CO'NODONTS (from Gk. *κῶνος*, *kōnos*, cone + *ὀδούς*, *odous*, tooth). Minute fossil teeth of uncertain affinities, found in rocks of Ordovician to Permian age of North America and Europe. They are very small, shining objects, with more or less extended bases, from which arise one or many slender, sharp, short or long denticles. They thus vary in form from conical to pectinate according to the number and length of the denticles. The material of which they consist is red, brown, or white calcite or phosphate of lime. Associated with the tooth-like forms are minute plates of the same material, that probably belonged to the same organisms. Conodonts were first described by Pander, in 1856, from the lowest fossiliferous (Cambrian) rocks of Russia, and were by him regarded as fish-teeth. Since then they have been found in England, the United States, and Canada, and various opinions have been expressed regarding their affinities. Newberry described a number from the Carboniferous shales of Ohio, and compared them to the teeth of myxinoïd fishes. Other authors have considered them to be the spines of crustacea or the lingual teeth of naked mollusks. These opinions are all less well supported by facts than is that of Zittel and Rohon, that conodonts are the teeth of annelids allied to the Nereide. In the same rocks with conodonts are often found jaws of annelids, described as *Prioniodus*, *Polygnathus*, etc. Consult: Pander, *Monographie der fossilen Fische des silurischen Systems* (Saint Petersburg, 1856); Hinde, "On Conodonts from the Chazy and Cincinnati Groups," etc. *Quarterly Journal Geological Society*, vol. xxxv. London, 1879; Newberry, *Paleontology of Ohio*, vol. ii. (Columbus, Ohio, 1875); Zittel and Rohon, "Ueber Conodonten," *Sitzungsberichte der königlich-bayerischen Akademie der Wissenschaften* (Munich, 1886). See *WORM*, *FOSSIL*; *ANNULATA*.

CO'NOID (Gk. *κωνοειδής*, *kōnoeidēs*, cone-shaped, from *κῶνος*, *kōnos*, cone + *εἶδος*, *eidōs*, shape). A conoidal surface is a surface generated by the motion of a straight line which always meets a fixed straight line, is parallel to a fixed plane, and obeys some other law. The surface is called a right conoid when the fixed plane is perpendicular to the fixed line. It was formerly used to designate quadrics of revolution, as the surfaces of paraboloids, ellipsoids, and hyperboloids. Cones, cylinders, and conoids are

special forms of ruled surfaces. Wallis (1663) effected the cubature of a conoid with horizontal directing plane, whose generatrix intersects a vertical directing straight line and vertical directing circle.

CON'OLLY, JOHN (1794-1866). An English alienist. He was born at Market Rasen, Lincolnshire, and studied medicine at the University of Edinburgh. In 1839 he became director of the Middlesex Asylum at Hanwell. Immediately after his installation, he abolished all the devices theretofore employed to confine and restrain the insane by means of strait-jackets, straps, and similar appliances. During the period in which he was connected with the institution (1839-1851) he succeeded in completely revolutionizing the treatment of mental disease, and his so-called "no restraint system" found rapid extension everywhere. Among his principal works may be mentioned: *The Treatment of the Insane Without Mechanical Restraints* (1856); *Construction and Government of Lunatic Asylums* (1847); *Essay on Hamlet* (1863).

CON'NON (Lat., from Gk. Κόνων, Κονών). A distinguished Athenian commander. He first came into prominence in B.C. 413, when he was chosen admiral for the year. In B.C. 407 he was appointed general to succeed Alcibiades, but was defeated by Callicratidas at Mitylene. In B.C. 405 he was defeated by Lysander at Egospotami, but succeeded in escaping with eight ships to Cyprus. In B.C. 394 he commanded the combined fleets of Persia and Athens which defeated the Spartans at Cnidus. He afterwards rebuilt the Long Walls of Athens, and was, in B.C. 392, sent as envoy to the Persian Tiribazus, by whom he was thrown into prison. He died, according to the more probable account, at the court of Evagoras in Cyprus.

CON'NOSCOPE (from Gk. κώνος, κώνος, cone + σκοπεῖν, σκοπεῖν, to view). A polariscope adapted to the study of crystals, having a revolving stage for regulating the position of the crystal section under examination, two Nicol's prisms (polarizer and analyzer) for production of double polarized light, a strongly convergent lens system below the stage to cause the light to enter the crystal in a cone of rays, and a similar system above the stage to correct the divergence of the rays, so that the eye may focus them for the retina. A conoscope is chiefly used to examine the so-called interference figures of crystals. The mineralogical or petrological microscope is constructed so as to be used either as a stauroscope or a conoscope. See POLARISCOPE.

CONQUEROR, THE. A surname popularly given to William, Duke of Normandy, on becoming King of England.

CONQUEST (from OF. *conquēste*, Fr. *conquête*, Sp., Port., It. *conquista*, from ML. *conquista*, conquest, from Lat. *conquirere*, to procure, from *com-*, together + *quarere*, to seek). The forcible extension of sovereignty by one State over the territory of another as the result of successful war. Though it is denied by advocates of natural justice that this carries with it inherent rights of appropriation in territory, and destruction of national life, conquest has been one of the strongest agencies in molding civilization, and, in its influence upon the relationship of nations, it belongs to the realm of international law as well as to that of history.

Military conquest is developed from mere occupation of territory when the victorious State exercises continuously sovereign powers over the section affected, and such conquest is deemed to be completed in the legal sense by the conqueror's signifying by some formal act his intention of adding it to his dominions, such as the publication of a diplomatic circular or a proclamation of annexation. The conditions justifying such acquisition and insuring immunity from interference by other States are: (1) A situation where, in order to redress a wrong or in self-protection, it becomes necessary to strip an aggressor of a portion of his territory. (2) The completion by treaty of the title which possession by conquest has given. (3) A general acquiescence in the act of the conqueror by neutral States. The changes in the map of Europe wrought by Napoleon's conquests and annexations were not accepted by the nations affected, and, by the Congress of Vienna, a return to the original conditions was made.

Title by conquest is, in principle, to be distinguished from title by cession, by the fact that, whether ratified by treaty or not, title by conquest rests avowedly on force, whereas the cession of territory is, in theory at least, always a voluntary act on the part of the ceding power. Thus, the acquisition of Porto Rico by the United States, as the result of the late war with Spain, was due to its conquest by the military and naval forces of the United States, while the acquisition of the Philippine Islands was disguised as a voluntary cession thereof by Spain. Indeed, it is usual for conquering nations in modern times to require as a condition of peace that the defeated nation shall recognize the title of the former to the conquered territory by a treaty of cession. The title is then, in legal theory, referred to the cession, rather than to the act of conquest upon which it is really based.

Unless otherwise defined by treaty, the following rules govern the status of property and of the inhabitants of conquered territory: All public property passes to the conqueror absolutely. Except in the case of rebellion, private property rights remain undisturbed, and the conqueror is bound to make laws to insure the enjoyment of such rights, appropriate to the new political system imposed. Political laws and systems, being based upon reciprocal relations between citizens and the body politic, are destroyed, and, in the absence of treaty stipulations, political and civil rights of the inhabitants depend upon the provisions of the new régime. Absolute allegiance is due the conqueror, and, on bare conquest, he may forbid emigration from the country, but not in case of cession. Municipal laws regulating the private relations of individuals are not abrogated, however, but continue in force by the implied acquiescence of the new sovereign, until superseded by new enactments.

Difficult problems arise in determining the conflicting claims caused by the temporary exercise of sovereign powers by a conqueror. A famous example is Hesse-Cassel, overrun by Napoleon's troops in 1806, and later annexed by him to the Kingdom of Westphalia. When the Elector returned under the Treaty of Vienna, he refused to respect payments made by the public debtors and the sale of the Crown lands by Jerome Bonaparte. After passing before several tribunals, it was finally decided that the Elector's reinstatement

ment was not a continuation of his former sovereignty, and that the acts of the conqueror were valid. Consult: Lawrence, *Principles of International Law* (London and New York, 1897), and also the authorities referred to under INTERNATIONAL LAW. See ALLEGIANCE; CESSION; CITIZEN; TITLE.

CONQUEST, IDA. An American actress, who made her debut at the Tremont Theatre, Boston, in 1892, with Alexander Salvini, in a performance of *Rohan the Silent*. She is the daughter of a merchant of Boston, where she pursued her dramatic studies, and, when a child, played the part of Little Buttercup in *Pinafore*, at the Boston Museum. She has since appeared in a number of successful pieces, among them *The Charity Ball* and *Americans Abroad*, under Daniel Frohman's management; *Liberty Hall* and *Under the Red Robe*, with the Empire Theatre Company, which she joined in 1895; *Too Much Johnson*, in which she played with William Gillette in London, and Gillette's *Because She Loved Him So*, produced in Boston in 1898. In 1901 she appeared with John Drew in *The Second in Command*. Consult Strang, *Famous Actresses of the Day in America* (Boston, 1899).

CONQUEST OF GRANADA, grā-nā'dā, THE. (1) A tragedy by Dryden (1672), also called *Almanzor and Almahyde*. (2) A brilliant historical sketch by Washington Irving (1829) of the taking of Granada by Ferdinand and Isabella of Spain.

CONQUEST OF MEXICO, THE. A noted historical work by W. H. Prescott (1843), containing the life of Hernando Cortes and an account of ancient Mexican civilization.

CONQUEST OF PERU, THE. An historical work by W. H. Prescott (1847) containing an account of the Incas and their civilization.

CONQUISTADORES, kōn-kēs'tā-nō'rās (Sp., conquerors). A collective term for the Spanish conquerors of America, such as Cortes, Almagro, and Pizarro.

CONRAD I. (? -918). King of the Germans from 911 to 918. He was the son of Conrad, Duke of Franconia, and the grandson of the Emperor Arnulf. On the extinction of the direct line of the Carolingians, the Germans determined to make the sovereign dignity elective, but preferred to choose one who was related to the late imperial family, and elected Conrad in 911. He was supported by the Church, but could not command the obedience of the great dukes who were almost independent. He died December 23, 918, and was buried at Fulda. On his death-bed he enjoined his brother to carry the royal insignia to his mortal enemy, Duke Henry of Saxony, with whom he had been continually at war since A.D. 912. Consult: Stein, *Geschichte des Königs Konrad I.* (Nördlingen, 1872); Dümmler, *Geschichte des ostfränkischen Reiches*, vol. ii. (Leipzig, 1887).

CONRAD II. (c.990-1039). King of the Germans and Roman Emperor from 1024 to 1039, known as the Salic. He was the son of Henry, Duke of Franconia, and was elected King of the Germans in 1024, after the extinction of the Saxon imperial line, becoming the founder of the Franconian dynasty. Immediately after his election he commenced a tour through Germany for the purpose of administering justice.

To ameliorate the condition of his subjects, he instituted the Truce of God (q.v.). In 1026 he crossed the Alps, chastised the rebellious Italians, was crowned at Milan as King of Italy, and in the following year was anointed Emperor of the Romans by the Pope. He was soon recalled to Germany by the outbreak of formidable revolts, which he succeeded in suppressing. In 1032 he annexed the Arletan territories to the Empire. In 1036 a rebellion in Italy again compelled him to cross the Alps; but his efforts to restore his authority were this time unsuccessful, and he was forced to grant various privileges to his Italian subjects. Shortly after his return he died, at Utrecht, June 3, 1039. Conrad was one of the most remarkable of the earlier monarchs of Germany. He repressed the power of the great feudal nobles, and, by keeping the great duchies in his own family, strengthened the position of the Crown. Consult Bresslau, *Jahrbücher des deutschen Reiches unter Konrad II.* (Leipzig, 1879-84).

CONRAD III. (1093-1152). King of the Germans from 1138 to 1152. He was the son of Frederick of Swabia, and the founder of the Hohenstaufen (q.v.) dynasty. Conrad, with his elder brother, Frederick, supported Henry V. against his enemies, and in return that monarch granted Conrad the investiture of the Duchy of Franconia. He subsequently contested the crown of Italy with the Emperor Lothair of Saxony, but without success. On the death of Lothair the princes of Germany, fearing the increasing preponderance of the Guelph party, and attracted by Conrad's brilliant courage and noble character, offered him the crown, and he was accordingly elected at Aix-la-Chapelle, March 7, 1138. He was immediately involved in a quarrel with Henry the Proud, Duke of Bavaria and Saxony, and this was the origin of the conflict that raged for centuries between the Welfs or Guelphs, the partisans of Duke Henry, and the Waiblingers or Ghibellines, the supporters of the Franconian house. (See GUELPHS AND Ghibellines.) In 1147 Saint Bernard of Clairvaux commenced to preach a new crusade, and Conrad set out for Palestine at the head of a large army (see CRUSADES), in company with his old enemy, Welf of Bavaria. He died February 15, 1152. Consult: Bernharti, *Jahrbücher des deutschen Reiches unter Konrad III.* (Leipzig, 1883); Jaffé, *Geschichte des deutschen Reiches unter Konrad III.* (Hanover, 1845).

CONRAD IV. (1228-54). King of the Germans from 1250 to 1254. He was the son of Frederick II., and was born at Andria, in Apulia, April 25, 1228. He was elected King of the Romans in 1237, but was never crowned. Frederick II. died in 1250, and Conrad and William of Holland contended for the imperial throne. Unable to make head against the increasing anarchy in Germany, Conrad retired to Italy in 1251, and succeeded in reëstablishing the power of the Hohenstaufen in Naples in the face of the hostility of the Papacy. He died of fever, May 20, 1254. Consult: Schirrmacher, *Die letzten Hohenstaufen* (Göttingen, 1871).

CONRAD, kōn'rāt, JOHANNES (1839—). A German political economist. He was born in West Prussia, and was educated at Berlin and Jena. He became successively professor of political economy at Jena and Halle, and took a

prominent part in the proceedings of the second commission appointed to revise the civil code of Germany. In 1878 he became editor of the *Jahrbücher für Nationalökonomie und Statistik*, and associate editor of the *Handwörterbuch der Staatswissenschaften* (1889-95; 2d ed. 1898 et seq.). His works include: *Das Universitätsstudium in Deutschland während der letzten fünfzig Jahre* (1884); *Grundriss zum Studium der politischen Oekonomie*, which work, originally published in 1896, within five years had appeared in a third edition.

CONRAD, JOSEPH. An English novelist, the son of a Polish revolutionist. He passed his youth in Poland. On the death of his father, Conrad, then only thirteen years old, wandered to Marseilles, where he became a merchant seaman and afterwards captain in the merchant service. He has embodied his experiences in the Malay Archipelago in novels, fresh in subject and in style. They comprise: *Almayer's Folly* (1895); *An Outcast of the Islands* (1896); *The Nigger of the Narcissus*, published in the United States as *The Children of the Sea* (1897); *Tales of Unrest* (1898); *Lord Jim* (1900); *The Inheritors*, with F. M. Hueffer (1901); *Typhoon* (1902), and others.

CONRAD, ROBERT TAYLOR (1810-58). An American judge and dramatist, born in Philadelphia, Pa. While a student he wrote *Conrad of Naples*, a tragedy successfully represented in many cities. He wrote also for the press, and in 1832 began the *Daily Intelligencer*, which was soon merged in the *Philadelphia Gazette*. Failing health compelled his retirement from editorial work, and he became judge of the Court of Criminal Sessions, continuing until its dissolution, when he resumed his literary work and became editor of *Graham's Magazine* and associate editor of the *Philadelphia North American*. From this work he was called to be mayor of his city, and from 1856-57 was judge of the Court of Quarter Sessions. Judge Conrad, although an able lawyer and a brilliant orator, will be best remembered by his literary productions, notably his *Aylmere, or the Bondman of Kent*, a drama which Edwin Forrest purchased and played. In 1852 this was published with other poems.

CONRAD, TIMOTHY ABBOTT (1803-77). An American paleontologist, born in New Jersey. He was geologist in 1837 and paleontologist from 1838 to 1841, to the State of New York, and published a number of works whose high scientific value was recognized in Europe as well as in the United States. His paleontological writings include: *American Marine Conchology* (1831); *Fossil Shells of the Tertiary Formations of the United States* (1832); *A Monography of the Family Unionida of the United States* (12 parts, 1835-59). He was also the author of numerous original papers, a list of which may be found in the catalogue of the Royal Society of England.

CONRADE. (1) In Shakespeare's *Much Ado About Nothing*, a follower of Don Juan, taken in custody by Dogberry and Verges. He is the bastard brother of Don Pedro. (2) In Scott's *Talisman*, the Marquis of Montserrat, a conspirator against Richard Cœur de Lion.

CONRÄDER, kôn'râ-dêr, GEORG (1838—). A German painter. He was born at Munich,

studied under Piloty at the academy there, and first attracted attention by his "Billy in the Grave-Digger's Dwelling at Leipzig." Other works of his are: "The Destruction of Carthage" (Maximilianum, Munich), and "The Death of the Emperor Joseph II." He was appointed to a professorship in the Munich Academy.

CONRADIN (kôn'râ-dên) **OF SWABIA** (1252-68). The son of Conrad IV., and the last descendant of the imperial house of Hohenstaufen (q.v.). At his father's death he was only two years old. Innocent IV. immediately seized upon the young prince's Italian possessions, on the plea that the son of a prince who died excommunicated had no hereditary rights; and other enemies of the House of Hohenstaufen were only too glad to follow the Pope's example. Conradin was not left, however, totally friendless. His uncle Manfred took up arms in his behalf, drove the Papal forces from Naples and Sicily, and, in order to consolidate his nephew's authority, declared himself King till the young prince came of age. This antagonism between the Papacy and the Hohenstaufen induced Clement IV. to offer the crown of the Two Sicilies to Charles of Anjou (q.v.), an able warrior and politician. Charles immediately invaded Italy, and met his antagonists in the plain of Grandella, where the defeat and death of Manfred, in 1266, gave him undisturbed possession of the kingdom. The Neapolitans, however, detested their new master, and sent deputies to Bavaria to invite Conradin, then in his fifteenth year, to come and assert his hereditary rights. Conradin accordingly made his appearance in Italy, and, being joined by the Neapolitans in large numbers, gained several victories over the French, but was finally defeated, and, together with his relative, Frederick of Baden, taken prisoner near Tagliacozzo, August 23, 1268. The two unfortunate princes were executed in the market-place of Naples, on October 29. Consult Schirmacher, *Die letzten Hohenstaufen* (Göttingen, 1871).

CONRART, kôn'râr', VALENTIN (1603-75). A French writer, born in Paris. A careful student of modern languages, he became an authority on matters of style. He gathered about him a weekly circle of littérateurs, who read and discussed original works. In 1634, under the auspices of Richelieu, this company was organized by royal letters patent as the French Academy, of which Conrart became perpetual secretary. He wrote little—a few poems, letters, and brief *Mémoires*, besides compiling copious extracts from contemporary writers. Hence the well-known verse from the *First Epistle* of Boileau: "J'imite de Conrart le silence prudent." Consult Kerviler and Barthélemy, *Conrart, sa vie et sa correspondance* (Paris, 1881).

CONRING, HERMANN (1606-81). A German physician, jurist, and miscellaneous writer, born at Norden, East Friesland. He studied at Helmstedt and Leyden, in 1632 was appointed professor of natural philosophy at Helmstedt, and in 1636 professor of medicine. He subsequently was transferred to the chair of politics. In 1664 he was granted a pension by Louis XIV. of France, and in 1669 was appointed by the King of Denmark a Councilor of State. He was a determined opponent of alchemy, and contended for the pharmaceutical value of chemistry and for Harvey's theory of

the circulation of the blood. His *De Origine Juris Germanici* (1643) was the pioneer work on the history of German law; and his *Exercitationes de Republica Imperii Germanici* (1674) was an important contribution to the literature of the civil law. A six-volume edition of his works was prepared by Göbel, with a biography (Brunswick, 1730). Consult Stobbe, *Hermann Conring, der Begründer der deutschen Rechtsgeschichte* (Berlin, 1870).

CONSALVI, kôn-säl'vê, ERCOLE, Marchese (1757-1824). A Papal diplomatist and reformer of abuses in the Papal States. He became chamberlain to Pope Pius VI. in 1783, and auditor of the Rota Romana in 1792, in which office he displayed great administrative ability. As secretary of the conclave at Venice, in 1799, he contributed mainly to the election of Pius VII., who in 1800 made him a cardinal and Secretary of State. In this capacity he concluded with great diplomatic skill the concordat with Napoleon in 1801; but having afterwards incurred the displeasure of the Emperor by his stout resistance to the encroachments of France on the rights of his sovereign, Napoleon demanded his removal from office in 1806. After the Emperor's downfall, the Pope sent him as his representative first to London, to meet the allied princes assembled there; then to the Congress at Vienna, where, by his tact and moderation, he succeeded in securing the restoration of the Papal States, the government of which he assumed as Secretary of State, continuing in office until 1823. His clever management of the relations to the European Powers resulted in the conclusion of concordats with most of them under conditions most favorable to the Papal authority, and he made his domestic policy memorable by beneficial reforms and the suppression of abuses in various branches of administration. The sciences, literature, and especially the fine arts, are much indebted to his liberal patronage.

CONSANGUINITY (Lat. *consanguinitas*, from *consanguineus*, having the same blood, from *com-*, together + *sanguis*, blood). The relationship which subsists between persons who are of the same blood; that is, who are descended from a common ancestor. It is either direct, which is the relationship between ascendants and descendants; or collateral, between persons who have a common ancestor but are in a different line of descent; as cousins, who have the same grandparents on either their fathers' or mothers' sides, but who are the issue of different children of those grandparents.

DEGREES OF CONSANGUINITY. For legal purposes different degrees of consanguinity are established. Thus, in the direct line, a child is in the first degree from its parents, a grandchild in the second degree, and so on. In the collateral line degrees are established beginning with brothers and sisters and extending to the most distant collateral relatives.

The method of computing degrees varies in different jurisdictions according as they follow the civil or canon law in this particular. By the civil law the degrees are separately numbered downward to each party, the common ancestor not being counted. Thus, by this rule brothers would be in the second degree, uncle and nephew in the third, and so on.

By the canon law, where the parties are equally removed from the common ancestor, consanguinity is computed by the number of degrees between them and the common ancestor, and by this rule brothers would be in the first degree and others correspondingly one degree less than under the civil law.

The question of consanguinity is important, and sometimes controlling in determining a person's legal rights, qualifications, or disabilities, especially as to entering into certain relations with another, or acting in certain capacities. Thus the law prohibits marriage between certain relations; judges and jurors and other officers are sometimes disqualified from serving in their particular capacities because of relationship with persons who may come before, or deal with, them in public matters; and consanguinity within the prohibited degree is the gravamen of the crime of incest. It is the controlling factor in the laws of inheritance and descent, which, although they vary somewhat in different jurisdictions, are always based on relationship; and blood relatives always take in preference to collaterals. See AFFINITY; COLLATERAL; MARRIAGE; SUCCESSION; HEIR.

CONSCIENCE (Lat. *conscientia*, from *conscire*, to be conscious, from *com-*, together + *scire*, to know). A term that has been used with various shades of meaning. Perhaps the definition that agrees best with general usage, and with the requirements of the scientific treatment of ethics, is that conscience is the process of consciousness which surveys one's own past, present, or contemplated action, and judges that it comes up to or falls short of a moral standard—a process which is pleasant or unpleasant according as the judgment approves or condemns the act. See ETHICS.

CONSCIENCE, COURTS OF. English courts for the recovery of small debts, constituted by special local acts of Parliament in London, Westminster, and other trading districts. These courts were also called *courts of requests*. The first of these, the Court of Conscience for London, was created in the ninth year of Henry VIII., but others were subsequently established and their jurisdiction and procedure minutely regulated by Parliament. They were freely resorted to for the small cases within their jurisdiction, which was originally limited to 40s., but afterwards extended to £5. With the reorganization of the county courts in 1888 (the County Courts Act, 51 and 52 Viet. c. 43) the courts of conscience lost their importance, and were, with a few exceptions, abolished. See COURT.

CONSCIENCE, kôn'syân's, HENDRIK (1812-83). A Belgian novelist, distinguished for his pictures of Flemish village life. He was born in Antwerp, December 3, 1812, and was largely self-educated. He entered the army in 1830, left it in 1836, and in 1837 published his first novel in Flemish, *In the Wonderful Year 1566*, which won him great success, but left him in debt to his printer. Patronage secured him a post in a Government office. He wrote *Phantasy* (1837), a collection of fantastic tales, and *The Lion of Flanders* (1838). Finding office work irksome, he abandoned it for gardening, which in turn he gave up for a sinecure at the Royal Academy of Painting. In 1845 he was appointed associate professor in the University of Ghent and in-

structor in Flemish to the royal children. In 1868 he was made custodian of the Wiertz Museum. These posts and others were rewards for unlagging efforts to revive and stimulate a literary interest in Flemish. He died in Brussels, September 10, 1883. Among other well-known works of Conscience, most of which are translated into French and German and a few into English, are: *How One Becomes a Painter* (1843); *The Poor Nobleman* (1851); *The Good Luck to be Rich* (1855); *Duke Karl's Justice* (1876); *Benjamin of Flanders* (1880). He has probably contributed more than any other individual to the revival of Flemish literature. For his biography, consult Eckhoud (Brussels, 1881), and Pol de Mont (Haarlem, 1883).

CONSCIENCE WHIGS. A name applied to those members of the Whig Party in Massachusetts who in 1850 and thereafter refused to cooperate with those of their old associates—the so-called 'Cotton Whigs'—who declared that the slavery question had been permanently settled by the Compromise of 1850. In New York the two factions were known respectively as the 'Woolly Heads,' or 'Seward Whigs,' and the 'Silver Grays,' or 'Snuff-Takers.'

CONSCIOUS LOVERS, THE. A comedy by Sir Richard Steele (1722), modeled upon Terence's *Andria*. This play was an attempt by Steele to purify the stage, and is referred to in Fielding's *Joseph Andrews* as the only fit play for a Christian to see.

CONSCIOUSNESS. A term employed by psychology in two principal meanings. (1) In the first meaning, it is the equivalent of 'mental endowment' or 'the possession of mind.' I am conscious of the objects and persons about me, of my own successes or shortcomings, of the validity of an argument or the beauty of a work of art, in the sense that I am mentally alive to these things, am capable of a mental reaction upon them, whether by way of mere perception or by way of critical estimate and appreciation. So if I am sound asleep, or in stupor from a blow on the head or from the action of some drug, I am said to be 'unconscious'; my mental life and reactions are in abeyance. This meaning, which would perhaps have lapsed from psychological usage were it not deeply rooted in the phraseology of philosophy and in popular parlance, must be carefully distinguished from the second and more technical meaning, according to which (2) consciousness is simply 'present mind,' 'mind now,' the total mental experience given at a particular time. "Consciousness," says Wundt, "does not mean anything that exists apart from mental processes; nor does it refer merely to the sum of these processes, without reference to their mode of interrelation. It expresses the general synthesis of mental processes, within which the single complexes are marked off as more intimate connections." It is "a comprehensive interconnection of simultaneous and successive mental processes." We may therefore define it as a cross-section or temporal division of mind (q.v.); mind consists of a series of consciousnesses, more or less sharply differentiated. As we begin the day we have the waking consciousness, followed by the getting-up consciousness, the breakfast consciousness, the work consciousness, etc., etc.

The separate complexes which enter into and compose a consciousness are termed the 'contents of consciousness.' Thus, the consciousness of a writer, at his desk, contains various psychological ideas, mostly in verbal form; the perceptions of sight and touch that are aroused by the act of writing; a general feeling of effort, etc. The question of the 'range of consciousness,' i.e. of the number of mental processes that a single consciousness can contain, has been approached experimentally, and partly answered. It is found, e.g. that if an auditory consciousness be set up, by subjecting an observer (whose mind is otherwise unoccupied) to a continued series of metronome strokes, its range lies between the limits of 8 double impressions (16 strokes, rhythmically grouped in twos) and 5 eightfold impressions (40 strokes, rhythmically grouped in eights). In other words, a practiced observer can distinguish, without counting, between two successive series of 40 and of 39 strokes, if he be allowed to group by eights; whereas he cannot, however he may group them, distinguish between series of 41 and 42 strokes; these numbers exceed the maximal range of consciousness. The phrase 'state of consciousness,' formerly applied to mental processes like ideas, emotions, etc., now designates the mode of existence (clearness, prominence, obscurity, inhibition) of the contents of a particular consciousness; it is fully explained under ATTENTION (q.v.). Other phrases in general use are 'field of consciousness' and 'stream of consciousness,' the one formed after the analogy of the phrase 'field of vision,' the other emphasizing the essentially transient nature of conscious contents. Consult: Wundt, *Human and Animal Psychology* (London, 1896); id., *Outlines of Psychology*, trans. by Judd (London, 1898); Titchener, *Outline of Psychology* (New York, 1899); James, *Principles of Psychology* (New York, 1890). See SELF-CONSCIOUSNESS; UNITY OF CONSCIOUSNESS.

CONSCIOUSNESS, UNITY OF. See UNITY OF CONSCIOUSNESS.

CON'SCRIPT FATHERS. A name given to the Roman senators after the expulsion of the Tarquins, when Brutus added 100 to the number of senators, the names of the newcomers being 'written together' (*conscripta*) on the rolls with those of the original councilors. The proper designation was then *Patres et Conscripti*, afterwards abridged to *Patres Conscripti*.

CONSCRIPTION (Lat. *conscriptio*, from *conscribere*, to enroll, from *com-*, together + *scribere*, to write). The enlisting of men for military service by a compulsory levy. Conscription, in its modern sense, is built on the military constitution of ancient Rome. Four legions of infantry, two for each consul, and each legion containing 6666 men, were annually levied. The consuls, who in the time of the Republic were always commanders of the army, would announce by herald or written proclamation that a levy was to be made. The proper conscription was as follows: *Milites cogere, colligere, scribere, conscribere*. From 1798 conscription by compulsory levies, and individual selection determined by the drawing of lots, prevailed in France; but in 1872 substitution was abolished and personal service made obligatory on every man not physically unfit. Prussia followed France with a conscription system in

1813, which in a more exacting form was made universal throughout the German Empire in 1887. Continental European nations generally have now adopted it in one form or another. In England, the Ballot Act of 1860 provides that all males over 5 feet 2 inches in height, and between the ages of eighteen and thirty, be called upon to serve in the militia; but it is kept from enforcement by an annual army act passed for that purpose. During the Civil War President Lincoln several times recruited the armies of the North by levying drafts of men.

CONSCRIT DE 1813, kōx'skré' de mé lwē sän tráz, LE. An historical novel by Erckmann-Chatrian (1864). The hero, Joseph Bertha, is a poor young man who relies on his physical disabilities to save him from military service, but who is forced to join the ranks. His story sets forth the author's solution of the problem of harmonizing patriotism with the hatred of war.

CONSECRATION (Lat. *consecratio*, from *consecrare*, to hallow, from *com-*, together + *sacrare*, to consecrate, from *sacer*, holy). The act of solemnly dedicating a person or thing to the service of God. It is one of the most widely spread of all religious ceremonies of the ancient world, having been practiced in Chaldea, Egypt, India, Judea, Greece, Rome, Britain, and other countries. In the Old Testament we read of the consecration or dedication of the first-born, both man and beast, to the Lord, also the dedication of the Levites, of the tabernacle and altar, of fields, houses, walls, etc. The custom of consecrating the places of public worship developed in the Christian Church as soon as persecution ceased, when, according to Eusebius, "the sight was afforded so eagerly desired and prayed for by all—the festivals of dedications and consecrations of the newly erected houses of prayer throughout the cities." Eusebius also describes the consecration of the church built at Jerusalem by Constantine in A.D. 335. The practice of consecrating religious edifices has continued in the Oriental, Roman, and Anglican churches. The forms, as found in the sacramentaries of Gelasius and Saint Gregory, were at the first very simple, but they were gradually developed until, in the Roman Catholic Church, the office of consecration became a long and impressive ceremony. It includes the placing in the altars of relics of the saints, the purification of the place with specially prepared holy water (called Gregorian Water because the formula for its benediction is first found in the sacramentary of Saint Gregory), and the anointing of the church in twelve specified places with holy oil. The anniversary of this ceremony is kept as a festival of the first class. A church may not be consecrated until it is entirely free from debt; when the consecration is delayed, it is opened with a simple form of benediction. The ceremonies in the Eastern churches are as elaborate and not dissimilar. In the Church of England each bishop is left to his own discretion as to the form to be adopted, but that most generally used is the form sent down by the bishops to the Lower House of Convocation in 1712. The American prayer-book provides a simple form of prayer, which retains the old ceremony of the bishop knocking for entrance at the door of the church. For the consecration of bishops, see BISHOP; ORDERS.

HOLY; for that of the eucharistic elements, see MASS; LORD'S SUPPER.

CONSECUTIVES (Fr. *consécutive*, Sp., Port., It. *consecutivo*, from Lat. *consequi*, to follow, from *com-*, together + *sequi*, Gk. *ἐπείθεαι*, *hepēsthai*, Lith. *skėti*, Skt. *sac*, to follow, Goth. *saihwān*, Icel. *sjá*, AS. *sēon*, OHG. *schan*, Ger. *schen*, Engl. *see*). In music, the progressions of parallel fifths or octaves, which, according to the strict rules of harmony, are forbidden.

CONSENT (OF. *consente*, from *consenter*, to consent, from Lat. *consentire*, to agree, from *com-*, together + *sentire*, to think). In law, the free will and assent of the mind of a competent person to some act or obligation affecting his legal rights or relations. The law prescribes under what conditions it is binding, and when it is void or voidable. Thus, apparent consent obtained by fraud or coercion, or from an infant, or from an insane, intoxicated, or otherwise legally incompetent person, is deprived of all legal effect if such person chooses to avoid it. It is an essential element of contract, and is of the greatest importance in certain cases in the law of crimes and torts, where the essence of the crime or wrong is that it was against the will of the person injured. One may legally consent to the infliction of a limited amount of bodily harm if there is no malice involved, as in friendly boxing or in football; but one cannot consent to the infliction of death or anything which will amount to a breach of the peace. See AGE; CONTRACT; CRIME; TORT.

CONSENTES DI'I (Lat. *consentes*, of uncertain etymology and meaning, probably from *com-*, together + *sens*, being, pres. p. of *esse*, to be, cf. Skt. *sant*, being, from *as*, to be; less probably for *conscutiens*, *consentire*, to agree). The twelve chief Roman deities: Jupiter, Apollo, Mars, Neptune, Mercury, Vulcan, Juno, Vesta, Minerva, Ceres, Diana, and Venus.

CONSERVATION OF ENERGY, PRINCIPLE OF. See MECHANICS; ENERGETICS.

CONSERVATION OF MATTER. See MATTER, section *Properties of Matter*.

CONSERVATIVE. See WHIG; TORY; and POLITICAL PARTIES, GREAT BRITAIN.

CONSERVATIVE CLUB, THE. A Tory club founded in London in 1840. Its club-house is in Saint James Street.

CONSERVATOR OF THE PEACE. In the law of England, an ancient office of great dignity and authority. It existed at common law as an incident of certain tenures of lands held immediately of the King; or the King might appoint one to be his warden or the conservator of his peace; and before the institution of justices of the peace certain officers were so appointed. Now the only official conservators of the peace are certain officers who hold this power annexed to the offices which they hold. The sovereign, by virtue of his office, is the principal conservator of the peace in British realms. Several high officers of the Crown, the Chancellor or Lord Keeper, the Lord High Steward, the Lord Marshal, and the Lord High Constable, when there are such officers, all the justices of the Queen's Bench, the Master of the Rolls, are conservators of the peace throughout the whole kingdom, and may commit breakers of the peace or bind them in recognizances anywhere. Other

judges possess this power only within the limits of their own jurisdiction. The sheriff and coroner are conservators of the peace within their respective counties, and constables, tithing-men, etc., within their jurisdictions. The phrase is not in use in the United States. Consult Stephen, *Commentaries on the Laws of England* (13th ed., London, 1899).

CONSERVATORY (ML. *conservatorium*, place for preserving anything, from Lat. *conservare*, to preserve, from *com-*, together + *servare*, to keep, Ar. *har*, to preserve). A school for the cultivation of music in all its branches. Besides strictly musical subjects, stage department and the modern languages used in singing (German, French, Italian) are usually included in the curriculum. Originally, however, a conservatory was not a school of music, but an orphan asylum or institution of a benevolent character for the care of children of the poor. Such children as showed a talent for music were educated in the art. At first this instruction was given to the inmates only, but subsequently day-scholars also were admitted upon payment of a moderate fee. The oldest conservatory is the Conservatorio Santa Maria di Loreto in Naples, founded in 1537. Within the same century three more conservatories were established in the same city. By order of King Murat these were consolidated, in 1808, under the name Collegio Reale di Musica. Venice had four such institutions which ceased to exist with the downfall of the Venetian Republic. To-day the Conservatory of Venice is known as the Liceo Benedetto Marcello. The success of these schools was so pronounced that soon conservatories were founded all over Italy. Among the best known are (1) the Regio Conservatorio di Musica, in Palermo, founded 1615; (2) the Liceo Musicale, in Bologna, founded 1861, noted for its magnificent library, the greater part of which was bequeathed to it by Padre Martini and Gaetano Gaspari; (3) the Regio Conservatorio di Musica, in Milan, founded 1807; (4) the Civico Istituto di Musica, in Genoa, founded 1829; (5) the Liceo Musicale, in Turin, founded 1865; (6) the Liceo Musicale Rossini, in Pesaro, established in 1882 by a gift of 2,300,000 lire from Rossini. In France the necessity of a school for the education of singers led to the establishment, in 1784, of the Ecole Royale de Chant et de Déclamation. During the French Revolution, in 1793, owing to the scarcity of instrumental performers for the army, the course was extended, and the name was then changed to Institut National de Musique. In 1795 it was reorganized and has since been known as the Conservatoire de Musique. To-day it is beyond all question the most famous music-school in the world. Prizes are awarded in all the classes. The highest honor conferred is the Grand Prix de Rome, which entitles the winner to a three years' stay in Italy with a single condition: that the holder send from time to time original compositions as evidence of his progress. Nearly all the famous French composers of the last century have been winners of this prize. (See **PRIX DE ROME**.) There is scarcely a musician of note in France who has not been at some time a professor in the Conservatory. The directors since its foundation have been Sarette (the founder, 1784-1814); Perne (1814-22); Cherubini (1822-42); Auber (1842-71); A. Thomas

(1871-96); Dubois (1896—). The oldest among the German conservatories is that of Prague, founded 1811, which, in addition to the usual musical courses, offers also a liberal-culture course. The Vienna Conservatory was opened in 1817 by Salieri as a school for singing. It became a true conservatory in 1821. The most famous conservatory in Germany is that in Leipzig, founded by Mendelssohn and Schumann in 1843. Among its professors have been M. Hauptmann, L. Plaidy, E. F. Richter, Hiller, Gade, Moscheles, Reinecke, and Brendel. Among its pupils were Grieg, Sir A. Sullivan, Svendsen, Wilhelmj, Kirchner, Jadassohn. The oldest Berlin conservatory was founded in 1850 by Kullak, Marx, and Stern. Among its professors were Bülow, Kiel, de Ahna, B. Scholz. The Neue Akademie der Tonkunst (chiefly for piano) was opened in 1855 by Kullak. The most important of the Berlin conservatories is the Königliche Hochschule für Musik, a branch of the Royal Academy of Arts. It is divided into three parts: (1) Königliches Institut für Kirchenmusik; (2) Abteilung für musikalische Komposition; (3) Abteilung für ausübende Tonkunst. Among the professors have been Joachim, Ph. Spitta, Bargiel, Herzogenberg. The conservatory of Cologne was founded in 1850 by Hiller. The Dresden Conservatory was founded 1856, and that of Stuttgart in the same year. The famous Königliche Musikschule in Munich, founded 1867, offers, besides the musical, liberal-culture courses. Among the other famous German conservatories of to-day are those in Würzburg, Frankfurt, Hamburg, Breslau, Strassburg, Karlsruhe, Regensburg (church-music). Besides these public or State conservatories there are also a number of not less famous private conservatories, such as those of Sehawenka, Schwanzler, Klindworth, Freudenberg. Switzerland also boasts some efficient conservatories in Geneva, Zurich, Basel, Bern. One of the greatest and best-known conservatories is that in Brussels, founded 1813, among the directors of which were Fétis and Gevaert. The conservatories in Liège and Ghent are also famous. In Antwerp Peter Benoit founded, in 1867, entirely after German models, the well-known Vlaamsche Muziekschool. Nor is Holland behind in the efficiency of her conservatories. The Maatschappij tot bevordering van tonkunst was opened in 1862 at Amsterdam. Also the conservatories in Rotterdam and The Hague have risen to importance. The oldest conservatory in Russia is that of Warsaw, founded 1821; the most famous, that in Saint Petersburg, established 1862. Among its professors were Zarembo, Anton Rubinstein, Leschetitzky, Wieniawski, Davidoff, and Tschaikowski. A conservatory was also founded in Moscow in 1864 by Nicholas Rubinstein. In England we find five conservatories in London—the Royal Academy of Music (1822); the London Academy of Music (1861); the Trinity College Conservatory (1872); the Guildhall School of Music (1880). The best of all is the Royal College of Music, established originally by Sir Arthur Sullivan as the National Training School of Music (1876). Sir George Grove was the first director under the reorganized administration (1883-94). He was succeeded (1894) by C. H. Passy. All other European countries have now conservatories of more or less importance. In the United States

music has made enormous strides within the last quarter of a century, and conservatories have been founded in nearly all the larger cities. The best-known is the National Conservatory of Music of America, founded in New York, 1885. For a time A. Dvořák was the director. He was succeeded by Emil Paur. Among its professors have been Anton Seidl, R. Joseffy, B. O. Klein, D. Buck. Other well-known conservatories are the Peabody Institute in Baltimore (1871), the Cincinnati College of Music (1878), the New England Conservatory of Music in Boston (1882). Besides, some of the great American universities have added a complete course of music to their regular curriculum, as Harvard (John K. Paine), Yale (Horatio W. Parker), Columbia (E. A. MacDowell).

CONSERVATORY. In horticulture, a glass house used for the preservation of tender exotics and the display, rather than the propagation or growing, of plants which have been brought to their ornamental perfection in a greenhouse. The term is often applied loosely to any ornamental greenhouse. See GREENHOUSE.

CON'SHOHOCK'EN. A borough in Montgomery County, Pa., 13 miles northwest of Philadelphia; on the Schuylkill River, and on the Pennsylvania and the Philadelphia and Reading railroads (Map: Pennsylvania, F 3). The more important industrial establishments include rolling-mills, steel-mills, foundries, furnaces, surgical-implement works, and cotton and woolen mills, the principal products of which form the basis of an extensive trade. Conshohocken was founded in 1830, and was incorporated as a borough in 1852. Population, in 1890, 5470; in 1900, 5762.

CONSIDÉRANT, kôn'sé'dá'rán', VICTOR PROSPER (1808-93). A French socialist, born at Salins, in the Department of Jura. After being educated at the Ecole Polytechnique in Paris, he entered the army, which, however, he soon left to promulgate the doctrines of Fourier (q.v.). After the death of his master, Considérant became the head of the Societarians (q.v.), and undertook the management of the *Phalange*, a review devoted to the propagation of their opinions. Having gained the financial support of a young Englishman, Mr. Young, he established (1832) on a large scale, in the Department of Eure-et-Loir, a Socialist colony or *phalanstère*; but the experiment failed, and with it the *Phalange* went out of existence. However, a new organ of coöperative doctrine, the *Démocratie pacifique*, was soon established, and was edited by Considérant with great zeal, perseverance, and ability. In 1848-49 he was a member of the Constituent Assembly, but was accused of high treason and compelled to flee to Belgium. Thence he emigrated to Texas, where he founded, near San Antonio, a Societarian community, La Réunion; this, however, proved a failure, and Considérant returned to France in 1869. The most important of his numerous writings is *Destinée sociale* (1834-45). See COMMUNISM.

CONSIDERATION (Lat. *consideratio*, from *considerare*, to observe, from *com-*, together + *sidus*, star). In the law of contracts, in the case of a simple contract, a detriment or the surrender of a right by one party in exchange for the promise of the other party. In case of a bilateral contract—i.e. one in which the promises

are mutual—each promise is a consideration for the other. A consideration is essential to a valid simple contract. A mere promise made without a consideration is called by lawyers a naked promise (*nudum pactum*), and on it suit will not lie. Such a promise, even though made in writing, is not a valid legal contract; but by the law of negotiable paper it is presumed to be given for valid consideration. This presumption may be rebutted as between maker and payee, but is conclusive in favor of *bona fide* holders for value, against whom want of consideration is never a defense by the maker of negotiable paper. The requirement of consideration as a necessary element in a simple contract is due to the historical development of the contract action of *assumpsit* (q.v.) as an action in tort. In that action the plaintiff was required to show that he had given up a right or suffered some detriment in reliance upon, or in exchange for, the defendant's promise, by reason of which he had been damaged. Thus a consideration need not be in the form of a direct benefit to the contracting party, but may be something involving loss or prejudice to the second party to the contract. A service rendered gratuitously is not a consideration which will support a promise to pay for the service made subsequently to the rendering of the service, because such service is not rendered in reliance upon, or in exchange for, the promise; thus, where one man voluntarily rescues another's property from loss, and the second party promises to pay therefor, that promise cannot be sued upon even though made in writing. So a promise to reward another for performing his legal duty cannot be sued upon, since the performance of a legal duty is not the surrender of a right or any detriment in a legal sense. Thus, if a taxpayer promises to pay a policeman for guarding his house, it is held that, since it is the policeman's duty to guard the public's property, there has been no real consideration and no legal contract, and the promise of a debtor to pay his debt is not a consideration for a contract, as the promisor is already under a legal obligation to pay his debt. If, however, the promise is made after the debt is barred by the statute of limitations, the promise has the effect of reviving the obligation, and may be sued upon although no consideration is given for it. This is anomalous. The law takes no account of the adequacy of consideration if the contract is made in good faith; but if inadequacy results from fraud or mistake, the contract may be rendered void or voidable according to the circumstances of the case. If the consideration given is contrary to public policy, or is a promise to do an illegal act, the contract based therein is illegal and void. If the consideration be illegal only in part, still the contract is void unless it is possible to separate the illegal and the legal so that the one may be thrown out as void and the other enforced. Failure by one party to a contract to perform his contract is commonly, though erroneously, stated to be failure of consideration. The effect of a true failure of consideration is to prevent the formation of a contract. See CONTRACT; MISTAKE; FRAUD.

CONSIGNMENT (from Fr. *consigner*, to consign, from Lat. *consignare*, to seal, from *com-*, together + *signare*, to sign, from *signum*, sign). In mercantile law: (1) A quantity of goods de-

livered by one party, called the consignor, to another, called the consignee, for custody, for transportation, for sale, or pursuant to a contract for their sale. When they are delivered to a common carrier for transportation, the consignment is generally evidenced by a *bill of lading* (q.v.). (2) The act of consigning goods. See BAILMENT; CARRIER, COMMON; FACTOR.

CONSISTORY (Lat. *consistorium*, from *consistere*, to stand together, from *com-*, together + *sistere*, to station, from *stare*, to stand). Properly a place of assembly, but in later Latin the word came to mean a particular place where the Council of the Roman Emperor met, and, after the time of Diocletian and Constantine, the Council itself, which became the supreme judicial tribunal of the later Roman Empire. Up to the time of Marcus Aurelius, the Roman Emperor frequently exercised in person the supreme judicial authority, which covered matters brought directly before him for decision, as well as appeals from the judgments of the provincial praetors in all parts of the Empire. In the troublous times which succeeded, this function was devolved upon a council, made up largely of jurists, which acted in his name, and whose judgments were of equal authority with statutes immediately promulgated by him. These judgments of the consistory were known as decrees (*decreta*) and formed an important part of the imperial legislation (*constitutiones*) of the later Empire. In the membership of this Council were the imperial officials, and its function was to deliberate on the important affairs of legislation, administration, and justice. The form of the imperial consistory passed over into the early Christian Church. The bishops established their consistories, and the name was applied to the assemblies of the Roman clergy and the bishops of the suburban sees, out of which the College of Cardinals has developed. Public consistories are now held in the Vatican for formal functions, such as the giving of the hat to a cardinal, the final decision on the question of canonization, or the reception of an ambassador. Private consistories, to which none but cardinals have access, discuss a variety of administrative matters, such as the erection of new sees and the nomination of cardinals and bishops. The detailed work, however, is done in the committees, which are known as consistorial congregations. (See CONGREGATION.) In the Greek Church each bishop has his own consistory of three to seven members nominated by him and confirmed by the Holy Governing Synod. An appeal lies from the consistory to the bishop, and from the bishop to the synod.

In English ecclesiastical law, the consistory or consistorial court is the tribunal in which the bishop exercises his ordinary legal jurisdiction. This jurisdiction was formerly very extensive, including the trial for common-law offenses of clerks, or persons entitled to claim exemption from the process of the secular tribunals (see BENEFIT OF CLERGY), and to a very recent date the cognizance of all matrimonial causes, the probate of wills, the administration of decedents' estates, etc. The reform of the judicial procedure in England in 1857 transferred the latter classes of cases to the jurisdiction of the ordinary tribunals, leaving to the consistorial courts only their more strictly ecclesiastical jurisdiction. This is very consider-

able, however, and includes the trial of a clergyman for offenses against morality as well as upon questions of doctrine or ritual. In general, an appeal lies from the judgment of the consistory court to that of the archbishop—the Court of Arches (of Canterbury)—or the Chancery Court of York. The presiding officer of the consistory is the chancellor of the diocese, his judicial title being variously the ordinary, the official-principal, and vicar-general. See those titles; also ECCLESIASTICAL COURTS; ECCLESIASTICAL LAW; and consult Phillimore, *Ecclesiastical Law of the Church of England* (2d ed., London, 1895).

In the Lutheran State churches the consistory is a board of clerical officers either national or provincial, usually appointed by the sovereign and charged with various matters of ecclesiastical administration. These bodies exercise a supervision and discipline over the religion and education of the people, as well as over the clergy and the schoolmasters, and examine the candidates for the ministry for license and ordination. They have also the regulation of public worship and the administration of church property. In the Protestant churches of France the consistory exercises a more restricted jurisdiction than in Germany. In the Reformed (Dutch) Church the consistory is the lowest ecclesiastical court, having charge of the government of the local church and corresponding to the session of a Presbyterian church.

CONSOLACIÓN DEL SUR, kōn'sō-lā'thé-ōn' dēl sōor (Sp., Consolation of the South). A town in the Province of Pinar del Rio, Cuba, about 15 miles northeast of Pinar del Rio. It is noted for the excellent tobacco produced in its vicinity. Population, in 1899, 3062.

CONSOLATO DEL MARE (Sp., Consulate of the Sea). A celebrated code of maritime law, compiled, it is believed, at Barcelona in the fourteenth century, and made up of the settled usages, in respect to trade and navigation, of the maritime communities of the Mediterranean. The earliest copy known was published at Barcelona, in 1494, in the Catalan language. It contains (1) a code of procedure issued by the kings of Aragon for the guidance of the courts of the consuls of the sea; (2) a collection of ancient customs of the sea; and (3) a body of ordinances for the government of cruisers of war. It enjoyed considerable authority, and has passed, by legislation and by judicial adoption, into the maritime law of Europe and America. Its provisions were largely embodied in the French Maritime Code of 1681 (*Ordonnance sur la marine*). The code was translated into Italian and printed in Venice in 1549, and French, Dutch, German, and English translations have also been made. The most valuable portion, the customs of the sea, will be found printed in English in the appendix to the *Black Book of the Admiralty* (London, 1874). Consult: Robinson, *Collectanea Maritima* (London, 1801); Pardessus, *Collection des lois maritimes antérieures au 18ème siècle* (Paris, 1828-45); Reddie, *Researches, Historical and Critical, in Maritime International Law* (Edinburgh, 1844-45); Wheaton, *History of the Law of Nations in Europe and America* (New York, 1845); Schaubé, *Das Konsulat des Meeres in Pisa* (Leipzig, 1888); Valroger, *Etude sur l'institution des consuls de la mer au moyen-âge* (Paris, 1891).

CONSOLE, *kōn'sōl* (Fr., probably ultimately from Lat. *consolidare*, to strengthen, from *com-*, together + *solidus*, firm). In architecture, a projection resembling a bracket or corbel, frequently in the form of a letter S or of a single or double scroll, used to support cornices, or sometimes busts, vases, figures, etc. Consoles are often richly ornamented, and are, in fact, almost purely decorative features, differing in this from brackets (q.v.) and corbels (q.v.), which have a structural function.

CONSOLIDATION (Lat. *consolidatio*, from *consolidare*, to strengthen) **ACTS**. Statutes which combine in a single act all previous statutes relating to, and coming under, the same general subject-matter. As a general rule, this cannot be done by a mere collocation, or gathering together under one head, of acts of different dates in their original form; but they must be re-written, arranged in sections, all inconsistencies and surplusage be omitted, and uniformity of expression obtained, so that the whole may be a complete and logical act. Frequently, in order to do this, amendments to many of the measures which it is proposed to bring together are passed, and then they are re-enacted by the consolidation act. The meanings of various technical terms in the statutes are usually defined and explained in a sort of prefix, which is made a part of the whole, and is thus binding on the courts. The acts which are consolidated, and thereby superseded, are repealed by an express provision in the same measure. Consolidation measures have proved successful in England in rendering their statute law more simple and concise. Several of the United States have followed the idea, but generally have gone further, and enacted all the existing law on a given subject, whether contained in statutes or decisions, and the result is more in the nature of a codification act than a consolidation act as known in England. See **CODE**; **REVISED STATUTES**.

CONSOLS. A contraction of the words 'consolidated annuities.' In incurring the English debt, the Government borrowed money at different periods on special conditions, being generally the payment of an annuity of so much per cent. on the sum borrowed. Great confusion arose from the variety of stocks thus created, and it was thought expedient to strike an average of their value, and consolidate them into one fund, kept in one account at the Bank of England. The Consolidated Annuities Act was passed in 1757.

CONSONANCE (Lat. *consonantia*, from *consonare*, to sound together, from *com-*, together + *sonare*, to sound, from *sonus*, Skt. *svana*, sound, from *svan*, to resound), or **CONCORD**. In music, the simultaneous sounding of two or more tones belonging to the same major or minor triad. The effect upon the ear is entirely satisfying, so that further progression or resolution is not required, as it is in the case of dissonance (q.v.). This feeling of rest is attributed to the simple ratios existing between the number of vibrations of consonant intervals; whereas the ratios between dissonant intervals are complex. Consonant intervals are the unison, perfect fourth, fifth, and octave, as well as major and minor thirds and sixths. (See **INTERVAL**.) Chords formed by only consonant intervals are consonant chords. They are of two kinds, major and minor triads;

the major triad consisting of tonic, major third, and perfect fifth, the minor composed of tonic, minor third, and perfect fifth. See **ACOUSTICS**; **CHORD**; **HARMONY**; **TRIAD**.

CONSONANT. See **LETTERS**.

CONSORT (Lat. *consors*, partner, from *com-*, together + *sors*, lot; probably connected with Lat. *serere*, Gk. *εἶπερ*, *circin*, Skt. *si*, to join together). A term applied to the husband or wife of a reigning sovereign, viewed in a public capacity. Whatever political influence may attach to the position, the probability that the consort will attempt to secure some share in the royal prerogative is naturally greater where the consort is the husband; and as the royal spouse is most frequently a foreigner, national legislatures have always been careful to restrict his activity to the ornamental functions of royalty. In some cases, however, the husbands of ruling sovereigns have been granted a share in the government, a notable instance being that of Ferdinand of Aragon, who on his marriage to Isabella of Castile was declared joint ruler of that country.

CONSPIRACY (OF. *conspiracie*, *conspiratic*, from Lat. *conspirare*, to conspire, from *com-*, together + *spirare*, to breathe). As a criminal offense this has been judicially defined as "a combination by two or more persons, by some concerted action, to accomplish an unlawful purpose, or to accomplish a purpose not in itself unlawful, by unlawful means." It will be observed that the gist of this offense is in the agreement or confederation of the conspirators; an overt act pursuant to the agreement is not necessary to the completion of the crime, although, in most cases of conspiracy, such acts are performed. This doctrine of the common law has been changed by Federal legislation and by statutes in many of the United States. Under such legislation, the commission of an overt act to effect the object of the conspiracy is essential to consummate the crime; but as soon as that act is done the offense of conspiracy is complete, and is not in any way affected by the nature or results of the act, even though the act be such that it could not possibly accomplish the conspirator's intention.

When a conspiracy has been entered into, the conspirators become so related legally that the acts or statements of any of them in reference to the common purpose are admissible against all—each is the authorized agent of all. This rule often induces the public prosecutor to have persons indicted for a conspiracy, even when their confederation has resulted in the commission of other crimes, such as treason or murder.

Some of the more important common-law conspiracies were those to commit treason or sedition, to murder, to cheat and defraud, and to maliciously injure another. They were misdemeanors only. Statutory conspiracies, that is, acts declared by legislation to be punishable as conspiracies, have been raised to the rank of felonies, in some instances.

Whether conspiracy is a civil wrong of itself is a question upon which judges and writers differ. There is eminent authority for the view that it is a distinct tort—an actionable wrong, without respect to the consequences of the acts done pursuant to the confederation. The prevailing view at present, however, both in Eng-

land and in the United States, is that the gist of the civil cause of action is the actual damage done to the plaintiff, not the agreement or confederation against him.

Consult: Wright, *Law of Criminal Conspiracies* (London, 1873; Philadelphia, 1887); Bishop, *New Commentaries on the Criminal Law* (Boston, 1900); and *Commentaries on the Non-Contract Law* (Boston); also consult the *Encyclopædia of the Laws of England* (London, 1897).

CONSTABLE, kün'stä-b'l (OF. *conestable*, Fr. *conñtable*, from ML. *constabulus*, *comes stabulus*, *comistabuli*, constable, from Lat. *comes stabuli*, count of the stable). (1) An officer of great dignity and authority in the Eastern Roman Empire, whence the office passed, with varying functions but no loss of authority, to the western nations of Europe. The Constable of France, as commander-in-chief of the army and navy and chief arbitrator in chivalry, became the most powerful officer and dignitary in the State after the King, and, because of the danger to the Crown that lurked in its greatness, the office was abolished by Richelieu in 1627. The dignity was revived by Napoleon Bonaparte, but again abolished after the restoration of the monarchy. Across the Channel the office existed with similar functions, under the title of Lord High Constable of England, but it never attained to the authority which attended it in France, and it was suspended for reasons of economy by Henry VIII. It is now filled by temporary appointment on great occasions of state, as the coronation of the monarch, etc. Formerly the Lord High Constable, in conjunction with the Earl Marshal of England, held the courts of chivalry, or honor, and the courts martial of the kingdom. But the former jurisdiction has now completely lapsed, and courts martial are held by the ordinary military authorities. The court of the constable and marshal, therefore, while still nominally in existence, is practically obsolete. The office of constable still survives in Scotland, where it has become an hereditary dignity of the earls of Errol, but shorn of its former authority.

(2) The office of constable also existed in England with the signification of warden or keeper of certain royal castles and fortified towns. In a few cases it long survived as an hereditary office, and in some others it is filled by royal appointment. Of the latter class are the constables of the Tower of London and of Windsor and Dover castles.

(3) The peace officer whom we know as constable is the petty constable of English law, an officer of great antiquity—so called to distinguish him from the High Constables of Hundreds, created by the Statute of Winchester, 13 Edward I. (1285). The office has in recent years lost much of its importance in England, the institution of county and borough police having deprived it of most of its functions. In most of the United States, however, outside the cities, the constable continues to be the principal officer of the peace. As such he is invested with large powers of arresting, imprisoning, breaking open houses, executing civil and criminal process, and often with limited judicial functions. His duties are generally defined by statute. In cities, as in English boroughs and counties, his functions have generally been transferred to the police (q.v.). See **PEACE**; **SHERIFF**; and consult: Bacon, *New Abridgment of the Law*, title

Constable (any edition); Dalton, *The Country Justice: Containing the Practice, Duty, and Power of the Justices of the Peace*.

CONSTABLE, ARCHIBALD (1774-1827). A Scottish publisher, born in Fifeshire. He became famous for the sumptuousness of his editions and the liberality shown toward his employees. He published nearly all of Sir Walter Scott's works, and his failure in 1826, with that of Ballantyne & Co., involved Scott for £120,000. Constable became publisher of the *Scots' Magazine* (1801), and of the *Edinburgh Review* (1802), and owner of the *Encyclopædia Britannica* (1812), which he enlarged. He edited the *Chronicle of Fife* (1810), and wrote a *Memoir of George Heriot* (1822). Consult: Constable, *Archibald Constable and His Literary Correspondents* (3 vols., Edinburgh, 1873); and Lockhart, *Life of Scott* (7 vols., London, 1838).

CONSTABLE, HENRY (1562-1613). An English poet. He was graduated from Saint John's College, Cambridge, in 1580; became a Roman Catholic, and therefore found it best to live mostly on the Continent. He died at Liège, October 9, 1613. He wrote many pretty pastorals and sonnets to Diana, sometimes marred by conceits, and decadent in tone. His one independent publication was *Diana* (1592; enlarged, 1594; reprinted in Arber's *English Garner*, 1877). He contributed four pastorals to *England's Helicon* (1600), and sonnets to other collections. Sixteen "Spiritual Sonnets," attributed to Constable, were first printed by T. Park in *Heliconia* (1815).

CONSTABLE, JOHN (1776-1837). An English landscape painter, the founder of modern landscape art. He was born on June 11, 1776, in East Bergholt, Suffolk, the son of a wealthy miller. His father intended him for the clergy, and afterwards tried him as a miller, but the youth's taste was all for art. He received his first instruction from a local amateur named Dunthorne, with whom he painted the scenes about his native home, always in the open air. In 1795 he went to London in order to study painting, but was recalled soon afterwards. In 1799 he returned to London and entered the Academy School, where he received instruction from Farrington and Reinagle. He was greatly impressed with the works of Ruysdael in the National Gallery. At first he attempted portraits and historical subjects, according to the custom of the day, but in 1803, weary of studying pictures and of acquiring truth second-hand, he returned to East Bergholt. From this time he painted landscapes from nature only, passing at least the summer months entirely in the country near his home.

His work, however, was too revolutionary and original to become popular in his native land, although he found a few devoted friends who believed in him and bought his pictures. Among these were Sir George Beaumont, the Mæcenas of his boyhood, Bishop Fisher, of Salisbury, and his nephew, Archdeacon Fisher. Constable's most intimate friend, and, above all, Miss Maria Bicknell, whom he afterwards married. He did not sell a single picture to a stranger until 1814, but was compelled to support himself by painting portraits and copies of paintings. But never discouraged, he worked on in his quiet way, knowing well that the future was his. At length

JOHN CONSTABLE

"THE HAY WAIN"

FROM THE PAINTING IN THE NATIONAL GALLERY, LONDON

he found recognition in France. In 1823 three of his pictures were exhibited at the Salon, where they excited the greatest admiration, and were accorded the place of honor in the exhibition. The King of France sent Constable a gold medal, and the same honor was accorded to him in the following year at Lille. At last, in 1829, came the tardy honor of membership in the Royal Academy, but accompanied by an ungracious remark on the part of the president, and too late to afford satisfaction to the painter.

Constable was a simple and noble character, who bore bravely discouragement and adversity, and never wavered in his ideal of art. His other great passion in life was his love for his wife, Miss Maria Bicknell, to whom, after many difficulties, he was secretly wedded in 1816. With a family of seven children, he was sometimes hard pressed for money, until he was at length relieved by his own inheritance and the ample inheritance of his wife. In 1827 he removed to his favorite Hampstead, where many of his best pictures were painted. He was greatly bereaved by the death of his wife in 1828, and died unexpectedly on March 30, 1837.

Constable was a great innovator in landscape painting, and he may be justly termed the father of the modern school. The old Dutch masters gained their effects by giving the forms of objects, placing more weight upon drawing than upon color, in which they achieved harmony by a uniform brown tone. Constable saw that landscape is rather a problem of light and air, and that its effect depends upon the light and shadow in which the objects are seen. He was the first to paint the subtle gradings of the atmosphere, and to show not only the objects themselves, but how he saw them. He laid on his colors fresh and fair, as they are in nature, applying to oil paintings the results of water-colors. His pictures are always harmonious in tone. He always gives the effect of a landscape, suppressing unimportant details—a tendency which increases with his later years. He frequently uses the palette knife, sometimes executing the entire picture by this means, as in the case of "Waterloo Bridge." In consequence of these teachings an able group of landscape painters arose in England in the forties and fifties, the most important of whom was David Cox (q.v.). But his greatest successors were the French painters of the Barbizon School, through whom his work has been transmitted to the landscape of the present day.

The National Gallery in London contains three of his finest works, the "Cornfield" (1826); "Valley Farm" (1835); and "Hay Wain." In South Kensington Museum are eight of his works, among which are "Deadham Mill" (1820); "Hampstead Heath" (1823); and "Water Meadows Near Salisbury." The Louvre has three good examples: "The Cottage," "Weymouth Bay" (1827), and the "Glebe Farm." Twenty of his chief works were published in 1833 in a series of fine and sympathetic etchings by his friend David Lucas, with an introduction by Constable himself.

Consult: Muther, *History of Modern Painting* (London, 1896), vol. ii.; Leslie, C. R., *Memoirs of Constable* (London, 1845), containing Lucas's plates; Chesneau, *La peinture anglaise* (Paris, 1882); Brock-Arnold, *Gainsborough and Constable* (London, 1881); Wedmore, *Studies in English Art* (London, 1876-80).

CON'STANCE (Ger. *Konstanz* or *Kostnitz*). A city of the Grand Duchy of Baden, situated on both banks of the Rhine, where it leaves Lake Constance, about 35 miles northeast of Zurich (Map: Germany, C 5). Remains of its ancient fortifications are still extant in the two old city gates. The cathedral, founded in the eleventh century, was rebuilt in the fifteenth century. The carved oak portals and choir-stalls are fine specimens of wood-carving. It was here that Huss was sentenced by the council to be burned at the stake. Other ecclesiastical buildings of interest are the Church of Saint Stephen and the Dominican monastery, on an island, in which Huss was confined, and now used as a hotel. The notable secular buildings include the old Kaufhaus, containing the hall in which the conclave of cardinals met to elect a pope at the time of the famous council in 1417; the Rosgarten, the former guildhall of the butchers, containing an interesting museum; and the town hall, with the city archives. Constance has manufactures of linen and cotton, carpets, soap, and chemicals. Population, in 1890, 16,235; in 1900, 21,345. Constance was known to the Romans at least as early as the third century. In 570 it was made the seat of a bishopric, which existed as one of the most powerful in Germany until its secularization in 1803. In 780 Constance was given municipal rights, and in 1192 was made a free imperial city. For joining the Schmalkaldic League it was deprived of its imperial privileges in 1548 and presented to Archduke Ferdinand of Austria. In 1806 it became a part of the Grand Duchy of Baden. Consult *Geschichte der Bischöfe von Konstanz* (Innsbruck, 1894-96).

CON'STANCE. (1) Daughter of the Emperor and eventually the wife of King Alla, in Chaucer's *Man of Law's Tale*. (2) The mother of Prince Arthur, in Shakespeare's *King John*. (3) Nonesuch's daughter, enamored of Lovely, in Dryden's *Wild Gallant*. (4) The heroine of Brome's *The Northern Lass*. (5) Fondlove's daughter and Wildrake's mistress, in Knowles's comedy *The Love Chase*. (6) The daughter of the Provost, later proved a serf, in G. W. Lovell's *Provost of Bruges*.

CONSTANCE, or CUSTANCE, DAME CHRISTIAN. A rich and beautiful widow in Udall's play *Ralph Roister Doister*.

CONSTANCE, COUNCIL OF. The sixteenth ecumenical Church council (1414-18) called by Pope John XXIII, at the suggestion of the Emperor Sigismund, to attempt to heal the Papal schism (see **SCHISM, WESTERN**), the scandal of which was then at its height; to deal with the Hussite heresy; and to consider measures for the general reform of the Church. It was the most brilliant and numerously attended Church council ever held. Dignitaries of Church and State, with large retinues, attended from all the countries of Europe; and many merchants and artisans, with a miscellaneous crowd, including showmen, players, and harlots, were attracted by the occasion. It is said that more than 18,000 priests, and in all about 100,000 strangers, were gathered in the city. The predominating influence of Pope John was nullified by a decision to vote by nations rather than by individuals, and it was proposed that all the three rival popes should abdicate. John fled from the city and attempted to dissolve the Council,

which then (April, 1415), under the lead of Jean de Gerson (q.v.), declared itself the highest authority of Christendom and above the Pope. John was deposed and condemned to imprisonment for life. Gregory XII. voluntarily withdrew, and Benedict XIII. was deposed and retired to Spain, where he spent the remainder of his life, without power or influence. The election of a new Pope was temporarily postponed. Huss was condemned after a turbulent trial, and burned at the city gate, July 6, 1415. Jerome of Prague was also condemned and perished at the stake, May 30, 1416. The movement for reform came to nothing. A beginning had been made, when the cardinals, with the help of the French, succeeded (November, 1417) in electing Otto Colonna (Martin V.) Pope, who brought the proceedings to an end with some slight concessions. Consult: Richtenthal, *Kronik des Konziliums in Konstanz* (Augsburg, 1533; new ed. Tübingen, 1882); Leufant, *History of the Council of Constance* (Eng. trans., London, 1730); Finke, *Forschungen und Quellen zur Geschichte des Konstanzer Konzils* (Paderborn, 1889). See JOHN XVIII.; GREGORY XII.; BENEDICT XIII.; MARTIN V.; HUSS, JOHN; JEROME OF PRAGUE.

CONSTANCE, LAKE (named from the city of *Constance*, Ger. *Konstanz*, or *Kostnitz*, Lat. *Constantia*; German *Bodensee*, formerly *Bodemsee*, *Bodnensee*, *Bodmansee*, from the castle of *Bodman* on its shores, ML. *Lacus Podamicus*, *Mare Podanum*, Lat. *Lacus Brigantinus*, *Lacus Venetus et Acronius*). A lake of glacial origin, situated at the north base of the Alps and forming a portion of the boundary between Switzerland and Austria (Vorarlberg) on the south, and the German States of Baden, Württemberg, and Bavaria on the north (Map: Switzerland, D 1). It is on the course of the Rhine, which enters from the south and flows out in a westerly direction. Lake Constance extends northwest and southeast, and at its northwest end forks into a northern prolongation known as Ueberlinger See, which has a broad connection with the main lake; and into a southern fork, called the Lower Lake (Untersee), formerly known as the Zeller See, connected with the main lake by a narrow channel, 600 to 1600 feet wide, and only two and one-half miles long. The outlet of the lake is at the foot of this arm. The height of its surface is about 1300 feet above sea-level; the length of the lake is about 40 miles; the greatest breadth about nine miles; the length of shore line 160 miles, and the area 208 square miles. The greatest depth is 906 feet. The water of the lake is subject to sudden rises of from three to twelve feet, due to the melting of the snows. While the Rhine from the south is the main affluent, a number of minor streams discharge into the lake, nearly all of them on the northeast side. Among these tributaries are the Bregenz Ach, Leblach, Argen, Schussen, Steinach, Ach of Uhlhingen, and Stoekach.

The lower lake is covered with ice nearly every winter, but it is only rarely, in an extreme winter, that the surface of the main lake becomes frozen. The lake contains twenty-six varieties of fish, among them salmon and salmon trout, and twenty-two species of shell-fish. The shores are hilly and picturesque. The land is productive and in great part under cultivation, but extensive woodlands still remain. Lake Con-

stance formerly extended much farther south than at present, and even within historic times, in the fourth century, it extended as far as Rheineck (Rheinegg). The towns on the shores of Lake Constance are Bregenz, Lindau, Friedrichshafen, Ueberlingen, Constance, Arbon, and Rorschach. Steamboats navigate the lake, and railways follow its shores.

CON'STANS. In the old romances, a King of Britain, and grandfather of Arthur.

CONSTANS, FLAVIUS JULIUS. A Roman Emperor (A.D. 337-50). He was the youngest son of Constantine the Great (by Fausta), and was born A.D. 323 (or 320). He was made Crown Princee (*Cæsar*) in 333, and became Emperor together with his brothers Constantine and Constantius, on the death of their father in A.D. 337. Constans received the government of Italy, Illyricum, and Africa. In 340, however, war broke out between the brothers and Constantine was killed near Aquileia. Constans now ruled also his brother's dominions. He was killed by a soldier of the self-proclaimed Emperor, Magnentius, January, 350.

CONSTANS, KÖN'STÄN', JEAN ANTOINE ERNEST (1833—). A French statesman, born at Béziers. He was appointed Under-Secretary of State in the Freycinet Cabinet in 1879, and was Minister of the Interior in the Freycinet and Ferry Cabinets (1880 and 1881). After serving for one year as Governor-General of Indo-China, he was compelled in 1887 to resign this position as incompatible with his duties as a Deputy. From 1889 to 1892 he was again Minister of the Interior (in the Cabinets of Tirard and Freycinet), and during this period his vigorous measures served to overthrow Boulangism. In 1887 he was elected to the Chamber of Deputies, and in the following year received an appointment as Ambassador to Constantinople.

CONSTANT, KÖN'STÄN', JEAN JOSEPH BENJAMIN (1845-1902). A French painter, born in Paris, June 10, 1845. In 1866 he obtained a municipal prize entitling him to free instruction in the Ecole des Beaux-Arts, and he was besides this a pupil of Cabanel. In 1872 he went to Morocco, where he painted a series of Oriental scenes, which brought him great reputation. Among his chief works of this character are the "Last Rebels" (now in the Luxembourg Gallery), and the "Thirst," and "Les Chérifas." His large canvas, "The Entrance of Mahomet II. into Constantinople," received a medal in 1876. All these works show him to be a fine colorist and a master of technique. After 1880, however, he changed his manner, devoting himself to mural decorations and to portraits. The most prominent examples of the former are a great plafond in the Hôtel-de-Ville, Paris, entitled "Paris Convoking the World," and his paintings in the New Sorbonne, representing "Literature," "The Sciences," and the "Academy of Paris." He painted important mural decorations in other cities of France, and was equally distinguished as a portrait painter. A good example of his portraiture is "Mon Fils André," which took the medal of honor at the Salon in 1896. Constant was made Officer of the Legion of Honor in 1894, and died on May 26, 1902. He visited the United States several times, and painted a number of portraits, now in private possession. The Metropolitan Museum of New

York possesses a large mural decoration by Constant representing "Justinian in Council." Constant was also a writer of repute, having contributed a number of good studies on contemporary French painters. Consult Stranahan, *Modern French Painters* (New York, 1893).

CONSTANT'A. See KÜSTENDJE.

CONSTANT DE REBECQUE, kōn'stān' de rā'bēk', HENRI BENJAMIN (1767-1830). A distinguished French politician and novelist, born at Lausanne, October 23, 1767. His family was Protestant, and had taken refuge in Switzerland from religious persecution. Till thirteen, Constant studied at Lausanne, then successively at Oxford, Erlangen, and Edinburgh, laying the foundations of a cosmopolitan culture that explains his affinity for Madame de Staël. He was a moderate Republican during the Revolution, and after 1795 settled in Paris, where his political writings, especially his pamphlet, *De la force du gouvernement actuel de la France*, attracted great attention. In 1799 Bonaparte called him to the tribunate, but he opposed the First Consul's attack upon constitutional rights, and was exiled in 1802. His political career thus checked, he turned to literature, and accompanied Madame de Staël, like him an exile, on her travels. At Weimar he learned to know Goethe and Schiller. He translated, or rather adapted, the latter's *Wallenstein*. He also wrote *Adolphe* (1816), a literary result of his relations to Madame de Staël, who had put her experience with him into *Delphine*: This sole novel of the versatile politician is a clear, keen, relentless analysis of the mutual degradation resulting from ill-assorted matings. It is brief, almost cruelly simple, and told in a style as precise and dry as that of a mathematical demonstration. Chivalrous toward Madame de Staël, he is pitiless to himself, to his father, to his former love, Madame de Charrière, and to their officious friend, Madame Récamier. Constant's *Correspondence*, his *Journals*, all that we know of his life, show him, as he reveals himself here, always seeking emotion, never attaining to passion. With this novel still unpublished, he returned to France after Napoleon's first abdication (1814), with the prestige of his stirring pamphlet *De l'esprit de conquête et de l'usurpation* (1813). He hoped to find the Restoration more favorable to constitutional liberty than Napoleon's 'government of mame-lukes,' but he was soon undeceived. During the Hundred Days, he cooperated with the returned Emperor, and assisted in drawing up the *acte additionnel* to the Constitution. After Waterloo he retired to England, but was permitted to return to France in 1816. He joined the liberal writers of the day, and was elected Deputy in 1819. He became the acknowledged leader of the opposition to Charles X., and the most brilliant champion of a constitutional monarchy. He deplored the violence of the Revolution of July, which occurred while he was convalescent in the country. At the request of Lafayette he returned, and for the few months that remained to him of life supported the Government of Louis Philippe and the principles to which his political life had been dedicated. He died at Pau, December 8, 1830. Constant was not a graceful speaker, but a singularly effective writer. His speeches are collected as *Discours* (2 vols., 1828); his essays on representative government as *Cours de politique constitutionnelle* (4 vols., 1817-20).

He wrote also *Mémoires sur les Cent Jours* (1820), and *De la religion considérée dans sa source, ses formes, et ses développements* (1824-31), in which he undertook to show that the religious instinct remained essentially unaffected through all changes of dogma and forms. In teaching that Christianity had "introduced moral and political liberty into the world," he widened the breach with the thought of the eighteenth century shown and in part caused by the *Génie du Christianisme* of Chateaubriand. "Lucian was incapable of understanding Homer," he said; "Voltaire has never understood the Bible." Consult: Faguet, *Politiques et moralistes* (Paris, 1898), and Sainte-Beuve, *Nouveaux Lundis*, vol. i. (Paris, 1863), and *Portraits littéraires*, vol. iii. (Paris, 1864).

CONSTANTIN, kōn'stān'tān', ABBÉ. The lovable, benevolent old parish priest in Ludovic Halévy's graceful romance *L'Abbé Constantin* (1882), a revulsion from the sensational work of the naturalistic school. It tells the simple story of the good abbé and his old housekeeper, the wealthy American woman who becomes his collaborer in good works, and her sister, who falls in love with a young lieutenant. A successful comedy under the same title was adapted from the romance by Crémieux and Decourcelle, and presented at the Gymnase in 1887.

CONSTANTINA, kōn'stān-tē'nā. A town of Spain, in the Province of Seville, about 40 miles north-northeast of Seville (Map: Spain, C 4). It is in a mountainous region, and has silver and lead mines, lumbering interests, distilleries, and tanneries. Population, in 1901, 9687.

CONSTANTINE, kōn'stān-tēn'. A fortified city and a Catholic episcopal see, the capital of Constantine, the easternmost department of Algeria (Map: Africa E 1). It is situated on a precipitous hill with a flat summit, three sides of which are washed by the Rummel, flowing through a deep and narrow ravine. The fourth and west side is connected by a natural mound with the surrounding mountains. It is 830 feet above the river and 2162 feet above the sea. It is surrounded by walls constructed by the Arabs out of Roman sculptured stones. The streets in the Moorish or older portion of the town are narrow and dirty, and the houses mean. The chief ancient buildings are the Kasba, or citadel, of Roman construction; the palace of the Bey; the harem of Salah; and three mosques, one of which, Suk-er-Rezel, dating from 1143, is now the Christian Church of Notre Dame des Sept Douleurs. The modern and French portion of the town is marked by wide streets and open squares. Its principal buildings include the Palais de Justice, administrative buildings, the Protestant church, and theatre. The Mohammedans support a medreso, or religious seminary, and the French Government maintains a college and other educational institutions for Arabic and European culture. There are an archaeological society and museum of local antiquities. The town has manufactures of woolen cloths, saddlery, and other articles in leather, and a considerable grain trade with Tunis. Its seaport for foreign trade is Philippeville, 50 miles to the northeast, with which and the principal towns of Algeria it is connected by rail. Constantine, anciently one of the most important towns of Numidia, called Carta by the Carthaginians,

and Cirta by the Romans, was a royal residence. It was destroyed in the wars of Maxentius against Alexander, about A.D. 311, but was soon rebuilt by Constantine the Great, from whom it derives its present name. It was a flourishing town in the twelfth century, its commercial relations extending to Venice, Genoa, and Pisa. Subsequently it shared in general the fortunes of Algeria. The French captured it by assault, after a long siege, in 1837. Population, in 1901, 48,911, including 15,096 French residents.

CONSTANTINE. The name of two popes.—**CONSTANTINE I.** (Pope 708-15). His pontificate was marked by the submission of Felix, Archbishop of Ravenna, to the supremacy of Rome, and by his voyage to Constantinople, at the invitation of Justinian II., to confirm the decrees of the Quinisextan Council, which his immediate predecessor had refused to do.—**CONSTANTINE II.** (Pope 767-68). He was forced into the see by his brother, Duke Toto of Nepi, but within a few months was overthrown and blinded by an opposing faction, his deposition being solemnly confirmed by the Lateran Synod of 769, which laid down the rule that the Pope must be chosen from the College of Cardinals.

CONSTANTINE I., FLAVIUS VALERIUS AURELIUS CONSTANTINUS, surnamed 'the Great,' A Roman Emperor (A.D. 306-337). He was born soon after A.D. 270, at Naïssus, in Mœsia. He was the eldest son of Constantius Chlorus, and first distinguished himself by his military talents under Diocletian, in that monarch's famous Egyptian expedition (296); subsequently he served under Galerius in the Persian War. In 305 the two emperors, Diocletian and Maximian, abdicated, and were succeeded by Constantius Chlorus and Galerius, who could not endure the brilliant and energetic genius of Constantine, took every means of exposing him to danger, and it is believed that this was the period when he acquired that mixture of reserve, cunning, and wisdom which was so conspicuous in his conduct in after years. At last Constantine fled to his father, who ruled in the West, and joined him at Boulogne just as he was setting out on an expedition against the Piets in North Britain. Constantius died at York, July 25, 306, having proclaimed his son Constantine his successor. The latter now wrote a conciliatory letter to Galerius, and requested to be acknowledged as Augustus. Galerius did not dare to quarrel with Constantine, yet he granted him the title of Cæsar only. Political complications now increased, and in a short time no fewer than six emperors were 'in the field'—viz.: Galerius, Licinius, and Maximin in the East, and Maximian, Maxentius (his son), and Constantine in the West (A.D. 308). Maxentius, having quarreled with his father, forced him to flee from Rome. He took refuge with Constantine, but was ungrateful enough to plot the destruction of his benefactor. This being discovered, he fled to Marseilles, the inhabitants of which city gave him up to Constantine, who put him to death (A.D. 309). Maxentius professed great anger at the death of his father, and assembled a large army, with which he threatened Gaul. Crossing the Alps by Mont Cénis, Constantine thrice defeated Maxentius—first near Turin, then under the walls of Verona, and finally near

the Milvian Bridge at Rome, October 27, 312, Maxentius himself, in the last of these engagements, being drowned in an attempt to escape across the Tiber. It was during this campaign that he was said to have had the apparition in the sky of a luminous cross with the words *Hoc signo vinces*, "by this sign shalt thou conquer," as the contemporary historians Eusebius and Lactantius record. Constantine now entered the capital, disbanded the pratorians, and adopted other judicious measures for allaying the public excitement. He was honored with the title of Pontifex Maximus, or supreme dignitary of the pagan hierarchy.

Constantine was now sole Emperor of the West. Similarly, by the death of Galerius in 311 and of Maximin in 313, Licinius became sole Emperor of the East. In 314 a war broke out between the two rulers, in which Licinius was worsted and was fain to conclude a peace by the cession of Illyricum, Pannonia, and Greece. Constantine gave Licinius his sister Constantia in marriage, and for the next nine years devoted himself vigorously to the correction of abuses in the administration of the laws, to the strengthening of the frontiers, and to chastising the barbarians, who learned to fear and respect his power. In 323 war was renewed with Licinius, who was defeated and ultimately put to death. Constantine was now at the summit of his ambitions—the sole governor of the Roman world; but Rome was no longer the political or geographical centre of this world, and he determined to move the capital to Byzantium, which he solemnly inaugurated in 330 under the name of Constantinopolis, the City of Constantine. From here he ruled his vast empire until his death, which occurred May 27, 337. From the reign of Constantine, Christianity was not only recognized and tolerated, but became the religion of the rulers themselves. As to Constantine's personal feeling in the question of Christianity and paganism much has been written. By birth and education he was much inclined toward the growing faith; his mother was a Christian, and his father Constantius, though a pagan, was very tolerant, and would allow no direct acts of violence in his part of the Roman domain during the great persecution of 303. Constantine was by nature mild and kind-hearted; his legislation was governed by humane principles. He abolished the system of branding the faces of convicts; ordained that masters who killed their slaves were guilty of homicide, and published an edict of toleration which insured liberty of conscience throughout the Empire. The Christians were as yet but a minority of the whole population, but the Emperor openly sympathized with them and did not hesitate, upon occasion, to insult the pagans. Yet his Christianity was not deep-seated, though doubtless quite sincere as far as it went. He looked upon his overthrow of Maxentius as due to the help of God, *instinctu divinitatis*, as the inscription on his arch in Rome (see **CONSTANTINE, ARCH OF**), built in 315, shows; but the very form of expression displays a concession to pagan sensibilities that a rigorous Christian of the period would not have made. He retained the traditional pagan title of Pontifex Maximus, as did his Christian successors of the fourth century, and his coins still bear the figures and names of the old gods. In the Arian controversy he sided with the Catholic bishops,

THE ARCH OF CONSTANTINE

and it was he who called the great Council of Nicæa (Nice) in Bithynia in 325 (see NICE, COUNCIL OF), and presided at the first sitting. By this council the doctrine of consubstantiality was defined, and the Nicene creed was adopted; but Constantine took no active part in the discussion. He did not receive baptism until shortly before his death.

CONSTANTINE II., or JUNIOR, FLAVIUS CLAUDIUS CONSTANTINUS. A Roman Emperor (A.D. 337-40). He was the eldest son of Constantine the Great, and was born A.D. 317, at Arelate (Arles), in Gaul. He became joint Emperor with his brothers, Constantius and Constans, on the death of their father, in 337, receiving Gaul, Britain, Spain, etc., as his share of the Empire. In 340 he invaded the dominions of Constans, and was killed in the battle of Aquileia (A.D. 340).

CONSTANTINE VII., PORPHYROGENITUS (905-59). A Byzantine Emperor. He became, at the age of six, associate Emperor with his father, Leo VI., at seven the associate of his uncle, and at eight sole ruler; but in reality he was the ruler only after the death of his father-in-law, Romanus (q.v.), in 944. Even then, he paid more attention to literature than to State affairs, leaving the latter to his wife Helena. It is reported that he was poisoned by the wife of his son Romanus, who was his successor. He wrote a life of his grandfather, Basil I., and a number of political works, including: *On the Themes*; *On the Ceremonies at the Court of Constantinople*; and *On the Administration of the Empire*. Some of his works are published, in three volumes, in the Bonn edition of the Byzantine Historians. Consult: Krumbacher, *Geschichte der byzantinischen Litteratur* (Nördlingen, 1891); Rambaud, *L'empire grec au Xe siècle*; *Constantin Porphyrogénète* (Paris, 1869).

CONSTANTINE XI., PALEOLOGUS (1404-53). The last of the Byzantine emperors. He was the son of the Emperor Manuel II., and from 1427 to 1446 was engaged in almost continuous warfare against the Frankish princes of the Peloponnese. His brother, the Emperor John VIII., died in 1448, and Constantine became Emperor. He entered Constantinople in 1449, and showed himself an intelligent, brave, and resolute ruler, but his position was a hopeless one. Mohammed II. was preparing for the final assault on Constantinople, and Constantine appealed in vain to the princes of Christendom. A long siege preceded the capture of the city, which was finally accomplished May 29, 1453. In the desperate battle waged at the gates of the city Constantine fell, slain by some unknown hand. Mohammed gave his body honorable burial. Consult Miyatovitch, *Constantine, the Last Emperor of the Greeks* (London, 1892). See BYZANTINE EMPIRE.

CONSTANTINE, KONSTANTIN NIKOLAYEVITCH (1827-92). A Grand Duke of Russia, the second son of Emperor Nicholas I. and brother of Alexander II. He was grand admiral of the Russian fleet, and, in addition, held numerous military offices. During the Crimean War he commanded the Russian fleet in the Baltic, and directed the defensive preparations which held the English and French armaments in check before Cronstadt. He earnestly supported his brother's liberal reform plans, and endeavored in many ways to promote the cause of enlightenment in Russia. He was appointed Governor of

Poland in 1862, but failed in his attempts to reconcile the Poles, and resigned soon after the outbreak of the Revolution in 1863. In January, 1865, he was appointed president of the Council of the Empire. On the accession of his nephew, Alexander III., he was deprived of most of his offices, and soon retired altogether from public life.

CONSTANTINE, KONSTANTIN PAVLOVITCH (1779-1831). A Grand Duke of Russia, the second son of the Emperor Paul I. After the Congress of Vienna, the government of the newly created kingdom of Poland was intrusted to him by his brother, the Emperor Alexander I. In January, 1822, on his divorce and remarriage out of the ranks of royalty, he executed a private deed by which he resigned his claims to the throne in the event of Alexander's death, and, when that event took place in 1825, he adhered to this resignation, although he had meanwhile, in his absence, been proclaimed Emperor in Saint Petersburg. The succession thus fell to his younger brother Nicholas. The character of Constantine's administration in Poland was not such as to conciliate any class of the people, and a widespread conspiracy was formed. The Revolution of July (1830) in France supplied the spark which was needed to kindle the revolution in Poland, and he was obliged to flee for his life. He died soon after of the cholera.

CONSTANTINE (1868—), Duke of Sparta, Crown Prince of Greece. He was born in Athens, and studied at the universities of Berlin and Leipzig. In 1889 he married the Princess Sophia of Prussia, sister of Emperor William II. He was appointed commander-in-chief of the Greek troops operating against the Turkish forces under Edhem Pasha, in Thessaly, in March, 1897, and conducted the retreat from Dhomokos in May of that year. See GREECE; TURKEY.

CONSTANTINE, ARCH OF. A famous arch at Rome, between the Palatine and Cælian hills, southwest of the Coliseum, at the junction of the Sacred and Triumphal ways. It was erected in A.D. 315, to commemorate the Emperor Constantine's victory over Maxentius. The arch is the best-preserved ancient monument of Rome, probably because the fact that its builder was a Christian Emperor saved it from destruction during the devastations of the Middle Ages. It has three openings and four columns on each face. Little more than the brickwork was contemporary with Constantine, the marble facing, the statues of the Dacian kings, the eight columns, and the entablature having been taken from other buildings, especially from a destroyed arch of Trajan.

CONSTANTINE, BASILICA OF. A vast basilica begun by Maxentius and completed by Constantine, on the site of a former market at Rome. It had a nave over 100 feet high and 80 broad, supported on eight white marble columns, of which one is now standing in front of the Church of Santa Maria Maggiore. The entrance, originally facing the Coliseum, was later changed to the north, facing the Sacred Way. The preserved portions of the basilica have served as a cattle-shed, a riding-school, a hayloft, and a drilling-place for recruits. The vaulting of the south aisle is still standing.

CONSTANTINE, BATHS OF. Enormous baths built by Constantine, covering nearly the whole breadth of the Quirinal Hill, in Rome. The only extant remains are some foundations seen in excavating the Via Nazionale, and a few blocks of marble now in the adjoining Colonna Gardens. The baths were demolished by Paul V., in 1610, and their site is now occupied by the Quirinal and Rospigliosi palaces. The figures known as the "Horse Tamers," from which Monte Cavallo is named, stood in front of the baths, and here was found the colossal statue of Constantine.

CONSTANTINOPLE (Lat. *Constantinopolis*, from Gk. *Κωνσταντινου πόλις*, *Konstantinou polis*, city of Constantine, Turk. *Istanbul* or *Stambul*, from Gk. *εἰς τὴν πόλιν*, *eis tēn polin*, or, in the corrupted dialect of the people, *εἰς τὰ μὲν βόλιν*, *es tam bolin*, to the city). The capital and largest city of the Ottoman Empire, situated in the extreme southeastern part of European Turkey, on the shores of the Sea of Marmora, the Bosphorus, and the Golden Horn, a long, narrow inlet, extending in a northwestern direction from the Bosphorus; latitude 41° N., longitude 28° 59' E. (Map: Turkey in Europe, G 4). With its many mosques, kiosks, and extensive gardens, it presents from the sea a magnificent appearance, which is greatly enhanced by the imposing picturesqueness of the situation. Constantinople proper, or Stambul, occupies a triangular peninsula. The suburbs of Galata and Pera are situated on the northern and opposite shore of the Golden Horn, which is spanned by two iron pontoon bridges. Stambul is surrounded by partly ruined walls, the most famous of which is the Theodosian double wall dating from 447. The fortifications have strong towers, and are pierced by numerous historic gates. The streets are narrow, crooked, and without sidewalks. There are countless house-gardens and many beautiful cemeteries. The houses, usually of one story, are mostly built of wood, though some portions of the city, since the great fires of 1865, 1866, and 1870, have been reconstructed in a modern fireproof style. Many fine public buildings have latterly been erected; new suburbs have been built, and old ones enlarged and improved. On the whole, however, the rate of growth and the extent and character of the improvements of the city are surpassed in nearly every other European capital.

The architectural beauty of Constantinople itself lies conspicuously in its mosques, 379 in number, among which that of Agia Sofia (originally the Church of Saint Sophia) is most famous. The present edifice, 250 by 235 feet in size, was begun in 532 by Justinian, and was completed in five years. It is constructed of brick, faced with marble. Its shape is that of a cross. While its outward appearance is not in keeping with the grandeur and charm of its interior, it is regarded as one of the most magnificent of ecclesiastical edifices. The dome in the centre rises 180 feet high (from the ground), and is 108 feet in diameter. It is supported by four arches. Within the mosque are 107 pillars of gigantic proportions—40 on the ground floor and 67 above. They are of green marble and red porphyry, with capitals in the Byzantine style. The walls were originally decorated with beautiful mosaics, which have been either partly effaced or partly covered up with inscriptions from the Koran. After the

conversion of the church into a mosque by Mohammed II., in 1453, four minarets were added, and the golden cross on the dome was replaced by the crescent.

The Mosque of Solyman covers a site nearly as large as that of Saint Sophia, and, like most mosques, is surrounded by a well-shaded court. It was built in 1550-66, by the Sultan Solyman. It has four minarets, and is surmounted by a dome somewhat higher than that of Saint Sophia. The marble decorations in the interior are magnificent. The Mosque of Achmet I. was built in 1609-14, and exceeds in dimensions the Mosque of Solyman, but is inferior to the latter in design and in ornamentation. Among other mosques may be mentioned those of Mohammed II., Bajazet II., Selim I., Yani-Jami, and Mur-i-Osmani.

Secular buildings of historic interest are: The Castle of the Seven Towers, once a State prison where a number of dethroned sultans were executed; the hippodrome, completed by Constantine, the scene of public festivals as well as of popular uprisings; and the old Scraglio, with its extensive gardens and beautiful kiosks and palaces. There are also interesting ruins of ancient royal palaces. The present abode of the Sultan, the Serai Humayun, is in reality a little city whose walls inclose mosques, administrative buildings, dwelling-houses and gardens. It is over a mile and a half in circumference. In royal grandeur, however, it does not equal the residences of many other European rulers. Its outer gate is called 'The Sublime Porte.'

The bazaars of Constantinople are very numerous. The chief of them, the Grand Bazaar, somewhat injured by an earthquake in 1894, occupies a large number of narrow, vaulted alleys, and contains about 3000 shops. It is filled with merchandise of great variety and beauty, and presents in daytime one of the finest sights of the city. The bazaars, however, are gradually losing their importance, the wealthier classes preferring to make their purchases in the French shops on the Grande Rue in Pera.

Galata, situated on the eastern shore of the Golden Horn, is the business port of Constantinople. Here are found the warehouses, banking houses, exchanges, and the custom-house. The town is built of stone, and the streets in some sections are new and regular. The Galata Tower, formerly known as the Tower of Christ, is 150 feet high, and is divided into several stories and surrounded by galleries. It serves as a fire-signal station.

Pera, the foreigners' quarter and the most modern part of Constantinople, lies beyond Galata. Here are the foreign embassies and the residences of the Europeans. Here also is the Grande Rue, lined with fashionable shops and hotels. Pera has a fine park, barracks, and several cemeteries which are occasionally used as festival grounds.

Administration.—As to government, Constantinople, including the town of Scutari across the Bosphorus, forms a separate district, under the administration of a prefect. It is probably the only city in Turkey where the police force is not recruited from the regular army. The fire department is utterly inadequate, and the system of alarms used is most primitive. Systematic street-cleaning is attempted only in the European section of the city. In the native

quarters the dogs are the principal scavengers. The water-works of Constantinople, dating in part from the reigns of Justinian and Valens, are regarded among the finest remaining specimens of ancient engineering. Some of the cisterns are the largest in the world; the roof of one of them is supported by 336 marble columns. The water comes from the reservoirs of Belgrade, and also from Lake Berkos, the latter source of supply being exploited by a French company.

The numerous elementary public schools are attached to the mosques and offer instruction free. Colleges, or 'medresses,' some 150 in number, with public libraries, are found in connection with the principal places of worship. A university was opened in 1900, with faculties of philosophy, Mussulman theology, mathematics, law, and medicine. The Imperial Art School is not without importance. The French conduct several schools for the children of the wealthier classes. Many of the libraries are filled with valuable volumes and manuscripts. Within the inclosure of the Seraglio is the Royal Museum of Antiquities, containing a fine collection of curious tombstones, sarcophagi, Turkish art objects, natural-history specimens, etc. The benevolent institutions are to be counted by the score; indeed, almost every craft has a benevolent guild.

The industrial importance of Constantinople is not great. The few large establishments manufacture tobacco products, fezzes, and iron wares. The hand-made products, on the contrary, are important, both as regards variety and quantity; and to the trade in these small articles the life of the city lends itself most interestingly, with its bustling little shops, its noisy street traffic before the mosques, and its curious and picturesque trade customs. The geographical position and natural harbor facilities of Constantinople are unsurpassed. The Golden Horn affords accommodation for over 1000 vessels of the heaviest draught. It is divided by its two bridges into the outer and inner ports of trade, and the port of war.

Not until 1888 did the city have railway connection with the rest of the world. Since the establishment of direct steam communication between Persia, Syria, Arabia, and Southern Europe, and the opening up of Central Asia by Russia, Constantinople has lost a considerable part of its commerce. Important imports are food products, textiles, coal, metalware, instruments and implements of all kinds, petroleum, and wood. The exports are largely confined to carpets and rugs, lambskins and wool, attar of roses, embroideries, and filigree-work. The annual entrances and clearances of shipping comprise about 14,500 vessels, with a tonnage of about 10,500,000. Of these about 11,000 represent foreign trade. The number of Turkish vessels is over 6000, but their total tonnage is comparatively light. For local transportation there are omnibuses, four horse-car lines, and one underground cable road. The Constantinople-Adrianople line has several stations within the city limits. Small steamers and ferries ply between Stambul and Galata.

The population of Constantinople proper numbers about 650,000. This figure is increased to over 1,100,000 by including the suburbs. In the city proper nearly two-thirds of the population are Mohammedans.

History.—In A.D. 330 the Roman Emperor Constantine the Great gave the name Constantinople to the new capital which he had built for himself on the Bosphorus round the ancient Byzantium as a nucleus. The presence of the Emperor made Constantinople from the first distinctively the capital of the Greek civilization in the eastern part of the Roman Empire, as Rome remained the head of the Latin civilization in the West. From the final disruption of the Roman Empire in 395 to 1453, the city was the capital of the Byzantine or Eastern Empire. The Patriarch of Constantinople gradually rose to the position of head of the Christian Church in the East. In the course of years, as the imperial provinces in Asia and Africa, with the great metropolises of Antioch and Alexandria, fell into the hands of the Mohammedans, the Christian culture of the East found refuge in Constantinople, and Byzantinism—a blending of the ideas of Oriental despotism with the Roman conception of the State—found its home there. In the struggle between Latin and Eastern Christianity, Constantinople naturally was the great opponent of Rome, and, as the champion of inflexible orthodoxy, it welcomed the great schism of 1054, which disrupted the Catholic Church. The strategic position of the city at the meeting-place of two continents exposed it to attacks from numerous nations—Avars, Arabs, Bulgars, Varangians, Venetians, and the Latin powers of Western Europe, and finally the Turks. It was besieged more than thirty times, and its walls were repeatedly assaulted; but it was taken thrice only—by the Venetians and Crusaders in 1203 and 1204, and by Mohammed II., after a memorable siege, on May 29, 1453. The prosperity of the city sank during the period of the Crusades, when its lucrative commerce was diverted to the Italian towns. Its capture by the Turks marks an epoch in European history, for the scholars and rhetoricians who fled from Constantinople brought back to Western Europe the knowledge of the ancient Greek literature, and by their contribution to the revival of learning fostered the Renaissance and the Reformation. In more recent times Constantinople has been important as a storm-centre in the play of international politics known as the 'Eastern Question.' In 1878 the Russian armies advanced to the fortifications of the city.

CONSTANTINOPLE, COUNCILS OF. Eight councils which are recognized as ecumenical either by the Greek or Latin Church, or by both, were held at the city of Constantinople. The first was the second ecumenical council of the Church, convened in 381 by the Emperor Theodosius I. It consisted of 150 bishops, chosen under the dictation of the Emperor and chiefly from the East, besides the semi-Arians, followers of Macedonius of Constantinople, who withdrew after their opinions had been condemned. This council condemned also the Arians, Eusebians, and Eudoxians; it reaffirmed the resolutions of the Council of Nice, completed the definition by that council of the divinity of the Holy Ghost, and declared that the Bishop of

Constantinople, or new Rome, was, of right, next in rank to the Bishop of old Rome; both of them being alike subject only to the Emperor. The *second* was the fifth ecumenical council of the Church, convened in 553 by Justinian I. to sustain his condemnation of three distinguished teachers of the Antiochian school—viz. Theodore of Mopsuestia, Theodoret, and Ibas of Edessa—whose opinions had been collected into ‘three chapters.’ (See CHAPTERS, THE THREE.) There were 165 bishops, mostly Eastern, in attendance. They condemned the ‘three chapters’ and renewed the condemnation of the doctrines of Nestorius. Pope Vigilius, though not present, afterwards sanctioned the condemnations. The *third* was the sixth ecumenical council, held in 680-81, and consisting of 289 bishops. Through the influence of the Roman legates, the council condemned the doctrine that “as there was only one Christ, so He had only one will,” and recognized in Him, consistently with the doctrine of two natures in one person, two wills made one by the moral subordination of the human to the divine. The *fourth* was the council held in 692, by command of Justinian II. It is recognized as ecumenical only by the Greeks, and is called ‘*quinisextum*,’ because it supplemented the fifth and sixth. It passed more than one hundred canons concerning the morals of the clergy and Church discipline. The *fifth* was held in 754, and attended by 338 bishops. It is recognized only by the Greeks, and is called ‘the Mock Synod’ by Hefele. It issued a decree against image-worship, which was revoked in 787 by the second ecumenical council of Nice. The *sixth* was held in 869-70, and is recognized only by the Latin Church. It was attended by upward of 60 bishops. It deposed the patriarch Photius, restored Ignatius, and enacted laws concerning Church discipline. The *seventh* was held in 879, and is called by the Greeks the eighth ecumenical. There were 383 bishops present. It recalled Photius, repealed the action of the preceding council against him, and defined the position of the patriarch of Constantinople in relation to the Pope. The *eighth* was held in 1341, and is called by the Greeks the ninth ecumenical. It condemned Barlaam, an educated monk, as heretical in opposing the Hesychasts, a mystical sect among the monks of Mount Athos, who asserted the possibility of attaining, while yet in the body, an intuition of the divine light and essence by a perfect cessation of corporeal life.

CONSTANTIUS I., kōn-stān’shī-ūs, FLAVIUS VALERIUS. A Roman Emperor (A.D. 305-06), commonly known as *Chlorus*. He was adopted as Cæsar in 292 by Maximian, and received the government of Gaul. When Diocletian and Maximian abdicated the throne, May 1, 305, Constantius and Galerius became emperors respectively of the West and the East. Constantius died at Eboracum (York), in Britain, July, 306, and was succeeded by his son, Constantine the Great. He was distinguished alike for his intrepidity as a soldier and for his ability and humanity as a ruler.

CONSTANTIUS II., FLAVIUS JULIUS. A Roman Emperor (A.D. 337-61). By Fausta, the second son of Constantine the Great, he was born at Sirmium (Illyricum), A.D. 317. Constantine made him Cæsar in 323, and in 335 appointed him ruler in the East, where, after 337,

he reigned as Emperor. Often involved with the Persians, he suffered at their hands a galling defeat in 348. His brother Constans being murdered by Magnentius, he met the latter in battle at Mursa, and punished him so grievously that he subsequently perished by his own hand. Constantius now reigned alone over the whole Empire. He made his cousin, the apostate Julian, Cæsar in Gaul, and bestowed upon him the hand of his sister, Helena. When, however, Julian achieved great glory, he became jealous, and demanded the relinquishment of many troops. With this order Julian was disposed to comply, but his admiring soldiers refused to leave him. Constantius then proceeded against him, but died of fever before an engagement, whereupon Julian, previously proclaimed, succeeded to the title. As a ruler Constantius was severe and oppressive.

CONSTANTS OF NATURE. A term applied to various unchangeable quantities that are found to be characteristic of natural phenomena or relations. The propagation of light through space takes place invariably at the rate of 186,770 miles per second, and hence the velocity of light may be referred to as a constant of nature. The period of rotation of the earth on its axis may be considered as another constant of nature, although, strictly speaking, it is subject to slight variation. The atomic weights of chemistry—i.e. the smallest relative combining weights of the elements—furnish another example of important constants of nature—important because they permit of expressing the composition and reactions of all substances in a simple and useful form. The electrolytic equivalents—i.e. the weights of elements deposited in the electrolysis of their compounds by a unit current in one second—are likewise constants characteristic of the several chemical elements.

In choosing the units of precise measurement, which form the basis of all calculations in pure and applied science, it is necessary to employ the constant quantities of nature. For example, the second, which is the unit of time generally used at present, is defined in terms of the time of a complete revolution of the earth on its axis. As thus defined, however, the unit is not quite perfect; the time of a revolution of the earth on its axis is subject to slow variation, and hence the duration of the second, referred to that time, must likewise be slowly changing. With a view to establishing a more perfect unit of time, scientists have proposed to adopt as its basal constant of nature the period of vibration of an atom emitting light of a given wave-length—an interval of time that is believed to be absolutely constant.

The laws of science are generally expressed in the form of mathematical equations whose numbers and terms represent the constant as well as the variable factors of typical natural phenomena. Thus, the variation of volume under variable conditions of temperature and pressure, which is characteristic of all bodies, is in the case of perfect gases subject to laws that are usually expressed by the equation $PV = RT$, in which P stands for pressure, V for volume, and T for the absolute temperature. If, in experimenting with different gases, we should employ such quantities of them as would, under the same conditions of pressure and temperature,

occupy equal volumes, we would find that while the pressure and temperature might subsequently be changed, the factor R would remain constant and the same for all gases, irrespective of their chemical nature: that is to say, the product of the pressure and volume (PV), divided by the absolute temperature (T), would yield invariably the same number. That number (R), called 'the gas constant,' is therefore obviously characteristic of the interdependence of pressure, volume, and temperature, in all gaseous matter; and being so general, it has great importance in both pure and applied science. Thus, the constants of nature characterize natural phenomena and enter into all the mathematical laws of science.

Consult: Lupton, Everett, *C. G. S. System of Units* (London, 1891); Landolt and Börnstein, *Physikalisch-chemische Tabellen* (Berlin, 1893); Clarke, *The Constants of Nature* (5 parts, Smithsonian Miscellaneous Collections, Washington, 1873-88). Some of the constants of nature may of course be found in any scientific text-book. See also CALCULUS; C. G. S. SYSTEM.

CONSTANZA, *Sp. pron.* kón-stán'thá. A character in Middleton's *Spanish Gipsy*, who disguises herself as a gipsy called Preciosa and accompanies her father into exile.

CONSTELLATION (Lat. *constellatio*, from *com-*, together + *stella*, star, Gk. ἀστὴρ, *astēr*, Skt. *star*, Ar. *star*, OHG. *sterno*, *sterno*, Ger. *Stern*, AS., Engl. *star*). A group of stars. From a time earlier than authentic records can trace, the stars have been formed into artificial groups, which have received names borrowed from fancy or fable. These groups are called constellations. Though quite devoid of anything like systematic arrangement, this traditional grouping is found a sufficiently convenient classification, and still remains the basis of nomenclature for the stars among astronomers. Before the invention of almanacs, the risings and settings of the constellations were looked to by husbandmen, shepherds, and sea-faring men as the great landmarks of the seasons, and consequently of the weather which each season was expected to bring with it (see Job xxxviii. 31); and it is not surprising if the storms or calm weather that usually accompanied such seasons were connected, in the popular imagination, with the influence of the stars themselves, or the beings with whom superstition or fable identified them. Thus, the risings and settings of Boötes with the bright star Arcturus, which took place near the equinoxes, portended great tempests. (See Vergil's *Georgics*, i. 204.) The great heat in July was ascribed to the rising of Canis, the dog, with its bright star Sirius. (See CANICULA; HELIACAL RISING.) The appearance of the twins, Castor and Pollux, was hailed as the harbinger of fair summer weather.

Almost all nations have, from early times, arranged the stars into constellations, but it is chiefly from the nomenclature of the Greeks and Romans that our own is derived. Eudoxus, a contemporary of Plato, about 370 years B.C., gave a description of the face of the heavens, containing the names and characters of all the constellations recognized in his time. Though this production is lost, a poetical paraphrase of it, written about a century later by Aratus (q.v.), is still extant. This poem describes twelve zodiacal constellations (see ZODIAC), with twenty

in the Northern Hemisphere and thirteen in the Southern. The next enumeration occurs in the *Almagest* of Ptolemy, which includes the preceding, with three additional, one northern and two southern constellations, making in all 48. These are the ancient stellar groups. Large accessions have been made to the nomenclature in modern times, in consequence of maritime discovery having made us acquainted with constellations in the Southern Hemisphere which never rose upon the world known to our ancient authors. In 1751 Lacaille went to the Cape of Good Hope for the purpose of making a catalogue of the southern stars, and forming them into constellations—an undertaking which he prosecuted with great ardor for nearly four years, at the expense of the French Government. Even the flattery of courtiers has contributed toward the stellar nomenclature. Upon the restoration of Charles II., the evening before his return to London, Sir Charles Scarborough, the Court physician, was gazing upon a star in the northern heavens which shone with greater luminosity than usual, as might be expected from a loyal star on such an occasion. This, in connection with a few others, was formed into *Cor Caroli*, the heart of Charles II., by Halley, at the doctor's recommendation. The chief constellations will be noticed under their several names. (See ARIES; URSA MAJOR, etc.) The fanciful figures from which the constellations are named are depicted on celestial globes and maps of the heavens.

In the older writers upon astrology, constellation signifies the relative positions of the planets at a given moment. See ASPECT.

CONSTELLATION. A famous United States vessel, built in 1798, which, as the flagship of Commodore Truxton, captured the French frigate *Insurgente* in 1799, and in 1800 won a brilliant victory over the superior French frigate *La Vengeance*.

CONSTIPATION (Lat. *constipatio*, from *constipare*, to crowd together, from *com-*, together + *stipare*, to crowd, from *stipes*, stem). Abnormal retention in the intestines of fecal matter, or its passage in abnormally hard masses. Normally the bowels of an infant should 'move' or be emptied from two to five times in 24 hours; the bowels of an adult once in 24 hours. The causes of constipation are imperfect digestion (due to deficient secretion in the alimentary canal, inaction of the liver, or insufficient contraction of the muscular fibres of the intestine), insufficient exercise, the use of alcohol or drugs, or improper food. The treatment of constipation may be dietetic, hygienic, and medicinal. The diet should be largely vegetable, with whole-wheat bread, cereals, fruit, and an increase of fats and water, with little meat, no alcoholic beverages, and little sugar. A daily cold sponge-bath, regular out-of-door exercise, and circular massage of the abdomen in the direction of the passage of the intestinal contents, relieve many cases. In other cases an enema of soap and water or cathartic medicines may be necessary. See CATHARTIC.

LOWER ANIMALS. Constipation in the lower animals depends, as in man, on imperfect secretion from, or motion of, the intestinal walls. In the horse it is usually accompanied by colic (q.v.), and when long continued leads to enteritis (q.v.). The appropriate remedies are soap

and water clysters, given every two hours; smart friction and cloths wrung out of hot water applied to the abdomen, with three drachms of aloes and one of calomel, given in gruel, and repeated in sixteen hours if no effect is produced. Give, besides, walking exercise; restrict the amount of dry solid food, but allow plenty of thin gruel or other fluids, which may be rendered more laxative by admixture with treacle or a little salt. Similar treatment is called for in dogs, cats, and pigs. In cattle and sheep digestion principally takes place in the large and quadrisected stomach; the bowels, accordingly, are little liable to derangement; and constipation, when occurring in these animals, generally depends upon impaction of dry hard food between the leaves of the manyplies, third stomach, or fardel-bag. The complaint is hence called *fardel-bound*. It results from the eating of tough and indigestible food, such as ripe vetches, rye-grass, or clover; it prevails in dry seasons, and on pastures where the herbage is coarse and the water scarce. It occurs among cattle partaking freely of hedge-cuttings or shoots of trees, hence its synonym of *wood-civil*. From continuous cramming and want of exercise, it is frequent in stall-feeding animals, while from the drying up of the natural secretions it accompanies most febrile and inflammatory diseases. The milder cases constitute the ordinary form of indigestion in ruminants, are accompanied by what the cowman terms *loss of cud*, and usually yield to a dose of salts given with an ounce or two of ginger. In more protracted cases rumination is suspended, appetite is gone, constipation and fever are present. There is a grunt noticeable, especially when the animal is moved, and different from that accompanying chest-complaints, by its occurrence at the commencement of expiration. By pressing the closed fist upward and forward beneath the short ribs on the right side, the round, hard, distended stomach may be felt. This state of matters may continue for ten days or a fortnight, when the animal, if unrelieved, becomes nauseated, and sinks. Stupor sometimes precedes death, while in some seasons and localities most of the bad cases are accompanied by excitement and frenzy. In this, as in other respects, the disease closely corresponds with stomach-staggers in the horse. *Treatment*.—Give purgatives in large doses, combining several together, and exhibiting them with stimulants in plenty of fluid. For a medium-sized ox or cow, use three-quarters of a pound each of common and Epsom salts, ten croton beans, and a drachm of calomel, with three ounces of turpentine, and administer this in half a gallon of water. If no effect is produced in twenty hours, repeat the dose. Withhold all solid food; encourage the animal to drink gruel, soft bran mash, molasses and water; and give exercise, enemata, and occasional hot fomentations to the belly.

CONSTITUENT ASSEMBLY. See ASSEMBLY, NATIONAL.

CONSTITUTION (Lat. *constitutio*, a settlement of a controversy; then a decree: from *constituere*, to cause to stand, to establish, from *con-* + *statuere*, to erect, to establish). Formerly used of any law promulgated by sovereign authority. In the Roman Empire, the imperial legislation, decreed and put into effect by the will of the Emperor, was comprehensively described by the term *constitutiones*. These included *re-*

scripts, or answers to questions or petitions; *mandates*, or instructions to officials, administrative and judicial; *decrees*, or judgments on causes brought before him, directly or on appeal; and *edicts*, or general proclamations. See CIVIL LAW.

So in early English law, *constitution* signified any statute, though it was not commonly employed except with reference to certain important legislation affecting the relations of the State and the Church. Thus, the Constitutions of Clarendon were laws enacted in the reign of Henry II. at a Parliament held at Clarendon in 1164, restricting the power of the clergy, limiting the right of appeal to the Pope, and virtually making the King the supreme head of the Church in England.

At the present time, however, the term is used in the more restricted sense of the fundamental law of a State, society, or corporation, public or private. More specifically, the Constitution of a State or society is the body of legal rules by virtue of which it is organized and governed, and which determines its legal relations to other States and societies and to its own members. This Constitution may be created by the political or other body whose powers it defines and regulates, or by the individuals composing it and from whom its powers are derived, or it may be the creation of an external authority to which it is subject. Examples of the last form of constitution are afforded by the case of the ordinary private corporation, whose fundamental law is prescribed by the State to which it owes its existence; by municipal corporations, such as cities and villages, which derive their authority from their charters of incorporation and from the municipal law of the State to which they belong; and by subject States, territories, or colonies, whose constitutions are to be looked for in the legislation of the parent or sovereign State. The constitutions of Canada, of Hawaii, of Porto Rico, and to a certain extent that of the Republic of Cuba, belong to this class—the act of the American Congress, under the authority and the limitations of which the Cuban Constitution was recently enacted, being in effect a part thereof.

Examples of the second form of fundamental law exist, in the political sphere, in popular constitutions like those of the United States, of the several States of the American Union, of the French Republic, and of Switzerland; and, in the domain of private law, by the rules adopted by the stockholders of corporations and voluntary associations for the conduct of their affairs by their boards of directors and other officers.

The first type of constitution, in which the fundamental law is the creation of the powers yielding the sovereign authority of the State, is to be found in all of the monarchical States of Europe which have adopted, in whole or in part, a constitutional form of government. The free Constitution of England, so popular in character and so largely the product of custom, in a strict legal sense, belongs in this category as clearly as does the government of the Czar, the autocratic character of which has been modified by imperial concessions. To this class also we must refer the Constitution of the Roman Empire, as well as of the Republic, and of the free commonwealths of ancient Greece. It is to this form of constitution, because it is alterable by the ordinary legislative authority of the State, that Mr. Bryce ap-

plies the term 'flexible,' while constitutions of the second and third classes, which are superior to the ordinary law-making power and not capable of amendment except by the higher authority which created them, he describes as 'rigid' constitutions.

It is obvious that the authority of a self-imposed constitution differs widely from that of a true fundamental law, which underlies the ordinary processes of government and by which a political society has chosen to limit or has been constrained to restrict its governmental agencies. In a legal sense, therefore, the real distinction between constitutions does not turn upon the ease or difficulty with which they can be altered, nor yet upon the fact that the established process for amending a constitutional provision differs from the ordinary processes of legislation, but in the fact that a constitution of the one type is a part of the ordinary law of the land, and that a constitution of the other type is superior to the ordinary law; that in the one case legislation is irresponsible and uncontrollable, while in the other it is controlled by the fundamental law. In a State having a constitution of the one sort we shall expect to find a court or other independent representative of the sovereign power from which the Constitution was derived, which shall protect it from encroachments on the part of the ordinary law-making power; in a State of the other sort, we shall look to see the governing authority of the State unfettered by any external authority—itsself the supreme representative of the sovereignty of the State.

Ordinary Constitutions.—The Constitution of Great Britain affords the best modern example of the nature and operation of an *ordinary* constitution; that of the United States, the best example of an *extraordinary*, or *supreme*, constitution. The British Constitution is an indefinite body of legal rules and principles, partly customary, partly the result of judicial decisions, and partly made up of acts of Parliament. These are nowhere collected in one place, but must be extracted from the whole body of the common and statute law of the realm and from observation of the workings of the Government. Any act of Parliament and any judicial decision may modify it, and not infrequently statutes have been passed which have contained both constitutional and ordinary legislation mingled together in one and the same paragraph. Not only is there no authoritative statement of the British Constitution to be found, but, from its very nature, no such statement could be made. So much of it depends upon custom and so much is left to time and circumstance, that the most precise definition of its terms would be the most misleading. No law, statutory or judicial, has created the Cabinet, to which, as the executive committee of the House of Commons, the government of the Empire is at present committed; but whether it is really the Cabinet, or a committee of the Cabinet, or the Prime Minister, that governs England, is so much a question of personality and of circumstances that it defies answer. So no one can say whether the Crown still retains the ancient prerogative of vetoing an act of Parliament. It is commonly assumed that the power is extinct. The only safe statement that could be made, however, would be that the right has not been exercised for nearly two hundred years, and that only a grave emergency would justify the

sovereign in employing it; and if this should occur, there is no lawful process by which the act, however repugnant to current ideas of government in England, could be declared unconstitutional or deprived of its legal effect. Under such a system the Constitution would sanction any governmental act which could be performed without precipitating a revolution.

The latest English writers distinguish between the *law* and the *custom* of the Constitution, the former having reference to certain statutory provisions—such as the act settling the succession to the crown, the bill of rights, etc.—which, being laws in the strictest sense of the term and tending to limit the authority of a single branch of the Government and not the supremacy of Parliament, are capable of enforcement by the courts; and the latter, to the great body of customary rules and observances which in practice control the working of the Government and the distribution of its powers, but are enforced only by public opinion and by respect for the settled order of the Constitution. The latter are not true laws, as they lack the sanction of any but legal authority to declare and enforce them. In the field of ordinary jurisprudence no such distinction as this can be drawn between custom and law. There custom is law, and will be enforced as such. But the case is manifestly different in the sphere of constitutional law, for there a custom tending to restrict the action of the sovereign power can find no jurisdiction to enforce it.

A constitution of the ordinary legal type may belong to either of the two old categories of 'written' and 'unwritten' constitutions—an unwritten constitution being one which is wholly or largely based on custom or judicial decisions, and a written constitution being the result of a specific act of legislation and having the definite form and the certainty of a body of statute law. But the distinction, though sound enough, is of no practical importance, as no considerations of political philosophy or of legal validity are involved in it. In fact, every political constitution is a composite of common and statute law, of custom and of legislation, and the validity of its several provisions is not in the least dependent upon the manner in which the principles which they embody have acquired the form and content of legal authority. The British Constitution, for example, is much more than a body of customary law. At least five important sources of the rules and principles which it embodies may be distinguished. These are: (1) Two principal treaties, the Act of Union with Scotland in 1707 and the Act of Union with Ireland in 1800. (2) Certain great 'compact,' viz. Magna Charta, in 1215, the Declaration of Right, in 1689, and the Act of Settlement, in 1701. (3) A large number of public acts of Parliament, ranging from matters of the greatest to those of the least political importance. (4) The body of precedents and customs known as the common law. (5) The usages and practices known specifically as the customs of the Constitution, which are in reality the mass of practical expedients and understandings by which government is mainly carried on. To these last we have denied the character of law, partly because of their indefiniteness and fluctuation, but more particularly because of their lack of a legal sanction. The fourth class consists of legal rules in the proper sense of the term, but of the sort contemplated by the use of the word unwritten;

but nevertheless, if formal treaties and acts of Parliament are written law, then is the British Constitution, in part at least, a written constitution. Some constitutions of the ordinary type, however, are of the strictly 'written' sort, being the result of a single legislative act or a grant of power from the sovereign head of the State. Most of the constitutions which have been promulgated in the several States of Continental Europe, as well as that of Japan, are of this character. They have the common characteristic of the lack of any superior sanction. A law enacted by the ordinary legislative authority and promulgated by the supreme executive power of the State is a law, whether sanctioned by the Constitution or not. In other words, a law may be unconstitutional and yet valid.

Extraordinary Constitutions.—As the polity of the British Empire furnishes the best example of the ordinary, 'flexible,' and unwritten constitution, so does the fundamental law of the United States exhibit the best and most characteristic constitution of the opposite type—of the extraordinary, or supreme, and 'rigid' form. Though the constitutions of the General Government and of the several States have very great and even fundamental differences, they are all alike in this respect, that the organic law has a sanction superior to that of the ordinary law of the land; that the Constitution is in fact 'the supreme law' to which the ordinary law must conform; that the sovereignty is not wholly committed to the ordinary agencies of government, but the power of these is limited, and that this limitation on legislative and executive action is not a mere form of words, but is rendered effective by the power vested in the courts of annulling acts of the State in contravention of the supreme law. The Federal Government and the governments of the States are, therefore, not sovereign, but legally limited corporations, strictly analogous to private and minor municipal corporations, which derive a limited authority from the State which created them. There is nothing singular in the power exercised by the courts in declaring a corporate act invalid because of its transcending the legal authority of the body performing it, even in the political sphere. It is plain that the political action of a colony, even of the 'self-governing' type, and of dependent States, as well as of cities and towns, is subject to control by the dominant political authority. The British Parliament and the English courts exercised this authority over the American colonies as they now exercise it over Canada and Australia. The novelty of the American system consists in the application of this familiar principle to independent and sovereign States. The right of the Supreme Court of the United States, and even of the ordinary Federal tribunals, to pass upon the validity of acts of the National Congress was long disputed, but it was asserted by the Supreme Court as early as 1797, and actually exercised in the celebrated case of *Marbury vs. Madison* in 1803. This conclusion was so plainly sound, and so obviously necessary to the working of the American constitutional scheme, that it has been generally acquiesced in. Several of the State courts had in the meantime reached a similar decision as to their authority to nullify acts of their own legislatures when in conflict with the local Constitution or with that of the United States, and the prin-

ciple may now be regarded as an essential part of the constitutional system of the United States. See SUPREME COURT OF THE UNITED STATES.

There is one important difference between the fundamental law of the United States and that of the several States. The National Government being a federal union of independent commonwealths—some of them existing before its formation and others having come into the Union as independent States—the National Constitution is simply a grant of powers from the latter to the former, while the State constitutions are merely limitations upon the power of the ordinary agencies of government of the States. From this it follows that the Federal Government has no powers excepting such as are conferred by the Constitution to which it owes its existence, while the State governments, on the contrary, have vested in them the full sovereignty of the commonwealth, excepting as this is limited by the local Constitution and that of the United States. The function of the courts of the United States and of the several States in interpreting their respective constitutions is very different therefore. An act of Congress is invalid if it transcends the powers conferred upon the legislative branch of the Government by the fundamental law; whereas, an act of the Legislature can be impeached for unconstitutionality only if it is in contravention of one of the limits placed by the Constitution on legislative power.

In general, constitutions may be amended, altered, or abrogated by the same power which created them, or by a process provided in the fundamental law for that purpose. A constitution which is the free gift of the sovereign authority may be recalled or nullified by the authority that conferred it. A rigid constitution of the American type, which is the creation of the people, and which cannot be directly changed without their concurrence, has in practice been found to be of the most inflexible kind. For a period of more than sixty years after the adoption in 1803 of the Twelfth Amendment (relative to the election of President and Vice-President) the Constitution of the United States did not suffer a single amendment, and the three amendments adopted at the close of the Civil War, and as the result thereof, have been the only changes which it has since sustained. Like the English Constitution, however, it has changed greatly, though imperceptibly, by the insidious processes of custom and of judicial interpretation. The history and language of the instrument, and the nature of the changes which it has undergone, will be set forth in the article on the CONSTITUTION OF THE UNITED STATES. See also GOVERNMENT; STATE; SOVEREIGNTY; GREAT BRITAIN; and the titles of other States concerning whose constitutions information is sought.

CONSTITUTION, THE. A forty-four-gun frigate, the most famous vessel in the history of the United States Navy, sometimes called 'Old Ironsides,' from the hardness of her planking and timbers. She was launched on October 21, 1797, but was not completed and equipped until the following year, when she put to sea under Captain Nicholson for service against the French. During the war with Tripoli, 1801-05 (see *BARBARY POWERS, WARS WITH*), she was Preble's flagship, and in 1805 took part in three of the five bombardments of the port of Tripoli. In July, 1812, in command of Isaac Hull (q.v.), she escaped from a British squadron off the New Jersey coast, after a spirited chase of three days, and on August 19, off Cape Race, fought her famous battle with the *Guerrrière*, Captain Daeres, a somewhat weaker English frigate, which she left a total wreck after an engagement of thirty minutes, the English losing 79 of their crew, the Americans 14. On December 29, under the command of Captain Bainbridge, she captured off Bahia, Brazil, the *Java* (38 guns, Captain Lambert), after a two hours' engagement, in which the British lost 300 in killed and wounded, the Americans 34. On February 14, 1814, under Captain Stewart, she captured the *Piéton*, 16 guns, and a convoy, in the West Indies; and on February 20, 1815, she took the *Cyane*, 34 guns, and the *Levant*, 18 guns, after a fierce engagement—remarkable for the seamanship of the Americans and the gallantry of the English—between the Madeira Islands and Gibraltar. The English lost 19 killed and 42 wounded out of 320; the Americans, 6 killed and 9 wounded out of 451. Soon afterwards the *Constitution* was closely pursued by a strong British squadron, which recaptured the *Levant*. Reported unseaworthy between 1828 and 1830, she was ordered to be dismantled, but was retained in deference to the popular sentiment aroused by Holmes's poem "Old Ironsides," and in 1833 was rebuilt. She went out of commission in 1855 at Portsmouth, N. H., was subsequently used occasionally as a training ship, was again partially rebuilt in 1877, crossed the Atlantic for the last time in 1878, and was stored at the Boston Navy Yard in 1897. Consult: Hollis, *The Frigate Constitution* (Boston, 1900); and Roosevelt, *The Naval War of 1812* (New York, 1882).

CONSTITUTION, CHEMICAL. See *CHEMISTRY; CARBON COMPOUNDS; STEREOCHEMISTRY.*

CONSTITUTIONAL LAW. In general, that branch of public law which deals with the nature and organization of government, the distribution and mode of exercising the sovereign powers of the State, and the relations of the Government to those who are subject to its authority. It has nothing to do with the regulation of the external relations of a State with other States, these being governed by international law, though the agencies for maintaining those relations, and the determination of their character and form, may be included within the constitutional law of the State. Thus, the choice of ambassadors, as well as their rank and functions, being the direct

concern of the State they are chosen to represent, is governed by its constitutional law, and so, in the United States, is the power exercised by the Senate in approving, amending, or rejecting treaties with foreign powers.

Again, where the States are not related to one another as independent political communities, but sustain a relation of superior and dependent States, as of a colony to the parent State, or a subject to a dominant State, or of a member of a federation of States to the central authority, such relations are matters not of international, but of constitutional law. Thus, the Acts of Union of England with Scotland and Ireland, the acts of the British Parliament incorporating the Dominion of Canada and the Commonwealth of Australia, the various acts of Congress providing for the government of Porto Rico, Hawaii, and the several Territories of the United States, the provisions of the American Constitution determining the relations between the General Government and the individual States—all these are as much a part of the constitutional law of the States affected by them as are their Bills of Rights, or the laws and customs determining the powers of their respective legislatures.

On the other hand, two political communities may be for some purposes constitutionally related and may yet in some respects remain foreign to one another. Thus, while the relations of the several States of the American Commonwealth to the central authority, and, through that authority to one another, are governed by their constitutional law, they are yet for many purposes independent of one another, and, in so far as they are independent, their relations are matters of international and not of constitutional law.

Specifically, the constitutional law of a State consists of its Constitution, or so much of it as is legally effective, together with the constructions and interpretations which it has received at the hands of the courts or other competent authority.

BRITISH CONSTITUTIONAL LAW. Under a flexible constitution like that of England, which is mainly the result of the accumulated experience of ages, the principal function of constitutional law is to discriminate between those portions of the Constitution which are law, in the strict sense of the term, i.e. which have a legal sanction and will be declared by the courts, and those that rest only upon the customs of the community and upon considerations of practical expediency. These last, which are known as the 'custom of the Constitution,' may have a moral sanction which makes them for the time being as effective politically as the law of the Constitution. But, being legally ineffective, i.e. unenforceable by the authority of the State, they do not, strictly speaking, belong in the category of constitutional law. As a considerable part of the British Constitution is made up of such customs and practical expedients, the range of law comprised within it is comparatively narrow. It is to be remembered, however, that though custom, in and by itself considered, is not a part of constitutional law, it may become a source of such law by being adopted by the courts and declared in judicial decisions. More than one of the so-called liberties of the subject in England have thus arisen and now form part of the common law of the land. It is to be observed, also, that in Great Britain constitutional law does not exist as a

separate and distinct body of rules and precedents, its provisions being an integral part of the common and statute law of the realm, from which they are to be collected.

AMERICAN CONSTITUTIONAL LAW. In a State which has a constitution of the 'fixed' or statutory type, like the United States, much less is left to convention and understanding, and much less depends upon custom and expediency. The area of law under such a constitution is, therefore, much wider, while the task of the constitutional lawyer is much simpler. The constitutional law of such a State consists of the terms of the Constitution itself, with the amendments thereto, and the judicial decisions in which its provisions have come up for construction and application. No acts of the legislature declaring the rights of the citizen, no treaty with a foreign government, no abdication of power by any arm of the State, enters into it. In the American system the only authoritative exposition of a constitution is that afforded by the courts. This extraordinary jurisdiction is not confined to the Supreme Court, but is exercised as well by the inferior Federal courts and by the regular tribunals of the several States. As constitutional law, the judgments of these courts vary according to the Constitution whose provisions are under examination. The Supreme Court of the United States is the final authority on the Federal Constitution, and the supreme appellate courts of the several States on the constitutions of their respective States.

It will be borne in mind that the judicial power in the United States extends to acts of Congress and of the legislatures, the Constitution being the supreme law to which all legislation must conform; whereas, the British Constitution, not being a supreme law, but a part of the ordinary law of the land, the powers of Parliament are not and cannot be limited by it. Accordingly judicial decisions upon the legislative power and its limitations, which constitute the bulk of constitutional law in the United States, are wholly unknown in England.

This, indeed, is the leading principle of American constitutional law—that all acts of government, whether legislative, judicial, or administrative, made or done in contravention of the Constitution, are void. This principle is equally applicable to the constitutions of the several States and to that of the United States. But the Federal Government being one of strictly limited powers, a still more stringent principle is applied to test the validity of its acts—namely, that they are void if not specially sanctioned by the fundamental law. But it does not lie within the competence of the courts to control the action of the State on any other principles than such as are laid down in the fundamental law. They cannot declare void an act within the general competence of the legislative powers, merely because it is contrary to natural justice, or because it violates fundamental principles of republican government, or because of a supposed conflict with the general spirit of the Constitution. It should be added that an act adjudged to be unconstitutional is held to have been void and without legal validity from the time of its enactment.

In the article **CONSTITUTION** (q.v.), reference is made to certain changes which the Constitution of the United States has undergone as the result

of judicial interpretation and the slow growth of custom. The former of these is clearly a part of constitutional law, but it is not easy to say how far a particular custom, if threatened with violation, would be supported by the courts. It seems probable, however, that the Supreme Court would not hesitate to recognize a well-established practice of the Government as a part of the constitutional law of the land. If, for example, a Presidential elector should at the present time assert his right to disregard the instructions under which he was chosen and cast his vote for the candidate of the opposing party, there is at least a question whether he could not be restrained by the courts from carrying his intention into effect. See **CONSTITUTION OF THE UNITED STATES; LAW; PUBLIC LAW.** Besides the authorities referred to under the title **CONSTITUTION**, consult: Boutmy, *The English Constitution* (London and New York, 1891); and Story, *Commentaries on the Constitution of the United States* (5th ed., Boston, 1891).

CONSTITUTIONAL UNION PARTY. A party, formed chiefly out of the remnants of the Know-Nothing and Whig parties, which met in convention at Baltimore in May, 1860, and nominated John Bell (q.v.) and Edward Everett (q.v.), for President and Vice-President, respectively, on a platform which declared simply for "the Constitution of the country, the union of the States, and the enforcement of the laws." The party carried Virginia, Kentucky, and Tennessee, and east a popular vote of about 600,000, and an electoral vote of 39, in the ensuing election. After this campaign the party virtually went out of existence. It was also known as the 'Bell-Everett party.'

CONSTITUTION OF MATTER. See **MATTER, PROPERTIES OF.**

CONSTITUTION OF THE UNITED STATES. The Federal Constitution of the United States of America is one of the class of 'written' and 'rigid' constitutions, and the most important example of a constitution of the 'supreme' or 'extraordinary' type. That is to say, it is not only the result of a definite purpose and of a deliberate act of legislation, embodied in written form: it is not only incapable of modification by ordinary legislative processes; but it is the true supreme law of the land, to which all other law must conform, and conformity to it is the test of the validity of the ordinary law. The commanding quality of the Federal Constitution is the fact that it is not, like most political constitutions, including those of the several States of the American Union, a mere restriction upon the authority of the governing powers of the State, but that it creates a new frame of government, which it endows with certain limited powers, and from which it deliberately withholds all powers not so granted. The government so constituted by it is, therefore, a government of granted, and not of antecedent authority, and the Constitution is not only the supreme law of the land, but comprehends within itself the whole of that law.

There is some confusion, therefore, in the use of such phrases as the 'territorial extent,' 'the Constitution follows the flag,' and whether the Constitution 'applies' to certain newly acquired Territories. Strictly speaking, the Constitution has no territorial extension; it neither expands

nor contracts with the limits of American jurisdiction; but, whatever those limits may be, it steadily and invariably binds the governmental agencies of the nation and limits their authority. In so far as it confers general powers of government on the President and Congress, those powers may be exercised in the ends of the earth as well as within the limits of the original States; whereas, the restrictions upon that power are equally valid, wherever it may be exercised.

This view of the Federal Constitution, as a carefully guarded grant of powers to the Central Government, explains even those guarantees of personal liberty and security which it contains and which are commonly referred to as the Bill of Rights of the Constitution (Amendments I-X.). These are not, as they are commonly understood, an unlimited charter of liberties for the people of the United States, but only restrictions upon the exercise of arbitrary power by the President and Congress. They are not aimed at the States or at local authority. It is announced as "a settled rule of construction of the national Constitution, that the limitations it imposes upon the powers of government are in all cases to be understood as limitations upon the government of the Union only, except where the States are expressly mentioned" (Cooley, *Constitutional Limitations*, p. 19). Accordingly, even such a right as that of trial by jury in criminal cases, which is usually regarded as one of the inalienable rights of the American citizen, is by the Federal Constitution protected only against violation by Congress and the Federal judiciary. Excepting as they are restrained by their own constitutions, there is nothing to prevent the several States from abolishing the jury system entirely.

From what has been said above it will be observed that the Constitution of the United States is not, as it is conceived by foreigners, a complete scheme of government for the people of the United States, but only a part, and that the smaller part, of such a scheme. To fill out the outline, the constitutions and laws of the several States must be taken into account. These provide by far the greater part of the machinery of government, the securities of life, liberty, and property, and the political rights of the citizen.

The Constitution of the United States, in the form in which it is reprinted in this article, represents a long process of experiment and discussion, in the course of which the jealousies and conflicting interests of the different States and sections of which the Union was made up, were gradually compromised and subordinated to the common welfare of all. The Articles of Confederation, by which the ill-jointed union of the thirteen original States was held together from 1779 to 1789, can scarcely be described as a constitution. In any proper sense of that term, as they created only the form and not the substance of government, and vested no real authority in the common representatives of the several commonwealths. They were more in the nature of a treaty of alliance, by which the States bound themselves to common action, and the Congress constituted by them an international conference for promoting the common welfare. The inconveniences and dangers of this arrangement speedily became too pressing to be ignored, and in February, 1787, Congress took such action as its limited powers permitted, and passed a resolution, suggesting that a convention of delegates from the several

States be held at Philadelphia on the second Monday of May following, "for the sole and express purpose of revising the Articles of Confederation, and reporting to Congress and the several State legislatures such alterations and provisions therein as shall, when agreed to by Congress and confirmed by the States, render the Federal Constitution adequate to the exigencies of government, and the preservation of the Union."

Pursuant to this resolution of Congress, delegates from twelve of the thirteen States (Rhode Island alone being unrepresented) assembled at Philadelphia, the convention opening its sessions in Independence Hall on May 14, 1787, under the Presidency of George Washington. For four months the delegates carried on the great work which had been intrusted to them, and at the close of their deliberations, on September 17, 1787, they had completed the Constitution of the United States, with the exception of the amendments, in the form in which we have it to-day. Their work was promptly approved by Congress, and at the close of the year 1788 had been adopted by eleven of the States and went into operation between them. The two remaining States, North Carolina and Rhode Island, ratified it and entered into the American Union in 1789 and 1790, respectively.

These results were not achieved without difficulty—in the face of profound differences of opinion. In most of the States the ratification of the Constitution was secured by narrow majorities, and after prolonged and earnest discussion, and in none of the States was it approved with anything approaching unanimity. This opposition and these differences of opinion were primarily due to what have been called 'the compromises of the Constitution.' These were three in number. The first dealt with the fundamental conflict between those who desired a strong central authority and those who feared the extension of executive power. This was compromised by investing the President of the Republic with great powers, but for a limited term only, and by a complicated system of 'checks and balances,' whereby the exercise of his power was at divers points and in various ways subjected to the control of Congress or of the Senate.

The second compromise was of the conflict of the great and small States, the former claiming the weight in the National Government to which their size, wealth, and population entitled them, and the latter insisting upon the recognition of their equality as independent, self-governing commonwealths. This was effected by the institution of two chambers of legislation, a Senate, in which the States were to have equal representation, and a House of Representatives, in which the representation should be in proportion to population. This compromise involved also the delicate question of the distribution of power between the two Houses of Congress.

The third compromise was of the controversy between the upholders of slavery and those who believed that slavery should be restricted or abolished. This was adjusted by the proviso forbidding Congress to prohibit the importation or migration of slaves before the year 1808 (Art. I., Sec. 9), and the requirement that fugitive slaves should be delivered up by the States in which they had taken refuge (Art. IV., Sec. 2). As no power was conferred upon Congress or the President to

interfere with slavery in the States in which it existed, the institution was left within the complete control of those States.

In some of the States, great dissatisfaction was expressed at the absence of anything like a Bill of Rights in the Constitution, and for a time the fear was felt that certain of the States might refuse to ratify unless the Constitution were amended. Accordingly, the first Congress after the adoption of the Constitution proposed a series of amendments, which were promptly ratified by the States as Articles I-X. of the amendments as they now stand. (See RIGHTS, BILL OF). Articles XI. and XII. speedily followed, in 1793 and 1803, respectively. From that date to the Civil War, no amendments to the original instrument were adopted. The three remaining amendments, Articles XIII., XIV., and XV., were adopted in 1865, 1868, and 1870, respectively, as a part of the reconstruction policy of the Government after the Civil War, in order to secure to the lately emancipated slaves the legal and political benefits of full citizenship in the United States and in the several States. The character and effect of these amendments are considered in the article on RIGHTS, CIVIL. See, also, CIVIL WAR; RECONSTRUCTION; SLAVERY.

It remains to be said, in conclusion, that, in speaking of the Constitution of a State, reference is made to the whole body of its fundamental law, whether embodied in written form or not. The Constitution of every active political community is the product of many agencies and influences, not merely of deliberate legislative action. That of the United States is no exception to this rule. The Constitution, as adopted in the early formative period of the Republic, and formally amended from time to time in the manner therein prescribed, has been more extensively amended by the insensible processes of use and custom, and by the far-reaching effects of judicial construction. As to the last, it may be said that the Constitution, in setting up a supreme judicial tribunal, with the function of passing upon the validity of national and State legislative action and of executive action, has indirectly provided for a process of amendment much more efficacious than that directly provided. The Constitution of the United States, as it exists to-day, therefore, must be looked for in the decisions of the courts and in the political practice of the people, as well as in the text of the original articles and their formal amendments. The leading authorities on the Constitution are: *The Federalist*; *Elliott's Debates in Convention on the Adoption of the Federal Constitution*; Curtis, *History, Origin, Formation, and Adoption of the Constitution of the United States*; Story, *Commentaries on the Constitution of the United States* (any edition); Cooley, *Treatise on the Constitutional Limitations Which Rest Upon the Legislative Powers of the States*; Von Holst, *Constitutional Law of the United States of America* (translation, Chicago, 1887); De Tocqueville, *Democracy in America* (translation, London, 1835); Bryce, *The American Commonwealth* (3d ed.), and the *Cases on Constitutional Law of the United States*, collected and edited by J. B. Thayer (Cambridge, Mass., 1894-95). See also, CONSTITUTION; CONSTITUTIONAL LAW; SUPREME COURT OF THE UNITED STATES. The text of the Constitution is as follows:

CONSTITUTION OF THE UNITED STATES.

We, the people of the United States, in order to form a more perfect union, establish justice, insure domestic tranquillity, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this Constitution for the United States of America.

ARTICLE I., Sec. 1. All legislative powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.

Sec. 2. The House of Representatives shall be composed of members chosen every second year by the people of the several States, and the electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State Legislature.

No person shall be a Representative who shall not have attained to the age of twenty-five years, and been seven years a citizen of the United States, and who shall not, when elected, be an inhabitant of that State in which he shall be chosen.

Representatives and direct taxes shall be apportioned among the several States which may be included within this Union according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three-fifths of all other persons. The actual enumeration shall be made within three years after the first meeting of the Congress of the United States, and within every subsequent term of ten years, in such manner as they shall by law direct. The number of Representatives shall not exceed one for every thirty thousand, but each State shall have at least one Representative: and until such enumeration shall be made, the State of New Hampshire shall be entitled to choose 3; Massachusetts, 8; Rhode Island and Providence Plantations, 1; Connecticut, 5; New York, 6; New Jersey, 4; Pennsylvania, 8; Delaware, 1; Maryland, 6; Virginia, 10; North Carolina, 5; South Carolina, 5; and Georgia, 3.

When vacancies happen in the representation from any State, the executive authority thereof shall issue writs of election to fill such vacancies.

The House of Representatives shall choose their Speaker and other officers; and shall have the sole power of impeachment.

Sec. 3. The Senate of the United States shall be composed of two Senators from each State, chosen by the legislature thereof, for six years; and each Senator shall have one vote.

Immediately after they shall be assembled in consequence of the first election, they shall be divided as equally as may be into three classes. The seats of the Senators of the first class shall be vacated at the expiration of the second year, of the second class at the expiration of the fourth year, and of the third class at the expiration of the sixth year, so that one-third may be chosen every second year; and if vacancies happen by resignation, or otherwise, during the recess of the legislature of any State, the Executive thereof may make temporary appointments until the next meeting of the legislature, which shall then fill such vacancies.

No person shall be a Senator who shall not have attained to the age of thirty years, and been nine years a citizen of the United States, and

who shall not, when elected, be an inhabitant of that State for which he shall be chosen.

The Vice-President of the United States shall also be president of the Senate, but shall have no vote, unless they be equally divided.

The Senate shall choose their other officers, and also a president *pro tempore*, in the absence of the Vice-President, or when he shall exercise the office of President of the United States.

The Senate shall have the sole power to try all impeachments; when sitting for that purpose, they shall be on oath or affirmation. When the President of the United States is tried, the Chief Justice shall preside; and no person shall be convicted without the concurrence of two-thirds of the members present.

Judgment in cases of impeachment shall not extend further than to removal from office, and disqualification to hold and enjoy any office of honor, trust, or profit under the United States; but the party convicted shall nevertheless be liable and subject to indictment, trial, judgment, and punishment, according to law.

Sec. 4. The times, places, and manner of holding elections for Senators and Representatives shall be prescribed in each State by the legislature thereof; but the Congress may at any time, by law, make or alter such regulations, except as to the places of choosing Senators.

The Congress shall assemble at least once in every year, and such meeting shall be on the first Monday in December, unless they shall, by law, appoint a different day.

Sec. 5. Each House shall be the judge of the elections, returns, and qualifications of its own members, and a majority of each shall constitute a quorum to do business; but a smaller number may adjourn from day to day, and may be authorized to compel the attendance of absent members, in such manner and under such penalties as each House may provide.

Each House may determine the rules of its proceedings, punish its members for disorderly behavior, and, with the concurrence of two-thirds, expel a member.

Each House shall keep a journal of its proceedings and from time to time publish the same, excepting such parts as may in their judgment require secrecy, and the yeas and nays of the members of either House on any question shall, at the desire of one-fifth of those present, be entered on the journal.

Neither House, during the sessions of Congress, shall, without the consent of the other, adjourn for more than three days, nor to any other place than that in which the two Houses shall be sitting.

Sec. 6. The Senators and Representatives shall receive a compensation for their services, to be ascertained by law, and paid out of the treasury of the United States. They shall in all cases, except treason, felony, and breach of the peace, be privileged from arrest during their attendance at the sessions of their respective Houses, and in going to and returning from the same; and for any speech or debate in either House they shall not be questioned in any other place.

No Senator or Representative shall, during the time for which he was elected, be appointed to any civil office under the authority of the United States, which shall have been created, or the emoluments whereof shall have been increased during such time; and no person holding any

office under the United States shall be a member of either House during his continuance in office.

Sec. 7. All bills for raising revenue shall originate in the House of Representatives; but the Senate may propose or concur with amendments, as on other bills.

Every bill which shall have passed the House of Representatives and the Senate shall, before it become a law, be presented to the President of the United States; if he approve, he shall sign it; but if not, he shall return it, with his objections, to that House in which it shall have originated, who shall enter the objections at large on their journal, and proceed to reconsider it. If after such reconsideration two-thirds of that House shall agree to pass the bill, it shall be sent, together with the objections to the other House, by which it shall likewise be reconsidered; and if approved by two-thirds of that House, it shall become a law. But in all such cases the votes of both Houses shall be determined by yeas and nays, and the names of the persons voting for and against the bill shall be entered on the journal of each House respectively. If any bill shall not be returned by the President within ten days (Sunday excepted) after it shall have been presented to him, the same shall be a law in like manner as if he had signed it, unless the Congress by their adjournment prevent its return; in which case it shall not be a law.

Every order, resolution, or vote to which the concurrence of the Senate and the House of Representatives may be necessary (except on a question of adjournment) shall be presented to the President of the United States; and before the same shall take effect, shall be approved by him, or, being disapproved by him, shall be repassed by two-thirds of the Senate and House of Representatives, according to the rules and limitations prescribed in the case of a bill.

Sec. 8. The Congress shall have power

To lay and collect taxes, duties, imposts, and excises, to pay the debts and provide for the common defense and general welfare of the United States; but all duties, imposts, and excise shall be uniform throughout the United States;

To borrow money on the credit of the United States;

To regulate commerce with foreign nations, and among the several States, and with the Indian tribes;

To establish an uniform rule of naturalization, and uniform laws on the subject of bankruptcies throughout the United States;

To coin money, regulate the value thereof, and of foreign coin, and fix the standard of weights and measures;

To provide for the punishment of counterfeiting the securities and current coin of the United States;

To establish post-offices and post-roads;

To promote the progress of science and useful arts, by securing for limited times, to authors and inventors, the exclusive right to their respective writings and discoveries;

To constitute tribunals inferior to the Supreme Court;

To define and punish piracies and felonies committed on the high seas, and offenses against the law of nations;

To declare war, grant letters of marque and reprisal, and make rules concerning captures on land and water;

To raise and support armies, but no appropriation of money to that use shall be for a longer term than two years;

To provide and maintain a navy:

To make rules for the government and regulation of the land and naval forces;

To provide for calling forth the militia to execute the laws of the Union, suppress insurrections, and repel invasions;

To provide for organizing, arming, and disciplining the militia, and for governing such part of them as may be employed in the service of the United States, reserving to the States respectively the appointment of the officers, and the authority of training the militia according to the discipline prescribed by Congress;

To exercise exclusive legislation in all cases whatsoever over such district (not exceeding ten miles square) as may, by cession of particular States, and the acceptance of Congress, become the seat of the Government of the United States, and to exercise like authority over all places purchased by the consent of the legislature of the State in which the same shall be, for the erection of forts, magazines, arsenals, dock-yards, and other needful buildings; and

To make all laws which shall be necessary and proper for carrying into execution the foregoing powers, and all other powers vested by this Constitution in the Government of the United States, or in any department or officer thereof.

Sec. 9. The migration or importation of such persons as any of the States now existing shall think proper to admit shall not be prohibited by Congress prior to the year one thousand eight hundred and eight; but a tax or duty may be imposed on such importation, not exceeding ten dollars for each person.

The privilege of the writ of *habeas corpus* shall not be suspended, unless when in cases of rebellion or invasion the public safety may require it.

No bill of attainder or *ex post facto* law shall be passed.

No capitation or other direct tax shall be laid, unless in proportion to the census or enumeration hereinbefore directed to be taken.

No tax or duty shall be laid on articles exported from any State.

No preference shall be given by any regulation of commerce or revenue to the ports of one State over those of another; nor shall vessels bound to or from one State be obliged to enter, clear, or pay duties in another.

No money shall be drawn from the treasury but in consequence of appropriations made by law; and a regular statement and account of the receipts and expenditures of all public money shall be published from time to time.

No title of nobility shall be granted by the United States; and no person holding any office of profit or trust under them shall, without the consent of the Congress, accept of any present, emolument, office, or title, of any kind whatever, from any king, prince, or foreign State.

Sec. 10. No State shall enter into any treaty, alliance, or confederation; grant letters of marque and reprisal; coin money; emit bills of credit; make anything but gold and silver coin a tender in payment of debts; pass any bill of attainder, *ex post facto* law, or law impairing the obligation of contracts, or grant any title of nobility.

No State shall, without the consent of the Congress, lay any imposts or duties on imports or exports, except what may be absolutely necessary for executing its inspection laws; and the net produce of all duties and imposts, laid by any State on imports or exports, shall be for the use of the treasury of the United States; and all such laws shall be subject to the revision and control of the Congress.

No State shall, without the consent of Congress, lay any duty of tonnage, keep troops, or ships of war in time of peace, enter into any agreement or compact with another State, or with a foreign power, or engage in war, unless actually invaded, or in such imminent danger as will not admit of delay.

ARTICLE II, Sec. 1. The executive power shall be vested in a President of the United States of America. He shall hold his office during the term of four years, and, together with the Vice-President, chosen for the same term, be elected as follows:

Each State shall appoint, in such manner as the legislature thereof may direct, a number of electors, equal to the whole number of Senators and Representatives to which the State may be entitled in the Congress; but no Senator or Representative, or persons holding an office of trust or profit under the United States, shall be appointed an elector.

The Congress may determine the time of choosing the electors, and the day on which they shall give their votes; which day shall be the same throughout the United States.

No person, except a natural-born citizen or a citizen of the United States at the time of the adoption of the Constitution, shall be eligible to the office of President; neither shall any person be eligible to that office who shall not have attained to the age of thirty-five years, and been fourteen years resident within the United States.

In case of the removal of the President from office, or of his death, resignation, or inability to discharge the powers and duties of the said office, the same shall devolve on the Vice-President, and the Congress may by law provide for the case of removal, death, resignation, or inability, both of the President and Vice-President, declaring what officer shall then act as President, and such officer shall act accordingly, until the disability be removed, or a President shall be elected.

The President shall, at stated times, receive for his services a compensation, which shall neither be increased nor diminished during the period for which he shall have been elected, and he shall not receive within that period any other emolument from the United States, or any of them.

Before he enters on the execution of his office, he shall take the following oath or affirmation: "I do solemnly swear (or affirm) that I will faithfully execute the office of President of the United States, and will, to the best of my ability, preserve, protect, and defend the Constitution of the United States."

Sec. 2. The President shall be commander-in-chief of the army and navy of the United States, and of the militia of the several States when called into the actual service of the United States; he may require the opinion, in writing, of the principal officer in each of the executive departments upon any subject relating to the duties of their respective offices, and he shall

have power to grant reprieves and pardons for offenses against the United States, except in cases of impeachment.

He shall have power, by and with the advice and consent of the Senate, to make treaties, provided two-thirds of the Senators present concur; and he shall nominate, and by and with the advice and consent of the Senate, shall appoint ambassadors, other public ministers and consuls, judges of the Supreme Court, and all other officers of the United States, whose appointments are not herein otherwise provided for, and which shall be established by law; but the Congress may by law vest the appointment of such inferior officers as they think proper in the President alone, in the courts of law, or in the heads of departments.

The President shall have power to fill up all vacancies that may happen during the recess of the Senate, by granting commissions which shall expire at the end of their next session.

Sec. 3. He shall from time to time give to the Congress information of the state of the Union, and recommend to their consideration such measures as he shall judge necessary and expedient; he may on extraordinary occasions convene both Houses, or either of them, and in cases of disagreement between them, with respect to the time of adjournment, he may adjourn them to such time as he shall think proper; he shall receive ambassadors and other public ministers; he shall take care that the laws be faithfully executed, and shall commission all the officers of the United States.

Sec. 4. The President, Vice-President, and all civil officers of the United States, shall be removed from office on impeachment for, and conviction of, treason, bribery, or other high crimes and misdemeanors.

ARTICLE III., Sec. 1. The judicial power of the United States shall be vested in one Supreme Court, and in such inferior courts as the Congress may from time to time ordain and establish. The judges, both of the Supreme and inferior courts, shall hold their offices during good behavior, and shall, at stated times, receive for their services a compensation, which shall not be diminished during their continuance in office.

Sec. 2. The judicial power shall extend to all cases, in law and equity, arising under this Constitution, the laws of the United States, and treaties made, or which shall be made, under their authority; to all cases affecting ambassadors, other public ministers, and consuls; to all cases of admiralty and maritime jurisdiction; to controversies to which the United States shall be a party; to controversies between two or more States; between a State and citizens of another State; between citizens of different States; between citizens of the same State claiming lands under grants of different States, and between a State, or the citizens thereof, and foreign States, citizens, or subjects.

In all cases affecting ambassadors, other public ministers, and consuls, and those in which a State shall be party, the Supreme Court shall have original jurisdiction. In all the other cases before mentioned, the Supreme Court shall have appellate jurisdiction, both as to law and fact, with such exceptions and under such regulations as the Congress shall make.

The trial of all crimes, except in cases of impeachment, shall be by jury; and such trial

shall be held in the State where the said crimes shall have been committed; but when not committed within any State, the trial shall be at such place or places as the Congress may by law have directed.

Sec. 3. Treason against the United States shall consist only in levying war against them, or in adhering to their enemies, giving them aid and comfort.

No person shall be convicted of treason unless on the testimony of two witnesses to the same overt act, or on confession in open court.

The Congress shall have power to declare the punishment of treason; but no attainder of treason shall work corruption of blood, or forfeiture except during the life of the person attainted.

ARTICLE IV., Sec. 1. Full faith and credit shall be given in each State to the public acts, records, and judicial proceedings of every other State. And the Congress may by general laws prescribe the manner in which such acts, records, and proceedings shall be proved, and the effect thereof.

Sec. 2. The citizens of each State shall be entitled to all privileges and immunities of citizens in the several States.

A person charged in any State with treason, felony, or other crime, who shall flee from justice, and be found in another State, shall, on demand of the executive authority of the State from which he fled, be delivered up, to be removed to the State having jurisdiction of the crime.

No person held to service or labor in one State, under the laws thereof, escaping into another, shall, in consequence of any law or regulation therein, be discharged from such service or labor, but shall be delivered up on claim of the party to whom such service or labor may be due.

Sec. 3. New States may be admitted by the Congress into this Union; but no new State shall be formed or erected within the jurisdiction of any other State, nor any State be formed by the junction of two or more States, or parts of States, without the consent of the legislatures of the States concerned as well as of the Congress.*

The Congress shall have power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States; and nothing in this Constitution shall be so construed as to prejudice any claims of the United States, or any particular State.

Sec. 4. The United States shall guarantee to every State in this Union a republican form of government, and shall protect each of them against invasion, and, on application of the legislature, or of the Executive (when the legislature cannot be convened), against domestic violence.

ARTICLE V. The Congress, whenever two-thirds of both Houses shall deem it necessary, shall propose amendments to this Constitution, or, on the application of the legislatures of two-thirds of the several States, shall call a convention for proposing amendments, which, in either case, shall be valid to all intents and purposes as part of this Constitution, when ratified by the legislatures of three-fourths of the several States, or by conventions in three-fourths thereof, as the one or the other mode of ratification may be proposed by the Congress; provided, that no amendment which may be made prior to the year one thousand eight hundred and eight shall in any manner affect the first and fourth clauses in

the ninth section of the first article; and that no State, without its consent, shall be deprived of its equal suffrage in the Senate.

ARTICLE VI. All debts contracted and engagements entered into before the adoption of this Constitution shall be as valid against the United States under this Constitution, as under the Confederation.

This Constitution and the laws of the United States which shall be made in pursuance thereof, and all treaties made, or which shall be made, under the authority of the United States, shall be the supreme law of the land; and the judges in every State shall be bound thereby, anything in the Constitution or laws of any State to the contrary notwithstanding.

The Senators and Representatives before mentioned, and the members of the several State legislatures, and all executive and judicial officers, both of the United States and of the several States, shall be bound by oath or affirmation to support this Constitution; but no religious test shall ever be required as a qualification to any office or public trust under the United States.

ARTICLE VII. The ratification of the conventions of nine States shall be sufficient for the establishment of this Constitution between the States so ratifying the same.

Done in convention, by the unanimous consent of the States present, the 17th day of September, in the year of our Lord one thousand seven hundred and eighty-seven, and of the independence of the United States of America the twelfth.

AMENDMENTS.

ARTICLE I. Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech or of the press; or the right of the people peaceably to assemble, and to petition the Government for redress of grievances.

ARTICLE II. A well-regulated militia being necessary to the security of a free State, the right of the people to keep and bear arms shall not be infringed.

ARTICLE III. No soldier shall, in time of peace, be quartered in any house without the consent of the owner, nor in time of war but in a manner to be prescribed by law.

ARTICLE IV. The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated; and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

ARTICLE V. No person shall be held to answer for a capital or otherwise infamous crime, unless on a presentment or indictment of a grand jury, except in cases arising in the land or naval forces, or in the militia, when in actual service, in time of war and public danger; nor shall any person be subject for the same offense to be twice put in jeopardy of life or limb, nor shall be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use without just compensation.

ARTICLE VI. In all criminal prosecutions, the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been

committed, which district shall have been previously ascertained by law, and to be informed of the nature and cause of the accusations; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the assistance of counsel for his defense.

ARTICLE VII. In suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury shall be otherwise re-examined in any court of the United States than according to the rules of the common law.

ARTICLE VIII. Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishment inflicted.

ARTICLE IX. The enumeration in the Constitution of certain rights shall not be construed to deny or disparage others retained by the people.

ARTICLE X. The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.

ARTICLE XI. The judicial power of the United States shall not be construed to extend to any suit in law or equity commenced or prosecuted against one of the United States by citizens of another State, or by citizens or subjects of any foreign State.

ARTICLE XII. The electors shall meet in their respective States, and vote by ballot for President and Vice-President, one of whom at least shall not be an inhabitant of the same State with themselves. They shall name in their ballots the person voted for as President, and in distinct ballots the person voted for as Vice-President; and they shall make distinct lists of all persons voted for as President, and of all persons voted for as Vice-President, and of the number of votes for each, which lists they shall sign and certify, and transmit, sealed, to the seat of the Government of the United States, directed to the President of the Senate. The President of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates, and the votes shall then be counted; the person having the greatest number of votes for President shall be the President, if such number be a majority of the whole number of electors appointed; and if no person have such a majority, then from the persons having the highest numbers, not exceeding three, on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President, the votes shall be taken by States, the representation from each State having one vote; a quorum for this purpose shall consist of a member or members from two-thirds of the States, and a majority of all the States shall be necessary to a choice. And if the House of Representatives shall not choose a President, whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the Vice-President shall act as President, as in the case of the death or other constitutional disability of the President. The person having the greatest number of votes as Vice-President shall be the Vice-President, if such number be a majority of the whole number of electors appointed; and if no person have a majority, then from the two highest numbers on the list the Senate shall choose the Vice-President; a quorum for the purpose shall consist of two-

thirds of the whole number of Senators, and a majority of the whole number shall be necessary to a choice. But no person constitutionally ineligible to the office of President shall be eligible to that of Vice-President of the United States.

ARTICLE XIII., Sec. 1. Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction.

Sec. 2. Congress shall have power to enforce this article by appropriate legislation.

ARTICLE XIV., Sec. 1. All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States, and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws.

Sec. 2. Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed. But when the right to vote at any election for the choice of electors for President and Vice-President of the United States, Representatives in Congress, the executive and judicial officers of a State, or the members of the legislature thereof, is denied to any of the male inhabitants of such State being twenty-one years of age, and citizens of the United States, or in any way abridged, except for participation in rebellion or other crime, the basis of representation therein shall be reduced in the proportions which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such State.

Sec. 3. No person shall be a Senator or Representative in Congress, or Elector of President and Vice-President, or hold any office, civil or military, under the United States, or under any State, who, having previously taken an oath as a member of Congress, or as an officer of the United States, or as a member of any State legislature, or as an executive or judicial officer of any State, to support the Constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid or comfort to the enemies thereof. But Congress may, by a vote of two-thirds of each House, remove such disability.

Sec. 4. The validity of the public debt of the United States authorized by law, including debts incurred for payment of pensions and bounties for services in suppressing insurrection or rebellion, shall not be questioned. But neither the United States nor any State shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for the loss or emancipation of any slave; but all such debts, obligations, and claims shall be held illegal and void.

Sec. 5. The Congress shall have power to enforce, by appropriate legislation, the provisions of this article.

ARTICLE XV., Sec. 1. The right of the citizens of the United States to vote shall not be denied or abridged by the United States, or by any State, on account of race, color, or previous condition of servitude.

Sec. 2. The Congress shall have power to enforce this article by appropriate legislation.

CONSTITUTIONS, APOSTOLICAL. See APOSTOLIC CONSTITUTIONS AND CANONS.

CONSTITUTIONS OF CLARENDON. See CLARENDON, CONSTITUTIONS OF.

CONSTRUCTION (Lat. *constructio*, from *construere*, to construct, from *com-*, together + *struere*, to heap). In geometry, the process of drawing a figure so as to satisfy the conditions of the given problem. Thus, to construct an equilateral triangle of side *a*: with each end of *a* as a centre and with *a* as a radius, describe a circle; connect either intersection with the ends of *a*. Here the construction is not unique, since two triangles satisfy the condition. In solving problems a valuable method is to assume the construction and investigate the properties of the figure. Thus, to draw a line through a given point parallel to a given line: assuming the construction and a transversal of the parallels through the given point, it appears that the alternate angles are equal; hence, to construct the figure, draw a line through the point cutting the given line and construct the alternate angle.

Another fruitful method is that of the intersection of loci; e.g. if it is known that a point is on each of two intersecting straight lines, it is uniquely determined at their point of intersection; but if it is on a straight line and a circumference which the line intersects, it may be either of the two points of intersection.

The best works upon the constructions of elementary geometry are Petersen, *Methods and Theories* (Copenhagen and London, 1879); Rouché and de Comberousse, *Traité de géométrie* (Paris, 1900); and Alexandroff, *Problèmes de géométrie élémentaire*, translated into French by Aitoff (Paris, 1899). Consult also Beman and Smith, *New Plane and Solid Geometry* (Boston, 1899).

CONSUELO, kón-swá'lo. A famous novel by George Sand (1842) and the name of its chief character, a little Spanish girl abandoned in Italy, whose voice attracts the old maestro Porpora. Through him she is presented to Count Zustiniani, and the latter, after her successful debut on the stage, falls in love with her, but is repulsed. When her early lover Angoletto forgets her she is sent by Porpora to the home of a German family in Bohemia. Her entrance into this household prepares the way for the sequel, *La Comtesse de Rudolstadt*.

CONSUL (Lat., OL. *consul*, probably from *consulere*, to consult; less plausibly from *con-*, with + *salire*, to leap). The title given to the two chief magistrates established in Rome on the expulsion of the kings in B.C. 509. So violent was the hatred of the monarchy that the Romans were unwilling to intrust the new Republic to a single executive, but gave the entire administration to two consuls, of equal rank and jurisdiction, that each might check, if need were, any tyranny on the part of the other. At first the entire power of the King, in State and Church, at Rome and abroad, was vested in the two consuls, and each was wholly responsible for the acts of both; but gradually their powers were limited and many of their functions were given to other officials. They held office for one year only, and years were reckoned by their names. In the early days of

the Republic, one consul was generally commander-in-chief in the field, while the other remained to administer affairs at Rome; but often both were forced to lead the armies in battle. They presided at meetings of the Senate, at elections, and at the chief public festivals. As a mark of their high office they wore a white toga with a purple band (*toga prætexta*), sat in public in the 'curule chair' (*sella curulis*), and were accompanied by twelve attendants (*lictors*) bearing the *fascces*, or axe bound within a bundle of rods.

The consuls were elected at the *Comitia Censuriata* (see *COMITIA*). In the earlier period the date of the election and of the entering upon office was irregular and dependent on circumstances; but if convenient the election took place generally in July, and after B.C. 153 the consulship began regularly on January 1. At first only patricians were eligible to the office, and a consul could not be reelected. After a long struggle of the plebeians for recognition, it was established by the *Leges Licinia Sextie* (see *LICINIAN ROGATIONS*), in B.C. 367, that one of the consuls must be a plebeian. In 342 both consulships were opened to the plebs by a popular vote, and it was ordained that ten years must elapse before a consul could be eligible for reelection; however, it was not until 215 that two plebeian consuls were elected together, and one of these was quickly ousted. Not until B.C. 162 did the plebeians succeed in obtaining two effective consuls.

With the organization of the Empire by Augustus, the consulship ceased to be of real importance. In the division of functions between the Emperor and the senatorial body the consuls remained the head of the latter; but their nomination became a prerogative of the Emperor, and their election a farce. They still gave their names to the year, and the position was simply one of honor, so that we very often find several consuls named in succession in one year, the *eponymous* consuls holding office only for four, or even two, months, and then being replaced by others. The original pair were called *consules ordinarii*, their substitutes *consules suffecti*. Under the later Empire nothing but the name and honor of the consulship remained. The Emperor Honorius was made consul in the very year of his birth! Official dating by the name of the consuls came to an end in A.D. 537. Consult: Mommsen, *Römische Staatsrecht*, ii. (Leipzig, 1887-88); Daremberg et Saglio, *Dictionnaire des antiquités romaines*, vol. i. (Paris, 1892); Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vol. iv. (Stuttgart, 1839).

CONSUL, MERCANTILE. An agent appointed by one nation to reside within the territory of another for the special purpose of promoting commercial intercourse between them. The earliest prototype of this official is the ancient Greek *proxenus*, whose functions were to represent his country, and to protect its citizens while trading at the place of his residence. Modern Greek applies this term to the consul of to-day. That 'consul' has superseded 'proxenus' as the title of the international agent of commerce is due to the supremacy of Italian commerce in the Middle Ages. During that period Italian traders in a foreign country were accustomed to have their disputes settled by magistrates of their own upon

whom they conferred the proud title of 'Consul.' In 1485 Richard III. appointed the first consul for English merchants (Lorenzo Strozzi, at Pisa), being moved thereto, it is said, "by observing from the practice of other nations the advantage of having a magistrate for settling disputes among merchants trading in another country."

This judicial function of the early consul is maintained at present only in Oriental and African countries. In other lands his primary duties are those of an international commercial agent. The exact nature of his activities and the manner in which he is to perform them are determined mainly by the regulations of the Government appointing him.

The consular service of the United States embraces one consular agent and consul-general (located at Cairo, and enjoying a quasi-diplomatic position), consuls-general, vice-consuls-general, deputy consuls-general, consuls, vice-consuls, deputy consuls, consular agents, commercial agents, consular clerks, and office clerks, numbering, in 1902, over 1000 persons. Their salaries and fees amount to about two million dollars annually. Most of the fees (which aggregate nearly a million) are covered into the United States Treasury, but many consuls are paid for their services wholly or in part by fees. It is said that the American consuls-general at London and at Paris receive about \$20,000 each, although the salary is but \$5000. The number of consulates-general (July 17, 1902) is 44, of consulates 256, and of commercial agencies 25. As a rule, the incumbents of these offices are not allowed to transact business in or with the countries to which they are accredited, but a few of the consuls and commercial agents are exempted from this rule, because of their limited official income. Commercial agents are peculiar to the service of the United States and are not recognized by other countries as entitled to the rank or privileges of consuls. They are appointed by the President without confirmation by the Senate, and enter upon their duties without an exequatur from the Government in whose territory they reside. All other consuls are appointed by the President by and with the advice and consent of the Senate. They qualify by taking a prescribed oath of office, and by executing a bond to the United States for the faithful discharge of their duties and for accounting for, paying over, and delivering up all fees, money, goods, effects, books, records, papers, and other property coming to their hands. Upon filing the oath of office and the bond a commission issues, and a request is made by the State Department to the Government within whose jurisdiction the office is situated for an exequatur, upon the receipt of which the consular officer is entitled to perform his functions and enjoy the privileges of his station. The exact extent of these privileges depends upon the conventions or treaties existing between the United States and the countries to which they are accredited. In the absence of any convention, a consul, after receiving his exequatur, while not entitled to the exemptions of a diplomatic agent (see *DIPLOMATIC AGENTS*; *ALIEN*), is a recognized officer of a foreign State, under the special protection of international law; he may raise the flag and place the arms of the United States over his gates and doors; and his official papers and archives are exempt from seizure and destruction. While these duties

of consular officers pertain chiefly to commercial transactions, they are not limited to them. These officers "stand as protectors and advisers of their countrymen present in foreign lands; they act as judges, notaries, administrators of interests and of all property of such as have no legal representative; they have to prevent frauds on the revenue; to notice infractions of treaty stipulations relating to trade; to advise their Government of new laws or regulations within their district; to preserve the discipline of the commercial marine; to guard seamen from oppression; to aid the destitute; and to make reports upon matters affecting commercial, industrial, financial, and agricultural pursuits."

Some of the specific duties of consuls included under these general duties are: in connection with their control of the shipping of their country, the arbitration of disputes between master and crew, the relief of destitute seamen, the care of property of their countrymen in case of shipwreck, etc., the issuing of passports, the authentication of documents, and the certification of marriages, births, and deaths. The consuls of the United States are expressly prohibited from performing the marriage ceremony; but the statutes provide that when a marriage is duly solemnized in accordance with the law of the country in which the consul resides, the consul shall, upon proper application, issue a certificate of such solemnization, provided such persons would have been authorized to marry if residing in the District of Columbia, and the consul must forward a duplicate to the Department of State at Washington. Such a marriage is valid in the District of Columbia and in the Territories of the United States; but how far it is valid in the various States of the Union has not been judicially determined.

Ministers and consuls of the United States in China, Siam, and Madagascar have the judicial powers which are bestowed upon them by Chapter XLVII. of the Revised Statutes, including jurisdiction in minor criminal cases and in civil cases involving sums of \$500 or less. The personnel of the consular courts is specially determined, varying with the country and the subject matter under dispute; thus, in capital cases it is provided that the consul must sit with four of his countrymen as his associates, and that their verdict must be approved by the Minister before conviction can be had; and in some countries provision is made for a consular mixed court consisting of natives of the country and of the United States. Consuls have the judicial powers above referred to also in Turkey so far as relates to crimes and offenses of the citizens of the United States, and in civil cases where such powers are permitted by the laws of Turkey or its treaties with civilized nations or by its usages with the Franks or foreign Christian nations; and in Persia, as to suits and disputes between citizens of the United States. Special provisions exist granting special powers to the consuls of the United States in the Barbary States, Muscat, Samoa, and in some other places where treaty has provided for them. In China, Madagascar, Siam, Turkey, and other non-Christian countries the property of deceased persons, both real and personal, is administered under the probate jurisdiction of the consular courts of those countries. (The judicial powers of the United States Consul in Japan were terminated on July 17, 1899, by

the treaty with Japan which took effect upon that date.) Provision is made for an appeal from the consular courts under certain conditions to the Minister, and to the circuit courts of the United States.

Various attempts have been made during recent years to reorganize the consular service of the United States, but without success, and its consular system has remained practically unchanged since 1792. In 1895, and again in 1900, bills were introduced in Congress to provide a system by which persons shall be trained to the duties of the consular service, so that they shall be able to perform them in the best possible way at a reasonable expense to the Government. Fitness for the particular place, permanency of tenure, and promotion for efficiency were the principles upon which the new system was to be based. While Congressional action has not been secured, a step in the direction indicated by these bills was taken by President Cleveland in 1895, when he issued an executive order providing for an examination, by a board of three persons to be designated by the Secretary of State, of applicants for certain places in the consular service.

C.); *House Report No. 562, Fifty-sixth Congress, First Session*; *Senate Report No. 1202, Fifty-sixth Congress, First Session*.

CONSULATE (Fr. *consulat*). The form of government in France from 1799 to 1804. After the sudden overthrow of the Directory on the 18th Brumaire (November 9, 1799), the members of the Council of Ancients and the Five Hundred, or rather such of them as approved of that act of violence on the part of Bonaparte, appointed three Consuls—Sieyès, Bonaparte, and Roger Ducos. Sieyès and Ducos were quietly got rid of by pensions and Cambacérès and Lebrun took their places. This approach to a monarchical government was confirmed December 24, 1799, by the Constitution of the Year VIII., by which Bonaparte was made First Consul. The Consuls were elected by the Senate for ten years, and were eligible for reelection. There was a Conservative Senate (*sénat conservateur*) of some sixty members appointed for life, a Tribunal of 100 members, and a Legislative Assembly of 300, but their powers were very limited, while those of the First Consul were made almost absolute. He promulgated laws and appointed or dismissed ministers, ambassadors, members of the Council of State, military and naval officers, and all civil and criminal judges, excepting justices of peace and members of the Court of Cassation. Bonaparte at once took up his residence at the Tuileries, and held a splendid Court. In May, 1802, he was reelected for ten years, and in August of the same year was made First Consul for life. Nothing but the imperial name and insignia were wanting to complete the picture of absolutism, and these were supplied May 18, 1804, when Napoleon was made Emperor. Consult: Hélie, *Les constitutions de la France* (Paris, 1875-80); Thiers, *Histoire du consulat et de l'empire* (Paris, 1845-62); and the various lives of Napoleon, the me-

moirs of the time, and general histories. See FRANCE; NAPOLEON I.

CONSULATE OF THE SEA. See CONSOLATO DEL MARE.

