notorious witch," said the secretary.

"It seems so indeed," said William, with something like a sigh. And so were Torfrida's early follies visited on her; as all early follies are. "But Hereward, you say, is a good knight and true?"

"Doubtless. Even when he committed that great crime at Peterborough——"

"For which he and all his are duly excommunicated by the Bishop," said the secretary.

"He did a very courteous and honourable thing." And Ascelin told how he had saved Alftruda, and instead of putting her to ransom, had sent her safe to Gilbert.

"A very knightly deed. He should be rewarded for it."

"Why not burn the witch, and reward him with Alftruda instead, since your majesty is in so gracious a humour?" said Ivo.

"Alftruda? Who is she? Ay, I recollect her. Young Dolfin's wife. Why, she has a husband already."

"Ay, but his Holiness at Rome can set that right. What is there that he cannot do?"

"There are limits, I fear, even to his power. Eh, priest?"

"What his Holiness' powers as the viceroy of Divinity on earth might be, did he so choose, it were irreverent to inquire. But as he condescends to use that power only for the good of mankind, he condescends, like Divinity, to be bound by the very laws which he has promulgated for the benefit of his subjects; and to make himself only a life-giving sun, when he might be a destructive thunderbolt."

"He is very kind, and we all owe him thanks," said Ivo, who had a confused notion that the Pope might strike him dead with lightning, but was good-natured enough not to do so. "Still, he might think of this plan; for they say that the lady is an old friend of Hereward's, and not over fond of her Scotch husband."

"That I know well," said William.

"And beside—if aught untoward should happen to Dolfin and his kin——"

"She might, with her broad lands, be a fine bait for Hereward. I see. Now, do this, by my command. Send a trusty monk into Ely. Let him tell the monks that we have determined to seize all their outlying lands, unless they surrender within the week. And let him tell Hereward, by the faith and oath of William of Normandy, that if he will surrender himself to my grace, he shall have his lands in Bourne, and a free pardon for himself and all his comrades."

The men assented, much against their will, and went out on their errand.

"You have played me a scurvy trick, sir," said Ascelin, "in advising the king to give the Lady Alftruda to Hereward."

"What! Did you want her yourself? On my honour I knew not of it. But have patience. You shall have her yet, and all her lands, if you will hear my counsel, and keep it."

"But you would give her to Hereward!"

"And to you too. It is a poor bait, say these frogs of fenmen, that will not take two pike running. Listen to me. I must kill this Hereward. I hate him. I cannot eat my meat for thinking of him. Kill him I must."

"And so must I."

"Then we are both agreed. Let us work together, and never mind if one's blood be old and the other's new. I am neither fool nor weakly, as thou knowest."

Ascelin could not but assent.

"Then here. We must send the King's message. But we must add to it."

"That is dangerous."

"So is war; so is eating, drinking; so is everything. But we must not let Hereward come in. We must drive him to despair. Make the messenger add but one word—that the king exempts from the amnesty Torfrida, on account of——You can put it into more scholarly shape than I can."

"On account of her abominable and notorious sorceries; and demands that she shall be given up forthwith to the ecclesiastical power, to be judged as she deserves."

"Just so. And then for a load of reeds out of Haddenham fen!"

"Heaven forbid!" said Ascelin, who had loved her once. "Would not perpetual imprisonment suffice?"

"What care I? That is the churchmen's affair, not ours. But I fear we shall not get her. Even so Hereward will flee with her—maybe escape to Flanders, or Denmark. He can escape through a rat's hole if he will. And then we are at peace. I had sooner kill him and have done with it: but out of the way he must be put."

So they sent a monk in with the message, and commanded him to tell the article about the Lady Torfrida, not only to Hereward, but to the abbot and all the monks.

A curt and fierce answer came back, not from Hereward, but from Torfrida herself—that William of Normandy was no knight himself, or he would not offer a knight his life, on condition of burning his lady.

William swore horribly. "What is all this about?" They told him—as much as they chose to tell him. He was very wroth. "Who was

Ivo Taillebois, to add to his message? He had said that Torfrida should not burn." Taillebois was stout; for he had won the secretary over to his side meanwhile. He had said nothing about burning. He had merely supplied an oversight of the king's. The woman, as the secretary knew, could not, with all deference to his majesty, be included in an amnesty. She was liable to ecclesiastical censure, and the ecclesiastical courts. William might exercise his influence on them in all lawful ways, and more, remit her sentence, even so far as to pardon her entirely, if his merciful temper should so incline him. But meanwhile, what better could he, Ivo, have done, than to remind the monks of Ely that she was a sorceress; that she had committed grave crimes, and was liable to punishment herself, and they to punishment also, as her shelterers and accomplices? What he wanted was to bring over the monks; and he believed that message had been a good stroke toward that. As for Hereward, the king need not think of him. He never would come in alive. He had sworn an oath, and he would keep it.

And so the matter ended.

ORKNEY AND THE ORCADIANS.

THE islands of Orkney and Shetland are so little known that many persons, in other respects well informed, seem to look upon them as in a sort the refuse of creation—some of the rubbish for which no use could be found, and which was therefore tossed out into the great lumber-room of the ocean to be out of the way,—a collection of rocks either uninhabitable or inhabited by a race of men almost as untamed as the seals which play upon their shores, and with intellects very little more developed; a race with whom the civilised world has no communion, living on fish, dressing in sealskin, gloriously ignorant of broad cloth, crinoline, the "Saturday Review," and other evidences of civilization; destitute of education, coming into the world and leaving it without benefit of clergy. I know many think they speak Gaelic—not that that is any fault, only it is not the case. They are, and have always been, as ignorant of Gaelic as we are of Chinese. But these northern islands and their inhabitants are in reality very interesting, and it is in the hope of making them better known and appreciated that I now attempt to give some account of the nearer group—the Orkneys. Separated from the mainland by the Pentland Frith, from ten to twelve miles in width, and "confronting," (as Mr. Balfour, their latest historian, remarks,) "within a few hours' sail, the mouths of the Baltic and the Elbe; indented with fine harbours, easily made as impregnable as any in Northern Europe, and never boomed like them by half a year of ice; with a soil of more than ordinary fertility; and a sea-loving people, hardy, intelligent, and enterprising—Orkney was well adapted to become the vanguard of northern civilisation and commerce."

To those who have not had their attention directed to the subject this may seem strong language; the description nevertheless is a true one.

The Orkney Islands are upwards of sixty in number, containing from 400,000 to 500,000 acres, and a population of 32,416, according to the census of 1861. Twenty-five are inhabited, and to these only the name of *island* is generally given. Those not inhabited, and used only for pasture, are called *holms*.

The general appearance of the group is flat, and to some extent tame. The only very high hill is Holy Head, which is upwards of 1300 feet above the level of the sea. There are other fine bold headlands, such as the Noup in Westray, the east side of Copinshay, and Moull Head. No trees meet the eye. You must look for them in some sheltered spot under the protecting care of a large building; and indeed those near the Cathedral at Kirkwall are perhaps the only specimens of full grown trees in Orkney or Shetland. So long as the young plantations are protected from the sea breezes they grow well enough, but whenever they show their heads above the sheltering wall, they become stunted. In some of the islands attempts are being made to foster them, but with little prospect of success; in others again there is not as much wood growing as would make a walking-stick. There is therefore some foundation for the joke against the Orkneyman, who, when it was thrown in his teeth that there were no trees in Orkney, indignantly replied, "It is not true, for there are three growing beside the kirk." He might have said three hundred, and have been well within the mark.

Orkney must have undergone a most remarkable change in respect of climate, for in the mosses, trunks of very large trees are found; and I have seen many deer's horns that have been dug up, proving that in some pre-historic age this now treeless, deerless country had not only deer but forests to shelter them.

The mosses containing these remains—trees, deer's horns, and hazel nuts—extend under the present sea level; and at very low tides they are sometimes exposed, as in Otterwick Bay, Sanday, and Deerness, suggesting that at one time the islands may have been joined to the mainland of Scotland. This conjecture is much strengthened by the fact that the granite and conglomerate at the western end of Graemsey and the shore of Stromness, bear a striking resemblance to the prevailing rocks in Sutherland and Caithness; while the sandstone flag of Orkney is exactly similar to the slaty rock of Caithness.

Pomona, or Mainland, is by far the largest of the Orkney group; its length from east to west is upwards of thirty miles, and its breadth in some places from six to eight miles. The two largest towns of Orkney are in Pomona—Stromness, in the south-west, with a population of about 3000, and a very fine harbour; and Kirkwall, the capital of Orkney, which lies on the north side, and contains above 4000 inhabitants, many good shops, three banks, two newspapers, churches and schools in proportion to the population, and a very fine Cathedral. The plan of the town is irregular, with a great show of gable-ends to the street, as is common in sea-board towns liable to frequent storms. The oldest houses have two gable-ends to the street, with a court or close between them. The same style of architecture is found in many old continental towns. The principal street is about a mile in length, and is made up of houses that would not seem out of place in any county town. It is not surprising that the metropolis of Orkney should now contain all the necessaries, and most of the luxuries, which modern refinement demands; but it is strange to find that 700 years ago, on this extreme verge of civilisation and so near the polar regions, there arose a cathedral, more perfect, very little smaller, and in some respects finer, than that of Glasgow. It was built in the 12th century, by Ronald, one of the Lords of Orkney, and dedicated to his uncle Magnus, the patron saint of the Orcadians. Tradition says that two rival Earls, cousins, had settled in Orkney. One of these, Magnus, who is called the Apostle of Orkney, endeavoured to instil the principles of Christianity into his wild people; the other, inheriting a love of war and plunder, despised the peace-loving tendencies of his cousin, laid violent hands on him, and ordered his followers to put him to death. Magnus, unable to avert his fate, prepared to meet it with the humility of a Christian and the nobility of an Earl. When about to be beheaded he said to the executioner, "Stand before me, and strike with all your might, that your sword may cleave my brain; it were unseemly that an Earl should be beheaded like a thief." Regard for his memory led to his canonization as a martyr, and to the erection and dedication of the Cathedral to his honour.

The architecture is Romanesque, with a little of the Early Pointed style. The view of the centre aisle lengthways is perhaps finer than anything of the kind in Scotland. The building is in good repair, but a portion of it has been partitioned off and is used as a parish church. That part has been thoroughly spoiled by pews, ugly square windows, and hideous galleries, looking as ill-suited to the beautiful nave of the old Cathedral, as would peg-tops and a dress-coat on a monk.

Near the Cathedral are the ruins of the Bishop's palace, where Haco, King of Norway, died in 1263, soon after the fatal battle of Largs. A little to the east of it is the Earl's palace, also in ruins, though not yet 300 years old.

Within an easy walk from Kirkwall is Wideford Hill, from the top of which nearly all the islands may be seen; and no one who goes there on a clear day will hesitate to admit that the scene before him, looking seaward, is one of exquisite beauty. In calm weather, the sea, land-locked by the islands, resembles a vast lake, clear and bright as a mirror, and without a ripple save from the gentle impulse of the tide. Here, a bluff headland stands out in bold relief against the horizon; there, the more distant islet is lost in sea and sky; on one side a shelving rock sends out a black tongue-like point, sharp as a needle, losing itself in the water, where it forms one of those reefs so common among the islands, and so fatal to strangers, but which every Orkney boatman knows as we do the streets of our native town; while on the other side a green holm, covered with cattle and ponies, slopes gently to the water's edge. Then there is the dovetailing and intercrossing of one point with another, the purple tints of the islands, the deep blue of the sea, the indentations of the coast, the boats plying their oars or lingering lazily on the waters, the white sails of the pleasure yachts contrasting with the dark brown canvass of the fishing craft, and here and there a large merchant vessel entering or leaving the harbour;—all these combine to make a most lovely picture, in which the additional ornament of trees is not missed. And again in a storm, the boiling tides, the green and white billows, the pillars of foam which spout aloft when dashed against the rocks, make a scene with which the absence of trees is in perfect harmony. You feel that trees here would be out of their element. In calm weather they are not needed, in a storm they would seem out of place. Anyone who has seen an Orkney sunset in June or July, tracing its diamond path across island, reef, and tideway, must confess that it is scarcely possible to suggest an addition to its beauty.

From Wideford Hill you can cast your eye upon structures that are memorials of every form of religion that has ever existed in Scotland. Stennis and its standing stones are in sight, eight or ten miles off. Nearer to you are some of those inscrutable mounds called Picts' houses. On the Isle of Eagleshay, which may be seen from the some spot, stand the walls and tower of probably the earliest Christian church in Britain. On the right you have the more complete development of the religious idea in the Cathedral of Kirkwall. With the same glance you take in the United Presbyterian Church, the Free Church, and those of every other considerable denomination in Scotland; for Kirkwall is not behind other places in its religious distinctions.

The Standing Stones of Stennis are still about thirty in number, forming portions of two circles, the larger of which measures above a hundred yards in diameter, and the smaller about thirty-four. These circles are not now complete, as many of the stones have fallen and many have disappeared, but sufficient traces remain to show what they were. The stones vary in form and size, and are all totally unhewn. The largest is about fourteen feet high, but the average height is from eight to ten; the breadth varies from three to eight; and the average thickness is one foot. They are grand, solemn-looking old veterans, painfully silent regarding their past life, as if ashamed to speak of those bloody rites in which they may have had a share. They were formerly called *Druidical Circles*, perhaps for no better reason than that their history is utterly unknown. Later investigations refer their erection to another race, and give them a Scandinavian origin, but the author of *Prehistoric Annals of Scotland* remarks, "We shall be nearer the truth when the exclusive Scandinavian theory has been demolished. . . . The common Gaelic phrase. '*Am bheil thu dol d'on chlachan?*' 'Are you going to the stones?' by which the Scottish Highlander inquires at his neighbour if he is bound for church, seems no doubtful tradition of worship within the Megalithic ring at an earlier date than that of the Norsemen." Professor Munch of Christiana, who visited Orkney in 1849 in order to investigate the traces of Norwegian intercourse with Scotland, was convinced that the first Scandinavian settlers found the stones standing. Possibly the Norsemen appropriated the great temple to their own use, as Dr. Wilson truly says,—"The rude Norsemen who possessed themselves of the Orkney Islands in the ninth century, found far less difficulty in adapting the temple of Stennis to the shrine of Thor, than the Protestants of the sixteenth century had to contend with, when they appropriated the old Cathedral of St. Magnus to the rites of Presbyterian worship."

Of the mounds called Picts' houses, of which there are hundreds in Orkney, we know as little as we do of the stones, save that they are of two kinds, very similar in construction, and that the smaller seem to have been the dwellings of the early inhabitants of the country, and the others the sepulchres of their dead. These structures are not strictly subterranean, although they are covered with earth. They were either erected on level ground, or excavated in the side of a hill. They are built of large stones converging towards the centre, where an aperture seems to have been left for air and light. Bones and teeth of the horse, cow, sheep, and boar, were found in the Picts' houses on Wideford Hill opened in 1849, but not a vestige of any human remains; whereas in a tumulus in the island of Burray, discovered and explored in 1863, the central compartment contained ten human skeletons and the skulls of four dogs. Similar remains, human and canine, were found in seven smaller chambers adjoining. I happened to be in Orkney when a party of antiquarians opened up the Maeshowe, the largest of all these mounds, about four years ago. It consists of a chamber 14 feet square and 20 feet high, with a recess in each of three walls, which may have been used either as a bed for the living, or a resting place for the dead. The walls are finely built and quite entire, though erected no one knows how long ago. A great many Runic characters were found engraven on the stones, and an excited buzz tingled the ears and quickened the pulses of the whole antiquarian world, even as far as Norway and Sweden; and those deep in antiquarian lore exchanged congratulatory whispers, that the Mystery was about to be solved. Casts of the Runes were taken and sent to Norway to be translated; but, alas! when interpreted they proved next to nothing, and seemed only to be the slightly scratched record of the exploration of the Maeshowe by the Norsemen, or the common formulæ of name-records, carved at different times by those who ransacked the mound in search of treasure. The disappointment on this occasion was scarcely less than that of the Antiquary on discovering that A. D. L. L. meant nothing more than "Aiken Drum's lang ladle." A full account of the excavation of the mound has been printed for private circulation by James Farrer, Esq., M.P. There seems little doubt that the stones of Stennis formed a temple for religious worship of some kind, either Celtic or Scandinavian or both.

We turn with more certainty to the church of Eagleshay, which is believed to have been built in the eighth century. It has the peculiar cylindrical tower found only in churches of that early period, and of which there are only other two in Britain (at Brechin and Abernethy), though there are many in Ireland. It is said that within the walls of that little church, Magnus, the Apostle of Orkney, was murdered by his cousin Haco, and Eagleshay became famous as his shrine.

The climate of Orkney is moist and mild; there are neither such warm summers nor such cold winters as in the south and west of Scotland. In June, 1861, however, a child died at Kirkwall from sunstroke. But such heat is very unusual. A gentleman who has lived in Orkney the greater part of his life, told me, that he had seldom seen ice strong enough to bear a man's weight. The Gulf Stream is, no doubt, the cause of this.

The length of day-light makes these islands a desirable summer residence. I have myself read a newspaper without difficulty at midnight in the month of June; and I have been told by a friend who lives in Orkney, that on the shortest day he has read the "Times" at 4 o'clock p.m. by daylight, or rather by the beautiful twilight of that region, for in winter the sun is only about four hours above the horizon.

The soil is in many parts mossy, but there is almost everywhere a stiff clay underneath, and this, when ploughed up, and mixed with the moss, makes a very good loam. In many places, the ground merely requires to be "tickled with the plough, that it may smile with the harvest," as somebody has said. With such a soil, and such mildness of climate, Orkney is likely to become a very rich agricultural district. The prevalent moistness, and the withering sea-breeze, will, however, always make the farmer's returns from grain crops more or less uncertain.

There is, perhaps, no district in Scotland, where so much is being done in the way of improving the land. In 1814, very considerable progress had been made on some of the larger estates in Orkney, more especially in the North Isles, where turnips were pretty extensively grown, and at least one flock of fine Cheviot merino sheep was profitably kept; but it was not until about twenty-five years ago that the agricultural movement began in earnest.

Previous to that time, the sea had been the sole support of the working man. He rented land, and paid his rent out of fish and sea-weed. Leases of land were not given to small tenants, and of course no improvement was possible. Small crofts were held on the run-rig system, and a croft was supposed to do its work if it raised some stunted oats, bere, and a few potatoes. The women were generally the farmers, while the men fished.

It is not many years since Orkney made out of her sea-weed alone an annual income of 15,000*l.*, 20,000*l.*, and even 25,000*l.* There is a kind of sea-weed, the *fucus palmatus*, commonly called tangle, thrown up in great abundance on the shores of the Orkneys, and also of the Western Isles. From this a substance called kelp is made, valuable from the large amount of iodine it contains, and once extensively used in the manufacture of soap and glass. Its value at one time ranged from 8*l.* to 16*l.* per ton, and during the war, when the importation of barilla from Spain was prohibited, it reached the price of 20*l.* per ton. Orkney kelp always brought double the price of that of the Western Isles or of Ireland.

The process of kelp-making is as follows:—The sea-weed is collected and dried, and put into a hole in the ground about three feet wide. A live coal is then put in, and the heap is allowed to smoulder. During the smouldering it is stirred with an iron-hook, until in course of time it gets into a state somewhat like molten lead. When it cools and dries, it is kelp. Besides iodine it contains glauber salts, common salt, and carbonate of soda.

Owing to the reduction of duty on barilla, which is both cheaper and better for glass-making, the manufacture of kelp is no longer remunerative, and as a general rule, kelp-making in Orkney has given place to farming.

It was not until after the failure in the kelp-trade, in 1832, and the establishment of weekly steam communication with Edinburgh, in 1833, that it occurred to some of the larger proprietors on and near the Mainland, that something might be made of the soil, to balance the loss of income from kelp. Even the most sanguine could not have anticipated, that, in a few years, improved farming, and communication with southern markets, would raise the export value of bacon and eggs alone to a larger sum than had ever come into the islands from the kelp-trade.

In saying a few words on the present state of agriculture in the Orkneys, I shall take the island with which I am best acquainted as a type of the whole. It is perhaps below some, and above others, but it is a fair representative.

In the island of Shapinshay, which contains about 7000 acres, only 730 were under cultivation 15 years ago, when the rental of the whole island was 601*l.* The thriftlessness of the farming of these days is well illustrated by an anecdote I had from Mr. Balfour, the proprietor. His father, observing that one of his tenants was always in difficulties, though he did not pay a farthing of rent, said to him one day, that he was surprised at his being so much in want, seeing that he had a good croft, and paid nothing for it. "Oh, Captain Balfour," he replied, "I *dae* pay a rent." "Why, what rent do you pay?" "Weel—I *sud* pay a hen." He thus took shelter under the fact, that a hen was exigible, but he did not venture to say it was paid.

Another tenant, whose rent of 10*s.* had been reduced in successive years to 7*s.* 6*d.*, 5s., and 2*s.* 6*d.*, was at length, for his importunity's sake, allowed to sit free. This kept him quiet a year or two, but at the end of that time he presented himself on the rent day to the laird, who, at a loss to know what more he could want, said, "Well, Robert, do you wish for a further reduction of rent?" "Oh, Captain," he replied, "ye're joking me noo; but I just cam to say that if ye dinna big me a barn I maun flit."

The island is now in a very satisfactory state of cultivation, about 5000 acres being under the plough, although the rental is as yet only about 1500*l.*

The rise in the price of land is surprising. Thirty years ago it was thought valueless, and could be bought for an old song. One half of Shapinshay was purchased by the grandfather of the present proprietor in 1796 for 1200*l.*; in 1846 the other half, though not better land, sold for about 14,000*l.* A dozen years ago Shapinshay imported meal for the support of its inhabitants; it now exports largely grain, potatoes, cattle, sheep, pigs, eggs, &c.

Any one who takes a trip to Orkney will see, as he sails into Kirkwall roads, a noble mansion, which for elegance and size would attract attention anywhere; and he will be at a loss to think what could induce a man to build so fine a house so far out of the world. But if the traveller were to pass a week with Mr. Balfour, and have a talk and a walk with him over his estate, and see how much has been done, and is still doing through his encouragement and residence among his people; if he could see the cheerful, independent, yet thoroughly respectful bearing of his tenants towards him, as if every face said plainly, "The world is going well with me; I have enough to eat, drink and put on, and I expect to be better off still, and I know that my landlord sympathises with me and helps me,"—if he saw all this, as I have, he would be at no loss to understand why Mr. Balfour has cast in his lot with his people, and made his home with them.

One plan adopted to encourage the inprovement of the land is, to charge for the first seven years a merely nominal rent—6*d.* or 1*s.* per acre. For the second seven years there is a small rise in the rent, and for the third seven a reasonable rent is charged, according to the state of the land. Another plan is:—A large piece of comparatively waste, or half cultivated land, is squared off and made into farms. The previous rent is a little raised, and a lease is granted for twenty-one years, on the understanding that if, at the end of seven years, the improvements stipulated for have been carried out, one-third of the rent shall be remitted towards payment of the expense of them. After the first seven years no further remission is made, and the rent is raised 15 per cent. each successive seven years, till an average rent be charged.

The rental of the whole of Orkney is above 50,000*l.*, and is constantly increasing, perhaps at the rate of 2000*l.* a year; and the condition of the people is improving every year in consequence. In the three banks at Kirkwall there are understood to be deposits, made chiefly by the middle and working classes, to the amount of 300,000*l.* These are large figures, but they cease to be surprising when you are told that, at a moderate computation, 10,000 head of cattle, a large proportion of them short-horns, are exported annually; besides a great number of pigs and sheep. Compare this with the traffic, not a great many years ago, when a sloop of seventy tons burden, making ten trips a year, was found to be almost sufficient. Fifteen years ago beef was sold at 2*d.* per lb., butter at 6*d.*, eggs at 3*d.* a dozen, cows from 30*s.* to 2*l.* The average price of two-year-olds raised in Orkney is now from 12*l.* to 15*l.*

The habits and mode of life of the islanders were very primitive even fifty years ago. The chimney of the cottage was simply a hole in the roof, and the fire was in the middle of the floor, so that the smoke had to find its way out as best it might. Such fire-places have, I think, almost disappeared from Orkney, at least I do not remember seeing one. A friend of mine told me that when he was a boy he was sitting one night with a farmer's family round the fire in the middle of the floor. Behind the dwarf wall, which formed the back of the fire-place, the peat-ashes were collected as bedding for the cattle, straw being scarce. An old woman of the party was relating a kelpy or fairy tale, with all the thrilling details which have such a horrible charm for children, and she had just got to the most exciting and terrible part of it. Every one began to look over his shoulder fearfully as if expecting the hobgoblin to appear, when, without the slightest warning, a terrific flop was heard, followed by such a cloud of dust as almost blinded every one present, though it was not so thick as to prevent them from seeing a figure emerge from the ashes and disappear through the door like a flash of lightning. The solution of the mystery was, that the sweetheart of Jeanie, one of the daughters, had climbed to the top of the house, and, looking down the hole which served for a chimney, threw pieces of turf at her, to let her know he was there. Missing her several times, and getting impatient, as young lovers are generally supposed to do, he made an extra effort to hit her, overbalanced himself, and fell down among the ashes, to the terror and amazement of the honest farmer's family. The young man is, I believe, still alive, and eighty years of age. I saw him in 1863, when a friend reminding him of the circumstance, he replied: "Deed ay, it's true enough; but it's time you and me were forgetting thae daft auld-warld stories."

In old times the islanders had many strange beliefs and antipathies, which some of the older people still cherish. For instance, they have a prejudice against turbot, and will not eat it—nor even name it at sea—although they constantly eat halibut, a much less delicate fish of the same species.

A strange belief was held generally at one time, that drowned persons are changed into seals. The island of Borey, in the bay of Milburn, is sometimes called the Seal Island, and a romantic legend is told in connection with it, which has already found its way into print, but not so fully as it was related to me.

It was a fine summer evening, and Harold of the isle of Gairsay had been fishing till late, when, as the sun went down, he heard the most enchanting music. He followed the sound till he reached the island of Borey, where he saw a company of gaily-dressed people dancing to it, but no musicians were visible. He went close inshore, and saw a number of black objects like beasts. They lay so still that he landed and took up one, and found it to be a seal-skin. He watched the dancers for some time, and when the sun began to rise the music suddenly ceased, and they all hurried down to the shore. Harold dropped the seal-skin into his boat, pushed off, and pulled away to a short distance, to see what would happen next. Each person seized a seal-skin, put it on, and plunged into the sea. One woman alone was left, and she went along the shore seeking the seal-skin which Harold had taken. He put back to the island, spoke to her, and then recognised her as his own mother, who had been drowned many years before. She told him that all drowned persons became seals, and once a month they were allowed to resume their human form and come on shore at sunset, and dance till sunrise. She begged hard for her seal-skin, which at first he refused to give up; but on her promising that he should have the prettiest maiden in all seal-land for his wife, he gave it back. She desired him to return to Borey that day month: she would then show him the seal-skin of the girl who should be his bride, and he was to keep the skin carefully hidden from the owner, whom he would thus have in his own power. On the night appointed Harold went again to Borey; again he heard the beautiful music, and saw the mysterious dancers. His mother went to the shore and laid her hand on a seal-skin, which Harold put into his boat; then rowed home and concealed it. Before sunrise he returned to Borey. The music ceased as before, the dancers resumed their seal-skins, and disappeared in the sea—all but one beautiful girl, who went about wringing her hands and weeping for the loss of hers. After a little time Harold approached and spoke to her. She told him that she was the daughter of a pagan king. He endeavoured to comfort her, and succeeded so well, that she consented to go home with him and become his wife. He loved her fondly, and she bore him several children; but at length she fell sick—some secret grief was consuming her. Often she asked for her seal-skin, but Harold never suffered her to see it; and at last she confessed that she was anxious about her soul. A priest was sent for, and she was baptised—yet still she was not satisfied, and pined away. "Harold," she said one day, "we have lived long and happily together. If we part, we part for ever. If I die, you cannot be sure that my soul is saved, for I have long lived a pagan. To-night is the dancing night; roll me in my seal-skin and leave me on the beach—they cannot take me away if I am Christian. But you must go out of sight, and return for me in the morning; then you will know my fate." Harold yielded to her wish. He laid her on the shore, and went himself to the other side of Gairsay to wait till sunrise. All night he sat with his face buried in his hands. Once he heard a sudden wail; they had found his wife on the shore, but he dared not move. That short midsummer night seemed endless to him; at last the sun appeared, and he hastened to the place where he had left her. She was still there. They had not taken her away, for she was a Christian. She was dead, but with a smile on her face that spoke of a soul at peace. That smile comforted Harold, and assured him that their parting would not be for ever.

The islanders are brave and hardy. During the season of egg-gathering they may be seen at one time climbing a precipice to rob the nests, at another swinging from the face of a rock with nothing between them and almost certain death but a rope round their waists. They thus naturally acquire the habit of talking of danger and even of death in a way that seems to indicate indifference to both. Probably few, however, reach the degree of coolness exhibited by an old man who went out one day with his son to gather eggs. The son descended the face of a high rock with one end of a rope round his waist, the other being fastened to a stake above, while the old man remained in his boat at the base, in case of accident. The precaution was not unnecessary, for the rope gave way, and the lad fell into the sea. There was a considerable ground swell, and the poor boy had sunk once or twice before his father could rescue him, but at last he was taken into the boat almost lifeless. This elicited from the father the simple remark, "Eh! I'm thinking thou's wat, Tam." The saying that those born to be hanged will never be drowned, is probably no truer of hanging than of other deaths. Tam was reserved for a different but scarcely less enviable fate. An acquaintance of the old man's, years afterwards, reminded him of Tam's escape, and asked what had become of him, to which the father replied in the same indifferent tone: "Tam? our Tam? Oh! Tam gaed awa' to a far country, and the haithens ate him." This anecdote I know to be perfectly true, and I have as reliable authority for another of the same kind. A man was one day gathering eggs on the face of a precipitous rock, and while creeping cautiously yet fearlessly along a ledge little broader than the sole of his foot, he came to an angle round which he must pass. The wall-like steepness of the rock and the narrowness of the ledge made this under any circumstances difficult and dangerous. The difficulty, however, grew into an apparent impossibility, when he found on reaching the corner that he had the wrong foot first. To turn back was impossible, to get round while his feet were in that position was equally so. The danger was observed by the friend who related the occurrence to me, and who looked on with terror at the probable consequences, for a false step or a stumble involved certain death. The man paused for a moment, took off his broad bonnet, in which he carried, as was customary, his snuff-horn, and after shaking up the snuff in the most unconcerned way, he took three hearty pinches, and then returned the horn to his bonnet, and the bonnet to his head. Then straightening himself up, he made an agile spring, and got the right foot first. It was an awful moment for the looker-on, and an awful risk for the performer. Happily it was successful; he got round the point, and finally reached the top of the rock in safety. My friend, who had waited for his ascent, said to him: "Man, Johnnie, were ye no feared?" "Eh man, if I had been feared, I wudna be here." "I daresay that," replied my friend; "but what made you think of taking a snuff when you were in such danger?" "Weel," he answered, with admirable simplicity and truth, "I thocht I was needin't."

It is impossible, within the limits of a short paper, to give a detailed description of the various islands. Nor is this necessary. Shapinshay, of which I have spoken, is a fair specimen of the others. Stronsay is, perhaps, farthest advanced towards general cultivation. Westray, Sanday, and Rousay are following up rapidly. I cannot, however, omit giving some account of North Ronaldshay, the most curious, most primitive, and most remote of the whole group. It is also the most difficult of access. Perhaps I was unusually unlucky, but I made five several attempts to reach it without success. In my sixth attempt, however, three years ago, I was more fortunate, though even then it was with some difficulty. The frith between North Ronaldshay and Sanday is a very dangerous one, and the wind and tide must be carefully consulted. If you start too late to reach it before the turn of the tide, you are almost inevitably carried back to your starting point, unless the wind be all the more favourable. A friend of mine, with his wife and some ladies, had once got within gun-shot of the shore as the tide turned, when, caught in the fringe of it, they were carried off as in a mill-stream, and in a very short time were miles off. One of the ladies was very sea-sick, and exhibited the disregard to personal appearance usual under the circumstances. She was lying huddled up in a corner of the boat, when one of the crew, being asked to do something, said, "Oo ay, I'll do't this minute, but I think it a pity of Miss —— lying that way; we'll hae to put her in some kin' o' shape first."

I got there in decent enough shape myself, about three o'clock in a fine summer morning, though a good stiff breeze was blowing. The beach is very rough, and the aspect of the island generally is about as inhospitable as can well be imagined.

It is very flat, the highest elevation being only 47 feet. What strikes one at first sight as most peculiar, is a dry stone wall, between 5 and 6 feet high, with small holes left at regular intervals. It stretches along the beach as far as you can see, and is but a little above high-water mark. You are still more surprised to learn that it goes right round the island. The purpose of this wall is very puzzling to a stranger. The island is a small one, only 4000 acres. Can it be meant to keep the young islanders from tumbling into the sea? or, if they are supposed to have more sense, is it to keep the sheep from the shore, lest they should be swept off by the waves which often play wildly there? No, but exactly the reverse. The wall was built for the double purpose of depriving the winds as they pass through it of the saline vapour which used to blight the crops, and of keeping the sheep out. The grass is very valuable, being required for the cattle, so the sheep must have other fare. What other fare, we naturally ask, can a sheep have than grass? Sea-weed—nothing but sea-weed—if we except some small patches of *plantago maritima*, or similar stunted grasses. From January to December, hundreds of sheep stroll about like the pariahs of the brute creation, outside that inhospitable wall, exposed to every variation of summer's heat and winter's cold. Perhaps, in the lambing season, if a ewe has the good luck to have twins, she may be taken inside the wall for a few days, and treated to a little grass as a delicacy suited to her tender condition, and as more likely to supply the drain made on her suckling powers by her "heavy handfu'." I need scarcely say, that the sheep here are unlike any animal of the species I ever saw. They are called wild sheep, are lean and scraggy, and are like goats. Their mutton is dark coloured. the natives like it very much, and some people say it has the flavour of venison. The taste is certainly peculiar, and suggests the idea of sea-weed. Though not at all disagreeable, I must confess that I failed to detect the smack of the deer's flesh in it.

Each tenant on North Ronaldshay is entitled to keep a certain number of sheep—three or four for every pound of rent that he pays—and he is bound to keep up a corresponding part of the wall. The sheep feed and roam about in common, and though they may belong to seventy or eighty different owners, one man's sheep is never mistaken for another's. This is managed by a system of marks on the ears, so ingeniously contrived, that nearly a hundred different marks can be made in the two "lugs" of a sheep. These marks are definitely specified in the various leases, and should a dispute arise, reference is made to the lease with as much confidence as if the question were about the annual rent. The population of the island at the last census was 582. I found 81 scholars on the school roll, and only eight different names among the whole. Every man is cousin or uncle to everybody else on the island. Every one you meet is a Tulloch, Turfus, Cutt, Muir, Thomson, Kilday, Swanny or Scott, and to distinguish those of the same name from each other the name of the farm or residence is added, such as John of Phisligan, Tom of Hooking, William of Purlatreck, &c., and the additional names are as formally entered on all business documents as those the minister gave them.

The Thomsons, Scotts, Tullochs, and Muirs, are descended from a ship-load of west-country Covenanters who were banished to the island; the others are from the original Norse settlers; but all are now so mixed by intermarriage, that you often find, in the same family, the blue eyes, flaxen hair, and bright red complexion of the Norse, with the black hair and eyes, and bilious look of the Scotch.

Almost every rood of the island is under cultivation. There are therefore no peats, and there is no wood, except when an unfortunate ship is wrecked. Coals and peats are very expensive. To obtain a supply of fuel, the people have recourse to an expedient practised by the Arabs in the desert, and also by the inhabitants of Cornwall. Every family has a cow, and when the byre is cleaned out, the dung heap, instead of being used for agricultural purposes, is mixed with straw, and then cut into pieces, which are called scones. These are laid in the sun to dry, and are not used until they are a year old, when the sulphuretted hydrogen is gone, and the smell in burning is not so offensive. One can see from this why the cow is made so much of, and has the grass all to herself, to the detriment of the sheep. It is not every animal that can supply us with meat, drink, clothing and fire. It is scarcely necessary to say, that the atmosphere of houses heated by this kind of fuel is not particularly pleasant. When I saw some smoked fish hanging in a cottage, I could not help asking if they had been smoked with scones. "Oh yes?" "But does it not spoil the fish?" "Well, peat or wood is better, but we soon get used to it." I could not help thinking that this eel-like facility in getting used to things is very fortunate;—and that it is the same kind of happy knack which discovers the flavour of venison in sea-weedy mutton. The same fuel is used in Sanday, and was until lately in Papa Westray.

There is no inn on North Ronaldshay, and as the minister was from home, I was thrown on the hospitality of a farmer, whose genuine kindness I shall not soon forget, and with whom I spent a very happy day and night. He is a very ingenious clever fellow, who can turn his hand to anything, and do everything well. He unites in his own person the varied offices of farmer, watchmaker, smith, carpenter, kelp-maker, and, if I mistake not, doctor—in all of which capacities he is purely self-taught. He has never been further south than Kirkwall, and has no desire to leave his little world, to which he is passionately attached. He knows all about it; but his knowledge, like charity, though it begins at home, does not end there. He is thoroughly up in the politics of the day, has a keen sense of humour, is full of anecdote, and well acquainted with the works of Scott, Thackeray, and Dickens. There is a post once a week to this island; to Westray, Sanday, and Rousay twice a week; and to some of the less remote islands once a day. This is a very different state of things from what existed formerly. At the time of the Revolution, a Scotch fisherman was imprisoned at Kirkwall, in May, 1689, for saying that King William III. had been crowned the previous November; and he was just about to be hanged for the treasonable statement when a vessel arrived to confirm it.

I have only to add one word on the people. They are, of course, first rate sailors. In appearance there is not any very striking indication of their descent, though now and then you see a decidedly Scandinavian face. Scott describes them as known by

> "The tall form, blue eye, proportion fair,
> The limbs athletic, and the long light hair;"

and this type you not unfrequently find.

I was much struck by the exceeding gentleness of the working classes. A brawny, bearded man, who has not a particle of cowardice or sneaking in his composition, speaks to you with all the softness of a woman. Swearing is a vice from which, so far as I could judge, they are singularly free. Their language is Scotch, with some unusual words, and a slightly peculiar accent, which no doubt are the remains of the Norse. In talking to each other, the common people use the familiar and kindly "thou" instead of "you," and their bearing towards each other is gentle and pleasing. I was one day crossing a frith in a pretty rough sea. The smack was being steered by one of the passengers, as the whole crew were required for other duties. He had a difficult task, but he managed it well, and one of the men said in banter: "Robbie, I'm thinking when thou was a young man [Robbie was not above forty] thou could steer a boat a little." "Weel," he replied, "my han' has been oot o't for some time; but when I was a younger man and in the way o't, if onybody had said that I kent naething aboot it *I wud hae lookit at him.*" In many other parts of Scotland the "*wud hae lookit at him*" would probably have taken an uglier form. I have seen some pretty female faces in Orkney, but the men are generally handsomer than the women. They are a people of whom I have formed a very high opinion, both morally and intellectually. The criminal and pauper rolls of Orkney will, I believe, bear a most favourable comparison with those of any part of the kingdom. The country presents many objects of interest to the antiquarian, the naturalist, the farmer, and the merchant. Hospitable, intelligent, industrious, and self-reliant, the Orcadians are sure to keep well abreast of their neighbours, and are likely to realize Mr. Balfour's idea of a prominent place in civilisation and commerce. When the resources of the country are developed, as they will be in the course of a few years, by the stimulus of regular leases and kindly encouragement on the part of the proprietors, they will be better known and appreciated by us on the mainland than they are now.

JOHN KERR.

ON LIGHT.

By SIR JOHN F. W. HERSCHEL, Bart.

PART II.

THEORIES OF LIGHT.—INTERFERENCES.—DIFFRACTION.

(*Concluded from page* 574.)

Diffraction.—The optical phænomena which refer themselves to this head are many and various. They are not, for the most part, very obvious, but are exceedingly curious and interesting in their details, and some of them, under careful arrangement and with good optical appliances, very brilliant. Familiar examples offer themselves in the twinkling of the stars and the changes of colour they exhibit during the different phases of their scintillations:—in the vivid radiating streaks of light which seem to stream outwards from any small and *dazzlingly* brilliant point of light (as for instance the reflection of the sun on a small polished globe, as a thermometer ball):—in the colours exhibited when a bright point is seen reflected on or refracted through a surface regularly striated or scratched across with fine equidistant lines, as beautifully exhibited in the so-called "Barton's buttons" (from the name of the ingenious and skilful amateur mechanist who first executed them); brass or steel buttons delicately cross-lined by engine work:—in the lateral images of a candle seen reflected on polished mother-of-pearl: and in the coloured halos often seen to surround the flame of a candle in certain states of the eye and their artificial imitations in a mode presently to be described. Less obvious to common observation, and requiring particular arrangement, instrumental or otherwise, to see them distinctly, are the phænomena (referable to the head of diffraction) of the rings and other appendages seen to surround the images of stars when viewed through telescopes of great magnifying power and with apertures either of the usual circular form, or of forms otherwise varied for this express purpose. And though last in our order of enumeration, by far the most important and instructive as elucidatory of the principle of explanation, applicable to all the phænomena of this class;—the coloured fringes seen to follow the outlines of shadows when thrown by a light emanating from an extremely small but intensely luminous point. With these therefore we shall begin.

It was objected to the undulatory theory of light by Newton himself, that sound, to which that theory assimilates it, spreads from an aperture through which it is transmitted, or round the edge of an intercepting screen of any kind, equally in all directions; and thus, were the analogy exact, there could be no shadows. The objection is founded partly on an imperfect statement of the fact, and partly on omitting to allow for possible differences in the natures of the conveying media, and in the modes of vibratory motion conveyed. Every one is familiar with the sudden outbreak of sound from a railway train heard at a great distance when it emerges from a cutting, or turns the corner of a wall or of a hill. Sound is propagated through water with greater sharpness, velocity, and distinctness, than through air. But an obstacle interposed under water, as a projecting pier, or a rock, cuts off the *rays of sound*, as appears from direct experiment, with much greater definiteness than in air, and casts, so to speak, an evident acoustic shadow. Nor will it appear at all surprising that an effect of this kind should, in the case of light, be carried still farther when we consider that the aerial impulses by which sound is propagated, take place *in the direction* of the sound-ray, so that in passing (for instance) through an aperture in a screen, a quantity of air is *pushed bodily through it*, and issuing on the other side, causes an increase of *local* density due to the actual introduction of additional air at a given spot, which of course tends to *expand laterally* as well as to *push forward*, and is not restrained from so doing by the lateral pressure of the rest of the wave, which is suppressed. Light, as we have already intimated, is propagated through an elastic medium more in analogy with a solid than a fluid (which Newton's objection implies) and by vibrational movements not in the direction of the ray, but transverse to it, so that in its passage through an aperture, or beside the edge of an obstacle, *this* cause of lateral spreading, at least, is absent; whatever other this peculiar mode of propagation may call into action. Lastly, however, the phænomena of diffraction with which we are now concerned rely for their explanation on this very principle—that shadows are *not* strictly definite, and that there really *is* a certain, and not very small amount of lateral spreading of the light into the space occupied by what may be called the geometrical shadow.