CONSUMERS' LEAGUE. An "association of persons who desire, so far as possible, to do their buying in such a way as to further the welfare of those who make or distribute the things bought." It recognizes that every one is a consumer; that the individual purchaser is indirectly a maker of goods and an employer of labor, and that as an individual he often has no test for goods. In harmony with the new political economy represented by Professor Patten, Professor Marshall, and others, which puts the emphasis upon consumption, the League offers a means of organizing and educating consumers to a knowledge of their responsibilities. The movement started in England in 1890. About the same time the Working Women's Society of New York was investigating the condition of women and cash-girls in the stores of that city. They called a public meeting in May, 1890, to ask the help of consumers in bettering these conditions, and as a result the Consumers' League of New York was formed in January, 1891. Similar leagues have since been organized in Pennsylvania, Massachusetts, Illinois, Minnesota, New Jersey, Ohio, Wisconsin, and Michigan. The work of the leagues has been principally: (1) to try to reform the conditions of workers in retail stores; and (2) to educate buyers, especially women. The leagues, according to the needs of their respective cities, drew up lists of conditions which a store must maintain in order to be called a 'fair house.' Some or all of the following points are considered: (1) wages (fines, time of payment, or minimum wage); (2) hours (length of working day and compensation for overtime); (3) vacations (week with pay, half-holiday during two summer months, legal holidays); (4) physical conditions (seats, sanitary work, lunch and retiring rooms); (5) humane treatment, appreciation of fidelity and length of service, and the employment of children. The stores that fulfill these conditions are placed on the 'white list.' Members of the League are urged to do their buying at these stores, and to show consideration for employees by courteous treatment and in the choice of purchasing hours.

The promoters of the League soon found that its work must be extended to reach the makers of goods, both to improve their conditions, and to protect the purchaser, who had no way to distinguish between factory-made goods and those made or finished in sweat-shops. Accordingly the National Consumers' League was organized in 1899 with Mrs. Florence Kelly, who had been a successful factory inspector in Illinois, as secretary. In order to identify the factory-made article a 'consumers' label' was adopted, which can be placed on goods made in factories maintaining the following conditions: (1) compliance with State factory law; (2) the manufacture of the goods on the premises; (3) no child under sixteen employed; (4) a ten-hour day; (5) permission given for inspection by a representative of the League. During its first year's work the National League, by means of the visits of its secretary, investigated factories making white goods. A list of fifteen factories was prepared whose conditions were satisfactory and whose owners were willing to use the label. The

National League has provided for the education of purchasers through lectures, the distribution of literature, and organization. The State leagues use similar methods, and, also, arrange parlor, church, and school talks. Although the membership of the League is still small, it is likely to prove an important educational factor in the community.

See FACTORY INSPECTION; SWEAT-SHOPS; UNION LABEL.

CONSUMPTION (Lat. *consumptio*, a consuming, from *consumere*, to consume, from *com-*, together + *sumere*, from *sub*, under + *emere*, to buy). One of the divisions—with production, exchange, and distribution—into which the subject of political economy is commonly divided. In the greater part of the works upon the subject, consumption follows the divisions above noted, and the subject has generally been treated in a stepmotherly fashion. It seems to have been assumed that the consumption of goods, the goal of all economic effort, sufficiently explains itself. Such treatment as is found deals with a few well-defined aspects. One of these has been the discussion of luxury, and the respective effects upon the economic order of wasteful and careful personal expenditure. In further examination of this subject attention has been called to the objects of personal expenditure. An examination of household budgets, especially those of the laboring classes, has given rise to an extensive and interesting literature. Attention was first directed to this line of investigation by the French economist Le Play and the German statistician Engel (q.v.). Much consideration has also been given under the head of consumption to the effects upon the economic order of the various forms of taxation.

It is obvious that consumption cannot be confined to the consideration of personal expenditure—that it is an integral part of the processes of production; and in this sense consumption has been defined as the 'withdrawal of goods from the market,' and would thus include not only direct consumption of goods for the satisfaction of immediate wants, but also the indirect consumption of goods in the production of other goods. It is this view of the subject which has in later years led to the attempt to correlate the phenomena of consumption more closely with the other economic processes. The stimulus seems to have been given by German economists, who have directed attention to the fact that the ultimate goal of all economic effort is the satisfaction of human wants. From this it was a natural step to a closer analysis of the human wants themselves, and this analysis has led up to the newer economic doctrine of which in England Marshall (q.v.), on the Continent of Europe the Austrian writers and in the United States Clark (q.v.) and Patten are the leading exponents. Their view is well stated in Marshall's

Principles of Economics (London, 1890-91), in which consumption or demand is given the first place in the discussion. The analysis of the forces which awaken the demand for goods, thus giving direction to the national production, has given rise to many new views in economics, and has reopened the discussion of fundamental principles. Such a development corresponds to the actual development of modern life in which the rapid strides of physical and mechanical science seem to have thrown for the time being questions of the limitations of human powers by physical conditions into the background. See EXCHANGE; POLITICAL ECONOMY; PRODUCTION.

CONSUMPTION. See TUBERCULOSIS.

CONTACT (Lat. *contactus*, from *contingere*, to touch, from *com-*, together + *tangere*, to touch). In geometry, two lines of which one at least is curved are said to be in contact when they have two or more consecutive points in common. E.g. in analytic geometry a tangent is said to be in contact with a circle in two consecutive points. This is called contact of the first order. If two curves have contact at three consecutive points, the contact is said to be of the second order, and so on; e.g. the curves $y = x^3$ and $y = 3x^2 - 3x + 1$ have contact of the second order. The analytic condition for contact of the first order at point $x = a$, between two curves, $y_1 = \phi(x)$, $y_2 = \psi(x)$, is that $\phi(a) = \psi(a)$, $(\phi)' = \psi'(a)$, ϕ' and ψ' being the first derivatives. The condition for contact of the second order is that $\phi(a) = \psi(a)$, $\phi'(a) = \psi'(a)$, $\phi''(a) = \psi''(a)$. Contact of the third order requires the derivative of the third order, and so on. In contact of the n th order between two surfaces, there must be $(n + 1)$ consecutive common points.

CONTACT-ACTION, CHEMICAL. See CATALYTIC ACTION; REACTION.

CONTACT DEPOSITS. See ORE DEPOSITS.

CONTAGION (Lat. *contagio*, contact, from *contingere*, to touch, from *com-*, together + *tangere*, to touch). The communication of a disease from the sick to the healthy, either by direct contact of a part affected with the disease, or by indirect contact through the medium of the excretions and exhalations of the body. Among the contagious diseases are measles, scarlet fever, smallpox, erysipelas, typhus fever, bubonic plague, epidemic influenza (the grippe), diphtheria, and tuberculosis. See BACTERIA; EPIDEMIC; INFECTION.

CONTAGIOUS DISEASES. The law takes cognizance of contagious and infectious diseases as they menace the public health, for the protection of which health and quarantine laws are enacted under the broad authority of the police power of the State. (See POLICE POWER.) For purposes of administration, this power may be delegated to municipal corporations or like political subdivisions.

While the right to take summary measures for the public safety is one of the most ancient of government prescriptions and is rarely challenged, yet it is none the less formidable, involving as it does the power of the State forcibly to confine those suffering from infectious diseases, even where properly cared for by friends or relatives, and other like interference with the personal rights of liberty and property. Maritime quarantine was early practiced by the com-

mercial nations, and was enforced by the Venetians in the fifteenth century; but municipal health regulation is of somewhat later development, and the two are still usually separated in administration. Thus, for instance, the Board of Health of the City of New York exercises jurisdiction within the city proper and upon the waters of the bay to the limits of quarantine, which, with its shipping, is under the authority of the Board of Quarantine Commissioners and the health officer of the port. In the United States the enactment of quarantine laws is held to be among the powers preserved to the States under the Constitution. Under their authority, however, State boards of health are created and general statutes passed delegating the power to local boards in cities, towns, and villages. In the larger cities this power is usually conferred separately by provision in their charter or act of incorporation. The public health laws of the several States are similar in character, and may be consulted for details. Violations of the sanitary code are usually made misdemeanors, and punished by imprisonment or fines. For the purpose of avoiding any questions that might arise from the possible interference of local regulations of the public health with the Federal prerogative of regulating interstate commerce, Congress early passed acts adopting such State laws and requiring their observance by Federal officials (act of February 25, 1799; act of April 29, 1878 [20 Stat. L. 37]). In 1879 a National Board of Health was created, but its powers were little more than advisory, and by the act of Congress, February 25, 1893 (27 Stat. L. 449), it was abolished and its powers and duties transferred to the Marine Hospital Service, which, under the direction of the Secretary of the Treasury, performs the functions of national quarantine. Questions pertaining to the people at large arising from immigration and importation belong to Federal jurisdiction as incidental to the constitutional right of regulating commerce. Thus conditions of entry are imposed, such as detention, inspection, and disinfection, and under the act of 1893 protective restrictions may even be laid upon interstate intercourse where a danger is threatened and State authority is wanting or lax. The Federal quarantine may arrest the entrance of forbidden persons or things; but once past the 'Barge Office' or custom-house, the local authorities take jurisdiction. Naval vessels as well as commercial are bound to observe quarantine rules.

In Great Britain a similar system of sanitary protection prevails. In England, the controlling statute, the Public Health Act (38 and 39 Viet. c. 55 [1875]), is comprehensive in its provisions and regulations, though it does not extend to Scotland or Ireland, or, except as to special provisions, to the city of London. The Infectious Disease (Notification) Act (52 and 53 Viet. c. 72) and the Infectious Disease (Prevention) Act (53 and 54 Viet. c. 34), as the titles signify, provide respectively for the course to be pursued in notifying the proper authorities in cases of defined contagious illness, and the regulations to be adopted in the way of inspection and disinfection to prevent infection. The first applies to the United Kingdom, and may be adopted by urban and rural authorities of ports and local districts; the second is confined to England.

In its international aspect, the obligation rest-

ing upon a State to adopt proper regulations to prevent the spread of epidemics belongs to the so-called natural duties, rather than the more defined and absolute principles of international jurisprudence. But with the increase of international intercourse and the development of a more sensitive national conscience, a demand has arisen among civilized nations for the recognition of the right to such protection by another State, as well as the long-established one of surrounding itself by defensive barriers. The United States has taken the lead in a commercial way by vigilant inspection of meats and like food exports. In 1879 Sir Shenstone Baker prepared a Code of International Quarantine, which was approved by the United States. See QUARANTINE; and consult the authorities referred to there and under POLICE POWER.

CONTARINI, kōn'tā-rē'nē. The name of a noble family in Venice, one of the twelve that elected the first Doge. Between 1043 and 1674, seven doges were furnished by this family, and several of its members were men of note. *Domenico*, Doge in 1043-71, was the first of the family to be invested with that dignity; during his reign the rebuilding of Saint Mark's Church was begun. *Andrea*, Doge in 1367-82, terminated the long war between Venice and Genoa by defeating the Genoese fleet at Chioggia. His return from this expedition was depicted by Paolo Veronese by order of the Republic. *Ambrogio* was Ambassador of Venice to Persia in 1473-77 and gave an account of his travels, published in Venice (1487). *Gaspuro* (1483-1542), cardinal and diplomatist, went as Venetian ambassador to the Diet of Worms in 1521, thence accompanied Charles V. to the Netherlands, England, and Spain, and in 1523 concluded the Emperor's alliance with Venice. In 1535 he was made cardinal by Pope Paul III., and as Papal legate to the Diet of Ratisbon, in 1541, made the most extensive concessions to the Protestants, endeavoring to bring about a reconciliation with the Catholic Church. Of his earnest efforts to introduce sweeping reforms in the latter, his *Consilium de Emendanda Ecclesia* (1537) is sufficient proof. The best-known of his other writings is *De Magistratibus et Republica Venetorum* (1543). *Giovanni* (1549-1605) was a painter of the Venetian School, who formed himself chiefly after the works of Titian and Palma the Younger. Called to Vienna by Emperor Rudolph II., he painted many portraits, but he is more noted for his historical compositions, among which are "The Doge Marino Grimani Adoring the Virgin," "Conquest of Verona by the Venetians," both executed for the Doge's Palace in Venice; and "Baptism of Christ."

CONTARINI FLEMING. A romance by Benjamin Disraeli (1832).

CONTÉ, kōn'tā', NICOLAS JACQUES (1755-1805). A French chemist and inventor, born at Aunou-sur-Orne (Orne). He was at first a painter, but afterwards turned to the mechanical arts, and, when France was deprived, through war with England, of its plumbago supply, invented a substitute in the shape of a mixture of graphite and clay. This substance he utilized for the manufacture of black-lead pencils, known as *crayons Conté*, by a process since followed in making all pencils. He also made extensive researches concerning the military aërostat, became director of the aërostatic school at Meudon,

and was appointed by Napoleon chief of the aërostatic corps of the French army of invasion in the Egyptian expedition. During that expedition his inventive genius proved to be of great service; for, after the reverse at Aboukir, the revolt at Cairo, and the consequent loss of instruments and supplies, he directed the manufacture of cloth, surgical instruments, bread, arms, ammunition, and other necessaries. He also devised (1798) a barometer, similar to the later one of Vidi. In 1802 he assisted in founding the Society for the Encouragement of National Industry. Consult Jomard, *Conté, sa vie et ses travaux* (Paris, 1852).

CONTEMPORANEITY (from Lat. *contemporaneus*, simultaneous, from *com-*, together + *tempus*, time). A term used in geology to imply that two formations were deposited during the same period of time. This does not necessarily mean that they must contain the same fossil species, nor is it likely that they will, except when the two areas of deposition are in the same basin. The term contemporaneity is sometimes confused with *homotaxy*, which means that certain formations occupy the same relative positions with respect to the development of life forms. Thus, certain formations of the Devonian in Europe and North America might show similar faunas, but not have been deposited at exactly the same time. They would be homotaxial. See GEOLOGY.

CONTEMPT (Lat. *contemptus*, from *contemnerē*, to despise, from *com-*, together + *tenere*, to despise). In law, any disobedience of, or disrespectful or disorderly conduct in the presence of, any court or legislative body. It is punishable because it tends to impair the dignity, power, and authority of such bodies, and thus interfere with the administration of the law, and generally the body concerned has an inherent power summarily to impose upon the offender a penalty of fine or imprisonment, or both. All courts have such power. The guilty person may usually have these penalties remitted by 'purging' the contempt; that is, by making pecuniary reparation, as far as possible, for any damage caused by his acts, and apologizing for his fault. If satisfactory, an order or minute is then entered reciting that this has been done and directing that the culprit be relieved from the penalty. Consult: Rapalje, *Treatise on Contempt* (New York, 1884); Oswald, *Contempt of Court, Committal, and Attachment, and Arrest Upon Civil Process* (London, 1895).

CONTEMPT OF PARLIAMENT. See PARLIAMENT.

CONTES À NINON, kōnt zā nē'nōn' (Fr., Ninon stories). A collection of short stories by Emile Zola, which were collected and published in 1864, when their author was only twenty-four years old. It was his first important work, and has been deemed by some critics his best book of short stories, being free from the exaggerations and brutalities which marked many of his later writings. In 1874 he published *Nouveaux contes à Ninon*.

CONTES DE MA MÈRE L'OYE, kōnt de mā mā lwä (Fr., stories of my Mother Goose). A famous collection of fairy tales by Charles Perrault (1697), purporting to be written by his ten-year-old son. The stories are taken from popular tradition, and are told in simple, child-

ish language, which has made them very successful among children for 200 years.

CONTES DES FÉES, dà fâ (Fr., stories of the fairies). A collection of fairy stories from various sources by the Comtesse d'Aunoy (1710), in which many of the tales received their literary form in French.

CONTES DRÔLATIQUES, drô'lâ'ték' (Fr., droll stories). A series of thirty tales by Balzac, abounding in Rabelaisian humor, and copying the style and spelling of the sixteenth century. They were published variously in 1832, 1833, and 1837.

CONTES DU LUNDI, du lôn'dé' (Fr., Monday stories). A collection of short stories by Alphonse Daudet (1873), of which *La dernière classe*, the touching story of the last school session held by an old French schoolmaster in Alsace before the German occupation, attracted much attention.

CONTI, kôn'té', HOÛSE OF. A younger branch of the House of Bourbon-Condé (see CONDÉ). It first appears in French history in the sixteenth century when François, son of Louis de Bourbon, first Prince of Condé, took the name of Marquis de Conti from his mother's fief of Conti-sur-Selles, in Picardy. Toward the end of the century he was made Prince of Conti. He died without heirs in 1614, and for sixteen years the title was in abeyance. In 1630 it was bestowed upon the infant Armand de Bourbon, second son of the Prince of Condé. This second Prince de Conti is generally regarded as the founder of the house. His son, Louis Armand, Prince de Conti, succeeded him, and on his death, in 1685, left the title to his younger brother, François Louis (1664-1709), who styled himself Prince de la Roche-sur-Yon et de Conti, and was the most noted member of the family. He had been educated under the eyes of the great Condé and embraced a military career with enthusiasm. He served in Hungary against the Turks, but, owing to incautious letters which he wrote home, he lost the favor of Louis XIV., and on returning was banished to Chantilly. Pardon through the intercession of the great Condé, the Prince served with distinction under the Duke of Luxembourg, and was present at the battles of Steenkerk (1692) and Neerwinden (1693). In 1697 he was put forward by Louis XIV. as a candidate for the Polish crown, and was in fact elected King by a part of the nobles, but found himself powerless against the opposition of Russia, the Emperor Leopold I., and the Pope, and abandoned his claim. Louis XIV. was never his friend, and feared Conti's popularity, so that the Prince spent his later life in retirement. In 1709, however, he was summoned to take command of the Army of Flanders, but was carried off by an attack of the gout, February 22, 1709. Massillon pronounced his funeral oration, and Saint-Simon, in his memoirs, speaks of him in glowing terms. His son was a worthless *roué* of the time of the Regency; but his grandson, Louis François (1717-76), Prince de Conti, distinguished himself as a brave and popular commander. The last member of the house was Louis François Joseph (1734-1814), Prince de Conti, son of the preceding, who, after a somewhat checkered career, died at Barcelona. Consult: Martin, *Histoire de France*, vols. ix., x,

xi. (Boston, 1864-66); *Mémoires de Fontenay-Mareuil, La Rochefoucauld-Doudainville* (Paris, 1861-64), and Saint-Simon (London, 1889); Topin, *L'Europe et les Bourbons* (Paris, 1868); *Mémoires of Noailles* (Paris, 1777); D'Argenson, *Mémoires* (London, 1893); and Bernis, *Mémoires* (Paris, 1878); De Broglie, *Le secret du roi* (Paris, 1879).

CONTI, AUGUSTO (1822—). An Italian philosophical writer, born near San Miniato in Tuscany. He studied law at several Italian universities and practiced in Florence until 1848, when he enlisted as a volunteer for service against Austria. Subsequently he practiced law and taught philosophy in San Miniato; in 1855 was made professor of philosophy in Lucca; in 1863 professor of the history of philosophy in Pisa, and in 1864 professor of mental and moral philosophy in Florence. His published works include: *Evidenza, amore e fede, o i criteri della filosofia* (1862, and subsequent editions); *Storia della filosofia* (1864, and subsequent editions); *L'armonia delle cose* (2 vols., 1878); *Filosofia clementare* (1869; ed. 9, 1879); *Dio come ordinatore del mondo* (1871); and *Il vero nell'ordine* (1876; 2d ed., 1891). In these and other works, Conti makes an earnest attempt to bring into agreement the teachings of different philosophical schools.

CONTI, NICCOLÒ DEL. An Italian traveler of the fifteenth century. He learned Oriental languages and carried on an extensive traffic in the East. He traveled in Egypt, Arabia, Persia, and India, and later gave a complete account of his travels to Poggio Bracciolini, secretary of Pope Eugenius IV. Poggio's manuscript relating the observations and adventures of Conti was first published in 1723, under the title *Historia de Varietate Fortuna*. Conti was one of the pioneers of European commerce in the East, and one of the first to advocate the idea of finding a western way by sea to the Eastern countries. Consult Giardina, *I viaggi di Niccolò de' Conti* (Catania, 1898).

CONTINENT (ML. *continens*, from Lat. *continere*, to touch, from *com*, together + *tenere*, to hold). The largest natural land division; of greater area than an island or peninsula. The outer portion of the earth is composed of two layers, the solid rocky crust, or 'lithosphere,' and the water areas, or 'hydrosphere.' In the early period of its history the earth may have been surrounded entirely by the hydrosphere, but at present, and, so far as known, in all geological ages, the crust has been folded into mountain chains, forming nuclei around which the continental land areas are grouped, while the waters have accumulated in the intermediate depressions. Geographers usually recognize as continents Eurasia (comprising Europe and Asia), Africa, Australia, North America, and South America; the two Americas, however, are sometimes grouped as a single continent, although such a classification is hardly justifiable unless Africa be included with the Eurasian continent. A sixth continent may be represented by the land areas in the Antarctic region (q.v.). It is estimated that the land constitutes about 55,000,000 square miles, or 28 per cent. of the entire surface of the earth. The continents vary widely in form, area, relief, and distribution on the globe, yet they may have many features

in common. Usually the regions of greatest elevation are found in the interior, while along the coast line there is a gentle slope outward which, continued beneath the sea, forms a slightly submerged land strip called the 'continental shelf.' On the seaward edge of the shelf the slope is very rapid down to the great depths of the sea. The average altitude of the continents, according to the calculations of Lapparent, Murray, Penck, Supan, and Heiderich, is shown below:

ESTIMATED AVERAGE ELEVATIONS OF THE CONTINENTS

CONTINENT	Lapparent	MURRAY	Penck	Supan	Heiderich
Europe.....	958	938	918	951	1,230
Asia.....	2,883	3,188	3,116	3,084	3,018
Africa.....	2,007	2,020	2,132	2,034	1,975
Australia.....	1,188	803	918	853	1,542
North America....	1,953	1,886	1,968	2,001	2,723
South America....	1,762	2,077	2,067	2,001	2,493

Between the form and distribution of the continents many interesting comparisons may be drawn. The two Americas, comprising the greater part of the land area in the New World, are triangular in shape, the apex of the one lying in the Isthmus of Panama and the apex of the other being represented by Cape Horn. Both continents are bounded on the west by a long mountain system and both have a region of lower elevation in the eastern portion. The Old World, on the other hand, is composed of a single triangular land area which has its base on the Arctic Sea and its apex at the Cape of Good Hope. Here the main trend of the mountain chains is east and west. In general, the continents that extend into or lie within the Southern Hemisphere—South America, Africa, and Australia—are most regular, contrasting strongly in this particular with North America and Eurasia in the Northern Hemisphere. The northern continents have a wider extension from east to west than the southern, and are further characterized by a great group of islands lying along the southeastern coast.

That the great land areas are not stable either as to form or elevation may be regarded as established beyond doubt by geological evidence. Moreover, certain coastal regions are known at the present time to be undergoing changes of level by which land emerges above or sinks below the sea. The extent of these oscillations in past ages can only be conjectured. Lyell's theory that there has been a constant interchange between the land and water areas has been objected to on the ground that there is no evidence that the abysmal depths of the ocean have ever been elevated; this objection has been weakened, however, by the discovery within continental areas of deposits abysmal in character and containing a deep-sea fauna. The changes of level between the land and the sea take place very slowly, and may be caused either by gradual vertical movement of the land area or by variations in the level of the ocean itself. Geologists generally agree that the positions of the present continents were determined as far back as Archæan times. The Laurentian plateau of North America, the Brazilian highlands of South America, and the Scandinavian peninsula and Lap-

land in Europe are composed of crystalline rocks, and except on the margins they are bare of all sediments. These primitive lands were extended in area by the deposition of sedimentary strata on their borders, and by great upheavals accompanied by foldings of the crust into mountain ranges.

The evolution of the continental lands can be studied only tentatively, and is largely conjectured from the evidence afforded by the characters of the fauna and flora that lived in past ages. During the Cretaceous and Tertiary times the animal and plant life of South America, South Africa, and India were strikingly similar, while there was also a uniformity between the life-forms of Europe and North America. This circumstance can best be explained by the assumption that in these periods the continents had an east and west trend, so that Brazil, Central Africa, and Lower India were united by one broad land-strip, and eastern Canada with Europe by another. Between the northern and southern continents an ocean basin extended from the isthmus of Central America eastward to the Indian Ocean, or nearly at right angles to the basin now occupied by the Atlantic. The changes by which the continents assumed their present form took place gradually and were accomplished by a slow depression of portions of the land and by encroachment of the sea. It is probable that certain regions for a long time remained above sea-level as large islands, the unsubmerged remnants of which still exist, for example, in the Cape Verde and Canary islands, in the British Isles, and in Madagascar. These changes were doubtless completed before the appearance of mankind; at least within historical times, so far as is known, there has been no marked alteration in the form of the continents.

CONTINENTAL CONGRESS. See UNITED STATES.

CONTINENTAL SYSTEM. The name given to the commercial policy adopted by Napoleon for the purpose of shutting England out from all connection with the Continent of Europe, and thus compelling her to acknowledge the maritime law as established at the Peace of Utrecht. This system began with Napoleon's famous Berlin Decree of November 21, 1806, which declared the British Isles in a state of blockade and prohibited all commerce or correspondence with them; every Englishman found in a country occupied by French troops or by their allies was declared a prisoner of war; all merchandise belonging to an Englishman was made lawful prize; and all trade in English goods was entirely prohibited. No ship coming directly from England, or from a British colony, was allowed to enter any port; and any ship seeking by false declarations to evade this regulation was confiscated with its cargo as if British property. England was not long in making reprisals. By an Order in Council, January 7, 1807, all neutral vessels were prohibited from trading from port to port within France or any country in alliance with it or under its control. Every neutral ves-

sel violating this order was to be confiscated with its cargo. Napoleon responded by a decree dated Warsaw, January 25, 1807, which ordered the confiscation of all English or English colonial merchandise found in the German Hanse towns. By a second Order in Council, November 11, 1807, all harbors and places in France and her allies in Europe and the colonies, as well as in every country with which England was not at war, but from which the English flag was excluded, were placed under the same restrictions as if strictly blockaded. These orders were followed by reprisals on the French side. By the Milan decree of December 17, 1807, strengthened by a second, of January 11, 1808, issued from the Tuileries, any vessel, of whatever nation, that had been searched by an English ship, or had submitted to be sent on a voyage to England, or paid any duty to the English Government, was to be declared denationalized, and treated as English. By the Treaty of Tilsit (1807) Russia consented to close her ports to English commerce, and in order the more effectually to annihilate such commerce, there appeared, August 3, 1810, the tariff of Trianon for colonial goods; this was extended by a decree of September 2; on October 18 followed the decree of Fontainebleau, ordering the burning of all English goods, an order which was to be carried out with more or less modification in all countries connected with France.

The consequence of the Continental System was undoubtedly the springing up upon the Continent of many branches of manufacture to the loss of England; on the other hand, the price of foreign goods rose to an extraordinary height, enabling a few merchants to make fortunes, but sensibly affecting the daily comfort of the middle classes. On the whole, the Continental System, both politically and economically, was a mistake. Russia abandoned it in 1810, and with the breaking up of Napoleon's power the system collapsed entirely. On the English side the enforcement of the Orders in Council gave offense to the United States, and was one of the principal causes of the War of 1812. Consult: Mahan, *The Influence of Sea Power upon the French Revolution and Empire* (Boston, 1894); Thiers, *Histoire du consulat et de l'empire* (Paris, 1845-62); Cime, *Etude sur les tarifs de douane et les traités de commerce* (Paris, 1875); Henry Adams, *History of the United States* (New York, 1889-91). See NEUTRALS; NAPOLEON I.

CONTINGENT (from Lat. *contingere*, to touch). A quota of troops, furnished to the common army by another branch of the service, or by different cooperating nations or armies. It was the naval contingent that saved the day in the defense of Ladysmith against the Boers in 1899. The various contingents of the international armies formed the common army under the leadership of Count Waldersee, the German commander, in the China campaign of 1900. The troops to be furnished by each of the United States under a call for volunteers by the President is its *quota*.

CONTINGENT REMAINDER. See REMAINDER.

CONTINUED FRACTION. See FRACTION.

CONTINUITY (Lat. *continuitas*, from *continuus*, uninterrupted, from *continere*, to hold
VOL. V.—23.

together, from *com-*, together + *tenere*, to hold). In geometry, a vital principle which asserts that if from the nature of a particular problem we would expect a certain number of solutions, then there will be the same number of solutions in every case, although some may be imaginary. E.g. a straight line and a circle in the same plane intersect in two points real, coincident or imaginary. The sum of the angles of a quadrilateral is a perigon whether the quadrilateral is convex, cross, or concave. In this case, however, angles which have decreased and have passed through zero must be regarded as negative. By the principle of continuity theorems concerning real points or lines may be extended to imaginary points or lines. This change can take place only when some element of the figure passes through either a zero value or an infinite value; e.g. rotate an asymptote of the hyperbola about the origin; before rotation it cuts the curve in two infinite points; after rotation it cuts it in two real points or two imaginary points. In case of the real points rotate it still further, and these pass to infinity, and imaginary points occur. Many propositions of elementary geometry may be inferred from this principle. It was first stated by Kepler, emphasized by Boscovich, and put into acceptable form by Poncelet in his *Traité des propriétés projectives des figures* (2d ed., Paris, 1865-66).

More generally continuity is a philosophical concept exemplified in space and time. It has been defined as a series of adjacent parts with common limits; as, infinite divisibility; that is, that however small the segment between two points, a further division is possible; but in modern analysis continuity is the essential property of a continuum. By a continuum is understood a system or manifoldness of parts possessed in varying degree of a property *A*, such that between any two parts distant a finite length from each other an infinite number of other parts may be interpolated, of which those that are immediately adjacent exhibit only indefinitely small differences with respect to the property *A*. This is expressed by Cantor as a 'perfekt zusammenhängende Menge,' a perfect concatenation of points; e.g. all numbers rational and irrational in any interval form a continuum. A concatenation not perfect is called a semi-continuum; e.g. the rational or the irrational numbers in any interval. A straight line is said to possess continuity.

By the continuity of the roots of an equation is meant that as a result of certain variations of the function, different pairs of roots may during the process become equal or imaginary, the total number always continuing the same—an example given by Leibnitz. By the continuity of a function of *x* is meant the fact that indefinitely small and continuous changes in the value of *x* between certain limits produce indefinitely small and continuous changes in the function. Consult: Jordan, *Cours d'analyse* (Paris, 1893); Poncelet, *Traité des propriétés projectives des figures* (Paris, 1865-66); *Encyclopédie der mathematischen Wissenschaften*, vol. i. (Leipzig, 1901); Cantor, *Mathematische Annalen*, vols. xx. and xxi. (Leipzig, 1882-83); Mach, in *The Open Court*, vol. xiv. (Chicago, 1900).

CONTINUITY, LAW OF. A principle first formulated by Leibnitz (q.v.), which is expressed

in the Latin sentence, *Natura non facit saltum* ("Nature does not make sudden leaps"). It is opposed to the principle of discreteness, which asserts that all differences are hard and fixed, and that differences of kind are not differences of degree. Of late the significance of the law of continuity is coming more and more to be recognized. Indeed, it is the fundamental presupposition of all evolutionary thought, which maintains that all the differences of organic species and genera are differences appearing here and there in a continuum of variation, and that they get their discrete character from the disappearance of intergradient forms. The law of continuity may be illustrated in many ways. The solar spectrum, for instance, presents us with a series of colors which blend into each other in such a way that it is impossible to say where one color ends and another begins. Within this series we see many recognizably distinct colors; but this really means that red and blue are so different that a normal eye cannot confuse them. It does not mean that they are so different that no conceivable difference in degree can account for the difference in kind. In fact, it takes only a glance at the spectrum to see that the difference in kind is mediated by differences in degree, and that these latter are not abrupt and intermittent, but continuous and unbroken. By abstracting from the intervening colors and shades we can represent any detectable differences to ourselves as discrete, but this appearance of discreteness comes from failure to attend to the mediating shades. It is, however, to be observed that the continuity of the difference does not in the least prejudice the fact of difference. This truth can be stated in the following paradox: The colors and shades that *separate* two given colors in a spectrum also *unite* them. Generalizing this, we get the law that all intervenients while uniting separate, and while separating unite, the extremes between which they lie. See **IDENTITY**; and for the continuity of the states of aggregation of chemical substances, **CRITICAL POINT**.

CONTINUOUS SERVICE. See **ENLISTMENT**.

CONTORNIATE (It. *contorniato*, from *contorno*, contour, from ML. *contornare*, to go around, from Lat. *com-*, together + *tornare*, to turn, from *tornus*, Gk. *τόρνος*, *tornos*, lathe). A term applied to a class of antique medals which have a deep line cut round the edge, like a furrow, and are also marked by a strongly projecting edge. They show on one side a head, often of an emperor or other ruler, sometimes Homer, Sallust, Horace, or other authors, and on the other a scene from the circus or amphitheatre or from mythology or, rarely, daily life. No contorniate is known to be certainly earlier than the third century A.D., and most of them are even later. Many explanations of the use of contorniates have been given; the most probable is that they were counters in games, the reliefs on the sides being protected from contact with the board by the projecting rim.

CONTORTED STRATA. See **GEOLOGY**.

CONTOURS' (Fr., from ML. *contornare*, to go around). In topographical surveying and military sketching, the intersection of a hill by a horizontal plane. On topographical maps and military sketches hills are shown by contours, which are imaginary lines, generally represented

in red or black on the map, drawn round the hill at exactly the same level. Height is also shown by contours; on a map the distance between contours, commonly called the vertical interval, is always a fixed number of feet. The value of contours in a map or sketch to the engineer or military officer is that he is enabled to tell at a glance the slope of the ground to be traversed, and also whether the hills are gentle or steep, as the nearer together two contours appear on a map the steeper is the slope, and vice versa. See **SURVEYING**; and **ENGINEERING, MILITARY**. See article **MAP**, where contour lines are shown on the topographical map there given.

CONTRABAND OF WAR (It. *contrabbando*, Sp., Port. *contrabando*, from ML. *contrabannum*, contraband, from *contra*, against + *bannum*, *bannum*, proclamation, from OHG. *ban*, Ger. *Bann*, AS. *bann*, Engl. *ban*; ultimately connected with Lat. *fari*, Gk. *φῆσαι*, *phēnai*, to speak). Goods of such character as to be liable to seizure by a belligerent in trade between a neutral and the enemy in time of war. International complications arise over the definition of what, in a particular instance, constitutes contraband. To some extent this has been defined by treaty, especially by the United States, but the changes in methods of modern warfare render the list a constantly shifting one. Great Britain has adopted the classification of (a) *goods absolutely contraband*, and (b) *goods occasionally contraband*; i.e. making the decision depend upon the condition of being intended for warlike use. Under the latter head are included provisions, coal, horses, fittings for steam vessels, etc. Thus, in the case of a Swedish ship in the War of 1812 bound for the neutral port of Bilbao with a cargo of grain intended for the use of the British fleet lying there, the cargo was subject to confiscation as contraband. So coal came up for discussion in the Crimean War, Great Britain claiming it to be included under the head of *occasional contraband*. France in the war of 1859 refused to treat coal as contraband. The United States at the time of the Civil War adopted the English position, as did Germany in the war of 1870, while Russia follows France. Such differences threaten to furnish serious controversy in the event of war between any of the great commercial nations. The rules of international law provide that subjects of neutrals may carry contraband to either belligerent, but must do so at their own risk. So neutral merchants may trade in arms, ammunition, and stores in time of war as in time of peace, but either belligerent may capture such goods as are of direct and immediate use in war, if they cannot intercept them in their passage to the enemy while not within neutral jurisdiction. While a neutral is bound to prevent the departure of armed expeditions from its shores and the supplying of fighting gear to belligerent vessels in its ports, no duty is imposed of restraining contraband trade, though it has no right to interfere in behalf of subjects whose property is seized by one belligerent on the way to another, provided it belongs to the class of forbidden commodities.

Three requisites are necessary to constitute the offense of *carrying contraband*: (1) Sale and transport of contraband goods within a neutral territory is permissible, but they may not be sent across the frontier to a belligerent

by land or sea. (2) The goods must be intended eventually for a hostile destination. (3) The offense is completed with the deposit of the contraband cargo at the belligerent destination.

The ship when captured is generally taken to a prize court by the captor, and the penalty of conviction is the confiscation of the contraband goods, unless the owner of the contraband also has ownership in the vessel, in which case the ship, or his share therein, is likewise confiscated, and also any innocent goods of his ownership. False papers or misrepresentation as to destination may lead to the ship's condemnation. The carrying of agents or dispatches of an enemy must be distinguished as more properly unneutral service than carrying of contraband. The Trent Affair (q.v.) comes under the application of the rules relating to this question.

The term *contraband of war* was inappropriately though ingeniously applied during the Civil War by Gen. B. F. Butler, while in command at Fortress Monroe, to captured slaves, as a ground for retaining them when demanded by their Southern owners. Consult the authorities referred to under NEUTRALITY; BELLIGERENTS; BLOCKADE; INTERNATIONAL LAW.

CONTRA-BASS. See DOUBLE BASS.

CONTRA-BASS TUBA. See TUBA.

CONTRACT (from Lat. *contrahere*, to draw up, from *com-*, together + *trahere*, to draw). In English and American law, an agreement, enforceable at law, between two or more parties to do or not to do a particular thing. The elements essential to all forms of contracts are: (a) an obligation founded on the promise made by a party to the contract and resulting in his intent to enter into such an obligation; (b) a meeting of the minds of all the parties to the contract as to the terms and conditions of the promise given. Additional elements may be required to give solidity to various classes of contracts, as is pointed out below.

Classification.—Contracts are usually classified as: (a) contracts of record; (b) contracts by specialty; and (c) simple contracts.

Contracts of record, so called, are conclusive legal obligations created by the judgment or order of a court of record. Examples of contracts of record are judgments, recognizances, statutes staple, etc. They are not true contracts at all, as they do not contain a promise and are not founded upon the intention of the party bound, but should probably be classified as *quasi contracts* (q.v.).

Contracts by specialty are contracts depending for their validity upon the formality of their execution. They are required to be in writing and to be perfected by sealing and delivery by the party to be bound thereby. The usual form of specialty contract is by covenant (q.v.). A bond (q.v.), though in strictness not a contract, being an acknowledgment of indebtedness instead of a promise to pay, has always been regarded and classified as a specialty contract. Contracts by specialty require no consideration (q.v.) to give them validity. As in the case of other contracts, the courts of equity will not specifically enforce a specialty contract unless it is founded upon a consideration.

At common law the seal required to be placed upon specialty contracts was of great technical importance, but the law in this connection has

been greatly modified by modern statutes. In nearly all of the United States a scroll or mark with the pen may be used in place of a seal. In a number of States it is provided by statute that the seal upon a sealed instrument is only presumptive evidence of a consideration; the effect of which probably is to make a consideration necessary to the validity of a sealed instrument, at least where it is intended by the parties that a consideration is to be given. In a few States all distinction between specialty contracts and simple contracts has been abolished by statutes. The common-law form of action for enforcing all kinds of specialty contracts, except a bond, was the action of covenant (q.v.). Recovery upon a bond was secured by the common-law action of debt (q.v.). These distinctions are not preserved in modern systems of pleading. The usual period of limitation upon specialty contracts is twenty years.

Simple contracts are contracts which do not depend upon any particular formality as to execution for their validity, but upon the existence of a consideration, which is a detriment, or a surrender of a right, given in exchange for the promise. (See CONSIDERATION.) A simple contract may be in writing or by parole, or may even be implied from the acts and conduct of the parties manifesting their intentions.

As no formality is required in the creation of a simple contract, it always comes into existence as the consequence of an offer and acceptance. The offer must be accepted in accordance with its terms within a reasonable time, or within the time stated in the offer, in order to give rise to a contract. A refusal to accept, or a counter-offer, puts an end to the first offer, which cannot thereafter be accepted. In contracts entered into by letter, in most jurisdictions, the offer is deemed to be accepted upon the posting of the letter of acceptance, but in a few States it is held that there is no acceptance until the letter of acceptance is actually received by the person making the offer. Inasmuch as there must be an agreement in order to create a contract, any mistake as to the time of the offer or acceptance will prevent a meeting of the minds of the parties and no contract will arise. But a mistake as to some collateral matter will have no effect upon the contract unless induced by fraud, in which case the defrauded party may rescind the contract. Thus, if A offers to sell property to B for \$10,000, and B accepts, understanding the offer to be \$5,000, no contract arises; but if B understands the offer made and accepts it because he erroneously believes the property is of much greater value, a contract does arise. Simple contracts are frequently classified as *express* and *implied*. An express contract is one entered into on terms expressed in spoken or written words. An implied contract is one which is inferred from the acts or conduct of the parties. The latter should not be confounded with the so-called contracts implied in law, as, for example, the obligation to repay money paid by mistake, which are not true contracts, because not based upon intention. They are properly classified as *quasi contracts* (q.v.). Express contracts may be by parole or in writing, the only difference in legal effect being in the method of proof. (See EVIDENCE.) A few simple contracts are required, however, by the Statute of Frauds (q.v.) to be executed in writing. Simple contracts are further

classified as *unilateral* and *bilateral*. A unilateral contract is one in which one party to the contract makes a promise in exchange for the other party's giving something or doing some act. A bilateral contract is one in which each of the two parties gives his promise in exchange for the promise of the other, the promise of each being a consideration for the promise of the other.

Contracts are also said to be *executory* or *executed*. An executory contract is one which has not been fully performed. As the performance of a contract terminates its existence as a legal obligation, it will be observed that the expression 'executed contract' is a contradiction of terms. A present sale of personal property is sometimes said to be an executed contract, but the expression is improper, as the sale may be effected by a mere meeting of the minds without any promise, and, hence, without contract. See SALES.

Performance.—In the case of all true contracts, whether by specialty or simple contracts, the obligations of a party to perform may not arise until the happening of a condition, or the performance of his promise by the other party, as expressly or impliedly provided in the contract by its terms. If there be no such provision in the contract, by certain settled rules of construction (known as the law of conditions) implied in law, the performance of one party may be deemed a condition precedent to the performance of the other, or the performance of each of the parties may be a concurrent condition to the performance by the other; that is, each party must tender his performance before he can recover damages for the breach of contract by the other. In general, impossibility of performance is no defense to an action brought to recover damages for breach of contract. If, however, the contract contemplates the continued existence of the parties or the subject-matter of the contract, the death of a party of failure of subject-matter is a defense. Thus, in contracts for personal service, death of the employer or employee terminates the contract, and a contract for the use of a particular building or other property is terminated by the destruction of the property.

Suits upon Contracts.—Owing to the rule of pleading in actions upon contract at common law, the plaintiff must show that he has given consideration for the defendant's promise. A third person for whose benefit the contract was made, but who was not a party to it, could not sue upon it. This is still the rule in most jurisdictions, although not in all; and in a few, notably New York, in the single case when A gives money or property to B upon his agreement to pay money to C, C may sue upon the contract upon the theory that a debt has been created in his favor. Equity exercises jurisdiction to compel specific performance of a contract when legal damages would be inadequate. It also exercises its powers to rescind or reform written contracts affected with fraud or mistake. Fraud is also a defense at law to an action founded on contract, it having been early adopted by the courts of law, although it is a defense equitable in character. Contracts which contravene rules of public policy or statutory enactment are illegal and void. See ILLEGALITY.

Contracts in the Civil Law.—In the Roman law contract (*contractus*) signified an agreement which created an actionable obligation. The original roots of contractual obligations were

apparently pledge and vow. In the first case, the debtor gave the creditor a pledge, which the creditor held until the debtor had fulfilled his promise. If a debtor had nothing else to pledge, he pledged his own person in the form of a sale. This transaction the Romans called *accum*. It created something analogous to a judgment debt; and as the debtor was in default, the creditor levied on his body (*manus iniectio*). At the time of Gaius this contract was antiquated. A vow to the gods to do something for or pay something to the third person enabled the priest to intervene and insist upon performance—from this root sprang the sacral contract of the priestly law, the *sponsio*, and out of the *sponsio* grew the sacral contract of *stipulatio*.

At the time of Gaius (early Empire) five classes of contracts were recognized: (a) The *verbal* contract, *stipulatio*, which was actionable because a certain form of words (question and answer) had been observed. It was usual to draw up a written statement (*cautio*) reciting the terms of the agreement, but the validity of the contract rested on the exchange of the spoken words. (b) The *literal* contract (from *littera*, writing). This was actionable because a formal entry had been made in the creditor's ledger (*expensilatio*). In the case of the verbal and the literal contract it was neither the agreement alone nor the form alone which created obligation, but the two together. (c) The *real* contract. This was actionable because something (*res*) had passed from the creditor to the debtor, and the return of the thing or an equivalent had been promised. To this class belonged the bailments known as *mutuum*, *commodatum*, *depositum*, *pignus*. (See BAILMENT.) Besides these there were many other real contracts without special names. Ultimately it was recognized that any agreement for reciprocal performances would become a binding contract as soon as one party had performed. (d) The *consensual* contract. This was actionable by virtue of the agreement (*consensus*) between the parties, although no form had been observed and nothing had passed. There were only four contracts of this class: *emptio venditio*, sale; *locatio-conductio*, hiring; *societas*, partnership; and *mandatum*, commission of agency.

Agreements that fell in none of these four classes were simple pacts (*pacta*), not contracts, and were not actionable. Such pacts might, however, be available for defense, e.g. when a creditor had given his debtor an informal release or an extension of time, and pacts made immediately after the conclusion of a contract (*pacta adiecta*) were treated as part of the contract.

In order that a contract should be valid it was necessary that the parties should be of such age as to be capable of binding themselves, and of sound mind, and that the object to be attained should be neither impossible, illegal, nor immoral. Mistake (*error*) was regularly fatal to the validity of a contract, provided the mistake was excusable and essential. A mistaken reason or motive for contracting was not regarded as essential. Where, however, the mistake was caused or utilized by the other party, these limitations disappeared and the contracts were voidable for fraud (*dolus*). Duress (*metus*) also made a contract invalid.

In modern European codes, all agreements except those looking to impossible or immoral ends are valid and actionable, unless a special form is

required by law and the required form has not been observed. It is therefore maintained by many writers that the Roman category of real contracts has disappeared, and that there are now but two classes, the formal and the consensual. The formal contracts of the modern codes are not Roman. Where a form is prescribed, it is usually a written document, and in many cases attestation by a notary is necessary to its validity.

BIBLIOGRAPHY. For special branches consult the authorities referred to under the titles treating of those subjects, as REAL PROPERTY; SALE; MORTGAGE, etc. Also consult: Parsons, *Law of Contracts* (8th ed., Boston, 1893); Anson, *Principles of the Law of Contract* (7th ed., Oxford, 1893; 2d American ed., Chicago, 1887); Chitty, *Treatise on the Law of Contracts* (13th ed., London, 1896); Addison, *Treatise on the Law of Contracts* (7th ed., London, 1893); Marrison, *Elements of Contracts* (2d ed., Boston, 1901); Hollingsworth, *The Law of Contracts* (1896); and the authorities referred to under such special titles as QUASI CONTRACT; NEGOTIABLE INSTRUMENTS; SALE, etc.

CONTRACTION (Lat. *contractio*, from *contrahere*, to draw up). The wish or necessity for economizing labor and parchment led the scribes of the Middle Ages to use a great many abbreviations or contractions in their manuscripts. These contractions were transplanted into the first printed books; and more recently they have been reproduced in many works, where it was thought desirable that the modern print should represent as nearly as possible all the peculiarities of the ancient manuscript. A knowledge of contraction, therefore, is indispensable, not only to readers of old writings, but to readers of the printed books of the fifteenth, the sixteenth, and the earlier part of the seventeenth centuries, and to all who desire to avail themselves of the vast stores of historical and archeological materials accumulated in the rolls and records published by the governments of Great Britain, France, and other countries. This subject is treated in detail under PALEOGRAPHY.

Contraction may be divided into six classes: (1) contraction, properly so called; (2) contraction by elision or suspension; (3) contraction by writing a smaller letter above the word contracted; (4) contraction by running two or more letters into one character; (5) contraction by symbols representing syllables or words; (6) contraction by initial letters.

CONTRACT SURGEON. In the United States Army, a civilian physician or dental surgeon, employed under contract with the Surgeon-General of the army. Civilian physicians and dentists may be employed as contract surgeons and contract dental surgeons under contracts entered into by, or with the authority of, the Surgeon-General of the army. They are entitled to the transportation and fuel allowances of first lieutenants, and when on duty at a post or station where there are quarters belonging to the United States, they receive the quarters in kind allowed by regulations to an assistant surgeon of the rank of first lieutenant; they are not entitled to commutation of quarters, nor to the ten per centum increase of pay when serving beyond the territorial limits of the United States. They are entitled to the same official obedience from enlisted men as regularly

commissioned officers, and may be detailed on councils of administration and boards of survey, act as post treasurer, etc., and witness payments to enlisted men under the provisions of paragraph 1502 to 1527 of the Regulations, but may not be detailed for duty on courts-martial. Generally expressed, the contract surgeon's eligibility for duty is the same as that of an assistant surgeon, except in so far as it is limited by the fact that he is not a commissioned officer. Candidates for appointment as dental surgeons must be not less than twenty-four, nor more than forty years of age, and must be graduates of standard medical or dental colleges, trained in the several branches of dentistry, of good moral character, and, prior to appointment, will be required to pass a satisfactory professional examination before a board of dental surgeons, convened for that purpose. Contracts with dental surgeons are made for three years, but may be annulled, for cause, at any time. They are attached to the medical department, and are assigned to duty in accordance with the recommendations of the Surgeon-General of the army, or the chief surgeon of a military department. A dental surgeon is allowed, as an assistant, one enlisted man from the Hospital Corps, and must operate between the hours of 9 A.M. and 4 P.M. upon soldiers entitled thereto only. Before and after these hours, he is free to pursue his private practice.

The United States is the only country in the world employing army dental surgeons. For detailed information as to the duties, privileges, etc., of contract surgeons, consult *Army Regulations War Department* (Washington, 1901). See SURGEON, MILITARY.

CON'TRA-FAGOT'TO (It., counter-bassoon). The name in orchestral scores for the double bassoon. See BASSOON.

CONTRAL'TO. See ALTO.

CONTRARY MOTION. See MOTION, in Music.

CONTRAST (Fr. *contrasté*, from ML. *contrastare*, to withstand, from Lat. *contra*, against + *stare*, to stand). The enhancement of the difference between objects or attributes of objects which results from their juxtaposition or immediate comparison. Contrast has been employed, very loosely, as a principle of explanation in psychology; and we cannot even now say that the whole field of 'contrast phenomena' has been adequately explored. It is, clearly, no explanation of a given fact to refer it to a general law of contrast, any more than it is an explanation of a mental connection to refer it to the 'association of ideas.' We must know, in each particular case, the conditions under which the fact is determined and the connection takes shape.

(1) One chapter of the psychophysics of contrast may, however, be considered closed. This is the chapter that deals with the contrast of brightness and colors. If we lay two black strips upon a gray ground, and then push a white cardboard under one of them, so that the white projects on either side, we see at once that the black on white is blacker than the (same) black on gray. If we lay a gray disk upon a red ground of the same brightness, and stand so far away that the contour of the disk is eliminated, we see a bluish-green in place of the gray disk; and the color is most intensive

along the line of junction of disk and ground. These experiments may be varied in many ways.

Disks for mounting upon the color-mixer, to show brightness and color contrast. The black portions of the disks are black, the white portions white, and the shaded portions of some color. From Helmholtz, *Physiol. Optik* (1896.)

The principal laws of contrast, as determined by such experiments, are five in number: (a) Contrast always takes the direction of greatest opposition. A white induces a black, a color its complementary color. (See VISUAL SENSATION.) (b) The more saturated the color (the redder the red, the purer the white), the greater is the contrast effect. (c) The contrast effect is greatest along the line of junction of the contrasting surfaces (marginal contrast). (d) The more nearly alike two colors are in brightness (both bright, or both dull), the better will be the contrast effect. And (e) the more nearly homogeneous the contrasting surfaces (the less distinction there is at the line of junction), the better will be the contrast effect. Helmholtz sought to explain these facts, in purely psychological terms, as deceptions of judgment; we see aright, but estimate wrongly; and Wundt accepts the explanation for certain of the phenomena. The psychological theory, however, breaks down when one attempts to carry it out in detail. There can be no doubt whatsoever that, as Hering maintains, contrast of color and brightness is a matter of direct physiological conditioning, the result of the interaction of excitations within the visual organ, a symptom or expression of the functional unity of the retina.

(2) Whether contrast occurs in the perceptual sphere; whether, e.g. 'great' and 'small' contrast as do blue and yellow, is a much-disputed question. There are certain optical illusions (see ILLUSIONS) which seem to be most easily 'explained' by reference to a law of space contrast. In its most direct form, the theory of spatial contrast affirms that "the space sensation of a stimulated retinal point is a function primarily of the position of the point stimulated, but also of the space sensations of the neighboring retinal elements" (Loeb); the formula that holds of sensation is thus applied, without modification, to the sphere of visual space-perception. It has been said, again, that lines of different direction exercise 'contrastive' influences upon the movements of regard, i.e. upon the movements made by the eyes as we

attentively follow the course of the lines (Heymans). And, lastly, it has been asserted that figures of the same size, surrounded by like figures of another size, look larger 'by contrast' if the surrounding figures are smaller, and smaller if these are larger (Wundt). Most of these illusions can, however, be otherwise explained; and, despite the array of authorities, the fact seems to be that a given perception is never really changed by contrast with other perceptions. 'Perceptual' contrast' consists rather in a feeling. When we see a middle-sized man by the side of a dwarf, we are surprised at his height; when we see him by the side of a giant, we are disappointed in his height. Our perception of the man's height is not affected by the neighborhood of smaller and larger men; the contrast that we 'feel' is felt, literally, as surprise or disappointment.

(3) Many psychologists, again, assume the existence of an affective contrast (see AFFECTION); a particular pleasure appears more pleasant if it follows a preceding unpleasantness, and vice versa (Fechner, Höföding, Lehmann). The affective value of a stimulus, however, is not constant, as is its sensation value, but varies with the present state of the organism and the corresponding disposition of consciousness. The 'particular' pleasure, then, is not a determinate amount of pleasantness, that may 'seem' to be greater or less according to its affective setting. The pleasure actually aroused may differ within wide limits, while the stimulus remains the same. Moreover, where there is affection, there is also sensation; where there is affective contrast there must also be a 'perceptual contrast,' in the sense just defined of the conditions of the arousal of a contrast-feeling. It is, then, perhaps safer to give up the idea of an 'affective contrast' altogether.

(4) Lastly, we must note that, in certain psychological systems (Wundt, Höföding), the law of contrast figures as a general law of the mental life. Wundt, e.g. speaks of the 'law of psychical contrasts' as one of the three psychological laws of relation; all "volitional processes . . . are arranged in groups made up of opposite qualities; . . . these opposites obey in their succession the general law of intensification through contrast. . . . The law is secondarily applied to ideas and their elements." The rejection of this law does not necessarily carry with it the rejection of spatial and affective contrast; though its acceptance would naturally incline us to accept the alleged illustrations of its working.

(Leipzig, 1898).

CONTRAT SOCIAL, kŏn'tră' sŏ'se'äl'. See ROUSSEAU, JEAN JACQUES.

CONTRAYERVA (Sp. *contrayerba*, antidote, from *contra*, against + *yerba*, Lat. *herba*, Engl. *herb*). A medicine once in much repute against low fevers and as a mild stimulant and diaphoretic, but not used in the United States. It consists of the rootstocks (rhizomes) of different

species of *Dorstenia*, tropical American plants of the natural order Moraceæ. The genus is remarkable for the plane receptacle in which the numerous small flowers are fixed; the male flowers in superficial depressions, the female flowers in deep sockets. The flowers have neither calyx nor corolla. The fruit consists of achenia, imbedded in the fleshy receptacle from which they are projected by elastic force when ripe. *Dorstenia contrayerva* is a perennial plant with palmate leaves and somewhat quadrangular receptacles. Its rootstock is knotty, one to two inches long, about one-half inch thick, reddish-brown, pale within, sending out on all sides many slender fibres (roots), which are generally loaded with small brown knots. It has a peculiar aromatic, overpowering smell, and a somewhat astringent, warm, bitter taste. It keeps badly. It contains so much mucilage that a decoction of it will not pass through a filter. *Dorstenia Brasiliensis*, a stemless species, with oblong, heart-shaped leaves, and a circular receptacle, a native of the West Indies and Brazil, possesses similar properties, but is said to be more energetic. Other species possess similar properties. They have been also represented as efficacious against serpent-bites, and hence the name 'contrayerva,' a counter-poison.

CONTRERAS, kón-trá-rás. A village about 12 miles southwest of the City of Mexico, the scene, August 19 and 20, 1847, during the Mexican War, of an important battle between a Mexican force of 7000 under General Valencia, supported by another of 12,000 under General Santa Anna, and a United States force of 4500 under General Scott. The Mexicans occupied a strong position on high ground and fought for a time with great gallantry, but, being attacked both in front and rear at daylight on the 20th, finally gave way and fled in confusion, after having lost in killed and captured over 1500. The American loss in killed and wounded was reported by General Scott at 60. Consult Wilcox, *History of the Mexican War* (Washington, 1892), and *Autobiography of Lieutenant-General Scott* (New York, 1864).

CONTRERAS, HERNANDO DE (c.1520-50). A Spanish adventurer, a son of Rodrigo de Contreras, Governor of Nicaragua. After the confiscation of his father's property, he plotted revenge by organizing, in company with his brother Pedro, an expedition against Peru, which he determined to seize as his inheritance, tracing his claim somewhat remotely to certain rights of his grandfather, Pedrarias, the former Governor of Nicaragua. After murdering the Bishop of Nicaragua, they captured Panama, April 20, 1550, and took a large part of the treasure left there by the licentiate Gasca. While Hernando was pursuing Gasca, who was already on his way from Peru to Spain, the citizens of Panama retook the city, and pursued the brothers. Hernando was shortly afterwards drowned (May, 1550) while endeavoring to make his escape, and Pedro fled into the interior of the country, where every trace of him was lost.

CONTRERAS, JUAN SENEN DE (1760-1826). A Spanish soldier. He was born in Madrid, studied military matters in England and various Continental countries, and took part, in 1788, in the campaign of Austria against the Turks. In

the War of Independence he greatly distinguished himself, in particular at Talavera and at the defense of Tarragona, where he was captured by the French. He was imprisoned in the Castle of Bouillon, but escaped thence in 1812, and made his way to London, whence he returned to Spain in 1814. He wrote an account of the siege of Tarragona which appeared in Paris in 1825 as volume iii. of the *Mémoires relatifs aux révolutions de France et d'Espagne*.

CONTRIBUTION (Lat. *contributio*, from *contribuere*, to contribute, from *com-*, together + *tribuere*, to grant, from *tribus*, tribe; probably connected with *trabs*, beam, Umb. *trēfu*, Welsh *trēf*, village, Goth. *þawrp*, AS. *þorp*, OHG. *dorf*, Ger. *Dorf*, village). In the law of war, a levy of money or supplies imposed by an invader upon the citizens of an enemy's territory entered. The term *requisition* is usually applied to a levy of supplies, which may consist of food, forage, clothing, or means of transport. Contributions are an outgrowth of the old conditions of pillage and devastation which formerly marked the course of an invader. Private property in land early became exempt from seizure owing to immovability; but personal property, being of a portable character, was appropriated so as to impair the enemy's strength. This custom reached its height during the seventeenth century, when armies of adventurers swept over Europe, depending upon the country for support. Gradually, with the growth of more humane feelings and the more practical reason of increased efficiency and discipline in armies, the custom hardened into the usage of permitting inhabitants of invaded territories to purchase immunity from plunder by payment of a money indemnity.

A contribution is of the nature of an extraordinary tax (regular taxes being appropriated as public property by the enemy), and though it is levied primarily by the invader, it is administered by local representative authorities, and its incidence is thus regulated. Modern usage has approved the giving of receipts or '*bons de requisition*' for the sums or quantities taken, to guard against burdensome demands by later commanders; also to furnish a basis for recovery from the domestic government in the event of national division of the loss. Yet the State is not generally held liable for losses entailed by contribution; but these losses are considered to have happened from superior force beyond the State's control, except when a certain territory has been given over to an enemy to protect the rest of the country. In that case justice demands a different rule. Effort has been made by international convention to modify the usage of exacting contribution, and modern warfare has relaxed its severities, though during the Franco-Prussian War it was rigorously enforced by Prussia. The Allies made no levies in the Crimea, nor did the United States in Mexico in 1847. The British also generally purchased supplies from the Boers. In each of these cases, however, this conduct appears to have been dictated by motives of momentary policy. Contribution should be distinguished from tribute, which is usually a condition of peace exacted by treaty. Consult the authorities referred to under WAR. See TAX; TRIBUTE; CONQUEST.

CONTRIBUTORY NEGLIGENCE. See NEGLIGENCE.

CONTRITION (Lat. *contritio*, grief, from *contrecere*, to bruise, from *com-*, together + *terere*, to rub). Sorrow for sin. As a term of Roman Catholic theology, it signifies "a sorrow of mind and a detestation for sin committed, with the purpose of not sinning for the future." A smaller degree of sorrow, arising from "the consideration of the turpitude of sin, or from the fear of hell and of punishment," is called attrition.

CONTROLLER (variant of *comptroller*, which see for etymology). On shipboard, a contrivance for holding the anchor-chain and keeping it from running out while getting up anchor or mooring. It is made in two parts, one of which slides vertically. When this part is up the chain slips freely over the jaws of the controller; when the movable part is lowered the chain drops in a slot, where it is caught and held. For further security, the controller usually has an arch-shaped iron strap above it; this keeps the chain in place and has sockets for a heavy bar which holds the chain down against the jaws.

CON'ULA'RIA (Neo-Lat. nom. pl., from Lat. *conus*, cone). A genus of fossil Pteropoda of curious form found abundantly in some Paleozoic rocks, and rarely in Permian and Triassic beds. The shell, when perfectly preserved, has the form of an elongated quadrangular pyramid of which the sides are flattened and the edges sharp. In size they vary from one-half to ten inches in length. The surface is ornamented by numerous transverse ridges, and the interior is divided by septa in the apical portion. The aperture is closed by four in-curved lobes, which are extensions of the sides of the pyramid. Certain forms in the Utica slate of New York State, originally described as algae, have been shown to be sessile Conularia, in which the young remain attached to the parent shell to form a colony with the appearance of a branching seaweed. Consult: Ulrich, *Beiträge zur Geologie und Paläontologie von Südamerika, I. Paläozoische Versteinerungen aus Bolivien* (Stuttgart, 1892); Ruedemann, "Notes on the Discovery of a Sessile Conularia." *American Geologist*, vol. xvii. (Minneapolis, 1896). See also PTEROPODA.

CONUNDRUM (probably a pseudo-Latin word; hardly from Lat. *conandum*, thing to be attempted, from *conari*, to attempt). A pun in the interrogative form, a kind of riddle (q.v.) involving the discovery of some odd or absurd resemblance between things utterly dissimilar, or of some odd difference between similar things. The conundrum is usually in the form of a question, the answer to which either is or involves a pun. A good example is the following: Q. When is it easiest to read? A. In the autumn, when Nature turns the leaves. The conundrum has almost entirely supplanted the riddle, save in folklore and savage life.

CON'VALLA'RIA. See LILY-OF-THE-VALLEY.

CONVECTION OF HEAT, CONVECTION CURRENTS. See HEAT, *Expansion*.

CONVENTICLE (Lat. *conventiculum*, dim. of *conventus*, assembly, from *convincere*, to assemble, from *com-*, together + *vincere*, to come). (1) The private religious meetings in the early Church. Later (2) a cabal among the monks of

a monastery formed to secure the election of a favorite as abbot; the word consequently fell into disrepute. (3) It was given as an appellation of reproach to the assemblies of Wielif's followers, and was afterwards applied (4) to the meetings of English and Scottish Nonconformists. In this connection the legal term developed. The Conventicle Act of 1864 made all assemblies for religious purposes, other than those of the Church of England, illegal, permitted houses to be searched for suspected conventicles, and imposed the penalty of transportation for repeated offenses.

CONVENTION (Fr., from Lat. *conventio*, a coming together, a meeting, from *convincere*, to meet, from *com-*, together + *vincere*, to come). In the civil law, a contract, pact, or treaty. Hence, in more general usage, a rule of conduct depending upon agreement, express or implied, rather than on any positive rule of law. Thus, we speak of the *conventions* of a constitution, meaning those parts of it which are the result of custom and of general agreement, as distinguished from the *law* of the constitution, which is embodied in statutes or in judicial decisions. The term is also employed in a technical sense, in the language of diplomacy, and in military affairs, with the signification of treaty or agreement respecting the conduct of military operations or the relations of the contracting parties to one another.

In the political sense, the term 'convention' signifies an extraordinary assemblage of delegates, representing the people of a State or the members of a political party, for other purposes than the regular functions of government. Thus, a regular legislative body is not a convention, though the term is sometimes applied to the joint meetings of the two Houses of a State Legislature when convened for the formal election of a United States Senator. The two Houses of Parliament constitute a convention, whether acting jointly or severally, if assembled without authority of law. This was the character of the two 'convention Parliaments,' as they were called, which met in 1660 to restore Charles II. to the throne, and in 1689 to alter the succession from the House of Stuart to William and Mary. In both of these cases the illegal and revolutionary acts performed were afterwards validated and confirmed by regular acts of Parliament. Of a similar character was the convention by which the first French Republic was declared in 1792, and under which the Revolution was carried on till the establishment of the Directory in 1795.

CONSTITUTIONAL CONVENTIONS. The fact that conventions may be made up of delegates representing the whole body of the people of a State, and chosen specifically to represent the popular will in a particular matter, has made them a favorite instrument for framing a new scheme of government or for amending an old one. The convention is thus a more immediate representative of the people, with a higher and more imperative mandate than the legislature. There has been only one national constitutional convention in the United States—that which framed the Constitution; but the high character of this assemblage, the patriotic spirit and wisdom which animated it, and the astonishing success which has attended its labors, have made it the immortal type of such gatherings. In the Unit-

ed States its members are revered as the 'Fathers of the Constitution.'

This convention met, pursuant to the call of the Congress, in Philadelphia, on the 14th of May, 1787, to frame measures for the preservation of the union of the States and the establishment of a stable and efficient government; and, under the presidency of George Washington, it completed its labors on the 17th of September. It included most of the men of authority and influence in the country, among them such well-known figures as Alexander Hamilton, Benjamin Franklin, James Madison, Roger Sherman, Robert Morris, Elbridge Gerry, and Rufus King, and all but one (Rhode Island) of the original thirteen States were represented in its deliberations and in the final vote by which the Constitution was adopted. The Constitution (art. v.) provides for its own amendment by the process of a convention called upon the demand of two-thirds of the States; but the greater ease and simplicity of the alternative method, of proposing amendments to the several States by a two-thirds vote of the two Houses of Congress, has caused the latter method to be preferred. See CONSTITUTION OF THE UNITED STATES.

In the States composing the American Union, however, the convention method of amending their constitutions has usually been followed. The ordinary procedure is for the Legislature to call a convention to be chosen by vote of the electors, and providing for the submission of the results of its work to the Legislature, and then to the people for ratification. In many cases the proposed amendments are submitted directly to the people, without previous reference to the Legislature, and in at least one recent case (Mississippi, 1890) an amended constitution was promulgated and put into effect by the constitutional convention which framed it, without ratification by the people or the Legislature. Doubtless such amendment, by convention only, is valid, if the powers of that body are not limited by the statute calling it into existence. But where the Legislature, in calling a convention, prescribes for the submission of its conclusions to the Legislature or the people, or both, for ratification, the amendments do not acquire the force of law until such ratification has been had. See Jameson, *Treatise on Constitutional Conventions* (4th ed., Boston, 1887).

POLITICAL CONVENTION. A gathering of delegates representing a political party for the purpose of placing in nomination the candidate of that party for an elective office. The method of holding elections is carefully regulated by statute in all communities in which public offices are filled by popular vote, but the method of nominating candidates for such offices is usually left to the initiative of the voter. Under the party system which prevails in most popular governments, the process by which candidates are selected and placed in nomination is usually supervised by the party organizations seeking to control the election. In Great Britain candidates for Parliament are named by committees composed of party leaders, and in the early history of the United States the necessary leadership was supplied by party committees in Congress. Nominations for the Presidency were made in this way until 1824. At the present time, however, nearly all nominations for elective offices in

the United States, whether great or small, are made by the primary and convention systems. The primary is the meeting of the electors themselves, at which delegates to the nominating conventions are chosen. In some instances, however, the system is more complicated, the voters at the primaries choosing delegates to local conventions, and these, in their turn, electing delegates to represent the party in State or national conventions. The enormous extension of this system is doubtless due to the ease and completeness with which it lends itself to partisan control of elections, and thus of the machinery of government. It has doubtless done much to build up the system of party domination and the power of the great party leaders. The party organization, controlling the primaries, makes up a convention of its partisans and dependents, and thus dictates the nominations for office, leaving to the voter no choice but that of supporting or rejecting the candidate of his party. Then, when the party organization of city, county, or State, through a refinement of these methods, becomes wholly subservient to one man, we have the 'boss' system as it exists and flourishes in this country at the present time. In some of the States attempts have been made to render the primaries and conventions more truly representative of the body of the voters by statutory regulation of the nominating machinery, especially in the direction of providing for independent nominations without the employment of primaries and conventions, but thus far without much success. The political convention continues, and is likely to continue, the usual and favorite method of procuring nominations for office.

National conventions—for the nomination of candidates for the Presidency and Vice-Presidency of the United States—were first held about seventy years ago. The Anti-Masonic Party (1828-32) was the first political party to perfect the national-convention system, and that party held the first national convention in the Presidential campaign of 1832. Both factions of the Democratic-Republican Party had, however, held nominating conventions that were not national nor systematically representative during the campaigns of 1824 and 1828. The collapse of the Congressional nominating caucus in the campaign of 1824 hastened the development of the convention system. Political conventions, like most other representative bodies, usually reach their conclusions by a majority vote of the delegates present. The national conventions of the Democratic Party, however, are governed by a peculiar rule, requiring a two-thirds vote for a candidate in order to secure the nomination. Another practice, peculiar to the machinery of the Democratic Party in nominating its candidates for the Presidency and Vice-Presidency, is the 'unit rule,' as it is called, under which certain State conventions bind the delegates of those States in the national convention of the party to cast the unanimous vote of the delegation according to the wishes of the majority of its members.

Although the principal business of political conventions is the nomination of candidates for office, they have, in the course of American political development, become the councils of the great parties, and in and by them the principles of political action are formulated and declared.

The 'platforms,' as they are called, adopted at State and national conventions, constitute the declarations of policy of the parties making them, upon which they seek the verdict of the people at the ensuing election. This declaration of principles has become one of the most important functions of political conventions, and often constitutes the principal part of their work. See ELECTION; NOMINATION; POLITICAL PARTY. Consult Bryce, *The American Commonwealth* (ed. 1895).

CONVENTION, NATIONAL (Fr. *convention nationale*). The third assembly of the deputies of the French people chosen after 1789, and the one which assumed the government of France on the overthrow of the throne in 1792. After the Legislative Assembly had decreed the suspension of the King, August 10, 1792, it voted the election of a National Convention, which commenced its sittings on September 21, immediately after the dissolution of the Legislative Assembly. Its first act was to declare the abolition of the kingship, and to make France a republic. Upon this followed the trial and condemnation of the King. Through the support of excited mobs, the extreme Jacobin Party became predominant in the Convention, where, from the elevated seats on which its members sat, it received the name of the Mountain. (See MONTAGNARDS.) The Revolutionary Tribunal and the Committee of Public Safety were created by this party. The Girondists (q.v.), at first a powerful party, were destroyed, many of them perishing by the guillotine; and a new Constitution, thoroughly democratic, was adopted August 10, 1793. Its operation, however, was suspended until peace should be restored. Meanwhile the rulers in the Convention displayed marvelous energy, almost a million citizens being placed under arms, and immense supplies of military stores being raised by means of continual requisitions. By order of the majority of the Convention, thousands of its political opponents were thrown into prison, and the number who died by the guillotine increased daily both in Paris and throughout France. In the end the National Convention became subject to the dictatorial power of Robespierre, and independent opinion was no longer expressed. The overthrow of Robespierre was followed by a great reaction; the Jacobins were suppressed; and finally, the remnant of the Convention, after concluding peace with Prussia and Spain, dissolved itself, October 26, 1795, leaving to the nation a new Constitution, which placed the Government in the hands of the Directory (q.v.). During its long lease of life the National Convention had passed over eight thousand decrees and acts, and had set into motion forces which profoundly influenced the history of France and of Europe. Consult Barante, *Histoire de la convention nationale* (2 vols., Paris, 1851-53). See FRANCE; DANTON; HEBERT; MARAT; ROBESPIERRE; etc.

CONVENTIONAL. In art, a term which indicates that a work has been produced in accordance, not with the absolute principles of beauty in form and color, but with the theories and rules concerning forms and colors which chance to prevail at a given time or in a given country or social class. An artist who adheres too rigidly to such rules is said to be conventional. The term is also used to describe representations of natural ob-

jects; as, for example, leaves which are not strictly true to nature. Such representations are frequently used for decorative effect, and the objects are said to be conventionalized.

CONVENTION PARLIAMENT. A British term for a Parliament convened without royal authority. The English sovereign has a vested prerogative in the assembling of Parliaments, but when the Crown is in abeyance convention Parliaments meet—as before the restoration of Charles II. (1660), and when William and Mary were offered the sovereignty after James II. had fled the kingdom (1689). The acts of such Parliaments are subsequently ratified by a Parliament summoned in due form.

CONVERGENCE. See SERIES.

CONVERSANO, kōn'vēr-sā'nō. A city in southern Italy, in the Province of Bari, situated on an eminence about 20 miles southeast of the city of that name, and 5 miles from the Adriatic coast (Map: Italy, M 7). It is the seat of a bishop, has a beautiful cathedral, a minnery, and a castle which belonged to the family of Acquaviva. A trade in wine, oil, flax, cotton, and almonds is carried on. Population (commune), in 1881, 11,890; in 1901, 13,685.

CONVERSAZIONE, kōn'vēr-sā'tsê-ō'nā. (It., conversation). A gathering for social purposes and conversation, where amateurs and others may meet for interchange of ideas on literature, art, or science.

CONVERSION (Lat. *conversio*, from *convertere*, to turn, from *com-*, together + *vertere*, to turn; connected with O-Church Slav. *vrătĭti*, Skt. *vart*, to turn, Goth. *wairpan*, AS. *wearpan*, OHG., Ger. *werden*, to become). In logic, the transposition of subject and predicate in a proposition—e.g. "No S is P" becomes by conversion "No P is S." Conversion is *simple* when no other change is made in the original proposition than the transposition of subject and predicate. It is *limited* or *accidental* (*per accidens*) when the quantity of the proposition is reduced from universality to particularity—e.g. "All S is P" becomes by limited conversion "Some P is S." Simple conversion here would be unwarranted. Conversion is *by contraposition* when it is preceded by obversion (q.v.). The proposition obtained by conversion is called the *converse* of the original proposition. See LOGIC.

CONVERSION. As a term of the common law, the unauthorized assumption of the powers of the true owner over goods or personal property. The act of conversion may consist either in the destruction of the property, the sale or transfer of it to a third person, or the use of it as owner. For example, a person converts the horse of another by wrongfully shooting it; an auctioneer or agent for B converts the furniture of A by selling it as the property of B, although he may believe that it is B's property; a manufacturer converts A's cotton or wool when he makes it into cloth, even though in good faith he thinks the cotton or wool is his own; a person who wrongfully draws out a gallon of liquor from a cask and fills up the cask with water converts the entire quantity. In each of these cases the converter wrongfully assumes the dominion over the property of a true owner, and exercises it to the exclusion of the true owner. The mere loss of property by a carrier, or its

deterioration because of careless storage by a warehouseman, is not conversion, as neither carrier nor warehouseman in such case exercises an act of ownership over it.

The common-law action by the owner against the converter was that of *trover* (q.v.), so called from the French *trouver*, to find, because the declaration contained an averment that the defendant had found the property and had thereafter converted it to his own use. This averment, being in most cases fictitious, is no longer employed, and the action is now spoken of as that of conversion rather than of *trover*.

The amount of damages recoverable in an action of this kind is generally the value of the plaintiff's interest in the property at the time of the conversion. Whether the defendant has the right to reduce damages by tendering the property to the plaintiff is a question upon which the courts in this country are not agreed. Upon principle it would seem he has no such right. In case the property is still in possession of the converter, the owner has the option of reclaiming or of suing for damages. If he resorts to the latter alternative, obtains judgment, and collects it, the title to the converted property vests in the defendant. But neither in England nor in this country does title vest in the defendant without the plaintiff's assent, unless the judgment is satisfied. See **TORT**; and consult the authorities there referred to.

Conversion of property in equity is quite a different thing from the common-law tort, which we have been considering. In equity, real property is treated as converted into personalty, and personal property into realty, where the owner has properly expressed his intention that such an alteration should take place. Land may be converted into the purchase money, in equity, by a contract to sell; it may be converted into personalty, also, by a devise in a will to sell it and distribute the proceeds. As equitable conversion works a radical change in the legal character and the devolution of property, the intention of the owner to effect such a conversion must be clearly manifested.

The conversion of land into personalty is also brought about in the administration of the estates of bankrupts or of intestates, generally under statutory provisions. The land is sold by trustees or administrators, and the proceeds applied to the payment of debts. Conversion is applied, by some authorities, to the change of partnership debts, with the consent of creditors, into the debts of one partner, or the change of a partner's debts into those of the firm. See **EQUITY**; and consult the authorities there referred to.

CONVERTER. A device used in metallurgy, and consisting of a receptacle holding iron which is to be converted into steel. It is a vessel usually of spherical shape, lined with fire-clay, the bottom having numerous holes through which a powerful blast is driven during the process. From this vessel the liquid steel is poured into molds. The converter forms an essential part of the Bessemer process, which is described at length under **IRON AND STEEL**. The apparatus is also employed in copper-melting. See **COPPER**.

CONVEX. See **CONCAVE**.

CONVEYANCE (from *convey*, OF. *conveier*, *convoier*, Fr. *convoyer*, from ML. *conviare*, to accompany, from *com-*, together + *via*, way; con-

nected with Lith. *veza*, wagon-track, Skt. *vaha*, road, Goth. *wigs*, OHG. *wec*, Ger. *weg*, AS. *weg*, Engl. *way*, from Lat. *vehere*, Skt. *vah*, to carry). The technical term for a transfer of real property the word having in law retained its earlier English meaning of a transfer, or passing, of a thing from one to another. It comprehends all manner of transfers—whether by livery of seizin, judgment of law, or deed—whereby any interest in land is vested in another, but it is strictly applicable only to transfers *inter vivos*, and does not include devises of land by will, or the devolution of an estate upon the heir by descent, or to the husband and wife of their estates and dower, or to the State of its right by escheat or forfeiture; neither does it include involuntary transfers of property, as by bankruptcy, the creation of judgment or statutory liens, etc. It is, thus, a term of much narrower signification than *alienation*, and somewhat more restricted than *common assurance*, though it is much wider than the term *grant*, as it includes transfers of interests which do not require, or which cannot be effected by, that process. A lease for years, even though made by parol, is a conveyance, and so is a mortgage, a declaration of trust, a marriage settlement, the creation of a power affecting land, etc. The term is also applied to the transfer of title to vessels, but not to the alienation of other species of personal property. The general substitution of written for parol and ceremonial transfers of land, effected by the Statute of Frauds (29 Car. II., c. 3, 1676), has made the term *conveyance* one of common application to the instrument of transfer, as well as to the transaction itself.

The difficult and technical character of the law of real property appears at its worst in the complicated processes which have from time to time been developed for transferring such property. The earlier methods of the common-law system depended for their efficacy largely on the notoriety of the transaction, the feoffment, or livery of seizin, being a public ceremonial, and the subsequently devised processes of 'levying a fine' and 'suffering a recovery' being attended with the publicity of judicial proceedings. These 'notorious' conveyances, as they were termed, have in modern times given place to more convenient modes of transfer, which are called 'secret' conveyances. This salutary change has been brought about by the general substitution of written deeds of transfer, which take effect upon delivery, for the older and more formal methods, and the form and style of these deeds, formerly in the highest degree technical and complicated, have in recent years been greatly simplified by statute. The general prevalence of registry acts and of the practice of recording in the United States does not affect the secret character of the conveyance, as such, this being complete upon the delivery of the deed, the object of the recording being only to guard against a subsequent fraudulent transfer of the same property.

The earlier modes of conveyance at the common law, besides their notoriety, and in part as a consequence thereof, had the extraordinary operation of transferring a greater estate in the land than the transferer himself had. That is to say, a tenant for life or years might by feoffment convey the premises in fee simple to a

stranger. It is true the fee thus conveyed was a defeasible one; but it placed the landlord—reversioner or remainderman—in the situation of a disseizee, and forced him into the disadvantageous position of a plaintiff seeking to recover his land from one who claimed it under a notorious public conveyance. This was called a 'tortious,' or wrongful, conveyance, and the term tortious was thus applied to all the earlier modes of alienation which possessed this curious power. Conveyances by deed, on the other hand, have never been attended with these consequences, have never possessed a tortious operation, and have, therefore, been distinguished as 'innocent' conveyances. Whatever they may purport to do, they pass only such interest as the grantor can lawfully convey. All modes of conveyance are now of this character, the older conveyances and the tortious effect of them having been done away with, both in England and in the United States, by statute. A curious survival of this obsolete and discredited doctrine appears in the modern American doctrine of conveyance by estoppel (q.v.). Notwithstanding the improvements which have been effected in recent years in the substitution of secret for notorious conveyances and the simplification of the former, the conveyance of land continues to be a much more cumbrous, uncertain, and expensive operation than the transfer of personal property. Many suggestions have been made looking to the elimination of these objections and the assimilation of the two species of property in this respect, and in several of the United States and in some of the British colonies different systems for achieving these objects have been adopted and are now on trial. These will be explained under the titles LAND TRANSFER: REGISTRATION OF TITLE. See the several titles of the various modes of transfer referred to in this article, and in addition, ALIENATION; CONVEYANCING; TITLE; WARRANTY; and the authorities there referred to.

CONVEYANCING. The act or art of preparing the deeds or instruments used for the transference of property from one person to another. As such writings not only form the evidence of the right of the person possessing or claiming possession of property, but do in themselves constitute the title thereto, it is of the greatest importance that the conveyancer employed to prepare them should be possessed of a competent knowledge of the law and have the skill required to frame them in such a form as clearly to express and attain the object intended. In the early stages of society there is no call for the profession of a conveyancer; property is held in right of occupancy, without any written title, and even lands are conveyed from one to another without writing, the new owner being usually put in possession in presence of witnesses called for the purpose, by some symbolical form, such as the delivery of earth and twigs.

In the early history of the Jews, the symbolical mode of transferring title prevailed (Ruth iv. 7). But they subsequently developed a much more artistic system of conveyancing, making use of all the safeguards that are used in modern times—viz. writing, witnesses, subscribing, sealing, and recording the documents (Jer. xxxii. 9-12). In Rome, as elsewhere, early transfers of property, whether land or goods, were of

a ceremonial character. Later, a distinction was made between property capable of transfer by a simpler process (*res nec mancipi*) and such as could be effectually transferred only by the older and more formal method (*res mancipi*). It was not until Justinian's reign that the distinction between the two classes of property was abolished and a simple form of conveyance made sufficient for both.

Strictly speaking, the term *conveyancing* has no application to the various modes by which the title to chattels is transferred. These processes have almost always been of the simplest character, and do not even to-day usually call for expert knowledge or for elaborate writings to render them safe and effective. It is to the feudal system of land tenures, and to the complexities and refinements which it introduced into the simple notion of ownership, that we owe the difficulties and dangers which attend the transfer of title to land at the present time. As the feudal system nowhere exercised a stronger and more persistent influence than in England, so there is no country in Europe in which the conveyance of lands is as complicated and precarious an undertaking as it is in that country and in most of the United States. The number and variety of estates and other interests which may exist at one and the same time in the same parcel of land, and the diversity of circumstances under which these varied interests may arise, may be transferred and extinguished, have combined to make conveyancing one of the most technical and difficult branches of the work of the legal profession. In England it has resulted in the development of a special branch of lawyers who are known as conveyancers. In the United States the process of specialization has not gone so far as that, the business of conveyancing being still for the most part in the hands of the profession at large.

The process through which the conveyancer must go may be briefly described. He has first to make a careful search of the public records and from these to prepare an abstract (q.v.) of the title to the land in question. He must then examine with the greatest care all of the documents constituting the chain of title, in order to determine their validity and sufficiency. He will then be prepared to draw up the appropriate document to effect the transfer desired—which may be a deed of trust, a marriage settlement, a grant of the lands, or a last will and testament. In England, where no system of general registration of land titles is in force, the conveyancer has recourse to the original documents of title, which are carefully preserved and transferred with the land.

The complexity, uncertainty, and expense of the old method of conveyancing have long called for radical reform. In England, in the United States, and in Canada, land transfer reform associations exist, and are vigorously pushing for legislation in this direction; something has already been achieved, but much remains to be done. Few even of professional conveyancers would deny the truth of the statement made by the Duke of Marlborough in the *Fortnightly Review*, that heretofore "in every country the theory of the land laws has depended on the fact that land was never intended to be dealt with by free commerce and barter, and its sale and ex-

change have at all times been surrounded with legal difficulties of every description." As property is subdivided into smaller and smaller portions, and as the number of conveyances which make up the chain of title to a piece of real estate continually increases, the difficulty and cost of establishing a clear title becomes more and more burdensome. An illustration of this is given by a New York newspaper, which points out that when the famous Jumel estate in New York was disposed of, it was divided into 1383 pieces and sold to over 300 buyers; each of these had to engage a lawyer to search carefully through every old deed, mortgage, and record relating to the entire property, picking them out from 3500 volumes of deeds and mortgages in the office of the New York City Registrar; here it is clear that 299 out of 300 parts of the total labor and expense were wasted. The same writer asserts that in New York City the amount thus expended is over one per cent. of the total value of the property transferred, and that at least half of this is unnecessary waste. So great has the task of searching and verifying titles become in New York and other large cities that land-title guarantee companies have been formed, which insure purchasers and mortgagees against flaws in titles; the companies make a business of searching records, and sometimes have elaborate analyses and abstracts of real estate records, costing them many scores of thousands of dollars.

In the United States the system of conveyancing generally adopted is that by deeds of grant, or bargain and sale; many States have enacted statutes simplifying the old method, and several prescribe an exact form of deed, defining the legal effect of the specific words of conveyancing, limiting, conditioning, and so on. It follows that the laws of the States are not uniform, but the essentials of a conveyance by deed are practically the same, requiring that it be in writing, be signed and sealed by the grantors, be acknowledged before a notary or other officer authorized by the statutes, and be actually delivered. The direction which all present agitation for reform in conveyancing is taking is that pointed out by the success of the Torrens system of Australia. The main principle in that system is the registration of titles as distinguished from the registration of deeds. It was introduced first in South Australia about thirty years ago by Mr. (now Sir) Robert Torrens, was eminently successful practically, and has since been adopted by the other Australian colonies. Under it the ownership passes only on the filing, in the proper registry office, of the title; thus the actual transfer and the public notice of it are simultaneous, and the records of the office cannot be impeached by flaws in the conveyance itself, nor can a purchaser be deceived by the existence of a deed not recorded and of which he could have no knowledge. The system of registration is a very simple one; a special folio of the record is devoted to a single piece of land, and there in one place and together are recorded all transfers and transactions affecting the title of that piece of land or forming a charge on it; and, we repeat, the title to that land can shift only upon the registration itself. The Government holds to the land-owner under this system much the same relation that a corporation issuing certificates of registered stock holds to the purchaser

thereof—that is, the transfer of such stock certificates is made on the books of the company and takes effect only upon new entry therein. Under the Torrens system a 'Master of Titles' is intrusted with the duty of seeing that the transfer is regular and is properly executed. A guarantee fund is established by the State to compensate any persons injured by errors of any kind. But the percentage of claims made from the guarantee fund to the value of the property involved has been very small—less, it is said, than the one-hundredth part of one per cent. The great merit of this system is that, once established, it makes title certain and absolute, and obviates research in ancient conveyances. No doubt there is expense and difficulty in changing from the old to the new system of conveyancing, but the results attained are great. In Canada the system has been tried—though in a limited and imperfect form—in Toronto, and there is a strong agitation for its universal adoption under a compulsory law. In England a Land Transfer Reform Bill was introduced in 1875 by Lord Cairns, and passed, but in a mutilated and altogether unsatisfactory form; in 1882 a second act was passed simplifying the art of conveyancing and leading the way toward a general reform; in 1889 Lord Salisbury's Government introduced a bill making the Torrens system compulsory, which was defeated only after its third reading and by a very small majority. It seems probable that such a reform bill will pass before many years. In the State of New York an act was passed and went into effect in January, 1891, which provided for a reformed or block scheme of indexing conveyances to supplant the old system of consecutive registration of deeds indexed only by the names of the parties thereto. This is also a step in the direction of the Torrens system of registration and transfer by titles. The Torrens system has been adopted in Massachusetts, Illinois, and several other States.

Jones, *Forms in Conveyancing and General Forms* (5th ed., Indianapolis, 1899); Wolstenholme, *Forms and Precedents Adopted for Use Under the Conveyancing Acts* (5th ed., London, 1891); Sheppard, *The Touchstone of Common Assurances, etc.* (Amer. ed., Philadelphia, 1840-41); Greenwood, *Manual of the Practices of Conveyancing* (8th ed., London, 1891); Elphinstone, *Introduction to Conveyancing* (5th ed., London, 1900); Hunter, *The Dominion Conveyancer* (Toronto, 1893).

CONVICT (Sp., Port. *convicto*, from Lat. *convictus*, p.p. of *convincere*, to convict, from *com-*, together + *vincere*, to conquer). A person found guilty, after due trial, of a criminal offense; in general use applied only to those convicted of felony or serious crimes, not to those guilty of petty offenses. The system used by a country in dealing with convicts is termed the convict system. In Europe in the Middle Ages the punishments inflicted upon criminals were cruel and brutal. Through the influence of the Church a system of fines was established and physical punishments were modified. Later it became customary to transport convicts to colonial possessions. England transported convicts to Australia until about the middle of the nineteenth century. The year 1900 marks the practical abandonment of transportation by all civilized countries, except France, where it is a secondary

feature of the penal system. In civilized countries fines and imprisonment are the customary punishments. In Europe the prisoners are usually kept apart from each other; in America more freedom of association is allowed. For economic and moral reasons, prisoners are given steady employment. Consult: Drühms, *The Criminal: His Personnel and Environment* (New York, 1900); Lombroso, *L'uomo delinquente* (Turin, 1896). See CONVICT LABOR; PENOLOGY; PRISONS.

CONVICT LABOR. In all penitentiaries the work of keeping the institution in good order and carrying on the domestic arrangements is done by the prisoners. In addition, repairs and improvements, such as constructing new buildings, is often done by inmates under expert direction. This would not furnish sufficient employment to keep the prisoners occupied. For the sake of the convict as well as for the pecuniary returns, it is customary to employ the prisoners in productive enterprises. In America these general systems prevail.

In the lease system the convicts are leased to contractors for a fixed sum and period, the entire responsibility for the care and safe-keeping of the convicts devolving upon the contractors. This system may reduce the cost to the State, but it tends to great abuses and should be abolished. It prevails only in some of the Southern States.

The contract system exists in two forms. In the first the labor of the convicts is furnished to contractors for a fixed sum, the contractors personally directing the employment in the institution. The raw material and machinery are furnished by the contractor, though in some cases the State furnishes the latter. In the second form, the piece-price system, the contractor furnishes the material and pays a stipulated price for the finished product. The direction of the industry is in the hands of the prison officials. The advantage of this form is that it avoids the possibility of trouble coming from the presence in the institution of employers who are not directly responsible to the authorities.

The contract system has been in general use. It has many advantages. The industry is managed by experts who can buy and sell to better advantage than can the warden, who, presumably, is not so well posted. Moreover, the State is not subject to loss because of gluts in the market or because of official ignorance or duplicity. It necessitates no great investment in expensive machinery. It has furnished steady employment to the prisoners and has reduced appreciably the net cost of maintenance.

There are, however, serious objections to the plan. When it involves the presence of outside overseers it may seriously interfere with prison discipline. From an educational standpoint the highly developed industry interferes with the training of the individual convict. This applies with special force to the younger prisoners. Employers have condemned the system on the ground that the cheap labor gave the contractor an unfair advantage. Labor unions have objected because they felt that it had a tendency to lower wages. The objections have weight. While the total of prison labor is but a small part of the labor of the country, the introduction of special industries may easily depress and unfairly compete with similar local industries.

For these reasons the contract system is losing ground and is giving place to the public-account system. The State furnishes the plant and materials and conducts the entire business through its officials. Any profits go to the State, and any loss is borne by it. Products are sold upon the open market, or, as in New York, only such articles may be made as will be utilized in other public institutions, or in the various State departments. Under this system the individual prisoner may be employed as seems for his best interest. Generally speaking, this plan is probably the best yet proposed. It tends, however, to influence the warden to strive for financial success rather than for the upbuilding of character, and opens the way for financial scandals. It does not avoid competition with free labor. If the New York plan is adopted there should be a central body to regulate the industries in the different institutions, that there may not be a surfeit of certain articles and a scarcity of others.

Penologists now advocate manual and technical training, particularly for the younger men. They agree that this system, though more expensive, will in the end yield far larger returns to society than the present industries. It might be thought that the employment of convicts in public enterprises, such as road-making, would be profitable. Experience has not confirmed this view, and such employment is now considered advantageous only under peculiar local circumstances. Consult: *United States Industrial Commission Report on Prison Labor* (Washington, 1900); *Proceedings of National Prison Association* (Pittsburg, 1898, 1899); Henderson, *Introduction to Study of Dependents, Defectives, and Delinquents* (Boston, 1893). See PENOLOGY; CRIMINOLOGY.

CONVOCATION (Lat. *convocatio*, from *convocare*, to call together, from *com-*, together + *vocare*, to call, from *vox*, voice). An assembly of the clergy of the Church of England, analogous in many respects to Parliament, at the same time with which it usually meets. As a factor in the development of English institutions, it is of great interest, being in some shape perhaps older than Parliament, into which attempts were made to incorporate it in the reigns of Edward I. and Edward II. Convocation formerly exercised the right of enacting ecclesiastical legislation, and also of voting subsidies to the Crown; but the former right was greatly restricted under Henry VIII. and by later acts of Parliament, while the latter was abandoned in 1664, since which time the clergy have been taxed like other citizens. Certain convocations are of importance in the history of both Church and State in England; in particular that of 1529, which established the royal supremacy; that of 1562, which confirmed the Articles of Religion; that of 1603, which enacted an important body of canons; and that of 1661, which completed the revision of the Book of Common Prayer. About the beginning of the eighteenth century a factious spirit prevailed, so that the sittings of the Lower House were distinguished by contention with the bishops. Convocation was prorogued in 1717, and not again assembled until the revival of Church life in the nineteenth century caused a demand for the renewal of its sessions. By the influence of Bishops Wilberforce, of Oxford, and Philpotts, of Exeter, the

Convocation of Canterbury reassembled in 1852 and that of York in 1856, since which time their meetings have been regularly held. Each province has a convocation of its own. The Upper House is composed of the diocesan bishops; the Lower of bishops suffragan, deans, archdeacons, and certain representatives of the lower clergy, known as proctors; in the Province of Canterbury they are elected by the beneficed clergy alone, while in that of York all the clergy have a vote, sending one proctor for each archdeaconry. The Lower House in the southern province numbers about 160 members, in the northern about 80. While Convocation has no legislative functions nowadays, its discussions are of great interest to members of the Church of England. A 'House of Laymen' has recently been organized, which, while not constitutionally forming a part of Convocations, discusses similar topics on parallel lines. Consult: Trevor, *The Convocations of the Two Provinces: Their Origin, Constitution, and Forms of Proceeding, with a Chapter on Their Revival* (London, 1854); Lathbury, *A History of the Convocation of the Church of England to 1742* (London, 1842); Whitehead, *Church Law* (London, 1872).

In the University of Oxford, the term Convocation is applied to the assembly composed of all masters of arts, non-resident as well as resident, which finally accepts or rejects the statutes which have passed the narrower governing bodies, the Hebdomadal Council and Congregation. See OXFORD UNIVERSITY.

CONVOLVULA'CEÆ (Neo-Lat. nom. pl., from Lat. *convolutus*, bindweed, from *convolvere*, to roll together, from *com-*, together + *volvere*, to roll). An order of dicotyledonous plants, the morning-glory family. They are annuals or perennials, many are twining or climbing in habit, and one genus, *Cuscuta*, is a climbing parasite. (See DODDER.) In many the stems contain a milky juice, and some have tuberous roots which are of economic value as furnishing jalap, scammony, sweet potato (q.v.), etc. Some are noted for their beautiful flowers, as the morning-glory (q.v.). The leaves are generally alternate and without stipules. The calyx is five-parted and the corolla with a five-lobed and plaited limb which is usually valvate, sometimes convolute. The stamens are inserted within the corolla, alternating with its lobes. The ovary is free and consists of two, rarely more, carpels and bears two or more ovules. The fruit ripens into a berry, nut, or capsule. This order is closely related to the Scrophulariaceæ and Boraginaceæ (q.v.). The order is divided into Convolvuloideæ, which are green plants, the principal genera being *Dichondra*, *Evolvulus*, *Ipomœa*, *Convolvulus*, and *Erycibe*; and *Cuscuta* with *Cuscuta* as the only genus, the species of which are leafless parasites of curious habit.

CONVOLVULUS (Lat., bindweed), or BINDWEED. A genus of plants, the type of the natural order Convolvulaceæ. This genus contains nearly 150 species, herbaceous and shrubby, generally with a twining stem and milky juice; large and beautiful flowers, a five-parted calyx, a monopetalous corolla, with regular five-lobed and plaited limb. The plants of this genus are very abundant in the tropics, but comparatively rare in cold climates. Many are cultivated as orna-

mental plants, particularly species of *Convolvulus* and *Ipomœa*, the latter being commonly known as 'morning-glory.' Some species have large farinaceous roots, capable of being used as food, of which the sweet potato (q.v.), or batatas, is the most important. Two or three are common in the Eastern United States and are called bindweed. *Convolvulus arvensis* is a troublesome weed in some sandy soils near the coast, and *Convolvulus scpium* in richer soils. The former has rose-colored fragrant flowers, the latter large white flowers. Both are ornamental, the latter is now often planted to cover posts and trellises. *Convolvulus scammonia* yields scammony, and the root of *Ipomœa pandurata* is used as a purgative in the United States. *Convolvulus scoparius*, a shrubby species, native of the Canary Isles, yields one of the kinds of wood called rosewood, which has a strong smell of roses. *Ipomœa jalapa* of this order yields jalap, a well-known cathartic. It abounds in Mexico. For illustration, see Plate of DICOTYLEDONS.

CONVOY (Fr. *convoy*, from *convoyer*, to convey). The name given to one or more ships of war appointed to protect a fleet of merchant vessels against the attacks of an enemy or pirates. If a merchant ship part company with the convoy, or neglect to obey the signals, all claims of insurance are forfeited. The name is sometimes applied to the merchant vessels so escorted. In the military service, a convoy is, properly speaking, a train of wagons laden with provisions or warlike stores; the term, however, is applied also to the detachment of troops, or escort, appointed to protect such a train.

CONVULSION (Lat. *convulsio*, convulsion). A symptom of disease occurring in sudden attacks during which the patient generally loses consciousness; the muscles of a part or of much of the body are contracted and relaxed involuntarily, in spasmodic and irregular movements; the eyes are generally open, the eyeballs turned up or to one side; the teeth are set tight together; the tongue or cheeks are frequently bitten; the breathing is at first arrested, then labored and deep; the face is generally red, and the saliva cozes from the mouth as froth. In epilepsy (q.v.) the convulsions are as just described and the patient generally sleeps immediately after them before regaining consciousness. In hysteria (q.v.) there is less writhing and more rigidity, the patient is not entirely unconscious in most cases, her cheeks remain pale, and she regains consciousness after a period of confusion, without sinking into a sleep; the tongue is not bitten and froth does not issue from the mouth. Uræmic convulsions are very similar to those of epilepsy. Convulsions are also caused by irritation of the brain and spinal cord from other sources than those mentioned, such as anæmia of the brain, tumors of the brain, alcoholic intoxication, acute indigestion, Bright's disease, intestinal worms, etc., as well as certain acute diseases with an initial rise of temperature.

In all cases of convulsions, except when occurring in a mother who has just given birth or is about to give birth to a child, the clothing should be removed and the patient immersed in a hot bath up to the neck for ten or fifteen minutes or till the limbs relax. An enema of scapsuds containing twenty drops of turpentine will always be of advantage to an adult, and an

enema of water to a child. The patient should never be grasped and held by any one, but should be protected from falling from the bed with cushions and pillows. In epileptiform convulsions, the tongue should be protected from being bitten by being thrust back into the mouth, or by a rubber eraser inserted between the teeth. The patient should not be allowed to bury the nose and mouth in the pillows.

CONVULSIONARIES (Fr. *convulsionnaires*, from Lat. *convulsio*, convulsion, from *convellere*, to convulse, from *com-*, together + *vellere*, to pluck). A fanatical sect of Jansenists who sprang up in France about 1730. Their meeting-place was the churchyard of Saint Médard, in a suburb of Paris, where was the tomb of a certain Francis of Paris, who died in 1727, and was reckoned very holy by the Jansenists on account of his extravagant asceticism. At this tomb a multitude of people poured forth fanatical prayers, preachments, and prophesyings. Miracles are also alleged to have been performed, for proof of which we are referred to a work written by Carré de Montgeron, a member of the Parliament of Paris, and entitled *La vérité des miracles opérés à l'intercession de M. de Paris et autres appellans* (Paris, 1737, 3 vols.). After 1731 the fanaticism of the convulsionaries increased to utter madness. "They threw themselves into the most violent contortions of body, rolled about on the ground, imitated birds, beasts, and fishes, and at last, when they had completely spent themselves, went off in a swoon." In 1733 the King issued an order for the imprisonment of these fanatics, but it was found impossible to put a complete stop to the mischief. They took to predicting the downfall of the throne and the Church. They were not much heard of in Paris after the middle of the eighteenth century, but were met with later in country places at various times. They brought Jansenism into so much disrepute that Voltaire declared the tomb of Francis to be the grave of Jansenism. Consult P. F. Mathieu, *Histoire des miracles et des Convulsionnaires de Saint-Médard, précédée de la vie du diacre Paris, d'une notice sur Carré de Montgeron et d'un coup d'œil sur le Jansénisme* (Paris, 1864).

CONWAY. A river in North Wales, 30 miles long, noted for its scenic beauty. It rises in a small mountain lake and flows past Llanrwst Trefriw into the Irish Sea. At Conway it is half a mile broad at spring-tides, which rise here 21 to 24 feet. The Conway has been famous for its pearls since Roman times.

CONWAY, or ABERCONWAY. A seaport market town and municipal borough of Carnarvonshire, North Wales, beautifully situated on a steep slope on the left bank of the Conway, 22 miles northeast of Carnarvon (Map: Wales, C 3). It is surrounded by walls 12 feet thick, with towers and battlements. The principal streets are well-proportioned and regular, and contain several ancient houses. Conway Castle, one of the noblest castellated structures in Britain, stands on a precipice overlooking the river. It was built in 1284 by Edward I. to check the Welsh. Its walls are 12 to 15 feet thick, with eight vast towers, four of which are each surmounted by a slender turret. Population, in 1891, 3,400; in 1901, 4,700. Consult *Historical*

Sketch of Conway Castle and Its Environs (Carnarvon, 1852).

CONWAY. A town and the county-seat of Faulkner County, Ark., 30 miles north of Little Rock; on the Saint Louis, Iron Mountain and Southern Railroad (Map: Arkansas, C 2). It has an extensive cotton trade, lumber, flour, and cottonseed-oil mills, excelsior-works, etc. The town is the seat of Hendrix College (Methodist Episcopal, South), organized in 1884, and Central Baptist College for Women, opened in 1892. Conway was settled in 1871 and incorporated three years later, and is governed by a mayor, elected annually, and a council. Town meetings are held annually to select candidates for mayor. The electric-light plant is owned and operated by the municipality. Population, in 1890, 1,207; in 1900, 2,003.

CONWAY. A town in Carroll County, N. H., containing the villages of Kearsarge, North Conway, Conway, and Conway Centre, 71 miles northeast of Concord; on the Saco River and on the Boston and Maine Railroad (Map: New Hampshire, K 5). The village of North Conway is famed for beautiful scenery, and is a popular summer resort. Conway is the centre of an extensive granite industry, and has a ribbon peg factory, spool-mill, and lumber and canning interests. Population, in 1890, 2,331; in 1900, 3,154.

CONWAY, HENRY SEYMOUR (1721-95). An English field-marshal, a second son of Francis Seymour, first Lord Conway. He was aide-de-camp to the Duke of Cumberland at the battles of Fontenoy and Culloden, in 1745 and in 1746. On March 30, 1759, he was appointed lieutenant-general, and in this capacity served under the Duke of Brunswick in Germany. He persistently opposed the war with America, and on February 22, 1782, in an address to Parliament, urged the advisability of discontinuing aggressive warfare against the American Colonies. Shortly after the resignation of Lord North, he became Commander-in-Chief of the Army (March 27, 1782).

CONWAY, HUGH. The literary pseudonym of Frederick John Fergus, part of which may have been first suggested to him by his student life on the school-frigate *Conway*.

CONWAY, MONCREE DANIEL (1832—). An American clergyman, historian, and ethical writer. He was born in Stafford County, Va., March 17, 1832, and was graduated at Dickinson College (1849), and at the Harvard Divinity School (1854), having studied law and been a Methodist minister in the interval. He imbibed humanitarian and rationalistic ideas, and returned to Virginia to preach them, but was obliged to leave the State. He then took charge of a Unitarian church in Washington, D. C., but, too outspoken against slavery, was forced to go to Cincinnati, where he preached, wrote books, and edited *The Dial*. There, and later in Boston as editor of *The Commonwealth*, he urged emancipation, and in 1863 went to England to explain the cause of the war. Here he accepted a call to the ultra-liberal South Place Chapel, London, and was minister there from 1863 to 1884, doing a large amount of varied literary work. At the close of the last century he returned to America and resided in New York City. He subsequently began the writing of his reminiscences. Among his volumes are: *The Rejected Stone* (1861); *Idols and Ideals* (1877); *Demonology and Devil*

Lore (1878); *The Wandering Jew* (1881); as well as biographies of *Edmund Randolph* (1888), *Thomas Carlyle* (1881), *Emerson at Home and Abroad* (1882), and *Hawthorne* (1890). His edition of the writings of Thomas Paine (4 vols., 1894-96) and his life of Paine (2 vols., 1892) are his most important works.

CONWAY, ROBERT SEYMOUR (1864—). An English classical philologist. He was born at Stoke Newington, September 20, 1864. He received from Gonville and Caius College, Cambridge, the degrees of B.A. (1887); M.A. (1891); Litt.D. (1898). He was made fellow of Gonville and Caius (1888-91); classical lecturer in Newnham College (1887-93); professor of Latin, University College, Cardiff, Wales (1893—). He is the author of *Verneri's Law in Italy* (1887); collaborator in the translation of *Brugmann's Comparative Grammar* (1888-95); and the editor of *The Italian Dialects* (Cambridge, 1897), etc.

CONWAY, THOMAS (1733-c.1800). An Irish soldier of fortune, who became an officer on the American side in the Revolutionary War. He was educated in France, entered the French army, and had attained the rank of colonel when, early in 1777, he came to America and offered his services to Congress. He was appointed a brigadier-general in May of this year, served at Brandywine and Germantown, and later in the year was made inspector-general, with the rank of major-general, contrary to Washington's wishes. He was the chief conspirator in the 'Conway Cabal' (q.v.), and upon the discovery of his intrigue resigned from the army in 1778. Soon afterwards, on July 22, he was wounded in a duel by General Cadwallader, who challenged him because of his attacks upon Washington. Conway then returned to France, reentered the army, and in 1784 was appointed Governor of Pondicherry and the French settlements in Hindustan. In 1792 he was appointed commander of the royalist forces in the south of France, but on the success of the Revolutionists fled from the country.

CONWAY, SIR WILLIAM MARTIN (1856—). An English author and explorer. He was born at Rochester, was graduated M.A. at Trinity College, and remained at Cambridge till 1880; lectured on art in university extension courses, and was appointed first professor of art at University College, Liverpool (1884). Subsequently he traveled extensively, surveying the Himalayas (1892), traversing the Alps (1894), exploring the interior of Spitzbergen (1896-97), and the Bolivian Andes (1898). Among his numerous works on art and exploration are *Woodcutters of the Netherlands in the Fifteenth Century* (1884); *Literary Remains of Albrecht Dürer* (1889); *Climbing and Exploration of the Karakoram-Himalayas* (1894); *The Alps from End to End* (1895); *The First Crossing of Spitzbergen* (1897); *Climbing and Exploration in the Bolivian Andes* (1900). He was knighted in 1895.

CONWAY CABAL', THE. In American history, the name given to an intrigue, organized under the leadership of Thomas Conway (q.v.), in 1777, during the Revolutionary War, for the purpose of bringing about the supersession of Washington, as Commander-in-Chief of the American armies, by General Horatio Gates. With Conway were associated such men as Gates, Charles Lee, Thomas Mifflin, and Benjamin Rush,

besides several other army officers and members of the Continental Congress, who charged Washington with gross incompetence and favoritism, and in particular endeavored to prove the superiority of Gates over Washington as a commander by contrasting the victories of the former at Saratoga with the almost contemporaneous reverses of the latter at Brandywine and Germantown. The faction gained sufficient power to secure the appointment of Gates as head and of Thomas Mifflin as a member of the Board of War and the promotion, against Washington's emphatic advice, of Conway to the rank of major-general, and to the position of inspector-general; but they did not succeed in retaining any considerable following, and in a few months their schemes fell through, and Conway was virtually forced to leave the service (1778). A good account of the intrigue is given in vol. ii. of Fiske's *The American Revolution* (Boston, 1893).

CONWELL, RUSSELL HERMAN (1842—). An American Baptist clergyman. He was born at Worthington, Mass., and was educated at Wilbraham Academy, and at Yale and Albany colleges. During the Civil War he served in the Union Army (1862-65), and rose to the rank of lieutenant-colonel. After the war he devoted himself to the practice of law. He was correspondent in Germany of the *New York Tribune* and the *Boston Traveller* from 1868 to 1870. After his ordination to the ministry in 1879 he occupied the pulpit of Grace Baptist Church, Philadelphia (1881-91). He founded and became president of Temple College (established 1888), and the Samaritan Hospital was also established by him (1890). In 1891 he became pastor of the Baptist Temple, in Philadelphia. The following are his principal works: *Why the Chinese Emigrate; Woman and the Law; Joshua Gianavello; Acres of Diamonds; Lives of the Presidents*; and special biographies of Bayard Taylor, Charles H. Spurgeon, and Presidents Hayes and Garfield.

CONYBEARE, KŪN'Ī-BĀR, JOHN (1692-1755). An English clergyman. He was born at Pinhoe, graduated at Oxford, and was ordained priest in 1716. In 1730 he was chosen master of Exeter College, of which he had previously been a tutor. Before this time he had attracted notice by the publication of two sermons on *Miracles* (1722), and on the *Mysteries of the Christian Religion* (1724). In 1732 he published his great work, *A Defense of Revealed Religion*, a reply to Matthew Tindal's *Christianity as Old as the Creation* (1730). Conybeare was appointed Dean of Christ Church, Oxford, and finally Bishop of Bristol (1750).

CONYBEARE, JOHN JOSIAS (1779-1824). An English scholar. He was the grandson of the Bishop of Bristol, and became professor of the Anglo-Saxon language (1807) and of poetry at Oxford (1812). He made some contributions to the literature of geology and chemistry, but is chiefly remembered for his devotion to Anglo-Saxon literature. His *Illustrations of Anglo-Saxon Poetry* (1826) was edited by his brother, William Daniel Conybeare.

CONYBEARE, WILLIAM DANIEL (1787-1857). An English geologist and clergyman, the younger brother of John Josias Conybeare. He was educated at Westminster and Oxford. While at the latter institution he devoted much time to the study of geology, and his researches

in this science afterwards procured for him the friendship of Buckland, De la Bêche, Elie de Beaumont, and many of the leading geologists of the time. He contributed several papers on various geological subjects to English periodicals and was admitted to membership in the Royal Society and the Geological Society of London. In 1844 he became Dean of Llandaff, an office he retained until his death in 1857.

CONYBEARE, WILLIAM JOHN (1815-57). An English clergyman and essayist, the son of Rev. William Daniel Conybeare (q.v.). He graduated at Cambridge in 1837, took orders four years later, and in 1848 succeeded his father as vicar of Axminster. He wrote *Perversion; or, the Causes and Consequences of Infidelity*, a religious novel (1856); and *Essays Ecclesiastical and Social* (1856). He is best known, however, as joint author, with Rev. J. S. Howson, of the *Life and Epistles of Saint Paul* (1851).

CONYERS, kōn'yērz. A town and the county-seat of Rockdale County, Ga., 30 miles east-southeast of Atlanta; on the Georgia Railroad (Map: Georgia, B 2). It is in a cotton-growing and granite-quarrying country. Population, in 1890, 1349; in 1900, 1605.

CONZE, kōn'tse, ALEXANDER (1831—). A German archaeologist. He was born at Hanover, and was educated at Göttingen and Berlin. He was professor of archaeology at Halle (1863-69), Vienna (1869-77), and Berlin (1877-87). He was also director of the Berlin Museum, and in 1887 received an appointment as general secretary of the German Archaeological Institute. His writings include chiefly, in addition to some general studies, the following descriptions of travel and excavations: *Reise auf den Inseln des thrazischen Meeres* (1860); *Archäologische Untersuchungen in Samothrace* (2 vols., Vienna, 1875-80); *Beiträge zur Geschichte der griechischen Plastik* (2d ed., Halle, 1869); *Die Ergebnisse der Ausgrabungen von Pergamon* (Reports 1-3, Berlin, 1880-88).

COO'DIES, THE. A name applied to the New York Federalists who favored the War of 1812. It was derived from Abimalech Coody, the pseudonym adopted, in his communications to the press, by Gulian C. Verplanck, the leader of the faction. Consult Hammond, *The History of Political Parties in the State of New York* (4th ed., Coopers-town, 1846).

COOK, MOUNT (called by the Maoris *Ahoarangi*, cloud-breaker). A mountain in the Southern Alps, on the South Island, New Zealand. (Map: New Zealand, C 5). It has an altitude of 12,350 feet, and is regarded as the highest point of Australasia. Its top is covered with perpetual snow. The first ascent was made in 1882. Since then the mountain has been repeatedly ascended and explored.

COOK, ALBERT STANBUROUGH (1853—). An American scholar, born at Montville, N. J. He graduated in 1872 at Rutgers College, studied at the universities of Göttingen and Leipzig, and in 1879-81 was associate professor of English at the Johns Hopkins University. In 1882 he was appointed professor of English at the University of California, where he thoroughly reorganized the department, and through it indirectly influenced the instruction in English in the entire State. In 1889 he was called to the chair of English language and literature at Yale Uni-

versity. He became an editor of the *Journal of Germanic Philology*, and has published a valuable translation of Sievers' *Old English Grammar* (Boston, 1885), at once most favorably received and adopted as standard in the majority of the universities of the English-speaking world. His publications further include: *The Phonological Investigation of Old English* (1888); *The Bible and English Prose Style* (1892); *The Art of Poetry* (1892); *The Artistic Ordering of Life* (1898); and editions of Leigh Hunt's *What Is Poetry?* (1893); of books i. and ii. of *Paradise Lost* (1896); and of the *Christ of Cynewulf* (1900).

COOK, CHARLES (1787-1858). An English Wesleyan clergyman, born in London. He was appointed in 1818 to the French mission of the Methodist Church in Normandy, and it was mainly by his exertions that Methodism was established in France. He engaged in a controversy with César Malan on predestination, which led to his work *L'amour de Dieu pour tous les hommes*. Consult Cook, *Life of Charles Cook* (Paris, 1862).

COOK, CLARENCE CHATHAM (1828-1900). An American art critic and author, born in Dorchester, Mass. He graduated at Harvard in 1849, studied architecture, and spent several years in teaching. He was a contributor of articles on American art to the *New York Tribune*, from 1863 until 1869, when he was appointed Paris correspondent for the same paper, and took up his residence abroad. He remained in Paris until the outbreak of the Franco-Prussian War, when he returned to New York and resumed his former relations with the *Tribune*. Cook was one of the first American art critics, and on that subject, as well as archaeology, was an accepted authority. Besides his chief work, *The House Beautiful* (1878), he wrote *Central Park* (1869), and edited a translation of Lübke's *History of Art* (1878). From 1884 he edited *The Studio* for a number of years.

COOK, EDWARD DUTTON (1829-83). An English author and dramatic critic. He studied painting and engraving; with Leopold Lewis wrote a melodrama, *The Dove and the Serpent*, in 1867-75 was dramatic critic of the *Pall Mall Gazette*, and from 1875 of the *World*. Of his works in fiction, the best known is *The Trials of the Tredgolds* (1864).

COOK, ELIZA (1818-89). An English poet, born in London. Her first volume, entitled *Lays of a Wild Harp*, she published in 1835, and, after writing considerably for periodicals, particularly the *Weekly Dispatch*, she published *Uclala and Other Poems* (1838). In 1849-54 she edited *Eliza Cook's Journal*, much of whose contents was republished in *Jottings from My Journal* (1860). In *New Echoes and Other Poems* (1864), she was not so successful as in previous works. Her unpretentious verse, including, notably, "God Speed the Plough," "The Old Armchair," and "The Star of Glengarry," has been very popular among a wide circle of readers in both England and America. A complete edition of her poetical works appeared in the "Chandos Classics Series" (London, 1870); and they were also published in New York (1882).

COOK, FRANCIS AMES (1843—). A United States naval officer. He was born in Massachusetts, and in 1863 graduated at the United States

Naval Academy. He then served for two years as an ensign in the western Gulf blockading squadron, attained the rank of commander in 1881, was in charge of the department of seamanship at Annapolis until 1883, and was inspector of ordnance at the Boston Navy-yard from 1889 to 1893. He was subsequently assistant to Rear-Admiral Ramsay, chief of the Bureau of Navigation in Washington, and in 1896, with the rank of captain, took command of the cruiser *Brooklyn*. At the beginning of the war with Spain (1898), he joined the 'flying squadron' under Commodore Schley, and took a prominent part in the battle of Santiago (q.v.), pursuing the *Cristóbal Colon* until she ran ashore at Río Tarquino, when he went aboard to receive the surrender of her commander, Captain Moren. At the close of the war he was relieved of sea duty, at his own request, and was appointed to the United States Naval Examining Board.

COOK, FREDERICK ALBERT (1865—). An American physician and explorer, born at Callicoon Depot, N. Y. He graduated at New York University in 1890, was surgeon of the Peary Arctic expedition of 1891-92, and of the Belgian Antarctic expedition of 1897-99. In addition to numerous magazine articles, he has published *Through the First Antarctic Night* (1900).

COOK, GEORGE HAMMELL (1818-89). An American geologist, born at Hanover (Morris County), N. J. He graduated in 1839 at the Rensselaer Polytechnic Institute (Troy, N. Y.), was a professor there in 1842-46, and in 1853 became professor of chemistry and the natural sciences at Rutgers College. His chair was changed to that of chemistry, natural history, and agriculture in 1867, analytical chemistry, geology, and agriculture in 1878, and geology and agriculture in 1880. In 1864 he was appointed State Geologist of New Jersey, and in 1880 director of the New Jersey Agricultural Experiment Station (Somerville, Somerset County). In addition to annual reports and many papers in scientific periodicals, he published a *Geology of New Jersey* (1868).

COOK, Captain JAMES (1728-79). A celebrated English navigator. He was the son of a farm laborer; was born at Marton, Yorkshire; was meagrely educated at the village school, and, at twelve years of age, was apprenticed to a small shopkeeper in the fishing village of Staithes. Disagreeing with his employer, he applied to a firm of Whitby ship-owners engaged in the Newcastle, Norway, and Baltic trades, and in their service soon rose to the rank of mate. In 1755, at the outbreak of the French war, he volunteered for the Royal Navy. Showing ability, in 1759 he was given a master's warrant, and, in command of the *Mercury*, proceeded to the North American station. During a winter at Halifax he diligently applied himself to the study of mathematics and astronomical navigation. The charts and observations which he made of the coasts of Newfoundland and Labrador, published in 1776-78 and distinguished for their accuracy even to the present day, introduced him to the notice of the Royal Society, and this society intrusted him with the command of an expedition to the Pacific, to observe the transit of Venus. He left Plymouth on August 26, 1768, and, after touching at Madeira and Rio Janeiro, doubled Cape Horn and reached Tahiti on April 13, 1769,

where the transit was successfully observed, June 3. On the return voyage six months were spent in sailing around and charting the coast of New Zealand, which had not been visited by Europeans for more than a century. In a similar way the eastern coast of Australia was examined and named New South Wales. The entire separation of Australia from New Guinea was determined. After a two months' stay at Batavia, he returned by the Cape of Good Hope, and arrived in England, June 12, 1771. The important geographical results of this successful voyage won universal recognition, and two months afterwards Cook received the rank of commander and an appointment to organize a new expedition for the discovery of the imaginary *Terra Australis Incognita*. He sailed with two ships from Plymouth, July 13, 1772, and in a three years' cruise of over 20,000 leagues, encircled the Antarctic region from New Zealand to Cape Horn. This voyage proved the non-existence of any very great southern continent, and established the map of the region, with the exception of details, essentially as it exists to-day. He returned to England, July 30, 1775. Taught a lesson by a mortality of 46 per cent. in his first voyage around the world, Cook had made such excellent hygienic arrangements that only one man out of 118 died during the cruise. His detailed account of the measures and precautions adopted were read before the Royal Society, which granted him the Copley Gold Medal for his important services to humanity and to the maritime world. Promoted to the rank of captain, he received an appointment at Greenwich Hospital, but shortly afterwards he offered to command an expedition in search of a passage round North America from the Pacific. He sailed July 12, 1776, by way of the Cape of Good Hope, and spent the following year in the South Pacific. Thence he set sail for the north in January, 1778, and, after rediscovering the Sandwich Islands, reached America, and added to geographical knowledge by making an almost continuous running survey of the coast as far as Bering Strait, where, stopped by impenetrable ice, he returned to winter at the Sandwich Islands. In an endeavor to recover a stolen boat he was killed by savages at Hawaii, February 14, 1779. His death occasioned widespread regret, and the King pensioned his wife and children. An obelisk erected in 1874 marks the spot where he fell. A practical and scientific seaman, a sagacious commander, kind but strict with his crew, Cook was also distinguished by indomitable perseverance and decision. An account of Cook's first voyage appeared originally as part of Hawkesworth's *Voyages* (1773); the narrative of the second was written by Cook himself, under the title of *A Voyage Towards the South Pole and Round the World, Performed in His Majesty's Ships the Resolution and Adventure, in the years 1772, 1773, 1774, and 1775* (1777); the story of Cook's third voyage, partly written by Cook himself and partly by Captain James King, appeared in 1784. Consult: Wharton, *Captain Cook's Journal During His First Voyage Round the World* (London, 1897); Syngé, *Captain Cook's Voyages Round the World* (London, 1897); Besant, *Captain Cook* (London, 1890); Kippis, *Life of Captain James Cook* (London, 1788); *Narrative of the Voyages Round the World Performed by Captain James Cook* (2 vols., London,

1878); Russell, *Chart of the World*, *Showing the Track and Discoveries of Captain Cook* (London, 1799).

COOK, JOSEPH (1838-1901). An American lecturer and author, born at Ticonderoga, N. Y. He studied at Phillips Academy and at Yale, and graduated at Harvard in 1865. He then spent three years at Andover Theological Seminary; preached in various Congregational churches; spent two more years in study in Germany, and then settled in Boston, where in 1874 he began his 'Boston Monday Lectures,' which became very popular and which he continued until 1880, when he set out on a two years' lecturing journey round the world. In 1883 he resumed his Monday Lectures in Boston. In 1888 he founded a religious monthly called *Our Day*. He lectured on many subjects, both in Europe and in America, and had great vogue with a part of the religious public for the reason that all of his philosophical discourses were attempts to harmonize religion and science. He published: *Monday Lectures* (11 vols., 1876-88); *The Higher Levels of Arbitration* (1900); and *New Defences of the Lord's Day* (1900).

COOK, THOMAS (1808-92). An English railway excursion and tourist pioneer, born at Melbourn, Derbyshire. His energy was at first devoted to the cause of temperance, but later to the work with which his name is now inseparably connected. Beginning in 1841 with trips between Leicester and Loughborough, on the Midland Railway, the business rapidly increased in spite of many difficulties. The tourist tickets of Thomas Cook & Son have now become known all over the world. See **COOK'S EXCURSIONS**.

COOKE, GEORGE FREDERICK (1756-1811). An English tragedian, born at Westminster. He made his debut on the stage in 1776, and soon became very popular in England and Ireland. In 1810 he appeared in New York and other American cities, where his success was equally great. Although possessed of fine talents, Cooke ruined his career by intemperance, which also caused his death. His best work was in the characters of Shylock, Iago, and Richard III. Edmund Kean, who admired him as the greatest of actors, erected a monument to his memory in Saint Paul's Churchyard, New York City. Consult Dunlap, *Memoirs of Cooke* (London, 1813).

COOKE, GEORGE WILLIS (1848—). An American clergyman, editor, and author, born at Comstock, Mich. He studied at Olivet College (Mich.) and at the Meadville Theological School (Pa.); was in 1872 ordained to the Unitarian ministry, and until his retirement in 1899 held pastorates at Grand Haven, Mich.; Indianapolis, Ind.; Dedham, Mass.; Lexington, Mass.; and Dublin, N. H. In 1897 he became an editor of *The Christian Register*, and in 1900 of the *Boston Evening Transcript*. He has lectured at the Concord School of Philosophy and has published such useful critical works as *Ralph Waldo Emerson: His Life, Writings, and Philosophy* (1881); *George Eliot: A Critical Study of Her Life, Writings, and Philosophy* (1883); and *A Guide-Book to the Poetic and Dramatic Works of Robert Browning* (1891).

COOKE, HENRY (1788-1868). An Irish Presbyterian leader. He was born at Grillagh, near Maghera, County Derry, May 11, 1788; studied at Glasgow and Dublin; entered the ministry in

1808, and from 1829 was pastor in Belfast, and from 1847 professor of sacred rhetoric in Queen's College there. He played a prominent part in his denomination's affairs and was especially active and successful in combating Arianism in the Irish Presbyterian Church, and in promoting educational movements. He was an orator of a high grade, but he left no publications other than speeches and sermons. For a half-century his life was a large portion of the religious and public history of Ireland. A statue of him was erected in Belfast in 1875. For his life, consult J. L. Porter (3d ed., Belfast, 1875).

COOKE, JAY (1821-1905). An American banker and financier, born in Sandusky, Ohio, the son of Eleutheros Cooke, a pioneer Ohio lawyer and member of Congress. He was privately educated, and in 1838, entered the banking house of E. W. Clark & Co., in Philadelphia, where he developed such rare ability in banking and financial matters that he was made a junior member of the firm in 1842. In 1858 he retired from the firm, and until 1861 was engaged in financing railroad companies and negotiating their bond issues. In the latter year he established the banking house of Jay Cooke & Co., in Philadelphia. During the Civil War, as the principal financial agent of the Federal Government, he performed services of inestimable value to the nation. He negotiated the first five-twenty loan of \$513,000,000, the ten-forty loan of \$200,000,000, the seventy loan of \$830,000,000, and others, making a total of over \$2,000,000,000. He was an ardent advocate of the national banking system, and was influential in securing its success at the start. The failure of his banking house in 1873, through having advanced too largely on Northern Pacific Railroad bonds, was one of the causes of the financial crisis in that year; but the principal and interest was eventually paid on all claims, and the firm continued successfully.

COOKE, JOHN ESTEN (1830-86). An American novelist. He was born at Winchester, Va., the son of a distinguished lawyer, John Rogers Cooke, and brother of Philip Pendleton Cooke (q.v.). He studied law, but showed early a literary bent, and published several books before he was twenty-five. Among these was his best work, *The Virginia Comedians* (1854), a Colonial romance uneven in merit, yet full of a promise not destined to be realized, on account in part of the strenuous experiences its author underwent during and after the Civil War. He entered the Confederate service on Stonewall Jackson's staff, and on the death of the latter was transferred to the staff of Gen. J. E. B. Stuart. Later he was inspector-general of the horse artillery of the Army of Northern Virginia. From the close of the war until his death his pen was rarely idle. Novels dealing with military events in Virginia and biographies of the great generals under whom he had served were produced with a speed fatal to high literary art, but they did not prevent his work having distinct literary and historical value as representing the thoughts, feelings, and experiences of an active participant in the stirring events of the war and reconstruction periods. The most popular of his military novels is *Surry of Eagle's Nest* (1866), which is understood to be partly autobiographical. A complete list of his publications is not necessary, but the following may be mentioned as important: *Leather Stocking and Silk* (1854); *The*

Youth of Jefferson (1854); *Ellie, or the Human Comedy* (1855); *Henry Saint John, Gentleman* (1859), a sequel to *Virginia Comedians*; *Wearing of the Gray* (1867) and its sequel, *Mohun*; *or, the Last Days of Lee and His Paladins* (1868); *Life of Stonewall Jackson* (1863, 1876); *Life of R. E. Lee* (1871); and *Virginia: A History of the People* (1883), an excellent book contributed to the "American Commonwealths Series."

COOKE, JOSIAH PARSONS (1827-94). An American chemist, born in Boston. He graduated at Harvard in 1841, and soon afterwards was appointed to the chair of chemistry and mineralogy at Harvard College. In this capacity he stimulated the scientific study of chemistry at collegiate institutions, urging laboratory instruction, which, before his time, had not been introduced into the undergraduate course of American colleges. His publications include *Chemical Problems and Reactions* (1853); *The New Chemistry* (1871); *Religion and Chemistry* (1864); and *The Credentials of Science the Warrant of Faith* (1888).

COOKE, MORDECAI CUBITT (1825-). An English botanist, born at Horning, in Norfolk. When a boy he was apprenticed in the draper's trade, afterwards acted as clerk in a law office, and subsequently taught school. At the age of thirty-five he obtained a position in the India Museum, from which he was transferred to the Kew Botanical Gardens in 1880. His publications include more than forty botanical works, for the most part dealing with fungi, and including *Manual of Botanic Terms* (1862); *A Fern Book for Everybody* (1867); *Handbook of British Fungi* (1874); *Mycographia* (6 vols., 1879); *Illustrations of British Fungi* (8 vols., 1881); *An Introduction to the Study of Fungi* (1895).

COOKE, PHILIP PENDLETON (1816-50). An American poet, elder brother of John Estlin Cooke and first cousin of John Pendleton Kennedy, the novelist. He was born at Martinsburg, Va. He graduated at Princeton in 1834, and, like his more famous younger brother, studied law under his father, but preferred literary pursuits, and contributed many poems and stories to the *Southern Literary Messenger* and other magazines. He was equally devoted to field sports, which in part accounts for the fresh quality of his work, especially of his *Froissart Ballads* (1847), his only published book. In spite of a lyrical talent which once gained the commendation of Lowell, Cooke is little known save for his sweet lyric of sentiment "Florence Vane," which was popular and has been frequently translated.

COOKE, PHILIP SAINT GEORGE (1809-95). An American soldier, born near Leesburg, Va. He graduated at West Point and was assigned as second lieutenant of the Sixth Infantry in 1827, served for many years on the frontier, participated in the Black Hawk War of 1832, and became lieutenant of dragoons in 1833. During the Mexican War he served from October, 1846, to July, 1849, in California as lieutenant-colonel of a battalion of Missouri volunteers, and for a short time commanded a regiment in the City of Mexico. In 1847 he became major of the Second Dragoons. After 1849 he was reassigned to frontier duty, took part in several operations against the Indians, commanded the cavalry in

the Utah Expedition of 1857-58, became colonel of the Second Dragoons in 1858, and from August, 1860, to August, 1861, was in command of the Department of Utah. He was raised to the rank of brigadier-general in November, 1861, and participated as a commander of a cavalry division in the Peninsular Campaign, commanded the Baton Rouge District of the Department of the Gulf from October, 1863, to May, 1864, and from May, 1864, to March, 1866, was general superintendent of the recruiting service. At the close of the war he was brevetted major-general for 'gallant and meritorious services.' He commanded the Department of the Platte in 1866-67, the Department of the Cumberland in 1869-70, and the Department of the Lakes from 1870 until his retirement in 1873. He published *Scenes and Adventures in the Army, or Romance of Military Life* (1856); *The Conquest of New Mexico and California: An Historical and Personal Narrative* (1878); and *New Cavalry Tactics* (1884).

COOKE, ROSE TERRY (1827-92). An American poet and writer of short stories, chiefly of New England rural life, whose prominent characteristics are pathos and humor. She was born at West Hartford, Conn., and was educated at the Hartford Female Seminary. She lived chiefly at Collinsville till her marriage to R. H. Cooke in 1873, after which she lived at Winsted, Conn., till 1887, removing thence to Pittsfield, Mass., where she died in 1892. Her first published work was *Poems* (1860), which won cordial recognition. A second and complete collection of her verses was made under the same title in 1888, but the earlier pieces remain the best. Her genial talent then turned to fiction, often defective in form, but spontaneous, fresh in its humor, and keen in its perception of New England traits and character. Her volumes, except for a single novel, *Steadfast* (1889), are collections of short stories: *Happy Dodd* (1879); *Somebody's Neighbors* (1881); *Root-Bound* (1885); *The Sphinx's Children* (1886); *Huckleberries* (1891). Of individual stories she is said to have regarded *The Deacon's Week* as best. It was translated into four languages and had a very wide circulation. Others deserving of special commendation are: *Polly Mariner*; *Old Miss Dodd*; and *Freedom Wheeler's Controversy with Providence*.

COOKE, THOMAS (1703-56). An English writer, known as Hesiod Cooke. In 1725 he published a poem called *The Battle of the Poets*, in which he attacked Pope and the other wits, and was rewarded by a place in the *Dunciad* (ii. 138). He did a large amount of miscellaneous literary work and was for a time editor of the *Craftsman*. He has a deserved place in literature as the translator of Hesiod (1728) and of Terence (1734).

COOKE, SIR WILLIAM FOTHERGILL (1806-79). An English electrical engineer, born at Ealing, in Middlesex. He received his education at Durham and Edinburgh, served on the Indian staff from 1826 to 1831, and then studied medicine and the physical sciences in France and in Germany. In 1837 he entered into partnership with Wheatstone, and together with him rendered services of the highest importance to electrical engineering, especially to telegraphy. In 1838 he built the first English telegraph line, between

London and West Drayton. He was knighted in 1869.

COOKERY. The art of preparing food for the table. Foods are cooked by the application of heat, and according to the manner in which the heat is applied the principal processes of cooking are termed boiling, stewing, steaming, braising, baking, roasting (grilling or broiling), frying, and sautéing. The effect of proper cooking is to render food more wholesome and palatable than it can possibly be in the raw state.

HISTORY. Cooking, in one form or another, has been practiced since immemorial times, and the knowledge we possess of the ancient modes of cooking presents some interest in connection with the study of the customs and habits of the past. The Egyptians, it is said, were great bread-eaters. Though they possessed wheaten flour of the finest sort, they do not appear to have used it for their common bread, which was made of spelt, or of the centre of the lotus dried and pounded. Fish they salted and dried in the sun; quails, ducks, and small birds they salted and ate raw. We read of their roasting and boiling the flesh of the ox. There appears to have been considerable difference as to the manner in which good eating was appreciated in different parts of Greece. After the Homeric age of simplicity, in which roast and boiled meats seem to have sufficed the kingly table, a diversity of preparation was attained in cooking, and a certain epicureanism displayed in the quality, seasoning, and method of dressing food. The names of many authors of cookery-books are preserved in the writings of Athenæus, that of Archestratus, who is called the guide of Epicurus in his pleasures, and styled 'the inventor of made dishes,' being the most renowned.

Fish was a principal article of food with all classes of Greeks; but with the wealthier much skill and delicacy were used in cooking it, and choice and expensive varieties were sought after. Archestratus writes of "a boiled torpedo done in oil and wine, and fragrant herbs, and some thin grated cheese" (*au gratin*). Fish, stuffed with force-meat and fried, boiled in pickle, baked in fig-leaves soaked in oil, cooked in hot ashes, etc., are among the recipes that we find recorded. The Greeks boiled and roasted the flesh of sheep, pigs, lambs, and goats. They had poultry, small birds, and game, and sausage made of blood, partaking of the character of black puddings (*Blutwurst*). The bread of Athens was the most celebrated in Greece; it was sometimes home-made, but chiefly bought in the market, and prepared in great variety, as pan-loaves, rolls, sweet loaves, etc. The bread eaten by the poorer classes was made of barley, and was sometimes flavored with oil, honey, poppy-seed, etc. Athenian cheese cakes were also famous; and there were honey and sesame cakes, which, with fresh and dried fruits, as figs, almonds, olives, and nuts, seem to have been partaken of after dinner. They consumed vegetable food also in abundance, and had cabbage, onions, lettuce, and so on.

In the Greek house there was no regular cook, though in the establishments of the wealthy several women were kept to attend to the kitchen. The women in general saw to the requirements of the table, and even the mistress of the house was not idle. Cooks stood in the market in Athens, ready to be hired for particular occasions; the

most celebrated were those of Sicily; they were probably persons of some importance.

In the early days of Rome a gruel made of lentils, and called *puls*, was the principal food of the people, and with green and other vegetables was, till later times, the usual fare of the inferior classes—meat being used but sparingly. By degrees, however, a taste for better eating crept in; and after the Asiatic conquests luxury was imported. Lucullus introduced habits of epicureanism after his return from Asia; the gourmand Apicius earned for himself an enduring name. The wealthy Romans were fond of elegant service at their tables, and studied carefully the quality of the viands that were placed before them. With them, as with the Greeks, fish was a necessary as well as a luxury; they took much trouble to procure their oysters, and gave large sums for other fish. We read of a mullet of six pounds sold for 8000 sesterces (some \$400), and of the rhombus or turbot from Ravenna being held in high estimation. They seem to have been as clever as the French in preparing surprises, and in carrying out disguises in their dishes. The *pistor*, who made the bread and pastry, and the *structor*, who built up artificial figures of fruit or flesh, and who also arranged the dishes, seem to have shared the duties of the cook. We read of dainties, as ring-doves and fieldfares, hares, capons, ducks, peacocks, pheasants, and the livers of geese; also of such a formidable *pièce de résistance* as a "huge boar, surrounded with sucking pigs made in sweet paste, which were distributed among the guests." The Romans prepared and cooked their food with oil to a great extent. Their meals probably consisted of two courses and a dessert, the first course being intended to excite an appetite; the second was a joint, roasted or baked. It was a saying of Varro's that the number of persons at a repast should not be less than that of the Graces (three) nor more than that of the Muses (nine). The Greeks and Romans used honey for the purposes for which we use sugar. Cane-sugar probably was cultivated in China, and its manufacture understood there; but the Greeks took it for a kind of concrete honey, and used it only for medicinal purposes.

Of ancient British cooking nothing is known; it was probably of an extremely rude description. Hares, poultry, and fish are said to have been forbidden as food. We do not find much mention of the art of cooking in the Saxon chronicles. The Danes and Germans appear to have been great drinkers, and to have paid little attention to the preparation of their eatables. The Normans were more curious in these matters; some offices among them were held in right of the kitchen. In early English cooking much use was made of the mortar. Oil and lard were used instead of butter. Several English cook-books bear an early date, as *The Forme of Cury*, by Pegge (1390), and others date as follows: Sir J. Elliott's book (1539); Abraham Veale's (1575); and *The Widdowe's Treasure* (1625).

The cooking of France was probably of an imperfect and rude kind until the introduction of Italian tastes by the princesses of the House of the Medici. The ancient use of oil was modified through the discovery made by the French of dressing meat in its own gravy. In our own day it is universally admitted that the French cook is a true *gastronomie* artist. We may, if we

please, impute the trouble he takes with the dressing of his meat to the inferiority of the material, but this can be said of meat only; the preparation of vegetables and fruits is attended to with equal care. The great difference between French and English or American cooking consists in the fact that the French cook their meat much longer, knowing that this renders it more digestible. They are thereby enabled to multiply dishes by altering or annihilating the original taste of the meat, and making it a vehicle for foreign flavors. The variety, daintiness, and grace of form which dishes thus acquire are very admirable. In the point of economy, the French have a decided superiority over Anglo-Saxons. The French cook throws nothing away. Instead of going to the butcher for meat for stock, as the American cook does, he uses the trimmings for stock and glaze, and the skimmings of his boiled meats in many combinations wherein we use butter or lard; and like every skilled workman, he produces great results from small means.

The estimation in which the services of a cook are held may be known by the large salary attached to the office in wealthy families, hotels, and club-houses. A visit to the kitchens of one of these establishments will show what a highly important post is that of *chef de cuisine*. There must be in such a person not only the necessary knowledge of how things are to be done, but the power to arrange and direct the work of the numerous assistants, as to the exact part which each must fulfill at every moment of the long and busy day. These places indeed are excellent schools for cooks, where they can undergo that severe training without which a thorough practical knowledge of the art cannot be attained.

The art of cooking as a branch of woman's education has latterly engaged considerable attention in America; and there are in New York, Boston, Philadelphia, and other places establishments where young women receive this kind of instruction. A school of cookery has been attached to the South Kensington Museum in London, England. Efforts are also made to teach cooking to the humbler classes of girls, but much in this respect remains to be done. For any shortcomings in cooking, however, the taste of the American is in some measure accountable.

BOILING. The use of the term 'boiling' in connection with cooking meat in water is rather unfortunate, for the operation thus designated, if properly carried out, should involve hardly any boiling. The coloring matter of the blood is changed, the fibre softened, and the connective dissolved at a temperature far below the normal boiling-point of water. Boiling over-coagulates the proteids, dissolves the mineral salts, and renders the meat less valuable as a food. This is best shown in a hard-boiled egg, in comparison with one cooked below the boiling-point. In the former the albumin is rendered hard, dense, and indigestible; in the latter the albumin is soft and creamy, and is even more easily digested than when raw. While the effect of over-boiling on meat is not so apparent as in the case of an egg, the results are precisely the same. In the case of meat, however, some boiling in the beginning of the operation is necessary. As the juices of meat are rich in albumin, it is necessary to cover the meat with boiling unsalted water, boil rapidly for five minutes to coagulate the albumin on the surface, and inclose the meat

in a water-proof casing. This will prevent the escape of the juices from the interior. But after this first hard boil the kettle should be placed over a moderate fire, where the water will simmer at 180° F., twenty minutes being allowed for each pound of meat. Seasoning may be added when the meat is partly cooked, salt having the effect of drawing the juices from raw meat. These rules apply to the flesh of fish and fowl. The flesh of fish, however, is found to be firmer and more highly flavored if cooked in water containing more or less salt. Salt meats, as corned beef and ham, should be carefully washed in cold water, and soaked in cold water twelve hours before cooking. Ham will be more tender if the temperature never exceeds 165° F.

SOUP. The preceding directions do not by any means apply to making soup. In fact, directly opposite methods must there be followed in order to get the best results. Soup should contain as much as possible of the juices of meat. For this purpose, the meat should be divided into small pieces, covered with cold water, and either soaked in cold water, or slowly brought to the boiling-point, and then allowed to simmer for four or five hours until the meat falls apart. In this way the water dissolves and holds all the extractives, mineral salts and gelatin.

STEWING. Stewing, or *en casserole*, occupies a midway position between boiling and soup-making. The perfection of a stew depends upon the thorough coagulation of the outside juices and the slow process by which it is finished. The temperature should never exceed 180° F. The meat should be divided into small pieces, thrown into a kettle containing two ounces of hot suet and shaken until the outside is thoroughly coagulated; the pieces may then be gathered to one side of the kettle, a thickening of two ounces of flour added, the whole well mixed with the fat, and a pint of water or soup-stock added. The contents of the kettle are then heated to boiling and a level teaspoonful of salt, a salt-spoonful of pepper, and a teaspoonful of browning are added. Such flavorings as bay-leaf, onion, and celery are also usually added. The kettle should be closely covered and the contents cooked for one and a half hours, at a temperature of about 180° F. The meat is best softened in a rich sauce. A *ragout* is nothing but a highly seasoned stew. Stewing is a very economical method of cooking; there is no waste, all escaped juices are held in the sauce, all the nourishment is secured, and if the dish is well cooked and not too greasy or over-seasoned, the meat is tender and easy of digestion.

STEAMING. Steamed foods as a rule are more highly flavored than those boiled, for the reason that in steaming the soluble constituents are not so easily lost as in 'boiling.' The operation of steaming may be carried out in a modern 'steam cooker,' or in a perforated kettle that fits closely over another kettle containing boiling water. If the steam is under pressure, the temperature may be much higher than that of boiling water, and hence the method may be used for sterilizing canned foods; in large establishments the method is also used for the 'baking' of meats. Ordinary home steaming is an excellent method of cooking vegetables, hams, fruit cakes, puddings, and other dishes that require the prolonged application of moist heat. Such vegetables as potatoes, rice, young peas, corn, squash, cucumbers,

pumpkin, and spinach are better steamed than boiled. On the other hand, meats are generally better 'boiled' than steamed. In an ordinary double boiler, which may be used in making eustards and in cooking cereals, the food is obviously neither steamed nor 'boiled,' the heat being a dry heat; the double boiler serves to maintain a constant temperature several degrees below the boiling-point of water.

BRAISING. The operation of braising is intermediate between 'boiling' and baking. The meat is partially browned and cooked in a moist heat. To do this perfectly one must have a well-fitting lid to cover the baking-pan or a so-called roasting-pan, a braising-pot being preferable. The meat should be placed in the pot or pan and partly covered with hot stock or water; seasoning, such as bay-leaf, onion, and celery-seed, should be added, and the pan closely covered. The cooking should be done in a hot oven, fifteen minutes being allowed for each pound of meat, and salt being added when the meat is partly done. A half-hour before serving, the top cover should be removed, and the stock reduced so that it may be served as a sauce. Braising is an economical process of cooking, the constituents lost by the meat being contained almost entirely in the gravy. The process is best adapted to the so-called inferior pieces, as leg of mutton, the upper or under round, and the fleshy part of the shoulder. Braising-pans are frequently sold under the name of 'self-basting' pans.

ROASTING (Grilling, Broiling). Of the several methods of cooking meats, roasting best preserves their juices and develops their flavor. The operation of roasting may be carried out in a metallic vessel ('the roaster,' tin oven, or 'tin kitchen'), fitted up in front of a bright fire, one side of the meat being thus directly exposed to the heat; or else, the meat may be cooked on a revolving spit. The terms broiling, grilling, and roasting denote the same operation; the first two are used to designate the process when applied to steaks or smaller pieces of meat; the term roasting is used in the case of a joint. In this country the process of baking beef has almost entirely replaced that of roasting. In roasting, the meat loses, especially if the joint be a fat one, more weight (fat and water) than in boiling or baking, but is incomparably finer in flavor.

In broiling a steak, the meat should first be placed near a clear, hot fire and turned when one side is seared. When the other side, too, is moderately seared, the steak should be placed at a greater distance from the fire and the cooking thus continued at a lower temperature, five minutes being allowed for a steak one inch thick, ten minutes for a steak one and a half inches thick, and twenty minutes for a steak two inches thick. Seasoning may be added after the steak has been cooked.

BAKING. The process of cooking meat in the dry heat of an oven is properly termed baking. The oven of a stove generally receives its heat from the fire-box, although in very large establishments it is heated by steam under pressure. No matter how great the surrounding heat, a thermometer plunged into the centre of the joint will register scarcely 200° F., the meat being thus cooked in its own juice at a gentle heat. To avoid the considerable waste of fuel which may be involved by it, the process should be ear-

ried out in an apparatus carefully lined and thus rendered capable of holding nearly all the heat produced by a small flame, as the 'Soyer cooker,' Aladdin oven, or Goodrich oven. The heat from an ordinary oil lamp under such an apparatus will bake a piece of meat quickly, thoroughly, and at a minimum cost. The 'feather' oven, an ordinary box entirely surrounded by a thick layer of feather, is still used in many country places, meats and vegetables (such as old beans, peas, lentils) being placed in the feather oven after being heated to boiling, and thus cooked for several hours at a constant temperature slightly below the boiling-point of water.

In baking, a number of mechanical and chemical changes take place. More or less water is driven off, so that the baked foods are, generally speaking, drier than before cooking; heat and the moisture present in foods rupture cell-walls. In this way and by the coagulation of proteids, and possibly also in other ways, the texture and consistency of food are changed. The chemical changes are of the following character: Proteids are coagulated; fats are more or less volatilized and broken down into simpler chemical bodies; and carbohydrates, especially on the surface of foods, are to a greater or less extent caramelized.

FRYING. Frying is cooking by immersion in hot fat at a temperature from 350° to 380° F. The upper limit of temperature answers in the case of croquettes or ceils that are covered with beaten egg; the gentler heat is best adapted to such delicate articles as batters, fritters, crullers, bouchees, and potato or rice croquettes. If the temperature of 380° is not exceeded, the fat does not boil, nor does it smoke, i.e. decompose. It is perhaps chiefly on account of overheating fat that fried foods are but too often unsightly and indigestible. The temperature cannot, of course, be properly regulated without the use of a thermometer. The following test, however, may serve to indicate that the proper frying temperature is nearly reached: a crumb of bread dropped into hot fat will turn brown in ten seconds if the temperature has reached 340° F. The frying-pan should be deep enough to permit of covering the cooking article completely. The high temperature of the fat will then cause the formation, on the surface of the article, of a complete covering, through which neither grease can enter nor juice escape. Without this impermeable covering, the outside of the fried article will be greasy and the inside flavored with the frying material, while if properly fried, the article should be as free from fat as if it had been cooked in water. After removing the article from the hot fat, it should be drained on brown paper, to remove all traces of fat. Croquettes and other made dishes should be covered with beaten egg and rolled in dry bread crumbs before frying. The albumin of the egg will coagulate as soon as it comes in contact with the hot fat and thus make a perfect grease-proof covering. As to the frying material, oil, either olive or cotton-seed, is probably the best form of fat. A mixture of oil and suet is also very good. Further, while neither suet nor lard is suitable to be used isolated, a mixture of the two is found to be well adapted for frying. Butter is unfit for frying, because it decomposes at

too low a temperature. Nor should butter be cooked in making sauces.

SAUTÉING. Unlike frying, sautéing is cooking with fat in a shallow pan.

VEGETABLES. Vegetables not only form indispensable foods by themselves, but also serve to season and impart flavor to soups and made dishes. Potatoes, when served, should be dry and mealy; they should be cooked in water, which should be kept continuously boiling until the vegetable is perfectly tender, and then the water should be drawn off, and the potatoes dusted with salt to absorb some of their moisture. A second baking of potatoes (stuffed potatoes) has the effect of making them more easily digestible. Green vegetables should go over the fire in boiling salted water, the salt in the solution preventing them from absorbing too much water. Old peas, beans, and lentils, however, should be cooked in unsalted water. To preserve the color and prevent the odor of vegetables from spreading through the house, an abundance of water in uncovered vessels should be used in cooking them.

CHAFING-DISHES. These are small utensils made of tin, copper, nickel, or silver, arranged in a frame and heated by alcohol lamps. The better forms are supplied with an under hot-water pan and are very useful for cooking milk or cream dishes that might be easily overheated if cooked directly over a flame. Formerly, a chafing-dish was a shallow saucepan used over a small portable charcoal furnace, principally for keeping things hot. At present such light dishes as melted cheese, Welsh rabbit, creamed chicken, sweetbreads, lobster à la Newburg, oysters, and eggs, are often prepared at the table in a chafing-dish. Venison, breasts of birds, tenderloin of beef, and mushrooms are easily cooked at the table and much better served, directly from a hot dish. Cold boiled potatoes, peas, and string beans are easily warmed in cream sauce made in the chafing-dish.

COOK INLET. A bay of the Pacific Ocean, indenting the Sitka District, Alaska, and cutting off the Kenai Peninsula on the east (Map: Alaska, E 3). It is included between latitudes 59° and 61° 20' N., and longitudes 149° and 154° W. In shape long, relatively narrow, and crooked, its length is about 200 miles and its greatest breadth 60 miles. Sudden storms and the high tidal rise make navigation very dangerous. It contains several islands, Augustine Island, with its extinct volcano, being the largest. The coast scenery is grand, comprising active volcanoes, of which Mount Hiamna, 12,066 feet altitude, is the highest, snow-clad mountains, glaciers, and green hills. At its northern extremity are the Knik Inlet and the Turnagain Arm branching to the northeast and east. It

was explored in 1778 by the navigator whose name it bears, in the hope of finding a passage to the Arctic Sea. It receives the waters from a number of rivers, chief of which is the Su-shitna River, coming from the north. Coal is found on its shores, along which are a number of small towns.

COOK or HERVEY ISLANDS. An archipelago of small islands in the Pacific consisting of six larger and a number of smaller islands and reefs, extending from about latitude 18° to 22° S. and from longitude 157° to 163° W. (Map: World, West. Hem., M 4). The total area is 142 square miles. Raratonga, with an area of 31 square miles, is the largest island. The soil is generally fertile, but water is scarce and milk of the cocoa-palm is used as a substitute on some of the islands. The chief products are copra, coffee, and oranges, and the trade is mostly with New Zealand, to which the group has been annexed since 1900. Population, 8400, entirely consisting of Polynesians mostly converted to Christianity. The group was discovered by Cook in 1773.

COOK'S EXCURSIONS. A system of travel originated by Thomas Cook in 1841, by which companies of tourists are conducted by a manager or guide, who makes all the traveling arrangements and directs the disposition of the time. These tours, for which reduced rates are obtained, are very popular with inexperienced travelers, and cover Europe, America, and parts of Asia and Africa.

COOK'S TALE, THE. One of the stories forming Chaucer's *Canterbury Tales*. It is told in the pilgrimage by Roger of Ware, and is the story of a London apprentice, Perkin Revelour. The "Tale of Gamelyn," once supposed to be a part of the "Cook's Tale," is now rejected by critics.

COOK STRAIT. A passage which separates North Island and South Island, New Zealand (Map: New Zealand, E 4). Its greatest width is 80 miles. It was discovered by Captain Cook on his first voyage in 1769.

COOK TOWN. A seaport of North Queensland, Australia, on the Endeavor River, 122 miles northwest of the Palmer gold-field, with which it is connected by rail (Map: Queensland, D 3). Sugar-cane is cultivated in the neighborhood, gold and tin mines are worked, and pearl and sea-slug fisheries are carried on. The port formed by the estuary of the Endeavor River is accessible to ships of 18 feet draught. Municipal enterprise is evinced in the erection of fine public buildings. The town, founded in 1873, was named after Captain Cook, who, in 1770, beached his ship, the *Endeavor*, at this place. A monument was erected to him here in 1899. Population, in 1901, 1936.

COOLEY, LE ROY CLARK (1833—). An American chemist. He was born at Point Peninsula, in Jefferson County, New York, graduated at Union College in 1858, and from 1860 to 1874 was professor of natural sciences in the New York State Normal School. In 1874 he became professor of physics and chemistry in Vassar College. His chair was made that of physics only in 1894. He is the author of several textbooks on chemistry and physics which are highly esteemed among modern educators. These in-

clude *The New Text-Book of Physics* (1880); *The New Text-Book of Chemistry* (1881); and *The Student's Manual of Physics* (1897).

COOLEY, THOMAS MCINTYRE (1824-98). An American jurist and writer on constitutional law. He was born in Attica, N. Y., but removed to Michigan in 1843, and in 1846 was admitted to the bar. He compiled the general statutes of the State, was reporter for the Supreme Court (1858-64), and published eight volumes of reports and a digest of the Michigan decisions. He was professor in the law department of the University of Michigan and dean of the faculty in 1859. In 1861 he became professor of constitutional and administrative law in the school of political science in the university, and also dean, and later occupied the chair of American history in the academic department. From 1864 to 1885 he was a justice of the State Supreme Court, and was Chief Justice from 1868 to 1869. In 1887 he became chairman of the Interstate Commerce Commission, but resigned four years later. Judge Cooley's publications on constitutional law, which are authoritative, are: *The Constitutional Limitations which Rest upon the Legislative Power of the States of the American Union* (1868); *Story's Commentaries on the Constitution of the United States, with Additional Commentaries on the New Amendments* (1873); and *General Principles of Constitutional Law in the United States* (1880).

COOLGARDIE. A mining town in western Australia, 350 miles east-northeast of Perth, with which it is connected by rail and telegraph (Map: Australia, C 5). Gold, discovered here in 1891, has given rich yields since 1893. Population, in 1901, 4213.

COOLIDGE, SUSAN. The pen-name of Miss Sarah Channey Woolsey.

COOLIDGE, THOMAS JEFFERSON (1831—). An American manufacturer and diplomat. He was born in Boston, Mass., and was educated at Harvard and in Europe. In 1892 he was sent as United States Minister to France, but was superseded by James B. Eustis in 1893. He was appointed member of the Joint High Commission to adjust disputes between the United States and Canada.

COOLIE (Beng. *kūli*, Hind. *qūli*, laborer, from Tamil *kūli*, daily hire). A name applied to an unskilled laborer in India and Eastern Asia and to contract emigrant laborers sent from India and China to other countries, especially to the West Indies. In tropical countries where white labor is impossible, there arose with the abolition of slavery a need for cheap labor capable of doing the heavy tasks of plantations, factories, and shipping. For this purpose the acclimated cheap labor of the overpopulated Asiatic countries seemed especially adapted. The coolie trade began about 1834. It was accompanied by abuses which made it little better than a form of slavery, and Great Britain, which had been largely interested in the trade, undertook to put a stop to it in 1855. This threw it largely into the hands of the Portuguese. The coolie trade from Macao to Cuba and Peru was little better than the slave trade so far as its conditions were concerned. The traffic was regulated by the convention of 1866 between China, France, and Great Britain. The requirement by China of a return passage at the end of five years

practically stopped the trade with the West Indies. The number of coolies in British Guiana in 1871 was estimated at 50,000. The advantages and evils of the coolie trade were made the subject of numerous reports, and protective enactments were passed by the Chinese, British, and French governments. Under the Indian Emigration Act of 1883, emigration under contract is allowed only to certain colonies, where good treatment is assured. These are the British colonies of British Guiana, Jamaica, Mauritius, Trinidad, Saint Lucia, Saint Kitts, Saint Vincent, Grenada, Natal, and Fiji, and the French Guadeloupe and Martinique, as well as Dutch Guiana and the Danish Saint Croix.

Besides what may be called the *legitimate* traffic in Chinese coolies (stopped at present), an infamous counterfeits was long carried on at Macao (q.v.). Native crimps brought thousands of their countrymen to that Portuguese island, and shipped them for Cuba and Peru. This 'involuntary emigration,' as it has been called, began in 1848, and as many as 13,000 persons were shipped in the course of a year; but as in reality it was nothing more than an elaborate system of kidnapping, the Chinese and British governments, in 1872, prohibited any vessel suspected of being engaged in this trade from fitting out in any Chinese or British port, and the 'trade' was practically destroyed in consequence. At the close of 1873 the Portuguese Government formally declared the 'exportation' of coolies illegal, and the atrocious traffic may now be considered at an end. Consult, in addition to numerous British and French official papers and reports, Jenkins, *The Coolie: His Rights and Wrongs* (London, 1871); Hope, *In Quest of Coolies* (London, 1872).

COOMANS, kō'māns, *Fr. pron. kō'mān'*, PIERRE OLIVIER JOSEPH (1816-90). A Belgian painter. He was born at Brussels and was the pupil of de Keyser and Wappers at Antwerp. He afterwards accompanied the French troops on their expeditions in Algeria, traveled for several years in Italy, Greece, Turkey, and the Crimea, and on a second visit to Italy in 1857 was so strongly influenced by the Pompeian paintings as to confine his art thereafter mainly to antique subjects. His noteworthy pictures are: "Conquest of Jerusalem by the Crusaders" (1841); "The Battle of Ascalon" (1842); "The Deluge"; "Emigration of Arab Tribes"; "Algerian Dancing Girls"; "The Battle of the Alma" (1855); "Feast of the Philistines" (1856); "Last Days of Happiness of Pompeii" (1863); "Phryne"; "Glycera," and "Lucretia."

COOMASSIE. See KUMASSI.

COON OYSTER. An oyster growing wild near shore, where it can easily be obtained by a raccoon. The name originated in the southern United States, where these oysters are often called 'strap-oysters,' because their clustered manner of growth makes them long, narrow, and thin.

COONS. A popular name for members of the Whig party in 1838-45, when the raccoon formed the emblem of the party.

COON'TIE. See ZAMIA.

COOPER, kōōp'ēr or kup'ēr, ANTHONY ASHLEY. See SHAFTESBURY.

COOPER, Sir ASTLEY PASTON (1768-1841). A celebrated English surgeon, born in Norfolk.

In 1784 he began the study of surgery in London under Mr. Cline, and in 1789 was appointed demonstrator of anatomy at Saint Thomas's Hospital. In 1793 he was appointed professor of anatomy at Surgeons' Hall; and in 1800, surgeon to Guy's Hospital. In 1813 he received the professorship of comparative anatomy in the College of Surgeons. An essay on the effects resulting from the destruction of the *membrana tympani* gained him, in 1802, the Copley Medal of the Royal Society, of which he was elected a fellow three years afterwards. In 1804-07 appeared his great work on *Hernia*. His other works include: *The Principles and Practice of Surgery* (1836-37); *On Dislocations and Fractures* (1822); *Anatomy and Diseases of the Breast* (1829-40); *Anatomy of the Thyroid Gland* (1832). He was the first to attempt the tying of the carotid artery—an attempt which, though unsuccessful in his hands, has since proved effectual in the hands of other practitioners. In 1817 he tried what was considered the boldest experiment ever attempted in surgery—the tying of the aorta—which did not prove successful. Consult Cooper, *Life of Sir Astley P. Cooper* (London, 1843).

COOPER, EMMA LAMPERT. An American artist, born at Nunda, N. Y. She studied at the Cooper Union and the Art Students' League, New York, and traveled abroad. Her picture in water color, "The Bread-Winner," was awarded a medal at the World's Columbian Exposition at Chicago in 1893. Her works include: "Picardy Hillside" (1897); "Through the Meadows" (1900); and "Behind the Dunes" (1895).

COOPER, GEORGE HENRY (1821-91). An American naval officer, born in Fort Diamond, New York Harbor. He was appointed a midshipman in the United States Navy in 1837, and in 1838-42 was attached to the *Constitution*, of the Pacific Squadron. From 1847 to 1861 he was stationed successively on board the receiving-ship at Norfolk, Va., at the naval station there, on board the *Susquehanna* of the East Indian Squadron, again at Norfolk on board the *Roanoke* of the Home Squadron, and at the Portsmouth Navy-yard. Promoted in 1862 to be commander, he was in charge of several vessels during the Civil War, notably of the monitor *Saugamon*, which for seven weeks in 1863 was constantly employed in shelling Fort Sumter and Sullivan's Island. In 1867-69 he commanded the Norfolk Navy-yard, in 1874-78 that at Pensacola, Fla., and in 1880-82 that at Brooklyn, N. Y. From 1882 until his retirement in 1884 he commanded the North Atlantic Squadron, with the flagship *Tennessee* and headquarters at New York. His further promotions were—in 1867 to be captain, in 1874 commodore, and in 1881 rear-admiral.

COOPER, HENRY ERNEST (1857—). An American statesman, born at New Albany, Ind. He graduated at the Boston University Law School in 1878, and subsequently became established at Honolulu. Upon the outbreak of the Hawaiian Revolution he was appointed chairman of the Committee of Safety, and three days later (January 17, 1893) publicly read the proclamation abolishing the monarchy. He was active in the organization of the Provisional Government, and was subsequently appointed Minister of Foreign Affairs (1895-99), Minister of Public Instruction (1896-99), acting President of the Republic of Hawaii (January 9 to March, 1898), and Attor-

ney-General (1899-1900). He also served as Minister of the departments of the Interior and of Finance.

COOPER, JACOB (1830—). An American clergyman and author. He was born in Butler County, Ohio, and was educated at Yale University, at Berlin, and at the Theological Seminary in Edinburgh. He was professor of Greek at Centre College, Kentucky, from 1856 to 1866; professor of Greek at Rutgers College from 1866 to 1883; and professor of ethics and metaphysics at the University of Michigan, from 1883 to 1884. In 1893 he became professor of philosophy and logic at Rutgers College. His publications include: *Creation, a Transference of Power* (1900); and *The Passage from Mind to Matter* (1901).

COOPER, JAMES (1810-63). An American statesman and soldier, born in Frederick County, Md. He graduated in 1832 at Washington College (Pa.), studied law in the office of Thaddeus Stevens at Gettysburg, Pa., and, upon his admission to the bar in 1834, began practice in that place. In 1839-43 he was a Whig member of the Federal House of Representatives, in 1843-48 of the Pennsylvania Legislature, of which he was Speaker in 1847, and in 1848 was elected State Attorney-General. From 1849 to 1855 he was United States Senator. Upon the outbreak of the Civil War he organized the Maryland volunteers, and in 1861 was appointed a brigadier-general in the volunteer army. He was subsequently assigned to the command of Camp Chase, Columbus, Ohio, where he was stationed until his death.

COOPER, JAMES FENIMORE (1789-1851). An American novelist, born at Burlington, N. J., September 15, 1789. His father came of good English and Quaker stock; his mother, Elizabeth Fenimore, was a Swede and also of Quaker ancestry. He was the eleventh of twelve children, and in his second year was taken by his father, William, to a large estate that he had acquired near Otsego Lake shortly after the Revolution. Here had been already laid out the site of Cooperstown. For some years the family lived in a log house, but the settlement prospered, and, determining to make it his home permanently, Cooper's father, who for many years represented the district in Congress, began in the year 1796 to build a manor house, Otsego Hall, which was for many years the finest residence in that region. That Cooper thus spent his boyhood years on the frontier of civilization, surrounded by primeval forests, and never far removed from the possibility of Indian raids, while in daily contact with the red men who came to Cooperstown for trade, was most important to his future literary development. The environment stimulated his imagination, made him responsive to the sense of mystery, and gave him materials for the most important section of his writings, the *Leatherstocking Tales*. He passed through the village school and received private instruction in the family of the Rev. Mr. Ellison, rector of Saint Peter's, Albany, whose refined culture and un-American ideals had a not altogether desirable effect on the style and character of the future novelist, who was something of an aristocrat at heart. In January, 1803, Cooper went to Yale College. Here he learned more out of doors than in the classroom. Indeed, he neglected his studies with such persistent defiance of academic restraints that he was expelled in his third year.

His father resented the action of the faculty, but readers may be glad that the future novelist of the sea should have been led to choose a naval career. To fit himself for this, there being no Naval Academy at that time, Cooper entered the merchant service as a sailor before the mast (September, 1806), and after sixteen months' experience on the sea, in London, and at Gibraltar, received a midshipman's commission (January 1, 1808). He served for a time on the *Vesuvius*, then with a construction party on Lake Ontario, where he saw a new aspect of frontier life and became familiar with the details of ship-building. He saw also other forms of naval service before his resignation in 1811. Meantime he had been married (January 1, 1811) to a daughter of John Peter DeLancey, who came of a conspicuous Tory family. The marriage was happy, but Cooper's resignation on the eve of the War of 1812 did not escape criticism, for a Tory connection seemed to imply lack of patriotism. For the next ten years he lived chiefly in Westchester County, his wife's home, devoting himself to farming and becoming the father of six children before he conceived the idea of authorship. As it was, he began to write, less in emulation of the success of others than through conviction of their failure. He had been reading an English novel aloud, when he suddenly said to his wife, "I believe I could write a better story myself," and proceeded to try it. But *Precaution* (1820), dealing with high life in England, about which Cooper knew nothing, was naturally a failure, and wholly uncharacteristic of his future work. Then when advised to deal with more local themes, he remembered a story that John Jay had told years before about a spy, and his home in Westchester, the scene of much fighting during the Revolution, furnished a fit stage for the play of his fancy. The result was *The Spy* (1821-22), which achieved a success till then unapproached in America, and determined its author to pursue his new-found career. It proved to a very self-conscious generation that it was not impossible for America to produce a novelist almost worthy of being ranked with the great author of *Warley*. Even to-day it remains a stirring narrative that deals adequately with important events, and in Harvey Birch, the Spy, it has added to our national fiction one of its few imperishable characters.

In 1823 Cooper began what is now known as the Leather-stocking Series with *The Pioneers*, for he did not compose the famous five romances in their natural chronological order. Early in the next year he published *The Pilot*, thus practically for the first time joining the ocean to the domain of fiction, just as he had previously added the backwoods, and as he was soon to add the prairie. He also added to Harvey Birch and Natty Bumppo his third great character, Long Tom Coffin. He now removed to New York City, and shortly after had a serious illness. His next novel was *Lionel Lincoln* (1825), a story of Boston during the Revolution. This was not specially successful, but in 1826 *The Last of the Mohicans* placed him at the summit of his popularity and probably represented his highest achievement.

In 1826 he changed his name, in compliance with the wishes of his grandmother, from simple James Cooper to James Fenimore-Cooper, but soon dropped the hyphen. He

could not so easily get rid of the misapprehensions caused by his act in a crude society. Immediately afterwards he went abroad and resided there for seven years, during which time he was the recipient in foreign capitals of many attentions from distinguished people, but felt called upon, as in *The Bravo* (1831), to proclaim vigorously the beneficent greatness of republican institutions. His pride in the better features of American government and society did not, however, prevent him from being one of the first Americans to perceive how really crude his fellow-citizens were, and he told them their faults with a frankness that was not discreet. He exploited his prejudices against New England and in favor of the Episcopal Church, and soon became in his native land a synonym of all that was unpopular and snobbish. His honest, if over-emphatic, strictures outweighed with his comically sensitive critics such fine romances as *The Prairie* (1827), *The Red Rover* (1828—the dates of Cooper's books are often hard to determine exactly), and the less interesting, but creditable, *Water Witch* (1830). But the fault was not entirely on the side of his countrymen, for he took an injudicious part in more or less unnecessary foreign discussions of American political affairs.

On his return to America, in 1833, he at first spent his winters in New York City, but soon took up his permanent abode at Cooperstown. Here he published several volumes of travels, and still not restraining himself from criticism of his countrymen, especially in his story, *Home as Found* (1838), he was again embroiled in bitter controversy and exposed to almost incomprehensible vituperation, which was increased through the fact that in 1837 a dispute had arisen with regard to the claims of his townspeople upon a certain tract of the Cooper estate. The great author's determination to enforce his plain rights was distorted by the newspapers into a heinous crime. And, ironically enough, just at that time this proud aristocrat was being denounced in England for his obtrusive republicanism. But Cooper still plied his pen and produced his *History of the Navy of the United States* (1839), his *Pathfinder* (1840), his *Deerslayer* (1841), *The Two Admirals* (1842), and *Wing-and-Wing* (1842). For the admirable English and Mediterranean setting of the last two stories he was as much indebted to his European stay as he was to his return to the home of his boyhood for his equally admirable setting of the two novels preceding. Mention should be made here of an 'anti-rent series' of novels, dealing with the well-known demagogic agitation against the proprietors of certain large estates in New York. These were *Satanstoe*, *The Chain-Bearer*, and *The Redskins* (1845-46). The first of them contains one of the best pictures that we have of life in colonial New York.

Yet, while Cooper was thus composing novels which have been translated into many languages, and have gained him an undying reputation abroad, especially in France, he was bringing libel suits against many of the Whig editors of his native State, among them Horace Greeley, Thurlow Weed, and James Watson Webb. He was Quixotic enough to conduct these suits himself, and he proved able to win verdicts which finally brought his critics to their senses, although they did little to restore his popularity. A later gen-

eration smiles wonderingly at the whole matter, but sympathizes with the pugnacious author. The last few years of Cooper's life saw the publication of enough novels to occupy an ordinary lifetime, but they added little to his reputation. He maintained his proud independence to the last, and just before his death forbade his family to give any biographer access to his papers, an injunction which has been obeyed, but which has not prevented the life written by Prof. T. R. Lounsbury (q.v.) in the "American Men of Letters Series" (Boston, 1885) from being an admirable piece of work. Cooper died at Cooperstown, N. Y., September 14, 1851. Six months after his death a public meeting in New York, addressed by Daniel Webster and William Cullen Bryant did something to atone for the evil treatment America had accorded one of the very greatest of her writers.

But even after the lapse of half a century, it can hardly be said that Americans are prepared to do full justice to Cooper. His great romances are frequently spoken of as if they were, in the main, fit reading for boys only. His undoubted defects, such as his careless style, his exploitation of his prejudices, his stilted conversations, his inability, as a rule, to draw women who were not distressingly prim, the fact that he wrote entirely too many novels, and that not a few of his men are as wooden as his women—these grave faults have been put forward, while his greater merits have been kept in the background. For, when at his best, as in nearly all the romances named above, Cooper was a very great novelist. He had the narrative faculty of carrying his readers along, however much they might grumble at this detail or that. In "Leatherstocking" he added a character to the small gallery of the world's fictitious personages—something no other American has ever done, except Mrs. Stowe—and in Harvey Birch, Long Tom Coffin, and other sailors, as well as in Uncas, Chingachgook, and other Indians, he created characters of undying power. His Indians, at whom it was once the fashion to sneer, as the creations of a romantic fancy, are now said by ethnologists to be far from overdrawn portraits. He was, as we have seen, practically the first writer to extend the domain of fiction over the sea, the primeval forest, and the prairie. If he was in a way a follower of a still greater romancer, Scott, he won the enthusiastic commendation of another great writer of fiction, Balzac, and he has the unique credit of having written a prose epic of the planting of his native country, which is as spacious and free as the virgin woods and lakes amid which its scenes are laid. In other words, Cooper is a large genius, who ranks well with his fellow-romancers. It is almost absurd to judge one of Cooper's rapidly written romances by the canons one might legitimately apply to a short story by Daudet or Maupassant. When the man is judged in the large by the effects of his best works, and when he is compared with his rivals like Simms and Bird, and with his predecessor, Brockden Brown, his full genius and the service he did American literature emerge splendidly. For carrying power his work has probably had no equal in America; with fewer crying faults he would in all likelihood have been our greatest author.

A full bibliography of Cooper is not needed here, but to the works already named may be added: *The Wept of Wish-ton-Wish* (1829); *The*

Heidenmauer (1832); *The Headsman* (1833); *Sketches of Switzerland* (1835); *The American Democrat* (1838); *The Chronicles of Cooperstown* (1838); *Homeward Bound* (1838); *Mercedes of Castile* (1840); *Wyandotte* (1843); *Ned Myers* (1843); *Afloat and Ashore* (1844); *The Crater* (1847); *Jack Tier* (1848); *Oak Openings* (1848); *The Sea-Lions* (1849); and *The Ways of the Hour* (1850); Lounsbury's *Life*, already mentioned, contains a good bibliography and the best criticism that has yet been devoted to Cooper. Consult, also: Clymer, *James Fenimore Cooper* (1901); Richardson, *American Literature*, vol. ii. (New York, 1887-88); Wendell, *A Literary History of America* (New York, 1900); and essays by Mark Twain, T. W. Higginson, and Brander Matthews.

COOPER, MYLES (1737-85). An English clergyman, scholar, and educator, second president (1763-76) of King's College (now Columbia University). He was educated at Queen's College, Oxford (M.A. 1760), was appointed a fellow of that college, and in 1762, on the recommendation of the Archbishop of Canterbury, came to America as fellow of King's College, professor of moral philosophy, and assistant to President Samuel Johnson. In 1763 he succeeded Dr. Johnson in the presidency. He strengthened the curriculum, and to the academic department and divinity school already existing added a medical school, which was organized in 1768, and in 1769 conferred the first medical degrees bestowed in America. In 1771 he visited England on behalf of the college. A true Oxonian, a high-churchman, and a Tory, he supported the cause of King George against the Colonies, and by such vehement pamphlets as *A Friendly Address to All Reasonable Americans on the Subject of our Late Political Confusion* and *What Think ye of Congress Now?* made himself cordially detested. On May 10, 1775, he escaped from a mob attack upon the college, and the next day took passage for England. He there received the livings of Sulhamsted-Abbots and Cowley, and afterwards became senior minister of the English chapel at Edinburgh. Among those trained under him were Gouverneur Morris, Robert R. Livingston, John Jay, and Alexander Hamilton. He was perhaps the finest classical scholar in eighteenth-century America.

COOPER, PETER (1791-1883). An American inventor, manufacturer, and philanthropist, born in New York City. He assisted his father in his successive occupations of hatter, brewer, and brick-maker; gained such education as his limited means allowed, and from 1808 to 1812 was apprenticed to a carriage-builder. He invented a machine for shearing cloth, which was used during the War of 1812-15; then manufactured cabinet-ware; was for a time a grocer, and finally established a glue and isinglass factory on Long Island, continuing the business for more than fifty years and acquiring great wealth. In 1828 he built large iron-works in Baltimore, and afterwards a rolling and wire mill in New York, and blast-furnaces in Pennsylvania. In 1830 he designed and built the first American locomotive engine, a rude little contrivance, which he exhibited on the Baltimore and Ohio Railroad, and about 1845 made at Trenton the first rolled-iron beams for building purposes. He was among the earliest to promote the laying of the Atlantic cable, and for

eighteen years was president of the New York, Newfoundland, and London Telegraph Company. He invented a method of propelling canal-boats by an endless chain, which, while not adopted at the time, was used later on the Delaware and Raritan Canal. Mr. Cooper served in both branches of the New York Common Council and as a trustee in the Public School Society, an organization formed to advance the cause of public education. Upon the union of that body with the Board of Education he became a school commissioner. In 1876 he received the Independent nomination for President. Peter Cooper engaged in many forms of mercantile life and was successful in all. In gratitude for his success and wishing to afford others opportunities which he himself had never enjoyed, he established in 1853 the 'Cooper Union' (q.v.) in New York City. Consult Carter, "Life of Peter Cooper," in *Century Magazine* (New York, 1883-84).

COOPER, SUSAN FENIMORE (1813-94). An American author, born at Scarsdale, N. Y. She was the daughter of James Fenimore Cooper, the famous American novelist. Her chief publications include: *Rural Hours* (1850), a year's journal of country scenes; *Rhyme and Reason of Country Life* (1854), a volume of selections; and *Mount Vernon to the Children of America* (1858).

COOPER, THOMAS (1759-1840). A British-American scientist, political economist, educator, and publicist, conspicuous for his versatility and his radicalism in politics. He was born in London, studied for a time at Oxford, and was admitted to the bar. In 1792 he spent four months in Paris and while there acted with James Watt, the famous inventor, as a delegate from the Manchester Constitutional Society to the Patriotic Societies of France. For this both he and Watt were warmly criticised at home, especially by Edmund Burke, who took them to task in a somewhat intemperate speech before Parliament. To this speech Cooper replied in a caustic pamphlet entitled *A Reply to Mr. Burke's Inveictive Against Mr. Cooper and Mr. Watt* (1792), the circulation of which in a cheap edition designed to reach the lower classes was prohibited by the British Government. After an unsuccessful attempt, as a bleacher and calico-printer, to apply a secret process learned in France for preparing chlorine from sea-salt, he emigrated to America in 1795, and for a short time practiced law in Northumberland County, Pa. He soon began to take an active part in support of the Anti-Federalists in current political discussions, and for a violent attack upon President John Adams in the Reading *Advertiser* of October 26, 1799, was tried under the Sedition Law (see ALIEN AND SEDITION ACTS), was convicted of libel, and, besides being fined \$400, was sentenced to six months' imprisonment. He was appointed a land commissioner for the State of Pennsylvania in 1806, and subsequently acted as president judge of a common pleas district until 1811, when he was removed because of his alleged arbitrary conduct and overbearing temper. He was professor of chemistry in Dickinson College, Pa., from 1811 to 1814, and of mineralogy and chemistry in the University of Pennsylvania from 1816 to 1821, and from 1820 to 1834 was president of South Carolina College, where he acted also as professor of chemistry and political econ-

omy, and for a time of 'rhetoric, criticism, and belles-lettres.' From 1834 until his death he was engaged, with Dr. McCord, in revising the statutes of South Carolina, which were published in ten volumes (Columbia, 1836-41). Though he was strongly condemned by many for his radicalism in philosophy, religion, and politics, he undoubtedly exercised a powerful influence in the South, especially in South Carolina, and did much to inculcate in the minds of the politicians of his State the doctrine of extreme States' rights, nullification, and free trade. In a speech which was widely circulated in 1827, he openly urged both nullification and secession upon South Carolina, and he was unquestionably responsible to a considerable degree for the nullification measures of 1832-33. Besides editing *The Emporium of Arts and Sciences* at Philadelphia from 1812 until 1814 and writing numerous pamphlets and articles for the press, he published: *Some Information Respecting America* (1794); *Political Essays* (1800); *An English Version of the Institutes of Justinian* (1812); *A Practical Treatise on Dyeing and Calico Printing* (1815); *Lectures on the Elements of Political Economy* (1826); and *A Treatise on the Law of Libel and the Liberty of the Press* (1830).

COOPER, THOMAS (1805-92). An English agitator, one of the leaders in the Chartist movement, poet and author. In youth he was a shoemaker, but at the age of twenty-three became a schoolmaster. He was the leader of the Leicester Chartists in 1841, lectured during the riots of that year, was found guilty of conspiracy and sedition, and was sent to prison for two years. While in jail he wrote an epic poem, *The Purgatory of Suicide*, and a series of stories entitled *Wise Saws and Modern Instances*. Some time afterwards he wrote papers on *The Condition of the People*; later still, *Triumphs of Perseverance and Triumphs of Enterprize* (1856). In 1848 he was lecturing; in 1849 he edited a radical penny paper, *The Plain Speaker*, and in 1850 a free-thinking publication, *Cooper's Journal*. Near the close of 1855 he gave up skepticism, and afterwards lectured in support of Christianity. He published *The Bridge of History Over the Gulf of Time* (1871); an *Autobiography* (1872); and *Collected Poems* (1878).

COOPER, THOMAS AETHORPE (1776-1849). An actor who was born at Harrow, England, but came to this country in 1796 and for many years held a leading place on the American stage. He made his debut in Edinburgh, and afterwards played at Covent Garden, London, before coming to America, where he made his first appearance in Philadelphia, in the rôle of Macbeth. He quickly won great popularity. Later he went to New York and remained several years, gaining a wide reputation. In 1803-04 he was again in London and had a successful engagement at Drury Lane, in Shakespearean tragedy. A later visit to London, in 1827, met with a less flattering reception, for which he was required, however, on his return to America; but before he retired from the stage his popularity in this country had greatly declined, as had also, apparently, his artistic talents. Among his best parts were Shylock, Richard III., Othello, Damon, and Virginius. In later life he was for a time a custom-house officer in New York, a son of Presi-

dent Tyler, having married one of Cooper's daughters. It was at the home of this daughter in Bristol, Pa., that Cooper died. Consult: Ireland in Matthews and Hutton, *Actors and Actresses of Great Britain and the United States*, vol. ii. (New York, 1886).

COOPER, THOMAS SIDNEY (1803-1902). An English painter, born in Canterbury. He was a pupil of the Royal Academy in London, and of Verboeckhoven in Brussels. He first exhibited at the Royal Academy in 1833, where he continued to send work for sixty-seven consecutive years. He attained considerable reputation as a painter of cattle, and the skill and spirit with which he depicted them made his works very popular. Among his numerous pictures, in some of which Frederick R. Lee (q.v.) painted the landscapes, are "Etrick Shepherds" (1842); "Cattle at Pasture" (1843); "Summer Evening" (1846); "Charge of the Household Brigade, Waterloo" (1847); "Snowed Up" (1867); "Passing Shower" (1870); "Children of the Mist" (1872); "God's Acre" (1875); "Isaac's Substitute" (1880); and "In the Rob Roy Country" (1885).

COOPERAGE (from *coop*, AS. *cypa*, OS. *cōpa*, OHG. *chuofa*, Ger. *Kufe*, vat, from ML. *copa*, Lat. *cupa*, vat, Gk. *κῦρη*, *kypē*, hole, Skt. *lūpa*, well). The art of making vessels of pieces of wood bound together by hoops. It is a very ancient art, such vessels having been in use among the Romans at the beginning of the Christian Era. The upright pieces forming the sides of a barrel, or cask, or other cooper's work, are called *staves*; and, as casks are usually larger in the middle than at the top and bottom, this swelling, called the *belly* or *bulge*, is formed by skillfully shaping each stave so that it shall form part of the required double conoid, and so that, when all are built and hooped together, their edges shall coincide perfectly. For this purpose, each stave is made broadest in the middle, and narrowed down in a curved line toward each end. A skillful cooper can produce this curve so accurately that no further fitting or alteration is needed when the staves are put together. The staves are made to meet at their inner edges, and by driving the hoops very hard, the inner part is compressed until the slight gaping outside is closed, and thus slight inaccuracies of fitting are remedied. There are several branches of cooperage. The *wet* or *tight* cooper makes vessels for holding liquids. The *dry* cooper does inferior work, such as barrels for containing dry goods, where an inferior degree of accuracy is sufficient. The *white* cooper makes churns, pails, etc., which for the most part have straight sides. The best wood to employ is oak, which must be thoroughly dried before the staves are put together. In warm countries the drying of the sun is sufficient, and casks are therefore mounted in summer only; but in northern countries artificial drying is commonly resorted to. The hoops are hammered down from the narrow to the wide part of the cask, by means of a mallet striking a piece of wood held against the hoop. Iron hoops are sometimes put on hot, in order that their contraction on cooling may bind the work together.

Like most other processes of manufacture, the cooper's trade has changed in modern times, with the substitution of machinery for hand work. The machinery used is commonly termed barrel-making machinery; but it is employed, with

suitable modifications, in making casks and kegs as well as barrels. Barrel-making machinery may be divided into machines for the manufacture of staves, machines for manufacturing heads, and machines for setting up and finishing the barrel. The saw used for cutting staves is a cylindrical sheet, having teeth upon one end; the blocks of wood are clamped in the usual manner, and the staves fall within the cylinder. They are then laid upon an endless conveyer, which carries them against two circular saws that cut them a definite length. Each piece is then placed in a pair of clamps, and moved against a rotary wheel provided with cutters, that dress the edge to the required bilge and bevel; the *bilge* is the increased width midway between the ends, which causes the enlarged diameter of the cask at the middle; the *bevel* is the angle given to the edge conforming to the radius of the cask. The surface of the stave is smoothed by passing it under revolving cutters; a recent form of machine takes off the surplus wood from riven staves without cutting across the grain, following winding or crooked pieces as they are split from the block. The heads are usually made of several flat pieces jointed and fastened with dowels, or pins of wood. The edge of each piece is pushed against the side of a rotary disk, provided with cutters that instantly straighten it; it is then pushed against bits that bore holes for the pins to be afterwards inserted by hand. Several boards being pinned together, enough to make a head, the whole is first smoothed on one side and dressed to a uniform thickness; then it is elamped between two disks, and, as these disks turn, a saw trims the head into a circle with a beveled edge; if the wood is green, an oval form may be given to provide against shrinking.

The barrel has next to be 'set up.' A sufficient number of staves are set into a frame, their edges refitted if necessary: stout iron hoops, called 'truss hoops,' pushed up from below grasp the lower ends tightly, and the whole may be lifted from the mold. One end of the barrel is formed, but the other end is open and flaring. A rope is passed about the open end and taken to a windlass, and the staves are drawn together by tightening the rope; in this stage the barrel is heated, to cause the staves to yield more easily to their required form. The barrel is now leveled by placing it upon a horizontal bed and bringing down upon it a powerful disk that presses upon its ends and forces the staves into their proper position. A machine is devised which trusses and levels the barrel at a single movement. The slack barrel stands in its truss hoops, two on each end; those of the lower end rest on strong supports; those of the upper end are seized by hooks whose handles pass down through the platform to a common level; when all the parts are in place, powerful machinery pulls the upper trusses down, at once driving the barrel into the lower trusses, drawing together both ends, and leveling the whole. Each end of the shell, thus made, passes under a rotary cutter which forms a *croze*, or groove, to receive the head, and chamfers, or bevells, the ends of the staves. The heads are put in and the hoops set by hand. The barrel is then made to turn under a smoothing tool and rapidly finished.

COOPERAGE (from Dutch *koper*, sort of boat, from *kopen*, Ger. *kaufen*, Goth. *kaupōn*, AS.

cypan, to buy, from Lat. *caupo*, innkeeper). The sale of tobacco, alcoholic liquors, or clothing to fishermen in the North Sea, or the barter of these articles for fish, nets, or other such property. As the goods for sale had escaped duty, the business was profitable, but it demoralized the fishermen. In 1882 a mission was founded for supplying the fishermen with good clothing, literature, etc., at a fair cost, and in 1887 six nations concerned signed an agreement to prohibit the sale of intoxicating liquors to fishermen at sea. Next year Great Britain embodied the terms of this convention in the North Sea Fisheries Bill.

COÖPERATION (Lat. *cooperatio*, from *cooperari*, to coöperate, from *co-*, together + *operari*, to work, from *opus*, Skt. *apas*, work). In the widest sense of the word, all production is the result of the coöperation of nature, labor, and capital; but economists have generally restricted the term to three classes of enterprises, namely: (a) Coöperative distribution; (b) coöperative production; and (c) coöperative societies for banking or loaning money. It is sometimes extended to profit-sharing, by which the employee shares beyond his wages to some extent in the profits of his employer: but this is a misapplication of the term, for coöperation starts with the worker, while profit-sharing starts with the employer.

COÖPERATIVE DISTRIBUTION. This is sometimes called consumers' coöperation, and is an effort to do away with the middleman and to have the consumers themselves organize distributive stores and reap the profit which would otherwise fall to the storekeeper. There can of course be no doubt that under existing conditions of production the merchant who serves as an intermediary between the producer and the consumer, or between the wholesale dealer and the retail purchaser, performs an important social service for which he is entitled to a reasonable remuneration; but, unfortunately, the number of these intermediaries has increased beyond all measure; and, as they all must strive to subsist, there is still, in spite of great improvements in the distributive process, a vast difference between wholesale and retail prices. A French economist, Prof. Charles Gide, estimates that more than one-tenth of the population of France depends on commerce for its subsistence. In other words, every ten persons support one intermediary. The economic waste of commercial competition indicated by these facts aroused, many years ago, the condemnation of such social reformers as François Fourier (q.v.) and Robert Owen (q.v.); but the first lasting, successful attempt to dispense with the middleman was made in 1844, by twenty-eight poor weavers of Rochdale, near Manchester. They organized, under the name of 'Equitable Pioneers of Rochdale,' to supply themselves with provisions, beginning with flour, butter, sugar, and oatmeal. Business was transacted at first in a small room in Toad Lane, with a capital of £28, each member having subscribed an equal share. They overcame all difficulties, and outlived not only internal divisions and jealousies, but also external prejudices and opposition. The success of the store led to many imitations, a considerable number of which, however, had only a very short existence, owing in many cases to want of harmony among the members, bad

management, insufficient capital, or dishonest officials. Notwithstanding all difficulties, coöperation continued to increase, and in 1864 no less than 295 societies in Great Britain made returns to the registrar, possessing a share and loan capital of £774,000, doing an annual trade of nearly £3,000,000, and making an annual profit of £225,000. It was then proposed to form a federation of societies for the purpose of undertaking the wholesale trade of the movement, thereby protecting the societies from the imposition of the wholesale traders, and securing the profits of wholesale dealing. The 'North of England Wholesale Society' began business in Manchester in 1863, and in 1871 became the 'English Wholesale Society.' This organization has purchasing and forwarding depots not only in England and Ireland, but in New York, Hamburg, Copenhagen, Calais, and Rouen. It owns six steamships, which ply between England and the Continent. Following the same lines, the 'Scottish Wholesale Society' was formed in 1868, and commenced business in Glasgow. Both of these organizations have prospered and grown, and now supply a large portion of the goods sold by the retail societies. They not only purchase direct from the producers, but produce on their own account, or in connection with other associations. The latter activity falls under the head of productive coöperation, which will be discussed later. In 1895 the membership of the societies was nearly 1,500,000, and their share capital amounted to over \$80,000,000; the net profit of the concerns was nearly \$27,000,000, after paying 5 per cent. interest on capital and accumulating a surplus. About one-sixth of the population of Great Britain have their wants in whole or in part supplied through coöperative stores.

In the United States isolated experiments of a similar nature were made as early as the eighteenth century. In 1845 the 'Workmen's Protective Union' of Boston organized a successful store, which was afterwards carried on under the name of the 'New England Protective Union.' The 'Patrons of Husbandry,' founded in 1867, for a time developed a variety of coöperation by encouraging the local 'granges' to form purchasing clubs and to employ agents to buy supplies. The 'Sovereigns of Industry,' a secret order with ritual, founded in 1874 to do for the artisan classes what the 'Patrons of Husbandry' were doing for the farmers, founded numerous coöperative stores on lines resembling the 'Rochdale Pioneers.' In 1877 the organization was doing a business of \$1,089,372, but by 1880 the order had collapsed, although not a few stores in various parts of the United States still remain as a result of the movement.

The foundation of a coöperative store on a small scale is a simple matter in itself. A group of consumers meet to discuss rules and regulations for the enterprise, and agree to furnish the necessary capital by subscribing, say, five dollars each. As coöperative stores almost always do business on a cash basis, the original capital need not be very great. Each share of capital receives a fixed rate of interest, say 5 per cent. The dividends may be credited as payments on additional shares up to the maximum number of shares allowed any one shareholder. In this wise the store serves also as a savings-bank for the members. Usually the money sub-

scribed as share capital need not all be paid at once; weekly payments of ten cents are customary. Whatever profit the store makes after deduction of the interest on loans, the charge for depreciation in the value of the stock and plant, 5 per cent. dividend on the capital, a reserve fund, and perhaps a bonus to employees, is divided among the purchasers according to the respective amounts of their purchases. Goods are sold at the usual prices of private stores. Outsiders may buy at the store, but only members receive shares in the gains. These shares are also usually credited as payments on the stock shares until they are paid in full. The amount of each member's purchase is recorded by means of checks distributed with every sale. The management of the business is in the hands of an executive committee, which appoints the storekeepers, and oversees the purchase of goods and the finances. It is evident that the success of the society will depend largely on this committee, which must be honest and efficient.

COÖPERATIVE PRODUCTION. An attempt to solve the more difficult problem of doing away with the employer, the 'entrepreneur,' by having the workers furnish their own capital. Under our present economic system the distribution of wealth among the agents of production involves a grave conflict of interests, which may lead to industrial warfare and jeopardize the welfare of society by separating laborers and capitalists into distinct antagonistic classes; but the relation between capital and labor is most satisfactory when there is no sharp separation into classes. Productive coöperation, therefore, by uniting men in the twofold capacity of workers and capitalists, has been recommended by many social reformers as a cure for our social ills. The voluntary union of a number of workers to conduct an enterprise collectively is by no means a modern invention. Schmoller and other economic historians have shown that it is, indeed, one of the earliest forms of industrial organization. The guilds of the Middle Ages were managed by associations of workmen, each one furnishing a small share of the capital required for the conduct of industry under mediæval methods. But their conservatism of method led to their displacement by capitalistic industry, and it is not until the nineteenth century that we find widespread attempts to reestablish coöperative productive enterprises; but only a few of them, notably among masons and piano-makers, were successful.

Ferdinand Lassalle (q.v.) believed that the foundation of coöperative societies of production, with State aid in providing the necessary capital, would gradually transform present economic society into a socialistic one.

The first productive association in the United States of which we have any record was that of the 'Boston Tailors' Associative Union,' which was formed in 1849, but did not last long. There were many other experiments of a like nature, the most promising of which seems to have been the stove foundry of the Iron Moulders' International Union, started in 1867 in Allegheny County, Pa. But the paid-up capital proved insufficient at a critical moment, and the enterprise failed. By far the most successful experiment in the United States is found among the coopers of Minneapolis. In 1868 a few journeymen coopers made an attempt

to manage industry for themselves; they were so successful that in 1874 a strong organization known as the 'Coöperative Barrel Company' was formed, with a membership of about twenty coopers. They bought a shop for \$3000, paying \$1000 cash. The profits were to be divided in proportion to the work done. In 1885 the paid-up capital amounted to \$50,000; the membership had reached 120, besides 20 employees working for wages. The number has since been reduced.

This example has been followed by others, and frequently with success. Experience seems to show that where articles are produced to order and not for the general market, coöperative production may succeed, but that these enterprises fail when they are confronted with the difficulty of adjusting the supply to the variations of the market demands.

COÖPERATIVE CREDIT AND BANKING ORGANIZATIONS. These are founded for mutual financial aid, and have been wonderfully prosperous in Germany, where they do a business of hundreds of millions of dollars. In 1849 Herr Schulze (Schulze-Delitzsch) founded a coöperative society to purchase raw material, among thirteen cabinet-makers in Delitzsch, his native town. In the next year he founded the first of his loan associations (*Vorschussvereine*), which differed from the earlier banks in that the persons to whom loans could be granted must themselves be members of the association, paying regular monthly contributions. They thus themselves indirectly furnished the security for the credit afforded them. While these loan associations put the lender's interest foremost, Raiffeisen, another German, born in the Westerwald, organized a coöperative bank in 1849 which placed the borrower's interest as the keystone of his system. Both systems have spread over the country, especially Schulze-Delitzsch's banks, numbering over a thousand in 1892, with over half a million members and a paid-up capital of nearly \$30,000,000. In Italy, at the instigation of Signor Luzzatti, an organization of a very similar sort was founded in 1866, at Milan, and has been widely imitated. As a matter of fact, all these 'people's banks' bear a close resemblance to our American building and loan associations (q.v.), whose special and marked development in this country makes the United States one of the pioneer countries and chief homes of this form of coöperation.

COOPERIA, *kōō-pē'ri-a*. A genus of two or three species of tender, bulbous plants, of the order Amaryllidaceæ. The narrow, elongate, twisted leaves appear with the fragrant solitary

flowers in summer. The flowers, which resemble those of the Zephyranthes, but have erect instead of versatile anthers and, unlike other members of the order, bloom at night, are two inches or more in diameter, usually waxy white, blushed with pink outside and green-tinged within. Those of *Cooperia pedunculata* (giant fairy-flower), the most popular species, are larger, of purer color and longer duration than those of *Cooperia Drummondii* (evening star), the other well-known species. A species or variety, *Cooperia Oberwetteri*, said to have bright-green flowers, was advertised during the last years of the century just closed. The plants are of easiest culture. They do well in garden soil, and if dug at the approach of frost and stored in dry soil, where the temperature is maintained below 50° F. but not so low as 32°, they may be kept over winter without trouble. The genus is named after Joseph Cooper, an English gardener. For illustration, see Colored Plate of AMARYLLIDACEÆ.

COOPER RIVER. A river rising in Berkeley County, S. C. It flows southeast, and unites with the Ashley River below the city of Charleston, in the estuary forming Charleston Harbor (Map: South Carolina, E 3). It is navigable for 30 miles to the canal connecting it with the Santee River.

COOPER'S CREEK. An Australian river springing from two headwaters, the Thomson and Victoria, in Queensland, and flowing southwest through South Australia into Lake Eyre. During the rainy season the river rises 20 feet and widens to two miles, while in the summer season its lower course is dry (Map: Australia, P 4). On its banks the explorers Burke and Wills succumbed to starvation in 1861. Consult: Burke and Wills, *Exploring Expedition* (Melbourne, 1861); Wills, *Exploration* (London, 1863).

COOPER'S HILL. A descriptive, or, as Dr. Johnson termed it, a 'local' poem, by Sir John Denham (1642), issued in perfected form in 1665. It suggested many lines in Pope's *Windsor Forest*.

COOPERSTOWN. A village and county-seat of Otsego County, N. Y., 52 miles southeast of Utica; at the outlet of Otsego Lake, and on the Cooperstown and Charlotte Valley Railroad (Map: New York, F 3). It is in a hop-growing and farming region, and contains a cheese-factory, box-factory, etc. The village is growing in popularity as a summer resort, and has a park, 'Cooper Grounds,' and a library and Y. M. C. A. building. Cooperstown was first incorporated in 1812, and is now governed under a charter of 1889, revised in 1895. The executive holds office for a year. Population, in 1890, 2657; in 1900, 2368.

The land on which Cooperstown stands was the site of an Indian town, and in 1769 became the property of George Croghan, who attempted, unsuccessfully, to found a settlement. In 1785 it came into the possession of Judge William Cooper, who in 1786 founded a village, and in 1790 moved thither with his family, including J. Fenimore Cooper, the future novelist, then an infant. The latter lived here thirty-seven years, and is here buried. Consult: Cooper, *The Chronicles of Cooperstown* (Cooperstown, 1838), and Livermore, *A Condensed History of Cooperstown* (Albany, 1862).

COOPER UNION FOR THE ADVANCEMENT OF SCIENCE AND ART. An institution established in New York City in 1859 for the free instruction of the working classes in applied science, art, and social and political science. The Union embodies the social philosophy of its founder, Peter Cooper (q.v.), and is unique among educational institutions in the United States. Its central idea is to afford working people full opportunity, by means of day and evening classes, to obtain a mastery of the technical trades and sciences; and also, through the medium of lectures, reading-rooms, and art and scientific collections, to induce a more discerning citizenship and a broader mode of living. To accomplish these purposes, Mr. Cooper erected a large building at the point where the Bowery divided into Third and Fourth avenues, and deeded both land and building, valued at \$630,000, to a self-perpetuating board of trustees. This board was to consist of not less than five or more than six members, and upon the board was especially enjoined the establishment of regular courses of evening study; the maintenance of a library, galleries, and collections; the establishment of a school of art for women, in order that those who "might otherwise struggle through a life of poverty and suffering," should be raised to "competence and comfort"; and the establishment of a polytechnic school "equal to the best technological schools now established or hereafter to be established." By 1864 the trustees had developed this broad scheme of education so far as their funds permitted; but afterwards, for many years, the Union was unable through lack of endowments adequately to extend in scope, and was even obliged to turn away large numbers of its constantly increasing applicants. Indeed, except for large sums given by Peter Cooper, and afterwards by Edward Cooper and William Cooper, and by Mr. and Mrs. Abram S. Hewitt, the Union remained practically unendowed until 1900, when Andrew Carnegie gave \$300,000, and later \$300,000 more. These sums, together with considerable gifts made by Mr. Abram S. Hewitt and others, permitted the final rounding out of the original plans. The scope of the institution now includes, besides day and evening courses in technical science and art, instruction for women in stenography, typewriting, and telegraphy, courses in decorative composition, architecture, and interior decoration, in elocution, oratory, and debate, and several lectures a week in engineering, civics, and ethics. Degrees are conferred in science, and in civil, electrical, and mechanical engineering. In 1902 the annual income of the Union approximated \$100,000, its endowments amounted to over \$2,000,000, and the total value of property under its control to \$3,200,000. In the same year 2399 pupils were enrolled, of whom 825 entered the evening school of science and 1150 the evening art department: visitors to the reading-rooms numbered 500,000; while the attendance at the lecture-rooms was estimated to aggregate 150,000. The trustees originally appointed in 1859, and to whose untiring efforts the success of the Union must in large measure be ascribed, were: Peter Cooper (q.v.), Daniel F. Tiemann, Wilson G. Hunt, Edward Cooper, Abram S. Hewitt, and John E. Parsons.

COÖRDINATES (from ML. *coördinare*, to coördinate, from Lat. *co-*, together + *ordinare*, to arrange, from *ordo*, order). Magnitudes which serve to determine the position of an element—point, line, or plane—relative to some fixed figure. For instance, latitude and longitude are arcs (or angles) that define the position of a ship at sea relative to the equator and the prime meridian; latitude, longitude, and elevation above sea-level serve to determine the position of a balloon.

The method of treating geometry analytically by use of coördinates is due chiefly to Descartes (1637), although the terms coördinates and axes of coördinates were first used by Leibnitz (1694). For the explanation of rectangular coördinates as used in plane geometry, see ANALYTIC GEOMETRY. As there explained, the axes in the rectangular system are at right angles to each other, but it is often more convenient to employ a system in which the axes form oblique angles. Coördinates referred to such a system of axes are called oblique coördinates. The notation is the same as in the rectangular system, and the lines which determine a point are drawn parallel to the axes; thus the coördinates (x, y) of a point form the outer adjacent sides of a parallelogram of which the axes form the inner sides. Another system in common use is that of polar coördinates. This involves two magnitudes—the linear distance from a fixed point and the angular distance from a fixed line.

In the figure the position of point P is determined by the distance ρ from O, and the angle θ between ρ and the fixed line OA. O is called the pole and ρ the polar radius or radius vector. If OA passes through the centre C of a circle, the polar equation of the circle is $\rho = 2r \cos \theta$. That is, the values of ρ and θ , which satisfy this equation, determine points on the circle. If C is taken as the pole, the equation of the circle is evidently $\rho = r$. Rectangular coördinates may be changed to polar coördinates, and vice versa, by means of the equations

$$x = \rho \cos \theta, \quad y = \rho \sin \theta;$$

$$\rho = \sqrt{x^2 + y^2}, \quad \theta = \tan^{-1} \frac{y}{x}.$$

So far we have considered lines as loci of points whose coördinates satisfy given relations; but it is often more convenient to select magnitudes which determine lines passing through a given point. Thus $ux + vy + l = 0$ may be taken as the equation of a straight line in which u

is the negative reciprocal of the intercept on the X-axis, and v the negative reciprocal of the inter-

cept on the Y-axis. For if $y = 0, x = -\frac{l}{u}$, and if $x = 0, y = -\frac{l}{v}$. The segment a , in the figure, is the intercept on the X-axis, and corresponds to $y = 0$, and b is the intercept on the Y-axis and corresponds to $x = 0$. Therefore, $a = -\frac{l}{u}$ and $b = -\frac{l}{v}$, whence $u = -\frac{l}{a}$ and $v = -\frac{l}{b}$. If x and y are regarded as constants

and u, v as variables in the equation $ux + vy + l = 0$, this is the equation of all lines passing through the point (x, y) —that is, of a pencil of which the point (x, y) is the vertex. Hence this equation is called the line-equation of the given point, and the system of coördinates one-point intercept coördinates. Two-point or bipunctual coördinates determine the position of an element in the plane by reference to two fixed points and a given direction. As in one-point coördinates there are two kinds, line coördinates and point coördinates, so these classes exist in two-point coördinates. Bipunctual line coördinates are the distances of a variable line taken in a constant direction from two fixed points. Bipunctual point coördinates are, each, the negative reciprocal of the distance measured in a given direction from one of two fixed points to the line determined by the variable point and the other fixed point.

Although two magnitudes are sufficient to fix the position of a point in a plane, the introduction of a third has the advantage of rendering homogeneous certain equations involved; how-

ever, the coördinates of a single element are, in general, connected by a non-homogeneous relation. Thus, if x, y, z in the figure represent the perpendicular distances of a point from the

sides a, b, c of the triangle ABC , they are connected by the relation $ax + by + cz = k = 2 \times$ area of ABC , or $x \sin A + y \sin B + z \sin C = a$ a constant. (See TRIGONOMETRY.) We may also take x, y, z oblique to a, b, c , each forming the same angle with its corresponding side. Equations between the coördinates of two or more points in this system are homogeneous, as $mx + py + qz = 0$, the equation of a straight line. Such coördinates are called trilinear or homogeneous coördinates. These form a special case of barycentric coördinates, the first homogeneous coördinates in point of time, introduced by Möbius (q.v.) in his *Der barycentrische Calcul* (1827). Tetrahedral space coördinates belong to the same class. If in the above figure rectangular axes are also assumed, and if P_1, P_2, P_3 are the perpendiculars from the origin upon the sides a, b, c , respectively, then

$$\frac{x}{P_1} = \frac{BPC}{CBA}, \quad \frac{y}{P_2} = \frac{ACP}{CBA}, \quad \text{and} \quad \frac{z}{P_3} = \frac{BAP}{CBA};$$

these expressions may be designated by x', y', z' , and be employed to determine the position of point P (P denoting the point at which x, y , and z meet). Since they are expressed in terms of areas, they are called areal coördinates. In either the trilinear or areal system a point is determined if the ratios only of the coördinates are known. If $lx + my + nz = 0$ is the trilinear equation of a straight line (L in the

figure), then by making x, y, z constant and l, m, n variable, the equation is called the tangential equation of the point $O(x, y, z)$. Since l, m, n are variable, the equation represents any straight line passing through O . If λ, μ, ν are the perpendiculars from A, B, C , upon the line L , and p_1, p_2, p_3 the altitudes of the triangle ABC , the equation of the point O is

$$\frac{\lambda x}{p_1} + \frac{\mu y}{p_2} + \frac{\nu z}{p_3} = 0$$

When the perpendiculars λ, μ, ν are taken for the coördinates of the line, the coefficients become the areal coördinates of the points referred to the same fundamental triangle. Any homogeneous equation in l, m, n as tangential coördinates is expressed in terms of λ, μ, ν by substituting $\frac{\lambda}{p_1}, \frac{\mu}{p_2}, \frac{\nu}{p_3}$ for l, m, n respectively.

An equation in λ, μ, ν of a degree higher than the first represents a curve such that λ, μ, ν are always the perpendiculars upon the tangent. The curve must therefore be the envelope (q.v.) of the line (λ, μ, ν) . Tangential coördinates are often called Boothian coördinates, in honor of James Booth, who invented them. Bilinear coördinates are magnitudes which determine a point with reference to two series of circles

which intersect one another at a constant angle. Generalized, Lagrangian, Eulerian, and Rodrigue's coördinates are special systems used in treating certain problems of mechanics.

From the idea of coördinates of an element in a plane we easily pass to the notion of coördinates of an element in geometry of three dimensions. The determination of a point in such space requires three coördinates. In the Cartesian system these are represented by x, y, z . An origin being taken (as O in the figure), and three

axes, OX, OY, OZ mutually at right angles to one another, the point is referred to the three planes through these axes. Here z or PN is its distance above the plane YOX ; y or NM is its distance from the plane XOZ ; and x or OM is its distance from the plane ZOY . In three dimensions, as in two, the problem may be stated to be: Given the law of the motion of P , to express the law of variation of its coördinate; the algebraic expression of the latter law is the equation of the surface traced by the point in moving over all the space it can traverse consistently with the law of its motion. Thus, the equation of a sphere referred to its centre O is $x^2 + y^2 + z^2 = r^2$. As in plane geometry, if the axes are taken oblique to one other, the coördinates are called oblique coördinates. Likewise, the polar coördinates in space corresponding to the polar coördinates in a plane are ρ, θ, ϕ . In the above figure $\rho = OP$, the distance from the origin; $\theta = \angle POZ$, the angle between OP and OZ , and $\phi = \angle XON$, the angle between planes XOZ and POZ . As in plane geometry there are intercept equations for straight lines, so in solid geometry there are intercept equations for planes. And as certain equations of plane geometry are made homogeneous by the introduction of a third coördinate, so in solid geometry certain equations are made homogeneous by the introduction of a fourth coördinate. Thus, in tetrahedral or barycentric four-plane coördinates, the four faces of a tetrahedron (q.v.) of reference are taken as the coördinate planes. The equation of any plane in this system is $lx + my + nz + rw = 0$, in which

$$l : m : n : r = \frac{x_1}{p_1} : \frac{y_1}{p_2} : \frac{z_1}{p_3} : \frac{w_1}{p_4}, \quad x_1, y_1, z_1, w_1$$

being the perpendiculars upon the plane from the vertices A, B, C, D of the tetrahedron of reference, and p_1, p_2, p_3, p_4 the altitudes of the tetrahedron from A, B, C, D respectively. For the coördinate systems for space of n -dimensions, and for the transformations from one sys-

tem into another, it will be necessary to refer to special works on the subject. Consult: Carr, *Synopsis of Pure Mathematics* (London, 1886); Lamé, *Leçons sur les coordonnées curvilignes* (Paris, 1859); Möbius, "Der barycentrische Calcul" (1827), in his *Gesammelte Werke*, vol. i. (Leipzig, 1885); Townsend, *Modern Geometry of the Point, Line, and Circle* (Dublin, 1863-65); Scott, *An Introductory Account of Certain Modern Ideas and Methods in Plane Geometry* (New York, 1894); Clebsch, *Vorlesungen über Geometrie* (Leipzig, 1876-91).

COORG, *kōrg*, or *KĪRG*. A province of British India, on the southwest of Mysore. Area, 1583 square miles. Population, in 1891, 173,055; in 1901, 180,460. It was a native principality of ampler dimensions before 1834, in which year it was annexed by Great Britain. Nearly the whole of the region is covered with forests, more or less dense. Especially notable are the ancient artificial fortifications. The country is intersected by ramparts, which are from 15 to 25 feet in height, and by ditches of about 10 feet in depth and about 8 in width; while, being in some places double or triple, or even quadruple, they measure in aggregate length upward of 500 miles. Capital, Merkara.

COORNHERT, *kōrn'hērt*, or **CORNHERT**, DIRK VOLCKERTSZOON (1522-90). A Dutch scholar and poet, born in Amsterdam. He lived in Haarlem from about 1542, supporting himself by his skill in engraving. In 1561 he became notary, and in 1562 secretary to the municipality also. Most active as a champion of political and religious liberty, he incurred the disapproval of the Spanish Government, was imprisoned in 1567, and afterwards took refuge at Cleves and Xanten. When the States threw off the Spanish yoke in 1572, he was recalled and made secretary to the States of Holland, in which capacity he rendered important services to William of Orange. He was a famous theologian, stoutly opposed the orthodox Protestant party, and by his writings aided materially in preparing the classical period of the literature of the Netherlands. His poetical works include *Abrahams uytgang* (The Death of Abraham) and *Comedie van de blinde van Jericho* (Comedy of the Blind Man of Jericho). Of his works in prose, the *Zedekunst, dat is wellevens kunst* (Ethics: that is, the Art of Right Living), which appeared in 1586, deserves special mention.

COOSA, *kōō'sā*. A river formed by the confluence of the Etowah and Oostanaula rivers in Floyd County in northwestern Georgia (Map: Alabama, C 2). It flows southwest and enters Alabama, where it flows between the hills of the southern extremity of the Appalachian range and is joined by the Tallapoosa River to form the Alabama River just above Montgomery. The Coosa is about 335 miles long, is navigable in the lower part of its course, and drains an area of 10,000 square miles.

COOS (*kōōs*) **BAY**. An arm of the Pacific Ocean in about latitude 43° 45' N., in Coos County, Ore., about one mile wide and 15 miles long, a safe ship harbor, having a depth of 14 feet of water on its bar at high tide. On its south shores are two important manufacturing and coal-mining cities, Empire City and Marshfield. It receives the Coos River.

COOSHIE (native name) **ANT**. A South American leaf-cutting ant (*Ecodoma cephalotes*). See SAUBA ANT.

COO'SY. See KUSI.

COOT (probably from Welsh *crota*, Corn. *cut*, Ir., Gael. *cutach*, bob-tailed). A kind of rail or 'mud-hen' (*Fulica*), distinguished from other rails (q.v.) chiefly in having the toes edged with a scalloped membrane. Coots have a strong, straight bill, the base of which extends up the forehead, and there dilates so as to form a remarkable naked patch. The color is generally dark with more or less white, and the length is about 15 inches. Coots are aquatic in their habits, preferring lakes, or pools with reedy margins, and retreating among the reeds on any alarm. The American coot (*Fulica Americana*) is found breeding throughout all North America, and is migratory in the north, but resident in the south. It is dark-slate color, deepening on the head and neck, and the crissum is white. The nest is a hollow heap of broken, dead reeds: the eggs (see Colored Plate of EGGS OF WATER AND GAME BIRDS) are usually about a dozen in number, clear clay color, dotted with dark brown. The young are covered with black down, striped with bright orange-red. See Plate of RAILS, ETC.

The common coot (*Fulica atra*) of the Old World is found in most parts of Europe, Asia, and the north of Africa. It is about 16 inches long, black, with a narrow white bar across the wings, and the naked patch on the forehead pure white, on account of which it is often called 'bald' coot. The crissum is not white, and this is the most important difference between it and its American cousin. It makes a large nest of water-plants among reeds or rushes. Although not very highly esteemed for the table, the circumstance that many can be killed by a single shot, on the mud-banks to which coots resort in winter, as on the south coast of England, makes coot-shooting profitable to market gunners. Other species inhabit eastern Asia, Africa, and South America. The name 'coot' is very often incorrectly applied in the United States to certain ducks, which are properly known as scoters (q.v.).

COOTE, Sir EYRE (1726-83). An English general, born at Ash Hill, County Limerick, Ireland. He joined the first regiment sent to India, and took a conspicuous part in the capture of Calcutta. It was by his advice that Clive decided on the immediate and vigorous action which culminated in his victory over Siraj-ud-Daula at Plassey in 1757. On January 22, 1760, he achieved a victory over Lally at Wandewash, which destroyed the power and prestige of France in India. Appointed commander-in-chief of the Indian forces in 1779, he began, in 1781, his celebrated campaign against Hyder Ali, whom he finally vanquished at Porto Novo, thus saving Madras to the English. He died on shipboard while on his way from Calcutta to Madras.

COCTER. A name in the southern United States for the Carolina box-tortoise. See TURTLE.

COPAIBA, *kō-pā'ba* (Sp. and Port., from Brazil. *cupaiba*), or **COPAIVA**. A valuable medicinal substance, consisting chiefly of a resin (resin of copaiba), and a volatile oil (oil of copaiba). It flows from incisions made in the stems of trees of the genus *Copaifera*, such as

Copaifera Langsdorffii and others, natives of the tropical parts of America. Copaiba has a peculiar, not disagreeable odor, and an acrid taste. It is diuretic, when taken in small doses; large doses cause gastro-intestinal and renal irritation, and the administration of even a small quantity may give rise to an eruption somewhat like that of measles. It is principally useful from its powerful stimulating action on the mucous membranes. It is much used in affections of the genito-urinary system, during the subacute or chronic stages; and is also employed in chronic catarrhs, etc. The medicinal dose of the balsam is from $\frac{1}{4}$ to 1 fluid drachm. Balsam of copaiba is not infrequently adulterated with castor-oil. The wood-oil, Gurgina or Gurjum balsam of India, the produce of a species of *Dipterocarpaceae*, is sometimes sold as balsam of copaiba. See GURJUN BALSAM.

- COPÄIS (kō-pā'is) LAKE. See BEOTIA.

CO'PAL (Mex. *copalli*, resin). A resinous mineral substance of vegetable origin, chiefly used in the manufacture of varnishes and lacquers. The hardest varieties are used like amber, for making various objects. It appears in commerce in smooth rounded masses, colorless or lemon-yellow, translucent or transparent, rather brittle, fusible at a somewhat elevated temperature, and but sparingly soluble in oil of turpentine. In making varnishes, copal is first rendered soluble; for this purpose it is melted, and, on cooling, reduced to a powder and exposed for some time to the action of atmospheric air. It is then boiled with linseed oil and oil of turpentine, and the resulting solution is filtered. A number of different pale-yellow or almost colorless varnishes are obtained by slightly modifying this process and changing the relative quantities of the ingredients. Copal is found in many parts of the globe; it is dug in Zanzibar and Mozambique, at several places in western Africa, in New Caledonia, and New Zealand, in East India, Brazil, etc. The varieties brought from Zanzibar and Mozambique are noted for their hardness, and have therefore the highest market value; they are supposed to have been produced by trees like the *Trachylobium Hornemannianum* and *Trachylobium Mosambicense*. The copal dug in New Zealand and New Caledonia is known in commerce as *courie* and *dammar*; it is the semi-fossil resin of the *Dammara australis* and *Dammara ovata*, trees still abundantly growing in those countries; the natives of New Zealand chew the resin when freshly exuded by the trees. *Anime* (q.v.) is another variety of copal; in England, however, the name anime is applied to all the different varieties of copal. A mineral substance resembling copal, and known as *fossil copal*, is found at Highgate, near London.

COPALCHE or **COPALCHI** (kō-pāl'ehé) **BARK**. A name given to the bark of two species of *Croton*, natives of Mexico. One, the product of *Croton pseudochina*, reaches the market in small, slender, ash-colored quills which resemble a light variety of cinchona, for which they may easily be mistaken, but have a taste and an odor, especially when burned, which suggest cascarrilla (*Croton eleuteria*), to which the tree is allied; the other in large quills, presumably derived from *Croton suberosus*, which is very bitter and yields an aromatic odor upon burning. The

barks are credited with tonic, aromatic properties, and have been used, particularly in Mexico, in intermittent fevers, and in cases which seemed to demand a mild bitter. The barks have been sold for quebracho.

COPALM, kō-pām'. See LIQUIDAMBAR.

COPAN, kō-pān'. An ancient ruined city of Honduras; one of the most imposing monuments of aboriginal American culture. The buildings are of stone carved with symbolic designs. Good collections of the sculptures made by Saville and others are in the American Museum of Natural History (New York) and other American museums. The city was a native stronghold, and was captured by Hernando de Chavez in 1530. See ARCHITECTURE, AMERICAN.

COPAR'CENARY (from *co-* + *parcenary*, from OF. *parcenerie*, from *parcenier*, partner, from ML. *partionarius*, having a share, from Lat. *partitio*, share, from *pars*, portion). An estate in England originating in descent to two or more persons, called thence coparceners or parceners. It generally arises under the rule of law which makes the daughters of one dying without male heirs inherit equally, but it may also arise by local custom, as in the case of gavelkind, where all the sons inherit equally. Although the property remains unsevered, yet each parcener is entitled to a distinct share of it, and consequently there is no benefit of survivorship, but the right of each descends to his or her heirs, who are still called coparceners with the surviving original parceners. The rule of descent is also *per stirpes*, so that the heirs of one who has predeceased the common ancestor take only the share which would have come to their immediate ancestor had he or she survived, and thus in England a grandson of the common ancestor will also exclude his own sisters. If one of the coparceners alienates his share, the coparcenary is destroyed, and the estate becomes a tenancy in common (q.v.). It may also be destroyed by partition, when the estates become in severalty. This may be effected either by voluntary agreement, or by a suit in chancery. Such parts of the property as cannot be divided (such as the manor-house, etc.) pass to the eldest sister or her issue, but an equivalent in value is assigned to the remaining sisters. If the estates in coparcenary are by descent reunited in one person, they become again an estate in severalty.

In the United States, where descent is to all the children or to all of a group of heirs equally, without distinction of age or sex, coparcenary was from the beginning a common form of joint ownership of land. At the present time such descendants are usually declared by statute to take the land as tenants in common. See COMMON, TENANCY IN; JOINT TENANCY; DESCENT.

COPE. See COSTUME, ECCLESIASTICAL.

COPE. A custom or tribute due to the Crown, or lord of the soil, out of the lead-mines in Derbyshire, England.

COPE, CHARLES WEST (1811-90). An English historical and portrait painter. He was born in Leeds, July 28, 1811, and received his first instruction in art from his father, who was a landscape painter. He also became a pupil of the Royal Academy, and after two years of study in Italy was made a member of that institution in 1848, and professor of the Academy in 1887.

As an historical painter he is represented in the Houses of Parliament by fresco painting, representing the "Burial of Charles I.," "Embarkation of the Pilgrim Fathers," and other subjects. He treated Shakespearean themes in the "Taming of the Shrew" (1874) and "Anne Page and Slender" (1875). Among his earlier works are "The Cotter's Saturday Night" and "The Poor-Law Guardian." As an etcher he was highly regarded by Hamerton, and was one of the original members of the Etching Club. He was also a trustee of the Royal Academy. Cope died August 21, 1890. Consult *Reminiscences of C. W. Cope* (London, 1891).

COPE, EDWARD DRINKER (1840-97). An American naturalist, born in Philadelphia. He received his earliest training in private schools, and then studied anatomy at the University of Pennsylvania. From 1864 to 1867 he was professor of the natural sciences at Haverford College, Pennsylvania. On the death of Leidy, in 1891, he was made professor of geology and paleontology at the University of Pennsylvania, where he was also professor of zoology and comparative anatomy: from 1878 until his death he was editor of the *American Naturalist*. He was geologist and paleontologist of the survey of the region west of the 100th meridian under Capt. G. M. Wheeler, and also of the survey of the Territories under Dr. F. V. Hayden. He made an immense collection of fossils which he described in his various reports, usually published by the Government. His most important contributions were to the history of extinct vertebrates. Scarcely less important were his investigations of the herpetology and ichthyology of North America. In these fields (and especially in the former) his work was epoch-making and laid the foundation for the modern classification of North American reptiles, amphibians, and fishes. Cope's contributions to science number about 400. The most important are: *Systematic Arrangement of Lacertilia and Ophidia* (1864); *Systematic Arrangement of Extinct Batrachia, Reptilia, and Aves of North America* (1869-70); *Systematic Relations of the Fishes* (1871); *Cretaceous Vertebrates of the West* (1877); *Tertiary Vertebrates* (1885); *The Batrachia of North America* (1889); *The Crocodilians, Lizards, and Snakes of North America* (1898). Cope was deeply interested in the questions relating to the subject of evolution. He was the leader of the school of American evolutionists, teaching Neo-Lamarckism (q.v.), which considers the changes and variations wrought in the organism by the immediate influence of environment and the inheritance of such variations by the offspring as the most important factors of organic evolution. His most important works on evolution are: *Origin of Genera* (1868); *Origin of the Fittest* (1886); *Primary Factors of Organic Evolution* (1896).

COPE, SIR JOHN (? -1760). An English general, known through his ignominious defeat at Prestonpans (q.v.) by the Highlanders, under Prince Charles Edward Stuart, September 21, 1745, and perhaps more widely through the sarcastic Jacobite song, based on the event, "Hey, Johnny Cope! are ye wankin yet?"

COPE, THOMAS PYM (1768-1854). An American merchant. He started at Philadelphia the first line of sailing vessels between that city and

Liverpool, and made a large fortune during the War of 1812 by taking all the marine risks on his vessels, which were singularly fortunate in their voyages. He was largely instrumental in introducing the Schuylkill water into Philadelphia, in the completion of the Chesapeake and Delaware Canal, the construction of the Pennsylvania Railroad, and the foundation of the Mercantile Library of Philadelphia. In 1807 he was elected to the State Legislature.

COPEK (Russ. *kopicika, kopeika*, from *kopati*, OChurch Slav. *kopati*, to dig). A Russian coin, the oldest kind in Russia, and the first substitute for furs as a medium of exchange. It is worth one-hundredth of a silver ruble or about half a cent.

COPENHAGEN (Dan. *Kjöbenhavn*, Merchants' Haven, from *kjöbc*, Ger. *kaufen*, to buy + *havn*, Ger. *Hafen*, haven). The capital and largest city of Denmark, situated on the islands of Zealand and Amager, in latitude 55° 41' N., and longitude 12° 35' E. (Map: Denmark, P 3). The Kalvebod Straud, an inlet of the sound separating the two islands of Zealand and Amager, forms the excellent harbor of the city.

Copenhagen is divided into six parts, of which that lying within the former fortifications (now converted into boulevards) forms the nucleus of the city. The quarter situated on the island of Amager is called Christianshavn. The centre of the city is marked by the Kongens Nytorv (New King's Market Place), an irregular square with an equestrian statue of Christian V. From this square issue the principal streets, the finest of which is Bredgade, leading to the esplanade of the citadel. The National Theatre and some of the more important commercial buildings are on this square. The most interesting of the numerous churches of Copenhagen are the Vor Frue Kirke, the metropolitan cathedral, famous for its statues of Christ and the Twelve Apostles, and of a kneeling angel holding a shell for a font, designed and partly executed by Thorwaldsen; the Holmen's Kirke, built in the seventeenth century, and containing monuments to the naval heroes, Juel and Tordenskjöld; Trinitatis Kirke, with a high round tower; the Vor Frelsers Kirke (Church of Our Redeemer), with a winding staircase outside leading to the tower; and the handsome Frederiks Kirke, begun in 1749 and completed in 1894, its fine dome being one of the most conspicuous objects of the city. Christiansborg, the King's residence and a noted palace, was destroyed by fire in 1884. The royal abode was then removed to Amalienborg, a palace made up of four palaces built in the style of Louis XV. The Rosenborg palace, built in the Renaissance style at the beginning of the seventeenth century, contains a remarkable collection of jewels, weapons, and regalia. The palace of Charlottenborg, situated on Kongens Nytorv, is now the seat of the Royal Academy of Art. Other notable public buildings are the Exchange, erected in 1619-40 in the Dutch Renaissance style; the handsome Royal Theatre; the University; the new city hall; the Glyptothek, containing one of the choicest collections of sculpture and other objects of art in Northern Europe; and the new Art Museum, with the Royal Picture Gallery, which ranks high among the minor collections of paintings, including choice specimens of the Dutch and Italian schools, and by modern Danish

masters. The picture gallery of Count Moltke is also quite noteworthy; but above all the world-renowned Thorwaldsen Museum is of the highest artistic interest, comprising an extensive collection of that great sculptor's works and numerous other objects of art, ancient and modern, left by him to his native city. The museum also contains Thorwaldsen's grave.

The University of Copenhagen (q.v.) occupies a distinguished place among European institutions of learning. Other prominent educational institutions are the polytechnic institute affiliated with the university, the veterinary school, founded in 1773, the military and naval schools, and the Academy of Arts. Copenhagen has a number of scientific and art associations, the most prominent of which are the Royal Scientific Society, founded in 1742, and the Royal Northern Antiquarian Society, founded in 1825. The Royal Library contains upward of 500,000 volumes and about 20,000 MSS., and the National Museum, situated in the so-called Palace of the Princes, comprises the Danish and the Ethnographical collections as well as collections of antiquities, coins, medals, and engravings.

The city is administered by a board of magistrates, including the president, appointed by the King, and a municipal council of thirty-six members.

The chief manufactures of Copenhagen include sugar, machinery, textiles, and porcelain-ware. Ship-building is carried on extensively. Over one-half of the commerce of Denmark passes through Copenhagen, and the chief financial institutions of the country are situated here. There is regular steam communication between Copenhagen and ports of Germany, Russia, England, France, and the United States. It is the seat of a United States consul. The population increased considerably during the last decades of the nineteenth century, partly owing to the annexation of adjacent suburbs. In 1880, the population was 234,580; in 1890, 312,859; and in 1901, 378,235.

Copenhagen was a fishing village until the middle of the twelfth century; it began to grow in importance after coming into the possession of Bishop Absalon, who fortified it in 1167. Owing to its good harbor, Copenhagen soon became a place of commercial importance and received from the Bishop of Roskilde municipal rights about the middle of the thirteenth century. It was repeatedly attacked by the Hanseatic towns. It was chosen for the capital of the kingdom in 1443 by King Christopher, the Bavarian. During 1658-59 it withstood a severe siege by the Swedes under Charles X., by its resistance probably saving the Danish monarchy. In 1700 it was bombarded by the united fleets of England, Holland, and Sweden. It suffered heavily from conflagrations during the eighteenth century. In 1801 the harbor of Copenhagen was the scene of the destruction of the Danish fleet by Nelson, and in 1807 the city was subjected to a bombardment by the British, during which the university and a number of public buildings were destroyed. Consult: *Copenhagen, the Capital of Denmark* (Copenhagen, 1898); Seelig, *Führer durch Kopenhagen* (Hamburg, 1895).

COPENHAGEN, UNIVERSITY OF. The only university in Denmark, and the oldest and one of the most famous in Northern Europe. It was founded by Christian I., in 1478, taking its

statutes as well as some of its teachers from the University of Cologne, which, up to that time, had been the chief resort of Danish students. This first foundation perished during the civil wars accompanying the Reformation, but was reestablished in 1539 by Christian III., as a Protestant university, on the model of Wittenberg, then at the zenith of its influence. This foundation, destroyed by fire in 1728, was reestablished in 1732 by Christian VI., and reorganized on its present basis in 1788. Among the distinguished men who have shed lustre on the university are Holberg, in the first half of the eighteenth century, and Oehlenschläger, the poet, Madvig, the classical scholar, Rask, the philologist, Oersted, the physicist, and Worsaae, the archaeologist, in the first half of the nineteenth century. Supported partly by the State and partly by endowment, the university had, in 1902, some 2000 students, a library of 300,000 volumes, museums, an academy of surgery, and an observatory. Instruction is gratuitous, and the courses are open to both sexes. The university has five faculties. Attached to it are botanical and zoological gardens.

CÖPENICK or **KÖPENICK**, kē'pe-nik. A town in the Prussian Province of Brandenburg, situated at the confluence of the Dahme and the Spree, 10 miles southeast of Berlin. It contains a royal palace dating from the sixteenth century, now used as a seminary for teachers, and a seventeenth-century Rathaus. The chief manufactures include glass, linoleum, starch, sugar, chicory, shoddy, and trimmed lumber. Population, in 1890, 14,619; 1900, 21,024. The city is mentioned in 1157, as the residence of the Slavic prince Jaczo. It was conquered by the Margrave of Brandenburg in 1240, and plundered by the Russians in 1760.

COPEPODA (Neo-Lat. nom. pl., from Gk. κόπη, *kōpē*, oar + πούς, *pous*, foot). A large and important order of entomostracous crustaceans, characterized by having the five pairs of feet specially adapted for swimming. There are no branchial sacs on the feet and there is never any bivalve shell. The copepods, sometimes called 'water-fleas,' live in both salt and fresh water in swarms. Some species are parasitic on fish and sometimes do great damage in that way, but most copepods are free-swimming, and feed on organic matter in the water. They thus act as scavengers and must be of great importance in keeping harbors clean. Moreover, they serve as food for many species of food-fishes. Among our freshwater species, those of the genus *Cyclops* are perhaps the best known. They are very minute, actively moving creatures. The genus *Argulus* is parasitic on carp, suckers, and other fish. They reach a considerable size, frequently half an inch in length. Consult publications of United States Fish Commission and National Museum; and Herrick and Turner, *Synopsis Entomostraca of Minnesota* (Saint Paul, 1895). For further information see the articles CRUSTACEA; ENTOMOSTRACA.

COPERNICAN SYSTEM. The system which represents the sun to be at rest and the earth and planets to move round it; in other words, that which we now know, on unquestionable evidence, to be the true system of astronomy. (See PTOLEMAIC SYSTEM.) It has its name from Copernicus, but, in point of fact, it may

COPERNICUS
FROM THE PAINTING BY OTTO BRAUSEWETTER

be described as being a growth to which he was only one of many contributors. The merit of having first formed the general notion of the system seems to be due to Pythagoras; Copernicus has the credit of having, after the lapse of centuries, again drawn the attention of philosophers to it, and of having greatly increased the probability of its truth by his calculations and arguments: for the rest, the glory of having matured the idea belongs to Kepler, Galileo, and Newton, who, through the discovery of the law of gravitation, finally demonstrated its truth effectually. Many who have been used to reverence the name of Copernicus in connection with this system would be surprised to find, on perusing his work, *De Revolutionibus Orbium*, how much of error, unsound reasoning, and happy conjecture combined to secure for him in all times the association of the system with his name.

De Revolutionibus Orbium, dedicated to Pope Paul III., consists of six books, in which Copernicus undertook to demonstrate his whole system. The character of the reasoning which then passed for demonstration must be borne in mind in judging of the author's procedure in establishing his various positions. It was then thought a sufficient demonstration of a phenomenon to make a supposition, on which its occurrence would be intelligible, without attempting to bring the supposition itself, by an induction of facts, within the truth of nature; many abstract propositions, too, which would now appear to be simply silly, were at that time universally admitted to be of great weight in scientific arguments.

Illustrations of both of these peculiarities may be gleaned from the first of the six books of *De Revolutionibus*. It contains the following propositions: (1) That the universe is spherical. This is established by such arguments as that the sphere is the most perfect figure, etc. (2) That the earth is spherical, which flows from the same kind of considerations. (3) That the earth and sea make one globe. (4) That the motions of all the heavenly bodies must be uniform and circular, or compounded of uniform and circular motions. Here, again, we meet with singular reasons. A *simple* body must move circularly, and nothing but circular motion could give periodicity to phenomena. (5) That, supposing the distance of the stars to be immense, there is no reason why the earth should not have a motion round its axis as well as a motion in its orbit. (6) That the sphere of the stars is immensely distant. (7 and 8) The ancients were wrong in placing the earth at the centre of the universe. The arguments under this head are as imaginary as those which they were designed to refute. The falling of a body to the earth is deduced from the assumption that it is only given to wholes to move circularly, while it is of the nature of parts, separated from their wholes, to move in straight lines. That there must be a *centrum mundi*, an entity not recognized by modern science, is admitted, the question being as to its position. (9) It is possible for the earth to have several motions. (10) Copernicus establishes the order of the planets, and draws a diagram of the system much as it is now represented. It may be observed that, following the old systems, such as the Ptolemaic, he lays down a *sphere* for the fixed stars. See FIRMAMENT.

The most brilliant and valuable part of the *De Revolutionibus* is that in which he explained, for the first time, the variations of the seasons, the precession of the equinoxes, and the stations and retrogradations of the planets. In general, his explanations are right, and perfect as to the general nature of the causes of the phenomena. But Copernicus had neither mathematical nor mechanical knowledge sufficient to enable him to explain more than the mean motions of the solar system. To account for irregularities, he was obliged to introduce a system of epicycles entirely resembling that of Ptolemy. (See PTOLEMAIC SYSTEM.) This arose from the false notion of his time that all motions must be compounded of circular ones, with the application of which idea, and with the invention of convenient epicycles, the greater part of the *De Revolutionibus* is occupied. It may further be added, to rectify the vulgar notion regarding the relation of Copernicus to the system of the heavens, that he had no answer to offer to the mechanical objections to his system. Most of them, indeed, were such as could not possibly be met by the mechanical knowledge of the time. One of the commonest was that against the axial motion of the earth, that it was inconsistent with the fact of bodies falling to the points of the earth directly beneath the points from which they are dropped; for this he had no answer, nor could he have, the laws of motion being not yet discovered.

COPERNICIA, kō'pēr-nish'ī-ā. See CARNAUBA PALM.

COPERNICUS (Latinized form of *Koppernick*), NICHOLAS (1473-1543). A celebrated German astronomer, born at Thorn, a Prussian town on the Vistula, at that time belonging to Poland. He was instructed in the Latin and Greek languages at home; in 1491 he was sent to the University of Cracow, where he studied mathematics and other sciences. In 1495 he went to Italy and spent some years in the study of law, astronomy, and medicine, in Bologna and Padua. His natural bent, however, was toward mathematics, the study of which he pursued with passion through all its branches.

Having become enamored of the study of astronomy, he projected a journey to Rome in his enthusiastic admiration of Regiomontanus, who resided there and was then the most illustrious of the astronomers. On his arrival, in 1500, he was kindly received by Regiomontanus. Here his reputation, and the favor of his distinguished friend, led to his being chosen professor of mathematics. He became doctor decretorum at Ferrara in 1503, and in 1505 returned to his native country, where, having entered into holy orders, he obtained through his uncle, the Bishop of Ermeland, a canonry at Frauenburg, in the enjoyment of which he passed the rest of his life. His working day, it is said, he divided into three parts—one devoted to the duties of his office, another to giving medical advice gratuitously to the poor, and the third to study.

Soon after his return to Prussia, he began, in his thirty-fifth year (1507), to apply his fund of observations and mathematical knowledge to correcting the system of astronomy which then prevailed. The result was his *De Revolutionibus Orbium*, a brief account of which is given under COPERNICAN SYSTEM. He completed it in 1530, in his fifty-seventh year. Twelve years, however,

elapsed before he could be persuaded to give his book to the world. Perhaps the strongest motive for his reticence was the fear of the unpopularity which the work threatened to bring him; for many who had heard of the views it advocated doubted if these were in harmony with Scripture. At all events, it is pretty certain that it was his desire to conciliate the Church that led him to dedicate his book, when it was published, to Pope Paul III. By the time the book was actually printed, however, the author was beyond the power of the Church. An attack of dysentery, followed by paralysis of the right side, had destroyed his memory and obscured his understanding, and he is said to have died a few hours after a copy of the labor of his life reached him.

Besides the *De Revolutionibus*, may be mentioned among Copernicus's works a treatise on trigonometry, entitled *De Latribus et Angulis Triangulorum* (Ermeland, 1542); and *Theophylactici Scholastici Simocattæ Epistolæ Morales, Rurales, et Amatoricæ, cum Versione Latina*. He also wrote a work on money, and several MS. treatises from his pen are in the library of the bishopric of Ermeland.

COPHET'UA. An African king who loved and married a beggar maiden, Penelophon. The story is told in a ballad contained in Percy's *Reliques*, and is alluded to in various plays of Shakespeare, and by other writers. Tennyson's *Beggar Maid* gives the legend in modern form.

COPIAPÓ, kō'pyá-pō' (So. Amer. *Copayapu*). The capital of the Province of Atacama, Chile, situated on the Copiapó, 50 miles by rail from its port, Caldera (Map: Chile, C 9). It is regularly laid out and possesses a fine parish church, a bronze statue of Juan Godoy, the discoverer of the Chañareillo silver-mines, and also a provincial high school, a mining-school, and a public library. The town is the centre of a productive mining district and contains machine-shops and smelting-works. Population, in 1895, 9301.

COPING, kōp'ing (from *cope*, variant of *cape*, from Lat. *capa*, cape). The upper or covering course or cop of a wall, generally either overhanging or sloping or rounded, so as to shed the water. It can be of stone, brick, or terra-cotta. In the Middle Ages, where the coping was of heavy stone, it was often ornamented with a circular molding along the top, a stepped slope, and a groove under the lower edge.

COPINGER, WALTER ARTHUR (1847—). An English jurist. He served as president of the Bibliographical Society and became professor of law at Owens College and at Victoria University. Among his numerous publications may be mentioned: *Index to Precedents* (1872); *Title Deeds* (1875); *An Essay on the Abolition of Capital Punishment* (1876); *The Law of Rents* (1886); and *Law of Copyright* (3d ed., 1891).

COP'LAND, JAMES (1791-1870). An English physician. He was born at Deerness, studied medicine at Edinburgh, traveled on the Continent, and subsequently undertook a journey to Africa to investigate the nature of epidemic diseases prevalent in tropical lands. He settled in London about 1818 and was made a member of the Royal College of Physicians. In 1822 he undertook the editorship of the *London Medical Repository*; and, being chosen in that year to deliver the annual oration before the London

Medical Association, he advanced in his lecture a new theory of electro-galvanism. His *Outlines of Pathology and Practical Medicine*, in which he especially treated of the ganglionic nerves and their functions, and proposed a new and more simple classification of diseases, appeared in 1822; the *Elements of Physiology* in 1824, and *On Pestilential Cholera* in 1832. But Copland's most important work was the *Dictionary of Practical Medicine* (1833-58), four closely-printed volumes, to which he devoted the labor of many years.

COPLEY, kōp'li, JOHN SINGLETON (1737-1815). An American historical and portrait painter, born in Boston of Irish parents, July 3, 1737. He received instruction in America from Peter Pelham, a portrait painter, advanced rapidly in his profession, and executed numerous portraits in this country. He traveled much on the Continent, but exhibited mainly in London, where he lived after 1775. He was made R.A. in 1783. Of his large historical paintings, "Charles I. Demanding the Five Members from Parliament" is now in the Boston Public Library. His picture "The Death of Major Pier-son" is in the National Gallery, London. In Buckingham Palace is the portrait of three children of George III. His portraits of prominent Americans are held in high esteem by their descendants for their distinction, dignity, and fine coloring. That of Mrs. Thomas Boylston is in the Memorial Hall of Harvard University. Copley died September 9, 1815, and was buried in Croydon Church, near London. He was father of John Singleton Copley, Lord Lyndhurst. Consult: Amory, *Domestic and Artistic Life of J. S. Copley*, R. A. (Boston, 1882); Perkins, *Sketch of the Life of Copley* (Boston, 1873).

COPLEY, JOHN SINGLETON, Lord Lyndhurst (1772-1863). A British lawyer and statesman, four times Lord Chancellor of England. He was the son of J. S. Copley, R.A., and was born in Boston, Mass., May 21, 1772. While yet an infant, his father removed to England for the practice of his art. He was educated at Trinity College, Cambridge, where he was second wrangler and Smith's prizeman in 1794. In 1795-96, as a traveling bachelor and fellow of his college, he visited the United States, and in company with the French author Volney made a tour which he described in Latin letters to the vice-chancellor of his university. Called to the bar at Lincoln's Inn in 1804, he chose the Midland circuit, but did not achieve financial success until 1812, when his defense of a Luddite at Nottingham established his reputation. In politics he was at first a Liberal, and long expressed sentiments hostile to the Ministry of the day. He ably defended Watson and Thistlewood on their trial for high treason in 1817, and obtained their acquittal. In 1818 he entered Parliament; in 1819 he became Solicitor-General in the Liverpool administration and was knighted, and in 1824 he was promoted to the rank of Attorney-General. In 1826 he became Master of the Rolls. When Canning was charged to form a Ministry in 1827, he offered the Great Seal to Sir John Copley, who was raised to the Upper House as Baron Lyndhurst, and remained Lord Chancellor from 1827 to 1830. In 1831 he became Lord Chief Baron of the Exchequer, which office he exchanged for the woolsack during the brief administration of Sir Robert Peel in 1834-35. In 1835 he led the opposi-

tion to the Melbourne Ministry in the Upper House, in speeches of great power and brilliancy. Lyndhurst's orations and annual reviews of the session did much to reanimate the Conservative Party, and pave the way for their return to power in 1841. He then became Lord Chancellor for the third time, and held the Great Seal until the defeat of the Peel Government in 1846. After that time he took little part in home politics; but his voice was often heard on matters of foreign policy, and in denunciation of tyranny in Italy and elsewhere. He died in London, October 12, 1863. Lord Lyndhurst's high attainments as a lawyer have never been questioned, and his judgments have never been excelled for clearness, method, and legal acumen. In the House of Peers he had few equals among his contemporaries as a brilliant orator and debater. He delivered his last speech in Parliament at the age of eighty-eight with his usual force and ability. Consult Martin, *Life of Lord Lyndhurst* (London, 1883).

COPMANHURST, THE CLERK OF. An alias of Friar Tuck in the Robin Hood tales. Sir Walter Scott alludes to him by this title in *Ivanhoe*.

COPPÉE, kó'pá', FRANÇOIS EDOUARD JOACHIM (1842—). A French poet, dramatist, and novelist. He was born in Paris, January 12, 1842, and was a weak, nervous, sentimental boy, son of a clerk in the War Department. His mother died in his childhood, his father in his youth. He obtained a Government clerkship, but the sadness and trials of early days left deep impress on his later work. Moments that he could spare from office labors were given to poetry, but he first attracted notice by a one-act play, *Le passant* (1869). In the Franco-German War he served in the militia. He had already published three volumes of verse, *Le reliquaire* (1866); *Les intimités* (1868); and *Poèmes modernes* (1869), but first caught the popular ear after the experiences and disasters of the war had prepared him and his public for *Les humbles* (1872). The next six years brought each its volume of verse, *Le cahier rouge*; *Olivier*; *Une idylle pendant le siège*; *L'exilée*; *Les mois*; *Le naufragé*. During all this period he had been producing dramas, collected in four volumes (1873-86). Of these the more noteworthy are *Le luthier de Crémone* (1877) and *Pour la couronne* (1891). His prose tales date chiefly from the eighties. Of these, the best are *Fille de tristesse*; *Henriette*; *Madame Nunu*; and *Le coucher de soleil*. He has told his own story in the essentially autobiographical *Toute une jeunesse* (1890). There is also a series of journalistic essays, *Mon franc parler* (1894). Coppée best deserves study as a poet, for it is the poetic element in his stories and dramas that gives them their charm. He was at first and by instinct an artist in verse, a skilled craftsman, though, perhaps, a little affected; after 1870 his facile suavity yielded to sterner notes in the lyric of democracy, of work, poverty, and self-denial, and of the indignant patriotism of defeat. To this succeeds the gentle idyllic vein with an occasional tragic touch. But whether in prose or verse, he continues the poet of the Parisian workman and the petty trading class. He has happily described himself as "a man of refinement who enjoys simple people, an aris-

toocrat who loves the masses." Consult Lescure, *Coppée, l'homme, la vie et l'œuvre* (Paris, 1888).

COPPÉE, HENRY (1821-95). An American educator and author, born in Savannah, Ga. He graduated at West Point in 1845; served in the Mexican War, and was assistant professor at the Military Academy from 1850 to 1855, when he became professor of English literature and history in the University of Pennsylvania. Here he remained for eleven years, after which he was president of Lehigh University until 1875, and a professor there till his death. In 1874 he was appointed a regent of the Smithsonian Institution. Among his publications were: *Elements of Logic* (1857); *Gallery of Famous Poets* (1858); *Gallery of Distinguished Poetesses* (1860); and *The Conquest of Spain by the Arab-Moors* (1881). He edited two volumes of the Comte de Paris's *Civil War in America* (1876).

COPPER. A metallic element known to the ancients. It is mentioned in the Bible, although the term there used is believed to include also brass and bronze. The prehistoric inhabitants of North America worked the native copper deposits of the Lake Superior region. Specimens of metal-work of pure copper have been excavated at the ruins of Troy. Deposits of copper ore on the island of Cyprus were early mined and smelted by the Greeks, and, according to Homer, the combatants in the Trojan War had no other armor than that made of bronze, which is a mixture of copper, tin, and zinc. The Romans learned of it from the deposits in Cyprus, and it was originally called by them *es cyprium*, Cyprian brass, a term which was subsequently shortened into *cyprium*, and then *cuprum*. It was regarded as the metal specially sacred to Venus, and in the writings of alchemists it is designated by the symbol known as the *looking-glass* of that goddess. Paracelsus and other early chemists believed that when iron precipitates metallic copper from solutions of its salts, a transmutation of iron into copper takes place, and it was not until the seventeenth century that chemists recognized the elementary character of copper. Copper is found, either native or combined, in the following minerals: *cuprite* (the red oxide); *tenorite* (the black oxide); *chalcocite* (sulphide); *malachite* (the green copper carbonate); *azurite* (the blue copper carbonate); *chalcocopyrite* (copper and iron sulphide); *bornite* (black copper and iron sulphide). In addition to these, copper is found in many minerals of a more complex composition, such as *atacamite*, *bourbonite*, *enargite*, *tetrahedrite*, etc. It is also found in sea-water and in mineral waters, in seaweed, in the blood of various animals, in eggs, in flowers, in plants that live in soil containing copper, etc. Minerals containing copper have a wide distribution, but the chief sources of the world's supply are the United States, Spain, Germany, Japan, Australia, Mexico, and Chile. Among these countries which together are responsible for 90 per cent. of the output, the United States stands far in the lead, contributing at present about 55 per cent., while Spain ranks second with little more than 10 per cent. of the total. The world's production of copper increased from 269,615 long tons in 1890 to 487,993 long tons in 1900. The distribution of the output in the latter year is shown in the

following table compiled for *The Mineral Industry*:

THE WORLD'S PRODUCTION OF COPPER IN 1900.

COUNTRIES	Long Tons	COUNTRIES	Long Tons

Italy.....	2,753	United Kingdom...	765
Japau.....	27,840	United States.....	268,229
		Total.....	487,993

Copper-mining has long been carried on in the United States; deposits were worked in Connecticut, New Jersey, and Pennsylvania in the early part of the eighteenth century, and there are records of ore-shipments to England as early as 1731. The beginning of the industry in its present importance, however, may be said to date from the opening of the Lake Superior district in 1844. At this time the output of the whole country was inconsiderable, but increasing steadily as new mines were developed; it reached 10,000 long tons in 1867 and 27,000 tons in 1880. Then, with the extension of railway facilities in the West, the rich deposits of Montana and Arizona became accessible for exploitation and quickly assumed a prominent place in the list of producers. The Lake Superior copper-mining district on the Upper Peninsula of Michigan is remarkable for its unique character as well as for its great commercial importance. The ore is native copper, carrying some silver, but with only small amounts of other impurities. It occurs as a cement, binding together or replacing the pebbles of a conglomerate, as a filling in an amygdaloidal diabase, and as irregular masses in veins. The last-named deposits have yielded immense masses of copper, but, as the veins are irregular and of variable tenor, they cannot be worked at a profit when copper prices are low. The productive mines, at the present time, are located in the conglomerate or in the diabase. These deposits yield an ore averaging from six-tenths to four per cent. copper. With the lower limit, which is reached in the Atlantic mine, the operations must be conducted on a large scale and at a minimum of cost to yield a profit. The

bornite, chalcopyrite, chalcocite, and other sulphides, carrying silver and some gold, occur as fissure veins in granite. Enormous quantities of ore averaging as high as 40 per cent. copper were discovered in some of the mines and resulted in the rapid development of the district. With depth there has been a gradual decrease in values, and the average at the present time is probably less than 5 per cent. The Anaconda Company for several years maintained an output of over 100,000,000 pounds, and still ranks as the largest producer of copper in the world. Next in importance to the Lake Superior and Montana districts are those in Arizona at Bisbee, Clifton, and Globe. The ores, here, are carbonates, oxides, and native copper. Their occurrence is limited to Carboniferous limestone and porphyry. The mining companies have the advantage of working a rich and easily smelted ore, but this is offset by the lack of water as well as of cheap fuel and transportation facilities. Besides the foregoing there are less important districts in California, Colorado, Utah, New Mexico, Tennessee, and Vermont.

The following table, compiled from the statistics of the United States Geological Survey, gives the copper production of the United States by decades, and shows the relative amount of the Lake Superior product:

YEAR	Total production in long tons	Lake Superior	Percentage of Lake Superior product
1845	100	12	12
1855	3,000	2,593	86.4
1865	8,500	6,410	75.4
1875	18,000	16,089	89.4
1885	74,052	32,209	43.5
1895	169,917	57,737	34
1899	253,870	65,803	25.9

Among foreign countries Spain ranks first in the production of copper. Deposits near Huelva, Andalusia, have been worked since Roman times. The ore (pyrites) carries only 2 to 3 per cent. copper, but it occurs in immense deposits and is easily extracted. Chile and Mexico are important copper-producers and give promise of attaining greater prominence in the immediate future.

The great increase in the use of copper in electrical and other industries is shown in the following table, giving, in long tons, the world's production for the decade of 1890-99:

WORLD'S PRODUCTION OF COPPER 1890-1899, ACCORDING TO THE UNITED STATES GEOLOGICAL SURVEY

Calumet and Hecla is the richest and largest of the Lake Superior mines. While this district has been an active producer for more than fifty years, it still has a promising future, owing to the favorable conditions for deep mining. The most productive copper-mines of Montana are situated near Butte. The deposits, consisting of

Copper (symbol, Cu; atomic weight, 63.60) is a red-colored metal with a bright, metallic lustre. The specific gravity of finely divided copper is 8.36; that of hammered copper is 8.95. It is very malleable and may be hammered or rolled into thin leaf or drawn into fine wire. Its melting-point is about 1100° C., and it burns

with a green flame. Copper is an excellent conductor of electricity, and hence its extensive application in the form of wire in electric telegraphy. Metallic copper is used for the manufacture of tubular boilers, for the sheathing of ships, for electrolytes, in coinage, and for numerous other purposes. It is also much used in the form of alloys with other metals, its principal alloys including brass, bronze, bell-metal, speculum-metal, aluminum bronze, and German silver. (See ALLOYS.) Copper combines with oxygen to form four oxides, the *quatroxide* or *sub-oxide* (Cu_2O); *cuprous oxide*, *hemioxide*, or *protoxide* (Cu_2O); *cupric oxide*, or *monoxide* (CuO); and the *peroxide* (CuO_2). Of these, the more important are the cuprous and cupric oxides, which form, with acids, series of cuprous and cupric salts. Cuprous oxide is found native as *cuprite*, or red copper ore, and is used in the production of ruby glass; with the black oxide it forms one of the copper paints used for coating the bottoms of ships. Cupric oxide is found native as *tenorite*, or black copper ore, and is used to make green and blue glass, and as a pigment. Other important compounds include: *Cupric hydroxide*, which is used as a blue pigment by paper-stainers, and when dissolved in ammonia is known as *Schweitzer's reagent*, a solvent for various forms of cellulose, as cotton, wool, linen, filter-paper, etc.; *cuprous chloride*, which is used as a pigment under the name of *Brunswick green*; *cupric chloride*, which finds employment in calico-printing, in the manufacture of methyl violet and other colors. *Cupric sulphate*, or blue vitriol, the most important of the copper salts, may be prepared by dissolving metallic copper or its oxides in sulphuric acid; it forms large, transparent, blue crystals which are soluble in water and find extensive employment in calico-printing, in dyeing, in the preparation of pigments, for the preservation of timber, and in agriculture. Another salt, *cupric nitrate*, is used to some extent in dyeing and calico-printing, as is also *cupric sulphide*. *Cupric carbonate*, which occurs native as the green malachite and as the blue azurite, two minerals almost identical in their composition, is used as a pigment. An anhydrous basic carbonate, too, is used as a pigment, especially for paper-staining, under the names of *Bremen blue*, *Bremen green*, *Verditer blue*, and *Verditer green*. Copper oxide, when dissolved in acetic acid, yields the commercial *verdigris*, which is used in the manufacture of pigments, as an oxidizing agent, in the indigo bath, etc. Many of the copper salts are poisonous, and emetics should be promptly given in cases of poisoning. See ANTIDOTES.

METALLURGY. The extraction of copper from its ore consists, first, in the production of crude copper, and, second, in the refining of this crude product. The extraction of crude copper is performed by (1) dry methods; (2) wet methods; (3) electro-metallurgical methods. Copper obtained by the wet or dry methods is called black copper or blister copper, that is, crude copper, and contains a number of foreign substances which interfere with its use in the arts. It must, therefore, be purified or refined, by special processes, which may be either by the dry or electrolytic methods. The most important ores of copper are the sulphuretted compounds, and next come the oxides, carbonates, and silicates of copper, as well as native copper con-

taining impurities. All these ores, when sufficiently rich, are treated by smelting or by the dry method. Wet methods are employed for ores so poor in copper that they cannot be treated profitably by dry methods; ores containing only one-quarter to one per cent. of copper can, under favorable circumstances, be profitably worked by wet methods.

Dry methods of copper-smelting may be classified as follows: Blast-furnace smelting, also known as the German or the Swedish process; reverberatory smelting, also known as the English process; and the converter or Bessemer process, used only in reducing copper mattes. The blast-furnace or German process, consists in roasting the ores in special appliances, followed by smelting the roasted material with coke or charcoal in blast-furnaces. The series of chemical reactions which take place during these operations are rather too technical to be treated here; the result is copper matte, a mixture of copper sub-sulphide and a portion of the original impurities of the ore. This matte is then commonly enriched by partly calcining it and again smelting it in the blast-furnace; this second process is not always employed. The matte direct from the original smelting or from the second enriching process is roasted and then smelted with siliceous fluxes in addition to the carbon which is used in the first smelting to produce coarse or black copper. In the reverberatory process the ore is first partly calcined, and is then smelted in a reverberatory furnace with a quartz lining, with the addition of siliceous materials or ores if necessary. The resulting matte is then concentrated by being partially roasted and then smelted in reverberatory furnaces. The matte resulting from the concentrating process is converted into crude copper by partial roasting followed by fusion in reverberatory furnaces. The converting process is not applied to ores, but is usually employed to reduce to coarse copper the matte produced by either the blast-furnace or the reverberatory process. It consists in blowing a highly subdivided stream of air under pressure through molten matte which is contained in a pear-shaped or cylindrical converter lined with quartz ore material. The matte to be blown is first melted in cupolas and from them run into the converter. Neither the blast-furnace nor the reverberatory process is commonly used in the pure form, but the two are combined in an attempt to unite the advantages of both.

Wet methods of reduction consist in getting into aqueous solution, by means of suitable solvents, the copper, which must necessarily occur in some combination suitable for solution and of precipitating it from these solutions by means of suitable precipitants. The copper precipitate thus obtained is refined in the dry way. The ores from which copper is extracted in the wet way contain it in the form of oxide, carbonate, sulphate, and sulphide. From all these ores, except the sulphide, the copper can be dissolved with sufficient rapidity by the aid of a cheap solvent, and as the more energetic solvents are too costly to be applied on a large scale, sulphide ores are transformed into some form suitable for solution by cheap solvents such as water, hydrochloric acid, sulphuric acid, or solutions of metallic chlorides. To explain the application and action of the different solvents and pre-

ecipitants with different classes of ores would require entering into details of too technical a character. In all cases, however, the copper is brought into solution as a sulphate or a chloride, and precipitated from solution by means of iron as metallic copper, or, in exceptional cases, by other precipitants which produce compounds of copper.

The electro-metallurgical method of extraction is mostly used in separating copper from alloys of copper and the precious metals. The process is as follows: The ingot of alloy is attached to a conductor from one pole of a dynamo and a sheet of copper is connected to the other pole, and both are immersed in acid solution of sulphate of copper. A current is then passed through the solution between the two poles, the effect of which is to dissolve from the ingot the copper and deposit it on the copper plate, leaving the other metal, which falls as mud to the bottom of the tank. Strictly speaking, this is a refining process as applied to alloys rather than an extracting process, but it has been adapted to the extraction of copper from the ore and matte, although it has not been extensively employed for this purpose. This same process can be used for refining coarse copper, but it is too costly a process for simply purification and is seldom used unless the copper is alloyed with gold, silver, or nickel. The usual method of refining coarse copper is to fuse it in a reverberatory furnace, subjecting it to the oxidizing influence of the air, and then to reduce the cuprous oxide formed by stirring the molten mass with a green wood pole. Consult Peters, *Modern Copper Smelting* (New York, 1899).

COPPER, IN SHIP-BUILDING. A ship which has her bottom sheathed with sheet copper is said to be coppered, or copper-bottomed. The copper so used is in sheets measuring about 48 inches by 14, and weighs 18 to 32 ounces per square foot. The copper is always applied over wood to which it is nailed; at ordinary draught, the line of the copper is usually well above water. It seems to keep the bottom free of serious marine growth, which readily attaches itself to wood and less readily to iron. Coppering checks the formation of marine growth in two ways, as a germeicide—the carbonate of copper formed is a deadly poison to animal and vegetable life—and by exfoliation, the film of copper salt peeling off quite readily, carrying with it the attached growths. When cheapness is more desired than strict efficiency, alloys of copper are used for sheathing. Iron and steel ships are coppered by first putting on a thickness or two of wood planking; this is to avoid galvanic action, which may be serious if the hull and copper are connected. The question of coppering men-of-war is one still unsettled. In the United States Navy very few vessels have been coppered, and the Board of Construction in the Navy Department has decided against coppering. A wooden ship is copper-fastened when the bolts used in her under-water body are of copper instead of iron. Iron bolts rust rapidly when exposed to the action of salt water, particularly when merely damp, or wetted and dried alternately. This seriously reduces the strength of the ship. Copper bolts are eaten away much less rapidly.

COPPERAS (ME. *coprose*, from OF., Fr. *couperose*, from ML. *coporosa*, *euperosa*, *cuprosa*,

from Lat. *cupri rosa*, rose of copper). The name given to the commercial ferrous sulphate, and also applied to the native mineral melanterite.

COPPER BUTTERFLY. Any of several small butterflies, so called in reference to their colors. In England collectors apply the name to those of the family Lycaenidae in general. In the United States it is restricted to the closely related forms of the genus *Chrysophanus*, which, however, is found also in the Old World.

COPPERFIELD, DAVID. See DAVID COPPERFIELD.

COPPERHEAD. A venomous North American snake (*Ancistrodon contortrix*) of the rattlesnake family. It may exceed four feet in length, and has a burnished copper-colored head, hazel-brown (sometimes golden) body, with y-shaped dark blotches on the sides, which usually meet over the back. The belly is marked with round black spots. The belly is tapered, greenish when young, chestnut in age, and has no rattle; nor

THE COPPERHEAD.
(Top of head, and face view.)

does the snake vibrate it against the grass, "and so produce a warning sound not unlike that of the rattlesnake," as is often said, more than is the habit of all snakes when excited. Another unfounded fable is that it waits until you pass and then strikes from the rear. The truth is it is sluggish, moving about mainly at night, and by day seeks to avoid notice and will not bite unless greatly alarmed or provoked; most accidents result from picking it up or touching it with the hand in handling brush or stones in the woods, or clearing swamps. Its bite is as deadly as that of any snake of its size, and the absence of rattling makes it especially dangerous. In the fall it seeks some underground den, where occasionally several have been found entangled together in dormancy; these are usually, if not always, pregnant females. When aroused in spring it seeks swamps and wet meadows, where its food (mainly mice) is most abundant, and where the young are brought forth alive in midsummer. This snake is known from Massachusetts to the Rio Grande, especially in mountainous districts, and is still common in the rocky hills of the Hudson and Connecticut valleys. It has many names, such as 'pilot,' 'red-eye,' 'red adder,' 'copper-belly,' and, in the South, 'cotton-mouth' and 'moccasin'—the last confusing it with its near relative, the true or water moccasin (q.v.). Consult Stejneger, "The Poisonous Snakes of North America," in *Ann. Rept. U. S. Nat. Museum* for 1893 (Washington, 1895). See Plate of RATTLESNAKES.

COPPERHEADS. A name given by their political opponents during the Civil War to those Northern men who, believing the conquest of the South impossible—though not necessarily sympathizing with the Southern cause—strenuously objected to the vigorous prosecution of the war by the administration. In some parts of the country the name was uniformly used as synony-

mous with 'Democrats.' The most prominent and most obnoxious of the 'Copperheads' was Clement L. Vallandigham (q.v.). The name was taken from the copperhead snake, which gives no warning before it strikes. It originated in 1862, and quickly came into general use throughout the North.

COPPER INDIGO. A name given to the mineral covellite, especially when found in spheroidal masses of an indigo-blue color, as is the case at various localities in Thuringia and at Vesuvius. Covellite is a copper sulphate.

COPPERMINE RIVER. A river of northern Canada, so named, in common with the mountains to the west of it, from the metallic products of the vicinity. It rises in Point Lake, Mackenzie division, and enters Coronation Gulf, in the Arctic Ocean, about latitude 68° N. and longitude 116° W. (Map: America, North, G. 3). The Coppermine River, throughout its course of over 300 miles, is little better than a series of falls and torrents.

COPPER-NOSED BREAM (so called from the color of the snout). The blue sunfish, or dollardee (*Lepomis pallidus*), of the Mississippi Valley. See SUNFISH; and Plate of DARTERS AND SUNFISH.

COPPER-PLATE ENGRAVING. See ENGRAVING.

COPPER RIVER. A river of Alaska, which rises near Mount Wrangel, flows at first northwest, and then, turning sharply toward the south, maintains a general southerly direction until it empties into the Gulf of Alaska, in about latitude 60° N. and longitude 145° W. (Map: Alaska, F 3). Its total length is about 500 miles, and it receives a number of tributaries, some of which bring down copper in solution—hence the name of the river.

COPPERSMITH (translation of the native Philippine *tambagut*, which is imitative of the bird's cry). One of several barbets (q.v.) of India and eastward to the Philippines, which are called by the natives by names meaning 'coppersmith,' 'ironsmith,' etc., on account of their sharply accented metallic notes. A familiar species in Natal is called 'tinker-bird.' They are gorgeously plumaged, sluggish, fruit-eating birds, very numerous and noisy, but keeping in the tops of the trees and making only short, heavy flights. The crimson-breasted coppersmith (*Megalana harnacephala*) is one of the best-known and most gaudy.

COPPET, kô'pâ'. A village in the Canton of Vaud, Switzerland, situated on the west bank of the Lake of Geneva, nine miles north-northeast of Geneva (Map: Switzerland, A 2). It has a charming appearance, and is famous as the residence of Madame de Staël. Population, in 1900, 552.

COPPICE. See COPSE.

COP'PINGER, JOHN JOSEPH (1834—). An American soldier. He was born at Queenstown, Ireland, and early joined the Papal Army in the struggle against King Victor Emmanuel. Afterwards he came to the United States, was appointed a captain in the Fourteenth Infantry in 1861, served throughout the Civil War, being brevetted major and lieutenant-colonel for gallantry at Trevillian's Station and Cedar Creek, respectively, in 1864. In 1865 he became colonel

of the Fifteenth New York Cavalry. He served in several Indian campaigns (1866-68), receiving the brevet of colonel (1868), and was promoted to be major of the Tenth Infantry (1879), lieutenant-colonel of the Eighteenth Infantry (1880), colonel of the Twenty-third Infantry (1891), and brigadier-general on April 25, 1895. During the Spanish-American War he was appointed major-general of United States Volunteers, and was placed in command of the Fourth Army Corps, stationed at Camp Wheeler, Huntsville, Ala. He was retired from active service October 11, 1898.

COPPINO, kôp-pē'nô, MICHELE (1822—). An Italian statesman and author. He was born in Alba, Piedmont, and was the son of a shoemaker in that city. He was educated in Turin, where he became professor of Italian literature in 1861 and rector in 1869. He was Minister of Education in the Cabinets of Rattazzi (1867), Depretis, Cairoli (1876-79), Depretis (1884-88), and Crispi (1888-91), in which capacity he introduced several marked improvements and secured the passage of an important law regulating compulsory elementary education. His most important work is the *Parole al popolo italiano* (1848).

COP'RA (Hind. *khoprâ*, from Malayalam *Koppura*). The dried kernel of the coconut. It is much used in India as an ingredient of curries, but its chief value is for the coconut oil which is extracted from it. It is stated that 500 pounds of copra yield 25 gallons of oil.

COPRI'NUS. See FUNGI, EDIBLE, for article and Colored Plate.

COPROLITES (from Gk. *κόπρος, kopros*, dung + *λίθος, lithos*, stone). The fossil excrements of animals found at times in the Paleozoic and Mesozoic strata of the earth's crust. Their true nature was first inferred from their occurrence in the bodies of several species of ichthyosaurus, in the region where was situated the intestinal tube. It has been since shown that they are the voidings chiefly of saurians and also of fishes. They often contain portions of scales, bone, teeth, and shells, the indigestible parts of the food on which the animals lived. Occasionally they may be found exhibiting the spiral twisting and other marks produced by the conformation of the intestinal tube, similar to what is noticed in the excrement of some living fishes, and some specimens have been erroneously described as plants. These peculiar markings obtained for them the name, when their true nature was unknown, of 'larch-cones' and 'bezoar-stones.' Coprolites are found to contain a large quantity of phosphate of lime; and as this forms a valuable manure, the deposits containing them have been of late years largely quarried.

Among the most interesting coprolites are those of spiral form from the Waverly group of Pennsylvania and elsewhere, originally described as fossil algæ and problematic plants under the generic names of Palæoxyris, Spirangium, Spiraxis, and now known to be the dung of ancient shark-like fish such as Cladoseleche. The silicified coprolites of the Lias of Hanover, Germany, have afforded great numbers of radiolarian remains which have been described by Rüst. (See RADIOLARIA.) Consult: Mantell, *Petrifactions and Their Teachings* (London, 1851); id., *Medals of Creation* (London, 1844).

COPSE, or **COPPICE** (OF. *copciz*, from *copcr*, Fr. *couper*, to cut, from OF. *coup*, *caup*, *cop*, *colp*, Fr. *coup*, from ML. *colpus*, blow, from Lat. *colapulus*, Gk. *κόλαφος*, *Koluphos*, bullet, from *κόλαπτειν*, *kolaptein*, to strike). A name given in England and elsewhere to a natural wood or plantation in which the trees are periodically cut before being allowed to attain the size of timber-trees, and where new shoots are permitted to grow from their roots or stumps. Some kinds of trees refuse to send up new shoots; but many—as the oak, birch, chestnut, ash, elm, maple, alder, hazel, and willow—very readily do so, especially when not allowed to attain too considerable a size before being cut over. Copse woods are sometimes planted to vary and beautify the landscape, but more generally with a view to profit, either owing to a great local demand for their produce, or to peculiarities of soil and situation. It often happens that, owing to scantiness of soil or to unfavorable subsoil, oaks and other trees, after growing vigorously for a number of years, are arrested, and remain almost stationary in their growth. In such circumstances, it is advantageous to cut them over early, and to treat the plantation as a copse, the former vigor being again manifested in the young shoots, and the land yielding in this way a greater return to its owner. Oak and birch are much planted as copse wood, in consequence of the demand for their bark; the trees are cut over every twelve to twenty-five years, dependent upon the character of the soil, climate, etc. The largest pieces of the wood are used for making wheel-spokes and for other purposes of timber; the smaller portions are used for making charcoal and firewood. Ash is sometimes planted as copse, with a view to the employment of the wood for handles of implements, hurdles, hoops, etc., the wood of the ash, even when very young, being highly valued for strength and elasticity. Chestnut copses are planted in England to supply hop-poles. Hazel is a very common copse wood, being in great demand for making crates, etc. Besides the cultivation of different kinds of willow or osier for basket-making, in which they are cut over annually, some of the species are cultivated as copse, and cut every five, six, or seven years, for hoops, crates, etc., the species which is deemed most suitable being *Salix cuprea*. *Salix alba* is also commonly employed in copse plantations for larger willow wood. In some countries copse wood is particularly valued for the regular supply of fuel which it affords.

In cutting copse wood, care is taken to dress the stumps so that water may not lodge in them and cause them to rot. The size to which the stems are allowed to attain before being cut, and the frequency of cutting, differ according to the different kinds and the uses intended. Stems more than four inches thick are generally cut with the saw, but smaller stems with a curved bill or axe cutting upward.

COPTIC VERSION. See BIBLE.

COPTIS (Neo-Lat., from Gk. *κόπτειν*, *koptein*, to cut; referring to its divided leaves), or **GOLD-THREAD**. A genus of plants of the natural order Ranunculaceæ. *Coptis trifoliata*, the best-known species, is a native of the north of Europe, Siberia, Greenland, Iceland, and North America. It grows in swamps, and derives its popular name from the golden-yellow color of its long,

thread-like rhizomes. The rootstocks are very bitter, and have some reputation as a tonic. They also contain a yellow dye. The leaves of this plant have three wedge-shaped leaflets, and its leafless stems bear each a solitary, rather pretty, white flower, the petal-like sepals of which have yellow bases.

COP'TOS. See KOPTOS.

COPTS. The name given to the Christian descendants of the ancient inhabitants of Egypt. The Arabic word *Qubt* is probably nothing but a mutilation of *Egypt* (not of *Koptos*, or *Jacobite*). The present number of the Copts is estimated as high as 500,000 by some authorities; other authorities give much lower figures. They are most numerous in the towns of Upper Egypt, south of Assiut. As they usually live in towns and are rarely engaged in agriculture, they present a certain contrast to the Mohammedan peasants. They are as a rule of smaller stature than the latter, and of a lighter complexion. Most of the Copts still wear the black coat and black or blue turban which they were forced to assume in the time of the Mohammedan persecution. They are frequently goldsmiths and money-lenders, and they are also excellent clerks and accountants, although few of them attain to the higher governmental positions. Their character is apt to be marked by sullenness, distrust, and avarice. Although the Arabs owed the conquest of Egypt to the assistance of the Copts, they soon began to oppress them cruelly, taxing them to the utmost, hindering their religious worship, and occasionally even branding them. These persecutions reduced the numbers of the Copts very considerably. A few of them are at present adherents of the Roman Catholic Church; still fewer of the Greek Church. The majority adhere to the old National Church, which originated in a schism after the rejection by the Council of Chalcedon (A.D. 451) of the monophysitic doctrine, the Egyptians not accepting the decision of the council. A long and bitter struggle against the orthodox Byzantine Government arose, lasting until this was replaced by the Arab invasion. The Coptic sect is also called Jacobite, after a prominent teacher of the fifth century. The highest ecclesiastical dignitary of the Monophysitic Church is the Patriarch of Alexandria, who at present, however, resides at Cairo. This patriarch is always chosen from the monks of the Convent of Saint Anthony. By him the Metropolitan of Abyssinia is nominated. The rest of the clergy represent orders similar to those of the Roman Catholic Church. They have twelve bishops. The monks and nuns were once very numerous, but they have in the course of time greatly diminished in number. The elaborate rites of the Church present some rather curious features—e.g. the celebration of the Lord's Supper with unleavened bread dipped in wine, and the strict division of the sanctuary or chancel from the body of the church. The Copts practice circumcision and baptize by immersion. The feasts and fasts, which are very strictly observed, are numerous. Owing to the extreme length of the service and the absence of seats, many worshipers lean on crutches which they bring with them. The Copts are very bigoted, and are especially fanatical against other Christian denominations. Of late, however, the American Presbyterian mission has worked among them with success. At Qus it

converted the Coptic bishop and his whole congregation. The Coptic language, which was spoken from the third to the sixteenth century, but has now become extinct as a vernacular, belongs to the Hamitic group of African languages. It is of great importance linguistically as being the descendant of Ancient Egyptian (see EGYPT, paragraph *Language*), although its own literature is of comparatively small importance. In character Coptic was at first almost monosyllabic, like Egyptian, but it developed at a later period into a highly agglutinate language (q.v.). The morphological side of Coptic was, therefore, little developed, but the phonology became the real basis of the grammatical system for variations of meaning. It gained in consequence a far greater flexibility than Egyptian had possessed, and it also enriched its vocabulary by many Greek loan-words, as well as a smaller number of Latin and Persian terms. Arabic words are significantly lacking in the Coptic vocabulary. The language was divided into five principal dialects. These were the Sahidic or Thebaic and Achmimic in Upper Egypt, the Boheiric, and Memphitic in Lower Egypt, and the Fayumic, or so-called Bashmuric, spoken near Lake Menzaleh in Central Egypt. There were also doubtless a number of dialects of much importance of which no record has been preserved. Of the Coptic dialects the oldest is the Sahidic, whose literature dates from the period extending from the third to the seventh century, comprising annals, translations of the Bible, apocryphal and Gnostic books, legends of the saints, and the like. This oldest literature has been in great part lost, and only fragments remain. The Boheiric dialect, dating from the seventh century, contains by far the greater amount of extant Coptic literature, again in the main translations from the Greek or revisions of the older Sahidic texts, as well as a few translations from the Arabic. It is this dialect which is still used in the liturgy of the Coptic Church. The Fayumic dialect has only very scanty literary remains, which have been discovered lately by excavations in Egypt. The Sahidic is the most harmonious and has more Greek loan-words than the Boheiric, while the Fayumic stands midway between the two. The Coptic script has thirty-one letters, twenty-four of which are Greek uncials (see UNCIAL LETTERS), while the remaining characters, for š (sh), f, h (German *ch*), h, z (French *j*), c (English *ch* in *child*), and ti, are derived from the Egyptian demotic script. After the Mohammedan conquest of Egypt Arabic gradually displaced Coptic, although Coptic is said to have been spoken as late as 1633 by one old man.

Consult: Kircher, *Prodromus Coptus sive Ægyptiacus* (Rome, 1636); *Lingua Ægyptiaca Restituta* (Rome, 1643-44); Tattam, *Compendious Grammar of the Egyptian Language* (London, 1830; 2d ed. 1863); Rosellini, *Elementa Linguae Ægyptiæ sive Copticæ* (Rome, 1837); Peyron, *Grammatica Linguae Copticæ* (Turin, 1841); Schwartz, *Koptische Grammatik* (Berlin, 1850); Uhlemann, *Lingua Copticæ Grammatica* (Leipzig, 1853); Stern, *Koptische Grammatik* (Leipzig, 1880); Loret, *Manuel de la langue égyptienne* (Paris, 1892); Steindorff, *Koptische Grammatik* (Berlin, 1894); Peyron, *Lexicon Linguae Copticæ* (Turin, 1835); Tattam, *Lexicon Ægyptiaco-Latinum* (Oxford, 1835);

Partley, *Vocabularium Coptico-Latinum et Latino-Copticum* (Berlin, 1844).

COP'ULA (Lat., bond). A term employed in logic to designate the word which expresses the relation of subject and predicate in a judgment. Thus, in the sentence "Art is long," *art* is the subject-concept, *long* the predicate-concept, and *is* the copula. The copula is either expressed separately, as by some part of the verb 'to be,' as in the above sentence, or it is contained in the word expressing the predicate—as, "The flower blooms," i.e. *is* blooming.

COPULATIVE (Lat. *copulativus*, from Lat. *copulare*, to join together, from *copula*, bond, from *co-*, together + *apere*, Gk. *ἄπτειν*, *haptein*, to fasten). A term applied to words and sentences that introduce something which adds to the preceding thought, in the same direction. They are sometimes for this reason called cumulative conjunctions. The principal ones are *and* (the typical copulative conjunction), *also*, *as well as*, *likewise*, *moreover*.

Adversative, marking degrees of opposition of thought in the words and expressions connected; as, *but*, *however*, *nevertheless*, *only*, *still*, *yet*.

Causal, introducing a reason or cause; as, *consequently*, *for*, *hence*, *then*, *therefore*.

Alternative, expressing a choice between two or more things; as, *either*, *else*, *nor*, *neither*, *whichever*.

When two conjunctions connect closely related parts of a sentence they are called correlatives, as, *either—or*, *neither—nor*, *whether—or*. The subordinating conjunctions may also be subdivided, the principal classes being place, time, manner, cause, comparison, purpose.

COPY (OF. *copie*, abundance, from Lat. *copia*, from *co-*, together + *opcs*, riches). In the fine arts, a reproduction of a work, whether painting, statue, or engraving, not by the original artist. A copy made by the master himself is called a repetition or replica (in French, a *doublette*). A copy of a statue, or other piece of sculpture, taken from a mold, is not called a copy, but a *cast* (q.v.).

COPYHOLD. A species of estate or right of property in land in Ireland and England, the modern form of the ancient tenure in villeinage, and closely resembling in many particulars the feu rights of Scotland. Copyhold is expressed technically as "tenure by copy of court-roll at the will of the lord, according to the custom of the manor." This means that it is tenure of land, being part of a manor, the title being evidenced by the court-rolls of the manor, and the right of the owner being in conformity with the immemorial customs of the manor. The addition, "at the will of the lord," serves only as a memorial of the derivation of this species of estate from the estates granted in old times to the bondmen, or villeins, which estates were of course resumable at the pleasure of the lord. But the will of the lord is now absolutely controlled by the custom of the manor, which forms the law of the tenure; and as this custom must be immemorial, i.e. extending to the reign of Richard I., no new copyholds can be created.

The custom of each manor may vary in important particulars. In some the copyhold lands are held for life only; in some they descend according to particular rules of their own; in most, however, they descend according to the

ordinary rules of succession. But the custom, whatever it may be, cannot be altered by the holder of the copyhold; he cannot, for instance, entail his land unless the custom warrants it.

One practical distinction of much importance, drawn between freehold and copyhold land, is the mode in which it must be conveyed. An ordinary conveyance is ineffectual in regard to copyhold, and, indeed, would operate, like other attempts to break through the custom which forms the title, as a forfeiture. The owner comes to the steward of the manor, and by a symbolical delivery, according as the custom may prescribe, surrenders the land to the lord of the manor, in order that it may be granted again to such person and on such terms as are desired, and as the custom authorizes. The steward, by a repetition of the symbolical delivery, transfers the copyhold to the person in question in terms of the surrender; and the transferee then pays the customary fine, and takes the oath of fealty. This is called conveyance by surrender and admittance. In the case of an heir succeeding there is no surrender, but there is admittance only upon payment of the customary fine, and it is enforced by a customary penalty. A mortgage is effected by a surrender upon condition that the money is repaid, and the admittance takes place only in event of failure of payment. A copyhold may in like manner be devised by will, the devisee being admitted on the death of the deviser.

The inconveniences and loss accruing through the variety of customs to which copyhold lands are subject led the legislature to provide for their gradual extinction. By consent of the copyhold commissioners, all the services due to the lord of the manor may be commuted for a fixed rent. The lord of every manor is also authorized to enfranchise, or convert into freehold, the copyhold lands by agreement with their owners, and either the lord or the tenant may compel enfranchisement on payment either of a fixed sum, where it is at the instance of the lord, or of an annual rent, where it is at the instance of the tenant, fixed in both cases by the commissioners. See MANOR; TENURE; SERF; and consult: Elton, *Treatise on the Law of Copyholds and Customary Tenures of Land* (2d ed., London, 1893); and Scriven, *Treatise on Copyhold, Customary Freehold, etc.* (7th ed., London, 1896).

COPYING. A term applied in photography to the reproduction of paintings, engravings, manuscripts, maps, etc. A copying camera is usually employed, but any form of camera, where the distance between the lens and plate can be made sufficiently great, may be used for this purpose. The lens should be rectilinear, with a tolerably wide angle of aperture, and slow plates are considered preferable. Care should be taken in developing to use a sufficient restrainer and camera, and suitable color-screens.

It is important that the work or surface to be copied should be placed in a strong light, and exactly at right angles to the axis of the lens, which should be furnished with a *small* stop. These three conditions, it will be seen, are such as are calculated to insure density in the blacks of the negative, freedom from distortion, and sharpness at the edges of the picture. The copying of oil-paintings seems to the amateur, at first sight, to present almost insuperable difficulties, on account of the reflected light from the varnish passing through the lens, and producing

black patches on the negative. This may, however, be completely avoided by the employment of a lens of long focus, which admits of the oblique pencils of light passing off without entering the camera, and suitable color-screens.

In copying transparent negatives, a somewhat different arrangement is required, as will appear from considering the following facts. Every object to be copied may be regarded, for the sake of illustration, as an assemblage of bright points, from each of which divergent pencils of rays are reflected, and suffer refraction on passing through the lens; an engraving or oil-painting is, in fact, in its relation to the sensitive surface, the *source of light*. In a negative, however, many of the parts of which are transparent glass, it is manifest the case is different, for if we suppose the sun or a luminous background to be placed behind the negative, *that* will act as the source of light, and any rays coming therefrom will pass almost directly through those parts of the negative which are bare glass, to the lens; thus producing the same effect as if the transparent parts were opaque, but luminous, and emitted divergent pencils of light. It is necessary, therefore, that the rays should be made to converge at those points where bare glass exists, and this may be accomplished by employing what is called a condensing lens, by which means negatives may be most successfully copied, by placing an artificial light behind it, or still better, by reflected sunshine through it.

Negatives are sometimes copied on glass by direct superposition in the ordinary printing frame, such as is used for printing photographs on paper, being exposed to a gas-flame or other source of light, and then developed in the usual way. See PHOTOGRAPHY.

COPYING MACHINES. The various contrivances for procuring duplicates of manuscripts without the labor of transcribing them may be reduced to two classes. In the one, the writing is first made, and then copied; in the other, the copy and the original are produced at the same time. The essence of the first method is this: In writing the original, an ink is used that is made for the purpose, or common ink is thickened by the addition of a little sugar. When the writing is dry, a damped sheet of thin unsized paper is laid upon it, and over this a piece of oiled paper. The whole is then subjected to pressure, and the damped paper is found to have received an impression of the writing. It is of course the reverse of the original, but the thinness and transparency of the paper allows it to be read right on the other side. The machines for communicating the pressure are of various kinds. Some pass the sheets between rollers like the copper-plate press; others act on the principle of the simple screw-press. A simple plan is to wrap the sheets around a wooden roller of about an inch diameter, lay this upon a table, and roll it under a flat board, pressing all the while. In the second method of copying, prepared blackened or carbon paper is laid between two sheets of thin writing-paper. The writing is traced firmly on the upper sheet, with a steel or agate point, or common black-lead pencil, and the lines are found transferred in black from the blackened sheet to the paper adjacent. By having several of these blackened leaves, a number of copies may be produced at once, so that the method can be employed in duplicating invoices,

newspaper-copy, and telegraph messages. The blackened paper is prepared by saturating it with a mixture of lard and lampblack. The *manifold writer* of Wedgewood, invented in 1806, was on this plan.

The first suggestion for a copying press is said to have been made by Benjamin Franklin, who sanded the yet wet ink of his manuscript with emery and then passed the manuscript between rollers in contact with a soft, highly polished pewter plate. This received the impression from the emery, from which numerous copies could be made by the copper-plate printing process. In 1780, James Watt adopted the simple plan of copying by pressing transparent, bibulous paper against the damp manuscript, so that the writing would be transferred as on a blotter and then read from the other side.

In the *papyrograph* a specially prepared paper is used, upon which words are written with a common pen, but with a special ink. The sheet is then soaked in water, and the ink corrodes the fabric of the wet paper, leaving open lines in place of the writing. The sheet is then used as a stencil, like that prepared by the electric pen. The *mimcograph* is an apparatus invented by Thomas A. Edison, by which stencils of written pages are obtained for the purpose of producing an indefinite number of copies. It consists of a fine-pointed steel stylus, moving over the surface of a sheet of tissue paper, coated on one side with a film of sensitive material. This paper is placed on a plate of steel, known as the baseboard, upon which are cut intersecting corrugations, numbering 200 to the inch. As the stylus moves over the paper it presses it down upon the steel plate, and the fine sharp points puncture the paper from the under side in the line of the writing. This paper, or stencil-plate, is then fastened into a frame, which stretches it tight and smooth, again placed upon the baseboard with a sheet of paper between, and an ink-roller of peculiar construction is passed over its surface, forcing the ink through the perforations upon the paper beneath, thus making a print. The patent for this instrument was applied for in 1878, and there have been numerous improvements since, the apparatus being used extensively in connection with the typewriter, where the stencil is made by the type bars striking a sheet of paper laid against a piece of gauze.

THE BLUE-PRINT PROCESS is peculiarly adapted to the reproduction of drawings and plans, and is used by architects, engineers, and mechanics. Two solutions are prepared: the first contains one part of citrate of iron in four parts of pure water; the second contains one part of red prussiate of potash in six parts of water. When ready for use, equal parts of the solutions may be mixed in a shallow dish, and applied to sheets of paper with a sponge or a camel's-hair brush. Any paper will serve, but that is best which has but little sizing. The solution should be applied and the paper should be dried and kept in the dark. The solutions themselves will keep, separately, in the dark as long as desired, but if mixed soon begin to deteriorate. The drawing or writing to be copied should be made with very black ink, upon paper or tracing-cloth. A photographer's printing-frame, with a plain glass and a back easily removed, is used in the following manner: Place the drawing face down upon the glass; the prepared paper with its face

against the back of the drawing; put the movable back in place, reverse the frame, and expose to light. In direct sunshine, two to seven minutes will be long enough, the time to be ascertained by trial; in diffused light, the exposure must be five to ten times as long. After exposure the print should be immediately washed in clear water; when the chemicals are removed, the sheet is fastened by its corners to a line to dry, and the surface may afterwards be finished by a hot iron, or by pressure. A little practice is needed to secure the best results, and in a good print the lines will be clear white, and the background a deep blue. A light blue background indicates a weak solution, or insufficient exposure; over-exposure is shown by a grayish tint. Clear, quick sunshine will give sharper lines than can be obtained by slow, diffused light. The chemical change is evident; the light causes a reaction between the prussiate of potash and the iron, of which Prussian blue is the product; this occurs whenever the light has not been intercepted by the black lines of the drawing, which therefore appear in white upon an intensely blue and unfading background. Copies may be multiplied at will from negatives on glass or films, from engravings in books, from drawings, or from manuscripts.

BLACK PRINTS on a white ground may be made in the same general way, by using the proper solution in preparing the paper, and sometimes the process is reversed.

COPYRIGHT. The exclusive right of reproducing, by writing, printing, or otherwise, the language and form of a literary or artistic production, and of publishing and vending the same. In this broad sense the right is wholly modern, being based upon a series of statutes, beginning with 8 Anne, c. 19, in England, and with the first Federal Copyright Act passed by the Congress of the United States in 1790.

Copyright in published works exists in England to-day by virtue of the Copyright Act of 5 and 6 Vict., c. 45 (1842). With this must, however, be considered the following amendments: 1844, international provisions; 1847, Colonial act; 1850, designs and sculpture; 1852, international and engravings; 1862, fine arts; 1875, international, for dramatic works; 1875, Canada; 1882, musical compositions; 1886, international; 1887, order in council (confirming the Bern convention); and 1888, musical compositions. In the United States, the matter is one for national and not for State regulation, the power "to promote the progress of science and useful arts by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries" being vested in Congress by Art. I, Sec. 8 of the Constitution. The only effective restriction which this clause places upon the power of Congress to legislate concerning copyrights is the virtual prohibition of the grant of a perpetual right of this character. The apparent limitation of the power to a copyright for 'writings' only, has been removed by judicial construction, the term 'writings' having been held to include maps, charts, music, prints, engravings, drawings, paintings, and photographs, as well as books, written and printed articles, and the like. The power to protect the author of a book in the right to dramatize the same, and the author of a dramatic composition in the right of publicly performing or repre-

senting it, is obviously included within the constitutional provision. But it is not clear whether the protection afforded by the copyright law to sculptors places them in the category of authors of writings or of inventors or designers. However this may be, there is no dispute as to the authority of Congress to enact general copyright legislation.

The law now in force is to be found, in substance, in U. S. Rev. Stat., Tit. 60, Chap. 3. The most important modification of this act is the enactment of March, 1891, introducing international provisions. Further amendments are: 1893, deposit of copies; 1895, limitation of penalty for art infringements; 1897, additional penalty for dramatic infringements; 1897, instituting the register of copyrights; 1897, penalty for fraudulent notice. Under the act of 1870, the supervision of the business of copyrights is placed under the control of the Librarian of Congress. Under the act of 1897, the office of Register of Copyrights was created. The details of the copyright business are managed by the Register, who remains, however, subject to the general supervision of the Librarian of Congress. The statute provides that two copies of the work copyrighted, printed from type set within the limits of the United States (except in the case of musical compositions), shall be deposited in the office of the Librarian of Congress not later than the day of publication of the work in this or any foreign country. The original jurisdiction of all suits under the copyright laws rests with the United States circuit courts. Under the interpretation of the United States courts, copyright in published works exists only by virtue of the statute.

The terms of these acts are very similar to those of the English law, and provide that the author, inventor, designer, or proprietor of any book, map, chart, dramatic or musical composition, engraving, cut, print, or photograph, or negative thereof, or of a painting, drawing, chromo, statue, statuary, etc., being a citizen of the United States or a resident therein, or a citizen of any State which grants reciprocal privileges to citizens of the United States, may secure the sole liberty of printing, reprinting, publishing, copying, executing, and vending them for the term of twenty-eight years, which period may, on the application of the author or inventor, or, if he be dead, of his widow or children, be extended to a further period of fourteen years. The time limit of the first American Act is that specified (for books thereafter printed) in the English statute of 1709, and was originally adopted by analogy from the Statute of Monopolies (21 Jac. I., c. 3), which permitted a royal patent to be granted to any inventor of a new manufacture for the sole working or making of the same for a period of fourteen years, and which is the foundation of our patent laws.

WHAT MAY BE THE SUBJECT OF COPYRIGHT. In order to make clear the claim of a work to copyright, it is necessary that it should be original, but the originality can exist in the form or in the arrangement, as well as in the substance. Corrections and additions to an old work (itself not the property of the compiler) can also secure copyright. The copyright of private letters constituting literary compositions is in the composer, not in the receiver. As to the right of property in lectures, whether written or oral, the Ameri-

can courts have followed the English precedents. The most important English decision on this point is that of *Abernethy vs. Hutchinson* (1801). In *Putnam vs. Meyer* (1886), the New York Supreme Court held that certain tabular lists of anatomical names, arranged in a peculiar and arbitrary manner for the purpose of facilitating the work of memorizing, were entitled to protection. Abridgments and abstracts which can be called genuine and just are also entitled to copyright. There is no record in the United States of a case in which consideration has been given to the question of copyright in irreligious books.

It is to be borne in mind that what is thus protected by law, and thus erected into a species of property, is not the ideas, sentiments, and conceptions of the author, artist, or designer, but the substantial form in which he has embodied them. There is no property in thoughts and feelings, and there can therefore, in the legal sense of the term, be no theft or piracy of ideas. It is the literary or artistic creation, i. e. the form, which is protected, and not the substance. Hence ideas, whether expressed in conversation or in lectures or in copyrighted books, immediately become common property and may be employed by any one who will clothe them in a new and different form from that in which they were communicated to him. But the new form must be substantially different from that of the copyrighted matter. It must not be merely a disguised copy or reproduction of the original, for the law protects the arrangement of the matter as well as the language in which it is conveyed. On the other hand, as it is the financial and proprietary interest, and not the pride of the author, which the copyright law seeks to protect, it is no infringement of his rights to make a fair and reasonable use of a book by way of quotation or otherwise, whether for purposes of criticism or for the private use of the reader. Thus it has been held that "extracts and quotations fairly made, and not furnishing a substitute for the book itself, or operating to the injury of the author, are allowable." Furthermore, as the law is aimed at reproducing a work by printing, publishing, dramatizing, or translating any copy thereof, it is conceived that it is no infringement of the author's copyright to read in public a printed poem or other literary production, though of course it cannot be reprinted in a newspaper or magazine, even as an item of news, without permission. It has, however, been held by the English Courts that the presentation, through reading or through singing, of a copyrighted work to a public which makes payment for the privilege, constitutes an infringement.

It is not necessary that matter shall be literary or artistic in form, nor even that it shall be original in substance, to be entitled to copyright. A translation or dramatization of another's work may be so protected, and so may be an abstract or newspaper report of a speech, a judicial opinion, or a debate. The law extends equally to compilations of the writings of others, to dictionaries, gazetteers, road and guide books, directories, calendars, catalogues, mathematical tables, and the like, the arrangement of the material being protected even though the matter of which it is composed is common property.

There is in the United States no general principle of law conferring the copyright on all pub-

lished works, nor does it arise in favor of an author merely by virtue of his authorship. It is a peculiar privilege, which can be had for the asking, but which is not conferred on those who do not seek it. It is still possible for an author or an artist to dedicate the productions of his genius to the public. Having once done this by publishing his work, he is precluded from setting up an exclusive title to it thereafter. In other words, the steps requisite to secure copyright of any work entitled thereto must be taken in advance of publication. The process of obtaining a copyright is very simple, consisting only in the deposit in the Library of Congress at Washington, not later than the day of its publication in this or any other country, of a copy of the title-page and two copies of the book or other work to be copyrighted, and printing on the book or other work and on all reproductions thereof a notice that the copyright has been secured, together with the date thereof. In Great Britain, on the other hand, copyright attaches, without previous application therefor, in favor of all books, etc., first published in the United Kingdom. The right does not exist and cannot be acquired in favor of works previously published elsewhere. The English statute provides for registration at Stationers' Hall, not as a prerequisite to the existence of copyright, but as a preliminary to a suit for its infringement.

INTERNATIONAL COPYRIGHT. As already stated, copyright is a matter of only national and local concern. The granting of copyright by one nation to the productions of citizens of another has resulted as a slow development from influences that first began to have effect about the beginning of the nineteenth century. (For a historical treatment of this, see **LITERARY PROPERTY**.) At the present time many of the leading States of Europe have granted international copyright, mostly under specific conditions of time or place of publication. In Great Britain, the copyright law now in force is in substance that of 5 and 6 Victoria, c. 45. The international provisions are contained in the acts of 1844, 1852, 1875, 1886, and the order in council of 1887, confirming the Bern convention. The decision given in June, 1891, by the law officers of the Crown that citizens of the United States could secure copyright throughout the territory of the British Empire by compliance with the provisions of the British statute, enabled President Harrison to include Great Britain in the proclamation of July 1, 1891, in the list of States the citizens of which could secure copyright in the United States under the act of March, 1891. The term is for the life of the author and seven years, or for forty-two years from the date of first publication, whichever may be the longer. The Privy Council is given the authority to license the republication of books which after the death of the author the owner of the copyright may have declined to keep in print. There seems to be no record of editions of any books having been brought into the market under this authority of the Privy Council. The law provides that a copy of the first and of each subsequent edition of every book must be sent, on demand, to the following libraries: The British Museum in London, the Bodleian in Oxford, the University Library in Cambridge, the Library of the Faculty of Advocates in Edinburgh, and the Library of Trinity College in Dublin.

The term for art copyright is fixed, under the

act of 38 George III., at twenty-eight years. Copyright in a dramatic production is protected for the same term, of forty-two years (or for the life of the author and seven years), as that accorded to a work of literature. The copyright in letters vests in the writer, except in so far as any particular circumstance may give to the person to whom the letter is addressed, or to his representatives, a right to publish the same. The perpetual copyright of the authorized versions of the Bible and of the Book of Common Prayer (and possibly, adds Stephen, in the text of acts of Parliament) is vested in the Crown. A perpetual copyright in books first issued by the following institutions (unless such books came into the control of the institutions for but a limited term) is vested in the universities of Oxford, Cambridge, Edinburgh, Glasgow, Saint Andrews, and Aberdeen, and also in each college of the universities of Oxford and Cambridge, in Trinity College, Dublin, and in the colleges of Eton, Westminster, and Winchester. The book of registry of copyrights is kept at Stationers' Hall. There is no obligation to make registration, excepting that such entry must be made before the owner of the copyright is in a position to take action in regard to any alleged infringement. A bill for the reshaping of the British copyright act, known as the Monkswell Bill, is now (1903) on the calendar of the House of Lords. It was originally introduced in November, 1886, at the instance of the British Society of Authors. It was reintroduced, with some material modifications, in 1900. Under this bill, the term of copyright is extended to the life of the author and thirty years.

The provisions controlling copyright in Germany, including Alsace-Lorraine, date from 1871. The statute of June 19, 1901, now in force, made no material changes in the conditions of copyright, but instituted detailed regulations for the relations of authors and publishers, covering the *Verlagsrecht*. There are also acts of January 9, 1876, for sculpture, and January 10, 1876, for photographs. The copyright relations with the United States are defined in the convention of January 15, 1892. The term is for the life of the author and for thirty years thereafter. Copyright registry for the Empire is kept in Leipzig. The protection of the law is afforded to the works of German citizens, whether published inside or outside of the Empire. Under this same law, the works of aliens receive protection provided that they are published by a firm doing business within the Empire. In Italy literary copyright rests upon the statute of September, 1882. The term is for the life of the author and for forty years after his death, or for eighty years from the publication of the work. In Austria the term of literary copyright is thirty years after the author's death. In Belgium copyright (formerly perpetual) is now limited, under the law of 1886, to the life of the author and fifty years thereafter. In Holland, under the law of 1881, the term is for fifty years from the date of publication. In Hungary the term is the life of the author and fifty years. In Japan, under the law of March 3, 1899, the term is the life of the author and thirty years. In Russia the term is for the life of the author and fifty years. In Spain, under the act of 1879, the term is for the life of the author and eighty years.

The United States International Copyright Act

has greatly narrowed the beneficial operation of the law by a provision that a foreign book or lithograph to secure its benefits must be manufactured in this country. Consult: Copinger, *Law of Copyright in Works of Literature and Art* (3d ed., London, 1893); Scrutton, *Laws of Copyright* (3d ed., London, 1896); Drone, *Treatise on the Laws of Property in Intellectual Productions* (Boston, 1879); McGillivray, *The Law of Copyright* (London and New York, 1902); Birrell, *Lectures on Copyright* (London and New York, 1901).

COQUELIN, kô'klân'. BENOÎT CONSTANT (1841—). A distinguished French actor, known as Coquelin Aîné, to differentiate him from his younger brother, Coquelin Cadet. Born at Boulogne-sur-Mer, January 23, 1841, he early showed such dramatic gifts that he was sent to the Paris Conservatoire (1859). The following year he took the second prize for comedy, and made his début on the stage of the Comédie Française in *Le dépôt amoureux*. Later he appeared with brilliant success in *Le mariage de Figaro*, *Le malade imaginaire*, *Le misanthrope*, *Le barbier de Séville*, and other pieces in the classic repertoire. In modern plays he was no less effective, and he speedily became a great popular favorite. His versatility is considered remarkable. Among his creations have been rôles in *Le lion amoureux*, *Gringoire*, *Paul Forestier*, *Les faux ménages*, *Le monde ou l'on s'ennuie*, and *Denise*, to mention only a few. He had been elected a *sociétaire* in the Théâtre Français as early as 1864, but in 1886 he retired and made an extensive tour abroad. In 1888 he visited America. At the end of 1889 he returned to the Théâtre Français, where as a salaried member of the company he remained till 1892, creating among other parts that of Labussière in *Thermidor* (January, 1891). In 1893-94 he appeared again in the United States. His engagement in 1895 at the Renaissance Theatre in Paris led to a lawsuit from the Comédie Française, in which he was condemned to pay damages. In 1897, at the Porte-Saint-Martin, he produced Rostand's *Cyrano de Bergerac*, which has become his most celebrated character. In 1899 came his Napoleon in *Plus que reine*. In 1900-01 he visited America once more, this time in company with Sarah Bernhardt, to whose Due de Reichstadt he played Flambeau in Rostand's *L'inglot*. M. Coquelin is known also as a writer and lecturer, among his publications being: *L'Art et le comédien* (1880), which has been translated into German, and into English (as *The Actor and His Art*); *Les comédiens, par un comédien* (1882); *L'Arnolphe de Molière* (1882); and *L'Art de dire le monologue*, in part by his brother, Coquelin Cadet (1884).

COQUELIN, ERNEST ALEXANDRE HONORÉ (1848—). A French actor, known as 'Coquelin Cadet,' to distinguish him from his more famous elder brother, Constant Coquelin. He was born May 16, 1848, at Boulogne-sur-Mer, and in youth was for a time in the employ of the Northern Railway, but went, in 1864, to Paris to enter the Conservatoire and make a career upon the stage. He was graduated three years later with the first prize in comedy, and made his début at the Odéon. In 1868 he appeared with his brother at the Théâtre Français, and he continued there till 1875, playing in *Les plaideurs*, *Le barbier de Séville*, *Les femmes savantes*, *Le mariage de*

Figaro, *L'arare*, and other well-known pieces. In 1875 he went to the Variétés, but returned to the Comédie Française in the following year, and in 1879 he became a member of the company. Among the principal plays in which he has created parts are: *Le sphinx*, *L'ami Fritz*, *Les corbeaux*, *Denise*, and *L'héritière*. M. Coquelin Cadet owes much of his reputation to the success of the numerous monologues of which he is the author, and in the rendering of which he has gained great popularity in the salons of Paris. He has written also, under the pseudonym of Pirouette, *Le livre des conralescents* (1880); *Le monologue moderne* (1881); *Fariboles* (1882); *Le rire* (1887); *Pirouettes* (1888); and other humorous volumes.

COQUELIN, JEAN (1865—). A French actor, son of Constant Coquelin (q.v.). He studied under his father, and in 1890-92 was engaged at the Théâtre Français. In 1897 at the Porte-Saint-Martin he created the rôle of Raguenau in *Cyrano de Bergerac*. He has also played Lubin in *Thermidor*, Verdet in *Le gendre de M. Poirier*, and Talleyrand in *Plus que reine* (1899).

COQUEREL, kô'krel'. ATHANASE LAURENT CHARLES (1795-1868). A French theologian. He was born in Paris, and studied theology at Montauban. In 1818 he became pastor of the French church in Amsterdam, and in 1830 was induced by Cuvier to return to Paris, where he won high reputation as a pulpit orator. An earnest opponent of the doctrine of predestination, he drew upon himself the violent attacks of the orthodox Calvinists, and propagated his opinions in three periodicals founded by him. He was elected a member of the Constituent Assembly in 1848, and later also of the Legislative Assembly. Among his writings may be mentioned *Réponse au livre du docteur Strauss: La vie de Jésus* (1841), which was translated into English; *Biographie sacrée: L'orthodoxie moderne; Christologie* (1858). His son ATHANASE (1820-75) also won distinction as a pulpit orator and was prominent as the leader of liberal Protestantism in France. He wrote *Libres études* (1867) and *Jean Calas et sa famille* (1870).

COQUES, kôk, or **COCKX**, GONZALES (1618-84). A Flemish painter, born in Antwerp. He studied under the third Pieter Breughel, and afterwards with David Ryckaert the elder. His works were greatly admired, and he received commissions from many of the notable persons of the time. He married the daughter of Ryckaert, and was president of the Antwerp Guild from 1665 to 1666 and from 1680 to 1681. His portraits usually depict a family group engaged in different tasks, the backgrounds often painted by other artists. They are very small, but a certain elegance of manner has given him the title of 'Van Dyck in miniature.' Among his chief works are "The Scholar and His Family," in the Cassel Gallery, and his own "Family" in the Dresden Gallery, and a portrait of Charles I. of England.

COQUETTE, kô-kët' (Fr. *coquette*, flirt, fem. of *coquet*, gallant, little cock, from *coq*, cock; so called from its fanciful plumage). A kind of humming-bird, of which a dozen species are known, constituting the genus *Lophornis*, and scattered from the lowlands of Mexico to and throughout the Amazon region. The *coquettes* are small, crested, and exquisitely adorned with spangled frills on each side of the neck; the

tail is long, graduated, and capable of wide spreading; the colors are unusually varied and brilliant, and the whole effect of the bird is peculiarly gem-like. Two species are illustrated on the Plate of HUMMING-BIRDS. See also CROSS-FERTILIZATION.

COQUI, kō'kē (probably of West Indian origin). A West Indian tree-frog (*Hylodes Martinicensis*) remarkable for undergoing its whole metamorphosis within the egg. "The pairing takes place on land in the months of May and June, when the female lays about twenty eggs, which are enveloped in a foamy mass and glued onto a broad leaf, or hidden in the axillæ of iridescent plants. The mother seems to remain in the neighborhood watching the eggs, which are large, measuring four to five millimeters in diameter . . . pale and straw-colored. The embryo develops neither gills nor gill-openings, but a large, well-vascularized tail, by means of which, being immersed in the watery fluid contained within the egg, it seems to breathe. After twenty-one days the tadpole, having used up all the available yolk and fluid, and most of its own tail, bursts the egg-shell and hops away as a little frog." Consult Gadow, *Cambridge Natural History*, vol. viii. (London, 1901).

COQUILLA (kō-kwil'la) **NUT** (Sp. *coquillo*, cocconut). The fruit of a palm, *Attalea funifera*. It forms an article of export from South America, being used to a considerable extent in America in the manufacture of buttons and in turning, as for making knobs of walking-sticks. It is also called vegetable ivory. See **ATTALEA**.

COQUIMBO, kō-kēm'hō. A seaport in the Province of Coquimbo, Chile, about ten miles south of La Serena, the capital of the province, with which it is connected by rail (Map: Chile, C 10). It has a good harbor, with a lighthouse equipped with a revolving light, and customs office, and is an export centre for ores, chiefly copper. It is the residence of a United States consular agent. Population, in 1895, 6270.

COQUIMBO. See BURROWING OWL.

COQUINA, kō-kē'nā (Sp., shellfish, from Lat. *concha*, Gk. *κόγχη*, *kōnchē*, shell, Skt. *śaṅkha*, conch-shell). A porous variety of limestone which occurs in Florida. It is made up of cemented fragments of shells and corals that have been cast about by the waves and accumulated in some sheltered basin of the sea-bottom. Coquina is extensively used for building-stone in Florida and the Bermudas.

CORACLE (Welsh *coragl*, *curiagl*, coracle, from *corwg*, *curiwig*, Ir. *curachan*, skiff). A boat of oval shape with a frame of wicker-work covered with hide or oiled cloth, which covering is removed when the boat is not in use. The ordinary coracle will carry comfortably only one

man, but it is so light that he can easily carry it on his back to a place where it may be safely deposited. See CURRACH.

CORAIS, kō'rā', ADAMANTIOS. See CORAY, ADAMANTIOS.

CORAL (OF. *coral*, Lat. *corallum*, *corallius*, from Gk. *κοράλλιον*, *korallion*, coral; of uncertain origin, possibly a loan-word from Heb. *gōrāl*, small stone). A calcareous or horny secretion or deposit of many kinds of polyps of the class Anthozoa, which assume various and often beautiful forms. Millepore 'coral' is produced by polyps of the class Hydrozoa. (See MILLEPORE.) The coral-producing polyps form colonies which increase by gemmation, young polyp-buds springing from the original polyp, sometimes indifferently from any part of its surface, sometimes only from its upper circumference, or from its

STRUCTURE OF A SIMPLE CORAL.

1. Diagrammatic cross-section of a coral; the black part represents the stony outer wall (theca) and partitions (septa); the open lines, the fleshy lining and partitions (mesenteries). 2. Semi-diagrammatic view of a coral; *a*, a septum; *b*, a tentacle; *c*, position of the gullet; *d*, theca; *e*, mesenteric filaments; *f*, epitheca; *g*, basal plate.

base, and not separating from it, but remaining in the same spot, even when the original or parent polyp has ceased to exist, and producing buds in their turn. The calcareous or horny deposition begins when the polyp is single, adhering to a rock or other surface, on which the coral grows or is built up, the hard deposits of former generations forming the base to which those of their progeny are attached. One layer of the chambers, of which the greater number of corals are composed, occasionally surrounds another like the concentric circles in the wood of exogenous trees; one layer is sometimes deposited above another; the whole structure sometimes branches like a shrub, spreads like a fan, or assumes the form of a cup, a flower, or a mushroom. Under the common name coral are included many species, also designated madrepores (q.v.), and some have received other names derived from peculiarities of their form and appearance, as brain coral, etc. This last forms into large rounded masses furrowed with winding depressions like the convolutions of a man-

REPRESENTATIVE FORMS OF CORALS.

1. Beginning of a colony (of Zoanthus), showing simplest mode of budding from a creeping stolon (*st.*). 2. Sea-pen or pennatulid (*Virgularia mirabilis*); a portion of the stem in the living condition; *a*, the same, dead. 3. Organ-pipe coral (*Tubipora musica*); skeleton of a colony showing two living polyps; *a*, manner of growth, by budding from the lateral shelf-like expansions. 4. Red or 'precious' coral (*Corallum rubrum*); part of a living colony. 5. Part of a fan-coral (*Rhipidogorgia flabellum*), showing the polyp cells. All the foregoing are Alcyonarians. The following are 'true' or 'stony' corals. 6. *Syringopora ramulosa*; fossil in the Carboniferous of Germany. 7. *Halysites catenularia*; fossil in the Silurian of Gotland. 8. *Favosites polymorpha*; fossil; Devonian; *a*, corallites, enlarged, two of them broken open and showing tabulae. 9. Cup-coral (*Cyathophyllum cespitosum*); fossil in the Devonian of Germany. 10. Cup-coral (*Cyathophyllum hexagonum*); fossil in the Devonian of Germany. 11. A madrepor (*Madrepora aspera*); the lower part shows the living polyps, the upper part naked (dead) corallum, at the summit of a bushy branch. 12. Part of a branching coral (*Dendrophyllia*) in which a common calcareous stem (*co.*, coenenchym) is formed by calcification of the coenosarc (*cs*) and gives origin to the individual corallites (*co*); *p*, an active polyp. 13. Star-coral (*Astraea*), an example of the massive type of reef-corals, in its living condition.

malian brain or a meadow brook, hence its technical name is Meandrina. In the greater number of kinds, besides the plates which form and separate the polyp-cells, and which are variously arranged, there is a more solid internal or central part, formed by the additional deposition of matter at the bottom of each polyp-cell, or from the common living part in which the polyps are united. The calcareous framework is sometimes further strengthened by a greater or less mixture of horny animal matter with the purely calcareous substance.

Kinds of Corals.—Corals are roughly classed under two heads, the horny corals and the lime or stone corals. The former consist chiefly of a horny secretion from the polyps, which may include also separate particles of lime, while the stone corals consist almost wholly of lime firmly united in a solid mass. No sharp line can be drawn between these two groups, for all possible gradations can be found. The Antipatharia and Aleyonaria as a rule have a horny skeleton, while the millepores and madrepores are almost wholly limestone. The polyps of the common red or precious coral (*Corallium rubrum*) belong to the suborder Aleyonaria (q.v., for illustration); but the central axis in this and other corals forming the family Corallidæ is quite solid, and is produced in concentric layers by the living gelatinous substance which envelops it like the bark of a tree, and from which the polyps project like buds, or, when their tentacles are expanded, like little flowers. Another aleyonarian coral of more than usual interest is the 'organ-pipe' coral (Tubipora) in which no central axis fills in behind the polyps, but the chambers in which they live remain as open, elongated tubes, crowded together side by side to form a solid mass. Its polyps are violet or grass-green, but the coral itself is red or purplish. These corals are found in the Indian and Pacific oceans. Many of the madrepores have the whole calcareous framework covered, as in the Corallidæ, by a gelatinous living substance which unites all the polyps. The whole living part soon decomposes and disappears, when the coral is taken out of the water, in some species almost immediately running from the calcareous part as a watery slime.

Utilization.—Red coral—so much admired for its fine color and susceptibility to a high polish, and much used for ornamental purposes—is chiefly obtained from the Mediterranean, in some parts of which extensive 'fisheries' are carried on. It is brought up from considerable depths by means of a sort of grappling apparatus dragged after a boat or boats, the pieces being broken from the bottom by beams of wood which are sunk by weights and then entangled among bemp. Red coral has a shrub-like branching form and grows to the height of about one foot, with a thickness like that of the little finger. Much of the coral of the Mediterranean is exported to India, but red coral is also obtained in the Red Sea, the Persian Gulf, etc. Black coral (Antipathes), the axis of which is more solid, is still more highly prized. Coral was known to the ancients, and was used for ornamental purposes by the Gauls.

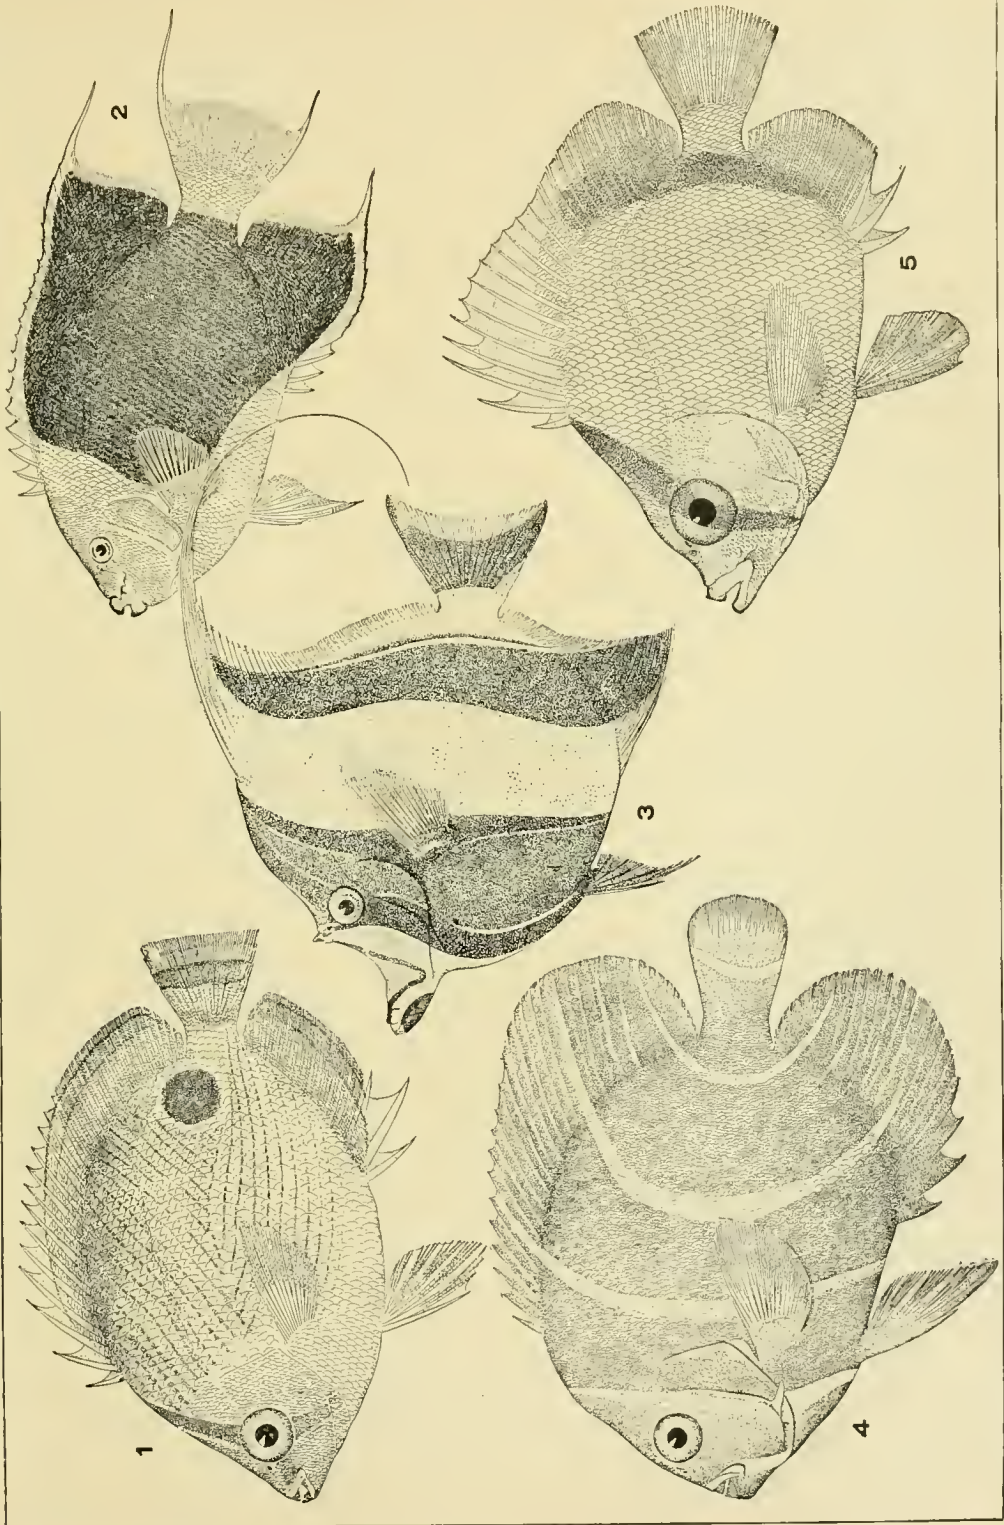

Reefs.—The formation of coral reefs and islands is one of the most noteworthy results of the action of coral polyps. Many kinds of polyps are concerned in the building of a reef, but the

growth is mainly dependent on the stone corals. Reef-building corals only flourish in clean, fresh sea-water, which is not over 125 feet in depth and never is cooler than 68° F. They are consequently confined to the tropics and to shallow water, and never thrive near the mouths of rivers. Although reef-building corals are not found on the coast of the United States north of Florida, some species of coral occur much further north. Even on the coast of New England there is to be found quite commonly a true stone coral (*Astrangia Danaë*), the polyps of which when expanded are large and very beautiful.

Fossil Forms. Among the fossil corals only those belonging to the Anthozoa are of importance, those of the Hydromedusæ either not appearing until the Mesozoic, and then but sparingly (for fossil Hydrocorallinæ and Tubulariæ, see CELENTERATA), or not being clearly recognized as to their systematic position and only provisionally referred to the Hydrozoa. (See STROMATOPORA and GRAPTOLITE.) The Anthozoa appear in the Cambrian rocks with the Archaeocyathinæ, forms of peculiar structure and uncertain relationships. In the Upper Silurian period they have become the most important fossils, as well in number of individuals as in diversity of structure and importance as rock-building organisms. They continue thus throughout geologic times, and are hence of great importance to the paleontologist and geologist. As they are also objects of great beauty, they are much sought by collectors and dealers. Especially rich and famous are the fossil coral faunas of the Silurian of North America and Gotland; the Devonian of the Helderbergs of New York, the Falls of the Ohio, and the Rhenish provinces; the Jurassic formations of Middle Europe and the Tertiary beds of northern Italy.

The Anthozoa are divided by Haeckel into the sub-classes Tetracoralla, Hexacoralla, and Octocoralla, according to the number of their septa, which were considered to be multiples of these figures. The Tetracoralla comprise, together with the Tabulata, the Paleozoic corals; the Hexacoralla and Octocoralla, the Mesozoic and later forms. Recent investigations on the embryology of the Hexacoralla and thecal structure of the Tetracoralla (Dr. M. Ogilvie) seem to demonstrate that these divisions are artificial, that the tetrameral system is only an ancestral feature strongly marked in certain of the old families (Cyathophyllidæ, Zaphrentidæ, Cyathaxonidæ), while hexamerous symmetry is but one of many forms of radial symmetry. The Anthozoa are therefore at present divided into but two sub-classes, according to Ray Lankester: the Aleyonaria or Octocoralla, and the Zoantharia. None of the fossil aleyonarians, which with doubtful forms do not appear till the Mesozoic, are of importance; the Paleozoic Heliolitidæ, which are referred with doubt to this sub-class, are quite abundant in the Silurian and Devonian rocks.

The sub-class Tabulata, of Milne-Edwards and Haime, comprising common and important Paleozoic genera, such as Favosites, Aulopora, Syringopora, Halysites, and Chætetes, which was long considered as a distinct sub-class characterized by the slight development of the septa and the presence of numerous tabulæ, has now been broken up; it having been recognized that some families belong to the Octocoralla, others (Favositidæ, Syringoporidaæ, Halysitidæ) exhibit close relationships to the Hexacoralla, and

1. CHÆTODON CAPISTRATUS.
2. HOLACANTHUS TRICOLOR.
3. ZANELLIUS CORNUTUS.
4. POMACANTHUS ZONISPECTUS.
5. CHÆTODON OCELLATUS.

others (Chætetidæ, Monticuliporidæ) are even placed by some authors, as Ulrich, among the Polyzoa. All these very primitive groups of tabulate corals played important rôles as Paleozoic reef-builders.

Bourne, "The Anthozoa," in Lankester's *Treatise on Zoology*, part ii. (London, 1900).

CORALBERRY. See SNOWBERRY.

CORAL-FISH. A name given in a general way to various tropical fishes of the families Chætodontidæ and Pomacentridæ, because they frequent submarine coral growths. All are much compressed, high-backed fishes of brilliant hues; and most of them are marked with vertical black bars, and possess filamentous appendages upon the fins and tail. They remain among the branching corals for safety, and are further protected, apparently, by the curious pattern of their coloration. Many species abound in the waters from Bermuda to Brazil, where several species are known as 'angel-fishes.' All are small, but excellent eating.

CORAL ISLAND AND CORAL REEF. An island or marine ridge formed from the petrified skeletons of coral polyps. They are numerous in the warmer portions of the Pacific and in the Indian Ocean, where the growth of coral goes on with great rapidity, occurring to a lesser extent in the Gulf of Mexico and along the Atlantic shores of the West Indies. The coral islands and reefs may be classed, according to their general form, into fringing reefs, barrier reefs, and atolls. *Fringing reefs* are closely attached to the shore line of an island or land mass and extend outward as a submarine platform. *Barrier reefs* lie at some distance from the land, the intermediate space being occupied by a shallow lagoon of salt water. Usually some parts of the barrier rise above the level of the ocean as islets which support a scanty vegetation, while the position of the submerged reef is indicated by a line of breakers. An excellent illustration of this type is the Great Britain Reef of Australia, 1250 miles long, lying off the east coast of Queensland. *Atolls* (q.v.) are of rude circular form, inclosing a lagoon, but without any visible land to which the reefs are attached. Their presence is made known by a girdle of breakers and by wave-formed islets on which the cocoanut-palm and a few other tropical plants grow. The central lagoon of placid, transparent water is usually less than 300 feet deep, and when there are passages through the reef it constitutes a safe harbor for ships. Soundings have shown that the slope of the bottom is gentle in the interior, but very steep on the seaward side of the reef, indeed being sometimes almost perpendicular. The Pelew Islands of the Caroline Archipelago, the Low Archipelago in the Pacific, and the Læcædive and Maldivé island groups in the Indian Ocean, exhibit many examples of atolls.

FORMATION OF REEFS. The great masses of coral rock have been built up by the continuous growth of various genera and species of corals, which secrete carbonate of lime dissolved in the sea-water. The coral polyps flourish only under

certain conditions; their growth requires clear, warm, salt water, an abundance of food, and a water-depth of not more than twenty fathoms. They cannot live in muddy or brackish water, or in regions where the mean temperature for any month falls below 68° F. The polyp also does not grow above the level of the lowest tides. As to the rate of growth of coral many observations and estimates have been made. Some species build up a reef as rapidly as three inches per year, others increase less than one inch in the same time. Alexander Agassiz estimates that the corals on the Florida coasts would construct a reef from the depth of seven fathoms to the surface in a period of from 1000 to 1200 years.

Under the special conditions necessary for the growth of coral it is a matter of interest to discover by what means the reefs and atolls have been formed, that often rise from depths of several hundred and even of thousands of feet. Darwin, who recognized the fact that shallow water was necessary for the living polyp, inferred that the sites of the reefs must have undergone a gradual subsidence, corresponding to the growth of the reef upward. According to his theory, the colonies of polyps first settled along the shores of an

FIG. 1.

island, where after a time a fringing reef would be formed (Fig. 1). Then if the ocean floor subsided at a sufficiently slow rate to permit the growth of the coral to be continued on the outward side of the reef, the water-channel would gradually widen and deepen and a barrier reef (Fig. 2) would be formed, which, after a long

FIG. 2.

interval, upon the submergence of the entire island, would give way to an atoll (Fig. 3). This

FIG. 3.

simple explanation, first advanced by Darwin in 1835 and afterwards elaborated by J. D. Dana, found wide acceptance among geologists. It was soon discovered, however, that in certain cases the theory of submergence did not conform with the actual conditions. Semper, in 1868, directed attention to the Pelew Islands, where the sea floor and the reefs built thereon have actually

undergone elevation. Later, Murray pursued the study of the question still further and was able to show that reefs do not necessarily require a sinking shore for their formation, but they may grow on a stable foundation such as a submarine bank, raised to near sea-level by accumulation of fossil organisms, or the slopes of a volcanic island. After becoming established in such localities the corals continue their growth outward, and at the same time wave-action washes down debris from the reef to the bottom, forming a platform for their further activity. In case the original foundation was above sea-level the projecting portion may have been cut down by breakers. The solvent action of water would remove the dead coral from the interior of the reef and thus excavate a basin to be occupied by the lagoon. Both theories of reef-building are probably to be accepted as valid, and each must be tested by actual conditions before its application in any particular instance can be determined.

(Edinburgh, 1880); Agassiz and Pourtales, *Monograph of the Corals of Florida* (Cambridge, Mass., 1871); Heilprin, *The Bermuda Islands* (Philadelphia, 1889). See ATOLL; CORAL.

COR'ALLI'NÆ, or **COR'ALLINE ALGÆ** (Lat. nom. pl. fem. of *corallinus*, made of coral, from *corallium*, *corallius*, coral). A group of red algae (Rhodophyceæ, q.v.), distinguished by the calcareous incrustations secreted by the thallus. The thallus is branching, usually articulated, and, with its limestone deposits, forms stony masses like those of the branching corals with which they are often associated. Coralline are important rock-making organisms in some formations, especially of Tertiary age, such as the granular limestone of the Paris basin, the lower Eocene of Ariège, and the nummulitic limestone of the Alps. The genus *Corallina* itself, now abundant, was rare during Tertiary time. Lithothamnium, however, appeared in Jurassic time, extending through the Cretaceous, was very abundant during the Tertiary, and has persisted to the present era with little change of its characters. Consult: Gümbel, "Die sogenannten Nulliporen, etc." *Abhandlungen der königlich bayerischen Akademie der Wissenschaften*, vol. ii. (München, 1874); Unger, "Beitrag zur näheren Kenntniss des Leithakalkes," *Denkschriften der Kaiserlich-königlichen Akademie der Wissenschaften zu Wien*, vol. xiv. (Vienna, 1858); Zittel and Schimper, *Traité de paléontologie*, part ii., *Paléophytologie* (Paris, 1891). See ALGÆ.

CORAL SEA (so named from its numerous reefs). A section of the Pacific, stretching between Australia on the west and the New Hebrides on the east (Map: Australasia, G 4). Soundings in 1874 gave an extreme depth of 14,700 feet.

CORAL-SNAKE. A poisonous serpent of the genus *Elaps*, common in tropical America, and

also represented in Africa, so called because coral-red is its prevailing color. There are many species, each marked by some different arrangement of black and yellow rings; the epidermis is also iridescent, probably due to laminations on the scales, and no more beautiful snakes exist. (See Plate with article SNAKE.) All are

CORAL-SNAKE OF FLORIDA.

small, of terrestrial habits, and provided with a poison apparatus sufficient for the killing of small animals and birds, but rarely fatal to man. A representative species (*Elaps fulvius*) is well known from Mexico to South Carolina, and common in Florida, as the 'coral-snake,' 'American cobra,' 'garter-snake,' and 'harlequin;' it is the only poisonous snake, not crotaline, in the United States, and, though small and gentle, is not safe to handle. Consult: *Report United States National Museum* (Washington, 1893), and Males and Urich, "Serpents of Trinidad;" in *Proceedings Zoological Society of London* (London, 1894). See CYLINDER-SNAKE.

COR'AM, THOMAS (c.1668-1751). An English philanthropist, born at Lyme Regis, Dorsetshire. His father was a merchant captain and he was probably a shipwright by profession. He lived some time in Taunton, Mass. (c.1694-c.1716), and then settled in London about 1720. He was constantly interested in philanthropic schemes, particularly in the establishment of the Foundling Hospital, which was accomplished after many years of struggle. The institution was opened in Hatton Garden in 1741. Coram was also a promoter of the English settlements in Georgia and Nova Scotia. In later life he lost most of his fortune, and at his death was in possession of an annuity from the Government. He was buried in the chapel of the Foundling Hospital. One of Hogarth's best portraits is that of Coram, which has hung in the hospital since its presentation by the painter (1740).

CORAM'BIS. In Shakespeare's *Hamlet*, the name given in the quarto edition of 1603 to the character afterwards called Polonius.

CORANACH, kōr'ā-nāk, **CORONACH**, **CORANICH**, or **CRONACH** (Gael. Ir. *coranach*, from Gael. Ir. *comh*, with + Gael. *ranaich*, a crying, from *ran*, to cry out). A funeral dirge, formerly in use among the Irish and Scottish Celts. "The cries (coranich) are called by the Irish the ulagohne and hululu, two words extremely expressive of the sound uttered on these occasions (funerals); and being of Celtic stock, etymologists would swear to be the origin of the *ololumyon* of the Greek, and *ululatus* of the Latins."—Pennant's *Tour*.

The coranach seems to be identical with the Irish *caóine*, generally written and pronounced *keen*, a dirge for the dead, "according to certain loud and mournful notes and verses," wherein the pedigree, property, the good and great deeds of the deceased, and the manner of his death are recounted, in order to excite sorrow or revenge in the hearers, and to show them the loss they have sustained.

CORALS FROM THE GREAT BARRIER REEF, AUSTRALIA

1. STAGHORN CORAL (*Madrepora muricata*), etc.
2. A MADREPORE (*Madrepora formosa*).
3. A MADREPORE (*Madrepora convexa*).
4. A FUNGOID FORM (*Podobacia Crustacea*).
5. SEVERAL MUSHROOM CORALS (*Fungia lacerta*).
6. A RELATED SPECIES (*Mussa multiobata*).
7. *HERPETOLITHIA TALPINA*.

The word, in one or other of its forms, occurs in the writings of many of the ancient Scottish authors:

- "Cryand for you the cairfull corrinnoch,"
Sir D. Lindsay.
 "Cryand the corynoch on his,"
Battle of Harlaw.
 "Be he the correnoch had done shout,"
Dunbar.

The coranach has long since fallen into disuse among the Highlanders. The funeral lament performed on the bagpipes, which may be considered as an instrumental coranach, lingered on till the latter half of the eighteenth century.

For specimens of the coranach see Sir Walter Scott's *Lady of the Lake*, and accompanying notes; Crofton Croker's *Researches in the South of Ireland*; and *Blackwood's Magazine*, vols. xiii. and xxiii.

COR ANGLAIS, kōr ǎn'glá' (Fr., English horn). A wooden wind instrument of the double reed species, the body of which was formerly bent in the form of part of a circle, which accounts for its being called a horn. It is merely a large oboe (called in German *Altoboe*, i.e. alto of the oboe), and is usually played on by oboe-players. Its compass is two octaves and a fifth from E or E flat, fourth line in the bass, to B flat above the treble staff. It is a transposing instrument, and music for it is written a fifth above its real tones. Also the name of an eight-foot organ stop occasionally used in French and English pipe organs. For illustration, see **MUSICAL INSTRUMENTS**.

CORATO, kō-rá'tó. A city of Italy, in the Province of Bari delle Puglie, situated about 26 miles west of the city of Bari (Map: Italy, L 6). Not far from Corato are the ruins of the Castel del Monte, built by the Emperor Frederick II., in which the sons of Manfred (q.v.) were imprisoned. The town carries on a trade in cattle and leather, the surrounding country being well adapted for grazing. A good deal of tartar is manufactured here. Population (commune), in 1881, 30,552; in 1901, 41,573.

CORAY, kō-rá', **CORAIS**, or **KORAIS**, ΔΟ-ΑΜΑΝΤΙΟΣ (1748-1833). A Greek classical scholar and patriot. He was the son of a merchant in Smyrna. He engaged in trade in Amsterdam, but in 1782 went to Montpellier to study medicine and natural history. In 1788 he settled in Paris. Coray was one of the first to attempt to revive modern Greek literature, and his political tracts did much to arouse the Greeks to a successful revolt against Turkish rule. Of his classical works the most important is his edition of Heliodorus's romance, *Ethiopian Histories*, his commentaries on the writings of Hippocrates, and his editions of Xenophon's *Memorabilia*, Plato's *Gorgias*, and Strabo. His work, *Atacta, ou mélanges sur la littérature grecque moderne* (1828-35), did much to elevate the Greek vernacular to a literary language. Consult his *Autobiography* in Greek (Paris, 1833) and a Latin translation by Schultze (Liégnitz, 1834); also Simmer, *Life and Works of Korais* (Zurich, 1837); and Bywater, in *Journal of Hellenic Studies*, vol. i. (London, 1881).

COR'BAN (Heb. *qorban*, offering, from *qarab*, to draw near, to offer). A term used by the Jews to denote anything devoted to the Deity.

In the Priestly Code it is the regular word for an offering to God of any kind. Such an object was necessarily sacred and could not be applied to profane use. So the word came to be a general expression of prohibition and was used when there was no intention of devoting a thing to God. Certain of the schools held that the mere pronunciation of it, however rashly, constituted a vow. Hence it became a convenient makeshift to avoid a distasteful duty. Thus a son might say his money or other property was corban and so escape the obligation to use it for the support or need of a parent. This interpretation was rebuked by Jesus (Matt. xv. 5; Mark vii. 11.).

CORBELL, kōr'bá'y' (Lat. *Corbulinum*). A town in the Department of Seine-et-Oise, France, at the junction of the Essonne with the Seine, 18 miles south-southeast of Paris (Map: France, J 3). From the tenth to the twelfth century it was the chief town of a powerful countship. It was besieged by the Duke of Burgundy in 1418, by the Huguenots in 1562, and by Alexander Farnese in 1590. The Gothic Church of Saint Spire was rebuilt in the fifteenth century. The town has flour-mills, print-works, cotton-factories, and manufactures of watches, clocks, etc. Population, in 1901, 9362.

COR'BEL (OF. *corbel*, Fr. *corbeau*, basket, from Lat. *corbis*, basket). A bracket projecting from a wall and forming an integral part of it, so as to receive and support any superincumbent weight. In France it is not a corbel unless it has parallel sides and projects more than its height, but the English usage is more general and includes those slight projections, called in French *culs-de-lampe*, from which vaulting-ribs or moldings spring when they do not rise from the floor. See **BRACKET**; **CANTILEVER**; **CONSOLE**.

COR'BENIC. The name of a stronghold erected by Galafres after his conversion as a shrine for the Holy Grail. It is called also the Palace of Adventure, and in it Galafres, christened Alphasan, is stabbed to death.

COR'BETT, JULIAN STAFFORD (1854—). An English lawyer born in Surrey, and educated at Trinity College, Cambridge. He became counsel of the Navy in 1901. In addition to monographs on Sir Francis Drake and other English celebrities, in the work entitled, *English Men of Action*, he wrote the popular romances, *The Fall of Asgard* (1886); *For God and Gold* (1887); *Kophetua XIII.* (1809); and *A Business in Great Waters* (1895).

CORBIE, kōr'bé'. A town in the Department of La Somme, France, formerly a fortress, ten miles northeast of Amiens. It has cotton and woolen factories. Population, in 1901, 4133. Corbie owes its fame to the Benedictine abbey founded here in 662 by Queen Bathilde. The Abbot enjoyed the title of Earl and a munificent income. Of the abbey, the Church of Saint Pierre alone remains. The banished King Desiderius was sent here by Charlemagne in 774. Corvei (q.v.) owes its origin to Corbie.

CORBIE STEPS, **CORBEL STEPS**, or **CROW STEPS** (a Scotch corruption of *corbel steps*, from OF. *corbel*, corbel, but confused by popular etymology with Scotch *corbie*, crow, from ME., OF. *corbin*, Lat. *corvinus*, crow, and supposed to mean steps for crows). In architecture, the succession of steps with which the

gables of old houses are everywhere ornamented in Scotland. This gable ornament is by no means peculiar to Scotland and France, but is met with in Flanders, Holland, and all over Germany, where it is even more characteristic and general, especially in the brick architecture of North Germany—both of churches and of houses.

COR'BIN, HENRY CLARK (1842—). An American soldier, born in Clermont County, Ohio. In 1862 he entered the Union Army as a lieutenant in the Eighty-third Ohio Volunteers, but in the following month was transferred to the Seventy-ninth Regiment. He was major of the Fourteenth United States colored troops in 1863, lieutenant-colonel in 1864, and colonel in 1865, and remained with the Army of the Cumberland until the close of the war, when he was brevetted brigadier-general of volunteers. In 1866 he entered the regular army as a second lieutenant in the Seventeenth Infantry, and became captain in the Thirty-eighth Infantry in the same year. He was brevetted major and lieutenant-colonel, U. S. A., for gallantry at Decatur, Ala., and Nashville, Tenn., respectively (1867). Subsequently he was engaged in military duty in the far West. He was appointed major and assistant adjutant-general in 1880, lieutenant-colonel in 1889, and colonel in 1896. After a term of service at the Adjutant-General's office in Washington, and on Governor's Island as chief of staff in the Department of the East, he was appointed Adjutant-General of the army in 1894. During the war in Cuba he was involved in the criticism of the War Department, but in the reorganization of the army it was considered that he displayed industry and ability, and in 1900 he was, by special act of Congress, promoted major-general and adjutant-general, "this grade to expire with the termination of office of the present incumbent."

CORBOULD, kór'böld, EDWARD HENRY (1815—). An English painter, born in London. When only nineteen he painted "The Fall of Phaethon from the Chariot of the Sun," for which he received a gold medal from the Society of Arts. Since then he has produced a great number of large pictures. In 1851 he was appointed instructor of historical painting to the royal family, and as such he continued until 1872. He excels in pageants and chivalric subjects. Some of his well-known pictures are "Greek Chariot-Race," "Lady Godiva," "Héloïse," and "Canterbury Pilgrims."

COR'BULO, GNÆUS DOMITIUS (?-c.67 A.D.). A Roman general under Claudius and Nero; brother of Cæsonia, the wife of the Emperor Caligula. He commanded a successful campaign against the Parthians under Tiridates, but excited the jealousy of Nero, who gave orders for his execution. Upon hearing the Emperor's orders, Corbulo committed suicide. His account of his experience in Asia, which is mentioned by the Elder Pliny, has been lost.

CORCHORUS, kór'kô-rūs (Neo-Lat., from Gk. κόρχορος, *korchoros*, a wild plant of bitter taste). A genus of plants of the natural order Tiliaceæ, containing about thirty species, both shrubby and herbaceous, natives of the warm parts of the globe. *Corchorus olitorius* is widely diffused in tropical countries, and is supposed to be a native of Asia and Africa, and introduced into America. It is an annual, with a smooth, more or less

branching stem, varying in height from 2 to 14 feet or upward, according to soil and climate. It has smooth, stalked, alternate, oval, or ovate-lanceolate leaves, and small yellow flowers, solitary or in pairs. It is much used as a pot-herb, and is called Jews' mallow, from being much cultivated by Jews in Syria and other parts of the East. It is still more valuable for the fibre of its inner bark, as is also *Corchorus capsularis*, a species very similar, but distinguished by its capsule, which is short, globular, and wrinkled in *Corchorus capsularis*, and elongated and slender in *Corchorus olitorius*. Both are much cultivated in India, yielding the greater part of the jute (q.v.) of commerce, and of the fibre employed in making gunny bags (q.v.). *Corchorus capsularis*, being extensively cultivated in China, is sometimes called Chinese hemp. *Corchorus siliquosus* is a small American shrub, occurring from the West Indies southward. It is of little value. In Panama an infusion of its leaves is used instead of tea.

COR'CORAN, MICHAEL (1827-63). An American soldier. He was born at Carrowkeel, Ireland, emigrated to the United States in 1849, enlisted in the Federal Army at the beginning of the Civil War, and was taken prisoner at the first battle of Bull Run. Upon his exchange, he was commissioned brigadier-general in 1862, and organized the Corcoran Legion, which in 1863 checked the Confederate advance on Norfolk and was subsequently attached to the Army of the Potomac. He died as the result of a fall from his horse.

CORCORAN, WILLIAM WILSON (1798-1888). An American financier and philanthropist, born in Georgetown, D. C. He studied for a time at Georgetown College; became an exchange broker in Washington, and in 1840 formed a partnership with George W. Riggs. At the time of the Mexican War he took a large part of the Government loans, and financed them so skillfully as to lay the foundation of an immense fortune, which he used with liberality and munificence. He was the founder of the Louise Home for impoverished gentlewomen, the Oak Hill Cemetery at Georgetown, and the Corcoran Art Gallery, and made many liberal gifts to colleges and benevolent associations.

CORCORAN ART GALLERY. A collection of works of art, presented to the city of Washington, D. C., and heavily endowed by William Wilson Corcoran. The beautiful white marble edifice in Neo-Greek style, in which it is now lodged, was erected by Ernest Flagg in 1894-97. Besides the collections of paintings, sculptures, and ceramics, the building contains a school of art. Among the sculptures the famous "Greek Slave," by Powers, and the "Last Days of Napoleon I.," by Vela, are especially noteworthy.

CORCOVODA, kór'kô-vô'bâ (probably Peruvian in origin). A crane-like bird (*Psophia leucoptera*) of Peru and the upper Amazon, closely related to the trumpeter (q.v.). It is domesticated and has some curious and friendly habits, described at length in *American Museum of Natural History Bulletin*, vol. ii. (New York, 1887-90).

CORCY'RA. See CORFU.

COR'DA, AUGUST JOSEF (1809-49). An Austrian botanist, born in Reichenberg, Bohemia. At the age of twenty he published his *Monographia*

Rhizospermarum et Hepaticorum, and in 1834 was made one of the keepers of the Museum in Prague. In 1847 he came to Texas, where he carried out many interesting observations and collected a large number of valuable botanic specimens; but on his voyage home, in 1849, he was shipwrecked and drowned. His published works include, besides the *Monographia* already mentioned, the following: *Icones Fungorum Hucuscque Cognitorum* (6 vols., 1837-54); *Prachtflora europäischer Schimmelbildungen* (1839); and *Beiträge zur Flora der Vorwelt* (1845).

CORDAGE (from *cord*, Fr. *corde*, ML. *corda*, Lat. *chorda*, from Gk. *χορδή*, *chordē*, string; connected with Lat. *haru-specer*, inspector of entrails, Icel. *gorn*, OHG. *garni*, entrails, Lith. *zarnà*, Skt. *hira*, intestine, also Icel., OHG. *garn*, Ger. *Garn*, AS. *gearn*, Engl. *yarn*). A name applied chiefly to the running rigging of a ship and to the rope of which the rigging is made. See RIGGING; ROPE.

CORDAITES, *kōr'dā-ī'tēz* (Neo-Lat. nom. pl., named in honor of A. J. Corda). A genus of fossil plants, of the family Cordaitae, that shows intermediate characters between the conifers and the cycads. The genus appeared in Devonian time, reaching its maximum during the coal-measure period, when it was an important forest tree of the coal-swamp flora, and declined during the Permian. The tree grew to a height of thirty to fifty feet, with a trunk that branched freely, and it had dense foliage of parallel-veined leaves of lanceolate or linear form. These leaves are found in great abundance in some coal-measure shales, where they often lie packed in layers as do the fallen leaves of a modern forest. In the Middle Devonian of New Brunswick, Canada, a formation is called the 'Cordaites shale,' because of the number of Cordaites leaves it contains. The indorescence of Cordaites was separate as in the cycads, and the male and female elements were arranged in catkins placed in the axils of the leaves. The fructification is nut-like, resembling somewhat that of the yew or that of *Cycas revoluta* (a cycad), and has been described under the names *Cardiocarpum*, *Trigonocarpum*, etc. These fossil nuts are often exceedingly abundant. The trunk had a large pith, which often decayed to form a cavity of which the casts, known as *Artesia* and *Sternbergia*, are found on the dumps of some coal mines. The wood of the trunk, described partly as *Araucaroxyton*, has a microscopic structure remarkably like that of the conifers. Consult H. Graf zu Solms-Laubach, *Fossil Botany*, pp. 104-122 (Oxford, 1891). See CARBONIFEROUS SYSTEM; CYCADACEÆ; CONIFERÆ.

CORDAY D'ARMONT, *kōr'dā' dār'mān'*, MARIE ANNE CHARLOTTE (1768-93). The assassin of Marat, generally known as CHARLOTTE CORDAY. She was born at Saint Saturnin in Normandy. Her youth, passed in a convent, was spent in the reading of Plutarch, Rousseau, Raynal, Voltaire, and Corneille. Though she was noble by birth, she sympathized ardently with the cause of the Revolution in its early phases; but when the fall of the Girondists ushered in the Terror, she swung immediately to the opposite pole. She saw Barbaroux (q.v.) at Caen, spoke to him, and was convinced that Marat and Robespierre were the enemies of France. To the fervent student of the classics, the rôle of Brutus seemed a noble one, and she

determined to save the nation by murder. Telling her father that she was bound for England, she journeyed to Paris (July 1, 1793), inquired there for the house of Marat, pretending to be the bearer of a message, and bought a knife on the way. Twice delayed, she found Marat at last in his bath, writing (July 13). He had asked that morning, in the *Ami du Peuple*, for 200,000 heads, and Charlotte told him she could give him those of the Girondists at Caen. As he was setting down the names she uttered, one by one, she drove the knife up to the hilt into his heart; then she tried to escape. Marat died immediately, and the girl, quickly captured, and saved with difficulty from the mob, was taken to prison. Brought to trial and speedily condemned, she died calmly, going, as she said, to join the divine Brutus in the Elysian Fields (July 17, 1793). Consult: Dubois, *Charlotte Corday* (Paris, 1838); Vatel, *Charlotte Corday et les Girondins* (Paris, 1872).

CORDEIRO, *kōr-dā'é-rō*, JOÃO RICARDO (1836-82). A Portuguese dramatist. He was born in Lisbon, and in 1863 became secretary in the Conselho de Beneficencia. He was the founder of the periodical *Futuro*, and his numerous reports on charitable work contain valuable suggestions as to the most efficacious methods of dealing with the problem of poverty. In 1877 he obtained a Government position under the president of the Ministry, Luciano de Castro. His plays include: *Fernando* (1857); *Amor e arte* (1860); *A sociedade elegante* (1862); *A familia* (1869); *Osparaizos conjugues* (1882).

CORDE/LIA. In Shakespeare's *King Lear*, the youngest daughter of the King, by whom she is disinherited for not making sufficiently effusive protestations of love for him. But when he is turned out by his other daughters, Goneril and Regan, she comes to his rescue with an army. She is taken prisoner, and killed in prison.

CORDELIERS, *kōr'd'lyā'* (Fr., cord-wearers). The name given in France to the most austere branch of the Franciscan friars, on account of the girdle of knotted cord they wore. After 1790 the name was applied to the members of a political club which assembled in the abandoned chapel of a Franciscan monastery, and exercised great influence on the progress of the Revolution in Paris. Its leaders were men of various opinions, Danton, Camille Desmoulins, Marat, Hébert, and the picturesque Anacharsis Clootz. It drew its strength from the very lowest classes of Paris, and always had an armed mob at hand ready for insurrections. The members of the Cordeliers were the first to demand a republic, took a very prominent part in the events of the tenth of August, 1792, and chiefly contributed to the overthrow of the Girondists (q.v.). While the club was at the height of its influence, Desmoulins began the publication of his popular journal *Le Vieux Cordelier*. Later, the spirit of the Cordeliers became so violent as to out-Jacobin the Jacobins, and men like Danton and Desmoulins abandoned it. In 1794 the Cordeliers awakened the enmity of Robespierre, who determined to crush them. On March 24 and April 5 most of the leaders were guillotined, and the club practically came to an end. Consult Bougeart, *Projet d'organisation des Cordeliers* (Paris, 1870).

CORDER, FREDERICK (1852—). An English musician, born in London. He studied at

the Royal Academy of Music, London, gained the Mendelssohn scholarship in 1875, and, after studying in Cologne under Ferdinand Hiller, returned to London, and in 1880 became conductor of the orchestra at the Brighton Aquarium. His works include *Morte d'Arthur*, opera (1877); *In the Black Forest*, suite for orchestra (1876); *The Bridal of Triermain*, cantata (1886); Rumanian suite for orchestra (1887); *The Minstrel's Curse*, declamatory ballad, with orchestra (1888), and *The Sword of Argantyr*, dramatic cantata (1889). With his brother Henry, he translated the libretti of Wagner's music dramas into English. In 1896 he lectured on Wagner, Berlioz, and Liszt, before the Royal Academy. He published a valuable theoretical work, *The Orchestra and How to Write for It* (London and New York, 1896).

CORDE'RIOUS, or **CORDIER**, kôr'dyâ', MATHEURIN (1479-1564). A French humanist, author of the *Colloquia*. He was especially fond of teaching children, and taught in Paris, where he had as one of his scholars John Calvin, who dedicated to him the commentary on the *First Epistle to the Thessalonians*. He subsequently taught in Geneva. He wrote a number of books for children, one of which, *Colloquiorum Scholasticorum Libri Quattuor ad Pueros in Latine Sermone Exercendos* (1564), appeared in numerous later editions and was translated into English and French.

CORD GRASS (*Spartina*). A genus of grasses having compound spikes, the species of which are found in wet places, many of them in salt or brackish tide marshes. The spikelets are arranged on one side, and have only one perfect floret and very unequal glumes. The species are perennial, rigid, from creeping rootstocks, and have long, tough leaves, hence the name cord grass. *Spartina striata*, found in muddy salt-marshes on the east and southeast coasts of England, and in America, although remarkable for its extreme stiffness and rigidity of habit, is used for making ropes, on account of the toughness of its fibre. *Spartina cynosuroides* and *Spartina patens* are common in the United States, the former along the ocean and lake shores from Maine to the Pacific; the latter species is common in salt-marshes, and this and *Juncus Gezardi* furnish the best of the marsh-hay. *Spartina cynosuroides* has been successfully used in the manufacture of twine and paper. It is recommended as a binding grass for wet banks, ditches, etc.

COR'DIANI. See SANGALLO.