If a room be darkened and the sun allowed to shine into it only through a very small aperture, as a pin-hole, the rays which emanate from different points of its apparent disc, passing straight through and crossing at the hole, will depict on a white screen held at a distance of several feet from the hole a circular *image* or inverted picture of the sun, which may be considered as the circular base of a cone of rays having the pin-hole for its vertex. In this case, the illumination of the screen, if placed at a great distance, is feeble, and, if near, the circular patch of light inconveniently small. But if instead of a pin-hole, be substituted a convex glass lens of short focus, the whole of the sun-light received on it will be concentrated in the very small image of the sun formed in its focus, and, diverging *thence* will spread out into a much wider cone of light, and form a much larger circular and brilliantly illuminated area on the screen, affording every facility for the examination of the shadows of objects thrown upon it; with the additional convenience that by a reflector outside of the window, the illuminating sunbeam may be thrown horizontally, at whatever time of day the experiment is made.

The condition essential to the distinct exhibition of all phænomena of this class—that of a very brilliant light emanating from a very small point, being thus secured, let an opaque body of any form be placed between the point and the screen, so as to cast a shadow on it. It would naturally be expected under such circumstances that the termination of the shadow on all sides should be a clear and sharply marked outline, separating a uniformly bright space on the outside from a uniformly dark one within, and free from that external gradation from light to darkness which constitutes what is called the *penumbra* in ordinary shadows, which arises from the angular diameter of the sun.* Quite otherwise. A shadow indeed *is* formed, but instead of a sharp and sudden transition from darkness to light, it terminates in three coloured fringes, following its contour, the inner being the broadest and more distinctly coloured, the outer extremely faint and feebly tinted. The order of the colours, reckoning from the first *dark* fringe, is, generally speaking, analogous to that of the colours of thin plates proceeding outwards from the dark centre rings, only degrading more rapidly, viz., blue within, and yellow and red without. And that the tints originate in the same way from the superposition of a series of dark and bright fringes of the different prismatic colours, of different breadths, is shown (as in the colours of thin plates) by throwing on the lens in succession the several coloured prismatic rays, when the fringes are seen in each colour much more numerously and sharply defined, being broadest in red light and narrowest in violet.

---

* The diffracted fringes may be seen very well on the borders of shadows cast by the light of Venus when at its greatest brightness, on a white surface, in a room with a single window, and under favourable circumstances as to twilight.

If the object casting the shadow be long and very narrow, as a hair or a strip of card not more than a 30th of an inch broad, the phænomena are still more curious and complex. Besides the exterior coloured fringes already described, others are seen *within the shadow*, running parallel to its length, similarly disposed along both its edges, and blending in the middle into a central line devoid of colour. That these fringes originate in the mutual interference of rays which have passed beside *both* the edges of the object and entered the shadow, is proved by intercepting the light on one side only, leaving that on the other to pass freely. *All* the interior fringes and the central streak disappear, leaving only the *exterior ones on the illuminated side* outstanding. The shadow (which is now formed under the same circumstances as in the former case) must, it is clear, be still receiving one-half the total quantity of light which it did before; and if its edge be narrowly examined, it will be seen not to terminate in any sharply-defined line cutting it off from the fringes, but to graduate off insensibly: and hence arises a very singular phænomenon. If the light be readmitted on *both* sides, and the breadth of the shadow, or what under such circumstances must be accepted as such, be measured, it is found to be much broader than it ought to be were it limited by straight lines drawn from the illuminating point through the edges of the object. And, what is still more remarkable, if its breadth be measured on a screen, successively placed at different distances from the object, its increase of breadth is found not to be in the simple proportion of its increased distance, as it would were the aerial shadow (or the space shaded by the object) bounded by straight lines; but as if by curves starting from its edges, and having their convexities towards the light. And, finally, if the object and the screen, *preserving the same distance between them*, be moved gradually nearer and nearer to the illuminating point, the fringes, both interior and exterior, are observed to dilate in breadth, according to a certain law which it is not necessary here to state, but whose agreement with the result of calculation affords a very satisfactory verification of the theory adopted for the explanation of the whole series of these phænomena on the undulatory hypothesis; while, on the other hand, it is very obvious that no such dilatation could possibly take place were the fringes produced by any kind of action on the rays in their passage by or near to the edges of the object, in the nature of attractive or repulsive forces originating in the material substance of which it consists, and deflecting them from their rectilinear paths, inasmuch as such action *could* neither be increased nor diminished, or in any way modified, by the greater or less distance traversed by the rays *before* their arrival within its sphere.

The appearances exhibited when the light is *transmitted* through a narrow rectangular slit, are even more curious. In this case a bright image of the opening is thrown on the screen, but instead of being an evenly illuminated narrow band, bounded on either side by uniform darkness, it is bordered both externally and internally by parallel fringes. The external ones are bright and highly coloured, and vary in breadth, but not materially in brightness as the screen is withdrawn from the slit; but the interior fringes undergo singular changes as the distance increases. At near distances they are narrow and close, and leave a medial space of uniform light; but as the distance increases they enlarge in breadth, and close in on the illuminated space, so that at a certain distance a medial *dark* line makes its appearance—which, if the distance be still further increased, changes to a bright one, and so on alternately till after a certain distance is attained the alternations cease. If the screen be stopped at the last position in which the medial line is dark, and there fixed, and an opaque strip, exactly half the breadth of the slit, be held *medially* along its whole length, so as to divide the slit and reduce it to two parallel ones, each one quarter of the original breadth (by which, of course, the total light traversing the aperture will be reduced to half its amount),—instead of darkening still more the medial dark fringe on the screen, as would naturally be expected on throwing a shadow upon it, the very reverse happens: the dark fringe in question disappears altogether, and is replaced by a bright one.

If the shape of the body which casts the shadow be angular, having salient and re-entering angles, the fringes where they surround the re-entering angles cross and pursue their courses up to the shadows of the sides respectively opposite to them; but those which surround salient ones *curve round them*, preserving their continuity. At an angle of the latter kind too, crested or plume-shaped *interior* fringes are seen—"Grimaldi's crested fringes," as they are called, from the name of Father Grimaldi of Bologna, who first described (in 1665) these curious appearances. If a re-entering angle, however, be very acute, the external fringes which border its sides on approaching the angular point curve outwards, cross one another, and run out both ways into the shadow in elegant curves of a hyperbolic form. Nothing can be imagined more singular and *bizarre* than the appearance of shadows cast on a screen in this manner by a variety of minute objects of different shapes,—needles, feathers, lace-work, locks of hair, &c.; and as their observation, as we have shown, is exceedingly simple and easy, we earnestly recommend them to the attention of our readers—a bit of looking-glass, or, still better, a polished metallic reflector, a hole in a window shutter, a lens of an inch focus, a screen of white paper, and a sunny day, being all the requisites.

When the image of a small circular aperture (as a pin hole) is thrown on the screen, it is seen as a small round disc, highly coloured, the colours varying as the screen is approached from a distance to the hole—presenting in regular succession the tints of the reflected colours of thin plates described in a former part of this article, beginning with the first white, or, if the illumination be effected by homogeneous light, alternate gradations of light from brightness down to total obscurity, and thence through an alternate succession of light and darkness. Around the central spot, too, coloured rings are formed, the tints of which vary in dependence on those of the centre. When the light is transmitted through two holes side by side, and very near together, besides the rings belonging to each, a set of *intersectional* coloured streaks is formed, straight if the holes be equal, hyperbolically curved if unequal. With three holes forming an equilateral triangle, or with a still greater number *arranged with perfect regularity* (as in machine-stamped paper in patterns), an endless variety of elegant and pleasing appearances will be witnessed. To see them to the greatest advantage, a magnifying glass should be used, *placing the eye in the place of the screen, and looking through the glass at the fringes and images of the holes as if they were real objects in its focus.*

When the system of apertures examined consists of a great multitude of exceedingly narrow parallel slits, precisely equal and equidistant, they constitute what is called a "diffractive grating," and present very curious, and in some cases brilliant, phænomena, which are best viewed by placing the eye close behind the grating. The luminous point (which appears colourless) is then seen accompanied laterally and on either side by a succession of highly coloured spectra, arranged in a line passing through it, and with their lengths directed along that line; their colours not like those of the fringes (which are composite) but the pure unmingled hues of the prismatic spectrum, even more vivid (if the grating be delicately executed) than the best spectrum which can be formed by refracting a sunbeam through a prism; and exceedingly remarkable in another respect, viz., that the proportional lengths of the coloured spaces in each, instead of depending, as in the case of the spectrum formed by a prism, on the nature of the particular medium of which the prism consists, is independent of any such consideration, and determined solely by the proportion between the wave-lengths corresponding to the colours of the rays. They are, therefore, what may be called *normal spectra.* So pure and undiluted indeed are their tints, that by the aid of a magnifying telescope the "fixed lines," so often above referred to, may be seen in them, and thus the wave-lengths, corresponding to the most conspicuous of these lines, ascertained with great precision. The violet ends of all the spectra are nearest to the central point, and the more distant spectra longer than the nearer, so that at length they overlap and confuse one another by the intermingling of the red end of one with the violet of that next in order.

If the apertures of which the grating consists be formed by removing with a graver portions of an opaque varnish covering a glass surface, spectra exactly similar are seen accompanying the image of the luminous point reflected on the anterior surface of the glass from the polished portions laid bare. The same is observed, and with far more brilliancy, when a highly polished surface of metal is furrowed in equidistant parallel grooves by a graver or diamond point (which destroys the polish of those lines), and if the metal be hardened steel, the furrows so formed are transferable by violent pressure to the polished surface of a softer metal, which then in its turn exhibits similar appearances, and thus are produced the "buttons" above spoken of. Mother-of-pearl, too, which consists of exceedingly thin layers of calcareous matter superposed, and agglutinated or otherwise held together, when ground and polished, has these layers, which lie very little oblique to the general surface, torn up at their edges, where they crop out; which remain rough and unpolished, however brilliantly polished the general surface. The polished surface, therefore, is lined all over with almost exactly equidistant, exceedingly minute, non-reflective grooves, and when, if held close to the eye, a candle is seen in it reflected, its image is accompanied with two lateral and very vivid spectra of similar origin, and an impression of the surface taken on black sealing-wax presents the same phænomenon.

When, as occasionally happens, the eyes are suffused with a nebulous film, (due to the presence in the lacrymatory secretion of extremely minute globular particles of equal size,) the image of a candle in a dark room some feet distant is seen surrounded with two or three broad circular halos of rainbow colours alternately ruddy and green; similar halos are formed round the candle when viewed through two pieces of clear glass between which has been placed a little oil mixed with the delicate powder of the common puff-ball or *lycopodium*, reduced to a thin even film by pressure and gently rubbing them together. In this case they are much more vivid and beautiful, the tints being those of the colours of thin plates beginning from the centre, only more dilute, so that it is difficult to discern more than a feeble indication of the fourth ring. Their diameters, however, unlike those of the coloured rings figured in fig. 6 (p. 568), increase in arithmetical progression, or nearly so; that of the first or smallest, reckoned to the minimum of illumination, being 21° 36′ or thereabouts. They owe their origin to the exceeding minuteness, uniformity of size and sphericity (or at least circularity) of outline (if flat discs) of the spores of this fungus.

The explanation of these and of other phænomena referable to the head of diffraction, turns on two considerations, one of which may be regarded as a theoretical postulate (founded, however, on the analogy of sound), viz., that if a portion of a luminous wave be intercepted, the non-intercepted undulation spreads laterally into the dark space beyond, diminishing however in intensity as the lateral deviation of the *ray* (or perpendicular to the wave) from its original rectilinear course increases:—the other, a natural consequence of the mode in which a wave is propagated, viz., that every point in the surface of the non-intercepted portion may be regarded as the origin of a new wave spreading out spherically in all directions from that point as a centre, only with this proviso, that all such secondary waves start, each from its own origin, at the same precise instant of time and in *the same precise phase of its undulation.* And this, because all belong to one wave surface, and are therefore necessarily coincident in time and identical in phase.

To show how this last consideration affects the question of diffraction, let us suppose a point P on a screen illuminated by light emanating from a single bright point O (fig. 9), from which is propagated a series of equidistant spherical waves corresponding to light of any one refrangibility, and therefore distant from each other by one entire undulation of such light (say, to fix our ideas, a 50,000th of an inch). If O P be joined, intersecting the surface of any one such wave, at a given distance, O A from O in A; P A will be the shortest line that can be drawn from P to that surface. Suppose now we take on either side of A a series of points B, *b*; C, *c*; D, *d*; &c., progressively more distant (by pairs) from P than A is, by 1, 2, 3, &c., hundred-thousandths of an inch, or semi-undulations of the light under consideration; and let the whole figure be conceived as turned round on O P as an axis. Then these points will mark off on the spherical surface of the wave, a central circular area (call it the area A), and a series of concentric rings or rather zones of the wave (call them in succession B, C, D, &c.), surrounding it, like those represented in fig. 7 (p. 569), from every point in each one of which the light sent to P will reach it in more or less discordance of phase, with that which reaches it from the next in succession. Thus if all the vibrations propagated from the central circle (A) arrive at P in a phase of compression, all these *simultaneously* reaching it from the zone (B) will arrive in a phase of expansion, all from (C) again in one of compression, and so on alternately. Now if the distance A P of P from the wave be anything considerable, suppose a few feet or even inches, it will be *enormously* great in proportion to one semi-undulation or 100,000th of an inch, the length by which the distances P A, P B, &c., differ from each other, and in that case it is very easy to show by geometry, that the successive areas (A), (B), (C), &c., are almost exactly equal. Were these areas *rigorously* equal, and were moreover the vibrations (propagated as they are from them to P *more and more obliquely* with respect to the general surface of the wave at their points of emanation) all of equal intensity, it would follow therefore that the totality of the movement propagated to P from (A) would be precisely opposed and destroyed by that from (B), that from (C) by that from (D), and so on; so that an ethereal molecule at P would in effect be agitated by no preponderating movement, one way or another, and there would be no illumination on the screen at P. Inasmuch, however, as the vibrations diminish in intensity as they are propagated more obliquely, and as the areas (A), (B), (C), (D), &c., are, though very nearly, yet not rigorously equal, this mutual distinction in the case of each consecutive pair is only partial, and the point P will be agitated by the sum of all these outstanding excesses (taken in pairs) from the centre outwards; which, though excessively small individually, in virtue of their immense number make up a finite sum. And as the same is true for each point of the screen (if spherical, and therefore everywhere equidistant from O), the whole of its surface will be equally illuminated: if plane, very nearly so, in all the region around P.

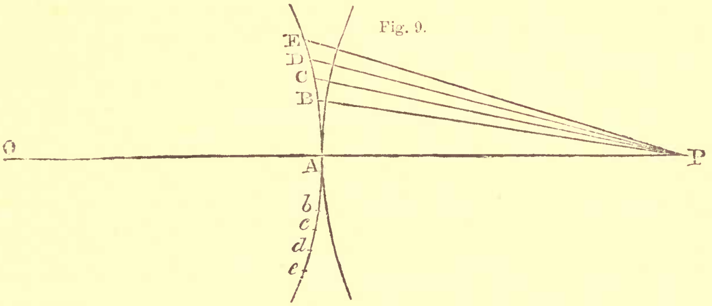


Fig. 9.

A very singular consequence follows from this reasoning, and one admirably calculated to test its validity, and the soundness of the theory it relies on, by experiment. There can be no better presumptive evidence of the truth of a physical theory than its enabling us to predict, antecedent to trial, a result in direct contradiction to what mankind in general would consider as the obvious conclusion of common sense founded on all *ordinary* experience. This is the case in the present instance. Since the total illumination of one point P on the screen is only that due to the undulations which remain outstanding after the mutual destruction of by far the greater proportion of those propagated from the zones (A), (C), (E), &c., (the *odd* zones, reckoning (A) as No. 1,) by those emanating from the even ones (B), (D), (F), &c., it follows that if all the even zones could be entirely suppressed or rendered ineffective, the illumination at P would be prodigiously increased, and that even the obliteration of a few of them would produce a very material augmentation of brightness at that point. In other words, that by *stopping out* a large proportion of the luminous rays passing through a circular aperture from a bright illuminating point, the illumination of the central point of the image of such aperture thrown on a screen at a certain distance behind it, may be made to *exceed by many times what it would be were the whole aperture left open.* This strangely paradoxical result is stated by M. Billet[*] to have been experimentally verified by M. Fresnel (to whom its suggestion is due), and more recently by M. Billet himself, who by merely interposing (concentrically) between the luminous point and the centre of the screen, a small *opaque* annulus exactly corresponding to the calculated dimensions (for red rays and using red light) of the first even ring (B) obtained an illumination at P estimated at five times that when no obstacle was interposed.

By way of showing the kind of explanation these principles afford of some of the simplest and easiest cases of diffraction (for their calculation is for the most part very complicated in its details, though simple enough in its principles); let us suppose first the case of a screen illuminated by a minute radiant point O through a small circular aperture, and consider only the illumination of the central point of projection on the screen, or of P in our figure. Suppose P to approach the screen from a very great distance—so great that the *difference of its distance from the centre and either edge of the aperture* shall be less than a semi-undulation of the light considered (say 100,000th of an inch). Then the undulations from every part of the aperture will reach P in phases more or less accordant with each other, and P will therefore be more or less illuminated, and, P still approaching, its illumination will increase till it attains such a distance that the difference in question exactly equals a semi-undulation. In this case the portion of the wave transmitted corresponds precisely to the whole of the central circle (A) of our system of wave-zones above discussed, and we have here the greatest possible amount of concordant and no discordant rays, and the illumination will be a maximum. But if P approach nearer, the difference in question will be greater than a semi-undulation, and the portion of the aperture near the edges will send rays to P more or less in *dis*cordance with those from the centre, and these will destroy a portion of P's illumination. P approaching, this will go on till the difference amounts to an entire undulation (1-50,000th), that is to say, till the aperture extends (as respects the new situation of P) over the whole of the *two* first zones (A) and (B), of which the second (B) destroys almost the whole of the light from (A) (being equal in area, and differing very little in obliquity). Here then the illumination at P will be *nil* or very small. P still approaching, the third zone (C) (which sends vibrations in unison with (A)) will begin to be included within the limits of the aperture, and the illumination will again increase, to another maximum, viz., when the three, (A), (B), (C), are just included; thence again it will diminish to a degree of obscuration not *quite* so complete as before; and so on. Thus as the screen approaches the aperture, its central point, after attaining a maximum of illumination, will suffer a succession of eclipses or obscurations gradually less and less complete, with intermediate recoveries, just as we have seen above, is really the case. When the light is not homogeneous, the different coloured rays having different wave-lengths, the obscurations of one colour will not correspond to those of the others and thus will arise a succession of colours at the central point of the screen, agreeing with those there described.

Take now the case of the exterior fringes, when the shadow of a broad straight-edged body, as a ruler, is thrown on a fixed screen at a considerable distance behind it. Suppose P first placed exactly at the edge of the geometrical shadow. In that case, the view of exactly half of each of the concentric wave-zones (A), (B), (C), &c., will be intercepted, and P will therefore receive from the remaining halves just half the amount of *luminiferous* agitation it received when opposed to the whole wave, viz., half the amount of concordant and half of discordant undulation. Its intensity of *illumination* will therefore be *one-fourth* of that when the ruler is altogether removed.[*] Now, suppose the ruler withdrawn gradually, and *laterally*, so as to disclose to the view of P successively, 1st, the whole of the central zone (A) of the wave surface; 2ndly, the whole of the two first zones (A), (B); 3rdly, the three first, (A), (B), (C), and so on. It is very evident

---

[*] Billet, *Traité d'optique Physique.* 1858. ii. § 55. By far the fullest *résumé* of that subject hitherto published, only too little explanatory, and sadly deficient in facility of reference.

[*] The effect on the retina is estimated, not by the simple *momentum* or *velocity* of the impulse communicated by the vibration, but by the "*vis viva*," "energy," or "work done," which is proportionate to the *square of the velocity* of movement. In this the undulatory doctrine of light agrees with the theory of sound.

then, on merely casting our eyes on fig. 6, (p. 568), and imagining a line drawn through the common centre of all the circles to be removed parallel to itself, step by step, so as to become in succession a tangent to the 1st, 2nd, 3rd, &c., circles; that in the first step of its removal it will disclose to P all the remaining half of the central area (A), which sends to it undulations *concordant* with those by which P is already illuminated, but less than half of the second (discordant), still less of the third, &c., so that on the whole there will be a preponderance of the concordant undulations so introduced, and P will be *more strongly* illuminated than before. When removed one step further however, since the newly introduced half of (B) the second zone almost exactly counteracts that of (A), the effect of the change will have its character decided by the proportional magnitudes of the segments of (C), (D), &c., disclosed, among which the preponderance is evidently in favour of (C), that is, of *discordant* undulation, so that by *this* removal of the shading obstacle the illumination of P will be *diminished;* and so on alternately. Now at each stage of these removals of the shading body, the edge of the geometrical shadow retreats farther and farther from P, or (which is the same thing) P is successively farther and farther outside of the edge of the shadow, becoming alternately more and less illuminated than at the actual edge. Here then we see the origin of the bright and dark external fringes exhibited in homogeneous light; and therefore by the very same reasoning, of the coloured ones produced by the successive overlapping of those formed by several coloured rays to each of which corresponds a different breadth of fringe; that for the red being broadest and for the violet narrowest.

The twinkling or scintillation of the stars partakes so far of the nature of a phænomenon of diffraction, as that it depends for its origin on the mutual interference of discordant rays arriving at one instant, but *by different routes*, on the same point of the retina of the eye; and which, therefore, do not interfere with or enfeeble one another in any part of their previous course. The image of a star on the retina is formed by the union in a focal point of the whole bundle or *pencil* of parallel rays contained within a cylindrical space or column, having the circular opening of the pupil for a base or section, continued through the whole atmosphere, however far it may extend. Now the air, though a very feebly refracting medium, has still a certain amount of refractive power, and *that* a variable one, depending on its density, temperature, and moisture; and corresponding to the degree of this power is the velocity with which it is traversed by the luminous undulations. Now, however the density, temperature, and moisture of the lower and upper regions of the air may differ; if throughout the whole extent of this column it were perfectly uniform in these respects, *at every point of each cross section* of it (however it might differ in different sections) all the rays traversing its length from the star to the eye would have their undulations *equally* retarded by the aerial medium, and therefore all the rays belonging to any one wave setting out at the same instant of time from the star would reach the focal point on the retina at the same moment, such being the condition which determines the focal point of a lens. But if the air in one side of the column should for any considerable distance along it be slightly different in these respects from that in the other, the undulations transmitted along that side would be differently retarded from those along the other, and would not arrive on the retina at the same instant. The one portion, then, on its arrival would meet there, not the other portion of the same wave to which it originally belonged, but one in advance or in arrear of that by either a whole, a half, or any part of an undulation, or any number of such, according to the extent of the difference in the quality of the aerial contents of the column. Suppose, for instance, the light from the two halves of the column to differ in their time of arrival by 1, 3, 5, or any odd number of semi-undulations of the most luminous or the yellow rays; these then would interfere and totally extinguish each other, and the apparent light of the star would undergo a great obscuration, assuming at the same time a hue complementary to yellow, or dark purple: and so for other rays. Now the constitution of the air is so irregular—such a perpetual mixture of masses of it, differing in temperature and moisture, is continually going on under the influence of wind-currents, that such differences as above supposed must be almost constantly in progress, even within the narrow space of a column no wider than the pupil of the eye, much more in that corresponding to the aperture of a small telescope. The scintillations, with their accompanying changes of colour, are beautifully seen through an opera-glass (*not binocular*), especially if somewhat out of focus, in which case the colours and the darkness are seen, as it were, to run over the circular disc into which the image is dilated in a very singular and capricious manner. If a small circular motion be given to the glass, so as to make the image of the star describe a circle, this will be seen *as* a luminous circle (as when a burning stick is whirled round, forming a ring of light), and in the circle so formed spaces highly coloured—red, blue, or green, as well as dark and bright—will be seen, corresponding to the state of the image at the instant it occupied those spaces, forming an easy, pleasing, and very interesting experiment.

An effect, the precise parallel to the scintillation of the stars, might be produced, affecting the ear instead of the eye, by sounding together two strings, at first exactly in unison, and then very slightly increasing and diminishing alternately the tension of one of them, thus producing a succession of beats, not regular as in the case of two strings permanently differing by a minute interval of pitch, but capricious in their succession.

CHRIST THE LIGHT OF THE WORLD.

By C. J. VAUGHAN, D.D.

IX.—CHRIST THE CONQUEROR OF SATAN.

"When a strong man armed keepeth his palace, his goods are in peace: But when a stronger than he shall come upon him, and overcome him, he taketh from him all his armour wherein he trusted, and divideth his spoils."—Luke xi. 21, 22.

In the original it is still more forcible. Not "a strong man," but "the strong one," in the former verse: not "a stronger than he," but "the stronger than he," in the second. In short, it is exactly, even in form and figure, the subject now before us, "Christ the Conqueror of Satan."

In opening a former topic, "Christ the Lord of Nature," we began by asking "What is Nature?" Is it needful for the information of any who read these pages, to ask the like question now, "What, or who, is Satan?"

We might, no doubt, have expressed the idea differently, and said, "Christ the Conqueror of Evil."

There are places, even in Scripture, where the original language leaves it ambiguous whether "evil" or "the evil one," is the right translation.

It is so in the Lord's Prayer. "Deliver us from evil," might be rendered, "Deliver us from the evil one."

It is so in our Lord's Intercession in the 17th chapter of the Gospel by St. John, "I pray not that Thou shouldest take them out of the world, but that Thou shouldest keep them from the evil." "From the evil" might be given, in like manner, "From the evil one."

And so in the 5th chapter of the 1st Epistle of St. John, "We know that we are of God, and the whole world lieth in wickedness." It might be, "lieth in the wicked one."

These are ambiguous passages. But there are others, neither few nor exceptional, in which there can be no doubt and no evasion.

That evil which is in the world—that mass of sin and corruption which is ever working around, amidst, and in every man—has a personal head, who both embodies the principle of evil in all its malignity, and also stirs it into activity by a perpetual process of temptation.

The 3rd chapter of the Bible shows us this being, and shows him to us at work. It is he who puts to mankind the first question of disloyalty, "Yea, hath God said?" lodges in the unsuspecting heart the earliest cavil of treason, and then follows it up with the audacious defiance of unbelief, "Ye shall not surely die: for God," your tyrant, "doth know that" this which He has forbidden you is in deed and in truth your highest good. Hence "sin entered into the world, and death by sin."

In the onward course of the Old Testament Scriptures, the same fallen spirit is presented again in the various yet consistent characters of man's accuser, man's tempter, and man's tormentor.

It is he who in the 21st chapter of the 1st Book of Chronicles "stands up against Israel, provoking David to number Israel." It is he who in the Book of Job defames the righteous man, in God's presence, as "not fearing God for nought;" as reverencing God only so long as he receives good at His hand, and ready to curse God to His face as soon as the Divine power is put forth upon him in suffering. It is he, too, who executes that ministry of evil by which the fidelity of God's servant is to be tried to the uttermost, and out of which he comes forth at last like gold from the refiner's furnace. It is he, finally, who in the Book of the Prophet Zechariah is seen standing, in vision, at the right hand of the Angel of the Lord—or, as it should seem from the following verse, at the right hand of the Lord God himself—to withstand the cause and to resist the work of Joshua the high priest in behalf of the chosen Jerusalem. "The Lord said unto Satan, The Lord rebuke thee, O Satan; even the Lord that hath chosen Jerusalem rebuke thee: is not this a brand plucked out of the fire?"

I need not stay to prove to any one how constant, how decisive, are the references to this fallen spirit as the mover and inciter of human evil, in the Scriptures of the New Testament. From the 4th chapter of the first Gospel, where he presents himself as the tempter of "the Word made flesh," down to the last chapter but two of the Book of Revelation, where he is himself finally cast into the lake of fire, the devil, or Satan, is spoken of in every variety of application, but with an entire unity of description, as the spiritual enemy who is ever seeking man's ruin, and whom it is the one business of Divine Redemption to vanquish for the individual and at last to destroy for the race. "For this purpose the Son of God was manifested, that he might destroy the works of the devil." "That through death He might destroy him that had the power of death, that is, the devil."

One of the most comprehensive of the Saviour's titles is that now before us, "Christ the Conqueror of Satan."

The time is short, and we must turn aside from a thousand topics which invite enquiry.

We may notice five steps by which Christ our Lord advances to this victory over Satan.

1. The first was when He vanquished him in Himself.

"Christ was tempted in all points like as we are."

(1) Through the body. He was hungry. His long fast ended, He was conscious of a painful exhaustion. The tempter seized the moment, and bade Him turn one of the stones of the desert into bread for Himself. It sounded like a recognition of His omnipotence. It was so. "The devils also believe." It sounded like a consideration for His comfort; like the voice of a friend caring for life and health. It sounded like a regard for duty: could it be right to perish wantonly for hunger, with all the resources of Deity at command? So plausibly can the tempter argue! So difficult is it, for all save One, to discern between the seeming right and the real! But Christ discerned, and conquered. Christ would not, like the profane Esau, for one morsel of meat sell his birthright: would not so exalt the body as to humour it at the devil's bidding; at the expense of trust in God and of affiance in His protection. In its subtlest and most persuasive form He conquered that temptation which comes to us through the body.

(2) The tempter tried Him through the mind. The human nature is ambitious; loves power; desires distinction; thirsts for greatness. To such dispositions and inclinations did Satan now address himself in Christ. He offered Him universal empire. He would make the kingdoms of the world the kingdoms of God and of his Christ without delay and without a struggle. He proposes (as it were) a short road to redemption. He will spare the Saviour all suffering: he will excuse mankind from centuries of sin and pain and conflict: all shall be Christ's at once—on one condition. He must do homage for His throne to Satan. He must hold His crown as from him. In short, it was an offer of a great good through a little evil. It was the proposal of a momentary compromise out of which was to spring endless blessing. To save Himself, and to save mankind, a deluge of blood and tears, He was to make a royal road to the destined end, not through the cross and the grave, not through the bitterness of atonement, and not through the tardiness of sanctification, but by one brief acknowledgment of an enemy's right, and by one passing homage to a usurper's crown. Christ discerned the snare and foiled the stratagem.

(3) The tempter tried Him yet again—and this time through the soul. "Thou art God's Messiah. Thou art He of whom it was written, that the Angels have thee in their keeping; that each step is guarded for thee by heavenly watchmen; that in their hands they bear thee up, lest thou so much as strike thy foot against a stone. Now therefore claim the promise. Cast thyself down, if thou be the Son of God, from this pinnacle. God will keep Thee. Thou canst not perish." It was a temptation addressed to the religious part of man. Faith itself is appealed to. "It is a want of faith to exercise prudence. Show thy trust by hardihood. If thou art God's, God will keep thee. Try Him: test the promise. In thee presumption is faith." The Saviour calmly answered Scripture by Scripture; corrected the promise by the precept; refused either to ask, or to give, the proposed sign from heaven; bade us, by His own example, to walk in safe ways, and not provoke God to withdraw that hand which is our one safeguard. Christ conquered Satan in the region of the spirit. He was in all points tempted like as we are—and in all without sin.

And it became Him—may we not so apply the inspired saying?—it became Him, who was to conquer Satan for mankind, to conquer him first of all in Himself. The great question of comparative strength must be decided first within. The stronger than the strong man armed must first meet him and vanquish him at home. How many have inverted this process! have gone out in Christ's name to encounter evil in the world, without having first met and overcome it in the soul within! Hence weakness, disappointment, and defeat—falsely imputed to Christ and Christ's Gospel—really due to him who made himself into a champion of that faith which he had not first realized and embraced in the heart. That man went forth in armour which he had not proved: and therefore the evil spirit could give the old answer to the self-taught exorcists, "Jesus I know, and Paul I know: but who are ye?"

Not so did Christ. He began with the fasting and the temptation; disciplined Himself first for battle; conquered Satan there, in solitude and in Himself; and then was able to pass forth into other battle-fields, conquering everywhere and to conquer.

2. Secondly, then, by His works. And here we will put aside those miracles of bodily healing, in which, nevertheless, Christ taught us to recognize the same great principle, that they were all in their place dispossessions of Satan. "Ought not this woman," He said of one poor sufferer, in terms descriptive equally of all, "whom Satan hath bound, lo, these eighteen years, be loosed from this bond on the Sabbath day?"

We will turn to those particular cases in which the devil himself was present in the struggle.

A mystery hangs over the whole subject: how should it not be so? God never speaks to gratify curiosity. Where there is no practical object in the disclosure, His word either speaks not, or speaks in dark sayings. It is so in all matters concerning the existence of spiritual beings not human. So far as to assure us of the aid of God's ministering Angels, of their sympathy in our good, of their ministrations in time of need, so far Scripture speaks to us; but not to tell us the nature of angelic existence, in itself or in its circumstances. So far as to put us on our guard against the malignity and power of evil spirits, Scripture speaks; but not so as to tell us the history of spiritual foes—what they were, when and how they fell, or by what means they find access, in the way of temptation, to the hearts and minds of men. So then the direct conflict of Christ with Satan in the cure of persons possessed with devils, has in it, of necessity, much that we cannot understand. But are we therefore to leave it unregarded? to treat it with suspicion? to repress its solemn lessons, both of fear and hope? God forbid. Let us gather up that which is written, and see what it says for our admonition.

It seems to be implied in every such record, that at least in the days of the Son of Man there was a sort or a degree of Satanic influence at work among men, beyond or beside that which is exemplified in all suffering, disease, and sin. Is it unreasonable to suggest that this singular type of human disease may have been permitted for the very purpose of bringing to open issue the warfare then waging between Christ and Satan? to enable men, not to infer by reasoning, but as it were to see with their eyes, the virulence of diabolical power and the gracious efficacy of that Omnipotence which came to counterwork it? In no other manner, we may venture to say, could the great lesson have been so decisively taught—the twofold lesson, of the extremity of man's need, and the irresistible might of a Saviour's grace.

Take the pitiable instance of the demoniac whose cure is described in the 5th chapter of St. Mark's Gospel. Every stroke of the picture is most terrible, yet most life-like. The man has an unclean spirit. It makes him a solitary. His dwelling is among the tombs. It makes him a maniac. He has a madman's strength and a madman's rage. It makes him a self-tormentor. The suicide's spirit is in him. He is always doing himself harm—crying and cutting himself with stones. We have called it an instance of an exceptional malady; of one belonging to other times than these. And yet how does every particular reproduce itself again now, morally in the effects of sin, mentally in the workings of madness! What is wanting is the linking together of the two in one and the same person: the sin which has developed itself into madness, and the madness which is distinctly traceable to sin.

Such was the condition, before Christ is in sight. Now mark the condition as brought face to face with Him. There is first a distinct recognition of Him: of His nature, of His power, of His right to command. Along with this, a fearful shrinking from contact with Him: "What have I to do with thee?" and a special dread of being debarred from the work of tormenting: to torment is the solace of Satan. Again, there is a glimpse of the miserable confusion, discord, and war within, arising out of a divided personality. "My name is legion:"—the poor human being has lost its unity: every faculty, every affection, every power and energy of the soul, is in a state of warfare with every other: what a picture, this also, of the soul distracted and torn by appetite, passion, and sin! What a type of the fallen and diseased nature, by whatever name called!

And then see the strong man despoiled and ejected by the stronger. See the unclean spirits so dispossessed of their victim, that they shall even be seen to be elsewhere. See the proof of their departure, the illustration of their character, and the exhibition of their malignity, in that marvellous incident of their destructive entrance into the herd of swine: an incident full of difficulty for the sceptic, full of mystery even to the true believer, but withal so fertile in spiritual lessons, so instructive in its bearing upon the nature and tendency of all sin, so encouraging in its assurance of the separability of evil from the human being, of its merely adjunctive and circumstantial presence in us, and of Christ's absolute power to eject and exterminate it, so that it shall no longer *be* for us—that I do not scruple to call it one of the most important and edifying of all miracles, and to claim for it a foremost place among those marvels of grace by which Christ proved Himself to be "for this purpose manifested, that He might destroy the works of the devil."

Mark then, in conclusion, the condition of the same human being when Christ has wrought upon it. See the violent man calm, the madman reasonable, the suicidal hand at rest, the legion become one man in Christ Jesus. "Sitting at the feet of Jesus, clothed, and in his right mind." Hear him pray that he may remain with his benefactor and liberator, as though fearing to go back into the misery from which Christ had set him free. Hear the correcting voice saying to him, "Go home to thy friends, and tell them how great things the Lord hath done for thee, and hath had compassion on thee!"

If these pages shall fall into the hand of any one whom Satan hath bound, perhaps for long years, with the chain of sin—with the band of some inveterate evil habit or sinful lust—let him read in this history the prescription for his malady and the assurance of his cure! Let him come, in heart, by prayer, to Jesus—reminding Him of that which He did upon earth for this demoniac; and let him know this, on the word which cannot lie, that all power is given to Him in heaven as on earth—that He is the Conqueror of Satan still, as once by miracle, so now by grace!

3. Christ is the Conqueror of Satan by His death. "It shall bruise thy head," said the original prophecy, "and thou shalt bruise his heel." The promised seed of the woman should bruise the serpent's head in the very act of the serpent bruising his heel. It was "through death," says the Epistle to the Hebrews, that Christ "destroyed him that had the power of death, that is, the devil." "Now is the judgment of this world," said the Lord Himself, in the immediate foreview of His Passion; "now shall the prince of this world be cast out. And I, if I be lifted up from the earth, will draw all men unto me." It was the death of Christ which cast out Satan. It was through death that He destroyed the devil. It was in submitting to the bruising of the heel, that He Himself struck the mortal blow upon the head of "the old serpent, called the devil and Satan."

How true! how touching a thought! Yes, it was by His death, even more than by His temptation, even more than by His miracles, that Christ conquered the devil.

How was this?

Can any one ask who knows anything of himself, or anything of Christ?

Was it not by submitting to death as the sacrifice and propitiation for sin, that Christ redeemed us? Was it not by being "made sin for us?" by being "wounded for our transgressions" and "bruised for our iniquities?" We thank God, every day, for His "inestimable love in the redemption of the world by our Lord Jesus Christ." Is there no meaning in those words? Or is it only a vague hope which we thus express, for a future deliverance? or else a thanksgiving for a limited number, interested (where others are not interested) in the Saviour's cross?

We do not thus read the language of Holy Scripture, nor the language of the Church's words of worship.

We believe that the Cross and Passion of our Saviour Christ was the means of a real and actual redemption, and that for all the world. We believe that that death did avail as an atonement for all sin of all men; that it removed that obstacle of unforgiven and uncancelled guilt which was the very strength of Satan's kingdom; that void between man and God which was the real and actual impediment between the soul of man and the glorious liberty of the children of God. And therefore we can never consent to speak of Satan's kingdom as unaffected by that great transaction; that death of the Son of God in human form, to take away the curse and the debt of sin, and to buy back the world for holiness and for happiness and for God.

We mourn indeed, and well may we mourn, over the comparatively small effects which the Gospel has as yet wrought upon the souls and lives of men. We point with sad misgivings to vast regions of earth still unblessed with the very knowledge of the Saviour: and we feel with shame and self-reproach that even Christendom is but faintly influenced, but superficially penetrated, by the light of Christ and of the Spirit. We find in ourselves a coldness and a reluctance and an inconsistency in reference to Christ's work and to Christ's will, which humbles us in the dust while we give thanks for His redemption. Yet none the less do we maintain, for His honour and for that of God who gave Him, that the power of Satan has been shaken by the redemption; that the world, at its worst, is not quite in the state in which it was in days of heathen darkness; that the kingdom of the devil is both contracted in its limits, and weakened in its dominion; and that preparations are visibly making for that day when the Son of Man shall send forth His angels, and shall gather out of His earth all things that offend.

4. And so this brings us to speak of the victory of Christ over Satan achieved by His life. And when we now speak of His life, it is not of His life on earth, but of His life after death in heaven; that life upon which He entered by resurrection, and to which the seal was finally set by His ascension into God's presence.

We have spoken of the conquest by death: now the life is the fruit of that death; according to His own saying, in a passage already referred to, "Verily, verily, I say unto you, Except a corn of wheat fall into the ground and die, it abideth alone: but if it die, it bringeth forth much fruit." The life after death is that of which He said to His disciples, "Because I live, ye shall live also." The death had in it the seed and the promise and the first fruit of victory: but the life after death is that which reaps the harvest.

Is it not so?

The power of Satan is a power exercised over hearts poisoned and lives ruined. If that power is to be broken, not in name but in truth, it must be broken in the heart, broken in the life, which Satan hath bound.

And what is it which alone can break that power in the heart and in the life of man?

What but the Holy Spirit of God, given as the purchase of redemption—given to the individual—given in answer to prayer awakened and aroused by the message of the Gospel; by the Gospel which says first, "Believe in the Lord Jesus Christ, and thou shalt be saved;" by the Gospel which says secondly, "God will give His Holy Spirit to them that ask Him."

Now therefore it is the life of Christ in heaven which makes Him in this particular sense the Conqueror of Satan.

Whenever one of us, wearied and grieved with the burden of his sins, comes to Christ for salvation; whenever one of us, feeling the yoke upon him of some inveterate evil habit, wicked temper, or deadly lust, kneels down seriously and humbly before God, and asks Him for Jesus Christ's sake to forgive and to cleanse him; to pardon all that is past, and to send into his heart that Holy Spirit who is all liberty and love and peace and strength; and when in answer to this prayer—as will be the case if he only prays on and faints not—he is set free; gradually, tardily it may be, but really, decisively, and at last completely; then does Christ conquer Satan: then is the saying again verified, which He spake once on earth, "I beheld Satan as lightning fall from heaven;" the saying which He wrote afterwards from His glory, by His Apostle and Evangelist St. John, "There was war in heaven: Michael and his Angels fought against the dragon; and the dragon fought, and his angels, and prevailed not, neither was their place found any more in heaven."

My friends, it is in our power—it is in the power of each one who reads these sayings—to multiply and to extend this conquest of Christ. Look into your own hearts: find out there anything which defileth: drag to the light of conscience any bad disposition, any sinful desire, any indulged or half-indulged lust: and then ask of God, through Jesus Christ, to give you His Holy Spirit to mortify and to extirpate it: and you too, like thousands and tens of thousands before you, shall experience that of which this subject tells, when it describes our Lord Jesus Christ as the Conqueror of Satan in this fourth and most practical sense of all, by His life after death, by His life now in heaven, at the right hand of God. The last-mentioned was a victory wide as the world: this is a victory minute and searching as the very personal life of the individual soul.

5. And now, finally, there is yet one more way in which the words before us are verified.

Christ the Conqueror of Satan in Himself.

Christ the Conqueror of Satan by His works.

Christ the Conqueror of Satan by His death.

Christ the Conqueror of Satan by His life after death.

Now, fifthly and lastly, Christ the Conqueror of Satan by his future judgment.