CORDIER, kôr'dyâ'. HENRI (1849—). A French Orientalist, born in New Orleans. He studied in France and England, and in 1869 went to China, where he spent eleven years. He became professor of the School of Political Science in Paris in 1886, and professor of history, geography, and Eastern legislation at the School of Living Oriental Languages. His works include *Bibliotheca Sinica*, a bibliographical dictionary of books about the Chinese Empire (1878-95); *La France en Chine* (1882); *Recueil de voyages et de documents pour servir à l'histoire de la géographie depuis le XIII^e siècle jusqu'à la fin du XVI^e siècle* (1882-85), and an *Atlas sino-coréen* (1896).

CORDIÈRE, kôr'dyâr', LA BELLE (Fr., the beautiful rope-maker). A nickname of the

poetess Louise Labé, whose husband was Perrin, a rope-maker.

CORDIERITE, kôr'di-ēr-īt. See IOLITE.

CORDIL'ERA. A general term applied to the system of elevations that extends along or near the Pacific Coast of North and South America from northern Alaska to Cape Horn. The Cordillera of North America includes the mountain ranges in Mexico, the Rocky Mountains, the Sierra Nevadas, the Coast and Cascade ranges in the United States, and the several ranges in British Columbia and Alaska. The whole western part of the continent traversed by these ranges is commonly called the 'Cordilleran region.' In South America the term is sometimes used comprehensively as a synonym for the Andes, or the two may be united, i.e., Andean Cordillera, and it is also applied to definite portions of the Andes, as in Colombia, where the three mountain ranges are known as the Eastern, Central, and Western Cordilleras. The term, originally borrowed from the Spanish, is being used more and more by geographers in a general sense to signify an extensive system of elevations. See AMERICA; ANDES; etc.

CORDITE (from *cord*, on account of the appearance of the grains). A form of smokeless gunpowder used in England. It is composed of nitrolycerin, 58 parts; nitrocellulose, 37 parts; vaseline, 5 parts. It is colloidized by dissolving the nitrocellulose in a solvent, incorporating the ingredients, and then evaporating the solvent. See EXPLOSIVES.

CÓRDOBA, kôr'dô-bâ, or **COR'DOVA**. The flourishing capital of the province of the same name in Argentina, on the Río Primero, a tributary of the Paraná (Map: Argentina, E 10). It is situated at an elevation of about 1200 feet, and is regularly laid out and well built, except on the surrounding heights, which are inhabited mostly by the poorer classes. The city has a fine park, or promenade, and plazas, in the principal of which is situated the cathedral, an imposing structure of composite architecture with a fine cupola, dating from the seventeenth century. The Government palace is also worth mentioning. An equestrian statue of General Paz stands in the plaza of that name. Among the educational institutions are the university—founded by the Jesuits in 1613, thus ranking in age next to that of Lima—a national college, two seminaries, and an observatory and meteorological station. Other features of Córdoba comprise a public library, a well-equipped general hospital, asylums for orphans and the poor, etc. The city is an episcopal see. Though the surrounding country is rendered fertile only by irrigation, Córdoba is an important commercial centre, owing to its geographical position. Live stock, wool, and hides are the chief exports of the vicinity, and beds of ealcite are worked. The city has some industrial interests, principally manufactures of building material, lime, bricks, and flour. Population, in 1901, 50,000. Córdoba was founded in 1573, the neighborhood having been visited some thirty years before by an officer of Pizarro, and, after becoming the capital of Tucumán, rose to prominence as an educational centre and as the headquarters of the Jesuits in that region. It suffered to some extent in the revolutionary struggles. In 1871 Córdoba was the seat of the first national exposition of Argentina.

CORDON (Fr. *cordon*, from *corde*, cord). A military term for a line of sentries, posted within view of each other, and designed to prevent forbidden contact or communication between one side of the line thus guarded and the other. When large separate bodies of troops are so disposed as practically to shut in a section of country, they are spoken of as a cordon of troops. Country inclosed by a series or system of block-houses, as in South Africa under General Kitchener (1901), is described as *cordoned*. A cordon instituted to prevent contagion from an infected place or district is a *cordon sanitaire*.

CORDON. A system of training by which a plant that is naturally diffusely branched is made to grow as a single stem in order to induce large fruits. Trees trained as cordons may have one or two stems trained horizontally or obliquely; if two stems are retained these are carried horizontally in opposite directions about 18 inches from the ground, or they may be carried obliquely and parallel; the laterals of such branches being kept spurred. Any plant which bears its fruit upon spurs will, therefore, lend itself to this style of training.

CORDON BLEU, kôr'dôn' blē (Fr., blue ribbon). Knights of the ancient French Order of the Saint Esprit, or Holy Ghost, were so called because the jewel of the Order was suspended on a blue ribbon. In late times the term was degraded to mean a first-rate cook. The *cordon grand* is any member of the Legion of Honor, the decoration being suspended by a broad ribbon.

CORDOVA, kôr'dô-vâ, or **CÓRDOBA**, kôr'dô-bâ (Lat. *Corduba*, from Phœnician *Kartatubâ*, Great City). A city of Spain, and capital of the Province of Cordova, situated on the Guadalquivir, 120 miles by rail north of Malaga (Map: Spain, C 4). It lies at an altitude exceeding 390 feet at the base of the Sierra de Cordova. In appearance the city is less characteristically Moorish than might be supposed, its aspect being one rather of heterogeneity arising from the conglomerate architecture of various periods; it retains but few marks of the Saracen period, and but faintly recalls the grandeur of the former metropolis of Mohammedan Spain. The streets are with few exceptions narrow and crooked, and the houses gloomy. The finest edifice is the cathedral, once the chief mosque of the 'Infidels,' and one of the most splendid examples of Moorish architecture. Together with the court, it occupies a site 570 feet by 425 feet, with a bell-tower 300 feet in height. It is surrounded by a wall with strong buttresses, and was originally both mosque and fortress. The interior is almost a labyrinth of pillars, for they number some 850, in various styles and mostly of marble, porphyry, and jasper. The building has suffered considerably through the changes of different epochs, made in the endeavor to convert the mosque into a Christian cathedral. A short distance from the cathedral, to the south, stands the marble triumphal column, erected 1765, of San Rafael, the patron saint of Cordova. Among the Moorish remains are the ruined city walls, part of the Alcázar, and the old bridge of 16 arches, 730 feet long, connecting Cordova with its suburb, Campo de la Verda. The bridge, originally built by the Romans, was reconstructed on the same foundations by the Saracens. Cordova contains a large num-

ber of churches and convents, a bishop's palace, a theatre, and a bull-ring. The educational institutions include a lyceum, a theological seminary, a veterinary school, and a library.

Once a great centre of commerce, Cordova is in a state of decline, her local industries suffering in the general stagnation of the country. The railroad connection with Seville, Malaga, and Madrid brought in a little new life, but Cordova is still a city of the Middle Ages. There are manufactures of leather, liquors, hats, cloth, silk, and paper, besides the ancient silver-filigree industry for which Cordova has long been famous. Iron is mined in the vicinity. Population, in 1900, 56,097.

Cordova is said to have been founded by the Phœnicians, but was acquired B.C. 152 by the Romans. It rose to be the second city of Spain, the seat of a prætor and a supreme tribunal, and a centre of industry. Taken by the Goths in the sixth century, it fell in 711 into the hands of the Saracens. In 756 the city became the capital of an Omniad realm, which existed till 1031 and embraced all Mohammedan Spain. This State, whose rulers at first were content with the title of *Emir* and finally assumed that of *Caliph*, rivaled in splendor the Eastern Caliphate of Bagdad. From the ninth century to the twelfth Cordova was one of the greatest centres of commerce in the world. According to Arabian historians the city at the height of its splendor contained 200,000 houses, a million inhabitants, 600 mosques, 80 institutions of learning, and a public library with 600,000 volumes. Such accounts are doubtless exaggerations, but certainly when all was dark over the rest of the Occidental World, Cordova held aloft the light of civilization. After the fall of the caliphate the decline was rapid; the city was taken by Ferdinand III. of Castile in 1236 and never afterwards regained its prosperity. Cordova was plundered by the French under Dupont in 1808. It is noted as being the birthplace of the two Senecas, the poet Lucan, and the philosopher Averroës.

CÓRDOVA, FERNANDO FERNANDEZ DE (1792-1883). A Spanish commander and statesman, who began military service in 1810, and served in the wars against Napoleon. In 1841 he was implicated with Concha in the conspiracy against Espartero; in 1847 he was Minister of War, and afterwards was inspector-general of infantry. He was Captain-General of Cuba in 1850. In 1853 he was made general-in-chief of cavalry. He attempted to support Isabella in the outbreak of 1854, but when revolution became successful he fled to France. He returned a few years later, and in 1864 Narvaez made him Minister of War. In 1868, in common with most of the Spanish grandees, he took part in the Prim revolution against Isabella. In 1870 he was again appointed Captain-General of Cuba, and in 1871 he was made Minister of State *ad interim* at Madrid by King Amadeus. On the proclamation of the Republic he was named Minister of War.

CÓRDOVA, FRANCISCO HERNANDEZ (c.1475-1526). A Spanish soldier and explorer. He accompanied Pedrarias to Castilla del Oro, Panama, in 1514, and in 1524 was sent by that commander to take possession of Nicaragua, ignoring the rights of the discoverer, Gil Gonzalez Davila. After exploring the country and founding several important settlements, he endeavored

to sever his allegiance to Pedrarias and to establish a government of his own. Upon being informed of the treachery of his lieutenant, Pedrarias personally conducted an army into Nicaragua, and after defeating Córdova in battle, ordered his execution.

CÓRDOVA, GONSALVO DE. See GONSALVO DE CÓRDOVA.

COR'DOVAN, or **CORDUAM**. A species of leather prepared from goat-skins or split horsehide, and used throughout Europe during the Middle Ages for the boots of the wealthy. It was originally, and at one time exclusively, manufactured by the Moors of Cordova, and hence its name.

CORDOVA Y FIGUEROA, é ié'gá-rū'á, PEDRO DE (1692-c.1770). A Chilean historian, born at Concepcion. He entered the army in 1725. In 1739, by order of President Velasco, he founded Los Angeles, the capital of Aracania. About 1745 he wrote a history of Chile from the conquest until 1717. It has been published in the *Colleción de historiadores de Chile*, and was long regarded as the highest authority on the subject.

COR'DUROY (probably for Fr. *corde du roi*, King's cord). A cotton material having a cut pile like velvet, but with the surface ribbed. The gut or division which separates the ribs is produced by binding the pile weft to the cloth. See FUSTIAN.

CORDUROY ROAD. A roadway in marshy places formed by laying logs side by side. It takes its name from its rough or ribbed surface, resembling corduroy. This method of road-building is rarely employed now except for temporary purposes, as in military operations. It is still in use, however, in sparsely settled regions where nothing better can be afforded. See ROAD; ROADS AND RAILROADS, MILITARY.

COR'DUS, CREMUTUS. A Roman historian, who in A.D. 25 was, according to Tacitus (*Annales* iv., 34, 35), accused before Tiberius of having praised Caesar's assassin, Brutus, and of having termed Cassius the 'last of the Romans.' The true cause for this accusation, however, was his free expression of opinion regarding Sejanus, the influential minister of Tiberius (q.v.). Having pronounced an apology, he, anticipating no favor from the Emperor, starved himself to death. Some copies of his works escaped destruction by the officials, but there are now extant only a few fragments preserved in the *Suasoriae* of Seneca. Consult Rathlef, *De Cremutio Cordo* (Dorpat, 1860).

COR'DYLINE. See TL.

CORE (OF. *cor*, Fr. *corur*, from Lat. *cor*, heart). In masonry, the central portion of any heavy part of the structure, such as pier, buttress, main wall, etc., which is not visible, but is covered with a sheathing or surface of another material. Roman buildings have a concrete or rubble core, with a facing of brick or coarse stone construction; sometimes of marble slabs or stucco. In mediæval structures the core is sometimes of brick, with stone facing.

COREA. See KOREA.

COREAL, kó'rá-ál'. FRANCISCO. Probably the pseudonym of an author who in 1722 published a book entitled *Voyage aux Indes*. According to the statements of the author, he was born in

Cartagena, Spain, in 1648, and spent more than thirty years in travel, chiefly in the Caribbean region and in South America. The work passed through several editions, one of the most important of these being published in Brussels in 1736. The numerous errors which it contains and the doubts which have been cast upon its authenticity justify the belief that it was a pseudonymous publication.

CORELLI, ARCANGELO (1653-1713). An eminent Italian violinist and composer, surnamed *Il Divino*. He was born at Fusignano, near Bologna, and studied in Rome under Bassani and Matteo Simonelli. He is said to have been in Paris in 1672, and subsequently passed several years in Germany in the service of the Elector of Bavaria. In 1681 we find him settled in Rome, where he found a generous patron in Cardinal Ottoboni, and soon acquired fame as a virtuoso, teacher, and composer. He was especially admired for the beauty of his tone and expressive execution, and laid the foundation for the development of superior violin technique. His compositions rank among the best of his time and continue to this day models of classical study in instrumental music. The finest and most famous among them are twelve *Concerti grossi*, op. 6 (1712).

CORELLI, MARIE (1864—). An English novelist, the adopted daughter of Charles Mackay, the poet. She was born in Italy and educated in London and in a convent in France. A musical career was planned for her, but she early adopted literature instead. Among her writings are: *The Romance of Two Worlds* (1886); *Thelma* (1887); *The Sorrows of Satan* (1895); *The Mighty Atom* (1896); *The Murder of Delicia* (1896); *Ziska* (1897); *Jane* (1897); *The Master-Christian* (1900); *Boy* (1900); and *Temporal Power* (1902).

CORENTYN, kó'rén-tén' (Dutch *Corantyn*). A river of Guiana, South America. It rises on the boundary of Brazil and flows in a northerly direction and empties into the Atlantic. Throughout its length it forms the boundary line between British and Dutch Guiana (Map: Guiana, F 3). It is navigable for a distance of over 40 miles for large steamers, while light vessels can ascend as high as 170 miles from its mouth, where navigation is interrupted by cataracts, which occur at a number of points on its middle and upper course.

COR'EOP'SIS (Neo-Lat., from Gk. *κόρις*, *koris*, bedbug + *opsis*, appearance). An herbaceous annual or perennial plant of the order Compositæ, nearly all natives of eastern North America, and popularly known as tick-seed, the fruit being in the shape of a small tick. It is often raised for its showy yellow or rose-purple flowers with yellow or brown disks. The perennials are grown in hardy borders; the annuals in the garden in almost any soil. For illustration see Plate of CRANBERRY.

CORFE (kôrf) **CASTLE**. A village of Dorset, England, in the middle of Purbeck Isle or Peninsula, 24 miles east-southeast of Dorchester (Map: England, D 6). In the vicinity are stone and marble quarries, and clay-works for potteries. Population of parish, in 1901, 1967. A castle, giving its name to the village, stands on a neighboring hill. Founded in the tenth century, it was long

one of the strongest fortresses in the kingdom. Here King Edward the Martyr was murdered by his step-mother, Elfrida, in 979, and King John, during his disputes with his barons, kept his regalia here for safety. In 1642 Lady Bankes defended the castle for six weeks against Charles I. It was dismantled by Fairfax in 1645.

CORFLAM'BO. In Spenser's *Færic Queen*, a giant representing licentiousness.

COR'FU (Gk. *Κόρυφα*, *Korkyra*, or *Κέρκυρα*, *Kerkyra*, Lat. *Corecyra*). The most northerly of the Ionian Islands (q.v.). in latitude 39° 20' to 39° 50' N., longitude 19° 40' to 20° 10' E. It has a length of about 38 miles, with a breadth varying from 3 or 4 to 20 miles. Area, 275 square miles. Population, in 1896, 90,872. Like the rest of the Ionian Islands, it is mountainous, and the mountains are generally naked and dry, the highest summit, Pantokrator, being about 3000 feet above the sea. The valleys, however, are very fertile, and yield olive-oil, wine, honey, oranges, figs, etc. Salt is also produced in some quantity. The climate is generally mild and healthful. The principal town, Corfu, on the east, situated on an elevation, has some good streets, and a fine esplanade. It has about 25,100 inhabitants and a considerable trade. It is the seat of a Greek archbishop and of a Catholic bishop. The early history of the island is purely mythical, as the later inhabitants identified it with the Homeric Scheria (Phæacia). About B.C. 734 the Corinthians are said to have colonized the island, which, however, soon attained such wealth and maritime power as to assert its independence. After the Persian wars, in which Coreyra took no part, a further dispute with Corinth led the Coreyreans to ally themselves with Athens, and the intervention of the latter city was one of the factors which contributed to the outbreak of the Peloponnesian War. Internal dissensions and varying foreign control marked the history of the island until it was taken under Roman protection in B.C. 229. During the greater part of the Middle Ages it formed part of the Byzantine Empire, and later passed into the possession of the Venetians, who held it in spite of two fierce attacks by the Turks, until 1797. Since that time Corfu has shared the fortunes of the other Ionian Islands. Consult: Riemann, *Recherches archéologiques sur les îles ioniennes*, vol. i., *Corfou* (Paris, 1879); and Partsch, *Die Insel Korfu* (Gotha, 1887).

CORI, *kō'rē*. A city in the Province of Rome, Central Italy. 36 miles southeast of Rome (Map: Italy, G 6). Important to the antiquarian are the huge polygonal blocks that formed the walls of the ancient Cora—a city that was an early member of the Latin League and that had for traditional founder the Trojan Dardanus or Coras; also the ruins of a temple of Castor and Pollux and of a so-called temple of Hercules. Population (commune), in 1881, 6300; in 1901, 7363.

COR'RIAN'DER (Lat. *coriandrum*, Gk. *κόριαννον*, *koriannon*, *κόριον*, *korion*, coriander, possibly from *κόρις*, *koris*, bedbug, referring to the smell of the leaves), *Coriandrum sativum*. An annual or biennial plant of the natural order Umbellifera, with branching stem, one to two feet high, the lower leaves bipinnate, the upper leaves more compound, divided into very narrow

divisions, and with globose fruit. It is a native of the south of Europe and of the East, and has long been cultivated for the sake of its fruit. It has thus become naturalized in some parts of England and the United States, where its fruit, coriander-seed, is much less used than in Germany and some other European countries. The whole plant, when fresh, has a very offensive smell, due to an essential oil, but the ripe and perfectly dry fruit has an agreeable aromatic smell and a sweetish aromatic taste. It is used in medicine as a carminative, and in domestic economy as an aromatic, being very often mixed with bread in the north of Europe; spirituous liquors are flavored with it; and confectioners cover it with sugar, to make a well-known kind of confection. In the south of England it is common to sow coriander and caraway together, the coriander yielding a crop in the first year, and the caraway in years following. Coriander delights in a rich soil and is much cultivated and used in India. It is little used in the United States.

CORIGLIANO CALABRO, *kō'rē-lyā'nō kā-lā'brō*. A city in the Province of Cosenza, South Italy, four miles from the Gulf of Taranto and 85 miles southwest of Taranto (Map: Italy, L 8). It has a castle and an aqueduct, and markets a high quality of manna from the ash-trees of the surrounding country. Population (commune), in 1881, 13,272; in 1901, 13,320.

COR'IN. In Shakespeare's *As You Like It*, a shepherd who offers his services to Rosalind and Celia as a 'faithful feeder.'

CORIN'NA (Gk. *Κόριννα*, *Korinna*). A Greek lyric poetess, nicknamed 'The Fly' (*Mvta*, *Myia*), famous alike for her beauty and for her genius. She was born at Tanagra, in Bœotia. The date of her birth is not known, but she was an elder contemporary and, according to tradition, a rival of Pindar. Elian and Suidas speak of her five victories over him, and Pausanias saw at Tanagra a picture of her wearing about her head a fillet of victory, which he supposes she gained in a contest with her younger rival. An anecdote has been preserved by Plutarch, relating that when Pindar had been advised by her to embellish his poems with mythology, he produced a hymn to Thebes in which all Theban mythology was alluded to in the first six verses; whereupon she advised, "Sow with the hand, not with the full sack." Her poems were all in the Bœotian dialect. The fragments are edited by Bergk, *Poetæ Lyrici Græci* (Leipzig, 1900).

CORINNA. (1) A name given by Dryden to Mrs. Elizabeth Thomas, with whom he had a correspondence. She afterwards made the acquaintance of Curll, the notorious publisher, and furnished him with a selection of letters interchanged between herself and Dryden. They were probably fictitious. (2) The daughter of Gripe in Van Brugh's comedy *The Confederacy*.

CORINNE, OU L'ITALIE, *kō'rēn' ou lē-tā'lē'* (Fr., Corinna, or Italy). The most important novel of Madame de Staël, published in 1807, named from its heroine, who pines and dies after her lover proves false.

CORINTH (Gk. *Κόρινθος*, *Korinthos*; said to have been called in early times Ephyra). An ancient city of Greece, situated at the south end of the isthmus connecting the northern division of Greece with the Peloponnesus. Its

citadel was the Acrocorinthus, an isolated hill 1886 feet high, with precipitous sides, and commanding one of the finest views in Greece. At the northern foot of this hill lay the city of Corinth, on a broad terrace nearly 200 feet above the level of the isthmus. In the Homeric epic *Ephyra* is mentioned as the home of Sisyphus and Bellerophon, but the city does not seem to have played a great part in the heroic age, and appears in dependence upon the rulers of Mycenæ, with which place it was connected by a very early system of roads. Discoveries of pre-Mycenæan pottery in graves show that there was a settlement at the foot of the Acrocorinthus in very early times, but as yet few remains of the Mycenæan age have come to light. The growth of the city seems to have occurred after the Dorian conquest of the Peloponnesus, and to have been especially favored by the development of the intercourse with the west: for this its situation with harbors on both the Corinthian and Saronic gulfs gave it peculiar advantages, which were further enhanced by alliances with Samos and Chalcis on Eubœa. By the end of the eighth century B.C., Corinth was the chief trading city of Greece, and the extent of its trade is shown by the number of Corinthian vases found in Italian graves, as well as by the testimony of ancient writers. Among the colonies founded by Corinth at this period was Syracuse. The government was a strict oligarchy under the leadership of the family of the Bacchiadæ, but when, early in the seventh century B.C., Coreyra successfully maintained her independence of the mother city, a revolution occurred, and Cypselus became tyrant (c.657 B.C.). Under his rule and that of his son, Periander, the prosperity of the city increased, Coreyra and Epidaurus were reduced, and the establishment of Potidæa on the northern coast of the Ægean gave Corinth a share in the rich trade of Macedon and Thrace. About B.C. 582 the tyrants were overthrown, and a moderate oligarchy established, which seems to have remained as the usual form of government, though occasionally interrupted by democratic revolutions. Like the other cities of Peloponnesus (except Argos), Corinth became a member of the Lacedæmonian League, and played her part in the Persian wars. The great development of Athenian power was a serious blow to the commercial interests of Corinth, and accordingly we find the city active in promoting the Peloponnesian War. After the fall of Athens, the Corinthians became jealous of the Spartan rule, and formed an alliance with Thebes and Athens, which led in B.C. 395 to the Corinthian War. Later, Corinth returned to the Spartan alliance, and supported the city in the war waged with the Thebans under Epaminondas. Three years after the battle of Chæronea (B.C. 338), it was garrisoned by the Macedonians, who held it until B.C. 196, with the exception of B.C. 242 to B.C. 223, when it was occupied by Aratus for the Achæan League. When the freedom of Greece was proclaimed by the Romans, Corinth was restored to the Achæan League. Having become the centre of the last uprising of Greece against the Roman power, it was utterly destroyed (B.C. 146) by L. Mummius, the Roman general, and for a whole century it continued in ruins. In B.C. 46 Julius Cæsar rebuilt it, and it afterwards became the capital of the Roman Province of Achaia; and although it never again

attained its early importance, it became both prosperous and powerful. Saint Paul planted a Christian church here, to which he addressed two epistles. In A.D. 1458 it was conquered by the Turks under Mohammed II., was taken by the Venetians in 1687, and retaken by the Turks in 1715, who held it till 1823. Reduced to ashes in the Revolutionary War, and again utterly destroyed by an earthquake in 1858, Corinth is now rebuilt in a more convenient position on the shore of the Gulf of Corinth. Ancient Corinth was surrounded by walls, having a circuit of about four and one-half miles, or, including the Acrocorinthus, of eight miles. It had two harbors—*Lechaum*, on the Gulf of Corinth (q.v.), and *Cenchrea*, on the Saronic Gulf, opening into the Ægean. The former was connected with the city by two parallel walls. The wealth and prosperity of Corinth made it the seat of luxury and licentiousness. Besides the sea deities Poseidon and Amphitrite, Aphrodite claimed a large share in the religion of the city, and her temple alone is said to have had 1000 courtesans as sacred slaves. The Corinthian *hetæra* were famous throughout Greece. In the earlier period Corinth was famous for its work in clay and bronze, and even in later times 'Corinthian bronze' was almost as precious as gold. Though devoted to art, and filled with costly paintings and statues at the time of its capture by Mummius, the city does not occupy a prominent place in either art or literature, and but few Corinthians except Periander and Timoleon appear among the famous names of Greece. Before 1896 the chief remains of ancient Corinth were the foundations on the Acrocorinthus and the seven columns of a very early Doric temple, probably of the time of Periander. In 1896 excavations were begun by the American School of Classical studies at Athens, and although few works of art or inscriptions have been found, the discoveries have furnished a sure basis for the topography of the ancient city, of which the traveler Pausanias (q.v.) gives a detailed description. The chief sites determined are the Theatre, the Fountains of Pirene and Glauce, the road to Lechaum, the Propylæa, and the Agora to which it led, and the identification of the old temple with the Temple of Apollo. The mediæval walls are still in a fair state of preservation. Consult: E. Curtius, *Peloponnesos* (Gotha, 1851-52); Wilish, *Beiträge zur inneren Geschichte des alten Korinth* (Zittau, 1887); id., *Geschichte Korinths von den Perserkriegen bis zum dreissigjährigen Frieden* (Zittau, 1896); these pamphlets contain also a bibliography of Corinthian history. The reports of the American excavations are published in the *American Journal of Archaeology*, 2d series, vol. i., et seq. (New York, 1897), a popular account by Director Richardson, in the *Century Magazine* (New York, 1899); and by Cooley in *Records of the Past*, I. (Washington, 1902).

CORINTH, or **NEW CORINTH**. An episcopal city and seaport of Greece, situated on the north coast of the Isthmus of Corinth, three and one-half miles northeast of the ancient city (q.v.) and one and one-half miles southwest of the northern terminus of the Corinth Canal (Map: Greece, D 4). Corinth is about 55 miles west of Athens. The town was founded in 1858 after the destruction of the vestiges of old Corinth by an earthquake. It is wholly a modern town and has wide streets. It is connected by rail with

Athens, Patras, and Argos. It has a good harbor. There are a custom-house and a gymnasium. It has been prospering since the Corinth Ship Canal was opened in 1893. Among its exports are oil, honey, silk, corn, and currants. It is the capital of the nomarchy of Corinth, and has a population of about 5000.

CORINTH. A city and county-seat of Alcorn County, Miss., near the Tennessee border, 90 miles east-southeast of Memphis, Tenn., on the Mobile and Ohio and the Memphis and Charleston railroads (Map: Mississippi, J 1). Population, in 1890, 2111; in 1900, 3661.

At the outbreak of the Civil War, Corinth, being at the junction of the Mobile and Ohio Railroad running north and south, and of the Memphis and Charleston running east and west, became a point of great strategic importance. It was fortified by the Confederates, and immediately after the battle of Shiloh (April 6, 7, 1862) General Beauregard with 50,000 men retreated thither, followed by General Halleck at the head of a force of over 100,000 men. Halleck advanced with great caution, being more than a month in covering a distance of only 23 miles, and when he approached Corinth, Beauregard, after slight skirmishes, quietly evacuated the place during the night of May 29th, Halleck taking possession the following day. On October 3, 4, 1862, a force of 22,000 Confederates under Generals Van Dorn and Price attempted to recapture the place, then defended by General Rosecrans with 20,000 troops. But the assailants, notwithstanding the heroic valor displayed, were repulsed with great loss. The Union loss was 315 killed, 1812 wounded, and 232 missing, while that of the Confederates (estimated) was 592 killed, nearly 2000 wounded, and 2225 prisoners.

CORINTH, GULF OF, or GULF OF LEPANTO. An arm of the Mediterranean extending from west to east through the centre of Greece, and dividing the Peloponnesus from the northern mainland. The outer portion extends from the promontory of Araxus (now Kalogria) in Achaëa to the narrow strait (1¼ miles) between Rhion and Antirrhion (south and north shores), the inner from this point to the isthmus, a distance of about 80 miles. The gulf has the appearance of an inland lake, and the scenery is remarkably attractive, since the shores show striking contrasts of rocky promontories and fertile plains, while the background is everywhere marked by lofty mountains. The narrow neck of land which separates the Gulf of Corinth from the Saronic Gulf, and unites the Peloponnesus to the mainland, is called the Isthmus of Corinth (see **ISTHMUS**). It is about 10 miles in length, and about four miles in width at its northern extremity, near Mount Geraneion. In ancient times a wall was built across the isthmus to prevent invasion from the north. On the Saronic Gulf, at the point where this wall terminated and where the Isthmian games were celebrated, is situated the modern town of Isthmia. Excavations by the French School in 1883 brought to light remains of the ancient sanctuaries and houses on a fortified hill; near by are scanty ruins of the old Stadium. The isthmus is pierced by a canal, completed in 1893. See **CORINTH CANAL**.

CORINTH CANAL. The construction of a canal across the Isthmus of Corinth was begun

by Nero, but the undertaking proved too vast and was abandoned. In 1881 a French company obtained a concession to construct such a canal and in 1882 work was begun. In 1889 the work was transferred to a Greek company, and was brought to completion by Matsas, a Greek engineer, in 1893. The canal, uniting the Gulf of Corinth with the Saronic Gulf, shortens the journey from the Adriatic to the Piræus by 202 miles. It is 4 miles long, and has a depth of 26 feet, thus admitting the largest vessels. The difficulties of navigation, however, in the Corinthian and Saronic gulfs, have led large steamships to prefer the longer voyage around Cape Malea. At its western extremity a new town, Poseidonia, has sprung up, and at its eastern end is the modern town of Isthmia.

CORINTHIAN ORDER. The latest developed and most elaborate of the three orders of Greek architecture. See **COLUMN**.

CORINTHIANS, EPISTLES TO THE (translation of Gk. *πρὸς Κορινθίους*, sc. *ἐπιστολαί*, *pros Korinthiōus*, to the Corinthians, sc. *epistolai*, epistles). Two writings in the New Testament addressed by Paul to the Church at Corinth, which he had founded in A.D. 50. The former of these letters was written during Paul's stay in Ephesus, from A.D. 52 to 55, probably shortly before Pentecost of 55 (cf. xvi. 8, 9: "But I will tarry at Ephesus until Pentecost; for a great door and effectual is opened unto me, and there are many adversaries"). It was occasioned primarily by reports brought to the Apostle through certain members of the Corinthian Church to the effect that there were grave disorders in the Church, consisting chiefly in party factions, gathering around the names of the Apostles and their workers and Christ (chaps. i.-iv.), and also in grossly immoral practices (chap. v.) and in a contentious spirit which resulted in bringing one another before the courts of law (chap. vi.), all of which things the Apostle sternly rebuked. The further occasion of the Epistle was a letter addressed by the Corinthian Church to the Apostle, apparently in reply to a previous letter sent by him to them, in which he had prohibited their companionship with persons of bad character and life, but evidently in such terms as to lead to the misunderstanding that he had in mind all persons of this character in their community. The practical impossibility of complying with this command they had doubtless laid before the Apostle in their letter, in view of which protest he explains that his intention was to prohibit Christian companionship with such persons in the membership of the Church (v. 9-11: "I wrote unto you in my Epistle to have no company with fornicators; not at all meaning with the fornicators of this world . . . but . . . if any man that is named a brother be a fornicator, or covetous, or an idolater, or a reviler, or a drunkard, or an extortioner, with such an one no, not to eat"). In this same letter the Corinthians apparently laid before the Apostle definite questions regarding certain troubles in their church life, to which the Apostle replies in order (chaps. vii.-xvi.). These questions regarded marriage (chap. vii.), the eating of meat offered in sacrifice to idols (chap. viii.), the proprieties of public worship (chaps. xi.-xiv.)—chiefly as to the use of the charismata or spiritual gifts (chaps. xii.-xiv.),

the doctrine of the resurrection (chap. xv.), and the collection for the saints in Jerusalem (chap. xvi.)—possibly also the return of Apollos to work among them (xvii. 12).

The second of the letters was written after Paul had left Ephesus, while he was on the journey from that city to Corinth, most likely in the spring or early summer of 55, from some of the Christian centres in Macedonia. It was occasioned by the report brought to the Apostle through Titus, to the effect that the personal hostility to the Apostle in the Church had given way to the spirit of general loyalty to his rule (chap. vii.). In this second letter there are passages which make it impossible to avoid the impression that the Apostle made more visits to Corinth than are recorded in the Book of Acts, and that, in addition to the letter of prohibition referred to above, he wrote more letters to the Church than are distinctively preserved in the New Testament. The passages referring to the visit are the following: (ii. 1) "But I determined this for myself, that I would not come again to you with sorrow;" (xii. 21) "Lest again when I come my God should humble me before you;" (xiii. 2, 3) "I have said beforehand . . . as when I was present the second time . . . that, if I come again, I will not spare." From these it is clear that the Apostle had made a visit to Corinth, which was of a sorrowful kind. This cannot possibly be the only previous visit of which we have record in the Acts—the visit in which he founded the Church; since, while at that time he was discouraged regarding his gospel work in Corinth, there had been no sorrow between him and his people, such as these passages necessarily imply. This inference is confirmed by the remaining passages: (xii. 14) "Behold, this is the third time I am ready to come to you;" (xiii. 1) "This is the third time I am coming to you," from which it is clear that the visit which he was about to make was, to the Apostle, his third visit to this place. The passages referring to the letter are the following: (ii. 3, 4) "Out of much affliction and anguish of heart I wrote unto you with many tears;" (vii. 8, 9-12) "For though I made you sorry with my Epistle, I do not regret it. . . . So although I wrote unto you, I wrote not for his cause that did the wrong, nor for his cause that suffered the wrong," etc., from which it is clear that the Apostle has in mind some other letter than that which we know as I. Corinthians; since, while I. Corinthians might be called a letter of censure, whose object was to shame its readers, it could not in any way be termed a letter of 'affliction' and 'anguish of heart' and 'many tears.'

The only reasonable explanation of these intimations is to be found in the theory that, between the writing of the first and second canonical letters, Timothy, whom Paul had sent to Corinth at the time of the first letter, returned to Ephesus with news of an urgent situation in the Church—an outbreak evidently of personal hostility against the Apostle (see ease of discipline referred to in ii. 5-11), in response to which Paul hurries across to Corinth by the direct sea route, but is unable to better the state of affairs (cf. xii. 21, as above, which is confirmed by the estimate placed upon him by his opponents in x. 10: "His letters, they say, are

weighty and strong; but his bodily presence is weak, and his speech is of no account"). Returning to Ephesus, he writes to the Church in the fullness of his mortification and grief a letter bearing upon his experience in this visit and upon the general situation in the Church, a letter which might easily have been one 'of many tears.'

In such a case, however, it is quite certain that we have a portion of this painful letter preserved in the last four chapters of our second Epistle (chaps. x-xiii.). The evidence for this statement lies in the following facts: (1) Between chaps. i-ix. and chaps. x-xiii. there is a marked and otherwise unaccountable difference in the feelings of the Apostle. The earlier chapters are full of cheer and satisfaction; the later of dissatisfaction and distress. (2) Between these two groups of chapters there is, further, a marked and otherwise unintelligible difference in the condition of the Church's affairs. In the earlier chapters the Church is manifestly loyal to the Apostle; in the later it is as manifestly disloyal. (3) Between these two groups of chapters there is a peculiar set of cross-references. It is found in the following passages:

I. (ii. 3) "And I wrote this very thing, lest when I came, I should have sorrow from them of whom I ought to rejoice" (xiii. 10) "For this cause I write these things while absent, that I may not when present deal sharply," etc.

II. (i. 23) "But I call God for a witness upon my soul, that to spare you I forbore to come to Corinth;" (xiii. 2) "I have said beforehand, and I do say beforehand . . . that, if I come again, I will not spare."

III. (ii. 9) "For to this end also did I write, that I might know the proof of you, whether ye are obedient in all things;" (x. 6) "—being in readiness to avenge all disobedience, when your obedience shall be made full."

From these passages it would appear (1) that the actions or states of feeling described in the later chapters as future are in the earlier chapters described as past; (2) that between the future references to these states and actions and the references to them that are past there had come over the situation to which they apply a change for the better. These two phenomena are rendered the more significant by the fact that the passages in the earlier chapters are all of them from a portion of the letter (i. 23-ii. 11) in which reference is made expressly to the painful letter (ii. 3, 4) and most probably to the experiences of the sorrowful visit (ii. 5-11); while two of the three passages in the later chapters are from a portion of the letter (xiii. 1-10) in which reference is made specifically to a contemplated visit which has in it the possibilities of being one of unpleasantness between the Apostle and his people.

These internal evidences are confirmed by the fact that II. Corinthians does not seem to have been known as early in the post-Apostolic Church as I. Corinthians. This is especially evident from the fact that Clement of Rome, in writing to the Corinthian Church (A.D. 95), though there was in the situation of the Church that which would have made references on his part to II. Corinthians most apt and forceful, apparently confines all his references to the less applicable I. Corinthians. There seems to be no allusion to it before Polycarp's letter to the Philippian

Church (A.D. 116); while, generally speaking, references to it by the Fathers are few and not over clear. But if II. Corinthians was thus so much later in coming to the notice of the Church, this period of obscurity would involve necessarily a harsh usage for the first copies of both the letters of which it is composed, and this may easily have resulted in a loss of the closing portion from Paul's last letter (chaps. i.-ix.) and, correspondingly, of the earlier portion of his painful letter (chaps. x.-xiii.). Inasmuch, however, as both these fragments, when finally discovered, gave evidence of having been written by Paul (cf. i. 1, 2, which gives the Apostolic greeting in the name of Paul: "Paul an Apostle," etc., and x. 1, which presents Paul by name as the writer: "Now I, Paul, myself entreat you," etc.), and as one showed itself clearly to be the beginning, while the other as clearly showed itself to be the close of one of his letters, it would be not at all unnatural were the two fragments placed together as one Epistle and so received generally in the Church.

In view, therefore, of the facts presented in the Epistles, we recognize three visits of Paul to Corinth: (a) at the founding of the Church; (b) in response to the urgency call; (c) at the close of his mission work in the East. We recognize also four letters of Paul to the Church: (a) the letter of prohibition; (b) the canonical I. Corinthians; (c) the painful letter (II. Corinthians x.-xiii.); (d) the canonical II. Corinthians (chaps. i.-ix.).

Together with the Epistle to the Galatians and the Epistle to the Romans, the Corinthian Epistles have been almost universally received as genuine letters of Paul. The Tübingen School (1845) made these four Epistles the standard for their criticism against the remaining New Testament writings. Recently a school of Dutch critics (1880-90) has sought to disprove their Apostolic origin. Other Continental critics (1875-90), while admitting their substantial genuineness, have attempted to redistribute their contents among various documents. Still other critics (1880-87) confine their efforts to the elimination of certain minor interpretations. Apart, however, from the two-epistle theory for II. Corinthians, as advanced in this article, the letters are not only unmistakably genuine products of Paul, but are clearly integral in their contents.

CORINTHIANS, THIRD EPISTLE TO THE. See APOCRYPHA.

CORINTO, kō-rēn'tō (Sp. Corinth). A seaport in the Department of Chinandega, Nicaragua, situated on the island of Aserradores, between Realejo Bay and the Pacific (Map: Central America, D 4). It has an excellent harbor, and is the chief Nicaraguan port of the west coast, having supplanted Realejo. It is the residence of a United States consular agent. Corinto was founded in 1863. Population, 3000.

CORIOLANUS, CAIUS or GNAEUS MARCIUS, a Roman patrician. According to the half-fabulous legend, he was surnamed Coriolanus on account of his capture, B.C. 493, of the town of Corioli, belonging to the Volsci. Of a proud and haughty spirit, he was strongly opposed to the plebeians, whom he looked upon as the 'enemies' of his order: and on one occasion, during a time of famine, he argued in the Senate against a gratuitous distribution of the corn which had arrived from Sicily, and insisted that the plebeian tribunes, lately instituted, should first be discharged from office. For this he was impeached and banished. He took refuge among the Volscians, whom he aided in their war with the Romans. His victories at the head of his Volscian troops alarmed the Romans, who, on his approach to their city, sent a variety of deputations to plead with him. He was deaf to every entreaty. At last, the noblest matrons of Rome, headed by his old mother and his wife, Volturnia, leading her two children, came to his tent. His burning desire to be revenged on those who had dishonored him was cooled by the tears of his relatives, and he led back the Volsci to their own territories, where he lived to an advanced age.

CORIOLANUS. (1) A tragedy by Shakespeare, produced, probably, in 1609, and published in 1623. The plot is derived from *Plutarch's Lives*, and some speeches are taken verbatim from Sir Thomas North's translation of that work, published in 1579. The leading idea of the play is the rivalry between the patricians and plebeians, which existed in the fifth century B.C.

(2) A tragedy by James Thomson, published, after his death, in 1748 or 1749.

CORIPPUS, FLAVIUS CRESCONIUS. An author, native of Africa. He is supposed to have lived in the sixth century. He was the author

of a panegyric on Justin the Younger, Byzantine Emperor (A.D. 565-578). Corippus was also the author of *Johannis*, a poem celebrating the exploits of a proconsul of that name in Africa in Justinian's time.

CORIS'CO. An island belonging to Spain, situated off the coast of Guinea, Africa, at the entrance to Corisco Bay, in latitude 0° 55' N., longitude 9° 20' E. It has an area of about five and one-half square miles, and is generally low and flat. The island is densely wooded, chiefly with ebony and logwood, which, with the ivory obtained from the mainland, constitute the chief articles of trade. Population, in 1900, 1438.

CORK (OIr. *Corach-Mor-Murham*, Great March of Munster). A maritime county in Munster and the southernmost and largest of the Irish counties (Map: Ireland, C 5). Area, 2890 square miles. Cork is hilly, with a great diversity of surface. The western part is rocky, mountainous, wild, and boggy; the east and south, rich, fertile, and picturesque. The Munster coal-field occupies 400 square miles in the northwest section of the county; some iron is also mined. The dairy industry is extensive, Cork butter being highly esteemed. The capital is Cork. Population, in 1841, 858,100; in 1891, 438,432; in 1901, 404,800.

CORK. A city, civic county, port, and Parliamentary borough, capital of Cork County, Ireland, on the Lee, 11 miles above its discharge into the sea, and 165½ miles southwest of Dublin by rail (Map: Ireland, C 5). It stands in the centre of a picturesque valley, partly on an island, formerly a swamp, which the word Cork, *Corroch*, or *Corcagh* implies, and partly on the north and south slopes of the river banks. Several bridges span the river to the central island. The situation is picturesque from the uneven ground, irregular streets, intersecting river, and overhanging heights. Cork is the seat of a Roman Catholic bishopric. Its finest building is the Anglican Cathedral of Saint Finn Barr, completed in 1879 on the site of the saint's seventh-century foundation. There are four monasteries, two nunneries, and among other buildings of note are the bishop's palace, the free library schools of science and art (with a museum), and Queen's College, affiliated with the Royal University of Ireland and occupying a fine Tudor-Gothic quadrangular building. The Church of Saint Anne Shandon, with its high tower, is near the site of the old Shandon Castle, once a stronghold of importance. There is a public park of 240 acres, with a well-known race-course. There is also a handsome public cemetery. The banks of the Lee, above and below Cork, are studded with villas. The estuary contains several islets rising abruptly from the water, with narrow channels between them. It is a land-locked basin, having an entrance one mile in width, which is defended by batteries on Spike, Haulbowline, and Rocky islands, which are also occupied by a convict prison, Government repairing dock, ordnance depots, and artillery barracks. On the shores of the estuary are the towns of Passage and Queenstown, formerly Cove of Cork. The Lee is navigable for a considerable distance above the city, and on the improvement of the navigation the harbor commissioners have expended large sums. The harbor, formed by the Lee estuary, is noted for its size and safety, and has been

the main source of the rise and progress of the city. It has dry-docks and patent slips. An average of 2500 ships enters and clears the port annually. Its own shipping comprises 60 sailing and 50 steam vessels of 22,000 tons burden. It has a large export and import trade, but of a fluctuating and latterly declining character. Its chief exports are oats, manure, and whisky; imports, wheat, maize, fish, meat, chemical products, sugar, and timber. The chief manufactures of the city are leather, metallic goods, woolen and linen goods, beer and whisky. The United States is represented by a consul. Founded in 622 by Saint Finn Barr, during the ninth century Cork was frequently devastated by the Danes, who in 1020 made it a trading station and built the city walls. Desmond Macartly, King of Munster, surrendered it to Henry II. in 1172. During the Civil War it held out for the King, and was taken by Cromwell in 1649. In 1690 it was again besieged and taken by Marlborough. Population, in 1891, 75,345; Parliamentary borough, 97,300; in 1901, 75,978; Parliamentary borough, 99,690; of whom the great majority are Roman Catholics. Cork returns two members to Parliament. Consult Cusack, *History of the City and County of Cork* (Dublin, 1875).

CORK (Sp. *corcho*, cork, from Lat. *cortex*, bark). The unusually developed epiphloeum (see BARK) of the bark of the cork-tree or cork-oak (*Quercus suber*), the *alcornoque* of the Spaniards, a species of oak (q.v.), a native of southern Europe and northern Africa. Theophrastus, in book ii. of his *Historia Plantarum*, speaks of the cork-tree as a native of the Pyrenees. Spain and Portugal chiefly supply the world with cork, although the imported tree is said to thrive in some parts of the United States. Planted trees are said to be inferior to the natural forests. The cork-tree is not of great size, generally 20 to 40 feet high, with ovate-oblong evergreen leaves, which are sometimes entire and sometimes sharply serrated. It lives to a great age, in some instances 300 or 400 years, and is as much as 15 feet in circumference. It blossoms in April or May; the fruit ripens from September to January, falling on the ground as soon as ripe. The acorns are edible, and in taste resemble chestnuts. The bark in trees or branches from three to five years old acquires a fungous appearance, new layers of cellular tissue being formed, and the outer parts cracking from distension until they are finally thrown off in large flakes, when a new formation of the same kind takes place.

Cork intended for the market is generally stripped off a year or two before it would naturally come away, and the process is repeated at intervals of twelve or fourteen years, according to the vigor of the tree. The cork of the first barking, which is removed usually when the tree is about twenty-five years old, is known as the virgin bark, and is valueless. The removal of the cork does not require the removal of the whole bark, but only of external layers of spongy cellular tissue, all or the greater part of which has ceased to have any true vitality, and has become an incumbrance to the trees. Consequently, instead of being injurious, the taking of the bark, when done with proper care, rather promotes the health of the tree, which continues to yield crops for 150 years. In stripping off the cork

longitudinal and transverse incisions are made to the proper depth, and each piece is then cut away from the tree. The average yield for one tree is about 45 pounds. The slabs are placed in boiling water for one hour, a process which increases their bulk one-fourth and also their elasticity, and dissolves the tannin and other substances. Steam is sometimes employed instead of hot water. The cork is then scraped either by hand or by scraping machines, in which process it loses from 20 to 30 per cent. of its weight. The cork is then cut crosswise into strips of the proper length, then lengthwise, and finally into pieces of the proper shape. In many districts this industry is carried on in the homes by hand, but there are also cork-cutting machines, especially in the United States, of great efficiency. The cork is then washed in oxalic salt, or some other solution, and then dried. It is now ready to be sorted and packed for the market. In Spain the corks are packed in lots of 30,000 in bagging cloth, and called bales.

Besides its use for stopping bottles, casks, etc., cork is largely used, on account of its lightness, for floats of nets, swimming-belts, etc.; and, on account of its impermeability to water, and its being a slow conductor of heat, inner soles of shoes are made of it. All these uses are mentioned by Pliny; but the general employment of corks for glass bottles appears to date only from the fifteenth century. It is also used for bicycle-handles, smokers' mouthpieces, and many other modern devices. The bits that are left in the process of manufacture are ground to powder and used in the manufacture of linoleum and for many other purposes. The Spanish black used by painters is made by burning cork in close vessels.

CORK, EARLS OF. See BOYLE.

CORLEONE, kôr'lâ-ô'nâ (It., lion-heart). A city in the Province of Palermo, Sicily, situated 1950 feet above the sea, at the foot of Mount Cardellia, and 21 miles south of Palermo (Map: Italy, H 10). It has a handsome church that was restored in 1840, and the ruins of two castles. The ancient Korlium was founded by the Saracens and colonized with Lombards by Frederick II. in 1237. Population (commune), in 1881, 15,686; in 1901, 14,803.

CORLISS, GEORGE HENRY (1817-88). An American engineer and inventor, born at Easton, N. Y. In 1844 he removed to Providence, R. I., where he engaged in the manufacture of steam-engines, and in 1848 established the Corliss Steam Engine Company. He made and patented many improvements in steam-engines, and in 1876 furnished the 'Corliss engine' to Machinery Hall in the Philadelphia Centennial Exhibition. This engine now furnishes the motive power for the works of the Pullman Car Company, in Pullman, Ill.

CORM (Gk. κορυβς, *kormos*, the trunk of a tree, with boughs lopped off, from κερειν, *keirein*, Lith. *skirti*, OHG. *sceran*, Ger. *scheren*, Icel. *skera*, AS. *sceran*, Engl. *shear*). A compact subterranean stem which is related both to tubers and bulbs. It is very short and fleshy, usually more or less rounded or depressed, and in this feature is related to the tuber. It is related to the bulb, however, by the fact that this short and compact fleshy stem is invested by thin

scale leaves. Corms are sometimes spoken of as 'root bulbs,' and in popular usage are con-

CORMS.

a, Colchicum; b, Arisaema (Indian turnip).

stantly spoken of as 'bulbs.' Common illustrations are found in the Indian turnip, crocus, gladiolus, cyclamen, etc.

CORMENIN, kôr'me-nân'. LOUIS MARIE DE LA HAYE, Vicomte de (1788-1868). A distinguished French jurist and publicist, born in Paris. He was educated for the law, and in 1810 was appointed auditor of the Council of State, in which capacity he drew up several of the Council's most important reports. He was a Deputy from 1828 to 1846. His extensive knowledge of jurisprudence and of the practical affairs of government, and the clear and logical force with which he presented his ideas, soon secured for him great influence in public affairs. His famous *Lettres sur la liste civile* began to appear in 1831, and passed through twenty-five editions within ten years. He was elected to the National Assembly in 1848, and was made president of the commission appointed to remodel the Constitution, in which capacity he strongly advocated universal suffrage. Although he had opposed the admission of Louis Napoleon to the National Assembly, and afterwards had protested against the coup d'état, he was appointed, in 1852, a member of the reconstituted Council of State. In 1855 he was elected a member of the Institute. Besides his numerous political pamphlets, published under the pseudonym of 'Timon' and subsequently collected as *Pamphlets de Timon* (1848), Cormenin wrote *Etudes sur les orateurs parlementaires*, a work which has passed through nearly twenty editions, and a valuable *Droit administratif*, dealing with the law of France.

CORMON, kôr'môn'. FERNAND (1845—). A French painter. He was born in Paris, and studied under Fromentin, Cabanel, and Portaels. He received the Prix du Salon in 1875, a medal of honor at the Salon in 1887, the Grand Prix at the Exposition of 1889, and in the same year became an officer of the Legion of Honor, of which he had been chevalier since 1880. In his archaeological paintings, of which "The Stone Age," exhibited in 1884, is a good specimen, he shows great accuracy in reproducing the char-

acteristics of the time, having given much study to the scientific accounts of ancient and prehistoric periods. He enjoys high reputation as an instructor, and has been successful also in painting portraits. Other works worthy of special mention are: "The Death of Ravana" (1875); "Cain" (1880); and "The Victors of Salamis" (1887).

CORMONT, kôr'môn', THOMAS and REYNAUD de. Father and son; French architects of the thirteenth century; prominent among the builders of the Cathedral of Amiens, following Robert de Luzarches (1223-69).

CORMONTAIGNE, kôr'môn'tü'ny', LOUIS DE (1695-1752). A French military engineer, who took part in some of the most important sieges in the War of the Polish Succession and that of the Austrian Succession. He had charge of the line of fortification from Calais to the Rhone, and he built new defenses at Strassburg, Metz, and Thionville. His improvements of Vauban's system of fortification are embodied in his *Architecture militaire, par un officier de distinction* (1741).

COR/MORAN. A Cornish giant in the story of *Jack the Giant-Killer*, whom Jack killed by causing him to fall into a covered pit.

CORMORANT (Fr. *cormoran*, It. *corro marino*, from *corro*, crow, and *marino*, marine; cf. Bret. *morrnan*, cormorant, from *mor*, Lat. *mare*, sea + *bran*, crow). A group of web-footed birds comprising the steganopode family Phalacrocoracidae, characterized especially by a bare dilatible membrane beneath the lower mandible, but not in the form of a sac under the throat as in the pelicans; a compressed bill, rounded above, and with a strong hook at the point of the upper mandible; the nostrils linear, and seemingly impervious to air; the claw of the middle toe serrated, used in trimming the plumage; the wings of moderate length; the tail rounded, the feathers stiff and rigid, and used to aid in walking or climbing. The species are distributed over the coasts of most parts of the world, some of them ascending rivers and even visiting freshwater lakes in pursuit of fish, on which all of these birds subsist exclusively.

Cormorants are proverbially voracious. They do not take their prey by diving, when on the wing, but pursue it by swimming and diving, using their wings in progress under water, and sometimes descending to a great depth; a British species has been caught in a crab-pot fastened 120 feet under water. When the prey has been taken in a manner inconvenient for swallowing, they toss it in the air and adroitly catch it as it descends. The behavior of cormorants in fishing and toward each other in their colonies has been described at length by E. Selous in *Bird Watching* (London, 1901). Some of the species frequent high rocks, others low islands, on which they make rude nests, chiefly of seaweed and almost always in colonies; some perch and even build their nests on mangroves and other seaside trees. Their greenish-blue eggs are covered with a calcareous incrustation. The flesh of all the species is dark and of a fishy taste, but is sometimes used as food, particularly that of young birds.

There are described about twenty-five well-defined species, of which seven are found in North America. The commonest is the double-

crested cormorant (*Phalacrocorax dilophus*), so called from the lateral crest of curly feathers on the sides of the head, and present throughout North America. The 'common' cormorant (*Phalacrocorax carbo*) occurs abundantly on both sides of the Atlantic, especially northward, while on the Pacific Coast three species are numerous—the tufted cormorant (*Phalacrocorax penicillatus*), the red-faced cormorant (*Phalacrocorax bicristatus*), and the violet-green cormorant (*Phalacrocorax violaceus*); the two latter are especially characteristic of Alaska. The British species are the 'common' cormorant, which is about 33 inches long and almost of a black color, but during the breeding season exhibits a sprinkling of elongated white and almost bristly feathers on the head and back of the neck; and the green cormorant, or 'slag' (*Phalacrocorax graculus*), which is smaller and dark-green. Two notable species are Pallas's cormorant, now extinct (see EXTINCT ANIMALS), and Harris's, the surf-fishing, flightless species of the Galapagos Islands, which is exceedingly rare, of great size, and has wings useful only as fins. See FLIGHTLESS BIRDS.

Fishing with cormorants is a very ancient practice, still regularly followed among the Chinese and Japanese, and lately revived as a sport in Great Britain. The birds are taken from the nest when young, and are easily tamed and trained; or old cormorants may be trapped and taught to serve. They are kept for a while and fed meat, etc., until accustomed to their master and the feeding methods. Then a line is fastened to one leg by a leather anklet, and they are taken out in a boat to fish and drawn in after each capture. After a time they may be set free. A ring or strap-collar is fastened about their necks, so that no fish can be swallowed, but only pouched, and they return to the boat to be relieved of their burden. After a suitable time the ring is removed, and they are allowed to fish for themselves, or fed. These birds make a living for many families on the Chinese coast, and well-trained ones are highly valued. The modern use of cormorants in this way in England was described and illustrated in *The Field* (London, October, 1890). See Plate of FISHING BIRDS, and Colored Plate with WATER BIRDS.

CORN (Lat. *cornu*, horn; connected with Ir., Welsh *corn*, Gall. *kápron*, *karnon*, Goth. *haurn*, AS., Engl. OIG. *horn*, Ger. *Horn*, also with Gk. *képas*, *keras*, Skt. *srīṅga*, horn). A small hard growth resulting from an increase in the thickness of the cuticle or epidermis, which is generally caused by the irritation of some excessive pressure or friction on the part. Corns occur most commonly on the toes, as a result of tight shoes. Three varieties of corns are described—viz. (1) Laminated corns, or callosities, in which the hardened cuticle is arranged in layers, frequently of a dark-brown color, from the effusion of blood in the deeper layers. (2) Fibrous corns (clavi), which are not only fibrous in their early stages, but have convex surfaces, and, as time goes on, sink into the skin, sometimes producing great pain. Frequently a bursa, or small bag containing serum, is formed beneath, and if this should inflame, pus speedily forms, and the pain and constitutional irritation become severe; at other times the pressure may cause absorption of the ends of bones, and serious alterations in the condition of a joint. (3) Soft corns occur between the toes and cause much annoyance; they

are generally small, and as they are constantly bathed in perspiration, the cuticle does not harden, as in the other varieties. They sometimes give rise to painful ulcerations, and should never be neglected. The treatment of corns consists in the removal of all undue pressure or friction, either by removing the shoe altogether, or protecting the corn by surrounding it with a ring of felt or 'corn plaster'; or the hardened cuticle may be softened by the application of water of ammonia and then scraped or filed away; or it may be extracted by using a dull instrument. A soft corn should be treated by putting small rings of absorbent cotton around it and between the toes, and keeping it dry till it becomes a hard corn, and then treating it as such. Most druggists keep a 'corn cure' composed of salicylic acid dissolved in collodion, several applications of which will remove a hard corn. In all serious cases, application should be made to a chiropodist.

Corns affect horses as well as man. In the foot of the horse they occur in the angle between the bars and outer crust, and are caused by a bruise of the sensitive secreting sole. Two forms of feet are especially subject to them—those with deep, narrow, slanting heels, in which the sensitive sole becomes squeezed between the doubled-up crust and the shoe; and wide, flat feet, which, by the senseless cutting away of the bars and outer crust, allow the delicate interior parts to be pressed with all the force of the animal's weight on the unyielding iron shoe. Serum and blood are poured out, while the secreting parts, being weak and irritable, produce a soft, scaly, unhealthy horn. Corns constitute unsoundness; cause a short, careful, tripping gait; are a very frequent source of lameness among roadsters; abound in badly shod horses, especially those with the kind of feet alluded to, and usually occur in the inside heels of the fore feet, these being more especially subjected to weight, and hence to pressure. The discolored spot indicating the recent corn must be carefully cut into with a fine drawing-knife, any serum or blood being thus allowed free vent. If the bruise has been extensive, a poultice will have the twofold effect of allaying irritation and relieving the sensitive parts by softening the hard, unyielding horn. When the injury has been of long standing, and soft faulty horn is secreted, a drop of diluted nitric acid may be applied. On no account must the bars or outer crust be removed: they are required for bearing weight, which may be further kept off the injured part by the use of a bar-shoe. In horses subject to corns, the feet should be kept soft by dressing with tar and oil, or any suitable emollient; the corn should be pared out every fortnight: a shoe with a wide web on the inside quarter should be used, and should be nailed only on the outside: and, if the sole is thin and weak, leather pads should be employed. In bad cases the shoes may be removed and the horses turned out to pasture for a few weeks with good results.

CORN, INDIAN. See MAIZE.

CORNARO, kōr-nā'rō, CATERINA (1454-1510). Queen of Cyprus. She was born in Venice, of a patrician family. She was married to James II., of Lusignan, King of Cyprus, in 1472, and succeeded him on his death, only eight months later. When her son had also died, in

1475, the Republic of Venice assumed the government, and in 1489, fearing the conclusion of a marriage between her and Alfonso, the hereditary Prince of Naples, forced her to abdicate and leave the island. She was received in Venice with great pomp, and thereafter resided at Castle Asolo, near Bassano. Caterina has been the favorite subject of romances and the heroine of several operas. Of her life in Venice her cousin, Pietro Bembo, has left a vivid description in *Gli Asolani*.

CORNARO, LODOVICO (1467-1566). A Venetian nobleman and hygienist. Up to his fortieth year he so wasted his forces, originally but feeble, in dissipations of every kind that his life was despaired of. He thereupon adopted strict rules of frugality in eating and drinking, with general care of his health and gentle exercises, and in consequence lived for almost a century. To promote those habits which had proved so advantageous in his own case, he wrote, in his eighty-third year, his celebrated treatise, *Discorsi della vita sobria* ("Essay on Temperate Living"), which was first published at Padua in 1558, and has been translated into many European languages. The best English translation is one bearing date 1779.

CORNBURY, EDWARD HYDE, Lord, third Earl of Clarendon (1661-1723). An English politician, Governor of the colonies of New York and New Jersey from 1702 to 1708. He was a member of Parliament for Wiltshire from 1685 to 1695, and for Christchurch from 1695 to 1701, and in September, 1701, was appointed Governor of the Province of New York by King William, to whose side he had treacherously deserted in 1688, from that of his uncle, James II. He reached New York in May, 1702, was confirmed in his office by his cousin, Queen Anne, on the death of King William, and later in the year was also appointed first royal Governor of New Jersey. In both New York and New Jersey his arbitrary policy, his religious intolerance, his administrative incapacity, and his dissolute habits soon made him extremely unpopular, while in New York the dislike of the people was considerably intensified by his fraudulent appropriation of public funds and his attempts to override the Legislature, which insisted on its right to appoint a treasurer of its own for the "receipt and disbursement of any moneys the Legislature might order to be raised for public purposes," and contended that "the Assembly as representatives of the people of this province are entitled to the same privileges and have a right to the same powers and authorities as the House of Commons enjoy." Finally, as a result of lists of grievances passed by the legislatures of both colonies, Cornbury was removed from office in 1708, and was immediately thrown into prison in New York by his creditors; but, on his becoming third Earl of Clarendon by the death of his father in 1709, he was enabled to pay off his debts and returned to England. He became a Privy Councillor in 1711 and was envoy extraordinary to Holland in 1714. During his term as Governor of New York and New Jersey, he was fond of appearing in public dressed as a woman, and Lewis Morris, a contemporary, wrote: "He dresses publicly in women's clothes every day and puts a stop to all public business while he is pleasing himself with that peculiar but de-

testable maggot." William Smith, in his *History of the Late Province of New York* (New York, 1829-30), speaks of him as follows: "We never had a governor so universally detested, nor one who so richly deserves the public abhorrence. In spite of his noble descent, his behavior was trifling, mean, and extravagant. The indignation of the people was kindled by his despotic rule, savage bigotry, insatiable avarice, and injustice not only to the public, but even his private creditors." Consult: Wilson, *Memorial History of the City of New York*, vol. ii. (New York, 1891-93); and Gordon, *A History of New Jersey* (Trenton, 1834).

CORN-CRAKE. See **CRAKE**.

CORNEA, kôr'nè-à (Neo-Lat., fem. of Lat. *cornus*, horny, from *cornu*, horn; so called from its resemblance to horn). The transparent anterior portion of the outer coat of the eye. It contains no blood-vessels and obtains its nutrition by means of a system of spaces filled with lymph. Like other portions of the eye, the cornea is subject to inflammation, known as *keratitis*. Ulcer of the cornea is very common, resulting most often from injury, inflammations of the conjunctiva, phlyctenular keratitis, various disturbances in nutrition, etc. A number of forms are seen attacking different portions of the cornea. Aside from inflammation of other portions of the eye accompanying the ulceration, there may result adhesion and prolapse of the iris, closure of the pupil, and opacity of a portion or the whole cornea. *Staphylococci* (q.v.), a protrusion of a part or the whole of the cornea, may follow. *Keratoconus* frequently occurs in young women; the cornea protrudes at the centre from weakness and intraocular pressure. See **EYE**; and **EYE, DISEASES OF THE**.

CORNEILLE, kôr'nâ'y', PIERRE (1606-84). One of the greatest tragic poets of France. He was born at Rouen, June 6, 1606, the son of a lawyer and magistrate of worth, ennobled in 1637. He was trained by the Jesuits, took the advocate's oaths in 1624, and held minor legal offices until 1650. His first play, *Mélite*, presented in Paris (1629), was popular, and was followed by *Clitandre* (1632); *La veuve* (1633), his first comedy; *La galerie du palais* and *La suivante*, both comedies (1634). In 1634 he met Richelieu, composed a Latin elegy on his visit to Rouen, and was enrolled among the five poets of the cardinal statesman, of whom Rotrou alone was at all worthy of his company. He soon incurred Richelieu's displeasure for too frank criticism of his literary work, and wrote, uninfluenced by the Minister's favor, *La place royale*, *Médée* (both 1635), and *L'illusion comique* (1636). But all this earlier work was completely cast in the shade by the triumph of his epoch-making *Cid* (1636), though we may not leave these earlier dramas without recording that they are far superior to anything that had preceded them in vigor and in truth to nature, and that to them we owe the happy invention of the *soubrette*. Such promise as they gave, however, pointed less to the field of Corneille's great achievement than to the drama of intrigue and to the comedy of contemporary society, for some of them are full of rather coarse

stage business and a battledore and shuttlecock repartee, and are written in a style that he felt needed apology for its familiar simplicity.

The tragi-comedy of *Le Cid* was so different from Corneille's earlier dramas that it hardly seems the work of the same hand. It gave him a preëminence over contemporaries and predecessors, questioned only by interested rivals and the Academy, which Richelieu summoned to support them, and which it did with stunted half-heartedness. Among the conservative critics passion ran as high as in the famous battle over Hugo's *Hernani*. Scudéry, a critic of repute, asserted, and seems to have believed, that *Le Cid's* subject was ill-chosen, its structure unpardonable, its action clumsy, its versification bad, and that its undeniably beauties were stolen from a Spanish play by Guillen de Castro, which was indeed its acknowledged source. But the public spoke with no uncertain voice, and though *Le Cid* may lack the ethical depth and tragic force of some of Corneille's later dramas, it was and has remained the most popular on the stage of them all. Modern French drama dates from *Le Cid*.

In the controversy that raged around *Le Cid*, Corneille's position was delicate. He was not by nature a tactful disputant, being indeed inclined to arrogance, as he showed on this occasion by his *Excuse à Ariste*; he could not afford to lose the favor that Richelieu continued to show him, and he could not secure a full hearing without imperiling it. He therefore withdrew for three years to Rouen. When he returned in 1639 to Paris it was with a matured genius that almost immediately asserted itself in unparalleled splendor and fecundity. Yet the theme of *Le Cid*, the struggle between honor and love in the hero, between duty and love in the heroine, remains typical of the later tragedies. Typical of them all are also the five acts and the three 'unities': the time limited to twenty-four hours, the scene to a single town, and the action to a central interest—self-imposed fetters worn with even greater complacency by Racine. The Spaniards knew nothing of these unities, and the effort to force their romantic drama into this rigid mold had by the improbabilities, material and psychic, that it involved, given occasion for most of the criticism that had befallen *Le Cid*. Corneille, therefore, in 1639, turned to classical subjects that would lend themselves more readily to the episodic treatment which the unities demanded. What survived of romance in him was the invariable intermingling of love with sterner themes.

Horace (1640) sets the love of man and woman against the love of race and fatherland in four-fold treatment of a single theme. In *Cinna* passion twists love of fatherland to its purpose, and is opposed at once to the magnanimity and the patriotism of Augustus. *Polycuete* (1642) opposes Christian to marital duty in a story of Christian martyrdom, which was a bold venture, for many thought with Boileau that the mysteries of the faith should be kept out of literature. These three, with *Le Cid*, mark the height of Corneille's achievement, save that he touches for a moment a greater intensity of terror in *Rodogune* (1645). The other tragedies are more or less pale imitations of the merits of these. Among them it is worth while to name *La mort de Pompée* (1643); *Théodore* (1646), an even

more dubious venture in Christian martyrology than *Polycette* had been; *Héraclius* (1647), followed by Corneille's election to the Academy; *Nicomède* (1651); *Pertharite* (1652). The last was an unmistakable failure which led Corneille for a time to withdraw altogether from the stage. During these years he had written also two comedies on Spanish models, *Le menteur* and *Suite du menteur* (1644-45), and a good tragi-comedy, *Don Sanche d'Aragon* (1650), which, as the name implies, was Spanish also.

For seven years, from 1852 to 1859, Corneille lived at Rouen and turned his talent to versifying Thomas à Kempis's *Imitation of Christ* (1656), and to the writing of very frank critical essays on his own plays and the drama in general. He was recalled from this by a visit of Molière's company to Rouen in 1658, and between 1659 and 1674 wrote eleven tragedies of unequal mediocrity, though in each of them there were verses "with necks in thunder clothed and long resounding pace," such as he alone has known the art to create. The time to regret had passed, the time to cry halt had come when Boileau wrote his famous epigram, *Après Agésilus hélas* (1666); *Mais après Attila hélas* (1667). A new conception of dramatic art had been introduced by Boileau and Racine, and when Corneille was beguiled into a contest for Court favor he was fated to see his young rival's *Bérénice* preferred to his *Tite et Bérénice* (1670). Other plays of this period are: *Œdipe* (1659); *La toison d'or* (1660); *Scrtorius* (1662); *Sophonisbe* (1663), after which he received an irregularly paid pension of 2000 livres; *Othon* (1664); *Psyché* (1671), in collaboration with Molière and Quinault; *Pulchérie* (1672); and *Suréna* (1674). He had written some devotional poetry between 1665 and 1670, and among his last compositions were some beautiful verses of thanks addressed to King Louis XIV. in 1676. Corneille's last years were passed in pecuniary straits, "satiated with glory and hungry for money," as he said, and when, at the urgent request of Boileau, the King sent him 200 pistoles, it was already too late. He had no time to spend them, and two days after he was dead (October 1, 1684).

Corneille's works show him as his friends describe and as his portraits paint him, a man of serious, rugged, and almost stern temper. Whether from pride or shyness, he never courted favor, nor took his place with courtiers at a time when this was almost necessary to literary prosperity. His public manners were not gracious, though he was an affectionate husband and brother. His best work never lost popular favor, and the most eminent of his literary contemporaries always did him justice. The greatest of them, Molière, spoke of him as his master, and Racine pronounced at the Academy a eulogy on his rival at once just and generous, that later critics have in the main confirmed.

The first impression made by an attentive reading of Corneille's work is its remarkable unevenness. Judged by his best he ranks with the greatest. No dramatic poet rises to grander heights, but many a lesser talent may attain a higher average. Hence no poet is more quotable and few more quoted, for he has hundreds of lines that cling to the memory by their crash of sound and startling fullness of sug-

gestion, "the most beautiful," says the French critic Faguet, "that ever fell from a French pen." And the same critic says of Corneille's language that it is "the most masculine, energetic, at once sober and full, that was ever spoken in France."

Corneille's tragedies arouse admiration rather than tragic fear. His interest is not in the fate of his characters, but in the unconquerable mind with which they meet it, their haughty disdain of destiny. He is of the school of the emphatics, delighting in extraordinary situations and subjects, in whatever will challenge the will to its utmost utterance. There is no fine-spun sentiment even in the love of *Le Cid*. But tragedy with the limitations of the 'unities' involves much talk and little action, and Corneille's disdain of the endless subject of talk allows the interest to flag for scenes and even acts. There is monotony even in his nobility, and that in spite of the lyric and epic elements which he found in the drama and from which Racine was to free it. Yet his declamations, the tirades of Camilla, Augustus, Cornelia, and many another, are supreme in their kind and will thrill audiences everywhere as long as the antinomies of love and patriotism, honor and duty, perplex men's souls.

The best edition of Corneille is Marty-Laveaux's (12 vols., 1862-68). For early bibliography, see Picot's *Bibliographie Corneilienne* (1865). The best translated biography is Guizot's *Corneille and His Times* (1857); the best modern study, Faguet's "Corneille" (Paris, 1886), in the series *Classiques Populaires. Le Cid, Horace, and Polycette* have been done into English blank verse by Nokes, and (with *Cinna*) into English prose by Mongan and McRae (1878-86). Consult: Sainte-Beuve, *Nouveaux lundis*, vol. vii. (Paris, 1863-72); Levallois, *Corneille inconnu* (Paris, 1876); Guizot, *Corneille et son temps* (7th ed., Paris, 1880); Lemaitre, *Corneille et la poétique d'Aristote* (Paris, 1888); Bouquet, *Points obscurs et nouveaux de la vie de Corneille* (Paris, 1888); Liéby, *Corneille* (Paris, 1892); Brunetière, *Epoques du théâtre français* (Paris, 1892).

CORNEILLE, THOMAS (1625-1709). A French dramatist and miscellaneous writer, whose productions are obscured by the genius of his brother Pierre. He was born at Rouen, August 20, 1625. His forty plays are for the most part of a facile mediocrity, but he has to his credit the longest run of the century for his *Timocrate* (1656), the largest price for his *Sorcière*, and one of the most sensational failures in his *Baron des Foudrières*. He was given his brother's chair in the Academy on the latter's death (1684), and published a dictionary supplementary to the Academy's, and a complete translation of Ovid's *Metamorphoses*, as well as a *Dictionnaire universel géographique et historique* (1708). He was blind from 1704, but his literary activity continued uninterrupted until his death at Les Andelys, December 8, 1709. *Ariane* (1672) and *Le comte d'Essex* (1678) are among his plays the best worthy of memory. His dramatic Works are edited by Thierry (Paris, 1881). Consult Reynier, *Thomas Corneille, sa vie et son théâtre* (Paris, 1893).

CORNEL (OF. *cornille*, from Lat. *cornolium*, cornel-tree, Lat. *cornus*, a cornel cherry-tree,

from *cornu*, horn, so called on account of the hardness of the wood). A term applied in America to various plants of the genus *Cornus*. In Europe the name seems to be restricted to *Cornus mas*, known as cornel or cornelian cherry. It is a common shrub, and was formerly much cultivated as a fruit-tree. It has oval leaves, small heads of yellow flowers appearing before the leaves in spring. The fruit is oblong in shape, a little larger than the sloe, shining red, rarely yellow or white, and when perfectly ripe has an agreeable vinous acid taste. It is either eaten as it comes from the tree, or is made into a preserve. When gathered green it is pickled like olives. In America none of the plants to which the name is applied bears an edible fruit of value. *Cornus canadensis*, dwarf cornel, or bunchberry, is not properly edible, and, so far as known has been little used by man. See DOGWOOD.

CORNE'LIA. A celebrated Roman matron. She was the younger daughter of Scipio Africanus the Elder, the conqueror of Carthage, and mother of the great tribunes Tiberius and Gaius Gracchus, and of Cornelia, the wife of Scipio Africanus the Younger. On the death of her husband, refusing numerous offers of marriage, including even one from King Ptolemy, she devoted herself to the education of her children, a task for which her lofty spirit and wide attainments rendered her admirably fitted, and which had extraordinary results. The only attack ever made upon her lofty reputation was the charge that she was concerned in the death of her son-in-law, Scipio, which was, there is no reason to doubt, a base slander. On her death a statue was erected to her memory bearing the inscription, "Cornelia. Mother of the Gracchi." The base, with the inscription, is now in the Capitoline Museum, Rome. To a Campanian lady who asked to see her jewels, she is said to have presented her sons as the only jewels of which she could boast. After the murder of Gaius, the second of her sons, she retired to Misenum, where she devoted herself to Greek and Latin literature, and to the society of men of letters.

CORNELIA GENS. A distinguished patrician and plebeian clan of Rome. The names of its patrician families, from which came more prominent men than from any other Roman gens, are Arvina, Blasio, Cethegus, Cinna, Cossus, Dolabella, Lentulus, Maluginensis, Mammula, Merenda, Merula, Rufinus, Scapula, Scipio, Sisserna, and Sulla.

CORNE'LIAN CHERRY. See CORNEL.

CORNELISZ, kôr-nā'lis, or **CORNELISSEN.** A family of Flemish painters. The best-known is Cornelis, called Cornelis van Haarlem (1562-1638), an historical and portrait painter. He studied in Haarlem and Antwerp, but finally returned to Haarlem and worked there until his death. He received many civil honors and painted the portraits of the members of the Society of Archers, which are much admired. There are pictures by him throughout Holland and in the art galleries of other European countries.

CORNE'LIUS. (1) A courtier in Shakespeare's *Hamlet*. (2) A physician in Shakespeare's *Cymbeline*, who furnishes soporifics

instead of poisons to the Queen. (3) In Marlowe's *Doctor Faustus*, the friend of Faustus.

CORNELIUS. Bishop of Rome 251-252. His lenient course respecting the lapsed (q.v.), those who in fear of death had renounced Christianity, led to the opposition of Novatian and to the Novatian schism. When persecution was renewed in Rome by Gallus, he fled to Civitavecchia, and there met a martyr's death, September 14, 252. His correspondence with Saint Cyprian on the question of the lapsed is of great historic interest and value, especially on the question of the position of the Roman see. Consult Hartel's edition of the *Letters of Cyprian*, vol. ii. (Vienna, 1871).

CORNELIUS, kôr-nā'lé-ōōs, KARL SEBASTIAN (1819-96). A German physicist, born at Ronshausen in Lower Hesse. He studied the exact sciences at Göttingen and at Marburg, and from 1851 to the time of his death taught physics and physiography at Halle. His published works include: *Die Lehre von der Electricität und dem Magnetismus* (1855); *Theorie des Sehens und räumlichen Vorstellens vom physikalischen, physiologischen und psychologischen Standpunkte aus betrachtet* (1861, followed by another work on the same subject in 1864); *Meteorologie* (1863); *Ueber die Bedeutung des Kausalprinzips in der Naturwissenschaft* (1867); *Ueber die Entstehung der Welt* (1870); *Ueber die Wechselwirkung zwischen Leib und Seele* (2d ed., 1875, followed by another work on the same subject in 1880); *Grundriss der physikalischen Geographie* (6th ed., 1886); and *Abhandlungen zur Naturwissenschaft und Psychologie* (1887).

CORNELIUS. PETER (1824-74). A German composer, nephew of the painter Peter von Cornelius, born at Mayence. He studied for the stage, but not meeting with success as an actor, he turned his attention to music. He became intimate with Liszt, who, in 1858, produced his opera, *Der Barbier von Bagdad*, in Weimar, where, however, it failed. Cornelius was a cultivated man and possessed literary tastes, and as a result of his friendship with Liszt and later with Wagner, he became one of the literary champions of the new, more specifically the Wagnerian, movement in music. In 1886 his *Barbier von Bagdad* was revived in Dresden and other German cities. It was given in the United States under Anton Seidl's direction. Cornelius also composed the operas *Der Cid*, *Guntöd*, unfinished, and songs and choruses.

CORNELIUS, PETER VON (1783-1867). A German historical painter, the founder of the Munich School. He was born September 23, 1783, in Düsseldorf, where his father was inspector of the gallery. At the age of sixteen the youth assisted in supporting the family by his art, and at the same time studied drawing in the Düsseldorf Academy under Langer. His earliest works are unimportant, but after his removal to Frankfort-on-the-Main in 1809, he acquired some celebrity. His first work of importance was his twelve drawings for Goethe's *Faust*, now in the Städel Institute of Frankfort. In 1811 he went to Rome, devoting himself to the study of the art of the Cinquecento, especially to that of Raphael and Michelangelo. He was associated with the so-called Nazarene painters, among whom he found a life-long friend in

Overbeck, but he was too independent to follow their footsteps. During this period he executed his famous drawings for the Nibelungenlied. Together with Overbeck, Veit, and Schadow, he received a commission to decorate a room in the house of the Prussian Consul at Rome, with scenes from the "History of Joseph." In executing this task he revived fresco painting, which had been almost forgotten since the days of Raphael Mengs. His work and that of his associates excited the greatest admiration, and they were engaged to decorate a room in the Villa Massimi, opposite the Lateran, with frescoes from the works of Dante, Ariosto, and Tasso. He had scarcely begun his work when there came a double call to return to Germany. The Prussian Government invited him to become head of the Düsseldorf Academy, and Crown Prince Louis of Bavaria chose him to decorate the new Glyptothek in Munich.

Cornelius arranged to pass his winters in Düsseldorf, where a great crowd of students soon gathered about him, and his summers in executing the frescoes in Munich. He returned to Germany in 1819, and in 1820 he began his work upon the frescoes, which were carried out by his pupils, painting after his design. In two great halls of the Glyptothek he represented the myths of the Greek gods and heroes in works which are masterpieces of drawing and composition. In 1825 he became Director of the Academy of Munich, and was raised to the nobility by King Louis I. of Bavaria. He finished the frescoes of the Glyptothek, representing in the third hall scenes from the *Iliad*. All of this work, however, was executed by his pupils, and may best be studied in the original cartoons by Cornelius, which are now preserved in the National Gallery of Berlin. In 1830 he began the decoration of the Ludwigskirche in Munich, with frescoes representing the "General Confession of Faith of the Christian Church." Contrary to his usual custom, he himself painted upon the large altar wall (62 × 38 feet) a fresco of the "Last Judgment." During the same time he made sketches representing the "History of Christian Art" for the twenty-five loggias of the old Pinakothek, which were painted by Zimmermann.

After a disagreement with the King of Bavaria he was called to Berlin by Frederick William IV. in 1841, and given a commission to decorate the proposed Campo Santo, a burial-place for the royal family of Prussia. The four cartoons executed for this purpose, now in the National Gallery in Berlin, surpass all his previous work. This is especially true of the one containing the "Four Apocalyptic Riders," which is a masterpiece of conception, dramatic life, and boldness of drawing. On the other hand, the "Beatitudes" show appreciation for the beautiful and compact in outline. Until nearly the time of his death, Cornelius was occupied with cartoons. He resided mostly in Rome, but returned to Berlin in 1861, remaining there until his death, which occurred March 6, 1867. During this last period he executed his design for a silver shield, which was a christening present of the King of Prussia to the Prince of Wales, his godson, representing the "Expansion of the Church." He also painted his dramatic picture "Hagen Casting the Nibelungen Treasure into the Rhine," now in the National Gallery, Berlin.

More than any other man, Cornelius may be considered the founder of modern German art. His traditions are still influential in Germany, and are followed by the Munich School of mural painters. His contemporaries held him in high repute, echoing the opinion of Crown Prince Louis: "There has been no painter like Cornelius since the Cinquecento." Modern critics, on the other hand, are not equally favorable, some of them, as Muther, going to the opposite extreme of considering his activity harmful. It is true that he imitated Michelangelo, and that imitation can never produce the healthiest and greatest art; that Cornelius's work is of an intellectual character requiring study for appreciation; that his colors are poor, and that he is sometimes deficient in technique. But, on the other hand, his works were certainly great in composition and in conception. His tendency, like Michelangelo's, was heroic, indeed Titanic, but he was not insensible to grace, and was even capable of expressing the tenderest emotion. He was more of a designer than painter, and his work must be judged by his cartoons. And certainly no painter exercised greater influence upon German art and imagination than did Cornelius in his great cycles of frescoes in Munich and in his cartoons in Berlin. Among his pupils were Wilhelm Kaulbach (q.v.), Carl Hermann, Eberle, and many others. All of them were devoted to the earnest but affable man, who, whatever his deficiencies, had only the highest and noblest aims in art.

Consult: Muther, *History of Modern Painting*, vol. i. (London, 1895); Förster, *Peter von Cornelius: ein Gedenkbuch* (Berlin, 1874); Riegel, *Cornelius, der Meister der deutschen Malerei* (Hanover, 1870); Von Wolzogen, *Peter von Cornelius* (Berlin, 1867); Grimm, H., *Neun Essais* (Berlin, 1865).

CORNELIUS À LAPIDE (1568-1637). A Roman Catholic commentator, whose name was Van den Steen, though he is always known by its Latinized form. He was born at Bocholt, near Liège. He became a Jesuit, and lectured on the Scriptures in Louvain and in Rome, where he died. His fame rests upon his commentary on all the Bible except Job and the Psalms, the first complete edition of which was published in ten volumes folio (Antwerp, 1681). The best edition appeared in Lyons (1838), in eleven volumes, and an English translation of parts of it has been published (3 vols., London, 1876-87).

CORNELL, ALONZO B. (1832-1904). An American politician, son of Ezra Cornell (q.v.). He was born at Ithaca, N. Y., became a telegraph operator, and from 1855 to 1859 was manager of the Central Telegraph Office in New York City. Afterwards he was first vice-president of the Western Union Telegraph Company. In 1868 he was the Republican candidate for Lieutenant-Governor of New York, and from 1869 to 1873 was surveyor of customs in New York. He was chairman of the Republican State Committee from 1870 to 1878, and was three times Speaker of the New York Assembly. From 1880 to 1883 he was Governor of New York, after which he became connected with large financial interests.

CORNELL, EZRA (1807-74). An American capitalist and philanthropist, the founder of Cornell University. He was born in Westchester

County, N. Y., of Quaker parentage; removed with his father, a potter by trade, to De Ruyter, N. Y., in 1819; received a scant education, and for some time taught a district school, besides assisting his father in farming and the making of pottery. He also learned the carpenter's trade, spent a year as a mechanic at Homer, N. Y., and in 1826 removed to Ithaca, where for eight years he managed a flour-mill. In 1839 he joined his brother in the lumbering and farming business, but his attention being turned accidentally in 1842 to the project of constructing a telegraph line from Baltimore to Washington, he invented a machine for laying the wires under ground and was subsequently put in charge of the work. The insulation being poor, however, the plan had to be abandoned, and on Cornell's suggestion the wires were strung on poles, and the line was thus speedily completed. Subsequently Cornell devoted his attention almost wholly to the construction of telegraph lines and the organization of telegraph companies, and was instrumental in forming the Western Union Telegraph Company in 1855. In 1858, having accumulated a large fortune, he settled on a farm at Ithaca, N. Y. He was a member of the first Republican National Convention in 1856, was president of the New York State Agricultural Society in 1862, and was a member of the State Assembly in 1862-63, and of the State Senate in 1864-67. After the passage of the 'Morrill Land-Grant Act' in 1862, he succeeded in getting a bill through the Legislature assigning the whole of New York's land scrip to one institution, and in addition contributed an endowment of \$500,000 toward building such an institution at Ithaca, N. Y. He subsequently (in 1866) bought up the scrip then remaining unsold, located it with great care, and by his skillful management enormously increased the income accruing therefrom to the university. In 1868 'The Cornell University,' so founded, was formally opened. Mr. Cornell also built a public library at Ithaca. Consult *The Life of Ezra Cornell*, by his son A. B. Cornell (New York, 1884).

CORNELL, JOHN HENRY (1828-94). An American musician, born in New York City, and educated in Germany and England. He held several prominent positions as organist in New York, notably at Saint Paul's Chapel (1868-77) and the Old Brick Church (1877-82). His sacred compositions, several of which possess considerable merit, and his theoretical works, include the following: *The Introit Psalms* (1871); *Yesper Psalter* (1861); a *Te Deum*; *Congregational Tune Book*; *Manual of Roman Chant*; *Theory and Practice of Musical Form*; *Primer of Modern Tonality* (1876). The last-mentioned two works attained considerable popularity.

CORNELL COLLEGE. An institution of higher learning, situated at Mount Vernon, Iowa. It was founded by members of the Methodist Episcopal Church in 1853, but was not organized as a college until 1857. The college offers courses leading to the B.A., B.S., B.S. in C.E., and the corresponding master's degrees. The faculty consists of 34 professors and teachers, and the enrollment of students is 382, excluding students in the preparatory department. Among its principal benefactors were Bishop L. L. Hamline, Hon. D. N. Cooley, Hon. W. H. Johnston, Hon. Edgar T. Brackett, and

Capt. E. B. Soper. The principal buildings are College, Science, Chapel, Bowman, and Conservatory halls. The library numbers about 22,000 volumes. Its endowments amount to \$300,000, and its annual income is over \$40,000.

CORNELL UNIVERSITY. An institution of higher education, situated at Ithaca, N. Y. The university owes its origin to the Hon. Ezra Cornell (q.v.), who desired to found an institution where any person could find instruction in any study. Under the Morrill act of 1862 the State of New York received scrip representing 989,920 acres of land as its share of the public lands granted by the Federal Government to the several States for the purpose of establishing colleges of agriculture and mechanic arts. Mr. Ezra Cornell offered \$500,000 as an endowment fund for a university on condition that the State should set aside the proceeds of the sale of its public lands for the same purpose. After much wrangling in the Legislature, this offer was accepted, with the stipulation, however, that the university should offer free tuition to as many students residing in the State as there were Assembly districts. Cornell University was incorporated in 1865, and was formally opened in 1868, with a registration of 412 students. This large matriculation was due, in the first place, to the liberal spirit of the charter, which provided that at no time should the adherents of any one religious denomination compose a majority in the board of trustees; and, secondly, to the low entrance requirements adopted at the new institution, as compared with the high requirements and rigid curriculum maintained at other colleges. The elementary branches were sufficient to admit students to courses in engineering, mechanic arts, and agriculture, while courses leading to the Ph.B. and B.S. degrees were offered to those who could not satisfy the classical entrance requirements. The plan of the whole institution was modeled with a view to the practical tendencies of the times. Its liberal programme was warmly welcomed by such men as James Russell Lowell, Louis Agassiz, Theodore D. Dwight, John Stanton Gould, Goldwin Smith, George William Curtis, and Bayard Taylor, who signified their interest in it by accepting non-resident professorships on its faculty. Andrew D. White gave up for a while the prospects of a political career to become its first president. This auspicious beginning, however, was not maintained. From 1868 to 1882, the university was engaged in a struggle for existence that seriously diminished its students, disheartened its trustees, and brought the whole structure to the verge of bankruptcy. Mr. Cornell, seeing that the State's land scrip, on whose proceeds the university was solely dependent except for the original endowment of \$500,000, was selling at about fifty cents an acre, a sum far less than its ultimate worth, bought up all the unsold 'scrip' and located and transferred to the university before his death over 500,000 acres of the finest timber lands in Wisconsin. But the anticipated advance in forest values did not take place, taxes and cost of administration amounted to over \$60,000 a year, and the university was soon obliged to trench heavily on its capital to meet current expenses. A way of escape that offered in 1880 was blocked by Henry W. Sage, Chairman of the Board of Trustees. In that year a New York syndicate proposed to

buy 275,000 acres of the Western lands for \$1,225,000—an amount that would have released the trustees from their troubles. But Mr. Sage, believing that the lands would go still higher, refused his consent and the bargain fell through. Less than two years later his faith was vindicated; 140,000 acres was sold for \$2,320,000, other sales were made later at increasing prices, and the university has up to the present time realized a net profit of some \$6,000,000. Besides its income from these sources Cornell has received large private gifts. Henry W. Sage gave altogether \$1,175,000; Andrew D. White, \$200,000; Daniel B. Fayerweather, over \$300,000, and Hiram Sibley, John McGraw, Dean Sage, and William H. Sage, more than \$100,000 each.

Out of the 2704 students enrolled in the first five years, 2347 entered on the minimum entrance requirements. In 1872 the university became co-educational, and in 1877, in spite of the constant decrease in attendance, the entrance requirements were raised so as to include plane geometry, physiology, and physical geography. A year of French or German was also added to the primary requirements for admission to the course in letters or science. In 1882 the faculty, including instructors and assistants, numbered but 49. The additions made to the library were few. During this anxious period in the history of the university, the members of the faculty, ill paid and overworked, loyally stood by it, and pursued their work notwithstanding all difficulties. New courses were offered in the departments of civil and mechanical engineering, architecture, agriculture, the sciences, humanities, and military science. After 1882 the university developed and expanded in accordance with the original idea of the founder. The law school, a school of pharmacy (discontinued in 1890), and the Andrew D. White School of History and Political Science, were organized in 1887. The Sage School of Philosophy, which has become known for its work in experimental psychology, was organized in 1890. President Schurman appealed to the State in 1892 for further aid, on the ground that Cornell, although not a State institution in the strict sense of the term, was educating 512 students free of tuition. The Legislature generously responded to his appeal by establishing at Cornell University the Veterinary College in 1894, and the State College of Forestry, the first institution of its kind in the United States, in 1898. A tract of 30,000 acres of forest in the Adirondacks was granted the college for experimental purposes. The situation of Cornell University in a small town prevented it from adding a medical school to its departments, although a medical preparatory course has existed since its inception. In 1898 this problem was solved by establishing a medical college in the city of New York, with a branch at Ithaca, where the first two years of the course may be taken. In the same year the entrance requirements, which had been gradually raised since 1877, were put on a footing equivalent to those of the leading universities in the United States.

Cornell University comprises the following departments and colleges (the attendance given is in all cases that of 1902): (1) The Graduate Department, having charge of all graduate studies pursued at the university under the several faculties. This department offers courses lead-

ing to the degrees of A.M., Ph.D., etc. It numbers 189 students. Twenty-four fellowships, ranging from \$500 to \$600 a year, and 17 scholarships, of the annual value of \$300 a year, are available for students. (2) The Academic Department offers elective courses leading, whether sciences, letters, or the classics are mainly chosen, to the degree of A.B. The attendance is 831. (3) The College of Law offers courses leading to the LL.B. degree, and numbers 198 students. (4) The Medical College, partially conducted at New York City, confers the degree of M.D., and numbers 433 students. (5) The College of Agriculture offers courses leading to the B.S.A. degree, and numbers 188 students. Connected with this college is an agricultural experiment station, established by the Federal Government in 1887. (6) The New York State Veterinary College confers the degree of D.V.M. Its attendance is 59. (7) The State College of Forestry confers the degree of F.E., and numbers 44 students. (8) The College of Architecture confers the degree of B.Arch., and has an attendance of 50. (9) The College of Civil Engineering confers the degree of C.E., and numbers 214 students. (10) Sibley College of Mechanical Engineering and Mechanic Arts, consisting of the departments of mechanical, electrical, experimental engineering, the department of mechanic arts, etc., confers the degree of M.E. Its total registration is 792.

Undergraduates are required, except for special reasons, to take a course of military drill, extending over two years, under the supervision of a United States Army officer.

The government of the university is vested in a board of thirty-nine trustees, the university faculty, composed of the members of the several faculties, having charge of educational matters concerning the university as a whole, and the faculties of the several schools and colleges, who are charged with the administration of their respective departments.

The total attendance, excluding summer-school students and those taking the short winter courses, is 2845. The staff of instruction numbers 367. The principal buildings of Cornell University include the \$500,000 library, the gift of Henry W. Sage; Sage College, a dormitory for women; Boardman Hall, Stinson Hall, and Sibley College. The campus, situated on a hill looking down upon Cayuga Lake and surrounded by gorges, falls, and cascades, is considered one of the most beautiful in the world. Barnes Hall and Sage Chapel represent the religious life of the university. The libraries, including the famous Andrew D. White collection on the French Revolution and the Fisk Dante collection, contain 261,852 volumes, besides 43,000 pamphlets. The income of the university from all sources is about \$800,000 a year. The presidents since its inception have been: Andrew D. White, LL.D. (1865-85); Charles Kendall Adams, LL.D. (1885-92); Jacob Gould Schurman, LL.D. (1892—).

CORNER. A commercial term of United States origin, denoting the operation, or more properly the resultant effect, of acquiring contracts for the delivery of so much of a commodity or of the stock or certificates of indebtedness of a corporation, as to raise abnormally the values thereof to the advantage of the buyers. A corner is 'effective' when those who have contracted to

sell and deliver the stock or commodity are forced, for lack of other supply, to buy it, or the certificates or warehouse receipts representing it, from the buying or cornering pool, at the pool's prices. Conversely a corner is 'smashed' when the buyers, finding their means inadequate to their operations, are forced to throw their holdings on the open market, or when those who have contracted to deliver the stock or commodity are able to obtain it independently of the pool. For the latter reason, because the total supply is not strictly determinable nor all obtainable, attempted corners in wheat and other actual commodities are seldom successful. On the other hand, corners in stocks and certificates having definite total issues may be carried just to the point where they bankrupt the seller; that is to a point where, if the prices are put any higher, the sellers repudiate their contracts and the corner is 'smashed' for lack of a market. The possibility of any considerable corner arises from buying and selling on margin. In this usual and speculative form of stock-dealing the broker or commission house lends the buyer or seller the money needed for the deal, demanding, however, for his own protection, a deposit of five, ten, or twenty per cent. of the face value of the contracts made. The dealer is thus enabled to buy or sell stock to a value of from five to twenty times the amount of his actual capital, and a combination of large dealers can without difficulty buy or sell the whole stock issue of the largest trusts or railroads. If, now, such a combination sells, that is, agrees to deliver, practically the entire issue of a road, they may find when they attempt to buy the stock to fill their contracts that it is already held by the very persons to whom they contracted to sell it. That is, a rival combination has been secretly working against them, and the sellers of the stock are forced to buy the stock at exorbitant prices and then sell it back to those for whom they bought it. This is the process technically known as 'squeezing the shorts.' Until recent years nearly all corners of importance were manipulated for speculative reasons: for the immediate gain of the operators, that is, and without any investment purpose. Of such a nature was the famous gold corner, organized in New York by Jay Gould and his associates. This corner, culminating on "Black Friday," September 24, 1869, was 'smashed' by the release of Government gold by the Secretary of the Treasury—thus rendering the 'shorts' or sellers of gold independent of the cornering syndicate who held the gold which the 'shorts' had agreed to sell. Latterly, however, many corners or quasi-corners have resulted incidentally, and often to the regret of all concerned, from the effort of rival combinations to buy the control of some large trust or railroad for permanent investment and administrative purposes. Of this kind was the corner in the Northern Pacific Railroad in May, 1901, when the price of the stock rose abruptly to 1000 bid. For an account of the gold corner of 1869, consult: Boutwell, *Reminiscences of Sixty Years in Public Affairs* (New York, 1902). For an interesting account of the actual manipulation of a corner, consult Frederic, *The Market Place* (London, 1899). See MARGIN DEALS; SHORTS; SPECULATION; TRUSTS.

CORNET (OF., Fr. *cornet*, from ML. *cornetum*, *corneta*, bugle, dim. of *cornu*, horn). A stop or series of pipes in an organ, intended to imitate the tone of an obsolete wind instrument which has been superseded by the oboe. The **CORNET-À-PISTON** (Fr., cornet with pistons), a modern brass or silver wind instrument of the trumpet kind, has two or three valves, and in brass bands takes the soprano and contralto parts. It was first introduced in France as an orchestral instrument. The cornet-à-piston produces very penetrating tones, though less powerful than those of the trumpet. The rapidity of execution in runs, trills, staccatos, etc., which can be attained on this instrument, combined with the pealing quality of its tones, have made it the favorite solo instrument in open-air band-concerts; but this very resonance will most likely keep it out of the symphonic orchestra.

CORNET (Fr. *cornette*, standard, so called as having two points or horns, dim. of *corne*, from Lat. *cornu*, horn). Formerly a junior or subaltern commissioned rank in the British cavalry, so called because the cornet carried the flag (cornet). Its equivalent rank in the infantry was the ensign (q.v.).

CORNETO, KŌR-nā'tō, or **CORNETO TARQUINIA** (from It. *cornio*, horn). A town of central Italy, about 12 miles north of Civitavecchia, occupying a commanding eminence on the left bank of the Marta, and 2 or 3 miles from the Mediterranean, over which it has an extensive view. Corneto arose near the ruins of the Etruscan city of Tarquinii, and was built in part from its remains. It was erected into a city by Pope Eugenius IV, in 1432; but the picturesque old battlemented walls and towers which surround it are said to belong to an earlier period. During the faction wars of the Guelphs and the Ghibellines, this city maintained a firm allegiance to the popes. Population (commune), in 1901, 7219. The scanty remains of Tarquinii lie about a mile and a half from Corneto. This city was regarded as one of the most ancient and important of the Etruscan cities, and took part in the wars with Rome in the fourth century B.C.; but later, with the rest of Etruria, came under the Roman dominion. It seems to have been destroyed by the Saracens. The Necropolis of Tarquinii, which is far the most important relic of the ancient city, is on the same hill as the modern city, and extends into the neighboring plain. It is of great extent, and has been said to cover 16 square miles. Many tombs have been opened, but most of them had been plundered in early times. The most important tombs are those decorated with paintings on the walls, among which are noteworthy the Grotta delle Iserizioni (probably one of the earliest), Grotta del Barone, Grotta Querciola, Grotta del Convito Funebre, Grotta del Tifone, and Grotta dell' Orco. Consult: Dennis, *Cities and Cemeteries of Etruria* (London, 1878), and Dasti, *Notizie di Tarquinia Corneto* (Rome, 1878).

CORN-FLAG. See IRIS.

CORNFLOWER, or **BLUEBOTTLE** (*Centaurea Cyanus*). A plant of the natural order Composite, indigenous to Europe, where it is a common weed in grain-fields, and whence it has spread to other countries. Its long, slender, branched stems, which reach a height of from one to two and one-half feet, bear

CORNFLOWER, ETC.

1. COCKLEBUR (*Xanthium strumarium*).

2. CORNFLOWER (*Centaurea cyanus*).

3. CALISAYA (*Cinchona calisaya*), var. *Ledgeriana*.

4. COLCHICUM (*Colchicum autumnale*).

5. COCA (*Erythroxylon coca*).

6. NIGHT-BLOOMING CATCHFLY (*Silene noctiflora*).

terminal flower-heads about one and one-half inches in diameter during summer and autumn. These flower-heads have a wreath-like appearance, due to the neutral ray florets, and from early times have been favorites for making garlands. Being hardy and of easiest culture, the cornflower has become one of the most popular annuals in American flower-gardens, and has developed many varieties, which range through various shades from deepest blue to white. In the United States it has at least fifteen names, the commonest of which is perhaps bachelor's-button, a name also applied to two other plants—*Ranunculus acris* and *Gomphrena globosa*.

CORNHILL. An important London street, named from a corn market formerly held there. The Tun, a prison, and the Standard, a water-conduit, stood upon it in mediæval times.

CORNIANI. kôr'nê-î'nê, GIAMBATTISTA, Conte di (1742-1813). An Italian literary historian, born at Orzi-Nuovi (Brescia). In his youth he studied law and wrote for the theatre; but afterwards he became connected with the College of Brescia and published some works on agriculture. In 1797 he was made one of the Tribunal of Cassation of the Cisalpine Republic. The work for which Corniani is best known is a literary history of Italy, *I secoli della letteratura italiana* (1804-13; new edition by Predari, 1854-56).

CORNICE (OF., It. *cornice*, ML. *corniæ*, border, from Gk. *κορωνίς*, *korōnīs*, garland, from *κορωνός*, *korōnōs*, curved; connected with Lat. *corona*, crown, fr. *cor.* circle). In architecture, either the crowning member of a wall or a projection from it, such as a coping, or the crown of a minor division, as a colonnade. It has been used in nearly every style. The usual Egyptian cornice consists of a fillet and cavetto molding, as the upper member of a simple entablature crowning all the main walls. Ancient Oriental architecture did not develop any style of cornice. It was reserved for Greek architecture to establish a type of cornice as the upper member of the entablature of the different orders, immediately above the frieze, as is more fully explained under ENTABLATURE (q.v.). The slanting cornice of a gable is called *raking cornice*, to distinguish it from the horizontal cornice. The Doric cornice is crowned by a strongly projecting corona, the upper part of which is the *cymatium* or *cyma*; the lower part is usually the *tenia*. The corona rests on a thin bed-mold of one or two simple moldings. Along its horizontal edges are placed *antefixes* (q.v.). The under surface, or *soffit*, of the cornice is decorated with *mutules* (q.v.). In the more decorative Ionic cornice there is no very projecting broad, flat *tenia*, but a group of richer moldings gradually projecting. The corona is very high, the *ogee cyma* being richly decorated between two fillets, and connected with the *tenia* by a smaller regular *cyma*; the lower part of the cornice consists of a flat denticulated projection immediately above the frieze. The Corinthian cornice is both richer and more varied, its principal variation being the addition, in its central section, of *volute-like mutules* (q.v.) and *modillions* (q.v.), and the adornment of the *tenia* with *egg-and-dart* and other ornamentation. It was not fully developed until Roman times, when it was also used in the Composite

order, and the characteristic forms of the different Greek orders were mingled. In early Christian and mediæval architecture the variety of forms of cornice is too great to allow of classification or description. Some resemblance to the classic cornice is preserved in the rich churches of the fifth and sixth centuries in Syria, and the classic type is even more closely followed in the mediæval churches of some parts of Italy, especially Rome and its neighborhood; and it was, of course, revived by the Renaissance. Mediæval cornices are often supported on foliage and lines of small, blind arches: simple in the Romanesque, freer and richer in the Gothic style. The mediæval surface decoration was usually in very high relief, often in part detached from the ground. The imitation of every kind of foliage and flower, as well as the use of traditional and new geometric and schematic forms, gives great scope to this architectural member. In its simplest form it consists often of a projecting table supported on corbels, with or without arches.

The term is also used in modern terminology for the upper termination of a piece of furniture, a window or door casing, or anything that acts as a frame, of whatever material it may be. Consult the works cited under COLUMN; ENTABLATURE; which also discuss cornice.

CORNICHE, kôr'nêsh', ROUTE DE LA (Fr., cornice road). A renowned carriage road following the coast line of the Riviera between Nice and Genoa. It is noted for its striking views, particularly between Nice and Mentone, and is much traveled in preference to the railway.

CORNIDES, kôr'nê-dēs, DANIEL VON (1732-87). An Hungarian historian, born at Szent-Miklós. He studied philosophy and theology at Erlangen, Germany. As the companion of Count Joseph Teleki he visited Italy, Germany, and France, and while in Germany contributed greatly to the enlargement of the Hungarian department in the University of Göttingen and other institutions. In 1784 he was appointed librarian and professor of heraldry and diplomacy at the University of Pest. His principal works include: *Regum Hungariae, qui Saeculo XI. Regnarere, Genealogia* (1778); *Bibliotheca Hungarica* (1792); *Commentatio de Religione Veterum Hungarorum* (1791); *Vindiciae Anonymi Bæw Regis Notarii* (1802).

CORNIFEROUS SERIES (from Lat. *cornu*, horn + *ferre*, to bear). In American geology, the second of the four great divisions of the Devonian system. It includes the Schoharie and Corniferous stages. The rocks of the Corniferous series—mostly sandstones—are found along the Appalachians, in Ohio, and in Canada, where they inclose valuable deposits of petroleum. See DEVONIAN SYSTEM.

CORNIFICIUS, kôr'nê-fish'f'ūs, QUINTUS (?-c.40 B.C.). A Roman general and writer on rhetoric; a contemporary of Cicero. During the Civil War he supported the party of Cæsar, by whom he was appointed Governor of Syria and afterwards of Africa. After Cæsar's death he maintained the latter province for the Senate; but on the establishment of the Second Triumvirate was defeated and slain in battle by T. Sextius. Cornificius appears to have been almost equally distinguished for his literary abilities, which are frequently mentioned by Quintilian.

Catullus, and Ovid. Some scholars now attribute to him the authorship of the rhetorical treatise, *Rhetorica ad Herennium*, commonly ascribed to Cicero. Consult the editions by Kayser (Leipzig, 1854), Friedrich (part i., vol. i., of the Teubner Cicero, Leipzig, 1884), and Marx, who refuses to recognize the authorship of Cornificius, and has published the text under the title, *Incerti Auctoris de Ratione Dicendi ad C. Herennium Libri IV.* (Leipzig, 1893); also Kröhnert, *Die Anfänge der Rhetorik bei den Römern* (Memel, 1871).

CORNING. A city and one of the county seats of Steuben County, N. Y., 18 miles west-northwest of Elmira; on the Chemung River, and on the New York Central, the Erie, and the Lackawanna railroads (Map: New York, C 3). It has extensive manufactures of cut and flint glass, terra-cotta goods, building and paving brick, lumber, sash and blinds, etc. Among the more prominent buildings may be noted the city hall, free academy, and Saint Mary's Orphan Asylum. Corning was incorporated in 1849 as a village, and in 1890 as a city. Under the revised charter of 1899 the Mayor holds office for two years, and the city council is elected by wards. The river, police, and civil-service commissioners, fire wardens, and the board of health are nominated by the Mayor, with the consent of the council; other offices are filled by popular election. Population, in 1890, 8,550; in 1900, 11,061.

CORNING, ERASTUS (1794-1872). An American capitalist, born in Connecticut. In 1814 he settled in Albany, N. Y., where, as owner of the large iron-works there, and later as a banker, he accumulated a large fortune. He was for many years one of the great railroad owners and operators of the country, being largely interested in the formation of the New York Central Railroad, of which he was president for twelve years. He was also active in promoting the welfare of popular education, and, taking part in public affairs, served as a Democrat in Congress in 1857-59 and again in 1861-63.

CORN-INSECTS. Insects affecting Indian corn are numerous and varied.—*Plant Lice*: An aphid (*Rhopalosiphum maidis*) is widely dis-

Washington, 1888-90.)—*Beetles*: Certain weevils attack the roots and stems, especially bill-bugs of the genus *Sphenophorus*, the grubs burrowing in the bulbs of the young plants and eating the roots of the tender leaves near the surface of the ground; their work is sometimes confounded with that of a cutworm (larva of *Hadena stipata*). Fall plowing is useful against both. The larvae of several flea-beetles (*Diabrotica*) are often styled corn root-worms. The adult beetles, closely related to the cucumber, melon, and squash beetles, feed on the pollen and silk of corn and the larvae on the roots, and both do great damage in the Mississippi Valley. Rotation of crops is the most effective remedy. Various other beetles are locally or occasionally harmful, and one is prominent as destructive to grain, the corn silvanus (*Silvanus Surinamensis*). From an economic standpoint this is the most important member of the family Cucujidae. It is a flat beetle with the edges of the prothorax saw-toothed. Besides Indian corn, wheat, and other grain, it infests dried fruits and other food-stuffs. Another member of the same family, a bright-scarlet beetle, of the genus *Cucujus*, also infests stored grain.—*Moths*: The larvae of moths, 'cutworms' and 'webworms,' do much damage. The worst species, however, is the 'corn-worm,' or 'corn-bud worm,' the caterpillar of a noctuid moth (*Heliothis armigera*), which destroys the flower-buds. (See COTTON-INSECTS.) The large 'stalk-borer,' often highly injurious in Southern fields, is the larva of a phalænid moth (*Diatraea saccharalis*), which perforates the stems at their base, where, in the axils of the starting leaves, the parent moth lays its eggs in spring. This insect is better known as the sugar-cane borer of the American tropics. Tidy methods of farming are the best preventive. Other smaller borers are the caterpillars of the moths *Pempelia lignosella* and *Gortyna nitela*. The chinch-bug (q.v.) is also an enemy of Indian corn. Consult: Riley, "Insects of Missouri," in *United States Department of Agriculture, Division of Entomology, Reports 1 and 3* (Washington, 1881); Lintner, "Insects of New York," in *Agricultural Experiment Station Report 1* (Albany, 1882); Comstock and Slingerland, "Wire-worms," in *Agricultural Experiment Station Bulletin 33* (Ithaca, 1891).

CORNISH LANGUAGE AND LITERATURE. The Cornish language belongs to the British subdivision of the Celtic family, and stands, on the whole, nearer to the Old Breton than to the Old Welsh. (See CELTIC LANGUAGES.) It ceased to be a living language in the eighteenth century. Dolly Pentreath (who died in 1775) is traditionally said to have been the last person who spoke it; but some knowledge of it apparently survived her, and a small number of Cornish words are used to this day in the English dialect of Cornwall.

Only a small quantity of Cornish literature has been preserved. For the Old Cornish period nothing exists but a few proper names in old records. For Middle Cornish we are somewhat better off. A vocabulary of the twelfth or thirteenth century has been preserved, and also a few texts dating from the fourteenth century to the seventeenth. The Middle Cornish literature, like the Middle Breton, consists almost entirely of religious poetry and drama.

INSECTS INJURIOUS TO INDIAN CORN.

(1) Larger corn-stalk borer (*Diatraea*): a, boring larva within the base of the stalk. (2) Smaller borer (*Pempelia*): a, the moth at rest. (3) A flea-beetle (*Diabrotica*) and its root-destroying grub.

tributed by means of its migratory winged swarms; it lays its eggs on the stems of the corn beneath the ground, and the young attack the roots: the ants assist this injury by carrying females heavy with young and colonizing them upon the roots. (See *Insect Life*, I., III.,

For Old Cornish, consult Stokes, "The Manuscripts in the Bodmin Gospels," *Revue celtique*, vol. i. (Paris, 1870). The Middle Cornish vocabulary is printed in Zeuss, *Grammatica Celtica*, edited by Ebel (Berlin, 1868-71). For the other monuments, consult: Norris, *The Ancient Cornish Drama* (Oxford, 1859); Stokes, "Pascon Agan Arluth," *Transactions of the Philological Society* (London, 1861-62); and *Beunans Meriasek* (ib., 1872).

CORN LAWS. A name given in England to the long series of statutes dating as far back as the reign of Edward III., and terminating only in the year 1846, which had for their object the regulation of the trade in grain. The tenor of these laws varied with the idea which was uppermost in the minds of the legislators. At one time designed to secure a proper supply of grain, the exportation of grain was prohibited, or allowed only when a surplus of the home supply revealed itself in the low price for grain. Later the underlying principle was frankly the encouragement and support of the agricultural interests, resulting in the prohibition of the importation of grain, or permitting it only when the price of grain was extremely high and importation seemed unavoidable to prevent famine. At times, moreover, in the long and varied history of this legislation, resort was had to bounties as a means of encouraging and promoting home production. The shifting of legislation attracted little comment and less agitation until the beginning of the nineteenth century. At that time the manufacturing interests grew restive under the restrictions which were placed upon the trade in grain, and early in the century something in the nature of a compromise was made by the adoption of a sliding scale in the duties on importation. The object of this device was to reduce the import duties in proportion as the price of grain increased, so that at famine prices grain might be imported duty free. By the act of 1828, at the price of 62s. a quarter for wheat, the import duty was £1 4s. 8d. For every shilling less in the price, a shilling was added to the duty, but when the price rose above this point the duty decreased by a larger ratio than the rise in price. At the price of 69s., the duty was 15s. 8d., and at 73s. the duty sank to its minimum of 1s. Such an arrangement not only promoted speculative operations, but also prevented foreign countries from furnishing grain habitually for the British market.

This legislation was obviously in the interest of the landowners, but as the tendency of Great Britain to be an importing rather than an

virtually an attempt to aggrandize the landed interest by pressure upon the food of the people. The manufacturing interests, which were now rapidly coming into power, devoted their energies to combating this principle, which increased the cost of living, and, through wages, the cost of manufacturing. But the public at large, though conscious that the laws were some way improper, or at variance with the principles of political economy, did not, till the very last, earnestly unite in calling for repeal. There was a powerful party who represented with wonderful plausibility that these restrictive statutes were identified with the best interests of the country. Their arguments might thus be summed up: (1) Protection was necessary, in order to keep certain poor lands in cultivation. (2) It was desirable to cultivate as much land as possible in order to improve the country. (3) If improvement by that means were checked, England would be dependent on foreigners for a large portion of the food of the people. (4) Such dependence would be fraught with immense danger; in the event of war, supplies might be stopped, or the ports might be blockaded, the result being famine, disease, and civil war. (5) The advantage gained by protection enabled the landed proprietors and their tenants to encourage manufactures and trade; so much so, that if the corn laws were abolished, half the country shopkeepers would be ruined; that would be followed by the stoppage of many of the mills and factories, and no one would venture to say what would be the final consequences. It cannot be uninteresting to put on record that these arguments exercised a commanding influence over the laboring classes, the small town shopkeepers, almost all the members of the learned professions, and a considerable section of both Houses of Parliament. Yielding at length to the continued agitation, and recognizing that England's prosperity lay in the development of her manufactures rather than in the further encouragement of agriculture, Sir Robert Peel, in 1846, at the time of the Irish famine, effected the repeal of the Corn Laws. (See ANTI-CORN-LAW LEAGUE; CORBEN, RICHARD.) The area devoted to wheat cultivation in England is less to-day than it was fifty years ago, although the population has greatly increased. Modern methods of communication, however, have opened up new areas of supply, and the development of manufactures and commerce has amply compensated for the loss in agricultural production.

The following table shows the immediate effect of the repeal of the Corn Laws:

IMPORTS OF FOREIGN WHEAT, CURRENT PRICES OF WHEAT, AND DECLARED VALUE OF ALL BRITISH EXPORTS FROM 1801 TO 1859

AVERAGE PERIOD OF TEN YEARS	Average amount of wheat imported	Average price of wheat during each period	Average total declared value of all British exports
	Bushels	s. d.	£
1801 to 1810.....	600,946	81 5	40,737,970
1811 " 1820.....	458,578	84 11	41,506,794
1821 " 1830.....	534,992	58 3	36,000,536
1831 " 1840.....	907,638	56 10	45,249,037
1841 " 1850.....	2,877,999	53 3	57,412,494
1851 " 1859.....	4,547,311	54 9	103,253,189

exporting country had already become manifest, it seemed clear that the effort to increase home production by the pressure on importation was

Coincidentally with an increased importation of food-stuffs there was a notable expansion of foreign trade, as shown in the exports. In later

years imports are measured in hundredweights. The increase in grain imports is shown in the following table:

YEAR	Wheat and wheat flour in cwts.	Value of all breadstuffs
		£
1860.....	31,841,926	31,676,353
1870.....	39,906,115	42,502,252
1880.....	68,459,814	62,857,269
1890.....	82,381,591	53,484,584
1900.....	98,597,450	58,942,390

In the meantime the aggregate value of all British imports and exports has risen from £376,000,000 in 1860 to £698,000,000 in 1880, and £877,000,000 in 1900. The growing dependence of Great Britain upon foreign sources of supply for breadstuffs is reflected in the decline of the area sown in wheat, which in 1870 was reported as 3,773,663 acres, and as 1,845,042 acres in 1900. Russia and other European countries contribute to the British imports, as does also India, but the principal sources whence imports are drawn are shown in the following statement:

IMPORTS OF WHEAT, GRAIN, AND FLOUR IN 1900

	Cwts.
United States.....	57,418,064
Argentina.....	18,769,000
British North America.....	7,997,626
Australasia.....	4,057,811
All other countries.....	10,354,949
Total.....	98,597,450

BIBLIOGRAPHY. The text of the Corn Laws is to be found in *British Statutes*, revised edition (16 vols., London, 1882-1900), and the speeches on both sides of the question in Hansard, *Parliamentary Debates* (1815-46). A comprehensive and accurate presentation of the whole subject and its bearing on trade is given in McCulloch, *Dictionary of Commerce and Commercial Navigation* (London, 1870); Acland and Ransome, *Political History of England* (London, 1894), summarizes the Corn Laws previous to 1815, and the progress of legislation from that time until 1846, when the Corn Laws were repealed. Other sources of information are: "The First and Second Reports from the Select Committee on the Epworth (Corn Law) Petitions," *Great Britain Parl. Papers, Sess. 1843*, vol. xi.; Wilson, *Influences of the Corn Laws* (London, 1840); Thornton, *Historical Summary of the Corn Laws* (London, 1841); Platt, *History of the British Corn Laws* (London, 1845); Bastiat, *Œuvres complètes*, vols. i., iii. (Paris, 1855); Morley, *Life of Richard Cobden* (London, 1881); McCarthy, *The Epoch of Reform, 1830-50* (London, 1882); and for a full bibliography, *New York Public Library Bulletin*, vol. vi., No. 5 (New York, 1902).

CORNO. kōr'nó, MONTE (Mount Horn). The highest peak of the Apennines (q.v.).

CORN-OIL, CORN-PITH. See MAIZE.

CORN PLANTER (1732-1836). A celebrated half-breed chief of the Seneca Indians, the son of a trader named John O'Neil. During the French and Indian War he led a war-party of the Senecas which had joined the French against the English, and took part in the defeat of Braddock in 1755. During the Revolutionary War he joined the English, took an active part in the

border conflicts in New York, and seems to have been present at the massacre of Wyoming. Afterwards, however, he became a steadfast friend of the whites, and, with Red Jacket, directed the affairs of his tribe for many years. His Indian name was Garyan-Wah-Gah.

CORN-SALAD, or LAMB'S-LETTUCE (*Valerianella*). A genus of plants belonging to the natural order Valerianaceae. The species are annual plants of humble growth, with repeatedly forked stems, and very small flowers, native of Europe. Some of them are frequently used as spring salads, and sometimes as a substitute for spinach, particularly the common corn-salad (*Valerianella oleraria*). For early spring plants the seed is sown in September and cultivated, mulched, and wintered like spinach. Corn-salad lacks pungency as a salad plant, but comes early in the spring when other salad plants are scarce. For illustration, see SALAD PLANTS.

CORN-SHELLER. See MAIZE.

CORN-SMUT. See SMUT.

CORN-SNAKE (so called from its color, which resembles that of red Indian corn).

CORN-SNAKE (*Coluber guttatus*).
(Plates of the top and side of the head.)

Either of two harmless snakes in the southern United States: (1) *Coluber guttatus*, found in Virginia and southward, two and one-half feet long, reddish-brown with black bordered brick-red blotches; (2) the milksnake (q.v.).

CORN-STALK (c.1720-77). A celebrated Shawnee Indian chief. He commanded the Indians in the stubborn battle of Point Pleasant (q.v.) on October 10, 1774, during Lord Dunmore's War, and won the praise even of the whites by his great bravery and address. After the battle he made a treaty of peace with the Virginians, in spite of the opposition of a part of his tribe, and kept it loyally until 1777, when the Shawnees being incited to renew hostilities, he appeared at Point Pleasant in person and notified the settlers that he might find himself forced 'to run with the stream.' The settlers decided to detain him and his son as hostages, and soon afterwards, while still in confinement, the two were treacherously murdered by some whites infuriated by continued Shawnee outrages.

CORNSTALK DISEASE. A disease that affects cattle, and occasionally horses and sheep. The cause of the disease is still undetermined. By some investigators it has been considered as due to corn-smut or to the organisms of the Burrill disease of corn. Others have believed that a poisonous principle is sometimes present in cornstalks which causes the death of animals. The name *toxemia maidis* for the disease was based on this theory. In some localities the disease has been supposed to be due to the combined action of indigestion and some poisonous substance absorbed by the corn, for example, saltpeter. In a case of cattle-poisoning in

Kansas from eating dried cornstalks, an investigation revealed the presence of large quantities of potassium nitrate. This substance had formed in small white crystals which resembled mold, but was readily recognized by tasting. By cutting a cornstalk in two and tapping it on a table a considerable quantity of powdered nitrate of potash was jarred out. A chemical analysis showed that this substance constituted 18 per cent. of the dry weight of the cornstalks. Feeding experiments with potassium nitrate showed that 500 grams would kill an adult animal weighing 1200 pounds.

The symptoms are those of violent digestive disturbances followed by delirium and complete unconsciousness. A pronounced weakness of the hind parts is usually observed, which finally leads to paralysis.

Corn-smut has been extracted with alcohol and injected into guinea-pigs with negative results, and no poisonous alkaloid has been isolated by chemical means. Corn affected with the Burrill corn disease has been fed to cattle without producing any poisonous effects. Until more is known about the cause of the disease it is impossible to suggest a rational treatment.

CORNU, kôr'nû', JULIUS (1849—). A Swiss philologist, born at Basel. He was made professor of Romance philology in his native town, and in 1877 was called to the chair of that study in the University of Prague. Among his works are: *Phonologie du Bagnard* (1877); *Glanures phonologiques* (1878); *Etudes sur le poème du Cid* (1881-1900).

CORNUCOPIA (Lat., horn of plenty, from *cornu*, horn + *copia*, plenty). The horn of plenty—regarding the origin of which several fables are told by the ancient poets—is generally placed in the hands of figures emblematical of Plenty, Liberality, etc., who are represented as pouring from it an abundance of fruits, corn, etc. It is frequently used in both architecture and heraldry. On the arms of banks and other public institutions it is often represented as pouring forth coins.

CORNU'TUS, LUCIUS ANNÆUS. A Stoic philosopher of the time of Nero. He was a native of Libya, but a resident of Rome. He was the teacher and friend of Persius Flaccus, who left to him all his books and a large sum of money. He took the books, but gave the money to the sisters of the donor. Although he was a friend of Nero, the tyrant banished him because he did not like his advice as to the number of books in which he (Nero) proposed to write the history of the Romans. Cornutus was a voluminous writer, but little is known concerning his works. His treatise in Greek, *On the Nature of the Gods*, is extant. It is edited by Lang (Leipzig, 1881).

CORNWALL (AS. *Cornucallas*, from Welsh, Ir., Bret. *corn*, horn, Lat. *cornu*, Gk. κέρα, *keras*, Goth. *hairu*, Eng. *horn* + AS. *ucallas*, strangers, *Wealh*, Welsh. Ger. *welsch*, foreign, Lat. *Volca*, name of a people). A maritime county forming the southwest extremity of England (Map: England, B 6). Its area is 1357 square miles, most of which is arable or in meadow and pasture. Cornwall is a mining as well as an agricultural county, and has important pilchard fisheries. The chief towns are Bodmin (the county town), Launceston, Penzance, and Falmouth. Population, in 1891, 322,571; in 1901, 323,000.

Cornwall is rich in remains of the ancient Celtic culture. These comprise cromlechs or dolmens, found chiefly in the Land's End district; monoliths, circles, and avenues of stone, caves, cliff and hill castles. The products of the Cornish tin-mines were famous in the ancient world, and furnished the Phœnicians with one of their chief articles of trade. The absence of Eastern coins and inscriptions, however, would seem to indicate that the Phœnicians never set foot in Britain, but carried on their trade indirectly through Gaul. After the Saxon Conquest Cornwall constituted part of the British Kingdom of Damnonia, which held out against the kings of Wessex till 926, when Athelstane captured Exeter. At the time of the Norman Conquest the Saxons were in full possession of the land. Christianity was introduced probably as early as the fifth century, and the inhabitants maintained an independent priesthood till the tenth century, when the country was annexed to the see of Canterbury. William the Conqueror gave nearly the whole of Cornwall to his half-brother, Robert of Montain, who was followed by a line of powerful earls, of whom the most celebrated was Richard, the second son of John, elected in 1257 King of the Romans. In 1336 Cornwall was created a duchy for the Prince of Wales, by whom it has continued to be held. During the Civil War the inhabitants of Cornwall were intensely loyal, and supplied Charles I. with some of his bravest soldiers. Royalist victories were won at Braddock Down (January 19, 1643) and Stamford Hill (May 15, 1643). From Sudeley Castle Charles I. on September 10, 1643, issued a proclamation to the people of Cornwall, thanking them for their great devotion. Copies of this letter are still to be seen in a number of churches. See CORNISH LANGUAGE AND LITERATURE.

CORNWALL. A port of entry and capital of Cornwall and Stormont County, Ontario, Canada; on the Saint Lawrence River, the Cornwall Canal, and the Ottawa and New York Railway, 67 miles southwest of Montreal (Map: Ontario, J 2). It has excellent water-power, and one of the largest of Canadian woolen mills, besides paper, flour, cotton mills, etc. It has several churches and schools, and its lacrosse club is one of the foremost in the Dominion. The United States is represented by a consular agent. Population, in 1891, 6805; in 1901, 6704.

CORNWALL. A village in Orange County, N. Y., 55 miles from New York City; on the Hudson River, a little north of the Highlands, and on the Erie and West Shore railroads (Map: New York, F 4). It is in a picturesque region, much frequented as a place of summer resort. Idlewild Park and Storm King Mountain are among the prominent points of interest. The village has a large carpet-mill, which employs some 500 persons. There is a public library. Population, in 1900, 1966.

Cornwall was settled about 1684, became a precinct in 1764, a township in 1778, and was incorporated in 1885. From the original township, Highlands, Blooming Grove, and Monroe, besides parts of Chester and Hamptonburg, have since been taken. Consult: Eager, *History of Orange County* (Newburgh, 1846-47), and Beach, *Cornwall* (Newburgh, 1873).

CORNWALL. Regan's husband in Shakespeare's *King Lear*; a hard, cruel man, well 'matched and mated' with his cruel wife.

CORNWALL, BARRY. See PROCTER, BRYAN WALLER.

CORNWALLIS, CAROLINE FRANCES (1786-1858). An English author. She was born July 12, 1786, and was a daughter of William Cornwallis, rector of Wittersham and Elam, in Kent. As a child she was precocious. Later she acquired a knowledge of Latin, Greek, Hebrew, and German, and studied philosophy, theology, history, natural science, social science, politics, and even law. She refused an offer of marriage from Sismondi; but later for a time occupied his house, in Pesceia, Italy. Her first work, *Philosophical Theories and Philosophical Experience, by a Pariah*, appeared in 1842. It was the first of a series entitled "Small Books on Great Subjects," which she had formed the idea of writing with the help of a few friends. Of the twenty-two volumes of this series, which appeared between 1842 and 1854, all the most important were written by herself. The subjects discussed were various—the connection of physiology and intellectual science, ragged schools, grammar, criminal law, chemistry, geology, Greek philosophy, and the history and influence of Christian opinions. The series attracted much attention in England and the United States. She died January 8, 1858. Although a voluminous author, her name was at her death unknown to the world, and it remained unknown until the publication of her *Letters and Remains* (1864).

CORNWALLIS, CHARLES, first Marquis and second Earl (1738-1805). An English general and statesman. The son of the first Earl Cornwallis, he was born in London, December 31, 1738. After an education at Eton and Cambridge, he entered the army, and served as aide-de-camp to the Marquis of Granby in the Seven Years War. In 1760 he was elected member of Parliament for Eye; in 1766 received his promotion as colonel; in 1770 was made governor of the Tower of London; and in 1775 became major-general. Though personally opposed to the war with America, he went with his regiment thither, and the first successes of the British arms were, in the main, due to him. After the battle of Long Island, in which he took a prominent part, he pursued Washington through New Jersey. A detachment of his army, consisting of Hessians, was captured by Washington at Trenton, December 26, 1776, and part of his forces suffered a defeat at Princeton, January 3, 1777. He had the principal share in the victory of the Brandywine, September 11, 1777, after which he secured for the British the command of the Delaware River. In disgust at Howe's failure to grasp the critical situation of affairs and to attempt operations on a large scale, Cornwallis sent in his resignation, which the King refused to accept. He served under Clinton at the reduction of Charleston in 1780, achieved a great victory over Gates at Camden, S.C., on August 16 of that year, and defeated Greene at Guilford Court House, N. C., March 15, 1781. He was in the end out-generaled by Greene, and withdrew into Virginia, where he carried on a vigorous campaign against Lafayette, but without avail. Finally he was shut up in Yorktown by Washington and Ro-

chambeau, aided by a French fleet under De Grasse, and was compelled to surrender on October 19, 1781. With the surrender of Cornwallis the triumph of the American cause was virtually achieved. Although the disaster resulted in the resignation of the British Ministry, Cornwallis escaped censure owing to royal favor. In 1786 he was appointed Governor-General of India and Commander-in-Chief, and distinguished himself by his victories over Tippu Sahib, and by his indefatigable efforts to promote the welfare of the natives. He returned from India in 1793, when he was raised to the rank of Marquis. Appointed Lord Lieutenant of Ireland, he succeeded in quelling the rebellion of 1798, and established order in a manner that gained him the good will of the Irish people. As Plenipotentiary to France he negotiated the Peace of Amiens. Re-appointed Governor-General of India in 1804, he died at Ghazipur, in the Province of Benares, October 5, 1805, on his way to assume the command of the army in the upper provinces.

Consult: Marshall, *Memoir* (Gateshead, 1806); Lord Cornwallis's *Correspondence*, edited by Ross (London, 1859); Johnston, *The Yorktown Campaign* (New York, 1881); and Seton-Karr, "The Marquess Cornwallis," in *Rulers of India* (Oxford, 1890).

CORO, kō'rō, or SANTA ANA DE CORO. A city of the State of Falcón, Venezuela, situated east of the Gulf of Coro (Map: Venezuela, D 1). It is engaged in cattle-raising, and is a centre for interior commerce. Coro contains several churches, interesting for their antiquity, though they either have been rebuilt or lie in ruins. La Vela, its port, which is six miles to the east, has a good harbor and a trade with the Dutch West Indies, and is the residence of a United States consular agent. Population, in 1889, 9452. Coro, one of the oldest cities in Venezuela, was settled in 1527, and for a time was the Spanish capital of Venezuela. It was created the first bishopric of Venezuela in 1531, but subsequently the see was removed. Its decline dates from the transference of the governmental and ecclesiastical authorities to Carácas. It was the objective point of Miranda's first descent upon Venezuela in 1805, when he led an abortive expedition against the Spanish in the hope of precipitating the revolution of the Spanish-American colonies.

COROADO, kō'rō-á'dó (Port., crowned, in allusion to a peculiar style of wearing the hair). A name without ethnic significance, applied by the Portuguese to several Brazilian tribes, notably to a people in the Province of Rio Grande do Sul, who use arrows five feet in length and clean and preserve the bones of their dead.

COROLLA (Lat., garland, dim. of *corona*, crown). In flowers, the inner one of the two sets of floral leaves. The individual parts are called 'petals,' and they are usually delicate in texture and variously colored, forming the showy part of the flower. In case they are absent the flower is said to be 'apetalous.' The corolla is supposed to serve as an attraction to insects, so that the flower may secure cross-pollination. See FLOWER.

COR'OLLA'RY (Lat. *corollarium*, deduction, gratuity, money paid for a garland, from *corolla*, garland). A proposition the truth of which appears so clearly from the proof of another

proposition as not to require separate demonstration. For example, having proved that the angles at the base of an isosceles triangle are equal, it follows as a corollary that an equilateral triangle is equiangular.

COROMANDEL COAST (Skt. *Cōramañḍala*, from *Cōra*, or *Cōla*, name of a people + *mañḍala*, circle, kingdom). A vaguely defined region of British India, comprising the portion of the eastern coast of Madras lying between Point Calimere, in about latitude 10° 17' N., and the mouths of the Kistna, in about latitude 15° 40' N. (Map: India, D 6). The name is sometimes applied to the whole of the west shore of the Bay of Bengal. The coast has numerous inlets, but possesses no safe harbors. Ships are compelled to anchor several miles off the coast. The districts along the coast were the battlefields for supremacy in India between England and France in the eighteenth century.

COROMANDEL GOOSEBERRY. See **CARAMBOLA**.

COROMBO'NA, VITTORIA. The principal female character in Webster's play *The White Devil*, a beautiful woman whose unscrupulous acts, in part instigated by her brother, Flaminio, produce a series of crimes and murders.

CORONA (Lat., crown). In astronomy, the name given to the faint outermost luminous appendage of the sun, seen only during total solar eclipses, when the brilliant central disk is obscured. See **ECLIPSE**; **SUN**.

CORONÆ, in meteorology, are colored rings seen around the moon through peculiar forms of cloud. See **HALO**.

CORONA. In architecture, the most projecting upper part of the classical cornice: also used to designate the drip, or lower member of the cornice above the bed-molding and below the cymatium. (See **ENTABLATURE**.) The term corona is also applied, especially by ecclesiastical writers, to the apse or semicircular termination of the choir, as in the case of 'Becket's crown,' at Canterbury. Corona is also applied in ecclesiastical nomenclature to a chandelier, in the form of a crown or circlet, suspended from the roof of a church, or from the vaulting of the nave or chapels, to hold tapers which are lighted on solemn occasions. A famous mediæval example is at Saint Michael, Hildesheim.

CORONA. In plants, a word applied to any crown-like appendage at or near the summit of an organ. It is usually restricted, however, to appendages which occur in connection with corollas. For example, in the species of *Silene* and allied forms, members of the pink family, there is a two-lobed outgrowth at the junction of the claw and blade of each petal. Taking the petals together these outgrowths form a ten-lobed crown at the base of the blades. In the passion-flowers there is a very conspicuous corona consisting of many rows of filamentous outgrowths. Similar outgrowths are found in the flowers of other families, but are most notable in sympetalous corollas, where they form folds or projections in the throat, as in oleander, various borages, etc. In the several species of *Narcissus* the corona which rises from the throat of the corolla is often very conspicuous. In all cases these appendages are outgrowths from the inner face of the petals, and it has been suggested that they are the equivalents of similar outgrowths from the inner

face of grass-leaves, at the juncture of the blade and sheath. In this latter case the appendage is called a 'ligule.'

CORONA (p) OF NARCISSUS.

CORONA BO'REA' LIS (Lat., Northern Crown). A small and bright constellation near Hercules.

CORONACH, kōr'ō-nāk. See **CORANACH**.

CORONADO, kō'rō-nā'dō (Sp., crowned). The name among Spanish-speaking fishermen of the West Indies and Mexico for the amber-fishes of the genus *Seriola*. See **AMBER-FISH**.

CORONADO, FRANCISCO VASQUEZ (? - c.1549). A Spanish explorer. He came to the New World about 1535, and, by marrying Doña Beatriz, the daughter of Estrada, the royal treasurer for New Spain, secured preferment at the viceregal Court in Mexico. He was appointed Governor of the Province of New Galicia, and in 1539 secured the command of an expedition for the conquest of the 'Seven Cities of Cibola,' which the friar Marco de Niza claimed to have discovered on a preliminary expedition earlier in 1539. On February 23, 1540, Coronado started from Compostela with a large force of horsemen, infantry, and native allies, supplied with artillery and abundant munitions and food. He followed the western coast of Mexico till some distance beyond Guaymas, and then crossed the mountains into southeastern Arizona. On July 7 he reached and stormed the chief city of Cibola, the stone pueblo of Hawikuh, now represented by large ruins a short distance west of the pueblo of Zuni, in New Mexico. Making this his headquarters, Coronado sent expeditions to the West, which explored the country as far as the Moqui villages of Tusayan, and to the Grand Cañon of the Colorado, which was first seen by Europeans when the soldiers under Lopez de Cardenas reached it early in September, 1540. Other parties explored toward the east, and in September Coronado moved his forces to the Rio Grande, camping in the village of Tiguex, near Bernalillo, New Mexico. During the winter the natives of the river villages were subjugated after a fierce resistance. In April, 1541, Coronado led his whole army across the mountains into the great buffalo plains of Arkansas and Indian Territory. Finding that he was being misled by a native guide, he sent his foot soldiers back to the Rio Grande, while he, with thirty

horsemen, pushed northward, hoping to find a country rich in treasure. In July he reached a group of tepee villages, somewhere near the border line between Kansas and Nebraska. Convinced that the country contained nothing of value for him, although he recognized its splendid agricultural possibilities, Coronado returned to Tiguex. A severe fall from his horse induced Coronado to turn homeward in the spring. After several months of deprivation he reached Mexico with such of his army as had not deserted along the route. The viceroy received him coldly and allowed him to resign the government of New Galicia. Coronado is said to have lived quietly on his ample estates until his death, about 1549. The original documents describing Coronado's journey, which contain much information concerning the southwestern United States at the time it was first visited by Europeans, are translated in Winship, "The Coronado Expedition," in the *Fourteenth Report of the United States Bureau of Ethnology* (Washington, 1896).

CORONATION (from Lat. *coronare*, to crown, from *corona*, crown). The act or ceremony of crowning the sovereign of a monarchical country. The use of crowns in antiquity, as a mark either of honor or of rejoicing, will be explained under **CROWN**. It was, no doubt, as an adaptation of this general custom to a special use that the practice of placing a crown on the head of a monarch at the commencement of his reign was introduced. The practice is very ancient, as we may learn from the fact that Solomon and Ahaziah were crowned, and it has been followed in one form or another in most civilized monarchies. The ceremony is religious as well as political, and is usually performed by a high ecclesiastic, as a recognition that "the powers that be are ordained of God." Generally it has been accompanied by what was regarded as the still more solemn rite of anointing with oil, a ceremony which, from the time of the ancient Hebrews to our own, has been peculiarly significant of consecration or devotion to the service of God. The term employed for 'crowned' in the Saxon chronicle is 'gehalgod,' hallowed or consecrated; and it would seem that the ceremony as then performed at Kingston-on-Thames or Winchester was in all essentials the same as that which now takes place in Westminster Abbey.

Coronation in the early days of the European monarchies was an indispensable rite, without which no accession to a throne would be recognized by the people; but in our day, the line of succession being clearly established, the ceremony is often deferred without prejudice to the loyalty of the subject.

As a generally indispensable preliminary to coronation, a solemn pledge is in most countries exacted from the new sovereign, called the coronation oath. There are very early traces of this, both among the Jews and among the rulers who established themselves upon the ruins of the Roman Empire. Before the principle of hereditary succession was firmly established, the consent of the people was an important factor in a transfer of sovereignty, and was purchased by this solemn undertaking to rule justly and to preserve every man's rights. The English coronation oath, as at present existing, is the most definite and carefully considered agreement

of the kind. After the Revolution of 1688 it was made more explicit than ever, including an express engagement on the part of the sovereign to maintain "the laws of God, the true profession of the Gospel, and the Protestant reformed religion as it is established by law." The oaths of other countries are less elaborate and specific than that of England.

For a learned treatment of coronation usages in general, as well as of a typical modern instance, consult Pascoe, *The Pageant and Ceremony of the Coronation of their Majesties King Edward the Seventh and Queen Alexandra* (New York, 1902).

CORONATION, THE. A play licensed by Shirley in 1635. It was, however, wrongly included in the earlier editions of Beaumont and Fletcher, as theirs.

CORONATION CHAIR. The ancient throne used at the coronation of English kings since Edward I. It is kept in a fair state of preservation in Westminster Abbey. Beneath the seat rests the famous Lia Fail, the Stone of Destiny, on which Scottish kings were crowned. The stone is said to be the one used by Jacob as a pillow, and to have been taken to Tara in Ireland in the fifth century B.C., whence it was brought to Scotland and removed to England by Edward I.

CORONATION GULF. An inlet of the Arctic Ocean, penetrating the continent of North America, north of the Arctic Circle, and included between longitudes 107° and 116° W., Bathurst Inlet being an extension toward the southeast. It is connected with other Arctic channels by Dease Strait on the northeast and Dolphin and Union Strait on the northwest (Map: North America, II 3). It is studded with islands and receives the waters of the Coppermine River from the south.

CORONATION OATH. See **CORONATION**.

CORONEL, kō'rō-nēl' (Sp., from Lat. *coronalis*, pertaining to a crown, from *corona*, crown). A port in the Province of Concepción, Chile, situated on the Bay of Arauco (Map: Chile, C 11). It is the commercial centre for the highly productive coal-mining district in the vicinity, and is a coaling station. It is the residence of a United States consular agent. Population, in 1895, 2292.

CORONELLI, kō'rō-nēl'le, MARCO VINCENZO (1650-1718). An Italian geographer, born in Venice. He became a monk and devoted himself to cosmography in Venice. He then went to Paris, where he was commissioned by Louis XIV. to construct two large globes four meters in diameter, which are in the Bibliothèque Nationale in Paris. They are considered among the greatest curiosities of the science of the seventeenth century. In 1685 Coronelli returned to Venice, was made geographer of the Republic in 1702, and in that capacity published a number of maps and histories. His works include: *Isola di Rodi, geografica, storica, antica e moderna* (1685-1702); *Memorie istorico-geografiche del regno della Morea* (1685).

CORONER. A very ancient and important county officer in England, Ireland, and Wales, whose original duty appears to have been that of keeping, as distinguished from holding, the pleas of the Crown: for coroners are designated in the earliest charters alluding to the office as

custodes placitorum coronæ and *coronatores*. The exact date of origin of the office is not known, but the better modern view is that it was at least firmly established under Henry II. in the twelfth century. From England the office of coroner has arisen in the United States and in the English colonies.

The chief duty of the coroner is that which is described by Lord Chancellor Campbell when he says: "The coroner, next to the sheriff, is the most important civil officer in the county, and he performs the duty of the sheriff when the sheriff is disabled from doing so; and there are peculiar duties prescribed to him, more particularly to inquire into the manner in which persons have come to their deaths where there is any reason to suppose that it may not have been by natural means; and, on the inquiry, the jury being sworn, the jury have all the rights of a grand jury to find a verdict of murder, and on that finding the accused may be tried and may be sentenced to death." The coroner's duties in respect to this inquiry as to suspicious deaths has hardly varied at all from the fourteenth century to the present time, except as regards the methods of procedure, such as summoning jurors, witnesses, etc.

Besides his duty to inquire into causes of suspicious deaths, his other peculiar duties included that of inquiring concerning treasure trove—who were the finders, and where the treasure is, or whether any one be suspected of having found it and concealed it—and, formerly, the duty of inquiring concerning shipwrecks, and certifying whether it was a wreck or not (see WRECK); of holding inquests on royal fish; inquiring into the goods of felons; and the holding of inquests on certain felonies, such as the breaking of a house and the sudden injury of a person under suspicious circumstances. Until 1888, in England, the coroners were chosen by the freeholders at a county court held for the purpose, but by the Local Government Act the county council were made the electors. The coroner is also *ex officio* a conservator of the King's peace (see CONSERVATOR OF THE PEACE), and in this capacity may act as a magistrate; his ministerial office is exercised only when he acts in place of the sheriff.

In the United States and in some of the colonies of Great Britain, the duties and powers of coroners have been enlarged, or restricted, and in some cases the office has been entirely abolished. The coroner is vested by statute in some jurisdictions with the power and duty to investigate into the causes and origins of fires which appear to be of incendiary origin or of such a nature as to require investigation; but *ex officio* the coroner has no authority to inquire into the cause or origin of a fire except when death has resulted from it.

For a fuller description of the manner of choosing coroners and of their duties and powers, the statutes of the jurisdiction must be consulted.

Consult: *Encyclopædia of the Laws of England*, vol. iii. (London, 1897); Binmore, *Instructions for Sheriffs, Coroners, and Constables* (2d ed., Chicago, 1894); Borden D. Smith, *Powers, Duties, and Liabilities of Sheriffs, Coroners, and Constables* (2d ed., Albany, 1897); Jarvis, *Office and Duties of Coroners, with Forms and Precedents* (5th ed., London, 1888); Stephen, *History of the Criminal Law* (London,

1883); Pollock and Maitland, *History of English Law* (2d ed., London and Boston, 1899); Boys, *Treatise on Coroners* (Toronto, 1893).

CORONET. A special crown worn by princes and nobles on state occasions, and always represented above their coats of arms. Coronets were apparently intended originally as fillets to confine the hair, and during the reign of Edward III., when they were not yet used as distinctions of rank, were ornamented with leaves. Later they came to be recognized as distinctions of nobility, but were assumed arbitrarily without royal warrant or restriction as to use. In more modern times they have been strictly regulated, especially in England. The following rules apply to that country: The coronet of the Prince of Wales differs from the crown of England only by having a single instead of a double arch; a duke's coronet has on the rim eight strawberry-leaves of equal height; that of a marquis four strawberry-leaves and four pearls or balls of silver, alternately; that of an earl, eight pearls set on lofty spikes, alternating with strawberry-leaves set lower; that of a viscount has fourteen or sixteen pearls close together; that of a baron, six pearls. The privilege of wearing coronets was first granted to viscounts by James I., and to barons by Charles II. The French rules are substantially the same.

CORONINI-CRONBERG, kō'rō-nē'né-krōn' bĕrk, FRANZ, Count von (1833—). An Austrian statesman, son of the following, and one of the early companions and schoolmates of Emperor Francis Joseph. After studying philosophy and law, he served in the campaigns of 1859, 1864, and 1866, and was promoted to the rank of colonel in recognition of his distinguished services at the battle of Königgrätz. He was president of the Chamber of Deputies from 1879 to 1881, and in 1882 founded the Coronini Club. He became a member of the Upper House in 1897.

CORONINI-CRONBERG, JOHANN BAPTIST ALEXIUS, Count von (1794-1880). An Austrian general, father of the foregoing, born at Grz. He entered the army in 1813, and participated in the campaigns of 1813 and 1814. After serving for several years in Italy, he was in 1836 appointed chamberlain of the Archduke Francis Charles, in which capacity he became preceptor of the Emperor Francis Joseph. As major-general he defended the passes of the Tyrol against the Italians in 1848, and by reason of the energy and skill displayed on that occasion he was selected for a somewhat similar task during the Crimean War (1854), being intrusted with the chief command of the army of occupation in Wallachia. He was commanding general in Upper and Lower Austria, Salzburg and Styria in 1860, and in 1861 was appointed to the same position in Hungary.

COROT, kō'tō', JEAN BAPTISTE CAMILLE (1796-1875). A French landscape painter, born in Paris, July 29, 1796. His father was a hairdresser who married a milliner, and by shrewd management of her business gained a competence. Camille was educated in the college in Rouen, his father's home, and on his return to Paris he was apprenticed to a draper, in accordance with his father's wishes. But trade had no charms for him, and in the meanwhile he had acquired a taste for painting. After seven years of apprenticeship with the draper, he

resolved to be a painter. His father made him an allowance, upon which Camille managed to subsist until financial success crowned his efforts. He first studied with Michallon, and upon the latter's death with Victor Bertin, a classicist and an apostle of the historical landscape. The years 1825 to 1827 he spent in Italy, and in the latter year he made his debut at the Salon with two Italian landscapes—a "View of Narai" and the "Campagna at Rome." He again went to Italy in 1834 and in 1842, besides traveling in France, Switzerland, the Netherlands, and England. But the greater part of his life was passed in Paris and Ville d'Avray, in the forest of Fontainebleau and the valley of the Seine. In these places he found subjects for his most beautiful pictures.

It was some time before his works were recognized, but in his later life honors were heaped upon him. He received medals in 1833, 1855, and 1857; in 1846 he received the Cross of the Legion of Honor, and in 1857 he was made a commander. The younger artists almost worshiped him, and in 1874 his friends gave him a gold medal to atone for the neglect of the Salon. Dealers sought his pictures, and it is said that in the time of his prosperity his income from sales alone amounted to 200,000 francs a year. But Corot never cared for money except to help his friends, which he did with a lavish hand. He was gentle, jovial, and kind, and the figure of Père Corot, in his blue blouse and woolen cap, with his long white hair and the inevitable pipe, brought joy and sunshine. He never married, but was devotedly attached to his sister and his mother. He died in Paris on February 22, 1875.

Corot's art naturally falls into two periods, divided from each other by about the year 1843. During the first of these he painted like the contemporary classicists, very detailed, with careful and severe drawing, but not without a certain charm of color. The influence of this classical training may be seen in the nymphs with which he loved to people his landscapes, and the absolute mastery over technique which we see in his second period. This may be said to have begun with his return from Italy in 1843, when he adopted the method of painting in the open air, which had been introduced from England by Constable and others. The works of this second period are the works from which we chiefly know him and which made him famous.

Corot was the great lyric poet of the Barbizon School, as Rousseau was the epic, and Duprè the dramatic. As Rousseau portrayed the strong and vivid side of nature—the oak, of all the trees, the plains, the hills, the river, and the forest—so Corot painted the tender, the wavering, the feminine side—the poplar, the birch, the willow, the wild flowers, sweet and shrinking. He was a painter of the misty morning and of the shadowy evening, of the hazy springtime. A light mist or a haze of atmosphere usually envelops his pictures. As with Rousseau drawing was the most important feature, so with Corot it was color. His pictures are always in a low key: browns, pale greens, and silvery grays are among his favorite colors, but in this sad setting the occasional touches of bright color appear all the more effective. The values of his colors are perfect, and above all each picture is an expression of deep sentiment—"the confession of a beautiful soul." His works have well been called painted

music, and it is no accident that he was himself a gifted musician.

His landscapes have often been criticised because of their similarity, but they are only similar in theme; the treatment is infinitely varied. It has also been urged that his works are too even; that they do not contain certain acid tones and little defects which are found in nature and add to the effect of the picture. Such blemishes might indeed have made his work more realistic, but they would not have harmonized with the softness and delicacy of effect, which it was his chief effort to obtain. As regards the figures which usually form a part of his picture, whether they be nymphs and goddesses or French peasants, they rather heighten the effect of the landscape than otherwise, and with it they are always in perfect harmony. So great was his technical ability and so vivid his imagination, that his usual method was to paint his works in his studio from sketches and notes taken from nature.

Corot has left a large number of works on a great variety of subjects. During his early period he painted many Italian landscapes, and even religious subjects. Of these landscapes there are two good examples which he himself bequeathed to the Museum of the Luxembourg, Paris, viz. the "Roman Forum" and "The Coliseum." Of his religious pictures the "Baptism of Christ," in the Church of Saint Nicolas du Chardonnet in Paris, is a good specimen. The landscapes of his later period are incomparably his best works. Among the best known is the "Dance of the Nymphs," in the Luxembourg Gallery, a fresh morning scene of a peculiar blue tone, and the incomparable "Paysage," in the same collection, showing his marvelous treatment of a lake with overhanging foliage. There are many other good examples in the museums and private collections of France, and not a few in America. The Metropolitan Museum in New York possesses in the "Ville d'Avray" a fine specimen of Corot's dainty treatment of water, foliage, and distant buildings in the early morning light. The faint rose of the sky suggests the coming dawn, and the touches of yellow and blue in the garb of the woman lend a soft brightness to the scene. There are other good examples in the Corcoran Gallery at Washington, in the Art Institute of Chicago, and in the private collections of Philadelphia. But not until the centenary exhibition in Paris in 1889 did men know what modern art possessed in Corot—"the greatest poet and the tenderest soul of the nineteenth century."

Corot," in Van Dyke's *Modern French Masters* (New York, 1896); Blane, *Les artistes de mon temps* (Paris, 1879); Roger-Milès, "Corot," in *Les artistes célèbres* (Paris, 1891); Rousseau, *Camille Corot* (Paris, 1884).

CORPORAL (Fr. *caporal*. It. *caporale*, corporal, from *capo*, head, from Lat. *caput*, head; influenced by popular etymology with *corporal*, bodily, or *corps*, body of troops). A military title of similar relative non-commissioned rank throughout the armies of the world. In the United States it is the lowest non-commissioned rank. It may be preceded by the appointment

of lance corporal, given to private soldiers desirous of and selected for promotion.

CORPORAL (Lat. *corporale*, from *corpus*, body, because the host or sacramental body of Christ rests upon it). A square linen cloth which is spread upon the altar during the mass, and upon which rest the chalice and paten. It was originally large enough to be folded over the oblations of the people when they were placed upon the altar. Even after this custom ceased, one fold of it was still turned over the chalice, but this was later made a separate piece, now known as the pall (q.v.). The older usage was long preserved in the French Church and in the Carthusian Order. Both corporal and pall must be blessed by the bishop, and when not in use are carried in the burse, a square pocket of cardboard covered with silk, none except those in holy orders being allowed to touch them.

CORPORAL, THE LITTLE (Fr., *Le petit corporal*). A term of familiarity and affection applied by the French soldiery to Napoleon I., who began his military career as a *sous-lieutenant* in Corsica.

CORPORAL PUNISHMENT. Punishment by the infliction of pain or hardship upon the body, as by confinement in the stocks, branding, or flogging. Ordinarily the term is understood to refer only to flogging or whipping of the body.

Much has been said for and against this last kind of punishment, both as a means of public and private correction. The contention of those who oppose its use and deny its value is that it degrades the one punished and the one who executes the punishment, and that it tends to deteriorate the character of the person punished by taking away his self-respect. Those who favor it generally admit that severe floggings which lacerate the body or which are so contrived as to cause extreme agony, as in the bastinado, do cause a degeneration in the moral character of the victim which increases his tendency to repeat his offense or commit others in spite of the danger of the second punishment, and that this is especially the case when such punishment is inflicted publicly. But they claim, with apparent truth, that whipping which produces stinging but transient pain, without mangling the body and without such public disgrace as to destroy the sense of shame, is an efficient corrective for those cruel, or brutal, or intractable offenders, such as wife and child beaters, who are insensible to the punishment of confinement or other ordinary penalties which are far more protracted and of much greater expense to the State. In such cases a smart whipping, not brutally inflicted, seems to exercise a control over the offender, without the long confinement which often necessarily removes from a dependent family its only means of support. Corporal punishment at the hands of public officers as a punishment for crime is usually inflicted by flogging in prison or at the public whipping-post. Further information will be given under the titles FLOGGING; WHIPPING.

The authority of the husband, parent, guardian, and schoolmaster to inflict corporal punishment upon the wife, child, or pupil will be considered under the titles HUSBAND AND WIFE; GUARDIAN; WARD; PARENT AND CHILD; SCHOOLMASTER, etc. See also the article APPRENTICE. For a bibliography of corporal punishment as a

punishment for crime, consult the authorities referred to under the titles PENOLOGY; CRIMINOLOGY.

CORPORAL TRIM. An old soldier, the servant of Uncle Toby in Sterne's *Tristram Shandy*.

CORPORAL VIOLET, or FATHER VIOLET. A name given to Napoleon Bonaparte by his adherents in France when he was in exile. The violet typified the Empire, which, in the person of Corporal Violet, it was predicted, would return in the spring.

CORPORATION (Lat. *corporatio*, from *corporare*, to embody, from *corpus*, body; the classical terms were *corpus*, *universitas*, *collegium*).

Roman and Civil Law.—The legal conception of the corporation was clearly worked out at Roman law. As a ship remains the same ship, although all its parts be gradually renewed by successive repairs: as a human body remains the same body, although waste and repair periodically change all its minutest particles; so a body of human beings, like a bench of judges, a legion, or the Roman people, remains the same body in spite of all changes in its composition (Afenus, in Digest, 5, 1, 76). In all cases in which such a body of persons is recognized as a separate legal entity—in all cases, that is, in which the body itself is regarded as owning property, holding claims, and owing debts—a *corpus* or *universitas* exists; where, on the other hand, the members of an association are treated as joint proprietors, joint creditors, and joint debtors, all that exists is a *societas* or partnership.

The Roman law recognized both *private* and *public* corporations. Private corporations (at least in the Imperial period) could not be established except by special authorization or under certain general statutes. In the field of public law, the towns (*municipia*), or, rather, the town councils (*collegia decurionum*), were regarded as corporations; and the Imperial treasury (*fiscus*) was recognized as an entity distinct from the Empire. From this latter theory was derived the valuable conclusion that the *fiscus* could be sued by private persons to recover property or enforce contractual claims. Charitable corporations were recognized; when the Empire became Christian, churches and monasteries received the rights of corporations; but where property was devoted to a permanent charitable use (*pia causa*) it was not necessary to give it to an existing charitable corporation nor to create a new corporation to hold it. The Roman law did not treat the persons who administered such property as titular owners subject to a trust, nor was it usual, as at English law, to incorporate boards of managers and to treat the corporations thus created as owners of the property. The Roman law, in its final development, treated the foundation itself as a legal entity, and viewed the persons who managed the property as mere officers and representatives of the foundation.

Modern civil law uses these Roman conceptions without substantial change. The German jurist Gierke, indeed, maintains that mediæval German law developed, and modern jurisprudence is bound to recognize, a third type of association, intermediate between corporation and partnership, which he terms the *fellowship* (*Genossenschaft*): but his theory has obtained no legislative or judicial recognition. The German civil

code (1896) declares that "societies which are not incorporated are governed by the rules relating to partnership."

As regards the theory of the 'juristic person,' modern civilians generally regard corporations and foundations as persons only by virtue of a legal fiction. This legal fiction is generally regarded as useful and indeed necessary; but a few writers regard it as unnecessary and harmful. These assert that a corporation is nothing but a plurality of natural persons acting under special rules as regards presentation (i.e. agency) and governed by special rules as regards succession; and they assert that harm is done by obscuring the fact that the private corporation is simply a particular method in which natural persons hold property and do business. Still another school maintains that permanent associations, public and private, have a character and a will which are not the sum or the resultant of the characters and wills of the individuals who compose them; and that such associations have thus a true personality which the law does not create, but merely recognizes. This is sometimes described as the anthropomorphic theory.

English Common Law.—Three distinct factors are to be recognized as essential to the existence of a corporation: (1) One or more natural persons, who are the incorporators, or so-called members; (2) one or more trustees, managers, or directors, who have the general control of its affairs, and may or may not include all, and be coincident with, the incorporators; and (3) the corporation, or artificial person, created by the fiat of the law, and always separate and distinct from both its members and its trustees or managers. It is this separate existence, as a legal entity, which distinguishes it from a partnership and from a joint-stock company.

Classification.—Corporations are classified as to either the number of members, or the objects for which they are formed, or the fullness and completeness of their powers. With regard to the number of members, they are either *aggregate* or *sole*. An aggregate corporation has more members than one, and is the more common form. A sole corporation consists of a single member and his successors, who are by law invested with the same capacities as an aggregate corporation. Thus the King of England, or a bishop, is a sole corporation. A very few sole corporations exist in the United States. In New York, for example, a joint-stock company composed of seven or more members may sue and be sued in the name of its president, and the president is for this purpose a sole corporation.

With respect to the purposes of their existence, corporations are classified as *ecclesiastical* and *lay*, and the lay are subdivided into *civil* and *eleemosynary*. Ecclesiastical corporations are concerned wholly with religious matters, including the management of ecclesiastical property, and are composed wholly of spiritual persons, as distinguished from laymen. There are none such, properly so-called, in the United States. An eleemosynary corporation is one formed for purposes of charity, in the legal sense of that word, i.e., general public benefit and utility. Examples are found in schools, colleges, and hospitals. *Civil corporations* are those that are formed for temporal purposes. They are either (1) *public*, or *municipal*, i.e. created for

governmental purposes, such as cities and villages; or (2) *private*, including others of a civil nature, such as railroad companies and manufacturing and general business corporations. Since municipal corporations are part of the machinery of government, they may be dissolved, restricted, or modified at the will of the legislature; but an act which creates a private corporation has in the United States been deemed to be in the nature of a contract, and (because of that provision of the United States Constitution which forbids the States to pass any laws impairing the obligation of contracts) cannot be repealed or materially altered or impaired against the will of the corporation. The operation of this rule is obviated in some States by constitutional provisions, or by special clauses in the acts creating corporations, to the effect that the legislature shall have power to abrogate or modify such acts. The divisions of corporations with reference to their powers is into *complete* and *quasi*. Those are *quasi* which possess some, but not all, of the ordinary powers of a corporation. Counties, school districts, and in some States, as New York, towns, afford examples of *quasi* corporations.

The methods of creating corporations are by charter or letters patent from the Crown, by legislative act, and by prescription. Some corporations which trace their origin to royal charter exist in the United States; while others may be found which derive their franchise from immemorial usage or prescription; but the most common mode of forming them is by act of the legislature. This latter method is either by special act or charter, or by a general law which enables persons so desiring, by conforming to prescribed conditions and formalities, to become *ipso facto* a corporation. The formation under a general law is most favored, and is made mandatory by the Constitution of some of the States.

Corporate Powers.—The powers of a corporation are those given by its charter, or the general law under which it is organized, or fixed and determined by usage when it exists by prescription, together with those which are implied by law as reasonably necessary or proper to enable it to exercise its express powers, and to realize the objects for which it exists. They include the power to make contracts; to sue and be sued; to hold property; to have a corporate seal; to make by-laws; and to elect and remove members and officers. If it exceed its proper functions, it is said to act *ultra vires*. A contract *ultra vires* is, according to the weight of authority, void; but money paid, or the value of property given, to a corporation under an *ultra vires* contract may be recovered under theory of quasi contract (q.v.). In a few jurisdictions, New York, for example, if the person dealing with a corporation has performed on his part an *ultra vires* contract, the corporation is held to be estopped from setting up its want of power. (See ESTOPPEL.) Corporations have been held liable for torts resulting from their negligent performance of an act, whether authorized or unauthorized, and it is now generally held that a corporation may be liable for any tort, the malice or negligence of the agent being imputed to the corporation. It was formerly held that a corporation could legally perform no act except under its corporate seal; but it may now act without a seal where natural persons may do so. The quantity of land which a corporation may

hold is usually fixed by its charter, or a general law, and is commonly restricted in this country to so much as is necessary for the proper conducting of its business. A corporation has never been held liable for a crime, except in cases where injury has resulted from its neglect of a duty required of it by law, or for nuisance.

Public Control of Corporations.—The right of *visiting* a corporation, conferred by charter or legislative appointment, is that of exercising legal superintendence and control over its actions. It is an absolute, summary power which is not reviewable by the courts, unless its arbitrary exercise would result in gross injustice. It is strictly applicable only to ecclesiastical and eleemosynary corporations; the visitor of the former being the bishop of the diocese, and of the latter, the founder and his heirs, or persons appointed by the founder. In the United States the visitors of charitable corporations are usually their trustees, the right of visitation being determined wholly by statute. Civil corporations are subject to the general law, and are amenable to the process of the courts; and for misuse of powers or flagrant wrongs may be dissolved by proceedings instituted in behalf of the State.

A corporation may be dissolved by legislative act; by judicial decree; by surrender of its franchise and acceptance of the same by the State; or by the death of so many members that enough are not left to elect new members pursuant to its charter. The power to dissolve by legislative act is unlimited in England, but in the United States it is restricted as pointed out above. A judicial decree dissolves for the violation of the conditions of the charter or the law under which it exists. Upon dissolution, the property of the corporation becomes a trust fund for the benefit of the State or the stockholders, usually the latter. If the institution were charitable, this fund is administered by new trustees appointed by the court.

Strictly, a corporation can have no legal existence outside the jurisdiction of the sovereignty under which it was created. By a legal fiction, however, a corporation is held to exist legally whenever it is doing business, and it may sue and be sued, acquire property, etc., outside of the State of its creation.

Citizenship of a Corporation.—Under the Constitution of the United States, a corporation is deemed not to be a citizen of a State, so that it cannot as a foreign corporation claim equal protection of the law with the citizen of a State other than the State of its creation. It follows that a State may impose any terms as a condition of a foreign corporation doing business within the State, provided it does not interfere with the corporation's constitutional right to carry on interstate commerce. A corporation, however, is a citizen within the meaning of the clause of the Constitution conferring jurisdiction on the Federal courts, and it may sue or be sued in the Federal courts, and may in a proper case remove a cause from a State to a Federal court. Consult: Angell and Ames, *Treatise on the Law of Private Corporations* (Boston, 1882); Cook, *Treatise on the Law of Corporations Having a Capital Stock* (Chicago, 1898); Thompson, *Commentaries on the Law of Corporations* (San Francisco, 1895-99); Clark and Marshall, *Treatise on the Law of Private Corporations* (St. Paul, 1901). See CHARTER; CERTIFICATE;

DARTMOUTH COLLEGE CASE; CONTRACT; CITIZEN, etc. For a discussion of municipal corporations, see the article on MUNICIPAL CORPORATIONS and its bibliography; and for the treatment of the subject of corporations in its relation to civil and Roman law, see article on CIVIL LAW. Consult also such general treatises as those of Kent and Blackstone.

CORPS, kōr (Fr. *corps*). A military term denoting a body of officers, or officers and men, generally a distinct military organization, as the signal corps, corps of engineers, and the various battalions of volunteers throughout England, locally known as the volunteer corps. More specifically it applies to the corps d'armée, or army corps, which, in the United States, consists normally of about 25,000 men, divided into three divisions, each of three brigades of three regiments of infantry, with cavalry and artillery in proportion, commanded by a major-general. European armies generally are similarly organized, with army corps of varying strength and composition. (See ARMY ORGANIZATION.) In the navy, it is used in both senses, as the *medical corps*, the *pay corps*, the *marine corps*, etc.

CORPS DIPLOMATIQUE, kōr dē'plō'ma'tēk' (Fr., diplomatic body). The entire body of foreign ambassadors and diplomatists assembled at the Court, or the capital, of a country.

CORPSE (OF., Fr. *corps*, body, from Lat. *corpus*, body). A dead human body is not property in the ordinary commercial sense of the term. In the absence of a statute authorizing it, a contract for the sale of such a body is void, as tending to outrage decency, humanity, and sound public policy; and an officer who seizes or holds the body under any legal process issued against the person while living is guilty of a criminal offense. But while a dead body is not property, it is the object of certain well-defined rights. The possessor of these rights is the surviving husband or wife, or the nearest of kin of the deceased, unless the deceased has made a valid disposition of his body by will. Accordingly, if one mutilates a dead body, or prevents its burial, or unlawfully interferes with it after burial, he may not only be punishable criminally, but be liable in an action for damages to the husband, or wife, or next of kin, of the deceased.

Controversies between persons as to the place of burial of a dead body, or as to its proper treatment, are within the jurisdiction of a court of equity in the United States, and are not subject to ecclesiastical decision—as has from an early period been the case in England. This is upon the theory that the rights in a dead body are in the nature of a sacred trust, in the proper performance of which all are interested who were allied to the deceased by family ties.

Not only is a dead human body the object of legal rights, but it is also the object of legal duties on the part of the living. The husband, or the wife, or the nearest of kin, or in the absence or poverty of these a stranger under whose roof a death occurs, is bound to give the body of the deceased a decent burial. Any one who casts it away without funeral rites, or indecently exposes it, is liable to criminal punishment. On the other hand, the expenses of a proper burial have priority over every other claim against the estate of the deceased. Con-

sult the authorities referred to under *SALE* (of *personal property*): *BURIAL*, etc.

CORPS LÉGISLATIF, kōr' lā'zhé'slā'téf' (Fr., legislative body). The name of the Lower House of the French national legislature from 1852 to 1870. The number of members was 251, elected by universal suffrage for a term of six years. They were largely the creatures of Napoleon III. Consult the histories of the period by Granier de Cassagnac, Taxile Delord, Beaumont-Vassy, and De la Gorce. See *FRANCE*; *NAPOLEON III*.

CORPS (kōr) OF ARTILLERY. See *ARMY ORGANIZATION*; *ARTILLERY CORPS*; and *UNITED STATES*, section on *Army*.

CORPS OF ENGINEERS. See *ENGINEERING, MILITARY*; *ARMY ORGANIZATION*; and *UNITED STATES*, section on *Army*.

CORPUS CATHOLICO'RUM, and **CORPUS EVANGELICO'RUM** (Lat., body of Catholics, and body of Evangelicals). The names given in Germany after the Peace of Westphalia (q.v.) to the Roman Catholic and Protestant divisions of the Empire respectively. The Elector of Mainz was at the head of the former as president. It generally held its meetings in a convent of that city in which the Diet happened to meet. The elector of Saxony was at the head of the latter. When the Electoral House of Saxony became Roman Catholic, the control was given to the Privy Council, which was a Protestant body. Both were extinguished by the dissolution of the German Empire in 1806.

CORPUS CHRISTI (Lat., body of Christ). An important festival of the Roman Catholic Church, in honor of the sacrament of the Eucharist. It was instituted in 1264 by Urban IV., partly in consequence of the vision of a Flemish nun named Juliana, and partly because the anniversary of the sacrament's institution fell at the most solemn and mournful time of the Christian year, when services of a festal character were impossible. It was assigned to the Thursday after Trinity Sunday, and this day is still observed in most parts of Continental Europe by magnificent processions through streets decked with flowers and green boughs. In Vienna the Emperor of Austria walks every year immediately before the Archbishop carrying the Host. The office of Corpus Christi, composed by Saint Thomas Aquinas, is one of the most beautiful in the breviary.

CORPUS CHRISTI. A city and county-seat of Nueces County, Tex., 178 miles south by east of Austin; on Corpus Christi Bay, and on the Mexican National and the San Antonio and Aransas Pass railroads (Map: Texas, F 6). It is the centre of a market-gardening section, has a canning factory, and exports fish and oysters. There is a good harbor, attracting considerable coasting trade. Settled in 1849, Corpus Christi was incorporated in 1876, and is governed under the charter of that date by a mayor, elected every two years, and a city council. Population, in 1890, 4387; in 1900, 4703.

CORPUS CHRISTI COLLEGE (Cambridge). In 1352 the two guilds of Corpus Christi and Saint Mary in the town of Cambridge united to found a hall or college for educating clergy to fill the places of those carried away by the recent visitation of the black death. The master and two fellows of this new founda-

tion served as chaplains of the guild, and officiated also in Saint Benet's Church, at which the members of the fellowship of Corpus Christi worshiped, and which was impropriated to the college. For this reason, the college was earlier known as Saint Benet's. In the sixteenth century the patronage of Sir Nicholas Bacon, who was a member and a benefactor of the college, together with the mastership of Archbishop Parker, brought the foundation much profit and honor. In particular, the unrivaled collection of manuscripts, collected by the latter at the dissolution of the monasteries and bequeathed to the college, are among its chief treasures. Besides this and the Lewis collection of printed books, the college owns the most interesting collection of plate in the university. Christopher Marlowe and John Fletcher were members of Corpus Christi, as was Archbishop Tenison. The buildings are of much interest, including, as they do, the earliest closed quadrangle in the university, standing almost unaltered since its erection in the fourteenth century. The college consists of a master, twelve fellows, and twenty-six scholars, besides undergraduates.

CORPUS CHRISTI COLLEGE (Oxford). One of the smaller colleges in the university. It was the first of the Renaissance foundations, and its establishment marks an epoch in the intellectual history of the university. It was founded in 1516 by Richard Fox, Bishop of Winchester, and Lord Privy Seal, the principal Secretary of State and chief counselor and diplomat of Henry VII., partly at the suggestion and cost of Oldham, Bishop of Exeter. In Corpus Christi College we find the first noteworthy attempt to depart from the older educational tradition of the university, in the establishment of an endowed chair of Greek, the first in Oxford, and in throwing open the professorial lectures to all members of the university. The honor of founding the professorial system Fox shares with Bishop Waynflete and Margaret of Richmond, whose executor he was. The statutes of his foundation contain the most stringent rules for life and work, quaintly worded in the form of an allegory of a hive of bees. These, with the liberal provisions for the study of Latin and Greek, and humanistic studies in general, called forth the high praise of Erasmus. Though his prediction of the future preëminence of the college in the university has not been fulfilled, Corpus Christi has always maintained an excellent reputation for scholarship. It has counted among its members, John Keble, Thomas Arnold, 'the judicious Hooker,' his patron Bishop Jewell, Nicholas Udall, the author of the first English comedy, and, for a very brief period, Oglethorpe, the founder of Georgia, Chief Justice Coleridge, and Thomas Day, author of *Sandford and Merton*. The buildings of the college, though of several periods, are among the most harmonious in Oxford, and in this, as in its size, character, and standing, it has been aptly reckoned among the three typical colleges of the university. Its statutes were revised in 1881, and the new provisions are not as yet fully carried out. It consists on its present foundation of a president, thirteen ordinary and two professorial fellows, twenty-eight scholars, and seven exhibitioners, besides undergraduates.

CORPUSCULAR THEORY OF LIGHT. See *LIGHT*.

CORPUS DELICTI (Lat., body of the offense). In criminal law, the essential element of the alleged crime. If a person is charged with murder, the prosecution must prove the death, as by the finding and identification of the corpse, or by evidence of criminal violence adequate to produce death and to account for the disappearance of the body. In other words, the *corpus delicti* in such a case consists in the death of the person alleged to have been murdered, and the criminal agency of the alleged murderer in producing that death. The same doctrine is applicable to other offenses. If one is charged with larceny, the prosecution must prove that the crime of larceny has been actually committed. See **CRIMINAL LAW**, and consult the authorities there referred to.

CORPUS DOCTRINÆ (Lat., body of doctrine). A collection of writings intended to have authority in the Protestant churches of Germany. The chief of such collections was the *Corpus Philippicum* (Leipzig, 1560), containing the Apostolic, the Nicæan, and the Athanasian Creeds, the Augsburg Confession, and Melancthon's *Loci Communes*. This and similar collections were superseded by the *Formula Concordiæ*. See **CONCORD, BOOK OF**.

CORPUS INSCRIPTIÖNUM LATINARUM (Lat., body of Latin inscriptions). A great collection of Latin inscriptions, geographically arranged in fifteen volumes, published by the Royal Academy in Berlin. The first volume appeared in 1863. This work is the most important authority in the study of epigraphy.

CORPUS JURIS (Lat., body of law). A comprehensive collection of the entire body of law of a given jurisdiction. The phrase has been specifically applied to two great compilations of law, both based on the jurisprudence of the Roman Empire, viz.:

(1) The *Corpus Juris Civilis*, or body of the civil law known, by way of eminence, as the *Corpus Juris*, is made up of the Code, the Pandects, or Digest, and the Institutes, compiled and promulgated by the authority of Justinian (A.D. 528-534), and the Novels (*Novellæ Constitutiones*), subsequently promulgated by him to correct errors and defects in the previous work. The first instance of the use of the expression *Corpus Juris Civilis* to describe the collection is found in the year 1583. As a whole the work became the text-book of mediæval law, was the basis of instruction in the great law schools of Bologna and elsewhere, and is the foundation of the scientific study of law in all the universities of Continental Europe to-day. It has been truthfully said that "with the exception of the Bible, no book was ever more widely studied by the Caucasian races." The best edition is that of Mommsen (who edited the Digest), Krüger (Institutes and Code), and Schæel (the Novels). It has been translated into German, but never as a whole into English, though the Institutes and some portions of the Digest have been made available for English readers. See **CIVIL LAW; CODE; DIGEST**; and consult Lee, *Historical Jurisprudence* (New York, 1900); and Hadley, *Roman Law*.

(2) *Corpus Juris Canonici*.—The corresponding body of the canon law of the Church of Rome had a slower growth. The first compilation to which the name was applied was the *Decretum*

of Gratian, a learned professor of the canon law at the University of Bologna, published about A.D. 1150. This was a private, unofficial collection of synodical canons and Papal decretals, made for use as a text-book in the law school, but it at once became a leading authority in the Church. Subsequent official collections—principally the *Libri Extra Decretum* of Pope Gregory IX., the *Liber Scetus* of Boniface VIII., and the compilation of Clement V., known as the "Clementine Decretals"—were embodied in the *Corpus* and became parts of it. Thus completed, the entire work has continued to be the standard of the canon law. The best editions are those of Böhmer (1747) and Richter (Leipzig, 1833, 1877-81). See **CIVIL LAW; CANON LAW**; and consult Lee, *Historical Jurisprudence* (New York, 1900).