The revelation is half disclosed to us in many places of Scripture.

We read in the 25th chapter of St. Matthew's Gospel, of an "everlasting fire prepared for the devil and his angels."

We read in the 1st Epistle to the Corinthians, "Know ye not that we shall judge angels?"

We read in the 2nd Epistle of St. Peter, that "God spared not the angels that sinned, but cast them down to hell, and delivered them into chains of darkness, to be reserved unto judgment."

And in St. Jude's Epistle, in like manner, "The angels which kept not their first estate, but left their own habitation, He hath reserved in everlasting chains under darkness unto the judgment of the great day."

These are hints of the things spoken of. But St. John, in the 20th chapter of the Book of Revelation, sets the very thing itself before us in all its fearful grandeur.

He has spoken of that binding of Satan for a thousand years, which we believe to have been the immediate effect of our Lord's death, resurrection, ascension, and Pentecostal gift. The "binding" there spoken of is the "falling from heaven" of the Gospels, the "casting out of heaven" of the 12th chapter of the Book of Revelation, the "delivering into chains of darkness" of St. Peter, the "reserving in everlasting chains under darkness" of St. Jude.

That season of limited power, figured by the binding, has now run its course. "The thousand years are expired." Satan is loosed out of his prison. A brief period (the theme of many prophecies) of more unbridled license, is to be granted to him in the near prospect of the last end of all. He goes out to deceive the nations. Gog and Magog are to be gathered to one last battle with the saints of God. They go up on the breadth of the earth, and compass the camp of the saints about, and the beloved city. In the very moment of their seeming triumph, fire comes down from God out of heaven, and devours them. The last onslaught of infidelity and wickedness has had its chance and lost it. Now all is ready for the consummation of all things. Then at last the devil that deceived them is cast into the lake of fire and brimstone, and shall be tormented day and night for ever and ever. Then is set the great white throne: earth and heaven flee from the face of Him that sits thereon: the dead, small and great, stand before God: the books are opened; and another book is opened, which is the book of life.

Christ the long despised and treated with scorn —Christ seen at length as King of kings and Lord of lords—is the Conqueror of Satan at last by judgment.

"Alas! who shall live when God doeth this?"

THE HOUR FOR ME.

I'll sail upon the mighty main—but this is not the hour—
There's not enough of wind to move the bloom in lady's bower:
Oh! this is ne'er the time for me: our pretty bark would take
Her place upon the ocean like a rose-leaf on a lake.
There's not a murmur on the ear, no shade to meet the eye;
The ripple sleeps; the sun is up, all cloudless in the sky.
I do not like the gentle calm of such a torpid sea;
I will not greet the glassy sheet—'tis not the hour for me.

But now the night-breeze freshens fast, the green waves gather strength;
The heavy mainsail firmly swells, the pennon shows its length;
Our boat is jumping in the tide—quick, let her hawser slip;
Though but a tiny thing, she'll live beside a giant ship.
Away, away! what nectar spray she flings about her bow!
What diamonds flash in every splash that drips upon my brow:
She knows she bears a soul that dares, and loves the dark rough sea.
More sail! I cry; let, let her fly!—this is the hour for me.

E. C.

EASTWARD.

BY THE EDITOR.

VIII.—THE NEIGHBOURHOOD OF JERUSALEM.

THE JORDAN, THE DEAD SEA, AND MAR SABA.

LIKE all travellers in Palestine, we of course paid a visit to the Jordan and Dead Sea.

To accomplish the journey, we were advised to take a guard. The very proposal threw a certain air of romantic danger over the expedition. I almost began to regret that I had no supply of bullets for my revolver; and to become painfully doubtful of its even being free from rust, to say nothing of the trustworthiness of the caps, should the trigger ever be drawn. But if it came to fighting, which I sincerely deprecated as involving a most unworthy position for a clergyman, I had fortunately no doubt whatever of my utter incapacity to hit either man or horse, should I be fool enough to try; and was confident that I would adopt no other course in the event of a "scrimmage," than that of either yielding with all grace to the Ishmaelite, or, if possible, of galloping off. There was no use, however, in speculating as to how one would feel or look, if stripped and robbed in the wilderness. It was enough to know that we had resolved to see certain places, and that an escort was necessary, come weal or woe.

Let me illustrate the position of a modern traveller wishing to see the Dead Sea, by a parallel case which might have occurred to a Sassenach wishing to visit Loch Lomond in the days of the Sheik Rob Roy, when his tribe of the Gregarach were in possession of one side of the lake. The traveller, we will suppose, reaches Glasgow on horseback a few weeks after leaving London, and brings with him a letter of introduction to Bailie Nicol Jarvie from some Scotch merchant in the metropolis. He applies to the Bailie for advice as to the safest manner of accomplishing his purpose of seeing the frontier wilderness of the Highlands. The magistrate speaks of its danger; and is ready, over his ale in the Saltmarket, to narrate his own adventures and escapes at Aberfoyle—but comforts the traveller by the assurance that the red-haired Sheik, Rob, happens to be in town; that he is a friend of his, having more than once saved him from the clutch of the Pasha Provost; and that he will easily arrange for a guard, on black-mail being paid. The Sassenach smiles at the idea, points to his fire-arms, talks contemptuously of the savage Gregarach, enlarges on the grandeur of the Saxon, and resolves to go with his own servant John only. The Sheik hears this, and vows vengeance for being thus done out of 5*l.*, which would keep his *spleuchan*, or pouch, full of tobacco for months. So he summons his henchman, the Dugald Cratur, and tells him to be off to the Wady of Balmaha, and there assemble half a dozen of his tribe, to lie in wait among the heather and behind the rocks with their long guns, until they see a white-faced Sassenach, with trousers, coming along,—then to fire some powder, rush at him with a yell, roar Gaelic in his ear, rob him,—but do no more. "The next chiel," adds the Sheik, taking a snuff, "will be more ceevil." Thus would act in all probability the Rob Roy of the Taamireh, Allaween, Anazi, Beni Sakker, or any other tribe. No doubt at Loch Lomond the Graham might dispute the right with the Gregarach of keeping the Wady of Balmaha as a preserve or net for travellers, and they might accordingly fight Rob or Dugald, when travellers were under their protection and paying them black-mail. So might the Anazi fight the Taamireh. Still it is better for every reason to pay and take your chance, assured that then you are, in ordinary circumstances — the extraordinary being easily ascertained before leaving Jerusalem—quite as safe in going to most spots in Palestine as to most spots in Europe, especially Italy. And there is one real advantage gained by such arrangements, that is the security given, and respected, that any property stolen will be replaced.

A tall Arab Sheik, in a shabby dressing-gown, with turban above, and bare legs thrust into clouted shoes below, did us the honour of squatting himself on our divan one evening, and of agreeing to protect us with the lives of all his tribe. The trifling sum asked for this service, it must be presumed, expressed the small extent of our risk and the little value put upon the lives of the warriors who might be sacrificed, rather than that put upon their honour.

The day before we started I was loitering in the streets and by-lanes of the city seeing what I could see. When opposite the Austrian Consul's house I was attracted by a troop of Arab horsemen drawn up in loose array. A handsomely-dressed Turk was calling over their names. They had formed the guard, I was told, of the Duke of Modena from Jaffa to Jerusalem, and were now being paid off. In my life I never beheld such a set of ragamuffins! The horses were far superior in their breeding to those who rode them; they were small, thin, and wiry, but with a life in their eyes and a defleshed firmness of muscle which marked them as fit for enduring hard work. Their riders wore the usual Arab dress. They had kaffiahs bound with cord round their heads; their cotton or camel-hair garments were sufficiently thin and loose; their feet were stuck into coarse leather sandals or boots; and they were accoutred with long spears and guns slung over their backs. Their faces were studies! Each rose from its own neck a distinct individual face, with all the essentials of a face, but these were arranged with an art which I had never seen before, concentrating scoundrel in every feature, and forming a combined whole to me quite unparalleled. I singled out two or three, and pictured to myself the feelings of any decorous parson, or sensitive lady, who might fall into such hands on the lonely and bituminous shores of the Dead Sea, and who might endeavour to read their fate in the expression of such countenances! One man, a black, seemed to me the personification of animal ugliness.

Next day, when our escort was mustered, I discovered among them my black friend, and some of my other studies of human villany. But I am bound in justice to add, that, after having been politely introduced to them, and making their acquaintance through our mutual friend Hadji Ali, and having done all I could to discover the cloven foot in them, the impression made upon me was, that they were all very good-natured and obliging fellows,—inclined no doubt, like all the children of Jacob as well as of Esau, to backsheesh, but on the whole pleasant and agreeable, and I should think much in advance of the Gregarach of old. I have no doubt that, in the event of a fight, they would have fired their guns, in a way I could not have done mine, but I have also no doubt that had I bolted they would have accompanied me (in kindness no doubt), and have even led the way far ahead.

We clattered over the stones of the Via Dolorosa, passed through St. Stephen's Gate, ascended the slope of Olivet, skirted the mud hovels of Bethany, and immediately began the rapid descent of the gorge leading for about twenty miles to Jericho. This road has been made for ever famous, not so much, strange to say, by the fact that along it our Lord journeyed, as by his glorious parable of the Good Samaritan, in which the religion of charity, and his own universal love to his "neighbour," are so grandly illustrated.

The descent from Jerusalem to the Dead Sea is, as the reader knows, a half greater than that from Jerusalem to the Mediterranean. In round numbers, it is twice 1300 feet from Jerusalem to the Mediterranean, three times 1300 from Jerusalem to the surface of the Dead Sea, and four times 1300 to the bottom of the Dead Sea. We had therefore to descend about 4000 feet.

The part of the descent immediately below Bethany is the steepest. There is a path here of loose stones and smooth rock, which rapidly plunges into the head of the long valley. I here deemed it safe and prudent, both for man and beast, to dismount and lead my horse. It must have been up this steep our Saviour toiled, on his momentous journey from Jericho to Bethany. And to the summit of this ascent, or possibly from it, gazing along the windings of the glen, must Martha and Mary have turned their longing and expectant gaze for the coming of the Saviour to heal their brother Lazarus. Up this road the wondering crowd had accompanied Him from Jericho, with one joyful man among them, the blind beggar Bartimeus, who having received his sight, beheld with a greater sense of novelty and wonder, than any traveller before or since, those wild scaurs and rocky uplands—unless indeed his eyes were fixed on one object only, Jesus, the Son of David, who had mercy on him.

On reaching the bottom of this rapid descent, and passing a well and the ruins of an old khan, our road ran right along the bottom of the valley. It was a bare, bleak, dry, limestone bit of scenery, but not tamer or more uninteresting than many places which I have traversed, even in Scotland. But after a few miles, when we got entangled among broken uplands and deep gorges, lonely, wild, and dreary in the extreme, things began to have a wilderness and Dead-Sea look. We rested at a spot well known to every traveller, near an old inn or khan now in ruins, which was famous as a sort of rendezvous for brigands, and where Sir Francis Henneker was robbed and wounded forty years ago. We did not, however, even catch a glimpse of man or boy prowling near. Was this the "inn" alluded to by the Saviour, to which the good Samaritan is represented as bringing the suffering stranger? It may have been some well-known spot like this, the parable gaining, to those who heard it, more vividness and reality by a local allusion. I may mention here, that, strange to say, this was the only part of our journey in Palestine where we saw any signs of cruelty. Two Arabs going to Jericho were driving before them a miserable skeleton-looking horse with a knee hideously diseased. The brute could hardly touch the ground with its agonised limb, but ever and anon it did so, leaving spots of blood on the road. It was vain to expostulate with its drivers; so for the sake of our own feelings, as well as for the sake of the wretched creature, we resolved to purchase it and shoot it. The skin alone, we thought, could be of any value to its owners; and our dragoman agreed that our offer of 100 piastres, about 1*l.*, was therefore a handsome price. But it was indignantly refused, and 1000 piastres demanded! And so the brute was driven on, at a rate too, which, fortunately for us at least, enabled it to get so far ahead that we lost sight of it. Another act, equally out of harmony with the spirit of the good Samaritan, was perpetrated by our escort. They seized a lamb from a flock and drove it on before them. We expostulated as earnestly as did its owner, but the deed was justified by the chiefs on some principle of black-mail which in their opinion made the claim a right, though we more than suspected it to be a robbery. So much for the unloving spirit still seen on the way from Jericho to Jerusalem.

Soon after passing the old khan, we entered a narrow path full of interest. Immediately below us, to the left, was a deep gorge that cut its way through bare rocky precipices, between which, 500 feet down, a fresh full mountain-stream rushed along to the plain of the Jordan. This was the Wady Kelt, and in all probability the brook Cherith where Elijah was supported during the famine. And here, as confirming the conjecture, we noticed many ravens, and heard their hoarse croak echoing from the wild precipices. We saw remains of old aqueducts, and other buildings. The precipices were also dotted here and there with cave-like holes, the first mementoes we had seen of the old hermits who once lived here, like grey bats, nourishing their strange religious life. Remains of old chapels, in which they had worshipped and had caught some glimpses of a higher life and of a better country, were visible on the heights.

On and down we went, winding through this arid waste, until at last we saw the plain of Jericho stretching below us, dotted with verdure produced by the mountain springs, and stretching, a grey flat with patches of wood here and there, until its bare shore-like surface was fringed, ten miles off, by the line of vegetation shading the unseen and deep bed of the Jordan. Beyond the Jordan rose the grand ridge of Moab, and to the right appeared the northern bay of the Dead Sea. Down, down, we crept, always thinking we would in a few minutes reach the lowest level, but always finding a lower still. But every lane has a turning, and so had ours; and right glad were we when it turned to the left, as the shades of evening were drawing over us, and we saw our white tents, pitched where those of many a thankful and wearied traveller had been pitched before, under the Quarantania, and near the Ain es Sultân, or Fountain of Elisha.

Oh what a blessed sight are those tents! What a paradise do they appear to a weary man after a day's ride, when everything is hot, from the heavens above to the earth beneath, and to the very waters under the earth. Your horse begins to neigh, and to pace along with cocked ears, the prospect of fodder being as cheering to him as Mohammed's dinner is to us. And then, after ablutions, how delightful to lean down on the camp-bed; and after dinner and pleasant friendly talk about the sights and adventures of the day, to go out in the cool night, with the world of stars all twinkling in the unsurpassed sky of this low region; to catch picturesque glimpses of the Arabs in the dim light around their fires; to *hear* the awful stillness of the silent land: and then to sleep, as motionless as a desert stone!

But before falling into this unconscious state, we here exhibited a few fireworks which we had brought from London (cockney fashion) for the purpose of amusing the Arabs, or maybe with the innocent hope of awing the desert tribes by a revelation of wonder and power.

The musical snuff-box was our *opus magnum*,* but the Roman candles were our most imposing spectacle. I had the honour, as the Hakeem Pasha, of setting them off in the presence of what the newspapers would describe as an "attentive and admiring audience." They shot aloft with great success, and "fortunately no accident occurred." Our Arabs were delighted, even Meeki smiled, and condescendingly manifested a sense of agreeable surprise. Had any robbers been prowling about the plain looking for plunder, it is more than likely, as we afterwards concluded, that our fireworks, instead of frightening them away, would rather have attracted them to our tents.

We gave our escort a homely supper of rice mixed with various ingredients prepared by the cook. They eagerly seized the food with their fingers, dexterously moulded it, and chucked it into their mouths, as they squatted round the large dish placed in the centre of their circle. In return they danced one of their dances, if dance it could be called where the body and not the feet moved. Twelve of them formed a line, while their chief with drawn sword stood facing them. They then began with a low monotonous chant, or rather howl, to move backwards and forwards, while he moved, and swayed, and ducked, making fantastic movements with his sword. And so on it went, utterly unintelligible to us. It had, of course, a meaning, to one able and learned enough to appreciate it; but to us it had none, and sundry attempts on Hadji Ali's part to make it plain, only served to convince us that he, too, knew nothing about it. So we were glad when it ceased, and we could retire to our tents without giving offence. These men, let us record it, in spite of their singular abstemiousness and "total abstinence"—or because of these, as "the League" would say—underwent a wonderful amount of physical endurance. During our journey they hunted partridges (which they fired at only when the birds sat) and gazelles along the whole road—now running down the valleys, and again rushing to the tops of the rocks with unwearied perseverance and activity. They managed to kill a gazelle and a brace of partridges, which we bought from them. Yet at the end of their day's journey, which they had made double by their exertions, they challenged us to race them; and for about two hundred yards they kept up with our horses urged to their highest speed, which, however, it must be admitted, was not equal to the Derby stride.

---

* Since mentioning, in a previous paper, the grand occasion on which we brought high class music in our snuff-box to the Gibeonites, I have heard with great pleasure that the Marquis of B——, when he encamped on the same spot this spring, was beset with applications for a display of Hakeem Pasha's art! Our dragoman Hadji Ali being with him, the mystery of these applications was soon explained. In olden time the box would have been the occasion of rearing a fane to Pan or Apollo. But unless some other travellers soon follow our example, we fear the echoes will die out.

I remembered, while seeing them, the fact of Elijah running before the chariot of Ahab from Carmel to Jezreel. His was not, after all, such a feat of physical strength, considering the state of the roads, and the probably somewhat slow driving of the king, as was that of our Arabs.

Next morning we enjoyed a view of the cliffs of Quarantania, which we had examined rapidly the evening before. The high pyramidal precipice was honeycombed with hermits' cells. A ruined chapel was on the summit. We were afterwards informed by an English clergyman who, with great difficulty and no small danger, (owing to the destruction of portions of the narrow footpaths,) had examined them by help of ropes, guides, and cool climbing, that there were interesting remains of Byzantine frescoes in the chapels, still fresh and vivid in their colours. They had, however, no interest as works of art, but only as ecclesiastical remains of a strange and interesting episode in the history of religion.

It is strange indeed to think of the world of thought, politics, and opinions, which interested those hermits, as they crept from cavern to cavern, or sat in groups on their limestone seats gazing from their rocks of sure defence, over the plain, on to the Dead Sea and wild hills beyond. There some of them lived, no doubt, their fourscore years or more, talking about the Greek Fathers, and the persecution of the Arians, and worshipping, amidst the awful silence of the hills, with the stars and God above, and scenes of desolation and death below; until they died, and were laid beside old friends in a dark cave. Yet our union with these old and gnarled specimens of mortality, in so far as they held communion with the same Father and through the same Saviour, is more real than we can have with any others on earth who are without God and Christ in the world.

We started at early morn for the Jordan and Dead Sea. The day promised to be hot, if indeed a cool one was ever known at the bottom of this singular hollow since the day it was formed by its restless and hot parents, the earthquake and volcano.

After visiting the Ain es Sultân, and rejoicing in the delicious though not very cool water springing from its limestone cave, we gazed on the great mounds on every side, speculating in vain on their relation to ancient Jericho. It is probable that the first Jericho was here, and that the Jericho of the Gospels was near the spot where the mountain road we had traversed debouched into the plain. The so-called Jericho is modern, and may possibly mark the site of Gilgal.

We struck across the plain to the Jordan. We pushed through a tangled wilderness of low trees, and passed Jericho, that capital of rascaldom, robbery, poverty, and vice, and soon began to pace over the bare flat of the Ghor. What a glorious plain that might be made, growing, as it could do, in full luxuriance the products of the tropics! The soil is excellent; the water at command abundant: yet all is a dreary waste. But could capital be applied to distribute the springs of the Kelt, Ain es Sultân, and El Duk over the soil; could a few Armstrong guns be placed in round towers to defend the fords of the Jordan, to sweep the plain, and stop the incursions of the Bedouin, there is no doubt the Ghòr would again become a paradise.

The sun was already getting hot, and the Jordan seemed to be farther and farther away. We passed in succession, and after considerable intervals, three steep beaches, leading down from a higher to a lower level, and each marking a former shore of the river. These shores may have been occupied for a long period, but more probably only during inundations, and when the Jordan flowed at higher levels. It was not until we descended the fourth beach that we reached the narrow plain through which it now flows. There its muddy and rapid waters rushed in eddying circles like those of a glacier stream, between tangled brushwood of various kinds, and trees, and tall reeds that bent their feathered heads in the quiet air, there being no wind to shake them. On the other side, perpendicular banks of white clay, with the edge of a higher bank appearing beyond, hemmed the water in. It did not seem more than one hundred feet broad. Some of our party and the Arabs bathed in it. I deferred that duty, chiefly from fear of being swept off by the stream, until we reached the Dead Sea. The Arabs revealed a very simple toilette, consisting merely of a long shirt, and a cotton or camel's-hair dressing-gown.

We lingered some time on the bank of the river, cutting walking-sticks for mementos, and also some bulrush-heads—an innocent amusement verily, and affording a striking enough contrast to boar-hunting and other "manly sports." One or two of our party had tin cases provided in which to carry home some of the water; but I was, alas! too prosaic to take the trouble, having no wish to baptise any child in holier water than that which springs up unpolluted among our own beautiful hills.

As we rode towards the Dead Sea, and turned away for ever from the Jordan, I began to recal all the grand events associated with the river and the plain through which it flowed. Somewhere beyond and above us was Pisgah,* from which that grand man, the Saint Paul of the old dispensation, saw revealed for the first time the vision of his life—the land on which he was not to tread until he appeared on it in glory along with the Messiah of whom he had testified. The Jordan was full of memories, dating from the famous day when the ark stayed its waters, and the armies of Israel defiled before it after their long wilderness journey

---

* It is difficult, if not impossible, to discover any point higher than another in the skyline of the ridge which runs parallel to the Jordan, and north of the Dead Sea. Mount Nebo cannot therefore be identified. But this famous point is believed to be the high ridge which rises a little to the east and south of where the Jordan enters the Dead Sea, and which, lying over against Jericho, must from its position command the whole of Palestine.

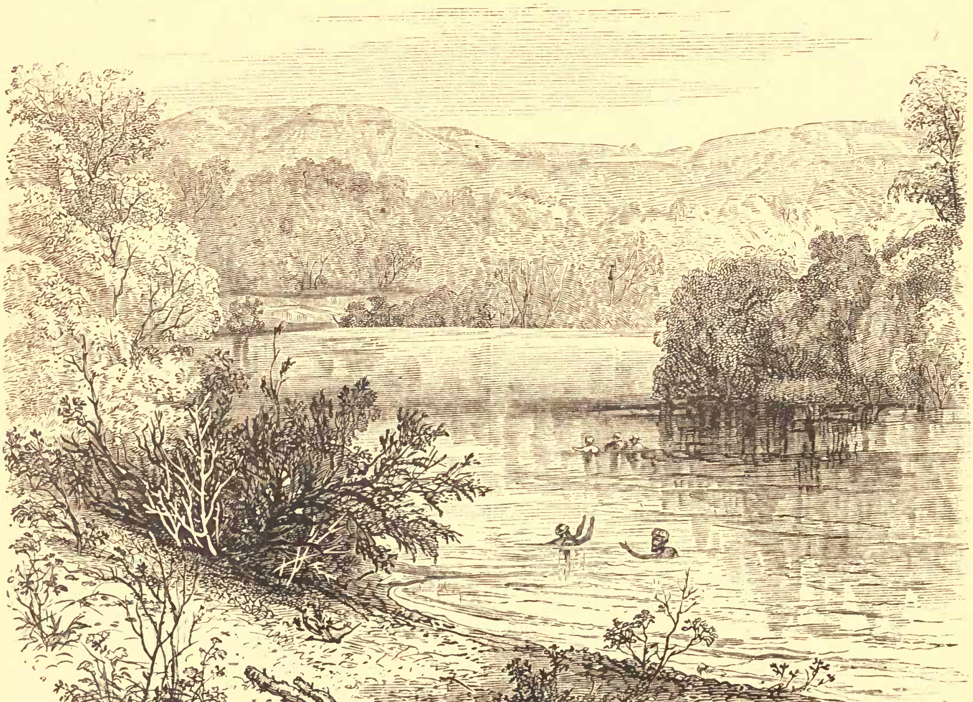
THE REMAINS OF JERICHO.

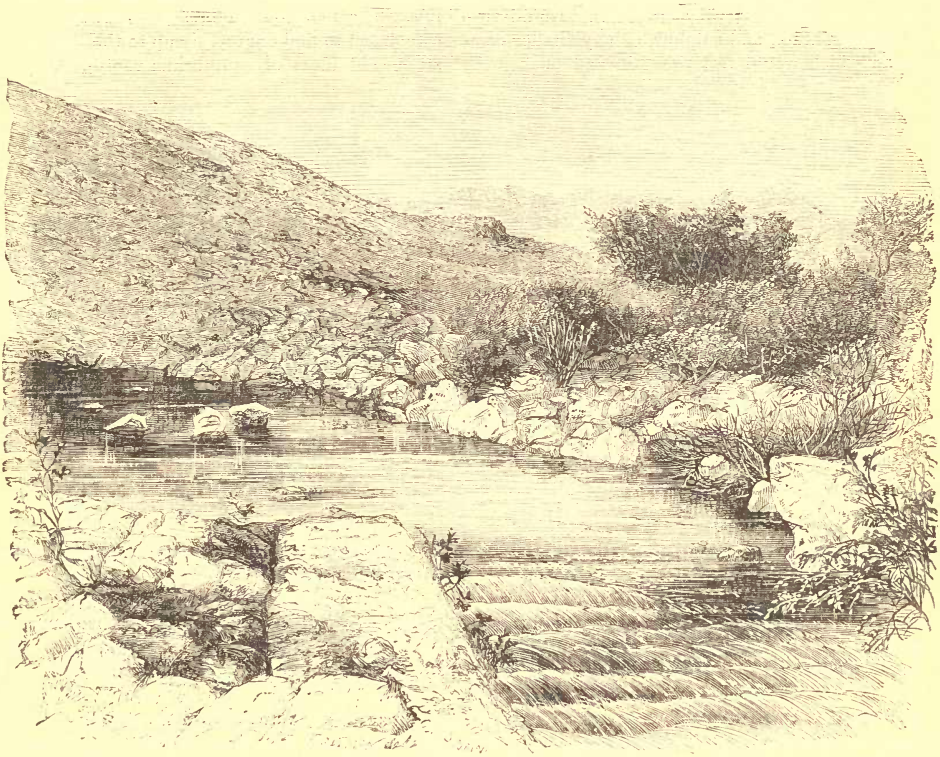


J. Graham, Photo.

THE JORDAN BELOW JERICHO.

into the Holy Land of Promise—Caleb and Joshua alone connecting them with Egypt—downwards through the times of Elijah and Elisha, Naaman the Syrian, and John the Baptist, until the Lord Himself was consecrated in its waters for the public work of His ministry. Behind us was Jericho, associated with the victories of Joshua, the school of the Prophets, the healing miracles of Jesus;—and holy Gilgal, also long the seat of worship before the Tabernacle was pitched at Shiloh, and the place where Samuel and Saul and David and the ancient Church had prayed, and offered sacrifices, and sung their songs of praise.

How desolate and dreary is all this scene now! It is the haunt of brigands, and the home of a few poor debased peasants. The great forests of palm-trees which filled the plain for miles together, with the fields of sugar-cane, have all disappeared, and tangled thickets of valueless trees and shrubs alone remain. The granaries of corn which could feed the armies of Israel, enabling them to dispense with the manna, have perished: while but a few patches of cultivation are left to testify of the former fertility. Desolation everywhere, and the stones of emptiness! The very sites of Jericho and Gilgal are uncertain, and wild beasts or wilder men roam where Holy Prophets taught, where the Baptist preached, and where the Son of God performed his miracles of love and power.

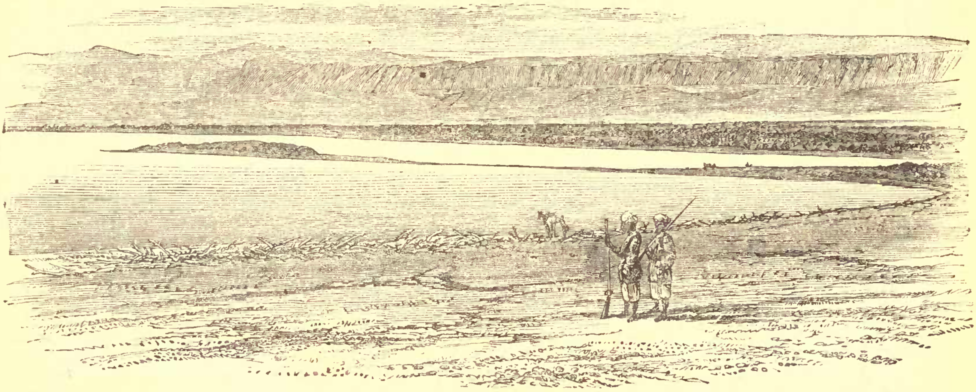


Ain es Sultán

J. Graham, Photo.

When we reached the shore of the Dead Sea, we all gazed in silence on the scene before us. What were our first impressions? Putting aside the associations of God's anger and righteous judgment which are irresistibly suggested by all we know of those degraded races who dwelt somewhere on its borders or on spots where its waters rest, the scene was decidedly pleasing. True, it is not picturesque. The want of life on this part of its waters makes it dull and uninteresting, without, however, giving it the dreary look of many a Highland loch—such, for example, as that darkest and most barren of all I have ever seen, Coruisk in Skye. Nor is the mountain range of its shores apparently "bleak and blasted," like the sides of a volcano, but, generally speaking, is clothed with what looks like herbage, though it may be but low shrubs; while several beautiful and luxuriant wadies debouch on its shores. And then there was a delicious breeze blowing over it, sending fresh-looking tiny waves to the shore; and the water was so marvellously clear and transparent, and we were so hot and deliquescent, that a bathe was anticipated with peculiar pleasure. It is an error to suppose that there is actually no life of plant or animal possible within the influence of its so-called noxious vapours. Plants do grow on its border; and further south, birds are seen not only flying over it but swimming or wading in its waters. No fish have as yet been discovered in it; and this no one who touches its waters will be surprised at, assuming that fish have tastes like men! But one must draw upon fancy more than on what is seen by the eye to make the Dead Sea so very dreadful as it is generally supposed to be.

We bathed of course, and the experiences gained thereby are such as its waters alone afford. Every one knows what a horrid taste it has. No mixture of vinegar, alum, and sulphur, or any similar compound which would fret the skin and pucker the tongue, can give any idea of it. One must taste the deceptive liquid, so clear and beautiful, yet so vile and nauseous, in order to appreciate its composition; and must let his lips, cracked and blistered with the sun, and his face, punctured with mosquitos and other insects, be touched by this limpid wash, before he can estimate its energy. Its buoyancy is also well known, but one must swim through its heavy waters to realise the novel sensation of being unable to sink. The first attempt to swim never fails to produce shouts of laughter,—a dangerous levity, as giving admission to the water by the lips. The moment we breast its waves, we are astonished to find our feet fly up to the surface, and all our old ideas of equilibrium vanish. The most comfortable attitude is either floating on the back, or sitting in the water with a gentle movement of the hands to balance our water-seat; and then the ease, quiet, and composure with which our object can be accomplished, inaugurates a new idea in aquatics. Some travellers tell us that they have dived, or attempted to dive, into these depths. The very idea would have terrified me! I felt uneasy once when losing connection with terra firma, and had a vision of a depth of possibly 1300 feet, near if not beneath me. Might not the edge of the abyss be but a few yards off? And the idea of hanging over such a precipice, with who knows what below, was enough to make one look to the pebbles at his feet for comfort. Besides, I did not see how anybody with only hands for paddles, and without the help of a screw, could ever force his way through those leaden depths. It may pain some solemn critics to know that we very frequently broke the silence of the Dead Sea by shouts of merriment. But the fact must nevertheless be confessed,—though we are in some quarters given to understand, that whatever coloured garments a clergyman may wear in Palestine, he is always to write as one who travels in gown and bands. We enjoyed our bath exceedingly, felt much refreshed by it, and did not find the pungent effect of the water on the skin peculiarly disagreeable.



The North Bay of the Salt Sea, at the South End of Jordan."—Joshua xviii. 19.

J. Graham, Photo.

We made no exploration of the shores. Our expedition had not an atom of science in it, here or elsewhere. We left such work, not without feelings of envy and admiration, to explorers like the Duc de Luynes, who had started a day or two before, as we were told, in his steamer, and Mr. Tristram, who has since added a truly valuable and pleasing contribution to scientific books on Palestine.*

We started now for Mar Saba. It was our original intention to have approached the Dead Sea from Mar Saba by the Ras el Feskah. But we were told that the district was rather disturbed, and that we might have some trouble in that route. This may have been an exaggeration, but our time was too limited to admit of unnecessary delays. There can be no doubt, however, that this is *the* point from which travellers should first behold the famous lake.

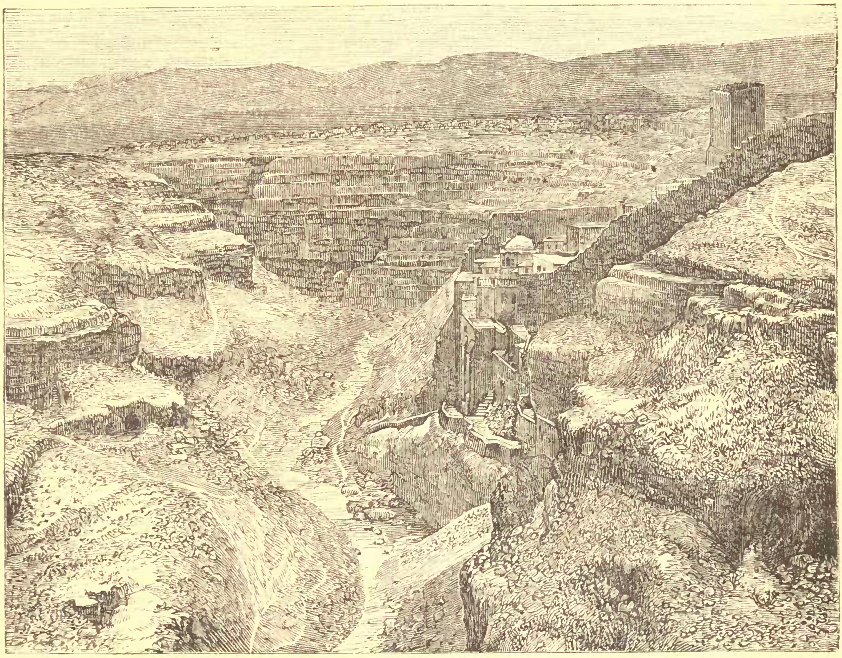
---

* In the above engraving, a narrow tongue is seen entering the Dead Sea to the right. My friend Mr. Reichardt of the Church Missionary Society, a resident for some years in Jerusalem, told me that more than once he had visited this point, and had seen remains of ancient ruins upon it, which he was inclined to think belonged to a remote period.

In riding along its shore before ascending the hills, we were struck by the appearance of an island near its western end. I remarked how strange it was that no such island was noted in any map. "It must be mirage," we said. Yet surely no mirage could create an island so clear and well defined as that! But being on our guard against deception, we rejected the evidence of sense, and fell back on faith in the map. There was no island; but had there been one, it could not have been more distinct.

The ride to Mar Saba was long and tedious. We were, I think, about eleven hours on horseback from the time we left Ain es Sultân until we reached the monastery. Travellers in the East will smile at this. But I did not smile, except grimly. I never was exposed, except once in the far West, to such oppressive heat, and we had no shelter of any kind. But I had fortunately a noble horse, which ambled along with a brave unfaltering step. I wish he could have known how much I pitied him, and how fully I appreciated the unselfish manner in which he did his work.

The scenery was altogether different from anything I had ever seen in my life or ever expect to see again. It realised all that can be imagined of a dry and parched land. We did not meet a human being. The silence was broken only, as I rode alone ahead, by the beat of the horse's hoofs and his strong breathing under the sweltering heat. A glare of light streamed from earth and sky. We crossed dry plains, and ascended along the narrow path which zigzags up and up to the summit of the ridge. Everywhere desolation, as if the fire of heaven had scorched the rocks, and ten thousand furious torrents had denuded the valleys, and left great white mounds and peaks of clay and limestone, like a series of gigantic cones, along the hill-sides. I have no distinct ideas of the journey beyond impressions of heat, glare, and dreariness, of bare rocks, narrow paths, deep ravines, valleys bare and wild as might be seen in the depths of an ocean along which icebergs had ploughed their way, tossing down hills of *débris*, to be moulded into fantastic forms by the roaring tides or whirlpools. More definite pictures my memory does not retain. That one day of life in the wilderness quite satisfied my fancy. But my memory does retain with more distinct clearness the satisfaction which I experienced when about sunset we went pacing along the edge of the Kedron gorge, and knew that Mar Saba was near.



The Convent of Mar Saba.

F. Bedford, Photo.

The approach to this famous old place is along one of the most picturesque paths in Palestine, or indeed in any country. The Kedron, with the help no doubt of earthquakes, has cut for itself during long ages a tortuous course several hundred feet deep. The rocks which rise from its bed in sheer precipices are so close at the top that a one-arched bridge could span them. This deep ravine winds along like a huge railway cutting until it reaches the Monastery. That wonderful building, the

[J. Graham, Phot.

hospice of pilgrims during many centuries, had its origin with the hermits—*tradition* says to the number of 15,000—who once sought refuge from persecution in this place of solitude and defence. The precipices are full of caves. These were enlarged, and fashioned, by the aid of walls closing up apertures and connecting jutting strata, into something like houses, or cells rather, by the anchorites. One abode communicated with another, a hundred feet below or above it, by narrow paths and tortuous holes, such as a fox might creep through with caution; and there they lived—God alone, who feeds the wild beasts of the desert, knows how!—on herbs and pure water (?), nourishing skeleton bodies containing queer minds, whose ideas belonged to a world of thought we know not of. And there they prayed, and starved themselves, and buried themselves, and held a sort of communion with each other, until one cannot conceive of them as being other than monomaniacs possessed of oddest thoughts of God and man—of the world present and of the world to come—thoughts which now, I doubt not, seem stranger to themselves than to any on earth who survive them.

But how can I give an idea of the convent? Well, imagine a cell scooped out between the ledges of those rocks, then several others near it, and then a cave enlarged into a chapel, and this chapel becoming the parish church of the wild glen, and being surrounded by other cells and houses built on this ledge of rock, and others below on another ledge reached by stairs, and others on storey below storey, and so down the face of the precipice, cells and chapels and houses being multiplied, until from the ridge above to the stream below a beehive has been formed, which is finally defended by high walls and two strong towers:—if you can fancy this hanging nest of bees and drones, you have an idea of Mar Saba. Its walls protect it from the incursions of the Bedouin. It is a haven of repose in the wilderness to every pilgrim. It can accommodate hundreds in its endless honeycombs; and is the *beau idéal* of a monastery, such as one reads about in tales of the Crusades and of the middle ages.

To enter it the traveller requires a

letter of introduction from the ecclesiastical superior of the monks at Jerusalem. This we had obtained. A basket to receive it was lowered from one of the high towers by a dot representing a monk. This form is always gone through, and only when the letter is read, and not till then, is the gate opened to pilgrim or traveller. The poor shrivelled, dried-up, and half-starved monks were very civil, giving us coffee and wine in a comfortable refectory. Those who can converse with them say that they are very stupid and ignorant. Yet the place seemed to be a very paradise for study, with its repose, wild scenery, solitude, and antiquity. We saw of course all the sights—such as the skulls of 10,000 martyrs. Oh, for the brain and eyes, for a few minutes only, of one of these, to feel as he felt, and to see as he saw! The wish could not be gratified; and so the skulls taught us nothing which other skulls could not impart.

We encamped outside the monastery. It was a glorious night. When all were asleep, I left the tent to enjoy it, and also, let me add, to get some water to drink. The moonlight, the cool air, the deep shadows of the rocks, the silent towers shining in the moonlight, and the dreams of the past, made the hour delightful. But a prowling jackall, fox, or wolf—for there are many of each in the neighbourhood—induced me to return to my tent, and to forget Mar Saba for a time in sleep.

We had a short ride next day to Jerusalem up the Kedron Valley. This is beyond doubt the finest approach to the city, which from it has an elevation and citadel-look which is afforded by no other point of view; —the wall and buildings of the Haram Area rising above the Valley of Jehoshaphat, as seen in the illustration on page 593.

A DAY'S RIDE SOUTH FROM JERUSALEM.

There is one remarkable peculiarity in the Bible, as a revelation of God's will to man—or rather of the many books which make up the one which we call the Bible,—that it is a record of historical events, extending over thousands of years, all of which occurred in many different places, but situated within a very small territory.

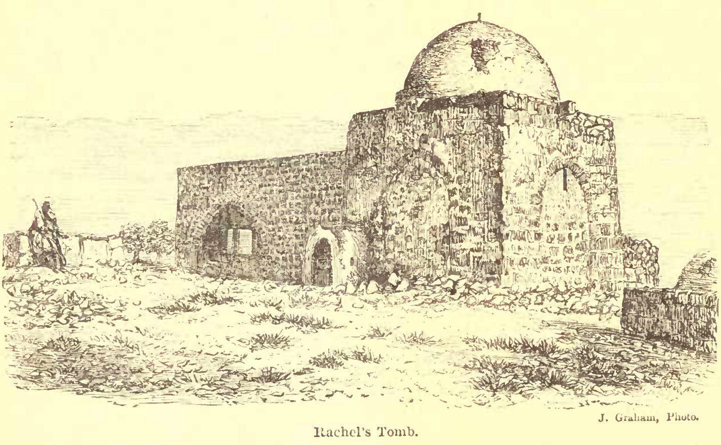
Accordingly there is hardly a hill or valley, stream or fountain, town or village in Palestine which has not been the home of some person, or the scene of some event known and familiar to the Church of Christ. Every spot is consecrated by holy associations. And so in journeying through the land, we almost every hour visit some sacred locality. Thus, for example, in one day's ride south from Jerusalem, after leaving the city by the old Jewish tower at the gate of Jaffa, we cross the plain of Rephadim, pass close to the tomb of Rachel, visit Bethlehem, drink at the pools of Solomon, stand on the plain of Mamre and by the well of Abraham, wind among the vineyards of Eshcol, and end with Hebron.

This was our day's ride, and let me tell the reader something of what we saw in so brief a journey.

As to the general aspect of the country, it is beyond doubt the least picturesque in Palestine, and, apart from associations, does not possess any attractive feature. The hills which cluster over this upland plateau, are like straw beehives, or rather, let me say, like those boys' tops, which are made to spin by a string wound round them,—*peeries* as they are called in Scotland,—but turned upside down, the grooves for the string representing the encircling ledges of the limestone strata, and the peg a ruined tower on the summit. Imagine numbers of such hills placed side by side, with a narrow deep hollow between them filled with soil, their declivities a series of bare shelves of grey rock,—the rough path worming its way round about, up and down, with here and there broader intervals of flat land, and here and there the hill-sides covered with shrubs and dwarf oaks,—and you will have some idea of the nature of the country between Jerusalem and Hebron. In some places, as about Bethlehem, there are olive plantations and signs of rapid improvement, with which my brother was much struck, as contrasted with what he saw on his visit seven years ago. To me, the scene had a friendly and home look, for many parts of the stony road, with its break-down fences, reminded me of spots in a Highland parish, endeared by touching recollections of an early home; but the grander features of "the parish" could not be traced in Southern Palestine. Yet it is obvious, as has been remarked by every traveller, that an industrious population could very soon transform these barren hills into terraces rich with "corn and wine." Were these limestone ledges once more provided with walls, to prevent the soil being washed down into the valley by the rain floods, and were fresh soil carried up from the hollows, where it must lie fathoms deep, magnificent crops would very soon be produced. It is well known also how soon the moisture of the climate would be affected by the restoration of the orchards. And when we remember the small quantity of carbonaceous food that is required to maintain life in such a climate as Palestine, it is obvious that a population larger than that of Scotland, living as the Easterns do, could be supported in "The Land."

There was always one redeeming feature of the road, and that was "the glory in the grass." The flowers gave colour and life to the path wherever they could grow. We came upon a large land tortoise crawling among them, the only specimen we met with in Palestine.

Rachel's Tomb was to me very touching. It was just where it should have been:—"They journeyed from Bethel, and there was but a little way to come to Ephrah. And Rachel died, and was buried in the way to Ephrah, which is Bethlehem." That place of burial is an undying witness to the oneness of our human hearts and of our domestic sorrows from the beginning of the world. It is this felt unity of our race in soul and spirit, in spite of some differences in the body, whether it be in the shape of the foot or of the skull, which strengthens our faith in the possibility of eternal fellowship among all kindreds and nations and tongues. To Rachel, with her dying breath naming her boy "the child of sorrow," every parent's heart will respond through all time.

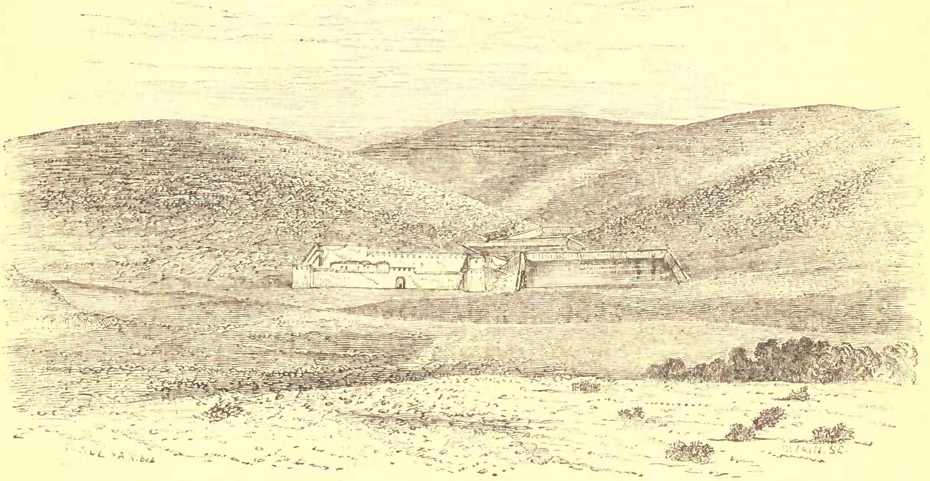


J. Graham, Photo.

Rachel's Tomb.

We passed Bethlehem, but did not visit it until our return from Hebron. The Pools of Solomon,* of which the picture will give a better idea than any verbal description could do, are interesting as being unquestionably grand old "waterworks" worthy of a highly civilised age, and such as all the Turks put together would never think of designing or executing nowadays. And the water is not surpassed by that of the great pool (Loch Katrine) which supplies Glasgow. The road during a part of the way is alongside the clay pipe which conveys the water to Bethlehem, as it did formerly to Jerusalem; and where there happens to be a break the fresh clear stream is seen gushing along as it did before the "works" were repaired by Pontius Pilate.

Below the Pools is the Valley of Urtas, which, being watered by them and other springs, looks like an emerald green river, of about two miles in length, and from 10 to 300 yards in breadth, flowing between high banks of barren limestone hills, and winding round their jutting promontories. Here were once the Gardens of Solomon, and no doubt these hills, now so bare, were once clothed with the trees and plants about which he "spake." It was probably with reference to his labours in this spot that he said:—"I made me great works; I builded me houses; I planted me vineyards: I made me gardens and orchards, and I planted trees in them of all kind of fruit: I made me pools of water, to water therewith the wood that bringeth forth trees." And here an attempt is being made to introduce model gardens, where converted Jews may support themselves by their own industry, instead of trusting to the charity which they are necessarily thrown upon when "put out of the synagogue." In this enterprise my much respected friend Major C—— took a lively interest, as he does in all that is good, and became one of the proprietors, as did also Lady Dufferin and his Royal Highness Prince Alfred. We had coffee and conversation at Bethlehem with the present superintendent of these gardens, old Mr. Meshallum, who appears to be a sincere good man. It is difficult to determine how far the benevolent experiment will succeed. It is not in a hopeful condition at present.



J. Graham, Photo.

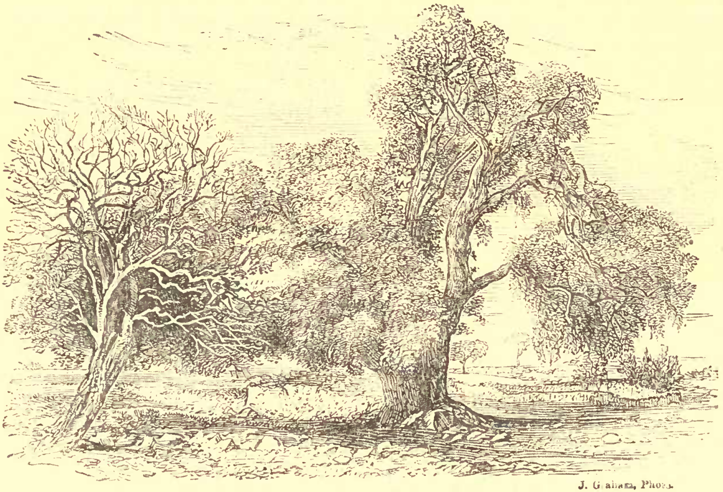
The Pools of Solomon.

About two miles from Hebron we turned off to the left, to visit the ruins of an old church built by Constantine round the stump of a terebinth tree, which, according to tradition, was Abraham's oak, and consequently marked the spot where he pitched his tent on the plain of Mamre, or "of the oak." The old stump had become an object of superstition, and attracted crowds, so the Emperor Constantine, to counteract this, and to turn the spot to good account, built a great Basilica around it. We found several feet of the walls of the church remaining, and we could easily trace the whole. Three tiers of stone remain at one side, some of the stones being upwards of 14 feet in length. "If Abram," remarked one of the party, "had his tent near the oak, depend upon it he had a well also. Let us get inside the ruins and search." There we found—as no doubt other travellers have done, when they sought for it—a deep well encased with stone, and having its edges deeply cut by the ropes which were wont to hoist the water-buckets or skins. I have not the slightest doubt that this was the true Mamre, and that it was close to this well that the wondrous interview between Abraham and those sent to destroy Sodom and Gomorrah, recorded in Genesis, took place. The scenery of the wady is dull and uninteresting in the extreme. But such an event as this sheds around it much of that holy light which more or less invests all Palestine. From the lower hills to the east, the smoke from the doomed cities could be easily seen, although the Dead Sea itself lies too low to be visible.

---

* These pools are three in number. The largest is 580 feet in length and 236 feet in breadth. The smallest is 380 feet by 207 feet. The depth from 25 to 50 feet.

Hebron is entered by a road which winds between the walls that enclose the vineyards and orchards of Eshcol, the grapes of which are still famous.* It is snugly nestled amidst bare, tame, limestone hills, with numerous olive groves clothing their lower spurs and the valleys between them. There is no "hotel" in the city, but travellers who do not bring their tents can be accommodated at the old Lazaretto, or, as we were, in a private dwelling. The houses are poverty stricken. The Jewish inhabitants wear dressing-gowns with girdles, and sugar-loaf hats, curl their hair in tiny ringlets, and have soft white faces, giving one the impression of great effeminacy. Our host was a Jew. His house was situated and arranged in a way which at once suggested the idea of danger, of liability to attack, and of the necessity of providing for defence. We first passed from the street by what we call in Scotland a narrow *close*, which one broad-shouldered man might almost have filled up with his own person; then along narrow tortuous windings, which could be easily defended by a few against many. Three or four steps led up to the narrow door of the house, which was situated in the deep recesses of alleys and back courts. The entrance-hall was a sleeping apartment with divans on each side; from it a second series of steps and another narrow door led to the kitchen. From this a stair ascended to the flat roof. On the left, a few steps led from the kitchen to a small room, round which we found our couches spread. The house thus possessed a succession of strongholds before the roof was reached, which was itself a citadel. The windows of our room had frames and shutters, but no glass, which afforded us at least ample ventilation. We provided of course our own food. The night was tolerably cool, and so, in despite of the howlings of jackalls without, and the attacks of insects common to Jew and Gentile within, we slept, as usual, profoundly.



J. Graham, Phot.

The Tree pointed out as Abraham's Oak.

There is certainly no town in Palestine which is so associated with early patriarchal history as Hebron. It has other associations no doubt, stirring and curious enough. For example, those connected with its early inhabitants, the strange race of giants who struck terror into the minds of the unbelieving spies; with those men of faith, Caleb and Joshua; and with David,* who reigned here for seven years, during which he probably composed some of his immortal Psalms. But still the memories of the patriarchs predominate, as this was at once their home, if home they had anywhere, and their place of burial.

The oak, or terebinth tree, which is now pointed out as Abraham's oak, is indeed a noble tree, twenty-four feet in circumference, with stately branches sweeping ninety feet round its stem. But it was planted many a century after the patriarchs were gathered to their fathers.

---

* I have been informed by one who had, he said, made the experiment, that even now the best way of carrying a large cluster of the grapes of Eshcol is over a long pole, as was done by the "spies,"—not on account of their weight, but from the long tendrils on which they grow giving a cluster a greater length than is found in the same number of grapes grown elsewhere. As to the wine of Hebron and Bethlehem—of which we had supplies—not being intoxicating, that is absurd. If anyone disposed to make the experiment can overcome the difficulty of *quality*, I have no doubt that a sufficient *quantity* will produce the same effect as other fermented liquors.

* The only memento here of David is the great pool—130 feet square by 50 deep—where he hung the assassins of Ishbosheth (2 Sam. iv. 4—12). There is another pool as ancient, but not so large.

The one spot connected with these ancient fathers which is unquestionably authentic is the cave of Machpelah, now covered by the famous mosque. The Prince of Wales, accompanied by Dean Stanley and other members of his suite, were the first Christian travellers who were permitted to enter it for centuries. Since their visit, Mr. Fergusson has been allowed ready admission; and it is soon likely to be as accessible as the Holy Mosques of Jerusalem or Damascus, which until but as yesterday were also closed against all "infidels."

Both Dr. Stanley and Mr. Fergusson have given full and interesting details of the interior of this hitherto mysterious building. To their accounts I must refer my readers. I may state, however, for the information of those who have not access to their volumes, that there are no tombs to be seen in the mosque, but cenotaphs, or so-called tombs, on its floor, each a sort of monument to the famous patriarchs. But the cave itself in which their mummies are laid is beneath the floor of the mosque, and, so far as is yet known, has no entrance except by a small hole in the floor, which opens into darkness. If there is another entrance, it has not been revealed by the Mohammedans even to the Prince of Wales. In that mysterious cave no doubt Abraham, Isaac, and Jacob lie. What a spot of matchless interest! There is no authentic tomb on earth like it. Nearly 4000 years ago, when earth was young and history just beginning, here were buried persons with whose lives and characters we are still familiar, whose names God has deigned to associate with his own, as the "God of Abraham, Isaac, and Jacob;" and whom Jesus has consecrated as guests at the great marriage supper of the Lamb. It is strange indeed for a Christian to be on the spot where that one lies in whose seed all the families of earth have been blessed, and who is "the father of all who believe!"

This is the only spot on earth which attracts to it all who possess the one creed, "I believe in God." The "Holy Sepulchre" in Jerusalem separates Moslem, Jew, and Christian: here they assemble together. The Moslem guards this place as dear and holy. The Jew from every land draws near to it with reverence and love, and his kisses have left an impress on its stones. Christians of every kindred, and tongue, and creed, visit the spot with a reverence equally affectionate. And who lies here? a great king or conqueror? a man famous for his genius or his learning? No; but an old shepherd who pitched his tent 4000 years ago among these hills, a stranger and a pilgrim in the land, and who was known only as *el-Khulil*, "The Friend." By that blessed name, Abram was known while he lived; by that name he is remembered where he lies buried; and by that name the city is called after him. And it is when all men through faith become with him Friends of God, that all shall be blessed along with "faithful Abraham." Praise be to God for such an immortality as this, whether possessed by us on earth or in heaven, through faith and love in Christ towards God, whose glory may be concealed from the wise and prudent, but is revealed to babes!

My space compels me to stop. I must delay till another chapter our visit to Bethlehem, where He was born in the flesh who was yet before Abraham, whose day Abraham saw afar off and was glad, and in whom "the promise" was fulfilled to Abraham's spiritual seed, more numerous verily than the stars of heaven!

ON POLISH.

By Polish I mean a certain well-known and immediately-recognisable condition of surface. But I must request my reader to consider well what this condition really is. For the definition of it appears to me to be, that condition of surface which allows the inner structure of the material to manifest itself. Polish is, as it were, a translucent skin, in which the life of the inorganic comes to the surface, as in the animal skin the animal life. Once clothed in this, the inner glories of the marble rock, of the jasper, of the porphyry, leave the darkness behind, and glow into the day. From the heart of the agate the mossy landscape comes dreaming out. From the depth of the green chrysolite looks up the eye of its gold. The "goings on of life" hidden for ages under the rough bark of the patient forest-trees, are brought to light; the rings of lovely shadow which the creature went on making in the dark, as the oyster its opaline laminations, and its tree-pearls of beautiful knots, where a beneficent disease has broken the geometrical perfection of its structure, gloom out in their infinite variousness.

Nor are the revelations of polish confined to things having variety in their internal construction; they operate equally in things of homogeneous structure. It is the polished ebony or jet which gives the true blank, the material darkness. It is the polished steel that shines keen and remorseless and cold, like that human justice whose symbol it is. And in the polished diamond the distinctive purity is most evident; while from it, I presume, will the light absorbed from the sun gleam forth on the dark most plentifully.

But the mere fact that the end of polish is revelation, can hardly be worth setting forth except for some ulterior object, some further revelation in the fact itself.—I wish to show that in the symbolic use of the word the same truth is involved, or, if not involved, at least suggested. But let me first make another remark on the preceding definition of the word.

There is no denying that the first notion suggested by the word polish is that of smoothness, which will indeed be the sole idea associated with it before we begin to contemplate the matter. But when we consider what things are chosen to be "clothed upon" with this smoothness, then we find that the smoothness is scarcely desired for its own sake, and remember besides that in many materials and situations it is elaborately avoided. We find that here it is sought because of its faculty of enabling other things to show themselves—to come to the surface.

I proceed then to examine how far my pregnant interpretation of the word will apply to its figurative use in two cases—*Polish of Style*, and *Polish of Manners*. The two might be treated together, seeing that *Style* may be called the manners of intellectual utterance, and *Manners* the style of social utterance; but it is more convenient to treat them separately.

I will begin with the Polish of Style.

It will be seen at once that if the notion of polish be limited to that of smoothness, there can be little to say on the matter, and nothing worthy of being said. For mere smoothness is no more a desirable quality in a style than it is in a country or a countenance; and its pursuit will result at length in the gain of the monotonous and the loss of the melodious and harmonious. But it is only upon worthless material that polish can be *mere* smoothness; and where the material is not valuable, polish can be nothing but smoothness. No amount of polish in a style can render the production of value, except there be in it embodied thought thereby revealed; and the labour of the polish is lost. Let us then take the fuller meaning of polish, and see how it will apply to style.

If it applies, then Polish of Style will imply the approximately complete revelation of the thought. It will be the removal of everything that can interfere between the thought of the speaker and the mind of the hearer. True polish in marble or in speech reveals inlying realities, and, in the latter at least, mere smoothness (either of sound or of meaning) is not worthy of the name. The most polished style will be that which most immediately and most truly flashes the meaning embodied in the utterance upon the mind of the listener or reader.

"Will you then,"—I imagine a reader objecting—"will you then admit of no ornament in style?"

"Assuredly," I answer, "I would admit of no ornament whatever."

But let me explain what I mean by ornament. I mean anything stuck in or on, like a spangle, because it is pretty in itself, although it reveals nothing. Not one such ornament can belong to a polished style. It is paint, not polish. And if this is not what my questioner means by *ornament*, my answer must be modified according to the differences in his definition of the word. What I have said has not the least application to the natural forms of beauty which thought assumes in speech. Between such beauty and such ornament there lies the same difference as between the overflow of life in the hair, and the dressing of that loveliest of utterances in grease and gold.

For, when I say that polish is the removal of everything that comes between thought and thinking, it must not be supposed that in my idea thought is only of the intellect, and therefore that all forms but bare intellectual forms are of the nature of ornament. As well might one say that the only essential portion of the human form is the bones. And every human thought is in a sense a human being, has as necessarily its muscles of motion, its skin of beauty, its blood of feeling, as its skeleton of logic. For complete utterance, music itself in its right proportions, sometimes clear and strong, as in rhymed harmonies, sometimes veiled and dim, as in the prose compositions of the masters of speech, is as necessary as correctness of logic, and common sense in construction. I should have said *conveyance* rather than utterance; for there may be utterance such as to relieve the mind of the speaker with more or less of fancied communication, while the conveyance of thought may be little or none; as in the speaking with tongues of the infant Church, to which the lovely babblement of our children has probably more than a figurative resemblance, relieving their own minds, but, the interpreter not yet at his post, neither instructing nor misleading any one. But as the object of grown-up speech must in the main be the conveyance of thought, and not the mere utterance, everything in the style of that speech which interposes between the mental eyes and the thought embodied in the speech, must be polished away, that the indwelling life may manifest itself.

What, then (for now we must come to the practical), is the kind of thing to be polished away in order that the hidden may be revealed?

All words that can be dismissed without loss. For all such more or less obscure the meaning upon which they gather. The first step towards the polishing of most styles is to strike out—polish off—the useless words and phrases. It is wonderful with how many fewer words most things could be said that are said; while the degree of certainty and rapidity with which an idea is conveyed would generally be found to be in an inverse ratio to the number of words employed.

All ornaments so called—the nose and lip jewels of style—the tattooing of the speech; all similes that, although true, give no additional insight into the meaning; everything that is only pretty and not beautiful; all mere sparkle as of jewels that lose their own beauty by being set in the grandeur of statues or the dignity of monumental stone, must be ruthlessly polished away.

All utterances which, however they may add to the amount of thought, distract the mind, and confuse its observation of the main idea, the essence or life of the book or paper, must be diligently refused. In the manuscript of *Comus* there exists, obliterated but legible, a passage of which I have the best authority for saying that it would have made the poetic fame of any writer. But the grand old self-denier struck it out of the opening speech because that would be more polished without it—because the Attendant Spirit would say more immediately and exclusively, and therefore more completely, what he had to say, without it.—All this applies much more widely and deeply in the region of art; but I am at present dealing with the surface of style, not with the round of result.

I have one instance at hand, however, belonging to this region, than which I could scarcely produce a more apt illustration of my thesis. One of the greatest of living painters, walking with a friend through the late Exhibition of Art-Treasures at Manchester, came upon Albert Dürer's *Melancholia.* After looking at it for a moment, he told his friend that now for the first time he understood it, and proceeded to set forth what he saw in it. It was a very early impression, and the delicacy of the lines was so much the greater. He had never seen such a perfect impression before, and had never perceived the intent and scope of the engraving. The mere removal of accidental thickness and furriness in the lines of the drawing enabled him to see into the meaning of that wonderful production. The polish brought it to the surface. Or, what amounts to the same thing for my argument, the dulling of the surface had concealed it even from his experienced eyes.

In fine, and more generally, all cause whatever of obscurity must be polished away. There may lie in the matter itself a darkness of colour and texture which no amount of polishing can render clear or even vivid; the thoughts themselves may be hard to think, and difficulty must not be confounded with obscurity. The former belongs to the thoughts themselves; the latter to the mode of their embodiment. All cause of obscurity in this must, I say, be removed. Such may lie even in the region of grammar, or in the mere arrangement of a sentence. And while, as I have said, no ornament is to be allowed, so all roughnesses, which irritate the mental ear, and so far incapacitate it for receiving a true impression of the meaning from the words, must be carefully reduced. For the true music of a sentence, belonging as it does to the essence of the thought itself, is the herald which goes before to prepare the mind for the following thought, calming the surface of the intellect to a mirror-like reflection of the image about to fall upon it. But syllables that hang heavy on the tongue and grate harsh upon the ear are the trumpet of discord rousing to unconscious opposition and conscious rejection.

And now the consideration of the Polish of Manners will lead us to some yet more important reflections. Here again I must admit that the ordinary use of the phrase is analogous to that of the preceding; but its relations lead us deep into realities. For as diamond alone can polish diamond, so men alone can polish men; and hence it is that it was first by living in a city (πόλις, *polis*) that men—

> "rubbed each other's angles down,"

and became *polished.* And while a certain amount of ease with regard to ourselves and of consideration with regard to others is everywhere necessary to a man's passing as a gentleman—all unevenness of behaviour resulting either from shyness or self-consciousness (in the shape of awkwardness), or from overweening or selfishness (in the shape of rudeness), having to be polished away—true human polish must go further than this. Its respects are not confined to the manners of the ball-room or the dinner-table, of the club or the exchange, but wherever a man may rejoice with them that rejoice or weep with them that weep, he must remain one and the same, as polished to the tiller of the soil as the leader of the fashion.

But how will the figure of material polish aid us any further? How can it be said that Polish of Manners is a revelation of that which is within, a calling up to the surface of the hidden loveliness of the material? For do we not know that courtesy may cover contempt; that smiles themselves may hide hate; that one who will place you at his right hand when in want of your inferior aid, may scarce acknowledge your presence when his necessity has gone by? And how then can polished manners be a revelation of what is within? Are they not the result of putting on rather than of taking off? Are they not paint and varnish rather than polish?

I must yield the answer to each of these questions; protesting, however, that with such polish I have nothing to do; for these manners are confessedly false. But even where least able to mislead, they are, with corresponding courtesy, accepted as outward signs of an inward grace. Hence even such, by the nature of their falsehood, support my position. For in what forms are the colours of the paint laid upon the surface of the material? Is it not in as near imitations of the real right human feelings about oneself and others as the necessarily imperfect knowledge of such an artist can produce? He will not encounter the labour of polishing, for he does not believe in the divine depths of his own nature: he paints, and calls the varnish polish.

"But why talk of polish with reference to such a character, seeing that no amount of polishing can bring to the surface what is not there? No polishing of sandstone will reveal the mottling of marble. For it is sandstone, crumbling and gritty—not noble in any way."

Is it so then? Can such be the real nature of the man? And can polish reach nothing deeper in him than such? May not this selfishness be polished away, revealing true colour and harmony beneath? Was not the man made in the image of God? Or, if you say that man lost that image, did not a new process of creation begin from the point of that loss, a process of re-creation in Him in whom all shall be made alive, which, although so far from being completed yet, can never be checked? If we cut away deep enough at the rough block of our nature, shall we not arrive at some likeness of that true Man who, the apostle says, dwells in us—the Hope of glory. He informs us—that is, forms us from within.

Dr. Donne (who knew less than any other writer in the English language what Polish of Style means) recognizes this divine polishing to the full. He says in a poem called "The Cross":—

"As perchance carvers do not faces make,
But that away, which hid them there, do take,
Let Crosses so take what hid Christ in thee,
And be his Image, or not his, but He."

This is no doubt a higher figure than that of *polish*, but it is of the same kind, revealing the same truth. It recognizes the fact that the divine nature lies at the root of the human nature, and that the polish which lets that spiritual nature shine out in the simplicity of heavenly childhood, is the true Polish of Manners of which all merely social refinements are a poor imitation.—Whence Coleridge says that nothing but religion can make a man a gentleman.—And when these harmonies of our nature come to the surface, we shall be indeed "lively stones," fit for building into the great temple of the universe, and echoing the music of creation. Dr. Donne recognizes, besides, the notable fact that *crosses* or afflictions are the polishing powers by means of which the beautiful realities of human nature are brought to the surface. One can tell at once by the peculiar loveliness of certain persons that they have suffered.

But, to look for a moment less profoundly into the matter, have we not known those whose best never could get to the surface just from the lack of polish?—persons who, if they could only reveal the kindness of their nature, would make men believe in human nature, but in whom some roughness of awkwardness or of shyness prevents the true self from appearing? Even the dread of seeming to claim a good deed or to patronise a fellow-man will sometimes soil the last touch of tenderness which would have been the final polish of the act of giving, and would have revealed infinite depths of human devotion. For let the truth out, and it will be seen to be true.

Simplicity is the end of all Polish, as of all Art, Culture, Morals, Religion, and Life. The Lord our God is one Lord, and we and our brothers and sisters are one Humanity, one Body of the Head.

Now to the practical: what are we to do for the polish of our manners?

Just what I have said we must do for the polish of our style. Take off: do not put on. Polish away this rudeness, that awkwardness. Correct everything self-assertive, which includes nine-tenths of all vulgarity. Imitate no one's behaviour; that is to paint. Do not think about yourself; that is to varnish. Put what is wrong right, and what is in you will show itself in harmonious behaviour.

But no one can go far in this track without discovering that true polish reaches much deeper; that the outward exists but for the sake of the inward; and that the manners, as they depend on the morals, must be forgotten in the morals of which they are but the revelation. Look at the high-shouldered, ungainly child in the corner: his mother tells him to go to his book, and he wants to go to his play. Regard the swollen lips, the skin tightened over the nose, the distortion of his shape, the angularity of his whole appearance. Yet he is not an awkward child by nature. Look at him again the moment after he has given in and kissed his mother. His shoulders have dropped to their place; his limbs are free from the fetters that bound them; his motions are graceful, and the one blends harmoniously with the other. He is no longer thinking of himself. He has given up his own way. The true childhood comes to the surface, and you see what the boy is meant to be always. Look at the jerkiness of the conceited man. Look at the quiet *fluency* of motion in the modest man. Look how anger itself which forgets self, which is unhating and righteous, will elevate the carriage and ennoble the movements.

But how far can the same rule of *omission* or *rejection* be applied with safety to this deeper character—the manners of the spirit?

It seems to me that in morals too the main thing is to avoid doing wrong; for then the active spirit of life in us will drive us on to the right. But on such a momentous question I would not be dogmatic. Only as far as regards the feelings I would say: it is of no use to try to make ourselves feel thus or thus. Let us fight with our wrong feelings; let us polish away the rough ugly distortions of feeling. Then the real and the good will come of themselves. Or rather, to keep to my figure, they will then show themselves of themselves as the natural home-produce, the indwelling facts of our deepest—that is, our divine nature.

Here I find that I am sinking through my subject into another and deeper—a truth, namely, which should, however, be the foundation of all our building, the background of all our representations: that Life is at work in us—the sacred Spirit of God travailing in us. That Spirit has gained one end of His labour—at which He can begin to do yet more for us—when He has brought us to beg for the help which He has been giving us all the time.

I have been regarding infinite things through the medium of one limited figure, knowing that figures with all their suggestions and relations could not reveal them utterly. But as far as they go, these thoughts raised by the word Polish and its figurative uses appear to me to be most true.

GEORGE MAC DONALD.

GRANDFATHER'S PET.

This is the room where she slept,
Only a year ago,—
Quiet, and carefully swept,
Blinds and curtains like snow;
There, by the bed in the dusky gloom,
She would kneel with her tiny clasp'd hands and pray!
Here is the little white rose of a room,—
With the fragrance fled away!

Effie, Grandfather's pet,
With her wise little face,—
I seem to hear her yet
Singing about the place;
But the crowds roll on, and the streets are drear,
And the world seems hard with a bitter doom,
And Effie is singing elsewhere,—and here
Is the little white rose of a room.

Why, if she stood just there,
As she used to do,
With her long light yellow hair,
And her eyes of blue,—
If she stood, I say, at the edge of the bed,
And ran to my side with a living touch,
Though I know she be quiet, and buried, and dead,
I should not wonder much.

For she was so young, you know,—
Only seven years old,
And she loved me, loved me, so,
Though I was gray and old,
And her face was so wise, and so sweet to see,
And it still lookt living when she lay dead,
And she used to plead for mother and me
By the side of that very bed!

I wonder, now, if she
Knows I am standing here,
Feeling, wherever she be,
We hold the place so dear?
It cannot be that she sleeps too sound,
Still in her little night-gown drest,
Not to hear my footsteps sound
In the room where she used to rest.

Nay!—though I am dull and blind,
Since men are bad and base,
The Lord is much too kind
To mar such a sweet young face:
Why, when we stood by her still bed-side,
She seemed to breathe like a living thing!
And when I murmur'd her name and cried,
She seem'd to be listening!

I have felt hard fortune's stings,
And battled in doubt and strife,
And never thought much of things
Beyond this human life;—
But I cannot think that my darling died
Like great strong men with their prayers untrue—
Nay!—rather she sits at God's own side,
And sings as she used to do!

A weary path I have trod;
And now I feel no fear,—
For I cannot think that God
Is so far, since she was here!
As I stand, I can see the blue eyes shine,
And the small arms reach thro' the curtain'd gloom,—
While the breath of the great Lord God divine
Stirs the little white rose of a room!

ISAAC TAYLOR.

The grave having just closed over the earthly remains of Isaac Taylor, I cannot but think that a few personal recollections of him and his home, and a brief glance at his principal writings, will gratify the readers of a magazine to which he was lately so large a contributor. What I have got to say will be, I know, a very meagre memorial of the man, and a very inadequate estimate of his writings; but the notices of him in the newspapers have been so very bare, that though I must come far short of what is due, I think I shall go a little beyond what has yet been done in the way of tribute to so estimable a memory.

Of one who reached the zenith of his fame so long ago as five-and-twenty or thirty years, many of the present generation can have but a very vague impression, especially as he occupied no public sphere, lived secluded from the world, and hardly ever appeared in person before a general audience. Many, I fancy, think of him dimly as a great and learned champion of truth, who sat in his study at Stanford Rivers, pondering men and things, and threw out a remarkable book now and then to the world, like a shot from an Armstrong gun, that told mightily upon intellectual minds, and greatly delighted the friends of Christian truth. The names of his books are no doubt familiar to most persons who know anything of the more solid literature of the present century; yet if the inquiry were made, in such a company as he himself in "Good Words" proposed to catechise as to whether or not they had read "Paradise Lost,"—Have you read the "Natural History of Enthusiasm?" or the "Physical Theory of Another Life?" or "Saturday Evening?" or "Home Education?" it is too likely that the per centage of "ayes" would be even less than the very small one which he allowed for the readers of Milton. It is the deep conviction, that both the man and his books deserve to be much more widely known at the present day, that induces me to bring before the public the few recollections of him which a short acquaintance supplies. No class of writings, I am persuaded, is more fitted to benefit the world just now. They are not of course popular books, they are not easily read, and not always readily understood. They are full of thought, of reasoning, of wisdom, of deep conviction, and earnest feeling. Every page shows how strongly the writer's mind was under the influence of truth. Every page shows as clearly his remarkable candour, and how well he was fitted for one of the great tasks he set himself—to separate real from fictitious piety, in its secret springs as well as its open appearances. From first to last he laboured to clear religion of every element of disease and impurity, and hand it down to future generations in a condition of health that would secure for it, under God, a career of continued vitality and growing power. A pure and lofty aim, doubtless; yet not more pure or lofty than the soul of the man who made it his own.

A few years ago, I set out on a winter afternoon to pay my first visit to Stanford Rivers. At that time, the most convenient way of reaching it from the Metropolis was by the train from Shoreditch, and a covered van that ran (if it could be said to run) between the Romford station and the village of Ongar. The latter conveyance was somewhat primitive, almost antediluvian. It took the world easily, the coachman, among other leisurely acts, pulling up at a road-side inn, and letting down the passengers to warm their feet at a comfortable fire, and have a glass of beer if they chose, or smoke a pipe. The eight or nine miles between Romford and Stanford Rivers were traversed in this way in about a couple of hours. Nothing could have been more striking than the contrast between the commencement of the journey from London and its close; between the roar and commotion at the Shoreditch station, and the sober jogging of the covered van. One could hardly have supposed that within twenty miles of London one should find such a quiet scene; but it was just what seemed appropriate for the residence of Isaac Taylor; near enough to the busy world for him to know and appreciate the forces by which it was agitated, yet so beyond the whirlpool as to favour that course of calm meditation on its currents and eddies, seen and unseen, to which his life was given.

The name "Stanford Rivers" is a puzzle to people at a distance, leading them instinctively to think of a land of streams, while nothing of the kind meets the stranger's eye. The very frequent occurrence of the syllable *ford* in the names of places in Essex has often been remarked (Romford, Ilford, Woodford, Chelmsford, Stanford, &c.); but however that fact may be explained, it has no connection with the latter half of the name of the parish where Mr. Taylor had his home. Stanford, according to Morant, in his "History and Antiquities of Essex," "is the name given to this parish because a ford through the river Rodon here was naturally stony, or was paved with stone after the manner of the Romans;" and the addition of Rivers "is from the family *De Ripariis*, or Rivers, its ancient owners, distinguishing it from Stanford le Hope."

Of this Stanford Rivers the reader must conceive as a thoroughly rural parish, with a few houses scattered over its rich fields and wooded slopes, wearing a charming aspect of rural seclusion and simplicity. Though thickening somewhat near the parish church of Stanford Rivers, the houses are still too much apart to form a village, or even the appearance of one. No one probably would at first sight be particularly struck by a modest house near the road-side, with the square windows and low ceilings of the old English style, having in front a small plot of grass and a few ornamental trees, and behind, a garden of average size, embellished with no ribbon-borders or other devices of modern gardening, but with the old-fashioned shrubs and flowers of half a century ago. As the coachman pulled up at the gate, I knew this to be the Stanford Rivers from which so many remarkable books had been dated. The scene of so much intellectual activity, the home of so much warm affection and Christian grace and purity, did not indicate one on whose fortunes the world had smiled. But the evidences of mental culture and refined taste, and of the victory of mind over unfavourable conditions of life, showed with how much more lavish a hand the higher gifts had been bestowed than the lower. On entering the house, one felt that one was welcome, and at home. Not that Mr. Taylor's manner was particularly easy or genial; on the contrary, it was abrupt and angular; but there was an honesty and genuineness about it that at once impressed you; you felt that he meant what he said, and more than he said. A slight figure, below the middle height, suggested no idea of commanding power. But besides what one gathered from the compact firmness of the face, and the finely-chiselled brow, crowned by an ample supply of crisp grey hair, the quick bright eye told the tale of intellectual prowess,—what a piercing glance he could cast into the field of intellectual vision, and how much he could see where all was mist and confusion to ordinary men. The very first look indicated one incapable of yielding his convictions in deference to any one; but you saw at the same time how much genuine Christian kindness mingled with this tone of decision, and how little his intellectual throne had interfered with the simplicity and kindheartedness of the man.

Mr. Taylor was sprung from ancestors remarkable through several generations both for the fear of God, and for acuteness and vigour of intellect; singularly skilled in the art of self-discipline, of making five talents ten by careful and constant trading; great economists of time, and of everything that contributes to the increase of intellectual and spiritual stores. How far back the Christian name Isaac goes in the family, we cannot tell; at all events it was borne both by his father and his grandfather, while his eldest son, the author of "Names and Places," and of some able pamphlets and articles on ecclesiastical subjects, gives evidence that it has not yet completed the wreath of honour destined to be gathered round it. Isaac Taylor, the grandfather, besides carrying on other business, took up that of copper-plate printing, when that art was introduced, and prosecuted it with success. His son, Isaac the second, followed out this department of his father's business, and became an eminent engraver, so that even still engravings with "Isaac Taylor, junior," in the corner are prized by collectors and connoisseurs. Another son, a man of considerable learning, was the editor of the edition of Calmet's "Dictionary of the Bible," in five volumes quarto, and author of the "Fragments" appended to it. In addition to his artistic pursuits, Mr. Isaac Taylor, junior, had charge of a Congregational church, first at Colchester, and afterwards at Ongar; and as if these employments were not sufficient, he acted as domestic tutor to his own family, devoting himself to their training with remarkable care. Some insight into the upbringing of the family, and the remarkable care with which even meal-hours were turned to account, has been given by his son in his recent papers in "GOOD WORDS." Both father and mother were equally in earnest in the rearing of their children, and their ideas of "Home Education" descended largely to their son, who not only adopted the practice, at least for the female part of his own family, but wrote the suggestive treatise, or rather portion of a treatise, which bears that title. The father seems to have bent his mind with great earnestness to find out what really was the nature of a child—its wants, capacities, and longings, and how these might be most effectually dealt with. For his children's use he wrote books, constructed chronological tables, and prepared lectures in history, science, and art. He was author of "Scenes of British Wealth," and other books familiar to the children of last generation. I remember his son showing me a box of geometric figures which he had made with his own hand for the use of his children,—cubes, cones, prisms, pyramids, and so forth, and by means of which he furnished them with several useful and interesting exercises. He found that it was a pleasure to a child to answer questions which should lead him to recognise each of these forms in some familiar object; as in the roof of a house, a prism; in the church spire or the extinguisher of a candle, a cone; in a cricket-ball, a sphere; in an egg, a prolate; in a turnip, an oblate spheroid. This prepared them for finding fit comparisons for other objects. It exercised the faculty that deals with resemblances, and enlarged their power of conception. How well the efforts of the parents were bestowed, both in an intellectual and religious point of view, is apparent from the distinction attained by several of the family, especially by Isaac, and by the two sisters, Jane Taylor and Mrs. Gilbert, the latter of whom still survives, and in whose son, a well-known artist, the family talent for the use of the pencil continues to flourish.

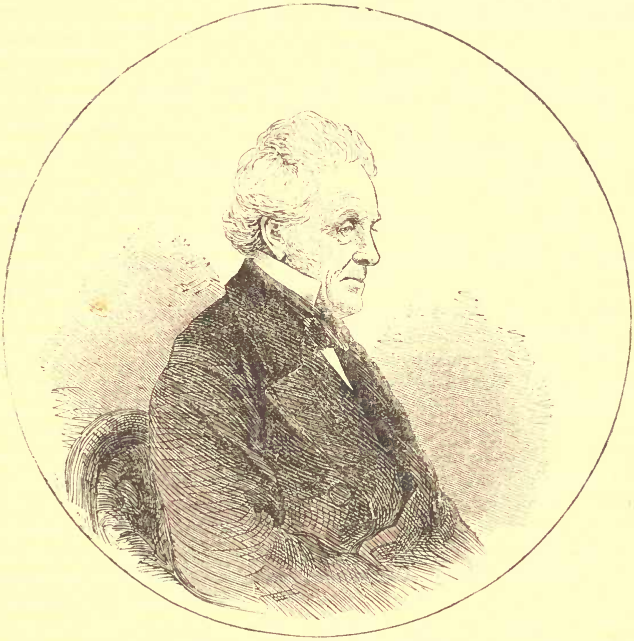
The author of the "Natural History of Enthusiasm" was born in 1786 at Lavenham, in Suffolk. At first he followed the artist's profession, but by degrees literature was found to be his congenial element, and the pencil yielded to the pen. The reader of Edward Irving's Works may see a sample of his pencil in the profile sketch of the great preacher, prefixed to the first volume. He and Irving were attached personal friends, though differing in the structure of their minds almost as much as in that of their bodies,—the one penetrating to the depths, the other soaring to the skies; but they were alike in the honesty and purity of their natures, in the subjection of their whole souls to the power of divine truth, and in that elevated view of Christianity and the Christian life which could find in no existing section of the Christian community a home altogether congenial to their hearts.

In his sister Jane, Mr. Taylor found a most congenial companion, and their similarity of taste and feeling, and warm affection and regard, bound them to each other as brother and sister are but rarely united. For some years (1813—1816) his health was so feeble that it was necessary for him to reside in Devonshire and the neighbourhood; there his sister Jane was his companion; and her most affectionate care was probably the means of preserving to the world a life whose full value even she could hardly have foreseen. She too, like him, had had the training of an artist, for their father seems to have anticipated modern discoveries on "the employments of women." But in her case also, art yielded to literature. Many is the nursery that has got sunshine and Christianity from her gentle hymns and rhymes. In these, and in some other publications, she was associated with her sister, Mrs. Gilbert; but in "Display," a fiction for young persons, she stood alone, and the publication was so favourably received that she would in all likelihood have attempted bolder and higher flights. But after a long illness, she died in 1824, full of peace and joy,—the sun shining out on her soul with extraordinary brightness shortly before she was taken away. To her brother, her death was not only a bereavement of unwonted intensity, but it altered the whole complexion of his life. Soon after he married an intimate friend of his sister's, Edward Irving giving away the bride. The calm contemplative leisure hitherto experienced could be but partially enjoyed amid the bustle and cares of a family reaching the patriarchal number of twelve children. To one whose chief property, as Southey said of himself, lay in his ink-glass, and who wrote, not for the superficial multitude, but for the thoughtful few, it was no easy task to provide for so many. Mr. Taylor's mechanical genius seemed at one time likely to secure the independence which his pen could hardly compass. He took out a patent for an ingenious process connected with the printing of calico. Though quite successful mechanically, it was far from being so commercially. Many a long journey did he take in its interest between Stanford Rivers and Manchester, and many a comfortless sojourn did he pass in the latter place, at the very time when he was incubating on some of his ablest works. Few would suppose that his books on Loyola and Wesley saw the light while his mind was hard at work on the best mode of printing patterns on calico. About the time of one of my visits to Stanford Rivers, the American war had dried up the last streamlet of return that this invention yielded. The pension conferred on him about this time by Lord Palmerston came very opportunely, freeing him from anxieties which must otherwise have pressed very hard on one so advanced in life.

It is not many literary men whose whole family of books have had a single cradle. But all, or nearly all, that is connected with the name of Isaac Taylor was produced at, or at least issued from, Stanford Rivers. The house, furniture, and all remained unchanged for forty years. It was his habit to spend the early part of each day in his study—the largest room of the house, surrounded with book-shelves, conspicuous among which were the rows containing the Christian Fathers, his intimacy with which he seemed to consider about the most important, as it had been the most laborious of his acquisitions. He greatly dreaded lest the Fathers should go out of fashion, and the minds of theologians should be occupied merely with any single school of divinity. In every branch of the Church, he used to say, there ought to be a few men thoroughly familiar with the Fathers, knowing all their views, and acquainted with the bearing of any passages to which controversialists might appeal. Having laid down his views on this point with great decision, he would ask somewhat abruptly, "Have you got any such men in Scotland?" His own sense of the value of the early Fathers seemed to increase in the latter part of his life. Indeed he seemed to feel that in his "Ancient Christianity" he had not altogether given them their proper place, and he showed some signs of regret that he had written that book during the heat of the Tractarian controversy, and under the influence of feelings that had somewhat disturbed the usual candour and calmness of his judgment. Dr. Stanley's Lectures on the Eastern Church had appeared a short time before one of my visits, and had been read aloud in the parlour, according to the custom of the family. But he could point to great gaps in the historical sketch of the lecturer; and, as if he felt that some injustice had been done to John of Damascus, and other magnates of the Greek Church, he longed for an opportunity of letting the world know something of the rich Oriental veins of which Dr. Stanley had told them nothing. His acquaintance with the Greek and Latin Fathers does not seem to have been made with rapidity. We remember his contrasting his own mode of reading such books with the extraordinary quickness of his neighbour, Dr. Tattam, the rector of the parish, to whom he would sometimes apply when he wished information on particular points. Once he showed me a great folio volume, of perhaps twelve hundred pages with double columns, which he had sent to Dr. Tattam, asking him to note the passages where anything was said about the Holy Places in Jerusalem—one of the subjects in which he felt a particular interest. In a very short time the volume had been returned, with a note of some eight or ten places in different parts of the book where the subject was referred to. Mr. Taylor could lay claim to no such quickness; though of course his activity of mind and readiness of apprehension would enable him to read faster than most.