CORRAL, kôr-räl', POINCIANO (c.1810-55). A Central American general, born in Costa Rica. He settled in Nicaragua early in his youth and became Minister of State in 1853. Subsequently he became identified with the Legitimist Government and commanded the army which defeated William Walker (q.v.) at Managua (1855). Shortly after the battle of La Virgen (September 3, 1855) and the occupation of Granada, he made terms with Walker, who, however, afterwards accused him of treasonable negotiations with leaders of the Legitimist Party. After a brief court-martial Corral was shot, November 8, 1855.

CORREA DA SERRA, kôr-râ'á dá sêr'râ, JOSÉ FRANCISCO (1750-1823). A Portuguese politician, scholar, and botanist, who was educated and took orders in Rome. With the assistance of the Duke of Alafoès he founded the Academy of Science in Lisbon and was made its perpetual secretary. He soon came into conflict with the Church, through the Inquisition, fled to France, and afterwards went to England, where he became secretary to the Portuguese legation. In 1813 he came to New York, and in 1816-20 he was Portuguese Minister at Washington. He had high rank as a botanist, but his principal work is *Collecção de livros ineditos da historia portugueza*.

CORRECTION. See **CRIMINOLOGY; PENALOGY; CHARITIES AND CORRECTION, THE NATIONAL CONFERENCE OF**.

CORRECTION OF THE PRESS. See **PROOF-READING**.

CORREGGIO, kôr-rêd'jô. A city in the Province of Reggio nell' Emilia, North Italy, situated 27 miles east of Parma (Map: Italy E 2). In the Piazza is a statue of the painter Correggio (q.v.), who was born here. The town was once the capital of a principality belonging to the Duchy of Modena, and the princely castle still remains. Population (commune), in 1881, 12,587; in 1901, 14,437.

CORREGGIO, ANTONIO ALLEGRI DA (c.1494-1534). An Italian painter, so called from his birthplace, a small town near Modena. We are less informed about his life than about that of any other of the chief Italian painters. According to the traditional accounts, as given by Vasari and the local historians, Correggio was humble and poor, and passed his life in drudgery. He made an unhappy second marriage, and died under distressing circumstances. But in contemporary documents it appears that his parents were tradespeople in comfortable circumstances, that

he inherited property from his uncle, and was well paid for his work. For his frescoes in the Cathedral of Parma alone he received a thousand gold ducats, besides materials. If he did not seek the courts of princes, where he might have gained high prices, it was because of his financial and moral independence.

Allegri's earliest years were passed in his native town. The lords of Correggio at that time maintained a number of artists and scientists at their Court, and it was in this atmosphere that the young artist grew up. It is generally believed that he acquired the rudiments of painting from his uncle, Lorenzo Allegri, an unimportant local painter. It is also supposed that he was a pupil of Francesco Bianchi-Ferrari at Modena, but late research has pointed out that this is unlikely, because his earliest work bears no resemblance to Bianchi's. Moreover, the latter died in 1510, when Correggio was not over sixteen years old. On the other hand, it is likely that he learned anatomy and optics, in which he excelled, from Giambattista Lombardi, head of the academy at Correggio. He seems ere this to have attracted the attention of Lady Veronica Gambara, of Correggio, about whom the scientific and artistic culture of the little Court centred. A probable tradition represents him as having gone with her to Mantua during the plague in 1511. Certain it is that his first works show the influence of Andrea Mantegna, particularly in his taste for mythological subjects, his love for illusions of perspective, and in the beautiful nude figures of children and geni which abound in his works. It is also likely that he studied under Lorenzo Costa (q.v.), who was at that time head of the school of Mantua, and perhaps under Dosso Dossi (q.v.), who was for a time in Mantua. In Correggio's earlier works we also find traces of the influence of Leonardo da Vinci. This influence appears in the handling of light and the modeling of figures, and is particularly evident in two paintings now considered to be early works of Correggio, viz. a "Holy Family," in the Malaspina Gallery, Pavia, and a "Madonna," in the Museo Artistico of Milan, both of which were formerly in possession of Milanese families. But it is not necessary to assume, as Ricci, the chief authority on Correggio, does, that he must have therefore studied in Milan. He may have become acquainted with Leonardo's work in some other way. A similar supposition is made by Thode, that because of certain resemblances of Correggio's frescoes in the Convent of Paolo, Parma, with Raphael's in the Farnesiana and elsewhere in Rome, the former must therefore have visited Rome in 1517-18. Even granting this resemblance, which is not generally conceded, this conclusion seems unwarranted. An artist of Correggio's merit could not have visited Rome in 1517 without attracting some attention, and Vasari's relations with the artists in Rome were such that Vasari could not have been misinformed when he made the statement that Correggio never visited the Eternal City. Correggio united in himself the tendencies of all the Lombard Schools—of Mantua, Milan, Bologna, and Ferrara—but it is unwarranted to infer that he studied in all of them.

In 1513 he returned to Correggio, and in 1514 he signed a contract to paint an altar-piece for the Franciscan church in that town. In 1518 he removed to Parma in response to an invita-

tion to decorate with frescoes the chamber of the Abbess of San Paolo. In this city he passed the greater part of his remaining life and painted his greatest works; here also he founded his school. Besides numerous easel works and altar-pieces, he was engaged from 1520 to 1524 in painting the frescoes of the cupola of San Giovanni in Parma, and from 1526 to 1530 he adorned the great cupola of the cathedral. In 1530, probably because he was displeased with the criticisms of this last great masterpiece, he returned to his native town, and there passed the remainder of his life in peace and quietness, under the patronage of Veronica Gambara, occupying himself with mythological subjects. He died on March 5, 1534. He was married in 1520 to Girolama Merlini, a maiden of seventeen. She may have been the inspiration of three of his most charming Madonnas, which seem to have been suggested by domestic scenes. She bore him four children, of whom a son and a daughter survived. This son, Pomponio, was a painter, but, unlike his father, a very mediocre one. Girolama died in 1529.

Correggio's individuality is so marked, and his mastery of technique was developed at such an early age, that it is impossible to divide his work into distinct periods, as is done in the case of Raphael. His art, like Michelangelo's, is a steady growth, which was little subject to influence. His earliest works are those executed before 1514, of which, according to the researches of Morelli, there are five in all. A characteristic example is the earliest of them all, a charming "Madonna" in the Uffizi in Florence. She sits enthroned in the clouds, with two angels making music on either side. The general disposition of the picture resembles Mantegna's, but the execution and the delicate transitions from light to shadow, the soft, round figures, and the dreamy, magical tone are characteristics of Correggio. The two paintings mentioned above as showing the influence of Leonardo also belong to this period.

In his large altar-piece for the Franciscans of Correggio (1514), now in Dresden, the painter appears before us with a style already developed. The "Madonna" sits on a high Renaissance throne with two saints on either hand. The most interesting figure of the composition is Saint Francis, whom she is blessing. He seems the incarnation of the happy and gentle spirit that softened and changed the Middle Age. A number of other works of a religious nature belong in the period of 1514-18, among which is the charming "Zingarella" of the Naples Gallery.

The frescoes in the Convent of San Paolo (1518) form an epoch in Correggio's career, for they were his first monumental efforts, and with them he may be said to have begun the school of Parma. They reveal him as a master of mythological representation, the peer of Raphael himself. On the principal wall of the Abbess's chamber is the figure of Diana returning from the chase, in a car drawn by white stags. The ceiling is decorated with a trellis-work of vines, from which peer sixteen little cupids, bearing attributes of the chase—the most bewitching figures imaginable. Lower on the walls are sixteen lunettes filled with the mythological figures, like The Fates, The Graces, and Satyrs.

In the cupola of San Giovanni of Parma Correggio attempted a grander style of composi-

CORREGGIO

"THE HOLY NIGHT," FROM THE PAINTING IN THE ROYAL MUSEUM, DRESDEN

tion (1520-24). This was the first example of a cupola to be treated with frescoes, and Correggio had no precedents to follow. He treated the cupola as if it were the heavens, portraying Christ and the Apostles amid the clouds. In the centre was Christ in glory, a specimen of keenest foreshortening. The Twelve Apostles, rapt in deepest wonder, are seated upon the cloud below, and in the pendentives are the four Evangelists and four fathers of the Church in groups of two—all figures of the utmost nobility of conception. The decorations of the cupola of the Cathedral of Parma (1526-30) are grander still, and constitute his most ambitious effort. Their subject is the "Ascension of the Virgin." In the upper half of the cupola Christ goes forward to meet the Madonna, who is borne upward by a host of angels. In the lower part stand the Apostles gazing in rapt wonder upon the scene, and behind them are a large number of beautiful genii with candelabra and the like, as if preparing for a great celebration. The innumerable hosts of the angels seem to float beneath the Madonna, and the whole picture is animated with ecstatic joy. The color is beautiful and soft—the great fresco has well been termed an apotheosis of color.

These three series of frescoes were his greatest works. But in addition to these Correggio painted many other pictures during the period 1520-30. The famous "Marriage of Saint Catherine," in the Louvre, was painted in 1522. It is impossible to conceive more beautiful and expressive heads than these, or hands and hair more perfectly painted. Correggio's works of this period may best be studied in the galleries of Parma and Dresden. Foremost among them is a series of five great altar-pieces, the best of which are the so-called "Night" and "Day." The latter, which is in Parma, represents the Madonna and a very beautiful Magdalen, painted in the full light of the day, which is wonderfully diffused. The famous "Night," in Dresden (ordered in 1522, but not painted until 1529), is in reality a birth of Christ, in which the light issues from the new-born infant, lighting with wondrous radiance the Madonna, and the faces of the two women and the shepherds, which stand out in vivid contrast to the darkness above. Never were light and shade better handled than in these two pictures. On the other hand, Morelli has conclusively shown that the well-known "Reading Magdalen" of the Dresden Gallery is no Correggio at all, but probably a work of Adrian von der Werff, a Flemish artist.

The last period of Correggio's life was chiefly spent in painting mythological pictures. Earthly love was the theme he sought to portray, and none could portray it better than he. His work is sensuous, but not sensual. His "Io" and his "Leda" are as innocent and charming as the Greeks themselves conceived them. Perhaps the finest of these productions are the "Jupiter and Antiope," in the Louvre, and the "Danaë" of the Borghese Gallery, Rome.

Correggio's canvases are peculiarly impressive because of his wonderful treatment of light and shade, of which he was the greatest master among the Italians. He generally represents the chief figures in high light, which is vividly contrasted with the surrounding gloom. His colors are soft and harmoniously blended, and the values are accurately given; his carnation is

perfect. His figures are faultlessly modeled, and with him a picture is no longer a flat surface. Another chief characteristic of his work is the dramatic action of his figures, which is sometimes so pronounced that their movements seem exaggerated, as was also the case with those of Michelangelo. But in the case of Correggio the effect is softened by the mystic light which envelops the picture. His drawing is said to be inaccurate, but such cases are certainly exceptional. Correggio drew with his brush, so to speak, and the general effect of the pictures is most charming. In the strength of his individuality, in the subjectivity of his pictures, he is second only to Michelangelo. His place in the history of art is among the five great Italian painters, with Michelangelo, Leonardo, Raphael, and Titian. The school of Parma which he founded was not of great importance, Parmigiano (q.v.) being the only pupil of note. But Correggio exercised great influence upon the Carracci in the following century and was the great model of the Baroque painters.

Consult: Morelli, *Critical Studies of Italian Painters*, vol. ii. (London, 1893); Heaton, *Correggio* (London, 1882); Thode, *Correggio*, in *Künstler-Monographien* (Bielefeld, 1898); Landon, *Life and Works of Correggio* (Paris, 1863-20). The best modern works are J. Meyer, *Correggio*, translated by Heaton (London, 1876); and Ricci, *Antonio Allegri da Correggio* (London, 1896).

CORREGIDOR, kōr-rāj'ī-dōr, *Sp. pron.* kōr-rā'nā-dōr' (*Sp. corregidor*, *Port. corregedor*, *correefor*). The Spanish and Portuguese title of the principal magistrate of a town. The term is sometimes applied to certain provincial magistrates.

CORRELATION (*ML. correlatio*, from *Lat. com-*, together + *relatus*, p.p. of *referre*, to refer, from *re-*, back + *ferre*, to bear). The reciprocal influence of plant-organs. The removal or unusual development of one organ may affect the mode of development of others. For example, if the terminal shoot of a pine be cut away, one or more neighboring laterals will grow erect and in a measure take its place, and branches will be formed on all sides of the new leader. Otherwise it would have grown almost horizontal, and become branched only in a horizontal plane. See **GROWTH**.

CORRENTI, kōr-rēn'té, CESARE (1815-88). An Italian statesman, born in Milan, and educated in that city and in Pavia. He originated several important statistical works, and the almanac *Nipote del Vestavverde*. As one of the strongest opponents of Austrian domination in Italy he contributed materially toward the establishment of unification. In the work entitled *L'Austria e la Lombardia* (1845) he set the popular sentiment against Austria, and during the insurrection at Milan (March 18-22, 1848) was appointed Councilor of War and Secretary-General of the Provisional Government, of which he eventually became in some respects the central figure. In 1866 he was intrusted with the organization of the Venetian Provinces, and subsequently served as Minister of Education in the Ricasoli (1866) and Lanza (1869-72) Cabinets. Correnti had exceptional oratorical power and marked literary ability. The publications with which he became identified, either as editor or as

collaborator, have advanced statistical science in Italy.

CORRESPONDENCE (Lat. *com-*, together + *respondere*, to answer, from *re-*, back + *spondere*, to promise). A term used in mathematics to express certain reciprocal relations. If each individual of one group of objects bears a certain relation to a definite number of individuals of another group, and a definite number of individuals of the first group bears the same relation to each individual of the second group, there is said to be a correspondence between the objects of the groups. If 1 of the first group corresponds to B of the 2d, and 1 of the second group corresponds to A of the 1st, the relation is called an A to B correspondence. If $A = B = 1$, it is called a 1 to 1 ($= 1$) correspondence; e.g. two numbers are said to be equal when there exists a 1 to 1 correspondence between their units. In geometry the simplest cases of 1 to 1 correspondence, or 'conformal representations,' are furnished by two planes superposed one upon the other. Here to every point of the first figure there corresponds one and only one point of the second figure, and to every point of the second figure there corresponds one and only one point of the first. The simplest case of Chasles's (q.v.) correspondence formula may be stated thus: If two ranges of points R_1 and R_2 lie upon a straight line so that to every point x of R_1 there correspond in general α points y of R_2 , and again to every point y of R_2 there always correspond β points x of R_1 , the configuration formed from R_1 and R_2 has $(\alpha + \beta)$ coincidences, or there are $(\alpha + \beta)$ times in which a point x corresponds with a point x . From these linear transformations Poncelet, Plücker, Magnus, Steiner, passed to the quadratic where they first investigated 1 to 1 correspondence between two separate planes. The 'Steiner projection' (1832) employed two planes E_1 and E_2 together with two straight lines g_1 and g_2 not co-planar. If we draw through a point P_1 or P_2 of E_1 or E_2 the straight line x_1 or x_2 which cuts g_1 as well as g_2 , and determines the intersection X_2 or X_1 , with E_2 or E_1 , then are P_1 and X_2 and P_2 and X_1 corresponding points. In this manner to every straight line of the one plane corresponds a conic section in the other. In 1847 Plücker had determined a point upon the hyperboloid of one sheet, like fixing a point in the plane, by the segments cut off by two fixed generators upon the two generators passing through the point. This was an example of a uniform representation of a surface of the second order upon the plane. Correspondence relative to surfaces has been studied by Chasles, Clebsch, Cremona, Cayley, and others. In space of three dimensions, only a beginning has been made in the development of this theory. Consult: Schubert, *Kalkül der Abzählenden Geometrie* (Leipzig, 1879); Klein, *Vergleichende Betrachtungen über neuere geometrische Forschungen* (Erlangen, 1872); Möbius, *Der barycentrische Calcul* (Leipzig, 1827).

CORRESPONDENCE CLASSES. See CHAUTAUQUA.

CORRÈZE, kô'rèz'. A south central department of France (q.v.), formerly part of the Province of Limousin, taking its name from an affluent of the Vézère, the Corrèze, which traverses the department from northeast to southwest (Map: France, H 6). Area, 2265 square miles; popula-

tion, in 1896, 310,514; in 1901, 318,422. The surface of the department is mountainous, especially in the north and east, where it is broken in upon by offsets from the Auvergne Mountains, which range from 2500 to 3320 feet (Mont Besson) above the sea. In the south and southwest the soil yields wheat, oats, barley, rye, maize, etc. Wine is also produced, but of poor quality. Coal, iron, and lead are found in considerable quantities. Capital, Tulle.

COR'RIB, LOUGH. A lake in the north of Galway, in the western part of Ireland, with an area of 68 square miles (Map: Ireland, B 3). From its southern end, four miles north of Galway, it discharges its surplus waters by Galway River into Galway Bay. It receives the waters of the Clare and smaller rivers, and those of Lough Mask, through the Pigeon Hole and other caves at its northern end. On its sides are metamorphic rock, carboniferous limestone, and marble. Near it are many monumental heaps and megalithic circles. It contains many islets, and to the west are mountains 3000 feet high.

CORRIENTES, kôr-ryân'tàs. A city of Argentina and capital of the province of that name, situated on the Paraná, just above the mouth of the Paraguay (Map: Argentina, F 9). It has several plazas, hospitals for men and women, a poorhouse and a national college, a normal school and a library. The natural history museum was at one time managed by the naturalist Bonpland. The city is the centre of a fertile district, and has considerable trade in lumber and oranges. Its chief industry is shipbuilding, but there are also meat-curing establishments and a foundry. Population, in 1901, 17,000. Corrientes was founded in 1588. It occupied a place of considerable prominence in the revolutionary movements during the latter half of the nineteenth century.

COR'RIGAN, MICHAEL AUGUSTINE (1839-1902). An American Roman Catholic prelate, born at Newark, N. J. He graduated in 1859 at Mount Saint Mary's College (Emmitsburg, Md.), pursued a theological course at the American College of Rome as one of the twelve students with whom that institution was begun, was ordained priest in 1863, and from 1864 to 1868 was professor of dogmatic theology and sacred Scriptures in the Diocesan Seminary of Seton Hall College (South Orange, N. J.). From 1868 to 1873 he was president of the college, and in 1873 was appointed Bishop of Newark. During his administration of the diocese he greatly increased the number of churches, introduced religious communities, and founded charitable institutions. In 1880 he became coadjutor (with right of succession and the title of Archbishop of Petra) to Cardinal McCloskey, Archbishop of New York, and from that time directed the larger part of the work of the archdiocese. He entered into the office of Archbishop of New York in 1885, and received the pallium in 1886. His administration was marked by the prolonged controversy between Dr. Edward McGlynn (q.v.) and the Roman Catholic Church. He effectively developed the archdiocese, which at the time of his death was one of the largest and most important in the world. Although personally retiring and unobtrusive, he became known, through his many activities, as one of the most prominent Roman Catholics in the United States. He was a scholar of high attainments.

CORROBOREE (Australian). A sort of ceremonial dance, of a more or less public character, in vogue among the Australian aborigines. The corroboree is held at night, and various types of it occur all over the country, or are borrowed from tribe to tribe, some of a warlike, some of an historical, others of a lascivious character. Generally the men do the dancing, and the women furnish the accompanying music. The songs that go with the corroboree give scope for individual and tribal invention. The corroboree combines in itself the elements of the public celebrations among civilized races and the opera of to-day. It is the nearest approach to a national institution among these primitive people. The corroboree serves also as a peace ratification, and as a means of intercommunication, etc.

CORRODI, kōr-rō'dē, WILHELM AUGUST (1826-85). A Swiss poet and draughtsman, born at Zurich. In his poems, many of which are written in the popular dialect, he mirrors the life of his native canton, celebrating its customs and reviving many of its best traditions. His works, which are generally distinguished by a fine sense of humor, include: *Dur und Moll, Aus Natur und Leben* (1855); *Ein Buch ohne Titel, aber für Kinder von sieben bis siebenmal sieben Jahren* (1855); *Waldleben*, a lyrical novel (1857). The works of Corrodi written in the dialect of Zurich include: *De Herr Professor*, an idyl (1872); *De Herr Dokter*, an idyl (1860, dramatized by the author in 1872); *Wie d'Warret wirkt*, a comedy (1887); and a translation of the works of Robert Burns into Swiss German (1872). Corrodi illustrated several of his books.

CORROZZO NUTS. See IVORY, VEGETABLE.

CORRUGATED IRON. A name given to sheet iron or steel in which grooves and ridges have been produced by passing the sheet between rollers, the surfaces of which are formed into rounded grooves and ridges, the ridges of one roller filling the grooves of the other. By corrugation the strength of the metal is greatly increased, and it is adapted for use in many places where a metal covering of lightness and strength is required, such as roofs, awnings, and the side walls of sheds and factory buildings. Corrugated iron is frequently galvanized with a thin layer of zinc to make it less liable to corrode or rust. It is manufactured in a variety of thicknesses and with corrugations varying in size.

CORRUPTION OF BLOOD. The blasting of inheritance: one of the consequences of an attainder for treason or felony under the old common law, whereby the offender was cut off, or outlawed, from all of his blood relationships and so rendered incapable of inheriting lands or of transmitting them by descent to his natural heirs, lineal or collateral. The effect of the corruption of blood being the extinction of the line of heirs of the person attainted, his lands at once, upon his execution, became subject to the law of escheat and became vested in his superior lord. In cases of treason the principle of forfeiture gave the lands to the King absolutely, and in cases of ordinary felony they went to the Crown for a year and a day before escheating to the lord. This barbarous penalty survived in England, nominally at least, until 1870, when it was abolished by the Forfeiture Act. It has never been tolerated in the United States, and is ex-

pressly forbidden by the Constitution, which declares (Art. III., Sec. 3, n. 2) that 'no attainder of treason shall work corruption of blood, or forfeiture, except during the life of the person attainted.' The constitutions of the several States contain similar provisions. See ATTAINDER; FORFEITURE; TREASON.

CORRUPT PRACTICES. Dishonest methods employed with the intent to influence the results of public elections. The practices to which the expression refers are the use of bribery, treating, undue influence, personation of voters, making false election returns, and knowingly making a false declaration as to election expenses. Of these, bribery, personation, and making false returns are common-law offenses, and render the offender liable to indictment, and so, it has been held in England, is the giving of entertainment to voters with the corrupt intention of influencing an election. Any of the acts enumerated above, excepting that of making a false declaration as to election expenses (which is purely a statutory offense), whether criminally punishable or not, will at common law vitiate the result produced by them, and, if the corruption be general, will have the effect of nullifying the election itself.

The prevalence of bribery and other corrupt practices at Parliamentary elections in England, and at all partisan contests in the United States, has in recent years led to the enactment of statutes in both countries to check the evil. The English Parliament led the way in these reforms by enacting the Corrupt Practices Prevention Act in 1854, which was aimed particularly at the practice of electoral bribery. This was followed in 1868 by the Parliamentary Elections Act, and in 1883 by the Corrupt and Illegal Practices Prevention Act. Altogether these statutes constitute a most comprehensive and well-devised body of legislation, and they have proved themselves to be admirably adapted to the end in view. They define with great particularity the acts which shall constitute the prohibited offenses, and prescribe the severe penalties of disfranchisement and the avoiding of the elections for their commission. The personation of voters is made a felony, and bribery and the other practices enumerated are declared to be misdemeanors. Many of the best provisions of these statutes have been incorporated in the election laws of American States. For the history and scope of these laws, see ELECTION; ELECTORAL REFORM. The English law may be further studied in Rogers, *Elections* (17th ed., London, 1895); Mattinson and Macaskie, *Law Relating to Corrupt and Illegal Practices* (3d ed., London, 1892).

CORY. A city in Erie County, Pa., 90 miles southwest of Buffalo, N. Y.; on the Erie, the Philadelphia and Erie, and the Western New York and Pennsylvania railroads (Map: Pennsylvania, B 2). It has steel-works, machine-shops, flour and feed mills, brick-works, and manufactures of tram locomotives, stationary, gas, and steam engines, furniture, radiators, shovels, wrenches, brushes, toys, etc. The State Fish Hatchery is located here, and there are three mineral springs of value. Settled in 1860, Corry enjoyed a rapid growth, due to the existence of petroleum in the vicinity. It is governed under a general 'Act of 1899' by a mayor, elected every three years, and a bicameral city council. Population, in 1890, 5677; in 1900, 5369.

CORRY (from OIr. *coire*, ravine, Swiss *Kahre*). A name applied to the recesses in a mountain slope beneath a sharp peak with serrate spurs, characteristic of the high Alps. These are referred by E. Richter to glacial erosion under specific conditions, although no glaciers occur in them at the present time. See **CIRQUE**.

COR'SAC (native name), or **ADIVE**. A small fox (*Vulpes corsac*) of the deserts of Central Asia, its range extending through the open country from the Ural Mountains and Caspian Sea to Mongolia. It is pale, reddish-yellow in hue, white on the ventral surface, and with the tip of the long bushy tail black. In the sixteenth century it was fashionable as a ladies' pet in France. It digs holes for itself or seizes upon marmot-burrows, preys, chiefly at night, on young marmots, small rodents, insects, etc., and resembles the American kit-fox (q.v.). The Russian traveler Przhevsky reports it as abundant in Tibet, where it is called *karsu* by the Mongols, and is both trapped and run down by dogs. During the breeding season, in February, the high deserts resound with its owl-like cries, night and morning. See **FOX**; and **PLATE OF FOXES AND JACKALS**.

COR'SAIR (Fr. *corsaire*, from Prov. *corsari*, Sp., Port. *corsario*, It. *corsaro*, corsair, from *corsa*, Sp., Port. *corso*, It. *corsa*, course, from Lat. *cursus*, course, from *currere*, to run). A pirate, or freebooter, or the vessel used by one. The term was used with special reference to the marauding vessels of the Barbary powers.

CORSAIR. One of the smallest and most brilliantly orange-red rockfish (*Sebastes rosenbuscus*) of the California coast. See **ROCKFISH**.

CORSAIR, **THE**. A narrative poem by Byron (1814). The romantic adventures of the lofty-spirited pirate who is its hero are supposed to be continued in *Lara*.

CORSE, *kōrs*. The French name of Corsica.

CORSE, **JOHN MURRAY** (1835-93). An American soldier, born in Pittsburg, Pa. In his eighteenth year he entered at West Point, which he left to take up the study of law. He enlisted in the Union army at the outbreak of the Civil War, commanded a division at Memphis, and became brigadier-general in 1863. He distinguished himself in the Chattanooga campaign, was in command of a division in General Sherman's 'March to the Sea,' and was brevetted major-general for his heroism at Altoona Pass (q.v.). He was afterwards collector of revenue in Chicago, and postmaster of Boston.

CORSET (Fr., dim. of *corps*, OF. *cors*, body, from Lat. *corpus*, body). An article appertaining to the costume of women, which was introduced into France about the time of the Revolution, when the French ladies adopted the Greek dress. Previously they had been worn by Germans, by whom they were invented. Bandages resembling corsets were used in Rome during the early ages, but only as a support, until a slender waist was considered a mark of beauty, when they were made to compress the form. Modern corsets are usually made of two thicknesses of white jean, quilted together so as to form vertical cases, in which steels or whalebones are inserted. They are in two pieces, closed in front with steel or whalebone plates, which rest on the breast-bone vertically, and laced at the back as tightly as the wearer may desire.

COR'SICA (Gk. *Kῆρος*, *Kyros*, *Kopols*, *Korsis*, Lat. *Corsica*, Fr. *Corse*). An island belonging to France (the fourth in size of the islands in the Mediterranean, situated between latitudes 41° 21' and 43° N. and longitude 8° 32' and 9° 31' E. (Map: France, P 8). It is separated by the Strait of Bonifacio from Sardinia, on the south, and occupies an area of nearly 3380 square miles. In the northeast is a long, narrow peninsula, pointing in the direction of Genoa and terminating in Cape Corso. In its physical formation Corsica undoubtedly belongs more to Italy than to France. Its surface is traversed by numerous mountain ranges of rugged appearance and covered with beautiful forests. The principal chain runs from north to south, sending off numerous offshoots in every direction. The highest summits of the island are Monte Cinto, 8890 feet; Monte Rotondo, 8600 feet; Monte Padro, 7846 feet; and Monte d'Oro, 7840 feet high. The coasts are precipitous on the west, while on the east they are low, and in some parts even swampy. The chief geological formation is granite, occasionally interspersed with porphyry and serpentine. There are a number of short and swift streams on the island, the principal of which are the Golo, Tavignano, and Taravo. The climate is generally healthful and the temperature moderate, the average for the summer being about 75°. The lower parts of the island are occasionally visited by malaria, but the mountain regions are very salubrious. The vegetation of the island is rich, and the fine forests for which Corsica was famous in ancient times are still found on the mountain slopes. The flora of the valleys does not differ materially from that of Italy. There is an abundance of olives, oranges, citrons, vines, and other Mediterranean plants.

The soil is very fertile, and, according to some estimates, over 40 per cent. of the total area is cultivable. The chief products are wheat, barley, rye, corn, wine, and chestnuts, the latter being used extensively for food. The agricultural work is done in part by laborers who come over from Tuscany. Cattle-raising is carried on on a very large scale, and constitutes the chief industry of the island. There are also good fisheries of tunny and pilchard. Among the minerals mined are iron, lead, copper, and antimony, and there are quarries of granite, marble, and alabaster. The commerce is of little importance. The chief imports are foodstuffs, building materials, and metal ware. The exports consist mostly of kine, olive oil, and fruits. Corsica forms a department of France, and is divided into the five arrondissements of Ajaccio, Bastia, Calvi, Corte, and Sartène. The population in 1896 was 290,168, or nearly 86 per square mile. The Corsicans are of mixed origin, independent in spirit, passionate, and revengeful. (See **VENDETTA**.) They scorn work and pay little attention to the development of the natural resources of their island. The current language is a corrupt Italian. The capital is Ajaccio, with a population of over 20,000.

Corsica is supposed to have been originally inhabited by a people of Iberian origin. It was settled in succession by the Etruscans, the Phœnicians, and the Phœceans, and finally came into the possession of the Carthaginians in the fifth century B.C. Wrested by the Romans from the Carthaginians in the second half of the third

century B.C., the island remained for seven centuries under the sway of Rome, until, after repeated attacks by the Vandals, it finally fell into their hands in 470. After the expulsion of the Vandals by Belisarius in 533, Corsica was occupied successively by the Byzantine Empire, the Goths, Franks, and the Saracens. At the beginning of the eleventh century it came into the possession of the Pisans, by whom it was ceded in 1300 to the Genoese. The rule of the latter was marked by continuous revolts on the island, and the ruling city found itself compelled on several occasions to ask assistance from Austria and France. In 1736 a German adventurer, Baron Theodor von Neuhof, became King of Corsica, but in 1738 he had to lay down his crown. The uprisings under the leadership of Paoli during the second half of the eighteenth century were of the most serious nature. In 1768 Genoa made Corsica over to France. Paoli made an attempt to resist the French rule, but the dispatch of 30,000 French troops to the island compelled him to seek safety in England. He returned in 1790, and in 1793 headed a successful rising, in which the British lent assistance to the patriots. In the following year Corsica came under the protection of Great Britain, from which it obtained a constitutional form of government. Two years later the British were forced by the French to evacuate the island, which has ever since remained in the possession of France. Corsica is noted as the birthplace of Napoleon. Consult: Girolami-Cordona, *Géographie générale de la Corse* (Ajaccio, 1893); Vuillier, *The Forgotten Isles* (New York, 1896); Caird, *The History of Corsica* (London, 1899).

CORSICANA, kôr'sê-kî'nâ. A city and county-seat of Navarro County, Tex., 163 miles northeast of Austin; on the Houston and Texas Central and the Saint Louis Southwestern railroads (Map: Texas, F 3). It is the seat of the State Orphan Asylum, and has an Odd Fellows' widows' and orphans' home. Corsicana is a progressive manufacturing centre, among its industries being cotton-compresses and cotton-gins, cottonseed-oil mills, brick-yards, flour-mills, a grain elevator, foundry and machine shops, planing-mills, etc. It is also the seat of an extensive oil industry, there being in its vicinity a number of wells which were regarded as extraordinary until the discovery of the Beaumont oil-field. Population, in 1890, 6285; in 1900, 9313.

COR'SICAN BROTHERS, THE. A romantic drama adapted by Boucicault from a French play, *Les frères corses*. The twin brothers, Louis and Fabian dei Franchi, are bound together by a strange sympathy, and each is conscious of the other's actions, though distant from him. The dual part of the brothers is a successful rôle of Henry Irving.

CORSINI, kôr-sê'né. A celebrated Florentine family, which from the thirteenth century was prominent in the history of Italy. The most famous was ANDREA (1302-73). Bishop of Fiesole, who was canonized in 1629. He was for forty years a monk in Florence, and then was made Bishop of Fiesole, and later legate to Bologna. That town was in the midst of a civil war, but the eloquence of Corsini was successful in subduing it. Austere in his life and ambitious only for his Church, he was a type of the

medieval bishop. LORENZO became Pope Clement XII. in 1730. He restored the Corsini Palace, now containing the interesting Corsini Gallery.

CORSNED (AS. *corsnad*, from *coren*, p.p. of *cōsan*, Goth. *kiasan*, OHG. *kiasan*, Ger. *kiesen*, to choose + *snad*, bit, from *snīpan*, Goth. *snīpan*, OHG. *snīdan*, Ger. *schneiden*, to cut). A form of ordeal in early English law, which consisted in administering to the accused a morsel of barley bread, about an ounce in weight, which had previously been endowed by excretion with the magical power of exposing his guilt or innocence. If the accused was innocent, the bread was readily swallowed; if guilty, it stuck in his throat and killed him. It was in this way (the chroniclers tell us) that Godwin, Earl of Kent, met his fate in the reign of Edward the Confessor when accused of the death of the King's brother. Compare the similar ordeal of the 'water of jealousy,' which, according to the Mosaic law, was administered among the Jews to a woman charged with adultery (Book of Numbers, chap. v.). See ORDEAL. Consult Blackstone, *Commentaries on the Laws of England*, bk. iv., p. 345.

COR'SO (It., course). A word used to express not only the racing of horses (without riders), but also the slow driving in procession of handsome equipages through the principal streets of a town, such as almost always takes place in Italy on festivals. This custom has given the name Corso to the principal streets in almost all the larger towns of Italy. The best known of these is the Corso in Rome, which is the scene of the celebrated diversions of the carnival (q.v.) and the favorite meeting-place of fashionable society.

COR'SON, HIRAM (1828—). An American scholar. He was born in Philadelphia, November 6, 1828. He held positions in the Library of Congress and the Library of the Smithsonian Institution from 1849 to 1856, and taught afterwards in Girard College, Philadelphia, and Saint John's College, Annapolis, and in 1870 became professor of the English language and literature in Cornell University. Later, the chair of English literature was created for him. He has published *Handbook of Anglo-Saxon and Early English* (1871); *Introduction to the Study of Browning* (1886); *Introduction to Shakespeare* (1889); *Primer of English Verse* (1893); *The Aims of Literary Study* (1894); *Selections from the Canterbury Tales* (1896); *The Voice and Spiritual Education* (1896); *Introduction to John Milton* (1899). His Shakespearean textual criticism is of the highest value, and his interpretation of poets is luminous and sympathetic.

CORSON, JULIET (1842-97). An American educator and author, born in Boston. She was secretary of the New York Free Training School for Women in 1872-73, and devoted herself to study and experiments on healthful and economical cookery and dietetics. In 1876 she established the New York School of Cookery. She wrote several popular books, among them, *Fifteen-Cent Dinners for Workingmen's Families* (1877); *Dietary for Schools* (1878), prepared at the request of the United States Commissioner of Education; and *Sanitary Living*.

CORS'SEN, WILHELM (1820-75). A noted German philologist, who devoted himself espe-

cially to the ancient Italic languages and dialects. He was born in Bremen, January 20, 1820, studied philology in Berlin 1840-44, and became professor of classical philology at Schulpforta in 1846. He retired in 1866 and dedicated the remaining years of his life to research. He died at Lichterfelde, near Berlin, June 18, 1875. His most important work, *Ueber Aussprache, Vokalismus und Betonung der lateinischen Sprache*, was published in two volumes in Leipzig, 1858-59, receiving the prize of scholarship. A second edition appeared in 1868-70, and remains a work of authority on the subject. It was followed and completed by *Kritische Beiträge zur lateinische Formenlehre* (1863) and *Kritische Nachträge* (1866). Corssen afterwards set himself to prove that the Etruscans were an Italic people, allied closely to the Latins, in support of which theory he published a monumental work, *Ueber die Sprache der Etrusker* (2 vols., Leipzig, 1874-75), on which he lavished all the force of his genius and erudition; but his arguments met at once violent and universal opposition (see especially Wilhelm Deecke, *Corssen und die Sprache der Etrusker, eine Kritik* (Stuttgart, 1875), and have never found support. This failure of his cherished hope doubtless hastened his death.

CORT, kōrt, CORNELIS (c.1536-78). An eminent Dutch engraver, born in Hoorn, Holland. He was first instructed by Hieronymus Cock, for whom he executed several plates which were published with the signature of his master. In 1566 he visited Venice, where he was entertained by Titian, whose best works he reproduced. In 1571 he went to Rome and established an influential school there. The art of engraving had previously been confined to small plates, and Cort was the first to use a larger size. He reproduced the chief works of Raphael, Correggio, Michelangelo, and others, besides designs of his own, the best of which are perhaps the "Birth of the Virgin" and the "Holy Family with a Pear." He died in Rome in 1578.

CORT, FRANS DE (1834-78). A Flemish lyrical poet, born in Antwerp. After being associated with the publication *Grondwet*, he was appointed editor of the *Schelde* (1858). He was secretary to the general auditor of the military court at Brussels from 1861 until his death. He was one of the most distinguished lyrical poets of Belgium, and his songs, although not conspicuous for fancy or imagination, are full of deep and genuine sentiment. His works comprise: *Liederen* (1857-59); *Zing-Zang* (1866); and *Liederen* (1868). He also translated *De schoonste liederen van Robert Burns* (1862), and after 1861 conducted the periodical *De Toekomst, tijdschrift voor opvoeding en onderwijs, taalen letterkunde*.

CORTE, kōrt. The capital of an arrondissement in the Department of Corse (Corsica, q.v.) at the confluence of the Tavignano and Restonica, 52½ miles northeast of Ajaccio by rail. It is picturesquely situated amid mountain and valley scenery, and is protected by a commanding citadel which has sustained many notable sieges. Corte was the seat of Paoli's reform Government. It has a university founded by that patriot, a communal college, an ancient palace, and an old Franciscan monastery which served as the Parliament house in 1765. There are

monuments to Pasquale Paoli, Joseph Bonaparte, and General Casanova, Duke of Padua. Marble is quarried extensively in the neighborhood. Population, in 1901, 5425.

CORTEGIANO, kōr'tā-jā'nō, IL. (The Courtier). A famous work on manners and etiquette by Baldassare Castiglione, published in 1528. It depicts in elegant language the polished Italian gentleman of the time of the Renaissance. There is an English translation by Thomas Hoby (1561).

CORTEREAL, kōr'tā-rā'ā'l, GASPARD (c. 1450-1501). A Portuguese navigator. In the course of two or three voyages in 1500 and 1501, he seems to have visited the North American coast at various points between Labrador and the Bay of Fundy. From his last voyage he did not return. In 1502 his brother MIGUEL, also a well-known navigator, sailed in search of him, but likewise was lost, probably on the northern coast of North America or in the Arctic Ocean. Consult HARRISSE, *Les Corte-Real et leurs voyages au nouveau monde* (Paris, 1883).

CORTES, kōr'tās (Sp., Port. pl. of *corte*, court). The name given in Spain and Portugal to the assembly of representatives of the nation. As one district of Spain after another was recovered by the Christian princes from the Moors, there arose in each a corporation composed of the different 'estates' or orders of the population, limiting the power of the princes. From the union of several of these territories were formed the two leading kingdoms of Castile and Aragon, each having its Cortes, representing the clergy, the nobility, and the cities. In Aragon the Cortes appointed a judge, known as the Justiciar, who decided disputes between the King and his subjects, and confined the royal power within constitutional limits. In Castile the rights of the burghers were less extensive than in Aragon, but in both States the King was dependent on the Cortes. After the union of Castile and Aragon the Crown succeeded in greatly lessening the powers of the Cortes, and it was seldom assembled except to do homage or to sanction an arrangement as to the succession to the throne. After 1713 it did not meet till 1789, on the accession of Charles IV. In 1809 the Cortes, as composed in 1789, was assembled by the Junta, and framed a new constitution, called the Constitution of 1812, which, however, was set aside at the Restoration. For the present Constitution of the Cortes, see SPAIN, paragraph on *Government*.

The history of the Portuguese Cortes is very similar to that of the Spanish. In 1826 Dom Pedro promulgated a new constitution after the model of the French, calling the Cortes again into life, and abdicating at the same time in favor of his daughter, Maria da Gloria. This Constitution was set aside during the usurpation of Dom Miguel, but was restored in 1842. Consult: Muro y Martinez, *Constituciones de España* (Madrid, 1881); Desdevisu du Degert, *L'Espagne de l'ancien régime* (Paris, 1897-99), which contains a bibliography; Colmeiro, *Cortes de los antiguos reinos de Leon y de Castilla* (2 pts., Madrid, 1883-84); Stephens, *Portugal*, in the "Stories of the Nations" Series; Prescott, *Ferdinand and Isabella* (in numerous editions).

CORTÉS, kōr-tās', HERNÁN or HERNANDO (1485-1547). Conqueror of Mexico. He was

born at Medellin, in Estremadura, Spain, and was sent to the University of Salamanca, but his superabundant animal spirits and unrestrained passions for the fair sex cut short his university career. The same cause made it impossible for him to remain at home, and so he decided to try his fortune in the New World. An accident, received in scaling a tumble-down wall while on his way to a final clandestine rendezvous, postponed his departure until the spring of 1504, when he sailed for Santo Domingo. There he joined the forces engaged in suppressing a native revolt, and quickly won promotion, so that in 1511 he was the chief executive officer with the expedition dispatched under Velazquez for the conquest of Cuba, becoming subsequently Alcalde of Santiago. Mining and stock-raising, although profitable, were not sufficiently to his taste, and he persuaded Velazquez to give him the command of an expedition to the mainland, made known at that time by the discoveries of Grijalva. No expense was spared in equipping a fleet of seven vessels, carrying three hundred men. Velazquez, however, became suspicious lest Cortés should refuse to recognize his authority when once he was in a position to establish himself independently. Learning that he was to be superseded, Cortés gathered his forces and set sail, on November 17, 1518, before Velazquez could order him to resign the command. Stopping for supplies at the settlements on the coast of Cuba, he proceeded to Cozumel Island, sailed along the Yucatan coast and fought a bloody battle with the natives at Tabasco. In the early spring of 1519 he landed at San Juan de Ulloa. There he obtained numerous captives, one of whom was the famous Marina, whom he made his mistress, and who, out of devotion to him, acted as the interpreter, guide, and counselor of the Spaniards, and frequently saved them from serious reverses. Finding a better harbor a little north of San Juan, the Spaniards removed thither and established a town, naming it La Villa Rica de Vera Cruz. An independent government was organized by vote of the settlers, who determined to renounce their allegiance to Velazquez and to acknowledge only the supreme control of the King in Spain. In order to prevent those who opposed this movement from deserting him and carrying the news to Cuba, Cortés dispatched one vessel to Spain with messengers to represent his cause at the Court, and then sank the rest of his fleet.

Starting on his march inland, Cortés entered the country of the Tlascalans, who fought him vigorously for a few days, but soon came to terms with the strangers and joined them against the Aztecs, by whom the Tlascalans had been subjugated not long before. From this time until the conquest was achieved, the tribe continued the most important and trusty of all the native allies of the Spaniards. Advancing into the country of the Cholulans, Cortés succeeded, after a little fighting, in persuading the people to accept a reconciliation with their traditional enemies from Tlasecala and to join them in his train for the march on Mexico. Motecuhzoma, or Montezuma, the Aztec chief-tain, pursued an irresolute policy and finally determined not to oppose the Spaniards directly by force of arms, but to await their arrival and learn more of their purposes. On November 8, 1519, Cortés entered the City of Mexico and

established himself in one of its large communal dwellings, which had belonged to the family of Motecuhzoma's predecessors. The Spaniards were allowed to roam through the city at their pleasure, and found much gold and other treasures in the storehouses. Realizing that a party among the native leaders were talking of driving the strangers out of town, Cortés induced Motecuhzoma to come to his house, where he was kept as a hostage. Shortly after, in April, 1520, messengers brought word that an expedition sent from Cuba by Velazquez, under the command of Narvaez, had landed at San Juan de Ulloa, with orders to arrest Cortés and send him to Cuba for punishment. Cortés promptly started for the coast with a small force. He found the camp of his enemies unguarded, entered on a dark night, captured Narvaez, and the next day induced nearly all the soldiers to join his own standard. Meanwhile, in Mexico, Alvarado, who had been left in command, had learned that the Aztecs intended to attack him at the close of a great religious ceremony which was then being held. To prevent this, Alvarado suddenly surrounded the leaders, who were all busy with the sacrifices in one of the large courtyards of the town, and killed most of them. Cortés, as soon as all danger from Narvaez was past, hastened back to Mexico. He was allowed to enter the city peaceably, with his followers, but was immediately surrounded and attacked. As there was no possibility of maintaining his position in the city, for lack of food or water, and as all hope of persuading the natives to desist vanished when Motecuhzoma died, an immediate retreat was decided on. Selecting a dark, rainy night—the famous *Noche Triste*, on June 30—the Spaniards and their native allies started out of the city. The Mexicans pressed on behind them. The Spaniards were hurried along the causeways or driven into the water, where they were seized by Mexicans in canoes and dragged off to the city for sacrifice. Some forty Europeans were captured alive, the great object of their enemies. Luckily for their fellows, the prospective sacrifices attracted the larger part of their assailants back into the city. Cortés retreated toward Tlasecala. At Otumba he was confronted by an overwhelming force of his enemies. In despair the harassed Spaniards hurled themselves upon the Aztecs and crushed them. They nevertheless continued their retreat to Tlasecala, where they recuperated during the summer.

The arrival of several vessels with men and war munitions enabled Cortés to reorganize his army, so that he was prepared to take the field again in October. The outlying Aztec strongholds were captured one by one, and the various subject tribes, ever ready to rebel against their native conquerors, gradually recovered confidence in the white men. Carpenters had been set to work at Tlasecala in constructing a fleet of small vessels, which were hauled along a canal dug for the purpose into the Mexican lake, so that it became possible to attack the city by water as well as along the causeways which connected Mexico with the land. By the end of April, 1521, with a force of over nine hundred Spaniards, and eighty-seven horses, Cortés again approached the capital. The city was attacked by columns along each of the three causeways from the shore, while the fleet of brigantines, with

cannon, engaged the vast number of canoes on the lake. For three months the Aztecs defended their homes stubbornly. Street by street was taken by the Spaniards, who were obliged to tear down each house as soon as they had stormed it, to prevent the natives from returning to the attack. At last, on August 13, the chief, Guatemozin, who had been the principal organizer of the defense, was captured while trying to escape in a canoe, and the war ended. Cortés promptly set to work to repair the loss he had caused. The ruins of the city were used to fill in the marshy ground so as to afford a secure foundation for new edifices. Colonists were brought from Spain, and in a very short time the City of Mexico became the principal European city in America. Numerous expeditions were sent off in all directions, to Tampico, across Honduras to the Gulf Coast, and to the Pacific, where Cortés established a shipyard in which were built the vessels he used later in his explorations of the Pacific Coast.

Meanwhile his enemies in Cuba and Spain were planning Cortés's destruction. Officials were sent to Mexico to investigate his acts and supersede him, but he succeeded in persuading them to return without disturbing him. In 1528, however, when Estrada arrived with explicit orders to take over the government, Cortés yielded without opposition and took ship for Spain. There he was welcomed with royal honors, was created Marquis of the Valley of Oaxaca, the fairest domain in the New World, and was reappointed Captain-General, although not restored to the civil governorship of Mexico. He married the daughter of the Count of Aguilar and niece of the Duke of Bejar. In 1530 Cortés returned to Mexico, where he amused himself for the next ten years with schemes for further conquests. But the civil government being in other hands, he found himself constantly checked in his activity, his property detained from him, his rights interfered with, and his prestige rapidly waning. In 1536 he discovered Lower California, and explored the Pacific coasts of Mexico, but no second treasure-trove awaited him. In 1539 Coronado secured the right to seek for the 'Seven Cities' of Marcos de Niza, and in disgust Cortés went back to complain to the Court. He was received with honor, but could secure no substantial assistance toward recovering his rights or his property. Joining an expedition to Algiers, he was shipwrecked, losing a large part of his fortune. He then retired to a small estate near Seville, where he died, December 2, 1547. There is no good biography of Cortés. Prescott's *Conquest of Mexico* is, so far as Cortés is concerned, little more than an admirer's abstract of the conqueror's official dispatches, which may be consulted in Folsom's translation (New York, 1843). The celebrated "Fifth Letter," describing Cortés's adventurous trip across Honduras in the winter of 1524, is in the Hakluyt Society Series for 1868.

CORTÉS, JOSÉ DOMINGO (c.1830-84). A Chilean author, born at Coquimbo. He was successively journalist, member of the Chilean legation in Belgium, and director-general of libraries in Bolivia. He published anthologies, histories, and biographical works, such as *Diccionario biográfico americano* (1876); *Historia de Bolivia*;

Los revolucionarios de la independencia de Chile; and *República de Méjico* (1872).

COR'TEX (Lat., bark). That region of a stem or root which occurs between the central vascular region (*stole*) and the epidermis. In those stems which increase in diameter each year, the cortex becomes very much modified by the development of cork cells, being then usually called 'bark.' See ANATOMY OF PLANTS.

CORTINA, kôr-té'ná, JUAN NEPOMUCENO (1830—). A Mexican soldier and brigand, born in La Higuera, State of Tamaulipas. During the Mexican War he organized a band of cowboy guerrillas, later incorporated in the Mexican army. He fought at Palo Alto, rose to the rank of captain, but at the conclusion of the war was refused a commission in the regular army. Thereupon he turned smuggler. Later he rose to be a general in the liberal-revolutionist forces, but after his defeat by General Hinojosa was forced to escape to the United States. From 1859 to 1863 he held sway on the frontier, devastating the country and making such official appointments as he saw fit. He supported the cause of Maximilian in 1864, in 1867 again joined the Republicans, and in 1869 was appointed, by Juarez, federal chief of Tamaulipas. In 1876 he was arrested by General Canales, but instead of being executed, as General Diaz had directed, was incarcerated without trial in the military prison of Santiago Tlateloleo.

CORTINA'RIOUS. See FUNGI, EDIBLE, and Plate.

CORTLAND. A city and county-seat of Cortland County, N. Y., 37 miles south of Syracuse; on the Tioughnioga River, and on the Lackawanna and the Lehigh Valley railroads (Map: New York, D 3). It is the seat of a State normal school, and, as a manufacturing centre, produces extensively wire, wire-cloth, carriages and wagons, carriage-trimmings, drop-forgings, door and window screens, wall-paper, etc. The government, under a charter of 1900, is vested in a mayor, elected biennially, a municipal council, and administrative boards and officials appointed by the executive, the appointments, except the board of education, being subject to the consent of the council. First settled in 1792, Cortland was included in the township of Homer until set off as Cortlandville in 1829. Population, in 1890, 8590; in 1900, 9014.

CORTONA, kôr-tó'ná. A city in the Province of Arezzo, Central Italy, situated 2170 feet above the sea, 72 miles southeast of Florence and 4 miles north of Lake Trasimeno (ancient Trasimenus) (Map: Italy, F 4). It has well-preserved cyclopean walls, 8500 feet in circumference, the ruins of a temple of Bacchus, a museum of Etruscan antiquities assembled by the Etruscan Academy, founded in 1726; a cathedral containing paintings by Luca Signorelli (q.v.), who was born here in 1441, as was Cortona (q.v.) in 1596. The thirteenth-century church of San Domenico also contains excellent paintings. The ancient Cortona, called Kyrtonia by Polybius, was the strongest of the twelve cities of the Etruscan League. As a Roman colony it lost its importance, but in the eleventh century again prospered. It sided mostly with the Ghibellines, came into the possession of the Casale family in the fourteenth century, in 1409 was given by the last of the house to King

Ladislas of Naples, and by him in 1412 to Florence. Population (commune), in 1881, 26,353; in 1901, 29,343.

CORTONA, PIETRO DA (1596-1669). An Italian painter and architect, born at Cortona. His real name was Berettini. A "Nativity" by him attracted the attention of Pope Urban VIII., who gave him the order to paint the decorations for a chapel at Bibiana. He also painted the decorations in the grand salon of the Barberini Palace. For a long time this was considered the finest work in Italy of the seventeenth century, and although his reputation has suffered since then, his pictures are still admired. There are many of them in the Louvre in Paris. Cortona decorated ceilings in the Pitti Palace and was architect for the façade of Santa Maria in Via Lata, the portico of Santa Maria della Pace, and the Church of San Martino, all in Rome.

CORUÑA, kō-rōn'nyá. A fortified seaport of Spain, capital of the province of the same name, in Galicia, situated on a small headland in the Atlantic, formed by the three bays of Betanzos, Coruña, and El Ferrol; 315 miles northwest of Madrid (Map: Spain, A 1). It is built partly on the slope and partly at the foot of a hill and is divided into the upper and lower towns, the former being the most ancient. The lower town, which was formerly an insignificant fishing village, is now more important, is well built, with streets broad and well paved. The ancient section, which is partly surrounded by the old walls, contains the more prominent edifices, though there are comparatively few public buildings of note in Coruña. The churches of Santiago and Santa María del Campo, of the twelfth century; the barracks, the Capitania-General, and the modern Military Hospital of San Carlos, are worthy of mention. The provincial institute has a considerable library and valuable scientific collections, and the city contains also a meteorological observatory, and various educational institutions, including a marine school. Other features of interest are the grave of Sir John Moore (q.v.), with a monument in the garden of San Carlos, and the so-called Torre de Hercules, of doubtful Phœnician origin, having been built more probably in the time of Trajan, which has served as a lighthouse for more than a century. The harbor, protected by five forts, two of which, San Centón and Santa Cruz, defend the entrance, is safe and commodious. Coruña is the centre of an extensive commerce, the exports comprising live stock, fruits, vegetables, wine, hams, sardines, leather, peat, etc., while the principal imports are sugar, hides, coal, oil, and manufactured articles. There is also an important coastwise trade. The city has a variety of manufactures, including cigars, linen goods, canvas, eordage, lumber, barrels, paper, etc., and many of the inhabitants are employed in the fisheries. Population, in 1897, 40,500; in 1900, 44,057.

Probably from early times a fishing village, Coruña may have been colonized by the Phœnicians. Its chronicled history dates from the Roman occupation. In the Middle Ages it was called Caronium. It was part of the emirate of Cordova for some time, and suffered severely, with the rest of Galicia, in the reconquest. The Portuguese captured the town in 1370. Here John of Gaunt landed in 1386, to urge the claims of his wife to the Castilian crown, and in 1554

Philip II. sailed from the port to marry Queen Mary of England. Coruña was the point of departure of the "Invincible Armada" in 1588, and in the following year it was taken by Drake and Norris, and nearly destroyed. The harbor was the scene of English naval victories in 1747 and 1805. Coruña is famous for the repulse, on January 16, 1809, of the French under Marshal Soult, by Sir John Moore, who succeeded, with an inferior force, in withstanding the French attempt to stop the English embarkation, but lost his life in the battle. The engagement took place on the heights of Elviña. In 1823 the city fell into the hands of the French. It was visited by an epidemic of cholera in 1851.

CORUNDUM (Neo-Lat., from Hind. *Kurand*, corundum), or ADAMANTINE SPAR. An anhydrous aluminum peroxide that crystallizes in the hexagonal system. Owing to their extreme hardness (in which corundum ranks next to the diamond) and their high specific gravity (from 3.95 to 4.10), the colored varieties are much sought after as gems. According to their colors, they are called sapphire, which is blue; Oriental ruby, which is red; Oriental topaz, which is yellow; Oriental emerald, which is green; and Oriental amethyst, which is purple. In addition to these, there is the *asteriated* or *star* sapphire, which exhibits an opalescent star of six rays. The dark-colored varieties are called *corundum*, and granular corundum is known as *emery*. The colored varieties of corundum are found chiefly in Burma, China, Ceylon, and the United States. In this country it is found in the crystalline rocks along the Appalachian Mountains, at Chester, Mass., in northern Georgia, and in Montana, where sapphires of gem grade have been found. Emery (q.v.), which is used as an abrasive material, is found in Asia Minor, at Chester, Mass., and in Canada.

CORUN'NA. A city and the county-seat of Shiawassee County, Mich., 30 miles northeast of Lansing; on the Shiawassee River, and on the Ann Arbor and the Detroit, Grand Haven and Milwaukee railroads (Map: Michigan, J 6). It has a considerable trade in coal, and manufactures, flour, furniture, shoes, lumber, etc. Population, in 1890, 1382; in 1900, 1510.

CORVAL'IS. A city and the county-seat of Benton County, Ore., 96 miles south by west of Portland; on the Willamette River, and on the Southern Pacific and the Corvallis and Eastern railroads (Map: Oregon, B 5). River steamboat lines add to the transportation facilities, and the city carries on a considerable trade in grain, lumber, flour, live stock, and wool. The manufactures include lumber, sash, doors, furniture, flour, foundry products, organs, carriages, etc. Corvallis is the seat of the State Agricultural College, and contains a fine court-house, public-school building, and city hall. Population, in 1890, 1527; in 1900, 1819.

CORVÉE, kōr'vá' (Fr., from ML. *corvata*, demanded, from Lat. *corrogata*, demanded, sc. *opera*, work, from *com-*, with + *rogare*, to demand). An obligation imposed under the feudal law, whereby the inhabitants of a district performed certain services, such as repairs of the highway and bridges, for the sovereign or the feudal lord. The system was enforced by the Dual Control in Egypt, where, in 1882, 234,000 *fellaheen* were called out

for 100 days to clean the irrigating canals; but the obligation was gradually abolished until, in 1887, through the efforts of the British, the corvée was wholly done away with, and the labor performed by contract.

CORVEL, kôr'vî (ML. *Corbeia Nova*, New Corbeia, as it was first occupied by monks from Corbie). A Benedictine abbey of Germany, on the Weser, near Hörter, the oldest and most famous abbey in Saxony. It was founded by Louis the Pious in the beginning of the ninth century, being a colony from the monastery of the same name in Picardy. It received rich endowments and was the centre of great agricultural improvement and prosperity during the earlier part of the Middle Ages, besides being the seat of a famous school. In 1793 it was made a bishopric by Pius VI. Its territory then embraced about 22 square miles, with 10,000 inhabitants. In 1802 it was secularized and annexed to Nassau, from which it was transferred, in 1807, to Westphalia, and in 1815 to Prussia. The church of the abbey is built in Gothic style, magnificently adorned in the interior, and contains a multitude of monuments of successive dynasties. The library and archives of the cloister, which contained most valuable records of the early ages of German history, have all been destroyed, the *Chronicon Corbeicense*, an alleged record of this abbey from its foundation to the end of the twelfth century, being a forgery. Certain brief *Innales Corbeenses* from 648 to 1148 are, however, printed in the *Monumenta Germaniæ Historica*. Consult Wigand, *Geschichte der Abtei Korvey* (Hörter, 1819).

CORVETTE, kôr-vêt' (Fr., from Sp. *corveta*, *corbeta*, It. *corvetta*, corvette, from Lat. *corbita*, slow ship of burden, from *corbis*, basket). In the days of sailing men-of-war, a corvette was a ship-rigged vessel (i.e. having three masts, all square rigged), carrying all her broadside guns on one covered deck. The upper deck, above the guns, was *flush* (i.e. was continuous from stem to stern, without poop or topgallant fore-castle). Corvettes occasionally had a bow or stern chaser on the upper deck.

CORVIDÆ (Neo-Lat. nom. pl., from *corvus*, crow). A family of passerine birds which includes the ravens, crows, magpies, jays, etc. See these words, and Plate of JAYS, MAGPIES, ETC.

CORVIN-WIERSBITZKI, kôr'vên-vêrs-bit'skê, OTTO VON (1812-86). A German author, born at Gumbinnen. He took part in the revolutionary uprising in Baden in 1848 and 1849, and became chief of the General Staff of the Republican forces at Rastatt. He was condemned to death, but the sentence was commuted to six years' solitary confinement. In 1855 he went to London, whence in 1861 he proceeded to the United States to act as the war correspondent of the Augsburg *Allgemeine Zeitung*. During the Franco-German War he was the correspondent of the Vienna *Neue Freie Presse*, and his experiences are admirably described in his well-known book, *In France with the Germans* (1872). In his earlier years Corvin devised 'Corviniello,' a species of metal-work inlaid with mother-of-pearl, stones, or other materials. His numerous historical and other writings include: *Historische Denkmale des christlichen Fanatismus* (1845), the second edition of which appeared under the title *Pfaffenspiegel*

(1869), and was further supplemented by *Die Geissler* (3d ed., 1892-93). Consult his *Erinnerungen aus meinem Leben* (4th ed., Rudolstadt, 1890-92).

CORVINO, kôr-vê'nô. A miserly fortune-hunter, the husband of Celia, in Jonson's *Volpone*. He is condemned, in the last act, to be rowed—

"Round about Venice, through the Grand Canal
Wearing a cap with fair long asses' ears."

CORVINUS, MATTHIAS. See MATTHIAS CORVINUS.

CORVO (Sp., crow). The most northerly of the Azores (q.v.). (Map: Portugal, A 4.)

CORVUS, MARCUS VALERIUS. A general of the early Roman Republic. He was born about B.C. 370. He was twice dictator and six times consul, and occupied the curule chair twenty-one times. He defeated the Gauls, the Volsci, the Samnites, the Etruscans, and the Marsi. He lived to be one hundred years old.

CORWIN, EDWARD TAXJORE (1834—). An American writer, and historian of the Reformed Dutch Church. He was born in New York City, July 12, 1834; graduated at the present College of the City of New York in 1853, and at the Theological Seminary in New Brunswick, N. J., in 1856. He has held various pastorates, but his reputation rests upon his literary work, which has made him the recognized historian of his denomination. He has published in book form: *Manual and Record of the Church of Paramus, N. J.* (New York, 1858; 2d ed. 1859); *Manual of the Reformed Protestant Dutch Church in North America* (1859; 4th ed. 1902); *Millstone Centennial* (1866); *Corvin Genealogy* (1872); *A History of the Reformed Church, Dutch* (1895). He has for many years been engaged upon a translation and elaborate annotation of the so-called Amsterdam Correspondence, or the letters which passed between the Classis of Amsterdam and the churches in the New Netherlands and Province of New York, and so are an important historical source. He discovered much of this correspondence himself. Its publication by the State of New York was authorized in 1900.

CORWIN, THOMAS (1794-1865). An American lawyer and statesman, born in Bourbon County, Kentucky. He studied and practiced law in Ohio, where his eloquence soon won him prominence. He was a member of the State Legislature from 1822 to 1829, and of Congress from 1830 to 1840, when he was chosen Governor of Ohio. From 1844 to 1850 he was a member of the United States Senate, and in the latter year became Secretary of the Treasury in President Fillmore's Cabinet. He was again in Congress (1858-60) and was Minister to Mexico from 1861 to 1864. As an orator he won his greatest distinction, his speeches both on the stump and in debate being examples of remarkable eloquence. His arraignment of the administration for the war with Mexico was a notable effort, which made him many enemies and damaged his political career. Consult: Strohn (editor), *Life and Speeches of Thomas Corwin* (Dayton, 1859); and Russell, *Thomas Corwin* (Cincinnati, 1882).

CORRY, CHARLES BARNEY (1857—) An American ornithologist, professor and honorary

curator in the ornithological department of the Field Columbian Museum in Chicago. His publications include *Birds of the Bahama Islands*, *Birds of Haiti and San Domingo*, *Catalogue of West Indian Birds* and *The Birds of the West Indies*.

CORY, WILLIAM JOHNSON (1823-92). An English poet, son of Charles Johnson, of Torrington, Devonshire; his mother was a grandniece of Sir Joshua Reynolds. He was educated at Eton, and at King's College, Cambridge; was graduated B.A. in 1845, and in the same year became fellow of his college. He was at once appointed assistant master of Eton, where he won great distinction as a tutor. In 1872 he retired from Eton and changed his name to Cory. His subsequent home was Hampstead, where he died, June 11, 1892. Cory is mainly known for a volume of verse entitled *Ionia* (1858), containing "Minnermus in Church" and other poems of great tenderness and beauty. The volume was reissued, with additions, in 1891. He is also author of an agreeable *Guide to Modern English History* (1880-82), and of several graceful Latin lyrics in *Lucretilis*, a treatise on writing Latin verse (1871). After his death appeared his *Letters and Journals* (Oxford, 1897).

CORYAT, kôr'yat, or **CORYATE**, THOMAS (1577-1617). An English traveler and author, born at Odcombe and educated at Oxford. He made an extensive tour of Europe, traveling mostly on foot, and published his experiences in a volume entitled *Coryat's Crudities* (1611). It was the first manual of Continental travel, and was illustrated with engravings. Coryat made other voyages through Greece, Asia Minor, North Africa, and India, where he died.

CORYBANTES, kôr'i-bân'têz (Gk. *Κορυβάντες*, *Korybantes*). Mythical beings, attendant upon the Phrygian Cybele, as the Curetes belong to the Cretan cult of Zeus and Rhea. Unlike the Curetes, with whom they were sometimes confused, the Corybantes were not believed to dance in armor, but rather to perform wild and orgiastic dances which frequently ended in ecstasy. The name does not properly denote priests or human beings at all; but, as the priests of Cybele imitated these dances, like modern Dervishes, the name is sometimes extended to them.

CORYCIA, kô-rîsh'i-â (Lat., from Gk. *Κορυκία*, *Korykia*). The mother of Lycoris, by Apollo. She was a nymph, whose name is preserved in the Corycian Cave on Mount Parnassus, and in the appellation Coryceides applied to the nymphs of the cave and to the muses.

CORYD'ALIS. See FUMARIACEÆ.

CORYDALIS (Neo-Lat., from Gk. *κορυδαλλίς*, *korydallis*, *κορυδάς*, *korydos*, crested lark, from *κόρυς*, *korys*, helmet) or DOBSON. A genus of large, net-veined insects (true Neuroptera), representing the family Sialidæ, and peculiar to America, where its larva, used for bait under the names 'crawler,' 'dobson,' 'hell devil,' and many others, is the largest of our aquatic insects. The single species (*Corydalis cornuta*), often called 'hellgrammite,' is brownish-green in color, about two inches in length, and expands its four nearly equal wings fully six inches. "In the female the jaws are very large, flat, and toothed at the extremity, but in the male they are remarkably long and slender, not toothed, and the sharp tips

crossing each other: their only use is evidently for seizing the soft, somewhat yielding body of the female during the act of pairing; hence, during its short life the male, at least, takes no food." The female lays her eggs in midsummer, in white, chalky masses almost an inch wide, on tree-leaves, rocks, timbers, etc., overhanging water, into which the young drop as soon as hatched. These sink to the bottom and grow rapidly into large, slate-gray, tough, predatory larvæ, which hide under stones, etc., in the rapid streams where they most abound, clinging firmly to some support with their anal hooks, while they seize in their jaws such living creatures as come within their reach. They remain in the water two years and eleven months, then creep out upon land, where they wander about at night for a few days, then pupate in some retreat and speedily emerge as adults. The larvæ (dobsons) are regarded as the most satisfactory bait known for still-fishing, and are captured with nets, after overturning stones, etc., and frightening them out into the open water. For the many interesting peculiarities of the structure and economy of this and other species of the Sialidæ (called 'adder-flies' in England), consult: Howard, *The Insect Book* (New York, 1901); Packard, *Standard Natural History*, vol. ii. (Boston, 1884); Miall, *The Natural History of Aquatic Insects* (London, 1895).

COR'YDON. A town and the county-seat of Harrison County, Ind., 108 miles south of Indianapolis, on Indian Creek and on the Louisville, New Albany and Corydon Railroad (Map: Indiana, C 4). It is known as a summer resort, one of its attractions being a sulphur spring. Corydon was the capital of the Territory of Indiana from 1813 to 1816, and of the State of Indiana from 1816 to 1825, when the seat of government was removed to Indianapolis. The Constitutional Convention of 1816 met here. In 1863 the town was the scene of a sharp skirmish between a small force of State militia and a superior force of Confederate raiders under John Morgan. Population, in 1890, 880; in 1900, 1610.

CORYDON. A town and the county-seat of Wayne County, Iowa, 85 miles south by east of Des Moines, on the Keokuk and Western Railroad. The electric-light plant is under municipal control. Population, in 1890, 962; in 1900, 1477.

CORYDON. (1) A shepherd in the Seventh Eclogue of Vergil, and in the *Idyls* of Theocritus, and hence a name conventionally used in literature to designate a country swain, as in Spenser's *Facrie Queene* and *Colin Clout*. (2) A shoemaker in Scott's *Count Robert of Paris*. (3) A musical countryman in Walton's *Complete Angler*, who fraternizes with Piscator.

COR'YLUS. See HAZELNUT.

COR'YMB (from Lat. *corymbus*, from Gk. *κόρυμβος*, *korymbos*, cluster, from *κόρυς*, *korys*, helmet). A flat-topped flower-cluster, in which the pedicels arise at different levels upon an elongated axis, and the outermost flowers bloom first. See INFLORESCENCE.

CORYMBUS (Lat., cluster). That mode of dressing the hair which prevailed among the Greek women and which may be seen in examples of the antique, particularly in the statues representing Venus. This arrangement of the hair was also adopted by the Romans. It con-

sisted in gathering it upward upon the crown and back of the head in one knot. It may be seen in its simplest form in the statue of the Venus de' Medici, in the Uffizi Gallery, Florence.

COR'YPHA. See FAN PALM; GEBANG PALM; TALIPOT PALM.

COR'YPHENE (Lat. *coryphæna*, from Gk. *κορύφαινα*, *koryphaina*, a sort of fish, from *κορυφή*, *koryphē*, summit, but explained by popular etymology as *κόρυς*, *korys*, helmet + *φαίνω*, *phainō*, to appear), or DOLPHIN. One of a genus of fishes (*Coryphæna*) of the family Coryphænidae, to which the name 'dolphin,' properly belonging to the Cetacea, has been popularly transferred. The coryphenes are allied to the opahs, and are remarkable for the beauty and metallic brilliancy of their colors, which delight the spectator as the graceful fish are seen gliding with extreme rapidity near the surface of the water, gleaming in the light; and the changes the colors undergo while the fish is dying have acquired a poetic celebrity. They have an elongated compressed body covered with small scales, the head rising in a sharp crest, the mouth large. They are large fishes, attaining a length of six feet, and are inhabitants of the high seas of warm climates, where they chase the flying-fishes and other surface prey with great speed and voracity. The many described forms are probably all reducible to two or three species. The common, almost cosmopolitan coryphene (*Coryphæna hippurus*) occurs on the coast of the United States as far north as Cape Cod. "They are often caught by sailors at sea, and are considered most excellent food. It is an almost universal custom before eating them to test the flesh by putting a piece of silver into the vessel in which they have been cooked, it being a common belief that if the flesh is poisonous the silver will turn dark" (Goode). See PLATE of HORSE-MACKERELS, ETC.

CORYPH'ODON (Neo-Lat., from Gk. *κορυφή*, *koryphē*, summit + *ὀδούς*, *odous*, tooth). A fossil amblypod mammal of the Lower Eocene beds (Wasatch) of western America, related to *Tinoceras* and the *Uintatheria*. A complete skeleton of *Coryphodon* radians has been found, and is mounted in the American Museum of Natural History in New York City. It shows an animal between five and six feet in length, a size rather large for the Lower Eocene mammals, with large skull, formidable teeth, short neck, rather long body, and short, strong, hinged legs with spreading toes. The brain-cavity is remarkably small. The skeleton indicates a heavy, clumsy animal that lived in the bordering marshes of the Wasatch lakes, feeding on succulent water plants which it uprooted with its spreading front teeth. *Coryphodon* remains have also been found in the Eocene beds of Europe. Consult Osborn, "A Complete Skeleton of *Coryphodon* *Radians*," *Bulletin of the American Museum of Natural History*, vol. x. (New York, 1898). See TERTIARY SYSTEM; TINOCERAS; UINTATHERIUM.

CORY'ZA. See OZENA.

COS (Gk. *Κῶς*, *Kōs*, It. *Stanchio*, Turk. *Istan-köi*). One of the Dorian Sporades, off the southwest coast of Asia Minor, now belonging to Turkey. Cos is about 23 miles long. On the southern side of the island, a range of hills extends along the coast; the western half of the island is also mountainous, but the eastern portion north of the jagged ridge of Mount Prion is

a fertile plain, producing the grapes which furnish the chief modern exports. In ancient times the island was famous for its perfumes, wines, and silk (probably produced from an inferior variety of worm), from which were woven the transparent Coan garments worn by the courtesans of Greece and Rome. There are many mineral springs on the island, which early became an important seat of the worship of Asclepius, the god of healing. Cos was the birthplace of the great physician Hippocrates (q.v.). The chief town, Cos, is situated on the northeast coast, on the site of the ancient city. In the centre of the main street is a gigantic palm-tree, said to have stood there before the Christian Era. To the northwest is an old fortress of the Knights of Saint John. The harbor is small, and so filled with mud as to be available only for small boats. The inhabitants are employed chiefly in agriculture. Cos is mentioned in the *Iliad* among the allies of the Greeks, and the island seems to have been early colonized, perhaps from Thessaly. Later it was the seat of a Dorian colony, apparently from Epidaurus, and became one of the cities of the Dorian Hexapolis. It was a member of the Athenian League, and in the fourth century B.C. enjoyed a prosperity which seems to have increased under Alexander and his successors. It was the birthplace of Ptolemy II. Philadelphus, and the home of Philetas, the bucolic poet, who founded on the island a school of which Theocritus (q.v.) was the most distinguished member. Cos was favored by the Romans, and seems to have been little disturbed till the Latin conquest of Constantinople (A.D. 1204). From that time till its capture by the Turks in 1523, Cos shared the vicissitudes of Rhodes and the neighboring islands. Consult: Rayet, *Mémoire sur l'île de Cos* (1876); Paton and Hicks, *Inscriptions of Cos* (Oxford, 1891), the introduction containing a brief history of the island; Herzog, *Koische Forschungen* (Leipzig, 1899).

CO'SA, JUAN DE LA. See LA COSA, JUAN DE.

COSCIN'OMANCY (from Gk. *κοσκινον*, *koskinon*, sieve + *μαντεία*, *mantēia*, divination). A species of divination, practiced from the earliest times by means of a sieve and a pair of shears or forceps. Tylor (*Primitive Culture*, I. 116) says: "The sieve was held hanging by a thread or by the points of a pair of shears stuck into its rim, and it would turn or swing or fall at the mention of a thief's name and give similar signs for other purposes." The ordeal of the Bible and key is a survival of the old custom. The fiftieth Psalm is read, and when the verse beginning "When thou sawest a thief" is reached, the apparatus is expected to turn toward the culprit. See SUPERSTITION.

COSE/CANT. See TRIGONOMETRY.

COSEGÜINA, *kō'sh-gwē'ná*, or **COSIGÜINA**, *kō'sh-gwē'ná*. A volcano in the extreme western corner of Nicaragua, Central America (Map: Central America, D 4). It is situated on a small peninsula which partly separates the Gulf of Fonseca from the Pacific; it has an altitude of over 3000 feet. During its latest eruption, on January 20, 1835, a shower of ashes fell for three days, and the explosion was heard as far as Mexico.

CO'SEL or **KOSEL**. The capital of a district of Silesia, Prussia, on the river Oder, at the confluence of the Klodnitz, 25 miles southeast of Oppeln. It is a garrison town, has a castle, and was formerly surrounded by walls, the site of which has been converted into boulevards. A fine pyramidal monument commemorates the unsuccessful siege by the French in 1807. The town has considerable trade and numerous domestic industries. It was the capital of a duchy in the fourteenth century. Population, in 1900, 7087.

COSELEY, kōz'li. A manufacturing town in Staffordshire, England, a suburb of Wolverhampton, with which its industries and public works are identified. Population, in 1891, 21,900; in 1901, 22,200.

COSENZ, kō'sānz, ENRICO (1820-98). An Italian soldier, born at Gaeta. He entered the military service of Naples in 1840, participated in the campaign in Upper Italy (1848), and afterwards was prominent in the defense of Venice against the Austrians. In 1859 he became a colonel in the 'Hunters of the Alps,' Garibaldi's corps, and in 1860 took part in the expedition to Sicily. Upon Garibaldi's assumption of the Dictatorship of Naples, he was appointed Minister of War. He commanded a division in the attack on Rome in 1870, and from 1881 until his retirement in 1893 was chief of the General Staff of the Italian Army. He also held civil office as a Deputy from 1860, and Senator from 1872.

COSENZA, kō-sān'zā (Lat. *Cosentia*). The capital of the Province of Cosenza (Calabria Citeriore), in South Italy, situated 120 miles southwest of Taranto (Map: Italy, L 8). It is commanded by a castle, whose walls, nine feet thick, were shattered in the earthquakes of 1783, 1854, and 1870. The older and lower part of the town is very malarious in summer. The cathedral, now being restored according to the discovered ancient plans, contains the tomb of Louis III. of Anjou, who died here in 1435. In the attractive public gardens, near the prefecture and the new theatre, are a figure of Liberty by Giuseppe Paechioni, erected in 1879 to the brothers Bandiera and others who took part in the Calabrian rebellion of 1844, and busts of Garibaldi, Cavour, and Mazzini. There are a seminary, a royal college, a technical school, two academies of science and fine arts, and a chamber of commerce. Cosenza markets silk, oil, wine, manna, hemp, grain, and honey, and manufactures faïence and hardware. Alaric, King of the Visigoths, died here in 410 while on his way to Sicily after the spoliation of Rome. Tradition has it that he and his treasures were buried just below the town in the Busento (ancient Buxentius) where the Crati joins it—a spot now marked by the Ponte Alerico. Population (commune) in 1881, 16,253; in 1901, 21,545.

COSETTE, kōz'ēt'. The adopted daughter of Jean Valjean in Hugo's *Les Misérables*. She is the child of Fantine, and gives her name to the second part of the novel.

COSHOCTON, kō-shōk'ton. A city and the county-seat of Coshocton County, Ohio, 69 miles east by north of Columbus, on the Muskingum River, and on the Pittsburg, Cincinnati, Chicago and Saint Louis, and the Wheeling and Lake Erie railroads (Map: Ohio, G 5). It contains a public library. The city has several novelty-

advertising establishments, machine-shops, wooden novelty works, glass-factory, and other industrial plants. Coshocton was settled in 1811 and incorporated in 1833. The government is administered under a charter of 1901, which provides for a mayor, biennially elected, and a city council. The water-works are owned and operated by the municipality. Population, in 1890, 3672; in 1900, 6473.

COSIMO, kō-zé'mō, PIERO DI. See PIERO DI COSIMO.

COSIMO DE' MEDICI, dā mā'dé-chē. See MEDICI.

COSIN, kūz'n, JOHN (1594-1672). An English prelate. He was born at Norwich and was educated at Cambridge. After holding rectorates at Elwick, Brancepeth, and elsewhere, he assumed charge of Saint Peter's College, Cambridge, in 1635. Three years afterwards he was made vice-chancellor of the university, and in 1640 was appointed Dean of Peterborough. He was chaplain to Charles I. and subsequently joined the royal family in Paris, where for nearly twenty years he conducted religious services in the household of Queen Henrietta. In 1660 he was appointed Bishop of Durham. Although by no means inclined toward Puritanism, he was an inveterate antagonist of Romanism, and during his long residence in France was regarded as the champion of the Protestant cause in that country. Many of the finest prayers in the English Church were written by him, while his other numerous writings are imbued with the force and brilliancy of his interesting personality. He was celebrated for the remarkable frankness with which he defended his views, even under the most unfavorable conditions, and by his splendid administrative ability in the Church. His works include: *Collection of Private Devotions*, prepared at the request of King Charles I. and first published in 1627; *Scholastic History of the Canon of Holy Scripture* (1657); *History of Popish Transubstantiation* (1675); and *Note on the Work of Common Prayers* (1710).

CO'SINE. See TRIGONOMETRY.

COS'MAS (Lat., from Gk. *Kosmās*, *Kosmas*), surnamed INDICOPLEUSTES (i.e. Indian navigator). A merchant of Alexandria, in which city he was probably born, who, after having traveled much in Eastern Asia, including India and Ceylon, returned to Egypt and ended his days in monastic retirement about the middle of the sixth century. While a monk he wrote a *Christian Topography* in 12 volumes, in the Greek language, containing much information about many countries, and particularly about India. An attempt to reconcile everything to his notions of the meaning of the Bible led him into many errors; but though deficient, and even absurd scientifically, as a record of travel and geographical information, the eleventh book, which gives a description of the animals of India and of the Island of Ceylon, takes high rank. His other works have perished. The work (which, among other things, gives the first account of the *Monumentum Adulitanum*—see ADULE) was edited by Montfaucon in the *Nova Collectio Patrum Græcorum*, vol. ii. (Paris, 1707), reprinted by Migne, *Patrol. Græca*, lxxxviii., and translated by Charton in his *Voyageurs* (Paris, 1854).

COSMAS (Lat., from Gk. Κοσμάς, *Kosmas*) and **DA'MIA'NUS** (Lat., from Gk. Δαμιανός). Two Arabian brothers of the third century, Christian martyrs under Diocletian. They practiced physic without fee at Ægea in Cilicia, and, having refused to sacrifice on pagan altars, were beheaded in 303. Their day in the calendar of the Roman Church is September 27. They are honored as the patron saints of physicians and apothecaries. A short-lived order of knights spiritual, named after them, was instituted during the Crusades.

COSMAS OF PRAGUE (c. 1039-1125). A Czech historian, dean of the cathedral at Prague. His works, particularly his *Chronica Boëmorum*, printed in the second volume of the *Fontes Rerum Bohemicarum* (Prague, 1874), constitute a very complete and accurate record of the history of the times.

COSMATI, kôs-mä'té. A family of Roman mediæval artists, named popularly the *Cosmati*, from Cosmas, a prominent member. It was founded about A.D. 1140, by Laurentius, continued by his son Jacobus, his grandson, Cosmas, and a considerable number of other descendants until about 1330, when it dispersed with the departure of the popes for Avignon and the fall of Rome as an artistic centre. The speciality of this school was the use of rich mosaic inlay in geometric patterns in architecture and church interiors and furniture; a style often called *Cosmati work*. But it was not confined to this family, being a style common to all the other family groups of artists of mediæval Rome and its neighborhood, such as the families of Paulus and Vassallectus. The beautiful cloisters of Saint John Lateran and Saint Paul's in Rome are the most familiar of their large works. The choir-seats at San Lorenzo, the tabernacles at Santa Cecilia and Saint Paul's, the pulpits at the Araceli, the tombs at the Minerva and Santa Maria Maggiore, the paschal candlestick at Santa Cecilia, the pavements of these and many other Roman churches, show the versatility and universal use of this style. But most of the finest works are scattered throughout the province, at Civita Castellana, Corneto, Alatri, Anagni, Alba, Ferentino, Terracina, and other cities. The architectural as well as the decorative work was executed by these artists. That the style was Roman is shown by the inscription of 1229 in the charming cloister of Sassovivo in Umbria, where the artist calls it *Roman work*. However, there were two other contemporary Italian schools which produced similar work: that of Campania, with centres at Salerno, Sessa, and Gaeta; and that of Sicily, in the churches of Palermo, Monreale, Cefalù, and others.

Consult: Boito, *Architettura Cosmatesca* (Milan); Frothingham, "Notes on Roman Artists of the Middle Ages" (in early volumes of *American Journal of Archaeology*). G. Clausse has recently published a very full account of this Roman school; see his "Les Cosmati," in *Revue de l'art chrétien*, vol. xlvi. (1897); *Les marbriers romains* (Paris, 1897).

COSMETICS (Gk. κομητικός, *kosmētikos*, skilled in adorning, from κόσμος, *kosmos*, order, world, universe). Preparations used on the skin or hair to beautify or improve their appearance. They include face-powders, such as *bloom*

of almonds and bloom of roses, which impart a red color to the skin; *carmine*, which is used as a rouge for the complexion; *pearl white*, which is a preparation of bismuth, and poisonous; and perfumed starch or chalk. The *kohl* of the Egyptians is supposed to have been a preparation of *stibnite* or antimony sulphide; it is still used by Oriental ladies for painting the eyebrows. Hair-dyes, which are in many cases preparations of lead and perfumes, may also be classed as cosmetics. The great objection to cosmetics, and especially to face-powders, is their tendency to fill up and clog the pores of the skin, and thus prevent free passage of gases and vapors, which is so essential to the preservation of any animal organ in a thorough state of health. See also **PERFUMERY**.

COSMIC DUST (Fr. *cosmique*, Lat. *cosmicus*, Gk. κοσμικός, *kosmikos*, cosmic, from κόσμος, *kosmos*, order, world, universe). Finely divided matter that falls to the earth from extra-terrestrial regions. It is probably similar in nature to meteorites, although much of the dust that reaches the earth's surface from the outer portions of the atmosphere is volcanic. Minute spherules of metallic iron and particles of minerals have been found in the deposits covering the floor of the deep sea, which are ascribed to cosmic origin. Such particles fall all over the earth, but it is only in the deeper ocean basins, remote from land, that they can accumulate in sufficient quantity to be detected.

COSMOG'ONY (Gk. κοσμογονία, *kosmogonia*, from κόσμος, *kosmos*, order, world, universe + γονη, *gonē*, birth, origin). A name used by astronomers to designate theories concerning the origin and development of the solar system, stellar systems, or the universe in general. Many remarkable facts connected with our solar system tend to show that its present condition cannot be the result of a purely accidental action of natural forces. Thus, the orbits of all the important planets are very nearly circular, and are situated nearly in the same plane; the directions of the planets' motions in their orbits are the same for all; all the planets, with the probable exception of Uranus and Neptune, rotate in the same direction on their own axes, and that direction is the same as the direction of their orbital revolutions, etc. Even the planetary satellites share in these peculiarities of the solar system; the planes of their orbital revolutions about the primary planets are always very near the corresponding planes of the planets' own axial rotations, and the directions of the satellites' revolutions also coincide with the directions of the planets' axial rotations.

THE NEBULAR HYPOTHESIS. Kant and Laplace have given us the well-known 'Nebular Hypothesis,' later developed by Sir W. Herschel, to account for the state of affairs existing in the solar system. According to this hypothesis, the material composing the system was originally a mass of intensely hot nebulous or gaseous matter that tended to assume a rotating globular form under the action of gravitational forces. Gradually the mass contracted, and successive rotating rings of matter were from time to time, as it were, left behind. These rings, in turn, broke up, and the matter of each formed a planetary system in which again rings and satellites could form just as in the parent nebular mass.

DARWIN'S HYPOTHESIS. In recent years several new and interesting cosmogonic theories have been elaborated. In 1855 George Howard Darwin showed mathematically that the present condition of our earth and moon (the revolution of the moon and its axial rotation being synchronous) might have been brought about by the action of the tidal friction working continuously through successive ages of cosmic time. Indeed, it is quite reasonable to suppose that, when earth and moon were nearer together, and as yet in a more or less plastic condition, very gigantic tides must have been set up—tides involving the earth's semi-solid matter, as well as the oceans of water and air. Darwin's researches have brought out the fact that such tides must produce important modifications in any system of celestial bodies, and he has been able to explain the origin of many puzzling phenomena in the case of the moon by making use of his fundamental idea of cosmic tidal friction.

THE METEORITIC HYPOTHESIS. Sir Norman Lockyer has recently advocated a cosmogonic theory altogether different from the nebular hypothesis. This is the so-called Meteoritic Hypothesis. It assumes that the stars have been made up by the combining together of masses of meteors (q.v.), space being supposed to contain numberless swarms of those little bodies.

It is not impossible that both the meteoritic and the nebular hypothesis may have had a share in the development of planetary systems. For the meteoritic building up of a nebulous mass may have antedated the contraction of that mass and its transformation into rings and planets in the manner suggested by Laplace. See **NEBULE; SOLAR SYSTEM; SUN;** etc.

ANCIENT COSMOGENIES. Scarcely any people, either ancient or modern, has been without some theory concerning the creation of the world. Passing over the views of such primitive tribes as the Anstralians or American Indians, the cosmogonies of chief interest in connection with our own views are those of Babylonia, India, Iran, Greece, and ancient Germany. The Babylonian system resembles in many respects the cosmogony of the Bible. There was darkness and water, with strange monsters. Into this chaos the god Bel entered, and clove the cosmic sea, and parted the darkness. Animals took the place of the former monsters, and man himself was created, as well as the sun and moon and five planets. In India the story of the creation was more philosophical. In some of the latest hymns of the Rigveda (q.v.), water was the source of all, whence came fire and wind—the breath of divinity. Or, again, the world arose from the sacrifice of Man (Skt. *purusha*), whose head became the sky, his feet the earth, his eye the sun, his breath the wind, while from his mouth, arms, thighs, and feet the four castes sprang. These ideas, developed more fully in the pseudoepical Sanskrit *Purānas* (q.v.), exhibit clearly the pantheistic trend of Hindu thought. The rôle of Kāma or Love in Indian cosmogony bears some resemblance to that of the Greek Eros. Iranian cosmology, as we find it in the *Avesta* and the writings in Pahlavi (q.v.), corresponds to the dualistic character of the Zoroastrian religion. Ormazd, the god of everlasting light, created the good in opposition to Ahriman, the devil, who dwells in eternal darkness. In the course of a

period of three thousand years Ormazd created the heaven, water, earth, plants, animals, and man. In the following three thousand years Ahriman produced evils to combat these creations of Ormazd; but, despite some temporary success, he was finally forced to yield to the powers of good.

Greek cosmogony is more varied. The Homeric poems regard Ocean as the source of the world, while the Hesiodic account ascribes the first beginnings to Chaos. Thales followed the first theory, and Anaximander the second, which has its parallel also in India. Anaximenes considered air to be the source of all, while Heraclitus postulated fire as the primal element, and supposed a constant flux of all things, where only the divine law (Zeus) was immutable. The notion of Eros or Love as a cosmic force was introduced into Greek philosophy by Parmenides and Empedocles, for which Anaxagoras substituted Mind (Gk. *νοῦς*). Of special interest in this connection is the atomic theory of Democritus, according to whose view the world is permeated by a soul which is composed of atoms in continual motion, and which partake of the nature of fire. Later Greek philosophy did hardly anything toward the development of cosmogonic ideas.

For Germanic beliefs on this subject, the most comprehensive source is the *Völuspá*, an Icelandic poem of the twelfth century of our era. Here, however, the Teutonic ideas are strongly influenced by Christianity, and contain, according to the opinion of some scholars, an admixture of Gnostic concepts.

BIBLIOGRAPHY. The cosmogonic ideas of the Egyptians may be found in the studies of Naville. The cosmological views of the American Indian and Eskimo tribes, of the African races, and of the peoples of Farther Asia and the islands of the Eastern seas, may be gathered from the writings of Brinton, Boas, Gill, George Grey, Tylor, and others. The Hindu theories of creation will be found in Hopkins, *Religions of India* (Boston, 1895), and the Persian speculations in Jackson, "Iranische Religion," in Geiger und Kuhn, *Grundriss der iranischen Philologie* (Strassburg, 1900). Consult also: Lukas, *Grundbegriffe in der Kosmogonie der alten Völker* (Leipzig, 1893); Jensen, *Kosmologie der Babylonier* (Strassburg, 1890); Meyer, *Eddische Kosmogonie* (Freiburg, 1891); Faye, *Sur l'origine du monde . . . théories cosmogoniques des anciens et des modernes* (2d ed., Paris, 1885).

COSMOPOLIS (from Gk. *κόσμος*, *kosmos*, order, world, universe + *πόλις*, *polis*, city). A French novel by Paul Bourget (1892). The characters come to Paris from all quarters of the earth, forming an international society. The theme of the action is the persistence of ethnical differences even where a complete cosmopolitanism has apparently been reached.

COSMOPOLITE (Gk. *κοσμοπολίτης*, *cosmopolitēs*, citizen of the world, from *κόσμος*, *kosmos*, order, world, universe + *πολίτης*, *politēs*, citizen, from *πόλις*, *polis*, city). A plant which grows spontaneously in every climate. Not to be confused with ubiquist (q.v.).

COSMORAMA, *kōz'mō-rā'mā* (from Gk. *κόσμος*, *kosmos*, order, world, universe + *ὄραμα*, *horama*, sight, from *ὄρᾶν*, *horan*, to see). An arrangement of lenses and mirrors for viewing pictures, so that they appear as natural as possible.

The name was applied to exhibitions where representations of landscapes, buildings, and other features of places in different parts of the world could be seen. By properly arranging the lenses, mirrors, and illumination, the pictures were produced not only enlarged, but with the effect of perspective. Cosmoramas were first introduced in France at the beginning of the nineteenth century.

COS'MOS (Neo-Lat., from Gk. *κόσμος*, *kosmos*, order, world, universe). A genus of annual and perennial herbs of the order Compositæ. The twenty or so species comprised in this genus are natives of tropical America, mostly Mexico. A few annual species are cultivated in flower-gardens, and have within recent years come into increased prominence and popularity, especially in the United States. (For illustration, see Plate of CRANBERRY, ETC.) The plants are sometimes 10 feet high, leaves pinnately cut, flowers mostly rose, crimson, purple, yellow, or white; generally solitary on a long peduncle. A sandy soil not too rich is preferred. The seeds are sown indoors, and the plants when large enough are set in the garden, after danger of frost is past. *Cosmos bipinnatus* and *Cosmos sulphureus* are the species most commonly grown. The former grows 7 to 10 feet high, blooms in the late fall, and has many different forms. A dwarf variety about 4½ feet high blooms in July. *Cosmos sulphureus* grows 2½ to 4 feet high, with sulphur or rich orange-yellow flowers 1 to ¾ inches in diameter. It comes into blossom in some of the more southern States in late spring, and continues to bloom without cessation until killed by fall frosts. The black cosmos (*Cosmos diversifolius*) is a tender annual growing only 12 to 16 inches high.

COSMOS. A great scientific work in four volumes, by Alexander von Humboldt, which appeared at intervals from 1845 to 1858. It is a physical description of the universe, setting forth physical laws in logical order, though modern science shows it faulty in some of its matter.

COSQUIN, kô'skän', EMMANUEL (1841—). A French writer on folklore. He was born at Vitry-le-François, Marne. In his *Contes populaires de Lorraine* (1887) he aims to show that the folklore of Europe has been derived from India. He has also written considerably on religious subjects, chiefly for the paper *Le Français*, and prepared the following French translation of the works of Fessler, secretary of the Vatican Council: *La vraie et la fausse infallibilité des Papes* (1873) and *Le concile du Vatican* (1877).

COSS. See ALGEBRA.

COS'SA, FRANCESCO (c.1438-c.80). An Italian painter. He worked at Ferrara and Bologna, and is considered, with Lorenzo Costa, to have been the founder of the Ferrarese School. In the Palazzo Schifanoja at Ferrara there is a curious fresco by him, "The Glorification of March, April, and May," the other months having been done by lesser artists. In this composition there are a number of portraits of his contemporaries, remarkable for their fidelity to nature and for the valuable studies of costume. The Marquis of Borso, for whom the picture was painted, gave Cossa but slight compensation, and he, indignant at this treatment, left Ferrara and settled at Bologna. His picture in the

gallery there—a Madonna surrounded by saints—is considered his finest work.

COSSA, LUIGI (1831-96). An Italian economist. He was born in Milan, studied at the universities of Pavia, Vienna, and Leipzig, and in 1858 was appointed professor of political economy in Pavia. His most important work is the *Primi elementi di economia politica* (8th ed., 1889), which has been translated into English and several other languages. Among his other publications may be mentioned *Saggi di economia politica* (1878).

COSSA, PIETRO (1834-81). An Italian dramatist, born in Rome. He is considered the most brilliant writer for the stage that the nineteenth century produced in Italy after the death of the Count Giraud. The best of his plays are the following: *Neroni* (1871); *Plauto* (1876); *Cola di Rienzi*; *Giuliano l'Apostata* (1876); *Messalina* (1876); *I Borgia* (1878); and *Clcopatra* (1879). "If not great plays or dramatic poems," says an eminent critic, "they are, at all events, very splendid historical masquerades." A collection of them, *Teatro poetico*, was published (Turin, 1887).

COSSACK ASPARAGUS. See ΤΥΡΗΑ.

COSSACK POSTS. A system of outposts, used in the United States Army. Each post consists of four men—three reliefs of one sentinel each and a non-commissioned officer as commander, or, failing such, an old and experienced soldier. They are a substitute for the usual line of pickets and sentinels. From four to twelve such posts are supplied from each support; and in close rugged country they are posted about 300 yards in front of them, and are usually 150 to 300 yards apart from each other. The sentinels are posted from 10 to 30 yards in front of the Cossack posts and are kept under constant observation by the other members of their post. They are relieved every hour, and the posts every three hours. The advantages claimed for the Cossack system are that it is more economical in point of men required than is the usual method, and is besides less fatiguing, and consequently more effective; and that, above all else, it enables the sentries to be more resolute in the performance of their duties, because, backed up by the nearness of their post, they are freed from any timidity of loneliness. See OUTPOST.

COSSACKS (Russ. *kozakü*, *kazakü*, from Turk. *kazäk*, robber; the same word in Tatar designating a light-armed warrior). A name borne by a people living under a peculiar military organization, who for several centuries have constituted an important element in the population of southern Russia. Their principal homes are the steppes of the Don and of Ciscaucasia and a region at the southern end of the Ural Mountains, on the borders of European Russia and Siberia. They are a mixed race, of Russian, Polish, Tatar, and other elements, with the Russian predominating. In fact, they are distinguished from the other Russians by their unsettled mode of life rather than by any difference of race or fundamental character. The Cossacks make their appearance in history about the close of the Middle Ages as a frontier people, on the border of Slavdom (Russia and Poland) on the one hand and the Tatar regions to the southeast on the other. A free, wild people.

accustomed to live in the saddle and in constant warfare, they acquired by inheritance the qualities of courage, endurance, self-reliance, and good horsemanship, which gave them high rank among the irregular cavalry of the world. Long unaccustomed to the restraints of civilized government, they distinguished themselves by their predatory habits. The Don Cossacks, who at the present time constitute the principal body of the Cossacks, became powerful about the close of the sixteenth century. The town of Tcherkask became the seat of their government. At the head of their democratic organization was the Ataman (Hetman). In 1773 the Don Cossacks joined the pretender Pugatcheff against Catharine II., for which they were chastised by being deprived of all of their liberties and their democratic institutions. Yermak Timofeyeff, a Don Cossack, belonging to a lawless band, the Good Companions of the Don, entered the service of the Stroganoffs, a wealthy family living in the Ural region and holding special trading privileges, crossed the Urals with a few hundred followers in 1581, and in a few years conquered and brought into a rude kind of subjection all of western Siberia. From this time the history of the Cossacks is closely connected with that of the Russian progress eastward through Siberia. With wonderful persistence and endurance, and a spirit of enterprise that would have been impossible in the stolid Russian village peasant, they explored and subdued this vast addition to Russia's territory. The Malorussian (Little Russian) Cossacks, or Cossacks of the Ukraine (Border Land), were organized in the second half of the sixteenth century by Stephen Báthory, King of Poland, into a defensive bulwark on the southeastern frontiers of the realm. In the middle of the seventeenth century, harassed by Polish oppression, they revolted under the lead of their Ataman, Chmielnicki (q.v.), and placed themselves under the protection of Russia. Under the lead of Mazeppa they joined Charles XII. against Peter the Great, whose victory at Poltava sealed their fate. Their liberties were abolished and they were treated with great harshness. The Zaporogian Cossacks (Russ. *Zaporog*, beyond the rapids), on the Dnieper, were one of the most notable of the tribes down to the middle of the seventeenth century, when they submitted to Russia. Their predatory incursions were not confined to the land, but included naval expeditions against the Turkish towns of Asia Minor. Among their peculiar tribal institutions was the celibacy imposed upon the ruling class.

The Cossacks are regarded by the Russian Government as a military division of the population. They are organized in eleven *voiskos* or *corps* (Don, Kuban, Terek, Astrakhan, Orenburg, Ural, Siberia, Semiryetchensk, Transbaikalia, Amur, Usuri). Their military training begins in boyhood; compulsory service in the *stanitsa*, or Cossack post, begins at seventeen; field service begins at twenty, and continues from twenty to twenty-five years. This service is divided into three classes—active, on furlough with arms and horses, and on furlough with arms but without horses. Each *voisko* equips and clothes its soldiers, and receives an allowance of land from the Crown. The Cossacks wear a distinctive uniform of dark green. Part of them, in addition to other arms, still carry a long lance. The Kuban

voisko enrolls 6 battalions of Cossack infantry, and there are also fifteen batteries (4½ on a war footing) of Cossack field artillery. The title of Ataman, or chief of the Cossacks, is now vested in the Imperial family. The Cossacks probably number between 1,500,000 and 2,000,000.

Consult: Erekert, *Der Ursprung der Kosaken* (Berlin, 1882); Tettau, *Die Kosakenheere* (ib., 1892); Wallace, *Russia* (9th ed., London, 1883); Krasinski, *The Cossacks of the Ukraine* (ib., 1848); Vladimir, *Russia on the Pacific* (ib., 1899). A splendid realistic picture of Cossack life may be found in Gogol's celebrated novel *Taras Bulba*.

COSSACKS, THE. A novel by Count Tolstoy (1852). It was translated into English in 1878.

COSSON, kō'sōn', ERNEST (1819-89). A French botanist, born in Paris. He carried on extensive botanical studies in Algeria and explored the flora in the suburbs of Paris. His published works include the following: *Flore descriptive et analytique des environs de Paris*, jointly with Saint-Pierre (1845); *Synopsis analytique de la flore des environs de Paris* (1845); *Atlas de la flore des environs de Paris* (1842); *Compendium Floræ Atlanticæ ou Flore des états barbaresques: Algérie, Tunisie, Maroc* (1881-87); *Conspectus Floræ Atlanticæ* (1881); and *Illustrationes Floræ Atlanticæ* (1883-92).

COSSUTIUS, kōs-sū'shī-ūs. A Roman architect noted for his selection by King Antiochus Epiphanes (B.C. 175-164) to rebuild the great temple of the Olympian Zeus at Athens in the Corinthian style.

COSTA, kō'stā, CLAUDIO MANUEL da (1729-89). A Brazilian poet. He was born at Mariamo (Province of Minas-Geraes). His works, which are numerous, are highly valued by the Portuguese, who consider them classics. The best of them is *Villarica* (1839-41).

COSTA, ISAAC DA. See DA COSTA, ISAAC.

COSTA, LORENZO (1460-1535). An Italian painter, born in Ferrara. He was a pupil of Cosimo Tura and Ercole Roberti in Ferrara, and perhaps of Francesco Cossa. Vasari says he also studied the works of Gozzoli and Lippi in Florence. After his return to Ferrara he painted several works now destroyed. In 1483 he went to Bologna, where he remained almost constantly until the fall of his patrons, the Bentivoglio family, in 1506, and there he began his connection with Francia. The artists had a joint school, and worked as co-painters. Costa first influenced Francia, but afterwards it was the other way. As a colorist Costa is inferior to Francia. Many of his best paintings are in the Bolognese churches. Among those may be mentioned: "A Madonna with Members of the Bentivoglio Family" (1488) in San Giacomo Maggiore, a characteristic example, admirable in its fresh, simple, sincere treatment and masterly drawing; "The Triumph of Life and Death," and frescoes, in the same church; an "Annunciation" and "Madonna" (1492) in San Petronio; and frescoes in Santa Cecilia. After he left Bologna he went to Mantua, where he lived until his death. Later works include the "Court of Isabella d'Este" (in the Louvre) and the "Dead Christ" (1504, Berlin Museum); they are rare outside Italy. Dosso, Garofalo, and others car-

ried on the traditions of the Ferrarese School, of which many consider Lorenzo Costa the founder.

Consult: Morelli, *Italian Painters: Critical Studies of Their Works*, translated by Constance Jocelyn Ffoulkes (London, 1892-93); Vasari, *Lives of the Painters*, translated by Blashfield (New York, 1897); Crowe and Cavalcaselle, *History of Painting in North Italy* (London, 1871).

COSTA, Sir MICHAEL, really MICHELE (1810-84). An Italian composer and conductor, born in Naples. He was taught by his father and Zingarelli (q.v.). When the latter's psalm was to be performed at the Birmingham Festival (1828), he sent Costa, then only eighteen years old, to conduct it. Owing to a misunderstanding, Costa had, instead, to sing the tenor part, but acquitted himself of the task brilliantly, and his reception induced him to settle in England. He became conductor of Italian opera in 1830, and in 1847 assumed the same post in the Covent Garden Opera. In addition he was appointed conductor of the Philharmonic Society (1846); Sacred Harmonic Society (1848); Birmingham Festivals (1849); and Handel Festivals (1857). His principal work, the oratorio *Eli*, was successfully produced at the Birmingham Festival of 1855 and *Naaman* in 1864. In 1869 he was knighted by Queen Victoria and also received the royal order of Frederick from the King of Württemberg. Costa wrote several ballets and operas, of which the most successful were *Don Carlos* and *Malck Adel*. He died at Brighton, England.

COSTA, PAOLO (1771-1836). An Italian author, born in Ravenna. He was educated in Padua, and was a teacher successively in Treviso, Bologna, and Corfu. His treatise on the *Divina Commedia* (1819) did much to popularize Dante in Italy. He collaborated with Orioli and Cardinali in a revision (1819-28) of the *Vocabolario* (1612) of the Accademia della Crusca, and with Giovanni Macchetti, translated into Italian Homer's *Batrachomyomachia*, and Schiller's *Don Carlos*. His collected works, with a sketch by Becchi, appeared in Florence in 1839-40 (4 vols.). Consult, also, the biography by Mordani (Forlì, 1840).

COSTA CABRAL, kó'stá ká-brál', ANTONIO BERNARDO DA, Count de Thomar (1803-89). A Portuguese statesman. He became judge of the Supreme Court in Oporto and in Lisbon, and in 1835 was elected to the Chamber of Deputies, where at first he was one of the leaders of the Radicals, but soon joined the Conservative Party. He was appointed Governor of Lisbon in 1838 and Minister of Justice in 1839. For the purpose of setting aside the Constitution of 1820 with its restrictions of the royal power, he fomented, in 1842, an insurrection in Oporto, assumed control of the army, established a censorship of the public schools, suppressed the universities, and so oppressed the people with taxes that he was driven from power in 1846. Once more appointed Prime Minister, in 1849, he again played the dictator, to the detriment, especially, of the State finances, but was compelled to resign. The Queen refused to accept his resignation, and a revolution was started against him under the leadership of Saldanha, which overthrew his administration in April, 1851. He fled to England, but returned the next year, and from 1859 to 1861 was Minister to Brazil. In 1862 he became a member of the Council of

State and president of the Superior Administrative Court.

COSTA RICA, kó'stá rē'ká (Sp., rich coast). The most southern of the Central American States, bounded by Nicaragua on the north, the Caribbean Sea on the east, Colombia (Panama) on the southeast, and the Pacific on the southwest (Map: Central America, E 5). Its area, after the adjustment of the boundary disputes with Nicaragua and Colombia, is estimated at about 21,500 square miles. Lake Nicaragua forms part of the northern boundary.

TOPOGRAPHY. The interior of the country is taken up partly by the Talamanca range of mountains (a continuation of the Cordillera of Chiriquí), which runs from the southeast to the northwest as far as latitude 10° N. The Talamanca is of volcanic origin and reaches in its highest peaks an altitude of over 12,700 feet. North of the Cartago highland commences the second mountain range, which extends in the same (northwesterly) direction to the northern boundary of the Republic. There are several volcanoes in this range. Of them, however, but two—the Irazú (11,500 feet) and Turrialba (11,350 feet)—show any signs of activity. Since 1841, when the town of Cartago was almost completely destroyed, no serious eruption has occurred. The Atlantic coast, which, according to the adjustment of the southern boundary in 1900, reaches only to a point a little north of the mouth of the river Teliri or Siesola, is generally low, and, with the exception of Port Limón, without any inlet. The Pacific coast, on the contrary, has a more elevated surface and forms the two spacious gulfs of Nicoya and Dulce, which are protected by two mountainous peninsulas. There are a number of smaller inlets in the northern part. The rivers of Costa Rica are short, and, although abundant in water, unnavigable. Most of them flow into the Atlantic or the Pacific, while some join the San Juan, which forms the eastern half of the northern boundary.

GEOLOGY. The interior highland region is composed of Paleozoic and Mesozoic strata, in places broken through by ancient eruptives and overlain by more recent lava-flows. Many districts are known to be mineralized; the deposits of gold are especially important and have attracted the attention of foreign capitalists, who are now engaged in developing this branch of the mining industry. The eastern coast of Costa Rica is an alluvial plain.

CLIMATE. In regard to its climate, Costa Rica may be divided into three zones. The torrid zone, below 3000 feet, comprising the coastlands, has an average temperature ranging from 72° to 82° F. The temperate zone, lying between 3000 and 7500 feet, has the most salubrious climate and a mean temperature ranging from 57° to 68°. Above 7500 feet the temperature is much lower and frosts are frequent, but snows rare. On the tablelands of San José, lying at an elevation of 3000 to 4000 feet, the climate is very agreeable, the temperature having a range of only about 5°, the mean for the year being 67°. The dry season lasts from December to May, while the months of December, January, and February are the coldest of the year. Owing to the proximity of the two oceans, winds blow almost continually, and occasion considerable discomfort during the dry season. On the whole, the climate of Costa

Rica is healthful and fevers occur only in regions below an elevation of 150 feet.

FLORA AND FAUNA. The vegetation and animal life are characteristic of Central America generally, which forms a part of the Neotropical region.

AGRICULTURE. Costa Rica is essentially an agricultural country, and is chiefly dependent on the cultivation of coffee. Notwithstanding the sparse population of the country and the lack of transportation facilities, agriculture is in a flourishing condition, as evidenced by the constantly increasing exports of agricultural products. This state of affairs is due partly to the fertility of the soil and favorable climatic conditions, and particularly to the fact that the larger part of the land is held by the State, which rents or sells it in small tracts on very advantageous terms, in some cases distributing it gratuitously, in lots not exceeding 500 hectares (1235 acres). As a result of this policy almost every inhabitant of Costa Rica is a landholder. The cultivation of coffee has been steadily increasing and will undoubtedly show a greater growth in the future, as a result of the law passed in 1901 abolishing the export duty on that article. According to the census of 1892, there were in Costa Rica 8366 coffee plantations, with an annual output of over 38,000,000 pounds. In 1894, 23,129,000 pounds of coffee were exported; in 1898, over 43,000,000 pounds; in 1901, over 36,000,000 pounds. Next to coffee, bananas form the most important agricultural product. The development of banana-growing has also been rapid, as seen from the export figures. Thus in 1881 there were exported only about 3500 bunches; by 1890 the exports increased to 1,034,765 bunches; while in 1901 they amounted to 3,870,000 bunches. Besides coffee and bananas, there are raised sugar, cacao, rice, and corn, but none of them is exported to any extent. Stock-raising is carried on quite extensively, and the forests are exploited on a steadily increasing scale.

MANUFACTURES. Of manufacturing establishments Costa Rica has very few, the largest being the national liquor factory and the national foundry at San José. The country is behind the neighboring States in manufacturing.

TRANSPORTATION AND COMMUNICATION. The Isthmian railway line has been in construction for over twenty years, and in 1900 only twenty-one miles were lacking to connect Port Limón on the Atlantic with Tivives on the Gulf of Nicoya, where a port is to be constructed. The line is being built by an English corporation, and in 1900 had a total length of 137 miles, reaching as far as Alajuela. A branch line toward Lake Nicaragua is also in process of construction. The telegraph lines of Costa Rica have over 900 miles of wire.

COMMERCE. In 1900 Costa Rica owned three small merchant steamers and two sailing vessels. The two main ports are visited regularly by eight lines of steamers—American, Chilean, and European. The annual value of the commerce exceeds \$12,400,000, the exports only slightly exceeding the imports. The exports for 1900 (not including gold coin) amounted to \$6,000,000, of which coffee contributed \$3,800,187; bananas, \$1,354,385; woods, \$382,000; gold and silver in bars, over \$240,000; and hides, rubber,

skins, etc., the remainder. The imports for the same year amounted to about \$6,000,000, and were distributed largely between the United States, England, Germany, and France, in the order named. The imports from the United States show an increase from about 33 per cent. in 1896 to over 46 per cent. in 1900. The imports of the other three countries show a decrease during the same period. The chief ports are Punta Arenas on the Pacific, and Port Limón on the Atlantic, whose combined shipping exceeded, in 1900, 700,000 tons. The annual imports of merchandise from the United States into Costa Rica for the period of 1891-1900 averaged \$1,246,000; the exports from Costa Rica to the United States during the same period averaged \$2,907,960. The United States takes almost the entire crop of bananas and a considerable portion of the coffee. In 1901 the import duties were increased 50 per cent., while the export duties on coffee and the import duties on machinery were abolished. Considering the area and population of the country, Costa Rica compares favorably in its economic condition with most of the Central and South American countries. The comparative freedom from political disturbances and the favorable climatic conditions have attracted foreign capital and immigration, factors which have figured prominently in the development of the country.

GOVERNMENT. In its form of government, Costa Rica is a republic. It is governed under a constitution adopted in 1871; but this was not wholly in force until 1882. The executive power is vested in the President, elected indirectly for four years, assisted by a Cabinet of four members. The Congress consists only of a Chamber of Representatives, elected indirectly for four years at the rate of one representative to every 8000 inhabitants. For administrative purposes the Republic is divided into five provinces and two comarcas, administered by governors appointed by the President. Justice is administered by a supreme court, two courts of appeals, a court of cassation, and also provincial courts. Capital punishment is prohibited. To guard the public health, the country is divided into twenty-one districts, which are in charge of physicians paid by the Government. The Constitution provides for compulsory military service in time of war. On a peace footing the standing army numbers 600 men and the militia about 12,000. The Government owns one gunboat and one torpedo-boat.

FINANCE. The revenue is obtained primarily from customs and excise. The budget at present exceeds \$4,000,000. The foreign debt of the Republic has been greatly augmented by the non-payment of interest, and the Government has repeatedly gone into default. By the terms of the latest arrangement with the creditors in 1897 the Government obtained a reduction of interest and agreed to pay up the debt at the rate of £10,000 (\$50,000) per annum, beginning in 1917. In 1901 the foreign debt amounted to \$10,129,600; the internal debt in 1900 was \$3,215,973. The metric system is legally established in the country, but Spanish weights and measures are generally used.

BANKS. The two banks of Costa Rica have a combined capital of about \$3,200,000. In 1900 there were 3,000,000 paper pesos in circulation, exchangeable for gold. The metallic money of the

country then amounted to 6,000,000 colones, five-sixths being gold, the rest being silver coin of the Republic. In that year a new coinage was put in circulation, based on an act passed in 1896, adopting a gold standard at 26 $\frac{2}{3}$ % to 1, and making the colon (worth \$0.465) the monetary unit. Under this law all debts contracted in national money are payable in the new coin, on the basis of 1 colon to a silver peso. Foreign silver is not legal.

POPULATION. The population of Costa Rica, as given by the census of 1892, was 243,205, but the actual population, including about 4000 aborigines, was supposed to be over 260,000. In 1899 it was estimated at 310,000. The foreign population exceeds 6000, and consists mostly of immigrants from Spain and Germany. The natives are in the main descendants of Spanish colonists from Galicia, and by their industry and peaceful disposition present a favorable contrast to their neighbors in South and Central America. The capital is San José (q.v.).

Costa Rica leads the Central American States in education. Public instruction is free and is enforced. There are several institutions of higher education, and three important public libraries. The majority of the population, however, are illiterate. The Roman Catholic Church is recognized and supported by the State, but other religions are tolerated.

HISTORY. Costa Rica was first visited, and probably named, by Columbus in 1502, and settled permanently about 1530. It formed a part of the Audiencia and Captain-Generaley of Guatemala till 1821. With other Central American States, Costa Rica was a part of Mexico till 1823, when the proclamation of a Mexican republic caused them to withdraw from a connection which had always been distasteful and which in effect had been merely nominal. A federal republic of the seceding States was first tried. It lasted until 1839, but its authority does not seem to have extended over the Costa Ricans, who busied themselves with commerce and took little interest in public matters. Affairs remained in an unsettled condition, however, and Costa Rica's exact status was not definitely determined until 1848, when she successfully declared herself an independent republic. In 1856 Costa Rica was involved in war against the filibuster William Walker (q.v.). The country has been freer from revolution than its neighbors. The present Constitution dates from 1871. In 1897 Costa Rica became a member of the short-lived Greater Republic of Central America, established in 1895 by Honduras, Nicaragua, and Salvador for the purpose of common defense and the harmonious adjustment of foreign relations. Within the last half-dozen years nothing more serious than boundary disputes has disturbed the Government of Costa Rica. The most important of these, with Colombia, was adjuted in 1900, in favor of Costa Rica. Besides the general works on Central America, of which Squier, *States of Central America* (New York, 1858), is the best, and Baneroff, *Central America*, vol. iii. (San Francisco, 1890), is the most copious, consult the English translation of Calvo, *Republic of Costa Rica* (Chicago, 1890). This is a popular and patriotic work, authorized by the Costa Rican Government, and gives the version of political

and commercial events most acceptable to the men in power in 1890.

Consult: Barrantes, *Geografía de Costa Rica* (Barcelona, 1892); Villafraña, *Costa Rica, the Gem of American Republics: The Land, Its Resources and Its People* (New York, 1895); Church, "Costa Rica," in *Geographical Journal*, vol. x. (London, 1897); Biolley, *Costa Rica and Her Future* (Washington, 1889); Schroeder, *Costa Rica State Immigration* (San José, 1894).

COSTE, kôst, JEAN VICTOR (1807-73). A French naturalist, noted for researches in embryology and for efforts toward the cultivation of fishes in his country. In 1841 he became professor of embryogeny at the Collège de France. Mainly through his influence, 600,000 salmon and trout were placed in the Rhone. In 1862 he was appointed inspector-general of the river and coast fisheries. He published *Embryogénie comparée* (1837); *Instructions pratiques sur la pisciculture* (1853); and *Voyage d'exploration sur le littoral de la France et de l'Italie* (1855).

COSTEANING (kôs-tên'ing) DITCH (from *costean*, from Corn. *cothas*, dropped + *stean*, tin, Welsh *ystaen*, Gael. *staoin*, Manx *stainny*, Lat. *stannum*, tin). A ditch dug with the object of encountering the outcrop of a mineral deposit, the presence of which is suspected. Sometimes a series of ditches is dug to determine the direction of the line of outcrop.

COSTEL'LO, LOUISA STUART (1799-1870). An English author and miniature painter. For a time she occupied herself entirely with painting, but having attracted the attention of Scott and Moore, she adopted literature as her profession and produced many works which attained popularity. Some of them are: *Songs of a Stranger* (1825); *The Maid of the Cypress Isle and Other Poems* (1815); *Specimens of the Early Poetry of France* (1835); *A Summer Among the Bocages and Vines* (1840); and a number of semi-historical novels, of which the most prominent are: *Memoirs of Mary, the Young Duchess of Burgundy* (1853), and *Memoirs of Anne, Duchess of Brittany* (1855).

COSTER, kôs'tēr, LAURENS JANSZON. A native of Haarlem, Holland, reputed inventor of printing (about 1440). He is said to have printed sentences from beech-bark blocks, to have discovered a suitable ink, and to have substituted types of lead and later of pewter for beech-wood. As he is alleged to have endeavored to counterfeit manuscript, he is supposed to have worked in secret, but to have taken apprentices, one of whom, Johann Günsfleisch, a member of the Gutenberg family, is said on Coster's death to have stolen types and matrices and fled to Mainz, where he might have revealed the secret to Gutenberg (q.v.). Coster's claim, vigorously maintained by many Dutch scholars, was disproved by Van der Linde (1870), who showed that Coster was a tallow-chandler and tavern-keeper, that he was confused with Laurens Janszoon, a wine-merchant and town officer, and that the claim for him as inventor was first made by Gerrit Thomaszoon in 1550. Consult Morley, *English Writers*, vol. vi. (London, 1890).

COSTER, SAMUEL. See KOSTER, SAMUEL.

COST'IGAN, CAPTAIN. A retired shabby-genteel Irish officer in Thackeray's *Pendennis*, whose sense of family dignity is second only to

his affection for whisky. He is the father of 'the Fotheringay.'

COSTIGAN, EMLY. 'The Fotheringay,' in Thackeray's *Pendennis*. She is the early sweet-heart of Arthur Pendennis, who is rescued from marriage with her only by the prompt action of his worldly-wise old uncle, the Major, ably seconded by Foker.

COSTIGAN, JOHN (1835—). A Canadian statesman. He was born at Saint Nicholas, Quebec Province; was educated at Saint Anne's College, and subsequently became a judge of the inferior common pleas court. He sat for Victoria in the New Brunswick Legislature from 1861 to 1866, and after the union of 1867 was elected by the same constituency to the Dominion House of Commons, of which he is still a member. In 1882-92 he was Minister of Inland Revenue, from 1892 to 1894 was Secretary of State, and afterwards was Minister of Marine and Fisheries.

COST-MARY (from *cost*, Lat. *costum*, an Oriental aromatic plant, from Gk. *κόστος*, *kostos*, spice-root + *-mary*, Fr. *marine*, Lat. *marinus*, pertaining to the sea, from *mare*, sea, but confused by popular etymology with *Mary*). The rayless form of *Chrysanthemum balsamita*, a perennial plant of the natural order Composite, a native of western Asia, long cultivated in gardens for the agreeable fragrance of the leaves. The root-leaves are ovate, of a grayish color, on long footstalks; the stem is two to three feet high; it has small heads of flowers in loose corymbs, deep yellow.

COSTS (from *cost*, OF. *cofter*, *couster*, Fr. *coûter*, ML. *costare*, to cost, from Lat. *constare*, to cost, stand together, from *com-*, together + *stare*, Gk. *στάνα*, *histanai*, Skt. *sthā*, to stand). In a litigated case, the sum of money which the successful party is allowed to recover from his opponent, as a partial compensation for the expenses of the litigation. In actions at common law, costs are the creation of statute; but in equity and admiralty suits they are fixed by the court, except where this power has been taken away or modified by legislation. Even in common-law actions, discretion is often vested in the court to grant an allowance to the prevailing party in addition to the ordinary costs; and in some jurisdictions paupers and seamen may be relieved from costs altogether.

Costs are either: (a) *interlocutory*, that is, such as are awarded upon motions or similar proceedings during the pendency of the action; or (b) *final*, that is, such as follow upon the determination of the action. Upon the decision of a motion, or upon a judgment on appeal reversing the judgment appealed from and awarding a new trial, costs are often ordered to *abide the event*. In such a case, if the final judgment is in favor of the party who succeeded on the motion or appeal, he gets his costs of those proceedings, otherwise he loses them.

The *taxation of costs* is the official adjustment, on notice, of the various items to which the successful party is entitled. For details relating to costs, consult the authorities referred to under PRACTICE.

COSTUME (Fr. *costume*, ML. *costuma*, costume, from Lat. *consuetudo*, custom, from *consuescere*, inchoative of *consuere*, to be accustomed, from *com-*, together + *suere*, to be accustomed,

probably connected with *suus*, own). Both dress and costume are concerned with what men and women have worn, in all epochs and under civilizations of all degrees; but dress (q.v.) deals with preserving the natural heat of the body, or protecting it from the sun or from rain, and with the requirements of that conventional propriety which varies so much in different lands and with different conditions; while costume has to do with appliances used to give to the person stateliness or grace, or an effective show of forms and colors, as well as with the strictly regulated ceremonial dress assumed by dignitaries or officials; but the description of these exceptional forms of costume cannot be included in this article. See e.g. CORONET; CROWN; and the article on various forms of knighthood.

Costume, as a matter of display, or at least of decorative effect, consists partly in the use of textile fabrics which are beautiful in themselves, or substitutes for them made of bark or leather, and decorated by printing or stamping; partly in the shaping and adjusting of the garments made of these decorative stuffs. Cognate subjects are the arrangements of jewels attached to the dress or hung upon the body, and the care of the hair, skin, and beard. See JEWELRY; HAIR-DRESSING; HAIR-POWDER; etc.

To judge from the artistic remains of ancient Egypt and Assyria, the use of rich stuffs was the primary thought of the Egyptians, who sought to be splendid in appearance. Beauty of material and of pattern at least held an even place in their minds with jewelry. Thus, from the earliest era known to us by the painted monuments down to a period later than the Macedonian conquest, the little-changing adornment of the Egyptian official or Court lady was something very magnificent indeed, in the way of broad necklaces made up apparently of ring within ring of carved gems, mounted in gold with exquisite handling and taste, and covering the shoulders and the junction of the throat with the breast, as completely as the steel gorget of the sixteenth century. The full significance of these collars is not entirely certain. It may be that in some cases the jewelry was sewn upon a collar-shaped piece of stuff, which has fallen away from those jewels which are found in the ancient tombs. Armlets worn on the upper arm and also on the wrist, like the modern bracelet, are as common as the necklaces, and there are evidences of a jeweled girdle as rich and as broad as the combination of necklaces, although this, being worn, as the necklaces are, directly upon the skin, is only in part seen, being often covered by the folds of the skirt, which is sometimes secured to the belt and falls below it. The stuffs themselves are found of still greater splendor in the representations of upholstered furniture; but this appears to be in part because a larger surface could be presented there than in the garment worn by man or woman. The patterns are so similar to the earlier painted designs of the tomb interiors that there becomes evident a close connection in the mind of the Egyptian designer between one surface and another, the beautifying of which was to be intrusted to color. There are, however, stuffs of the eighteenth dynasty, and perhaps earlier, usually of linen, which have been found in a more or less fragmentary condition in the tombs, and many of these are of the most ex-

quisite beauty, equaling in the perfect intelligence of the design adapted to textile fabrics the finest work of the Byzantines or Persians two thousand years later. In the warm climate of Egypt the clothes even of persons of rank were very slight, and rather for ceremonial purposes than for utility. In the Assyrian monuments, on the other hand, there is a marked tendency toward covering the whole person with what seem to be heavy draperies, whereas in the Egyptian bas-reliefs the lines of the body are often made visible through the opening which represents the outer garments, suggesting either a partly transparent material or at least a material so little adjusted to the person and so slight that the body itself was never forgotten. The monuments of the Assyrian tombs, on the contrary, show wrappings apparently opaque and stiff. It is evident, however, that embroidery was much used; for parts of the garments, as of a king, are sculptured in low relief upon relief, and in a way which resembles closely the representation of the embroideries upon priestly robes in the sculpture of the Italian Renaissance. As for jewelry, it was as rich and splendid in Assyria as in Egypt, though the forms differ.

Among the peoples of western Asia even partial nudity was considered dishonorable, or at least the badge of inferiority. Accordingly, the heavy garments shown in the works of art of Mesopotamia are easy of explanation, for where only slaves are wholly or partially naked, the tendency is strong toward the association of high rank with complete clothing. But then another tendency appears, that of making the garments of plainer stuff when the body is covered by them from shoulders to ankles, and using the richer stuffs, as above explained, for borders and the like. The Egyptian, with body, arms, and feet bare, might make his kilt of the most splendid piece of weaving obtainable, but the Assyrian, using yards of material for his garment, would naturally employ a simpler stuff: not to avoid expense, but because people of such refined taste as those of Mesopotamia would shun the use of large surfaces, of uniform patterns, or the contrast, side by side, of differing patterns, of about equal size and brilliancy.

This tendency is not maintained, however, in that other ancient civilization in a sense equal in antiquity as in importance to the civilization of western Asia. The Chinese, from the oldest times of which we have any knowledge, have been among the greatest artists in textile fabrics, as in other industrial arts, and history does not tell us of the time when the population, whether of true Chinese origin or of conquering Tatar dynasties and their followers, have not been more and more clothed in proportion to their rank and station. Porters may go bare-legged and bare-armed, and, in warm weather, with the body naked above the belt, but as one ascends in the orders of rank, the clothing becomes more and more complete. This tendency is not, however, accompanied by any objection to brilliant and rich stuffs. The more abundant the means of the wearer, the richer his costume—that seems to have been the rule from all time; and this is partly explained by the beauty of the floral and foliated designs. Embroidery, too, is used to heighten and complete the splendid weaves, and at least from the tenth century of our era until

the present day, the most magnificent stuffs in texture and in color are those used by the ladies and gentlemen of the Court. On the other hand, personal jewelry, that which is worn apart from the garments, is not very rich nor very costly, though it may be effective. Strings of pearls are known, and many stones that we, in the West, ignorantly despise because they are inexpensive, are made much of by the Chinese, who will use a rough turquoise, a piece of veined or spotted agate, or even a beautiful piece of glass accidentally rich in its veining and cut deliberately from the vessel to which it belonged—setting them in bronze or silver-gilt, and making a very decorative clasp, or buckle, or pommel of a sword-hilt. Chinese costume should be most carefully studied, because it has been maintained in its traditional character even to our own time. The blue cotton blouse of the working man, and the garment of delicate blue and gold silk, woven in very elaborate patterns expressly for this garment, with gold or gilt buttons spherical in shape and working in loops, are mainly the same garments as those of a century ago.

The people of India are even more divided among themselves in details of costume than are the people of Europe. The general character of the different races, north and south, leads toward a great distinction between classes of the population. The simple piece of stuff, four feet wide by thrice as long, worn by the women, is most gracefully draped about the shoulders and breast; in very recent times it is often a piece made in Europe of three large handkerchiefs, with their several borders complete. This is worn over a petticoat; arms and legs are bare, and the feet, except for occasional use of sandals; but the dark skin is barred and spotted with many and large jewels. Necklaces, broad armbands and wristlets, rings for toes and fingers, earrings, and nose-rings, are all made of silver wire for the poorer women, who often put their whole savings into these adornments. The necessity of providing for a very warm summer climate, and in the south for a wholly tropical year, has caused the making of muslins of a fineness and perfection of weave never approached in Europe, though these native manufactures have been destroyed by the competition of British cottons. A few of the native princes alone encourage the making of these exquisite weaves. Besides these there are figured cottons of such perfect make and so beautiful in design that they are worn even by princes, as if of equal importance with silk. The gold-flowered and silver-flowered textiles of silk and cotton, or even of fine cotton alone, are famous in Europe, under the name *kinkab* or *kineob*. The costume of India in general is mainly an affair of beautiful stuffs, very little shaped to the body, and usually worn loosely, and of jewels in great abundance.

Among the people of the tropical islands, the Malays, and the black and brown inhabitants of Polynesia, the art of weaving has never reached sufficient perfection to allow the stuffs to be sought for their own sake. Very beautiful patterns are printed upon cotton by the women of the larger islands, wood blocks being used for the purpose in a way almost exactly like that employed in the printing of paper hangings among the Western nations; but these stuffs, however attractive to our eyes, however superior

COSTUME

1. GREEK.
 2. ROMAN.

 8. ENGLISH (Henry VIII., 1509-1546).

in design, are yet inexpensive—they could be produced by any one who has a little skill in the use of the hands, and are, therefore, not a part of ceremonial or decorative costume. A few very beautiful weaves exist, as in the Solomon Islands, and especially in New Zealand, but still they are not of rare material, nor is the elaboration of the design very great. The skill in the working of metals which is great among the Indians of the continent is much smaller among the islanders, and so it happens that personal jewelry also is but little sought for by the chiefs. The result of all this is seen in the simple and tasteful use of natural productions, brilliant flowers, and richly colored fruits and seeds, which, strung as necklaces or worn as pendants, have especial significance and are attached each in its way to the traditional ceremonies of these curiously civilized peoples.

If now we turn to the race which of all peoples has had the most influence over modern intellectual life, we shall find that the Greeks of antiquity limited their desires in the way of textile fabrics to very simple patterns, as of stars or round spots arranged in a *semé* over all the surface of a stuff, and in somewhat more elaborate patterns of zigzags and frieze in the borders. Their costume, including their jewelry, was, in fact, marked throughout by extreme simplicity, which increases as our studies bring us to a later time. The statues discovered on the Acropolis at Athens since 1833 are certainly of the century before the Persian invasion of B.C. 480. They show a number of garments, certainly as many as three, worn one over the other by the priestesses represented in the statue; and each of these garments is made of a different stuff, all the stuffs, or all but the craped under-shirt (the *chiton* of later dress), covered with elaborate patterns in several colors. There is nowhere a more interesting study of brilliant coloring in costume than were these statues when first discovered, and, fortunately, the finest of them have been reproduced in water-color painting, and these water-colors often multiplied in chromolithography, and published by the archaeological societies. It is clear that, immediately after the Persian War, during the period of the Athenian hegemony in Greece, beginning with B.C. 477, the use of these striped and spotted stuffs becomes much less common, at least in the mainland of Greece, and the use of plain materials, white, bordered with stripes, or of one rather subdued color perhaps striped at the edge, becomes the rule. Those admirable bronze statues which were discovered in the famous villa at Herculaneum and now stand in the Museum of Naples (the Room of the Greater Bronzes), show perfectly well—better than any bas-reliefs, however elaborately detailed—the true Greek sense of what was beauty in costume. The long *chiton*, which, left ungirdled, would sweep the floor, is belted up so far as to allow a foot or more of its length to hang over the girdle outside of the skirt or lower part, forming a sort of pocket, known as the *kolpos*. Outside of this is seen hanging what looks like a cape, and which generally reaches just the line of the girdle, or may fall a little below it. This, however, is not a cape nor a separate garment at all: it is the reverse or turning over of the *chiton* at the top. Of the *chiton* there were several forms. The earliest was not sewn at all, and therefore left

the right side, thigh and leg, exposed on the slightest movement. A later form was a sewn-up cylinder, a long shirt in the modern sense. The stately maidens of the reliefs and the vase paintings often wear one of these two forms of *chiton*, and nothing else. To such a dress, even on occasions of great ceremony, there is nothing to be added, except perhaps a more splendid brooch on the shoulder, a broader and more brightly colored border to the *chiton*, perhaps an armlet, perhaps richer and more glittering earrings. Splendor in the more modern sense was hardly desired, and beauty was shown in the perfect taste with which these simple appliances were disposed. Other garments, however, are seen in the sculptures and vase paintings: the *himation* and a variety of it, the *chlamys*, were square or oblong pieces of woolen cloth, draped about the left shoulder and covering the body more or less as it might be adjusted; it was held sometimes by brooches. Statues show a garment arranged nearly as the Scotch plaid is, at times folded long and narrow, falling over one shoulder and passing around the waist; and this is thought to be a long and narrow *himation*. It is impossible to distinguish these garments from the *epiblemata*. The essential fact is that the Greeks, both women and men, wore a long shirt and a loose, square shawl over it, and nothing else on body or limbs.

The Etruscans, a people as devoid of refined taste as the Greeks were remarkable for it, bold and dashing designers of the coarser and more thoughtless kind, were still not more elaborately clothed than the Greeks. The later Etruscan work passes by insensible gradations into that Italian work of the centuries during which the Roman Republic and the early Empire controlled the whole peninsula, and introduced insensibly its own strongly Hellenic tendencies into the arts of the subject countries. The effect of this on the art of northern Italy was altogether fortunate, except in so far as the lover of strongly accentuated national peculiarities found reason to regret their partial disappearance. The terra-cotta sarcophagi, with high reliefs and with what are almost statues wrought upon the covers; the bronze statues and groups, the jewelry of the fourth century B.C., and the following epoch, are almost Greek in their charm, while preserving a certain attractive local color. It is probably because of this constantly increasing influence of the Grecian artistic sense upon all the nations of Italy that the Roman dress from the earliest times known to us remains Greek in its simplicity, although very different in form. The *toga* and its relations to the outer cloak of the Greeks is discussed under DRESS. Here there must be some mention of the different ways of wearing it, some of which were connected with ceremonial occasions. Thus, when a statue or a bas-relief shows a Roman draped in a large and elaborately folded toga, one fold of which is brought over the head, he is assumed by modern students to be a person who is performing a sacrifice. The toga, as ordinarily worn, showed the *tunica* in front, from the throat nearly to the waist, but the long end could be thrown over the right shoulder so as to cover the *tunica* entirely, and in this way the toga would cover the whole person, from the neck to the ankles. Here, as among the Greeks, good taste dictated the utmost simplicity of effect, except in the mere

arrangement and careful disposition of the folds. There was no other garment of the men while in the city which in any way concerned their appearance, as the only leg-coverings known were bandages or wrappers, not unlike those worn to-day by the peasantry in some parts of Europe. On the other hand, the *toga praetexta*, which was worn by certain officials, and even by some priests, had a 'purple,' that is a dark crimson border, and the *trabea* seems to have been a sort of cloak with still more elaborate stripes, including perhaps one made entirely of red cloth, which generals were allowed to wear on the day of their triumph. It is probable, however, that in this last usage the military cloak of red was worn during the triumphal procession, that being the one occasion when the soldiers of the Republic were allowed to appear within the walls with their arms and military trappings. The women were dressed as simply as the men, wearing over the tunica merely a garment called the *stola*, which replaces for them the toga of the men, and when the woman of rank went abroad, usually in a litter, a shawl-like garment called the *palla* might also be added. That which makes the peculiar stateliness of the dress seen in female statues of the early Empire is the contrast of the folds of the long tunica, reaching the floor, nearly covering the feet, and forming a strongly marked base, as it were, for the whole figure, while the more loosely folded stola above it seems to reinforce the lines of the undergarment. A veil of more or less thin and floating material covered the head, and could be brought around to the front to hide the face at pleasure. It must be constantly kept in mind that the idea of beauty in dress was simply uniform whiteness and many skillfully contrived folds; the whiteness was kept up by the use for woolen garments of the most elaborate system of cleansing applied by the *fullones*, or cleansers, and, for the folds of the drapery, highly trained experts—body servants who knew their business—were employed. It is evident how great an effect these peculiarities of dress had upon the art of sculpture.

In all the above discussion of costume, one thing is very noticeable—the absence of anything like tailoring, except, perhaps, among the Chinese. The clothes of the Greeks and the Romans, like those of the people of the Pacific Islands, always approximated to the ideal of an uncut, unsewed, unaltered piece of textile fabric; square or oblong, as in the himation, chlamys, sagum, or paludamentum; semicircular or semi-oval in shape, or approximately so, as in the toga, or simply sewn down one side so as to make a tubular garment of one piece of stuff, as in the later ebition, and in the tunica. A curious reproduction of this characteristic of ancient costume exists among the wilder Arabs, the Bedouins of the desert, and the horsemen of the uplands. They wear a shirt, indeed, and this is of thicker stuff, and covers the body more completely than what we know by that name, but apart from this their covering is almost wholly a matter of unaltered or scarcely altered pieces of woolen. Perhaps two breadths of the narrower stuff are sewn together to make the *haik*, or, as in the north of Africa, a square of striped woolen stuff is caught up in the middle of one side so as to form a sort of hood, as in the *burnous*; or, as in the *aba* or *abaych*, the square of stuff may

have its two outer edges folded over toward the middle, so that the two edges meet or nearly meet, and then two openings are made in the two outer folds where the stuff is actually creased, which serve as armholes, so that the square blanket resembles an overcoat. But in all this there is absolutely no fitting of the piece of stuff to the body. It is a heavy woolen blanket, which is adapted more or less to the shoulders so as not to slip off, but is not otherwise altered in any way, and might cover a man or a woman, and a person of any stature. What is curious about this costume is the enormously heavy woolen dress worn in the desert and under the semi-tropical sun. It is evident that nothing but a heavy material is expected to keep off the heat of the sun or the burning wind of the desert; and therefore a man who wears only the long shirt, and has the legs and feet, arms and neck absolutely naked, will pile two or three of these heavy woolen things upon his shoulders and head. The result of this arrangement is that the only decoration sought for is in the beauty of two or three colors arranged in stripes of different widths, and broken more or less by the carrying of threads of different colors across the stripes, in the way of counter-charging of heraldry. A much greater development of design by stripes alone is in the cotton *dhurries* of India. The *aba* may indeed be further adorned by very simple embroidery in woolen thread.

The first appearance of any tendency to fit the garments to the person among nations more western than the Chinese is probably in the leg-coverings of the Persians and Syrians, as represented in Grecian and Greco-Roman art, and yet these garments are of extreme simplicity and there is no appearance of tailoring in any modern sense in connection with them. They are merely loose trousers, gathered at the ankles, or sleeved tunics; and their use seems to have come from the mountain regions of Asia Minor and the shores of the Caspian Sea. The barbarians of Europe, Gauls, Scandinavians, and Germans, made up suits of clothes in a not dissimilar way; but it does not seem that their example affected the Greco-Roman world very much.

The beginning of change is to be looked for in the Byzantine Imperial epoch. From a time as early as the seventh century A.D. there is a constant increase in the number of garments worn, and in the elaboration of their shape and their combination, while at the same time the costliness and splendor of the stuffs are in no way diminished, and the custom begins which was destined to have so much effect on the costume of later times in Europe, the sewing of jewels, mounted in slender rings, or *chatons*, of gold or silver gilt, to the material. Sometimes smaller fragments of glittering material of no value were used in this way, as in a later time pieces of mirror were used throughout the lands influenced by Persian decorative ideas. In the Byzantine Empire the dress of the officials shows a certain disposition to follow early Roman traditions, but only in the general shape of outer garments and to a certain extent in their names. The general aspect of a member of the Imperial family, or an officer of the Court, as it is seen in the mosaics of Ravenna, or in the illuminated manuscripts of the time, is altogether different from that of higher antiquity. The robes reached to the feet, they were closely sewed up, and not very loose

or flowing, not greatly tending toward elaboration of folds or to what we commonly call drapery; and over them are worn dalmatics, maniples, and stoles, not merely by the clergy, but by the laity as well, and showing plainly where the peculiar clerical dress took its origin. See COSTUME, ECCLESIASTICAL.

The Eastern influence was still strong, and all costume which was at all splendid was a matter of long and ample robes, made of stuffs of almost incredible richness, and more or less richly decorated by embroidery. Western dress was at this early time very different from anything in common use in the Byzantine Empire, except in so far as that the poorer people, and those engaged in out-of-door work, would naturally dress in almost the same careless fashion east and west. For one thing, it was more nearly classical Roman in character. If the costume of the eleventh and twelfth centuries, in the lands which are now France and Germany and England, be studied in the sculptures of Romanesque and Gothic buildings, or in the rare illuminations of manuscripts of that time, it will be seen that a certain antique or early Roman character obtains in the garments worn by persons presented as kings and princes, which had already been lost in the Eastern Empire. The robed figures of the porch of Chartres, or the doorways of Le Mans, do not seem to record much that was splendid in the way of stuffs or of jewelry, loose or applied to the garment. Their robes are still simply falling in loose folds, girded at the waist and differing from the garments of antiquity mainly in this, that the arms are always covered by sleeves. Men and women alike wore a gown, that garment which in the French archaeological vocabulary is called the *robe*. This garment, which is treated under DRESS, served for people of every rank and of both sexes, but its fashion changed very much, and in like manner the resulting appearance of the clothed figure in the sculptures changed greatly between the twelfth and the fourteenth centuries. In the fourteenth century it grew more and more into that stately but most inconvenient garment, well known to us from the paintings in manuscripts of the time of Richard II. of England, and his immediate successor, and Charles VI. of France. This garment swept the floor. It was girded around the waist with the military belt, or some modification of it; it had sleeves, which also reached the floor, and were of fullness equal to that of the skirts, covering the hands also when the arms hung down. The collar covered the neck completely in a solid cylinder, and rose on the sides nearly to the ears. How this rich and grandiose dress could be used at all in summer, and how it could be girded and shortened in any way, in time of necessity, does not appear, nor is it known whether the men wore complete leg-coverings of some kind beneath this long and completely closed skirt. The dress of elegant women of the same epoch was less elaborately conceived; the same habit of long sleeves prevailed, but the upper part of the sleeve was pierced with a slit through which the forearm could be extended. The result of this was that the robe, as a garment for women, hardly changed during the next two centuries, whereas the use of it for men went out very soon, and while there are still representations of gentlemen of the first half of the fifteenth century dressed in robes reaching

the ground, those robes are far more convenient than before; they are evidently capable of being tucked up, and the man is dressed beneath his skirt, which can either be removed or shortened up to nothing when the occasion of ceremony is passed. Finally, as early as the second decade of the fifteenth century, it disappears from the dress of men, and from that time on the short-skirted garment, called *rochet*, or corset, became the dress of business, while the name *cotte* was then and thereafter given to a very tight-fitting garment, laced or buttoned close to the body and having a skirt reaching only to mid-thigh. This last-named garment existed under the name of *cotte d'armes* as long as the complete suit of armor was worn by gentlemen, and in this case it was embroidered with the armorial bearings of the wearer. The French terms were commonly used in England as well, as Chaucer lets us know; and in modern study we can hardly find English equivalents. Under all these garments were worn the long, close-fitting stockings, serving as the only covering from the waist to the toes, except as the skirt covered the upper part of the thigh. These changes involved the complete establishment of tailoring as the main thing in elegant costume. From the middle of the fifteenth century on, the dress of nobles and courtiers, and of men who affected elegance, was a matter of cutting out and shaping, fitting in gores and gussets, and, in fact, adapting garments closely to the body in the first place, and then covering them with elaborate adornment. This might be applied in the way of *passementerie*, or by modifying the whole surface of the stuff by what we now call quilting and the like. A piece of brocade used for a doublet or the body of a gown would be gathered up into puffs and projecting rounded surfaces, the lines of sewing between those projections being themselves decorated and even including the setting of a pearl or of a jewel of some other kind set in a gold *chaton* at the junction of these two lines of stitching. The stockings were the only part of the dress that was not elaborately decorated; and these stockings were half concealed in the sixteenth century by the enormous *hauts de chausses*, which, in 1530 and the following years, are sometimes in two or three rings of puffs like rounded ridges, passing horizontally around the thigh, and which, in the closing years of Elizabeth's reign and the corresponding times in France, the reigns of Henry III. and Henry IV., are closer in their fit and resemble not distantly the knee-breeches of the eighteenth century. They are, however, made of costly stuff, and elaborately adorned almost in the style of the body-garment. Still again, in the time of James I. of England, the *hauts de chausses* were stuffed (bombasted), or held with springs in a single rounded projection, as if the man had been thrust feet foremost through a rather flat, oblate spheroid. This projected so much all around the hips that the sword had to be hung in a horizontal position and great pains taken to prevent its being entirely dislodged by the monstrous garment.

At no time during the Middle Ages and the epoch of the Renaissance was the tailoring and mantua-making more rich and fantastic than during the French religious wars, and the succeeding reign of Henry IV. Painted portraits, prints from famous engravings, carved ivories,

medallions, and painted enamels of the time, exist in some quantity; and they agree in telling the most extraordinary tale of splendid extravagance in the dress of both sexes. Embroidery was loaded upon bodice and doublet, or was dispensed with only when a very rich brocade was employed; and lace, or its earlier forms of cut-work and drawn-work, and needle embroidery in pierced patterns like filigree, were used with freedom. The circular ruff, projecting like a dish on which the head seems to lie, appears, but is not yet so popular as the broad and flat laced collar, sometimes lying on the shoulders, sometimes standing stiffly out horizontally, or for women in steep, upward slope behind the head and neck. The fashion of bombasted thigh-coverings for the men is identified in artistic history with the reign of Henry IV. of France, but it did not last very long, being replaced by the loose, short trousers of about 1625 and after. No costume in the modern sense is perhaps more graceful and spirited at once than the dress of the gentlemen of the time of Louis XIII., which, with its short trousers, the stocking below covering the calf of the leg, which was concealed by the boots commonly worn out of doors, the doublet, reaching a little below the waist, and worn loose, generally unbuttoned in front and showing the shirt in its full folds, the short cloak, worn on the left shoulder, except when it was gathered around the body, the flat hat, with very broad brim, and soft falling feather, and the broad, loose collar, is a complete and graceful translation into form of those ideas which the modern world has conceived—ideas absolutely contrary to those of antiquity. Simplicity and grace have given place to picturesque combination of small details; and here is the new theory, perfectly put into practice. The reign of Louis XIV. had but little influence on this dress of men, except to stiffen it and make it rigid and hard, but the dress of women improved on the whole in tastefulness throughout the seventeenth century, and as late as 1670 was introduced that admirable costume which we identify with Madame de Sévigné, a skirt not very full, over which was worn a short upper skirt, open in front; a bodice fitting snugly, but not involving very tight lacing; a stomacher, but not excessive in its length; sleeves reaching the elbow, and accompanied by lace ruffles, which partly shroud the lower arm; the bodice cut low, but not to excess, and a cape worn over the neck and shoulders on occasion of going out of doors. The same thing, in simpler stuffs and in graver colors, was worn by the wives of the wealthier *bourgeois*, and this is the dress which we identify with the women of Holland and the English Puritans. It is preserved for us in a great number of paintings, and in the prints from Hollar's engravings; and it has impressed itself upon modern designers as the most complete type of womanly costume which we know; but that is because the richer dress of the time is impossible to realize nowadays—it seems non-human, as if of fairy-land. The eighteenth-century dress in England, which was at times popular and acceptable in decorative design, is a modification of it, not for the better. The fop of 1750 is less beautifully dressed than the *muquet* of 1650, and the ladies of 1775, with their enormous hoops, far less charming in appearance than Madame de Sévigné a hundred years earlier.

The French Revolution in 1789 brought in a number of strange vagaries in dress, red and white striped waistcoats, stockings, striped blue and white in horizontal rings, white cravats wound round and round the neck until they reached the point of the chin, while at the same time the women wore the lightest and thinnest costume possible, in fancied imitation of the Romans. Cocked hats of exaggerated shape for the men alternated with steeple-crowned hats with curly brims; while the female costume was finished by the most elaborate pile of curls and crinups, crowned by an enormous cap, either simply of muslin and lace, or with these combined with a sort of hat half concealed with feathers, flowers, and ruffles of lace. The momentary prohibition of elegances of this sort under the Revolution led to a change in the dress of both sexes, which was not to be temporary, except in details. Thus the dress which we call that of the 'Empire,' the famous 'pink night-gown,' girded immediately below the breasts and hanging thence to the ankles, but so close that a woman could hardly walk and was utterly unable to step across a gutter, was worn with low shoes and with an unprotected neck, while the cold of winter was met by a *pelisse*, generally worn open in front and affording merely shelter for the shoulders and back, however richly it might be furred. The men fell immediately into the simple and not impressive dress of a time when the civilian was of little account, and any man who was elegant in his aspirations found some excuse to wear a military or official uniform. The civilian dress was then merely a waistcoat, over which was worn a long-skirted coat, and the *pantalon*, or tight-fitting breeches reaching to the ankle instead of the knee. The large and loose white cravat still continued. From these dresses all our modern fashions have followed, succeeding one another through such changes as this—the coat with a round skirt, projecting much from the hips, from 1830 to 1840; the double-breasted dress coat (*habit*), from 1840 to 1850, or thereabout, often blue, with gold buttons, often claret-colored or brown; the very high coat-collars, worn with either or both of these fashions, but disappearing about 1835; trousers succeeding the *pantalon*, and worn rather close-fitting, and with an immense spread, or 'spring,' at the bottom, covering the boot almost to the toes, succeeding the strapped trousers of an earlier time, and succeeded in turn by the 'bags,' as the English slang term very properly has it, which, since 1860, have remained in fashion throughout western Europe and the nations of European settlement, and constitute certainly the ugliest article of costume hitherto discovered by mankind. The dress of women, now that we approach our own time, and the changes of every year become known to us, has a relative importance so diverse, with so many and such almost imperceptible changes, that a consideration of this is left for the article FASHION.

BIBLIOGRAPHY. A general work, containing 500 plates, most of them colored, and an elaborate commentary with an analysis of each plate, as well as some essays showing considerable insight, is Raeniet, *Le costume historique* (6 vols., Paris, 1888), published both in folio and in a more convenient small quarto.

Modern Costume.—Eastern: Lane, *Account of the Manners and Customs of the Modern Egyptians*, ed. by Lane-Poole (London, 1871); the article "Dress," fully illustrated, in Hughes, *Dictionary of Islam* (London, 1885); Watson, *Textile Manufactures and Costumes of the People of India* (London, 1868), with numerous colored plates; Audley and Bowses, *Keramic Art of Japan* (Liverpool, 1875-80). European Countries: Hefner-Alteneck, *Trachten, Kunstwerke, und Geräthschaften vom frühen Mittelalter bis Ende des 18ten Jahrhunderts* (2d ed., 10 vols., Frankfurt, 1879-89); Falke, *Kostümgeschichte der Kulturvölker*, 377 illustrations (Stuttgart, 1882); Planché, *Cyclopædia of Costume* (London, 1876-79); Lacroix, *Manners, Customs, and Dress of the Middle Ages and the Renaissance* (London, 1877); id., *The Eighteenth Century, Its Institutions, Customs, Costumes* (London, 1887); Bonnard and Mercuri, *Costumes historiques des XVIIe, XVIIIe, XIXe et XVe siècles*, 200 plates (Paris, 1867); Cheygnard and Duplessis, *Costumes historiques des XIe, XVIIe, et XVIIIe siècles* (2 vols., 150 plates, Paris, 1867); Viollet-le-Duc, *Dictionnaire raisonné du mobilier français*, vols. iii. and iv. (Paris, 1872-73); Jacquemin, *Iconographie générale et méthodique du costume du I^{er} au XIX^e siècle*, 315-1815 (Paris, 1876), a large folio of 200 elaborate plates, with supplement (Paris, n. d.) of 80 more; Strutt, *Regal and Ecclesiastical Antiquities of Great Britain*, 72 plates (London, 1842); M'lan and Logan, *Clans of the Scottish Highlands* (2 vols., 72 plates, London, 1857); Planché, *History of British Costume* (London, 1874); Hill, *History of English Dress* (London, 1900); Fairholt, *Costume in England*, Bohn's Library (London, 1885), a small but trustworthy handbook. For the American aborigines: Dellenbaugh, *North Americans of Yesterday* (New York, 1901); for the English colonies in America: Earle, *Costume of Colonial Times* (New York, 1895).

Books on decorative art often deal with parts of costumes, and collections of engravings, historically arranged, like Hirth, *Kulturgeschichtliches Bilderbuch aus drei Jahrhunderten* (Leipzig, 1895), as well as prints from the engravings of Direr, Collot, Hogarth, and other realists, which are often to be had in photographic reproduction.

COSTUME, ECCLESIASTICAL. The dress worn by ministers of religion as such, in contradistinction to the dress of ordinary life in different lands and periods. It may best be treated under two heads, the costume worn by the clergy in the exercise of their public functions, and that which constitutes the distinctive dress or habit of the various religious orders and communities.

OFFICIAL COSTUME.

Under the Jewish dispensation, the costumes of the officiating priests and Levites, like everything else pertaining to the divine worship, was

minutely prescribed and rigidly observed through centuries. It seems, however, clearly established that in the earliest Christian centuries no other dress was worn by the officiating clergy than the ordinary costume of their locality. No quotation can be adduced from any author of the first five centuries alluding to any distinctive vestment. In the Middle Ages a theory was held that the vestments then in use were directly derived from the Jewish ceremonial; but so early as the middle of the ninth century Walafrid Strabo (see WALAFRID) clearly affirms that Christian priests in the early centuries officiated in the dress of common life. In this, as in so many other particulars of ritual, the delay in establishing elaborate and splendid observances may be attributed largely to the state of obscurity and proscription in which the Church lived until the time of Constantine. Special garments were sometimes set apart for use in public worship, of the same shape but of costlier material.

The use of vestments since the establishment of a formal system must be considered chiefly under the usage of the Roman Catholic Church, which has regulated them most definitely and elaborately. They may be treated under three heads—sacrificial, episcopal, and general.

SACRIFICIAL. The *chasuble* is the principal vestment regarded as strictly sacerdotal or sacrificial. It was originally an ample round mantle falling over the arms, but this, while

CHASUBLE, OLDER FORM.

a far more picturesque vestment than the modern "fiddle-back," was found practically so inconvenient that in the sixteenth and seventeenth centuries it was cut away more and more, until the arms were left entirely free. The change in form may best be seen from the accompanying illustrations. Traces of its use as a distinctively ecclesiastical vestment are found as early as the first half of the sixth century, and the Fourth Council of Toledo (633) expressly mentions it as such. Its use seems not to have been at first confined to priests; and even to this day the deacon and subdeacon at solemn mass in Advent and Lent (except on *Gaudete* and *Lætare* Sundays) wear folded chasubles, which, however, they lay aside when they sing the Epistle and Gospel. Chasubles are also sometimes worn by canons and other dignitaries simply present in choir at a pontifical mass. In most Western countries a large cross is embroidered on the back; in Italy, usually on the front. The *stole* is a narrow strip of the same material as the chasuble, with at least one cross embroidered on it—generally three, and other elaborate deco-

ration. It is considered a symbol of priestly jurisdiction, in which sense the Pope wears it constantly, even when not officiating. It is worn as a rule in the administration of all the sacra-

CHASUBLE, MODERN FORM.

ments. At mass the priest wears it crossed over his breast, and the deacon over his left shoulder; at other times it is worn hanging straight down. The earliest traces of its use in the West as a sacerdotal vestment are found in Spain, where the Council of Braga (563) speaks of the *orarium* as worn by deacons, and the Fourth Council of Toledo mentions it as a vestment of bishops, priests, and deacons. The name of stole (Gk. *σκολή*) is properly applied to an enveloping garment such as was commonly worn by women in ancient Rome; and therefore the earlier use of the word in the Greek ecclesiastical writers must not be taken as applying to what is now called a stole; *orarium*, however, in later Latin, meant a handkerchief, sometimes worn as a scarf. The employment of this word suggests that the stole may have been originally a practical appendage of linen, designed for wiping the face during the service. The *maniple* is similar to a shorter stole, worn pendent from the left wrist alike by priest, deacon, and subdeacon at mass. Its origin was very possibly similar to that suggested for the stole—though a symbolical meaning has been found for it as typifying the cords with which Christ was bound before His passion. The *alb* is a close-fitting garment of plain white linen reaching to the feet, though the lower part is nowadays often made of lace, and sometimes pieces of embroidery called apparels are sewed on it in four places. Originally it was probably nothing more than the ordinary tunic of Greek and Roman costume. It is confined around the waist by a white linen girdle. The *amice* is a piece of fine linen, oblong in shape, which the priest rests for a moment on his head, and then spreads on his shoulders, tying it by strings in front. It originally covered the head, and to this day, in the Franciscan and Dominican rites, which have

preserved certain traditional peculiarities, the priest wears it in that position until he reaches the altar. It is supposed to symbolize the helmet of salvation. The *bands* were worn by French ecclesiastics, even with street costume, and until recently very generally in Protestant pulpits, have been supposed to be a relic of the amice, but are more probably from the ruff or band of general sixteenth-century costume, which was formally prescribed by Queen Elizabeth to English clergymen. The special vestments of the deacon and subdeacon are the *dalmatic* and *tunicle*, which differ very slightly, both being close-fitting vestments of the same material as the chasuble, reaching to the knees and with tight sleeves.

The color of all vestments seems to have been white at the first. Even the pseudo-Aleuin (tenth or eleventh century) knows of no other, with one or two minor exceptions. Innocent III. (Pope 1198-1216) is the first to mention the use of four colors, naming black instead of the modern violet, which he regards as merely a variant of black. The modern usage prescribes *white* for the feasts of our Lord, of virgins who were not martyrs, and of confessors; *red* (the color of fire and of blood) for the feast of Pentecost and of all martyrs; the mourning *violet* for the season of Advent and from Septuagesima to Easter; and *green* (the color of hope) for ferial or ordinary days. *Black* is worn on Good Friday and in services for the dead. This covers the general rule; space will not allow the details of minor exceptions. Cloth of gold is supposed to take the place of white, red, or green.

EPISCOPAL. The vestments officially worn by a bishop in the exercise of his functions are numerous and partly general, partly peculiar to his office. A bishop fully vested for celebrating solemn mass wears (over a purple cassock or a black one with red buttons) amice, alb, girdle, stole, maniple, tunicle, dalmatic, chasuble, and mitre, and carries his pastoral staff in his hand. The ring and pectoral cross which he wears at other times must also be included, as must the buskins or sandals and the gloves, which complete the pontifical attire. There is also the *gremial veil*, an embroidered cloth which is spread over his knees when he sits during the service. In other functions, such as confirmation, he wears cope and mitre, with a stole for the administration of the sacraments; but if he wishes to administer e.g. confirmation less solemnly, he may wear simply the rochet. The *mitre* is the principal ornament peculiar to the episcopal office. It is a head-dress worn in solemn services by bishops and by certain abbots who preside over specially distinguished monasteries known as 'mitred' abbeys. It may be described as a tall, tongue-shaped cap, terminating in a twofold point, which is supposed to symbolize the cloven tongues in the form of which the Holy Ghost came upon the Apostles. Two mitres are worn in pontifical functions; one called the precious or costly mitre, the other of plainer material and ornament. The *pastoral staff* or *crozier* in the case of bishops resembles a shepherd's crook, and is given to them at their consecration as a symbol of the authority with which they are to rule their flocks. An archbishop's pastoral staff does not differ from a bishop's; but he sometimes has carried in front

of him a staff surmounted by a cross or crucifix—that of a patriarch having two cross-bars. Another vestment peculiar to archbishops is the *pallium*, a circular band of white woolen stuff surrounding the neck, with a pendent strip before and behind; the whole being marked with several crosses. It is a symbol of jurisdiction, worn by the Pope and by him bestowed on archbishops, who wear it at high mass on solemn days, but only within their own jurisdictions. The *sandals* were not originally confined to bishops; the earliest authors who mention them allude to a special shape worn by deacons and subdeacons. Their early distinct liturgical use is an incidental proof that the vestments are derived from the costume of every-day life, not from that of the Jewish priests, who officiated barefoot. The *pectoral cross* is a small gold cross adorned with jewels, which is worn on the breast by bishops and abbots as a mark of their office. Innocent III. is the first author to mention its use. The *episcopal ring*, worn on the right hand and generally set with a large amethyst, is supposed to symbolize that the bishop is wedded to his diocese. Among less formal vestments, the *rochet* alluded to above is a close-fitting vestment of linen, somewhat like a shorter alb or a surplice with tight sleeves; it is worn by bishops and abbots, also sometimes as a special privilege by canons. The *mozzetta* is a short cape covering the shoulders, a part of the state dress of bishops when not pontificating, and is worn with the rochet. The *mantelletta* is a sleeveless garment of silk or woolen stuff reaching to the knees, worn by cardinals, bishops, and other prelates. It is used to cover the rochet, so that bishops wear it when out of their own dioceses, the uncovered rochet being a symbol of jurisdiction. The other vestments worn by a bishop have already been described, with the manner of their use, except that, wearing the pectoral cross upon his breast, he does not cross the stole as a priest does when preparing to celebrate. The combination of dalmatic and tunicle with the chasuble is supposed to express the union of all the orders in the episcopal office.

GENERAL. The most important vestment to be mentioned under this head is the *cope*, a wide cloak of silk or other costly material reaching nearly to the feet and fastened in front by a clasp called the *moose*, and having a semi-circular hood at the back. While it is worn by the officiating priest in benediction and other solemn rites, it is not distinctly a sacerdotal vestment, and is worn by cantors at solemn vespers and by other laymen. The *humeral veil* is an oblong scarf of the same material as the chasuble, worn by the subdeacon at high mass when he holds the paten from the offertory to the Pater noster, and by the priest when giving benediction or carrying the blessed sacrament in procession. It is worn over the shoulders, the paten, pyx, or monstrance being wrapped in it. The Levites (Num. iv.) were allowed to bear the sacred vessels only when wrapped in coverings; and although those in holy orders (and they alone) are allowed to touch the eucharistic vessels with the bare hands, the use of the veil is probably an expression of the feeling of reverence inculcated by the Jewish rule. The *surplice* (called also *cotta* at first in Italy, now generally) is a garment of linen worn by all clerics and assistants in choir and by priests in the adminis-

tration of the sacraments. As late as the twelfth century it was supposed to reach to the ankles, but in modern times it has been very much curtailed, and since the seventeenth century commonly ornamented with lace. Under all the other vestments is worn the cassock, a close-fitting garment reaching to the feet, which is the distinctive dress of clerics, in church and out. The color varies, being black for a simple priest, purple for a bishop, and red for a cardinal; the Pope alone wears a white cassock. The *berretta* (or *biretta*), which is also a part of the priest's street or house dress, must be mentioned under official costume, as the rubrics prescribe it for the sacred ministers going to the altar and for ecclesiastics in choir. It is a square eap with three ridges extending outward from the centre of the top—four in the case of doctors of divinity. "At Rome," says Benedict XIV., "and in most churches the berretta was unknown as late as the ninth century. Its ecclesiastical use began when priests gave up the ancient custom of covering their heads with the amice till the actual beginning of the mass." The *zucchetto* is a small, round skull-cap, of color suited to the wearer's rank, which, if worn in church, is removed only at the most solemn parts of the services.

EASTERN VESTMENTS. The influence which between the eighth and twelfth centuries in the West bore so strongly upon the development of ecclesiastical costume, that of the numerous liturgical writers, was almost wholly lacking in the East, where between the Patriarch Germanus of Constantinople in the eighth century, and Simeon, Archbishop of Thessalonica in the fifteenth, scarcely one of importance is to be named. The natural conservatism of the Oriental mind has also militated against change in the ecclesiastical usages. The Western maniple, amice, and cope are unknown in the Greek and Russian churches; in place of the first-named, somewhat similar bands (*cpimanikia*) are worn around both arms by bishops, priests, and deacons, those of the bishop being richly ornamented. The lector and readers wear an ample white or reddish vestment called *phelonion*, but differing from the priestly chasuble in only reaching to the waist. The subdeacon wears the *sticharion*, a sort of dalmatic, narrower and shorter than that of the deacon, who wears in addition the *orarion* or stole hanging before and behind over the left shoulder. The *sticharion* has undoubtedly developed from the alb, but more closely resembles the dalmatic both in shape and material. The priest wears the *sticharion*, the *epitrachelion* (a long narrow stole something like an archiepiscopal pallium in the West), the *zone* or girdle, and the *phelonion* or chasuble, which in Russia is much abbreviated in front, but hangs down to the ankles behind. The episcopal vestments are in the main similar to those of the priests, but more richly decorated; the bishop's *phelonion* is adorned with many small crosses. Instead of this vestment the Greek metropolitans, and in Russia all bishops since the time of Peter the Great, wear the *sakkos*, a tight-fitting garment supposed to symbolize the seamless robe of Christ. The episcopal gloves, sandals, and ring are not in use. The head-covering resembles a crown more than the Western mitre. The specific episcopal insignia are a pastoral staff, generally

in the shape of a T; the *epigonation*, a lozenge-shaped ornament of stiffened silk bearing a cross or picture, which hangs from the girdle on the right side, and the *omophorion*, a broader pallium with four crosses. The only colors normally used for all these vestments are white and dark red, the latter in penitential seasons.

ANGLICAN AND PROTESTANT USAGE. The universal tendency of the Reformers was naturally to dissociate themselves from the older Church by abandoning to a greater or less extent the ceremonies and vestments used by it. The Lutherans and the Anglicans, however, showed a more conservative spirit than the others. Luther himself considered the matter one of indifference; and his followers for a long time retained most of the old vestments, even the chasuble being worn in Sweden and Denmark, where the Lutheran bishops also wear copes and pectoral crosses. But the Calvinists and other more extreme Reformers of the Continent abolished the older vestments completely, and adopted the black Genevan gown or *robe de Calvin*. This, which is nothing more than the ordinary dress of a scholar in the sixteenth century, with the white bands at the neck, has become a distinctive costume of Protestant ministers for officiating. In recent years there has been a notable tendency, especially among the Scotch Presbyterians, toward the restoration or adaptation of ancient customs, and surpliced choirs have been introduced among other 'ritualistic' usages. The semi-military costume of the Salvation Army officers may be referred to as in some degree illustrating the same tendency.

The question of vestments was a very thorny one throughout the whole reign of Elizabeth, whose impulse in favor of decent and orderly ceremonial, at least, ran counter to the views of the advanced Puritan party, vigorously abetted by the Continental, and especially the Swiss, Reformers. (See ADVERTISEMENTS OF ELIZABETH.) The first Prayer-Book of Edward VI. had prescribed "a white albe plain with a vestment [chasuble] or cope" for the celebrant, and albs with tunicles for the assistants. The second Prayer Book, which represented the extreme attainment of innovation, ordered that "the minister shall use neither albe, vestment, nor cope, but being archbishop or bishop, he shall have and wear a rochet; and being a priest or deacon, he shall have and wear a surplice only." But this minimizing injunction was only temporary, and was followed by a cautious return to something like the previous standard. The present law, as contained in the Prayer Book, unchanged since 1661, is somewhat vague, being merely an authorization of the "ornaments of the Church and of the ministers thereof" as used by the authority of Parliament in the second year of King Edward VI. The Ritualistic School contends that this permits, if it does not enjoin, all the ancient vestments; and in recent times the clergy of that school have restored almost all of them, copying in many cases the modern Roman usage with great exactness, so that nothing distinctive remains to be said about them. Throughout the greater part, however, of the post-Reformation period, the Anglican use was uniform; for all ministrations except preaching, a linen surplice reaching to the feet and open in front, without a cassock, and a wide black stole (or more properly scarf, since it is contended with some

show of probability that it was not a stole, but the scarf worn as a distinctive mark by noblemen's chaplains), and for preaching the black gown with bands, until toward the middle of the nineteenth century it was displaced amid a storm of controversy by the surplice for that function also. The use of the surplice by men and boys in the choirs of English cathedral and collegiate churches was continuous throughout the post-Reformation period, and with the ritual revival became general in other churches as well, the cassock being added. In the closing years of the nineteenth century the custom of arraying women singers in these vestments was adopted by a number of churches, but strongly reprobated by many bishops as a gross violation of propriety.

The history of Anglican episcopal costume has some curious features. The first Prayer Book of Edward VI. directed a bishop "to have upon him, besides his rochet, a surplice or albe, and also a cope or vestment [chasuble] and also his pastoral staff in his hand or else borne or holden by his chaplain." Amid the gradual dis-use of the older vestments, the cope continued to be frequently worn, instead of the chasuble, in cathedrals, as expressly enjoined by the twenty-fourth canon of 1603. Blunt says "it was so used in Durham Cathedral until the end of the eighteenth century, being first discontinued by Bishop Warburton, through irritable impatience on some collision between his wig and the collar of the cope." The characteristic dress of the modern Anglican bishop consists of rochet and chimere; the latter may be merely a survival of a sleeveless garment so called, worn by persons of position in the thirteenth to sixteenth centuries, but more probably originated as an episcopal dress from the habit of bishops under Henry VIII. and Edward, of wearing their scarlet doctor's gowns with their rochets; in Elizabeth's reign the more sober black was substituted, and the tailors of the Stuart period sewed the sleeves of the rochet, greatly enlarged, to the chimere. The latter may be pressed into an analogy to the mantelletta of Roman Catholic bishops.

MONASTIC COSTUME.

The principle of uniformity of dress to mark those who lived a common life was adopted even among the early monks of the Egyptian deserts. The character of the Eastern religious costumes was usually, as far as can be determined from the vague descriptions of early writers, such as to express a spirit of penitence and differentiate their wearers from the gaily dressed worldlings. The early Western founders, Saint Benedict and even Saint Francis, prescribed the general character but not the exact shape and color of the garments to be worn by their followers. Custom gradually, in a community life, crystallized into rule. But since the thirteenth century the founders of orders have usually laid down the exact details of the habit to be worn, as a sort of regimental uniform. The notable exceptions are Saint Ignatius, Saint Philip Neri, and Saint Vincent de Paul, whose followers have never worn anything but the ordinary dress of secular priests. The wearing of the habit at all times is most strictly enjoined upon members of religious orders, except when it is sometimes dispensed with in non-Catholic countries; the early Jesuits in China, in pursuance of their policy of adapting themselves to the customs of the country, wore

the native costume. (See illustration of Father Adam Schall in the dress of a mandarin.) Normally, however, the habit is always worn, taking

FATHER ADAM SCHALL, S. J., IN MANDARIN COSTUME.

the place for preaching (and in some places for administering the sacrament of penance) of the surplice and stole. For specific details of the costume of the various orders, see the articles under their titles.

COS'WAY, RICHARD (1740-1821). An English miniature-painter, born at Tiverton. He studied in a London drawing-school, while serving as waiting-man there, and in 1771 became a member of the Royal Academy. He painted in oil and water-color, but his fame rests principally on his miniatures, most of which were of the aristocracy.

COT. kôt, PIERRE AUGUSTE (1837-83). A French painter, pupil of Cogniet, Cabanel, and Bouguereau. He painted at first historical subjects, later also portraits, and acquired great reputation, especially by his female heads. Among his most noteworthy works are: "Spring Time;" "Day of the Dead at the Campo Santo of Pisa;" "Dionisia;" "Prometheus;" "Meditation;" and "Mireille," in the Luxembourg Gallery. He was decorated with the cross of the Legion of Honor.

COTA. RODRIGO C. DE MAGUAQUE. A Spanish poet of the fifteenth century, born at Toledo. His reputation rests upon the dainty, witty *Diálogo*

entre el Amor y un caballero viejo, which appeared first at Modena in 1569. The authorship of this poem has been much disputed, but it seems quite safe to attribute it to Cota. He wrote *Las Coplas de Mingo Revulgo* (c.1472), and may have written the first act of the comedy *Celestina* (1480), which was finished by Rojas. He also produced some satiric poems.

COTAN'GENT. See TRIGONOMETRY.

CÔTE-D'OR, kôt'dôr' (Fr., golden hill). A department in the east of France (q.v.), formerly part of the Province of Burgundy (Map: France, L 4). Area, 3383 square miles; population, in 1896, 366,054; in 1901, 361,626. The surface is in general elevated, and is traversed by a chain of hills forming the connecting link between the Cévennes and the Vosges. A portion of that range, the Côte-d'Or ('golden hill'), which gives its name to the department, is so called on account of the excellence of the wines produced on its declivities. A great part of the department is covered with forests. The valleys and plains are fertile, and there is good pastureland, but agriculture is in a backward state. Côte-d'Or is watered by the Seine, which rises in the northwest, and by several of its affluents; by the Saône, and by the Arroux, a tributary of the Loire. Capital, Dijon.

COTELIER, kôt'lyá', or **COTELE'RIOUS**, JEAN BAPTISTE (1627-86). A French Hellenist. He was born in Nîmes, studied theology and philosophy in Paris, and in 1654 became counselor of the Archbishop of Embrun. He was appointed assistant librarian in the Royal Library in 1667, and in 1676 he became professor of Greek at the Collège de France. His principal publication, and one which made him widely famous, was his edition of the *Sanctorum Patrum qui Temporebus Apostolicis Floruerunt Opera Græce et Latine* (Paris, 1672). It was republished by Lelere in 1698, and another edition of it appeared in 1724.

COTES, kôts, ROGER (1682-1716). An English mathematician and physicist. He was born at Burbage, in Leicestershire; was graduated at Trinity College, Cambridge; became a fellow in 1705; and, in 1706, on the recommendation of Newton, Whiston, and Bentley, was made Plumian professor of astronomy. Cotes was editor of the second edition of Newton's *Principia* (1713). Various mathematical papers of his own, bearing on logarithms, trigonometry, and geometry, were published posthumously under the title *Harmonia Mensurarum* (Cambridge, 1722). Several theorems are known by his name—e.g. to determine the harmonic mean between the segments of a secant to a curve of the *n*th order reckoned from a fixed point (see CURVES; CIRCLE); and also the well-known theorem of trigonometry: If A is any point on the radius OB of circle O, and if the circumference is divided into *n* equal parts BP₁, P₁P₂, P₂P₃, . . . and into 2*n* equal parts BQ₁, Q₁P₁, P₁Q₂, . . ., the product AP₁ · AP₂ · AP₃ · . . . (*n* factors) = ± (OAⁿ - OBⁿ), and AQ₁ · AQ₂ · AQ₃ · . . . (*n* factors) = OAⁿ + OBⁿ.

Cotes was held in the highest esteem by the scholars and scientific men of his time. Newton remarked of him: "If Cotes had lived, we might have known something."

COTES, SARA JEANNETTE DUNCAN (1861—). An English novelist. She was born at Brant-

ford, Ontario, Canada, and was educated at the Collegiate School there. She found her way to the novel through letters and sketches contributed to newspapers and periodicals, and made a brilliant success in *A Social Departure*, the observations of a tour round the world in 1889-90 with Mrs. Lilian Rood. In 1891 Miss Duncan married Everard C. Cotes, a press correspondent of Simla, India, and has since written several stories of Anglo-Indian social life. Among her novels are: *An American Girl in London* (1891); *A Daughter of To-day* (1894); *Vernon's Aunt* (1894); *The Simple Adventures of a Memsahib* (1893); *The Story of Sonny Sahib* (1894); *His Honour and a Lady* (1896); *A Voyage of Consolation* (1898); *The Path of a Star* (1899); *The Other Side of the Latch*, the diary of an invalid in Simla (1901); *Those Delightful Americans* (1902).

CÔTES-DU-NORD, kôt'-du-nôr'. A department in the northwest of France (q.v.), formerly a part of Brittany, bounded on the north by the English Channel (Map: France, D 3). Area, 2659 square miles. Population, in 1896, 602,657; in 1901, 609,349. The Armoric hills, called also the Montagne Noire, and the Menez Mountains, cross the department from east to west. These formations give a rude and broken aspect to the coasts. The chief rivers, which are short but navigable, are the Rance, Gouët, Trieux, Guer, and Arguenon. The cultivation of flax and hemp, with the pasturing of cattle and iron-mining, supply employment in the mountainous districts; while in the sheltered valleys and on the coast levels grain, with pears and apples and other fruits, are produced. The coasts are well supplied with various kinds of fish. Capital, Saint Brieuc.