The study window opening to the garden allowed him in fine weather to relieve the sitting posture by an occasional promenade along the walks. Often had he paced those gravel walks. Sometimes a little summer-house became the study, and in one very warm summer—1828—when the "Natural History of Enthusiasm" was written, his writing-table had been placed under some trees, and his work was done in the open air. About two o'clock books were closed, and the circulation quickened by a walk. For forty years he had had the privilege of the neighbouring grounds of Navestock,—"my grounds," as he would humorously call them, not so much from the sort of prescriptive right to the use of them which the period gave him, as from the fact that he had really got the good of them to a far greater extent than the owner or anybody else. So far from envying the owner, the owner, he seemed to think, had more cause to envy him. What could a noble lord or lady, coming down for a few weeks in autumn with a bevy of fashionable company, know of these glades and wooded uplands, compared to one who had seen and studied them under every aspect of nature, and had loved them for forty years? And to him nature was something very different from what it is to most mental philosophers. We daresay the public were somewhat surprised, in his recent papers in "Good Words," to find how closely and how curiously he observed nature. The common notion that mental philosophers are for ever looking inwards, and another common notion that a man who is very eminent in one capacity must be little better than a booby in every other, would have led most people to say *à priori*, that if he thought of nature at all, it would only be with the vague sentiment of admiration which is common to nearly all men of cultivated minds. But in Isaac Taylor the cultivated eye of the artist was united to the abstract power of the philosopher. It is a rare combination; it would be difficult to recall another eminent instance. The outer forms and colours of things were peculiarly interesting to him, and suggested many a curious speculation. Witness his paper on "A Winter's Ride on a Starry Night," and his explanation of the manner in which, through the influence of sounds, the horse, when his rider is bewildered, takes the right road home. I remember him propounding several curious questions to a boy who walked with us, on some of the appearances of nature—as, for example, why it was that when a sunbeam came through an opening in a cloud, the rays seemed to spread out like a fan as they approached the ground—a phenomenon which he ascribed to the fact of their coming nearer to us as they descended, and therefore seeming to occupy more space, although they did not do so really. The phenomena of light interested him greatly. His eye was practised to notice the different intensities of light at different seasons of the year, and in different latitudes; and I well remember one evening, as we stood at the door looking out for the comet that was then expected, how confidently he affirmed that the feeble star in the "Plough" was decidedly and sensibly less bright than it had been in his younger days.

The chief literary undertaking to which Mr. Taylor may be said to have devoted himself, could hardly fail to make him unpopular in many quarters. At least it was not likely that he could be cordially liked by the ordinary leaders of sects and parties. He had set himself to study very carefully the diseases and aberrations, so to speak, of the Christian Church, and in this series of his books, he sought to exhibit at one view the leading forms of spurious or corrupted religion. It was not a popular task. And it became less so as it proceeded. The first volume of the series, "Natural History of Enthusiasm," was the most successful, as regards the interest it excited, and the extent of its sale. "Fanaticism" followed, but never reached the circulation of its predecessor. Then came "Spiritual Despotism," with the smallest circulation of the three.* Yet Sir James Stephen, in his remarkable critique in the *Edinburgh Review*, republished in his "Essays in Ecclesiastical Biography," considers this treatise the ablest of all, and is quite enraptured at the skill and power and wisdom with which the subject is opened up. "Little," he says, "is hazarded in announcing this work as the most original, comprehensive, and profound contribution which any living writer in our own country has made to the science of ecclesiastical polity." The great success of "Enthusiasm" may be accounted for partly by the fact that it dealt with the mildest form of religious disease, and partly also that while on the one hand it indicated some subtle seeds of evil, on the other it was a vindication of the intensely earnest spirit which was then beginning to vivify the Church, but which was the object of so much indiscriminate abuse. It was a noble defence of real enthusiasm in religion, but at the same time it made a skilful discrimination between the true and the false, and gave a masterly diagnosis of those elements of disease by which



Isaac Taylor.

---

* We are inclined to think that some modification of the opinions advanced in this book, led the author to prevent its being reprinted in recent years.

earnest religious movements are so often ruined in the second or third generation. It threw the shield of Achilles over the earnest Christian men of forty years ago, showing that instead of the ridicule of wise and thoughtful minds, they deserved their highest esteem and admiration; but at the same time, it laid the finger of warning on this point and on that, and showed that if the guides of these movements were not on their guard, excesses would appear that would weaken their strength and destroy all their beauty. Within the last few years, in connection with the earnest movements of the day, some of these very tendencies have appeared very prominently, to the great anxiety of wise and good men. Nothing has given us a higher impression of the wisdom of Isaac Taylor, than the perusal of that book in the light of the spiritual movements of the present day. The skill with which it draws the line between the good and the evil in earnest religion — between real and fictitious piety—is unrivalled. Had he been enabled and encouraged to complete his great plan of exhibiting all the corrupt forms and morbid tendencies of religious society under all the different conditions in which it may be placed in the world, the contribution coming from a man of such personal excellence, such profundity of thought, such store of learning, so attached to the great positive doctrines of Revelation, and so removed from the influences that usually cloud the vision and give a bias to the judgment, would have been invaluable. His original plan was to embrace treatises on Enthusiasm, Fanaticism, Superstition, Credulity, Corruption of Morals, and Scepticism. That he would have been right on all occasions we should never think of insinuating. But he could hardly have failed to be exceedingly useful and suggestive. Whatever he might have indicated in the case of particular churches and communities, would have been entitled to their most respectful and patient consideration. But it was not so ruled. How it fared with him in other quarters, we do not know; but when he tried, in 1856, in an elaborate critique on the writings of Chalmers in the *North British Review*, to indicate what seemed to him morbid in the excessive rigidity of the Scottish theological system, a storm of great vehemence arose against him and his friends, showing on the part of those who raised it a determination not to listen even to his most deliberate counsels. Mr. Taylor felt keenly this untoward occurrence; and used to ask in his later years whether six men could be found in that country who would pay the slightest attention to anything he might say. Still the views and spirit of Isaac Taylor have exercised, and will continue to exercise, a perceptible influence even in Scotland, especially in the promotion of Christian candour. Those whom it is not impossible to convince that all is not gold that glitters in their church or sect, will ever find much instruction and profit in his books. Mr. Taylor himself was not very sanguine, either as to the effect of his writings, or the future destinies of Christianity in these islands. "If I were to say what I believe," we remember him once jocularly remarking, in reference to some topic of the day, "people would say it's one of the crotchets of that cross old being, Isaac Taylor." Everyone will readily see that the ordeal through which he passed must have been a trying one for himself. But though immovable in his convictions, he could not be said to have the temper of a soured or disappointed man. Sunshine fell from his heart, especially on his friends and his family, and as years increased, he felt the more how rich a heritage he had in their love and esteem, while the great truths of "Scriptural Christianity" still proved the anchor of his soul.

It was but natural for Mr. Taylor to make his escape at times from working among the diseases and corruptions of the Christian Church,—"from the contemplation of souls, infected by the taint of their mortal prison-house, to a meditation on immortal spirits, whose corporeal shrines should eternally enhance their purest joys, and participate in their most exalted duties." The "Physical Theory of Another Life" is in many respects his most remarkable work. Never did a man about to soar on the wings of fancy bind himself down more rigorously to shun all that was merely fanciful, or confine himself more carefully to the exposition of the changes in the life of the soul, which the substitution of the spiritual for the natural body might be expected to cause. One hardly knows which to admire most in that book—the boldness of his flights into the unseen, the firmness of the reasoning that guides these flights, or the beauty and practical force of the views of the future which his several conjectures open up. In "Saturday Evening" the weaknesses and sorrows of the Christian Church are not absent from his view, but her hopes and prospects, and final glories, are the more congenial subjects of meditation. Sir James Stephen, describing how, on the completion of "Spiritual Despotism" he soared away in "Saturday Evening" into other contemplations more agreeable to himself, because more abstruse, says of him, very truly, that he sought and found relief in regions of thought where ordinary mortals find little else than lassitude. I would strongly recommend every one who can lay his hand on the seventy-first volume of the *Edinburgh Review* to read that most interesting "Essay in Ecclesiastical Biography" which Sir James first published there. So far as it is biographical, it is a biography constructed wholly out of hints and allusions in the author's works. It is a theory of an earthly life, framed from the records of the spiritual; and not less remarkable for the justice it does to his conceptions, than for the accuracy with which it traces the progress of his mind.

Nothing more could be needed to prove even to a perfect stranger, that Mr. Taylor had nothing of the cynic or even of the censor in his nature, than a perusal of his work on "Home Education;" and the conviction would become immovable if it were known that that volume is little else than an exposition of the method practised at Stanford Rivers. Not to be tedious, I may just remind my readers that the fundamental principle of the book and the method is, that home should be filled with cheerful influences,—that the happiness inherent in childhood, should be allowed to develop itself in all suitable and Christian ways,—and that love should be the great organ of education in the early years. At least he held very strongly that, apart from this method,—under any sky of gloom and frowns and terror,—the Christian education of the young could not be carried on successfully. His own family was a singularly happy one, and well fitted to gladden the heart of a Christian parent. "We have tried to bring up our children," he would say, "as God's children; not knocking them about as blocks or stones, but treating them with the respect and tenderness due to 'the heritage of the Lord;' not fearing to vindicate our authority, when that was really needful, but aiming rather at having it felt than seen. We have represented to them, at the proper time, the duty of giving themselves to Christ, and we have every cause to be gratified in the highest degree by the result." It will readily be understood that it was a special aim to make Sunday a happy day. And so long as the day was in the main devoted to the great and blessed ends for which it exists, he did not burden them with innumerable rules, or keep them under a yoke of perpetual restraint. In every respect he deemed "a due and fervent attendance on religious exercises, public and private," most important. "I am prepared to affirm," we quote his words from "Home Education," "that, *to the studious especially*, and whether younger or older, a Sunday well-spent,—spent in happy exercises of the heart, devotional and domestic—a Sunday given to the SOUL, is the best of all means of refreshment for the mere intellect. A Sunday so passed is a liquefaction of the entire nature,—a process dispelling mental cramps and stagnations, and enabling every single faculty again to get its due in the general diffusion of the intellectual power." Mr. Taylor was no advocate for what is currently known as intellectual preaching. In "Saturday Evening" he censures the preaching that makes "the glory of Christ as the Saviour of man, which should be always as the Sun in the heavens, shine only with an astral lustre;" and he declares his conviction, that "the mode of preaching which has been affectedly termed the intellectual, can hardly be made to consist with a bold, simple, cordial proclamation of the message of mercy." For himself, what he sought in the services of the sanctuary, was not so much the gratification of the intellect, as the invigoration of the conscience, and the refreshment and stimulation of the best feelings of the heart. Finding most of what he desiderated in the service of the Church of England, he latterly became a member of the Establishment. But, as Sir James Stephen indicates, and as "Spiritual Despotism" abundantly shows, there were other sympathies between him and the Church of England; and so early as 1829, in the "Natural History of Enthusiasm," he gave his judgment on its value when he described it as "the chief prop of modern Christianity."

Most careful though he was to avoid all the technical phrases and forms of theologians, it is plain that the old Puritan theology had a firm hold and a most vital influence on his whole life. Whenever he was drawn into controversy, it was the Bible and biblical theology he rushed to defend. A certain greater degree of freedom than is usually allowed in the interpretation of the Bible, he unquestionably desired, and with no small warmth he would sometimes inveigh against the hurtful influence of those systems which, giving undue prominence to certain aspects of divine truth, overlaid or neutralised, in his judgment, other aspects highly important; but when he drew his sword, it was ever in support of the great truths which are commonly received among Christians. Witness his "Restoration of Belief," his work on "Hebrew Poetry," his Remarks in reply to Bishop Colenso, or his articles on "Modern Thought," in the *North British Review*. Even the "Physical Theory of Another Life" was written in support of the same great cause. The author is most careful to claim paramount authority for every statement of Holy Scripture on the future Life, while he asks for his own treatise only the place of a hypothesis, which may throw light on difficulties, or inspire faith and patience under them, but must never be allowed to interfere with any article of religious belief. The verities of the Gospel were life and death realities to him, and so he desired them to be to all; feeling well assured that "when once the purity of law, and the impartiality and vigour of the divine government have been admitted, and the thought of standing at the tribunal of God has firmly lodged itself in the mind, the well-founded fear of condemnation is in no way to be allayed, until the SUBSTITUTE of the sinner is known to be THE VERY PARTY whom the sinner has insulted!"*

It is a singular fact—explain it as we may—that Mr. Taylor was never able to find a *niche* for himself in any literary institution, and remained out of office to the end of the chapter. Much though he loved Stanford Rivers, and the life of contemplation he led there, he would have been thankful for a position that would have enabled him (to use his own words) "to exert an influence favourable to humanity, piety, and knowledge upon the age to come."

In 1836, he was not far from obtaining the chair of Logic and Metaphysics in the University of Edinburgh. His mode of proceeding, in his application for that chair, was very characteristic. Up to this time, his chief writings had been anonymous. He was known, indeed, as the translator of Herodotus, —of this translation, Mr. Rawlinson formed so high an opinion, that, had he known of it in time, he would have adopted it as the basis of his own; and as the author of the "Life of Jane Taylor," and a few other works of no great pretension. But the "Natural History of Enthusiasm," and the other books on which he put forth his strength, had been published anonymously. He had deliberately renounced the distinction of literary eminence, believing that the work he had undertaken might be done better if he concealed his name. Consequently, when he came forward for the chair of Logic, he had no testimonials to offer. Writing to one of the patrons,* he told him that he had withdrawn himself from the sometimes flattering inquiries that had been made after the author, and that several expressions of favourable opinions by distinguished men that had incidentally come under his notice, were not at hand, or could not easily be turned to account. Then, as if the information were wrung from him by absolute force, he adds,—"I have been told that Dr. Chalmers has repeatedly honoured the author of the 'Natural History of Enthusiasm,' by his cordial eulogium. Dr. Whately, Archbishop of Dublin, I believe, entertains a similar opinion of the author. The Bishop of London has spoken in the same manner, and in a printed charge has quoted the author with approbation. The same, I believe, of the Bishop of Limerick, the late Dr. Jebb. I had once in my hands, for a day or two, a copy of 'Natural History of Enthusiasm,' enriched and honoured by the copious pencil annotations of the late Mr. Coleridge; and these notes included some strong encomiums, a part of which appeared in the volume on the 'Church and State.' In the United States, where my books have always been reprinted, and sometimes three editions simultaneously, I enjoy, I believe, an extended reputation." The opponent of Mr. Taylor was Sir William Hamilton. Sixteen years previously Sir William had advanced strong claims to the chair of Moral Philosophy, when Dugald Stewart retired; his testimonials now for the chair of Logic were absolutely overwhelming. Notwithstanding, Mr. Taylor had fourteen votes at the election, as against eighteen for Sir William. In his letters, Mr. Taylor explains the scheme of Logic he had long been meditating. He believed that the great vivifying principles of reasoning had yet to be deduced from the dim prophetic form in which Lord Bacon gave them, and that when this was done, a great impulse would be given to all the sciences. Even the logic of common life he thought might be digested,—the rationale of business and ordinary prudence. Interesting though these glimpses of his plans and intentions are, it may be doubted whether in a chair of Logic he would have been in his right place. He himself afterwards came to see that he would not. But it is interesting to think, had the majority been the other way, what effect would have been produced on Scotland and the world, by Isaac Taylor in place of Sir William Hamilton in the chair of Logic. The instance might be added to a multitude of others, in which very trivial circumstances, like the determination of two or three votes, have carried results of the greatest importance.

---

* "Saturday Evening."

The death of Isaac Taylor has severed the last link that connected our time with the age of the giants in the Evangelical movement in Great Britain in the earlier part of this century. Robert Hall, John Foster, Thomas Chalmers, and Isaac Taylor, were of an order that has now no living representative. It is astonishing how correct, for the most part, the public instinct is in recognising men of the highest intellectual calibre. The kingly faculty of these men met with a very general recognition; their voice, at least in their best days, commanded universal respect; but to not one of the many able divines that have followed or accompanied them, has the same rank been conceded. These four men rendered to evangelical religion a service of the highest importance. They gave to the winds the notion that earnest piety was necessarily associated with feeble intellect; they showed to demonstration how cordial the alliance might be between hearts completely possessed by evangelical truth, and minds of thorough independence and originality, that could embrace the whole world of intellect in their ken. They removed a great stumbling-block in the way of intellectual men espousing the cause of Christ. If the present age cannot rival the brightness of their gifts, it may at least profit by the light which they shed. And it will do well to remember, that the eminent position they reached was due not less to their transparent candour, high honour, and great charity, than to the strength of their convictions and the brilliancy of their powers.

W. G. BLAIKIE.

THREE WEEKS AMONG THE CHURCHES OF FRANCE.

By THE DEAN OF CANTERBURY.

My object in sending to press the following hasty notes has been, to show those who like myself have little technical knowledge of architecture, how rich a treat they may enjoy, in a small space of time, and at no great cost, whenever wearied energies demand recruiting.

This being so, I must deprecate being judged, as some have judged my former letters from abroad, for want of completeness in having omitted mention of some of the most noteworthy objects, or some of the most remarkable details in the objects which I described. If I were writing a guide-book, these omissions might be justly complained of; but I am merely setting down those things which struck me, and not elaborating a description of all that ought to be noted.

---

* I have to acknowledge the courtesy of Mr. Marwick, city clerk, Edinburgh, for the opportunity of reading the documents connected with this election.

And with regard to the objects included, it must be borne in mind by the reader that my time was limited, being merely that which could be spared for a Lenten holiday after a winter of unusually hard biblical work,—a parson's three weeks, from Monday morning till the evening of the Saturday fortnight. This necessitated the omission of several of the greater churches: of some because seen before, of others as being too far from the route to be conveniently taken in. In the former of these classes were Reims, Laon, Strasbourg, Amiens, Beauvais, Caen, Poitiers, Angoulême, Narbonne, Arles, and Metz; in the latter Bayeux, Coutances, and Evreux.

On Monday, March 6, I left Canterbury with a friend, taking the usual pleasant day's journey to Paris: pleasant that is, if the winds and waves are propitious during its former portion, and society or a book during its latter. The ruined abbey church of St. Bertin at St. Omer, the distant view of the grand mass of Amiens, the old church of St. Leu, on the right; the graceful spire of Senlis and the Abbey of St Denis on the left, are really almost the only objects to be made out before Montmartre looms ahead, and we find ourselves in Paris.

Nôtre Dame de Paris is, according to the authorities, one of the grandest and best proportioned of French cathedrals: but I am ashamed to say that I have always felt disappointment with it. There is little that the eye loves to dwell upon, or the memory to carry away. The view of any great west front is always imposing, but the front of Nôtre Dame is soon obliterated by the far greater interest of those of other cathedrals. The two massive square towers, exactly alike in their somewhat heavy details, and the uniform length of horizontal balustrade in two stories beneath, prevent, it always seems to me, the beautiful rose window and rich receding portals from producing their due effect of splendour and variety. The interior again is coldly correct, and devoid of varied interest. This effect has perhaps been increased by the modern restoration, which has left the walls of a dull leaden grey; and this tint, we were told, is intended to remain in the nave and aisles, while the outlying chapels are to receive richness of colour and gilding. The remembrance of Nôtre Dame which will probably dwell most on the mind of an observant Englishman, is that of the east end with its flying buttresses and chapels, as it will probably have been his first example of that form of this portion of a church, known as the *chevet*, and almost universal in France.

Our first expedition was to CHARTRES. The day was most favourable for cathedral effects; a wild gleamy March sky, with more of the lion than the lamb both in the quantity and quality of the wind; dark massive clouds laden with sleet and snow, alternating with bright sunshine: a day when the flying sunbeams chase the shadows along the pillars and triforia within, and the steep wet roofs glitter behind the pinnacles and parapets, gladdening him who stands and looks from without. On such a day we saw one of the most beautiful monuments ever raised by human hand,—the cathedral of Nôtre Dame de Chartres. The first feature for description is that which will ever dwell last on the memory, as the clear image recedes into dimness; the western end, with its two matchless spires. They are not twins, as they have been called: rather is the southern and elder of the two the brother, admirable in massive simplicity and perfect manly proportion, and the northern and later, the younger sister, beautiful in feminine grace, and veiled with the richest and most profuse adornment. Still I must add that as the day wore on, and I watched them with the westering sun creeping round, even till they glowed with the setting purple, that while *his* beauty grew on me every hour, *hers* somewhat waned. So it ever seems to be: that which is simple, wins with time, that which is elaborate and complicated, loses. It may be, however, that even longer habitude would have corrected this back again. The simpler proportions are soon mastered: the more complicated do not reveal themselves but by degrees. I might in a day have learned the relative parts of the older spire, while every week might have disclosed new reasons for the adjustment of details producing such exquisite grace in the other. The transept portal, who does not know? Those wonderful assemblages of long stately figures in stone: that profusion of light and elegant shafts, carried up above them: and wherever relief is wanted for the blank space, the receding trefoil, or the little clinging ballflower, studding like gems the buttresses and mullions.

Let us now enter the building. The nave is beyond all praise. It consists of seven bays with stilted arches, *i.e.*, arches which do not spring from the vertical till some way above the capitals of the shafts. These arches increase in width toward the east; the extreme westerly one being nine feet in space, the next ten, the next eleven, and so on. Those who know the choir at Canterbury will remember a similar arrangement. There the increase is in the reverse direction,—towards the west and not the east. It is very difficult to say what effect this increase of width produces on the eye. Certainly *not*, as commonly supposed at Canterbury, the lengthening out of the vista to those who look from the wider to the narrower arches. For, if the effect of distance be to diminish in a certain proportion arches of an equal width, then in the case of width gradually lessening, that diminution must be much more rapid, and the vista would appear shorter, not longer. And the same reasoning would lead to the conclusion, that if the eye looked in the opposite direction, from the narrower to the wider arches, the vista would be lengthened. Thus we should have Chartres lengthened by this device to one looking from the west, and Canterbury to one looking from the east. Whether this really is so, can never be determined, until one can compare simultaneously two series of arches, of one of which the spans are equal, and of the other of which they are unequal: a coincidence not likely to be attained. The eye is at the same time so confident of its own measurements, and so likely to be deceived, that its evidence in such a matter is not to be trusted.

But from speculation let us come to matters of fact. These clerestory windows, how grand and imposing, with their lofty lancet lights and colossal saints in the brightest amber and crimson! Then again, what can be more graceful than the arcade (for it is that, rather than a triforium) which is carried round the whole church under the clerestory windows? But even this noble church has not escaped the marring hand of the vulgariser. The semicircle of highly stilted narrow arches which finish the choir to the east was once as beautiful as the rest; but in evil hour the Italianising mania fell on the authorities of the church, and they have actually cut away the mouldings of the arches and worked the surface into Italian panels, thus rendering restoration almost impracticable. As might be expected, the fittings of the choir itself are in the worst possible taste; and between it and the nave is a heavy solid wall of square-panelled white marble, surmounted by an enormous gilded cross.

But let us hide these incongruities, as we pass round eastward behind the choir, and examine the magnificent windows in the aisle and chapels. Here we have older glass than that in the clerestory; probably coeval with the building of this part of the church in the beginning of the thirteenth century. In general character it resembles that in the windows of Trinity chapel at Canterbury; differing from them however in this, that here we have in the body of the window full-length figures mixed with the small medallion groups, and in the borders, figures of men and animals introduced in the midst of the floral patterns.

Another matter worthy of notice is the very richly-carved outer screen which surrounds the choir. It is mostly of the latest Gothic; some of it even of the renaissance period: all, most elaborate and highly finished. The subjects are chiefly from Scripture or sacred legend, but I noticed some curious mixtures. The figures on one small renaissance compartment were Titus Cæsar, Vaspasian Cæsar (*sic*), and Hector; surrounded by subjects from the legends concerning the life of the Virgin.

And now we have accomplished the round of the choir, and are again standing at the intersection of the transepts. Chartres is one of the very few great French churches which we have seen, having real transepts. Most usually, the portion of the building which serves as a transept inside is not carried out on the outside further than the plane of the north and south walls; and sometimes, as in one notable instance presently to be described, there is no pretence of any transept at all. Even at Chartres, the transepts project beyond the north and south walls of the choir by one bay only. But let us observe these two rose windows, glowing with so much richness of colour and variety of subject. Windows of this kind are not indeed peculiar to French churches, but the abundance and beauty of them in France are so great, as to render them almost national. Beneath each of these two is a pierced arcade, containing five single-light windows of admirable colours: in the middle light of both is the figure of the Virgin; on the south, in the other lights, are Melchisedec, David, Solomon, and Aaron; and on the north, an arrangement which I do not remember to have seen before: the four great Prophets, each bearing on his shoulder an Evangelist; Isaiah having St. Matthew,—Ezekiel, St. John,—Daniel, St. Mark,—and Jeremiah, St. Luke.

After all, the glory of Chartres Cathedral will be justly held to be the north and south porches at the ends of the transepts. These, with their stately population of kings and saints, are well known by photographs and engravings. We were not sorry to be enabled, by being driven into the south porch for refuge in a snow-storm, to examine its grand figures at more leisure than our hurried visit would otherwise have allowed.

The next day from Paris took us to Senlis. The glory of this church is the very light and elegant north-western spire, in the purest style of the best age of Gothic. This spire was peculiarly interesting to travellers from Canterbury, as it shortly follows upon the time when the east end of our own cathedral was in construction, and forms a datum for conjecture how the two staircase-towers of "Becket's crown" may have been intended to be finished. The church itself is a light and graceful specimen of the transition from Romanesque to what we here call Early English or First-pointed. One feature which distinguishes this church from the great majority of those which we saw during our present tour is, that the triforium, instead of being a mere arcade in the wall, is a repetition of the aisle beneath it, of the same width, and with a roof similarly groined. The same, if I remember right, is the case in the abbey church of St. Remi at Reims. The transept ends of this church are specimens of all the rich and meretricious vagaries of the later flamboyant style;—the crockets of leaves of curly kale, the different lines of interfering ornamental designs running through and over one another, the trefoil and quatrefoil distorted to fit into all manner of incongruous spaces. We were unfortunate in having a very wet day at Senlis. Had there been sun, the play of light and shade on the north-western spire would doubtless have made it still more beautiful. A hurried sketch under an umbrella, from the boulevard near the railway station, was all that I could carry away of Senlis.

Rouen is too well known to our English travellers to need any general description from me. I will only set down the things which struck me most on revisiting it after twenty-two years' absence.

The wonderful gigantesque mass of the cathedral façade,—that agglomeration of finished and unfinished, of delicately carved stonework and projecting lumps absolutely unhewn, impressed me less than when I first was astonished by it: St. Ouen, on the other hand, much more. This exquisite building is probably the finest parish church in the world. One might venture to call it the St. Mary Redcliffe of foreign churches: and the coincidence, that both have a truncated central spire, might seem further to justify the comparison. But in purity of style, as in size and importance, the Bristol church must yield the palm to the other. St. Ouen is of the purest Gothic of the fourteenth and fifteenth centuries. Although in size fitted for a cathedral, and indeed surpassing the cathedral its neighbour, its proportions are so perfect, and its architectural character so faultless, that all appearance of ambitious grandeur is absent. We mounted into its triforium and its roof, and found more and more at every step to admire. The western front has, since my last visit, been completed by two modern spires; of which, though they, as well as the whole work of the façade, are most carefully and correctly done, Mr. Pettit's criticism is undoubtedly true, that they approach too near to the height of the beautiful central tower for the general effect to be good. "The front," he observes, "should either have been kept subordinate to the central tower, by being furnished with lower towers having no spires, as in the original design, or by forming a flat mass, relieved by turrets and pinnacles: or else the steeples should have been carried boldly up, out-topping, as at Coutances, every part of the building. The present steeples, had they been carried up a stage or two higher, would have given the front a noble and beautiful proportion. As it is, it appears curtailed in its height in deference to the central tower, the effect of which is in reality more diminished by western spires, exactly equaling it in height, than it would have been had they far exceeded it. A spire, if it be anything more than a mere pinnacle, should always exceed in height any tower in the same building." (P. 148).

I am afraid I have not been endowed with faculties to admire the meretricious and overloaded flamboyant variety of Gothic. The much-praised church of S. Maclou (even by Pettit, p. 149) seemed hardly to deserve all that is continually said of it. Wherever the eye looks for repose and pleasure, it is disappointed—wearied with the crowding, and inconsistency, and want of symmetry, of the ornamentation.

In the course of our rambles round the old town, we came upon several churches of inferior size, possessing remarkably fine collections of the later cinque-cento stained glass. Especially let the traveller find out the church of St. Vincent, where the whole series of windows round the *chevet* is complete, and well worth examination.

There is a peculiarity in the interior of Rouen Cathedral, which I do not remember to have noticed elsewhere. The whole of the rich First-pointed nave arches are in two stories, the upper arch exactly corresponding to the lower. An appearance is thus given of a fine massive triforium running round the whole: the groining of the aisle roofs being seen through the upper arches. It is true, this is at the expense of that lightness and lofty spring, which characterizes for the most part the French interiors: but it is not unpleasing to the English eye, as giving more massiveness, and richness, and appearance of stability, which, in comparison with our great churches, the French interiors want.

After these visits made from Paris, we took our way southward towards Auvergne, staying a few hours on the first day at ORLEANS. Among the varieties of French architecture, one certainly does not expect to find a stately Gothic cathedral, almost correct even to its details, built in the seventeenth century. It is probable that the idea of Henry IV., who was the founder of the new building, was to reproduce the old one, destroyed by the Huguenots: and some portions of the ancient fabric are worked in among the arches and chapels of the modern church. Still, carefully and successfully as the object has in the main been carried out, instances of poor and shallow work abound: the resources of the time, hardly equal even to copying, were over-taxed, the moment anything beyond this was required. The general effect has been that of a body without a soul. The west front, with its two equal towers terminated by an ugly balustrade, betrays, even at a distance, its late character.

The evening brought us to BOURGES, and the next morning to its magnificent cathedral. If there is danger of monotony in describing, over and over again, the details of buildings having so much general resemblance, this danger is at any rate escaped at Bourges. For we have here some features of marked peculiarity. Transepts, which have been gradually, the further we have advanced in France, shrinking up into mere indications of such an arrangement, here fail us altogether, and the whole length is carried through, from west to east, absolutely unbroken. The three west end portals have become five, corresponding to five aisles, also carried through the whole length of the building. These five aisles are of unequal height, the outer one being the lowest. The effect thus produced in the interior, looking eastward, is the finest I remember to have seen anywhere: lofty and simple, the style being the purest First-pointed throughout. Here and there, in examining the church more in detail, we came upon flamboyant work: but in the main vista it does not appear at all. The painted glass is truly superb: a complete study of the different periods of the art. Of the older portion of it, there is very much that closely resembles ours at Canterbury, but is even more beautiful.

The day being Sunday, we wished to witness all that we could of the services in the cathedral: and for that purpose, after having the English service in our own room, we attended first high mass, then a military mass at noon, then vespers and a sermon at three : the latter in the presence of the Archbishop. Remembering always the fact, that the central "point of departure" in worship is wholly different from our own, and disclaiming, of course, all sympathy with the adoration of the real Presence in the consecrated elements, it is fair to say that these services, as well as those which we witnessed on the following Sunday at Lyons, were reverentially and even simply conducted. The music was good, and carefully done : and the general behaviour of the worshippers devout and pleasing. It struck me, that there had been great improvement in all respects since my last opportunity of observing Divine Service in France, in 1855. This was the more noticeable, when we came to visit the great pilgrimage church of Nôtre Dame de Fourvières at Lyons. There, the walls had been cleared of very many of the grosser evidences of superstition which were seen in abundance at my former visit. These symptoms are at all events pleasing, and point to a change in public feeling of the right kind. But it must ever be remembered, that for anything like real reform, it is impossible that mere amelioration can suffice. The very centre of worship itself must be shifted. Not only must excrescences, such as the adoration of saints and relics, and the foolish fiction of purgatory, be cleared away, but a spiritual worship must take the place of a material one. The consecrated wafer, now the depositary of the Divine Presence of our Lord, and therefore the main object of every worshipper's adoration, must absolutely disappear as such object of adoration, and only remain as a portion of the elements to be partaken by the communicant in the Lord's Supper. To bring about such a change as this, mere reforms are powerless. It cannot be approached gradually : we cannot conceive the moment when the Roman Catholic services should begin to admit it. This is *the real difficulty*, in any approach to the truth of Christian worship, for which we might hope, as in the case of the reforming movement in the Italian Church. And this difficulty is apt to be forgotten, in our ardent hopes for amelioration. It is hardly possible, it seems to me, for this change to take place as part of a reform from within :—hardly possible, without a break in the continuity of the Church, and of religion itself. Still, there is One to whom nothing is impossible : and Englishmen should hail all symptoms of change for the better as the stirrings of His Spirit who can, when He will, bring light out of darkness.

The sermon which we heard at Bourges was, as usual, lively and attractive, and contained no unsound *doctrine* whatever. It was a curious example of divergence from the text ; and also an example, by no means uncommon, of incorrect and perilous logic. The text was "Thou shalt love the Lord thy God with all thine heart and soul and strength." The preacher said he would prove to us that Christianity was a matter of the *heart*. This he essayed to do by beginning from its very commencement, and dwelling on the means employed by its Divine Founder, so insignificant, so inadequate, in human estimation, for the great work which was to be accomplished. All this part of the sermon was very eloquent and striking, but bore, I thought, the mark of being made up of *stock* declamation—a fault to which *mission preachers*, such as this was, are especially liable. He went on to show, from the success which Christianity had achieved in the world, that it must be of Divine origin. But how this was connected with his text, or with that which he proposed to prove at the outset, I could not see. He ended with another stock declamation on the oneness and unchangeableness of the (R. C.) Church. I noted down this somewhat bold sentence : "Tout ce que les Apôtres croyaient, nous croyons : et tout ce que nous croyons, les Apôtres croyaient" (!). It would be difficult surely to show that the Apostles held purgatory or the invocation of saints ; and easy to show that they did *not hold* the infallibility of St. Peter, nor grant him the slightest primacy among them. As I said, the sermon drifted wide of the text, and indeed wide of the subject which he proposed to treat. And the argument from the (apparent) success of Christianity to its Divine origin, is, unless far more cautiously handled, a perilous one. If we are allowed, in a superficial view of what it has accomplished, to assert it to be from God, the unbeliever must also be allowed, on a superficial view of what it *has not* accomplished, to infer that it is not from God : and an equally eloquent declamation, equally consistent with facts, might be made on those things which Christianity undertook to do and has not done. The truth is, that the Gospel will not bear weighing in any such scales as those of success and failure, as apparent to men. For evidence of this kind, we must wait till He comes who shall bring things to light which are hidden now, and shall teach us wherein the true success of His Gospel consisted.

From Bourges we went to NEVERS, a fine old city on the Loire, having two remarkable churches, the cathedral, and St. Etienne. The cathedral is an interesting building, of several dates : remarkable as having a semicircular apse at the west end, of pure Early Romanesque work, forming a sort of second choir. Throughout the length of the First-pointed arcading of the triforium in the nave, the bases of the shafts are terminated by quaint figures of men and women in grotesque supporting attitudes. The tower is late flamboyant, and overloaded with incongruous ornaments. At the angles are niches with unpleasing colossal figures : and the windows are deformed, as in several of the later French towers which we have seen, by huge projecting black louvre-boards. At one corner, an octagonal staircase turret rises up to a disproportionate height above the rest of the tower. Certainly, the flamboyant towers of France will not bear comparison with our Perpendicular towers.

We seek in vain for anything like Canterbury, or Gloucester, or Taunton, or Wrington, or a long list which might be gathered out of Somersetshire, or indeed almost any district of England.

But if the balance is inclined one way by comparison of towers, it is righted, and indeed thrown over on the other side, when we enter such a church as St. Etienne at Nevers. We have hardly any examples in our larger parish churches of the pure Romanesque carried throughout: indeed, properly speaking, no examples at all of this its southern variety. We have indeed grand cathedrals and collegiate piles of this early character: but in our large parish churches it has almost universally been broken in upon by later work, and its general effect marred. Little village churches not unfrequently occur in which the old Norman has remained entire: witness Iffley near Oxford, Corfe near Taunton, Patrixbourne and Barfreston near Canterbury: but I hardly remember a large parish church of which the same can be said, unless Melbourne in Derbyshire be thought to come up to the standard of size. But St. Etienne at Nevers is twice the size of Melbourne.

Thence southward to the Puy de Dôme and Auvergne: passing through, as is usual in central France, a vast plain with scarcely an object to detain the eye. The volcanic range of Puys, or peaks, first show themselves as we approach Riom. The churches, and the walls, begin to be built of black or dark brown lava. We pass various points which remind me of the much-loved and often-remembered Campagna of Rome. The rich puce-coloured pozzolana earth: the long level ranges of low hill, betraying the lava-streams of other days: the insulated peaks, such as lie basking in the blue mist under Monte Gennaro as you look eastward from Rome: these are too suggestive not to induce a comparison, and a regretful thought on that most lovely of all plains. But here we are at the old city of CLERMONT, the capital of the Puy de Dôme: and a succession of dark-looking streets and ample open spaces brings us to our hotel, situated in the largest of them all, and looking full on the hills now flushed in the sunset.

That evening took us to the remarkable unfinished cathedral: where we first witnessed the alternations of dark and light lava over the arches and in the open spaces between them, giving very much the effect of the mosaic of black and light marble in the churches of South Italy. The choir of Clermont cathedral is light and beautiful, a sort of Bourges on a smaller scale.

The next day, though bitterly cold, was clear and fine, and we started with a guide for a long ramble round the hills, and ultimately to explore the plateau of Gergovia, the scene of Cæsar's defeat by the Gauls under Vercingetorix. First we wound our way up an interesting gorge in the side of the hills which overlook Clermont, to the picturesque village and baths of Royat, piled, house above house, up the banks of a torrent, and surmounted by the dark mass of its ancient fortified church. This latter we examined, and found it an interesting specimen of its not very common kind.

It is cruciform, and on the outside machicolated like a castle: and this, while the shape is undeniably that of a church, gives it a strange unchurch-like appearance. The higher part of the central tower has been restored in the same style. The interior is plain Romanesque, the piers having rich and varied capitals. One unusual feature, is that the east end is square, as commonly in England. There is a simple but very beautiful Romanesque crypt.

From Royat we struck across the country by the deepest of muddy lanes, and climbed the precipitous mountain plateau of Gergovia.

Those who read Cæsar's account of his defeat hardly imagine that the Gaulish capital of Auvergne was perched on an abrupt elevation of 1200 feet above the plain, or that his unlucky troops had to scale anything more than a common wayside hill. But it appears to have been his object to extenuate all the circumstances of this failure. The whole subject is ably and lucidly treated in a little work entitled "Vercingetorix et César à Gergovia," by M. Mathieu of Clermont. By the aid of this book, all the positions on the plateau can be clearly made out, and also that of Cæsar's camp, across the plain at La Gondole, a triangular piece of ground at the junction of the brook Auzon and the Allier.

Our next day brought us from Clermont to BRIOUDE, the present terminus of the Central of France Railway: making a midday halt at ISSOIRE, where, as well as at Brioude, there is a remarkable Romanesque church in the style peculiar to Auvergne. That at Issoire is the finer, as it is the best cared for, of the two. It has been carefully restored, and the interior painted in the original colours. Certainly the general appearance makes one rather glad that all our old Romanesque churches have not had the same motley coat put on them.

The capitals of the piers in the choir are particularly rich in design. They represent scenes from the New Testament history: the figures, as might be expected, being quaint in the extreme. I copied one where the Roman solders, asleep at the Sepulchre, are packed horizontally one over another, like herrings in a barrel.

The Brioude church is in very bad condition: we were informed that a restoration is contemplated. It is full of interest. The eastern *chevet* is especially notable, having five projecting three-sided chapels clustering round the main apse, and like it adorned on the outside with mosaic patterns in dark and light lava. Inside, these chapels are very rich with clustered pillars and arcading: the latter having a kind of very obtuse foliation, the effect of which is anything but pleasing.

I may mention that the railway between Clermont and Issoire runs for some miles along the bank of the Allier, through some very pretty rock and river scenery.

From Brioude, it is at present a long diligence journey of eight hours, over an uninteresting mountain road, to LE PUY, one of the most curious old cities in France. In a wide basin-valley, surrounded by the round heapy mountains of the Haute Loire, rise two abrupt black masses of rock, one about 350 feet high, the other full 500 feet. The lower and more precipitous is a mere pinnacle, tapering to a point, and on that point is built the chapel of St. Michael, the aërial guardian of such rock sanctuaries. The other, and loftier, is of much more considerable bulk, and on it stands a huge colossal bronze figure of the Virgin and Child, recently cast from cannon taken at Sebastopol. Round the foot of these two strange black objects clusters the city, with its red roofs and sombre streets: and half-way up the larger mass of rock nestles the cathedral with its surrounding buildings. The west front is approached by more than 200 steps. Indeed, he who cannot climb stairs has small chance at Le Puy. The old cathedral is most curious: outside, mosaic, of various lavas: inside, of dull grey lava, and divided, as is the custom further south, into dome-like compartments. Behind it, there is an exceedingly beautiful Romanesque four-sided cloister, which no one should omit seeing.

Here we got another bright and interesting day's walk, exploring the village of Expailly, with its own dark mass of lava rock, fortress-crowned, and its strange organ-fronted basaltic cliff, known as "Les orgues d'Expailly;" and thence across some miles of upland to Polignac, the nest of the noble family of that name,—a village clustered round the grandest mass of black rock which we had yet seen, overtopped by the ruins of the once magnificent château. Hence, after exploring the curious little Romanesque church, and refreshing ourselves in very primitive style at the hospitable little inn, through many miles again of rich marshy valley, into the gorge of the Loire. This river, before only known to us in its wide and champaign wanderings, is here a blue mountain torrent, diversified with all the incidents belonging to such a description. Next day, our way lay, when we reached the rail at Pont de Lignon, for many miles along its banks, tunnelling the promontories, and varying at every minute the groupings of its rich grey rocky barriers.