COTGRAVE, RANDLE (?-c.1634). An English lexicographer, born in Cheshire, and educated at Saint John's College, Cambridge. It was while he was secretary to William Cecil, Lord Burghley, that he compiled his French-English dictionary (1611). Other editions were published in 1632, 1650, 1660, and 1673. The work contains many absurd errors, but it shows much more care than similar productions of that time, and is still much used by philologists.

CÖTHEN, or **KÖTHEN**, kē'ten. An ancient town of the German Duchy of Anhalt, situated on the Ziehe, about 22 miles north of Halle (Map: Germany, D 3). The streets are broad and the town is neat and well built. It is surrounded by high walls, and is divided into the old and new towns and four suburbs. Among its notable public buildings are the Gothic Church of Saint James, with some fine old stained glass and a handsome organ, and the former palace, now used as a museum and containing a library of 20,000 volumes. The chief industry is the manufacture of beet-sugar; there are also iron-foundries and machine-works. Population, in 1890, 18,215; in 1900, 22,100. Cöthen was an old Slavic settlement, and received municipal privileges in the twelfth century. In 1547 it joined the Schmalkaldic League and was taken by Charles V. Until 1853 it was the capital of the Principality of Anhalt-Cöthen.

COTHURNUS. See **BUSKIN**.

COT/DAL LINES. A system of lines on a globe or chart which show the movement of the

ocean tidal waves. The lines join the places where high water occurs at the same moment.

COTILLON. A French dance, the same as the german, and performed to quadrille music. It was a fashionable dance at the Court of Charles X., where it had been adapted from a peasant dance. At first for one, then for two performers, it soon became a *roude* dance, in which form it was introduced into England. There are hundreds of possible figures in the modern dance and the accessories are most elaborate. The cotillon is begun by a small number of couples, who occupy the floor while the rest of the guests sit about the ballroom. These couples select others from among those seated, and after going through a figure all take seats and are replaced by other couples until the whole company has danced that particular figure. Another method is for each set of couples to dance a different figure. There is a good description of some excellent figures in Grove, and collaborators, *Dancing* (London, 1895).

COTIN, kôt'tän', CHARLES (1604-82). A French poetaster, born in Paris. He was royal councilor and almoner to the King under Louis XIV., and in 1655 was admitted to the Académie Française. His knowledge of the Oriental and classic languages was extensive, and he was a member of the literary circles of the Hôtel Rambouillet and other salons. His verse, of which the *Poésies chrétiennes* (1657) are the most creditable, is of no importance. He is, however, unenviably famous as the object of Boileau's ridicule (*Satires*, 3, 8, 9) and the original of Trissotin in Molière's *Femmes savantes*.

COTINGA, kō-tēn'gā, or **CHATTERER** (native South American). A bird of the family Cotinidae, allied to the waxwings and manakins. Cotingas are numerous, both in species and individuals, inhabit tropical America exclusively, feeding on insects and fruit, and are remarkable for the splendor of the nuptial plumage worn by the males in many cases, or for eccentricities of ornament. The bell-bird and umbrella-bird, elsewhere described, are cotingas exemplifying such peculiarities, and the cocks-of-the-rock are included by some systemists. They have been specially studied by Dr. Leonard Stejneger, who refers to the group as follows in the *Standard Natural History*, vol. iv. (Boston, 1885): "The greater number of the species of cotinga are plain-colored, gray, rufous, or greenish . . . though even among these rather modest forms there are some which are more or less highly adorned. Among these is the rose-breasted 'fly-catcher' (*Hadrostomus Aglaia*), with a beautiful crimson rosy patch on the breast, which just enters our fauna across the southern frontier. Nevertheless, the cotingas are, generally considered, especially bright-colored and curiously adorned birds. . . . From Central America we have the exquisite *Carpodectes*, white all over, with a delicate tinge of bluish-gray washed over the upper surface; from Guiana to Brazil are found the deep purplish-carmine *Xipholena*, with white remiges, and the great wing-coverts singularly lengthened, narrow and stiffened, like a woodpecker's tail-feathers; the glorious cotinga, shining azure-blue, with purple throat, from the same countries; the greenish, fork-tailed *Phibalura* from Brazil; and the small, pipra-like *Iodopleura*, curious on account of the rare lilac

COTINGAS, ETC.

1. BAND-TAILED PLANT CUTTER (*Phytotoma rara*).
2. YELLOW-CRESTED PITTA (*Pitta coronata*).
3. AMAZONIAN COCK-OF-THE-ROCK (*Rupicola rupicola*).

4. GOLDEN-CAPPED MANAKIN (*Pipra auricapilla*).
5. ECUADORIAN UMBRELLA-BIRD (*Cephalopterus penduliger*).

color of the sides of the body hidden under the wings." Of all these the females are plainly colored, mostly gray, and are therefore inconspicuous when making their nests or brooding—an important precaution against the extinction of the race; and the gaudy hues of the males are molted to a great extent during the off-season, when their dress is much plainer than in the season of courtship. None of these birds are notable as singers, though several utter loud and singular cries. See Plate of COTINGAS.

COTISE, kō'tīs, or **COST** (Fr. *côte*, side). In heraldry (q.v.), one of the diminutives of the bend.

COT'MAN, JOHN SELL (1782-1842). An English engraver and painter, born at Norwich. He painted in oil and water-color, but is probably better known by his architectural etchings, collected and published under the title, *Etchings of Architectural and Picturesque Remains* (1838). There are two water-color drawings by him in the South Kensington Museum, London, and one picture in the National Gallery. Cotman is now more appreciated than when he was alive, and is called the most gifted of the Norwich school.

COTONEASTER (Neo-Lat., from Neo-Lat. *cotouca*, quince, Lat. *cotonea*, wallwort). A genus of plants of the natural order Rosaceæ. The species are pretty numerous, shrubs or small trees: some of them evergreen, with simple, undivided leaves, more or less woolly beneath, small flowers in lateral cymes, and small fruit not agreeable to the palate, but the bright color of which, and its remaining on the tree in winter, make them very ornamental. These plants, while common in Europe, seem little known in the United States. *Cotoneaster integerrima* is a deciduous species, a native of hills in Europe and Siberia. *Cotoneaster tomentosus* is found in the Alps. Most of the species are natives of mountainous parts of Asia: they are sufficiently hardy for the climate of Great Britain, where they are among the most common ornamental shrubs. Some of them, as *Cotoneaster rotundifolia* and *Cotoneaster microphylla*—both from the north of India—are much used for covering walls.

COTOPAXI, kō'tō-pāk'sé; *Sp. pron.* kō'tō-pä'né. The loftiest active volcano in the world. It is in Ecuador, in the eastern chain of the Andes, about 40 miles nearly south of Quito, and about 50 miles south of the equator, in longitude 78° 42' W. (Map: Ecuador, B 4). La Condamine estimated the height at 18,860 feet; Reiss, the first to ascend it (in 1872), found it to be 19,500 feet; and Whymper (in 1880), 19,613 feet. The valley at its foot, however, is itself over 9000 feet above the sea. The upper part of Cotopaxi, a perfect cone for a distance of 4400 feet, is entirely covered with snow, with the exception of the immediate margin of the crater, which is a bare parapet of rock. The snow-line on the northern exposure is 15,600 feet, and on the southern exposure 15,200 feet, above sea-level. Reiss, whose measurements are largely accordant with the more recent ones of Whymper, estimated that the crater, which is elliptical, has a depth of 1500 feet and a maximum diameter of about 2600 feet. Below the snow-line is a well-marked barren belt covered with lichens and shrubs, below which again is forest. Smoke issues from

the summit; sounds as of explosions are occasionally heard; and, also, a fiery glow is often visible by night. Lava rarely flows even during eruptions, but flame, smoke, and immense volumes of ashes are then ejected; and when the heat melts large masses of the snow lying on the sides, destructive floods are occasioned in the valleys beneath. The first eruption recorded was in 1533. Others followed in 1698 and 1743, since which date numerous eruptions have occurred. One of the most violent was that of 1768, during which ashes, thrown high into the air, were transported by the winds and thickly strewn over an area of about 250 miles in diameter. One of the more recent violent eruptions was in 1877.

COTRONE, kō-trō'nā. An episcopal city (since the sixth century) on the Gulf of Taranto, 146 miles, by the winding railway, south of Taranto (Map: Italy, M 8). It has a castle of the time of Charles V., a cathedral, and an excellent, though small, harbor. Of the Temple of Hera on the Caeinian promontory (now Cape Colonne), seven miles to the southeast, which was the most magnificent structure of the kind in Magna Græcia, only one solitary, but conspicuous, column remains. The worship of Hera has been replaced by that of the Madonna del Capo, to whose church, near the temple, the young girls of Cotrone go in barefoot procession every Saturday. The town markets oranges and other fruit, oil, licorice, wine, grain, and turpentine. The ancient Cotrone was an Achaean colony, founded in B.C. 710. In B.C. 540 Pythagoras, after being banished by Polycrates of Samos, established his brotherhood here and acquired such influence in the oligarchical council that the people rebelled, and expelled the Pythagoreans and established a democracy. Cotrone suffered severely during the Pyrrhic wars (see PYRRHIUS) and in the later years of the Second Punic War was Hannibal's headquarters for three successive winters. It then sank into obscurity not to appear again in history until the wars of Narses and Belisarius (q.v.) against the Goths. In the days of Herodotus, and long after, the medical school of Cotrone was the most famous in the Greek world. Population (commune), in 1881, 9649; in 1901, 9610.

COTS'WOLD. See SHEEP.

COTSWOLD, or **COTESWOLD HILLS** (village meadow, from *cot*, hut + *wold*, meadow). A range of oolitic and lias hills, running through the middle of Gloucestershire, England, from Clipping Camden in the northeast to near Bath in the southwest, parallel to the Avon and Severn (Map: England, D 5). They are 54 miles long, in some parts 8 miles broad, and cover 312 square miles, with an average height of 500 to 600 feet. The highest points are Cleave Hill (1134 feet) and Broadway Hill (1086 feet). The surface is generally bare, but corn, turnips, and sainfoin are grown, and coarse-wooled sheep are raised.

COTTA. The name of a family of German publishers, whose establishment was founded in Tübingen in 1649. It included the eminent theologian, JOHANN FRIEDRICH FREIHERR VON COTTA (1701-79), and his grandson, JOHANN FRIEDRICH VON COTTA (1764-1832), the most eminent publisher in German history. Educated for the law, he began the book business at Tübingen in 1787, and in 1795 began to publish Schiller's *Horen*,

the *Politische Annalen*, and an architectural annual. In 1798 he issued *Die Allgemeine Zeitung* (q.v.), the *Damcnblanach*, and some like undertakings. The *Litteraturblatt* and the *Kunstblatt* followed. Cotta was publisher for nearly all the distinguished literary men of the classical epoch. In 1810 he moved his printing-house to Stuttgart; in 1824 he introduced the first steam printing-press into Bavaria, and later he helped to found the Literary and Artistic Institute at Munich. In politics Cotta was a moderate but steadfast Liberal. He was a practical social reformer, abolishing serfdom on his estates, building model farms, and making them in effect neighborhood experiment stations. The house of Cotta is still among the greatest publishing firms in Germany.

COTTA, BERNHARD VON (1808-79). A German geologist, born at Zielbach. After studying at the School of Mines at Freiberg, and at the University of Heidelberg, he was associated with Naumann in the publication of a geological map of Saxony (12 sections, 1833-42), and from 1841 to 1874 was professor of geology at Freiberg. His publications, many of which have been translated into English, include: *Geognostische Wanderungen* (1836-38); *Anleitung zum Studium der Geognosie und Geologie* (3d ed., 1849); *Deutschlands Boden* (1854); and *Die Geologie der Gegenwart* (5th ed., 1878). In the latter work he proved himself an evolutionist, and an adherent of Darwin's theory of the origin of species. He was one of the first geologists to accept this theory and apply it to organic remains in sedimentary rocks.

COTTA, HEINRICH (1763-1844). A German forester of distinction, born near Wasungen. He studied at Jena, in 1801 became a master forester and a member of the Eisenach College of Forestry, and from 1795 to 1811 conducted at Zillbach a school of silviculture, founded by himself. In 1811 he was summoned to Saxony as counselor of forestry, and thither removed his school, which in 1816 received the title of 'Royal Academy of Forestry.' He wrote a number of volumes, including: *Anweisung zum Waldbau* (1817; 9th ed., 1865); *Die Verbindung des Feldbaues mit dem Waldbau* (1819-22); and *Grundriss der Forstwirtschaft* (1832; 6th ed., 1872).

COTTAGE (OF, *cottage*, ML. *cotagium*, from AS. *cot*, Icel. *kot*, hut). Formerly a term used in Great Britain for a small dwelling-house of a poor family, especially in the country, detached from other buildings. It had no second story (though sometimes garret-rooms), and was built usually of stone and thus distinguished from wooden cabins or huts, though wood was not excluded. Recently the term has been extended to mean country houses of moderate extent, but built especially as summer residences for well-to-do families; and finally it is applied, in the United States, to the most sumptuous summer residences at places like Newport and Bar Harbor.

COTTAGE CITY. A town, including several villages, on the northeast side of Martha's Vineyard Island, Dukes County, Mass., 22 miles southeast of New Bedford (Map: Massachusetts, F 5). One of the most popular resorts on the New England coast, it contains several hotels, camp-meeting grounds, and a public library, and

is noted for its invigorating air and fine bathing. Population, in 1890, 1080; in 1900, 1100.

COTTAR'S SATURDAY NIGHT, THE. A poem by Robert Burns, published with a volume of other verse in 1786. It describes the homely pleasures of the Scottish laborer when the week's work is completed.

COTTBUS, kö't'bus. A town of the Prussian Province of Brandenburg, situated on the Spree, about 70 miles southeast of Berlin. It is a mercantile centre of importance, with manufactures of linen, wool, yarn, jute, and carpets (Map: Germany, F 3). Population, in 1890, 34,910; in 1900, 39,327. Cottbus was founded in the tenth century by Henry I. In 1445 it was sold to the Elector of Brandenburg. It belonged to Saxony from 1807 till 1813, when it passed to Prussia.

COTTE, kö't, ROBERT DE (1656-1735). A French architect. He was born in Paris, and was a pupil and brother-in-law of J. H. Mansard. He at first attended only to the details of the work done by his master; but he afterwards built the chapel of Versailles, the colonnade of the Trianon, the dome of the Invalides, the Hôtel de la Vrillière (now the Bank of France), and left designs for the portal of Saint Roch and for many buildings outside of his own country. Cotte was made first architect to the king (1708), after the death of Mansard.

COTTENHAM, Earl of. See PEPYS, CHARLES CHRISTOPHER.

COT'TER, JOSEPH B. (1844—). An American Roman Catholic bishop, born in Liverpool. He came to America in his youth, and was educated at Saint John's University. After holding a pastorate at Winona, Minn., for eighteen years, he was in 1889 consecrated first bishop of that diocese. He has been active in the temperance movement, and has several times acted as president of the Total Abstinence Union of America.

COTTEREAU, kö't'rô', JEAN. See CHOUANS.

COT'TIDÆ (Neo-Lat. nom. pl., from Neo-Lat. *cottus*, Gk. *κόττος*, *kottos*, a sort of river-fish, probably the bullhead). A family of small, ugly-looking, spiny-rayed fishes having a large depressed head, usually armed with spines or tubercles, and a tapering body, which may be naked or irregularly armed with scales or bony plates. There are about 60 genera and 250 species. The typical genus is *Cottus*. Nearly all are small. They inhabit the rocky shores and pools of the northern regions, some of the species descending to great depths. Many inhabit fresh waters, occupying the clear, cool streams of northern regions. The family includes the sculpins, miller's-thumb, grubby, father-lasher, etc. Very few are used as food. See SCULPIN.

COTTIERS, kö't'ti-ēr-z. A term originally indicating tenants who rented cots or cottages, or at the most a plot of land too small to be designated a farm; but later the term had a more general application to peasant farmers whose rent was determined not by custom, but by competition. The most notable case of this system of land tenure was in Ireland, where the capitalist farmer was scarcely represented in the population. The same class in the western parts of Scotland are called 'crofters.' Among both the lack of capital and the competition for land, inducing rack-rent, has provoked much misery. It has been partially alleviated in Ireland by the

gradual diminution of the population. See IRISH LAND LAWS.

COTTIN, kó'tán', ALARIC. A nickname of Frederick the Great, originated by Voltaire.

COTTIN, GROSPIE RISTEAU (1770-1807). A French novelist, born at Tonneins, and generally known to a now past generation as the author of *Elisabeth ou les exilés de Sibérie*, which won the praise of imitation from Xavier de Maistre in *La jeune Sibérienne* (1825). In France her vogue was not lasting. Sainte-Beuve says that by 1840 her books were read only 'from curiosity to learn the emotional moods of our mothers.' She died in Paris, August 25, 1807.

COTTLE, JOSEPH (1770-1853). An English publisher, born probably in Gloucestershire. He opened a bookshop in Bristol and was instrumental in publishing some of the first poems of Southey, Coleridge, and Wordsworth. He remained in business from 1791 to 1799. After his retirement he produced several volumes of poetry, such as *Malvern Hills* (1798); *John the Baptist* (1801); *Messiah* (1815), which awoke the satire of Byron. His *Early Recollections, Chiefly Relating to Samuel Taylor Coleridge* (1837), with a second edition under the title *Reminiscences of Coleridge and Southey* (1847), contains interesting information on the early lives of Coleridge and Southey, but is disfigured by many details that show Cottle himself in an unpleasant light.

COTTON (Fr., Sp. *coton*, from Ar. *qūṭun*, *quṭn*, cotton, from *qaṭana*, to inhabit). An important vegetable fibre distinguished from all other fibres by the peculiar twist it possesses, which makes it exceedingly valuable for spinning. It is cultivated in those parts of the globe between the two thirty-fifth parallels of latitude (a region which contains the largest portion of the land surface of the globe), although its most profitable cultivation is between the twentieth and thirty-fifth parallels north of the equator. Within this belt lie the cotton districts of the United States, northern Mexico, Egypt, northern Africa, and Asia, except the extreme southern parts of India and the Malay Peninsula. South of the equator cotton is grown in Brazil, nearly all of which country is said to be favorably adapted to its cultivation; in Australia, though not to any great extent; in Africa, where the extent of production is not known, and in the islands of the Pacific. Cotton is grown under wider range of climatic conditions, over a greater area, and by a greater variety and number of people, and is useful for a larger number of purposes than any other fibre. Its cheapness and the extent of its production preclude the demand ever exceeding the supply except locally and temporarily. Although cotton is grown mainly for the fibre surrounding its seeds, its by-products, the seeds as a source of oil and cake, and also the fibre of the stalks, are of great importance. See COTTONSEED AND ITS PRODUCTS.

BOTANICAL AND COMMERCIAL CLASSIFICATIONS. The cotton of commerce is the product of a few species of *Gossypium*, a genus of the natural order Malvaceæ, to which also belong the hollyhock, mallow, hibiscus, etc., as may be readily seen by a comparison of their flowers. (For illustration, see Plate with article HEMP.) There are in all about 50 species of *Gossypium*, only a few of which are economically important. They are small trees, shrubs, or herbaceous plants, and in

their duration are perennials, biennials, or annuals. The leaves of the cultivated species are three to seven, or even nine-lobed, and are more or less sprinkled with small black or pellucid dots. The flowers vary in color; the common colors in the United States are white or light yellow, with purple spots at base, the whole flower turning red the second day after opening. The flowers usually are borne singly in the axils of the leaves except in the 'cluster' type, where a number occur together. At their bases the flowers are surrounded by three or more green heart-shaped bracts, which are deeply cut or fringed and are united at their bases to form a cup. These constitute the 'squares.' The fruit, known as the boll, is a three to five-celled capsule, containing the numerous seeds, more or less covered with lint, which is white or tawny. All of the species are of tropical origin, yet their most successful cultivation is in temperate climates where there is a period of six months free from frosts and where there is an abundant and well-distributed rainfall throughout the growing season. An increasing temperature during the period of greatest growth is believed to be conducive to the production of the best fibre, and in India, where a lower grade of staple is produced, the decreasing temperature at this period is held responsible for the inferior quality. The botanical origin of plants that have long been in cultivation is always a source of perplexity, and the exact species to which the different varieties of cotton belong has been the subject of much controversy. By almost common consent it is now agreed that most of the cotton of commerce is the product of three or four species and their hybrids. These species are *Gossypium arboreum* and *Gossypium peruvianum*, arborescent species grown only in the tropics; *Gossypium barbadense*, the source of the celebrated Sea Island cotton, and *Gossypium herbaceum*, the species from which most of the crop of India and the United States is grown. By some the American upland cotton is believed to have originated from *Gossypium maritimum* and *Gossypium hirsutum*, but these are now believed to be the same as *Gossypium barbadense* and *Gossypium herbaceum*. There is perhaps no other plant that responds so quickly to changes in environment and improved cultivation, and to this are doubtless due the many varieties and species.

The Sea Island cotton, *Gossypium barbadense*, with its beautiful, long and silky staple, is one of the most valuable of the races or species of cotton. The flower is of a rich cream-color and its seeds are black, small, and easily separable from the lint. This species attains the highest perfection along the coast region of South Carolina, Georgia, and Florida, with well-known varieties grown under irrigation in Egypt from American seed. The fibre of Sea Island cotton averages about one and three-quarter inches in length, with one and one-half to two and one-half as the extremes. It is adapted to the finest thread and lace work, and other products for which the short staple is not suited. The Egyptian varieties are usually a little shorter in staple and are of a tawny color. These are often used for the natural colored halbriggan underwear, hosiery, etc., where a smooth finish and silky lustre are desired. The cultivation of Sea Island cotton is highly developed, and the United States crop of 1898-99 was 67,611 bales of 500

pounds each. About the same amount is annually imported into the United States from Egypt.

The upland cotton of the United States is mostly derived from *Gossypium herbaceum*. In this country the varieties of this species have white flowers, which turn red the second day after opening. The fibre of this series is shorter, but the plant can be cultivated over a greater extent of territory than the others. The seed of the upland varieties is usually of a greenish color and has a closely adherent gray fuzz in addition to the longer lint, making the process of ginning more difficult. There are doubtless many hybrids between these series, as may be seen in the character of some upland cottons. In 1896 descriptions were published in the United States Department of Agriculture, Office of Experiment Stations, *Bulletin 33*, of more than 130 varieties of cotton in cultivation in the United States at that time, together with about an equal number of so-called varieties which were only old ones renamed. Most of these varieties were upland cottons, and they varied widely in their production and character of lint. *Gossypium arboreum* is a small tree rather common about the temples of India and China, but it is said never to be cultivated as a regular crop. The trees are rather short-lived, and they yield a fine, silky fibre an inch or more in length. This is called *Nurma* or *Deo* cotton and is little used except by the priestly class. It is probable that its value has been overrated. It will not mature in the United States. The origin of the cottons supposed to be derived from *Gossypium Peruvianum* is somewhat in doubt. They are South American, as their name would indicate, and their smooth black seeds adhere in a reniform mass, hence the name 'kidney cotton,' which is usually applied to them. Their fibre is strong, rather coarse and woolly, one and one-half inches or less in length, and from its great resemblance to wool is frequently used in combination with that staple. About 15,000 bales are annually imported into the United States, and it is claimed that most of it is used by woolen manufacturers to mix in making underwear, hosiery, etc., much of the material being sold as all-woolen goods.

In *commercial usage*, to fibres under 0.98 inch or 25 millimeters in length there has been given the name 'short staple'; 'medium' means from 0.98 to 1.17 inches (25 to 30 millimeters), and 'long' 1.18 to 1.57 inches (30 to 40 millimeters); 'extra,' including those which are 1.58 inches (40 millimeters) or more. The extra and the long in the United States seem to come from Sea Island cotton or some of its hybrids; the short and medium from *Gossypium hirsutum* or *Gossypium herbaceum*.

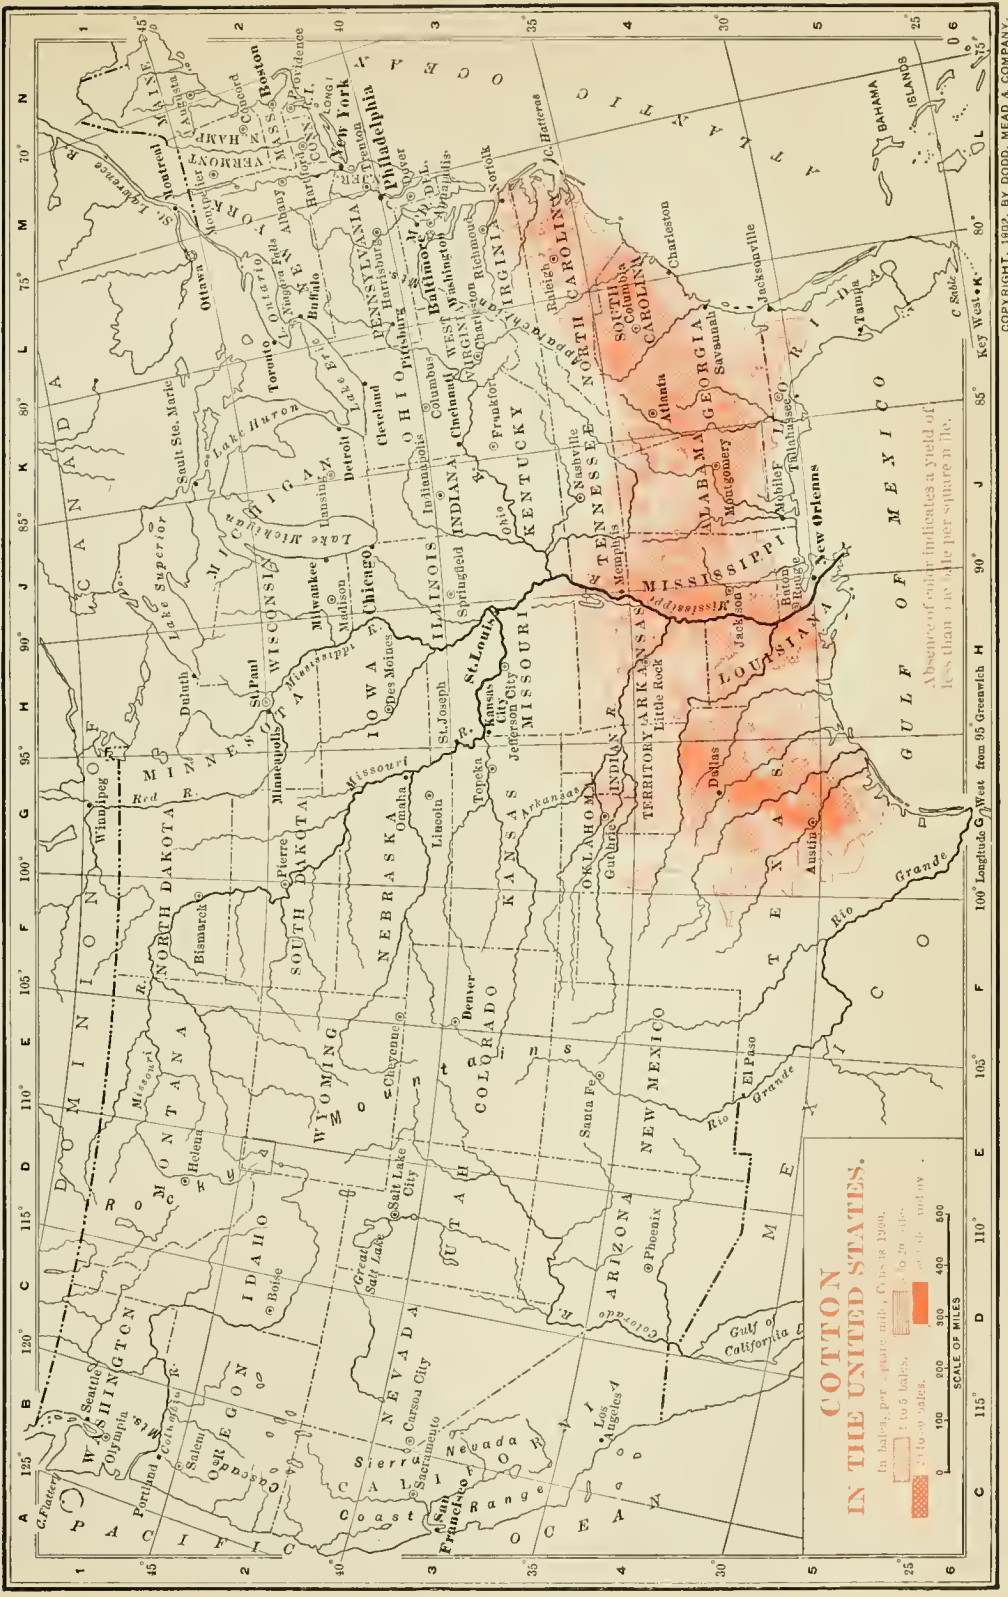

The commercial classification of cotton in New York is as follows: The 'full grades' are fair, middling fair, good middling, middling, low middling, good ordinary, and ordinary. Half grades are designated by the prefix 'strict,' quarter goods by prefixes 'barely,' meaning the point above half grade and the next full grade above, and 'fully,' meaning the mean point between the half grade and the next full grade below. Liverpool high grades are lower, and low grades higher than New York.

CULTIVATION. The plant requires for its best development a peculiar soil and climate. While the method of cultivation is about the same in the various countries where it is grown, that in

the United States is the most perfect. Although the plant is not really an annual, it is treated as such in its cultivation. The land is prepared in winter, the time of beginning varying with the locality. After thorough plowing, and after all frost has gone, the ground is bedded into rows from three to four feet wide, according to situation and the quality of the soil; the seed is sown along the centre of these beds, either in a straight furrow made with a small plow or opener, or in holes twelve to eighteen inches apart. Where artificial fertilizers or cottonseed-meal are drilled in this method of preparation is indispensable. The usual date to begin preparing land is from January 15 in southern Texas to March 5 in South Carolina. Sowing usually commences March 10 to April 15 and continues to May 15; but late spring frosts may delay it longer. The young shoots, which appear in from ten to fifteen days, are weeded and thinned when they have attained a height of two to six inches, say, when the third or first true leaf appears. The average date of bloom is June 5. As a general rule, cotton is a dry-weather plant, heavy rainfall interfering with both the culture and the stand, although an extremely dry spring interferes with the growth. For plowing it is best to have just enough rain to make the soil moist and spongy. When young, the crop flourishes best with warm steamy weather, with an occasional shower until blooming. An excess of rain produces weeds and wood; severe drought stunts the plant, matures it too early, and causes a small, light-stapled crop. Early frost causes the plant to turn brown; cold nights cause many of the plants to die. Lands in hilly or upland districts require more moisture than those lying in the plains and river bottoms. Overflowing often causes injury on bottom and flat prairie lands, but replanting or recuperation often redeems the most hopeless cases. Where, however, overflowing causes 'sanding,' the land is rendered utterly useless for cotton culture that year. The experiment stations in the Southern States have aided in introducing improved methods of cultivating, fertilizing, and handling the crop. Rotation of crops and green manuring have been shown to be of great advantage. From the date of bloom, warm, dry weather is needful, until picking time, which usually commences from July 10 in southern Texas up to September 10 in Tennessee, and continues until frost puts a stop to further growth. During the harvest all available hands are called into full employment. The cotton is gathered into baskets or bags hung from the shoulders of the pickers, and when the crop has been secured it is spread out, dried, and then the fibre separated from the seeds. For long-staple or Sea Island cotton in South Carolina the usual date to begin preparing land is February 1; planting begins April 1 and ends May 1; picking is from August 25 to December 10.

INSECT ENEMIES OF THE COTTON-PLANT. See COTTON-INSECTS.

COTTON DISEASES. There are a number of well-characterized diseases of the cotton-plant, some of which are due to disturbances in the nutrition of the plant, others are caused by fungous attacks, while still others are attributed to the presence of minute worms, called nematodes, in the roots. Attention to the requirements of the plants will correct the first class of diseases. For the fungous troubles but little in the way of prevention

COPYRIGHT, 1902, BY DODD, MEAD & COMPANY.

is known. Among the most important diseases due to physiological causes are those known as the mosaic disease or yellow leaf-blight, and the shedding of bolls. In the first, small areas of the leaves become yellow, giving to the leaf a peculiar checkered appearance. Later these areas turn brown and dry up, leaving the leaf in a more or less ragged condition. At this stage the disease is usually referred to as the black rust. Heavy applications of kainit or similar fertilizer are said to correct this evil. The shedding of the bolls, or their drying up while still attached to the plant, is often a serious trouble. Extreme dry or wet weather causes this disease by interfering with the proper supply of moisture and nutriment furnished the plant through its roots. Among the diseases due to parasitic fungi a few of the most serious and widely distributed may be mentioned. Damping off, soreskin, or seedling rot is caused by *Pythium debaryanum* and a number of other fungi. They attack the young plants at or near the surface of the ground, producing ulcer-like spots, and later rot the plant off. The sunken, ulcer-like spots can be readily seen on the affected stems. Another common disease is anthracnose, due to *Colletotrichum gossypii*. It is a widely distributed fungus that attacks the bolls, stems, and leaves. Upon the bolls small reddish spots appear which later become black. The centre then becomes gray or pink and the spots enlarge in a concentric manner with well-marked zones of color. The boll is killed outright or has its development checked so that the lint is worthless. Upon the stems the fungus is somewhat similar in its behavior, although the spots are not quite so definitely marked. Upon the leaves the disease is not very well characterized. A root-rot is very destructive in some places. Its behavior is so marked as to need no description. It is due to a rather widely distributed fungus that has been called *Ozonium auricomum*. It attacks a number of plants in addition to cotton. Rotation of crops is about the only method of relief known. A leaf-blight (*Sphærella gossypina*) and a mildew (*Ramularia arcota*) are common diseases in the cotton-field, but they seldom occasion much injury.

The most serious fungous disease to which the cotton-plant is subject is the wilt disease, or Frenching, as it is commonly known. It makes its appearance usually in May, when the plants are six or eight inches high. The plants are dwarfed, have an unhealthy appearance, the leaves turn yellow between the veins and their margins dry up. Sometimes plants wilt and die at once, while at other times the progress of the disease is slower and the plant may partly recover. A plant attacked by this disease will show a brownish stained color in the wood when cut across. The cause of the trouble is a fungus recently described as *Neocosmospora vasinfecta*, and the same or a closely related form occurs on the okra and watermelon. Some varieties and individual plants seem less liable to this disease, which attacks the plants through the soil, and it is thought the means for overcoming this trouble lies in resistant plants. This disease, as well as some others, is very much complicated by the presence in the roots of the cotton of nematodes (*Heterodera radiceicola*), minute worms that enter the roots of cotton and a number of other plants, causing a large number of galls to be formed. The plant is injured by the nourish-

ment taken from other parts of the plant to make the galls. This weakens the plant so it is more liable to fungous attack. When nematodes occur in abundance in the field no entirely efficient means of eradication is known as yet.

PRODUCTION AND DISTRIBUTION. The oldest known cotton-producing country is India, where for thirty centuries the plant has been grown and its fibre manufactured. For four hundred years before the Christian Era cotton was well known in what was then the civilized world, the writings of the Greeks and Egyptians plainly indicating the knowledge of the value of this fibre. Columbus found it in the Western world, although not so extensively cultivated as in the East; but during the past fifty years its culture here has distanced in quantity and in quality the produce of the Old World. Down to 1800 the cotton-consumers of Europe depended upon the Indies and the Levant for their raw material; but by 1860, so far had the inventive genius, the superior farming, and the greater energy of the planter of our Southern States pushed the production of the fibre, that they furnished the greater part of the cotton used by Great Britain and the Continent of Europe. From 1858 to 1860 America furnished 79 per cent. of the cotton imported to Great Britain. During our Civil War this dropped to 3½ per cent., rising to 58 per cent. in 1871, and amounting to 80 per cent. in 1900. During the Civil War, when the price of cotton was abnormally high, attempts were made to grow cotton in many countries. The industry flourished there for a while, but it has ceased to be profitable, in Europe, Australia, etc. Russia in her Asiatic possessions has developed cotton-growing greatly in recent years, so that the imports into the empire have fallen off 50 per cent. in the past decade.

COTTON PRODUCTION OF THE WORLD. This is difficult to more than approximate, as a large proportion and amount consumed is produced in uncivilized or in semi-civilized countries, where no accurate record is kept; and in many countries and districts absolutely no data are available—as in China, where soil and climate are favorable and the clothing of the population is largely of cotton, yet the extent of its cultivation is a close secret; and in some parts of India, where the production can be estimated only by the amount in sight and the known or assumed requirements for dress. The amount produced in the vast unknown continent of Africa is even more of a mystery, although native cottons form there a large proportion of the dress.

The commercial crop for the year 1898-99 was 13,110,000 bales of 500 pounds each. This includes the total crop of the United States and the known imports into Europe and America from other cotton-producing countries. The product was divided as follows: United States, 11,189,000 bales; Egypt, 1,243,000 bales; India, China, etc., 607,000; Brazil, 23,000 bales; Peru, West Indies, etc., 30,000; and Turkey, Asia Minor, etc., 18,000. The domestic consumption in those countries from which only the exportations are given would add very materially to the total production of the world. India leads in the domestic consumption of cotton among those countries not reporting, and in 1900 about 1,100,000 bales were consumed by the local mills. According to Latham, Alexander & Co., the total production for 1900 was: United States, 9,137,000

bales; East Indies, etc., 1,562,000 bales; Egypt, 1,228,000 bales; Brazil, etc., 250,000 bales, or a total of 12,177,000 bales of 500 pounds each.

COTTON IN THE UNITED STATES. The first authentic record of cotton cultivation in the United States was at Jamestown, Va., in 1607. Sea Island cotton was introduced from the West Indies in 1786. The first exportation was in 1747, when eight bags were sent to England, the first shipment of any importance being 2000 pounds in 1770. In 1791, 189,316 pounds were exported; Whitney's invention of the saw gin in 1793 raised this amount to 17,789,803 pounds by

The accompanying Table No. 1, taken from *Bulletin No. 58*, census of 1900, gives the cotton crop in the United States by States, according to censuses of 1870, 1880, 1890, and 1900, for the crops of the preceding year. The bale measurement of 1890 was 477 pounds; in 1880 it was 433 pounds; in 1870 it was 440 pounds. It is interesting to note the States in which cotton has at some time been cultivated. The *Bulletin* states that "early settlers north of the Ohio River planted cotton for domestic uses between 1749 and 1780. The census for 1860 gave for Illinois 1482 bales, or 659,490 pounds of cotton.

* Calculated on basis of 500-lb. bales.

1800. The production reached 2,160,000,000 pounds in 1860, and amounted to 4,506,000,000 pounds in 1895 (9,467,000 bales reckoned at 484 lbs. net each). Cheapening the processes of cultivation and cleaning, and increase of acreage, have so lowered the cost of the fibre that while the average price in Liverpool was 1s. 6d. (say 36 cents) per pound in 1793, it was 5¾d. (say 11½ cents) in 1851; averaging 7d. (14 cents) for the five years ending 1861. In 1867 there was a decline from the high prices consequent upon the Civil War to 7¾d. (14¾ cents), but in a few months it reached 1s. 1d. (26 cents). In 1890 it ranged from 5-9-16d. to 6¾d. in Liverpool, from 10¼ cents to 12¾ cents in New York; while in 1899 the range of price in New York was from 5-5-16 cents to 6½ cents, with an average of about 6 cents per pound, the 1900 values being considerably higher.

The acreage in cotton of the ten cotton-growing States for the season of 1899-1900 was as follows:

STATE	Aeres
North Carolina.....	1,220,000
South Carolina.....	2,212,000
Georgia.....	3,288,000
Florida.....	149,000
Alabama.....	2,883,000
Mississippi.....	2,784,000

Tennessee.....	816,000
All others.....	622,000
Total.....	23,521,000

Stimulated by the high prices following the Civil War, the cultivation of cotton was conducted to a limited extent in California, Illinois, Indiana, Nevada, Utah, and West Virginia. With the coming of low prices, cotton culture gradually disappeared from those sections not peculiarly adapted to it, and censuses after 1870 credited none to California, Illinois, Indiana, Nevada, Utah, or West Virginia. Natural selection continues to eliminate the industry from sections less favored by climatic conditions. To illustrate: Kentucky is credited by the censuses of 1880 and 1890 with 1367 and 873 bales respectively, but the census of 1900 finds in this State only 84 commercial bales. The loss in those States lying along the northern border of the cotton belt is more than offset by the increase found in the territory west and southwest of the Mississippi River. According to the Eleventh Census 2,872,524 bales, or 38 per cent. of the entire American crop of 1889, was grown in that region, while in the census of 1900, in the same territory, the production reaches 4,250,940 bales, or 45 per cent. of the whole crop."

The value of the exports of cotton from the United States between the years 1895-99 averaged \$213,378,243 a year. The United Kingdom took 49 per cent.; Germany, 22 per cent.; France, 11 per cent.; Italy, 5.2 per cent.; Spain, 3.8 per cent.; Belgium, 1.8 per cent.; Japan, 1.7 per cent.; Russia, 1.6 per cent.; and Canada, 1.5 per cent.

The number of spindles in Europe and the United States, September 30, 1900, and the consumption of cotton for the season of 1898-99, are as follows:

COUNTRIES	Number of spindles, round numbers	Annual consumption bales of 500 lbs.
Great Britain.....	45,400,000	3,519,000
Continental Europe.....	32,500,000	4,836,000
United States.....	* 18,100,000	3,582,000
India.....	4,728,000	† 1,675,000
Total.....	100,728,000	13,612,000

* Spindles in Northern States, 14,150,000.

" " Southern " 3,950,000.

† Bales of 392 pounds.

COST OF PRODUCTION. A great many estimates have been published as to the cost of production of a crop of cotton. None of these are accurate or of value, as so many factors must be considered, such as different soils, methods of cultivation, season, etc. According to Hammond, the cost of producing Sea Island cotton in 1880 ranged in South Carolina from 15 to 21 cents a pound; in Georgia, 50 cents per pound of lint. The cost of producing upland cotton varied within wide limits. In North Carolina in 1880 it ranged from 6.2 cents in the Piedmont region to 7.3 cents in the Pine levels. In 1892 the range was from 3.5 to 6.6 cents. The cost in South Carolina in 1880 ranged from 6.91 to 8 cents; in 1892 it was 6.6 cents for the Pine Hills region; in 1893, from 5 to 14 cents dependent upon the nature of the soil. In Georgia the crop of 1880 was estimated at from 3 to 6 cents for the Pine Hills region and 8 to 10 cents in other regions; the crop of 1892 averaged 7.5 cents per pound; that of 1893, 6.75 cents. In Alabama, in 1880, the crop cost from 3 to 8 cents per pound; in 1892, from 4.5 to 7.75 cents; and in 1893 it averaged 8 cents. In Mississippi the cost varied from 4 to 11 cents in 1880, and from 4 to 8.4 cents in 1893, dependent upon the producing region. In Louisiana the cost varied in 1880 between 6.8 and 7.4 cents, and in 1893 between 4.9 and 7 cents. In Arkansas in 1880 the range was from 6.2 to 7 cents per pound; in 1893 from 4 to 7 cents. In 1880 the Texas crop cost from 3 to 9 cents per pound, with averages of from 4.5 to 6.5 cents in the

principal producing regions. In Tennessee the cost of the 1880 crop was from 3.5 to 10 cents per pound, that of 1893 averaged 7 cents. The average production for the United States in 1900 was about 200 pounds per acre.

MANUFACTURE. The process of transforming cotton from its raw condition after picking into the thread or cloth that is such an essential of daily life is one which involves many different operations. It must first be cleaned to remove sand, dust, and other foreign substances. It then contains about two-thirds of its weight in seeds, which must be removed.

Cotton-Ginning.—Before Eli Whitney's invention of the cotton-gin, the removal of the seeds by hand was so difficult a task that very little cotton was raised. It would take one person two years to turn out an average bale of cotton, three to fifteen of which are produced by one machine in one day. Before the Civil War the gins were run chiefly by mule-power, which, when operated in connection with slave labor, was cheaper than steam. Whitney's cotton-gin, known as the saw gin, may be briefly described as a series of circular saws with fine teeth, revolving with an arc of their circumference projecting through a guide into a receptacle for seed cotton. These saws tear the lint from the seed and carry it through the guide. It is removed from the saws by a brush and carried to a condenser. Great care must be exercised not to injure the cotton (1) by having the saws too close to the bars of the grate, so as to rub; (2) by having them revolve too fast; or (3) by having the teeth too sharp. See Brooks, *Cotton* (New York, 1898). The roller gin is growing in favor among cotton-producers, especially for the long-staple or Sea Island cotton, and in the United States and Egypt all long-staple cotton is ginned in this way. It removes the seed with only one-fifth the rapidity of the saw gin, but it does not injure the fibre. In a primitive form it has been used in Egypt and India for many centuries. It consists of two rollers, revolving in opposite directions, between which the cotton is passed and the smooth, hard seeds thrown off. Both the saw gin and roller gin have been much modified and their effectiveness increased by successive improvements.

In *Bulletin No. 58*, on Cotton-Ginning, Twelfth United States Census, Daniel C. Roper divides

cotton-ginneries into three general classes: Those conducted exclusively for the public, those conducted exclusively for the plantation, and those conducted for both the public and plantation. Table II., preceding, shows the number of all classes by States in the United States. The *Bulletin* states that "the rapidity with which the private or plantation ginneries have been supplanted by public, and more modern equipments, is noteworthy. Through inquiries of the census of 1880, covering the power and machinery of cotton-ginning establishments, it was ascertained that a large percentage of the crop of 1879 was handled by ginneries of a private character. The motive power of these ginning and baling plants consisted of horses or mules, and each had a daily capacity of from three to five bales. The general introduction of steam-power brought economic methods that have crowded out primitive horse-ginneries to such an extent that they are now curiosities." As shown in the table, there are in the United States 29,620 cotton-ginneries, of which 2863, or less than 10 per cent., are reported as ginning exclusively for the plantation. *Bulletin* No. 98 of the Twelfth United States Census also deals with cotton-ginning, with particular reference to the crop of 1900, and contains an historical and descriptive sketch of the methods of preparing raw cotton for the market.

Baling.—The cotton having been separated from the seed, the next step is to pack it in bales, for shipment. Different methods of baling prevail among the cotton-producing countries. The American product, as put up in the old-fashioned tortoise-back bales, has the reputation of being the worst-baled cotton in the world. East Indian cotton is shipped in cubical bales, weighing about 400 pounds, covered with thick Indian hemp and held together with strong iron bands. The Egyptian bale weighs about 700 pounds, is a little thicker and not so long as the American, and has eleven, instead of seven or eight, bands around it. Brazilian cotton comes in very light bales, weighing only 200 pounds, which are tied with trailing vines. In the cotton States of America, the cotton which is not consumed by the Southern mills is shipped to the exporting city, by rail, steambot, or wagon. It is there graded by the exporter, who fastens a tag to each bale, and also to a sample taken from it. It is from these labeled samples that the foreign manufacturer makes his purchases. The bales are then subjected to enormous pressure, usually by the transportation company, a standard bale weighing 500 pounds. During its progress from the farm to the factory, a bale of cotton is given a series of brands, by the farmer and the ginmery, as well as the exporter, so that fraud can easily be traced. One of the objections to the American baling methods, however, is that the covering becomes so torn that the marks on it cannot be deciphered.

The manner in which American cotton is generally baled and pressed for transportation to the markets and mills is not only needlessly expensive and wasteful, but fails to protect the cotton from damage and theft. The bales are covered with jute cloth, made of thread so coarse and loosely woven that, while it adds unnecessarily to the weight of the bale, it does not protect the cotton. The bales are held together by steel bands, which still further increase the weight. The weight of the bagging and ties on a

bale weighing 500 pounds is about 23 pounds. Besides the increased freight rates due to this bulky method of baling, the necessity of a second pressing, and the bad condition in which the cotton reaches the factory, a more grave defect is its excessive inflammability, resulting in high insurance charges. So great is this risk that on some passenger steamers cotton is not carried, on account of the danger of fire. An illustration of this danger was afforded by the terrible fire which occurred on the docks of the North German Lloyd Steamship Company at Hoboken, N. J., on June 30, 1900. The fire started in some unknown manner in a lot of cotton-bales and spread with such rapidity that efforts to check it were unavailing. The loss of property caused by this cotton fire has been estimated variously at from \$4,000,000 to \$6,000,000, and the loss of life was about 200 persons.

Within the past few years the cylindrical bale has been growing in favor among all classes of cotton-dealers. The American Cotton Company makes a bale four feet long and two feet in diameter, weighing over 35 pounds per cubic foot. The cotton is pressed gradually, so as not to injure the fibre, and is in the form of a continuous lap or roll. Since the air is pressed out of the cotton, it has no tendency to expand, and the covering is only sufficient to keep the cotton clean. The heavy bagging and ties are entirely dispensed with. The cotton is compressed as fast as ginned and is shipped direct from the gin-house to the warehouse or mill. The cylindrical bale of the Planters' Compress Company is 36 inches long, 18 inches in diameter, and weighs 250 pounds. This bale is held together by wires passing from end to end through a small opening in the centre. It is covered with cotton duck, and the weight of the cloth and wire is about three pounds per bale. Most satisfactory tests have been made with each of these types of bales, showing that they are both fire and water proof. The other objections to the old-fashioned methods of baling are also met by the cylindrical bales described.

Spinning.—When the cotton-bales are received at the factory, the cotton from the different bales is first mixed in order that the yarn produced may be of uniform quality. It is next submitted to a process of opening and picking that loosens the fibres which became closely packed together when the bale was pressed. Then follow the processes of *carding*, *drawing*, *slubbing*, *roving*, *spinning*, and *doubling*, by which the cotton-fibre is reduced by successive stages from a web or sheet into cotton yarn. The process of carding is described under that title. Its object, besides cleaning the cotton of any foreign substances still adhering, is to reduce the lap into a thin fleece and then contract it into a ribbon or sliver. The sliver, after being doubled so that inequalities in the single slivers are counterbalanced, is put through a drawing machine, consisting of successive pairs of rollers, each of which revolves more rapidly than the preceding one, and which reduces the sliver to a finer and finer thread. By slubbing and roving, the process of attenuation is continued, the thread in each case taking the name of the machine through which it has just passed. The thread is also twisted, and when it leaves the roving machine it is strong enough to be wound on a bobbin. Spinning is the concluding process, and in this the thread is given

the requisite firmness and twist. Doubling is the combining of two or more threads into a single cord. Every step in the manufacture of cotton yarn has for its object (1) the removal of finer and finer impurities, (2) the attenuation and strengthening of the thread, (3) correcting the mistakes of the preceding process. The whole process is described in more detail in the general article on SPINNING.

The thread may be subjected to the additional processes of *gazing* and *polishing*. The object of gazing is to singe off all the loose fibres and so produce a very smooth yarn. This is accomplished by passing the thread through a very fine jet of gas, as it is wound from one bobbin to another. The yarn is polished by applying a sizing made of starch, beeswax, or other materials. This not only gives the yarn a gloss, but increases its strength and weight. The process of weaving cotton into cloth does not differ materially from that of silk and wool, and is treated in the general article on WEAVING.

The bulk of the world's cotton is shipped into foreign countries and often across the ocean twice, once to the factories to be transformed into yarn and cloth, and again, perhaps, back to the very region where it was first raised, in the form of cotton goods. The best example of this fact is offered by the United States, which raises nine-tenths of the world's cotton, yet exports less cotton goods than the republic of Switzerland, which raises not a pound of cotton and has not even a seaport. Of course the United States is an enormous consumer of cotton, and this fact must be remembered in considering the extent of her export trade. Obviously the amount of cotton goods imported, and the amount produced and consumed at home, are also important factors.

exported and in the actual amount produced. It is interesting to note that this enormous industry is concentrated about Lancashire, in a district whose area is about 50 per cent. greater than that of the State of Rhode Island. In the United States, the most marked development of the last decade of the nineteenth century is the relative importance of Southern factories, situated in the very locality where cotton is produced. In this period the number of spindles increased 245 per cent. and became nearly one-third of the whole number in the country. Other industrial conditions besides the nearness to the cotton crop produced this growth, chief of which has been the general industrial awakening experienced by the South. Capital, however, in this section, has shown greater progress than labor, so that the latter is still cheap; a working day is long, and there are comparatively few labor laws restricting the age, sex, and other conditions of labor.

Table III. gives the value of the world's export trade in cotton, by countries, for 1897, 1898, and 1899. The table is taken from a pamphlet, entitled *The World's Export Trade*, published by the Philadelphia Commercial Museum, April, 1900. Of more value, however, as showing the actual extent of the cotton industry, including both home and foreign consumption, and its geographical tendencies as well, are the Tables IV. and V., showing the number of cotton-mills and spindles, the amount consumed, and the value of the output. By studying these tables, certain facts and tendencies in the cotton trade are apparent. Great Britain is and always has been at the head of the cotton trade, both in the amount

During the closing years of the nineteenth century the manufacture of cotton was much advanced in China and Japan. In China cotton has been made into cloth since 1260, and for four centuries it usurped the place of silk. Steam-power was introduced into Chinese cotton-factories in 1865-67, and into Japan in 1889. Great difficulty has been experienced in both China and Japan in getting laborers. There is no factory legislation in either country limiting the hours of labor, and in China children begin to work at a very early age. The working day is eleven or more hours long, and the factories run seven days in the week. Labor is also very cheap, as estimated by the amount of money paid for a

day's work, which averages from 10 to 15 cents; but the standard of intelligence and faithfulness among operatives is so low that, measured by the amount and quality of the product, the real cost of labor is high. In Japan, it is particularly hard to keep steady employees. The girls are used to the freedom and out-of-door life of the country and will not stay long at their situations, so that mill operators are constantly hampered with green hands. In Japan the weaving of cotton and other fabrics is still largely a household industry. In 1896, according to the French consul at Yokohama, 660,408 dwellings or establishments contained 949,123 looms, at which 1,043,866 persons were engaged in weaving. The yarn used in this household art is largely factory-spun, thus increasing rather than diminishing the demand for cotton-factories.

Statistics.—Shepperson, *Cotton Facts* (New York, annually); *Statistical Abstract of the United States* (published annually); United States Department of Agriculture, Office of Experiment Stations, *Bulletin 33*, and Publications of the Statistical Division and Section of Foreign Markets, *Twelfth United States Census* (Washington, 1902). See COTTONSEED AND ITS PRODUCTS; SPINNING; WEAVING; MUSLIN.

COTTON, ARTIFICIAL. A material made in Germany from the wood of the fir-tree, which is reduced to thin shavings. These are washed, then steamed for ten hours, after which they are treated with a strong solution of sodium lye and then heated under great pressure for thirty-six hours. The wood is then said to be changed to pure cellulose. To give the material greater resisting power, castor-oil and gelatin are added.

TABLE V.—COTTON CONSUMPTION OF THE WORLD, IN 500-POUND BALES

YEAR	Great Britain	Continent of Europe	United States	India	All Others	Total World

1897-98.....	3,432,000	4,628,000	2,962,000	1,141,000	726,000	12,889,000
1898-99.....	3,519,000	4,784,000	3,553,000	1,297,000	845,000	13,998,000
1899-1900.....	3,334,000	4,576,000	3,856,000	980,000	789,000	13,535,000

Japan had 200,000 spindles in operation in 1889, and 1,358,125 spindles in 1899. Japan consumed 99,375 bales of cotton in 1890, and 644,818 bales in 1898. China had 570,000 spindles in operation in 1899. It is estimated that on July 1, 1900, the world's working spindles numbered 105,000,000.

after which it is ready to be spun into thread and reeled.

COTTON, CHARLES (1630-87). An English translator and poet, said to have been educated at Cambridge. He was a friend of Izaak Walton, to whom he addressed several poems, and to the fifth edition (1676) of whose *Compleat Angler* he contributed as the 'second part' an essay on fly-fishing. His works, nearly all in verse, include a translation of Corneille's *Horace* (1671); the *Life of the Duke d'Espernon* (1670); *The Fair One of Tunis*, published anonymously (1674); *The Scarronides, or Virgil Travestie* (1664); *The Voyage to Ireland*, and *The Wonders of the Peak* (1681). Cotton was a famous angler and was horticulturist enough to write an excellent *Planters' Manual* (1675). Some of his poems have been much admired for their sweetness and directness of style. Wordsworth and Lamb particularly praised his *Ode to Winter*. His best work, the English version of Montaigne's *Essays* (1685, and frequently since), places him among the greatest of translators.

COTTON, CHARLES STANHOPE (1843—). An American naval officer, born in Milwaukee, Wis., and educated at the Naval Academy. In 1861 he entered active service, and participated in several of the principal naval engagements of the Civil War. He was on the frigate *Saint Lawrence* when that vessel captured the *Petrel* (July 28, 1861), and took part in the fight between the *Merrimac* and the *Monitor* (March, 1862). He also participated in the battle of Mobile Bay, and soon after the close of the war was appointed lieutenant-commander. During the Spanish-American War he was in command of the auxiliary

cruiser *Harvard*, and after the war he became commandant of the Navy-yard at Norfolk, Va.

COTTON, GEORGE EDWARD LYNCH (1813-66). An English divine and educator. He was born at Chester and educated at Cambridge. From 1837 to 1852 he taught at Rugby, being the 'young master' mentioned in *Tom Brown's School Days*. He was for six years principal of Marlborough College, and in 1858 was made Bishop of Calcutta. In that office he founded many schools and effected great improvement in the education of the poorer classes of the Anglo-Indian population.

COTTON, JOHN (1585-1652). An eminent Puritan divine, known as 'The Patriarch of New England.' He was born in Derby, England, and was educated at Trinity College and Emmanuel College, Cambridge, at the latter of which he was successively a fellow, head lecturer, dean, and catechist. Inclining toward Puritanism, he left Cambridge about 1612, and for the next twenty years, with one short intermission, he had charge of the Church of St. Botolph's, at Boston, in Lincolnshire, where he had an extraordinary influence over his congregation, gained a wide reputation for learning and godliness, and trained many young men for the ministry. When Archbishop Laud became primate of England (in 1633), Cotton was summoned to appear before the Court of High Commission, but escaped the pursuivants sent to apprehend him, and, after lying in concealment for some time in London, embarked for Boston, New England (which had been named in compliment to him), where he landed in September, 1633. Almost immediately thereafter he was chosen as teacher of the First Church in Boston, of which the Rev. John Wilson was then pastor, and he continued to act in this capacity until his death. Here, as in England, he had a wide reputation for learning and piety, and soon came to wield a powerful influence over affairs both ecclesiastical and secular in New England, and especially in Massachusetts. According to William Hubbard (q.v.), a contemporary historian, whatever he "delivered in the pulpit was soon put into an order of court . . . or set up as a practice in the Church," and the enthusiastic Cotton Mather, speaking of his learning, says that he was "a most universal scholar, and a living system of the liberal arts, and a walking library." "He was," says Tyler, "the unmitred pope of a pope-hating commonwealth." He took an active part in the Antinomian controversy, first supporting and afterwards opposing Anne Hutchinson (q.v.), and conducted an extended controversy with Roger Williams, whose expulsion from Massachusetts he approved. He was a voluminous writer and published as many as fifty volumes, the most important of which are: *Set Forms of Prayer* (1642); *The Keys to the Kingdom of Heaven and the Power Thereof* (1664); *The Bloody Tenent Washed and Made White in the Blood of the Lamb* (1647), written in answer to a letter from Roger Williams; *A Brief Exposition upon Ecclesiastes; A Brief Exposition upon Canticles; A Treatise of the Covenant of Grace as It Is Dispensed to the Elect Seed; A Treatise Concerning Predestination*; and the famous catechism, entitled *Spiritual Milk for Babes, Drawn Out of the Breasts of Both Testaments, Chiefly for the Spiritual Nourishment of Boston Babes in Either England* (1646). A part of the controversy between him and Roger Wil-

liams may be found in the *Publications of the Narragansett Club*, vols. i. and ii. (Providence, 1866-67). Consult: McClure, *The Life of John Cotton* (Boston, 1846); Norton, *Abel Being Dead, Yet Speaketh: or, the Life and Death of That D deservedly Famous Man of God, Mr. John Cotton* (London, 1658; republished, Boston, 1834); an interesting sketch in Mather, *Magnalia* (London, 1702); and a critique of Cotton's writings in Tyler, *A History of American Literature* (New York, 1878).

COTTON, NATHANIEL (1705-88). An English physician and poet, the friend of Young, author of *Night Thoughts*, and of the poet Cowper, whom he cared for in 1763-65 in his sanatorium, or, as he rather grandiloquently styled it, 'Collegium Insanorum,' at Saint Albans, Hertfordshire, where he treated mental diseases with success. His *Visions in Verse* (1751) is his best known volume, and among his shorter poems, "The Fireside," and "To a Child Five Years Old," are still found in anthologies.

COTTON, SIR ROBERT BRUCE (1571-1631). A distinguished English antiquarian, founder of the Cottonian Library, now in the British Museum. After his education at Westminster School under the famous Camden, and at Cambridge, where he took a B.A. degree in his sixteenth year, he began those archaeological pursuits which made his name famous, and which proved of immense value to historians. As the dissolution of the monasteries, about half a century before, had dispersed many valuable collections of manuscripts among private persons, Cotton sought out and purchased these documents wherever practicable. On account of his ability and knowledge, he was frequently consulted by ministers of State on difficult constitutional points and international questions. In 1600, at the request of Queen Elizabeth, who desired antiquarian authority on the matter, he wrote *A Brief Abstract of the Question of Precedency Between England and Spain*. King James, who knighted him in 1603 and gave him a baronetcy in 1611, employed him to vindicate the conduct of his mother, Mary, Queen of Scots, and also to examine whether the Roman Catholics, on account of whom some alarm was then felt, should be imprisoned or put to death. Cotton advocated tolerance. His intimacy with the Earl of Somerset led him to be suspected of complicity in the death of Sir Thomas Overbury, and in consequence he was imprisoned for about eight months. In 1629 a tract entitled *A Project How a Prince May Make Himself an Absolute Tyrant* was obtained from his library, the tendency of which Charles I. and the Star Chamber considered dangerous to the liberty of the State. His library was accordingly declared unfit for public inspection, and he himself was denied all use of it. Depression at this edict caused his death, less than two years afterwards. His son, Sir Thomas (1594-1662), regained possession of the library, and his grandson Sir John (1621-1701), and great-grandson Sir John (1679-1731), added to it considerably. The latter bequeathed it in public trust to the nation. In 1730 the library was lodged with the royal collection in Ashburnham House, Westminster. The following year a fire occurred in which 114 out of 958 MS. volumes were reported as "lost, burned, or entirely destroyed; and 98 damaged so as to be defective." Fortunately, a great number of these injured volumes were skillfully restored, so that the library

now consists of nearly 900 volumes, of which, says Mr. Edwards in his *Memoirs of Libraries*, "nearly 200 are State papers of the highest value. They include a vast series relating to the diplomatic intercourse between England and almost every State of Europe, extending from the reign of Edward III. to that of James I. A large proportion of these documents consist of the original letters of sovereigns and of statesmen. Even those papers which are not original have a high degree of authority as coeval transcripts." The Cottonian Library was transferred to the British Museum (q.v.) in 1757. In addition to the MSS., the collection includes many valuable coins and antiquities. Among Cotton's works may be mentioned, in addition to those referred to above: *Povver of the Pecres and Comons of Parliament in point of Judicature* (1640); *Cottoni Postuma—Choeic Pieces of that Renowned Antiquary* (1672); *Divers Short Picces Exposed to Publick Light by J. Howell* (1679); "Speech before the Privy Council touching the Alteration of Coyn," in Shaw, *Select Tracts and Documents* (1896). Consult, also: *Calendars of State Papers* (London, 1591-1631); *Parliamentary Journals* (London); Planta, *Catalogue of the Manuscripts in the Cottonian Library* (London, 1802); Smith, *Catalogue* (Oxford, 1696), containing a memoir: Kippis, "Robert Bruce Cotton," in *Biog. Brit.* (London, 1797); D'Ewes, *Autobiography* (2 vols., London, 1845); Nichols, *Progresses of James I.* (4 vols., London, 1828); id., *Leicestershire* (London, 1795-1811); Gardiner, *History of England* (London, 1883-84).

COTTON-BIRD. A small South African titmouse (*Egithalus Capensis*), called *kapok vogel* (i.e. 'cotton-bird') by the Cape Colony Dutch on account of its wonderful nest, made of cottony materials, which closely resembles the nest of its congener, the penduline titmouse of Europe, illustrated on the Plate of PENSILE NESTS OF BIRDS. (See NIDIFICATION: TITMOUSE.) This nest, first figured by Le Vaillant (*Oiseau d'Afrique*, Paris, 1806), whose picture has been widely copied, is usually wrongly assigned to an entirely different bird.

COTTON FAMINE. The name given to an industrial crisis in the manufacturing towns of northern England, occasioned by the almost complete disappearance of cotton imports from the United States during the last three years of the Civil War. As a result of the blockade of the Southern ports by the Federal Government, the importation of cotton from the United States into Great Britain sank from more than 1,000,000,000 pounds in 1860 to 816,000,000 pounds in 1861, 13,000,000 pounds in 1862, and 6,000,000 pounds in 1863; and as the imports from the United States constituted more than three-fourths of the total supply, the blow to the cotton industry in Lancashire was a stunning one. The suffering fell most heavily on the mill operatives, who, as a body, were brought to the verge of starvation by the partial or complete suspension of production. In November, 1862, it was estimated that more than 350,000 persons in Lancashire were subsisting on parochial relief or private charity. It is a notable fact that, in spite of their great privations, the factory population of Lancashire was in thorough sympathy with the Northern cause, which they regarded as a crusade against slavery. (Consult Arnold, *History of the Cotton Famine* (London, 1865).

COTTON-GIN. A machine for separating the cotton fibre from the seed, invented by Eli Whitney of Massachusetts and patented March 14, 1794. Previously the work had been done by hand, a slow and tedious process, four pounds per day being the average of one man. See COTTON.

COTTON-GRASS (from its cottony spike), *Eriophorum*. A genus of plants of the natural order Cyperaceae, having the fruit accompanied with long, silky hairs which spring from the base of the ovary. The species are not very numerous; they are natives chiefly of the colder regions of the Northern Hemisphere. Several are found in America, and their white, cottony fruit-bearing spikes are well known in our swamps and bogs. The cottony substance is used for stuffing pillows, etc., and it is claimed that cloth may be made from it. The fibre lacks the twist of the cotton fibre and cannot be spun as readily. The stems of a Himalayan species, *Eriophorum cannabinum*, called *bhabhur*, yield a very strong fibre, and are much employed for making cordage, being simply twisted into cables, of which rope bridges are usually made; but they are not durable, and require much repairing every year. Cotton-grass is said to be valuable for sheep-pasture.

COTTON-INSECTS. The most important of the insects injurious to the American cotton-culture is the cotton-worm, the larva of a noctuid moth (*Alctia xyliana*), which sometimes defoliates whole districts. It is believed to be South American, and first became strikingly harmful in the Southern States in 1804. It is now known all over the Union, but its Northern food-plant is unknown. A Government commission reported in 1879 that the average loss to the cotton-growing States due to its ravages was then from \$15,000,000 to \$20,000,000 annually. The moth is 1½ inches in spread of wings, the fore wings and body reddish brown, with delicate zigzag markings, and the hinder wings pale gray-brown. It flies at night, and deposits eggs singly or sparsely on the under side of the leaves of the cotton-plant, where they hatch in mid-summer in about 50 to 60 hours. The caterpillars begin at once to devour the leaves, and so many are they, sometimes, that whole fields have been defoliated in three days, when the caterpillars swarm elsewhere in search of more food. In mid-summer the caterpillars remain about thirteen days, then fold a leaf about themselves and spin a cocoon in which they pupate. In two to four days after issuing from the chrysalis the female moth begins to lay—her average product being 400 eggs in the season. The natural food is the juice exuding from the glands on the leaf's midrib and at the base of blooms and bolls; but it will feed on any kind of fruit as it ripens. Until the worms are numerous enough to riddle the leaves badly, the moths continue to lay near their birthplace; then they migrate to considerable distances—seldom, however, until after the third generation of worms, say July 1, in southern Texas. Migrations are most common in the fall months, the moths flying at night and on cloudy days. In the Southern States only the moths hibernate (the worms never, nor anywhere), hibernation being more frequent in the Southwestern than in the Atlantic States. The moths hibernate under bark, in logs and timbers, etc., and mild winters are more severe on them than cold ones, which keep them torpid.

In some districts there are as many as seven generations in a season. The average time from the egg of one generation to that of the next is a month.

sap from the bolls by its puncture, causing them to become diminutive or abortive; but the principal injury it does is by voiding an excrementitious liquid which stains the cotton fibre yellow

THE COTTON-BOLL WORM.

1. Adult moth (*Heliothis armigera*). 2. Destructive larva (the 'boll-worm' or 'bud-worm'), with a small boll pierced by a young caterpillar. 3. Vertical section of a newly expanded cotton-flower, showing a young boll-worm at work. 4. Section of a large green boll, which contains a caterpillar that has devoured the contents of the cell. 5. A pupa within its earthen case.

The caterpillars visit earliest low alluvial lands where the plants are luxurious and thrifty. Moisture is favorable to their development, hot, dry weather unfavorable. The damages to the crop may reach 25 per cent. in the southern districts; but in the northern the worms may do more good than harm, by removing superabundant leaves, thus facilitating the ripening of the bolls.

For further and extensive information, and preventive measures, consult: Comstock, "Report on Cotton Insects," in *U. S. Dept. of Agriculture* (Washington, 1879), illustrated; Riley, *U. S. Entomological Commission, 4th Report* (Washington, 1885); *Bulletin No. 18, New Series* (Washington, 1898).

The bud-worm is scarcely second in its evil effects. (See BOLL-WORM.) It is hatched from eggs deposited singly on all parts of the plant, taking only three to five days to hatch in summer. The worm is much like the cotton-caterpillar, but larger. Its principal food is the flowers and bolls. The chrysalis is found a few inches underground. The chrysalis state lasts seven to ten days in midsummer, double that in cooler weather. The moth is in appearance and habits much like the Aletia, but seldom appears before July or August. Hibernation is in the chrysalis state only, and underground. Breeding continues until cold weather; but the first three generations of each year generally feed in the cornfields, the first lot seen on cotton being the fourth brood.

Other injurious moths infesting cotton and eating the foliage include the yellow bear (*Spilosoma Virginica*), the io (*Saturnia Io*), the basket-worm or bag-worm (q.v.), and several others. Cotton-culture in Egypt is afflicted by two very similar insects, viz., *Prodenia littoralis* and *Earias insulana*.

The cotton-stainer, or redbug (*Dysdercus suturellus*), is a small suctorial bug, "which drains the

or reddish, and very much depreciates its value in the market, the stains being indelible." It is also troublesome to orange-growers in cotton-growing districts. See *Insect Life*, vol. i. (Washington, 1888), illustrated. Several plant-bugs, such as the capsid (*Psallus delicatus*), known in Texas as the cotton-flea, and certain small beetles, are also injurious to cotton. For a description of the weevil, see WEEVIL.

The natural enemies of the cotton-worm and of the boll-worm are domestic fowls, birds, spiders, beetles, wasps, ants, parasites, etc. As preventive measures, the free use of poisons is good for both, and fall plowing, which upturns the chrysalids of the boll-worm, exposes these to the attacks of fowls and the fatal influences of cold.

COTTON-MOUSE. A field-mouse (*Peromyscus gossypinus*), dark brown, with grayish feet, prevalent in the southern United States, and injurious to cotton-plants. Its habits are similar to those of the common white-footed mouse of the North. See MOUSE.

COTTONMOUTH (so named from the white, cotton-like streak about its mouth). Properly, the moccasin-snake (q.v.), but also a name in the southern United States of the copperhead.

COTTONSEED AND ITS PRODUCTS. *Cottonseed-Oil.*—Cotton, which is described in the article bearing that title, when it is picked consists of the seeds, and the lint or fibre adhering to and covering the seeds. The seeds constitute rather more than two-thirds of this product, so that a crop of 9,000,000 bales of cotton would yield about 4,500,000 tons of cotton-seed. It constitutes a very valuable part of the product, and is used for manufacturing cottonseed-oil, for feeding animals, and for fertilizer. The cotton-seed, after the removal of the fibre, yields, upon pressure, a large amount of yellow oil, with a bland, nut-like taste. Even

before the invention of the cotton-gin in 1794, the utilization of cottonseed was attempted, and in 1770 samples of the oil were exhibited by the Moravians in Bethlehem, Pa. Previous to that time the seed had been allowed to rot on the ground by many of the planters, while others more intelligent had utilized it as food for cattle, sheep, and horses. Others dug furrow-trenches, and buried it in the rows on which the next crop of cotton would be planted. Some fed it raw to their stock, while others boiled it to make it possibly more palatable. In 1820 a patent was granted for a process for extracting the oil, but the construction of the mills was so slow that at the end of fifty years only twenty-six cottonseed-mills had been erected. In 1861 Mr. Edward Atkinson stated that if the cotton-plant produced no cotton it would still be well worth cultivating on account of the valuable products that can be extracted from the seed. This was fully realized toward the close of the nineteenth century, and the value of the cottonseed began to be more generally appreciated. Though much of it is still retained on the plantations as a fertilizing material, the amount manufactured in the United States was, in 1898, 5,594,602 tons, in 1899 4,450,000 tons, and in 1900 4,472,103 tons. The annual product is valued at \$33,000,000.

In addition to the oil extracted from the cottonseed, it yields the following by-products: *Linters*, or short bits of lint that adhere to the seed in the ordinary process of ginning, and are stripped by a specially constructed gin. These short fibres are used for the manufacture of batting and wadding. *Hulls*, the outer casings of the seed, which make a valuable cattle-food, whose properties are discussed below. *Oil cake*, the material left after the oil is expressed out of the nut. This is also used as a cattle-food or as a fertilizer. *Sludge*, which settles at the bottom of the oil-tanks, and is used in the making of soap, stearin, etc.

The process of manufacture is briefly as follows: The seed is shoveled from the ears into conveyors, which are spiral screens revolving in troughs with perforated bottoms through which any loose soil, sand, and stones are shaken. This process of cleaning is continued in a separator, where by means of different sized screens all dirt and impurities are removed. A strong magnet is also used to draw out bits of nails and other iron. The seed being sifted and cleansed, it is now passed through the linter, a specially constructed gin for removing these short fibres. The lint is ginned twice, the second process removing the shorter fibres, so that two brands or qualities are thus obtained. The next process is to crack the hulls in a machine between revolving blades and

oil: It may be expressed directly from the cold meats, this process making a high-grade oil; or the meats may first be heated in cookers. These cookers are steam-heated metal pans, covered with non-heat-conducting material and holding 700 pounds. The seeds are cooked from one-quarter to three-quarters of an hour, according to their condition as determined by the judgment of the operator, too little or too much cooking giving a smaller yield of oil. The cooked meats are dropped into a camel's-hair sheet, spread out on a steel plate. Wrapped in this sheet the meats are subjected to pressure, which is gradually increased till it reaches 3500 pounds per square inch. Under this pressure, a dark, murky oil flows out in streams and is received in reservoirs beneath the presses, whence it is pumped into settling-tanks. The cakes are now taken from their wrappings of camel's-hair, cooled, and dried. They are then cracked and ground into meal, which is shipped directly in sacks or pressed again into cakes. After the crude oil has settled it is drawn off and refined by treating it to a 10 or 15 per cent. solution of caustic soda and then allowed again to settle. As it settles the mucilaginous, albuminous, coloring matters and other impurities sink to the bottom, leaving a clear yellow oil, which may be still further filtered and purified if desired. The white oil of commerce is produced by shaking up the oil with a 2 or 3 per cent. mixture of fullers' earth and then allowing it to settle.

The commercial cottonseed-oils are classified as crude, summer yellow, summer white, winter yellow, and winter white. The winter oils are made by cooling the summer oils to the freezing-point, when the palmitin crystallizes and the oil is pressed out of the remaining solidified material. Cottonseed-oil consists chiefly of palmitin and olein, the winter oils being almost entirely olein. It stands midway between the drying and non-drying oils, its drying properties being inferior to those of linseed oil. (See OILS.) It solidifies at from 32° to 38° F., is almost odorless, and has a slight nutty taste. Its uses are constantly increasing. It is employed extensively in cooking and is also used as an adulterant of lard, olive oil, and other staples. By many it is preferred as a substitute for lard or butter, in cooking. It is used in pharmacy, in making soap and paint, as a lubricator and an illuminant. Consult Brooks, *Cotton* (New York, 1898).

Feeding and Fertilizing Value.—Brief mention has already been made of the use of cottonseed products for feeding cattle and for fertilizer. Whole cottonseed has been shown by a large number of analyses to range in composition as follows:

PERCENTAGE COMPOSITION OF WHOLE COTTONSEED

	Water	Ash	Protein	Fibre	Nitrogen-free extract	Fat
Maximum	17.51	8.00	29.70	32.40	36.70	29.34
Minimum	8.00	2.80	13.62	17.60	7.58	10.40
Average	9.92	4.74	19.38	22.37	23.94	19.45

bars, and then the meats and hulls are separated, the latter being sold either loose or in 100-pound bales. The meats are now ready to be passed through heavy calender rolls to crush the oil-cells. There are two processes of making cottonseed-

This material was used in the past to considerable extent as a feeding stuff for cattle and sheep, and was fed either raw, cooked or roasted, but, with the advent of oil-mills, its use for this purpose is much less in the vicinity of these,

because the seed is disposed of to better advantage to the millers or can be exchanged for cottonseed-meal. There are also the further reasons that the lint on the seed and the dust it collects are likely to be injurious, while at the same time it is not easy to mix the seed itself thoroughly with other coarse feeds. It is a very rich feeding stuff, and animals must be accustomed to it gradually. The whole seed is sometimes used for fertilizer, and then it is partially rolled.

Cottonseed-meal is the ground residue left in the manufacture of oil from the seed. It is sometimes called cottonseed cake and belongs to the class of feeding stuffs known as oil cakes. Cottonseed cake is of two kinds—undecorticated, or that from the whole seed, and decorticated, or made from the kernels after the hulls have been removed. Undecorticated cake was formerly largely used, but most of the mills now remove the hulls before expressing the oil. Cottonseed-meal is bright-yellow in color, with a sweet, nutty flavor. It deteriorates and becomes discolored with age. The following summary of over 400 analyses shows its range in composition, which is due to differences in the composition of the seed and the completeness with which the hulls are separated and the oil expressed:

PERCENTAGE COMPOSITION OF COTTONSEED-MEAL (DECORTICATED)

	Water	Ash	Protein	Fibre	Nitrogen-free extract	Fat
Maximum.....	18.52	10.60	52.88	15.15	38.68	20.66
Minimum.....	5.29	1.72	23.27	1.88	9.13	2.18
Average.....	8.52	7.02	43.26	5.44	22.31	13.45

This material is one of the richest feeding stuffs in use, considerably exceeding in protein and fat such materials as linseed-meal, but, in spite of this, it is quite well digested when fed in moderation. On an average, 88.8 per cent. of the protein, 57 per cent. of the fibre, 77.6 per cent. of the nitrogen-free extract, and 88.6 per cent. of the fat has been found to be digested by ruminants. It is fed extensively in the United States to cows, cattle, sheep, and nearly all kinds of farm stock, with the exception of pigs. The latter do not seem, for some reason, to be able to eat the meal, although they eat the whole seed without injurious effects. Young animals, like calves, have also often been injured by cottonseed-meal, and its use with them is attended with danger. All experience goes to show that the fresh meal can be fed to other kinds of animals without danger and in large quantities after they become accustomed to it. Six, eight, and even ten pounds of cottonseed-meal per head is often fed to steers, with good results, using no other kind of grain. It is undoubtedly best to mix some material like cornmeal with it. For cows about two pounds a day seems to be a safe limit for continued feeding, although three and often four pounds are often fed. It tends to give a firmer, harder butter, which will stand shipment better. Larger quantities can be fed with safety in winter than in summer. It is one of the cheapest of the highly nitrogenous feeding stuffs, and is therefore one of the most economical for balancing rations.

Cottonseed-hulls, which are removed at the mills by means of crushers, screens, and shakers, also possess some feeding value, and are much used with the meal. They constitute nearly one-

half of the weight of the ginned seed. They contain about 11 per cent. of water, 4 of protein, 46 of fibre, 33 of nitrogen-free extract, and 2 per cent. of fat. Their digestibility is low, less than 40 per cent. of the total dry matter being assimilated. They are hard and dry, usually covered with a fuzzy lint, and very bulky. For this reason they are put up in bales weighing about ninety pounds. They are used principally as a cheap substitute for hay, and for the purpose of giving bulk to the ration. Large numbers of cattle are fattened in the Southern States of the United States on cottonseed-meal and hulls exclusively, in proportions varying from two to six pounds of hulls to one pound of meal. The practice is claimed to be economical and profitable, and the diet apparently does not injure the health of the animals or impair the quality of the product.

Cottonseed-meal is rich in fertilizing materials, especially nitrogen, as shown by the following average of over 200 analyses: Water, 7.8; ash, 7; nitrogen, 6.8; phosphoric acid, 2.9; and potash, 1.8 per cent. It is chiefly used as a source of nitrogen, and finds quite extensive use for that purpose through the Southern portion of the United States. It has given excellent results with

sugar-cane, cotton, and corn, and has been successfully substituted for barnyard manure in the culture of tobacco. But its use as a fertilizer is of course wasteful, as the food constituents are not utilized in that case. A more rational practice in many cases is to feed the meal and apply the resulting manure to the soil, since from 80 to 90 per cent. of the fertilizing materials would be recovered in the manure, and additional benefit would be secured in the production of meat, milk, etc. Cottonseed-hulls are to some extent burned as fuel, and the resulting cotton-hull ashes are rich in potash and make an excellent fertilizer for tobacco. (See ASIENS.) Consult Roper, "Cottonseed Products," in *Twelfth United States Census*, vol. ix., part iii. (Washington, 1902).

COTTON STATE. Alabama. See STATES, POPULAR NAMES OF.

COTTONTAIL. Any of the smaller American hares, especially the common wood-hare or gray rabbit. The name refers to the fluffy white scut, and is often personified as 'Molly Cottontail.' See HARE, and Plate of HARES AND PIKA.

COTTON WHIGS. See CONSCIENCE WHIGS.

COTTONWOOD. A name applied to a number of species of *Populus* on account of the abundant white cottony hairs surrounding the seed. The trees are widely distributed. Some attain large size and are valuable for many purposes. See POPLAR.

COT'YLE'DON (Gk. *κοτύληδών*, *kotyledōn*, cup-shaped hollow socket, from *κοτύλη*, *kotylyē*, hollow cup). The first leaf or leaves of an embryo. In seed-plants the cotyledons are usually formed within the seed, and in most cases

they escape during germination, but are usually very different in appearance from the later leaves. See SEED.

COTYLOSAURIA (Neo-Lat. nom. pl., from Gk. *κοτύλη*, *kotylē*, hollow cup + *σαύρος*, *sauros*, lizard). The order which includes the most ancient reptiles, fossil in rocks of the Carboniferous Age, which, according to E. D. Cope, gave rise to the Theromorpha (q.v.), whence sprang the saurian and serpentine forms, and also to the lines leading to the fish-reptiles (Ichthyopterygia) and the turtles (Chelonia). The cotylosaurians are thus characterized by Cope: "Quadrat bone united with adjacent elements by suture; temporal regions with roof of a few symmetrical segments. No distinct post-orbital bars; vertebrae amphicelous; ilium narrow, vertical; feet ambulatory."—*Report United States National Museum, 1898* (Washington, 1900).

COTYS, or **COTYTTO** (Lat., from Gk. *Κότυς*, *Kotys*, *Κοτυττώ*, *Kotyttō*). A Thracian goddess, whose festival, the Cotyttia, was held at night and was notorious for its debaucheries. Her worship was adopted by some of the Greek States.

COUCAL, *kōō'kāl* (probably an African word, although according to Cuvier it was coined in 1796 by Le Vaillant in his *Oiseaux d'Afrique*, from Fr. *couc-ou*, cuckoo + *al-ouette*, sparrow). A kind of cuckoo, many species of which are widely distributed throughout Africa and south-eastern Asia to Australia, constituting the sub-family Centropodinae, especially characterized by having the hind toe terminated by a straight, spine-like claw, whence they have been called 'lark-heeled.' They are large, ground-keeping birds, generally red and black, more or less glossed, and sometimes banded with brown, and are known generally as 'ground-cuckoos.' A species of the Philippines has a rounded crest and black, horny appendages to the feathers of the head and throat. Some other Asiatic species mimic pheasants in appearance and gait and are called 'pheasant-cuckoos.' The best-known one is the very common Indian 'crow-pheasant' (*Centropus Sincensis*), is nearly two feet long, black, with the mantle and wings chestnut, and utters a curious howling cry, followed by a series of rattling exclamations. All these birds make their own nests, sometimes elaborate roofed structures in thorny bushes, and lay white eggs incrusted like those of an ani. They are closely allied to the American road-runner. See CUCKOO.

COUCH, DARIUS NASH (1822-97). An American soldier. He was born at South East, N. Y., graduated at West Point in 1846, served in the Mexican War (1846-47), and was brevetted first lieutenant in 1847 for 'gallant and meritorious conduct' at Buena Vista. In 1849-50 he served against the Seminoles, and in 1853 made an important exploring expedition into northern Mexico. In 1855 he resigned from the army to become a merchant in New York, but in June, 1861, reentered the service as a colonel of volunteers, and in August became brigadier-general. He served in 1861-62 with the Army of the Potomac, rendering valuable services at Fair Oaks, Williamsburg, and Malvern Hill; was promoted to be major-general in July, 1862; commanded the Second Army Corps at Fredericksburg and Chancellorsville; was in command of the Department

of Su-quehanna in 1863 and 1864; and was at the head of a division at the battle of Nashville. He resigned in 1865, and in the same year was an unsuccessful candidate on the Democratic ticket for the Governorship of Massachusetts. He was subsequently Collector of the Port of Boston in 1866-67, was quartermaster-general of Connecticut in 1877-78, and was adjutant-general of that State in 1883-84.

COUCHANT, *kou'chant* (Fr., pres. part. of *coucher*, to lie down). In heraldry, a beast lying down, with his head up, is couchant. If the head is down, he is dormant. See HERALDRY.

COUCH-GRASS (corrupted from *quitch-grass*, *quitch-grass*; so called from its rapid growth), *Agropyron repens*. Also called wheat-grass, dog-grass, quickens, and squich or quitch. A grass chiefly known as a troublesome weed. It is common in most parts of Europe and North America. See AGROPYRON.

COUCY, *kōō'sē'*, THE CHÂTELAIN DE. A French troubadour, whose name was Raoul or Renaud. He became Châtelain of Coucy in 1186, took part in the Third Crusade (1189-91), and was killed by the Saracens about 1203. His work consists of about sixteen songs, in the troubadour style, but with more sincerity and originality than the usual *chansons courtoises* of the time. They were published by Rath as *Die Lieder des Castellan von Coucy* (Heidelberg, 1883). The legend connected with his name is one of great age, and is found in the literature of many countries, though it is most likely of Breton origin. About the end of the thirteenth century there appeared a story or *roman* in verse by a certain Jakemon Sakesep, of whom nothing is known, and whose name is taken from an acrostic given in his work, *Roman d'aventure*. He tells of the loves of the Châtelain de Coucy and the Dame de Fayel. Falling ill on his way from the Holy Land, the Châtelain ordered that after his death his heart be taken to his lady. But the husband of the lady intercepted the messenger, took the sacred souvenir, and forced his wife to eat it. Thereupon the Dame for horror starved herself to death. The story was published with a modern version by Crapelet (Paris, 1829).

COUCY-LE-CHÂTEAU, *kōō'sē'le-shá'tō'*. A small village and cantonal seat (population, in 1901, 683) in the Department of Aisne, France, 10 miles north of Soissons. It is celebrated for the remains of its mediæval castle, standing on an acclivity, accessible on one side alone, and one of the most formidable fortresses of its period. The castle covers an area of 10,000 square yards, and is surrounded by lofty walls and a moat. Four towers flank the donjon, which is 210 feet high, 100 feet in diameter, and has walls 34 feet thick. It is public property and is classed among the historical monuments of France. Built by Enguerrand III., who died in 1242, it was purchased in 1396 by Louis of Orléans, and in 1498 became Crown property. It was dismantled by Mazarin's order in 1652.

COUDER, *kōō'dār'*. LOUIS CHARLES AUGUSTE (1789-1873). A French painter, born in London. He studied in Paris under David and Regnault and exhibited regularly at the Salon from 1817 until his death. Although he painted both religious and historical subjects, he is better known by his large historical compositions at

Versailles and in the Louvre, namely "The Siege of Yorktown" and "The Battle of Lawfield." He was a member of the *conseil supérieur* of the Ecole des Beaux-Arts and wrote some critical works on art.

COUDERT, kōō-dēr', FREDERIC RENÉ (1832-1903). An American lawyer, born of French parents in New York. He graduated at Columbia University in 1850, and was admitted to the New York bar three years later. In 1877 he was a delegate of the New York Chamber of Commerce to the Antwerp Congress, which was held for the purpose of establishing a universal system of general average. He was counsel for the United States before the International Bering Sea Commission (Paris, 1893-95); a member of President Cleveland's Venezuela Boundary Commission (1896-98); and president of numerous societies and clubs. He received the Cross of the Legion of Honor and also decorations from Italy and Venezuela.

COUDERSPORT, kou'dēr-z-pōrt. A borough and the county-seat of Potter County, Pa., 110 miles east by south of Erie; on the Allegheny River, and on the Coudersport and Port Allegheny Railroad (Map: Pennsylvania, C 2). It contains a public library. The borough has flour-mills, a foundry, a tannery, glass-factories, and manufactures of clothes-pins, baskets, furniture, barrels, hubs, etc. Population, in 1890, 1530; in 1900, 3217.

COUDREAU, kōō'drō', HENRI ANATOLE (1859—). A French explorer, born in the Department of Charente-Inférieure, and educated at Cluny. In 1881 he explored French Guiana and the adjacent territory, and in 1895 he was commissioned by the Government of Pará to explore the Tapajos, Xingu, and other branches of the Amazon. These explorations are described in several interesting volumes published in 1897. His other publications include: *Voyage au rio Branco et aux Montagnes de la Lune* (1886); *Etudes sur les Guyanes et l'Amazonie* (1887); *Chez nos Indiens* (1892); and three volumes on his voyages along the before-mentioned affluents of the Amazon (1897).

COUES, kouz, ELLIOTT (1842-99). An American naturalist, particularly distinguished for his researches in ornithology. He was born at Portsmouth, N. H., graduated at Columbian University in 1861, from the medical department of that institution in 1863, became an assistant surgeon in the United States Army, and made extensive studies of the flora and fauna in the vicinity of the various posts at which he chanced to be stationed. In 1873-76 he was attached as surgeon and naturalist to the United States Northern Boundary Commission, and from 1876 to 1880 as secretary and naturalist to the United States Geological and Geographical Survey of the Territories, directed by Dr. F. V. Hayden. He resigned his commission in 1880, and thenceforth was occupied wholly with scientific pursuits. From 1877 to 1887 he was professor of anatomy at the National Medical College at Washington, D. C. He was elected to the National Academy of Sciences in 1877, was a founder of the American Ornithologists' Union, and an editor of the *Auk*, the journal of that society. About 1880 he became interested in spiritualism, theosophy, and allied matters, and for a time was affiliated with the Theosophical Society. He was known as a

student of comparative anatomy and general biology, and for seven years was connected with the *Century Dictionary* as editor and contributor in the departments of general zoology, biology, and comparative anatomy. But while his field of activity was wide, he was prominent chiefly as a writer on ornithology, and in particular on that of North American birds. His *Key to North American Birds* (1872; rewritten 1884; again, 1901) has perhaps had a greater influence on American ornithology than any other work. With this should be named his *Field Ornithology* (1874); *Birds of the Northwest* (1874); *Birds of the Colorado Valley* (1878); an incomplete *Bibliography of Ornithology* (1878-80); *New England Bird-Life* (1881; with W. A. Stearns); and a *Dictionary and Check-List of North American Birds* (1882). He also made investigations regarding the early exploration of the trans-Mississippi region, and edited (1893) the *Journals* of Lewis and Clark. As a contributor to the technical advance of ornithology in America he ranked as not greatly inferior to Spencer Baird (q.v.), and as a popular expositor of the subject probably had no equal.

COUGAR, kōō'gēr (Fr. *couguar*, Sp. *cuguardo*, from native South American *cuguacuara*, *cuguacuarana*). One of the names of the American panther (*Felis concolor*), described in this work under PUMA (q.v.). Although widely in use, the name should be abandoned, because it perpetrates an error of identification. Cuvier explained its origin in his *Règne Animal* (Griffith's version, *The Animal Kingdom*, vol. ii., London, 1827), as follows, speaking of the puma: "It is called by the Mexicans *Mixtli*; in Peru, *Puma*; in Brazil, *Cuguacuarana* (the word *Cougoua* is contracted by Buffon from this latter barbarous appellation); and in Paraguay *Gua-zuara*. . . . The name *Cougoua*, by which it is most commonly known in Europe, particularly in France, appears, probably, to have been borrowed from that proper to another animal; . . . but puma is its native name." Elsewhere it appears that the 'other animal' was the *eyra* (q.v.). A drawing of this cat brought to Europe by John Maurice, Count of Nassau, when Governor of Dutch Guiana in the seventeenth century, was labeled *cugnacuarana* and *cugua-guarana*. This was copied by Maregrave and Piso and applied by Buffon, in the contracted form above noted, probably under the belief that the *eyra* (which is concolorous) was the same animal as the puma.

COUGHING (AS. *cohhetan*, Dutch *kugehen*, to cough, MHG. *küchen*, *kichen*, Ger. *keuchen*, *keichen*, to gasp; imitative of the sound). Considered physiologically, coughing consists, first, in a long inspiration which fills the lungs to a greater extent than usual; second, in a closure of the glottis, or narrow opening in the organ of voice (see LARYNX), at the commencement of the act of expiration; and third, in a sudden forcing open of the glottis by the violence of the expiratory movement. In this way, a blast of air is driven upward from the lungs through the mouth, which carries with it anything that may be present and cause irritation in the air-passages. Coughing may occur from irritation in the back of the throat, in the larynx, trachea, or bronchial tubes, and may be excited by irritant gases, or by articles of food or drink—such as

even a drop of water or a crumb of bread—making their way into the air-passages instead of into the œsophagus, or by excessive or morbid secretion from the walls of the air-tubes, or even by the entrance of cold air, when the lining membrane of the air-passages is abnormally irritable. Cough is reflex and involuntary generally, and is due to irritation of the terminal fibres of the pneumogastric nerves, which are distributed to the mucous membrane of the respiratory tract. The object of coughing in the animal organism is unquestionably to guard against the danger of the entrance of mechanical and chemical irritants into the air-passages; and accordingly the mucous membrane, especially of their upper part, is endowed with a most exquisite sensibility, which, when aroused by mechanical irritation or by disease, provokes incessant coughing until the cause of the irritation is removed. Cough is a common symptom of all diseases of the organs of respiration, as well as of inflammatory affections of the throat, tonsils, and nose. The treatment of cough depends upon the cause. See PNEUMONIA; BRONCHITIS; PLEURISY; TUBERCULOSIS.

COUIY. A tree-poreupine. See PORCUPINE.

COULANGES, kōō'lānzh', FUSTEL DE. See FUSTEL DE COULANGES.

COULANGES, PHILIPPE EMMANUEL, Marquis de (1631-1716). A French courtier, famous for his correspondence with his cousin, Mme. de Sévigné (q.v.). His writings include *Recueil des chansons* (1698); *Lettres* (published with those of Mme. de Sévigné); and *Mémoires*, edited by Monmerqué (Paris, 1820).

COULIN, kōō'lin. In Spenser's *Faerie Queene*, a British giant killed by falling into a chasm when pursued by Debon.

COULMIERS, kōō'miyá'. A village in the Department of Loiret, France, 13 miles northwest of Orleans (Map: France, H 4). Population, in 1901, 368. On November 9, 1870, the German and French forces, under Von der Tann and Aurelle de Paladines respectively, met here in a seven hours' battle, the former suffering a loss of 1308 and being compelled to retreat to Artenay, the French losing 1500.

COULOMB, kōō'lón' (named after the physicist Coulomb). The practical unit of quantity of electricity, being the amount produced each second by an electric current of the strength of one ampere; therefore, if in the ordinary form of silver voltameter, m grams of silver are deposited, $m \div 0.001118$ is the number of coulombs which have passed, assuming that an ampere deposits 0.001118 gram of silver per second. See AMPERE; ELECTRICAL UNITS.

COULOMB, CHARLES AUGUSTIN (1736-1806). A French physicist, celebrated for his researches particularly in electricity and magnetism. He was born at Angoulême in 1736, and in early life became an officer of engineers. In 1777 he gained a prize by an essay on the construction of magnetic needles (*Sur les aiguilles aimantées*). In 1779 his *Théorie des machines simples* gained the prize offered by the Academy; and in 1781 he was a third time successful in an essay on the friction and resistance of cordage, etc., used in machines. In the same year he was elected a member of the Academy, and his services were employed on all the most difficult problems in me-

chanics. He is known as the inventor of the torsion balance (q.v.), by which the attraction of electricity and magnetism can be measured, while his memory has been perpetuated by the use of his name for the unit of electric quantity. Having offended certain influential persons by reporting unfavorably on a project for a navigable canal in Bretagne, Coulomb was for some time imprisoned, but received from the States of Brittany a present of a handsome watch, as a reward of his firm opposition to an expensive and unprofitable scheme. He lived in retirement during the Revolution, but took part in the investigations attending the introduction of the metric system by the new Government.

COULOMMIERS, kōō'lō'myá'. The capital of an arrondissement and a garrison town in the Department of Seine-et-Marne, France, on the Grand-Morin, 38 miles east of Paris. Its parish Church of Saint Denis dates from the thirteenth century, and it has remains of a castle built in 1613. There is a monument to the heroic Beau-répaire, who killed himself in 1792 rather than surrender the town of Verdun. It has woolen mills, manufactures of starch and cheese, and market-gardening is largely carried on. Jean de Boullonge or Valentin, the artist, was a native of Coulommiers. Population, in 1901, 6505.

COULTER, kōl'tēr, JOHN MERLE (1851—). An American botanist and educator, born at Ningpo, China. He received his education at Hanover College, Indiana, and subsequently studied at Harvard. After serving for a year as botanist to the United States Geological Survey in the Rocky Mountains, he was made professor of natural science at Hanover College, where he remained for five years. In 1879 he was appointed professor of biology at Wabash College; from 1891 to 1893 was president of the Indiana State University, and from 1893 to 1896 presided over Lake Forest University. In 1896 he became head of the department of botany in the University of Chicago. Dr. Coulter's published works include the following: *Manual of Rocky Mountain Botany* (1885); *Handbook of Plant Dissection* (jointly with J. C. Arthur and C. R. Barnes, 1886); and *Manual of Texan Botany* (1892-93). He has also published a work on the morphology of gymnosperms, general works on plant relations and plant structures, and has edited the *Botanical Gazette*.

COUMARIN, kōō'mā-rin. * See CUMARIN.

COUMOUNDUROS, kōō-mōōn-dy'rōs, ALEXANDROS. See KUMUNDUROS.

COUNCIL (OF, *concile, concilic*, Lat. *concilium*, from *com-*, together + *calare*, Gk. *καλεῖν*, *kalcin*, to call, OHG. *holōn*, Ger. *holen*, AS. *goholian*, Engl. *hale*, to summon). An assembly of ecclesiastical dignitaries held for the purpose of regulating the doctrine or discipline of the Church. As early as the second century Church councils were convened in which only one or two provinces took part, the bishops and presbyters binding themselves to carry out the decisions arrived at in their own communities. These assemblies were commonly held in the chief town or metropolis of the province, and the bishops of such capitals—who, after the third century, bore the title of *metropolitan*—were wont to preside over the meetings, and to consider questions of doctrine and discipline which had arisen within the territory. Over these metropolitan councils

were established, at a later period, the provincial synods, exercising authority over several united provinces, and finally, the national councils. After the fourth century, when the Christian religion was established in the Roman Empire, we read of *ecumenical*, i.e. universal councils, so called because all the bishops of Christendom were invited or summoned by the Emperor. In some early synods we find bishops, presbyters, and others taking part in the deliberations; but after the opening of the fourth century only the bishops were convened. According to the doctrine of the Roman Catholic Church, the Pope alone, or, by way of exception, in some cases the college of cardinals, had the power of convening ecumenical councils, which, in the Catholic view, represent the universal Church under the guidance of the Holy Ghost. Questions were determined by the majority of votes, and the Pope or his proxy presided and confirmed the resolutions carried in the synod. In matters of faith, the Holy Scriptures and the traditions of the Church were the guide; while in lighter matters, human reason and expediency were consulted. In the former, ecumenical councils are held to be infallible, but in other matters of discipline, etc., the latest synod decides questions. The question of the Pope's subordination to the decrees of the ecumenical councils was long and warmly debated during the Middle Ages, but is not asserted by any Roman Catholic theologian to-day.

Twenty ecumenical councils are recognized by the Roman Catholic Church: (1) The first Council of Nicaea, held A.D. 325, in the height of the Arian controversy to define the doctrine of the Godhead of Christ, and to settle the proper time of keeping Easter against the Quartodecimans. (2) The first Council of Constantinople (381) completed the Nicene symbol by the definition of the Godhead of the Holy Ghost. (3) The Council of Ephesus (431) defined the unity of person in God the Son, against Nestorius, and guarded the definition by applying the term *θεοτόκος*, *theotokos*, to His mother. (4) The Council of Chalcedon (451), against the opposite heresy of Eutyches, asserted the twofold nature of Christ. (5) The second Council of Constantinople (553) condemned some survivals of Nestorianism. (6) The third Council of Constantinople (680-81) condemned the Monothelites. (7) The second Council of Nicaea (787) was directed against the iconoclasts and defined the respect to be paid to images. (8) The fourth Council of Constantinople (869-70) was called to secure the peace of the Eastern and Western churches, by the deposition of Photius, who had unjustly intruded into the see of Constantinople. The following councils, all held in the West, were subsequent to the schism between the Eastern and Western churches, and are consequently not recognized as ecumenical by Easterns or by Anglicans. Over the next seven councils, four held in Rome and three in southern France, the popes presided in person, without Imperial coöperation; they were held now, not so much to condemn heresy as to deal with other pressing needs of the Church, such as the encroachments of the Imperial power and reform in ecclesiastical discipline. (9) The first Lateran Council (1123) was called to settle the dispute between the spiritual and temporal powers on the question of investiture. (10) The second Lateran

Council (1139) condemned the errors of Arnold of Brescia and others. (11) The third Lateran Council (1179) condemned the Albigenses and Waldenses, and passed a number of reforming decrees. (12) The fourth Lateran Council (1215), the most important ecclesiastical gathering of the Middle Ages, formulated a more detailed confession of faith in opposition to the Albigenses and other innovators, and passed seventy reforming decrees. (13) The first Council of Lyons (1245) threatened the Emperor Frederick II. with excommunication and deposition, and called on Christendom to take up arms against the Mohammedans. (14) The second Council of Lyons (1274) strove for the reunion of the Greek and Latin churches, and regulated Papal elections. (15) The Council of Vienne (1311-12) suppressed the Knights Templars and condemned various sects of the time, such as the Fraticelli and Beghards. (16) The Council of Constance (1414-18) was called to restore the unity of the Church by the recognition of a legitimate pope, and condemned the doctrine of Wiclif and Huss. (17) The Council of Basel, convoked in 1431, and later removed to Ferrara and Florence, discussed ecclesiastical reformation, and made a determined attempt, in consultation with Greek deputies who came to Florence, to bring about a union with the East. (18) The fifth Lateran Council (1512-17) annulled the Pragmatic Sanction and confirmed the bull *Unam Sanctam*, besides occupying itself with ecclesiastical discipline. (19) The Council of Trent (1545-63, with some interruptions), called to meet the problems presented by the Reformation, was very rich in consequences both for the confirmation of doctrine and the establishment of discipline. (20) The Vatican Council (1870) decreed the infallibility of the Pope. For further details of important councils, see NICEA; BASEL; CONSTANCE; TRENT, etc.

Among Congregationalists and Baptists the term council is applied to an assembly of ministers and delegates from neighboring churches, called by a local church, as occasion arises, to act or assist in ordaining a minister, or give advice on matters referred to it, beyond which its power does not extend. They have also a national council, composed of delegates from all parts of the denomination, and meeting for conference concerning its work. The Pan-Presbyterian Alliance, as the association of the reformed churches holding the Presbyterian system is called, holds a council every four years for conference on matters of general interest to the allied churches. So the Evangelical Alliance, a loose, undenominational body, holds councils, and the Methodists throughout the world held one in 1901.

The great history of the councils of all kinds from the Apostolic age to the Council of Trent is by C. J. Hefele, assisted in the latter part by A. Knöller and Cardinal Hergenröther (9 vols., Freiburg, 1855-90); there is an English translation by Clark and Oxenham of the first two volumes, and up to the eighteenth book of the original (4 vols., Edinburgh, 1871 et seq.). Consult also the great collection of canons and other acts of the councils, by G. D. Mansi (31 vols., Florence and Venice, 1759-98). A study of the first seven ecumenical councils from a doctrinal standpoint is presented by W. P. du Bose (New York, 1897), and their *Canons and Dogmatic*

Decrees, annotated with much additional matter, all in English, by H. R. Percival (New York, 1900). See **SYNOB**.

COUNCIL, PRIVY. See **PRIVY COUNCIL**.

COUNCIL BLUFFS. A city and the county-seat of Pottawattamie County, Iowa, five miles east of Omaha, Neb.; near the Missouri River, and on the Union Pacific, the Chicago and Northwestern, the Chicago, Burlington and Quincy, the Chicago, Rock Island and Pacific, the Illinois Central, and other railroads (Map: Iowa, B 3). The city is well laid out, and lies to a great extent on a plain underlying high bluffs. It has a public library, one of the first established in the State, and beautiful parks, notably Fairmont and Bayliss, and is the seat of the Iowa School for the Deaf. Railroad and wagon bridges over the Missouri afford communication with Omaha. Good transportation facilities have made Council Bluffs a commercial point of great importance; it has an extensive trade in agricultural implements, live stock, fruit, and produce, and manufactures of machinery, engines, lumber, paper, carriages, agricultural implements, and many other articles. The city government is conducted under a general State incorporation law, revised in 1897. The Mayor holds office for two years, and the city council is composed of representatives from the six wards of the city and two members at large. The council elects the city clerk, street supervisor, city physician, pound-keeper, chief of fire department, and electrician; the marshal and police are nominated by the executive and confirmed by the council; all other offices are filled by popular election. In 1804, on the site of Council Bluffs, Lewis and Clark held a council with the Indians—hence the name. Here, in 1846, the Mormons established a settlement, called Kaneshville, which, however, they soon abandoned for Salt Lake City. The city was chartered in 1850. Population, in 1890, 21,474; in 1900, 25,802.

COUNCIL GROVE. A city and the county-seat of Morris County, Kan., 24 miles northwest of Emporia; on the Neosho River, and on the Missouri Pacific and the Missouri, Kansas and Texas railroads (Map: Kansas, F 3). It is surrounded by a fertile agricultural and stock-raising country. The city contains a public library, and has municipal water-works and electric-light plant. Council Grove, settled in 1847, is one of the oldest towns in the State. Population, in 1890, 2211; in 1900, 2265.

COUNCIL OF ANCIENTS. See **DIRECTORY**.

COUNCIL OF BLOOD. See **ALVA**.

COUNCIL OF FIVE HUNDRED. See **DIRECTORY**.

COUNCIL OF TEN (*Consiglio di dieci*). The supreme body in the Venetian Government from the beginning of the fourteenth century till the overthrow of the Republic in 1797. The creation of the Council of Ten was but the final step in the process by which the oligarchic party succeeded in obtaining sole control of the Government, beginning with the so-called "Closing of the Grand Council" in 1297. Its immediate cause was a popular uprising in 1310 headed by the noble families of Tiepolo and Que-

rini. After the suppression of the revolt the Council of Ten was constituted as a secret body for the purpose of discovering and punishing all the participants in the conspiracy. Created at first for a few days, its existence was prolonged from time to time until, in 1335, it was made permanent. In spite of its name, the Council consisted of seventeen members, ten Counselors of the Black Robe, elected for a year, six Counselors of the Red Robe, chosen for eight months, and the Doge. In times of great emergency the Council was augmented by a *giunte* of twenty or more of the noblest citizens, so that until 1595 it was officially known as the *Consiglio di dieci e giunta*. The powers exercised by the Council were unlimited and touched upon every affair of public and private life. Its decisions, from which there was no appeal, were arrived at in secret, and its sentences were often carried out in the same manner. In spite, however, of its arbitrary acts and the relentlessness with which it visited punishment upon those who offended it, the Council of Ten was popular with the large mass of citizens in that it insured internal tranquillity and the equitable administration of justice and preserved the State against the ambition of powerful nobles. In 1539 the discovery of treasonable behavior on the part of certain of the Ten led to the creation of the *Inquisitori di stato*, to whom the Council delegated its police functions, reserving to itself the trial of offenders brought before it by the inquisitors. Legend has pictured the Council of Ten as a horrid tribunal, whose history is one of stealth and secret murder, but as a matter of fact its influence in Venice, though absolute for five centuries, was far from malignant.

COUNCIL OF THE INDIES, THE. A governing council formed in 1511 by King Ferdinand for the regulation of Spanish colonial affairs. It had unlimited powers, and covered every branch of administration.

COUNCIL OF WAR. A conference of officers in war time, whom the commander voluntarily calls together to discuss matters of moment. It is an unwritten but generally understood rule that the commandant of a garrison will accept, or at least solicit, the opinion of a council of war before surrendering to an enemy.

COUNSEL (OF, *consil*, *cunsel*, *consel*, from Lat. *consilium*, consultation, from *consulere*, to consult). A term applied to attorneys and counselors who become associated together in the conduct of a cause at any stage of the proceedings, or who jointly act as legal advisers in any matter, whether litigated or not. It is less frequently used in speaking of a single lawyer acting in any of the above capacities. The term 'of counsel' is employed to designate a lawyer who assists the attorney of record in the management, trial, and conduct of a case. See **ADVOCATE**; **ATTORNEY**; **LAWYER**.

COUNSELOR. In law, a person admitted to practice law in any capacity, and who is by reason of that fact an officer of the court. The term was formerly used to distinguish those lawyers who were licensed to appear in court, corresponding to the barrister in England and the advocate in Scotland. The distinction has been abolished in most of the United States, and it is

now used synonymously with attorney. See ATTORNEY; LAWYER.

COUNT (OF. *conte*, *comte*, Fr. *comte*, from Lat. *comes*, companions, from *com-*, together + *ire*, Gk. *lévai*, *ienai*, Skt. *i*, to go). In classical writers down to the end of the fourth century, the meanings attached to the word *comes* were comparatively few and simple. At first the word signified merely an attendant, and differed from *socius* chiefly in expressing a less intimate and equal relation to the persons accompanied. A little later, in Horace's time, it was applied to those young men of family whom it had become customary to send out as pupils under the eye of a governor of a province, or the commander of an army. Very soon the fashion of having attendants at home was introduced. The Emperor had many *comites* in this sense, and to these, as he gradually became the centre of power, he transferred the various offices of his household and of the State. The example of the emperors of the West was followed by the emperors of the East. Most of the titles at present applied to court officials are translations of the names applied to similar offices in the Byzantine Empire. The *comes sacrarum largitionum* was grand almoner and practically chancellor of the exchequer; the *comes curie* was the grand master of ceremonies; the *comes equorum*, the grand equerry. The *comes marcharum*, or count of the marches, was the original of the later marquis.

In France, the count of the palace (*comes palatii*) was the highest dignitary in the State after the mayor of the palace, and in the eleventh century had already acquired a rank apart from that of the other counts. He presided in the court of the sovereign in his absence, and possessed sovereign jurisdiction. The habit of instituting counts palatine was adopted by Spain and England. The counts of Chartres, Champagne, Blois, and Toulouse arrogated to themselves the authority to appoint palatine counts, and the ancient houses of Chartres and of Blois continued to claim in perpetuity the title of count palatine as that of their eldest sons. Counts of this sovereign class owed their origin to the feebleness of the later Carolingian kings, under whom they contrived gradually to convert the provinces and towns which they had governed as royal officers into principalities hereditary in their families. It was then that the counts came to be known by the names of their counties. The title was never used in England, though its Latin equivalent has always been the common translation for 'earl,' and the wife of an earl from a very early period has been styled 'countess.' For the history of the office in Germany, where it was of great importance, see GRAF. Consult: Rambaud, *L'empire grec au Xe siècle* (Paris, 1870); Luchaire, *Histoire des institutions monarchiques de la France sous les premiers Capétiens* (Paris, 1883); Maury, "La noblesse et les titres nobiliaires en France," *Revue des Deux Mondes* (December, 1882); Pfaff, *Geschichte des Pfalzgrafentums* (Halle, 1847).

COUNTER-CHANGED. A term in heraldry (q.v.). When several metals and colors are intermixed, one being set against another, they are said to be counter-changed.

COUNTERCLAIM. In pleading, an affirmative cause of action asserted by the defendant against the plaintiff and introduced in connection with his answer or defense proper. The counterclaim is a modern statutory device for enabling a person who is sued on a claim against him to procure an adjudication, at the same time, of a legal claim which he has against the party suing him. Its purpose is to consolidate the causes of action which two parties may have against one another, reducing the amount and cost of litigation and compelling the adjudication, so far as possible, of all open controversies between them. No such practice existed at common law, but every claim, no matter how closely related to another and opposing claim, constituted a separate cause of action and had to be separately prosecuted. As early as the year 1729, however, an act of the British Parliament introduced the principle of the set-off (q.v.), whereby, in case of mutual indebtedness growing out of the same transaction, the defendant was enabled to set his claim off against that of the plaintiff and have it allowed on the judgment. It was not until the Judicature Acts in 1875, however, that the defendant acquired the right of setting up a cross-claim, constituting a distinct cause of action.

Both the set-off and the counterclaim exist in the United States, the former generally, but the latter only in the so-called 'code States,' which have adopted the reformed procedure. These differ among themselves, however, as to the nature of the actions which can be pleaded by way of counterclaim, some following the modern English practice, under which any cause of action, however divergent from that alleged in the complaint, may be set up, and others, like New York, limiting the right of counterclaim to a matter arising out of the same transaction as that on which the action is based, or, in an action on contract, any other cause of action on contract. (New York Code of Civil Procedure, § 501.) See PLEA; PLEADING; RECOUPMENT; and consult the authorities referred to under PLEADING.

COUNTERFEITING (from *counterfeit*, from OF., Fr. *contrefait*, counterfeit, from ML. *contrafacere*, to imitate, from Lat. *contra*, against + *facere*, to make). The criminal offense of falsely and fraudulently making an article in the semblance of another with the intent to induce the acceptance and use of such spurious article for the genuine one. It is used most frequently of imitations of coined money, but is applied also to spurious trade-marks, or dies. The most important British statute on this topic is the Coinage Offense Act, 1861 (24 and 25 Vict. c. 99). In this country the subject is dealt with in the Revised Statutes of the United States (§ 5413 et seq.), especially so far as it relates to Federal coinage and securities and the money or securities of foreign nations; and other forms of counterfeiting are made punishable by State legislation. See COINAGE; FORGERY.

COUNTER-IRRITANTS. Medical agents applied to the skin so as to reddens (rubefacients), to vesicate (blisters or vesicants), or to produce pustules, purulent issues, or even sloughs of skin and of the subcutaneous textures (pustulants). Counter-irritants act by reflex influence upon central nerve-centres which con-

trol the blood-supply to diseased internal organs or deep-seated structures. The milder counter-irritants are mustard, turpentine applied on hot cloths, and tincture of capsicum. The stronger are blisters of cantharides or of ammonia; croton oil or tartar emetic in ointment; and the actual cautery or hot iron. Setons, moxa, and caustics are no longer employed. None of the stronger counter-irritants should be used without medical advice, great mischief being done by their improper use. Counter-irritants relieve internal pain, and tend to promote the absorption of effusions. They should be applied at a distance from the site of the inflammation. Counter-irritants are much used for strains and diseases of the joints in horses, but should never be applied, as they too often are, in recent cases, or while the part is hot or inflamed. Cantharidine preparations and ointment of mercuric binoxide (red iodide of mercury) are the most convenient. For cows, use hot fomentations, followed by the smart friction of mustard paste; for dogs, soap liniment, strengthened, if required, by ammonia or turpentine. See MOXA.

COUNTERMINE. See MINES AND MINING, MILITARY.

COUNTER-PASSANT (Fr. *contre-passant*, passing opposite, from *contre*, Lat. *contra*, against + *passer*, ML. *passare*, to pace, from Lat. *passus*, step, from *pandere*, to stretch). In heraldry, a term denoting two beasts passing each other.

COUNTERPOINT. In music, the setting of one or more parts against a given melody, so that all the voices are of equal importance and independence. The name was first used in the fourteenth century. It suggested itself from the fact that one note (*punctus*) was set against another, *punctus contra punctum*. A counterpoint may be written in various ways against a given melody, as one, two, four, or even more notes against one of the cantus. The counterpoint most useful in practical composition is one where the different parts are variously constructed, as in the following (Handel):

When two voices are used the counterpoint is called two-part; when three, three-part, etc. When the counterpoint lies uniformly above or below the cantus it is single. If the parts be constructed in regard to one another so that they can be changed or transposed over or under each other, without alteration in the movement,

or injury to the harmony, it is then called double counterpoint, for example:

The intervals most frequently used for transposition in double counterpoint are the octave, decima, and duodecima. The following admits of different transpositions:

When three voices are constructed so that they can be exchanged one against the other, the counterpoint is triple; when four, quadruple. The first indications of counterpoint we find in the thirteenth century in the works of Adam de la Hale. The development of the art of contrapuntal writing was then very rapid, and in the school of the Netherlands (in the fifteenth and sixteenth centuries) the acme of technical skill was reached. But counterpoint was then less a genuine musical art than an exhibition of astounding technical tricks. The great Italian schools (see PALESTRINA) returned to a simpler and artistic style. As a genuine art counterpoint culminated in the form of the fugue (q.v.). The latest and best treatises on counterpoint are those of Dehn, Richter, and Jadassohn.

COUNTERPOISE CARRIAGE. See ORD-NANCE.

COUNTER-POTENT. A fur used in her-aldry (q.v.).

COUNTER-PROOF. An impression which is obtained from a freshly printed proof of an engraving, by laying it, before the ink is dry, upon plain paper, and passing it through the press. By this means the ink is transferred from the wet proof to the plain paper, and a reversed impression is obtained, which is often

of use in enabling the engraver to judge of the success of his work. See ENGRAVING.

COUNTER-REFORMATION. The term used to describe those measures which the Roman Catholic Church took, after the Reformation was fairly started. (1) to reform abuses, (2) to counteract the Protestant movement in those lands where it threatened to succeed, and (3) to uproot it where it had entirely or very considerably succeeded. Long before the Protestant revolt took place there had been a demand upon the part of faithful sons of the Church for a reform in 'head and members,' from the Pope down to the humblest Christian. Several councils had been called to accomplish it, but did little. At last the Council of Trent was assembled, which, lasting with interruptions from 1545 to 1563, solemnly reaffirmed and defined Catholic doctrine, and enacted disciplinary measures to rectify widespread and prevalent abuses. Of the agents most active in raising the tone of the Church, animating its pulpit and its schools, and inspiring self-sacrifice and ardent piety, the chief have been the Jesuits—so much so, indeed, that the counter-reformation is frequently spoken of as their work. The other measures spoken of have naturally incurred more censure. The check or extirpation of Protestantism has been accompanied necessarily with violence, and thus contravenes modern notions of religious freedom—though it must be said that the intolerance of the Roman Catholic ruler or prelate was matched, when opportunity served, by that of Protestants in similar positions. In Bavaria the nobility which had favored Protestantism were expelled in 1564. At Treves the Elector, James of Eltz, in 1572, forbade Protestants his Court. In other ecclesiastical States of the Empire, as Bamberg and Salzburg, the rulers drove out the evangelical clergy and gave the laity the alternative of conformity to the Catholic Church or exile. Austria attempted to uproot religious liberty in Hungary, but was forced to restore it. In Bohemia Protestantism was extirpated during the Thirty Years' War. As far as the German Empire was concerned, the arbitrary exercise of power to repress Protestantism ended with the Peace of Westphalia in 1648. In such countries as Spain and Italy Protestantism never had more than a feeble existence, and so was rather easily suppressed by the Inquisition. In France there was never more than a possibility of Protestantism gaining an ascendancy, but in the sixteenth and seventeenth centuries it had many influential adherents. Civil wars, the result of political intrigue, and the acceptance from personal ambition of Romanism by Henry IV., ruined whatever prospects the Protestants had; and with the revocation of the Edict of Nantes in 1685, all semblance of State favor to Protestantism was removed and the faith outlawed. In the Netherlands persecution and war wrested the southern provinces from Protestant domination, but it remained in the northern. Scandinavia was not seriously shaken in her acceptance of Protestantism. In England, after tireless, ingenious, and heroic attempts of seminary priests, upon whose head a price was fixed, to effect a return to Catholicism, with the secret coöperation of many nobles and other prominent men, the scheme had to be abandoned, mainly because the audacious invasion of England by the

Spanish Armada in 1588 welded the nation into a whole against foreign political or religious dominion.

Consult: Ranke, *History of the Popes*, English trans. (London, 1867); A. Ward, *History of the Counter-Reformation* (New York, 1889); A. R. Pennington, *History of the Counter-Reformation* (London, 1900).

COUNTERSCARP. The side of the ditch of a fortification opposite to the parapet. The slopes of the scarp and counterscarp will depend on the nature of the soil, and the action on it of frost and rain. The scarp or extreme slope of the parapet is less steep than the counterscarp, because it has to sustain the weight of the parapet. See FORTIFICATION.

COUNTERSIGN. A watchword used by military bodies as a precaution against an enemy or enemies. The countersign may be changed at any moment, or any number of times, but is usually altered each twenty-four hours. It is given primarily to commanders of guards, and outposts and their sentries, to reconnoitring and visiting patrols, and to the field and regimental officers of the day. All others desiring to pass through the lines must first be supplied with the countersign, which is thus a guard against spies, strangers, and surprise.

COUNTER-TENOR. The highest adult male voice; most commonly the male alto (q.v.).

COUNTER-VAIR. A fur used in heraldry (q.v.).

COUNTESS'S POWDER. See CINCHONA.

COUNTIES CORPORATE. In England, cities and towns possessing the privilege of being governed by their own sheriff and magistrates independently of the county in which they are situated.

COUNTING-OUT RHYMES. See NURSERY RHYMES.

COUNT JULIAN. A gloomy but impressive tragedy by Walter Savage Landor (1812). The scene is laid in the time of Roderick, the last of the Goths, about 711.

COUNT ROBERT OF PARIS. A late novel of Sir Walter Scott (1833), the scene of which is laid at Constantinople in the eleventh century. The title character was a renowned French Crusader. The novel, written after Scott's financial troubles, betrays the author's failing powers.

COUNTRY LASSES, OF THE CUSTOM OF THE MANOR. The title of a play by Charles Johnson (1715), based on Fletcher and Massinger's *Custom of the Country* and Middleton's *A Mad World, My Masters*.

COUNTRY PARTY, THE. The anti-Royalist party in England in Charles II.'s time, which opposed the Court party. It finally developed into the 'Whig' Party.

COUNTRY WIFE, THE. A comedy by Wycherley (1673), drawn largely from Molière's *L'École des maris* and *L'École des femmes*. It is called by Macaulay "one of the most profligate and heartless of human compositions."

COUNTY (OF. *counte*, *contec*, Fr. *comté*, It. *contado*, from Lat. *comitatus*, county, escort, from *comes*, count, companion). Either (a) one of the civil divisions of a country, for judi-

cial and political purposes; or (b) a local subdivision of a State created by the sovereign power of its own will, regardless of the solicitation or consent of the inhabitants of said subdivision; or (c) a "local organization which, for the purpose of civil administration, is invested with the functions of a corporate existence." The Saxon term was 'shire,' a name still preserved in England. In the United States counties are divided into a number of townships or towns. Cities and incorporated towns and villages are, generally speaking, subdivisions of counties and townships, but in some instances a city may be geographically coterminous with a county, as is the case with Chicago and Philadelphia, while 'the city of New York' includes within its municipal limits four distinct counties. In Louisiana the similar division is called a 'parish.' For purposes of local government, each county has at least one court and one prison, and usually an almshouse. The smaller divisions are townships, from three or four to a dozen or more in a county. The commissioners or supervisors of these towns, chosen by popular suffrage, form an administrative board to conduct the financial and other county affairs. In all the United States there are more than 6800 counties. Usually each county chooses one or more members to the Lower House of the State Legislature. Counties are the creatures of the legislative will. They are vested with certain corporate powers in order to enable them to perform the duties required of them as part of the machinery of the State; and, inasmuch as all their powers are derived from the Legislature, the latter may enlarge, modify, or diminish them at any time. Counties are generally invested with the following corporate powers: To sue and be sued by a corporate name; to have a county-seat, a courthouse, and prison; to acquire and hold title to real estate; to levy taxes and to make such contracts as may be necessary for their corporate existence. For an historical sketch of the English county, consult Pollock and Maitland, *History of English Law* (2d ed., Boston, 1899). See SHIRE; also MUNICIPAL LAW, and consult the authorities there referred to.

COUNTY COUNCILS. Until 1888 the county government of England was conducted in the quarter sessions, held by justices of the peace. As these magistrates were appointed by the Crown to attend to all administration and the minor judicial business of the county, there was practically no local self-government. To remedy this, the first Local Government Act was passed in 1888 by a Conservative Ministry. It established representative county councils elected every three years by all ratepayers, male and female, of the shire, besides other non-resident property-holders, under certain conditions. Practically the same qualifications are necessary for membership in the council, except that women are not eligible. The elected councilors choose additional members called aldermen, one-third of the council in number, and also a mayor, who may or may not be of their number. The council controls all the administrative functions of the county, such as the management of the roads, insane asylums, county jails, and the issue of liquor licenses; it shares the police control with the justices of the peace.

Mr. Henry Fowler's second Local Government Act, passed by the Liberals in 1894, perfected

the first by transforming the ancient vestries of a population of 300 and over into parish councils, for the management of local business. Smaller parishes, if they so desire, may, with the consent of the county council, have the same privilege. The system closely resembles the American township organization. Scotch and Irish counties have since been organized along similar lines, except that there are no coöpted aldermen in the former country.

Previous to 1885 all London lying without the ancient city had no local government except the church vestries. It was brought under the operation of the Act of 1888 and given a county government. In 1899 the administrative functions of the vestries not ecclesiastical were turned over by the county council to subordinate boroughs, having mayors, aldermen, and councilors of their own. The old city, though represented in the county council, retains most of its antiquated constitution. The personnel of the London County Council is very high, and the amount of work it has accomplished is remarkable. It has successfully provided public baths and libraries, parks and playgrounds, better dwellings for the poor, besides giving £500,000 for technical education. Consult: *The Local Government Act*, Statutes 56 and 57 Viet., c. 73; also Macmorran and Dill, *The Local Government Act of 1894*, with a good introduction (London, 1896); Courtenay, *The Working Constitution of the United Kingdom* (New York, 1901), 238-40, 246-50.

COUNTY COURT. In English and American law, a judicial tribunal of considerable dignity and importance, whose jurisdiction is co-extensive with the limits of a county (q.v.). The county courts are among the most ancient institutions in England, dating back to the popular tribunals of the Anglo-Saxon period. We find provisions regulating their procedure as far back as the laws of Edward the Elder (901-25) and of Canute (1014-35). Under the system of local self-government which was characteristic of that period, the county courts (*shire gemots*) were the chief ordinary tribunals of the English people, their judicial authority being superseded by that of the *Witenagemot*, or Great Council of the Kingdom, only for particular purposes and on rare occasions.

It will be remembered that in England the county, or shire, is not merely a political subdivision of the State for administrative purposes, as it is in most cases in the United States, and as are the departments into which the territory of France is divided; but it is a separate and distinct political division, in many cases antedating, in organization and in its functions, the State itself. As the supreme judicial tribunal, therefore, of such an ancient political organization, the county court was not only the fountain of justice for the people of England, high and low, but a court of great dignity and authority as well. It was presided over by the sheriff (*shire reeve*), who was the high judicial officer of the county, and, like the court baron and other popular tribunals, was composed of the freeholders of the county who should be summoned by the sheriff for that purpose. Its original jurisdiction extended to all civil and criminal matters, and it was the common court of appeal from all the minor courts of the county. Under the Saxon régime there was no regular

tribunal of appeal from the judgments of the county court, but after the Conquest the superior authority of the new national tribunal, the *Curia Regis*, or King's Court, drew to it appeals from the county courts. The rapid growth in power and importance of the King's courts, especially of the so-called common-law courts—the King's Bench and Common Pleas—tended to reduce the authority of the more ancient tribunals, and their jurisdiction was impaired by successive acts of Parliament. They still exist, however, with a limited but still considerable authority, which has been expressly defined by recent statutes. See County Courts Act, 1888 (51 and 52 Viet. c. 43).

For the modern organization of county courts in England and the United States, see the article COURT. See also CURIA REGIS; SHERIFF. Consult *Encyclopedia of the Laws of England* (London, 1897), title "County Courts" (vol. iii., 527); also the authorities referred to under COURT, and Raikes, *Admiralty Jurisdiction and Practice in County Courts* (London, 1896).

COUP, *koo* (Fr., stroke). A word often used in a figurative sense. *Coup d'état*, 'stroke of State,' means an arbitrary encroachment suddenly effected by the governing authorities upon the constitution of the State, altering or setting aside the prerogatives of other parts of the body politic. The coup d'état which is usually understood by this term is that effected by Louis Napoleon when he dispersed the legislative body, imprisoned the Republican leaders, and made himself practically dictator (December 2, 1851). *Coup de main*, a 'stroke of the hand,' is applied, in the language of war, to a sudden and successful attack. *Coup de foudre*, a thunderbolt; applied figuratively to any astonishing occurrence. *Coup d'œil*, 'a stroke (or glance) of the eye,' is applied in speaking of persons who have the faculty of comprehending all the relations of a complicated matter at one survey; or, in art, it expresses the general effect of a picture or group at first sight. *Coup de théâtre* means properly a trick of the stage to produce a shock by surprise, and is hence applied to any analogous dramatic effect.

COUPÉ, *koo'pá'* (Fr., literally, section, cut, from *couper*, to cut). A four-wheeled, one-horse, closed carriage, holding two persons, with separate seat for the driver. (See CARRIAGE.) The name is also given to a compartment of a railway carriage in Continental Europe.

COUPED, *koopt* (Hybrid Engl., p.p. of Fr. *couper*, to cut). In heraldry, a term used to describe the head or any limb of an animal cut off smoothly from the trunk. It is distinguished from *crased*—i.e. forcibly torn off, and therefore ragged and uneven. A distinction is also made between *couped* and *couped close*, the latter signifying that the head or limb is cut off close, leaving no part of the neck or trunk attached to it. When crosses, bars, bends, and the like are cut so as not to touch the sides of the escutcheon, they are also said to be couped.

COUPERIN, *koo'p-rän'*, FRANÇOIS (1668-1733). A French organist of high repute. He was probably the greatest of a family of great musicians which began with his grandfather, ARMAND LOUIS (1600-65), and continued through several generations of his own descendants. He

was born in Paris, and comparatively early in life earned for himself the title of le Grand. He is historically important chiefly because he was one of the first great composers for the harpsichord known to musical history. He is considered to have influenced materially the work of Scarlatti, Handel, and Bach, and is by many musical historians regarded as the actual pioneer of modern music. He died in Paris, having attained great popularity as a composer, and high distinction as the clavirist of the King's chamber and organist of the Chapel Royal. He left several important compositions and writings, among them four *Livres de pièces de clavecin* (Paris, 1713, 1716, 1722, and 1730 respectively).

COUPERUS, *koo-pá'rüs*, LOUIS (1863—). A Dutch author, born at The Hague. He attracted attention by his collection of poems, *Een Lent van Vaerzen* (A Springtide of Verse) (1884), followed by a second entitled *Orchidcen* (Orchids) (1887). Subsequently he turned to fiction, his best work in which is *Majesteit* (Majesty) (1893; a German translation by Raché, 1895). He is ranked among the most important of recent Dutch writers.

COUPLE (OF. *euple*, *coplc*. Fr. *couple*, Sp. *cópula*, from Lat. *copula*, bond, from *co-*, together + *apere*, Gk. *ἅπτειν*, *haptéin*, to join). A couple is the name given in statics to a pair of equal parallel forces acting in opposite directions and at different points of a body. It is shown in the article MECHANICS (q.v.) that when two parallel forces act in opposite directions on a body, they may be replaced by one equal to their difference, acting parallel to them and in the same plane with them, the point of application of this resultant being *beyond* the points where they are applied. This point recedes farther from the points of application of the original forces the nearer they approach equality, getting to an infinite distance when they become equal, and when their resultant accordingly is zero. In this limiting case, the forces constitute a couple. They have no tendency to *translate* the body; their action goes wholly to make it rotate about an axis passing through its centre of inertia, and perpendicular to the plane in which the couple acts. Such being the case, a couple cannot be replaced or counteracted by any single force, for such a force would produce translation; it can only be replaced or balanced by other couples. The length of the straight line which meets the lines of action of the forces at right angles is called the 'arm' of the couple, and the product of the arm and either force is called the 'strength' or the 'moment' of the couple. It is evident that a couple can be replaced by one of equal strength. For a complete discussion of the composition and resolutions of couples, reference should be made to some treatise on statics, such as Routh, *Treatise on Analytical Statics* (Cambridge, Eng., 1892); or Minchin, *Statics* (New York, 1892). See MECHANICS.

COUPLET (Fr., dim. of *couple*, pair, from Lat. *copula*, bond). Any two lines which rhyme together. The term is, however, more frequently used by critics to denote two lines which contain the complete expression of an idea, and are, therefore, to a certain extent independent of what goes before or what follows. The poetic wits of the age of Queen Anne excelled in this

kind of aphoristic versification. Pope, it has been said, reasons in couplets. For example:

"Tis with our judgments as our watches, none
Go just alike, yet each believes his own."

COUPON, κῶπῶν (Fr. *coupon*, from *couper*, to cut, from *coup*, It. *colpo*, Lat. *colpa*, from Gk. κόλαφος, *kolaphos*, blow with the fist, from κολάπτειν, *koláptein*, to strike). An undertaking on the part of an obligor on a money bond or other interest or dividend bearing obligation to pay a definite amount of accrued interest or dividends to the holder thereof at a specified date. It is usually so attached to the bond, debenture, or other principal instrument that it can conveniently be cut off (whence the name) and presented for payment. Each interest or dividend coupon constitutes in law a separate claim or demand, and may be separately enforced. Corporate bonds and similar securities are usually issued in this form, and so, sometimes, are shares of preferred stock, in which case the coupons represent the guaranteed dividend payments. Of course the coupon does not, in any of these forms, confer any additional legal rights on the holder of the security against the person bound thereby nor increase the liability of the latter. A general agreement to pay interest or dividends at such a rate would be equally valid and efficacious. The advantage of the coupon lies in the convenience to the holder of furnishing him with a separate undertaking for each interest or dividend payment for presentment and collection, and in the fact that corporate coupons are usually of a negotiable or quasi-negotiable character, facilitating their transfer from hand to hand. See **NEGOTIABLE INSTRUMENT**.

COURAJOD, κῶρᾶ'zhó', LOUIS (1841-96). A French archaeologist and art critic, born in Paris. For many years he was in charge of monuments of the Middle Ages and Renaissance in the Museum of the Louvre. He is the author of valuable books on the history of art in France and Italy, particularly that of the Renaissance and Middle Ages. His most important work is *Alexandre Lenoir, son journal et le musée des monuments français* (1878-87), but also noteworthy are *Livre-journal de Lazare Durand* (1873) and *L'école royale des élèves protégés* (1874).

COURANT, κῶρ-riint' (Fr., pres. part. of *courir*, to run). In heraldry, a term used for running.

COURAYER, κῶρ-rá'yá', PIERRE FRANÇOIS LE (1681-1776). A French theologian. He is chiefly known for the part which he took in the discussion, which so interested Leibnitz and others at the time, on the possibility of the reunion of Christendom, and especially of uniting the Church of England with the Roman Catholic communion at the Reformation. In 1723 he published anonymously a *Dissertation sur la validité des ordinations anglaises* (English trans. London, 1725; new ed. Oxford, 1844), in which he endeavored to prove that there had been no break in the line of ordination from the Apostles to the English clergy. This was naturally received with enthusiasm in England, and Oxford conferred the degree of D.D. on him; but it subjected him to so much criticism and unpopularity in France that he presently fled to England, where he remained until his death. In 1736 he published a French translation of Sarpi's *History of*

the Council of Trent, and in 1767 a translation of Sleidan's *History of the Reformation*.

COURBET, κῶρ'rá', AMÉDÉE ANATOLE PROSPER (1827-85). A French admiral, born at Abbeville. He was educated at the Ecole Polytechnique and graduated with honors. In 1880 he was made rear-admiral and three years afterwards commanded the French fleet in the campaign of Tongking. After the violation of the Treaty of Tientsin by the Chinese, Courbet, in a naval engagement (1884), destroyed the entire Chinese fleet without losing a vessel of his own. At the end of the war, in 1885, he started to return to France, but his strength had given out under the stress of the campaign and he died at sea.

COURBET, GUSTAVE (1819-77). A French landscape, figure, and portrait painter, founder of the modern Realist School. He was born at Ornans (Franche-Comté) on June 10, 1819, of wealthy peasant parents. His first instruction in art was acquired at his home under Flageonlet, a pupil of David. In his twentieth year he went to Paris, where he worked in different studios, but he was in the main self-taught. He speedily found recognition, and soon became the chief leader of the Realists, in opposition to both Classicists and Romanticists. Courbet was of a very independent character, and had so little regard for the opinions of the judges of the Salon that he returned for six successive years a picture rejected in 1841. When in the Exposition of 1855 his pictures were unfavorably hung, he withdrew them altogether and held a separate exposition. In 1870 he returned the Cross of the Legion of Honor to Napoleon with a protest. He was Radical and Socialist in politics, and under the Commune he was made director of the fine arts. As such he saved the collections of Thiers and of the Luxembourg from the infuriated populace, but he sacrificed the Vendôme Column in order to appease the crowd. For this act he was imprisoned after the downfall of the Commune, and all of his paintings were sold at public auction. In order to avoid further suits for damages, he went into voluntary exile, and died broken-hearted near Vevey, in Switzerland, December 31, 1877. He was a strong but rather coarse character, blustering, but good-natured—a healthy animal without the least spirituality.

His paintings portray nature exactly as it is, without the least addition of sentiment or idealism, for he conceived realism to be possible only through the absolute negation of idealism. As he confined himself to the reproduction of nature, there could be no refined composition or real action in his work, for these depend on the painter himself. His figures were no more than models in the positions painted, his landscapes mere patches of forest or country taken at random. In figure painting he was partial to the coarse types preferred by the Flemish School, and he always painted them life size. His coloring was excellent, and in his figure subjects, which are chiefly brush works, it was pure, strong, and mellow. In his landscapes he used the palette-knife very freely, obtaining brilliant and sparkling effects of color. His chief defect is his lack of strength in drawing.

The volume of Courbet's work was enormous, and his activity extends over a variety of sub-

jects. Among the best of his portraits and figure painting are the "Man with a Leather Belt," the "Fair Dutchwoman," the "Stone-Breakers," representing two workmen breaking stones, as one can see them in the street: the "Demoiselles de la Seine," two typical grisettes reclining in ungraceful attitudes on the grass, yet a picture of great beauty of color. The most ambitious of all is his "Burial at Ornans" (painted 1850, now in the Louvre), a village funeral. This picture is composed of thirty-nine life-size figures, admirably balanced. On the one hand are the perfunctory mourners, such as the priest, beadles, pall-bearers, grave-diggers; on the other, the real mourners. Among his best landscapes are the "Combat of the Stags" and the "Deer Retreat." His marine painting, "The Wave," has been acquired by the Luxembourg.

(London, 1896); Isham, "Gustave Courbet," in Van Dyke's *Modern French Masters* (New York, 1896); Silvestre, *Les artistes français* (Paris, 1878); Patoux, "Courbet," in *Les artistes célèbres*; D'Iderville, *Gustave Courbet* (Paris, 1878); and *La Vérité sur Courbet* (Paris, 1879).

COURBEVOIE, kōōr'b'vwā' (Fr., crooked way). A town in the Department of Seine, France, on the left bank of the Seine, five miles northwest of Paris (Map: France, B 6). Courbevoie has well-built houses and large barracks erected by Louis XV. Its principal manufactures are white lead and brandy. Population, in 1896, 20,105; in 1901, 23,765; commune, 25,330.

COURCEL, kōōr'sēl', Baron ALPHONSE CHOMON DE (1835—). A French diplomatist. He was educated in France and Germany, and entered political and diplomatic life in 1859. For several years he was Ambassador to Germany. He was appointed French arbitrator on the Bering Sea Arbitration Commission in 1892, and was elected president of that body by his associates. He became Senator in 1892, and was made Ambassador to Great Britain in 1897, but resigned in 1898. He is considered an authority on international law.

COURCELLE, kōōr'sēl', DANIEL DE RÉMY, Sieur de. French Governor of Canada from 1665 to 1672. He succeeded Mézy and preceded Frontenac. In 1666, in the depth of winter, he led a force of 300 men by way of Lakes Champlain and George to the country of the Mohawks, who had persisted in attacks upon the colony. He returned having accomplished nothing, and having lost a large number of his troops through the severity of the weather. Not long after, with Tracy, the lieutenant-general, and an army of 1300, he undertook a second expedition, which resulted in the complete destruction of the five Mohawk forts. The English were considerably alarmed at this invasion of territory claimed for the British Crown, and there ensued a correspondence between Tracy and Governor Nicolls of New York. Courcelle projected the post at Kingston (Katarakoui), afterwards established by Frontenac.

COURCELLE-SENEUIL, kōōr'sēl' se-nē'y', JEAN GUSTAVE (1813-92). A French political economist, born at Seneuil (Dordogne). He occupied the chair of political economy at the University of Santiago de Chile from 1853 to 1863, and became a member of the Paris Academy

of Moral and Political Science in 1882. Among his principal publications are the following: *Traité théorique et pratique des opérations de banque* (6th ed., 1876); *Manuel des affaires* (4th ed., 1883); *Traité d'économie politique* (3d ed., 1890); and *Liberté et socialisme* (1868), in which, as in several others of his writings, he defends the principle of individualism.

COUREURS DE BOIS, kōō'rēr' de bwā (Fr., wood-runners). Canadian bush-rangers of the seventeenth century who forsook their families and homes, and took to the woods to engage in the beaver trade. The movement became so general that whole communities were virtually deprived of their male support, and much destitution ensued. Stringent measures to restrain the movement were taken by the French King, but without much result. The rangers, declared outlaws, built palisade forts at Detroit, on Lake Superior, and at various points in the West and Northwest.

COURIER, kōō'rī-ēr (OF., Fr. *courrier*, runner, from *courir*, Lat. *currere*, to run). A bearer of dispatches or letters, usually sent on public business. Such messengers were extensively used up to comparatively recent years—indeed, until the establishment of the postal and telegraph systems superseded them. Organized courier service existed among the Medes, Assyrians, and Egyptians from very early times, and relays of runners were employed by the ancient Greeks until the system of mounted couriers was introduced by the Persians. Among the Romans the change from runners to mounted men took place in the time of Augustus. During the Middle Ages, besides the staff of couriers in the service of sovereigns, the English and French nobility employed professional runners, called in France *laquais*, and in England running footmen. They wore an elaborate costume and carried a long cane topped with a large, hollow silver apple which contained provision for the journey. Toward the middle of the fifteenth century, formal permission was given to the Government couriers of Germany and Spain to carry unofficial letters.

In modern times correspondence between diplomatic representatives and their home Government is sometimes conducted by means of special couriers, who are considered inviolable messengers unless they happen to fall into the hands of a hostile power in time of war. The office of King's Messenger in the English diplomatic service used to be an honorable and coveted position, but is now practically obsolete. The word courier also signifies a hired attendant who accompanies travelers abroad, and whose special duty consists in making arrangements for the journey, attending to passports, settling hotel bills, and the like. An important qualification is the ability to speak several foreign languages.

COURIER DE MÉRÉ, kōō'ryā' de mē'rā', PAUL LOUIS (1772-1825). A French liberal politician and classical scholar. He was born in Paris, January 4, 1772, entered the army in 1792, and served without distinction until 1809, pursuing his studies as he found opportunity, and publishing unimportant critical articles and translations. He from his youth cherished a bitter aversion to the nobility and a passionate love of Greek literature. On resigning from the army

he went to Florence and discovered there a complete MS. of the Greek pastoral *Daphnis and Chloë* (see LOXET'S), which he edited (1810) and translated into exquisite French. At the Restoration (1815) he became active as a political pamphleteer, writing letters for *Le Censeur*, comparable to *Les provinciales* of Pascal or the satires of Junius. Fined and imprisoned for his *Simple Discours* (1821) ridiculing a plan to endow the royal family, he published a report of his trial that had a sensational success throughout France. His last political satire, *Le pamphlet des pamphlets* (1824), is among the bitterest and best; witty, classical in form and scholarly allusion, epigrammatic in its common sense. A few months after, he was assassinated (April 10, 1825), by whom, the Government could or would never discover. Courier's *Œuvres complètes* were published in four volumes, with an essay on his life by Armand Carrel (Paris, 1830).

COURLAN, kōōr'lāu (Fr., probably from native South American). The French book name for a limpkin (*Aramidae*), called also 'crying bird' and 'mad-widow' (*vidua loca*) by Spanish Americans. See LIMPkin.

COURLAND, kōōr'lānd, or **KURLAND** (translation of Lett. *Kurscunne*, from *Kur*, Finnish tribe inhabiting the region in mediæval times + *scunne*, land, OCh. Slav. *zemlya*, OPruss. *samc*, land, Gk. *χάματ*, *chamai*, on the ground, Lat. *hemo*, *homo*, man). One of the Baltic provinces of Russia, bounded by the Gulf of Riga and the Province of Livonia on the north, Vitebsk on the east, Kovno on the south, and the Baltic Sea on the west (Map: Russia, B 3). Area, 10,535 square miles. The surface is level, broken only by isolated hills, while the coasts are very low. There are a number of lakes, and a large portion of the area is covered with forests. The climate is moderate, the annual temperature averaging 43° F. The chief occupations are agriculture, cattle-raising, and fishing. There are also a number of breweries, distilleries, and textile mills, but the manufacturing industries are very little developed. The commerce, on the other hand, is quite extensive. The seaport of Libau is the commercial centre. Courland had a population in 1897 of 672,634, over 70 per cent. of which were Letts, representing the agricultural laboring class; over 8 per cent. were Germans, mostly large landholders; and the rest consisted of Jews and Russians. The Protestant Church counts over 70 per cent. of the population among its adherents. The capital is Mitau.

Courland came under the rule of the Teutonic Order in the thirteenth century. In the second half of the sixteenth century it became an hereditary duchy under the sovereignty of Poland. After a long internal struggle between the Russian and the Polish parties the duchy came under Russian influence with the appointment of Biron as Duke of Courland in 1737. It was formally annexed to Russia in 1795.

COURSE. See MASONRY and BUILDING.

COURSE OF TIME, THE. A religious epic in blank verse by Robert Pollok (1827).

COURSER (Fr., *courseur*, from OF., Fr. *course*, Lat. *cursus*, course, from *currere*, to run). The French name of eight or ten species of plovers of various genera inhabiting desert regions of Africa and Asia. The best-known is

the cream-colored courser (*Cursorius gallicus*), common on arid plains from the western Sahara to northern India. All are sand-colored above, swift-footed, and wary, and conceal themselves by simply squatting and remaining motionless and so practically invisible; their food consists of insects, mainly locusts. The name black-backed courser is frequently given to the crocodile-bird (q.v.).

COURSING (from *course*, OF., Fr. *course*). The pursuit of a hare by greyhounds, who follow it by sight and not by scent, is one of the most ancient of field sports. Arrian (A.D. 150) made its history the subject of much research. There are two kinds of coursing—'open,' which may be described as the haphazard pursuit of any hare that can be discovered, without regard to any set rules or regulations; and 'close' coursing, in which the course is determined by fixed boundaries, or otherwise fenced in. In the latter case, the hares, which have been previously secured, are released, and after sufficient law (time or distance) has been allowed them, the dogs are slipped, and the pursuit begins. Both these kinds of coursing are practiced under similar rules in Great Britain and America alike. The oldest coursing club in England was that established at Swaffham in Norfolk in 1776, and of existing organizations, the most important is the Altear Club, established in 1825. In America the sport has been in existence since the middle of the nineteenth century, but open meetings, in which competitors from regular organizations take part, are of comparatively recent date. The supervising and controlling body of the sport is 'The American Coursing Board,' and the principal meets, or meetings, are in the two Dakotas, Kansas, Nebraska, Iowa, and Minnesota.

In England the sport is conducted under the laws and rules of the National Coursing Club, and the principal meet is that held every February over the Altear Course near Liverpool, for the Waterloo Cup, a prize instituted in 1836. It was originally an 8-dog course, increased the next year to 16, the year after to 32, at which it stood until 1857, when it became a 64-dog stake, and as such it still remains. The best dogs of the world compete, and the title 'Waterloo Cup' has become synonymous with the highest prize of the year in coursing, in many countries. Russia, America, South Australia, New South Wales, and New Zealand all have their Waterloo Coursing Cups. In competitions the judge follows the dogs throughout the course, noting every movement from the moment they are slipped until the 'kill,' or conclusion of the course—his decision being based on the following general rules: I. For *speed*, according to the degree of superiority shown, 1, 2, or 3. II. For the *go-by*—the starting of a greyhound a clear length behind its opponent, passing it in a straight run and obtaining a clear length ahead—2 points, or if gained on the outer circle, 3 points. III. The *turn*—a sharp turn of not less than a right angle in the hare's course when pressed by a dog, 1 point. IV. The *wrench*—a change of less than a right angle in a hare's course when pressed, one-half point. V. The *kill*, 2 points, or in a descending scale in proportion to the merit displayed, which may be of no value. VI. The *trip*—an unsuccessful effort which threw the hare off its legs, or the getting so close as to snatch it and lose hold.

COURT (Fr. *cour*, It. *corte*, from Lat. *cohors*, inclosure, from *co-* together + **hors*, connected with Lat. *hortus*, garden, Gk. *χῆρος*, *chortos*, hay, OIr. *gort*, sedge, Goth. *gards*, court, OllG. *garto*, Ger. *Garten*, AS. *gard*, Engl. *yard*). Courts, in the legal sense—i.e. authorities empowered to try and punish persons charged with offenses against the public or State, and to settle disputes regarding the rights and duties of individuals—have existed among all peoples that have emerged from savagery. There is no single root from which early judicial authority springs; nor is there, even among the Aryan peoples, any single typical form of primitive court. The right of the community to punish offenses against the community—a right which expresses itself originally in lynch law—may beget a popular jurisdiction in criminal cases; and the interest of the community in preventing feuds may make the popular assembly competent to decide civil cases. The belief that flagrant breaches of the social order are offenses against the gods may vest criminal jurisdiction in the priests; and the duty of the priests to see that vows and promises under oath are performed may be expanded into a fairly broad civil jurisdiction. The attribution to the king of disciplinary powers over the popular army, and the concentration in his hands of the power of preserving internal peace, may create an extensive royal jurisdiction over crimes and also over torts; and the king's civil jurisdiction may be widened by ascribing to him a patriarchal authority analogous to that exercised by the heads of houses and of clans. Private disputes may be referred, voluntarily at first, to the decision of king or priest or assembly, and when such references have become customary the duty of decision may be transformed into judicial authority. Traces of all these ideas and influences are discernible in the early judicial systems of the Aryan peoples.

Sir Henry Maine has called attention to the great importance given to courts and their machinery in every ancient code. It is due, he thinks, to the fact that the authority of a court of justice overshadowed all other ideas and considerations in the minds of those early code-makers. The dominant notion in their minds, when they undertook to classify legal rules, was not a law, or a right, or a sanction, as they are now considered by an analytical jurist, but a court of justice. "The great fact is that there now exists an alternative to private reprisals, a mode of stanching personal or hereditary blood-feuds other than slaughter or plunder. Hence, in front of everything they place the description of a court, of its mechanism, of its procedure, of its tests of alleged facts." This conscious reverence for courts of justice, and this sense of their paramount importance, have diminished, Sir Henry Maine believes, as civilization has advanced and peace has become more prevalent. Some doubt of the correctness of this opinion may be entertained. In the first place, the fact that the term 'court,' which, as we have seen, originally designated a body exercising legislative as well as judicial powers, has been limited in most countries to the designation of a tribunal exercising judicial powers only, indicates that such powers are deemed of prime importance. In the second place, the authority of courts, especially in federal governments un-

der written constitutions, and, throughout Christendom, under international arbitration treaties, is very great, and destined to be still greater.

GREEK COURTS. Among the Greeks of the Homeric age, jurisdiction both in criminal and in civil cases appears to have been vested in the kings and chieftains. In important cases their judgments were submitted to the people for confirmation, but no real participation in the finding of judgments was accorded to the people until the Greek States became democratic. Then the magistrates, whose powers at first were similar to those previously exercised by the kings, became mere chairmen of popular courts. At Athens, in the fourth century B.C., every adult citizen was normally a 'dikast' or juror, and civil and criminal cases were decided by majority vote in courts containing from two hundred to five thousand or more jurors.

ROMAN COURTS. Among the Romans criminal jurisdiction was exercised by the king or by officials appointed by the king. From the decisions of such officials appeal to the popular assembly was sometimes granted. In the Republican period such an appeal (*provocatio*) lay against all sentences condemning a citizen to death, or scourging, or exile, and also against fines beyond a certain amount; and this appeal became the real trial. The forms observed were substantially the same as in legislation. A proposal to condemn the accused to a certain punishment was submitted to the people, debated before them in informal assembly (*contio*), and accepted or rejected by them in formal assembly (*comitia*). (See **COMITIA**.) During the last century of the Republic, criminal courts of a different type, the *questiones*, gradually absorbed the jurisdiction previously exercised by the assembly. The *questio* was a body of select jurors sitting under the presidency of a special magistrate, usually a praetor. The jurors were drawn from a small panel, which included only the most distinguished and wealthy citizens.

Civil jurisdiction, also, is said to have been exercised by the Roman kings. It is probable, however, that the king did not decide the controversies submitted to him; but, like the praetor in later times, heard the pleadings only, and then sent the parties to a *judex*, or referee, nominated (or at least accepted) by the parties themselves. It also seems probable that, in the royal period, the referees were usually priests (*pontifices*). In the Republican period there were elected boards of *judices* (*decemviri, centumviri*), to which cases were sent by the praetor; but reference to a single *judex*, regularly a senator, seems to have been customary in actions on tort or on contract, and was admissible, during the last century of the Republic, in all cases.

The fundamental principle which controlled the administration of civil and criminal justice, and the composition of the courts, in the Republican period was the separation of jurisdiction (*ius*) and judgment (*judicium*). Pleas were made and the case was formulated before a magistrate, but the decision was rendered by a private citizen or by a body of private citizens. In the Imperial period this system (*ordo judiciorum*) was gradually supplanted by the *cognitio extraordinaria*, in which an Imperial official conducted the trial and rendered the decision. Under this system the administration of

justice was taken out of the hands of the people and became a part of the general administration created and controlled by the emperor. As in the general administration, so in the administration of justice, there were courts of lower and higher instance, and appeals could be taken. In the late Empire (fourth and fifth centuries) the municipal courts had jurisdiction only in police cases and in petty civil cases. The ordinary court of first instance was that of the rector or president of the province. From his decision appeal ran to the vicar of the diocese, and then to the praetorian prefect, the immediate personal representative of the emperor. The appellate courts had not merely cassational, but reformatory jurisdiction—i.e. they could not only set aside a decision, but they could also reverse or modify it.

TEUTONIC AND MEDIEVAL COURTS. The primitive Teutonic court was a folk-moot, or popular court, in which the decision was proposed by the presiding dignitary (king or prince or hundredman), or by a law-speaker appointed by the presiding dignitary, and was approved or disapproved by the assembled freemen. In the later Frankish (Carolingian) Empire, special judgment-finders (*scabini*, *Schöffen*, *échevins*) gradually took the place of the body of freemen. These judges or assessors were at first appointed by the count; but, after the dissolution of the Empire, their office, like most offices, became hereditary.

The early Teutonic courts were those of the hundred, of the county, and of the tribe. In the Frankish Empire the court of the tribe was replaced by the royal court, held by the count palatine; and in the Carolingian period circuit courts were held by Imperial *missi*. Even in the Carolingian period the courts of the hundred and of the county were being supplanted by manorial courts, held by the bailiffs of the seigneurs, and after the dissolution of the Empire the popular free courts disappeared in many parts of Europe. During the Middle Ages appeared special feudal courts and independent city courts. Nearly all the mediæval courts were courts at once of first and last instance; there was no system of appeals; the king's court was usually nothing but a feudal court for the great vassals. In all of these courts, from the king's court down to the manorial court, the decision was usually rendered (or at least approved) by a limited number of judges or assessors, who were regularly the *pares* of the defendant—i.e. persons of the same class and rank. Throughout the Middle Ages there were also special ecclesiastical courts (see **CANON LAW**), with jurisdiction not only over Church matters, but over the persons of the clergy and over many matters to-day regarded as civil. In these courts the judicial organization and procedure of the late Roman Empire were perpetuated. From the ordinary (bishop's) courts appeals ran to Rome, and the Pope could appoint legates to hold special courts.

MODERN EUROPEAN COURTS. When the administration of justice was reorganized by the absolute monarchy, the new royal courts were modeled on the ecclesiastical courts. Professional or 'learned' judges replaced the mediæval lay judges; the judge or bench of judges rendered decision both upon the law and the facts; appeals ran from the courts of lower instance to

those of higher, and finally to the king's court. The modern European courts are still, essentially, courts of this Roman-Imperial-ecclesiastical type, except that the court of last instance has usually cassational jurisdiction only, not reformatory jurisdiction. The only important modification which has been introduced is jury trial in criminal cases. Lay assessors have been retained or reintroduced, in some countries, in the police courts and in the commercial courts. These latter courts, with special jurisdiction over merchants and commercial cases, are survivals of the independent city courts of the Middle Ages. The number of judges in a European court is usually proportional to the amount of business with which the court has to deal. In the larger courts the judicial force is divided into sections (sometimes termed *senates*), and the judicial business is distributed according to its character, criminal cases going to one section, commercial cases to another, etc. When a doubtful question of general importance comes before such a section, a session of the entire court may be called. In all the leading European States the independence of the judge is safeguarded by life tenure and fixed salary, and in the German Empire by the rule that a transfer, even when it is technically a promotion, cannot be made without the consent of the judge concerned.

ENGLISH AND AMERICAN COURTS. Originally of wider signification, the term court has come to represent a permanent organization or tribunal for the public administration of justice, composed of one or more judges, who, when engaged in the transaction of business, are attended ordinarily by attorneys and counselors, who represent the litigants; by clerks, who keep records of what is done; and by marshals, sheriffs, constables, or like officers, who enforce judicial mandates and preserve order.

In primitive communities, courts perform legislative and executive as well as judicial functions. The *scyresgemot*, county court, or sheriff's turn of Anglo-Saxon England was not simply a judicial tribunal presided over by a bishop and sheriff, but was an assemblage of freemen for the discussion and transaction of local affairs generally. The *Aula Regis*, or Great Council of the Kingdom, in the early English history performed legislative as well as judicial duties; and so did the stated assemblages of the ruling class in some of the English colonies in this country. In Massachusetts the present names of the legislative and the judicial bodies—the General Court and the Supreme Judicial Court respectively—bear testimony to the fact that the primitive court of the colony performed both legislative and judicial functions.

I. English courts may be classified in various ways. One basis of classification is their relative authority; and this divides them into superior and inferior courts. (a) The latter class includes those tribunals over which courts of the former class may exercise a supervisory jurisdiction by writs of *mandamus* (q.v.), *certiorari* (q.v.), or prohibition. They are of four kinds:

(1) Local courts of criminal or quasi-criminal jurisdiction, such as *borough sessions*, held by a recorder or the justices of a municipal borough; *licensing sessions*, held by borough justices for granting or withdrawing liquor licenses;

petty sessions and *special sessions*, or courts held by two justices or a borough police magistrate in the exercise of a summary jurisdiction over minor offenses; *general* or *quarter sessions* of the borough and of the county, for the trial of felonies and misdemeanors within the borough or county jurisdiction, and for appeals from petty and special sessions.

(2) *Local civil courts of record*, such as borough civil courts and county courts. The latter are lineal descendants of the *scyresgemots* of King Alfred; but their present constitution, jurisdiction, and practice are regulated by the County Courts Act, 1888 (51 and 52 Vict. c. 43). Under this statute, England, with the exception of London, is divided into 491 county-court districts, each court having a judge who must be a barrister of at least seven years' standing, and who is appointed by the Lord Chancellor (except the judge within the Duchy of Lancaster, who is paid by salary), is allowed traveling expenses, is addressed as 'His Honor Judge —,' and ranks next after knights bachelors. Some of these judges have a high professional reputation. From the decisions of these courts an appeal lies in many cases to the High Court, and the latter possesses the power of supervising the proceedings of the former by writs of certiorari and prohibition, and by orders to show cause, which have been substituted for the old writ of mandamus.

(3) The *university courts* of Oxford and Cambridge, which exercise civil jurisdiction in some cases in which members of the university are concerned.

(4) *Manorial courts*, having a limited jurisdiction in some parts of the kingdom. See MANOR.

(b) The *superior courts* of England, prior to the Judicature Act of 1873, embraced those of Common Law and of Equity, the Probate and Divorce Court, the Admiralty Court, and the London Court of Bankruptcy. The superior courts of common law and of equity were evolved from the *Aula Regis*, or Great Council of the Kingdom. It was provided by Magna Charta that "common pleas shall not follow one court, but shall be holden in some certain place." Accordingly, new justices were appointed, and the *Court of Common Pleas* was established at Westminster Hall, with jurisdiction over all civil actions between individual litigants—that is, over all common pleas or suits, as distinguished from pleas of the Crown or criminal actions. A century later Edward I. detached from the *Aula Regis* the *Court of King's Bench*, the *Court of Exchequer*, and the *Court of Chancery*, thus settling the superior courts of law and equity upon the basis which they occupied until recently.

Originally the *King's Bench* (or *Queen's Bench* during the reign of a queen) was a criminal court and the conservator of the public peace. By a series of fictions, however, its jurisdiction was extended to civil actions.

So the *Exchequer*, which at first was a court of revenue only, extended its jurisdiction by fictions to a variety of suits between individual litigants.

Under Edward I. the *Court of Chancery* (q.v.) became an established judicial tribunal. It was presided over by the Chancellor, who had the custody of the Great Seal, and with it the power

to issue writs returnable in chancery, and thus to act as a check upon the common-law courts. Later the Lord Chancellor was assisted in the performance of his judicial functions by the master of the rolls and by vice-chancellors. For the influence of this court upon the development of English law, see CHANCERY; EQUITY.

(c) Reference has been made already to the fact that one of the presiding officers of the Anglo-Saxon local courts was a bishop. After the Norman Conquest the bishops ceased to take part in those assemblies, and were accorded exclusive cognizance of spiritual matters. This jurisdiction was steadily extended until it embraced not simply the discipline of the clergy and the regulation of ecclesiastical affairs, but also the control of marriage and divorce, and the disposition of the estates of deceased persons. At present, however, *ecclesiastical courts* in England are confined to the decision of ecclesiastical questions, while divorce and matrimonial causes, as well as the probate (q.v.) of wills and testaments and the administration of decedents' estates, are within the jurisdiction of secular courts.

(d) The *Court of Admiralty* is one of great antiquity, having its origin, undoubtedly, in the period when the King was in truth the source of all judicial power. After the courts of common law, described above, acquired a degree of independence of the sovereign, they did not hesitate to issue writs of prohibition to the Court of Admiralty, and to treat it as an inferior tribunal. Its present jurisdiction is mainly statutory.

The *London Court of Bankruptcy* was created and regulated by modern bankruptcy (q.v.) statutes.

(e) By a series of judicature acts, beginning with that of 1873, all of the foregoing secular courts were consolidated into one *Supreme Court*. This consists, at present, of two permanent divisions, one of which, styled *His Majesty's High Court of Justice*, has original jurisdiction of all actions formerly brought in either of the superior courts of common law or of equity, or in the admiralty, or probate, or divorce, or bankruptcy courts; and an appellate jurisdiction over various cases brought up from inferior courts. The other division is styled *His Majesty's Court of Appeal*, its jurisdiction being almost exclusively appellate. The High Court is separated into three parts, known respectively as the *Chancery Division*, with the Lord Chancellor as president, and five judges; the *King's Bench Division*, with the Lord Chief Justice as president, and fourteen judges; and the *Probate, Divorce, and Admiralty Division*, with a president and a judge; the general character of the subjects of which each division has cognizance being indicated by its name.

The *Court of Appeal* consists of the Lord Chancellor, every person who has held the office of Lord Chancellor, the Lord Chief Justice, the Master of the Rolls, the president of the Probate, Divorce, and Admiralty Division, and five judges, with the title of Lords Justices of Appeal. It is an august tribunal, whose decisions of appeals from the various branches of the High Court command great respect.

In addition to this permanent and impressive Appellate Division of the Supreme Court, there are divisional courts, in the *King's Bench Divi-*

sion and in the Probate, Divorce, and Admiralty Division, composed of two judges, ordinarily, for the disposition of appeals from the petty or quarter sessions, from the county court, and from divers other inferior tribunals.

(f) Above the Supreme Court, as a final court of appeal, is the *House of Lords*, whose appellate jurisdiction dates back to the thirteenth century. At present, however, only a few of its members take any part in the performance of its judicial functions. They are known as *Lords of Appeal*. The Lord Chancellor presides over them. (See LORDS, HOUSE OF.) The final court of appeal for cases arising in India and the colonies is the Privy Council (q.v.), which has also final appellate jurisdiction over judgments of the ecclesiastical courts and of the Naval Prize Court.

From the foregoing sketch of the English courts it is apparent that a litigated case may be passed upon by four successive tribunals. It may be instituted, for example, in a county court, thence appealed to a divisional court, thence to the Court of Appeals, and finally to the House of Lords. A similar series of appeals may terminate in the Privy Council.

II. In the United States, distinct systems of courts exist, one organized under the Federal Constitution and statutes, the others under the Constitution and statutes of the several States.

FEDERAL COURTS. (a) Sec. 1 of Art. III. of the Federal Constitution declares that "the judicial power of the United States shall be vested in one Supreme Court, and in such inferior courts as Congress may from time to time establish." By the second section of the same article, as modified by the Eleventh Amendment to the Constitution, the judicial power of these courts is extended to all cases in law and equity arising under the Federal Constitution, laws, and treaties; to all cases affecting foreign ambassadors, ministers, or consuls; to all admiralty and maritime cases; to controversies to which the United States shall be a party; to controversies between two or more States, between citizens of different States, between citizens of the same State claiming lands under grants of different States, between a State or the citizens thereof and foreign States, citizens, or subjects; and to suits by a State against a citizen of another State.

(b) Under the power conferred upon it to establish judicial tribunals inferior to the Supreme Court, Congress has established a Court of Claims, district courts, circuit courts, and circuit courts of appeal. Besides these, it has provided for various courts in the Territories. The latter are not, however, United States courts under article three of the Constitution, but are rather Congressional courts. They are called into being as an incident to the Congressional authority to make all needful rules and regulations respecting the territory of the United States. Their judges are not entitled to hold office during good behavior, but may be appointed for a term of years, and may be subject to suspension or removal from office by the President.

(c) The *Court of Claims* was established in 1855 to hear and determine certain classes of claims against the United States, thus permitting citizens in many cases to sue the Government. See CLAIMS, COURT OF.

(d) By the act of 1789 the States were divided into thirteen districts, which have increased to sixty-nine (1902), each district having a judge, a clerk, a marshal, and an attorney appointed by the Federal Government. The district courts have an extensive jurisdiction, embracing jurisdiction over admiralty (q.v.) and maritime causes; suits arising under the revenue laws, the civil-rights statutes, and various other legislation; prosecutions for crimes against the United States or for the recovery of penalties under Federal laws: proceedings in bankruptcy, and many other subjects of litigation. See DISTRICT COURT.

(e) Next above the district courts are the *circuit courts*, originally six, now nine, in number, exercising both an original and appellate jurisdiction. They have original jurisdiction over many subjects concurrently with the State courts or the district courts. For example, many criminal prosecutions may be instituted either in the district court or the circuit court; and many civil actions, both of a common-law and of an equitable nature, may be brought in a State court or in a United States Circuit Court at the option of the plaintiff. In some civil suits, the amount involved, exclusive of interest and costs, must exceed \$2000, in order that suit may be instituted in a circuit court. Most cases brought in one of these courts are controversies in which the United States or a State is the complainant, or are between citizens of different States, or involve rights secured by the Federal Constitution, or by Federal statutes or treaties. Originally these courts were held by members of the United States Supreme Court and by district judges, the Chief Justice and each of the associate justices of the Supreme Court spending a part of each year in the conduct of a circuit court. Later, circuit judges were provided for, the number being twenty-five at present (1902); and circuit courts may be held by a Supreme Court justice, or a circuit court judge, or a district judge, or by any two of these. The process of these courts runs to any part of the United States, so that a warrant of court issued by the circuit court in Florida may be served by a United States marshal in Alaska.

(f) By an act of Congress passed in 1891, the appellate jurisdiction of the circuit courts has been transferred to the circuit courts of appeal, of which there are nine—one in each circuit. Each of these courts consists of three judges, any two of whom constitute a quorum. Its members are selected from the following list: The Supreme Court justice assigned to the circuit in question, the circuit judges and the district judges of that circuit; but no justice or judge is allowed to sit in this tribunal in a case which was tried before him while holding a circuit or district court. It is apparent, therefore, that the personnel of these courts changes frequently.

(g) The final appellate tribunal of the Federal judiciary is the *Supreme Court*—probably the most unique and the most influential judicial body in the world. See SUPREME COURT OF THE UNITED STATES.

III. The State courts are modeled after those of England. It is true they do not include admiralty nor ecclesiastical tribunals; but this is because admiralty and maritime jurisdiction is confided exclusively to the Federal courts by

the Federal Constitution, and because there is no State Church in any of our commonwealths. That part of the powers of the English ecclesiastical courts relating to the estates of deceased persons and kindred subjects has been devolved in many States upon tribunals bearing various names, such as surrogates', probate, or orphans' courts. Most of the local or inferior courts, however, as well as the superior courts of law and of equity, were copied by State constitutions and statutes from English originals. In many of the States courts of chancery (q.v.) and of common law (q.v.) have been united into a single supreme court. It is impossible in this article to describe the judiciary system of each of the States, for in matters of detail they differ not a little; but a brief sketch of the New York courts will give the reader an idea of those existing in other States.

(a) To some extent these courts correspond to the territorial subdivisions of the State. For example, each town (q.v.)—the territorial unit in New York—is required to elect *justices of the peace* (q.v.), who are empowered to hold courts and to exercise a limited criminal as well as civil jurisdiction. In each county a *county court* is provided for, and also a *surrogate's court*; although in some counties these courts are held by the same judge. Other local courts, with a limited jurisdiction, have been erected by the Legislature, especially in cities and large villages. The *Supreme Court* possesses a general jurisdiction in law and equity throughout the State. It is composed (1902) of seventy-six justices, each of which is empowered to hold court in any county, although they are not elected by the State at large, but each is chosen by the electors in one of the eight judicial districts into which the State is divided. Some of these justices hold courts for the trial of cases or the determination of motions; while others, upon the selection of the Governor, constitute four courts of appeal, called *appellate divisions*, the State being divided into four departments, in each of which one of these courts has appellate jurisdiction. From determination by an appellate division an appeal may be taken in many cases (see Art. VI., § 9, of New York Constitution) to the *Court of Appeals*, the highest regular judicial tribunal of the State, from whose decision there is no appeal. It consists of a chief judge and six associate judges. A *Court of Impeachments* is also provided for by the State Constitution. This, however, is not a regular, but an extraordinary, tribunal, which rarely assembles.

(b) In some States the Supreme Court possesses original jurisdiction, and is also the final court of appeals. That is the case in Massachusetts, where an action brought in the Supreme Court may be tried and decided by a single justice, and from his decision an appeal may be taken to the full court. In that State the Supreme Court is the final tribunal for appeals from the decisions of a single justice; also from the Probate Court, the Insolvency Court, and the Superior Court—the Superior Court, in turn, possessing both original and appellate jurisdiction, appeals running to it from municipal, district, police, and justice courts.

Foster, *Treatise on Federal Practice* (Chicago, 1901); Cummings and Gilbert, *Official Court Rules of New York* (New York, 1900); The United States Constitution and Revised Statutes; the Constitutions and Statutes of the several States. For a separate treatment of special courts, see individual titles such as COMMON PLEAS, COURT OF; SURROGATE; COURTS, MILITARY; PROBATE COURT; ARCHES, COURTS OF; SUPREME COURT OF THE UNITED STATES; etc. Consult also the authorities referred to under such titles as CIVIL LAW; ADMIRALTY LAW; PLEADING; etc.

COURT. A name originally applied to the square or space inclosed by the buildings of a feudal castle. In time it came to denote the persons immediately surrounding a feudal chief or superior. Its application is now confined to the residence and surroundings of sovereign princes, together with such persons of distinction as are in the habit of approaching the monarch and of associating with the other members of the royal family, both in a public and a private capacity.

COURT, PRESENTATION AT. What in monarchical countries is considered the honor of being presented at Court or formally introduced to the sovereign, is valued not only for the *éclat* of the ceremonial, but also for its service as a credential. Having been received by his *own* sovereign, a person may expect to be received anywhere else, and may claim to be presented by the representative of his country at any foreign Court. The privilege is therefore carefully guarded from abuse; and during her long reign, Queen Victoria exercised the most scrupulous personal supervision over the names of those who sought the honor, excluding all whose reputation was in the slightest degree tarnished. In England the names of those desiring to be presented, and of their presenters, must be sent to the Lord Chamberlain's office several days previously for approbation. Those who are not British subjects may be presented by their own ambassador. An elaborate ceremonial, including the wearing of full Court dress, is connected with the ceremony. For fuller information as to court dress, etc., consult Armytage, *Old Customs and Modern Court Rules* (London, 1883).

COURT, KŌŪR. ANTOINE (1696-1760). A French Reformer called the 'Restorer of Protestantism in France.' He was born at Villeneuve de Berg, in Languedoc, March 27, 1695. His parents were peasants, adherents of the Reformed Church, which was then undergoing cruel persecution. When but seventeen years old Court began to speak at the secret meetings of the Protestants, held literally 'in dens and caves of the earth,' and often in darkness, with no pastor present to teach or counsel. He entertained a great desire to build up the Church so ruthlessly persecuted; and to this end he proposed four things: (1) regular religious meetings for teaching and worship; (2) suppression of the fanaticism of those who professed to be inspired, and of the consequent disorders; (3) restoration of discipline by the establishment of consistories, conferences, and synods; (4) the careful training of a body of pastors. To the performance of this great task he devoted his life. From audiences of half a dozen meeting in secret, he came to address openly 10,000 at one time. In

1715 he convoked the first Synod of the Desert. In 1724 further fury was hurled at the Protestants in a decree which assumed that there were no Protestants in France, and prohibited the most secret exercise of the Reformed religion. A price was set on Court's head, and in 1729 he fled to Lausanne. There, after great exertion, he founded a college for the education of the clergy, of which, during the remaining thirty years of his life, he was the chief director. This college sent forth all the pastors of the Reformed Church of France until the close of the eighteenth century. He died at Lausanne, June 13, 1760. Court intended to write a history of Protestantism, and made extensive collections for the purpose; but he did not live to do the work. He wrote, however, *An Historical Memorial of the Most Remarkable Proceedings Against the Protestants in France from 1744-51* (Eng. trans., London, 1732); *Histoire des troubles des Cévennes ou de la guerre des Camisards* (1760; new ed., Alais, 1819, 3 vols.). Consult his *Autobiography*, ed. by E. Hugues (Toulouse, 1885); his *Letters*, from 1739, ed. by C. Dardier (Paris, 1885, 1891); E. Hugues, *Antoine Court* (Paris, 1872); id., *Les synodes du désert* (3 vols., Paris, 1885-86); and H. M. Baird, *The Huguenots and the Revocation of the Edict of Nantes* (New York, 1895). His only son, ANTOINE COURT DE GÉBELIN (born at Nîmes January 25, 1725, died in Paris May 10, 1784), who took the name of his grandmother, was a literary man of recognized rank, and rendered excellent service, first as his father's amanuensis and assistant and afterwards as a scholar at the capital. He is remembered in connection with the famous case of Jean Calas (q.v.) by his work *Les Toulousaines, ou lettres historiques et apologetiques en faveur de la religion réformée* (Lausanne, 1763).

COURTAT, kōōr'tā', LOUIS (1847—). A French painter. He was born in Paris and studied there under Cabanel. He has exhibited frequently at the Salon, and his "Leda" (1874) was bought by the French Government for the Luxembourg.

COURT BARON (Lat. *Curia Baronis*). The domestic court of the lord of a manor. Such courts were incident to every manor, barony, or lordship of land, in the Anglo-Saxon period of English history, and in subsequent ages came to be regarded as the characteristic and essential quality of a manor, inasmuch that Coke declares that "a court baron is the chief prop and pillar of a manor, which no sooner faileth, but the manor faileth to the ground." Being of customary origin, and custom being a matter of immemorial usage, no new courts baron, and consequently no new manors, can be created, and it is asserted by Blackstone that all manors existing in his time "must have existed as early as King Edward the First." However this may be, the manorial courts of which we have any knowledge are of great antiquity, though those that remain have by successive acts of Parliament and social changes been reduced to mere shadows of their former authority and importance, most of them having to-day only a nominal existence.

The court baron was and is the court of the freeholders of the manor, as distinguished from the villeins and copyholders. The lord, or his

steward, is the presiding officer of the court, which is composed of those freehold tenants of the manor who owe, as one of the services or incidents of their tenure, the service of 'suit,' or attendance, at the court. While the judicial functions of the court varied considerably, according to the customs of the manor, in general it exercised an ordinary jurisdiction in civil suits among the tenants of the manor, determined proprietary rights to land, regulated rights of common, sanctioned grants of the waste, etc. Until the reform of legal procedure in England in 1833, the great proprietary action for the recovery of land, known as the 'writ of right,' was properly instituted in the court baron, though the great authority of the regular tribunals of the kingdom had long since brought safer and more convenient processes within the reach of persons asserting claims to land. Many of the manorial courts have died out from the lack of a competent number of 'suits,' i.e. freemen subject to do suit at court.

A species of court baron existed in the manors created by royal patent in the Province of New York in the seventeenth and eighteenth centuries. These were modeled after the historic courts baron of the mother country, and for a time enjoyed considerable authority. They were abolished with the manors to which they were incident in the revolutionary legislation of 1787. Consult: Bolton, *History of the Several Towns, Manors, and Patents of the County of Westchester, New York*; Digby, *History of the Law of Real Property* (5th ed., Oxford, 1898); Pollock and Maitland, *History of English Law* (2d ed., London, 1899); Maitland, *Select Pleas in Manorial Courts* (Selden Society, 1889); Introduction: Gurdon, *History . . . of Court Baron and Court Leet* (London, 1731). See COURT LEET; CUSTOMARY LAW; MANOR.

COURT BEGGAR, THE. A play by Richard Brome (1632).

COURTENAY, kērt'nā, EDWARD HENRY (1803-53). An American mathematician, born in Maryland. He graduated in 1821 at the United States Military Academy, where until 1824 he was an assistant professor. In 1829-34 he was professor of natural and experimental philosophy there, in 1834-36, professor of mathematics at the University of Pennsylvania, and in 1842-53 professor of mathematics at the University of Virginia. He was an engineer in the construction, in 1837-41, of Fort Independence in Boston Harbor, and in 1841-42 was chief engineer of the dry-dock work in the Brooklyn Navy-yard. He translated and edited the *Elementary Treatise on Mechanics* of Boucharlat (1833), and prepared a *Treatise on the Differential and Integral Calculus, and the Calculus of Variations* (1855).

COURTESY. See CURTESY.

COURTESY TITLES. See TITLES OF HONOR.

COURT FOOL. From very ancient times there existed a class of persons whose business it was to while away the time of the noble and the wealthy, particularly at table, by jests and witty sayings. The custom is so old that it is mentioned in the great Sanskrit epic *Ramāyana* (q.v.). Plutarch speaks of a jester owned by the King of Persia. Philip of Macedon, Attila, Harun-al-Raschid, and even Montezuma employed them. Only with the Middle Ages, however, did

the office of court fool become a regular and indispensable function. At the end of the fourteenth century the fashion developed rapidly. Queens, dauphins, dukes, and wealthy barons all maintained their fools. The symbols of such a personage were: the shaven head; the fool's cap of gay colors with ass's ears and cock's comb; the fool's sceptre, which was variously formed; the bells, which were mostly attached to the cap, but in some cases to other parts of the dress; and a large collar. The rest of the costume was regulated by the taste of the master. Of these professional fools, some obtained an historical reputation, as Triboulet, jester of King Francis I., of France, and his successor, Brusquet; Klaus Narr, at the Court of the Elector Frederick the Wise of Prussia, and Scogan, court fool to Edward IV. of England. The kings and regents of Scotland had their jesters; and the sarcastic sayings of some of these privileged personages—such as those of Patric Bonny, jester to the Regent Morton—are still remembered. English court jesters died out with the Stuarts, one of the last of the race being the famous Archie Armstrong. Besides the regular fools recognized and dressed as such, there was a higher class, called merry counselors, generally men of talent, who availed themselves of the privilege of free speech to ridicule the follies and vices of their contemporaries. Of these, Knuz von der Rosen, jester to the Emperor Maximilian I.; John Heywood, a prolific dramatic poet and epigrammatist at the Court of Henry VIII.; and Angely, a French courtier, were particularly distinguished for talent and wit. In all times there have existed at courts persons who, without becoming jesters by profession, were allowed the privilege of castigating the company by their witty and satirical attacks, or who served as an object for the wit of others. Among these were the Saxon general Kyaw, celebrated for his blunt jests; and the learned Jacob Paul, Baron Gundling, whom Frederick William I. of Prussia, to show his contempt for science and the artificial Court system, loaded with titles. Often imbecile or weak-minded persons were kept for the entertainment of the company. The custom survived long in Russia, where Peter the Great had so many fools that he divided them into distinct classes, and kept them with him wherever he went. As late as the nineteenth century the Czar of Russia kept a jester at court, and in France just before the Revolution Marie Antoinette had her fool. Consult: Nieck, *Die Hof- und Volksnarren* (Stuttgart, 1861); Flögel, *Geschichte der komischen Litteratur* (Leipzig, 1784); and Doran, *History of Court Fools* (London, 1858).

COURTHOPE, WILLIAM JOHN (1842—). An English author. He was born July 17, 1842; was educated at Harrow and at New College, Oxford, where his career was most distinguished; was appointed professor of poetry at Oxford (1893), and honorary fellow of New College (1896). As professor of poetry he has delivered valuable lectures on *Life in Poetry*. Among his publications are *Ludibria Luna*, an allegorical burlesque (1869); *The Paradise of Birds*, a fine extravaganza (1870); *Life of Addison* (1882); an exhaustive history of English poetry, of which two volumes (1895-97) have appeared. He also edited, with biography, five volumes of the standard edition of Pope (10 vols., 1871-89).

COURT LEET (from *court* + *leet*, AS. *lode*, OHG. *liut*, Ger. *Leute*, people; connected with OCh. Slav. *Gudŭ*, Lett. *laudis*, people, and ultimately with Skt. *ruh*, to grow). In English law, a local customary court of great antiquity and of a popular character, having a limited criminal jurisdiction. It has been declared to be "the most ancient court in the land for criminal matters, the court baron being of no less antiquity in civil," and it is supposed to have been derived from the Anglo-Saxon folk-mote, in contradistinction, perhaps, to the 'hall-mote,' or court baron, which consisted of the freeholders, sitting in the hall of the manor.

Though usually found in connection with manors, the leet was not, properly speaking, a manorial court. There were town leets, borough leets, and hundred leets. But it was in connection with the manor, to whose internal organization it was peculiarly adapted, that the court leet reached its highest development. Though held by the steward, with the aid of the freemen of the manor (they were not required to be freeholders, as in the court baron), it was still regarded as belonging to the King. It was, in effect, a royal magistrate's or police court, having complete jurisdiction only of minor offenses (misdemeanors) and the jurisdiction of a committing magistrate in cases of felony and treason. These latter it referred to the superior tribunals of the country for trial and punishment. The court has now completely lost its importance, having been superseded by the police and county courts, though it still has a nominal existence in some manors. See **COURT BARON**; **MANOR**; and consult the authorities referred to under **MANOR**; also Jacob, *Law Dictionary* (title, "Court Leet") (London, 1809); Pollock and Maitland, *History of English Law* (2d ed., London and Boston, 1899); Gurdon, *History . . . of Court Baron and Court Leet* (London, 1731).

COURTLY, CHARLES. Sir Harcourt Courtly's son, in Dion Boucicault's *London Assurance*, believed by his father to be mild and studious, while in reality he is a fast young man of fashion.

COURTLY, SIR HARCOURT. An old beau in Dion Boucicault's *London Assurance*. His son Charles wins away from him the heiress he was to marry.

COURTLY NICE, SIR. An insignificant fop, the principal character of Crowne's comedy *Sir Courtly Nice*.

COURTMANS-BERCHMANS, kōōr'māns bĕrk'māns, JOANNA (1811-90). A Flemish author, born at Oudegend, East Flanders. After the death of her husband in 1856, she conducted a school at Maldegem. She was closely identified with the movement aiming at the advancement of Flemish literature. Several of her poems and novels enjoy great popularity. They include: *Het geschenk van den jager* (1864); *De zwarte Haave* (2d ed., 1866); *De Koewachter* (1873); *De Hoogmoedige* (1882).

COURT-MARTIAL. See **COURTS**, MILITARY.

COURTNEY, kĕrt'nĭ, LEONARD HENRY (1832—). An English Liberal-Unionist statesman, born at Penzance. He graduated at Cambridge in 1853, and was called to the bar three years later. From 1872 to 1875 he occupied the chair

of political economy at University College, London. He was several times elected to Parliament and became Under-Secretary of State for the Home Department in 1880, and for the Colonies in 1881; Governor of Madras in 1882; and Privy Councillor in 1889. He served on the Labor Commission in 1893-94, and became known as a strong advocate of proportional representation.

COURTNEY, WILLIAM LEONARD (1850—). An English author. He was born at Poona, India, January 5, 1850; was educated at University College, Oxford; elected fellow of Merton College (1872), and of New College (1876); afterwards headmaster of Somersetshire College, Bath (1873), and has been editor of the *Portnightly Review* since 1894. Among his scholarly works are: *The Metaphysics of John Stuart Mill* (1879); *Studies on Philosophy* (1882); *Constructive Ethics* (1886); *Studies New and Old* (1888); *Life of John Stuart Mill* (1889); *The Idea of Tragedy* (1900).

COURT OF CHIVALRY. See CHIVALRY, COURT OF.

COURT OF CLAIMS. See CLAIMS, COURT OF.

COURT OF COMMON PLEAS. See COMMON PLEAS, COURT OF.

COURT OF INQUIRY. See COURTS, MILITARY.

COURT OF LIONS. The most famous court of the Alhambra, taking its name from twelve white marble lions from whose mouths streams of water flowed into a central alabaster basin. The tiled court is surrounded by 124 columns delicately ornamented in filigree and colors, supporting a low gallery. For illustration, see ALHAMBRA.

COURT OF LOVE (Fr. *Cour d'Amour*). The name applied in the later Middle Ages to groups of noble ladies who, often, while assembled to listen to the declamations of the troubadours, took occasion to decide upon questions of courtesy and etiquette, particularly in affairs of love. According to some authorities these courts formed regular institutions during the twelfth century, the custom flourishing especially in Provence. There was a code (still preserved) of thirty-one articles called *De Arte Amatoria et Reprobatione Amoris*, by André, a royal chaplain, who lived in the middle of the twelfth century. Decisions are said to have been based upon this code. A typical example of the questions submitted to such tribunals is the following: If a lady listened to one admirer, pressed the hand of another, and touched with her toe the foot of a third, which of these three was the favored suitor? Among the eminent ladies who presided over these 'courts' were Queen Eleanor of Guienne and her daughter Marie de France, Countess of Champagne. René of Anjou, in the fifteenth century, made an ineffectual effort to resuscitate these 'courts.' Consult: Meray, *La vie au temps des cours d'amour* (Paris, 1876), and Reynouard, *Choix de poésies originales des troubadours*, vol. ii. (Paris, 1817).

COURT OF LOVE, THE. A poem assigned to Chaucer, but possibly of later origin. It appears in the edition of 1561.

COURT OF REQUESTS. An inferior court of equity jurisdiction, instituted in the reign of Henry VIII. for the purpose of affording relief

to the Lord Chancellor. Its authority was limited to cases coming within the jurisdiction of the High Court of Chancery, but deemed of too small importance to engage the attention of that august tribunal. It was presided over by the Lord Privy Seal, assisted by judges known as Masters of Requests. It never attained to great importance, and was abolished by act of Parliament in 1641 (Stat. 16 and 17 Car. I., c. 10).

The courts of conscience were also known as courts of requests. See CONSCIENCE, COURT OF.

COURT OF SESSION. The highest civil tribunal in Scotland, instituted in the reign of King James V., by statute dating May 17, 1532. The object of its institution was to discharge the judicial functions which originally belonged to the King and his council, and which, since 1425, had in a great measure devolved on a committee of Parliament, as the great council of the nation. The Court of Session consisted at first of fourteen ordinary judges and a president. One-half of these judges and the president were Churchmen, and the practice of appointing ecclesiastics to the bench did not cease for some time even after the Reformation. The King had the privilege of appointing, in addition to the ordinary judges, three or four peers or members of his great council, to sit and vote with the lords of session. The Lord Chancellor was president of the session. His office was abolished at the union, and the habit of appointing peers gradually fell into disuse.

From its foundation, till 1808, the court of session consisted of one court; in that year it was divided into what are known as the first and second divisions, two separate courts possessing coördinate jurisdiction. The lord president is still president of the whole court when called together for consultation, and enjoys other privileges in that capacity; but on ordinary occasions he officiates simply as president of the first division. In 1830 the number of judges in the Court of Session was reduced to thirteen; and that is still the full number, though since 1877 there have actually been but twelve judges. Of the five lords ordinary, only four sit daily. The judgments of the outer house, with a few statutory exceptions, are appealable to the inner house. The youngest judge, or junior lord ordinary, officiates in a separate department of the outer house, called the bill chamber, where summary petitions and other branches of business peculiarly requiring dispatch are disposed of. This department alone is open during the vacations of the court, the judges, with the exception of the lord president and lord justice-clerk, officiating in it in rotation. Either division of the Court of Session may call in the aid of three judges of the other, when equally divided in opinion. In cases of still greater difficulty, the lords ordinary are also called in, and a hearing before the whole court, or *in prescnee*, as it is called, takes place.

Since the 31st and the 32d Vict., cap. 100, no hearings before the whole court have taken place; the cases being decided on written arguments submitted to the judges. The judges of the Court of Session are appointed by the Crown, and hold their offices for life. No one is eligible to the office unless he has served as an advocate or principal clerk of session for five years or as a writer to the signet for ten years. See COURT.

COURTOIS, koor'twä', GUSTAVE CLAUDE ETIENNE (1852—). A French figure and portrait painter, born at Pusey, Haute-Saône. He studied with Gérôme in Paris, and afterwards was frequently honored at exhibitions. In 1889 he won the first medal at the Paris Exposition. His genre and historical pictures include "Narcisse" (bought for the Luxembourg), and "Dante and Virgil in Hell," but the strength of his art is more truly shown in his portraits.

COURTOIS, JACQUES (1621-76). A French battle painter, better known as Le Bourguignon. He was a pupil of his father, Jean Courtois, but went to Italy at the age of fifteen and worked in Bologna, Florence, Siena, and Rome, influenced successively by Guido Reni and Francesco Albani in Bologna, and by Cerquozzi and Pieter de Laar in Rome. He was turned to his true field, however, by a study of Raphael's "Battle of Constantine" in the Vatican. His spirited battle scenes, which excited great admiration and found many imitators, are to be seen in most of the principal galleries of Europe. At the age of thirty-six, on the death of his wife, he entered a Jesuit convent as a lay brother, and is said to have executed thereafter a number of religious paintings. By the Italians he was called Jacopo (or Giacomo) Cortese and Il Borgognone.

COURT PARTY, THE. A term applied as early as 1620 to the supporters of the political policy of the Stuart dynasty as opposed to the *Country Party*, during the disputes of King and Commons. At the end of the century the party represented high Toryism, Jacobitism, and High Church principles.

COURTRAI, koor'trä' (Flemish *Kortryk*). A town in the Province of West Flanders, Belgium, on the Lys, or Leye, 30 miles south of Bruges (Map: Belgium, B 4). Courtrai is built on both sides of the river, is surrounded with walls, and has a castle, a citadel, a fine old bridge flanked with Flemish towers, a noble town hall, and a beautiful Gothic church, founded in 1238 by Baldwin, Count of Flanders. The town-hall, dating from the sixteenth century, and now restored, contains memorable chimney-pieces and noteworthy frescoes and statuettes. In the Church of Notre Dame is one of Van Dyke's most celebrated paintings—"Raising of the Cross." Though a busy manufacturing place, Courtrai is nevertheless attractive. Table damask and other linen are the principal articles of manufacture, and for which Courtrai is celebrated, as well as for its lace and the excellent quality of flax grown in the vicinity. Population, in 1890, 30,400; in 1900, 34,000. Courtrai dates back to Roman times, when it bore the name of Cortoriaeum. During the Middle Ages it was an important industrial centre. On July 11, 1302, the Flemings, citizens of Ghent and Bruges chiefly, numbering 20,000 men, won a splendid victory over 7000 French knights and 40,000 soldiers, beneath the walls of Courtrai. More than 4000 golden spurs, worn by the French nobility, were gathered from the field, and the battle was henceforth called the Battle of the Spurs. The town suffered greatly in the French wars of the seventeenth and eighteenth centuries.

COURTS, MILITARY. Military courts are distinguished from civil courts both in their organization and procedure. They are divided into

courts-martial and courts of inquiry, which in their various forms are described below.

COURTS-MARTIAL (Fr., military courts) are statutory institutions for the enforcement of order and discipline in armies and navies. The American Army is governed by a military code mainly derived from that of England. The military tribunals instituted in America and England for the administration of this code do not differ materially in composition, power, or procedure. The court of the constable and marshal recognized in the statute of Richard II. c. 2 appears to have been the first in England to administer military justice. The office of high constable was abolished in the reign of Henry VIII., and with it lapsed all the criminal jurisdiction of this court. From this time until 1689, when military courts were recognized by statute, military law was administered by means of commissioners, by the general in command of troops, or by means of deputies appointed by him. These commissioners or deputies were usually officers of the army, and constituted courts or councils of war. Some time prior to the passing of the Mutiny Act these councils of war were called courts-martial, and with few modifications are now the existing military tribunals.

American courts-martial are instituted by authority of Congress, in pursuance of a power, conferred by the Constitution, to try offenses committed while the party is in the military service. These courts are (1) the general court-martial; (2) the summary court; (3) the garrison court; (4) the regimental court. The jurisdiction of the general court-martial extends to every person subject to military law for any offense within the cognizance of a military court. It is the only military court that can try a commissioned officer, and it takes cognizance of the serious offenses committed by enlisted men. The power to assemble a general court-martial is given by statute to the President of the United States and to any general officer commanding an army, a territorial division, or department, or colonel commanding a separate department. In time of war the commander of a division or of a separate brigade of troops is empowered to appoint this court. The statute provides that a general court-martial may consist of any number of officers from five to thirteen inclusive, and that it shall not consist of less than thirteen when that number can be convened without manifest injury to the service. The officers who are competent to appoint a court-martial are competent to appoint a judge-advocate for the same. The judge-advocate prosecutes in the name of the United States, and is, under certain circumstances, counsel for the prisoner. He summons witnesses for prosecution and defense. The original charges are sent to this officer, and if he considers any amendment necessary he communicates with the officer appointing the court. When the convening officer has satisfied himself that the charge preferred discloses an offense under the Articles of War (q.v.), and that the evidence forthcoming is sufficient to justify the trial of the accused, he issues an order defining the place and time of the meeting of the court, and naming, in the order of their rank in the service, the officers who are to compose it.

When a commissioned officer is to be tried the officer appointing the court details, if he can, without prejudice to the service, officers of rank

equal or superior to that of the accused. He also avoids detailing the officer who has investigated the charges against the accused, or one who will be a principal witness against him, or the immediate commanding officer of the accused. A member of a court of inquiry respecting the matter on which the charges are founded, or an officer who has a personal interest in the case, is not detailed. Court-martial procedure does not differ materially from that of the ordinary criminal courts of the country. This court is, however, a judge of the law as well as of the facts of the case it tries. Before it proceeds upon any trial the judge-advocate administers an oath to each member which requires him, as a juror, to well and truly try and determine, according to evidence, the matter . . . before him, etc., and as a judge to duly administer justice without partiality, favor, or affection, etc. This oath includes also one of secrecy as to the votes of members, and of the sentence of the court, until approved. The judge-advocate is also required to take a similar oath of secrecy. Congress has power to prescribe not only the organization and jurisdiction of courts-martial, but also their practice, and the mode of executing their sentences. It has secured to the accused a right of challenge to a member of his court, and immunity from a second trial for the same offense. It has fixed the period of time within which the accused must be prosecuted. The form of procedure for a general court-martial is laid down in works treating of the subject of military law.

SUMMARY COURTS-MARTIAL have been instituted for the purpose of trying enlisted men for offenses ordinarily cognizable by garrison or regimental courts-martial, which courts they have practically displaced. This court, as instituted in the United States, has no power to try capital cases or commissioned officers. In England this court has been instituted for the purpose of trying offenses committed in active service, which, with due regard to the public service, could not be tried by the ordinary courts. It is competent to try any officers, soldiers, or other persons subject to military law for any offense, and if composed of three officers, can award all the punishments of a general court-martial. In the United States the summary court is composed of a single officer, and has power to try, in time of war, as well as of peace, enlisted men and general prisoners. Its power to punish is limited by statute. The commanding officers authorized to approve its sentences, and superior authority, have power to remit or to mitigate them.

GARRISON COURTS-MARTIAL are composed of three members and a judge-advocate. All are commissioned officers. They may be appointed by any officer commanding a garrison, fort, or other place where the troops consist of different corps. The order appointing a garrison court must state the fact giving it jurisdiction. As regards persons, offenses, and limit of power to punish, its jurisdiction does not differ from that of the summary court. In the military service of the United States this court is now seldom assembled except in the cases of non-commissioned officers objecting to trial by the summary court, and in the event of the accused refusing to consent in writing to trial by that court, when they may be brought to trial before garrison,

regimental, or general courts-martial. The testimony taken before a garrison or regimental court-martial is not reduced to writing. The garrison court-martial corresponds to the district court in the English Army.

THE REGIMENTAL COURT-MARTIAL is in composition the same as a garrison court-martial, with the exception that its members and judge-advocate are of the same regiment or corps as the offender. Every officer commanding a regiment or corps may appoint this court, which has jurisdiction only over offenders belonging to the same regiment or corps from which the court is appointed. In all other respects this court is like the garrison court-martial. In England regimental courts-martial can be convened by any officer authorized to convene the higher courts, by a commanding officer, or officer in command of two or more detachments, provided he be not under the rank of captain, and on board a ship, by a commanding officer of any rank. After investigating the charge against a prisoner a commanding officer, if he does not dispose of the case summarily, must without unnecessary delay, which should not exceed thirty-six hours, either refer the case to superior authority, order a regimental court-martial to assemble, or apply to a superior to convene a higher court. Clode says: "These three 'general,' 'district,' and 'regimental' courts are those under which the army is governed, and by which the military law is administered."

A COURT OF INQUIRY is, in its function, analogous to a grand jury in civil procedure. It is convened to examine into the nature of any transaction of, or accusation or imputation against, any officer or soldier in the service. Unless specially ordered to do so, it does not give an opinion on the merits of the case it investigates. A dissenting opinion is authorized. A court of inquiry may be ordered by the President, or by any commanding officer, but shall never be ordered by a commanding officer, except upon a demand by the officer or soldier whose conduct is to be inquired into. It consists of one or more officers, not exceeding three, and a recorder. The order convening a court of inquiry details the members and recorder by name, specifies the subject matter of inquiry, and directs a report of the facts, or of the facts with opinion. Under the military laws of the United States, a court of inquiry and the recorder thereof have the power to summon witnesses and to take evidence on oath. This is not so in the English service, where it has no judicial power, and is simply a board directed to collect evidence with respect to a transaction into which the commanding officer himself cannot conveniently inquire. A court of inquiry, wrote Sir Charles Napier, "ought generally to be a closed court, no one allowed to enter but such individuals as are called for, and who, being privately examined, are sent out. . . . It is generally objectionable to make a court of inquiry an open court."

MILITARY COURTS OF OTHER COUNTRIES. In the army of Germany there are general and regimental courts. In trials of enlisted men a certain proportion of the members of the court are of the rank of the accused. In the Russian Army there is a supreme tribunal at Saint Petersburg, and district and regimental courts-martial. In the French Army individual officers have large powers of imprisonment, and there

are regiments and courts of discipline for hard characters. In the Austrian Army there are courts of first instance, and courts of appeal from the former. Military lawyers are also attached to each regiment to help in the administration of military justice.

BIBLIOGRAPHY. A *Manual for Courts-Martial* was prepared by direction of the Secretary of War for the use of the Army of the United States in 1901. For the English practice, Simmons, *Courts-Martial* (London, 1873), may be consulted. See **MILITARY LAW.**

COURTSHIP OF MILES STANDISH, THE. A hexametric poem by Longfellow (1858), founded on the life of the "Captain of the Pilgrims."

COURT TENNIS. Indoor tennis (see diagram). Usually the court occupies an entire building, and is lighted from the roof, occupying a playing space of 96 by 32 feet, surrounded on three sides by a corridor about 6 feet wide (the

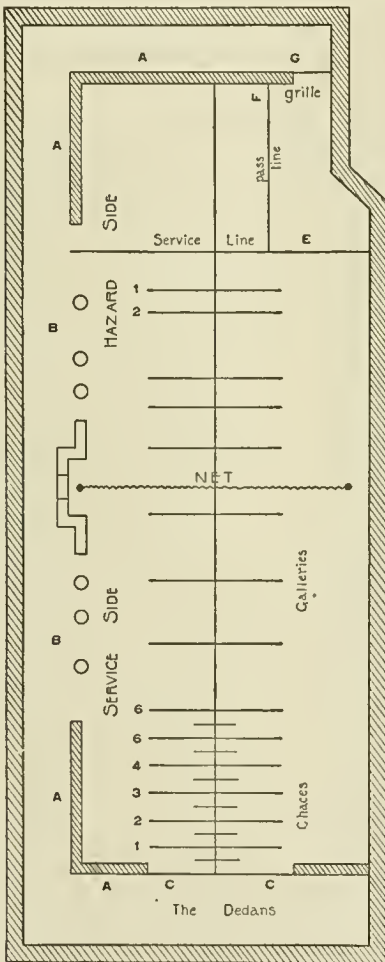

open grating. The most complete courts have floors of asphalt, and cement walls painted black to a height of 18 feet. The nets divide the court, and also the *service* and *hazard* sides of the game. The *tambour* is a projection on the hazard side, resembling a chimney, and near it (in the penthouse) is the *grille*. The *chases* are numbered on the wall (from 1 to 6) and are employed to divide part of the court into the number of spaces required by the game. In playing the game the server must stand in the service court and serve the ball over the penthouse, it being required to strike on the penthouse roof and then roll off into the receiving court. The player on the hazard side strikes it on the bound wherever he chooses, if only it first strikes the ground on the opposite side of the net: for instance, he may strike it against the nearest wall, so that it rebounds across the net. A 'chase' is called when the player fails to strike the ball before the second bound—unless he is on the hazard side and beyond the service-line. Further, a record is made of the cross-lines at which the ball bounds; which, however, does not affect the score unless the game stands at 40, in which event sides are changed and the contestants play for the 'chase.' The player responsible for the 'chase,' by permitting the same to be made, will attempt to return the ball nearer to the end wall than the point at which it was marked, to insure its bounding a second time, making the attempt as often as his opponent returns the ball until he either succeeds or misses. In the former event he is credited with the 'strike;' while in the latter, his opponent scores. For more detailed information regarding the game, its scoring and its history, see **TENNIS.**

COURT THEATRE, THE. A playhouse for comedies and farces, situated in Sloane Square, London. Originally a chapel built in 1818, it was turned into a theatre.

COUSA, JOHN. See **ALEXANDER JOHN I.**

COUSIN, KŌŌ'ZĀN', JEAN (1501-89). A French painter. He was born at Soney, near Sens, and little definite is known of his life. He was at first a glass-painter and afterwards a goldsmith in Paris. His work on glass is celebrated. His windows in the Sainte Chapelle at Vincennes are probably the finest in France, and he also made some for the Church of Saint Gervais, Paris, which, however, have been destroyed. At this period Cousin turned his attention to painting and became known as the 'founder of the French School.' He executed a fine "Last Judgment," which is full of action and spirit, in the manner of Parmigiano. It is now in the Louvre. He was also a miniaturist, sculptor, and a wood-engraver, and the author of two books, *Livre de perspective* (1560) and *Livre de portraiture* (1571). Consult Firmin-Didot, *Etude sur Jean Cousin* (Paris, 1872).

COUSIN, VICTOR (1792-1867). A French philosopher and historian. He was born in Paris, and studied with such brilliant success at the Ecole Normale that in 1814 he was appointed assistant to Royer-Collard in the chair of philosophy at the Sorbonne. He threw himself heartily into the reaction against the sensualistic philosophy and literature of the eighteenth century, which was then in possession of the field. In 1817 he visited Germany, where he was introduced to bolder and more speculative sys-

COURT TENNIS.

penthouse), which has a sloping roof about 7 feet high. The spectators occupy the *dedans*, or the part of the penthouse situated in the rear of the court, and separated from the same by an

tems of philosophy than any he had yet known, becoming acquainted with Jacobi, Schelling, Hegel, and Goethe. During a later visit to Germany, in 1824-25, he was suspected of revolutionary tendencies, arrested in Dresden, and sent to Berlin, where he was detained for six months. He took advantage of his compulsory detention in Prussia to study the philosophy of Hegel, which had no small influence on his susceptible intellect. On his return to France he took a decided stand against the reactionary policy of Charles X., and in 1827, when the comparatively liberal Ministry of Martignac came into office, Cousin, who had for some years been suspended from his professorial functions, was reinstated in his chair. Meanwhile he had become known as an author by his editions of Proclus and Descartes (1820-26), and by his celebrated translation of Plato, which was finished in 1840, in thirteen volumes. Cousin reached the height of his popularity and influence as a philosophic teacher in the years 1828-30, when often as many as two thousand enthusiastic hearers gathered around him. He was still young, simple, and pure in his habits; his doctrines were for the most part new to his audience, bold, and in harmony with the spirit of the time. The finest qualities of the national genius appeared in his lectures—a wonderful lucidity of exposition, and exquisite beauty of style, such as few philosophers have equaled, a brilliancy of generalization and criticism, and a power of coördinating the facts of history and philosophy so as to make each illustrate the other and reveal their most intricate relations. At this period Cousin was one of the most influential leaders of opinion among the educated classes in Paris. After the Revolution of 1830, when his friend Guizot became Prime Minister, he was made a member of the Council of Public Instruction, in 1832 a peer of France, and later director of the Ecole Normale and virtual head of the University. His efforts for the organization of primary instruction are to be seen in the valuable reports which he drew up from personal observation on the state of public education in Germany and Holland. In 1840 he was elected a member of the Académie des Sciences Morales et Politiques, and in the same year became Minister of Public Instruction in the Cabinet of Thiers. After the Revolution of 1848 Cousin aided the Government of Cavaignac, and published an anti-socialistic brochure called *Justice et charité*. After 1849 he disappeared from public life.

Cousin was greater as an expounder of historical systems of philosophy than as an original thinker. At first a disciple of Royer-Collard and the Scottish School, he was attached to the psychological method of investigating; afterwards a keen student of the German School, he expounded the views of Schelling and Hegel with such enthusiasm that he might legitimately enough have been considered a 'German idealist.' But he endeavored to mediate between the German standpoint of an impersonal reason and that of empirical psychology. In the later years of his life his views carried him to a modified Cartesianism. See DESCARTES.

Cousin's chief works, besides those already mentioned and his *Fragments philosophiques* (1826), appeared in two series. The first contained *Premiers essais de philosophie; Du vrai, du beau et du bien; Philosophie sensualiste;*

Philosophie écossaise; Philosophie de Kant. The second contained *Introduction à l'histoire de la philosophie; Histoire générale de la philosophie jusqu'à la fin du XVII^e siècle.* He also contributed a great variety of papers to the French reviews. Besides his philosophical work, he rendered a very real service to the history of the seventeenth century in France by his luminous and stimulating sketches of Mmes. de Longueville, de Hautefort, de Sablé, and a number of other great personages of the period. Consult: Hamilton, *Discussions on Philosophy, Literature, Education, and University Reform* (London, 1852); Taine, in *Les philosophes classiques du XIX^e siècle* (Paris, 1888); Janet, *Victor Cousin et son œuvre* (Paris, 1885); Barthélemy Saint-Lilaire, *Victor Cousin, sa vie, sa correspondance* (3 vols., Paris, 1895); Jules Simon, *Victor Cousin* (Paris, 1887).

COUSINE BETTE, kōō'zēn' bēt. LA. A novel by Balzac (1846) dealing with the love of an aunt and a niece for the same youth.

COUSIN MICHEL, mē'kēl. A humorous appellation for the German native, corresponding to Brother Jonathan as applied to the American.

COUSIN-MONTAUBAN, kōō'zān' mōn'tō'bān', CHARLES GUILLAUME MARIE, Count of Palikao (1796-1878). A French general. He was in command of the combined English and French forces in the victorious campaign of 1860 against China, and received the title of Count of Palikao (a place east of Peking) from the Emperor Napoleon after the fall of Peking. He obtained rich booty for himself in the plunder of the Imperial summer palace. In August, 1870, on the resignation of the Ollivier Ministry, immediately after the first reverses of the French, he was charged by Napoleon with the formation of a new Ministry. He himself took charge of the nation's defenses, and in twenty-four days placed 140,000 men in the field, besides arming the capital. After the defeat at Sedan he quitted France and afterwards retired to private life. His book, *Un ministère de vingt-quatre jours* (1871), describes his experiences.

COUSIN PONS, kōō'zān' pōn. LE. A novel by Balzac (1847), describing the treatment of the poor relative who outstays his welcome.

COUSINS, kūz'nz. SAMUEL (1801-87). An English engraver, born in Exeter. He was made a member of the Royal Academy in 1835, a member of the School of Engraving in 1854, and professor at the Royal Academy in 1855. He engraved innumerable portraits after Reynolds, Lawrence, and Gainsborough, and pictures from the originals of Wilkie, Landseer, and others.

COUSSEMAKER, kōōs'má'kār'. CHARLES EDMOND HENRI DE (1805-76). A French historian of music, born at Bailleul (Nord). After studying at the Donai Lycée, he completed his musical education under Moreau and Lefebvre. He devoted himself principally to researches on mediæval music, on which subject he published the following important works: *Mémoire sur Hucbald* (1841); *Histoire de l'harmonie au moyen-âge* (1852); *Drames liturgiques du moyen-âge* (1861); *Les harmonistes des XIII^e et XIV^e siècles* (1864); *Les harmonistes du XIV^e siècle* (1869); and *Scriptores de Musica Medii Ævi* (1866-75), his principal work.

COUSTOU, koo'stoo', NICOLAS (1658-1733). A French sculptor, born at Lyons, the son of a wood-carver, from whom he received his first instruction. He studied in Rome from 1683 to 1686, and settled in Paris, where he became rector of the Academy in 1720. Among his works, many of which were destroyed during the Revolution, are the marble groups, "Union of the Seine and the Marne," "Huntsman Resting," "Daphne Pursued by Apollo," all now in the Garden of the Tuileries; statues of Julius Cæsar and of Louis XV., in the Louvre; and "Descent from the Cross," in the choir of Notre Dame, one of his best efforts.

COUTANCES, koo'tain's. A town in the Department of La Manche, France, at the confluence of the Soulle and Bulsard, 57½ miles south of Cherbourg by rail (Map: France, E 2). It is built on a conical hill a few miles from the English Channel, and is a picturesque old city. It is the seat of a bishopric, and its cathedral is one of the finest specimens of ecclesiastical architecture in the early Pointed style of Normandy. Other noteworthy features are the Gothic Church of Saint Peter's, the public gardens and museum, and the ruins of an ancient aqueduct. Coutances has manufactures of muslins, lace, yarns, pianos and organs, etc., and a trade in grain. Population, in 1891, 8145; in 1901, 6991. The town is the Constantia of the Romans. For a history and description, consult *Annuaire-guide de Coutances* (Coutances, 1897).

COUTHON, koo'ton', GEORGES (1756-94). A French politician and revolutionary leader, born at Orsay, in Auvergne, December 22, 1756. He practiced law successfully at Clermont, where he acquired great popularity on account of his fine intellectual powers and grave gentleness of character. At first a moderate republican, he was elected to municipal office and later, in 1791, was sent by the electors of Puy-de-Dôme to represent them in the Legislative Assembly. He became more and more radical with the progress of the Revolution, and, though a chronic invalid, he poured forth invectives against royalty and the Church from the tribune. He voted for the death of the French monarch without delay or appeal to the country. Elected to the Convention, Couthon attached himself to Robespierre, was appointed a member of the Committee of Public Safety in 1793, and sent against the insurgent city of Lyons. After the entrance of the Republican army Couthon showed comparative moderation and controlled the soldiery. Only twenty-four of the insurgents were put to death, and though property was ruthlessly destroyed, the lives of the citizens were respected until the arrival of Collot d'Herbois (q.v.). Couthon returned to Paris, formed with Robespierre and Saint Just a supreme tribunal, and made himself conspicuous by his extreme virulence against England. He assisted Robespierre in destroying the partisans of Hébert and Danton, but was himself involved in the ruin which overtook his chief. After a vain attempt at suicide Couthon was borne to the guillotine, July 28, 1794, together with Saint Just and Robespierre. Consult: Mège, *Correspondance de Couthon* (Paris, 1872); Aulard, *Les orateurs de la législative et de la convention* (Paris, 1885-86); Morse-Stephens, *The French Revolution* (New York, 1891).

COUTRAS, koo'tra'. A town in the Department of Gironde, France, on the left bank of the Dronne, 26 miles northeast of Bordeaux. Coutras has a trade in flour, and the district produces red wine. The place is noteworthy on account of the bloody victory gained here in 1587 by Henry of Navarre over the forces of the Catholic League. In this battle the Duc de Joyeuse, commander of the Leaguers, was slain, as well as many other great noblemen on the same side. Population, in 1891, 4231; in 1901, 4062.

COUTTS, koots. See BURDETT-COUTTS.

COUTURE, koo'tur', THOMAS (1815-79). A French painter, born at Senlis, December 21, 1815. He studied under Gros, and after that master's death under Delaroche, without being a follower of either. In 1837 he obtained the Prix de Rome, and in 1845 his picture "The Thirst for Gold" brought him a wide reputation. His "Romans of the Decadence" obtained a first-class medal, and is now in the Louvre. Among his other works are the "Falconer" (1855) and "Damocles" (1872). Under Napoleon III. he became Court painter, but he was not enough of a courtier to please the Emperor, and resigned his position. In 1869 he retired to his estate, Villiers-le-Bel, near Paris, where he died on March 27, 1879. He was neglected in France, but his pictures were purchased by foreigners, especially by Americans. During his last period he painted many portraits, of which there are frequent examples in the museums of southern France. His art grew more symbolical with advancing life. Many of his works, particularly his sketches, are preserved in the Barbiedienne collection in Paris. Consult: Healey, "Couture," in Van Dyke's *Modern French Masters* (New York, 1896); Claretie, *Peintres et sculpteurs contemporains* (Paris, 1873).

COUVADE, koo'vad' (Fr., a brooding, from *couver*, to hatch, from Lat. *cubare*, to lie down). A custom of certain primitive peoples in accordance with which the father of a new-born babe adopts the rôle of invalid while the mother goes about her ordinary occupations. The custom was well developed on both hemispheres. On the authority of Strabo and later writers it was ascribed to the Basques of Europe, a theory which has been much discussed; Tylor regarded it as a survival of a supposed matriarchate into patriarchal society; while Ripley is skeptical as to the present existence of the custom among the Basques. Traces of it are found in Asia and in North America; and it has been well observed in South America by Rodway (*In the Guiana Forest*, 1895). The custom would appear to mark one of the most important steps in human progress, i.e. the transition from maternal organization to paternal organization. Recent researches tend to show that in all primitive society kinship is traced in the maternal line, because paternity is not recognized; that in this stage of civilization the tribal government is avuncular or adelphiarcal rather than matriarcal; and that the recognition of paternity first prepares the way for tracing paternal kinship and its responsibilities, which are sometimes exaggerated ceremonially into such observances as that of the couvade. Consult further: Ripley, *The Races of Europe* (1899); McGee, *The Seri Indians* (17th Rep. Bur. Am. Ethnology); Deniker, *The Races of Man* (1900); Keane, *Ethnol-*

ogy (1896); Ploss, *Das Weib* (1897); etc. See MAN, SCIENCE OF.

COUXIA, kōō'shē-á, or **COUXIO**, kōō'shē-ó. A South American monkey. See SAKI.

COVA'RIANTS. See FORMS.

COVE (AS. *cofa*, chamber, Teel. *kofi*, hut, MHG. *köbe*, Ger. *Koben*, stall). In architecture, a long concave surface usually connecting two planes at right angles, as in coved ceilings; or the surface beneath a projecting story or balcony. The large coves of Italian and French late Renaissance palaces were often elaborately decorated with frescoes and reliefs.

COVENANT (OF. *covenant*, Fr. *covenant*, It. *convenente*, from Lat. *convenire*, to agree, from *com-*, together + *venire*, to come). A term much used in theology in close connection with the Hebrew *berith* of the Old Testament and the Greek *diathēkē* of the New. God is represented as making successively, with Adam, Noah, Abraham, and all Israel, covenants, which are substantially the same covenant, under which Israel is adopted as God's special and chosen people, and is bound to Him in close and mutual obligations. The covenants of the Old Testament are all substantially 'covenants of works,' putting blessing upon the basis of obedience; the one covenant of the New Testament, which replaces the others, conditions blessing upon faith in Jesus Christ. This simple idea was built out and systematized into the Federal Theology during the constructive Protestant period (by Coecejus, 1603-69), and was incorporated in the Westminster Confession. See FEDERAL THEOL-OGY.

COVENANT. In English law, a contract by deed or specialty, that is, one in which the validity of the promise does not depend upon consideration (q.v.) as in the case of simple contracts, but upon the formality of execution of the contract by sealing and delivery. The essential characteristic of covenants distinguishing them from other specialties is the promise. Thus a bond differs from a covenant only in that it is a mere acknowledgment of indebtedness without an express promise to pay the amount of the bond.

The term covenant is also used in a narrower sense to indicate the promise or stipulation contained in a specialty or deed which is incidental to its main purpose, as, for example, the covenants of warranty contained in a deed of conveyance. Although consideration was not required to render a covenant valid and enforceable at law, courts of equity deemed the seal to be presumptive evidence of consideration only, and would not compel the covenantor to perform his promise if it appeared that no consideration was given for it. This is probably the effect of modern statutes, providing that the seal on sealed instruments is only presumptive evidence of consideration.

In general, covenants, from their nature, are required to be expressed in the instrument by which they are created, but in certain exceptional cases they are implied from the character of the instrument itself, as for example the covenants implied in a lease (q.v.).

At common law, the form of action used to recover damages for breach of covenant was also known as covenant. Under modern codes of procedure and practice acts, the action of covenant

has become obsolete, the same office being performed by the various statutory forms of contract action. Covenants contained in the same instrument are said to be *mutual*, *concurrent*, or *dependent*. The covenants in an instrument are said to be *mutual* when performance by each of the parties entering into the covenant is a condition of performance by the other, so that no action for breach of covenant will lie unless the party suing has tendered the performance of his covenant before bringing his action. An *independent covenant* is one which must be performed by the covenantor, irrespective of the performance of the covenantee's covenant in the same instrument.

Real covenants, or covenants which at early common law bound the covenantor's heirs to the extent to which they inherited real estate, are now of slight importance, since all of the property of a deceased person may be subjected to the payment of his debts. See ADMINISTRATION.

Covenants which run with the land is a term that embraces a special class of real covenants which relate to the use of real estate or require the covenantor to do something with reference to it. Their peculiarity is that any subsequent transferee of the real estate is entitled to the benefit of the covenant, and may sue upon it, and that, in certain exceptional instances, when the covenant imposes a burden upon the owner of the real estate, the liability to perform the covenant passes to the transferee of the real estate. This is anomalous. See ASSIGNMENT; EASEMENT.

Covenants for title, or *covenants of warranty*, are particular forms of covenants which run with the land, and are made by the grantor in a deed or instrument conveying real estate. The usual covenants of warranty are: "The covenant of seisin (i.e. that the grantor is seized of the estate which he undertakes to convey); the covenant that the grantor has the right to convey; the covenant for quiet enjoyment (i.e. that the grantor will not interfere with the use or enjoyment of the real estate by his grantee); the covenant for further assurance (i.e. that the grantor will make any further necessary conveyance to perfect his grantee's title); and the covenant of warranty, which binds the covenantee to warrant and defend the title against any one claiming under paramount title or interest in the real estate conveyed.

Formerly the effect of these covenants was to require the covenantor or his heirs to give the grantee other lands in case the title proved to be defective. In modern practice the effect of breach of any covenant for title is to entitle the covenantee or his grantee to recover damages. Covenants for title, however, are not deemed to be broken until the grantee is actually disturbed in his possession. An important effect of covenants for title is to estop the grantor, and all claiming under or through him, from claiming any interest in the title which he has warranted, thus conferring upon his grantee a title by estoppel, as it is said. See ESTOPPEL; WARRANTY.

Covenants to stand seized, formerly of great importance, were covenants by the owner of real estate to hold it to the use of, or in trust for, a relative. This covenant is of little importance in modern law. See USES; TRUST.

The terms 'affirmative,' 'negative,' 'joint,' and 'several' are applied to covenants, but are with-

out peculiar significance in this connection. Consult: Sims, *Treatise on Covenants* (Chicago, 1901); Rawle, *Treatise on the Law of Covenants for Title* (5th ed., Boston, 1887). See BOND; CONTRACT; SPECIALTY; RESTRAINT OF TRADE; etc.; and consult the authorities there referred to.

COVENANTERS. See COVENANTS, TIE; and PRESBYTERIANISM.

COVENANTS, TIE. A term by which the Scottish people denoted association of 'bands' under oath to support each other in times of danger, or to maintain some principle. The most famous ones are the *National Covenant* of 1638, and the *Solemn League and Covenant* of 1643, which are often referred to simply as the Covenant, though they should be clearly distinguished. The *National Covenant* was an agreement signed by all classes in Scotland to resist by force the introduction into Scotland by Charles I. of a modified form of the English *Book of Common Prayer*, and a new body of canons increasing the nominal power of the Scottish bishops. The nobles disliked the increased power of the bishops because they were beginning to look upon them as rivals, and because they feared that Charles would proceed to a recovery of the Church lands; while the commons disliked the Prayer Book, not only because it was English, but also because they looked upon it as a popish innovation. The Covenant was based upon a previous one of 1580, whose object was to maintain the Scottish Presbyterian Church against a Catholic conspiracy, but it added numerous citations of Parliamentary acts bearing upon the subject of religion, and a mutual oath "to labor by all means lawful to recover the purity and liberty of the gospel as it was established and professed before the aforesaid innovations." It became the basis of the Scotch resistance to the King, which culminated in the two Bishops' wars and the termination of Charles's arbitrary rule.

The *Solemn League and Covenant* was an agreement between the English and Scottish Parliaments by which the Scotch came with an army to the assistance of the English Parliament in the war against Charles I., on condition that Presbyterianism should be introduced into England and Ireland. The Parliament accepted the condition somewhat unwillingly, but in view of the Royalist successes in 1643, Scotch aid seemed indispensable. The Covenant was generally signed by the members of the House of Commons and the Assembly of Divines. It was imposed by ordinance upon all persons over eighteen years of age, upon members of the universities, and upon officers and soldiers of the New Model, although the ordinances could not be strictly enforced. It was not only the bond of union between England and Scotland during the war, but was used as a test against the rising Independents, and, as such, encountered lively opposition. The signers took oath to labor for "the preservation of the reformed religion in the Church of Scotland, in doctrine, worship, discipline, and government, . . . the reformation of religion in the kingdoms of England and Ireland, in doctrine, worship, discipline, and government, according to the Word of God, and the example of the best reformed churches," and to endeavor "to bring the churches of God in the three kingdoms to the nearest conjunction and uniformity in religion, confession of faith, form of Church government, direction for worship, and

catechising." Both covenants were abolished at the Restoration, and their adherents severely persecuted. They are printed in Gardiner, *Constitutional Documents of the Puritan Revolution* (London, 1897). Consult, also: Gardiner, *History of England* (London, 1883-84); and id., *Great Civil War*, vol. i. (London, 1886). See PRESBYTERIANISM.

COVENT (kūv'ént) **GARDEN** (properly *Convent Garden*, from having been originally the garden of Westminster Abbey). A square in London, celebrated for its history and for its great market of fruit, vegetables, and flowers. As the kitchen garden of the Westminster monks it was a walled inclosure, which extended from the Strand to Longacre. It came, as a Crown gift, into the possession of the Bedford family in 1552. The square was laid out by Inigo Jones in 1632, and the ancient garden was perpetuated by the continued sale of vegetables. (See COVENT GARDEN MARKET.) In the seventeenth century the neighborhood of Covent Garden was a very fashionable quarter of the town, and frequent allusions are made to the place in plays of Charles II.'s time. It has artistic associations of Marvell, Dryden, Fielding, Steele, Otway, Foote, Garrick, Hogarth, De Quincey, Charles and Mary Lamb, Turner, and other celebrities.

COVENT GARDEN JOURNAL. A short-lived bi-weekly periodical first issued in January, 1752, by Henry Fielding, under the name of 'Sir Alexander Drawensir, Knight of the Censor of Great Britain.' It soon involved Fielding in literary quarrels.

COVENT GARDEN MARKET. A great London vegetable, fruit, and flower market, established in the first half of the seventeenth century by small gardeners from the suburbs. In 1829 the rough sheds were succeeded by a market house, covering about three acres of ground, from designs by Mr. Fowler. In 1859 a flower-market, covered with glass, was built on the south side of the Opera House.

COVENT GARDEN THEATRE. A famous London theatre on Bow Street, the home of grand opera. It was built in 1731 by the harlequin Rich, under a patent from Charles II. to Sir William Davenant, 1662. It has been several times rebuilt. It was burned in 1808, and rebuilt in 1809 at great cost. The increased prices of admission, intended to defray part of the expenses, gave rise to the Old Price Riots. In 1847 it was called the Royal Italian Opera House. On March 4, 1856, it was burned again, and the present structure was erected in 1858.

COVENTRY, kūv'cu-trī (OE. *Coventre*, AS. *cofatrēo*, cove-tree, from *cofa*, cove + *trēo*, tree, or tree of Cofa; popularly etymologized as Convent Town, from the convent established there by Leofrie). A manufacturing city, Parliamentary and municipal borough in Warwickshire, England, on the Sherbourne, 18½ miles east-southeast of Birmingham (Map: England, E 4). It stands on a gentle eminence in a valley, with a ridge of hills on the south, and contains many old houses with timbered fronts projecting into narrow streets, and belonging to the fifteenth and sixteenth centuries. The modern part of Coventry, however, is well, though not regularly, built. Its most interesting public buildings are the three churches composing the 'three tall spires' of Coventry; Saint Michael's, built of red sandstone

in the Perpendicular style, about the fourteenth century, is said to be the largest parish church in England; Trinity Church, another Perpendicular structure, has a spire over 230 feet high; the third of the spires is that of the old Grey Friars' church. Saint Mary's Guildhall, built in 1450, for the united guilds, is one of the finest examples of ornamental architecture in England. Its great hall has a finely carved oaken roof and stained glass window, and is hung with ancient tapestries. The rapid industrial growth of Coventry is responsible for the recent extension of its boundaries and the widening of many of the old streets. The municipality owns its water-supply, on which it nets a substantial annual profit. It also supplies gas and electricity, and maintains public baths, libraries, a technical institute, markets, crematory, and cemeteries. The city has an excellent modern sewerage system, with which is connected a sewage farm. The chief manufactures are ribbons, watches, fringes, etc., and especially bicycles and tricycles, which are said to have been first made here. Coventry is in railway communication with all parts of England. The town sends one member to Parliament. Population, in 1891, 58,500; in 1901, 69,900.

HISTORY. Coventry is a very ancient place. In 1044 Earl Leofric and his wife, Lady Godiva, founded here a magnificent Benedictine monastery. For many years the traditional deed of Godiva (q.v.) was celebrated by a procession. In 1344 the town was incorporated. In the fifteenth century religious mysteries or plays were often acted here by the members of the various guilds before kings. Henry VIII. demolished the beautiful cathedral of Coventry, as well as the ancient walls which formerly surrounded it. Here occurred the famous meeting for the intended trial by battle between the Dukes of Norfolk and Hereford, immortalized in Shakespeare's *Richard II.* Two memorable Parliaments were held in the monastery of Coventry in the fifteenth century. The one contained no lawyers, while the other passed many attainders against the Duke of York, etc. In the fifteenth and sixteenth and seventeenth centuries Coventry was famous for woollens, broadcloths, caps, and blue thread bonnets. Consult: Fretton, "Antiquarian Losses in Coventry," in *Archæological Journal*, vol. xxxvi. (London, 1880); Dormer, *History of Coventry* (New York, 1898).

COVENTRY. A town in Kent County, R. I., 13 miles southwest of Providence; on the Pawtuxet River, and on the New York, New Haven and Hartford Railroad (Map: Rhode Island, B 3). The main industries are agriculture and the manufacture of cotton and woolen goods. The government is administered by town meetings. Coventry, taken from Warwick, and incorporated in 1741, was the home of Gen. Nathanael Greene (q.v.) after 1770. Population, in 1890, 5068; in 1900, 5279.

COVENTRY PLAYS. A set of forty-two plays, combining the 'Morality' and the 'Mystery,' acted during the sixteenth century at Coventry or thereabouts on *Corpus Christi* Day and probably written by the clergy. They were extremely popular and widely attended. The following reference is made to them by the elder Heywood:

"Thys devyll and I were of olde acquaintance,
For oft in the play of Corpus Christi
He hath played the devyll at Coventry."

For further information, consult Morley, *English Writers*, iv. (London, 1887, et seq.).

COVERDALE, MILES (1488-1568). An English Bible translator. He was born at Coverdale, in Yorkshire, was educated at Cambridge, was ordained in 1514 at Norwich, and became the same year an Augustinian at Cambridge. By 1526, however, his religious opinions had so far changed that he left his convent and devoted himself earnestly to the work of the Reformation. Dressed like a secular priest, he preached against confession and image-worship. Shortly after that he went abroad. In 1535 he brought out his first translation of the Bible 'out of Douche (German) and Latyn into Englishe,' with a dedication by himself to Henry VIII. This was the first complete translation of the Bible printed in the English language. The Psalms of this translation are those still used in the Book of Common Prayer. The vexed question as to the printer of the volume has been settled, probably, by recent discoveries in favor of Christopher Froeschouer, the famous Zurich printer. It also seems probable that Jacob Van Meteren, the Antwerp printer, employed Coverdale to make the translation, which was done in Antwerp. The basis was the Zurich Swiss-German Bible and Tyndale's New Testament, along with the Vulgate. It was reprinted in London in 1537, with the royal license. In 1538 Coverdale, with the consent of King Henry VIII., and with the permission of Francis I., went to Paris to superintend another English edition of the Scriptures, his reason for going to Paris being that paper and workmanship were there cheaper and better than in England. The Inquisition, however, notwithstanding the royal license of Francis, interfered, seized the whole impression, consisting of 2500 copies, and condemned them to the flames. But through the cupidity of one of their executive officers, who sold a considerable number of the heretical books to a haberdasher as waste paper, some copies were saved and brought to London, along with the presses, types, etc., which had been employed in printing them. Several of the workmen also came over to London: and Grafton and Whitchurch, the noted printers of that day, were thus enabled to bring out in 1539, under Coverdale's superintendence, the "Great Bible," as it is called on account of its size. Coverdale also in 1540 edited a second edition, commonly called Cramer's Bible, because that prelate wrote a preface to it. From 1540 to 1548 Coverdale was on the Continent. He married in the former year. On his return he became a royal chaplain, and in 1551 was appointed to the see of Exeter, the duties of which office he discharged with great zeal, until the accession of Mary in 1553, when he was ejected and thrown into prison, from which he was only released after a year's confinement, on the earnest intercession of the King of Denmark, whose interest was evoked by his chaplain, Coverdale's brother-in-law, and on the condition that he should leave the country. Coverdale went to Denmark, and subsequently to Westphalia, Deux Ponts, and Geneva. In 1559, after the accession of Elizabeth, he returned to England, but certain notions concerning ecclesiastical ceremonies, imbibed at Geneva, operated against his restoration to the see of Exeter, and his appointment as Bishop of Llandaff. In 1564 he was collated to the rectory of Saint Magnus, London, but, owing to age and infirmities, he resigned

it in 1566, and died about two years afterwards. He was buried February 19, 1568. Coverdale was the author of several tracts designed to promote the Reformation, and made various translations from the works of the Continental Reformers. His works and letters were published with a memoir, by the Parker Society (Cambridge, 1844-46). Consult, also: *Memorials of Myles Coverdale* (London, 1838); F. Fry, *The Bible by Coverdale* (London, 1867).

COVERED WAY, or **COVERT WAY**. A term used in fortification to describe a passage constructed on the side of the ditch toward the enemy. See **FORTIFICATION**.

COVERLY, kŭv'ŕ-li. **SIR ROGER DE**. An old English dance, so called from the tune used during its performance. Neither the author of the tune nor the date of its composition is known, but the editor of the Skene MS. claims the tune as Scotch, on the authority of a MS. dated 1706, and says that north of the Tweed it is known as the "Mautman comes on Monday." The tune is variously called "Old Roger of Coverly for evermore, a Lancashire Hornpipe;" "Roger of Coverly;" "Roger a Coverly," in Gay's opera *Polly*; "Roger de Coverly," in *Robin Hood*; and "Sir Roger de Coverly," in Fielding's *Tom Jones*. A song, "O Brave Roger de Coverly," is contained in *Pills to Purge Melancholy*. The dance is an old-fashioned country-dance (or contredanse), and is known in the United States as the "Virginia reel." Addison took the name for his Sir Roger de Coverley in the *Spectator*.

COVERSED (kŏ-vĕrst') **SINE**. See **TRIGONOMETRY**.

COVERTURE (OF. *coverture*, Fr. *couverture*, covering, from ML. *coaptura*, from Lat. *coopere*, to cover, from *co*, together + *operire*, to cover, for *operire*, Lith. *uch-veriù*, I shut). Under the common law, the legal condition or status of a married woman. By that law, an unmarried woman, whether spinster or widow, is a 'complete juristic person,' having the same standing before the law as a man. Upon marrying, however, i. e. coming under the protection of a man, her legal position is radically altered, and, in many respects, completely merged in that of her husband. This is especially true of her property rights. Her goods and chattels at once become his property. He acquires custody of her claims against others (*choses in action*), and may collect them for his own benefit. Her land passes under his control, and he acquires a joint seisin with her therein and may take the rents and profits to his own use during the continuance of the marriage relation. On the other hand, he becomes liable to pay her debts, those contracted before as well as those contracted after marriage, and under some circumstances he is responsible for her torts and crimes. The modern legislation which has almost restored to the married woman her lost personality will be described under the titles **HUSBAND AND WIFE** and **MARRIED WOMAN**. Consult the authorities referred to under these titles, and also those under **COMMON LAW**.

COVIELLE, kŏ'vyĕl'. In Molière's *Le bourgeois gentilhomme*, Cléonte's valet, whose wit brings about the marriage of Cléonte and Lucille.

COVIELLO, kŏ'vyĕl'ŏ. The clown of old Italian popular comedy.

COVILHÃO, kŏ'velyoun'. A town of Portugal, in the Province of Beira, situated on the southeastern slope of the Serra da Estrella at an altitude of 2180 feet (Map: Portugal, B 2). It is commanded by a castle, and is one of the chief centres of cloth manufacturing in Portugal. Population, in 1890, 17,562; in 1900, 15,527.

COVILLE, FREDERICK VERNON (1867—). An American botanist, born at Preston, N. Y. He received his education at Cornell University and was instructor in botany there from 1887 to 1888. In the latter year he became connected with the United States Department of Agriculture, and after serving five years as assistant in botany, was made curator of the United States National Herbarium. In 1899 he was elected president of the Biological Society of Washington. His publications include a monograph on the *Botany of the Death Valley Expedition* (1893), the author having taken part in the expedition during 1890-91. He also prepared a number of valuable reports.

COVINGTON, kŭv'ing-ton. A city and the county-seat of Newton County, Ga., 40 miles east-southeast of Atlanta; on the Georgia and the Central of Georgia railroads (Map: Georgia, C 2). It contains a female college, and is the commercial centre of a cotton-growing and dairying region. Population, in 1890, 1823; in 1900, 2062.

COVINGTON. A city and the county-seat of Fountain County, Ind., 70 miles west by north of Indianapolis; on the Wabash River, and on the Wabash, the Cleveland, Cincinnati, Chicago and Saint Louis, and other railroads (Map: Indiana, B 2). Population, in 1890, 1891; in 1900, 2213.

COVINGTON. A city and the county-seat of Kenton County, Ky., at the junction of the Ohio and Licking rivers, opposite Cincinnati, of which it is practically a suburb (Map: Kentucky, G 1). It is entered by the Louisville and Nashville, the Kentucky Central, and the Chesapeake and Ohio railroads, and electric railroads also connect it with the neighboring towns. Bridges to Cincinnati and to Newport, Ky., add to the facilities for communication, the great suspension bridge to the former city being a noteworthy specimen of engineering. (See **CINCINNATI**.) Covington occupies an area of about two and one-third square miles on a beautiful plain partly surrounded by hills, and resembles Cincinnati in its general arrangement. Of a total street mileage of about 45 miles, more than three-fourths are paved, the great part with macadam and asphalt. The city has many handsome private residences, a public library, city hall, and a Federal building noteworthy as a specimen of modern Gothic; and among charitable institutions, a hospital for contagious diseases, a German orphan asylum, and a home for aged men and women. Covington is a prominent centre of Roman Catholic influence, the cathedral, a type of flamboyant Gothic, being one of the finest ecclesiastical structures in the State. Connected with this denomination there are also a Benedictine priory, a convent, a hospital and founding asylum, and Notre Dame Academy. The facilities for transportation, both by rail and by water, placing the city in communication with a wide territory possessing valuable natural advantages, have contributed to the commercial

importance of Covington, though it is overshadowed by its greater neighbor. Its industrial interests also are important, and include extensive pork-packing establishments, rolling-mills, glass-factories, distilleries, tanneries, tobacco-factories, cotton-factory, and manufactures of vinegar, furniture, stoves, tinware, bricks, tile, pottery, rope, cordage, etc. There are municipal water-works, built in 1869 at a total cost of about \$1,200,000, the entire system now including some 45 miles of mains, and furnishing an abundant supply of water drawn from the Ohio River at a distance of about 13 miles above the city. Covington's annual budget approximates \$465,000, the main items of expense being \$90,000 for schools, \$85,000 for interest on debt, \$35,000 for police department, \$35,000 for the fire department, \$30,000 for street expenditures, \$30,000 for the water-works, and \$20,000 for charitable institutions. Settled in 1812 and laid out three years later, Covington was chartered as a city in 1834. Population, in 1860, 16,471; in 1880, 29,720; in 1890, 37,371; in 1900, 42,938.

COVINGTON. A town and the county-seat of Tipton County, Tenn., 37 miles northeast of Memphis; on the Illinois Central Railroad (Map: Tennessee, B 5). It is the shipping point for the cotton and other products of a fertile region, and has also flour and saw mills, cotton and cottonseed-oil mills, cotton-compress, etc. Population, in 1890, 1067; in 1900, 2787.

COVODE, JOHN (1808-71). An American legislator, born in Westmoreland County, Pa. He worked for several years on a farm; was apprenticed to a blacksmith; and afterwards attained considerable wealth as a woolen manufacturer. He served for two terms in the Pennsylvania Legislature, and was a member of Congress, first as an Anti-Masonic Whig and then as a Republican, from 1855 to 1863, and again from 1868 to 1870. In politics he was prominent as a supporter of Lincoln and as an opponent of Johnson, but is chiefly remembered for his connection as chairman with the special Congressional committee appointed in 1860 to investigate the charges brought against President Buchanan. See COVODE INVESTIGATION.

COVODE INVESTIGATION. An investigation (1860) by a Congressional committee of five, headed by Covode of Pennsylvania, into the charge made by two anti-Lecompton Democrats that the Administration had endeavored to persuade them corruptly to support the Lecompton Bill. (See LECOMPTON CONSTITUTION.) President Buchanan vigorously protested against the appointment of a committee for such a purpose, on the ground that it would detract from the dignity and independence of the executive office, but his protests were unheeded, and in June the committee made its report, the Republican majority supporting the charge and the Democratic minority denouncing it. The committee, however, was considered to have brought forward sufficient evidence to prove Buchanan's favoritism and his questionable use of patronage. The report was printed in a bulky volume. For a defense of Buchanan, consult Curtis, *Life of Buchanan* (New York, 1883).

COW. See CATTLE; DAIRYING.

COWAGE, COWHAGE, or COWITCH (from Hind. *Kawānch*, *Kōānch*). Short, slender,

brittle hairs, which grow on the outside of the pods of plants of the genus *Mucuna*, natives of the tropical parts of America and Asia. The genus belongs to the natural order Leguminosae and has a knotted, two-valved pod, divided by transverse partitions. The species are twining plants, shrubby or herbaceous, with leaves of three leaflets. That which yields most of the cowage brought to market is *Mucuna pruriens*, a native of the East Indies, with racemes of fine purple flowers, which have a disagreeable alliaceous smell, and pods about 4 inches long. *Mucuna urens*, the ox-eye bean of the West Indies, yields cowage of similar quality. The hairs readily stick in the skin, and cause intolerable itching. Cowage is sometimes used in medicine, acting mechanically in killing and expelling worms, particularly the species of *Ascaris* (q.v.). That it does not act on the inner surface of the intestinal canal is supposed to be owing to the mucous secretion. It is generally administered in syrup or honey. Before the pods of cowage-plants are ripe, they are used as a vegetable, like kidney beans, and are very palatable. *Mucuna nitilis*, velvet bean, is by some considered specifically the same as *Mucuna pruriens*, but velvet-bean pods are without the stinging hair of the other. The velvet bean has lately attracted much attention as a forage crop. It is well adapted to Florida and the Gulf States, having about the same value as the better varieties of cow-peas. As a green manure and mulch crop for orchards it is highly considered.

COW BAY. A seaport on an inlet of the same name in the northeast of Cape Breton Isle, Nova Scotia, Canada, 22 miles east of Sydney (Map: Nova Scotia, K 3). A Government breakwater and quay 1800 feet long protect the inlet. Bituminous-coal mines are worked in the vicinity. Estimated population, in 1901, 3000.

COWBIRD. A small North American blackbird (*Molothrus ater*) closely related to the redwing, remarkable for its parasitic habits, and frequenting in small flocks fields where cattle pasture, often alighting upon them to eat parasites, or clustering about their feet to snap up the insects disturbed by their movements; to this habit it owes its names, cow-blackbird, cowpen-bird or bunting, buffalo-bird, etc. This common species (see Plate of BLACKBIRDS) is about 8 inches long; the adult male is rich glossy black, with greenish reflections, except the head, which is chocolate-brown; the female and young are simply brownish-gray, paler beneath. The cowbird is found throughout the United States, from Texas northward nearly to Hudson Bay. In the north it is migratory, but south of the Ohio it is a permanent resident. It is to be seen in small bands frequenting fields and pastures, where its principal food is vegetable (mainly seeds of weeds), with insects caught upon the ground and about cattle. There are usually several more males than females in each band, for these birds do not pair; and the antics and spluttering and guttural squeaks with which the males try to attract the females are most queer and amusing. In the autumn they gather in large flocks and associate with other blackbirds. Two other species are found in the southwestern United States, a third and fourth in Mexico and Central America (of the allied genus *Colaptes*), and several in various parts of South America.

The *parasitism of the cowbirds* is their most striking characteristic, their behavior resembling that of the European cuckoo. None, except one, takes a mate, or makes a nest, or incubates its eggs. • Instead of this, when the breeding season (May and June) is at hand, the female ready to lay an egg quietly leaves the flock and stealthily seeks the home of some bird, from which the mother is temporarily absent, incubation not having begun. There she deposits her egg (see Colored Plate of Eggs of Song-Birds), to which she pays no more attention. It matters not whether the nest she visits has already its full supply of eggs, or even whether it already contains one or several eggs of her own species; she will sometimes throw out eggs of the owner to make room for her own. The egg of the cowbird usually hatches in less time than do the eggs of the bird on which it is imposed, whereupon the rightful eggs may be abandoned or thrown out; or, if some of them hatch, the young are speedily starved or smothered or elbowed out of the nest, while the foster-parents devote themselves to the care of the greedy stranger. He remains in the nest until it is really outgrown, but even after he has left it he is cared for, for a time, by the birds that brought him up. But at last, when well able to fly, he seeks out others of his own kind, and the birds that have devoted themselves to him so assiduously have nothing to reward their pains. Over 100 species of birds are thus burdened with more or less frequency; but some will desert the nest rather than incubate the strange egg; others build a second story on the nest, leaving the cowbird's egg to perish below, while they raise their own brood in the superstructure.

The egg of the cowbird is a rather blunt oval, measuring, on the average, .84 by .65 of an inch, and is white or grayish, profusely speckled with browns, the general effect of which is indistinct and pale; it is not easily mistaken for any other bird's egg of its size. Several species of cowbirds inhabit Central and South America, and have similar habits, except in one instance, the bay-winged cowbird (*Molothrus badius*) of Argentina and Bolivia, which differs from the ordinary type in several ways, among others in having a low and pleasing song, which it delivers more or less all the year around. It does not abandon its eggs to the care of other nurses, but forms conjugal ties and occasionally makes a nest of its own; more often, however, it seizes upon the nests of other birds, and in their despoiled property lays its eggs and rears its own young. A circumstantial history of this interesting group and a discussion of bird-parasitism may be found in Selater and Hudson, *Argentine Ornithology* (London, 1888-89), largely reprinted by Bendire, in "The Cowbirds," in *Report of the National Museum for 1893* (illustrated, Washington, 1895).

COWBOYS. (1) The name applied during the Revolutionary War to robbers, usually of cattle, sometimes of other property, who infested the roads east of the Hudson River between the British and American lines. They professed to be Tories. A similar band, professing to be Whigs, called 'Skinners,' plundered wayfarers at the same period and in the same places. See Cooper's romance *The Spy*.

(2) The name given to the mounted herdsmen hired by the owners of large herds of cat-

tle to look after their stock. In the great herding districts of the West, where cattle roam over vast areas without fences or roads, and with only scattered and irregular places for water and shelter, the cowboys occupy an important place. It is their business to keep the cattle together, to guide them to pasture, to prevent their being mixed with other droves, to protect them from Indian and other thieves, to brand them at the proper seasons, and to drive them to market when they are ready for slaughter.

COWELL, EDWARD BYLES (1826-1903). An English Sanskrit scholar. Born at Ipswich, he was educated at Oxford. He went to Calcutta in 1856, where he was professor of history in the Presidency College, and later principal of the Sanskrit College. In 1867 he was made professor of Sanskrit in the University of Cambridge. His contributions to advancing the knowledge of India were made not only through his writings, but also through the inspiration he gave to his pupils, whose numbers were large. His association with Edward FitzGerald of Omar Khayyam fame is of interest in English literary history. Among Cowell's more important works may be mentioned: *The Prākṛit Grammar of Vararuci* (2d ed. 1868); *The Black Yajur Veda*, books i. ii., in collaboration with Roer (1856-64); the *Kusumāñjali* (1864); *The Hindu Law* (1871); *The Hindu Digest* (1873); *The Aphorisms of Śāṅḍilya*, translated from the Sanskrit (1878); *The Sarva-darsāna-Saṅgraha*, translated from the Sanskrit, conjointly with Gough (1882); *The Buddha-Carita of Aśvaghoṣa*, in Sanskrit and English (1892-94).

COWEN, kou'en, FREDERIC HYMEN (1852—). An English musician, born at Kingstons, Jamaica. His parents took him to London when four years old, and while still a child he became a pupil of Benedict and Goss in that city. In 1865 he went to Leipzig, where he studied under Hauptmann, Moseheles, Reinecke, Richter, and Plaidd. In 1882 he became director of the Edinburgh Academy of Music, and in 1887 succeeded Sir Arthur Sullivan as conductor of the London Philharmonic. He was musical director of the Melbourne Centennial Exhibition (1888-89), and in 1896 was chosen conductor of the Liverpool Philharmonic and of the Manchester Concerts. His compositions include many songs, instrumental pieces, six symphonies, the operas *Pauline* (1876), *Thorgrim* (1890), *Signa* (1893), and *Harold, or the Norman Conquest* (1895), two oratorios, *The Deluge* (1878), and *Ruth* (1887), and a number of cantatas, of which the best known is *The Corsair* (1876).

COWES, kouz. A seaport and watering-place on the north coast of the Isle of Wight (Map: England, E 6). It consists of East and West Cowes, lying on opposite sides of the Medina. West Cowes is the more important of the two divisions, being the headquarters of the Royal Yacht Squadron, whose club has been located since 1856 in an old castle built by Henry VIII. Over two thousand of the pick of English sailors are employed as crews of the numerous yachts of the members. Several regattas are held annually, the principal in August, attracting crowds of visitors. Near East Cowes are several fine country seats, Whippingham Church, and Osborne House, the former royal seaside residence of Queen Victoria, now, with its grounds, a

public memorial and park, donated to the nation by Edward VII. Cowes is famous for its yacht-building yards, and has a considerable trade as the port of the island. Population, in 1891, 11,000; in 1901, 9000.

COWFISH (so named from the shape of its head). (1) A trunkfish (*Ostracium quadricorne*) of the tropical Atlantic, vari-colored in bright hues, and also called cinkold. (See **COWPILOT** and **PLATE OF PLECTOGNATH FISHES**.) (2) A grampus. (3) A cow-shark (q.v.).

COWGATE, THE. A well-known street in the Old Town, Edinburgh. It was once a fashionable place of residence, but is now given over to the poorer classes.

COWHAGE. See **COWAGE**.

COWHEEN. The local name in eastern Canada of the long-tailed duck (*Clangula hyemalis*), or old-squaw (q.v.).

COWITCH. See **COWAGE**.

COWL (AS. *cūle*, *cūhle*, *cugle*, Icel. *kúfl*, OHG. *cuglā*, Ger. *Kugel*, *Kogel*, OF. *coule*, It. *cuculla*, *cocolla*, from Lat. *cucullus*, cap). A hood generally attached to a loose cloak and worn on the head. It was common in England in the Middle Ages, but has come to be used chiefly by monks or members of some religious order, such as the Benedictines and Franciscans. See **COSTUME**, **ECCLESIASTICAL**.

COWLES, kōlz. WILLIAM LYMAN (1856—). An American scholar and educator, born at Belchertown, Mass. He graduated at Amherst College in 1878, was instructor in Latin there from 1880 to 1883, in 1883-84 studied at the universities of Berlin, Göttingen, and Leipzig, and in 1884 became associate-professor of Latin at Amherst. In 1894 he was appointed to a full professorship. From 1886 to 1894 he was lecturer in Latin literature at Smith College, where he was also acting professor of Latin in 1899-1900. He was elected a member of the American Philological Association and of the managing committee of the American School of Classical Studies at Rome, and in the study of classical archaeology has traveled extensively throughout the Italian peninsula. His publications include, besides many articles for periodicals, an excellent annotated edition of the *Adelphi* of Terence (1896; in Peck and Pease's Students' Series of Latin Classics), and *Selections from Catullus* (1900; with notes).

COWLEY, kou'li, ABRAHAM (1618-67). An English poet and essayist. He was born in London, and was educated at Westminster School and Trinity College, Cambridge. According to his own statement, he received his poetical inspiration from Spenser's *Faerie Queene*, a copy of which lay in his mother's parlor. A volume of poems, entitled *Poetical Blossoms*, was published by him at the age of fifteen, and one of the pieces contained therein was written when he was only ten years old. At Cambridge he obtained distinction for the elegance of his translations; and while there he composed the greater part of the *Davidis*, an epic in four books on the life of David—a work which he never completed. He was attached to the Court party, and, in consequence, was ejected from his college in 1643, after he had taken his degree of M.A. In 1646 he followed the Queen to Paris, where he remained ten years; and on his return to England,

being under suspicion, he was seized and bound in heavy securities for his future behavior. In the same year (1656) he published an important collection of his poems, including his elegies on Harvey and Crashaw, Pindaric odes, *The Mistress*, and the *Davidis*. He now studied medicine, receiving his degree the following year. After the Restoration he obtained a lease of the Queen's lands at Chertsey, in Surrey, whither he retired in 1665. He was buried in Westminster Abbey, near Chaucer and Spenser. Cowley belongs to what Dr. Johnson called the 'metaphysical' school of poets. He abounds in subtleties of thought and expression, enjoyed in his own day, but long since out of fashion. To us his fanciful love poems, displaying no emotion, seem very strange. Of his longer poems, the elegies cited above are the best. His most natural verse is scattered through his essays, which are graceful and beautiful. Consult: Johnson's essay in *Lives of the Poets*; and *Complete Works*, ed. Grosart (Blackburn, 1880-81).

COWLEY, HANNAH (1743-1809). An English poet and playwright. She was born at Tiverton, Devonshire, where her father, Philip Parkhouse, was a bookseller. It was not until several years after her marriage to Mr. Cowley, a captain in the East Indian service, that she began to write plays. Her first production, *The Runaways*, she wrote in less than a fortnight. It was presented by Garrick at the Drury Lane (May 10, 1779), and was instantly successful. Her other comedies include: *Who's the Dupe?* (Drury Lane, 1779); *The Belle's Stratagem*, which is still popular (Covent Garden, 1780); *Which Is the Man?* (Covent Garden, 1782); and *More Ways than One* (Covent Garden, 1783).

COWLEY, HENRY RICHARD CHARLES WELLESLEY, first Earl (1804-84). An English diplomatist. He was an attaché at Vienna in 1824, and was afterwards successively promoted to be secretary to the legation at Stuttgart, and to the embassy at Constantinople. He then acted as minister plenipotentiary to Switzerland (1848), and to the Germanic Confederation in 1851, and in the following year succeeded the Marquis of Normanby as ambassador at Paris. In this position he displayed eminent qualifications; and he held the appointment, whether his party was in or out of office, till 1867, when he resigned. With the Earl of Clarendon he represented Great Britain at the Paris Congress of 1856. He was created Viscount Dangan and Earl Cowley in 1857.

COW-PARSNIP (*Heracleum*). A genus of plants of the natural order Umbelliferae. One species, *Heracleum spondylium*, is a native of Great Britain, the common cow-parnsnip, or hogweed, called *kiesh* in Scotland; a common and rank weed, with coarsely hairy leaves, and stem about three to five feet high. It is gathered in some parts of England for fattening hogs, and is said to afford wholesome food for cattle. Some Siberian species are much larger, and have been recommended for cultivation on account of the great quantity of herbage which they yield very early in the season, particularly *Heracleum panaces*, which sometimes attains a height of ten feet, and whose root leaves are three to five feet long. *Heracleum lanatum*, a tall, stout, woolly perennial with grooved stems, and large compound leaves, is known as cow-parnsnip in the United States and Canada, being quite widely

distributed. In Alaska the leafstalks are peeled and eaten. It is there sometimes called wild celery. The stalks when drying exude a sweet substance, and they are said to be fermented and a liquor distilled from them in Siberia.

COWPEA (*Vigna catjang*). A leguminous plant indigenous to southeastern Asia, the Malay Archipelago, and parts of Central Africa. Its culture for human food and as a forage plant has spread to most tropical and sub-tropical countries. It was introduced into the United States early in the eighteenth century. At present it is a very common forage crop in the South, and is also grown to some extent in the Northern States. The plant is really a bean, and is closely related to the garden beans, such as the lima, the haricot, and others. The tendency of the cowpea to vary in habit of growth, color of leaf, stem, and pod, and in the shape and color of the seed gives rise to numerous varieties. (For illustration, see Plate of LEGUMES.) In the southern United States it grows as a vine with a rather long period of growth, but when grown in the Northern States it becomes a bush form and shortens its growing period. In addition to being a very important forage plant, it is especially valuable as a soil renovator, having the power of gathering the free nitrogen of the air in common with the clovers (q.v.).

Food and Feeding Value.—The green fodder has the following average percentage composition: Water, 83.6; protein, 2.4; fat, 0.4; nitrogen-free extract, 7.1; crude fibre, 4.8; and ash, 1.7; the cowpea hay the following: Water, 10.7; protein, 16.6; fat, 2.9; nitrogen-free extract, 42.2; crude fibre, 20.1, and ash, 7.5. The silage resembles the green crop in composition, containing some 80 per cent. of water, 3 per cent. of protein, and 8 per cent. of nitrogen-free extract, in addition to small amounts of the other constituents. Young pigs thrive on the cowpea forage and well-filled pods, and it is a custom to turn them into the fields planted for green manuring, about the time the first pods are ripening. An acre will pasture fifteen or twenty pigs for several weeks. The manure more than compensates for the vines eaten. Turkeys and chickens eat the ripe peas and do well on them. Cattle, sheep, and horses are sometimes pastured on cowpea, but the safest and most economical method is to cut or pull the vines and feed them partially wilted. Cattle and sheep are liable to bloat if they are allowed to eat too ravenously of cowpea vines, as is the case with other succulent crops. Cowpea hay compares favorably with other leguminous hays in digestibility; 59 per cent. of the total dry matter, 65 per cent. of the protein, 71 per cent. of the nitrogen-free extract, and 42 per cent. of the crude fibre being digested on an average. Like other leguminous seeds, the cowpea seed is rich in protein. It contains on an average: Water, 14.8; protein, 20.8; fat, 1.4; nitrogen-free extract, 55.7; crude fibre, 4.1; and ash, 3.2 per cent. Cowpeas, whole or ground, are sometimes fed to farm animals, but it is usual to harvest only enough for seed. As a food for man, cowpeas are much relished. In season, they are often gathered before the pods begin to change color and before they become dry. The shelled peas are then cooked in the same way as shell-beans or garden peas. For winter use the dry cowpeas are cooked like other dry beans, and have a very agreeable flavor. The plant is injured by a weevil (*Bruchis*

chinensis), to be recognized by two elevated, ivory-like lobes on the thorax; and by the September brood of the boll-worm (q.v.).

COWPEN. A town in Northumberland, England, on the south shore of the Blyth Estuary, 6½ miles east-southeast of Morpeth (Map: England, E 1). The town owns its markets and water-works. Its industries are connected with collieries and domestic manufactures. Population, in 1891, 13,000; in 1901, 17,800.

COWPENS. A town in Spartanburg County, S. C., noted chiefly for the battle which took place there on January 17, 1781, between 1100 British under Colonel Tarleton and 1000 Americans under General Morgan. This engagement, sometimes called the 'Bennington of the South,' for its decisiveness, was won for the Americans, partly by the rashness of the impetuous Tarleton, but especially by the daring position assumed by the American commander and the tactical skill he displayed in defending it. Losses—British, 800 killed, wounded, and captured; American, 12 killed, 60 wounded.

COWPER, kōō'pēr or kou'pēr, FRANCIS THOMAS DE GREY, Earl (1834—). An English statesman. He was educated at Christ Church, Oxford, and succeeded to the hereditary title in 1856. He was Lord Lieutenant of Ireland from 1880 to 1882, when he was succeeded by Lord Spencer, and proved a most able administrator during the critical period of the Land League. His antagonism to the Home Rule policy of Mr. Gladstone is well known. He was one of the founders of the Unionist party, and presided as chairman at the so-called 'Opera House Meeting.' Upon the installation of Lord Salisbury, he was appointed chairman of the commission in the Irish Land Act of October, 1881. He was also a member of the Gresham University Commission of 1892.

COWPER, WILLIAM, Earl (c.1664-1723). An English judge and the first Lord Chancellor of Great Britain. He was called to the bar in 1688 and was made King's Counsel in 1694. In the following year he entered Parliament, where he became known as an excellent debater, and was made lord keeper of the great seal. In 1706 he was made a peer, and was one of the commissioners to negotiate the union of Scotland with England. In 1707 he was made Lord Chancellor, in 1716 Lord High Steward, and in 1718 became an earl.

COWPER, WILLIAM (1666-1709). An English surgeon, born at Petersfield in Sussex. He was made a barber-surgeon in 1691, and became known not only as a skillful practitioner, but also as a thorough anatomist and pathologist. Among his permanent contributions to anatomical science, the discovery of the now so-called Cowper's glands (q.v.) will preserve his name. In 1696 he was made a fellow of the Royal Society. His published works include the following: *Myotomia Reformata* (1694; 2d ed., revised by Jurin, Pemberton, and Tanner, 1724); *The Anatomy of Human Bodies* (1698; 2d ed. 1737); *Glandularum Quarundam nuper Detectarum Ductuumque earum Excretionum Descriptio cum Figuris* (1702).

COWPER, WILLIAM (1731-1800). An English poet, son of John Cowper, D.D. He was born at his father's rectory, at Great Berkhamstead, Hertfordshire. Losing his mother when

he was only six years old, Cowper, who was naturally a delicate and sensitive child, became, as a boy, very deeply melancholy and depressed. Just after his mother's death he was placed in the school of a Dr. Pitman, in Market street, Hertfordshire. Removed because of cruel treatment by another boy, he was sent, at the age of ten, to Westminster School. The period he spent here was very miserable, and laid the foundation of that settled gloom which oppressed him till death. It is to the remembrance of these wretched days that we are indebted for the fierce invective that burns in the *Tirocinium, or a Review of Schools* (1784). Shortly after leaving Westminster, Cowper was articled to a Mr. Chapman, an attorney in London. Upon leaving Chapman's office he entered the Middle Temple. In 1754 he was called to the bar, but never practiced. His father died in 1756, and left him a small patrimony. In 1759 he removed to the Inner Temple, but his hatred of the law was so great that he seldom opened a book that bore on his profession. Yet he was industrious enough; he scribbled poetry, read Homer, and, in conjunction with his brother, translated some of the books of Voltaire's *Henriade*. In 1763 his cousin Major Cowper offered him the office of clerk of the journals of the House of Lords, which he accepted, but having to undergo an examination at the bar of the House, he was seized with nervousness, and could not appear. He even attempted suicide, but fortunately failed for want of courage. In December, 1763, he was removed to the private asylum of Dr. Cotton at Saint Albans, a prey to the deepest remorse. After his removal from Saint Albans (1765) he went to reside in the town of Huntingdon. Here he met Mrs. Unwin—the Mary of his poems—an acquaintance which ripened into the deepest friendship, and continued till death. After a few months in lodgings he resided with the Unwins, and enjoyed much tranquil happiness under that religious roof. Soon after the death of Mr. Unwin (1767) Mrs. Unwin and Cowper removed to Olney in Buckinghamshire. Here Cowper's malady returned. At this time he was engaged to marry Mrs. Unwin. She carefully tended him through his long and slow recovery. He found amusement in gardening, writing playful poems, and in building the famous summer house. Mrs. Unwin also suggested, as a subject suited to his genius, *The Progress of Error*. During the winter of 1780-81 he wrote *Truth, Table Talk, The Progress of Error, and Expostulation*, published in 1782. In 1781 Cowper made the acquaintance of Lady Austen, who suggested to him *The Task*, urged him to translate Homer, and—what the world is perhaps still more grateful for—she related to him the history of John Gilpin. *The Task* was begun in the summer of 1783, and published in 1785. Its success was great, and Cowper began to be considered the first poet of his day. In 1784 he began the translation of Homer, which appeared in 1791. It was received with great applause. Though Cowper wrote after this the beautiful and tender poem *To Mary*, his powers rapidly declined. He died at East Dereham, Norfolk. The centenary of his death was appropriately observed at Olney. Cowper's poetry is eminently healthy, natural, and unaffected. He and Burns brought back nature to English poetry. Besides being a poet, he was perhaps the most delightful letter-writer in the

English language. Nothing can surpass the charm of his epistles—full of humor, gentle sarcasm, anecdote, acute remark, and a tender shadow of melancholy thrown over and toning down the whole. The standard edition of Cowper's works is Southey's (15 vols., London, 1834-37, reprinted in Bohn's Library). Consult, also: *The Globe Edition of Poetical Works*, ed. Benham (London, 1870); the Aldine Edition, by Bruce (London, 1896); *The Unpublished and Uncollected Poems*, ed. Wright (London, 1900); and the lives of Cowper, by G. Smith (London, 1880) and by Wright (London, 1892).

COWPER'S GLANDS (discovered by the English anatomist William Cowper). Two small yellow glands, which are situated beneath the anterior portion of the membranous urethra in the male. The glands are of the racemose variety (see GLANDS), each one being made up of a number of small lobes, which are again subdivided into lobules. The acini are lined with low cuboidal epithelium, of the clear mucous type. The gland secretes mucus, which is carried by a small duct to the posterior part of the bulbous urethra. The vulvo-vaginal glands, or glands of Bartholin of the female, are the analogues of Cowper's glands.

COW-PILOT. A small fish (*Pomacentris saxatilis*) so called in Bermuda because it is believed always to accompany the cowfish (*Ostracium*). It is one of the demoiselles, and is also called 'mojarra.'

COW-POX. See VACCINATION; also SMALL-POX.

COWRY (Hind. *kauri*, Beng. *kari*, from Skt. *kapardikā*, shell). A gastropod mollusk of the family Cypræidæ, whose shells are shaped somewhat like coffee-beans, richly enameled and often beautifully marked. They are most abundant and attain their largest size in the seas of warm climates. The money cowry (*Cypræa moneta*) has long been in general use as a substitute for coin in many parts of Asia and Africa. It is yellow, or white, about an inch long, and nearly as broad; is found on the Indian coasts, and in particular abundance on those of the Maldive

A LIVING COWRY.

The animal is shown in the attitude of creeping (toward the left). The mantle is, however, withdrawn somewhat, revealing the normally clothed and protected shell. The short siphons and long tentacles appear, the last bearing the eyes, one of which appears as a black dot.

Islands, and has been one of their principal exports. In Bengal 3200 cowries were reckoned (in 1900) equal to a rupee, so that a cowry was then about equal in value to $\frac{2}{2500}$ of a cent. Yet cowries to the value of 200,000 rupees are said to have been at one time imported annually into Bengal. Many tons of cowries are annually used in trade with west-central Africa, but their circulation is fast disappearing. Consult Stearns, "Ethno-conchology: A Study of Primitive

Money," in *Smithsonian Reports for 1897*, pt. ii. (Washington, 1889). See SHELL-MONEY; also Colored Plate of MARINE GASTROPODS.

COW SHARK. A large shark of the tropical family Hexanchidae.

COWSLIP (AS. *cūslippe*, *cūstoppe*, from *cū*, cow + *slyppe*, *sloppc*, sloppy droppings, from *slūpan*, to dissolve, Engl. *slop*; alluding to the pastures where it is usually found; according to a euphemistic popular etymology *cow's-lip*) (*Primula officinalis* or *Primula vulgaris*). A common native of pastures in Europe; a delicate and modest little flower, a universal favorite, both for its beauty and its fragrance. (For illustration, see Plate of CRANBERRY, ETC.) The flowers have sedative properties, and are sometimes used as an anodyne and anti-spasmodic. They are fermented with sugar to make cowslip wine, an agreeable and favorite soporific domestic medicine. The name American cowslip, or shooting-star, is given to *Dodecatheon media*, a perennial plant, also of the natural order Primulaceæ, a native of North America, with a stalk about eight inches high, bearing an umbel of gracefully pendant lilac, rose-color, or white flowers, the petals reflexed over the calyx, the stamens and pistil long, and the anthers of a golden color. It is very ornamental in the flower-border, resembling a eyelamen. There are a dozen or more additional species and numerous varieties in the United States. See PRIMULA.

COX, DAVID (1783-1859). An English painter in water-colors and oils, the greatest English water-colorist. He was born at Deritend, near Birmingham, April 29, 1783, the son of a blacksmith. He studied drawing under Joseph Barber, of Birmingham, and water-color under John Varley in London. He was at first a scene-painter in theatres, and for a long time supported himself by teaching drawing, until at length there came patronage sufficient for his moderate desires. In 1805 he traveled in Wales, the scenery of which from this time became the favorite subject of his paintings. In 1813 he was made a member of the Society of Painters and Water-Colorists, and in 1814 he published his *Treatise on Landscape Painting and Effect in Water-Colors*. He did not begin the study of oil-painting until his fifty-sixth year, under Müller in London, but he attained great proficiency. Indeed, there is reason to believe that had he practiced it from the beginning he might have equaled Constable. In 1841 he retired to Harbourne, near Birmingham, where he resided until his death on June 7, 1859. Cox is certainly the most important of the successors of Constable. His work is bold and aims at a general effect, disregarding small and conflicting details. His colors are those of nature, pure, fresh, and rich, and he handles light with consummate skill. His treatment of atmosphere and atmospheric mood is of the highest order. His small productions are usually better than the larger. He is the great painter of Welsh scenery, of which he was particularly fond. The British Museum and the South Kensington Museum possess some of his drawings, but the best of his work is in private possession. Several general exhibitions of his work have been held, the best of which was that of Manchester in 1887. Among his best water-colors are the "Hay Field" (1843), "Bolton Abbey" (1847), and the "Welsh Funeral"

(1850); among his oils, the "Vale of Clwyd" and "Peace and War." His son DAVID COX, the younger (1809-85), was also a water-colorist of repute, but not of the same ability as his father. Consult: Hall, *Biography of David Cox* (London, 1881); Solly, *Memoir of David Cox* (London, 1875).

COX, Sir GEORGE WILLIAM (1827—). A British divine and scholar. He was born at Benares, India, but was taken to England when eight years old. He studied at Rugby and Oxford; took orders; was appointed curate of Salcombe Regis, near Sidmouth; and later was rector of Scrayingham, York, from 1881 to 1897, when he resigned with a pension from the Civil List. He is a leading exponent of the sun-myth theory in comparative mythology, and has published *Poems Legendary and Historical* (1850); *Life of Saint Boniface* (1853); *Mythology of the Aryan Nations* (1870); *History of Greece* (1874); *The Crusades* (1874); *The Athenian Empire* (1876); *British Rule in India* (1881); *Life of Bishop Colenso* (1888); and *The Church of England and the Teaching of Bishop Colenso* (1888). In 1891 he was chosen Bishop of Natal by the friends of Bishop Colenso (q.v.), but was refused consecration by the archbishops and bishops of England.

COX, JACOB DOLSON (1828-1900). An American soldier, politician, educator, and military historian. He was born in Montreal, Canada, was taken by his parents to New York City in 1829, graduated at Oberlin College in 1851, taught school at Warren, Ohio, in 1852, and there in the following year began the practice of law. From 1859 to 1861 he was a member of the State Senate, and in April, 1861, upon the outbreak of the Civil War, was appointed brigadier-general of Ohio volunteers. He took a prominent part in the Kanawha Valley campaign under McClellan in the summer of 1861; commanded the Ninth Corps of the Army of the Potomac in the battles of South Mountain and Antietam in 1862; commanded the Federal forces in West Virginia in the winter of 1862-63 and the military district of Ohio from April to December, 1863; was in command of the Twenty-third Army Corps during General Sherman's Atlanta campaign and the Franklin and Nashville campaign; was commissioned major-general of volunteers in December, 1864; and early in 1865 was sent to North Carolina to open communications with General Sherman, with whom he effected a junction at Goldsboro soon afterwards. In 1866 he resigned from the service. After the close of the war he served as Governor of Ohio in 1866 and 1867, attracting attention by his opposition to the policy of his party (the Republican) on the question of negro suffrage; and from March, 1869, until December, 1870, when he resigned, was Secretary of the Interior in the Cabinet of President Grant. He then again practiced law, was president of the Wabash Railroad for several years, was a Republican member of Congress from 1877 to 1879, was dean of the Cincinnati Law School from 1881 to 1897, and for a short time after 1885 was also president of the University of Cincinnati. He wrote many magazine articles, mostly on subjects connected with the Civil War and with microscopy, in which he attained considerable eminence, and published the following valuable works on the

military history of the Civil War: *Atlanta* (1882); *The March to the Sea: Franklin and Nashville* (1882); *The Second Battle of Bull Run as Connected with the Fitz-John Porter Case* (1882); and *The Battle of Franklin* (1879). His *Military Reminiscences of the Civil War* (2 vols.) were published posthumously in 1900.

COX, KENYON (1856—). An American painter. He was born in Warren, Ohio, October 27, 1856. He studied in Cincinnati and Philadelphia, and at the age of twenty-one went to Paris, where he remained seven years, under the instruction principally of Carolus Duran and Gérôme. On his return to America he became a member of the Society of American Artists in New York. The portrait of the sculptor Augustus Saint-Gaudens (1887), which took the medal at the Paris Exposition, and "An Eclogue" (1890) are among his best easel pictures. Examples of his mural decoration are to be seen in the Congressional Library at Washington and at Bowdoin College. He is noted for his large sense of form and competent drawing. He received several medals at Paris expositions. He was elected an associate of the National Academy of Design in 1900.

COX, LOUISE (1865—). An American artist, born in San Francisco. In 1892 she married Kenyon Cox, the well-known figure-painter. She is herself an artist of considerable ability. In 1896 she won the third Hallgarten prize, and in 1900 a bronze medal at the Paris Exposition of that year.

COX, PALMER (1840—). An American artist and author, born in Quebec. He lived for a time in California and began his career by writing for the *Golden Era* and other Western papers, but in 1875 went to New York City, where he still lives. Mr. Cox's productions are almost exclusively in the field of fancy, the most widely known being his sprightly verses and drawings of the *Brownies*, whose experiences fill several volumes.

COX, RICHARD (1500-81). An English bishop, born in Buckinghamshire. He was educated at Eton and Cambridge, and was tutor to Prince Edward, who, when he became King, made Cox one of the Privy Council and King's almoner. In 1537 he became chaplain to Archbishop Cranmer and the King, and a member of the commission that nullified the marriage of Anne of Cleves. In 1549 he was one of the seven royal visitors who led the King's attack on the religious, educational, and charitable establishments of England. Mary put him in prison, but he escaped to Frankfort, where he became the bitter opponent of John Knox. Elizabeth restored him to the See of Ely. Cox translated the four Gospels, the Acts, and the Epistle to the Romans, for the Bishop's Bible, and wrote a number of polemical essays.

COX, SAMUEL (1826-93). An English Baptist biblical expositor, born in London. He graduated at Steney Baptist Theological College, London, in 1851; was pastor at Southsea (1852-54) and at Ryde, Isle of Wight (1854-59). He was compelled by throat trouble to stop preaching for a while, but was pastor in Nottingham from 1863 till 1888, when failing health compelled his resignation. He died at Hastings, March 27, 1893. His fame rests upon his biblical exposition and his connection with *The Ex-*

positor, a monthly devoted to biblical topics, which he originated and whose first twenty volumes he edited (1875-84). Having become an advocate of Universalist views, he was obliged to resign his position. His publications were very popular and merited their wide sale. Of them may be mentioned *The Private Letters of Saint Paul and Saint John* (London, 1867); *The Quest of the Chief Good* (1868; rewritten as *The Book of Ecclesiastes, with a New Translation*, 1890); *An Expositor's Note-Book* (1872); *The Pilgrim Psalm* (1874); *Salvator Mundi* (1877) and *The Larger Hope* (1880), which two books on eschatology stirred up much controversy; *A Commentary on the Book of Job, with a Translation* (1880); *Expositions* (4 vols., 1885-90); *The Bird's Nest and Other Sermons for Children of All Ages* (1886); *The Hebrew Twins: A Prediction of God's Ways with Jacob and Esau* (London, 1894). Consult the prefatory memoir by his wife in the last-mentioned work.

COX, SAMUEL HANSON (1793-1881). An American clergyman, born in New Jersey. He began to study law, but left it for theology, and was ordained a Presbyterian minister in 1817. Three years later he had charge of a church in New York City, and was mobbed on account of his anti-slavery sentiments, his house and church being sacked. In 1834 he was chosen professor of sacred rhetoric in the theological seminary at Auburn, N. Y., and in 1837 became pastor of the First Presbyterian Church in Brooklyn, where he remained until 1854. He was, in the meantime, professor of ecclesiastical history in Union Theological Seminary. At the time of the division of the Presbyterian Church in 1837 he became a leader in the 'New School' branch. On several occasions he was a delegate to conventions in Europe, and at one time was moderator of the General Assembly. In 1854 his voice failed, and he resigned his pastorate. Among his published works are: *Quakerism not Christianity: Interviews, Memorable and Useful*; and many discourses.

COX, SAMUEL SULLIVAN (1824-89). An American politician and author, born in Zanesville, Ohio. He graduated at Brown University in 1846, and was later admitted to the bar, but forsook the law in 1853 to become editor of the *Ohio Statesman* at Columbus. For one year he was secretary of legation in Peru. He represented Ohio in Congress for eight years (1857-65), and New York, whither he removed in 1866, for seventeen years (1869-73, 1875-85, and 1886-89). In 1885-86 he was Minister to Turkey. He was popularly known as the 'letter-carriers' friend' in reference to legislation proposed by him for increase in their salary and the concession to them of a vacation with pay. A statue of him was erected by the letter-carriers in New York City. Mr. Cox wrote and lectured a great deal, some of his works being: *Eight Years in Congress* (1865); *The Buckeye Abroad* (1851); *Why We Laugh* (1876); and *Three Decades of Federal Legislation* (1885). A gorgeous piece of descriptive writing published in the *Statesman* during his editorship won him the nickname 'Sunset,' which clung to him through life.

COXALGIA (Neo-Lat., from Lat. *coxa*, hip, Gk. *άλγος*, *algos*, pain), or COXITIS. An obsolete name of hip-joint disease. Either arthritis or suppuration occurs in the joint, with the result

that in the former case the joint becomes immovable, or, in the latter case, the bones forming the joint become disintegrated.

COXCIE, kòk'sè, or **COXIS**, MICHEL (1499-1592). A Flemish painter, known by his copy of the "Adoration of the Lamb," from the original, made by the brothers Van Eyck, for Philip II. of Spain. Parts of this copy are now in the galleries of Berlin, Munich, and Ghent. His illustrations of the story of Cupid and Psyche have furnished models for innumerable paintings and engravings.

COXCOMB, kòks'kòm. THE. A comedy by Beaumont, Fletcher, Rowley, and others (1612), dealing with an experiment in self-sacrifice made by the coxcomb Antonio.

COX'COX'. The legendary Noah of the Mexican tribes, who with his wife escaped the Deluge. In its present form the legend shows probable Christian influence from early Spanish missionaries.

COXE, ARTHUR CLEVELAND (1818-96). An American prelate, second Protestant Episcopal Bishop of Western New York. He was born at Mendham, N. J., graduated at the University of New York in 1838, and at the General Theological Seminary in 1842, and in the same year was ordained priest. Rector at Hartford, Conn., in 1842-54, at Baltimore, Md., in 1854-63, and at New York City in 1863-65, he was in 1865 appointed to the bishopric of Western New York. In 1872 he visited Haiti, for the purpose of establishing churches and ordaining clergy in that island. He also founded the Christian Literature Company, of whose publications he edited a series of the Ante-Nicene Fathers. His writings include several volumes of verse, of which the *Christian Ballads* (1840; rev. ed., 1887) is the best known; and several theological works, such as *The Criterion* (1866), in opposition to the Tractarians; *Apollos, or the Way of God* (1873); and *The Institutes of Christian History* (1887).

COXE, HENRY OCTAVIUS (1811-81). An English scholar. He was born at Bucklebury and was educated at Oxford. From his appointment as under librarian at the Bodleian Library in 1838 until his death he devoted himself to the compilation of the colossal catalogue, comprising 723 folio volumes. In 1860 he became chief librarian of the institution. His other important publications include Roger de Wendover's *Chronica sive Flores Historiarum* (5 vols., 1841-44); *Metrical Life of Edward the Black Prince* (written in French, by Chandos Herald), with a translation and notes (1842); and Gower's *Vox Clamantis* (1850).

COXE, REGINALD CLEVELAND (1855—). An American artist, born in Baltimore, the son of Arthur Cleveland Coxe, Bishop of Western New York. He was a pupil of Bonnet in Paris, and is known especially as a painter of marines, and also as an etcher.

COXE, TENCH (1755-1824). An American political economist, born in Philadelphia. He served in the Continental Congress (1788), and was appointed Assistant Secretary of the Treasury in 1789. In the same year he proposed the introduction of Sir Richard Arkwright's cotton-spinning frame into the United States. The extensive planting of cotton in the South was

due chiefly to his initiative, for which reason he is frequently called the 'father of the American cotton industry.' Among his numerous works on economic subjects are: *An Inquiry into the Principles for a Commercial System for the United States* (1787); *View of the United States* (1787-94); and *On the Navigation Act* (1809).

COXE, WILLIAM (1747-1828). An English historian. He was born in London, and was educated at Cambridge. In 1771 he took the curacy of Denham, but soon resigned to become the tutor of several young noblemen. With them he spent many years in travel, and with great industry collected information of all kinds, which appears in many volumes of travels and history, all of which are characterized by close observation, care, and research. One of the best known of Coxe's works is his *History of the House of Austria from 1218 to 1792* (1807). He also wrote: *Memoirs of the Bourbon Kings of Spain from 1700 to 1788* (1813); *Memoirs of John, Duke of Marlborough* (1818-10); a *Life of Guy*, published separately from his *Fables* (1797); *Memoirs of Sir Robert Walpole* (1798); and *Memoirs of Horatio, Lord Walpole* (1802).

COXSWAIN (also *cockswain*, from *cock*, from OE., Fr. *coque*, boat, probably from ML. *concha*, small boat, from Lat. *coucha*, Gk. *κόχη*, *kouchē*, Skt. *śaṅkha*, shell + *swain*, AS. *swein*, from Icel. *sveinn*, OHG. *sucin*, herdsman). A petty officer in the navy who has charge of a boat and crew in the absence of officers. In double-banked boats he steers, and has a small seat in the *coxswain's box*, or after part of the boat abaft the stern-sheets. In single-banked boats the coxswain usually pulls the stroke oar. The steersman of a racing or other crew is also known as a coxswain.

COX'WELL, HENRY TRACEY (1819—). An English aeronaut. He was born at Wouldham, near Rochester Castle, and was educated at the Chatham Military School. He invented a balloon from which aerial torpedoes could be discharged, and made hundreds of ascensions, the most important being that undertaken with Glaisher in 1862, when the balloon sailed to a height of seven miles. During the Franco-German War he joined the aeronautic corps of the German Army. In 1845 he established the *Ærostatic Magazine*. His principal work is entitled *Life and Balloon Experiences* (1887-89).

COYOTE, kí'ò-tè or kí'òt (Sp., from Mex. *coyotl*). The modified native Mexican name of the prairie-wolf (*Canis latrans*), now universally adopted throughout the western United States. The coyote in several varieties is abundant almost everywhere from the Plains to the Pacific, south of central British Columbia, and is famous for its monotonous and reiterated yelping at night. This more resembles the barking of a dog than the howl of the ordinary wolf, and an early name was 'barking wolf.' One thinks half a dozen are yelping in chorus as he listens to it. It generally travels in packs, like other wolves, but, unlike them, it rarely attacks human beings. It is of rather small size, about as big as a setter dog, of a light reddish or yellowish-gray color, the longer hairs of the back tipped with black. The pelage is rather full and soft, the tail is bushy, the ears are upright, and the muzzle is slender and pointed. Several species are recognized by some naturalists, which others regard as geogra-

phical races only. Coyotes live in hollows among rocks, or take possession of old burrows in the ground, and usually produce four puppies in late spring. They hunt chiefly in the dusk. They are very fleet of foot, and two or three by acting in concert will run down a pronghorn; they seek to detach and seize the fawns, however, rather than to pull down adults. Their food consists mainly of gophers, ground-squirrels, mice, ground-nesting birds, and similar small animals; and they have become a great nuisance in the neighborhood of ranches and isolated settlements, especially in winter, by attacking sheep, poultry, calves, etc. Adapting themselves thus readily to circumstances, and having extreme cunning in avoiding traps and poison, they survive among the sparser settlements of the West, and in some regions increase rather than diminish. They will cross with the domestic dog, producing fertile hybrids; and the Indians were accustomed to induce such mixture of blood. This animal entered more largely than almost any other into the mythology and folk-lore of the aborigines, especially west of the Rockies. Consult: Ingersoll, *Wild Neighbors* (New York, 1897); Elliot, *Synopsis of Mammals* (Chicago, 1901). See WOLF; and illustrations on Colored Plate of CANIDE, and on Plate of WOLVES AND DOGS.

COYPEL, kwä'pél', NATALIS or NOËL (1628-1707). A French historical painter, born in Paris. He was employed by Louis XIV, on the large decorative works in Versailles, the Louvre, the Tuileries, and Fontainebleau. In 1695 he was made perpetual director of the Academy. When past seventy-five, he painted two frescoes in the dome of the Hôtel des Invalides in Paris. His pictures are very numerous, and, in a somewhat theatrical style, impressive. His two sons, ANTOINE and NOËL NICOLAS, and his grandson CHARLES ANTOINE, became well-known painters and engravers.

COYPU, koi-pōw' (native South American name), or NUTRIA. An aquatic rodent (*Myopotamus coypu*), widely common in South America. Its name in Chile is 'coypu,' and on the Pampas 'quiqui,' but it is always called by Spanish-speaking people of education nutria ('otter'), by which name its fur is known in commerce. It is not an otter, however, but is nearly allied to the beaver, yet somewhat smaller, and with a rat-like tail. It is dull brown, with a grayish muzzle and bright-red incisors; the nostrils are very high, allowing it to breathe with only the tip of the nose above water; and the teats are high on the flanks. When the beaver became scarce the fur (nutria) of this animal was in great demand for making hats, etc., and the coypus were nearly exterminated, but with less demand and the protection of local laws they have again become numerous. It is thoroughly aquatic, dwelling preferably in the permanent ponds (lagunas) of the La Plata Valley, and inhabiting burrows in the banks, where there are banks, or making a platform nest among the rushes. "Of an evening they are all out swimming and playing in the water, conversing together in their strange tones, which sound like the moans and cries of wounded and suffering men; and among them the mother coypu is seen with her progeny, numbering eight or nine, with as many on her back as she can accommodate, while the others swim after her, crying for a

ride." For further interesting facts, consult: Hudson, *The Naturalist on the La Plata* (London, 1875); *Proceedings Zoological Society* (London, 1894); Semper, *Animal Life* (London and New York, 1881). See Plate of BEAVER, ETC.

COYSEVOX, kwä'z-vöks', ANTOINE (1640-1720). A French sculptor, born in Lyons. His master was the versatile Le Lambert. The most notable works of this sculptor are fine busts of his contemporaries, such as Lebrun, Richelieu, and Bossuet; one of the mother of the painter, and one of himself. He also modeled the statue of Louis XIV, at the Hôtel de Ville in Paris, and various decorations for the interior of Versailles.

COYUVO, kô-yōō'vō. The natives of Calamianes Province, P. I. They speak Tagbanua. See PHILIPPINES.

COZENERS, kūz'n-ērz, THE. A comedy by Samuel Foote (1774), in which he himself played the part of Aircastle.

COZENS, kūz'nz, JOHN ROBERT (1752-99). An English painter. His father was one of the two natural sons of Peter the Great of Russia by a woman of Deptford. He traveled in Italy and Switzerland and left valuable drawings made on that tour. Toward the end of his life he became insane. In his day water-color landscapes were very conventional in drawing and dry in color. Cozens was one of the first to show the value of this medium in the poetical quality of his work. Turner and Constable have spoken in terms of admiration of Cozens's pictures. There are a number of them in the British Museum, but the most famous is a landscape, "Hannibal Crossing the Alps" (1776).

COZUMEL, kō'sōō-māl'. An island off the eastern coast of the Mexican Province of Yucatan, in latitude 20° N. and extending east of longitude 87° W. (Map: Mexico, P 7). It is about 24 miles long and about 7 miles wide. Its surface is low and the coasts are bordered by reefs. There is a small Indian settlement by the name of San Miguel. The chief industry is cattle-raising. The island was discovered in 1518.

COZZENS, kūz'nz, FREDERICK SWARTWOUT (1818-69). An American humorist, born in New York City. He became in early life a wine-merchant, and later editor of the *Wine Press*, for which he wrote papers on the culture of the grape and the manufacture of wine, as well as miscellaneous essays. He had previously contributed humorous poems and articles to magazines, and in 1853 he issued his first volume, *Prismatics*, under the pen-name Richard Hayward. Then came the *Sparrowgrass Papers*, his best performance, first published in the *Knickerbocker Magazine*, and, in 1856, as a widely read volume. They dealt with the trials of a city man who undertakes to run a country home (near Yonkers), and although their humor is mild, they are still fairly readable. Three years later (1859) he published a volume of travel-sketches, *Acadia; or, A Sojourn Among the Blue Noses*. Soon after the war he failed in a business for which he had labored earnestly, especially by promoting the sale of native wines, and retired from Yonkers to Rahway, N. J. Of his other works only *Poems* (1867) and a *Memorial of Fitz-Greene Halleck* (1868) need be named.

TYPICAL CRABS

1. FIDDLER CRAB (*Gelasimus pugnax*).
2. HERMIT CRAB (*Eupagurus longicarpus*) in a shell of *Natica heros*.
3. HERMIT, out of its borrowed shell, showing reduced and defenseless posterior parts.
4. EASTERN EDIBLE or BLUE CRAB (*Callinectes hastatus*).
5. A DEEP-SEA CRAB (North Atlantic) its arms closed into a defensive box.
6. COCONUT CRAB (*Birgus latro*).
7. COMMON CRAB OF PACIFIC COAST (*Cancer magister*).
8. SPIDER CRAB (*Libinia emarginata*).

CRAB (AS. *krabba*, Icel. *krabbi*, Ger. *Krabbe*). A crustacean of the order Decapoda and suborder Brachyura, characterized by the small size of the abdomen, which resembles a short tail curved under the thorax, all important viscera being included in the thorax. The term extends also to some of the suborder Anomura (purse-crabs, hermit-crabs, etc.), characterized by a condition of abdomen intermediate between that of the Brachyura and that of the Maerura, or long-tailed decapod crustaceans, such as the lobster, crayfish, etc. All the crabs, besides many other crustaceans, were comprehended in the Linnaean genus *Cancer*; but the number of species is very great, considerably more than 1000, and the Brachyura alone are now arranged in many genera and families.

These various crabs differ very much in the form of the carapace (the back), which in some is orbicular or nearly so; in some, much broader than it is long; in others, longer than broad; in some, prolonged in front into a kind of beak, etc.; also in its smoothness, or roughness with hairs, tubercles, or spines; in the length of the legs, etc. The eyes are compound, with hexagonal facets, and are elevated on stalks, which are generally short, but sometimes considerably lengthened, and which have the power of motion, so as to turn the eye in different directions. The first pair of limbs are not used for locomotion, but exhibit in great perfection the characteristic claws or pincers (*chela*) of the decapod crustaceans. Crabs are inhabitants of almost all seas; most of them, however, are found chiefly near the coast. Some crabs inhabit fresh water, particularly in the warmer parts of the world; and others, known as land-crabs, live among moist herbage, or burrow in sand or earth. Crabs are generally flesh or carrion eaters, though some forms seem to prefer a vegetarian's diet. They are always active and are noted for running sideways, rather than straight ahead. Some have the last pair of limbs expanded at the extremity into a broad blade for swimming, and some have even all the four pairs of limbs intended for locomotion thus expanded, and sometimes occur far out at sea.

LARVAL STAGES OF CRABS.

a, zoea stage; b, megalops stage.

Their development is accomplished by metamorphosis through succeeding stages. "In the crabs the nauplius stage (see CRUSTACEA) is passed through in the egg, and the young is hatched in the form of a peculiarly modified *zoea*, with an immense cephalothorax produced into spines, large stalked eyes, and a slender abdomen. This passes by successive molts into the *megalops* stage, which resembles an adult macruran [and] . . . passes by successive molts into the adult form."

Crabs, like all arthropods (see ARTHROPODA), molt or change their shell, not at fixed intervals or seasons, but according to the exigencies of their growth, the change being made with great frequency when they are very young, but rarely in advanced age; indeed, from the mollusks and other animals sometimes found adhering to the carapace, it is inferred that the same covering is sometimes worn for a number of years.

Crabs become interesting in the aquarium, from their readiness in seizing food, their activity in tearing and eating it, and their pugnacity. The number of specimens is apt, however, to be soon diminished by the stronger killing and eating the weaker. Crabs vary greatly in size and color, as might be expected from the great number of species and their wide distribution. The giant crab of Japan (*Macrochira Kampjerei*), although only a foot across the disk, which is 18 inches long, has such long legs as occasionally to be 15 to 18 feet from tip to tip of the first pair. The great stone-crab of Tasmania, which has short and very thick legs, has been known to reach a weight of over 30 pounds. On the other hand, many species of crab are only a fraction of an inch across. In color, crabs vary from black to white, through all the colors of the rainbow. Shades of green, blue, and gray are perhaps the most common, but the brightest shades of red and yellow are by no means rare. The sexes of crabs are easily distinguished, as the females are usually larger, and their abdomens broader and more oval, while males have the chela more powerfully developed—notably so in the fiddlers.

Economic Importance of Crabs.—These animals supply food for food-fishes, are of great service as scavengers, and are used as human food in various parts of the world. In the United States the principal crab so used is the blue crab (*Callinectes hastatus*), hundreds of thousands of which are sent to market every year from the waters of Chesapeake Bay alone. The little pea-crabs (Pinnotheres) often found in oysters (see COMMENSALISM) are regarded as a great luxury. In Europe the species most frequently used are those of the genus *Cancer*, especially the great *Cancer pagurus*, and there is no reason why the two eastern American species of this genus, the 'rock' and 'Jonah' crabs (qq.v.), should not be far more utilized as food than they are. To this group belong the principal edible crab of the American Pacific coast (*Cancer magister*), and others smaller which are eaten by the Chinese, etc. This species usually measures 7 to 9 inches in breadth of body, and abounds from Alaska to Mexico, usually below low-tide level on sandy bottom. Crabs which have just shed their shell, and are covered only by a soft skin, are regarded as best, and are called 'shedders' or 'soft-shelled.'

The ways of fishing are various. Many are taken in wicker traps or 'pots,' baited with meat or offal; another common method is to sink shallow hoop-nets of coarse material and mesh, which are baited and hauled up rapidly at intervals, bringing the crabs with them. Hand-line fishing, with bundles of meat to which the crabs cling until lifted out of water, is more a sport than a method of market-fishing; but in the Gulf of Mexico trawls or 'trot-lines' are set in several ways, and vast quantities of crabs are thus taken. They are kept for market in floating pens or

'ears,' and shipped alive packed in wet seaweed. They are also preserved by canning, etc.

FOSSIL FORMS. With the exception of some doubtful genera (Gitecragnon, etc.) from later Paleozoic rocks, no unmistakable fossil crabs are known from deposits antedating those of Mesozoic age. Fossil crabs first appear in the Jurassic, where occur members of the family Dromiacea, much smaller than the modern species, such as the genus *Prosopton*, which continues into the Cretaceous. In the Upper Cretaceous, *Dromiopsis* is the ancestor of *Dromia*, which latter appears in the Eocene and continues to modern time. Several other small genera of this same family are found in Cretaceous rocks, in which the family enjoyed its greatest expansion. The *Ranimoidea*, with elongated carapaces, broadly truncated in front, began in the Upper Cretaceous, had its maximum in the Eocene, and has since then declined to the present. Large numbers of the *Oxystomata*, or round crabs, are found fossil in the Upper Cretaceous and Eocene rocks. The *Oxyrhyncha*, which at present are very abundant, have few fossil ancestors, and these are of small size. The arcuate crabs, of the family *Cyclometopa*, contain the largest number of fossil genera. They appeared in the Cretaceous, attained a great expansion in the Eocene, declined during the later Tertiary, and in modern times seem to be again on the increase. This family contains most of the modern genera, such as *Cancer*, *Carcinus*, *Portunus*, *Xantho*, *Neptunus*, *Panopeus*. Certain of these are of old age. *Xantho* began in the Cretaceous, had a representative (*Xanthopsis*) that is very common in the Eocene of England, France, and Germany, and continued with little change to the present day. *Lobocarcinus*, with its broad, nodose carapace, deeply denticulate on the front margin, is a common and often beautifully preserved fossil crab from the Eocene rocks of Württemberg, Germany, and Cairo, Egypt. The *Catometopa*, or quadrangular crabs, have many ancestors of Eocene age. The first land-crab of the modern genus *Gecarcinus*, and the first fresh-water crab, also of a modern genus, *Telphusa*, both members of this family, are found in the Miocene deposits of Oeningen, Germany.

From the above remarks it will be seen that all the families of modern crabs, with the single exception of the *Oxyrhyncha*, were initiated during Cretaceous time; that they expanded rapidly so that their periods of maximum evolution were during the Eocene, when indeed crabs formed the dominant feature of the fauna in certain seas; that during the Miocene the general expansion was less than before, although certain genera were extremely abundant in particular localities; and that those of the Pliocene are mostly of recent species. During the present time the crabs seem to be enjoying another period of expansion, but along different lines from those of the Eocene evolution. The best collecting grounds are found in the Eocene deposits of the south of England; the nummulitic limestones of southern France, Switzerland, southern Germany, and of northern Italy, and those of central India; and the Miocene beds of Italy, Austria, Hungary, and Germany.

See CRUSTACEA, and special articles under names of various crabs, as KING-CRAB; SPIDER-CRAB, etc.

CRAB-APPLE. See APPLE.

CRABB, GEORGE (1778-1851). An English lawyer and author, born at Palgrave (Suffolk). He was educated at Oxford, admitted to the bar at the Inner Temple (1829), and practiced his profession in London. For a time, also, he was instructor in the classics in a Yorkshire school. His best-known work is the *Dictionary of English Synonyms* (3d ed., 1824), a careful, if not always scholarly, reference-book, which has appeared in numerous editions. Others of his publications are a *History of English Law* (1829), and a laborious *Digest and Index of All the Statutes at Large* (4 vols., 1841-47).

CRABBE, GEORGE (1754-1832). An English poet. He was born December 24, 1754, at Aldeburgh, Suffolk, where his father was collector of salt duties. Crabbe showed early a love for books, with a bias toward poetry. After some schooling, he was apprenticed first to a village doctor and then to a surgeon. By 1772 he was contributing verses to *Whistle's Magazine*, and two years later he published at Ipswich a moral poem entitled *Inebriety*. At this time he was in love with Sarah Elmy, whom he addressed in his poems as 'Mira,' and whom he afterwards married. Continuing his studies in London, he began the practice of medicine in the place of his birth. Disliking a profession in which he was not succeeding, he went to London in 1780 to begin a literary career. In that year appeared a poem called *The Candidate*, which was received coldly. Much distressed, he called upon Burke, who after reading some of Crabbe's verses took him under his protection, getting Dodsley to publish *The Library* (1781). While staying with Burke at Beaconsfield, he began his best-known poem, *The Village* (published 1783). At Burke's suggestion, Crabbe took orders. After a short period as rector of Aldeburgh, he was appointed chaplain to the Duke of Rutland (1782), and thus made Belvoir, Leicestershire, his home. After occupying several other church livings, he was given that of Trowbridge, Wiltshire (1814), where he remained till his death (February 3, 1832). Besides the poems already cited, Crabbe wrote *The Newspaper* (1785); *The Parish Register* (1807); *The Borough* (1810); *Tales in Verse* (1812); and *Tales of the Hall* (1819). Crabbe was a popular poet in his own time, numbering friends among the greatest. He was lavishly praised by Dr. Johnson, Scott, Wordsworth, and Byron. Jane Austen, charmed with humor akin to her own, declared that, were she ever to marry, she could fancy herself Mrs. Crabbe. Though his reputation has declined, he nevertheless occupies an important place in the progress of English poetry. Crabbe's stern descriptions of English life in old East Anglia were in marked contrast to Goldsmith's idyllic scenes, and led

the way to the realism of Wordsworth. What he lacked was the imagination necessary to give lasting interest to his subject. His great excellence is the directness with which he portrays the tragic life of men and women whom he knew and the scenes in which they lived. Consult: *Works*, with memoir, by his son G. Crabbe (8 vols., London, 1834-35); selections from poems, by Lamplough (London, 1888), and by Holland (London, 1899); Stephen's essay in *Hours in a Library* (London, 1876); Courthope's essay in Ward, *English Poets* (London, 1884); the *Life*, by Kibbet (London, 1888); and Ainger, *Crabbe*, in "English Men of Letters" Series (New York, 1902).

CRAB-EATER, or **COBIA**. See **SERGEANT-FISH**.

CRAB-EATING DOG, **RACCOON'**, ETC. See **DOG**; **RACCOON**, etc.

CRABETH, krá'bét, DIRK and WOUTER. Dutch painters on glass. They were brothers, born at Gouda, in South Holland, and they flourished in the latter half of the sixteenth century. As the brothers worked together and were the most famous glass-painters of their time, they cannot be separated in biography. Very little is known of their lives, but they executed a number of excellent works in the churches of Belgium and France. Their chief works are fourteen of the seventy-five windows of the great church at Gouda. Among the best of these are the "Baptism of Christ" and the "Last Supper," by Dirk, and the "Nativity" and the "Sacrilege of Heliodorus," by Wouter. The latter excels in brilliancy of color, but Dirk has a more vigorous style. The works of both show a somewhat mannered imitation of the Italian, but they still retain much of the brightness of the mediæval coloring. Dirk died in 1581; his brother about 1601. Consult Westlake, *History of Design in Painted Glass*, vol. iv. (London, 1894).

CRAB-GRASS. A name applied to *Panicum sanguinale*, an annual grass common throughout many parts of the United States. It is frequently seen to spring up in fields after the period of cultivation has passed. It grows to a height of two or three feet, bearing at the top three to twelve spreading purplish spikes which carry the flowers and seed. In many places it is considered a weed, but in the South it is valued for the hay it yields as well as for pasturage. The hay must be cured without rain falling upon it or its value is greatly impaired. It ranks close to Bermuda grass in the value and cheapness with which a crop may be produced. Eleusine indica is sometimes called crab-grass.

CRABIER, krá'byá' (Fr., crab-eater). The name in the French West Indies and Jamaica for several herons, especially the common night-heron (*Nycticorax violaceus*). See **NIGHT-HERON**.

CRAB'S-EYES. See **ABRUS**.

CRAB'S-POLOVER. A singular shore-bird (*Dromas ardeola*) nearly related to the oyster-catchers, but set apart in a family, Dromadidæ, of its own, which is to be found sparingly on the coasts and islands of the Indian Ocean. "Its habits remind us both of the plovers and the terns, and so do the unusually large eggs," but in India, according to Hume, it nests in burrows in sand-hills.

CRAB'SHAW, TIMOTHY. A plowman and carter, who becomes squire to Sir Launcelot Greaves, in Smollett's novel of the latter name.

CRAB-SPIDER. A spider of the family Thomisidæ, so named on account of the short, broad body and the fact that, like a crab, it runs more successfully sideways or backward than forward. These spiders spin no web, but await their prey hidden among foliage, and are colored in harmony with their background; but a few species are bright-colored and hide in flowers. The most common American form (*Misumena vatia*) is milk-white, occasionally with light-crimson markings. Another species (*Phidromus vulgaris*) eats house-flies almost exclusively. Consult: Emerton, *The Common Spiders of the United States* (Boston, 1902). Compare **BIRD-SPIDER**.

CRAB'TREE. Uncle of Sir Benjamin Backbite—a deaf, cross-grained old scandal-monger—in Sheridan's comedy *The School for Scandal*.

CRABTREE, SIR CADWALLADER. In Smollett's *Adventures of Peregrine Pickle*, the friend of the hero.

CRABTREE, CHARLOTTE (1847—). An American actress, known as Lotta. She was born in New York, and when a child of ten began her career in California. After starring for a time in the West, she came again to New York about 1860. In 1867, as Little Nell and the Marchioness in a dramatization of *Old Curiosity Shop*, she made her first great impression there, and became a popular favorite. Her success was entirely due to her personal charm. Critics found little to approve in the pieces in which she appeared, such as *The Little Detective*, *Zip*, *Musette*, and *The Firefly*, but her stage appearance was characterized by a naturalness and grace which won the hearts of the audience. She retired from the stage, still unmarried, in 1891, having acquired a fortune. Consult: Welch, in McKay and Wingate's *Famous American Actors of To-Day* (New York, 1896); and Clapp and Edgett, *Players of the Present*, Dunlap Society Publications (New York, 1899).

CRACKED HEELS. See **HORSE**.

CRACKER. See **BISCUIT**.

CRACKERS. A name given in the southern part of the United States to the poor and ignorant whites, probably because of their usual diet, which is cracked corn ground into a coarse meal. The term 'corn-crackers' is employed in the same sense.

CRACKER STATE. Georgia. See **STATES**, **POPULAR NAMES OF**.

CRACKLIN, or **CRACKLE WARE**. A kind of chinaware, the glazing of which is purposely cracked in the kiln, as an ornament, the effect being produced by a glaze which tends to contract in the burning more rapidly than the vessel itself.

CRACOW, krāk'kò (Pol. *Krakov*, Ger. *Krakau*, Fr. *Cracovie*, Lat. *Cracovia*, *Carodunum*; said to be named after its founder, *Krakus*, a legendary Slavic chief). The ancient capital of the Kingdom of Poland and residence of the Polish kings, now a fortified city of the Austrian Crown-land of Galicia (Map: Austria, F I). It is situated on the left bank of the Vistula, at its confluence with the Rudawa, about 10 miles from the frontier of Russian Poland and 256 miles north-

east of Vienna. Cracow, with its numerous churches, towers, and old castle, presents an imposing aspect from without. It consists of the inner town and a number of suburbs. The old walls surrounding the inner town have been demolished, and promenades laid out on their site. Cracow is one of the oldest cities of Poland, and bears the marks of its age in its imposing buildings as well as in its general appearance. First among the numerous churches of Cracow is the old Gothic cathedral, situated near the castle. It was erected under Casimir the Great, in the fourteenth century, and is famous for the numerous tombs of Polish kings and heroes it contains, including those of Sobieski, Poniatowski, and Kosciuszko. It is also adorned with numerous monuments, several of them by Thorwaldsen, and its treasury contains some remnants of the former splendor of Poland. The Church of Saint Mary, a Gothic basilica, was founded in the thirteenth century, and several times rebuilt since then. It contains a magnificent high altar by Veit Stoss, and a number of monuments. Besides these churches there are a number of very interesting mediæval ones. Among the interesting secular buildings is the former royal castle, situated on a broad hill at the southwestern end of the town; it was built in the thirteenth century, and suffered greatly from conflagrations; its remnants are used as barracks and a hospital. The old cloth-hall, dating from the thirteenth century, is now used as an art museum, and contains paintings by Polish artists, such as Matejko, Siemiradzki, and others. In front of the cloth-hall is a bronze statue of Mickiewicz, one of Poland's greatest poets. Among other notable buildings and historical monuments are the university, the old and new theatres, and the Rondell, a relic of the old fortifications. The chief educational institution is the famous university, styled the Jagellonian University, founded by Casimir the Great in 1364. It developed very rapidly, and eventually became the intellectual centre of Poland. At present it has faculties of jurisprudence, philosophy, and theology, with an attendance of over 1300 students. The university library contains over 300,000 volumes, besides numerous manuscripts, engravings, ancient documents, etc. Attached to the university are also an observatory, a botanical garden, a natural history museum, and a number of other institutions. Among other prominent educational establishments are the Royal Academy of Sciences, and the art school (until 1893 under the supervision of Matejko), several seminaries, and a number of artistic and literary societies. The Czartoryski Museum contains a collection of sculptures and antiquities and a fine picture gallery, with samples of the Italian and Dutch schools.

Economically Cracow is only of slight importance. The manufacturing industries include the production of machinery, textiles, leather, chemicals, etc. The trade is mostly in raw products, such as grain, wood, salt, animals. In the vicinity of the city is situated Kosciuszko Hill, a mound 65 feet high, erected in 1820-23 by the residents of Cracow, in honor of Kosciuszko, and since converted into a fort. The fortifications of Cracow are very extensive. Population, in 1890, 74,593; in 1900, 91,310; consisting mostly of Catholic Poles and Jews.

Cracow rose into importance in the Middle Ages

as the seat of a bishopric and a centre of commerce and trade, its prosperity being enhanced by the influx of German immigrants. It suffered terribly at the hands of the Tatars in the thirteenth century. It became the capital of Poland in 1320, and after having been superseded by Warsaw in 1610, it still remained the place where the Polish kings were crowned and buried. It later became exceedingly impoverished, so that at the end of the eighteenth century its population was only about 10,000. In 1655 and 1702 the town was taken by the Swedes. It was the starting-point of the rising of the Poles for independence under Kosciuszko in 1794, and came into the possession of Austria at the third partition of Poland, in 1795. From 1809 to 1815 Cracow formed a part of the Duchy of Warsaw. The short-lived Republic of Cracow, established at the Congress of Vienna in 1815, under the protectorate of Russia, Prussia, and Austria, was the last remnant of an independent Poland. It consisted of the city of Cracow and some adjacent territory, with a total population of about 140,000. The participation of a portion of the population in the Polish uprising of 1830 gave Russia an opportunity for military occupation. After that Cracow was repeatedly occupied by foreign troops. The little republic took a leading part in the Polish insurrection of 1846. The patriots were at first successful, but their overthrow soon ensued, and Cracow was annexed to Austria in the same year. In 1849 it was incorporated with Galicia. Cracow remains to the present day a great focus of Polish national life.

CRACOW, UNIVERSITY OF. See CRACOW.

CRADDOCK, CHARLES EGBERT. The *nom-de-plume* of Mary N. Murfree (q.v.), the Southern novelist.

CRADLE OF LIBERTY, THE. The name popularly given to Faneuil Hall, Boston, as the scene of early popular protests against British rule.

CRADOCK, KRÄD'OK, Sir. See CARADOC.

CRAFT OF LOVERS, THE. A poem assigned to Chaucer by John Stowe, who added this poem and a number of other spurious compositions, most of which were extremely inferior, to the edition of 1561. The author is unknown.

CRAFTS, JAMES MASON (1839-). An American chemist. He was born in Boston, and received his education at the Lawrence Scientific School of Harvard. In 1859 he went to Germany, and studied at the Academy of Mines of Freiberg and at the University of Heidelberg. At the latter institution he acted for some time as private assistant to Robert Bunsen. In 1861 he went to Paris, and there, in Würtz's laboratory, he first met Charles Friedel, in conjunction with whom he later carried out some of his most brilliant researches. In 1865 he returned to the United States, and, after devoting some time to mining, accepted the position of head professor of chemistry and dean of the faculty at Cornell University, where he remained until 1870. During the following four years he acted as professor of chemistry at the Massachusetts Institute of Technology, but in 1874 took leave of absence, joined Friedel in Paris, and devoted himself exclusively to scientific research. His investigations were mainly in the field of organic chemistry, but his name is connected also with many

interesting achievements in physics and in physical chemistry. He invented a new hydrogen thermometer; measured the densities of iodine at very high temperatures; demonstrated an interesting regularity in the variation of the boiling-points of chemically allied substances with the external pressure; prepared a number of new compounds of the element silicon, which are interesting because of their chemical resemblance to the corresponding compounds of carbon; and also prepared new compounds of arsenic. But his most important achievement was the discovery, jointly with Friedel, of one of the most fruitful synthetic methods in organic chemistry. According to an estimate published several years ago by Emil Fischer, the story of the results obtained by the method, or 'reaction,' of Friedel and Crafts is one of the most wonderful in the whole range of the science of chemistry. Hundreds of new carbon compounds have been brought into existence by this method, which is based on the action of the chloride of aluminum; and a host of compounds that had already been prepared by other methods of much greater complexity were produced by this method without any difficulty whatever.

In recognition of Crafts's services to science, the French Government made him a chevalier of the Legion of Honor (1885), and the British Association for the Advancement of Science made him one of its corresponding members. In 1891 he again returned to this country, and from 1892 to 1897 acted as professor of organic chemistry at the Massachusetts Institute of Technology. In 1898 he became the president of the institute, and in the same year Harvard University conferred upon him the honorary degree of Doctor of Laws. In 1900, however, he resigned the presidency of the Institute of Technology, and again turned to the investigation of problems in organic and physical chemistry. The numerous results of Dr. Crafts's researches were published in various scientific periodicals, mainly foreign. He also wrote a text-book of *Qualitative Analysis* (1869, and several later editions).

CRAFTS, WILBUR FISK (1850—). An American clergyman. He was born in Fryeburg, Maine; was educated at Wesleyan University and at the Boston University School of Theology; held various positions in the Methodist Episcopal Church, and in 1880 became a Congregational minister. From 1883 to 1888, however, he was the pastor of the First Union Presbyterian Church of New York. He conducted an International Sunday-School Parliament at the Thousand Islands in 1876-77, and is the author of a number of books designed primarily for the Sunday-school. He has also written: *Must the Old Testament Go?* (1883); *Successful Men of To-day* (1883); and *The Sabbath for Man* (1885), a strong presentation of the claim of the Lord's Day. He resigned his pastorate in 1888, to become secretary of the American Sabbath Union, and later became superintendent of the International Reform Bureau, organized to obtain legislation for moral purposes in the United States and Canada.

CRAFTSMAN, THE. A powerful journal organized in 1726 by Bolingbroke and Pulteney, with Nicholas Amhurst, who conducted it under the name of 'Caleb D'Anvers of Gray's Inn.' It

was the organ of the Opposition against Sir Robert Walpole.

CRAIG - MARTIN, or **ROCK-SWALLOW.** A swallow (*Circicola rupestris*), closely allied to the bank-swallow (q.v.), which is found from Portugal eastward to China in the breeding season, migrating to the tropics for the winter. It frequents mountains and rocky river-banks among hills, but does not ascend to Alpine regions. It builds in niches of the rocks a large, open-topped nest of mud, occasionally (as in the villages of the Pyrenees) placing this on the timbers of buildings or among ruins, and lays profusely speckled eggs. "The general color of the adult bird is a light ashy brown above, the lower parts being creamy buff, and the tail-feathers are dark brown, the central and outer pairs being conspicuously spotted with white." Consult Sharpe and Wyatt, *Monograph of the Hirundinidae* (London, 1885-94).

CRAIG, KRÄG, SIR JAMES HENRY (1748-1812). An English soldier, born in Gibraltar. In 1763 he was gazetted an ensign, and in 1771 was appointed captain in the Forty-seventh Foot. He accompanied his regiment to America, fought and was wounded at Bunker Hill, in 1776 was transferred to Canada, and in 1777 was present at the capture of Fort Mifflin. During the earlier part of General Burgoyne's advance upon Saratoga he so distinguished himself as to be intrusted by that commander with dispatches to England. He was promoted to be major in the Eighty-second, proceeded to Nova Scotia, and in 1781 served under Lord Cornwallis in North Carolina. In 1795, having then risen to the rank of major-general, he was placed in command of the expedition against the Dutch colony at the Cape of Good Hope. Aided by Rear-Admiral Elphinstone and Major-General Clarke, he obtained the surrender of the colony on September 14. He went in 1797 to India; and in 1805, as a local general in the Mediterranean, landed with 7000 troops at Castellumare, with orders to cooperate with the Russian forces under General Lacy in an attack upon the French army. After Austerlitz he prudently withdrew to Sicily. In 1807 he was appointed Governor-General of Canada, a post rendered difficult by reason of the French-Canadian hatred of British dominion. After a somewhat vexed administration he resigned in 1811, and was in 1812 promoted to be general.

CRAIG, JOHN (1512-1600). A preacher of the Scottish Reformation. He was born in Aberdeenshire, and educated at Saint Andrews. He entered the Dominican Order, but soon fell under the suspicion of heresy, and was cast into prison. On his release (1536) he traveled on the Continent, and after some time was, through Cardinal Pole's influence, made novice-master in the Dominican convent at Bologna, and later was rector. While here Calvin's *Institutes* fell in his way, and converted him to Protestant doctrines. He was brought before the Inquisition and sentenced to be burnt—a fate from which he was saved by the mob, on the death of Pope Paul IV., breaking open the prisons of Rome. Craig escaped to Vienna, and obtained favor at the Court of Maximilian II.; but the Pope demanded his surrender as one condemned for heresy. The Emperor, however, instead of complying with the request, gave Craig a safe con-

duct out of Germany. He now returned to Scotland (1560), and was appointed the colleague of John Knox in the parish church of Edinburgh. Thinking the marriage of Queen Mary and Bothwell contrary to the Word of God, he boldly refused to proclaim the bans, but afterwards yielded under protest. In 1572 Craig was sent "to illuminate the dark places" in Forfarshire until 1579, when he was appointed chaplain to King James VI. He now took a leading part in the affairs of the Church, was the compiler of part of the *Second Book of Discipline*, and the writer of the national covenant signed in 1580 by the King and his household. He was a man of great conscientiousness, and was not slow to oppose the proceedings of the Court when he deemed them contrary to Scripture, and to speak wholesome but unpleasant truths to majesty itself. He died December 12, 1600. Consult the black-letter facsimile reprint of Craig's *Catechisms* (Edinburgh, 1885), with introduction by T. Graves Law.

CRAIG, Sir THOMAS (1538-1608). A Scottish lawyer, author, and poet. Educated at Saint Andrews and in Paris, he passed as advocate at the Scottish bar in February, 1563, and was appointed justice-depute. He gained the favor of James VI., who, notwithstanding his modest and persistent refusal, created him a knight in 1603. Besides some much-admired Latin verse and prose, he wrote *Jus Feudale* (ed. Burnet, 1655; new ed., with notes and corrections by James Baillie, 1766). This learned work is still an authority on feudal law.

CRAIGENGELT, krā'gen-gēlt', CAPTAIN. In Scott's *Bride of Lammermoor*, a bully and adventurer, the friend of the Laird of Bucklaw, Frank Hayston.

CRAIGENPUTTOCK, krā'gen-put'tūk. A farm in the southwestern part of Dumfriesshire, Scotland, situated 12 miles north of Castle Douglas, and celebrated as the residence of Thomas Carlyle. It belonged to Jane Welsh before her marriage to the author. The Carlyles lived there most of the time between 1828 and 1834. Much of Carlyle's writing was done at Craigenputtock, and there are frequent references to it in his published correspondence. Consult "Homes and Haunts of Carlyle," in *Westminster Gazette* (London, 1895).

CRAIGHILL, krā'gīl. **WILLIAM PRICE** (1833—). An American military engineer, born at Charlestown, Va. He graduated in 1853 at the United States Military Academy; in 1854-55 superintended the building of Fort Sumter, and in 1858 that of Fort Delaware, and was for several years an instructor at the Academy. In 1863 he constructed the defenses of Pittsburg, and in 1865 was brevetted a lieutenant-colonel for service in the defense of Cumberland Gap. He was promoted to the rank of major, and from 1865 to 1867 was in charge of the defenses of Baltimore Harbor. Subsequently he was concerned with several public works, such as the improvement of the Potomac River (1870-74) and the Delaware River (1873). He was chief of engineers of the United States Army, with the rank of brigadier-general, from 1895 until his retirement at his own request in 1897. In 1894-95 he was president of the American Society of Civil Engineers. His publications include an *Army Officer's Pocket Companion* (1862), and

a translation of Dufour's *Cours de tactique* (1863).

CRAIGIE, krā'gē, PEARL RICHARDS. See HOBBS, JOHN OLIVER.

CRAIGLEITH (krā'lēth') **STONE**. A siliceous sandstone belonging to the Carboniferous series, quarried at Craigeleith, near Edinburgh. It is largely used in that city for building purposes, for which it is admirably adapted by its purity, durability, and the ease with which it can be wrought.

CRAIK, krāk, **DINAH MARIA** (1826-87). An English novelist, better known as Miss MULOCH. She was born at Stoke-upon-Trent, Staffordshire. In 1849 she published *The Ogilvies*, her first novel, and rapidly afterwards: *Olive* (1850); *The Head of the Family* (1851); *Alice Learmount* (1852); *Agatha's Husband* (1853); *John Halifax, Gentleman* (1857); *A Life for a Life* (1859); and *Christian's Mistake* (1865); and a great number of short papers. A pension of £50 was granted to her in 1864. In 1865 she married George Lillie Craik. Among her later works is *Sermons Out of Church* (1875). Her literary reputation rests chiefly upon *John Halifax, Gentleman*, a classic picture of middle-class English life, which had a remarkable success, and has appeared in frequent later editions. Some of her *Poems of Thirty Years, New and Old* (1881), such as "Douglas" and "Philip, my King," have been popular.

CRAIK, GEORGE LILLIE (1798-1866). An English miscellaneous writer. He was born at Kennoway, Fifeshire, and was educated for the Church at Saint Andrews University; but, preferring a literary career, he went to London in 1826. His first work of importance was the *Pursuit of Knowledge Under Difficulties* (1830-31), forming part of the series of publications issued by the Society for the Diffusion of Useful Knowledge. He also contributed largely to the *Penny Magazine* and the *Penny Cyclopædia*. In 1837 Craik became editor of the *Pictorial History of England*, some of the most valuable chapters of which were written by himself, and afterwards enlarged and republished separately as independent works. Such are his sketches of the *History of Literature and Learning in England from the Norman Conquest to the Present Time* (1844-45), and his *History of British Commerce* (1844). In 1845 he published *Spenser and His Poetry*, and in 1846-47 *Bacon and His Writings*. In 1849 Craik was appointed to the chair of history and English literature in Queen's College, Belfast, a situation which he occupied till his death. In 1848-50 appeared his *Romance of the Peccage*; in 1851 his *Outlines of the History of the English Language*, which has passed through various editions; and in 1856 his essays on *The English of Shakespeare*, which passed through several editions. He possessed an energetic mind, his thinking was clear, and he was careful in his statement of facts.

CRAIK, JAMES (1731-1814). The favorite physician of George Washington. He was born in Scotland. He accompanied Washington in the Braddock expedition, and subsequently entered the medical service of the Revolutionary Army, and was director of the hospital at Yorktown. He was active in the disclosure of the plot to remove Washington from command during the winter at Valley Forge (see CONWAY,

THOMAS), and was present at the surrender of Lord Cornwallis at Yorktown. After the war he settled near Mount Vernon, and attended Washington in his last illness.

CRAIK, ROBERT (1829—). A Canadian physician, born in Montreal. He studied medicine at McGill University, and in 1854 became connected with the general hospital in Montreal. In 1856 he was appointed demonstrator of anatomy at the university, and three years later was made curator of its anatomical museum. From 1860 to 1867 he held the chair of clinical surgery at the university. Meanwhile, in 1866, he was called upon to substitute for the professor of chemistry while continuing his lectures in clinical surgery, and in 1867 he decided to resign the chair of surgery and retain that of chemistry. He resigned the latter chair in 1879, but in 1889 was elected dean of the medical faculty and professor of hygiene and public health.

CRAILSHEIM, or KRAILSHEIM, kriłz'him. A town of Württemberg, Germany, on the Jagst, 47 miles northeast of Stuttgart. Its municipal offices are situated in the ancient castle of the Hohenlohes; the fifteenth-century Church of Saint John, a Gothic edifice, contains some good paintings and other interesting features, and there is a fine Rathaus. It has considerable trade, and manufactures of woollens and cement. Population, in 1900, 5255.

CRAIOVA, or KRAJOVA, kri-ō'vā. The capital of the Province of Craiova, Rumania, 112 miles west of Bucharest. It is the centre of a rich agricultural and forest region, and has considerable trade in timber, agricultural produce, and cattle. Salt is extensively mined in the neighborhood. It is a garrison town, and has large governmental industrial establishments for the manufacture of leather, rope, and carriages. In the Middle Ages it was the residence of a ban and the capital of Lower Wallachia. Population, in 1899, 45,438.

CRAKE, or CORN-CRAKE (from Icel. *kraka*, crow, so named from its cry). An English name for the land-rail (*Crex crex*), formed in imitation of its familiar cry, 'erek, erek,' which is heard from every field of grain in valleys and low grounds in Great Britain in early summer, and is associated with all that is pleasant in that pleasant season. It is a very pretty bird, of a reddish-brown color, marked with dark brown in streaks along the middle of the feathers, lighter below. (See Plate of RAILS, ETC.) Several other similar short-billed rails of the genera *Crex* and *Porzana* are often termed crakes, as the spotted crane (*Porzana porzana*), which is smaller than the corn-crake and is very similar to the American sora.

CRAKE, AUGUSTUS DAVID (1836-90). An English author. He was educated at London University, entered the ministry of the Church of England, and after holding pastorates at Bloxham and in the Isle of Wight, became Vicar of Cholsey, near Wallingford, in 1885, where he remained until his death. He was the author of a number of devotional books and of a long series of historical story-books, illustrating the history of the Church in England. His works include: *Emilius* (1871); *Evanus* (1872); *Edwy the Fair* (1874); *Alfgar the Dane* (1874); *Fairleigh Hall* (1882); *The Last Abbot of Glastonbury* (1884); *Yule-Log Stories* (1887); *Stories from*

Old English History (1887). His best-known historical work is a *History of the Church Under the Roman Empire* (1873).

CRAKEBERRY. See CROWBERRY.

CRAMER, krā'nēr, GABRIEL (1704-52). A Swiss mathematician. He was born in Geneva, and was subsequently professor of mathematics there. His chief work is a treatise on algebraic curves (Geneva, 1750); but he contributed to the subject of equations (q.v.), revived the study of determinants (q.v.), which had been begun by Leibnitz, and wrote on the physical cause of the spheroidal shape of the planets and the motion of their apses (Paris, 1730). He also edited the works of Johann Bernoulli (4 vols., Lausanne, 1742) and Jakob Bernoulli (2 vols., Geneva, 1744). In his investigation of curves Cramer generalized the problem of Pappus, to inscribe in a given circle a triangle whose sides produced shall pass through three collinear points; proved Newton's rule for determining the infinite branches of a curve; and completed the classification of cubic curves. Consult: Cantor, *Geschichte der Mathematik* (Leipzig, 1898), and Muir, *Theory of Determinants in the Historical Order of Development* (London, 1890). See CURVES.

CRAMER, JOHANN ANDREAS (1723-88). A German preacher and poet, born in Jöhstadt, Saxony. He studied theology in Leipzig, and in 1750 became chief Court preacher in Quedlinburg. In 1754 the influence of his friends Klopstock and Bernstorff secured for him an appointment to a similar position in Copenhagen, where he also became professor of theology. Owing to the antagonism of Struensee, he was subsequently banished from the country, and accepted an appointment as superintendent in Lübeck, whence he was recalled to Denmark after Struensee's execution in 1772, and appointed professor of theology and chancellor at the University of Kiel (1774). As a preacher he was unexcelled in his day, and his odes and hymns were very popular. Many of them, such as *Er ist gekommen her, Dein bin ich, Herr*, and *Der Herr ist Gott und Keiner mehr*, are still frequently sung in the Protestant churches of Germany. His collected poems were published under the respective titles, *Sämtliche Gedichte* (1782) and *Hinterlassene Gedichte* (1791).

CRAMER, JOHANN BAPTIST (1771-1858). A German pianist and composer. He was born in Mannheim, but in his infancy went to London with his father, the violinist Wilhelm Cramer, who was also his first teacher. Having completed his studies under Clementi, he appeared in public with great success at the age of seventeen, and after a concert tour in 1788-91, settled in London as a teacher. He repeatedly traveled on the Continent, and from 1832 lived in Paris, whence he returned to London in 1845. He was much admired as a pianist for his correct technique and sympathetic interpretation; his numerous compositions for the pianoforte are now antiquated, with the exception of the *Eighty-Four Studies, Op. 50*, which in their rare combination of superior technical requirements with the highest musical value have become an accepted classic, and are used in the entire musical world as models of fundamental studies for the acquirement of solid and tasteful pianoforte playing.

CRA'MER, JOHN ANTONY (1793-1848). An English philologist, born at Miltödi, Switzerland, of German parentage, and educated at Christ Church, Oxford. He was professor of modern history at Oxford from 1842 until his death, and during the last four years of his life was also Dean of Carlisle. The following are a few of his principal works: *Dissertation on the Passage of Hannibal Over the Alps* (in collaboration with H. L. Wickham; 2d ed., 1828); *Anecdota Græca e Codicibus Manuscriptis Bibliothecarum Orontisium Descripta* (4 vols., 1835-37); *Cæteræ Græcorum Patrum in Novum Testamentum* (8 vols., 1838-41).

CRA'MER, krä'mër, KARL EDUARD (1831-1901). A Swiss botanist, born in Zurich. He studied there and in Freiburg, taught for several years at the technological institute of Zurich, and in 1861 was appointed professor of botany at the Polytechnikum. In 1882 he was made director of the botanic garden in Zurich. His published works include the following: *Pflanzenphysiologische Untersuchungen*, jointly with Nägeli (1855-58); *Untersuchungen über die Ceramieccen* (1863); *Bildungsabweichungen bei einigen wichtigeren Pflanzenfamilien* (1864). He was also the author of a number of important monographs on botanical subjects, published in scientific periodicals.

CRAMP (OHG. *chrampfa*, Ger. *Krampe*, *cramp*, from OHG. *krampf*, curved, Icel. *krapp*, narrow; connected also with AS. OS. *crumb*, OHG. *krump*, Ger. *krumm*, crooked). An irregular, involuntary, and generally painful contraction of a voluntary muscle, without insensibility or other disturbance of the general system. Cramp is often the effect of cold, and has proved fatal to swimmers by attacking them suddenly when in the water. It is readily removed by warmth and friction, when due to a strained position, to cold, or prolonged contraction of a group of muscles, as in lifting a weight above the head. A swimmer attacked with cramp in the legs should turn on his back and, while floating, grasp and knead the affected muscles violently. Cramps are a distressing symptom in cholera (q.v.). They occur in colic (q.v.), in tetanus (q.v.), and in some cases of poisoning. Writers' cramp is an 'occupation neurosis' (q.v.) consisting of a spasmodic closure of the hand on attempting to write, which turns the pen over and prevents its moving. Telegraphers, brakemen on railroads, ballet-dancers, cigar-makers, and many others suffer from a cramp in the group of muscles which they use constantly in their occupations.

CRAMP, CHARLES HENRY (1828—). An American ship-builder, born in Philadelphia. He became a partner in, and later president of, the Cramp Ship-building Company. In the latter capacity he assisted in the reconstruction of the United States Navy, and the reestablishment of the United States merchant marine. The sunken battle-ship *Maine*, which was destroyed in Havana harbor on February 15, 1898, was built at the Cramp yards, in whose thirty-one acres of ground nearly 6000 workmen are employed.

CRAMP'EL, krän'pèl', PAUL (1863-91). A French traveler in Africa. He first went to the French Congo in 1886 as secretary to Savorgnan de Brazza, and in 1888-89 conducted most successfully an expedition from the Ogowe River

into the Fan country north and back to Corisco Bay. In the following year he was commissioned by the Comité de l'Afrique Française to penetrate to Lake Chad, and started from Stanley Pool with a small force of 30 Senegalese soldiers and 250 carriers, and accompanied by three Europeans. Having marched under great difficulties from Bangui on the Ubangi River northward to El Kuti, he was abandoned by his carriers, and while trying to force their way farther north, he and his remaining companions were surprised and massacred by the Semssi Moslems. Only one European escaped to bring the news to the Congo (July, 1891).

CRAMP'FISH (so called from the temporary paralysis caused by its shock). The electric ray. See TORPEDO.

CRAMP'TON, CHARLES ALBERT (1858—). An American chemist, born at Davenport, Iowa. He received his education at the University of Michigan, became assistant chemist in the United States Department of Agriculture in 1883, and, seven years later, was made chief chemist to the Internal Revenue Bureau. He carried out a number of interesting investigations in agricultural chemistry and published numerous memoirs and reports on special topics of the chemistry of food and agricultural products.

CRAMP'TON, THOMAS RUSSELL (1816-88). An English railway engineer. He was born in Kent and was educated by private tutors. Entering the engineering profession, he early turned his attention to locomotive and railway building. In 1843 he designed and patented the locomotive that is still known by his name, and which won him the cross of the French Legion of Honor from Napoleon III. in 1855. His best-known work was the successful laying of the telegraphic cable from Dover to Calais in 1851. He also constructed the Smyrna Railway, the Varna Railroad in Bulgaria, various lines in England, and the Berlin Water-Works.

CRANACH, krän'ác, LUCAS (1472-1553). A German painter, born in Upper Franconia. There is much dispute in regard to his family name, but it has been conclusively shown by Schuchardt, on Cranach's own testimony, that it was Müller. Cranach was a pupil of his father, and in 1504 became Court painter to Frederick the Wise, Elector of Saxony, at Wittenberg, by whom he was held in high repute. His office included the duties of master of ceremonies at Court, and besides this he found time for different business ventures at Wittenberg. In 1519 he was elected chairman of the town council; he became burgo-master in 1537, and again in 1540. Cranach was in equal favor with the two following Electors of Saxony, and for two years remained with John Frederick during his imprisonment. He died at Weimar, October 16, 1553.

Cranach has been called the painter of the Reformation, because of his active part in spreading its doctrines. This he did by means of paintings and woodcuts ridiculing the Pope and explaining the teachings of the Reformers, and by his numerous portraits of Luther and Melancthon, who were both his personal friends. Because of this activity and also on account of his great productiveness, he became the controlling influence in the art of middle and northern Germany, and founded what may be called the

CRANBERRY ETC.

1. COSMOS (*Cosmos tenuifolius*).
2. CRANBERRY (*Vaccinium macrocarpon*).
3. COREOPSIS (*Coreopsis lanceolata*).

4. CORN COCKLE (*Lychnis githago*).
5. COWSLIP (*Primula veris*).
6. SUNN HEMP (*Crotalaria juncea*).

Saxon School. He painted with great facility—in fact, the inscription upon his gravestone gives him the title of 'celerrimus pictor.' His early paintings were carefully executed, but in later life he did much negligent work. He paid great attention to detail, for which reason his smaller pictures were more attractive. His color was bright and clear, but his drawing was deficient, and he failed utterly whenever he attempted to represent the nude on a large scale. His work was always original, and though we see the influence of the Renaissance in his mythological subjects, his art was thoroughly German and national. It was, moreover, naïf and rich in fantasy, being best wherever there was a chance for genre.

Cranach's works survive in large numbers, especially in the German galleries. But he intrusted so much to his large school of pupils that it is difficult to decide how much is actually due to him. Among his best works are the "Repose in Egypt" (1504), now in Leipzig; "Christ Blessing the Children," in the Baring collection in London; "Samson and Delilah," in the Museum of Augsburg, and the "Fountain of Youth," in the Berlin Museum. All of these pictures possess a charming naïveté. Of his larger religious paintings, good examples are the "Marriage of Saint Catherine," in the Cathedral of Erfurt, of his earliest period, and his last great work, the "Crucifixion," in the town church of Weimar. This depicts the object of the Reformation, quaintly introducing the figures of Luther and of Cranach himself. His best works are probably his portraits, for in these the detailed execution is more appropriate. But even here he falls far short of the strength of character of Dürer and Holbein. Among the best are "Cardinal Albrecht of Mainz as Saint Jerome," in the Berlin Museum; John Frederick of Saxony, in Dresden; and an "Unknown Female" (No. 291), in the National Gallery, London. His oft-repeated portraits of Luther and Melancthon exercised a very great influence in spreading the Reformation. Cranach was also an excellent painter of miniatures, as may be seen in the album of the University of Wittenberg, now at Halle, and especially in John Frederick's "Book of Tourneys," now at Coburg, a work of 144 leaves. He also executed a few copper plates and a large number of drawings for woodcuts.

Consult: Kugler, *German, Flemish, and Dutch Schools* (Eng. trans., London, 1898); Schuchardt, *Cranach des älteren Leben und Werke* (Leipzig, 1855-71); Warnecke, *Cranach der ältere* (Görlitz, 1879); Lindau, *Lucas Cranach* (Leipzig, 1883).

CRANACH, LUCAS (1515-86), the younger. A German painter, the second son and pupil of the preceding. His works are hard to distinguish from his father's, and are often assigned to him. His coloring is heavier than his father's and his drawing is worse. A number of his works survive in Dresden, Leipzig, Weimar, and Wittenberg.

CRANBERRY (from *crane* + *berry*). A name given to the fruit of a few creeping, vine-like species of the genus *Vaccinium*, family Ericaceæ. The smaller cranberry (*Vaccinium oxycoccus*) grows wild in the peaty bogs and marsh lands of the temperate and colder regions of both Europe and America. The larger cran-

berry (*Vaccinium macrocarpon*) is native in similar situations in the United States, and is extensively cultivated for commercial purposes in Massachusetts, New Jersey, Wisconsin, and a few other Northern States. The cranberry is a firm, red, acid berry, of good keeping quality, and is used for sauce, tarts, and the like. In the improved commercial culture of cranberries, natural swamps or bogs are selected which can be drained by open ditches and flooded when desired. The native moss and swamp growth are removed, and the peat covered two to four inches deep with sand. The vines are planted about 14 inches apart, cuttings 6 to 8 inches in length being used. The sand keeps down the weeds, makes cultivation easy, and helps retain the moisture in the soil below. Additional sandings are given every four or five years, which keep the vines short and close. In some localities sanding is omitted altogether. The object of flooding is to protect the vines in winter and from early fall and late spring frosts, to destroy insects, prevent drought, and protect against fire. The berries are gathered preferably by hand, but often with special rakes and combs. There are three principal types of cultivated varieties, determined by the form of the berries—bell-shaped, bogle-shaped, and cherry-shaped—with many varieties of each. In 1900, 987,516 bushels of cranberries were marketed in the United States.

The cowberry or mountain cranberry (*Vaccinium vitis-idaea*) is common in both Europe and America, and, like *Vaccinium oxycoccus*, is gathered and sold in considerable quantities, but is not cultivated. The shrub *Viburnum opulus* is known as the high-bush cranberry. The fruit is tart, but is of little value, and is seldom eaten. The Tasmanian cranberry is the fruit of *Astroloma humifusum*, of the natural order Epacridaceæ.

CRANBERRY DISEASES. The scald, or rot, is the most serious fungous trouble of the cranberry, its name being derived from the appearance of the fruit. It is of fungous origin and may be recognized by the occurrence of a soft spot on one side of the berry. The skin becomes tense and of a reddish-brown color. Later the berry becomes shriveled and may or may not fall to the ground. Distinct brownish spots may also be seen on the leaves. The disease is most troublesome in hot, moist seasons, and the most satisfactory treatment, where it can be followed, is to cover the bog with a thin layer of sand, which can best be done when the bog is flooded. This disease has been known to destroy more than half the berries on a bog in a short time. A gall-producing fungus, *Synchytrium vaccinii*, is common on the cranberry and related plants. The presence of the fungus on the leaves and other parts of the plant causes the formation of red galls. Burning over the bog in autumn is recommended as a preventive means, since the spores are ripened the second year. Common and conspicuous malformations of leaves, flowers, and young shoots of the cranberry are due to *Exobasidium vaccinii*. The parts attacked are swollen and the green color replaced by rose or red. When severely attacked, the plants may be so affected as to reduce the crop. But the disease is seldom severe.

CRANBERRY INSECTS. The worst enemies of the cranberry are two moth caterpillars

—the black-headed fire-worm (*Rhopobata vaciniuna*), which defoliates the bushes, and a span-worm (*Acerobasis vaccinii*), which attacks the fruit. For the first, Prof. J. B. Smith, author of a treatise on "Insects Injurious Affecting Cranberries," in *Special Bulletin K, New Jersey Agricultural College Experiment Station* (New Brunswick, N. J., 1890), recommends reflowing the land and application of kerosene or Paris green; for the second, Paris green or London purple applied after the leaves are mostly gone and the berries are set. A scale, a leaf-hopper, and certain locusts and crickets are also harmful.

CRANBROOK, GATHORNE GATHORNE-HARDY, first Earl of (1814—). An English statesman, born at Bradford. He was educated at Oxford, and was appointed Under Secretary of State for the Home Department in 1858, two years after his election to Parliament. In 1865 he was again elected to Parliament as the representative of the University of Oxford, defeating Mr. Gladstone in that electoral contest. In 1867-68 he was Home Secretary, and was subsequently Minister of War (1874-78), Secretary of State for India (1878-80) under Lord Beaconsfield, and Lord Secretary of the Council under the Marquis of Salisbury (1885 and 1886-92). He was raised to the peerage in 1878 as Viscount Cranbrook, and was created Baron Medway in 1892.

CRANCH, CHRISTOPHER PEARSE (1813-92). An American artist and poet, born at Alexandria, Va. He studied theology at Cambridge, Mass., and became a Unitarian clergyman. In 1842 he retired from the ministry. He associated himself with the Transcendentalists, and wrote verse for *The Dial*, but in 1846 went to Europe to study art, remaining there until 1863. He returned to America in 1864; but after 1871 devoted himself wholly to literature, to which he had already contributed *Poems* (1844), two juveniles, *The Last of the Huggermuggers* (1856), and *Kobboltozo* (1857). His later works were a blank verse translation of the *Æneid* (1872); *Satan*, a libretto (1874); *The Bird and the Bell*, with other poems (1875); *Ariel and Caliban* (1887). He was a man of genuine culture, who, growing up in the midst of more gifted spirits, failed to make a deep impression upon his generation. He is probably best remembered for his good stanzas beginning "Thought is deeper than all speech."

CRANCH, WILLIAM (1769-1855). An American judge, born at Weymouth. He graduated at Harvard, and was admitted to the bar in 1790. In 1801 he was appointed a justice of the United States Circuit Court for the District of Columbia, and in 1805 was made Chief Justice, which position he held until his death. He published: *Reports of Cases in the United States District Court of the District of Columbia* (1801-41); and the *Supreme Court Reports* (1800-15).

CRANDALL (PHILLEO), PRUDENCE (1803-90). An American educator and philanthropist. She was born at Hopkinton, R. I., of Quaker parentage; was educated at the Friends' School in Providence, R. I.; taught for a time at Plainfield, Conn., and in 1831 established a private school for girls in Canterbury. Early in 1833 she admitted a colored girl into the school, and thereby aroused the violent opposition of her neighbors. This led her to abandon her original

plan, and to open her school unreservedly to "young ladies and little misses of color." Accordingly she issued an announcement to that effect in the *Liberator* of March 2, and early in April received fifteen or twenty colored pupils. Her neighbors then began a systematic course of persecution, and endeavored by boycott, insult, and abuse, and by enforcement of an obsolete vagrancy law, to break up the school. Public meetings were called, petitions were circulated, and on May 24 the celebrated 'Black Law' of Connecticut was passed forbidding any one to "set up or establish in this State any school, academy, or literary institution for the instruction or education of colored persons who are not inhabitants of this State," or to instruct or teach in any such school. For refusing to obey this law Miss Crandall was arrested, was imprisoned in the Canterbury jail, and in October was convicted, though the Court of Errors reversed the decision of the lower court on a technicality, in July, 1834. Soon afterwards Miss Crandall's house was assaulted and partially destroyed, and she finally decided to abandon her project. The whole affair attracted much attention throughout the country and served to intensify the conflict between the abolitionist and anti-abolitionist elements among the Northern people. A short time after giving up her school Miss Crandall married the Rev. Calvin Philleo, and passed the rest of her life in New York, Illinois, and Kansas. Consult May, *Recollections of the Anti-Slavery Conflict* (Boston, 1869).

CRANE. The largest of the wading birds (Grallæ). They constitute the family Gruidæ, which occupies a very distinctive position between the trumpeters and the rails, being connected with the latter by the limpkins, or Aramidæ. All are tall, long-legged, long-necked birds, with the head more or less naked, but sometimes tufted, rather long, straight, compressed beaks, short but powerful wings, short tails, the feet unwebbed, and the hind toe greatly elevated; they are like herons in appearance, but resemble rails in structure. One remarkable feature is the enormous development of the windpipe within the keel of the breastbone, where it is coiled and twisted before emerging into the neck; the extreme development of this is found in our American whooping crane, where the trachea reaches four or five feet in length in old age (it is perfectly straight and simple at birth), and the convolutions act like those of a French hunting-horn in producing the extraordinary resonance of tone for which the voice of this species (see IBS) is noted. About eighteen species of crane are known, representing three genera and all parts of the world except South America and the Malayan and Polynesian archipelagoes. The best-known, perhaps, is the European crane, which is about four feet high, ashy gray, with a blackish face and throat. The tertial feathers of the wings are so prolonged as to droop over the quills; their webs are fibrous and disconnected, and formerly they were much used as ornamental plumes. This peculiarity characterizes most other species to a greater or less extent, and some species have the power to elevate these plumes at will, forming a striking ornament. All the cranes of the temperate zone migrate, some going annually to the far north to breed; and the coming of flocks in the spring,

CRANES, ETC.

1. SERIEMA (*Seriema cristata*).

2. CROWNED CRANE (*Balearica pavonina*).

3. LIMPKIN (*Aramus pictus*).

4. WHOOPING CRANE (*Grus americana*).

5. TRUMPETER (*Psophia crepitans*).

always in a V-formation, and the extraordinary 'dances' with which some accompany courtship, have been observed for centuries and have caused a large body of myth and folklore to grow up about the bird during classical and mediæval times. On this point, consult C. de Kay, *Bird Gods* (New York, 1898).

The remote breeding of the European crane (*Grus grus*) in Lapland and along the northern border of Russia was little known until the mystery was solved by J. Wolley in 1853, who discovered among other new facts that the young run about as soon as they leave the egg, and that the sitting bird would not carry away eggs that had been handled, as had been commonly believed. The birds make their nests on the ground in the marshy plains that border the Arctic Sea. The whole account (*Ibis*, London, 1859) is exceedingly interesting, and is largely quoted by Stejneger in the *Standard Natural History*, vol. iv. (Boston, 1885). Other cranes of the Old World are the northwest African crowned or Balearic crane (*Balearica pavonina*), which has a top-knot like that of a peacock; and the smaller Numidian crane or demoiselle (*Grus virgo*), which in summer resides and breeds from Turkey eastward to China, and which is the one most famous for its dancing. The Manchurian crane (*Grus viridirostris*) is especially common in winter in Korea, where it is trapped in large numbers and sold to the Chinese and Japanese, who are especially fond of it, and endow it with many folklore qualities. The large Australasian crane (*Grus australasiana*) is one of the most conspicuous birds of that region, and is known to the Australians as 'native companion' because of its friendly disposition. It will sometimes follow the plowman, picking up the insects he turns out of the soil. Consult Blyth, *Natural History of the Cranes* (London, 1881).

American cranes are of three species. The greatest is the whooping crane (*Grus americana*), which is larger than the European crane, and is seldom seen except on the Western plains, where it has become rare. Two others are also species of the Western interior, and are diminishing in numbers: one is the sand-hill crane (*Grus mexicana*), and the other the little brown crane (*Grus canadensis*)—both until recently regarded as one species. Consult Coues, *Birds of the Northwest* (Washington, 1874). See Plate of CRANES, ETC.

CRANE (AS. *cran*, *cornoch*, OIG. *cranuh*, *chranih*, Ger. *Kranich*, crane; connected with Welsh, Corn., Bret. *garan*, OChurch Slav. *zherari*, Lith. *gérve*, Gk. *γέρανος*, *geranos*, crane; so called from the resemblance of the arm of the machine to the neck of the bird). A term used in mechanics to designate a hoist which can also move the load in a horizontal or lateral direction. Cranes are divided into two classes, as to their motions—viz. rotary and rectilinear—and into four groups as to their motive power—viz. hand, when operated by manual power; power, when driven by power derived from line shafting; steam, electric, hydraulic, or pneumatic, when driven by an engine or motor attached to the crane, and operated by steam, electricity, water, or air transmitted to the crane from a fixed source of supply; locomotive, when the crane is provided with its own boiler or other generator of power, and is self-propelling, usually being capable of both rotary and recti-

linear motion. Rotary and rectilinear cranes are thus subdivided: (1) Swing cranes, having rotation but no trolley motion; (2) jib cranes, having rotation and a trolley traveling on the horizontal jib; (3) column cranes, identical with the jib crane, but rotating around a fixed column, which usually supports a floor or roof above; (4) derrick cranes, identical with jib cranes, except that the head of the mast is held in position by guy rods, instead of by attachment to a roof or ceiling; (5) pillar cranes, having rotation only, the pillar or column being supported entirely from the foundations; (6) pillar jib cranes, identical with the last, except in having a jib and trolley motion; (7) walking cranes, consisting of a pillar or jib crane mounted on wheels and arranged to travel longitudinally upon one or more rails; (8) locomotive cranes, consisting of a pillar crane mounted on a truck, and provided with a steam-engine capable of propelling and rotating the crane, and of hoisting and lowering the load; (9) bridge cranes, having a fixed bridge spanning an opening and a trolley moving across the bridge; (10) tram cranes, consisting of a trunk or short bridge, traveling longitudinally on overhead rails and without trolley motion; (11) traveling cranes, consisting of a bridge, traveling longitudinally on overhead tracks, and a trolley moving transversely on the bridge; (12) gantries, consisting of an overhead bridge carried at each end by a trestle traveling on longitudinal tracks on the ground, and having a trolley moving on the bridge; (13) rotary bridge cranes, combining rotary and rectilinear movements and consisting of a bridge pivoted at one end to a central pin or post and supported at the other end on a circular truck, provided with a trolley moving on the bridge.

Cranes are built of wood and iron, but at the present time cast iron and steel are employed nearly exclusively. Hand cranes are employed for handling comparatively light loads, and the manual power is usually applied by means of a crank or cranks operating a windlass, around the drum of which the hoisting rope is wound and unwound. For heavy loads some form of mechanical power is always employed, which is applied through a suitable train of mechanism for performing the various movements of hoisting, rotation, and horizontal travel. A great variety of such mechanisms are in common use for each of the principal kinds of motive power, and for details the reader should consult special treatises on hoisting machinery. Cranes are built with capacities of from a few hundred pounds to as much as 150 tons. The traveling crane in the 12-inch gun shop at the Washington Navy-yard has a capacity of 150 tons; the span of the bridge is 59½ feet; the maximum travel of the trolley lengthwise of the bridge is 44 feet 2 inches, and its traveling speed is from 25 to 50 feet per minute; the effective lift is 40 feet, with four speeds of hoist; the speed of travel of the bridge is from 30 to 60 feet per minute.

The Finnisston Quay, at Glasgow, Scotland, is equipped with a pillar crane of 150 tons capacity. The jib is formed of two steel tubes, each 39 inches in diameter and 90 feet long; the radius of sweep for heavy lifts is 65 feet; the jib and its load are counterbalanced by a weight of 100 tons; and in a test a 130-ton load was lifted at a rate of 4 feet per minute, and a complete

revolution was made with this load in five minutes. The floating crane at Cramp's shipyard, in Philadelphia, Pa., has a steel mast 116 feet high and 3 feet in diameter, carrying a horizontal jib 65 feet long with a counterbalance arm 50 feet long which is stayed to the bottom of the mast and to the hull of the barge. The barge is 69 feet long, 62 feet wide, and 13 feet deep. This crane has a lifting capacity of 125 tons. A floating crane owned by the Chapman Wrecking Company, of New York City, has a mast 92 feet high and a jib 98 feet long, and is capable of lifting a load of 265 tons.

On board ship cranes are fitted for handling cargo, coal, boats, anchor, etc. The boat-crane of a large modern man-of-war is built up, box-girder fashion; it rises 20 or 25 feet above the skid-beams on which the boats are stowed, and the horizontal arm extends 10 or 15 feet beyond the ship's side when turned out for the purpose of lowering or hoisting a boat. The power is either electricity or steam, and serves to hoist and lower the boat, run it in or out on the horizontal arm of the crane, or train (i.e. turn horizontally) the latter. Consult: Glynn, *Treatise on the Construction of Cranes and Other Hoisting Machinery* (London, 1887); Marks, *Notes on the Construction of Cranes and Lifting Machinery* (London, 1889); and Towne, *A Treatise on Cranes* (New York, 1883). See DER-RICK.

CRANE, BRUCE (1857—). An American artist. He was born in New York, and studied there under A. H. Wyant. His landscapes are frequently exhibited, and he has become famed for his winter and snow studies. Mr. Crane became a member of the National Academy in 1879.

CRANE, ICHABOD. The lanky country school-master, and hero of the adventure with the Headless Horseman, in Washington Irving's "Legend of Sleepy Hollow," in *The Sketch Book*.

CRANE, STEPHEN (1870-1900). An American journalist and novelist, born at Newark, N. J., November 1, 1870. He was educated at Lafayette College and Syracuse University; began active life as a reporter and newspaper writer; was correspondent for the *New York Journal* in the Greco-Turkish War (1897) and in Cuba, and then removed to England. His first essay in fiction was a story of slum life, *Maggie, a Girl of the Streets* (1891). This was followed by a perversely eccentric collection of verses, *The Black Riders and Other Lines* (1895). *The Red Badge of Courage* (1896), a realistic though imaginary presentation of horrors in the Civil War, brought him deserved reputation, and marked the summit of his achievement. Less significant are: *George's Mother* (1896); *The Little Regiment* (1897); *The Open Boat; On Active Service; Whilomville Stories*, and other tales; although in such a short story as *The Master* he showed that he still possessed great power. For some time before his death he resided in England. He died at Badenweiler, Germany, June 5, 1900. Posthumous manuscripts have been collected by his wife under the title *Wounds in the Rain and Great Battles of the World*. Many magazine stories remain uncollected.