This journey took us, through the smoky and tall-chimneyed precincts of St. Etienne, to Lyons, where our second Sunday was spent. Here, as at Bourges, all the services were well and carefully done. At the vespers, the cardinal archbishop was present. At one part of this service, the tune which is known to us as Hanover, or the 104th Psalm, and (wrongly) passes for Handel's, was sung, and largely joined in by the congregation. I had noticed the same circumstance on a previous visit. The sermon, which was preached by a Capuchin friar on his Lent mission, was of a very different character from that of the former Sunday at Bourges. "Go, teach all nations." "There were various authorities. There was the authority of a father (which he described at length); of a magistrate; of a king; &c. But, my brethren, there is ONE authority, which is above ALL other authorities: L'AUTORITÉ DE L'EGLISE!" He was proceeding further and further with exaggerated ultra-montanism, when we were obliged to leave, for daylight was waning, and I wished to show my friend the great pilgrimage church of Nôtre Dame de Fourvières, on the lofty hill behind the old cathedral. Here I told him he would see superstition in all its perfection: votive pictures, waxen legs and arms, &c., hanging up in memory of various miraculous cures and preservations. When we had entered the church, we looked about in vain for the grosser portion of these offerings. Many votive pictures remained; but the greater part of the "ex voto" offerings had been removed, and the church was decorum itself, compared with former times. I noticed also that in the pilgrims' shops lining the steep street leading up to the church, waxen legs and arms were no longer exposed outside for sale. We found, however, the church filled with young girls, singing the blasphemous and revolting litany to the Virgin: showing that if public opinion has produced some superficial improvement, the real departure from the purity of the faith is as great as ever.

We examined with far more satisfaction the very ancient church of St. Aignan, where the dungeons of the primitive martyrs, Pothinus and Blandina, are still shown.

And now our steps turn northward and homeward.

In this portion of our tour we visited AUXERRE, and made an excursion to the old abbey church of Pontigny. Auxerre is an old town, with many towers and spires, grouped on a gentle acclivity above the Yonne. The cathedral hardly requires minute description. It is a noble old pile, of different dates, the choir of the purest thirteenth-century Gothic. At the east end of the church is a curious, and to us unique feature. The central, or extreme eastern chapel, instead of being polygonal as the rest, is square; and the problem of fitting it in among the polygonal ones is solved by the insertion of two very light and elegant detached shafts in the space where it joins the main wall. At the ends of the nave and transepts are three of the finest windows which we have seen, both as to form and as to colour; the design being the usual one, the rose resting on five or seven lights. In some cases the superincumbent circle is too large for the lower portion of the window thus produced, and the combination has an awkward and unpleasing effect: but at Auxerre the due proportion has been preserved, and very beautiful windows are the result. The glass in the more ancient windows of the choir-aisle is, like very much that we have seen, of the same character as that at Canterbury. One feature in its arrangement here, not peculiar to this church, is the arrangement of the groups of figures in the spaces of the ironwork, not on squares or circles.

but on shields lying obliquely, some from the left to the right, some *vice versa*.

Auxerre is a good spot for studying the vagaries of the later flamboyant style, from the odd mixture of pure and meretricious ornament in the church of St. Germain, to the very top of the climax of the hideousness of the ambitious debased, in St. Pierre. Of the former church the nave was destroyed by the Huguenots, who left only a very pure and beautiful Early-pointed tower and spire, which formerly stood in the western façade. Under the choir is a very ancient crypt, containing the tombs of St. Germain and of several of the first bishops of Auxerre. One or two of the original inscriptions are left; the greater part have been re-cut, or painted from the originals, the styles being the same throughout: no date; thus: "Avitus, who governed the church xvi years, vii months, vi days, and fell asleep on the xxii of May."

The abbey church of PONTIGNY, about twelve miles from Auxerre, is to Canterbury men full of interest. It was to the Cistercian monks here that Becket was entrusted by the Pope (Alexander III.) in December, 1164; and here he remained till, at Easter, 1166, the monks, frightened by the threats of Henry II., requested him to find shelter elsewhere. The great church was but lately built at the time of his visit, and remains now nearly as he left it. It is a long barn-like building, without a tower, lighted by lancet windows of extreme simplicity. The rules of the order enjoined the absence of ornament, forbidding towers and painted glass. The chapel where the Archbishop regularly said mass is now in ruins.

It was on the road from Pontigny to Sens, where he next took refuge, that those remarkable words were spoken to him by the Abbot who was escorting him: remarkable, as showing us the man, in the judgment of his own partisans and friends. Becket had expressed his expectation of martyrdom, and had related a dream in which the scene of his future death had been revealed to him. On which the Abbot replied, "What has a glutton and a drunkard to do with a martyr? The cup of wine which you drink has nothing in common with the cup of martyrdom." The Archbishop's answer is equally remarkable: "I own," he said, "that I indulge too much in the pleasures of the body, yet, unworthy as I am, He who justifieth the ungodly hath vouchsafed to reveal this unto me."*

Our next point was SENS, a city, both before and after the period just spoken of, much connected with the history of Thomas of Canterbury. It was here that he resigned his archbishopric into the hands of the Pope in 1164, and was by him anew invested with it: and here again, in the monastery of St. Columba, that he found refuge after his expulsion from Pontigny. The cathedral, it would appear, was yet unfinished at the time of his visit. It is a noble church: in many of its smaller details, though not in its general plan, reminding one of Canterbury, the choir of which, after the fire of 1174, was, it will be remembered, rebuilt by an architect from this city, William of Sens. In the capitals, in the vaulting, in the ornaments of the bases of the pillars, we were reminded of our own cathedral: and above all by the stained glass; which might have come, and perhaps did, from the same manufactory.

We made our way across pleasant fields, by the river Yonne, to the Abbey of St. Columba. We were shown over the building by one of the sisters who now hold it; but it is all modern, except a very small portion of the crypt, the only church which they now have, that above ground having been destroyed in the great Revolution. This crypt has been chastely and beautifully restored by the exertions of a former chaplain. No traces remain of the sojourn of Thomas of Canterbury.

A day at TROYES: too short to enjoy its numerous objects of interest, but enough, if diligently spent, and with a note-book in hand, to lay up many treasures for future recollection and description. The sky was almost cloudless, and the biting March wind had covered even the kennels in the streets with ice, so that we had every advantage of light and shade for effect, and all tonic influence from without to brace our energies. First, then, for the cathedral. The west front has certainly been over-praised, as it is over-drawn in Mr. Ferguson's book. There is no such depth of effect in the doorways, as he has represented: and the carved work over them, which he has given distinct in light, with dark shade behind, as if it were a light and elegant curtain hung before the deep recesses, is not capable of any such effect, being poor and formal, and having no pendants. The engraving in his valuable book, which is from Arnaud's "Voyage dans le Departement de l'Aube," is really only an artist's sketch for effect, and has no pretension to accuracy. The details of the carved work are, though early in the flamboyant style, full of its particular faults: a certain symmetry of general design is obtained at the sacrifice of the symmetry, and even of the meaning, of particular portions. For example, the simple trefoil window-head, beautiful in its own position, is twisted and deformed all manner of ways, to make it perform impossible duties. Had one never seen the west end of a French church before, that of Troyes might be thought very striking: but on any one at all versed in those magnificent façades, it will not produce much effect after Bourges,

---

* At the little inn at Pontigny, we had our first experience of the "escargots," or large yellow snails, which form a favourite article of diet through a considerable part of France. We pronounced them not unpalatable, but certainly should not care to taste them again. The good landlady presented me with three, in their hermetically sealed state of hybernation, to carry home: which three came to life in this year's extraordinary April heat, and signalised their vigour by devouring an Alpine plant in my little fernery.

We saw a curious announcement respecting these snails at Troyes, made more curious by the omission of stops:—"Bablon Restaurateur prend des pensionnaires huitres et escargots."

Chartres, Reims, or Amiens. On entering, the eye is struck with the extreme beauty of the nave arches, triforium and clerestory. All is rich but simple, regular but not monotonous. The clerestory windows are very large, and filled with truly magnificent glass: glass of a kind which a visit to Troyes first makes one familiar with: late in date, but most rich in colour and happy in its combination. Of this, elsewhere than in the cathedral, I shall have more to say by-and-by. The choir was closed for repair, so that we could not see the whole effect; which I much regretted, as Mr. Ferguson describes it as being spoiled, owing to the too great width given by the five aisles. What could be seen of the east end, beautiful in the nicest symmetry of width and height, made me doubt whether the adverse verdict would be universally agreed on. We mounted the tower, of which the less is said the better, as a sort of penance for having come from Sens to Troyes by night: but the view of Champagne from the summit showed us that our penance might have been spared. We saw spread around us one of those wide-stretching plains almost without an object to distract the eye, of which central France is in the main composed. At our second visit in the afternoon, a young priest was addressing a large assembly of children from the pulpit in the nave. As much as the echo would let me hear in the side aisle, was a vivid description of the monastery of the Grande Chartreuse.

Next to the cathedral in interest is the splendid unfinished church of St. Urbain, so named by its founder, Pope Urban IV., a native of Troyes. It is in the purest Gothic of the 13th century, with hardly any feature of the subsequent declension of the style. All is lightness and grace: every feature beautiful in itself, and beautiful as part of the whole. There are parts about it which somewhat reminded us of the Sainte Chapelle at Paris, which is of nearly the same date. There is a good deal of ancient glass, but it is not to be compared with that which will be described a few lines on.

St. Madeleine is the oldest of all the churches we saw in Troyes, being of the Early-pointed style of the 12th century, whereas most of the others are of the flamboyant of the 15th and 16th. It is the only church which we saw in France having the moulding, so well known in England as the dog-tooth, running round the arches and along the string courses. It is well known for its magnificent stone rood-screen, a wonder of late rich carved work: but I found more pleasure in the old glass, which is of its kind unrivalled, both in drawing and in colour. Many windows remain, of which I particularly noted, as being most accessible, the three in the central chapel of the *chevet* eastward. The central window of these three bears date 1506, and was an offering from the goldsmiths of Troyes in honour of their patron saint, St. Eloy. Its four lights are divided into sixteen squares, representing the life and acts of the saint. Each square has under it four lines of rhyming verse, describing the action represented in it. We read how, when he was born, a prophecy declared that he should become a great saint: how, when a child, he was apprenticed to the most noble art of the goldsmiths: how he made rings and sceptres and the like, and bestowed his profits on the poor: how he conceived the idea of devoting himself to the holy life, and was offered by the people of Noyon the staff and dignity of their bishop, and then:

“ Le s^{t} en la ville de Rouen
Fut sacré avec St. Ouen
Ce jour de may le quatorzieme
Dans le tems de Louis deuxieme.”

“Then all the infidel people came from all parts to his feet, to know the way of salvation. But he, knowing his end to be near, spoke words of consolation to the servants of his house, and rendered up his soul to God.” Hitherto it is a simple and beautiful story. But here, of course, the miracles begin. His soul is seen going up to heaven, in the form of a cross of fire. His body is placed by the mourning people of Noyon within their great church. A precious liquor flows from his tomb which cures many of their diseases. The Duke of Touraine (I suppose:—“tyrouenne”), being healed of pestilence, offers his goods at the tomb: and the queen, chanting the praises of the Most High, places the glorious remains in a splendid sepulchre set with precious pearls.

To the right of this is a splendid Jesse window, containing the genealogy of our Lord, full of colour, vigour, and beauty. The inscription sets forth how God of his mercy turned the bitter fruit of Eden into sweet, giving his Son, that whosoever believeth in Him may have eternal life.

To the left is a very curious representation of the events of the Old and New Testament histories. The squares devoted to creation are of the oddest. The Creator, under the guise, as usual, of an old man with the triple crown, standing amidst the blue heaven, holds a large white circle, which is seen in various degrees of advance,—in one square empty, in a second powdered with stars, in a third mapped out with seas and continents. The inscription runs thus:

“ Com̃ent apres ciel et terre
Et tout mi en son vray lieu
Est fait notre premiere pere
En bel image de Dieu
Comment il le faut repaire
Trompé de malin esprit
Par sacrifice et priere
De nostre Sauveur Jesus Christ.”

There are several other windows, equally as beautiful and full of incident, in the same part of the church. It must be sufficient to have described these three by way of sample. The glowing blues and crimson of the glass here seemed to me to be without parallel.

In the churches at Troyes, as in other places, was affixed to the wall the usual Lenten pastoral of the bishop of the diocese. In this case the bishop had taken for his subject the observance of the Lord's

Day; and in his treatment of it a remarkable passage occurred, which I thought worth translating.

"And Protestantism, whose destructive work seems to have had no other result than to break to pieces the united body of doctrines (*briser le faisceau des doctrines*)—of which Jesus Christ has committed the guardianship to His Church, and to cast to the winds one by one the holy practices by whose aid we approach evermore nearer to our Divine Model, —has it attacked the law of the Lord's Day? No, my beloved brethern: I venture to say, on the contrary, it has rather exaggerated it, by prohibiting, as did Pharisaism of old, the most innocent recreations. Look at this England, this so peaceful nation, whose whole wealth is in commerce and industry. From her countless machines she sends forth her fleets of merchandise which inundate all the markets in the world, and almost without exception gains the victory in the competition of nations.

"Well—has she effaced from her code and from her habits the law of sacred rest? Her time is precious. She uses, and she abuses, the strength of her children. All the week long, she exacts from the hands of her workmen all that their sweat and their energy can produce. But scarcely has the solemn hour struck which begins the sacred day, when all ceases: silence reigns everywhere: the fires are extinguished, the doors of the workshops are shut, and each man enters into the peace of his own abode to prepare for the celebration of the Sunday.

"If you have not been, as we have, witnesses of this spectacle, you have at least heard it described. For it remains as an indelible remembrance on the mind of all who have visited the capital of Britain. Only, it must be confessed, it is a remembrance marked with some *tristesse:* for, as we said just now, there is a certain Pharisaism, which banishes from this legal observance the sweet and touching joyousness which Catholicism knows how to mingle with it."

The document, which goes into the subject at full length in all its bearings, is signed "Emmanuel Jules (Ravinet), Evêque de Troyes."

St. Nizier is another notable church, Late Flamboyant in style, containing much beautiful painted glass. Against one of the pillars we saw a table of the Ten Commandments, perhaps a century old, containing the second Commandment *at length: the only instance*, among all the Roman Catholic documents that I have seen, *in which this is the case.* To this table of the Decalogue there is this addition: "Ne quitte la loy de ta mere L'EGLISE. Prov. i." The biblical critic might observe here a curious instance of the comment finding its way into the text.

On one of the last days of our little tour, we ran down from Paris to SOISSONS, tempted by Mr. Ferguson's report of the cathedral as being worthy to rank among the first in France. And we were indeed richly repaid. It is the purest specimen of Early Gothic we have seen, and one of the stateliest. In point of unity, it is the Salisbury of foreign churches. Every pier in nave and choir is on the same pattern: all the bays in the vaulting are alike; so are the clerestory windows, with the exception of the five lancets which terminate the choir eastward: so are the beautiful arcades, which form the triforium round both nave and choir. And with all this perfect regularity there is no monotony: the perfect proportions instantly arrest the eye and never cease to give pleasure. But the chief beauty of the church is the southern transept, semicircular, and with a ground and first story of open first-pointed arcades of the lightest and most elegant kind, surmounted by the same triforium arcade which runs round the rest of the building. It is hardly possible to imagine anything more chaste or pleasing. The great want felt throughout is that of painted glass, which in this cathedral has almost all been destroyed: only the five lancets at the east end of the choir clerestory, and three windows in each of the three central chapels in the *chevet*, remaining. The extreme beauty of these redoubles one's regret that the present glare of the whole building is not now subdued by all being like them. The western end hardly satisfies the eye which has become accustomed to the interior. It has indeed three stately doorways of chaste and faultless pattern; but around them there is a mass of plain wall which seems hardly congruous, either with the ornament fitted into it, or with the generally elaborate character of the church. Over the central doorway is the usual rose-window, but in this case enclosed within a highly ornamented pointed arch; an arrangement which I do not remember to have noticed elsewhere, except in the neighbouring ruined abbey of St. Jean-des-Vignes. Outside the southern face of the choir is a pretty octagonal building, attached to the church, with round-headed lights in its lower story, and pointed ones in its upper.

The west end of the abbey church of St. Jean-des-Vignes is all that remains. It is a magnificent fragment. Two spires of unequal height (as at Chartres) flank it to north and south: the doorways are exceedingly rich, as is the work over them, of the same character and date as the cathedral itself. We hurried away from the spot, where we willingly would have spent some hours, and regained the railway, delighted that our ramble among French churches should have been closed with such a journey as this to Soissons.

THE PRAYER OF PRUDENTIUS.

[AURELIUS PRUDENTIUS CLEMENS, the writer who is here introduced to the readers of GOOD WORDS, was born about the year A.D. 348. Little is known of his life beyond the facts that his father filled the office of Consul, and that the boy must therefore have received the education of the upper classes of the empire; that his early years were spent in reckless licence; that he twice filled the office of Prefect in a Spanish province under Theodosius; and that his maturer age was devoted to the attempt to create a Christian literature which should take the place of Virgil, and Horace, and Lucretius, for the generation then rising into manhood. For the most part, however, his poems do not rise above the level of neatly versified rhetoric. But the passage which is here translated has the merit of being something more,—the utterance of a deep feeling. The man himself is speaking out of the depths of his heart. At the close of a poem, on the Origin of Evil, his mind turns in upon itself, and the thought comes home to him, that there is an evil within which he has not yet conquered, and from which he is craving for deliverance. Wherever this feeling exists it claims our sympathy and respect. Without it there can be no true prayer. And it is because it is expressed by Prudentius with a truth and humility that carry their own witness with them, that I have thought it right, in spite of one serious drawback, to give it a wider circulation among English readers than it has had hitherto. The nature of that drawback is sufficiently obvious. The prayer implies, in its concluding words, the germ of the dogma which, in its developed form, as "the Romish doctrine of purgatory," English churchmen and other Protestants have learnt to distrust and to reject. I need hardly say that I have no wish to revive what the experience of so many centuries has shown to be the fruitful parent of "many superstitions." But it is one thing, in the light of that experience, to condemn the dogma, and quite another to refuse to acknowledge that when it first came there was much in it which might attract and fascinate minds of the highest order. As we find it in Prudentius, it is no instrument of priestly tyranny, no narcotic to dull the conscience, no substitution of the mere endurance of pain for a progressive sanctification. What we hear in him is the utterance of a spirit and temper upon which Christ himself has set the seal of His approval. In the "many mansions" of the Father's house, the writer of this prayer is content to "take the lowest room." In the consciousness that he is no more worthy to be called the son of that Father, he will simply ask that he may be as "one of His hired servants." He "stands afar off," like the Publican, and will not "so much as lift up his eyes unto Heaven." We may not doubt that, with such a soul, mists and shadows would pass away, that he would be bidden to "go up higher," that he would be welcomed as a son, that he too would enter into that great house "justified rather than the others" who were more confident and exulting.]

FATHER in heaven adored,
Of all creation Lord,—
Christ, Co-eternal Son,
And Spirit, Three in One,—
Thy wisdom guides my soul,
I bow to Thy control,
Before Thy judgment throne
I all my vileness own.
Before that judgment seat
I live in hope to meet
Thy mercy and Thy grace,
Thy smiling, pitying face,
Though what I do or say
Be stained with sin alway.

Before Thee I confess,
Help Thou my wretchedness;
Spare him who owns his sin,
The deep-dyed guilt within.
All woe and pain, of right,
On this vile soul might light;
But Thou, O Judge, be kind,
Cast all my sins behind.
Hear, Lord, the prayer of woe,
And better things bestow.

Grant this poor soul of mine,
When it shall leave its shrine
Of flesh and blood and bone,
The house it calls its own,
To which it fondly clings,
In love of earthly things;
When death's sad hour shall close
These eyes in dark repose,
And all in earth shall lie
This frail mortality:
When, cleansed and clear, the sight
Shall see the heavenly light:
Oh hide Thou then from view
The fierce wild robber crew,
That fright the startled ear
With voice of threat and fear,
Who fain would drag me down
With dark, relentless frown,
To caverns drear and deep,
And there a prisoner keep
Till all I owe be paid—
Guilt's utmost farthing weighed.

Within Thy Father's home
In different order come,
O Christ, the mansions meet,
Each soul's assigned retreat:
I ask not with the blest
To gain eternal rest;
There let the saints abide
Who conquered lust and pride,
And, seeking riches true,
From earth's vain shews withdrew.
There, in perpetual youth
Let white-soul'd, maiden Truth,
For ever dwell on high,
In stainless chastity.
For me enough, the deep
Of Hades dark and steep,
If only Thou wilt bind
The foes of human kind,—
If only Thou restrain
Gehenna's fire and pain,
Nor leave my soul to flit
All hopeless to the pit.
Enough, if fleshly stain
Require the cleansing pain,
That in the lake of fire
I purge each foul desire:
Enough, if breezes sweet
Temper the slackening heat,
And scorching flames abate
The fierceness of their hate.
The boundless realm of light,
The crown of glory bright,—
This meed let others gain;
Enough, if I attain,
Beneath Thy pitying eye,
A lighter penalty.

E. H. PLUMPTRE.

OUR INDIAN HEROES.

By JOHN WILLIAM KAYE.

IX.—SIR JOHN MALCOLM.

A SHORT hour's walk from the thriving little town of Langholm, in Dumfries-shire, there lived and toiled, nearly a hundred years ago, an industrious farmer named George Malcolm, who cultivated an estate known as "Burnfoot," and lived there, on the beautiful banks of the Esk, surrounded by a fine family of children, at that time far from complete. He was a man of more than common enlightenment for his station, for he had been trained for the Church, and, better still, of sterling integrity of character. His wife, too—a member of the Pasley family—was a woman excellent in all domestic relations, and of intelligence of a high order. As they dwelt together there, at Burnfoot, on the 2nd of May, 1769, a fourth son was born unto them, who in due course was christened John. It happened that, on the very day before, there came into the world one who was afterwards one of John Malcolm's closest friends, and the greatest man of the age in which he lived—Arthur Wesley, or Wellesley, known to a later generation as the Duke of Wellington—the "great Duke."*

I have no passion for the discovery of juvenile phenomena. I do not know that John Malcolm differed much from other healthy, robust, intelligent boys—such as swarm in all parts of our country. He was very good at "paddling in the burn," from which the name of the paternal estate was derived. Perhaps he was rather prone towards mischief, and not as industrious as could have been wished. He was rather given to the bad habit of putting off the learning of his lessons, until he was fairly on the start for the parish school, when he trudged up the hill, book in hand, and eye intent on the page. The schoolmaster used to say, when any wild pranks of mysterious origin had been committed, "Jock's at the bottom of it." There was not always good evidential proof of this, but worthy Archibald Graham had ever a strong conviction of the fact, and solemnly enunciated his belief that Jock, who was indeed the scapegrace, perhaps the scapegoat, of the family, was profoundly "at the bottom of it"—deep in amidst the mud, not of the transparent Esk, but of some slough imagined by the worthy preceptor of Westerkirk.

It is not forbidden to us to believe that promotion cometh from the North. In those days, an astonishing amount of patronage fell upon the striving inhabitants of Scotland and the border. It may seem strange that a yeoman of Dumfries-shire should have the power of providing, in all the finest services open to the nation, one after another, for a number of brave, clever, Eskdale boys. But so it was. Robert, the eldest, had permission, from the East India Company, to go out to shake the Pagoda tree, as a member of their civil service. James, the second son (afterwards Sir James), received a commission in the Marines. For the third son, Pulteney (afterwards Admiral Sir Pulteney), a midshipman's berth was provided. And John, as soon as he was old enough, was set down for the Company's military service. He was only eleven years old, when he had an offer of an appointment in the Indian army; but he was then too young to go abroad. Soon afterwards, however, his uncle, John Pasley, a thriving merchant, carried him up to London, and was anxious, above all things, to qualify him to "pass at the India House." But the good uncle, in November, 1781, wrote, that although tall of his age, Johnny would certainly not pass. In this, however, he was altogether wrong. The experiment was made. John Malcolm went up, nothing daunted, before an august assemblage of Directors. They were pleased by his juvenile appearance and his good looks; and one of them said, "My little man, what would you do, if you were to meet Hyder Ali?" "Do," said the boyish aspirant—"why, sir, I would out with my sword, and cut off his head." Upon which evidence of spirit and determination they declared that he "would do," and forthwith passed him as a cadet. It was not necessary that he should sail immediately; so his good uncle put him to school again, in the neighbourhood of London; and not until the month of April, 1783, did the ship, which conveyed him to India, anchor in the Madras Roads. The family connections, who received him on his arrival, wrote to Burnfoot that Jock had grown a head and shoulders on his voyage, and was one of the finest and best-tempered lads ever seen in the world.

When John Malcolm arrived in India the French and English were contesting the possession of Southern India. John went with his friends to Vellore, to do garrison duty there, as he was considered too young to take the field. Peace, however, having been declared in the West, the English and French left off fighting in the East; and so the former had nothing to do but to carry on, without any distraction, the war against Hyder Ali and his son. After awhile, however (1784), a treaty of peace was signed, and an exchange of prisoners was decreed. This interchange sent young John Malcolm on his first detached service. The English prisoners were to be brought to our frontier, and there received by a detachment of British troops. John Malcolm was appointed to command this detachment, which was to meet Major (afterwards Sir Thomas) Dallas, who was to convey them safely beyond the territory of Mysore. When Dallas met the detachment coming from the Company's territories, he saw a slight, rosy, healthy-looking English boy astride on a rough pony, and asked him for his commanding officer. "I am the commanding officer," said John Malcolm, drawing himself up on his saddle. Dallas smiled; but the friendship, which then commenced between the two, lasted until it was severed by the death of the elder man.

---

* Napoleon the First was born in the same year.

It is said that John Malcolm went out too young to India. He was a commissioned officer and his own master at an age, when in England boys were commonly subjected to the discipline of the birch-rod. If then he did not make use of his liberty and his pseudo-manhood, in the most virtuous and forbearing manner, there is nothing very surprising in the failure. He was assailed by many temptations; and being of a frank, open, unsuspecting nature, he went astray before he knew whither he was tending. He was generous, open-hearted, and open-handed. He got into debt, and suffered for it. He did not, as some are wont, wipe out old obligations by incurring new. But he set to work right manfully to extricate himself. And soon better days began to dawn upon him. He was contrite, and confessed his errors; and he wrote home that he was afraid his parents would think that all their good advice had been quite thrown away. "I must own, to my shame," he said, "that you had too much reason to think so. All that I now expect is that my friends will forget the past part of my conduct." And from that time (1788) he never relapsed, but went forward steadily to the great goal of honourable success.

A life of active service was now before him. The peace was at an end. Tippoo had broken it by ravaging the country of our ally, the Rajah of Travancore, and Lord Cornwallis had taken the field against him. Of the events of the two campaigns which followed I have spoken in the memoir of that statesman. The regiment to which John Malcolm was attached was ordered to co-operate with the troops of the Nizam. On this service he was often exposed to great hardships, and first learnt what war in India really is. At the siege of Copoulee he learnt another lesson. He was present at the attack of a strong fortress. Not long afterwards, his regiment joined the main army; and made the acquaintance of two of our principal political or diplomatic officers, Sir John Kennaway and Mr. Græme Mercer. A new ambition then stirred within him. He asked himself whether he also might not detach himself from the formalities of regimental life, become a diplomatist, and negotiate great treaties with the native powers.

He was now a man full-grown, tall and handsome, and of such a cheerful address, that he carried sunshine with him whithersoever he went. He was remarkably active, and fond of sport, and so playful, that he went by the name of "Boy Malcolm," and retained it long after he was well advanced in years and had attained high office in the state. But he had begun seriously to consider that it was his duty to earn a reputation as something more than a crack shot and a noted gymnast. The first step towards this was the study of the native languages; and Mr. Græme Mercer, taking a fancy for the youth, encouraged his desire to learn Persian, and gave him the use of his own Moonshee. Of the opportunity thus afforded him he made good use. Nor was the study of the languages the only improving pursuit to which he devoted himself. He applied himself to the investigation of Indian history, and endeavoured to master the principles, by the observance of which our great Indian Empire had been founded, and on which alone it could be maintained. In the prosecution of this, he began diligently to record upon paper the results of his inquiries and the substance of his reflections, and from that time to the end of his days he was ever a great writer.

I have said that it was John Malcolm's great ambition to obtain an appointment in the Political Department. After a while, he thought that he saw an opening. A subordinate post was vacant; he applied for it, and was just half-an-hour too late. It had been bestowed upon another young officer. His disappointment and vexation were great. He went back to his tent, flung himself down on his couch, and gave way to a flood of tears. But he lived, as many a man before and since has lived, to see in this first crushing miscarriage the crowning mercy of his life. The officer, who carried off the prize so coveted by John Malcolm, went straight to his death. On his first appearance at the native court, at which he was appointed an assistant to the Resident, he was murdered. This made a deep impression at the time on Malcolm's mind, and was ever afterwards gratefully remembered. He often spoke of it in later days, as an illustration of the little that man knows of what is really for his good; and he taught others, as he himself had learnt, never to repine at the accidents and mischances of life, but to see, in all, the hand of an all-merciful Providence working benignly for our good.

In God's time, however, that which he sought came; and John Malcolm received his first appointment. "I served," he wrote many years afterwards, "as a regimental officer, with European and Native corps (without ever having one week's leave of absence) for nine years. In 1792, when at Seringapatam, I was appointed Persian interpreter to the detachment serving with the Nizam, by the Marquis Cornwallis, on the express ground of being the officer with that corps best qualified for the station." His foot was now on the ladder of promotion; but, for a while, his upward progress was checked by the failure of his health. Continued exposure to the climate had done its sure work upon him; and he was compelled to return to England. He did not like it; but his friends persuaded him to take the advice of his physicians and he consented, with less reluctance, perhaps, than he would otherwise have felt, because Sir John Kennaway, his friend and patron in the political service, was going home also, and proposed to take young Malcolm with him.

It was great joy to him, and great joy to others, when John Malcolm reappeared in Eskdale, a fine, handsome young man, reinvigorated by the voyage, with an unfailing supply of animal spirits, and an inexhaustible budget of amusing and instructive talk. Great days were those at Burnfoot, when John sat by the fire and told to the admiring family circle pleasant stories of all that he had seen and heard in the Far East. But, having a career before him, he was not one to protract his stay in England a day longer than was perfectly necessary for the restoration of his health: so he returned to India, and under happy auspices, for he went out as aide-de-camp to General (afterwards Sir Alured) Clarke, who had been appointed Commander-in-Chief of the Madras army. On his way out, he stopped at the Cape of Good Hope, found the English and Dutch at open war; and was present at the operations which ended in the transfer of the settlement to the English, by whom, save for a short interval, it has ever since been retained.

When, in the cold weather of 1795-96, John Malcolm again found himself at Madras, he was still a subaltern, but he was on the staff of the Commander-in-Chief. General Clarke was soon transferred to the chief command in Bengal, and General (afterwards Lord) Harris was appointed to Madras to succeed him. There were circumstances which prevented Clarke from appointing John Malcolm to the military secretaryship in Bengal; so he remained at Madras, as Persian interpreter and secretary to General Harris. In this situation he was sufficiently happy; but the personal staff of a Commander-in-Chief afforded no great scope for the development of his powers, and he still longed for employment in the diplomatic line of the service. His next advancement, however, was in the military direction, for he was appointed Town-Major of Madras,—in those days an honourable and a lucrative office. But his hopes were about speedily to be realised, in a manner wholly unexpected. Lord Wellesley—then Lord Mornington—went out to India as Governor-General, and, on his way to Calcutta, touched at Madras. There he made the acquaintance of John Malcolm, by that time a captain in the army, who sent his lordship some reports which he had drawn up, on our relations with the native states of India, especially the state of Hyderabad. The result was, that soon after his arrival in Bengal, the Governor-General offered him an appointment as assistant to the Resident at Hyderabad; so without loss of time, Captain Malcolm proceeded to the chief city of the Deccan, and was soon in the thick of an exciting political contest.

Those were days of stirring adventure throughout the southern peninsula of India. Lord Wellesley was bracing himself up for the last decisive conflict with Tippoo Sultaun. He was "Citizen Tippoo" in those days—closely allied with France. At the court of Hyderabad also the French had for some time been making effectual progress. French officers had disciplined, and now commanded, several battalions of the Nizam's troops. Such a state of things could not be suffered to endure, on the eve of a great war with Tippoo. So Lord Wellesley determined to make a bold stroke for the destruction of the French force at Hyderabad. The consent of the Nizam was obtained; but it was still necessary to do it by a *coup d'état.* There was a large body of British troops at no great distance from the Residency, and with these Kirkpatrick, the Resident, and his assistant, Malcolm, determined to accomplish their object. Fortunately, it happened that at the critical moment the troops were mutinying against their officers, because they were in arrears of pay, and had made a prisoner of their French commandant. Malcolm was sent down to allay the tumult: but the crowd would not listen to him. They said that they would treat him as they had treated their own officers. And they were about to lay violent hands upon him, when some Sepoys of the French battalion who had formerly been in the Company's army, and served in John Malcolm's regiment, recognised him, and remembered many old kindnesses done to them by their English officer. So they lifted him up above the crowd, and bore him on their heads to a place of safety out of the reach of the exasperated mob.

How the French corps was afterwards dispersed, without the shedding of a drop of blood, is a matter of history, on which, however interesting, I cannot afford to enlarge. It was Malcolm's first great lesson in the stirring business of that "political department," whose concerns often savour more of war than of diplomacy. But the Governor-General had summoned him to Calcutta; and, the French corps dispersed, he set out with all possible speed, to join the vice-regal court at the great City of Palaces. He carried with him, as a palpable embodiment of success, the colours of the annihilated French battalions. At the capital, he was warmly welcomed. The Governor-General, no mean judge of character, saw at once that he was a man to be trusted and to be employed. In truth, this meeting with Lord Wellesley was the turning-point of John Malcolm's career. From that day his fortune was made. He found in the Governor-General a statesman after his own heart; and Lord Wellesley listened attentively to all that was said by the political assistant, because he found in John Malcolm's ready words fit and forcible expression of the opinions which were taking shape in his mind.

When Captain Malcolm returned to Madras, charged with the views and sentiments of the Governor-General, he was appointed to accompany the Hyderabad troops which, in accordance with our engagements with the Nizam, were to co-operate with the British Army in the invasion of Mysore and the assault of Seringapatam. In effect this political superintendance was little less than the military command of the Nizam's force. But afterwards it was considered advisable to attach a European regiment to this force, and His Majesty's 33rd Regiment, then stationed at Vellore, was selected for this duty. The regiment was commanded by Colonel the Honourable Arthur Wellesley, brother of the Governor-General, who then took command of the force; and the two became fast friends. The British Army was commanded by General Harris, whose secretary Malcolm had been. On the morning of the successful assault of Seringapatam, he paid a visit to the tent of his old master, and with characteristic hilarity addressed him as "Lord Harris." The general chided him for his levity in so solemn an hour; but the light-hearted prediction was fulfilled.

After the conquest of Mysore, a commission, of which General Wellesley was a member, was nominated for the settlement of Mysore, and John Malcolm was appointed secretary to it. He did his duty so well, indeed he had altogether so strongly recommended himself by his good service to the Governor-General, that Lord Wellesley, when the work of the commission was done, offered him far higher employment. He selected him to proceed on a mission to the Persian Court. In those days we knew little or nothing of the country. But Zemaun Shah, the ruler of Afghanistan, had been suspected of intriguing with Tippoo and with the deposed Prince of Oude, and we had visions of the French Directory in the background. The anti-Gallican tendencies of Lord Wellesley and of Captain Malcolm were equally strong, and the latter rejoiced all the more in the honourable appointment that had been offered to him, because there was a grand opportunity before him of checkmating France in the regions of Central Asia.

At the end of the year 1799, Captain John Malcolm, being then in his thirty-first year, sailed from Bombay to the Persian Gulf. After visiting Muscat, he steered for Bushire, where he landed, and made his preparations to advance into the interior of the country. This, however, was not very easily accomplished, for he was continually being arrested by absurd formalities, at which he laughed with the utmost possible good humour; but, at the same time, maintained the dignity of the great nation which he represented, by demanding from the Persian Government all the respect which he yielded on the part of his own. Not until the middle of November, 1800, was he presented to the Shah at Teheran. Some days afterwards he laid before his Majesty the magnificent presents with which he was charged. But he was in no hurry to enter upon the political business of his mission. He exhibited his diplomacy by leading on the Persian ministers to make the first proposal for the establishment of treaty-negotiations between the two powers. The result was that after a good deal of skirmishing, two treaties, the one commercial, the other political, were drawn up and discussed. Whether these treaties were ever really in force is matter of historical doubt. But at all events a good understanding was established between the two countries. The Persians were well pleased with the magnificence of the presents which were lavished upon them; they derived from them a grand idea of our national wealth; and it must be added that the personal belongings of the envoy himself made a profound impression on the Persian Court. His fine stature, his commanding presence, and the mixture of good humour and of resolute firmness with which he conducted all his negotiations, compelled them to form a high estimate of the English people. He was in their eyes a "Roostum," or hero of the first magnitude.

On his return to India, Captain John Malcolm was greeted by letters from the Governor-General, directing him to proceed at once to Calcutta. His reception at Government House was most cordial. Lord Wellesley bestowed his unqualified commendation on what had been done, and promised to give him, on the first opportunity, a high appointment in the political service. Meanwhile, he requested him to act as his private secretary, during the absence of Henry Wellesley, who had gone on a special mission to Oude. All this, it may well be conceived, filled with delight and gratitude the hearts of the family at Burnfoot. "The account of your employments," wrote his father to him, "is like fairy tales to us. . . . Your filial effusions brought tears of joy to the eyes of your parents. A good head will gain you the esteem and applause of the world, but a good heart alone gives happiness to the owner of it. It is a continual feast."

In the capacity of private secretary, John Malcolm accompanied Lord Wellesley on a tour to the Upper Provinces; but he had not proceeded further than Allahabad, when certain complications of a personal character at Madras caused the Governor-General to depute Malcolm, on a mission of much delicacy, to that Presidency. He did his work not only well—but nobly. For the arrangements, which were considered good for the public service, involved a great sacrifice on *his* part. He had been promised the Residency of Mysore; but he yielded his claims with cheerfulness in order to induce that excellent civil officer, Mr. Webbe, to remain a little longer in India. This done, he returned with all possible despatch to Calcutta, and met the Governor-General on his way back to the Presidency. But he did not remain long at the great man's elbow. Whenever any difficulty arose, it occurred to Lord Wellesley at once to "send Malcolm" on a special mission to set it right. So when, in July, 1802, the Persian Ambassador, who had come to India about the ratification of the treaties, was unhappily shot in an affray at Bombay, Malcolm was despatched to that Presidency to endeavour to make the best of so untoward an occurrence.

Making all speed, by land, to Bombay, he arrived there in October, and did everything that could be done to appease the expected resentment of the Persian Court. He wrote letters of explanation and condolence to the Shah and his ministers; and made such liberal grants of money to all who had suffered by the mischance, that it was said afterwards in Persia that the English might kill a dozen ambassadors, if they would always pay for them at the same rate. By the end of November the work was done, and Malcolm returned to Calcutta. He found the Governor-General and his advisers immersed in the troubled politics of the great Mahratta Courts. On New Year's Day, 1803, he wrote to Colonel Kirkpatrick that "the line was taken." In the diplomacies which preceded the war, Malcolm took a conspicuous part. Mr. Webbe having been transferred to the Residency of Nagpore, he was now appointed to Mysore. He hastened to Madras, therefore, to take up his appointment, and to communicate, on the part of Lord Wellesley, with the Governor of that Presidency. The work was soon done. On the 27th of February, 1803, he wrote to the Governor-General:—"I propose leaving Madras in a few days, and as I travel fast, I shall soon join the army, and convey to the Commander-in-Chief, in the clearest manner I can, a correct idea of the conduct which, in your Excellency's judgment, the present emergency demands."

The head-quarters of the Madras army were then at Hurryhur. To this place Malcolm proceeded post-haste, and after two days spent in camp, pushed forward to join the advanced division, under General Arthur Wellesley, which was to aid, in the lower part of the Mahratta country, the operations which Lord Lake was conducting in the upper. On the 19th of March he joined Wellesley's camp, and there was a cordial meeting between the two friends, and little disposition on either side to part. Malcolm saw clearly that they could act well together for the good of the public service, and, as no evil was likely to arise from his absence from Mysore, he determined to remain in Wellesley's camp, and there to turn his diplomatic experience to good account. "A political agent," he wrote to the Commander-in-Chief, "is never so likely to succeed as at the head of an army." It was a great epoch in the history of our Indian Empire, and there was a magnificent harvest of results. For a narrative of the events, which grew out of the Mahratta policy of Lord Wellesley, the inquiring reader must turn to the military annals of the time. It was enough, that the first great work which fell to the share of Wellesley and Malcolm was the restoration of the Peishwah, Badjee Rao, to the throne of Poonah. This accomplished, Malcolm fell sick. He struggled against his increasing infirmity—but in vain;—and at last, in the middle of August, to his intense disappointment, he was compelled to yield to the solicitations of General Wellesley and other friends, and to quit the camp for Bombay just as active business in the field was commencing.

But Malcolm was not long absent from his post. Just half-a-century afterwards, Mr. Elphinstone described to me, in vivid language, as though narrating an incident of yesterday, the effect of Malcolm's reappearance in camp. If not a little gloomy, the condition of social affairs among the General's Staff was a little grave and solemn, though everything had gone well with the army. It was all work and no play; and there was little laughter in the English tents. But when Malcolm reappeared among them, all this was changed. It was like a gleam of sunlight. He arrived in high spirits; he was overflowing with lively humorous talk; he had many rich stories to tell; he had a joke for every one, white or black; and no man left him without a smile upon his face. He was "Boy Malcolm" still. It was impossible to resist the fascinations of his genial presence.

His health, however, was not perfectly restored; and he was still haunted by apprehensions of another break-down, necessitating his second departure from the camp. But there was much work to be done, and he struggled against his infirmity. The beginning of the year 1804 found him negotiating a treaty with Sandiah, which, after much delay, was formally concluded. But it was productive of much distress of mind to Malcolm, for, although his views were shared by General Wellesley, they did not meet with the full approbation of Lord Wellesley. I think that Malcolm was right. If what he recommended was not more politic, it was at all events more generous and indeed more just than the opposite course. But the Governor-General was not a man to brook opposition of any kind, and for awhile he withdrew his smiles from his favourite lieutenant. But all this soon passed away. Lord Wellesley wrote him a long and very friendly letter, assuring him of his unbroken confidence—telling him that he was at full liberty to return to Mysore, to join the Government party in the upper provinces, to prepare for another mission to Persia, or to go home to recruit his health, as he might think best. He elected, in the first instance, to proceed to Mysore, whither he went, accompanied by General Wellesley. The latter soon returned to Madras, and Malcolm settled himself down at the Residency, intending to turn his leisure to good account by writing a history of Persia.

But his studies were soon broken in upon by a summons to Calcutta. Lord Wellesley wished to see him at the chief Presidency. So he closed his books, put aside his papers, and soon (April, 1805) found himself again an inmate of Government House. The Mahratta war had entered a new phase, and Malcolm's counsel was again in requisition. In a little while his personal services were required. In the conjuncture which had then arisen, it seemed more desirable than ever to "send Malcolm." So, at the end of a fortnight, he was sent to join the camp of General Lake in Upper India; and putting himself in a palanquin, he journeyed northward through the sultry summer weather, sorrowing most of all that he should look upon the face of Lord Wellesley no more in that part of the world, for the Governor-General had determined upon a speedy departure for England.

The head-quarters of the British army were then upon the banks of the Chumbul; but the scorching hot winds of the month of May compelled a season of inactivity, and they could do little but talk about the future. Grave and anxious talk it was, for news had come that Lord Cornwallis, with stringent instructions to adopt a pacific course of policy, had been a second time appointed Governor-General of India, and was expected shortly to arrive. The work was only half done, and to bring it to an abrupt, might be to bring it to a disastrous, close. Lord Cornwallis came, and the war was ordered to be wound up with the utmost possible despatch. The conduct of the Mahratta chiefs, however, rendered certain further operations on our part absolutely necessary. The insolence of Holkar demanded chastisement, but his courage was not equal to his pretensions, and as the army advanced he deemed it expedient to seek safety in flight. He crossed the Sutlej, and our troops pursued him. Malcolm accompanied the force, and was ever in the van. It was doubted whether the Hindoo Sepoys would cross the river. There were signs, indeed, of wavering, and it is said that the leading companies sat down on the banks, when Malcolm rode up to them, spoke in his brave hearty manner a few cheering words, reminding them that the holy shrine of Umritsur was in advance, and asked them if they would shrink from such a pilgrimage. And the story runs that such was the magic effect of these words, that the recusant Sepoys started up to a man, crossed the river, and soon, followed by their comrades, were in full march into the Punjab.

Lord Cornwallis died; Sir George Barlow succeeded him as provisional Governor-General, and the war, not without much murmuring in official quarters, was brought to a close. John Malcolm —he was then Colonel John Malcolm—after a brief residence in Calcutta, returned to the Residency at Mysore, and not very long afterwards took to himself a wife. In 1807, he married Charlotte, daughter of Colonel Alexander Campbell (afterwards Commander-in-Chief of the Madras army), a lady in whom, it has been said, "the charms of youth and beauty were united with a good natural understanding and a cultivated mind." This union was productive of much happiness to both. But nothing could ever relax John Malcolm's zealous activity in the public service. Single or married, he was ever hungering for employment; and in the course of the following year he was equipping himself for a second embassy to Persia.

Lord Minto had by this time succeeded to the Governor-Generalship; and the Gallo-phobia had been revived with increased force, not wholly without reason. The peace of Tilsit, as explained in a former memoir, threw the Emperors Napoleon and Alexander into each other's arms, and the invasion of India, for a time at least, was seriously contemplated by the two powers. But Malcolm started from Bombay to find that Sir Harford Jones had already started from England on the same mission; and it must be admitted that the contest, which then arose, was not a very seemly one. The danger, however, which the two envoys were sent to combat, soon passed away; and in due course, Malcolm, who had certainly done much more than his competitor to maintain the dignity of the British character in Iran, returned—if with nothing else—with an increased supply of materials for his history of Persia, and was eager to return to his beloved wife and his literary labours at Mysore.

It was in an interval, resulting from these complications, that Sir John Malcolm was called upon to address himself to a service of a very different kind. The European officers of the Madras army were in a state of revolt. The crisis was a very alarming one; and, perhaps, we do not even now know how nearly the state was wrecked. At Musulapatam, especially, there was a perilous state of things, for the Madras European regiment was garrisoned there, and it was believed that the men would follow their officers and hoist the flag of sedition. Sir George Barlow was then Governor of Madras. The presence of Malcolm was most opportune. If any man could restore discipline to the troops at Musulapatam, he could do it. He was asked, and he consented, to go. He took ship at the beginning of July, 1809, and was soon landed at Musulapatam. He found that the exasperation of the officers was even greater than he had expected. But he resolved to confront it with that frank, cheery, popular manner, so peculiar to himself, by which he had so often worked his way to success. He met the officers, talked the matter over freely and candidly with them, admitting as much as he safely could (for in part he sympathised with them), and afterwards joined them at Mess. After dinner, a young officer, flushed with wine, proposed as a toast, "Our Common Cause." With characteristic readiness of address, Malcolm rose and said, "Ay—the common cause of our country." The amendment was received and drunk with enthusiasm, and soon afterwards his own health was toasted with universal applause. This seemed to be the turning-point. On the following day, the leading officers of the garrison discussed the whole subject calmly with him; and, though it was not easy to allay their irritation, he held them in check; and endeavoured by mild persuasions, not wanting in dignity and resolution, to lure them back to their allegiance to the State. Sir George Barlow thought that he was too conciliatory—that such rebellion as theirs should not have been so treated. He sent a general officer, named Pater, to take command at Musulapatam, and Malcolm returned to Madras. A controversy then arose, which was maintained in vital force for some years. Some thought Malcolm was right, some thought that he was wrong in principle; but practically, at least, he gained time; and I am inclined to think that, if he had adopted any other course, the Musulapatam officers, followed by their men, would have formed a junction with the mutineers at Hyderabad, Jaulnah, &c., and that the danger would have risen to a point which, under the more conciliatory system, it was never suffered to attain.

There was now at last a brief season of repose for him. He took up his residence at Bombay early in the year 1811, and addressed himself assiduously to the completion of the financial accounts of his mission to Persia and the composition of his long-contemplated history. There he met, for the second time, Sir James Mackintosh, with whom he entered into the bonds of a life-long friendship, and was soon joined by his old comrade, Mountstuart Elphinstone, who, after returning from his mission to Afghanistan, had been appointed Resident at Poonah. In the following year, Malcolm, with his wife and children, took ship for England, uncertain about the future. There were times when he thought of retiring from the service, of farming and horse-breeding—but he was then in the full vigour of his manhood; and to abandon such a career at the age of forty-three required such strong inducements and substantial reasons as even the love of country and the charms of a happy home could not supply. But no man enjoyed life in his native country more than he did. There was but one drawback to the happiness of his return—one that has turned the joy of too many an Indian exile into sorrow—death had broken into the family circle. Both his parents were dead. He had started from Bombay full of the delightful hope of soon seeing his wife and children in his mother's arms; but news of her death met him at St. Helena, and the blow fell heavily upon him.

In the course of July (1812), he landed in England, and soon, having taken a house near Cheshunt, in Hertfordshire, he located his family there, and proceeded to Scotland to revisit the scenes of his youth. There, in his own native Dumfries-shire, he "went to visit all, high and low, that had known him as a child." "Visited the graves of my parents," he added, in the journal which he kept at the time, "and heard the noblest praise of them from the aged, the infirm, and the poor that they had aided and supported; and to whom the aid and support of the family are still given." At Burnfoot he was received with rapturous delight by all—scarcely less by the old servants and dependents of the family than by his own nearest kindred. On John Malcolm observing to one old servant that there had been many changes, but that he hoped that it was still, as before, a good house to live in, the man replied, "Faith, it's mair than that—it's the best house to die in of a' Scotland."

Having accomplished this visit to the North, Malcolm returned to London, and before the end of the year he was knighted by the Prince Regent. Soon afterwards, he was examined before a Committee of the House of Commons. This interested and employed him; and he was working assiduously at his history of Persia; but the stirring events of the great war in the Peninsula, and the success of his old friend Arthur Wellesley, now Duke of Wellington, raised within him a desire for active employment, and he asked the Duke if he could not obtain service for him. Wellington told him in 1813 to go into Parliament, and all the rest would follow in due course.

In the ensuing year (1814), Malcolm was created a Knight Commander of the Bath; and it is to be observed, that, two months before, the same high distinction had been conferred on his brothers James and Pulteny. In the same year Sir John Malcolm also won his spurs as an historian. His "History of Persia" was published, by Murray, in two magnificent quarto volumes, and was most favourably received by the literary world, both of England and of France. From many of the most distinguished writers of the day, including Byron and Scott, he received warm tributes of admiration, and had every reason to be satisfied with the success of his work. But in the life of Sir John Malcolm literature was only a digression. It is probable, that if he had been less a man of action, he would have been more highly esteemed as a man of letters. Whilst thinking of what he did, we are apt sometimes to forget our obligations to him for what he wrote.

The following year was the great Waterloo year; and, after the battle, Malcolm, like a host of other eager excited Englishmen, went to Paris to see the fun. He went under the happiest auspices, for the great conqueror was one of his dearest friends, welcomed his old Deccanee comrade in the heartiest manner, and gave him his own version of the battle. "People ask me for an account of the action," said the Duke, "I tell them it was hard pounding on both sides, and we pounded the hardest. There was no manœuvring." Nothing could have exceeded the friendly attention of Wellington to him during the whole period of his stay in the French capital. He met also a most flattering reception from some of the most eminent French savans—especially those interested in Oriental literature—and, sensible of his own deficiency in this respect, put himself to school to learn the French language.

Highly delighted with his continental visit, Malcolm returned to England in the autumn of 1815, and soon began to debate within himself the great question of a return or no-return to India. As he could not take his wife and young family with him to that country, there were strong appeals on behalf of the latter course continually tugging at his heartstrings; but it would, doubtless, be for their good that he should return to India, for, notwithstanding his great opportunities, he had amassed but a small fortune; so, after a while, he determined to continue his Indian career, and he took his passage in a ship which was to sail in October. Some months before his departure (June, 1816), Oxford conferred upon him the honorary degree of Doctor of Laws.

On the 17th of March, 1817, Sir John Malcolm landed at Madras; but he had not been many weeks on the coast before he received a letter from the

Governor-General, Lord Moira (better known as Lord Hastings), in which he said, "Let me assure you that I fully appreciate your talents and energy, and I shall rejoice if I find a fit field for their employment. I hear that for five months to come we must be restricted to Cabinet activity; perhaps in that interval you may be tempted to pay a visit to Bengal, when the opportunity of giving you such an insight into matters as cannot be afforded you by letter, may lead to your striking out a mode in which you may exert yourself with satisfaction." Upon this hint, Malcolm at once took ship for Calcutta. There he was received with the most flattering courtesy and kindliness by the Governor-General, and was at once taken into his confidence. It was a political conjuncture of the most serious character; for a state of things had arisen in Central India which could not be suffered to last. Lord Moira had determined to disperse the Pindarree hordes which were ravaging the country, and there was too much reason to believe that this movement would involve him in a war with the substantive Mahratta States. There was not a man in India who knew more about those States than Sir John Malcolm, nor one whom the Governor-General was more eager to employ. After a pleasant sojourn of a few weeks, he returned to Madras, with a mixed military and political commission from the Governor-General. "My situation is most flattering," he wrote from that Presidency. "As Governor-General's agent, all political work connected with our operations is in my hands; as Brigadier-General, I am destined for the most advanced force; and, what is really delightful, from the Governor-General down to the lowest black or white, red or brown, clothed or naked, all appear happy at my advancement."

In the autumn of this year, Malcolm, in pursuance of the objects of his appointment, visited the great political Residencies of Southern India, passing from Mysore to Hyderabad, and from Hyderabad to Poonah; sometimes riding long distances on horseback, and at others being carried in a palanquin. At Poonah he again took sweet counsel with Mountstuart Elphinstone, and afterwards visited the Peishwah, Badjee Rao, who received him with the most signal courtesy and respect. Malcolm tendered him the best possible advice, and he promised to take it; but he was utterly wanting in steadfastness of character, and when the hour of trial came he bitterly disappointed his English friend, who had hoped better things from him. From Poonah, Malcolm returned to Hyderabad to complete the necessary arrangements for the advance of the Army of the Deccan. From Hyderabad he hastened to Nagpoor, where he met another old friend and associate, Richard Jenkins; and having taken counsel with him, relative to the affairs of that state, he was eager to press on to join the army on the Nerbudda, and to merge his political into his military character. On the 29th of October he took command of his division at Hurda. "I do not contemplate," he wrote at this time, "that the Pindarrees will resist us. Scindeah has long submitted, and ruin must attend any tangible power that opposes us; but still, we shall have much work, and I am to have (for which I thank God) more than a common share. I am delighted with the work I have, the object of which is, beyond all wars, to give peace and prosperity to a miserable people and a wasted country." On the 10th of November, Sir Thomas Hislop, who had chief command of the army advancing from that side of the country, joined the force; and on the 15th Malcolm crossed the Nerbudda in pursuit of the Pindarrees. At the beginning of December he was hunting down the celebrated freebooter, Cheetoo. Cheetoo, however, escaped into the jungle, to be afterwards eaten by a tiger, and Malcolm had soon nobler game in view. It was now his good fortune to meet Holkar's army in the field at Mehidpore, and to fight one of the most famous battles in the Indian annals of those times. It was fought on the 21st of December, 1817. The story of this action has often been told before. It is enough to say here that all Malcolm's enthusiasm was roused to the highest pitch, and that if he made any mistake, it was in going forward too impetuously to the front. He never thought of himself, but exposed himself rashly to the enemy's fire, and was as cool and collected as if he had been on a morning parade. The battle was won. The victory was complete. But nothing pleased him more when he sent in the official report of the engagement, and afterwards forwarded copies to his wife and sisters in England, that there were the names of some Eskdale men in it who had covered themselves with glory.

Sir John Malcolm was one of those soldier-statesmen of the first class, whose vocation it was to pass rapidly from the command of an army to the negotiation of a treaty, and to be equally at home in the camp and in council. Badjee Rao, the Peishwah, had by this time thrown off the mask; he had forfeited his kingdom by his treachery and hostility to the British Government, and nothing remained but to bring him to such terms as might at once be merciful to him, and advantageous to the British Government. This business, one of great difficulty and delicacy, devolved upon Sir John Malcolm. Perhaps no other man could have brought the Peishwah to terms at all. By skilful negotiation, aided much by his own personal influence, he brought the Mahratta Prince at last to consent to an arrangement by which he was to become for ever a pensioner of the British Government. The terms, by the offer of which Malcolm brought the Peishwah to surrender himself and all his pretensions, were said by many at the time to have been over-liberal. It was stipulated that eight lakhs of rupees (or 80,000*l.*) should be paid to Badjee Rao for the remainder of his life. It may be doubted whether a less sum would have brought him into our camp, and the surrender of the Peishwah was necessary to the termination of the war. On the whole, viewed with reference to ulterior financial considerations, I am inclined to think that the arrangement was an economical one.

This engagement was made in June, 1818. There were afterwards some further operations, as the reduction of the fortress of Asseerghur, in which Malcolm was concerned; but the war was virtually at an end. And now came something more difficult than the conquest of Mahratta armies, the reduction to order and prosperity of a country long given up to anarchy and confusion. To no man could this be entrusted more confidently than to Malcolm. The work which now devolved upon him—the settlement of Central India—not, like some of more recent date, a settlement where everything is unsettled—showed the good stuff of which he was made, as a civil ruler and administrator. His success was great; and the secret of that success was the personal accessibility of the man. He had a word for every one, high and low. He did his own work by the force of his own individual character, and every one was satisfied with his reception, even though his claims were disallowed. "I wish I had you here for a week," he wrote to one of his oldest friends, "to show you my nabobs, rajahs, Bheel chiefs, potails, and ryots. My room is a thoroughfare from morning to night. No moonshees, dewans, dubashes, or even chobdars,* but '*char derwazah kolah*' (four doors open), that the inhabitants of these countries may learn what our principles are at the fountain-head. Suffice it, that from the highest ruler to the lowest robber, from the palace in the city to the shed in the deepest recess of the mountain forest, your friend *Malcolm-Sahib* is a welcome and a familiar guest, and is as much pleased, thank God, with firing arrows and eating roots with the latter, as at the fine durbars and sumptuous feasts of the former." About the same time I find an officer on Sir John Malcolm's staff writing confidentially to a friend, "Nobody that I ever saw or heard of can get over the same quantity of business in the same quantity of time that he does, and his reputation stands so very high with the natives, that his being personally concerned in any arrangements goes further in satisfying them than I believe would the interference of any other man upon earth. When we crossed the Nerbuddah in 1817, the state of Malwah was scarcely to be described. It was a country without government, a state without revenue, an army without pay; consequently, a peasantry without protection from the villanies of the troops of their own sovereign, or the depredators who chose to plunder them; and of these last the country was full. We now see around us the effects of our late operations. . . . . A state, though at present reduced in respect of revenue, yet respectable; that revenue increasing, and perhaps the finest country in India again wearing the face of cheerful industry; the inhabitants, assured of protection, returning to their villages, and looking forward with confidence to better times. . . . This is Sir John's work, and a most glorious work it has been. His is a noble character, and such as his are required to keep us now on the high ground on which, thank God, we stand in India. . . . . I believe, though it is possible that he may be equalled in some points, that in public virtue, and useful talent, he cannot be excelled by any public servant of any government at this time existing; and that for whatever time his fame may last in Europe, Malcolm Sahib will be remembered in Malwah as long as regular government exists, of which he has again laid the foundation." And high as was this praise, it was perfectly true; and the prediction was amply fulfilled. The names of Malcolm and Malwah have never since been disunited.

And all through the year 1819, Malcolm worked on bravely, and energetically, and with his whole heart, loving his work, and yet not without certain promptings of ambition, which made him look to the something beyond which is such a stimulus to all exertion in India—whether the thing coveted be a brigade-majorship, a deputy magistracy, or the government of a Presidency. Having been disappointed in his desires to obtain the government of Bombay, he thought that he had just claim to the government of Madras, which was about to be vacated, and that it would be recognised by the authorities in England. But when the post fell vacant, he was doomed to disappointment; for his old friend, Sir Thomas Munro, was nominated governor of Madras. Malcolm attributed his failures in no small measure to the opposition of Charles Grant, "an able leading director," as he said. But I believe that this was a mistake. The fact is, that there were three old servants of the Company, very nearly of the same standing, with very nearly equal capacity for government and administration. There were essential points of difference between them, and no one in all respects surpassed the other; so that it is hard to say to whom the palm of general superiority should be assigned by the biographer or the historian. Any accident, therefore, might have determined the preference to be given by the home authorities to one candidate or the other. And perhaps they were influenced in some degree by the feeling that Sir John Malcolm could not well be spared from Central India, and that there was a probability of a separate Lieutenant-Governorship being established in that part of the country, with Malcolm at its head.

This arrangement, however, which he had always warmly advocated, never took practical shape; and so, as the year 1821 advanced, Sir John Malcolm determined to rejoin his family in England, with no intention of returning to Indian work. "My Indian marches," he wrote to his wife on the 1st of September, from Bombay, "are, I trust, over for ever. I arrived here a few hours ago, after a very quick journey from Poonah. I am uncommonly well—better than I have been for many months. Elphinstone has given up Malabar Point to me,—a most delightful residence, almost in the sea." His reception at Bombay was of a most enthusiastic character. A grand entertainment was given to him by the inhabitants of the Presidency; and he took his leave of India, not however for the last time, amidst universal demonstrations of respect.

---

* Native officials of different grades.

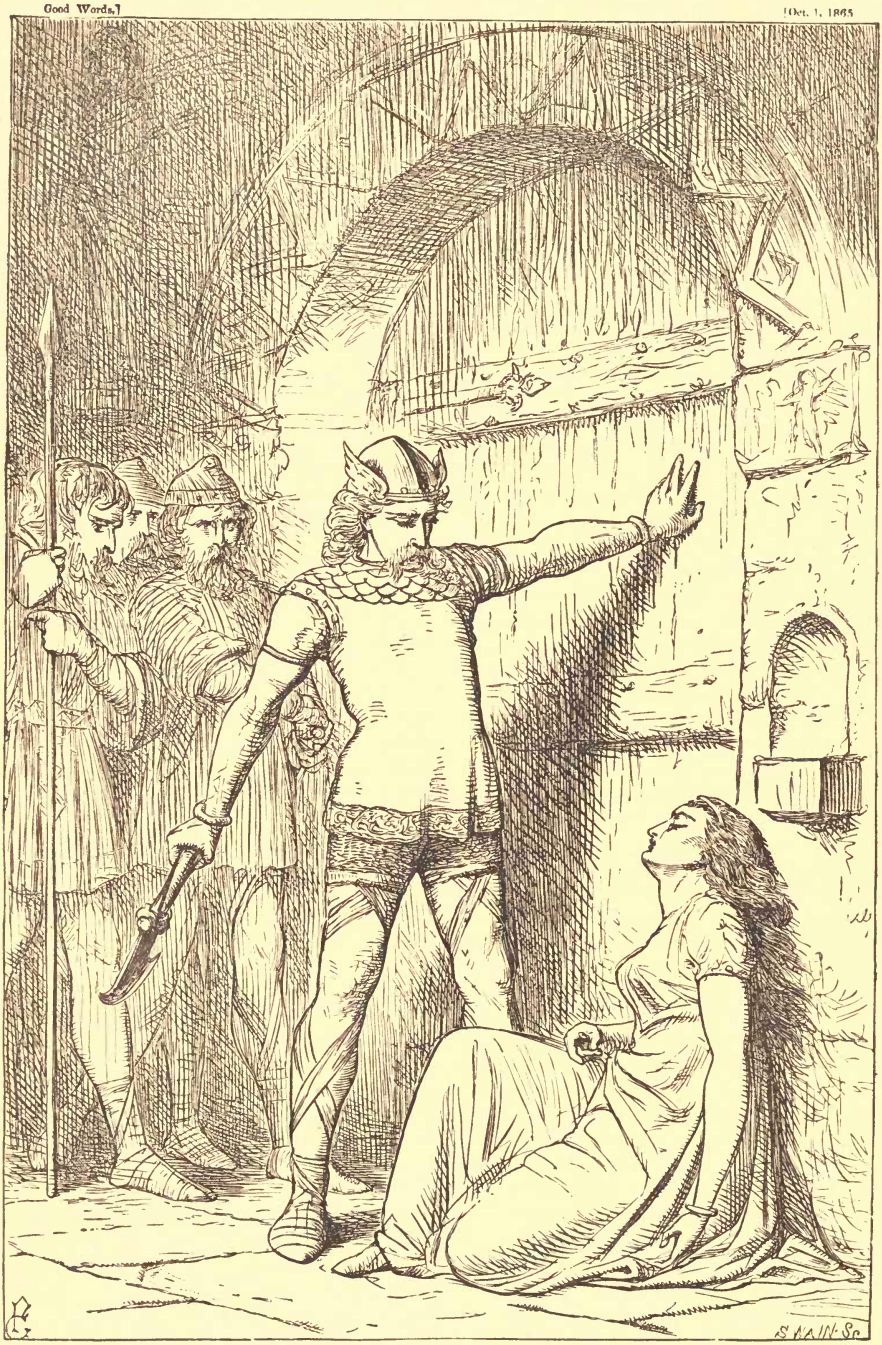
He went to England by the then unfamiliar route of Egypt, where he was received with all courtesy and hospitality by Mehemet Ali; and reached London at the end of April, 1822. It was no small delight to him to rejoin his wife and children. They had a house in London, and a cottage in Kent; but the latter was too small for the family, so he looked about for another country residence, and found one upon the borders of Hertfordshire, twenty-five miles from town, on the road to Cambridge, not far from the town of Sawbridgeworth. It was known by the name of Hyde Hall; and there, after a time, Malcolm pitched his tent—and a very hospitable tent it was, almost as much open, on all its four sides, as the old one in Central India. There he entertained many visitors from Cambridge, who long cherished the recollection of those days as among the happiest of their lives. Among these, I may cite the honoured names of Whewell, Sedgwick, and Hare.

In the midst of these home-pleasures, Sir John Malcolm was roused by an invitation to proceed again to India. The Government of Bombay was about to become vacant by the retirement of Mr. Elphinstone; and both the King's Government and the Court of Directors were of opinion that it would conduce greatly to the public interests to appoint Sir John Malcolm to the post. The offer was made and accepted. A grand farewell banquet was given to him at the Albion by the East India Company; and both Mr. Canning and the Duke of Wellington made impressive speeches in honour of the guest of the evening. The speech of the latter is especially worthy of being remembered, because the greatest man of the age then said, "A nomination such as this operates throughout the whole Indian service. The youngest cadet sees in it an example he may imitate—a success he may attain. The good which the country derives from the excitement of such feelings is incalculable." Nothing more true; nothing more deserving of abiding remembrance!

On the 1st of November, 1827, Sir John Malcolm, having arrived at Bombay a few days before, took the oaths of office, and entered upon the government of that Presidency. It was by no means an eventful period of our history; and there were no great opportunities, therefore, for Malcolm to display his capacity for government. It is generally said that his administration of Bombay was distinguished more by his collision with the Supreme Court than by anything else. This, however, is not strictly true. In a noiseless, unpretending manner, Malcolm did much good, and recorded, out of the fullness of his knowledge and experience, many important minutes distinguished by a strong sense of justice and a warm sympathy with the feelings of the people of the country. On the 5th of December, 1830, he turned his back upon India for ever. There was doubtless great happiness in the retrospect. The boy of thirteen, who had gone to India from the Eskdale Farm, had left it as the honoured Governor of a great province. Only one, who had started from the same small beginning, had done as much. Not one had ever done more.

When Sir John Malcolm arrived in England he was in his sixty-second year. The Duke of Wellington had told him years before to "go into Parliament." Whether the Duke would have given the same advice then is doubtful. But Malcolm did go into Parliament, supported by the interest of the Duke of Northumberland, and sat for Launceston, as a red-hot Tory. Had he entered Parliament a year or two later, when the continuance of the East India Company's Charter was one of the leading questions of the day, he would doubtless have been listened to with the profoundest respect; but speaking on the Reform question, and on the unpopular side, an old Indian General was not likely to make for himself a very attentive audience. The Reform Bill was passed. Launceston was disfranchised. There was a general election. Sir John Malcolm was requested to stand for Dumfries-shire; but a little inquiry soon assured him the case was hopeless; so he issued a frank, manly address, and withdrew from the contest.

The Company's Charter question was now coming on for discussion, and Malcolm, though excluded from the House of Commons, felt that he could at least do something by making his views known to the public through the medium of the Court of Proprietors of India Stock. He owed little or nothing to the Company—except the cadetship, which he had turned to such good account. It was his opinion that, as the pupil and friend of Lord Wellesley, who had denounced them as the "ignominious tyrants of Leadenhall Street," they had set their faces against him. This was a mistake; but he was not beholden to them for any special favours, and he could not be accused of any unjust leanings towards them. But he knew how necessary to the welfare of our Indian Empire was the existence of such an intermediate body as the Court of Directors of the East India Company, and he moved, in a long and able speech at the India House, the resolutions in favour of the continuance of the then-existing system. It was the last public act of his long and eventful life. Before the adjourned debate was brought to an end, Sir John Malcolm was struck down by paralysis, in his carriage; was carried home to his house in Manchester Street; and never again gave articulate utterance to his thoughts. On the 30th of May, 1833, he passed away from the world; and, perhaps, never has gone away from amongst us a man who had acted, so actively, so large a part in the great drama of Indian history, or who had done everything so worthily and so well.



"SHALL WE BURST OPEN THE DOOR AND KILL THEM ALL?"

Page 709.

HEREWARD, THE LAST OF THE ENGLISH.

By CHARLES KINGSLEY.

CHAPTER XXXIII.

HOW THE MONKS OF ELY DID AFTER THEIR KIND.

WILLIAM's bolt, or rather inextinguishable Greek fire, could not have fallen into Ely at a more propitious moment.

Hereward was away, with a large body of men, and many ships, foraging in the north-eastern fens. He might not be back for a week.

Abbot Thurstan—for what cause is not said—had lost heart a little while before, and fled to "Angerhale, taking with him the ornaments and treasure of the church."

Hereward had discovered his flight with deadly fear: but provisions he must have, and forth he must go, leaving Ely in charge of half-a-dozen independent English gentlemen, each of whom would needs have his own way, just because it was his own.

Only Torfrida he took, and put her hand into the hand of Ranald Sigtrygsson, and said, "Thou true comrade and perfect knight, as I did by thy wife, do thou by mine, if aught befal."

And Ranald swore first by the white Christ, and then by the head of Sleipnir, Odin's horse, that he would stand by Torfrida till the last; and then, if need was, slay her.

"You will not need, King Ranald. I can slay myself," said she, as she took the Ost-Dane's hard honest hand.

And Hereward went, seemingly by Mepal or Sutton. Then came the message; and all men in Ely knew it.

Torfrida stormed down to the monks, in honest indignation, to demand that they should send to William, and purge her of the calumny. She found the Chapter-door barred and bolted. They were all gabbling inside, like starlings on a foggy morning, and would not let her in. She hurried back to Ranald, fearing treason, and foreseeing the effect of the message upon the monks.

But what could Ranald do? To find out their counsels was impossible for him, or any man in Ely. For the monks could talk Latin, and the men could not. Torfrida alone knew the sacred tongue.

If Torfrida could but listen at the keyhole. Well—all was fair in war. And to the Chapter-house door she went, guarded by Ranald and some of his housecarles, and listened, with a beating heart. She heard words now incomprehensible. That men who most of them lived no better than their own serfs; who could have no amount of wealth, not even the hope of leaving that wealth to their children—should cling to wealth—struggle, forge, lie, do anything for wealth, to be used almost entirely not for themselves, but for the honour and glory of the convent—indicates an intensity of corporate feeling, unknown in the outer world then, or now.

The monastery would be ruined! Without this manor, without that wood, without that stone quarry, that fishery—what would become of them?

But mingled with those words were other words, unfortunately more intelligible to this day—those of superstition.

What would St. Ethelreda say? How dare they provoke her wrath? Would she submit to lose her lands? She might do—what might she not do? Her bones would refuse ever to work a miracle again. They had been but too slack in miracle-working for many years. She might strike the isle with barrenness, the minster with lightning. She might send a flood up the fens. She might——

William the Norman, to do them justice, those valiant monks feared not; for he was man, and could but kill the body. But St. Ethelreda, a virgin goddess, with all the host of heaven to back her—might she not, by intercession with powers still higher than her own, destroy both body and soul in hell?

"We are betrayed. They are going to send for the Abbot from Angerhale," said Torfrida at last, reeling from the door. "All is lost."

"Shall we burst open the door and kill them all?" asked Ranald, simply.

"No, King—no. They are God's men; and we have blood enough on our souls."

"We can keep the gates, lest any go out to the King."

"Impossible. They know the isle better than we, and have a thousand arts."

So all they could do, was to wait in fear and trembling for Hereward's return, and send Martin Lightfoot off to warn him, wherever he might be.

The monks remained perfectly quiet. The organ droned, the chants wailed, as usual; nothing interrupted the stated order of the services; and in the hall, each day, they met the knights as cheerfully as ever. Greed and superstition had made cowards of them—and now traitors.

It was whispered that Abbot Thurstan had returned to the minster: but no man saw him: and so three or four days went on.

Martin found Hereward after incredible labours, and told him all, clearly and shrewdly. The man's manifest insanity only seemed to quicken his wit, and increase his powers of bodily endurance.

Hereward was already on his way home; and never did he and his good men row harder than they rowed that day back to Sutton. He landed, and hurried on with half his men, leaving the rest to disembark the booty. He was anxious as to the temper of the monks. He foresaw all that Torfrida had foreseen. And as for Torfrida herself, he was half mad. Ivo Taillebois' addition to William's message had had its due effect. He vowed even deadlier hate against the Norman than he had ever felt before. He ascended the heights to Sutton. It was his shortest way to Ely. He could not see Aldreth from thence: but he could see Willingham field, and Belsar's hills, round the corner of Haddenham Hill.

The sun was setting long before they reached Ely: but just as he sank into the western fen, Winter stopped, pointing. "Was that the flash of arms? There, far away, just below Willingham town. Or was it the setting sun upon the ripple of some long water?"

"There is not wind enough for such a ripple," said one. But ere they could satisfy themselves, the sun was down, and all the fen was gray.

Hereward was still more uneasy. If that had been the flash of arms, it must have come off a very large body of men, moving in column, and on the old straight road between Cambridge and Ely. He hastened on his men. But ere they were within sight of the minster-tower, they were aware of a horse galloping violently towards them through the dusk. Hereward called a halt. He heard his own heart beat as he stopped. The horse was pulled up short among them, and a lad threw himself off.

"Hereward? Thank God, I am in time!"

The voice was the voice of Torfrida.

"Treason!" she gasped.

"I knew it."

"The French are in the island. They have got Aldreth. The whole army is marching from Cambridge. The whole fleet is coming up from Southrey. And you have time——"

"To burn Ely over the monks' heads. Men! Get bogwood out of yon cottage, make yourselves torches, and onward!"

Then rose a babel of questions, which Torfrida answered as she could. But she had nothing to tell. "Clerks' cunning," she said bitterly, "was an overmatch for woman's wit." She had sent out a spy: but he had not returned till an hour since. Then he came back breathless, with the news that the French army was on the march from Cambridge, and that, as he came over the water at Alrech, he found a party of French knights in the fort on the Ely side, talking peaceably with the monks on guard.

She had run up to the borough hill—which men call Cherry Hill at this day—and one look to the north-east had shown her the river swarming with ships. She had rushed home, put on men's clothes, hid a few jewels in her bosom, saddled Swallow, and ridden for her life thither.

"And King Ranald?"

He and his men had gone desperately out towards Haddenham, with what English they could muster: but all were in confusion. Some were getting the women and children into boats, to hide them in the reeds. Others battering the minster gates, vowing vengeance on the monks.

"Then Ranald will be cut off! Alas for the day that ever brought his brave heart hither!"

And when the men heard that, a yell of fury and despair burst from all throats.

Should they go back to their boats?

"No! onward," cried Hereward. "Revenge first, and safety after. Let us leave nothing for the accursed Frenchmen but smoking ruins, and then gather our comrades, and cut our way back to the north."

"Good counsel," cried Winter. "We know the roads, and they do not; and in such a dark night as is coming, we can march out of the island without their being able to follow us a mile."

They hurried on: but stopped once more, at the galloping of another horse.

"Who comes, friend or foe?"

"Alwyn, son of Orgar!" cried a voice under breath. "Don't make such a noise, men! The French are within half a mile of you."

"Then one traitor monk shall die ere I retreat," cried Hereward, seizing him by the throat.

"For heaven's sake, hold!" cried Torfrida, seizing his arm. "You know not what he may have to say."

"I am no traitor, Hereward; I have fought by your side as well as the best; and if any but you had called Alwyn——"

"A curse on your boasting. Tell us the truth."

"The Abbot has made peace with the King. He would give up the island, and St. Ethelreda should keep all her lands and honours. I said what I could: but who was I to resist the whole chapter? Could I alone brave St. Ethelreda's wrath?"

"Alwyn, the valiant, afraid of a dead girl!"

"Blaspheme not, Hereward! She may hear you at this moment! Look there!" and pointing up, the monk cowered in terror, as a meteor flashed through the sky.

"That is St. Ethelreda shooting at us, eh? Then all I can say is, she is a very bad marksman. And the French are in the island?"

"They are."

"Then forward, men, for one half hour's pleasure; and then to die like Englishmen."

"On?" cried Alwyn. "You cannot go on. The King is at Whichford at this moment with all his army, half a mile off! Right across the road to Ely!"

Hereward grew Berserk. "On! men!" shouted he, "we shall kill a few Frenchmen apiece before we die!"

"Hereward," cried Torfrida, "you shall not go on! If you go, I shall be taken. And if I am taken, I shall be burned. And I cannot burn—I cannot! I shall go mad with terror before I come to the stake. I cannot go stript to my smock before those Frenchmen. I cannot be roasted piecemeal! Hereward, take me away! Take me away! or kill me, now and here!"

He paused. He had never seen Torfrida thus overcome.

"Let us flee! The stars are against us. God is against us! Let us hide—escape abroad: beg our bread, go on pilgrimage to Jerusalem together—for together it must be always: but take me away!"

"We will go back to the boats, men," said Hereward.

But they did not go. They stood there, irresolute, looking towards Ely.

The sky was pitchy dark. The minster roofs, lying north-east, were utterly invisible against the blackness.

"We may at least save some who escape out," said Hereward. "March on quickly to the left, under the hill to the plough-field."

They did so.

"Lie down, men. There are the French, close on our right. Down among the bushes."

And they heard the heavy tramp of men within a quarter of a mile.

"Cover the mare's eyes, and hold her mouth, lest she neigh," said Winter.

Hereward and Torfrida lay side by side upon the heath. She was shivering with cold and horror. He laid his cloak over her; put his arm round her.

"Your stars did not foretell you this, Torfrida." He spoke not bitterly, but in utter sadness.

She burst into an agony of weeping.

"My stars at least foretold me nothing but woe, since first I saw your face."

"Why did you marry me, then?" asked he, half angrily.

"Because I loved you. Because I love you still."

"Then you do not regret?"

"Never, never, never! I am quite happy—quite happy. Why not?"

A low murmur from the men made them look up. They were near enough to the town to hear—only too much. They heard the tramp of men, shouts and yells. Then the shrill cries of women. All dull and muffled the sounds came to them through the still night; and they lay there spell-bound, as in a nightmare, as men assisting at some horrible tragedy, which they had no power to prevent. Then there was a glare, and a wisp of smoke against the black sky, and then a house began burning brightly, and then another.

"This is the Frenchman's faith!"

And all the while, as the sack raged in the town below, the minster stood above, dark, silent, and safe. The church had provided for herself, by sacrificing the children beneath her fostering shadow.

They waited nearly an hour: but no fugitives came out.

"Come, men," said Hereward, wearily, "we may as well to the boats."

And so they went, walking on like men in a dream, as yet too stunned to realise to themselves the hopeless horror of their situation. Only Hereward and Torfrida saw it all, looking back on the splendid past—the splendid hopes for the future: glory, honour, an earldom, a free Danish England—and this was all that was left!

"No, it is not!" cried Torfrida suddenly, as if answering her own unspoken thoughts, and his. "Love is still left. The gallows and the stake cannot take that away." And she clung closer to her husband's side, and he again to hers.

They reached the shore, and told their tale to their comrades. Whither now?

"To Well. To the wide mere," said Hereward.

"But their ships will hunt us out there."

"We shall need no hunting. We must pick up the men at Cissham. You would not leave them to be murdered, too, as we have left the Ely men?"

No. They would go to Well. And then?

"The Bruneswald, and the merry greenwood," said Hereward.

"Hey for the merry greenwood!" shouted Leofric the Deacon. And the men, in the sudden delight of finding any place, any purpose, answered with a lusty cheer.

"Brave hearts," said Hereward. "We will live and die together like Englishmen."

"We will, we will, Viking."

"Where shall we stow the mare?" asked Geri, "the boats are full already."

"Leave her to me. On board, Torfrida."

He got on board last, leading the mare by the bridle.

"Swim, good lass!" said he, as they pushed off; and the good lass, who had done it many a time before, waded in, and was soon swimming behind. Hereward turned, and bent over the side in the darkness. There was a strange gurgle, a splash, and a swirl. He turned round, and sat upright again. They rowed on.

"That mare will never swim all the way to Well," said one.

"She will not need it," said Hereward.

"Why," cried Torfrida, feeling in the darkness, "she is loose. What is this in your hand? Your dagger? And wet?"

"Mare Swallow is at the bottom of the reach. We could never have got her to Well."

"And you have——" cried a dozen voices.

"Do you think that I would let a cursed Frenchman—ay, even William's self—say that he had bestridden Hereward's mare?"

None answered: but Torfrida, as she laid her head upon her husband's bosom, felt the great tears running down from his cheek on to her own.

None spoke a word. The men were awe-stricken. There was something despairing and ill-omened in the deed. And yet there was a savage grandeur in it, which bound their savage hearts still closer to their chief.

And so mare Swallow's bones lie somewhere in the peat unto this day.

They got to Well; they sent out spies to find the men who had been "wasting Cissham with fire and sword:" and at last brought them in. Ill news, as usual, had travelled fast. They had heard of the fall of Ely, and hidden themselves "in a certain very small island which is called Stimtench," where, thinking that the friends in search of them were Frenchmen in pursuit, they hid themselves among the high reeds. There two of them—one Starkwolf by name, the other Broher—hiding near each other, "thought that, as they were monks, it might conduce to their safety if they had shaven crowns; and set to work with their swords to shave each other's heads as well as they could. But at last, by their war-cries and their speech, recognising each other, they left off fighting," and went after Hereward.

So jokes, grimly enough, Leofric the Deacon, who must have seen them come in the next morning, with bleeding coxcombs, and could laugh over the thing in after years. But he was in no humour for jesting in the days in which they lay at Well. Nor was he in jesting humour when, a week afterwards, hunted by the Normans from Well, and forced to take to meres and waterways known only to them, and too shallow and narrow for the Norman ships, they found their way across into the old Nen, and so by Thorney on toward Crowland, leaving Peterborough far on the left. For as they neared Crowland, they saw before them, rowing slowly, a barge full of men. And as they neared that barge, behold, all they who rowed were blind of both their eyes; and all they who sat and guided them, were maimed of both their hands. And as they came alongside, there was not a man in all that ghastly crew but was an ancient friend, by whose side they had fought full many a day, and with whom they had drunk deep full many a night. They were the first fruits of William's vengeance; thrust into that boat, to tell the rest of the fen-men what those had to expect who dared oppose the Norman. And they were going, by some by-stream, to Crowland, to the sanctuary of the Danish fen-men, that they might cast themselves down before St. Guthlac, and ask of him that mercy for their souls which the conqueror had denied to their bodies. Alas for them! they were but a handful among hundreds, perhaps thousands, of mutilated cripples, who swarmed all over England, and especially in the north and east, throughout the reign of the Norman conqueror. They told their comrades' fate, slaughtered in the first attack, or hanged afterwards as rebels and traitors to a foreigner whom they had never seen, and to whom they owed no fealty by law of God or man.

"And Ranald Sigtryggsson?"

None knew aught of him. He never got home again to his Irish princess.

"And the poor women?" asked Torfrida.

But she received no answer.

And the men swore a great oath, and kept it, never to give quarter to a Norman, as long as there was one left on English ground.

Neither were the monks of Ely in jesting humour, when they came to count up the price of their own baseness. They had (as was in that day the cant of all cowardly English churchmen, as well as of the more crafty Normans) "obeyed the apostolic injunction, to submit to the powers that be, because they are ordained," &c. But they found the hand of the powers that be a very heavy one. Forty knights were billeted on them at free quarters with all their men. Every morning the butler had to distribute to them food and pay in the great hall; and in vain were their complaints of bad faith. William meanwhile, who loved money as well as he "loved the tall deer," had had 1000 (another says 700) marks of them as the price of their church's safety, for the payment whereof, if one authority is to be trusted, they sold "all the furniture of gold and silver, crosses, altars, coffers, covers, chalices, platters, ewers, urnets, basons, cups, and saucers." Nay, the idols themselves were not spared, "for," beside that, "they sold a goodly image of our lady with her little son, in a throne wrought with marvellous workmanship, which Elsegus the abbot had made. Likewise, they stripped many images of holy virgins of much furniture of gold and silver."* So that poor St. Ethelreda had no finery in which to appear on festivals, and went in russet for many years after. The which money (according to another†) they took, as they had promised, to Picot the Viscount at Cambridge. He weighed the money; and finding it an ounce short, accused them of cheating the King, and sentenced them to pay 300 marks more. After which the royal commissioners came, plundered the abbey of all that was left, and took away likewise "a great mass of gold and silver found in Wentworth, wherewith the brethren meant to repair the altar vessels;" and also a "notable cope which Archbishop Stigand gave, which the church hath wanted to this day."

Thurstan, the traitor Abbot, died in a few months. Egelwin, the Bishop of Durham, was taken in the abbey. He was a bishop, and they dared not kill him. But he was a patriot, and must have no mercy. They accused him of stealing the treasures of Durham, which he had brought to Ely for the service of his country; and shut him up in Abingdon. A few months after, the brave man was found starved and dead, "whether of his own will or enforced;" and so ended another patriot prelate. But we do not read that the Normans gave back the treasure to Durham. And so, yielding an immense mass of booty, and many a fair woman, as the Normans' prey, ended the Camp of Refuge, and the glory of the Isle of Ely.

CHAPTER XXXIV.

HOW HEREWARD WENT TO THE GREENWOOD.

And now is Hereward to the greenwood gone, to be a bold outlaw; and not only an outlaw himself, but the father of all outlaws, who held those forests for two hundred years, from the fens to the Scottish border. Utlages, forestiers, latrunculi (robberlets), sicarii, cut-throats, sauvages, who prided themselves upon sleeping on the bare ground; they were accursed by the conquerors, and beloved by the conquered. The Norman viscount or sheriff commanded to hunt them from hundred to hundred, with hue and cry, horse and bloodhound. The English yeoman left for them a keg of ale, or a basket of loaves, beneath the hollins green, as sauce for their meal of "nombles of the dere."

---

* These details are from a story found in the Isle of Ely, published by Dr. Giles. It seems a late composition; probably of the sixteenth century; and has manifest errors of fact: but *valeat quantum.*

† Stow's "Annals."

"For hart and hind, and doe and roe,
Were in that forest great plentie,"

and

"Swannes and fesauntes they had full good
And foules of the rivere.
There fayled never so lytell a byrde,
That ever was bred on brere.

With the same friendly yeoman "that was a good felawe," they would lodge by twos and threes during the sharp frosts of midwinter, in the lonely farm-house which stood in the "field" or forest-clearing: but for the greater part of the year their "lodging was on the cold ground" in the holly thickets, or under the hanging rock, or in a lodge of boughs.

And then, after a while, the life which began in terror, and despair, and poverty, and loss of land and kin, became not only tolerable, but pleasant. Bold men and hardy, they cared less and less for

"The thornie wayes, the deep valleys,
The snowe, the frost, the rayne,
The colde, the hete; for dry or wete
We must lodge on the plaine,
And us above, none other roofe,
But a brake bushe, or twayne."

And they found fair lasses, too, in time, who, like Torfrida and Maid Marian, would answer to their warnings against the outlaw life, with the nut-browne maid, that—

"Amonge the wylde dere, such an archere
As men say that ye be,
He may not fayle of good intayle,
Where is so great plentè:
And water clere of the rivere,
Shall be full swete to me,
With which in hele, I shall right wele,
Endure, as ye may see."

Then called they themselves "merry men," and the forest the "merry greenwood;" and sang, with Robin Hood,

"A merrier man than I, belyve
There lives not in Christentie."

They were coaxed back, at times, to civilized life; they got their grace of the king, and entered the king's service: but the craving after the greenwood was upon them. They dreaded and hated the four stone walls of a Norman castle, and, like Robin Hood, slipt back to the forest and the deer.

Gradually, too, law and order arose among them, lawless as they were; the instinct of discipline and self-government, side by side with that of personal independence, which is the peculiar mark, and peculiar strength of the English character. Who knows not how, in the "Lytell Geste of Robin Hood," they shot at "pluck-buffet," the king among them disguised as an abbot; and every man who missed the rose-garland, "his tackle he should tyne;"

"And bere a buffet on his head,
I wys ryght all bare,
And all that fell on Robyn's lote,
He smote them wonder sair.

"Till Robyn fayled of the garlonde,
Three fyngers and mair."

Then good Gilbert bids him in his turn

"'Stand forth and take his pay.'

"'If it be so,' sayd Robyn,
'That may no better be,
Syr Abbot, I delyver thee myn arrowe,
I pray thee, Syr, serve thou me.'

"'It falleth not for myne order,' saith our kynge,
'Robyn, by thy leve,
For to smyte no good yeman,
For doute I should hym greve.'

"'Smyte on boldly,' sayd Robyn,
'I give thee large leve.'
Anon our kynge, with that word,
He folde up his sleve.

"And such a buffet he gave Robyn,
To grounde he yode full nere.
'I make myn avowe,' sayd Robyn,
'Thou art a stalwarte frere.

"'There is pyth in thyn arme,' sayd Robyn,
'I trowe thou canst well shoote.'
Thus our kynge and Robyn Hode
Together they are met."

Hard knocks in good humour, strict rules, fair play, and equal justice for high and low; this was the old outlaw spirit, which has descended to their inlawed descendants; and makes, to this day, the life and marrow of an English public school.

One fixed idea the outlaw had—hatred of the invader. If "his herde were the king's deer," "his treasure was the earl's purse;" and still oftener the purse of the foreign churchman, Norman or Italian, who had expelled the outlaw's English cousins from their convents; shamefully scourged and cruelly imprisoned them, as the blessed archbishop Lanfranc did at Canterbury, because they would not own allegiance to a French abbot; or murdered them at the high altar, as did the new abbot of Glastonbury, because they would not change their old Gregorian chant for that of William of Fescamp.*

On these mitred tyrants the outlaw had no mercy, as far as their purses were concerned. Their persons, as consecrated, were even to him sacred and inviolable—at least, from wounds and death; and one may suppose Hereward himself to have been the first author of the laws afterward attributed to Robin Hood. As for "robbing and reving, beting and bynding," free warren was allowed against the Norman.

---

* See the Anglo-Saxon Chronicle.

" 'Thereof no foors,' said Robyn,
'We shall do well enow.
But look ye do no housbonde harme,
That tilleth wyth his plough.

" 'No more ye shall no good yemàn,
That walketh by grene wood shawe;
Ne no knyght, ne no squyer,
That will be good felàwe.

" 'These bysshoppes, and these archbysshoppes,
Ye shall them bete and binde;
The hye sheryff of Nottingham,
Hym holde in your mynde.'

* * * *

" Robyn loved our dere Ladye.
For doubt of dedely synne,
Wolde he never do company harme
That any woman was ynne."

And even so it was with Hereward in the Bruneswald, if the old chroniclers, Leofric especially, are to be believed.

And now Torfrida was astonished. She had given way utterly at Ely, from woman's fear, and woman's disappointment. All was over. All was lost. What was left, save to die?

But—and it was a new and unexpected fact to one of her excitable Southern blood, easily raised, and easily depressed—she discovered that neither her husband, nor Winter, nor Geri, nor Wenoch, nor Ranald of Ramsey, nor even the romancing harping Leofric, thought that all was lost. She argued it with them, not to persuade them into base submission, but to satisfy her own surprise.

"But what will you do?"

"Live in the greenwood."

"And what then?"

"Burn every town which a Frenchman holds, and kill every Frenchman we meet."

"But what plan have you?"

"Who wants a plan, as you call it, while he has the green hollies overhead, the dun deer on the lawn, bow in his hand, and sword by his side?"

"But what will be the end of it all?"

"We shall live till we die."

"But William is master of all England."

"What is that to us? He is not our master."

"But he must be some day. You will grow fewer and fewer. His government will grow stronger and stronger."

"What is that to us? When we are dead, there will be brave yeomen in plenty to take our place. You would not turn traitor?"

"I? never! never! I will live and die with you in your greenwood, as you call it. Only—I did not understand you English."

Torfrida did not. She was discovering the fact, which her nation have more than once discovered since, that the stupid valour of the Englishman never knows when it is beaten; and sometimes, by that self-satisfied ignorance, succeeds in not being beaten after all.

So Hereward—if the chroniclers speak truth—assembled a formidable force, well nigh, at last, four hundred men. Winter, Geri, Wenoch, Grogan, one of the Azers of Lincoln, were still with him. Ranald the butler still carried his standard. Of Duti and Outi, the famous brothers, no more is heard. A valiant Matelgar takes their place; Alfric and Sexwold and many another gallant fugitive cast up, like scattered hounds, at the sound of "The Wake's" war-horn. There were those among them (says Gaimar) who scorned to fight single-handed less than three Normans. As for Hereward, he would fight seven,

" Les quatre oscist, les treis fuirent;
Naffrez, sanglant, cil s'en partirent
En plusurs lius issi avrit,
K'encontre seit très bien se tuit
De seit hommes avait vertu,
Un plus hardi ne fu veu."

They ranged up the Bruneswald, dashing out to the war-cry of "A Wake! A Wake!" laying all waste with fire and sword, that is, such towns as were in the hands of Normans. And a noble range they must have had, for gallant sportsmen. Away south, between the Nene and Welland, stretched from Stamford and Peterborough the still vast forests of Rockingham, nigh twenty miles in length as the crow flies, down beyond Rockingham town, and Geddington Chase. To the west, they had the range of the "hunting counties," dotted still, in the more eastern part, with innumerable copses and shaughs, the remnants of the great forest, out of which, as out of Rockinghamshire, have been cut those fair parks and

" Handsome houses,
Where the wealthy nobles dwell;"

past which the Lord of Burleigh led his Welsh bride to that Burghley House by Stamford town, well-nigh the noblest of them all, which was in Hereward's time deep wood, and freestone down. Round Exton, and Normanton, and that other Burley on the Hill; on through those Morkery woods, which still retain the name of Hereward's ill-fated nephew; north by Irnham and Corby; on to Belton and Syston, (par nobile,) and south-west again to those still wooded heights, whence all-but-royal Belvoir looks out over the rich green vale below, did Hereward and his men range far and wide, harrying the Frenchman, and hunting the dun deer. Stags there were in plenty. There remain to this day, in Grimsthorpe Park by Bourne, the descendants of the very deer which Earl Leofric and Earl Algar, and after them Hereward the outlaw, hunted in the Bruneswald.

Deep tangled forest filled the lower claylands, swarming with pheasant, roe, badger, and more wolves than were needed. Broken park-like glades covered the upper freestones, where the red deer came out from harbour for their evening graze, and the partridges and plovers whirred up, and the hares and rabbits loped away, innumerable; and where hollies and ferns always gave dry lying for the night. What did men need more, whose bodies were as stout as their hearts?

They were poachers and robbers—and why not? The deer had once been theirs, the game, the land, the serfs; and if Godric of Corby slew the Irnham deer, burned Irnham hall over the head of the new Norman lord, and thought no harm, he did but what he would with that which had been once his own.

Easy it was to dash out by night, and make a raid; to harry the places which they once had owned themselves; in the vale of Belvoir to the west, or to the east in the strip of fertile land which sloped down into the fen; and levy black-mail in Rippinghale, or Folkingham, or Aslackby, or Sleaford, or any other of the "Vills" (now thriving villages,) which still remain in Domesday book, and written against them the ugly and significant—

"In Tatenai habuerunt Turgisle et Suen IIII. Carrucæ træ," &c. "Hoc Ivo Taillebosc ibi habet in dominio"—all, that is, that the wars had left of them.

The said Turgisle (Torkill or Turketil misspelt by Frenchmen) and Sweyn, and many a good man more—for Ivo's possessions were enormous—were thorns in the sides of Ivo and his men, which must be extracted; and the Bruneswald a nest of hornets, which must be smoked out at any cost.

Wherefore it befel, that once upon a day, there came riding to Hereward in the Bruneswald, a horseman all alone.

And meeting with Hereward and his men, he made signs of amity, and bowed himself low, and pulled out of his purse a letter, protesting that he was an Englishman, and a "good felawe," and that though he came from Lincoln town, a friend to the English had sent him.

That was believeable enough, for Hereward had his friends, and his spies, far and wide.

And when he opened the letter, and looked first, like a wary man, at the signature,—a sudden thrill went through him.

It was Alftruda's.

If he was interested in her, considering what had passed between them from her childhood, it was nothing to be ashamed of. And yet, somehow, he felt ashamed of that same sudden thrill.

And Hereward had reason to be ashamed. He had been faithful to Torfrida—a virtue most rare in those days. Few were faithful then, save, it may be, Baldwin of Mons to his tyrant and idol, the sorceress Richilda; and William of Normandy,—whatever were his other sins,—to his wise, and sweet, and beautiful Matilda. The stories of his coldness and cruelty to her seem to rest on no foundation. One need believe them as little as one does the myth of one chronicler, that when she tried to stop him from some expedition, and clung to him as he sat upon his horse, he smote his spur so deep into her breast that she fell dead. The man had self-control, and feared God, in his own wild way: therefore it was, perhaps, that he conquered.

And Hereward had been faithful likewise to Torfrida, and loved her with an overwhelming adoration,—as all true men love. And for that very reason he was the more aware, that his feeling for Alftruda was strangely like his feeling for Torfrida; and yet strangely different.

There was nothing in the letter that he should not have read. She called him her best and dearest friend, twice the saviour of her life. What could she do in return, but, at any risk to herself, try and save his life? The French were upon him. The posse comitatus of seven counties was raising. "Northampton, Cambridge, Lincoln, Holland, Leicester, Huntingdon, Warwick," were coming to the Bruneswald to root him out.

"Lincoln?" thought Hereward. "That must be Gilbert of Ghent, and Oger the Breton. No! Gilbert is not coming. Sir Ascelin is coming for him. Holland? That is my friend Ivo Taillebois. Well, we shall have the chance of paying off old scores. Northampton? The Earl thereof just now is the pious and loyal Waltheof, as he is of Huntingdon and Cambridge. Is he going to join young Fitz-Osbern from Warwick and Leicester, to root out the last Englishman? Why not? That would be a deed worthy of the man who married Judith, and believes in the powers that be, and eats dirt daily at William's table."

Then he read on.

Ascelin had been mentioned, he remarked, three or four times in the letter, which was long, as from one lingering over the paper, wishing to say more than she dared. At the end was a hint of the reason:

"Oh, that having saved me twice, you could save me once more. Know you that Gospatric has been driven from his earldom on charge of treason, and that Waltheof has Northumbria in his place, as well as the parts round you? And that Gospatric is fled to Scotland again, with his sons—my man among them? And now the report comes, that my man is slain in battle on the Border; and that I am to be given away,—as I have been given away twice before,—to Ascelin. This I know, as I know all, not only from him of Ghent, but from him of Peterborough, Ascelin's uncle."

Hereward laughed a laugh of cynical triumph,—pardonable enough in a broken man.

"Gospatric! the wittol! the woodcock! looking at the springe, and then coolly putting his head therein. Throwing the hatchet after the helve! selling his soul, and never getting the price of it! I foresaw it, foretold it, I believe to Alftruda herself,—foretold that he would not keep his bought earldom three years. What a people we are, we English, if Gospatric is—as he is—the shrewdest man among us, with a dash of canny Scots blood too. 'Among the one-eyed, the blind is king,' says Torfrida, out of her wise ancients, and blind we are, if he is our best. No. There is one better man left I trust, one that will never be fool enough to put his head into the wolf's mouth, and trust the Norman, and that is Hereward the outlaw."

And Hereward boasted to himself, at Gospatric's expense, of his own superior wisdom, till his eye caught a line or two, which finished the letter.

"Oh, that you would change your mind, much as I honour you for it. Oh that you would come in to the king, who loves and trusts you, having seen your constancy and faith, proved by so many years of affliction. Great things are open to you, and great joys;—I dare not tell you what: but I know them, if you would come in. You, to waste yourself in the forest, an outlaw and a savage! Opportunity once lost, never returns; time flies fast, Hereward my friend, and we shall all grow old,—I think at times that I shall soon grow old. And the joys of life will be impossible, and nothing left but vain regrets."

"Hey?" said Hereward, "a very clerkly letter. I did not think she was so good a scholar. Almost as good a one as Torfrida."

That was all he said; and as for thinking, he had the posse comitatus of seven counties to think of. But what could those great fortunes and joys be, which Alftruda did not dare to describe?

She growing old, too? Impossible, that was woman's vanity. It was but two years since she was as fair as a saint in a window. "She shall not marry Ascelin. I will cut his head off. She shall have her own choice for once, poor child."

And Hereward found himself worked up to a great height of paternal solicitude, for Alftruda, and righteous indignation against Ascelin. He did not confess to himself that he disliked much, in his selfish vanity, the notion of Alftruda's marrying any one at all. He did not want to marry her himself,—of course not. But there is no dog in the manger so churlish on such points as a vain man. There are those who will not willingly let their own sisters, their own daughters, their own servants marry. Why should a woman wish to marry any one but them?

But Hereward, however vain, was no dreamer or sluggard. He set to work, joyfully, cheerfully, scenting battle afar off, like Job's war horse, and pawing for the battle. He sent back Alftruda's messenger, with this answer:—

"Tell your lady that I kiss her hands and feet. That I cannot write, for outlaws carry no pen and ink. But that what she has commanded, that will I perform."

It is noteworthy, that when Hereward showed Torfrida (which he did frankly) Alftruda's letter; he did not tell her the exact words of his answer, and stumbled and varied much, vexing her thereby, when she, naturally, wished to hear them word for word.

Then he sent out spies to the four airts of heaven. And his spies, finding a friend and a meal in every hovel, brought home all the news he needed.

He withdrew Torfrida and his men into the heart of the forest,—no hint of the place is given by the chronicler,—cut down trees, formed an abattis of trunks and branches, and awaited the enemy.

CHAPTER XXXV.

HOW ABBOT THOROLD WAS PUT TO RANSOM.

THOUGH Hereward had, as yet, no feud against "Bysshoppes and Archbysshoppes," save Egelsin of Selsey, who had excommunicated him, but who was at the other end of England, he had feud, as may be supposed, against Thorold, Abbot of Peterborough; and Thorold feud likewise against him. When Thorold had entered the "Golden Borough," hoping to fatten himself with all its treasures, he had found it a smoking ruin, and its treasures gone to Ely to pay Sweyn and his Danes. And such a "sacrilege," especially when he was the loser thereby, was the unpardonable sin itself in the eyes of Thorold, as he hoped it might be in the eyes of St. Peter. Joyfully therefore he joined his friend Ivo Taillebois, when, "with his usual pompous verbosity," saith Peter of Blois, writing on this very matter, he asked him to join in destroying Hereward.

Nevertheless, with all the Norman chivalry at their back, it behoved them to move with caution; for (so says the chronicler) "Hereward had in these days very many foreigners, as well as landsfolk, who had come to him to practise and learn war, and fled from their masters and friends when they heard of his fame; and some of them the King's courtiers, who had come to see whether those things which they heard were true, whom Hereward nevertheless received cautiously, on plighted troth and oath."

So Ivo Taillebois summoned all his men, and all other men's men who would join him, and rode forth through Spalding and Bourne, having announced to Lucia, his bride, that he was going to slay her one remaining relative; and when she wept, cursed and kicked her, as he did once a week. After which he came to Thorold of Peterborough.

So on the two worthies rode from Peterborough to Stamford, and from Stamford into the wilderness, no man knows whither.

> "And far they rode by bush and shaugh,
> And far by moss and mire:"

But never found a track of Hereward or his men. And Ivo Taillebois left off boasting how he would burn Torfrida over a slow fire, and confined himself to cursing; and Abbot Thorold left off warbling the song of Roland as if he had been going to a second battle of Hastings, and wished himself in warm bed at Peterborough.

But at the last they struck upon a great horse-track, and followed it at their best pace for several miles; and yet no sign of Hereward.

"Catch an Englishman," quoth the Abbot.

But that was not so easy. The poor folk had hidden themselves, like Israel of old, in thickets, and dens, and caves of rocks, at the far-off sight of the Norman tyrants; and not a living soul had appeared for twenty miles. At last they caught a ragged wretch herding swine, and haled him up to Ivo.

"Have you seen Hereward, villain?" asked he, through an interpreter.

"Nay."

"You lie. These are his fresh horse-tracks, and you must have seen him pass."

"Eh?"

"Thrust out one of his eyes, and he will find his tongue."

It was done.

"Will you answer now?"

The poor wretch only howled.

"Thrust out the other."

"No, not that! Mercy: I will tell. He is gone by this four hours. How have you not met him?"

"Fool! The hoofs point onward there."

"Ay"—and the fellow could hardly hide a grin—"but he had shod all his horses backwards."

A storm of execration followed. They might be thrown twenty miles out of their right road by the stratagem.

"So you had seen Hereward, and would not tell. Put out his other eye," said Taillebois, as a vent to his own feelings.

And they turned their horses' heads, and rode back, leaving the man blind in the forest.

The day was waning now. The fog hung heavy on the tree-tops, and dripped upon their heads. The horses were getting tired, and slipped and stumbled in the deep clay paths. The footmen were more tired still, and, cold and hungry, straggled more and more. The horse-tracks led over an open lawn of grass and fern, with here and there an ancient thorn, and round it on three sides thick wood of oak and beech, with under copse of holly and hazel. Into that wood the horse-tracks led, by a path on which there was but room for one horse at a time.

"Here they are at last!" cried Ivo. "I see the fresh foot-marks of men, as well as horses. Push on, knights and men-at-arms."

The Abbot looked at the dark, dripping wood, and meditated.

"I think that it will be as well for some of us to remain here; and, spreading our men along the wood-side, prevent the escape of the villains. A moi, hommes d'armes!"

"As you like. I will go in, and bolt the rabbit; and you shall snap him up as he comes out."

And Ivo, who was as brave as a bull-dog, thrust his horse into the path, while the Abbot sat shivering outside. "Certain nobles of higher rank," says Peter de Blois, "followed his example, not wishing to rust their armour, or tear their fine clothes, in the dank copse."

The knights and men-at-arms straggled slowly into the forest, some by the path, some elsewhere, grumbling audibly at the black work before them. At last the crashing of the branches died away, and all was still.

Abbot Thorold sat there upon his shivering horse, shivering himself as the cold pierced through his wet mail; and as near an hour past, and no sign of foe or friend appeared, he cursed the hour in which he took off the beautiful garments of the sanctuary to endure those of the battle-field. He thought of a warm chamber, warm bath, warm footcloths, warm pheasant, and warm wine. He kicked his freezing iron feet in the freezing iron stirrup. He tried to blow his nose with his freezing iron hand; but dropt his handkerchief into the mud, and his horse trod on it. He tried to warble the song of Roland: but the words exploded in a cough and a sneeze. And so dragged on the weary hours, says the chronicler, nearly all day, till the ninth hour. But never did they see coming out of the forest, the men who had gone in.

A shout from his nephew, Sir Ascelin, made all turn their heads. Behind them, on the open lawn, in the throat between the woods by which they had entered, were some forty knights, galloping toward them.

"Ivo?"

"No!" almost shrieked the Abbot. "There is the white bear banner. It is Hereward."

"There is Winter on his left," cried one. "And there, with the standard, is the accursed monk, Ranald of Ramsey."

And on they came, having debouched from the wood some two hundred yards off, behind a roll in the lawn, just far enough off to charge as soon as they were in line.

On they came, two deep, with lances high over their shoulders, heads and heels well down, while the green tufts flew behind them. "A moi, hommes d'armes!" shouted the Abbot. But too late. The French turned right and left. To form was impossible, ere the human whirlwind would be upon them.

Another half minute, and with a shout of "A bear! A bear! The Wake! The Wake!" they were struck, ridden through, hurled over, and trampled into the mud.

"I yield. Grace! I yield!" cried Thorold, struggling from under his horse: but there was no one to whom to yield. The knight's backs were fifty yards off, their right arms high in the air, striking and stabbing.

The battle was "à l'outrance." There was no quarter given that day.

"And he that came live out thereof
Was he that ran away."

The Abbot tried to make for the wood, but ere he could gain it, the knights had turned, and one rode straight at him, throwing away a broken lance, and drawing his sword.

Abbot Thorold may not have been the coward which Peter of Blois would have him, over and above being the bully which all men would have him; but if so, even a worm will turn; and so did the Abbot: he drew sword from thigh, got well under his shield, his left foot forward, and struck one blow for his life, and at the right place—his foe's bare knee.

But he had to do with a warier man than himself. There was a quick jerk of the rein; the horse swerved round, right upon him, and knocked him head over heels; while his blow went into empty air.

"Yield, or die!" cried the knight, leaping from his horse, and kneeling on his head.

"I am a man of God, an abbot, churchman, Thorold."

"Man of all the devils!" and the knight lugged him up, and bound his arms behind him with the abbot's own belt.

"Ahoi! Here! I have caught a fish. I have got the Golden Borough in my purse!" roared he. "How much has St. Peter gained, since we borrowed of him last, Abbot? He will have to pay out the silver pennies bonnily, if he wishes to get back thee."

"Blaspheme not, godless barbarian!" Whereat the knight kicked him.

"And you have Thorold the scoundrel, Winter?" cried Hereward, galloping up. "And we have three or four more dainty French knights, and a viscount of I know not where among them. This is a good day's work. Now for Ivo and his tail."

And the Abbot, with four or five more prisoners, were hoisted on to their own horses, tied firmly, and led away into the forest path.

"Do not leave a wounded man to die," cried a knight who lay on the lawn.

"Never we. I will come back and put you out of your pain," quoth some one.

"Siward! Siward Le Blanc! Are you in this meinie?" cried the knight in French.

"That am I. Who calls?"

"For God's sake save him!" cried Thorold. "He is my own nephew, and I will pay——"

"You will need all your money for yourself," said Siward the white, riding back.

"Are you Sir Ascelin of Ghent?"

"That am I, your host of old."

"I wish I had met you in better company. But friends we are, and friends must be."

And he dismounted, and did his best for the wounded man, promising to return and fetch him off before night, or send yeomen to do so.

As he pushed on through the wood, the Abbot began to see signs of a fight; riderless horses crashing through the copse, wounded men straggling back, to be cut down without mercy by the English. The war had been "à l'outrance" for a long while. None gave or asked quarter. The knights might be kept for ransom; they had money. The wretched men of the lower classes, who had none, were slain: as they would have slain the English.

Soon they heard the noise of battle; and saw horsemen and footmen pell-mell, tangled in an abattis, from behind which archers and cross-bowmen shot them down in safety.

Hereward dashed forward, with the shout of Torfrida; and at that the French, taken in the flank, fled, and were smitten as they fled, hip and thigh.

Hereward bade them spare a fugitive, and bring him to him.

"I give you your life; so run, and carry my message. That is Taillebois' banner there forward, is it not?"

"Yes."

"Then go after him, and tell him,—Hereward has the Abbot of Burgh, and half-a-dozen knights, safe by the heels. And unless Ivo clears the wood of his men by nightfall, I will hang every one of them up for the crows before morning."

Ivo got the message, and having had enough fighting for the day, drew off, says the chronicler, for the sake of the Abbot and his fellow captives.

Two hours after the Abbot and the other prisoners were sitting, unbound, but unarmed, in the forest encampment, waiting for a right good meal, with Torfrida bustling about them, after binding up the very few wounded among their own men.

Every courtesy was shown them; and their hearts were lifted up, as they beheld approaching among the trees great cauldrons of good soup; forest salads; red deer and roe roasted on the wood embers; spits of pheasants and partridges, larks and buntings, thrust off one by one by fair hands into the burdock leaves which served as platters; and last but not least, jacks of ale and wine, appearing mysteriously from a cool old stone quarry. Abbot Thorold ate to his heart's content, complimented every one, vowed he would forswear all Norman cooks and take to the greenwood himself, and was as gracious and courtly as if he had been at the new palace at Winchester.

And all the more for this reason—that he had intended to overawe the English barbarians by his polished Norman manners. He found those of Hereward and Torfrida, at least, as polished as his own.

"I am glad you are content, Lord Abbot," said Torfrida; "I trust you prefer dining with me, to burning me, as you meant to do."

"I burn such peerless beauty! I injure a form made only for the courts of kings! Heaven and all saints, knighthood and all chivalry, forbid. What Taillebois may have said, I know not! I am no more answerable for his intentions than I am for his parentage,—or his success this day. Let churls be churls, and wood-cutters wood-cutters. I at least, thanks to my ancestors, am a gentleman."

"And, as a gentleman, will of course contribute to the pleasure of your hosts. It will surely please you to gratify us with one stave at least of that song, which has made your name famous among all knights," holding out a harp.

"I blush: but obey. A harp in the green wood? A court in the wilderness! What joy!"

And the vain Abbot took the harp, and said—"These, if you will allow my modesty to choose, are the staves on which I especially pride myself. The staves which Taillefer—you will pardon my mentioning him——"

"Why pardon? A noble minstrel he was, and a brave warrior, though our foe. And often have I longed to hear him, little thinking that I should hear instead the maker himself."

So said Hereward; and the Abbot sang—those wondrous staves, where Roland, left alone of all the Paladins, finds death come on him fast. And on the Pyrenæan peak, beneath the pine, he lays himself, his "face toward the ground; and under him his sword and magic horn, that Charles his lord may say, and all his folk, the gentle count he died a conqueror;" and then "turns his eyes southward toward Spain; betakes himself to remember many things; of so many lands which he conquered valiantly; of pleasant France, of the men of his lineage, of Charlemagne his lord, who brought him up. He could not help to weep and sigh, but yet himself he would not forget. He bewailed his sins, and prayed God's mercy:—True Father, who ne'er yet didst lie, who raised St. Lazarus from death, and guarded Daniel from the lions: Guard my soul from all perils, for the sins which in my life I did. His right glove then he offered to God; St. Gabriel took it from his hand; On his arm the chief bowed down, with joined hands he went unto his end. God sent down his angel Cherubim, and St. Michael whom men call 'del peril.' Together with them St. Gabriel he came; the soul of the count they bore to Paradise."

And the Abbot ended, sadly and gently, without that wild "Aoi!" the war-cry with which he usually ends his staves. And the wild men of the woods were softened and saddened by the melody; and as many as understood French said, when he finished—"Amen! so may all good knights die!"

"Thou art a great maker, Abbot! They told truths of thee. Sing us more of thy great courtesy."

And he sang them the staves of the Olifant, the magic horn—How Roland would not sound it in his pride, and sounded it at Turpin's bidding, but too late; and how his temples burst with that great blast, and Charles and all his peers heard it through the gorges, leagues away in France. And then his "Aoi!" rang forth so loud and clear, like any trumpet blast, under the oaken glades, that the wild men leaped to their feet, and shouted "Health to the gleeman! Health to the Abbot Thorold!"

"I have won them" thought the Abbot to himself. Strange mixture that man must have been, if all which is told of him is true; a very typical Norman, compact of cunning and ferocity, chivalry and poetry, vanity and superstition, and yet able enough to help to conquer England for the Pope.

Then he prest Hereward to sing, with many compliments; and Hereward sang, and sang again, and all his men crowded round him as the outlaws of Judæa may have crowded round David in Carmel or Hebron, to hear, like children, old ditties which they loved the better the oftener they heard them.

"No wonder that you can keep these knights together, if you can charm them thus with song. Would that I could hear you singing thus in William's hall."

"No more of that, Sir Abbot. The only music which I have for William is the music of steel on steel."

Hereward answered sharply, because he was half of Thorold's mind.

"Now," said Torfrida, as it grew late, "we must ask our noble guest for what he can give us as easily and well as he can song—and that is news. We hear nought here in the greenwood, and must throw oneself on the kindness of a chance visitor."

The Abbot leapt at the bait, and told them news, court gossip, bringing in great folks' names and his own, as often and as familiarly mingled as he could.

"What of Richilda?" asked Torfrida.

"Ever since young Arnoul was killed at Cassel——"

"Arnoul killed?" shrieked Torfrida.

"Is it possible that you do not know?"

"How should I know, shut up in Ely for—years it seems."

"But they fought at Cassel three months before you went to Ely.

"Be it so. Only tell me. Arnoul killed!"

Then the Abbot told, not without feeling, a fearful story.

Robert the Frison and Richilda had come to open war, and Gerbod the Fleming, Earl of Clueter, had gone over from England to help Robert. William had sent Fitz Osbern, Earl of Hereford, the scourge and tyrant of the Welsh, to help Richilda. Fitz Osbern had married her, there and then. She had asked help of her liege lord, the King of France, and he had sent her troops. Robert and Richilda had fought on St. Peter's day, 1071—nearly two years before, at Bavinchorum, by Cassel.

Richilda had played the heroine, and routed Robert's left wing, taken him prisoner, and sent him off to St. Omer. Men said that she had done it by her enchantments. But her enchantments betrayed her nevertheless. Fitz Osbern, her bridegroom, fell dead. Young Arnoul had two horses killed under him. Then Gerbod smote him to the ground, and Richilda and her troops fled in horror. Richilda was taken, and exchanged for the Frison; at which the King of France, being enraged, had come down and burnt St. Omer. Then Richilda, undaunted, had raised fresh troops to avenge her son. Then Robert had met them at Broqueroie by Mons, and smote them with a dreadful slaughter.* Then Richilda had turned and fled wildly into a convent; and, so men said, tortured herself night and day with fearful penances, if by any means she might atone for her great sins.

Torfrida heard, and laid her head upon her knees, and wept so bitterly, that the Abbot entreated pardon for having pained her so much.

---

* The place was called till late, and may be now, "The Hedges of Death,"

The news had a deep and lasting effect on her. The thought of Richilda shivering and starving in the squalid darkness of a convent, abode by her thenceforth. Should she ever find herself atoning in like wise for her sorceries—harmless as they had been; for her ambitions—just as they had been; for her crimes? But she had committed none. No, she had sinned in many things: but she was not as Richilda. And yet in the loneliness and sadness of the forest, she could not put Richilda from before the eyes of her mind.

It saddened Hereward likewise. For Richilda he cared little. But that boy.—How he had loved him! How he had taught him to ride, and sing, and joust, and handle sword, and all the art of war. How his own rough soul had been the better for that love. How he had looked forward to the day when Arnoul should be a great prince, and requite him with love. Now he was gone. Gone? Who was not gone, or going? He seemed to himself the last tree in the forest. When should his time come, and the lightning strike him down to rot beside the rest? But he tost the sad thoughts aside. He could not afford to nourish them. It was his only chance of life, to be merry and desperate.

"Well!" said Hereward, ere they hapt themselves up for the night. "We owe you thanks, Abbot Thorold, for an evening worthy of a king's court, rather than a holly bush."

"I have won him over," thought the Abbot.

"So charming a courtier—so sweet a minstrel—so agreeable a newsmonger—could I keep you in a cage for ever, and hang you on a bough, I were but too happy: but you are too fine a bird to sing in captivity. So you must go, I fear, and leave us to the nightingales. And I will take for your ransom—— "

Abbot Thorold's heart beat high.

"Thirty thousand silver marks."

"Thirty thousand fiends!"

"My beau Sire, will you undervalue yourself? Will you degrade yourself? I took Abbot Thorold, from his talk, to be a man who set even a higher value on himself than other men set on him. What higher compliment can I pay to your vast worth, than making your ransom high accordingly, after the spirit of our ancient English laws? Take it as it is meant, beau Sire; be proud to pay the money; and we will throw you Sir Ascelin into the bargain, as he seems a friend of Siward's."

Thorold hoped that Hereward was drunk, and might forget, or relent: but he was so sore at heart that he slept not a wink that night.

But in the morning he found, to his sorrow, that Hereward had been as sober as himself.

In fine, he had to pay the money; and was a poor man all his days.

"Aha! Sir Ascelin," said Hereward apart, as he bade them all farewell with many courtesies. "I think I have put a spoke in your wheel about the fair Alftruda."

"Eh? How? Most courteous victor?"

"Sir Ascelin is not a very wealthy gentleman."

Ascelin laughed assent.

"Nudus intravi, nudus exeo—England; and I fear now, this mortal life likewise."

"But he looked to his rich uncle the Abbot, to further a certain marriage-project of his. And of course neither my friend Gilbert of Ghent, nor my enemy William of Normandy, are likely to give away so rich an heiress without some gratification in return."

"Sir Hereward knows the world, it seems."

"So he has been told before. And therefore, having no intention that Sir Ascelin—however worthy of any and every fair lady—should marry this one; he took care to cut off the stream at the fountain head. If he hears that the suit is still pushed, he may cut off another head beside the fountain's."

"There will be no need," said Ascelin, laughing again. "You have very sufficiently ruined my uncle, and my hopes."

"My head?" said he, as soon as Hereward was out of hearing. "If I do not cut off thy head ere all is over, there is neither luck nor craft left among Normans. I shall catch the Wake sleeping some day, let him be never so Wakeful."

A PLASTER CAST FROM POMPEII.

[In recent excavations at Pompeii, the dust in which the city was entombed was found to have taken the mould of the bodies of a group of men, women, and children, who appeared to have taken refuge in the court-yard of a villa. To remove the mould was impossible, but plaster of Paris was poured in, and the casts thus obtained (one of them, that of a girl of sixteen or seventeen) are now in the Museum at Naples.]

Once I was young and fresh,
  Fair with the fairest;
Now thou who standest there
  Know'st not, nor carest.
Then the youths sang my praise,
  Flushed with the dancing;
Now thine eye coldly falls,
  Here and there glancing.

Lo! the hot air was thick,
  Stifling and steaming;
Through the grey mist the sun
  Rose dimly gleaming.
Then a wild flash of fire,
  Crash as of thunder,
All faces black with fear,
  All sick with wonder.

Then the white dust fell fast,
  Blinding our vision;
Men who had feared the Gods
  Mocked in derision;
Mockers in fear fell down,
  Death's spell upon them;
Gamesters threw up their dice;
  Hades had won them.

Hushed was the minstrel's song,
  Stiff grew the lithest,
All the stout hearts waxed faint,
  Awe-struck the blithest;
I to my mother ran,
  Love's shelter seeking;
Men sought their wives and babes,
  Gasping, not speaking.

Still the hot dust came down,
  Choking our breath then,
And on our hearts there came
  Darkness of death then.
Friends, mothers, children fled,
  In the dark meeting,
Uttering, ere life had fled,
  Last words of greeting.

Flowers in my hair were twined,
  Gracefully braided,
Now by the scorching blast,
  Withered and faded;
Necklet of gold I wore,
  Pearls that I cherished;
These thou hast look'd on here,
  All else has perished.

I to the court-yard gate
  Rushed in my madness,
After wild throbs of dread,
  Fear conquering sadness;
There were they met, my friends,
  Father and mother,
Faithful slave, lover true,
  Sister and brother.

So we faced death at last,
  Each to each clinging;
Some, in their wild despair,
  Frenziedly singing,
Most with clenched hands and lips,
  Stiffened with sorrow:
We who were met there then,
  Saw no to-morrow.

Bright was the life we lived:
  This was its ending.
Had we provoked the Gods,
  Blindly offending?
Did they look down in wrath,
  Jealously grudging?
Did they chastise our guilt,
  Righteously judging?

Long had those fires of hell
  Peacefully slumbered;
Men lived, and toiled, and loved,
  Years none had numbered.
Now the dread doom came on,
  Sent without warning;
Sunk in the night of death,
  Where was our morning?

Gladly our years had passed,
  Buying and selling,
Dancing with pipe and harp,
  Lovers' tales telling.
Now the fierce wrath of Gods
  Dried up life's fountain;
Fire-streams none knew till then
  Flowed from yon mountain.

One there was, even then,
  Tranquil, unaltered;
Calmly he look'd on death,
  Voice had not faltered;
Strange in his blood and speech,
  Men used to flout him;
Girls, in their joy of heart,
  Danced on without him.

Now as we sank in death
  Came his voice clearer,
First sounding far away,
  Then near, and nearer;
Voice, as of one who prays,
  Eagerly pleading,
For friends, and foes, and all
  Still interceding.

"So once of old the fire
  Burst on Lot's city;
So Thou dost smite us now,
  Lord of all pity.
Through all the crowds I see,
  Aged or youthful,
Not ten, nor five are found,
  Righteous and truthful.

"Yet, Lord, have mercy now,
  Spare those who perish;
Take them, and teach them, Lord,
  Chasten and cherish:
Babes in the dawn of life,
  Youths in its morning,
Thou hast redeemed them, Lord,
  Not one soul scorning."

Such were the words we heard,
  Strengthening and cheering;
So we sank down to sleep,
  Hoping, yet fearing:
Just for one breath we knew
  What death's strange calm meant,
Then we were safe entombed,
  Dust our embalmment.

Now we lie side by side,
  None knows our story,
What has come after death,
  Darkness or glory;
None reads the lesson right,
  Awe-struck with wonder,
Though these clay lips might speak
  Louder than thunder.

Go thou, who standest there,
  Tranquilly dreaming,
Learn the stern truths that lie
  Under all seeming.
Feeding the pride of life,
  Thou thyself starvest;
Thine is the seed-time now;
  Whose is the harvest?

E. H. P.

CHRIST THE LIGHT OF THE WORLD.

BY C. J. VAUGHAN, D.D.

X.—CHRIST THE DESTROYER OF DEATH.

"Our Saviour Jesus Christ hath abolished death."—2 Tim. i. 10.

"ABOLISHED death?"

Have we not, then, all to die?

Yes, certainly that end is before all the living. Death, or its equivalent—death, for all generations save one; its equivalent, a change equal to death, for that one generation which shall be alive at Christ's Advent—this is our portion, this our prospect: nothing which Christ has done has interfered with the working of that one universal rule of the Adam being, "It is appointed unto men once to die."

And what is death? Who shall tell us what death is?

We know how to define it;. as the dissolution of soul and body; the snapping in twain of the twofold cord, the material body and the immaterial soul, which is our link to the living; the departure of that soul, the presence of which is life, from the house of this tabernacle, and the dropping down of the dead weight of the body upon the earth from which it was taken.

And we can say even more of the circumstances of death. We can tell of the gradual or the more sudden approach of that last enemy; of his coming as we have seen it in a decay of strength, a contraction of the daily walk, first within the four walls, then to the chamber, then to the bed, at last to the coffin; and (what is even worse) a slow but perceptible numbing of the faculties, enfeebling of the memory and reason, narrowing of the range of thought, and confining of the flight of mind, till at last we begin to say, What will be left for eternity and heaven?—or else of his coming as we have seen it in youth or middle age, through infection, through fever, through accident, through sin—when reason has been upset on her throne, or held down trembling upon it (according to that wonderful saying) by a frenzy seated beside her—or else, it may be, has simply slumbered, drugged by disease or by its remedies—and has so passed away, without word or sign to tell whither the man was going, or whether indeed any whither:—these things we have seen, and we have thought perhaps that we saw Death in seeing them—when, in reality, they were all but circumstances and accidents of the very thing itself, and we turned from that deathbed, or came back from that grave, just as ignorant of the essential nature of that mighty change which is before each one of us, as if indeed we had heard nothing, seen nothing, and felt nothing.

And yet, I say, this change, this mysterious, unknown, secret change, which we call death—which we define, and of which we daily see the circumstances and the consequences—this change is before each one of us. In some way, at some time, we must all, we must each, die.

This prospect affects different men very differently.

Some men are reckless of it. They not only forget, they even despise it. They not only do many things which they would not do if they expected it; they not only trifle with health of mind and body; they not only wanton with sin, and brave consequences, and defy judgment: but they even, in the boldness of a constitutional hardihood, will risk life itself, or give away life itself, without a fear of the thing called dying, and without an apprehension of that "undiscovered country" which they know lies just beyond it.