CRANE, THOMAS FREDERICK (1844—). An American folklorist and educator, born in New

York City. He graduated in 1864 at Princeton, was appointed professor of modern languages at Cornell, and in 1868 professor of the Romance languages. In 1901 he became dean of the general faculty of the university. He made valuable researches in the history of the development of European folklore, on which subject he accumulated one of the most valuable of extant libraries. His works include: *Italian Popular Tales* (1885); *The Exempla, or Illustrative Stories from the Sermones Vulgares of Jacques de Vitry* (1890); *Chansons populaires de la France* (1891); and *Tableau de la révolution française* (6th ed., 1892).

CRANE, WALTER (1845—). An English painter and engraver, born in Liverpool, August 15, 1845. He was a pupil of his father, Thomas Crane, a portrait painter, and afterwards studied under Linton in London. Among his best oil-paintings are the "Birth of Venus" and the "Fate of Proserpina;" among his aquarelles, "Plato's Garden," "Date Trees on Monte Pincio," and the "End of the Year." He is, however, best known from his illustrations in juvenile works, done in a sort of antique style, mostly in outline. Among the subjects which he has thus treated are "Echoes from Hellas;" "Flora's Feast;" and "Queen Summer." He is also known as a designer for glass windows, tapestries, and the like, and has written extensively upon subjects of general artistic interest. He belongs to the Morris group of Socialists. He has received many medals, is president of the Arts and Crafts Society of London, and is prominently identified with popular art movements in England.

CRANE, WILLIAM HENRY (1845—). An American comedian. He was born in Leicester, Mass., and was educated in the Boston schools. In 1863, after some amateur experience, he made his debut at Utica, N. Y., with the Holman Opera Company, taking the part of the notary in Donizetti's *Daughter of the Regiment*. In 1865 he turned his attention to comedy, and in 1870 became a member of the Alice Oates Company, with which he remained for four years. In 1874 he played at Hooley's Theatre in Chicago, filling the leading comedy rôles, and later he acted in San Francisco for nearly a year. Returning East, he made his first marked success with Stuart Robson (1877), at the Park Theatre, New York City, in Grover's farcical play *Our Boarding House*. Among their other successes were those in the *Comedy of Errors* and *The Henrietta* (1889), after which he separated from Mr. Robson. Since then he has added to his reputation by his excellent work in *The Senator; The American Minister; A Fool of Fortune; A Virginia Courtship* (1898); and *David Harum* (1900). Crane's speciality is eccentric American character.

CRANE-FLY (so called from its long legs). A big, slender-bodied fly of the family Tipulidae, having excessively long, slender legs. These flies appear, often in swarms, in late summer, and about 300 of the thousand or more known species belong to the United States. Their modes of life and reproduction are not well known. "The larvæ of most species," according to Howard, "live in the earth, but some live in water, in decomposing wood, and even upon the leaves of plants. Some of the earth-inhabit-

ing forms destroy grass and grain by injuring the roots. . . . The wings of the crane-flies are generally clear, but are sometimes beautifully marked and spotted." See DADDY-LONG-LEGS.

CRANE'S-BILL. See GERANIUM.

CRA'NIAL INDEX. See ANTHROPOMETRY.

CRANIOMETRY (from Gk. *κρανιον*, *kranion*, skull + *μετρον*, *metron*, measure) and **CRANIOL-OGY.** Systematic measurement and comparison of human crania. See ANTHROPOMETRY; MAN, SCIENCE OF.

CRANIUM. See SKULL.

CRANK. A mechanical device consisting of a bend or arm on an axle or shaft by which reciprocating motion is converted into rotary motion. The reciprocating motion of the piston-rod of a steam-engine is converted into rotary motion of the engine-shaft by means of a crank. The crank may consist of an arm on the end of a shaft or of a similarly located disk with a crank-pin, or of a U-shaped bend in the shaft between the ends. The piston-rod transmits its

CRANKS.

1, single crank at end of an axle; 2, double crank in the middle of a shaft; 3, bell crank.

motion to the crank by means of an intermediate connecting-rod. The connecting-rod exercises the maximum force on the crank-arm when this arm is at right angles to the line of motion of the piston-rod, and it exercises no force tending to produce rotation when the crank-arm is parallel to the line of motion of the piston-rod. Maximum force occurs at two points in the rotation of the crank, and no force occurs at two points at right angles to the points of maximum force. The two points of no force are called the dead points; and, in order to carry the crank over these dead points, where only a single connecting-rod is used, the shaft is provided with a heavy fly-wheel, the momentum of which supplies the necessary power to keep up rotation when the connecting-rod is not supplying power. When two connecting-rods are connected with the shaft by separate cranks, the two crank-arms are set at right angles to each other, so that one rod is exerting its maximum force while the other is at the dead points of the revolution.

CRANMER, THOMAS (1489-1556). Reformer of the English Church, and the first Protestant Archbishop of Canterbury. He was born at Aslaeton, in the county of Nottingham, on July 2, 1489. In his fourteenth year he went to Jesus College, Cambridge, of which he was elected a fellow in 1510, but lost his position temporarily by marriage, being reelected on his wife's death. In 1523 he took his degree of D.D., and was appointed lecturer on theology. In 1529, during the prevalence of the sweating sickness in Cambridge, he retired with two pupils to Waltham Abbey; and Henry VIII., in company with Gardiner and Fox, afterwards

bishops of Winchester and Hereford, happening to be in the neighborhood, the event proved a turning-point in the life of Cranmer. The King was then taking steps to secure his divorce from Catharine of Aragon, and, in conversation on the subject with Gardiner and Fox, Cranmer suggested that if the universities could be induced to declare that, in their opinion, the first marriage was unlawful, the King would be free to marry again. Henry was greatly pleased with this idea, and "swore by the Mother of God, that man hath the right sow by the ear." Cranmer was asked to reduce his suggestion to writing, and to have it submitted to the European universities. After this he was appointed Archdeacon of Taunton, and one of the royal chaplains. He was also sent to Rome on a special embassy in the matter of the divorce, but met with little success. Subsequently he was dispatched to the Emperor Charles V. on the same errand; and while in Germany he married a second time, a niece of the German divine Osiander. Shortly afterwards, on the death of Archbishop Warham, he was recalled to fill the vacant see of Canterbury. He was consecrated archbishop March 30, 1533. Under his auspices Henry's divorce was speedily carried through the Archbishop's Court at Dunstable, and on May 28 he announced the legality of the King's marriage to Anne Boleyn, which had taken place four months before. In Anne's subsequent disgrace, and again in the affair of Anne of Cleves, the Archbishop took a part not very creditable to him. His position was no doubt a difficult one; but his character was naturally pliable and timid, rather than resolved and consistent. The same spirit characterizes the measures of religious reform which were promoted by him. On the one hand he joined actively with Henry in restricting the power of the Pope, though he seems to have had less to do with suppressing the monasteries; but, on the other hand, he was no less active in persecuting men like Frith, Forrest, and others, who, on matters of religious faith, were disposed to advance further than himself or the King. He did what he could, however, to resist the reactionary movement which took place in 1539, and which is known by the institution of the *six articles*. He was also instrumental in promoting the translation and circulation of the Scriptures. On Henry VIII.'s death Cranmer was appointed one of the regents of the kingdom, and, along with Latimer and others, largely contributed to the advance of the Protestant cause during the reign of Edward VI. He assisted in the compilation of the service-book and the articles of religion. The latter are said to have been chiefly composed by him. He was also the author of four of the homilies.

On the accession of Mary he was committed to the Tower, together with Latimer and Ridley. In March, 1554, they were removed to Oxford and confined there in the common prison, called the Bocardo. Latimer and Ridley bore their cruel fate with magnanimous courage; but the spirit and principles of Cranmer temporarily gave way under the severity of his sufferings. He was induced to sign no fewer than seven recantations, though there is no ground for supposing that a hope of pardon was held out to him. On March 21, 1556, he suffered martyrdom, as his fellow-reformers had done, opposite

Balliol College. His courage returned at the end, and he showed an unexpected fortitude in the midst of the flames.

Cranmer's principal writings have been edited by Jenkyns, *Remains of Archbishop Cranmer* (Oxford, 1833), and by Cox, for the Parker Society, under the titles *Writings and Disputations Relative to the Lord's Supper* (Cambridge, 1844) and *Miscellaneous Writings and Letters* (Cambridge, 1846). Additional material is to be found in the appendix of Strype, *Memorials of Thomas Cranmer* (Oxford, 1848-54), and his *Ecclesiastical Memorials* (Oxford, 1822); in Nichols, *Narratives of the Reformation*, Camden Society, from the papers of John Foxe (London, 1859); but above all in Brewer and Gairdner, *Calendars of Letters and Papers, Foreign and Domestic, of the Reign of Henry VIII.* (London, 1862-80). Among older works, consult: Foxe, *Acts and Monuments* (London, 1877); Burnet, *History of the Reformation* (New York, 1842); and the *Lives* by Todd (London, 1861) and Le Bas (London, 1833). More recent works are: Dean Hook, "Thomas Cranmer," in his *Lives of the Archbishops*, New Series (London, 1868); Green, *History of the English People*, vol. ii. (New York, 1879); Lingard, *History of England*, vol. v. (London, 1854); and Froude, *History of England*, vols. i.-vi. (New York, 1870).

CRAN'NOGS, or CRANNOGES (Ir. *crannog*, Gael. *crannag*, pulpit, top of a mast, from Ir. Gael. *cram*, tree, Welsh *prenn*, Corn. *preu*, tree; probably connected with Gk. *κράνον*, *kranon*. Lat. *cornus*, cornel-tree, Lith. *kirna*, OPruss. *kirno*, shrub). Ancient lake-dwellings of Ireland and Scotland. Usually the dwellings were extended into villages, often occupying islands; they were analogous to the lake-dwellings (q.v.) or palafittes of Switzerland, and to types of structure still existing in various regions. Commonly they were supported wholly or in part on piles set in the lake bottom, and were connected by platforms. The type persisted in Ireland from an early prehistoric period, when stone implements were used, until the present millennium. The later examples were built by means of bronze and even iron tools, which are sometimes found in the ruins. The refuse heaps below the ancient structures are rich sources of relics, indicating the industrial and artistic status of the builders, their food habits, domestic and game animals, etc. Historical references to the structures began with the earliest Irish annals, about the ninth century, and continued until the middle of the seventeenth century. The archaeological survey and excavation of the ruins began in 1839, when Wilde explored a crannog in Lake Lagore, County Meath. Consult: Wilde's *Catalogue of the Museum of the Royal Irish Academy*; Munro's *Lake-Dwellings of Europe*; and *Ancient Scottish Lake-Dwellings, or Crannogs, etc.*

CRAN'STON. A residential town in Providence County, R. I., including several villages; on the New York, New Haven and Hartford Railroad (Map: Rhode Island, C 2). The principal industries are market-gardening, brewing, and the manufacture of cotton and print goods and wire. Within the precincts of the town are four village libraries, State reform schools for boys and girls, and the State prison, almshouse, insane asylum, and workhouse. The government is administered by annual town meetings. Cran-

ston, settled in 1638, was set off from Providence and incorporated in 1754. Population, in 1890, 8099; in 1900, 13,343.

CRANSTON, EARL (1840—). An American Methodist Episcopal bishop, born at Athens, Ohio. After graduating at Ohio University, in his native town, he entered the cavalry service of his State, served from 1862 to 1864, and was advanced to the rank of captain. He was publishing agent of the Methodist Episcopal Church from 1884 to 1896, when he was elected bishop. In 1898 he began a tour, lasting about two years, through China, Japan, and Korea.

CRANSTOUN, HENRY. A character in Sir Walter Scott's *Lay of the Last Minstrel*, who wins the hand of Margaret, daughter of his enemy, the Lady of Branksome, by assuming the guise of William of Deloraine.

CRAN'TOR (Lat., from Gk. *Κράτωρ*, *Krantōr*). A Greek academic philosopher, who lived about B.C. 300. He was born at Soli, in Cilicia, but went to Athens, where he became a pupil of Xenocrates. He was the first commentator on Plato, and wrote, among other works, *Περὶ Πύθωος*, *Peri Penthous*, or a *Treatise on Affliction*, from which Cicero borrowed largely in writing the third book of the *Tusculanae*, and the lost treatise *De Consolatione*. Horace (*Epodes* 1, 2, 4) classes him with Chrysippus as a moral philosopher. Consult Kayser, *Dissertatio de Crantoræ Academicæ*.

CRAN'WORTH. ROBERT MONSEY ROLFE, Baron (1790-1868). An English jurist. He was educated at Cambridge, was called to the bar in 1816, and was a member of Parliament and Solicitor-General from 1832 to 1839, when he became Baron of the Exchequer. In 1851 he was raised to the peerage, and in the following year was chosen Lord Chancellor in Lord Aberdeen's Cabinet. He resigned in 1858, but again occupied the post in 1865-66. He carried through Parliament a bill by which penal servitude was substituted for transportation, and the ticket-of-leave system was put in operation.

CRAPAUD, *krá'pó'*, JEAN, or JOHNNY. An English nickname for a Frenchman, from the popular belief that all Frenchmen were frog-eaters, *crapaud* meaning a frog or toad. The real origin of the term has been found in the arms of the old French kings, which bore three toads, later changed into the *fleurs-de-lis*.

CRAPE (Fr. *crépe*, OF. *crepspe*, crinkled, from Lat. *crispus*, crisp). A thin fabric made of raw silk which has been tightly twisted, without removing the viscous matter with which it is covered when spun by the worm. It is simply woven as a thin gauze, then dressed with a thick solution of gum, which in drying causes the threads partially to untwist, and thus gives a crinkled and rough appearance to the fabric. It is manufactured both in black and colors. Black crape is usually worn as mourning apparel, a use of the material which originated at Bologna, Italy. The Japanese and Chinese crapes are often white, or highly colored, and sometimes are adorned with ornamental designs. Crape-cloth is made to imitate the silk fabric by passing a form of woolen cloth through rollers which impart the crinkled surface.

CRAPE-MYRTLE. See LAGERSTREMIÆ.

CRAPPIE (possibly connected with Fr. *crappe*, crab-fish). A sunfish (*Pomoxys annularis*) of the rivers of the Mississippi Valley and Alleghenies, closely resembling in appearance and habits the calico-bass, and valued as a food-fish. It is distinguished from its congeners chiefly by the S-shaped profile of the head and the duller tone of its greenish hues. Also called 'bachelor,' 'new light,' 'Campbellite,' etc. See Plate of Bass.

CRAPS. A game of chance, played by any number of persons with two dice. The player holding the dice decides the amount to be played for, and this sum may be made up by one or more persons. After the total amount to be played for is made up, the person holding the dice 'shoots.' Should his first throw be two or twelve, it is 'craps,' and he loses; should he shoot seven or eleven, he wins. Should he throw any other number, then he continues to 'shoot' until he throws that number again and wins, or seven and loses.

CRASH'AW, RICHARD (c.1613-49). An English poet. He was the son of a clergyman in the English Church, and was educated at the Charterhouse, and at Cambridge, where he obtained a fellowship in 1637. In 1644 he was ejected from his fellowship by the Parliament for refusing to take the covenant. He went to France, adopted the Roman Catholic faith, and suffered great pecuniary distress, until, through Cowley's influence, he was introduced to Queen Henrietta Maria, who recommended him to Cardinal Palotta at Rome. The cardinal made him an attendant, and afterwards sub-canon in the Church of Our Lady of Loreto. Just after this latter appointment, Crashaw died, August 25, 1649. In 1634 Crashaw published a volume of Latin poems, in which appeared the famous line on the miracle at Cana, *Nympha pudica Deum vidit et erubuit* (The modest water saw its God and blushed). In 1646 appeared a volume of poems in two parts, one containing religious and the other secular poems, under the titles (abbreviated), *Steps to the Temple*, and *The Delights of the Muses*. Another (third) edition, with additions, was published in Paris in 1652. This volume is ornamented with twelve vignette engravings, drawn by Crashaw himself. Recent editions of Crashaw are by W. D. Turnbull (1858) and by A. B. Grosart (1872, with supplement in 1888). Crashaw belongs to a group of religious poets among whom are George Herbert and Henry Vaughan. His fancies and conceits seem over-subtle and artificial, but there is in his work great copiousness and beauty of language.

CRAS'IS. See ORTHOGRAPHY, FIGURES OF.

CRAS'SUS. LUCIUS LICINIUS (B.C. 140-91). A Roman orator, who excelled all others of his time. He was as distinguished for his wit as for his rectitude in the capacity of proconsul. In B.C. 95 he was elected consul, along with Quintus Mucius Sævola (who had been his colleague in all his previous offices). During their consulship was enacted the *Lex Licinia Mucia de Ciribus Regundis*, banishing from Rome all freemen who had not the full rights of citizens. This embittered the feelings of foreigners toward Rome, and partly led to the Social War. As censor (B.C. 92) he closed all the schools of the rhetors—asserting that they had exercised a bad influ-

ence on the minds of young men. He died in consequence of the excitement attending a debate in the Senate.

CRASSUS, MARCUS LICINIUS (?—B.C. 53). A Roman triumvir. He was a zealous partisan of Sulla, and rendered him efficient service in the battle at the Colline Gate, B.C. 82, which sealed the fate of the Marians. As praetor he crushed the revolt of the gladiators under Spartacus in B.C. 71, and in the following year was made consul with Pompeius, a colleague whom he hated. On the other hand, Caesar valued the friendship of Crassus, the most wealthy of Roman citizens. During his consulate Crassus gave a feast to the people, which was spread on 10,000 tables, and distributed a provision of corn for three months. Plutarch estimates the wealth of Crassus at more than 7000 talents, and Pliny states that his lands were worth 8000 talents. In B.C. 60 Caesar, Pompeius, and Crassus entered into the first triumvirate. (See CESAR.) In B.C. 55, as consul with Pompeius, he obtained the Province of Syria, and professed to make preparations of war against the Parthians; but the acquisition of more wealth seems to have been his main object, and this he effected by plundering the towns and temples in Syria. At length, however, he undertook a campaign in B.C. 54, after which he returned to Syria. In the following year he set out again, but was misguided by a treacherous Arab, and utterly defeated at the river Bilechas by the Parthians. Crassus now retreated to the town of Carrhae, intending to pass into Armenia; but was beguiled into a conference with the Parthian general, Surenas, and was slain at the appointed place of meeting. His quaestor, Cassius, with 500 cavalry, escaped into Syria; but the remaining Romans were scattered and made prisoners, or put to death.

CRATÆGUS (Neo-Lat., from Gk. *κράταιγος*, *krataigos*, a kind of thorn). A genus of plants of the natural order Rosaceæ, very nearly allied to *Mespilus* (medlar) and *Pyrus* (pear, apple, etc.). The species are about seventy, natives of the temperate parts of the Northern Hemisphere, being well represented in North America, and in general have flowers in beautiful terminal corymbs. They are all large shrubs or small trees, more or less spiny, hence the name thorn has been very generally applied to them. The only native of Great Britain is the common hawthorn (q.v.) (*Cratægus oxyacantha*). Most of the species resemble it in habit, size, form of leaf, etc. A number of species are now frequent in plantations and shrubberies. Of these, perhaps the most common is the cockspur thorn (*Cratægus crus-galli*), a native of North America from Canada to South Carolina. Its leaves are not lobed; its fruit is rather larger than that of the hawthorn. The azarole (*Cratægus azarolus*), and the aronia, a native of the south of Europe and of the Levant, are occasionally cultivated for their fruit, which is about the size of the Siberian crab, and is used either for dessert or for pies. *Cratægus orientalis* and *Cratægus tanacetifolia* have also fruit of considerable size. The latter is much eaten in Armenia. *Cratægus Mexicana* has a large, but inedible, apple-like fruit. It is, however, very ornamental. After the cockspur thorn, the best-known of the American species are probably the scarlet thorn (*Cratægus coccinea*),

Washington thorn (*Cratægus cordata*), *Cratægus Douglasi*, and *Cratægus punctata*. The wood of most of the species much resembles that of the hawthorn. It is common to graft the rarer species on the hawthorn.

CRATCH CRADLE (from OF. *creche*, Ger. *Krippe*, crib), also called CAT'S CRADLE and SCRATCH CRADLE. A childish game, played by two persons holding an endless string symmetrically in the fingers of the two hands, and taking it off each other's hands, so as to form a new pattern at once.

CRATCH'IT, BOB. The father of Tiny Tim in Dickens's *Christmas Carol*—a good-hearted little man, the poorly paid clerk of the miserly Scrooge.

CRATCHIT, TIM. In Dickens's *Christmas Carol*, the crippled son of Bob Cratchit, known as 'Tiny Tim.'

CRATER (Lat., from Gk. *κρατήρ*, *kratēr*, mixing-bowl, from *κερᾶνναι*, *kerannnai*, to mix). The bowl-shaped or conical cavity through which materials are ejected during a volcanic eruption. At the bottom the crater communicates by a pipe or chimney with the heated interior of the earth. When of small size a volcano usually erupts through a single crater at the summit, but, as the mountain mass increases by accumulation of material, the lava may find lines of lesser resistance through fissures in the sides. In this way subsidiary craters are formed, one of which in the course of time may become the principal crater, or they all may be buried beneath the renewed outpourings of the primary crater. The Peak of Teneriffe has a number of minor funnels on its sides and summit. In volcanoes of an explosive type, the whole top of the mountain may be blown off during an eruption, forming an immense crater, within which subsequently new cones may arise in concentric arrangement. This structure, called 'cone-in-cone,' is shown by Vesuvius, whose active crater is partially encircled by a rampart (Monte Somma) many miles in diameter. Volcanello of the Lipari Islands has three craters on the summit. The craters of extinct or dormant volcanoes are sometimes filled with water, and thus are formed crater lakes. Many of the beautiful lakes of Italy and the well-known Crater Lake of Oregon originated in this way. See VOLCANO.

CRATER, THE. A novel by James Fenimore Cooper (1847), describing a Utopian settlement on the Pacific Coast.

CRATER LAKE. A lake in Klamath County, Ore., in the Cascade Mountains, lying at an altitude of over 6200 feet above the sea. It is of exceptional interest on account of its location in the crater of a partly destroyed volcano (Map: Oregon, C 7). It is about 20 miles in circumference and is completely surrounded by cliffs varying in height from 500 to 2000 feet. Judging from its existing state, the cone once must have extended upward a considerable distance above the present cliffs, the destruction of the upper portion being attributed to explosive activity.

CRATERUS (Lat., from Gk. *Κρατερὸς*, *Krateros*). One of the favorite generals of Alexander the Great. He commanded a division of the royal body-guard in the Asiatic campaigns, and was sent back to Macedonia as regent, by the

King, in B.C. 323. On the division of the empire after the death of Alexander, Craterus received, jointly with Antipater, the government of Macedonia, Greece, Illyria, and Epirus, Antipater taking command of the military forces and Craterus attending to civil affairs. He formed an alliance with Antigonus (q.v.) against Perdiccas and invaded Asia with an army, but was defeated and slain by Eumenes in Cappadocia (B.C. 321).

CRATES, *krátēs* (Lat., from Gk. *Κράτης*, *Kratēs*). An Athenian comic poet of the fifth century B.C. He began his career as an actor in Cratinus's plays, and won his first victory in B.C. 449. Aristotle says that he was the first to give up personal satire in comedy; he likewise made the innovation of introducing a drunken character on the stage. We have the titles of fifteen plays and scanty fragments. Consult Koek, *Comicorum Atticorum Fragmenta* (Leipzig, 1880).

CRATES. A cynic philosopher of Thebes, of the fourth century B.C. Scorning the large property which he inherited, he moved to Athens and became an eager disciple of Diogenes and one of the most eminent of the Cynics. He was an excellent orator and skillful poet. Interesting fragments of his poetry have been edited by Bergk, *Poetæ Lyrici Græci* (Leipzig, 1882). The thirty-six letters which bear his name are generally thought to be spurious. They are edited by Hercher, *Epistolographi Græci* (Paris, 1873). Consult, also, Zeller, *Philosophie der Griechen*, vol. i. (Tübingen, 1892).

CRATES. A Greek grammarian and Stoic of the second century B.C. He was the head of the Pergamene Library and the chief opponent of Aristarchus. He devoted himself to the interpretation of Greek authors, especially of Homer; he likewise defended the grammatical theory of anomaly in opposition to the Alexandrian doctrine of analogy. (See ANOMALISTS AND ANALOGISTS.) He assisted in enlarging and cataloguing the Pergamene Library; and his work on the Attic dialect was much employed by later grammarians. About 167 B.C. he was sent by King Attalus on an embassy to Rome, where he introduced the study of formal grammar. Consult: Wachsmuth, *De Cratete Mallota* (Leipzig, 1860); Susemihl, *Geschichte der griech. Litteratur in der Alexandriner Zeit*, vol. ii. (Leipzig, 1892).

CRATINUS (Lat., from Gk. *Κρατίνος*, *Kratinos*) (? c.421 B.C.). An Athenian comic poet. He was born in the latter part of the sixth century B.C., and was one of the seven poets of the Old Comedy named in the canon of the Alexandrians. He first presented a comedy in 453; in all he left twenty-one plays with which he had won nine victories. He is said to have been the first to give comedy a political turn, and by the introduction of a third actor to place it on a level with tragedy. A follower of Cimon and the Conservative Party, he sharply attacked Pericles in two plays; and in his *Ἀρχιλοχοί*, *Archilochoi*, he represented a contest of poets which may well have been Aristophanes's model in his *Frogs*. Aristophanes defeated Cratinus in 425 with his *Acharnians*, and in 424 with the *Knights*. In the parabasis of the latter play he refers to his elder rival as 'an ancient ruin,' whereupon Cratinus retorted in 423 with his

Wineflask, which won the first prize over Aristophanes's *Clouds*. The fragments of his work are collected by Kock, *Comicorum Atticorum Fragmenta*, vol. i. (Leipzig, 1880).

CRATIPPUS (Lat., from Gk. Κράτιππος, *Kratippos*). A Peripatetic philosopher. He was a native of Mitylene, and a contemporary of Cicero. He appears to have been held in the highest estimation by the great men of his age. Cicero calls him the prince of all the philosophers whom he had known. Cratippus accompanied Pompeius in the latter's flight after the defeat at Pharsalia, and conferred upon him the consolations of philosophy; and Brutus went to Athens, where Cratippus had lately settled, to listen to his lectures even while making preparations to meet Octavius and Antonius. Nothing that Cratippus wrote has survived.

CRAUK, krá'úk'. GUSTAVE ADOLPHE DÉSIÉ (1827—). A French sculptor, born in Valenciennes. He was a pupil of Pradier, and won the Prix de Rome in 1851. His works are to be found in many of the public buildings and churches of Paris, and in the museums of Versailles, Amiens, Grenoble, Lille, and Valenciennes. Among them are: "Victory Crowning the French Flag" (1864), a bronze group, his masterpiece; "Twilight" (1870); the monument to Admiral Coligny (1899); "Youth and Love" (in the Luxembourg); and the bronze statue of Dupuytren.

CRAVEN, ALFRED WINGATE (1810-79). An American civil engineer, born in Washington, D. C. He was appointed engineer commissioner to the Croton Water Board in New York City in 1849, and his connection with that board was notable for the number and value of the works which he projected and superintended. Among these were the Central Park Reservoir, completed in 1867; the reservoir at Boyd's Corners, and the survey of the Croton Valley. The establishment of the sewerage system of New York is largely due to his endeavors. He was the first president of the American Society of Civil Engineers.

CRAVEN, ELLIJAH RICHARDSON (1824—). An American clergyman, born in Washington, D. C. He was educated at the College of New Jersey and at Princeton Theological Seminary, and in 1865 he was appointed a director of Princeton. In 1878 he became chairman of the committee appointed to revise the Book of Discipline of the Presbyterian Church, and he was made Moderator of the General Assembly of that Church in 1885. Afterwards he served as president of the board of directors of the Newark German Theological Seminary, Bloomfield, N. J. For more than thirty years (1854-87) he was pastor of the Third Presbyterian Church in Newark, N. J. In 1887 he became secretary of the Presbyterian Board of Publication. He translated Lange's *Commentary on the Revelation*.

CRAVEN, ELIZABETH BERKELEY, Lady. See ANSPACH, MARGRAVINE OF.

CRAVEN, PAULINE DE LA FERRONAYS, Madame AUGUSTUS (1820-91). A French religious romancer, born in Paris. She is best known for her *Histoire d'une sœur* (1866), an idyllic picture of an aristocratic Roman Catholic French family and of the slow passing-away, through consumption, of a simple-minded, noble, and deeply religious woman. Madame Craven's father

was at one time French ambassador to Berlin. She traveled widely, and after marriage lived much in England, writing articles on English politics, and biographical sketches of *Sister Nathalie Narishkine* and of *Lady Georgiana Fullerton*, as well as *Reminiscences* of England and Italy. She died in Paris, April 1, 1891. Her novels have been as popular perhaps in English translations as in the original. The best are: *Anne Severin*; *The Enigma's Answer*; and *Fleurange*, in all of which she pleads persuasively the cause of Roman Catholicism, and seeks in emotional ecstasy the only life that seems to her worth the living. To some her books will seem morbid, to others strong, but her fervid spirit appeals to all.

CRAVEN, THOMAS (1808-87). An American naval officer, born in Washington, D. C. He entered the navy in 1822; took part in the capture of the pirate *Federal*, in the West Indies, in 1828; and commanded Captain Wilkes's flagship in the Antarctic exploring expedition in 1838. He was commissioned captain in 1861, commanded the Potomac flotilla, and in the same year took part in the capture of New Orleans and the operations on the Mississippi. In 1866 he was assigned to the command of the Mare Island Navy-yard and was raised to the rank of rear-admiral.

CRAVEN, TUNIS AUGUSTUS MACDONOUGH (1813-64). An American naval officer, brother of Thomas Craven (q.v.). He was born in Portsmouth, N. H.; entered the navy in 1829; took part in the conquest of California, and in 1857 made a survey of the Isthmus of Darien for a prospective ship-canal. He saved the fort at Key West for the United States Government at the beginning of the Civil War, and was promoted to the rank of commander. While chasing the Confederate ram *Tennessee*, in the battle of Mobile Bay, his vessel, the monitor *Tecumseh*, struck a torpedo, and sank with himself and nearly every one on board.

CRAWFISH, or **CRAYFISH** (OF. *crevice*, *crevisse*, Fr. *écrevisse*, from OHG. *ehrebiz*, Ger. *Krebs*, crawfish). A fresh-water or terrestrial crustacean (*Istacus fluvialilis*) nearly allied to the lobster, from which, however, it differs in having the middle plate of the tail-fin transversely divided by a suture. It inhabits the rivers and streams of many parts of Europe, making burrows in clayey banks, and coming forth at night in search of food, which consists chiefly of mollusks, small fishes, larvæ of aquatic insects, and animal substances of almost any kind. It is esteemed for the table, and is readily attracted by a bait of decaying flesh or animal garbage inclosed in a net or in a bundle of twigs, by which many crawfish may be captured at a time. The use of the name has been extended until it is now applied to any of the fresh-water species of the family Astacidae. In the United States it is universally applied to any one of several species of *Cambarus*, which agree very closely in structure and habits with the common crawfish of Europe. They are six inches or so in length and of a greenish-brown color. They frequently do much damage to dikes and levees by opening water passages, as told in *Proc. Assoc. Econom. Entomologists* for 1895 (U. S. Dept. Agric., 1896). For general facts, consult Huxley, *The Crayfish: An Introduction to*

Zoölogy (London, 1887); "Revision of the *Astacidae*," *Memoirs Museum Comparative Zoölogy*, vol. x., No. 4 (Cambridge, Mass., 1885).

CRAWFORD, FRANCIS MARION (1854—). An American novelist, chiefly resident in Europe. He was born at Bagni di Lucca, Italy, a son of the sculptor Thomas Crawford. Of cosmopolitan education in America, England, and Germany, his first literary venture was as editor of the *Allahabad Indian Herald* (1879-80). His voluminous fiction was begun by *Mr. Isaacs*, a story of modern India (1882). The more significant of its frequent successors are *Dr. Claudius* (1883), *A Roman Singer* (1884), *Zoroaster* (1885), *A Tale of a Lonely Parish* (1886), *Saracinesca* (1887), *Paul Patoff* (1887), *Greifenstein* (1889), *Sant' Ilario* (1889), *A Cigarette Maker's Romance* (1890), *The Witch of Prague* (1891), *Don Orsino* (1892), *Pietro Ghisleri* (1893), *The Ralstons* (1894), *Casa Braccio* (1895), *Corleone* (1897), *Via Crucis* (1899), and *In the Palace of the King* (1900). Historical and descriptive are *Constantinople*, a book of travels, *Ave Roma Immortalis* (1898), and *Rulers of the South* (1900). In 1893 he published a slight brochure, entitled *The Novel: What It Is*. The *Saracinesca* series, the scenes of which are laid in modern Rome, is generally regarded as his most important performance; his strictly American fiction is less popular. Few recent novelists have held their readers more steadily than Mr. Crawford, in spite of the great number of his books.

CRAWFORD, GEORGE WASHINGTON (1798-1872). An American lawyer and statesman. He was born in Georgia, graduated at Princeton in 1820, and in 1822 was admitted to the bar. From 1827 to 1831, he was State Attorney-General, and from 1837 to 1842, with the exception of one year, was a member of the State Legislature. In 1846 he was in Congress, in 1843 and 1845 was elected Governor of Georgia, and from 1849 to 1850 was Secretary of War in President Taylor's Cabinet.

CRAWFORD, ISABELLA VALANCY (1851-87). A Canadian poet. She was born in Dublin, Ireland, went to Ontario as a child, and lived at Peterboro and Toronto. She wrote verse showing marked originality and intense lyrical power, comprised mostly in *Old Spookses' Pass*, *Malcolm's Katie*, and *Other Poems* (1884).

CRAWFORD, LORD. The captain of the Scottish archers, the body-guard of Louis XI., in Scott's *Quentin Durward*.

CRAWFORD, NATHANIEL MACON (1811-71). An American educator, born in Georgia. He graduated at the University of Georgia in 1829, taught mathematics, and became a Baptist minister. In 1846 he was appointed professor of theology in Mercer University, becoming president of this institution in 1856. He accepted the presidency of Georgetown College, in Kentucky, in 1865, and remained in this position almost to the time of his death. He published *Christian Paradoxes*.

CRAWFORD, THOMAS (1814-57). An American sculptor, born in New York, March 22, 1814. He was a contemporary of Hiram Powers, and, like him, passed much of his time in Rome, where his studio was the resort of travelers and lovers of art. He studied in Rome under Thorwaldsen. His life was comparatively short, but

he has left many interesting examples of his work. Munich was especially appreciative of his art, and celebrated the casting of two of his large statues by impromptu festivals. His monument to Washington, cast in bronze in Munich, was after his death completed by Randolph Rogers. He died in London, October 16, 1857. Among his principal works are the "Statue of Beethoven," placed in the Boston Music Hall, and "The Indian," to be seen in the New York Historical Society. His "Orpheus," "Adam and Eve After the Expulsion," and a bust of Josiah Quincy, are in the Boston Athenæum. The figure of "Liberty," on the Capitol in Washington, is his, and he designed the pediment and bronze doors of this building. Among his smaller works are "Flora," "Mercury and Psyche," "Daughters of Herodias," and "Aurora." Crawford executed many bas-reliefs, and eighty-seven of his plaster casts were presented by his wife to the Commissioners of Central Park, who arranged them in a building for public exhibition.

CRAWFORD, WILLIAM (1732-82). An American soldier, born in Berkeley County, Va. He was for a time assistant surveyor to George Washington, and he served as ensign of Virginia Rifles in the French and Indian War. He accompanied Braddock's luckless expedition against Fort Duquesne in 1755, and in 1776 was appointed lieutenant-colonel of the Fifth Virginia Regiment. In 1781 he resigned from the army with the rank of colonel. At the request of Washington, and of General Irvine, he assumed command in 1782 of an expedition against the Delaware and Wyandot Indians near the Sandusky River, who had long devastated the frontier. On June 4, on the plains northeast of the present site of Sandusky, he encountered a combined force of about three hundred Indians and British soldiers from Detroit. His troops having been discouraged by the accession of reinforcements to the enemy, he ordered a retreat which soon became a confused flight. He was himself separated from the main body, captured by a band of Delawares, and burned at the stake amid fearful torture. Notwithstanding his wholly creditable Revolutionary record, his leadership on this occasion appears scarcely to have been efficient. Consult: Butterfield, *Expedition Against Sandusky* (Cincinnati, 1873); Roosevelt, *The Winning of the West*, vol. ii. (New York, 1896); and Hill, "Crawford's Campaign," in *Magazine of Western History* (Chicago, 1885).

CRAWFORD, WILLIAM HARRIS (1772-1834). An American politician. He was born in Amherst, Va., February 24, 1772, but removed with his parents to South Carolina in 1779, and to Georgia in 1783, where, in 1798, he was admitted to the bar. In 1802 he was chosen a member of the State Senate, and in 1807 was chosen to fill a vacancy in the United States Senate. During the canvass he fought two duels, in the first of which he killed a man, while in the second he was himself wounded. He was elected to the Senate in 1811, and in 1812 was chosen president pro tempore of that body. He at first opposed, but finally supported, the war with England. In 1813 he was appointed Minister to France, where he became a general favorite, and in particular was an intimate friend of Lafayette. In 1815 he was made Secretary of War, and the next year Secretary of the Treasury, an office which he retained until

1825. Crawford had been a candidate for the Presidential nomination in 1816, and now thought himself entitled to succeed Monroe as President, and was regularly nominated by the Congressional caucus which was then controlled by him; but the caucus system was then temporarily superseded (see CAUCUS), and there were four other candidates against him—Calhoun, John Quincy Adams, Jackson, and Clay. Calhoun was pacified with the Vice-Presidency, to which he was chosen by 182 out of 260 votes. There was no choice for President, the vote being: Jackson, 99; Adams, 84; Crawford, 41; Clay, 37. About the time of the election Crawford was stricken with paralysis, from which he never wholly recovered. His condition rendered it impossible to consider him a candidate when the election came to be decided in the House of Representatives, although, even in such a condition, he received four of the twenty-four votes. From this time Crawford was out of the political field. He served as judge of the northern circuit of Georgia from 1827 until his death, which occurred September 15, 1834.

CRAWFORD, WILLIAM HENRY (1855—). An American educator, born at Wilton Centre, Ill. He graduated at the Northwestern University and the Garrett Biblical Institute, and became a minister in the Methodist Episcopal Church. He was appointed professor of historical theology in the Gammon Theological Seminary, Atlanta, Ga., in 1889, and in 1893 became president of Allegheny College (Meadvile, Pa.).

CRAWFORD AND BALCARRES, ALEXANDER WILLIAM CRAWFORD LINDSAY, Earl of (1812-80). An English author. After graduating at Cambridge, he traveled extensively in Egypt and Asia Minor. He took a considerable interest in astronomical investigations, and the expedition to the island of Mauritius in 1874, to observe the transit of Venus, was organized by him. For some inexplicable reason, his body was stolen shortly after its burial at Dunecht, and was not discovered until about fourteen months later in the woods near by. Among his principal publications may be mentioned: *Letters on Egypt, Edom, and the Holy Land* (1838); *Sketches of the History of Christian Art* (2d ed., 1885); *Argo, or the Conquest of the Golden Fleece*, an epic in ten books (1876).

CRAWFORD NOTCH. A defile in the White Mountains, New Hampshire, at an elevation of 1915 feet, between Mount Webster and Mount Willey, each about 4000 feet high. The Saco River, entering through a narrow passage, traverses the Notch, which is remarkable for its impressive rock scenery.

CRAWFORDSVILLE. A city and the county-seat of Montgomery County, Ind., 40 miles northwest of Indianapolis; on the Terre Haute and Indianapolis, the Cleveland, Cincinnati, Chicago and St. Louis, and other railroads (Map: Indiana, C 2). It is the seat of Wabash College, established in 1832, and contains a fine county court-house. The city has manufactures of lumber, wagons, spokes and hubs, flour, foundry products, barbed wire, etc. Settled in 1822, Crawfordsville was incorporated in 1865, and is governed under a charter of that date, which provides for a mayor, elected every four years, and a city council. Population, in 1890, 6089; in 1900, 6649.

CRAWFURD, JOHN (1783-1868). A Scottish Orientalist, born in the island of Islay, Hebrides. He went as a physician to India, and served for five years in the army of the Northwest Provinces. Transferred to Penang, Malay Peninsula, he acquired a knowledge of the Malay language, which proved valuable on the occasion of Lord Minto's conquest of Java (1811). From 1811 to 1817 he held various posts in Java, from 1823 to 1826 administered the government of Singapore, and subsequently was sent on a difficult diplomatic mission to the Court of Ava. He published, in addition to an account of this mission (1829), a valuable *Grammar and Dictionary of the Malay Language* (1852), and a *Descriptive Dictionary of the Indian Islands and Adjacent Countries* (1856).

CRAWL-A-BOTTOM. A local name in the Mississippi Valley for two small fishes: (1) The largest of the darters (*Hudropterus nigrofasciatus*). See DARTER. (2) The hog-sucker or stone-roller (q.v.).

CRAW'LEY. The family name of several characters in Thackeray's *Vanity Fair*.

(1) **SIR PITT CRAWLEY**, the elder, of Queens Crawley, a rich, close-fisted old country squire, who proposed to Becky Sharp, but, as she was already married, contented himself with an intrigue with his butler's daughter, Miss Horrocks. (2) **SIR PITT**, the younger, his son; a cold-hearted prig, immersed in Parliamentary blue books. (3) **COLONEL RAWDON**, brother of Sir Pitt (the younger), and husband of Becky Sharp. He was a gambler and a roué, but his belief in his wife to the moment when her guilt seemed undeniable, and his love for his boy, cover the multitude of his sins. (4) **REVEREND BUTE**, brother of old Sir Pitt. A country clergyman of the old, port-drinking, hard-riding school, whose wife wrote his sermons for him. (5) **MISS CRAWLEY**, sister of Sir Pitt and Mr. Bute, for whose £70,000 all the family scheme.

CRAW'SHAW, WILLIAM HENRY (1861—). An American educator and author, born at Newburgh, N. Y. He graduated in 1887 at Colgate University and in the same year was appointed professor of English literature at that university, of whose faculty he became dean in 1897. He has published an edition of Dryden's *Palamon and Arcite* (Boston, 1898); and two excellently suggestive little works in criticism: *The Interpretation of Literature* (1896), and *Literary Interpretation of Life* (1900).

CRAYER, kri'ēr, Fr. pron. krā'ya', GASPARD (1584-1669). A Flemish historical and portrait painter, born in Antwerp. He lived for many years in Brussels, and in 1664 went to Ghent, for the churches of which he painted more than twenty altar-pieces. His works are to be found throughout Flanders and Brabant. Their main characteristics are vigor and boldness of design, and care and truthfulness in execution. Among the most important of them are: "Glorification of Saint Catharine" (in Saint Michael's, Ghent); "The Miraculous Draught of Fishes," "Adoration of the Shepherds" (Brussels Museum); "Decapitation of Saint John the Baptist" (Ghent Cathedral); "Judgment of Solomon," and "Martyrdom of Saint Blasius" (1668), his last work, both in the Ghent Museum. He was a contemporary of Rubens, and an admirable portrait painter in his own style, which differs

materially from that of the great colorists, partaking rather of the drier manner of the German School.

CRAYON (Fr. *crayon*, from *craie*, chalk, from Lat. *creta*, chalk). A term usually applied to pencils made of charcoal, pipe-clay, or chalk, colored with various pigments and used for drawing on paper, wood, or other materials. Blackboard crayons are made largely of chalk, while black crayons are composed of pipe-clay and lampblack. Those used for drawing on lithographic limestone are commonly made of a mixture of wax, lampblack, soap, and resin. *Pastel* is a mixture of chalk and coloring materials, worked into a paste with gum water. The vegetable colors used are turmeric, litmus, saffron, and sap-green, but should in every case be free from acid, as the latter reacts on the chalk. *Vienna white*, used by artists, is simply purified chalk. *Red chalk* is made from an ochery clay, that is, one containing much iron oxide. *Briançon chalk* and *French chalk* are popular names for soapstone, which is very different from chalk in its composition, being a silicate of magnesia. See CHALK; PENCILS.

CRAYON, GEOFFREY. The *nom-de-plume* adopted by Washington Irving, in *The Sketch-Book*, etc.

CRAZY CASTLE, THE. The nickname of Skelton Castle, the house of John Hall Stevenson, a kinsman of Sterne and the Eugenius of *Tristram Shandy*. He wrote a series of broad stories, called *Crazy Tales*, whence the name given to his house. For further information, consult Bagehot, *Literary Studies*, ii. (London, 1879).

CREAKLE, krē'k'l, Mr. The bullying master of Salem House, in Dickens's *David Copperfield*, the school to which David was sent.

CREAM (OF. *creme*, Fr. *crème*, from Lat. *cremor*, thick juice). The thick, light yellow substance, rich in fat, which rises to the surface of milk on standing. The methods of creaming milks, by setting and by the separator, are described under BUTTER-MAKING. The composition of cream is influenced by the method and condition of creaming, and varies within wide limits. Cream contains the same constituents as milk, but in very different proportions. The fat may vary from 10 to 70 per cent.; good cream for butter-making, or for household use, contains from 18 to 25 per cent. of fat, and very rich cream from 35 to 40 per cent. The richness of cream raised by the separator can be regulated at will. Cream is sometimes thickened artificially by adding gelatin, isinglass, etc. Cream which has been pasteurized, or heated to prevent souring, loses some of its thickness or viscosity, and the addition of sucrate of lime has been proposed to make it whip better. The famous clotted or 'clouted' cream of Devonshire, England, is prepared by heating milk which has stood for twenty-four hours in a shallow pan over a slow charcoal fire for a half to three-quarters of an hour, without boiling, allowing it to stand for twenty-four hours, and then skimming off the cream, which is sprinkled with sugar.

CREAMERY. A factory where butter is made from milk or cream, furnished by the farmers of the neighborhood. It is an American institution, and originated in New York about 1864, being suggested by the success of the cheese-factory (q.v.), which had been in operation for

several years. Within the past fifteen or twenty years the growth of the creamery system has been very rapid, and creameries are now thickly distributed over the principal dairy regions. They differ in their form of organization, and also in the method of operation. Coöperative factories are owned by the farmers ('patrons'), who supply the milk, and who choose from their own number a managing committee, or board. The cost of running the factory, and the proceeds of sales, are divided pro rata according to the milk, cream, or butter-fat contributed. This is the oldest and in many respects the most desirable form of organization. In the joint-stock and proprietary creameries the milk or cream is bought of the farmers under a contract, or the factory may make butter and dispose of it for its patrons, for a fixed charge per pound. The milk may be delivered at the creamery, where the cream is separated by power, the farmers receiving the skim milk for feeding; or the cream may be raised or separated by the farmers themselves and sent to the factory every two or three days. The latter are called 'gathered-cream creameries.' The cream-gathering plan originated in Wisconsin, and was the basis upon which creameries were established in New England, where it continues popular. The cream is raised by gravity usually, in deep cans, and is paid for by the 'space.' This measure has been shown to be an unreliable one, as the value of a space of cream for butter-making varies widely; and payment on the basis of the fat furnished, as determined by test, is beginning to be adopted.

Where the whole milk is furnished to the creamery, it is delivered daily, which involves a great deal of labor in hauling. In almost all cases the hauling devolves upon the milk-producer; often the farmers' living near together coöperate in this, or contract with some person who makes a business of doing the hauling. The milk was formerly paid for by the pound, this being a convenient means of measurement; but the injustice of this to the producers of rich milk, and the introduction of the Babcock milk test, have led to payment on the basis of the butter-fat. The milk of each patron is weighed as it is received and a sample taken for testing; usually the samples for a week or so are combined into a composite, to reduce the labor of testing. From the amount of milk delivered, and the fat content, the amount of butter-fat furnished by each patron is calculated at the end of the month. In most of the leading creamery districts the separator factory is now the favorite system. In many places these creameries have located 'skimming stations' at points convenient for the patrons, where the milk is run through the separator, and the cream then taken to the creamery. This reduces the labor of hauling to a minimum. The system of making butter at creameries is, in many respects, a vast improvement over the ordinary farm dairy practice. The use of machinery reduces the cost of butter-making, and the milk and cream are handled by experienced butter-makers according to the most approved methods. The result is a uniform product, equal to the best of the single dairies, and a great improvement over the average, which sells for a high price. Furthermore, there is less loss of fat in making than at farm dairies, and hence a larger quantity of butter is produced from the same cows. The labor and expense of making

and marketing the butter are removed from the farms and households. Creameries have been of great advantage to the farmers where they are located, and the payment for milk on its fat content has stimulated the farmers to keep better and more profitable cows. Some of the more modern creameries have a very large capacity. The Franklin County Creamery, at Saint Albans, Vt., was formerly the largest in the country, having a capacity of five or six tons of butter a day. There are now a considerable number equally as large, and several much larger, running up to fifteen tons of butter a day in some cases. A large creamery in Nebraska has over 100 skimming stations connected with it. In the Elgin district in Illinois creameries using 10,000 pounds of milk a day are quite common. See BUTTER-MAKING.

CREAM-NUT. See BRAZIL-NUT.

CREAM OF TAR/TAR (OF. *tartre*, from ML. *tartarum*. MGk. *τάρταρον*, *tartaron*, tartar, probably from Lat. *Tartarus*, Gk. *Τάρταρος*, *Tartaros*; hardly a corruption of Ar. *durd*, dregs, from *darida*, to lose the teeth). A potassium bitartrate that is contained in argol (q.v.), and is prepared by dissolving the argol in hot water and removing any coloring matter by means of clay or egg-albumen; the cream of tartar is then separated from the filtered solution by crystallization, and may be purified by recrystallization. Cream of tartar is a white crystalline compound that is soluble in water, and is used in medicine as a refrigerant and purgative. With sodium bicarbonate it is used as a substitute for yeast in raising bread. It is also the source of tartaric acid and of tartrates.

CREASY, krè'sī, Sir EDWARD SHEPHERD (1812-78). An English historian, born at Bexley, Kent. He became fellow of King's College, Cambridge, in 1834, and in 1837 was called to the bar. In 1840 he was appointed professor of modern and ancient history in the University of London, and in 1860 Chief Justice of Ceylon. He is most widely known for his *Fifteen Decisive Battles of the World* (1852), a work which has been very favorably received alike by the critic and the general reader. His other works, less known, but in many cases of almost equal merit, include an *Historical and Critical Account of the Several Invasions of England* (1852); *History of the Ottoman Turks* (1854-56); and *Imperial and Colonial Constitutions of the British Empire* (1872).

CRE'ATIN. See KREATIN.

CREATININ, krè-ät'i-nin. See KREATININ.

CREATION (Lat. *creatio*, from *creare*, to create; connected with *crecere*, to grow, Gk. *κρῶρος*, *koros*, youth, Goth. *hairda*, Ger. *Herde*, Eng. *herd*, OIr. *carn*, heap, Arn. *ser*, species, Skt. *śardha*, Ar. *sarīda*, species). THE. The act of the Supreme Being in bringing the universe into existence, and specifically the account of the divine activity contained in the Book of Genesis. According to this account God created the 'heavens and the earth' by successive acts throughout a period of six days. On the first day light was produced and day and night divided; on the second day the firmament (q.v.) was created and the waters separated; on the third day the dry land appeared and plant life began; on the fourth day the heavenly luminaries were made; on the fifth

day aquatic life and birds appeared; on the sixth day land animals and man were created; and on the seventh day God rested from His work and instituted the Sabbath. This narrative has been regarded as veritable history, as a primitive and crude attempt to construct a scientific theory, as poetry, and as pure myth. It is significant that at the present time attempts to harmonize the narrative with the teachings of science are not in favor even with the more conservative, while the most radical critics recognize its value as a medium for teaching moral and religious truth. According to the compilatory hypothesis of the origin of the Hexateuch, Genesis contains two creation narratives. The first, beginning with chap. i. and extending through the first clause of chap. ii. 4, belongs to the Priestly Writer and was written by him to emphasize the importance of the Sabbath. The other, chap. ii. 4b-7, is from JE (see ELOHIST AND YAHWIST), is given only partially, and is not in all its details consistent with the account of the Priestly Writer. Nevertheless, the narratives may have a common source, and the discrepancies be due to different workings-over which they have undergone before reaching their present form. In 1875 portions of a Babylonian creation myth, previously known only in fragmentary quotations from Berosus (q.v.), were found in cuneiform character among the material brought from the palace of Assurbanipal, and were deciphered by George Smith. Since that time other fragments have been discovered and the myth is now quite well known. It has striking points of resemblance with the narrative of Genesis, which have been explained by two hypotheses: (1) that both accounts are independent developments of an original Semitic myth; and (2) that the Hebrew account is borrowed from the Babylonian. If the latter hypothesis is correct, the borrowing may have taken place at any one of several periods when relations between the Babylonians and Israel were specially close. It may be that the Hebrews first learned the story on their entrance into Palestine, since the Tell-el-Amarna tablets have proven that Babylonian influence prevailed there as early as B.C. 1500. Traces of Phœnician, Egyptian, and Persian influence have also been found by some scholars, and there are undeniable resemblances to cosmogonies of other peoples, even the more primitive, for it should be noted that the differences are marked, even where comparison is made with the Babylonian account. Consult the commentaries on Genesis (see GENESIS, BOOK OF); Jensen, *Die Kosmologie der Babylonier* (Strassburg, 1890); Gunkel, *Schöpfung und Chaos in Urzeit und Endzeit* (Göttingen, 1895); Smith, *The Chaldean Account of Genesis* (New York, 1876).

CREATION, THE. (1) A philosophical poem by Sir Richard Blackmore (1712), which was highly commended by Addison and Johnson. (2) A celebrated oratorio by Haydn, first produced in Vienna in 1798.

CREATIONISM. A term recently applied to the theory of the origin of man which is opposed to evolutionism. (See ANTHROPOLOGY; EVOLUTION.) As a theological term, it has long been in use to designate the theory of the origin of man's soul by the special creative act of God in the case of each individual. It is opposed to 'traducianism,' which is the theory that the soul

of the individual is derived by generation from the souls of his parents as truly as is his body. It is to be distinctly affirmed that the Scriptures give no decision upon this question. Creationists have sometimes quoted the account of the creation in Genesis ii. as favoring their view. But at most that would declare the mode of the original creation of the soul, not the method of its subsequent individual appearance in the world. The body, which is derived from that of the parents, is no less a creature of God than the soul, though this originates by special creation. Again, creationism is sometimes said to be alone consistent with the immateriality of the soul, since this does not admit of its composition or its division into parts and consequently of its derivation from other souls, which must be by the division of these souls. But it is now known that bodies, even, are not derived from those of their parents in such a way as to give much point to this argument. The developing body builds itself in accordance with the law of heredity. It is indisputable that mental traits are inherited, so that, as a matter of fact, the souls of children are built upon the pattern of their parents. If this is traducianism for the body, it is the same for the soul. Theories of original sin have also been brought to bear upon this subject, and it has been said that if Christ derived His soul by translation from Mary, then He acquired also the taint of original sin, and so could not be sinless. Hence His soul must have been a new creation. But this argument presupposes for ordinary men a derivation of original sin, and so a traducian origin. The drift of modern thinking is in favor of traducianism, because it emphasizes as never before the law of heredity. With the body is inseparably associated life, and with life the soul, since all living forms manifest some of the qualities of the soul. In respect to both body and soul there are laws of inheritance, which are none the less real because they are very intricate and obscure. Although the soul is immaterial and hence indivisible, it has a structure, a plan, an organization. It is this that is repeated in following generations. There is, of course, no division of the soul that some particles of it may make the soul of the child, or contribute to this. Modern traducianism is therefore simply this, that the soul as well as the body of a human individual is formed by the indivisible working of its own immanent powers under the law of heredity upon the pattern of its race, specially embodied in its own parents. Many theologians, however, perhaps with the highest wisdom, still refrain from adopting either theory, but emphasize the mystery enveloping the whole subject of life, and say with Augustine, "When I wrote my former book I did not know how the soul derives its being, and I do not know now." See **TRADUCIANISM**; **ORIGINAL SIN**.

CRÉBILLON, krá'bé'yón'. CLAUDE PROSPER JOLYOT DE (1707-77). A noted French story-teller and wit. He was born in Paris, February 14, 1707, the son of the dramatist Prosper Jolyot Crébillon. Except for a five years' exile for political and theological allusions in his novels, especially concerning the Papal bull *Unigenitus*, which led also to a brief imprisonment in the Bastille, he passed his life in Paris. Though he occupied at one time the office of literary censor, his fiction is a byword for its licentious suggestive-

ness. It shows a graceful talent, however. His best known tales are *L'écumeiro ou Tanzi et Nécularné* (1734), followed in 1736 by the notorious *Les égarements du cœur et de l'esprit*, and in 1745 by *Le sophia*, than which it has not been possible to descend further in the refinements of immorality; not a gross word and not a decent thought. The conversation is witty, the manners refined after their kind. This smirking voluptuousness is only the completest literary expression of the spirit of the time, that was sapping the foundation of national strength and character and preparing the way for the Revolution. He died in Paris, April 12, 1777.

CRÉBILLON, PROSPER JOLYOT DE (1674-1762). A noted French tragic poet, born in Dijon, January 13, 1674. He abandoned the law for the stage on the success of *Idoménée* (1705), and with *Atrée et Thyeste* (1707) took first rank among the tragic poets of his time. Among the more noteworthy of his subsequent tragedies are *Electre* (1708); *Rhadamiste et Zénobie* (1711), his best work; *Pyrrhus* (1726); and *Catiline* (1748). Crébillon became an Academician in 1731 and held several minor public offices, among them that of stage censor. Later he became indigent, but died in comfort through the profits of an edition of his *Works* (1750), made at the royal order and charge. He died in Paris, June 17, 1762. Crébillon suffered, as did his fame, from the envy and enmity of Voltaire, himself a tragic poet of greater polish, though less rugged power. He is apt to mistake the horrible for the grandiose, and inflation for energy in diction, as did Corneille, whom among French dramatists he most resembles both in his qualities and his defects. Crébillon's *Works* have been often edited, best perhaps by Didot (1812). There is a *Life* by the Abbé de la Porte, and a discriminating critical essay on Crébillon's place in the development of French drama in Brunetière's *Epoques du théâtre français*. See also Dutrait, *Etude sur Crébillon* (1895).

CRÈCHE, krâsh (Fr., manger, crib.) A public nursery where children can be left by their mothers and cared for while the mothers are at work. The children are fed, provided for, and instructed according to their capacity, for a merely nominal fee. Day nurseries in American cities perform similar services, usually free of charge.

CRÉCY, krá'sé'. A small town of France, in the Department of Somme, on the Maye, about 12 miles north of Abbeville (Map: France, II 1). It is celebrated as the scene of a brilliant victory gained August 26, 1346, by Edward III, with 35,000 English soldiers, over a French army amounting to about 75,000 men under the command of Philip VI. In this great battle vast numbers of the French nobility perished as well as King John of Bohemia and eleven other princes, who were fighting on the side of France. Altogether about 30,000 of the French army fell. At Crécy the Black Prince greatly distinguished himself and gained his spurs; and the crest of the slain Bohemian King, consisting of three ostrich-feathers, with the motto *Ich dien* ('I serve'), was adopted by him in memory of the victory, and still continues to be borne by the Prince of Wales.

CREDE, krâ-dâ'. KARL SIGISMUND FRANZ (1819-92). A German gynecologist, born in

Berlin. He studied medicine in Berlin and in Heidelberg, and in 1852 was made director of the School of Midwifery and of the obstetric department of the Charité in Berlin. Four years later he was made professor of obstetrics and director of the lying-in hospital in Leipzig. His published works include the following: *Klinische Vorträge über Geburtshilfe* (1853-54); *Die Verhütung der Augeneutzündung der Neugeborenen* (1884); *Gesunde und kranke Wöchnerinnen* (1886); *Lehrbuch der Hebammen* (6th ed., revised by Leopold and Zweifel, Leipzig, 1897). From 1853 to 1869 he was co-editor of the *Monatsschrift für Geburtskunde*, and, for many years, of the *Archiv für Gynäkologie*.

CRE'DENCE (It. *credenza*, belief, cupboard, ML. *credentia*, from Lat. *credere*, to believe). A side-table, buffet, or sideboard, on which dishes were placed or kept before meals; a cupboard in which stores or household gear were kept. Also, in the ecclesiastical terminology of the Roman Catholic and Episcopalian churches, a small table or shelf near the altar or communion table on which the bread and wine are laid before being consecrated; in the Greek Church it is called the *trapeza prothesis*. The Oxford movement was largely responsible for its re-establishment in the Episcopal churches of Great Britain and America.

CREDI, krà'dè, LORENZO DI (1459-1537). An Italian painter, born in Florence. He was a pupil of Andrea Verocchio, the master of Da Vinci and Perugino. His style was at first severe, like that of Verocchio, but in later life his manner became softer. He executed his work with great care—in fact, he paid almost too much attention to detail. Throughout his life he was influenced by the quality of Da Vinci's art. Their pictures have been mistaken for each other, and the charm of Lorenzo is of the subtle, intangible kind that made Da Vinci the master that he was. His favorite subject was the Madonna and Child, surrounded by angels, shepherds, or the worshiping kings. A beautiful example, the "Adoration of the Shepherds," is in the Accademia delle Belle Arti in Florence. Another equally fine is in the Louvre, and still another in the National Gallery, in London. In the Uffizi Gallery, Florence, there are some fine portraits by him.

CREDIT (Fr. *crédit*, from Lat. *credidum*, a loan, neut. p. p. of *credere*, to trust). In political economy this term indicates broadly the confidence which is reposed in the ability and purpose of men to meet future obligations. It is defined by J. S. Mill as permission to use another's capital, and by H. D. MacLeod as 'a right of action.' While it rests etymologically upon trust in human nature, the term embraces many operations in which this plays a small part, in which by the establishment of claims to portions of the debtor's estate the creditor assures himself of the repayment. A familiar illustration of such transactions are the loans of bankers upon collateral security.

From an objective point of view, the essence of a credit transaction is that on one side the transfer of goods or money is immediate, on the other that the return is deferred. Personal credit resting solely upon the good faith of the debtor is the earliest form in which credit appears, and is still widely prevalent, as in the

book accounts of retail merchants. But in the larger transactions of commerce credit could not have gained its prominent place without the intervention of instruments of credit. These assume various forms, notes, drafts, mortgages, bonds, etc.; but all have a common purpose—to insure the transferability of the claim against the debtor. Without them the lender—for whatever form the credit may assume it is always in the nature of a loan—must await the pleasure of the debtor or the termination of the contract before he can enter into possession of his own. With these instruments of credit he practically has control of his capital whenever he desires to use it. By transferring his claim to others he can secure his capital at any time.

Credit rests ultimately upon the fact that many persons possess wealth who have no present use for it and are willing that it should be employed by others. If circumstances arise, as in times of panic, when each seeks to secure for himself the actual possession of his wealth, then credit cannot be obtained, and those whose transactions require it must either pay exorbitant prices for it or be crushed out. This explanation of credit will serve to indicate the important function which banks play in the world of business. They are reservoirs of credit. In them are gathered claims upon the unemployed wealth of the community, and through them this wealth is directed by loans into channels of usefulness. It is brought together in small and large quantities from all classes of persons who do not immediately need it, and who are unable or unwilling to loan it directly. From the point of view of individuals credit is frequently spoken of as capital, because, like capital, it increases their productive power. But credit from a national point of view is only to be regarded as capital in so far as it diminishes the amount of wealth which would otherwise lie idle, and increases that which is devoted to productive purposes. An effective organization of credit does not produce wealth, but draws out wealth, and enhances its usefulness. Hence a nation in which credit, as in Anglo-Saxon communities, is highly organized, will have a higher productive capacity than one in which a primitive organization prevails. Credit is not without its dangers, and when the credit organization is out of joint the results are disastrous. This is the price of progress. As the disasters to a railroad express train are more severe than those which overtake the lumbering wagons which preceded it, so the commercial disasters of a highly organized nation with a broad development of credit are more serious than those of less advanced peoples. The remedy is not to go back to the wagons, but to apply every device to insure the safety of the modern vehicle. For a clear analysis of credit, consult: MacLeod, *Theory of Credit* (London, 1889-91); Dunbar, *Chapters in the History and Theory of Banking* (New York, 1892); *Report of Comptroller of the Currency, 1896*. See BANKS; CRISIS, ECONOMIC.

CREDIT, LETTER OF. This term is applied in general to commercial instruments, usually in the form of a letter in which one party addresses a second, requesting him to pay certain sums of money to a third. It is in effect a draft, except that the amount to be paid is stated, not absolutely, but as a maximum not to be exceeded. It presupposes that arrangements exist by which

the party who sends the letter shall reimburse him who makes the payment. Such letters of credit may be drawn on one or on several parties, being in the latter case sometimes called 'circular letters of credit.' They are much used by travelers, and the leading houses issuing them have correspondents in all parts of the world. Those who issue them are generally so well known to the banking fraternity that any banker, whether a correspondent or not, will, upon proper identification, make payment on the letter. When the letter is issued, the person to whom it is given either pays outright the amount named in the letter, or furnishes acceptable security that the maker shall be reimbursed for the drafts upon him.

The alternative for the letter of credit is the travelers' note. This differs from the letter in being issued in coupons, sometimes expressed on the face of the coupons for the currencies of other countries. Such travelers' notes were formerly issued extensively by the Cheque Bank of London, but the business in the United States has recently passed largely into the hands of the express companies. Such travelers' notes are sometimes designated circular notes.

CRÉDIT FONCIER, krá'dé' fôn'syá' (Fr., landed credit). The French name for a method of borrowing money on the security of landed property which is widely practiced in France and other Continental countries. The borrower takes a loan, in return for which he contracts to make certain annual payments, which are so adjusted as to make provision for the interest and for the gradual extinction of the principal, which is fully paid when the term of the contract has been concluded. These contracts are generally made with companies organized for the purpose of loaning their capital in this fashion. Another variety of this form of credit is found in the *Pfandbrief* institute of the large landowners of Germany. Loans are made in the same way, but in return for the debt the borrower receives the securities of the association. He does not actually contract a debt until he sells these securities, which he may do in whole or in part.

CRÉDIT MOBILIER, krá'dé' mó'bé'yá'. A well-known financial institution of France. On November 18, 1852, the French Government sanctioned the statutes of a new bank under the name of the Société Générale du Crédit Mobilier, with a capital of 60,000,000 francs. The name was intended as a contrast to the Société du Crédit Foncier, which are of the nature of land banks, and advance money on the security of real or immovable property, while the Crédit Mobilier proposed to give similar aid to the owners of movable property. The declared object of the new bank was especially to promote industrial enterprises of all kinds, such as the construction of railways and the opening of mines, by placing loans and handling stock. Various privileges were conferred upon it under its charter; among others it was allowed to acquire shares in public companies, and to pay calls made upon it in respect of such shares by its own notes or obligations; also to sell or give in security all shares thus acquired. The operations of the society were conducted upon a very extensive scale. In 1854 it subscribed largely to the Government war loan, raised during the Crimean campaign, to the Grand Central Railway Company, to the General Omnibus Company of Paris, and to

various other important undertakings. The dividend declared for 1854 was 12 per cent. In 1855 it loaned two sums to the Government—the one of 250,000,000 and the other of 375,000,000 francs. Its operations were vast during this year, and the net dividend declared amounted to 40 per cent. The directors then proposed to avail themselves of their privilege of issuing their own obligations, and thought to issue two kinds of notes—the one at short dates, the other at long dates, and redeemable by installments. The proposed issue was to amount to 240,000,000 francs; but the public became alarmed at the prospect of so vast an issue of paper money, and in March, 1856, the French Government deemed it necessary to prohibit the carrying out of the proposed scheme. This was a severe blow to the institution. In 1856 its dividends did not exceed 22 per cent.; in 1857 they were only 5 per cent. Several attempts to resuscitate its credit failed, and finally, in November, 1871, it was reorganized and put under a new board of management. In 1877 its assets were 77,000,000 francs, but its shares, the par value of which was 500 francs, sold for 200 francs only. In 1878-79 the capital was first reduced to 32,000,000 francs, and then raised to 40,000,000. In 1884 it was a second time reduced to 30,000,000 francs, but the company never regained its lost ground. The Crédit Mobilier was undoubtedly useful in developing the industrial power of France, but its operations were hazardous, and had they not been checked in time, they would in all probability have ended in disaster. See **CRÉDIT MOBILIER OF AMERICA**.

CRÉDIT MOBILIER OF AMERICA. A joint-stock company, whose alleged corrupt operations in connection with the building of the Union Pacific Railroad gave rise, in 1872-73, to the greatest Congressional scandal in American history. The company was chartered as the 'Pennsylvania Fiscal Agency,' in 1859, was organized for a general loan and contract business in 1863, and was reorganized under the above name in 1867, for the purpose of building the Union Pacific. This work, completed in 1869, was paid for largely in stock and bonds of the Union Pacific, so that the stockholders of the two companies soon came to be identical. The Mobilier stock, at first almost worthless, soon began to pay enormous dividends; suspicions were aroused; and in the Presidential campaign of 1872 the company was charged with gross dishonesty, and many prominent Republicans, including the Vice-President, the Speaker of the House, three Senators, and a number of well-known Representatives, were freely accused by the Democratic press of having been bribed in 1867-71 to use their influence and votes in favor of the Union Pacific, the alleged bribes having consisted of the sale of Mobilier stock to the accused at prices below its actual value. A prolonged investigation, conducted in 1872-73 by special committees in both the Senate and the House, resulted in a recommendation of the expulsion of one Senator, upon which, however, no action was taken, and the censure of two Representatives, Oakes Ames, of Massachusetts, and James Brooks, of New York, respectively for having sold Crédit Mobilier stock to members of Congress 'with intent to influence the votes of such members,' and for having, indirectly, received such stock. The scandal caused intense excitement throughout the country, and

the Mobilier Company met with almost universal execration; but subsequent investigation has shown that the charges were greatly exaggerated, and were at least never conclusively proved. Consult: Crawford, *The Crédit Mobilier of America, Its Origin and History* (Boston, 1880); and Hazard, *The Crédit Mobilier of America* (Providence, 1881), the latter being a paper read before the Rhode Island Historical Society in February, 1881.

CREDITON, or **KIRK'TON**. A market-town of Devonshire, England, on the Creedy, a tributary of the Exe, eight miles northwest of Exeter (Map: England, C 6). It lies in a narrow vale between two steep hills. Its chief industry is the manufacture of boots and shoes, but it has also chemical manufactures. Crediton was the birthplace of the Anglo-Saxon Winfred, or Saint Boniface. It was the seat of the bishopric of Devonshire until 1050, when the see was removed to Exeter. Population in 1891, 4359; in 1901, 3974.

CREDITOR (Lat. *creditor*, one who trusts, from *credere*, to trust). In its broadest sense, any person in whose favor a legal obligation exists, whether that obligation arises from the mutual assent of the parties, as in the case of *contract* (q.v.), or from a rule of law, as in the case of a *tort* (q.v.). The term is ordinarily applied, however, in legal usage only to him who has voluntarily given credit to another.

A *general* (simple or unsecured) creditor is one who has no *lien* (q.v.) on any property, and has only a personal claim or right of action against the debtor. If a lien on property has been given to him by way of collateral security, mortgage, or pledge, he is called a *secured* creditor. If the debtor or the law secures a priority to one creditor, or to a class of creditors over others, such favored ones are said to be *preferred creditors*. In the absence of statutory provision to the contrary, a debtor may pay one creditor in preference to others, or he may make an assignment for the benefit of creditors, and direct that one or more shall be paid in full before anything is paid to the others.

The common law gave certain creditors a priority over others. For example, creditors of a deceased person were to be paid out of his estate in the following order: (1) those having claims for funeral and probate expenses; (2) the State; (3) judgment creditors; (4) landlords having claims for rent, and bond creditors, that is, those who held bonds or sealed contracts of the deceased; (5) creditors by simple contract. This order has been modified to some extent by statute in the different States, and such legislation must be examined for detailed information on this point. The insolvency statutes of some States give a preference to the employees of an insolvent debtor over other creditors. Under the United States Bankruptcy Law of 1898, a preference given by the bankrupt to a creditor within four months before the institution of bankruptcy proceedings may be avoided by the trustee in bankruptcy; but the act secures a preference to workmen, clerks, or servants for wages earned within three months before the commencement of proceedings, not to exceed \$300 to each claimant.

When a person obtains a judgment for money against another, he is called a judgment creditor; and if an execution is issued and levied, he becomes an execution creditor. See **CONTRACT**; **AR-**

REST; **ATTACHMENT**; **DEBTOR**; **COMPOSITION**; etc., and consult the authorities there referred to.

CREDNER, kräd'nür, KARL FRIEDRICH HEINRICH (1809-76). A German geologist, born at Waltershausen (Saxe-Coburg-Gotha). He studied at the universities of Freiberg and Göttingen, and in 1836 was appointed by the Ducal Government warden of the mint. In 1839 he became surveyor of mines, in 1850 mining councillor, and in 1854 State and mining councillor. He was in 1858 appointed by the Government of Hanover superior mining councillor and reporting councillor to the Finance Ministry, in which capacity he had under his supervision all the Hanoverian mining works, including the important ones of the Harz. From 1868 until his death, he was mining privy councillor and director of mining in the Halle district. As a scientist, he was known for his study of the geology of those regions of Germany connected with his duties in the mining industry. He discovered a compound of oxides of copper and manganese, called in his honor Crednerite, and published some valuable treatises, including *Versuch einer Bildungsgeschichte der geognostischen Verhältnisse des Thüringer Waldes* (1855), and *Ueber die Gliederung der oberen Juraformation und die Wälder-Bildung im nordwestlichen Deutschland* (1863).

CREDNER, HERMANN (1841—). A German geologist, son of the preceding, born at Gotha, and educated at Clausthal, Breslau, and Göttingen. He has made extensive geological investigations in North and Central America (1864-68), the results of which were published in the *Zeitschrift der Deutschen Geologischen Gesellschaft*, and the *Neues Jahrbuch für Mineralogie*. In 1870 he became professor of geology at the University of Leipzig, and director of the Geological Commission for the Kingdom of Saxony. In addition to a geological chart of the Kingdom of Saxony (1877 et seq.), and numerous works on the geological formations of that country, his works include *Elemente der Geologie* (8th ed., 1897).

CREDULOUS, JUSTICE, and Mrs. BRIDGET. In Sheridan's farce *Saint Patrick's Day*, an ignorant, good-natured couple. The wife is a person of the Mrs. Malaprop type, and at times very amusing.

CREE, krē (possibly a corruption of *creek*). One of the largest and most important tribes of Algonquian stock, living chiefly in the British American territories of Manitoba, Assiniboia, Saskatchewan, about Lake Winnipeg and the Saskatchewan River. They are on friendly terms with the Assiniboin, but until brought under Government control were constantly at war with the Sioux and Blackfeet. They have numerous bands, commonly grouped under two main divisions, viz. Plains and Wood Crees. Soon after obtaining firearms from the traders, they began a war of conquest against the weaker Athabaskan tribes, as far even as the Great Slave Lake and the Rocky Mountains, but afterwards retired to their present position. In language and customs they differ but little from the Ojibwa, to whom they are closely related. They number now probably 10,000, on several reservations within the territories mentioned.

CREECH, THOMAS (1659-1700). An English translator. He was educated at Wadham

College, Oxford, elected fellow of All Saints College in 1683, and was head master of Sherborne School from 1694 to 1696. He afterward returned to Oxford, and, in a state of melancholy, committed suicide. Creech was a man of solid learning. He translated Lucretius (1682); Horace (1684); elegies of Ovid, two eclogues of Vergil, some of Plutarch's *Lives*, Theocritus, thirteenth satire of Juvenal, etc. The *Lucretius* was long ranked by the side of Dryden's *Vergil* and Pope's *Homer*.

CREECH, WILLIAM (1745-1815). A Scottish publisher and author. He was born in Edinburgh, and in 1770 was the traveling companion of Lord Kilmaurs, afterwards Earl of Glencairn, on the tour of that nobleman through central and western Europe. His publisher's shop in Edinburgh was much frequented by men interested in literary pursuits, and his morning 'levees,' at which he was accustomed to entertain the most distinguished authors of the Scottish capital, became exceedingly popular. Among the works published by him were those of Burns, Blair, Beattie, Cullen, Mackenzie, and other notables of the time. Burns's well-known poem *Willie's Awa'* was addressed to him.

CREEDE. A city and county-seat of Mineral County, Col., about 300 miles southwest of Denver; on the Denver and Rio Grande Railroad (Map: Colorado, D 3). It is in a narrow gulch on Willow Creek, high up among the mountains, and is engaged exclusively in mining, having a number of highly productive silver-mines. Wagon Wheel Gap, Hot Springs, and Antelope Springs are of scenic interest, and make the region attractive for tourists. Creede was founded in 1890 by N. C. Creede, who had established a mining claim there the previous year. Numerous successive strikes of amazingly rich silver deposits gave the city a wide reputation for a time. It was nearly destroyed by fire in 1892, the year of its incorporation. Population, in 1900, 958.

CREED MOOR. A village on Long Island, now included in New York City, 13 miles east of the borough of Manhattan (Map: Greater New York, K 5). The rifle-range located here was founded as a private enterprise by the National Rifle Association, and was later acquired by the State of New York. It is now used by the National Guard for target practice.

CREEDS AND CONFESSIONS (AS. *crēda*, OE., Fr., Prov., Port., Sp., It. *credo*, creed, from Lat. *credo*, I believe, the first word of the Apostles' and Nicene creeds). The names given to the authorized expressions of the doctrine of the Church at large, or of the several main sections into which it is divided. Such statements of doctrine sprang up naturally in the course of the Church's progress. As the simple truths taught by Christ in an informal and concrete form became the subject of thought, of argument, of controversy, they could not fail to receive a more definite intellectual expression, and to be drawn out into more precise dogmatic statements. Men's minds could not be exercised on subjects of such vast importance to them without this result; and the great creeds, as they rise in succession before us, and mark the climax of successive controversial epochs in the Church, are nothing else than the varying expressions of the *Christian consciousness and reason*, in their efforts more completely to realize, comprehend, and express

the originally simple elements of truth as they are recorded in Scripture. The study of the creeds would be nothing else than the study of theology in its highest historical development—in its reflex settlements after the great agitations of Christian thought had run their course.

Corresponding to this view, we find that the creeds of Christendom grow in complexity, in elaborate analysis and precision of doctrinal statement, as they succeed one another. The first are comparatively brief and simple in sense and form; the last are prolix and largely didactic. From the Apostles' Creed to the decrees of the Council of Trent, or the chapters of the Westminster Confession of Faith, there is a wide change, during which the Christian consciousness has grown from a childlike faith to a body of comprehensive critical opinions.

What has been called the Apostles' Creed has been referred by tradition to the Apostles themselves. The present text may be traced back to about the year 500, but evidently depends upon a still earlier and simpler form. This earlier form, which is called by scholars 'The Old Roman Symbol,' was in use in the Roman Church between the years 150 and 175, and was originally written in Greek. According to McGiffert (*The Apostles' Creed*, New York, 1902), it ran as follows: "I believe in God the Father Almighty and in Christ Jesus His Son, who was born of Mary the Virgin, was crucified under Pontius Pilate and buried; on the third day rose from the dead, ascended into Heaven, sitteth on the right hand of the Father, from whence He cometh to judge the quick and the dead; and in the Holy Ghost, and resurrection of the flesh." This shorter Roman symbol appears to be the root from which the later-received Roman text sprang, as well as the numerous other texts which are found, with various differences, greater or smaller, among the other Churches of the Occident. The interesting question as to its relation with the Oriental texts throws light on its own origin. The distinction must at once be made between various forms of *confession* used at baptism, and the proper, much briefer, 'rule of faith,' or *creed*. Oriental *confessions* display great variety of form, and great freedom in the choice of matter. The Eastern churches had no tradition, such as was prevalent at Rome, that the Apostles themselves composed the creed, and hence felt at liberty to modify it as was convenient. Hence, historical portions were replaced by dogmatic additions were made here and there, various heresies were noted. All, therefore, became subjective, reflective, dogmatic in character, though in different degrees. Yet at the basis of all the forms there lay a single original, which agreed substantially with the shorter Roman text. The two chief forms, Oriental and Occidental, are twin forms, with mesential variations. Carrying the investigation now still further back, by the study of the forms of the baptismal confessions found in Irenæus, Tertullian, Hippolytus, and Cyprian, we find that the earliest creed must have had all three of the members of the present creed, must have been thought of as an enlargement of the command in Matthew (xxviii. 19) to baptize all nations, and must have contained the portions as to the 'Church,' the 'resurrection of the flesh,' the 'return to judgment,' and the 'crucifixion under Pontius Pilate,' but no anti-gnostic passages. We must put the date

back, therefore, to 175. But it must go still earlier, because of the lack of 'maker of heaven and earth,' etc., which were directed against the heresiarchs who began to come to Rome as early as 110. Hence, we must put the date at least as early as about 133. That the creed was brought to Rome from the Orient is probable, but not capable of proof. Consult: Harnack, in Herzog, *Apostolisches Symbolum*; also his *Geschichte der altchristlichen Litteratur* (Leipzig, 1893).

The *Nicene*, or rather the Niceno-Constantinopolitan creed, is the next great expression of doctrinal truth that we meet in the history of the Church. It sprang out of the conflict, which had begun even in the second century, as to the dignity and character of Christ. From the beginning, Ebionitism had looked upon Christ as merely a Jewish teacher of distinction; Theodotus and Artemon openly taught such a doctrine in Rome toward the close of the second century. Others, on the contrary, taught a doctrine which identified Christ with God absolutely in such a manner as to destroy all distinction of persons in the Godhead. Monarchianism, as it was called, which held rigorously and formally to the unity of God, was the ruling principle of both doctrines, opposite as were the expressions it assumed in the two cases.

The controversy thus begun in the second, perpetuated itself in the third century, under various modifications. Paul of Samosata carried out the Unitarian tendency, which reduced Christ to the level of a mere man; Sabellius carried out the same tendency in the opposite direction, which made Christ not merely divine, of the same substance with the Father, but looked upon Him as merely a manifestation of the Father, without any distinct personality. Sabellianism recognized a Trinity of manifestations, but not a Trinity of essences. God was one and all-comprehending, and the Son and the Spirit were merely names or expressions for the different modes in which He successively reveals Himself. Sabellius flourished about the middle of the third century, and Paul of Samosata somewhat later. Arius, who was a presbyter of Alexandria, grew up in the midst of these influences, and soon distinguished himself in the Alexandrian Church by his advocacy of the doctrine that Christ, although in a true sense divine, or the Son of God, was yet not the very God. He denied that He was 'of the substance of God,' or 'without beginning'; He was only the highest created being, 'promoted' to divinity, but not the same in substance with the Father, nor equal with Him in power and glory. Athanasius came forward as the opponent of Arius, and the contest between them raged keen and wide throughout the Church.

The Council of Nicæa was summoned in 325 by Constantine, with the view of settling this controversy; and the Nicene Creed was the result. There were thus three parties in the council—the Athanasians, or extreme orthodox party; the Eusebians, or middle party; and the Arians, or heretical party. The heretics were few in number, and possessed but little influence; but the Eusebians were a strong party, and for some time resisted certain expressions of the orthodox or Athanasians, which seemed to them extreme and unwarranted; but at length the Homoiousians, as they were called, carried the day; and Christ was declared not merely to be of *like* substance

(*homoiousios*), but of the *same* substance (*homoousios*) with the Father.

The creed was formed by extending the Apostles' Creed to include the new definitions. The essential parts are: "And [I believe] in one Lord Jesus Christ, the only-begotten Son of God; begotten of the Father before all worlds, Light of Light, very God of very God, begotten not made, consubstantial [of one substance, *homoousios*] with the Father." The Council of Constantinople (381) simply reaffirmed this creed. Later the so-called Niceno-Constantinopolitan Creed arose by the incorporation of the Nicene Creed in the baptismal confession of the Church at Jerusalem, and was erroneously recognized by the Council of Chalcedon as the creed of Constantinople. It adds definitions as to the Holy Spirit, "Lord and Giver of Life, proceeding from the Father [Latin form adds "and the Son" (see *FILIOQUE*)], who with the Father and Son together is worshiped and glorified, who spake by the prophets." It also adds the word 'one' to the definitions of the Church and of baptism, putting the latter, "We confess one baptism for remission of sins."

The Christological controversies produced the council and creed of Chalcedon in 451. (See *CHRISTOLOGY*.) This creed pronounced in the most decided and elaborate way for the full and unchanged divinity and humanity of our Lord, these two natures being comprised in the unity of one person. It thus defined the elements of the doctrine of the person of Christ, and became one of the great doctrinal councils of Christian history, if not the greatest after Nicæa.

The next remarkable monument of doctrinal truth in the Church is what is called the *Athanasian Creed*, a product of the fifth century, much later than Athanasius himself, but representing, with great formal minuteness and fidelity, his doctrine of the Trinity, as apprehended and elaborated by the Western Church. See *ATHANASIAN CREED*.

The Apostles', the Nicene, the Chalcedonian, and the Athanasian may be said to form the great Catholic creeds of the Church. After the time of the last-mentioned formula, there is no general symbol of faith that claims our attention till the period of the Reformation. Theology continued to be cultivated during the Middle Ages, and especially during the twelfth and thirteenth centuries, with great assiduity. Scholasticism is nothing else than the vast expression of the intellectual labor bestowed upon this subject during these ages, when scarcely any other subject can be said to have engaged men's minds. It was characteristic of scholasticism, however, to work mainly upon the doctrinal *data* already adopted and authorized by the Church, developing these data in endless sentences and commentaries. There was, withal, no real freedom of inquiry, nor life of speculation. But as soon as the eye of free criticism and argument was turned upon Scripture with the Reformation, new creeds and confessions began to spring up. On the one hand, Protestantism had to defend its position and its scriptural authority by appeal to its system of belief; and, on the other hand, the Church of Rome, after many delays, gave forth at the Council of Trent (1545-63) a more extended and detailed statement of its doctrine than was to be found in any previous creed. The *decrees of Trent*, with the additions made in

1854 and 1870, are the fixed authoritative symbol or confession of faith of the Church of Rome.

Of the Protestant churches, the most notable confessions of faith are the Lutheran; the Continental Calvinistic or Reformed; the Anglican, or Thirty-nine Articles of the Church of England; and the Puritan, or Westminster Confession of Faith.

The Lutherans call their standard books of faith and discipline *Libri Symbolici Ecclesie Evangelicæ*, and reckon among them, besides the three Catholic creeds, the Augsburg Confession, 1530 (q.v.), the Apology for that confession by Melancthon, the Articles of Smalkald drawn up by Luther, 1537, Luther's catechisms, 1529; and in some churches, the Formula of Concord, 1576, or the Book of Torgau.

Of the Continental Calvinistic or Reformed churches, there are numerous confessions, the principal of which are: (1) The Helvetic Confessions, that of Basel, 1530, and Bullinger's *Expositio Simplex*, 1566; (2) The Tetrapolitan Confession, 1531; (3) The Gallic Confession, 1559; (4) The Palatine or Heidelberg Confession, 1575; (5) The Belgic Confession, 1559.

The *Thirty-nine Articles* of the Church of England have been already described. (See ARTICLES, THE THIRTY-NINE.) They were originally forty-two, and are supposed to have been chiefly composed by Crammer. In 1571 they were revised and approved by Convocation and Parliament. The Lambeth Articles, 1595, and the Irish Articles, 1615, became of great importance as affecting essentially the contents of the next great creed, the Westminster Confession of Faith. This was the product of the great Puritan agitation of the seventeenth century. As soon as the Long Parliament assembled in 1640, it set itself to consider the question of the reformation of religion. It carried resolution after resolution directed against the existing government of the Church of England; and at length, on the 23d of November, 1641, it passed the famous remonstrance, in which it proposed that, "in order the better to effect the reformation in the Church, there should be a general synod of grave, pious, learned, and judicious divines, who should consider all things necessary for the peace and good government of the Church." Out of this proposal sprang the Westminster Assembly, although the Parliamentary ordinance actually summoning the Assembly was not issued until a year and a half later, viz., June 12, 1643. According to this ordinance, the Assembly was to consist of 121 clergymen, assisted by ten lords and twenty commoners as lay assessors. Many of these appointed members, however, never took their seat in the Assembly. The bishops were prevented from doing so by a counter ordinance of the King.

Among the most notable divines who did assemble were Burgess, Calamy, Gataker, and Reynolds, and Gillespie, Henderson, Baillie, and Samuel Rutherford, the commissioners from Scotland, of the Presbyterian party; Goodwin, Nye, and Burroughs, of the Independent party; and Lightfoot and Coleman, with Selden, of the Erastians. The Presbyterians greatly predominated, and the acts of the Assembly bear throughout the stamp of Calvinistic Presbyterianism. It began its sittings in the autumn of 1643, and sat till February 22, 1649, having lasted upward of five years and a half. During this period it had met 1163 times.

The most important labors which it achieved were the directory of public worship and the Confession of Faith. This later document was completed in the third year of its existence (1646), and laid before Parliament in the same year. It was approved by the General Assembly of the Church of Scotland in 1647, and again in 1690, on the renewed establishment of Presbyterianism after the revolution.

The Confession of Faith is the latest of the great Protestant creeds, and the creed of the Presbyterian churches throughout the world. It is also one of the most elaborate of all creeds. It extends to thirty-three chapters, beginning with *Holy Scripture*, and ending with *The Last Judgment*. Of its thirty-three chapters, twenty-one may be said to be distinctly doctrinal—the first nineteen and the last two. The others concern such subjects as *Christian Liberty*, *Religious Worship*, *Oaths and Vows*, the *Civil Magistrate*, the *Church*, the *Sacraments*, *Synods and Councils*. The tone of the doctrinal chapters is that of the later and formal Calvinism which spread from Holland among the English Puritans. The ecclesiastical spirit is Puritan-Presbyterian. "God alone" is declared to be "Lord of the conscience"; yet the "publishing of opinions contrary to the light of nature, or to the known principles of Christianity," is at the same time declared to be matter of censure by the Church, and of punishment by the civil magistrate. In composition, the Confession is an able and comprehensive summary of theological truth, showing great logical skill in the deduction of particular doctrines from certain main principles. The third chapter, *Of God's Eternal Decree*, may be said to be the key-note from which its most characteristic doctrines follow in immediate sequence and harmony. It is not only a remarkable monument of Christian learning, but the most representative expression of a great spiritual movement which has deeply tinged the national thought of Great Britain, and modified the course of its history. See COVENANTS.

The work of forming creeds did not, however, cease with Westminster, but many creeds of less importance have been produced since, and will continue to be produced in consequence of the changing conditions in which the Church labors. Thus, the great Methodist revival in the eighteenth century led to a revision of the Articles of the Church of England for the use of the newly arisen body; the Unitarian controversy in New England at the beginning of the nineteenth, to the formation of many more or less elaborate Church and Seminary creeds. The Congregationalists of America put forth a new creed in 1883, the Presbyterians of England one in 1900, and the Northern Presbyterian Church of the United States in the General Assembly of 1902 adopted the revision of certain articles of the Confession of Faith and a declarative statement of sixteen articles, which was substantially a new creed. The best work on the subject is: Schaff, *Creeds of Christendom* (New York, 1877-78), history and texts.

CREEK CHUB. The horned dace. See DACE.

CREEKS (so called from the numerous creeks running through their land), or MUSCOGEE, *mūs-kō'jē* (Algonquin *maskoki*, creeks). An Indian confederacy, formerly holding the greater portions of Alabama and Georgia, and second in importance among the Gulf tribes only to the

CREEPERS

7

1. BANANA QUIT (*Cereba Bahamensis*).
2. NATAL COLLARED SUNBIRD (*Cinnyris collaris*).
3. HAWAIIAN OO (*Acridocercus nobilis*).
4. SLENDER-BILLED HONEYEATER (*Acanthorhynchus tenuirostris*).
5. AMERICAN BROWN CREEPER (*Certhia Americana*).
6. PARSON-BIRD (*Prosthematomera Novae-Zealandiae*).
7. ALPINE WALL-CREEPER (*Tichodroma muraria*).

Cherokee. The ruling tribe was the Muscogee, whose language was the court language, besides which there were the Alabama, Hitchitee, Koasati, and others of the same Muskogean stock, with the Uchee and Natchez (q.v.), and a considerable incorporated band of Shawano. The Seminole of Florida were an offshoot from the Muscogee confederacy. They were agricultural, but warlike, living in villages of log houses, plastered on the outside with clay, and arranged in a rectangle about a central space reserved for public ceremonies, chief of which was the annual 'buck,' or green-corn 'dance. In the Colonial wars, and during the Revolution, they generally adhered to the English side. They made a treaty of peace with the United States in 1790, but in 1813, instigated by the English, again took up arms against the Americans, beginning hostilities by the terrible massacre of Fort Mims. They were completely crushed by General Jackson in a brief but bloody campaign, in three battles in which they lost respectively 200, 300, and 800 warriors killed. Utterly broken, the Creeks were compelled to sue for peace, which was granted only on submission to a peremptory 'demand' for the surrender of more than half their ancient territory. Other cessions quickly followed, until in 1832 they sold all their remaining territory and agreed to remove beyond the Mississippi to their present habitat in the Indian Territory. Like the other Southern tribes, they were divided in sentiment during the Civil War, and suffered severely in that struggle. Under the name of the 'Creek Nation' they conduct an autonomous government, similar in form to that of the Cherokees (q.v.). The nation numbers 16,000 citizens, of whom about two-thirds are of pure or mixed Creek blood.

CREELMAN, JAMES (1859—). An American editor and newspaper correspondent, born in Montreal, Canada. He was first associated with the New York *Herald* (1877), and eventually became editor of its London and Paris editions. During the war between China and Japan, he was correspondent for the New York *World*, and in the Turco-Greek War did similar work for the New York *Journal*, which paper he also represented at Santiago during the Spanish-American War, where his gallant conduct met with wide and well-deserved recognition. He was a voluntary aide on General Lawton's staff during the Philippine insurrection. His publications include: *On the Great Highway: Wanderings and Adventures of a Special Correspondent* (1901), and *Eagle Blood* (1902).

CREEP (from *creep*, AS. *crēopan*, Icel. *krjapa*, OIIG. *chriochan*, Ger. *kriechen*, to creep). A miner's term for the depression which takes place in underground workings from the removal of beds of coal or ore. Masses of the coal-seam, like huge pillars, are left by the miners for the support of the superincumbent strata; the pressure, however, of these beds is so great that, in course of time, the roof gradually sinks, or, as is more frequently the case, because of the roof consisting of hard rock, the softer shale pavement rises up, until the intervening spaces between the pillars, left by the removal of the coal, are filled up. A consequent depression takes place in the beds above, as also an alteration of the surface level. But this, being so gradual, is seldom noticed, except when it is made evident from the

accumulation of surface-water, or in districts where railways pass over the coal-fields. The term is also used in geology to designate the movement of soil or rock outcroppings down a slope.

CREEPER. A name very generally applied to any bird, especially if of small size, which seeks its food by running or creeping about upon the trunks of trees. It is more properly applied to the members of the family Certhiidae and especially of the genus *Certhia*. They have a slender, arched, and pointed bill; a long, narrow, sharp-pointed tongue, jagged near its tip; the tail rather long, and the tips of the tail-feathers firm and pointed, extending beyond the webs. The feet are rather slender; the hinder toe about as long as the other toes. Of this conformation of feet and tail great use is made in climbing trees, the stiff feathers of the tail being employed for support. They display great agility in clambering, often back down, about the branches, and probe every cranny for hiding insects or insect-eggs. They make their nests in crevices in trees, old woodpeckers' holes, etc. Although the family is large, it is doubtful if the genus contains more than one true species, the common streaked-brown creeper (*Certhia familiaris*), a bird found in all temperate parts of the Northern Hemisphere, wherever wood abounds. In the United States the word creeper is very generally used as a part of the name of several warblers, as the pine-creeper (*Dendroica pinus*) and the black-and-white creeper (*Mniotilta varia*). In Jamaica the name is given to a small species (*Certhiola Bahamensis*), otherwise known as banana-bird, because it frequents and nests in the banana-trees. See HONEY-CREEPER; TREE-CREEPER.

CREEPING PLANTS. Plants whose stems run close to the surface of the soil and root at intervals. See STEM; VEGETATIVE PROPAGATION.

CREESE, or CREASE. See KRIS.

CREFELD, krä'fält. See KREFELD.

CREIGHTON, krä'ton, MANDELL (1843-1901). An Anglian prelate and historian. He was born at Carlisle, Northumberland, graduated from Merton College, Oxford, in 1866, with the highest honors, and continued there as tutor until 1873. In 1870 he became deacon, in 1873 priest, and in 1875 assumed the college living at Embleton in his native shire. He was appointed rural dean of Alnwick in 1879, honorary canon of Newcastle in 1882, and professor of ecclesiastical history at Cambridge in 1884. In 1891 he became Bishop of Peterborough and remained there until 1897, when he was transferred to the see of London and was made a Privy Councillor. He represented Emmanuel College, Cambridge, at the celebration of the two hundred and fiftieth anniversary of Harvard University (1886), and in 1896 attended the coronation of Czar Nicholas II, as delegate of the Church of England. As Bishop of London, which office he retained until his death, Dr. Creighton, although known as a High Churchman, acted with signal skill and impartiality in the numerous delicate questions of theological interpretation which confronted him. Besides his *History of the Papacy* (5 vols., 1882-94), which is an authority, his *Age of Elizabeth* (1876) and *Cardinal Wolsey* (1888) deserve especial mention. He was also the founder and first editor of the *English Historical Review*.

CREIL, krá'y'. The capital of a canton and an important railway junction in the Department of Oise, France, on the Oise, 32 miles north of Paris by rail. The parish church dates from the twelfth century; the ruined twelfth-century Transition Church of Saint Evremont is situated on an island in the river; and there are remains of a royal castle of Charles V. Hardware, copper, machinery, and pottery manufactures are its chief industries, and it has an increasing river-transit trade. Population, in 1901, 9125.

CREIZENACH, kri'tsc-näg, THEODOR ADOLF (1818-77). A German poet and literary historian. He was born in Mainz, the son of Michael Creizenach, a famous Hebrew scholar, studied at Giessen, Göttingen, and Heidelberg, and was one of the founders of the Jewish Reform Society in Frankfort-on-the-Main. He embraced Christianity in 1854, and in 1863 was appointed professor at the Frankfort Gymnasium. He was a versatile writer, his poems, *Dichtungen* (1839) and *Gedichte* (1851), being distinguished by simplicity and an elegiac character. His publication of the correspondence between Goethe and Marianne von Willemer (1878) is a valuable contribution to the literature on the great poet.

CRELLE, kré'le, AUGUST LEOPOLD (1780-1855). A self-educated German mathematician. He was born at Eichwerder, near Wriezen, and was an architect by profession, but is chiefly known as the founder of the *Journal für reine und angewandte Mathematik* (Berlin, 1826). This journal has given expression to many of the greatest mathematical developments of the nineteenth century. Abel's proof of the impossibility of solving the general equation of the fifth degree by algebraic methods appeared in the first volume. Steiner, 'the greatest geometrician since the time of Euclid,' was a leading contributor, and Möbius intrusted to it the publication of his most important researches. Crelle wrote quite extensively on algebra, trigonometry, the theory of numbers, the theory of functions, and various subjects of mathematical physics. His chief works are *Versuch einer allgemeinen Theorie der analytischen Facultäten* (1825); *Encyklopädische Darstellung der Theorie der Zahlen* (1843); *Sammlung mathematischer Bemerkungen* (1820-22); *Elemente der Geometrie und ebenen und sphärischen Trigonometrie* (1826-27). He was also editor of the *Journal der Baukunst*.

CRELLINGER, krä'ling-er, AUGUSTE (DÜRING) (1795-1865). A German actress, born in Berlin. She made her first appearance at the Court Theatre, Berlin, May 4, 1812, and subsequently became one of the most famous actresses of her day, and frequently appeared as a star at the leading theatres of Germany, as well as in Saint Petersburg. Sappho, Lady Macbeth, Iphigenia, Phädra, and Adelheid in *Götz von Berlichingen* were some of her favorite rôles. She excelled also in comedy parts, and was distinguished alike for her beauty, numerous histrionic accomplishments, and consummate artistic training.

CREMA, krä'má. A city in the Province of Cremona, north Italy, situated on the right bank of the Serio, 33 miles (by the winding railway) southeast of Milan (Map: Italy, D 2). The cathedral has a Romanesque façade, and the Church of Santa Maria delle Grazie has inter-

esting frescoes. The circular Church of Santa Maria della Croce, built in 1490, has an octagonal interior adorned with paintings by Campi. The chief products of the district are wine, fruit, and cheese; lace, silk, and linen goods are manufactured. Crema was founded by the Lombards in the sixth century and suffered much during the wars of the Guelphs and Ghibellines. It was besieged, taken, and destroyed by Frederick Barbarossa in 1159-60. Population (commune), in 1881, 9111; in 1901, 9755.

CREMATION OF THE DEAD (Lat. *crematio*, from *cremare*, to burn; connected with Goth. *hauri*, coal, Icel. *hyrr*, fire). The process of disposing of the bodies of the dead by reducing them to ashes. Three methods of disposing of the bodies of the human dead have prevailed since the earliest times: simple exposure; burial in the earth, in caves, or in artificial tombs; and cremation. Among the factors which have determined which of these methods should be adopted by a nation or race have been physical conditions, such as the character of the soil and climate and the abundance or scarcity of fuel; sanitary considerations; and religious beliefs. Only the most uncivilized tribes have practiced simple exposure, depending on the elements and the wild beasts to dispose of the bodies of their dead. Such was the practice of the early Colchians, who, we are told, hung dead bodies on the limbs of trees, while the Syrians abandoned their dead to wild animals.

DISPOSAL OF THE DEAD AMONG THE ANCIENTS AND AMONG UNCIVILIZED TRIBES. Of the two methods employed by civilized nations, cremation and burial, the former is the one originally prevalent among the Indo-European races. The graves of North Europe, throughout the Bronze Age, contain, not skeletons, but only urns for the reception of funeral ashes. The Egyptians, on the other hand, embalmed their dead: the Jews laid them away in sepulchres: and the ancient as well as the modern Chinese buried them in the earth. The Chinese, influenced by religious doctrine, now, as of old, insist on properly placed graves in their own land, and for this reason corpses are sent home from California. They do not have cemeteries specially set apart for the burial of the dead, but may bury them anywhere, and the frequent occurrence of these hallowed spots, which may not be desecrated, has proved a serious obstacle to railway projects. The dry, hot climate of Egypt made the embalming process possible, and the scarcity of fuel made it less expensive than burning. The same natural cause, lack of fuel, may have led to the practice of burial among the Jews and other tribes. Among the ancient Persians the bodies of the dead were exposed to the elements, as is the practice of the modern Parsis, or followers of Zoroaster. It is, however, probable that in some instances, especially in the case of kings, burial with a coating of wax was allowed. Many of the early American Indians burned their dead and disposed of their ashes in various ways, while the ancient Greeks practiced both cremation and burial, the former being introduced by the Phrygians, and burial by the Egyptians. Among the Romans, cremation was the general practice during the latter days of the Republic and through four centuries of the Empire. See BURIAL for a description of burial practices of ancient nations.

While natural causes, undoubtedly, had a great influence in determining the method of disposal, especially in very early times, religious belief in the resurrection of the physical man has usually been the chief factor which has caused the spread of the custom of interment rather than the more sanitary method of disposal by fire. The Egyptians, Jews, Mohammedans, and Christians all believe more or less fully in the physical resurrection of the body; and the question arises, whether cremation does not impair the prospect of a future life. With the spread of Christianity, burial was substituted for cremation, both in the heart of the Roman Empire and among the converted pagans on its outskirts.

Cremation was once common in England, and was but slowly supplanted by inhumation. The same is true of the Gallic and Germanic races. It is said that Charlemagne, in his zeal for Christian burial, punished the act of cremation with the death penalty. Cremation is still practiced in India and among some other Oriental nations. In Japan the Shinto sect practices burial and the Monto sect cremation.

CREMATION IN THE NINETEENTH CENTURY. In Great Britain the revival of the practice of cremation was discussed as early as 1658, when Sir Thomas Browne published his *Hydriotaphia, or Urn Burial*. In 1817 Dr. J. Jameson wrote a sketch on the *Origin of Cremation*. For many years during the early part of the century, Dr. Lord, Health Officer for Hempstead, continued to agitate the subject, but no practical results were achieved. In 1797 cremation was discussed by the French legislature under the Directory. But it was in Italy that the first practical steps were taken toward reestablishing the practice of cremation. From 1852 on, the subject was agitated in the various national scientific congresses and through their efforts the incineration of human dead was made legal by the introduction of a provision for that purpose in the National Sanitary Code. The process has since rapidly grown in favor in Italy, and, besides the private crematories, there are now municipally owned crematories in Rome, Milan, Florence, and Venice.

In Germany the subject was discussed at scientific meetings almost as early as in Italy, but greater legal difficulties were encountered here than in Italy. In 1874 the body of an Englishwoman was reduced to ashes in a Siemens furnace constructed at Dresden, and this was the first cremation scientifically performed; but the Government of Saxony, after two incinerations, forbade the practice. Soon after, legal right to construct a crematory was secured in the neighboring Duchy of Gotha, and for twelve years this was the only place in Germany where incineration could be practiced. During the closing decade of the nineteenth century crematories were put in operation in Heidelberg, Hamburg, Jena, and Offenbach.

In France, after much agitation, a law was passed in 1887, legalizing the practice. Soon after the city of Paris erected a crematory where cremation is compulsory for certain classes, including all unclaimed hospital dead, the remains from dissecting tables, and dead bodies from streets and sewers. In England, Sir Henry Thompson is widely known as the leader of the present agitation in favor of cremation. In 1874

he organized the 'Cremation Society of London,' whose object is to introduce "some rapid process of disposal which cannot offend the living and shall render the remains absolutely innocuous." Accordingly a crematory was erected at Woking, near London, and here the first incineration took place in March, 1885. Since that date several other crematories have been put in operation, including those at Manchester and Glasgow. In 1900 the city of Hull completed a crematory for general use, the first municipally owned crematory among English-speaking people. Its arrangements will be found described later in this article.

The first place in the United States where the subject of cremation was systematically agitated was the city of New York, in 1873, but it was not until 1881 that a crematory was built for the use of its population. In the meantime, a few cremations were made in private furnaces at Washington, Pa., and Salt Lake City. During the closing decade of the nineteenth century the movement grew rapidly in popularity, and the United States now ranks first in the number of optional annual incinerations. At the close of this article are appended tables showing the location of crematories and annual number of incinerations for the whole country.

ARGUMENTS FOR AND AGAINST CREMATION. Within the last few years the conviction has rapidly spread that a more rapid and sanitary method of disposal must be substituted for burial, especially in the great centres of population. To find enough land for burial purposes is becoming a more and more difficult matter. It has been estimated that 24 acres are annually required for the burial of the dead of London. If 4000 corpses are crowded into an acre, it has been estimated by the same authority that, at the mortality rate of 20 per 1000, New York, with a population of 3,000,000, requires 17½ acres annually to bury its dead. A similar computation of population, death-rate, and space required for burial will show that, unless the custom is changed, much of the available space in the vicinity of all large cities will eventually be required for burial purposes.

The sanitary objections to burial are of still greater importance than the economic difficulties. Through pollution of the air and water the presence of a crowded cemetery may become a menace to the health of the community. The development of the germ theory of disease has added to the realization of this general danger the specific fear that, in the case of those who die from communicable diseases, the germs may be conveyed through the ground from a dead victim to a living host. To what extent this is possible is still a mooted question among bacteriologists. Elaborate experiments, conducted by Pasteur, would seem to show that, in the case of animals at least, disease germs are conveyed from a buried to a living animal. It is a well-known fact that the purifying organisms, for the most part, must work near the surface of the ground, where there is a plentiful supply of oxygen, and that ordinarily bodies are buried too deep and with too many impedimenta about them to be readily acted upon. In 1900 Sir Henry Thompson, in an address before the Cremation Society of England, advocated that while cremation remained optional for ordinary cases, it should be made obligatory when death is due to such transmissi-

ble diseases as smallpox, diphtheria, scarlet fever, typhoid fever, and tuberculosis. In cases of epidemics and after battles, when there are large numbers of bodies to be disposed of at once, cremation seems especially advisable. In cities like New Orleans, where the soil is so full of water that burial is impossible, cremation seems a more natural alternative than sealing up bodies in artificial tombs, constructed above the surface of the ground.

An objection to cremation, in the minds of some, is that trace of the dead is obliterated from the sight of the living. But the condition and ultimate fate of graveyards, especially in the heart of great cities, is a proof that in many cases such memorials are but transitory. In Continental Europe an average of twenty-five years is allowed for the occupancy of a grave, after which, in most cases, the ownership reverts to the municipality and the grave may be opened again. (See CEMETERY.) In England the law permits the opening of graves after fourteen years. In London some of the abandoned cemeteries have been utilized as public parks. It is stated that about 100 graveyards have been destroyed or partially abandoned in New York since it became a city. During the construction of the Boston subway, King's Chapel burial-ground was excavated and its occupants removed. In considering the comparative merits of inhumation and incineration, it should be borne in mind that the ultimate fate of every human body is resolution into its elements.

The Boston Cemetery Board has recommended the erection of a municipal crematory for the incineration of paupers and criminals, thus doing away with the Potter's Field. It is asserted that bodies can be burned for \$1 each, while it costs about \$3 to bury them. The public burials in Boston amount to about 500 annually, and the Potter's Field is full. A public crematory is doubtless an improvement in all respects over the loathsome Potter's Field.

Aside from the sentimental objection to cremation already mentioned, the chief argument against cremation is the medico-legal one that with the burning of the body possible traces of crime are obliterated. Frederick L. Hoffman, in a paper on "Cremation as a Life Insurance Problem" (*Sanitarian* for January, 1901), calls attention to this phase of the subject and points out that 64 of the 528 persons cremated at Saint Louis, Mo., in 1895-99 died from accidents, violence, or suicide. In view of the number of murders, by poison or otherwise, that are committed to obtain insurance money, it is recommended that very special precautions be taken to ascertain the exact cause of death before issuing a permit for cremation. To meet this difficulty, the Cremation Society of England investigates the conditions of death in the case of every body for whose incineration application is made. It has also secured the services of a distinguished pathologist to make autopsies when necessary.

METHODS OF CREMATION. Among the practical methods of cremation which have been attempted may be mentioned, in the first place, the experiments of Dr. Polli at the Milan gas-works, and those of Professor Brunetti, who exhibited an apparatus at the Vienna exhibition of 1873, and described his results in *La cremazione dei cadaveri* (Padua, 1873). Polli obtained complete incineration or calcination of the bodies of dogs by

the use of coal-gas mixed with atmospheric air, applied to a cylindrical retort of refractory clay, so as to consume the gaseous products of combustion. The process was complete in two hours, and the ashes weighed about 5 per cent. of the weight before cremation. Brunetti used an oblong furnace of refractory brick with side-doors to regulate the draught, and a cast-iron dome above with movable shutters. The body was placed on a metallic plate suspended on wire. The gas generated escaped by the shutters, and in two hours carbonization was complete. The heat was then raised and concentrated, and at the end of four hours the operation was over; 180 pounds of wood, costing about 60 cents, was burned. In the reverberating furnace used by Sir Henry Thompson, a body, weighing 144 pounds, was reduced in 50 minutes to about 4 pounds of lime-dust. The noxious gases which were undoubtedly produced during the first five minutes of combustion passed through a flue into a second furnace, and were entirely consumed. In the ordinary Siemens regenerative furnace (adapted by Reclam in Germany for cremation, and also by Sir Henry Thompson) only the hot blast is used, the body supplying hydrogen and carbon, or a stream of heated hydrocarbon mixed with heated air is sent from a gasometer supplied with coal, charcoal, peat, or wood, the brick or iron-cased chamber being thus heated to a high degree before cremation begins. In one arrangement both gas and air are at a white heat before they meet and burst into flame in the furnace. The advantage of the Siemens furnace and gas-producer are that the heat of the expended fuel is nearly all retained by the regenerators, and that the gas retort admits of the production being stopped without much loss. Some difficulty has been felt about keeping the ashes free from foreign material. The Greeks used a shroud of asbestos, the Egyptians one of amianth. Mr. Eassie has suggested a zinc coffin—that metal being volatile.

At the Fresh Pond Crematory in New York City the body is removed from the coffin, which is burned separately. The body is then wrapped in an alum-soaked sheet to prevent premature ignition of the clothing and placed in a clay retort which is subjected to extreme heat. The retort is perforated to allow the gases which are generated during the early part of the process to escape into a combustion chamber, where they are burned and purified before passing off in the flues. The process of incineration requires from one to three hours, according to the size and condition of the body. The ashes weigh from one-half pound to five pounds. They are gathered from the bottom of the retort, the ashes from the clothing are fanned out, iron removed with a magnet, and the clean bone-ash sealed in a black tin canister. A columbarium or urn hall is provided, lined with niches where the ashes may be placed in suitable urns if desired. In this hall the funeral service may be held. At the crematory in Mount Auburn Cemetery, near Boston, Mass., the retorts and incinerating apparatus were designed and executed by the Engle Sanitary and Cremation Company of Des Moines, Iowa.

The first municipally owned crematorium in Great Britain was built at Hull, England, and opened for use in January, 1901. The cremating furnace is of the regenerative type and was de-

signed by the late Mr. Henry Simon, former president of the Manchester Cremation Society. It consists of three interior chambers, the two lower of which are surrounded by air-passages. The lower chamber contains a coke fire, and the upper one is for the reception of the body. The fire is lighted several hours before the apparatus is to be used, and is supplied with air in the usual way, so that by the time the apparatus is to be used the air-passages are thoroughly heated. Most of the direct air-supply is then cut off, and the partially consumed gas (carbonic oxide)

reached, it passes noiselessly, by means of invisible mechanical arrangements, through curtains into an intermediate chamber, and the curtain falls behind the coffin as it enters the cremating chamber. The charge for cremating the bodies of residents within the city is one guinea; for non-residents it is three guineas. The cost of the crematorium was about \$2500.

BIBLIOGRAPHY. A chapter on Cremation treating the subject from the sanitary and economic standpoint is contained in Baker, *Municipal Engineering and Sanitation* (New York, 1901).

from the coke is allowed to mix in the second air-chamber with the air heated by passing through the side air-passages. The incinerating chamber is thus filled with gas of an intensely oxidizing character in a state of incandescence. The degree of heat can be regulated in the most exact manner. There is no smoke and little visible flame before the body is introduced, and if the coffin is made in accordance with the regulations laid down, there is no smoke and no noise during the cremation. The process occupies about one hour, at the end of which there only remain the inorganic bases of the bones, in the form of silver-gray, pumice-like fragments. The cremating chamber is at no time visible to mourners. The coffin, when brought into the chapel, is placed on a catafalque. When the committal sentence in the religious service is

Cobb, *Quarter Century of Cremation in North America* (Boston, 1901), includes a complete history and statistics of the movement in the United States, with brief supplementary matter and tables for Europe. The book also contains a very full bibliography of the subject. Relating to the periodical literature on the subject, Mr. Cobb says: "During the period covered by this record there were published in the United States three magazines for the spread of knowledge concerning the subject. The *Columbarium* was issued from Philadelphia, *The Urn* from New York, and *The Modern Crematist* from Lancaster, Pa. . . . After a brief and valiant struggle for existence they were compelled to quit the field, and there is not to-day printed in the English language a single journal devoted to the interests of cremation."

CREMER, krá'mër, AUGUST BERNHARDT (1834—). A German Protestant theologian. He was born at Unna, Westphalia, October 18, 1834; studied at Halle and Tübingen, and since 1870 has been professor of systematic theology at Greifswald. Two of his numerous publications have been translated—his *Biblich-theologisches Wörterbuch der neutestamentlichen Grazität* (1866-67; 8th ed. 1895; Eng. trans., 1872, 3d ed. 1886), and *Ueber den Zustand nach dem Tode* (1883; 6th ed. 1901; Eng. trans. 1885).

CREMER, JACOBUS JAN (1827-80). A Dutch novelist, born at Arnheim. He studied painting before devoting himself to literature. Especially noteworthy are his rural tales in dialect, entitled *Beuwsche Novellen* (1856, and frequently reprinted), all of which are strikingly original and true to nature. His other works include: *De Lelie van 's Gravenhage* (1851); *Daniel Sils* (1856); *Anna Rooze* (1867); *Dokter Helmond en zijn vrouw* (1870). Several of his novels have been translated into German and other languages and have become widely popular.

CRÉMIEUX, krá'myč', ISAAC ADOLPHE (1796-1880). A French statesman and philanthropist, born at Nîmes, of Jewish parents, April 30, 1796. He studied law, and was admitted to the bar at Aix in 1817. About 1830 he went to Paris, where he soon became famous as an advocate, particularly in the defense of political prisoners. He entered public life in 1842 as a Deputy from Chimon, and served till 1848, sitting always on the Left. Under the Republic of 1848 he was elected as Deputy to the Constituent Assembly and the Legislative Assembly, and was one of the first seven named by the Chamber on February 24 to form the Provisional Government, in which he acted as Minister of Justice. On the night of Louis Napoleon's coup d'état (December 2, 1851) Crémieux was arrested and thrown into the prison of Mazas. He was soon released and voluntarily retired into private life until November, 1869, when he was elected a Deputy to the Corps Législatif. On September 4, 1870, he was proclaimed a member of the Government of National Defense, and the following day he was made Minister of Justice. His name is connected with many subsequent acts of legislation. He rendered the famous decree which expelled from their seat the infamous magistrates composing the 'mixed commissions' under the Empire, whose judgments had driven so many distinguished and gifted men from the country. Another decree bearing his name, the Decree Crémieux, naturalized in mass 30,000 of his coreligionists in Algeria. In 1871 he subscribed 100,000 francs toward the payment of the war indemnity for the liberation of the French territory from the Germans. He appears always as a man of the highest sense of honor. In 1875 he was elected life Senator. He was one of the founders of the Alliance Israélite Universelle (q.v.) and its president from 1863 to 1866 and from 1868 to 1880. He did much for the Jewish race the world over. He died, February 10, 1880, at Passy. Consult: Jaquet, *Les contemporains* (Paris, 1867); Blanc, *Histoire de dix ans* (Brussels, 1846).

CREMNITZ. See KREMNITZ.

CREMONA, krá-mó'ná. The capital of the province of the same name in North Italy, situated 60 miles southeast of Milan, in a fertile plain on the left bank of the Po, below the Adda

and above the Oglio (Map: Italy, E 2). It has broad but irregular streets and attractive public squares, and a bridge 3100 feet long over the Po; it is surrounded by old walls, and a partly covered canal passes through it. The twelfth-century Romanesque Lombard cathedral has a rich main façade and many frescoes by masters of the Cremona School. From the Torrazzo (397 feet), the highest clock-tower in Italy, is a view of the entire course of the Po through Lombardy. Others of the 44 (formerly 87) churches are the richly decorated sixteenth-century San Pietro al Po, the fourteenth-century Sant' Agostino e Giacomo in Braida, with paintings by Perugino and others, the sixteenth-century Santa Margherita, built and decorated by Giulio Campi, Sant' Agata with four large fine frescoes, and in a suburb San Sigismondo, with frescoes and paintings by Cremonese masters. Also noteworthy are the restored thirteenth-century city hall and the thirteenth-century Palazzo de' Gonfalonieri, and the Palazzo Reale, with natural-history and other collections. A memorial tablet marks the house where Antonio Stradivari (q.v.) made his violins. Cremonese violin-makers who preceded him were the two Amati and Guarneri. Famous painters of Cremona were Boceaccio Boceacino, Melone, Bembo, the three Campis, and Sofonisba d'Angussola, whose five sisters also practiced the art. Cremona has a seminary, a lyceum, a gymnasium, an industrial school, a technical school, two theatres, a library of 35,000 volumes, and a chamber of commerce. The town has an active trade by rail and water, markets grain, flax, cheese, etc., and manufactures silk, cotton, and wool fabrics, machinery, and earthenware. It is lighted by electricity and has a telephone system. Cremona was colonized by the Romans in B.C. 218 and grew to be an important commercial centre. It was destroyed in A.D. 70 by Vespasian, who afterwards encouraged its rebuilding. It was laid waste by the Lombards in 605. It again became important in the tenth century. In the fourteenth century it came into the possession of Milan. Population (commune), in 1881, 31,788; in 1901, 37,693. Consult Holder-Egger, "Die Annales Cremonenses." *Neues Archiv der Gesellschaft für ältere deutsche Geschichtskunde*, vol. xx. (Hanover, 1900).

CREMONA, LUIGI (1830-1903). An Italian mathematician, born in Pavia. He participated in the struggle for independence against Austria in 1848-49, later studied at the University of Pavia, obtained a mathematical professorship in Bologna, and in 1873 became professor of higher mathematics in the University of Rome and director of the engineering school of the institution. His contributions to the study of projective geometry and of graphical statics are important. He introduced these subjects into the curricula of Italian technical schools, whose organization he did much to improve. His published works include: *Introduzione ad una teoria geometrica delle curve piane* (1862); *Le figure reciproche nella statica grafica* (3d ed. 1879); and *Elementi di geometria proiettiva* (1873).

CREMORNE (kre-mörn') **GARDENS**. A famous resort in London, near Battersea Bridge, closed in 1877.

CRENEL', or **CRENELLE'** (OF. *crenel*, notch, embrasure, from ML. *crenellus*, dim. of

Lat. *crena*, notch). Any embrasure or opening in the walls of a fortified place; especially the spaces between merlons (q.v.) on a battlemented parapet, from which missiles could be discharged. Hence it is sometimes used to designate a battlement. Crenellated is used of a building supplied with crenels. See BATTLEMENT.

CRE'NIC ACID (from Gk. κρήνη, *krēnē*, fountain). One of the constituents of vegetable mold, produced wherever leaves and other plant matter are decaying, especially in peat-bogs and marshes.

CRE'ODON'TA (Neo-Lat., nom. pl. of Gk. κρέας, *kreas*, flesh + ὀδούς, *odous*, tooth). A suborder of extinct mammals, ancestral to the true carnivores, and hence sometimes called Carnivora Primigenia, and found fossil in the lower Tertiary rocks. The creodonts comprise primitive or synthetic types of animals that vary in size from that of a weasel to that of a grizzly bear, and that combine the characters of the true carnivorous families in such manner as to render determination of the taxonomic rank of any particular species a matter of some difficulty. The members of the suborder present resemblances to the bears, civets, and dogs among the true carnivores; the genus *Patriofelis* seems prophetic of the Pinnipedia, or seals, and *Mesonyx* resembles the carnivorous marsupials of Australia. The more primitive forms show characters possessed also by the Insectivora, Tillodontia, and Condylarthra. The oldest known mammal skull—that of *Triisodon* from the lower Puerco beds of the lowest Eocene of New Mexico—is placed among the Creodonta. Creodont remains are found in the lower Tertiary of Patagonia, and these are of interest because they resemble the carnivorous marsupials of Australia and New Zealand much more closely than do the North American creodonts. The range of the suborder in both North America and Europe is from the base of the Eocene into the lower Miocene. During Eocene time the creodonts played that important rôle among land animals which subsequently, during later Eocene and Miocene time, was assumed by the true carnivores. Among the more interesting and important genera are *Arctocyon*, *Hyænodon*, *Mesonyx*, *Oxyæna*, *Patriofelis*, *Stylolophus*.

(New York, 1897); id., "Additional Observations on the Creodonta." *Bulletin of the American Museum of Natural History*, vol. xiv. (New York, 1901); Scott, "A Revision of the North American Creodonta." *Journal of the Academy of Natural Sciences of Philadelphia*, vol. ix. (Philadelphia, 1887). See articles on **MESONYX**; **OXYÆNA**; **HYÆNODON**; **PATRIOFELIS**; **MAMMALIA**; **TRIIODON**.

CREOLE (Fr. *créole*, Sp. *criollo*; probably a negro corruption of Sp.**criadillo*, *criado*, servant, from *criar*, to create, rear). A name properly used in the southern United States and in Latin America to designate the pure-blooded descendants of original French, Spanish, or Portuguese stock. By English writers it has sometimes been incorrectly supposed to mean a mestizo or mulatto; but it cannot properly be applied to any person of mixed race, non-Latin stock, or

European birth, neither is it used in speaking of the Canadian French.

CREOLE CASE, THE. An incident in American history, which caused some friction between the governments of the United States and Great Britain and was the occasion of an animated debate between the pro-slavery and anti-slavery elements in Congress. In 1841, 19 of the 135 slaves on board the American brig *Creole* revolted, while being transported coastwise between Hampton Roads and New Orleans, and securing control, after killing the captain and wounding several others, directed the vessel to Nassau, New Providence, where all those who had not been directly concerned in the revolt were immediately liberated by the British authorities, the others being held for trial on a charge of murder, in the local courts. Daniel Webster, who was then Secretary of State, demanded the return of the slaves, on the ground that they were legally property and were on American soil and under the jurisdiction of the United States, so long as they were under the American flag, even when on board a ship. They were never returned, however, by the British Government. The incident caused J. R. Giddings (q.v.) to offer a series of resolutions in the House of Representatives, on March 21, 1842, declaring that slavery could exist only by positive law of the separate States; that these States had delegated no control over slavery to the Federal Government, which alone had jurisdiction on the high seas, and, therefore, that slaves on the high seas became free, and the coastwise slave trade was unconstitutional. The House passed a resolution of censure, and Giddings immediately resigned, but was triumphantly reelected. His resolutions expressed the basis of one phase of the constitutional anti-slavery agitation. They are given in full in Giddings's *History of the Rebellion* (New York, 1864). The statute of March 2, 1807, regulating the coastwise slave trade, is in 2 U. S. Statutes at Large 426. See **SLAVERY**.

CREOLE STATE. Louisiana. See **STATES**, **POPULAR NAMES OF**.

CRE'OLIN (origin uncertain). An unofficial dark-brown, sirupy liquid, of tarry odor, derived from coal-tar. It is soluble in alcohol and forms a milky fluid (an emulsion) with water. Different specimens vary considerably in composition and strength, and the careless use of the substance may cause poisoning. It is a good antiseptic, particularly against organisms that bear no spores, and is a powerful deodorizer. In operative surgery, it has the disadvantage that the milky character of the solution makes it difficult to see instruments placed in it.

CRE'ON (Lat., from Gk. Κρέων, *Krēōn*). In the Greek legend, the son of Menæceus, and brother of Jocasta, wife of Laius, King of Thebes. After the death of Laius he assumed the government and offered the crown and Jocasta to whoever could free the city from the Sphinx. Oedipus (q.v.) accomplished the task, and thus unconsciously became the husband of his own mother. After his fall Creon once more assumed the rule as guardian of the sons of Oedipus, Eteocles and Polyneices (q.v.). After the death of the brothers, Creon again became king, and forbade the burial of Polyneices and the Argives. Antigone (q.v.), however, defied Creon and buried her brother's body, whereupon Creon sen-

tenced her to be buried alive. Creon's son Hæmon, the betrothed of Antigone, killed himself on her body. This is substantially the story as it appears in the plays of Sophocles. Other versions told how Creon sacrificed a son on the walls of Thebes in order to avert the fall of the city, and how later he gave his daughter Megara to Heracles, who succeeded him on the throne of Thebes.

CRE'OSOTE, or **CRE'ASOTE** (Gk. κρέας, *kreas*, flesh + σωτήρ, *sōtēr*, preserver, from σώζειν, *sōzein*, to save). An oily liquid obtained by the destructive distillation of wood, particularly that of the beech (*Fagus sylvatica* Linné, natural order Cupulifere). It is almost colorless when freshly obtained, but gradually assumes a darker color if exposed to the action of light. It has a penetrating, smoky odor and a burning taste, and is slightly heavier than water, in which it is soluble only to a very limited extent. It mixes readily with alcohol, ether, chloroform, and glacial acetic acid. It is composed mainly of *guaiacol* and *crezol* and has a high refractive power. Creosote acts as an antiseptic and has been used in the preservation of meat—whence its name. At present it is largely used in the treatment of tuberculosis with mixed infection. For this purpose it may be administered in the form of an emulsion with cod-liver oil and other substances; or else a mixture of creosote with alcohol and chloroform may be inhaled by the patient, moderate doses of pure creosote being perfectly harmless, and causing no disagreeable symptoms whatever. Creosote was first prepared by Reichenbach in 1832, and Bouchard and Pimbert were the first to apply it to the treatment of tuberculosis. It is also used in bronchitis with profuse expectoration containing the *Streptococcus bacillus*, and in fermentative dyspepsia, diarrhœa, and dysentery. The *creosote-oil* used for the preservation of timber is derived by the fractional distillation of coal-tar, constituting the fraction that distills over between 230° and 270° C. It is composed mainly of phenol (carbolic acid), *crezol*, naphthalene, and anthracene.

The 'creosote-plant' (*Larrea Mexicana*) produces a substance similar to Indian gum-lac and having a strong creosote-like odor; hence the name of the plant.

CREOSOTE-BUSH. See ZYGOPHYLLACEÆ.

CREOSOTOL, krē'ō-sō-tōl' (from *creosote* + -ol), or **CARBONATE OF CREOSOTE**. A pale-yellow sirupy liquid similar to creosote, but having less odor and taste. It is used in tuberculosis and is well borne by the stomach.

CRÉQUI, krá'ké', CHARLES, Marquis de (1578-1638). A French soldier. He was a prominent officer under Henry IV., in 1622 was appointed a marshal of France by Louis XIII., and fought with great bravery against Spaniards and Huguenots. His military ability has been highly spoken of by Saint-Simon and Voltaire. Consult Chorier, *Histoire du Maréchal de Créquy de Blanchefort* (Grenoble, 1683).

CRE'RAR, JOHN (1827-89). An American philanthropist, born in New York City. He was a merchant in New York and from 1862 in Chicago, where he became head of the firm of Crerar, Adams & Co., and an incorporator and one of the directors of the Pullman Palace Car Company. He contributed \$2,500,000 as an endowment fund for a library now known by his name, \$100,000

for a statue of Abraham Lincoln, and bequeathed \$1,000,000 to charitable and religious organizations.

CRE'SAP'S WAR. See DUNMORE'S WAR.

CRESCEN'DO (It., increasing, pres. part. of *creocere*, from Lat. *creocere*, to grow). In music, a gradual increase of the volume of sound, or change from *piano* to *forte* and *fortissimo*. It is marked thus <, or with the abbreviation *crese.* The even swell of an organ produces a most perfect crescendo.

CRESCENT (from Lat. *creescens*, pres. part. of *crecere*, to grow). (1) A representation of the half-moon with the horns turned upward, called a crescent, is often used as an emblem of progress and success. It is generally spoken of as 'the arms' of the Turkish Empire; but is more properly the emblem of the empire and people. It was, however, a Byzantine emblem before the Turks assumed it on the capture of Constantinople in 1453; and at the present day is frequently to be seen on churches in Moscow and elsewhere in Russia, generally surmounted with the cross, marking the Byzantine origin of the Russian Church.

(2) A Turkish musical instrument introduced into the German military bands at the time of the Turkish wars, and now in general use in military music. It consists of a staff surmounted by a cap, and supporting several crescent-shaped brass plates, upon each of which little bells are hung. The instrument is played by being jingled in time with the music.

(3) In heraldry, the crescent is used both as a bearing or charge, and as a difference, or mark of cadency. In the latter case, it designates the second son, and those that descend from him. See **CADENCY**.

CRESCENT, ORDER OF THE. A Turkish order of knighthood. It was founded by Selim II. in 1799 after the battle of Abnkir, to be conferred on Christians for service to the Turkish State. Nelson was the first man to receive the honor. The order became extinct after half a century. An Order of the Crescent was founded by Saint Louis of France in 1269, and twice reestablished by the House of Anjou, reigning in Sicily and Naples. This is also extinct. The crescent and the star in white upon a red background constitute the Turkish flag. It is supposed that the appearance of the crescent in the horoscope of the great Othman led to the acceptance of it as the national symbol.

CRESCENT CITY. A name applied to New Orleans, because of its situation on a bend of the Mississippi River. The modern growth of the city has made the designation less applicable.

CRESCENTIIS, krēs-sēn'shī-is, **PETRUS DE**, or **CRESCENZI**, krá-shān'zē, **PIETRO** (c.1230-c. 1310). An Italian agricultural writer, the founder of modern agronomy in Europe. He was born in Bologna, but later sojourned in various cities of Italy, where he frequently acted in the capacity of judge lateral to the podestàs. Upon his return to Bologna after an absence of thirty years, during which he made valuable observations on agriculture, he published his famous work, entitled *Ruralium Commodorum Libri XII.* (1471). This work has been frequently reprinted and has been translated into Italian, German, and French. The genus *Cres-*

centia was named by Linnaeus in honor of the famous author, who was probably the first since the days of the Romans to point out the high value of agricultural science.

CRESCENTIUS, krēs-sēn'shī-ūs, JOHN (?-998). Leader (Patricius) of the national party in Rome against the authority of the Emperor in the last quarter of the tenth century. About 991, probably, Crescentius was all-powerful in Rome. With a short intermission, when Otho III. visited the city in 996, his rule lasted until 998, when he was beheaded by Otho. In 997 he had driven the Pope, Gregory V., from the city and appointed an antipope. Crescentius was long remembered as the champion of Roman liberty. Consult Gregorovius, *Rome in the Middle Ages*, vol. iii. (London, 1895).

CRESCENZI, krā-shān'zē, PIETRO. See CRESCENTIIS, PETRUS DE.

CRESCIMBENI, krā'shēm-bā'nē, GIOVANNI MARIA (1663-1728). An Italian critic and poet, born at Macerata. He received the degree of doctor of laws from the Jesuit College in his own town and then removed to Rome. Here, together with fourteen others (1690), he founded the Academy of the Arcadians, whose secretary he was for thirty-eight years. The academy was a great success, and was of great influence in counteracting the false taste of the time as embodied in Marini. Crescimbeni's most important works are: *Istoria della volgar poesia* (1698); *Commentario intorno alla volgar poesia* (1702-11); and *Trattato della bellezza della volgar poesia* (1700).

CRESCO. A city and the county-seat of Howard County, Iowa, 167 miles northeast of Des Moines, on the Chicago, Milwaukee and Saint Paul Railroad (Map: Iowa, E 1). It has extensive dairying and live-stock interests, and manufactures agricultural implements and machines, foundry products, flour, brick and tile, fire-ladders, etc. A 'Farmers' Alliance' store is successfully operated here. The water-works are owned by the city. Population, in 1890, 2018; in 1900, 2806.

CRE'SILAS (Lat., from Gk. Κρησίλας, *Krēsilas*). A Greek artist of the Attic school, born at Cydonia in Crete, who worked in the latter part of the fifth century B.C. He made a statue of Pericles, of the base of which fragments with the artist's signature have been found on the Acropolis of Athens. From this work seem to be derived the busts of Pericles in the British Museum, the Vatican, and Munich. He also made a statue of a wounded Amazon, which is probably represented by the Capitoline type. Other statues have been claimed as copies of his works, as the Munich Diomedes, and the Athena of Velletri. Consult Furtwängler, *Masterpieces of Greek Sculpture*, trans. by Sellers (New York, 1895).

CRESPI, krā'spē, GIOVANNI BATTISTA (1557-1633). An Italian painter, born in Cerano, and hence often called *Il Cerano*. He studied in Venice and Rome and established himself in Milan, where he found a patron in Cardinal Federico Borromeo. In sculpture and architecture also he was well skilled. His paintings, generally large and impressive in treatment, careful in detail, but occasionally mannered, include "Christ Appears to the Apostles Peter and Paul" (Hof-Museum, Vienna), and "The Baptism of Saint Augustin" (San Marco, Milan).

CRESPIN, krā-spān'. JEAN (c.1520-72). A French Protestant author. He was born in Arras, studied law in Louvain and Paris; became advocate in Parliament, 1540; fled on account of his religious opinions to Strassburg in 1545; removed to Geneva in 1548, and carried on the printer's trade there until his death in 1572. His fame rests upon his *Livre des martyrs* (1554), with its continuations or recastings under different names: *Recueil* (1554); *Histoire* (1570); new edition of the whole as *Histoire des martyrs* (3 vols., 1886-89). It was translated into Latin and has been the basis of many similar Protestant martyrologies.

CRESS (AS. *cressc*, *carss*, OIIG. *crecco*, *crecca*, Ger. *Kresse*; probably from OIIG. *chresan*, MHG. *kresca*, to creep). A name given to many plants, of which the foliage has a pungent, mustard-like taste, and is used as a salad. It is sometimes more strictly confined to the genus *Lepidium*, a genus of the natural order Cruciferae. The common cress or garden cress (*Lepidium sativum*) is an annual, a native of the East, frequently cultivated in European and American gardens. It is powerfully anti-scorbutic. Virginian cress (*Lepidium Virginicum*) resembles the garden cress in its properties, and is eaten as a salad, and used as a diaphoretic medicine in North America and the West Indies. *Lepidium piscidium*, a native of the South Sea Islands, is one of the plants used by sailors for prevention or cure of scurvy. The name winter cress is given to species of the genus *Barbarea*, also cruciferous biennial or perennial plants. The common winter cress (*Barbarea vulgaris*) is plentiful in moist pastures and hedge-banks throughout Europe and North America. It is occasionally cultivated as a winter salad; in Sweden it is used as a boiled vegetable. Its pungency is combined with some degree of bitterness. Very similar to this, and also occasionally cultivated, is the early winter cress, or American cress (*Barbarea praecox*), a native of Great Britain, the Continent of Europe, and North America. The common bitter cress or cuckoo-flower (*Cardamine pratensis*) is also known by the name of lady's-smock. *Cardamine amara* and *Cardamine hirsuta* are cultivated to a considerable extent in Europe, and are also found in America. Watercress (*Nasturtium officinale*) is a perennial aquatic plant, much used in the United States and Europe as a cold-weather salad. It is a native of almost all parts of the world. The leaves have a pungent, bitterish taste, with a little saltiness. The plant is of easy cultivation and grows best in clear, shallow, running water, with a bottom of sand or gravel. Mud is injurious both to its growth and to the flavor of its leaves. For Indian cress or nasturtium, see TROPÆOLUM.

CRESET (OF. *eresset*, Fr. *ercuset*, from Dutch *kruysel*, hanging lamp, dim. of *kruyse*, cup, Icel. *kräs*, Ger. *Krause*, Engl. *cruse*). A name given to a great light kindled upon a beacon or watch-tower, and also to a lamp or torch, or to a light fixed on a pole. The name owes its origin to the fact that formerly beacons were usually surmounted by a cross.

CRESSIDA, or **CRESID**. The lover of Troilus in the *Troilus and Cressida* (q.v.) of Chaucer, Shakespeare, Dekker and Chettle, and

Dryden, and a type of infidelity. The name is probably a mediæval invention representing Briseis, the daughter of Calchas, the Trojan seer.

CRESSID, or **CRESEIDE**, TESTAMENT OF, and COMPLAINT OF **CRESEIDE**. Poems by Robert Henryson, wrongly included in the earlier editions of Chaucer.

CRESSON. A pleasure resort in Cambria County, Pa., 102 miles east of Pittsburg, on the Pennsylvania Railroad. It has a fine situation, at an elevation of over 2000 feet, and is noted for pure air and the beauty of its scenery. Mineral springs add to its attractions as a resort. Population, about 800.

CRESSON, **ELLIOTT** (1796-1854). A Quaker merchant and philanthropist of Philadelphia, Pa., who devoted much attention to the emancipation of the negroes from slavery. He was president for some time of the Colonization Society (q.v.), and subsequently as its agent labored to establish the colony at Bassa Cove, on the Grain Coast, Africa.

CRESSY. See **CRÉCY**.

CRESSWELL, **SIR CRESSWELL** (1794-1863). An English jurist. He was born at Newcastle; graduated at Emmanuel College, Cambridge, in 1814, and in 1819 was called to the bar. In 1834 he was appointed King's counsel, in 1842 a puisne judge of the common pleas court, and in 1858 first judge of the newly created probate and divorce court. He was largely employed as advocate in important navigation and mercantile cases.

CREST (OF. *creste*, Fr. *crête*, Sp., Port., It. *cresta*, crest, from Lat. *crista*, comb, tuft; connected with Lat. *crinis*, hair). Though popularly regarded as the most important feature in heraldic emblems, the crest, in the eyes of heralds, is an external adjunct to the shield, without which the bearing is complete, and which may consequently be altered without materially affecting its significance. Occupying the highest place on the helmet, it is the member of the bearing by which the knight was commonly known in battle; and from this circumstance it is to the crest that the term *cognizance* (from *cognosco*, to know) is properly given. Its claim to a classical origin is probably better than that of any other portion of coat armor. The helmet, as we see it represented on ancient statues and gems, was frequently adorned with a crest. Sometimes it was of horse-hair; at other times a lion or other animal was placed on the helmet, either erect or couchant.

The first crest to be met with in the monuments of English chivalry is that on the great seal of Richard Cœur de Lion. They came into general use about the time of Henry III., and were used as marks of distinction by commanders in the holy wars, as they had formerly been by the Roman centurions. For lightness they were often made of stuffed leather, which was gilt, silvered over, or painted—a circumstance which explains their greater size than in later times, when they were made either of wood or metal. The earliest example of the wreath on which the crest is now invariably placed is that on the monument of Sir John Harsieck. It consisted of two pieces of silk, of the colors of the armorial bearings of the wearer, twisted together by the lady who had chosen him for her knight.

It is now represented as consisting of two stripes of gold or silver lace, twisted into a circular cord. Its tinctures are always those of the principal metal and color of the arms. It is a rule in delineating the wreath, which is shown edgewise above the shield, that the first coil shall be of metal, and the second of color. Civic, triumphal, and other crowns were used as wreaths; and this practice is supposed to have given rise to the use of coronets, out of which crests are sometimes represented as issuing, even in the case of persons who are not noble.

Consult: Fairbairn, *Book of Crests of the Families of Great Britain and Ireland* (Edinburgh, 1892); and for foreign crests, see Reitstap, *Armorial général* (Gouda, 1884-87). See, also, **HERALDRY** and the authorities referred to there.

CREST, or **CRESTING**. In architecture, an ornamental finishing in stone, tiles, or metal, running along the top of a wall, or the ridge of a roof, or surmounting a gable or pinnacle. *Crest-tiles*, or, as they are corruptly called, *crest-tiles*, or *crease-tiles*, are frequently in the form either of small battlements or Tudor flowers. See **COPING**.

CRESTED. A term in heraldry. When a cock or other bird has its comb of a different tincture from its body, it is said to be crested of such a tincture, naming the tincture.

CRESTED DOG'S-TAIL GRASS. See **DOG'S-TAIL GRASS**.

CRESTON. A city and county-seat of Union County, Iowa, 70 miles southwest of Des Moines; on the Chicago, Burlington and Quincy Railroad (Map: Iowa, C 3). It has extensive machine-shops, car-works, wagon-factories, etc. Creston was settled in 1868 and incorporated the following year. It is governed at present under a charter of 1870, revised in 1890, which provides for a mayor, chosen biennially, and a city council, elected by wards. Population, in 1890, 7200; in 1900, 7752.

CRESWICK, **THOMAS** (1811-69). An English landscape painter, born in Sheffield, February 5, 1811. He was a pupil of J. V. Barber in Birmingham, and went to London in 1828. He constantly exhibited at the British Institution and the Royal Academy. In 1842 the British Institution awarded him a premium of eighty guineas, and in the same year he was made an associate of the Royal Academy. He was made R.A. in 1851. He died at Bayswater, December 28, 1869. He was a landscape painter of popular subjects, such as rippling streams, riverside nooks, glens, and dells. He was a fair technician and a good colorist. Among his principal paintings are: "Welsh Glen" (1843); "London Road a Hundred Years Ago" (1847); and the "Weald of Kent." He was also an etcher of repute, and contributed many etchings to the publications of the Etching Club.

CRETACEOUS (krê-tā'shūs) **SYSTEM**, or **CHALK FORMATION** (Lat. *cretaceus*, chalky, from *creta*, chalk). A term applied to a series of strata underlying the Tertiary and resting on the Jura-Trias, the name being derived from the chalk-beds which form such a prominent member of the Cretaceous in England and France, although such chalk-beds are rare in the United States, occurring only in Texas and Arkansas. There exists at

times an unconformity between the Upper Cretaceous and the Eocene, or lower member of the Tertiary, especially in the United States. The classification of the Cretaceous presents many difficulties, owing to the variable section which it exhibits in different areas; but European and American geologists are agreed on a division into an upper and a lower member, while for divisions of lesser size local names are employed.

The Lower Cretaceous is represented in the northern Gulf States by (a) Tuscaloosa and (b) Eutaw stages; in Texas and the western Gulf borders by (a) Trinity, (b) Fredericksburg, and (c) Washita stages. The Upper Cretaceous in the Rocky Mountain region has the following subdivisions: (a) Dakota stage, (b) Benton stage, (c) Niobrara stage, (d) Pierre stage, (e) Fox Hills stage, (f) Laramie stage; while in the Atlantic border States it is divided into (a) Raritan stage and (b) New Jersey Greensand stage. The Cretaceous rocks of North America form a belt of increasing width, extending southward along the Atlantic coast from New York, through New Jersey, Maryland, North Carolina, Georgia, and Florida; then around the northern and western shores of the Mexican Gulf, up the Mississippi Valley to the mouth of the Ohio, and from Texas northward to the foothills of the Rocky Mountains. They occur also in Nebraska, Kansas, and Iowa. The greatest development of the Cretaceous system is in Wyoming, Utah, Colorado, and west of the Sierra Nevadas in California. In some portions of these last-named regions it is found at heights of 10,000 and 12,000 feet. It occurs also in Arctic America, near the mouth of the Mackenzie River. The American Cretaceous beds consist of greensand—called also 'marl,' and much used in New Jersey and elsewhere for fertilizing land—sands of other kinds, clays, shell deposits, and, on the Gulf of Mexico, especially in Texas, limestone. In New Jersey the formation is 400 or 500 feet thick; in Alabama, 2000 feet; in Texas, 800 feet, chiefly solid limestone; in the upper Missouri basin more than 2000 feet; and east of the Wasatch, more than 9000 feet.

The rocks of the Cretaceous contain an abundance of both animal and plant remains, for this was a closing period of an era in which reptiles predominated, and, curiously enough, but few or none of the Cretaceous species have continued into the Tertiary. The plants found in the Cretaceous represent angiosperms, which were not found before this era, both dicotyledons and palms, the former including species of the oak, willow, poplar, beech, maple, fig, tulip, sassafras, eucalyptus, and sequoia. Many palms and cycads are found in the Cretaceous of North America. The appearance of the dicotyledons in this formation is rather sudden. The animal remains found include both the smallest and largest forms. There are foraminifera, sponges (which were very common in the chalk), echinoids, many mollusks, especially spirally coiled ammonites, and oysters. The fishes show a continuation of the placoids and ganoids of the former era; but teleosts, or true bony fishes, made their first appearance. There was also an extraordinary abundance of reptiles, including enaliosaurs, dinosaurs, pterosaurs, and crocodiles. Some of the pterosaurs from the Kansas rock measured from 20 to 25 feet in expanse of wing. The sea-saurians were from 10 to 50 feet

long. Cope describes the elasmosaurus as a snake-like form 40 feet long, with an arrow-shaped head on a swan-like neck that rose 20 feet out of the water. Consequently it could swim many feet below the surface, and yet have its head extended into the air for breath. The American rocks supply 40 species of sea-serpents. More curious still were the birds with teeth, found in New Jersey and Kansas. (See *Ichthyorhynchus*.) The mammalian remains were mostly those of lower orders, such as marsupials and monotremes.

The geographic developments in North America during the Cretaceous were great. The interior continental sea was shallowed, and finally obliterated by the uplifting of the land, so that the eastern and western portion of the United States were joined into one continent. This uplift became emphasized toward the end of the Cretaceous, when the Rocky Mountains were formed. Violent volcanic eruptions accompanied this uplift, and the lava-flows of the Yellowstone regions date from this time.

The economic products include most of the coal and lignite deposits of the Western States. Many of the gold and silver bearing fissure veins of the Rockies were formed in the Cretaceous, while other products are fire-clays, chalk, greensand, and iron ores.

In Europe the Cretaceous rocks assume great importance. According to Geikie, they may be grouped into two fairly distinct areas, of which the northern includes Great Britain, the lowlands of central Europe, with portions of Silesia, Bohemia, and northern France; while the southern embraces the central and southern part of France, the Alps, and the Mediterranean basin. The northern area is characterized by shallow-water deposits—sandstones, conglomerates, and marls—more or less glauconitic, and passing into a loosely textured limestone or chalk. In the southern basin the typical rocks are massive, compact limestones, which indicate conditions of deeper water and freer communication with the open sea. The entire series of rocks is usually grouped by geologists as follows: Lower Cretaceous—(a) Neocomian, (b) Urgonian, (c) Aptian; Upper Cretaceous—(a) Gault or Albian, (b) Cenomanian, (c) Turonian, (d) Senonian, (e) Danian. The dividing line between the Upper and Lower Cretaceous is regarded by the French geologists as occurring at the top of the Albian. The most conspicuous member of the Cretaceous is the white chalk (Upper Cretaceous) which forms the remarkable cliffs of southeastern England and northwestern France.

Consult Dana, *Manual of Geology* (4th ed., New York, 1896); Geikie, *Text-Book of Geology* (London, 1893); White, "Correlation Papers, Cretaceous," *United States Geological Survey, Bulletin* 82 (Washington, 1891).

CRETE (Lat. *Creta*, Gk. *Κρήνη*, *Krētē*, NGk. *Κρήνη*, *Kriti*, Turk. *Kiriti*), or **CANDIA**. An island in the Mediterranean, situated south of Greece, considered the most southerly part of Europe. It lies between latitudes 34° 57' and 35° 41' N., and between longitudes 23° 30' and 26° 20' E. (Map: Greece, F 6). It is oblong in shape, having a length of about 150 miles, and varying from 6 to 35 miles in width, with an area of 3326 square miles. Its mountainous surface bears some resemblance to that of Greece. The western part of the island is the more elevated, and con-

tains the large mountain range of the White, or Madaras, Mountains, which rise to a height of over 8000 feet. The central mountain of Ida, or Psiloriti, reaches about the same altitude. The eastern part is lower, but there are several peaks between 5000 and 7000 feet high. The northern coast is well indented, and abounds in good harbors, that of the Bay of Suda on the northwest coast being one of the best in the Levant. The southern coast is mainly unbroken and inaccessible. There are several rivers, but they run dry during the summer season. There are numerous springs throughout the island. The climate of Crete is one of the most salubrious in Europe. In spite of its mountainous surface, Crete has a soil of remarkable fertility, producing most of the southern fruits and grains. The thick forests which formerly covered the mountains have entirely disappeared, but there are still found some trees, such as the cypress, the chestnut, and the olive, cultivated mostly in the lowlands.

The chief products are olive oil, grapes, oranges, lemons, and other southern fruits. The vine of Crete, which enjoyed such fame in the Middle Ages, has greatly deteriorated. One of the chief manufactured products exported is soap, which is made of olive oil. The commerce of Crete is chiefly with Greece and Turkey, to which it exports olive oil, chestnuts, and silk. The total value of the trade of Crete for 1899-1900 amounted to about \$3,300,000, of which about two-thirds represented imports. The principal ports are Khania, Retimo, and Candia. The Bank of Crete was founded in 1899, with a capital of \$1,930,000, and obtained the privilege of issuing notes for thirty years.

Crete is an autonomous State under the suzerainty of Turkey. In accordance with the Constitution of 1899, the executive authority is vested in a High Commissioner, a post now occupied by Prince George of Greece, who is assisted by a council of three nominated members, who also hold portfolios and sit in the Assembly, but have no votes. The Assembly consists of Deputies elected for two years at the rate of one for every 5000 inhabitants, and ten Deputies nominated by the High Commissioner. The foreign affairs of Crete are under the control of the representatives at Rome of the four Powers which are responsible for its autonomy—Russia, Great Britain, France, and Italy. The revenue is derived chiefly from direct and indirect taxes. For 1900-01 the budget balanced at nearly \$1,200,000. The public debt amounted in 1900 to nearly \$460,000. According to a decision rendered by the four Powers in August, 1901, the island is to pay the sum of about \$290,000 and concede the salt monopoly to the Ottoman Public Debt for twenty years, in return for the relinquishment on the part of Turkey of all privileges in Crete. For administrative purposes Crete is divided into five departments, which are subdivided into sub-prefectures and parishes. There is no standing army, but militia service is obligatory on all male Cretans. Education is compulsory between the ages of six and nine, and the 326 educational institutions of the island had in 1900-01 an attendance of over 36,000.

The population of Crete, according to the census of 1900, numbered 301,273, consisting of 267,266 Greeks, 33,281 Mussulmans, and 726 Jews. As compared with the figures of 1881, the

total population shows an increase of nearly 23,000, while the Mussulman element has decreased by nearly 40,000. The foreign population, which is not included in the above figures, numbered in 1900 over 6000. Greek is spoken by the inhabitants of the island. The capital is Canca (q.v.).

HISTORY. Of the aboriginal inhabitants of Crete little is known apart from legend; but recent archaeological discoveries tend to show that the island was settled at a very early period by Phœnicians and Egyptians, and that it undoubtedly was a stepping-stone for those who brought the culture of the valley of the Nile to the mainland of Greece.

Passing by the possible identification of Crete with the Old Testament Caphtor, and with the Kefto of the Egyptian inscriptions, one of the earliest historical notices of the island is that embodied in the *Odyssey* (xix. 172-79). Here it is spoken of as well populated, and by people of mixed descent, pure Cretans, Achæans, Dorians, and others. The main element in the population was Greek, but whether Dorian or some other type is uncertain. Here the fabled King Minos, son and companion of Zeus, reigned in legendary days. When the *Odyssey* was composed, Cnosus, Minos's capital, situated in the northern part, was the greatest of the ninety cities of Crete. By the side of Cnosus, the city republics of Gortyna, in the south, and Cydonia, in the northwest, rose to great prominence.

As allies of the Cilician pirates the inhabitants came into conflict with Rome, and, after a desperate resistance of two years, were subdued by Metellus in B.C. 66. On the division of the Empire the island fell to the Byzantine rulers, who held it till the year 823, when it was conquered by an army of Arabs from Andalusia. In 963 the Byzantines drove out the Saracens and reestablished Christianity in the country. Upon the establishment of the Latin Empire of the East, in 1204, Crete was given to Boniface of Montferrat, who sold it to the Venetians. These retained their power till 1669, when the Turks, after a blockade lasting twenty-one years, took the fortress of Candia. The last vestiges of Venetian authority disappeared in 1715, and Crete remained a part of the Ottoman Empire.

Widespread discontent with Turkish rule, and the hostility prevailing between the Christian and the Mussulman inhabitants, led to repeated revolts and civil wars in the latter half of the nineteenth century. An insurrection lasting from 1866 to 1868 extorted from the Porte the promise of reforms in the Government; the pledge remained unredeemed, however, till 1878, when the Sultan, spurred on by the Congress of Berlin, issued a pact or charter, and appointed a Christian Governor-General of the island; but the rights promised in the charter were not accorded, and the influence of the Christian *râli* was offset by the appointment of a Mussulman Military Governor, in whom the real power was vested. In 1889 the Christians rose in arms, but the revolt was suppressed, the pact was abrogated, and the island held under military rule till 1894, when the intervention of the Powers led to the reappointment of a Christian Governor. It was a repetition of the old farce.

In 1896 a fresh uprising took place. The Sultan gave his consent to the calling of a national assembly, but the Christian insurgents refused to

lay down their arms, in expectation of assistance from Greece, where their efforts for independence were watched with great sympathy. In February, 1897, a Greek force landed in Crete and attacked the Turkish troops. But Greece, which had counted on European sympathy, if not active aid, in its struggle with Turkey, found itself alone. The concert of Powers, comprising Austria, England, France, Germany, Italy, and Russia, declared that Crete should be granted complete autonomy, but that annexation to Greece was impossible; they established a peaceful blockade of the island, and demanded that Greece recall its troops. The refusal of Greece to comply plunged it into war with Turkey, the outcome of which destroyed all hopes of annexation. From 1897 to near the end of 1898 Crete was the scene of continuous violence, while the Powers quarreled over the appointment of a Governor. At length, the Ottoman forces were withdrawn from the island, and in December, 1898, Prince George of Greece, son of King George, was created High Commissioner of Crete for the Powers, for a term of three years. A national assembly met and formed a constitution providing for the creation of a legislature, and guaranteeing freedom of religion to all inhabitants. With life and property thus secured, the people returned to their wonted occupations and order was quickly restored. Consult: Hoeck, *Kreta* (Göttingen, 1823-29); the *Opus Magnum* of Cretan topography, mythology, and archæology; Raulin, *Description physique de l'île Crète* (Paris, 1869); Bursian, *Geographie von Griechenland*, vol. ii. (Leipzig, 1869-72); Pashley, *Travels in Crete* (Cambridge, 1837); Spratt, *Travels and Researches in Crete* (London, 1865); Stillman, *The Cretan Insurrection of 1866-68* (New York, 1874); Mitchell, *The Greek, the Cretan, and the Turk* (London, 1897); *Annual of the British School at Athens*, vol. vi., vii. (Athens, 1899-1901). For further information about discoveries, see ARCHEOLOGY; CNOSSUS.

CRETE. A city in Saline County, Neb., 20 miles southwest of Lincoln; on the Chicago, Burlington and Quincy and the Missouri Pacific railroads (Map: Nebraska, H 3). The principal industries comprise flour-mills, a creamery, and nurseries. The city contains a public library and is the seat of Doane College (Congregational), established in 1872, which has a well-equipped observatory. Settled in 1867, Crete was incorporated as a village in 1871, and is at present governed under a revised charter of 1886. The council is made up of the mayor, elected annually, and representatives from the city wards. The city owns and operates its water-works and electric-light plant. Population, in 1890, 2310; in 1900, 2199.

CRETIN, krâ-tân', JOSEPH (1800-57). An American ecclesiastic, first Roman Catholic Bishop of Saint Paul, Minn. He was born in Lyons, France, pursued ecclesiastical studies in that diocese, was ordained priest, and in 1838 volunteered to assist Bishop Loras, of Dubuque, Iowa, as a worker in the American missions. Vicar-General of Dubuque until 1851, and pastor of the cathedral church of Saint Raphael for much of the time, he in that year received episcopal consecration as pioneer bishop of Saint Paul, and entered upon his work with a clergy of nine. He soon established a school, a seminary, a

hospital, and an asylum; restored the mission among the Winnebagoes at Long Prairie, and founded new missions among the Ojibways. In three years he had increased the number of churches from one to twenty-nine, and to these had added thirty-five stations. He also began the building of the Cathedral of Saint Paul. Consult Clarke, *Lives of the Deceased Bishops*, vol. ii., pp. 415-500 (New York, 1872).

CRÉTINEAU-JOLY, krâ'tê'nô' zhâ'lé', JACQUES (1803-75). A French author. He was born at Fontenay-le-Comte, Vendée. His first publications were verses, of which *Les chants romains* (1826) are the best known. He then wrote for the newspapers, and made special historical studies, particularly of the war of the Vendée. His principal work is *L'Histoire religieuse, politique et littéraire de la Compagnie de Jésus* (1844-46). This may be called the official history of the Order, and is written from unedited and authentic documents.

CRE'TINISM (Fr. *crétinisme*, from *crétin*, idiot; possibly from OF. *christien*, *christien*, Fr. *chrétien*, Christian, as being one of simple mind). A term applied, in a general sense, to idiocy, or defective mental development, depending upon local causes and associated with bodily deformity or arrested growth. Cretinism is very often found in connection with goitre (q.v.), in the lower Alpine valleys, not only of Switzerland and Italy, but of the Pyrenees, Syria, India, and China. In Europe it is rarely met with at a higher elevation than 3000 feet, and haunts chiefly the valleys surrounded by high and steep walls of rock, which exclude the light and limit the free circulation of air. Cretins are either imbeciles with intelligence or idiots; their bodies are dwarfed, with curvature of the spine forward, pendulous belly, distorted legs, small, deep-set eyes, large mouth, with protruding lower lip, sparse harsh hair, dry skin, and irregularly large or small skull.

Cretinism was thought to be due to lime in the drinking-water of the districts in which these people live, but has been proved to be dependent upon disease of the thyroid gland. Treatment of adult cretins with thyroid gland, administered by the mouth, or by implanting thyroid glands from animals in the patients' bodies, has resulted in great improvement. Treatment of infant cretins with doses of the gland has resulted in a cure; but the thyroid must be taken as food for life, otherwise the patient relapses into an imbecile and the physical changes return. See GOITRE; THYROID.

CRETONNE, krê-tôn' (so named after its manufacturer). Originally a white cloth of French manufacture. The name is now applied to a printed cotton fabric introduced about 1860 and used for curtains or for covering furniture. Chintz (q.v.), so much employed for the same purpose in former years, is a comparatively thin printed cloth highly glazed. Cretonne, however, is generally thick and strong, and with a twilled, crape, basket, wave, or other figure produced on the loom. When a pattern is printed on this uneven surface, it has a rich, soft appearance. A cretonne is rarely calendered or glazed. The thick weft threads of inferior qualities are commonly formed of waste cotton, and the patterns upon these, though often bright and showy, are as a rule printed in more or less fugitive colors.

Some cretonnes are now printed on both sides with different patterns.

CREÛSA, krê-û'sà (Lat., from Gk. Κρέουσα, *Kreousa*). (1) The wife of Jason, and daughter of King Creon of Corinth. She was burned to death with her father by the magical poisoned diadem and robe given to her as bridal gifts by Medea. (2) The daughter of Priam and Hecuba, and wife of Æneas. She disappeared during the flight from Troy, and when Æneas returned to the burning city to search for her she reappeared, announcing her adoption as a nymph by Cybele, and prophesying his coming good fortune in Italy.

CREUSE, krêz (Fr., hollow). A central department of France watered by the river from which it derives its name (Map: France, H 5). Area, 2150 square miles. Population, in 1896, 258,900; in 1901, 277,831. Low mountains and chains of hills, intersected by winding valleys, deep and narrow, occupy the greater part of the land. The streams, with the exception of the Creuse, are insignificant. The climate is moist and variable, and the soil poor. The products are rye, buckwheat, oats, and potatoes; but the rearing of cattle forms the chief branch of rural industry. Large quantities of chestnuts and fruit are grown. Coal is mined at Ahun and Bourgneuf, while iron, lead, tin, and antimony are found at various points. The people of Creuse use a coarse patois; they are generally industrious, and annually migrate in large numbers to find work in various parts of France. Capital, Guéret.

CREUSE. A river of France, rising in the mountains on the southern border of the Department of Creuse, flowing in a generally north-northwest direction through that department, then in a northerly and westerly direction through Indre, then on the borders of the departments of Vienne and Indre-et-Loire, and falling into the Vienne, a tributary of the Loire, about 12 miles north of Châtellerault, after a course of 150 miles.

CREUSOT, krê'zò', LE. A town in the Department of Saône-et-Loire, France, 12 miles southeast of Autun (Map: France, L 5). It is situated in the midst of a district rich in coal and iron, and is noted as the seat of Schneider's immense works, comprising coal-mines, iron-foundries, and extensive factories for the production of heavy cannon and other ordnance, locomotives, stationary engines, etc. These works employ 16,000 persons. Le Creusot also has glass manufactures. A statue of Eugène Schneider (1805-75), by Chapu, is a feature in the town. From a small hamlet, known as Charbonnière, Creusot rose to its present importance after the establishment of iron-works in 1770, and their development from 1837 by Messrs. Schneider. The population, which in 1841 was 4000, reached 32,034 in 1896; but by 1901 it had decreased to 30,584.

CREUTZ, kroits, GUSTAF PHILIP, Count (1731-85). A Swedish politician and poet, born in Finland. In 1763 he was sent as Minister to Madrid, and in 1766 as Minister to Paris, where in 1783 he concluded with Benjamin Franklin a commercial treaty between Sweden and the United States. He was subsequently chancellor of the University of Upsala. He is chiefly known for the idyl *Atis och Camilla* (*Atys and Camilla*,

1761), which, with ten other poems, appeared in a volume edited by Gyllenberg (1795). A new edition of his poems was published in 1862.

CREUZER, kroits'sër. GEORGE FRIEDRICH (1771-1858). A German philologist. He was born at Marburg, and studied there and at Jena. In 1802 he was appointed a professor at Marburg, and in 1804 obtained the chair of philology and ancient history at Heidelberg, which he occupied for forty-four years with great credit. In 1848 he retired to private life. He died at Heidelberg, February 15, 1858.

Creuzer's whole life was devoted to the study of antiquity. His first, and probably his greatest work, was *Symbolik und Mythologie der alten Völker, besonders der Griechen* (1810-12). This treatise, which asserted the symbolical character of ancient mythologies, excited a lively controversy, in which Hermann and Voss appeared as the opponents of Creuzer. His next work in importance was a complete edition of the works of Plotinus (3 vols., Oxford, 1835). Along with G. H. Moser, Creuzer edited several works of Cicero—*De Natura Deorum* (1818); *De Legibus* (1824); *De Re Publica* (1826); and *De Divinatione* (1828). Between 1837 and 1848 he published a partial collection of his writings in ten volumes (*Deutsche Schriften*, Leipzig and Darmstadt), the last of which contains an autobiography of Creuzer under the title *Aus dem Leben eines alten Professors*. He was also a prolific writer of essays on archaeological topics. In 1854 appeared *Friderici Creuzeri Opuscula Selecta*.

CREUZNACH, kroits'näg. See KREUZNACH.

CREVAL'LE (from Sp. *caballa*, horse-mackerel, from *caballo*, horse, from Lat. *caballus*, horse), or CAVALLY. A name in Florida and the West Indies for various edible mackerel-like sea-fish of the genus *Caranx* (family Carangidæ), especially the large horse-erevalle or jaek (*Caranx hippos*), which is found on both coasts of the warm parts of America, and also in the East Indies. It is olivaceous above; sides and below golden; opercle marked with a large black blotch; canines of the lower jaw very prominent. It frequently exceeds fifteen pounds in weight, and is common in Florida, where it is regarded as a fine food-fish. A closely related species (*Caranx caballus*) of the Pacific Coast of Mexico is called 'cocinero' or 'cocinero dorado.' See JUREL; Plate of HORSE-MACKERELS, ETC.

CREVASSE, krâ-vâs'. See GLACIER.

CREVAUX, krâ'vò', JULES NICOLAS (1847-82). A French explorer, born at Lorquin, Lorraine. He made four extensive tours through South America. On the first of these (1877) he visited the interior of Guiana and crossed to the Tumuchumae mountains, the first European to perform that feat. In the following year he visited the valley of the Rio Oyapok, and after exploring the Amazon region, returned to Paris. On his next tour, undertaken for the purpose of exploring the left affluents of the Orinoco, he traveled from Bogotá, along the upper Rio Negro to the Rio Guaviare, which he reached October 20, 1880. In 1882 he journeyed through the valley of the Parana, explored the Tapajos and several other rivers, and discovered numerous remains of Inca civilization. While endeavoring to ascend the Pileomayo, in order to visit certain Indian tribes, he was attacked by the Tobas and killed with nineteen of his companions; two Bolivians

of his escort alone escaped to relate the details of the catastrophe. An account of his explorations has since appeared under the title, *Voyages dans l'Amérique du Sud* (1883). A work published by the Geographical Society of Paris, and entitled *Fleures de l'Amérique du Sud* (1883), is also based upon his researches.

CRÈVECŒUR, krëv'kêr', JEAN HECTOR SAINT JOHN DE (1731-1813). A French agriculturist, traveler, and author. He was born at Caen, and was educated in England. He came to America in 1754, bought an estate near New York, and married the daughter of an American merchant. He suffered much from the Revolutionary War, and in 1780 was imprisoned three months in New York on suspicion of being a spy. He was sent to England as a prisoner, was exchanged, reached France in 1782, and introduced there the culture of the American potato. On his return to New York (November, 1783) as French Consul, he found his wife dead, his house burned; his children, too, had disappeared, but were finally found in the care of a kindly merchant. He had previously published *Letters of an American Farmer* (1782), which he translated into French and published in Paris. They gave such glowing accounts of the climate and fertility of America that five hundred families are said to have left France for the Ohio Valley on the strength of his statements. Most of them soon died there. He wrote also a volume on *Potato Culture* (in French), and *A Journey in Upper Pennsylvania and in New York State* (2 vols., in French, 1801). In his most important work, the *Letters*, Crèveœur, disguising his French nationality, writes as a simple-hearted American farmer of slight education and narrow horizon. Internal evidence in his writings tends to indicate that he was a Quaker. He was a man of much cultivation, who refused to take any part in the fierce political and military controversies of the Revolution. His idyllic descriptions of life in the New World, with its approximation to Rousseau's state of nature, transformed crudity into an idealistic mirage that fascinated the philosopher. Yet in some ways Crèveœur's ideals were such as typical Americans have rarely been without—he saw in prophetic vision the future glory of the country. He had an exquisite sympathy with natural life that makes some of his descriptive passages prose idyls of great beauty; for example, the beautiful passage describing him feeding quails in the snow. The *Letters* were translated into German and Dutch, and their idealized treatment of American rural life may perhaps be traced in Campbell, Southey, Coleridge, and Byron—possibly in Chateaubriand. After holding his consulship for ten years, Crèveœur returned to France, dying at Sarcelles. Consult Tyler, *Literary History of the Revolution* (New York, 1897).

CREVILLENTE, krä've-lyän'tá. A town of Spain, in the Province of Alicante, about 20 miles west-southwest of the city of that name (Map: Spain, E 3). It is picturesquely situated at the foot of the hills near the boundary of Murcia and has a pretentious town hall, and a castle, formerly the possession of the Count of Altamira. Weaving and agriculture are the principal industries. Crevillente is supposed to have been founded by the Romans. Under the Goths it formed part of the Kingdom of Todmir;

it passed into the hands of the Moors, by whom it was held until 1263. Population, in 1900, 10,865.

CREW (older form also *crue*, apocopated from *accruc*, OF. *acrecie*, *acrecue*, increment, from *accristre*, Fr. *accroître*, to increase, from Lat. *accrescere*, to increase, from *ad*, to + *erescere*, to grow). A term used to designate the body of men employed to man a ship, boat, gun, etc. The crew of a full-rigged sailing ship is divided into five parts—forecastlemen, foretopmen, maintopmen, mizzen-topmen, and afterguard; these are called the *parts of the ship*, and they are again subdivided into port and starboard *watches*, and each watch is again separated into *first* and *second parts port* (or *starboard*). Modern men-of-war without sail-power usually have the crew divided according to the arrangement of the battery. It is customary to have four deck divisions and the guns are manned by them. In addition to these there are the powder division, engineer's division, and marines.

CREW, HENRY (1859—). An American physicist, born at Richmond, Ohio. He graduated at Princeton in 1882, was fellow in physics at the Johns Hopkins University in 1884-87, and instructor in physics at Haverford College in 1888-91. In 1891-92 he was astronomer of Lick Observatory, and in 1892 was appointed professor of physics at Northwestern University (Evanston, Ill.). He also became assistant editor of the *Astrophysical Journal*, and published *Elements of Physics* (1899).

CREWE, kröö. A town of Cheshire, England, about 43 miles southeast of Liverpool (Map: England, D 3). It is a central station of several railways and owes its importance to the establishment in 1843 of the immense workshops of the London and Northwestern Railway, which now employ more than 7000 men. Crewe was incorporated in 1877. Its affairs are administered by a mayor, a municipal council of nineteen, and a board of aldermen of seven members. (See GREAT BRITAIN, paragraph on *Local Government*.) Its supply of gas and water is provided by the London and Northwestern Railway. It has a modern system of sewerage connected with a sewage farm. Two hospitals, a technical school and school of art, public baths, and a large general market are maintained by the corporation. Among its chief industries are the manufacture of locomotives, railway-cars, clothing, and fustian. In 1851 its population was only slightly over 4000, in 1874 it had reached 18,000, in 1891 it was 32,774, and in 1901, 42,075.

CREWLER. The name of an indigent clergyman's family in Dickens's *David Copperfield*. The wife has an infirmity of the legs which makes them susceptible to the least domestic trial. Traddles marries one of the daughters, after a long engagement.

CREYTON, krä'ton, PAUL. A pseudonym of J. T. Trowbridge.

CRIB. See FOUNDATIONS.

CRIBBAGE (from *crib*, rack, Ger. *Krippe*, OHG. *krippa*, also *chripfa*; connected with MHG. *krêbe*, basket, which is probably related to Lat. *corbis*, basket). A game of cards, which can be played by two, three, or four persons, but is

mostly played by two with a pack of fifty-two cards. When four persons are engaged, they take sides. The value of the cards is: face cards ten, ace one, and the rest as marked. The number of cards dealt is usually five. The points are scored on a board, and sixty-one constitutes game. The players cut for deal; the player who loses the deal takes three points, as a makeweight for the adversary's advantage. Five cards in alternate succession are then dealt, the rest of the pack being placed face downward on the table. The players gather up their five cards, inspect them and select two to place them on the table face down. These cards are called 'the crib,' and become the property of the dealer. The non-dealer then cuts the remainder of the pack and the dealer turns up the top card. The play then begins, the player announcing the value of each card as he plays it; thus suppose it is a king he calls 10—the next player says, for example, 8; then another card is played by the first player, and so on until the whole amount reaches 31, or as near it, without exceeding it, as can be accomplished. The details of counting the points made in play are too intricate to exemplify in a general description. After the play of the hand is completed, each player counts all the fifteens he can by any combination make out of the cards he holds in conjunction with the 'turn up' card. Then the dealer takes up the four cards thrown out for the 'crib' by the two players as already mentioned and counts them in the same way in conjunction with the turn up or start card. Each party is entitled, in addition to the points made in play or in crib, to count 'pairs,' 'pairs royal,' 'double pairs royal,' and for 'the knave,' as well as to count sequences—three or more cards following in successive numbers—and flushes, when all the cards in crib are of the same suit. Consult: Cady, *Cribbage* (New York, 1897); 'Aquarius,' *Piquet and Cribbage* (London, 1883).

CRIBBING, or CRIB-BITING. A bad habit met with especially in the lighter breeds of horses, and those spending a considerable amount of time in the stable. The act consists in the animal seizing with his teeth the manger, rack, or any other such object, and taking in at the same time a deep inspiration, technically called wind-sucking. Cribbing springs often from idle play; may be first indulged in during grooming, especially if the operation is conducted in the stall, and the animal be needlessly teased or tickled; is occasionally learned, apparently, by imitation from a neighbor; and in the first instance is frequently a symptom of some form of indigestion. Its indulgence may be suspected where the anterior edge of the front teeth is worn off, and will soon be proved by turning the animal loose where he can find suitable objects to lay hold of. It usually interferes with thriving and condition, and leads to attacks of indigestion. It can be prevented only by the use of a muzzle or throat-strap; but in those newly acquired cases resulting from gastric derangement, means must further be taken to remove the acidity or other disorder.

CRICHTON, kri'ton, JAMES (1560-c.85), called THE ADMIRABLE CRICHTON. A Scotchman famous for his versatility and his universal accomplishments. He was the son of Robert Crichton, of Elioek, Dumfriesshire, who was joint

Lord Advocate of Scotland from 1562 to 1573, and from 1573 to 1581. On his mother's side he claimed descent from the old Scottish kings. He was educated at Saint Andrews University. Before he reached his twentieth year he had, it seems, "run through the whole circle of the sciences," mastered ten different languages, and perfected himself in every knightly accomplishment. In Paris, Rome, Venice, Padua, and Mantua, he achieved the most extraordinary victories in disputation on all branches of human knowledge, and excited universal amazement and applause. The beauty of his person and the elegance of his manners also made him a great favorite; while, as if to leave no excellence unattained, he vanquished a famous swordsman in a duel at Mantua (1582). The Duke of Mantua appointed him preceptor to his son, Vincenzo di Gonzaga, a dissolute and profligate youth. One night, between 1585 and 1591, during a carnival, Crichton was attacked in the streets of Mantua by six masked men. He pushed them so hard that their leader pulled off his mask, and disclosed the features of Vincenzo. With an excess of loyalty, Crichton threw himself upon his knees and begged the young prince's pardon, at the same time presenting him with his sword, which the heartless youth plunged into the body of his tutor. What degree of truth there may be in the eulogies of his biographers it is impossible to determine, but he is known to have associated himself with the Venetian publisher Aldus Mamtius, who is the authority for many otherwise unauthenticated biographical details. W. H. Ainsworth wrote a romance founded on the story of Crichton in 1837. Consult Tytler, *The Life of James Crichton* (London, 1819; revised ed. 1823).

CRICKET (OF. *crequet*, Fr. *criquet*; ultimately imitative in origin). Any of the saltatorial insects of the orthopterous family Gryllidæ, distinguished from the Locustidæ by the cylindrical spear-shaped ovipositor of the female. The family contains three very distinct groups: (1) Mole-crickets (q.v.), with fore legs developed for burrowing; (2) tree-crickets (q.v.); (3) true crickets, including the common field and house crickets. Most of them in all parts of the world are black or of some dull color, and are mainly nocturnal. They are herbivorous, and the American black field-crickets are most abundant in neglected fields, or where layers of old straw, etc., give them warmth and hiding. They dig holes in the ground and sit there during the day, chirping, as if with contented enjoyment, and going abroad at night; but any disturbance near them will produce instant quiet. Their eggs are laid in the loose soil, chiefly in the autumn, and hatch in the spring, few adults surviving the winters of cold climates. The commonest species in the northeastern United States (*Gryllus neglectus*) occasionally comes into houses; but the house-cricket proper is a European one (*Gryllus domesticus*) which habitually domesticates itself, and is especially fond of the crevices about old-fashioned fireplaces, where its merry chirping has woven itself into the romance and poetry of all Western nations, as a sound suggestive of domestic cheer. This species is now acclimatized in Canada and some of the Northeastern States. The wingless crickets are represented in the United States by a species

(*Ceuthophilus maculatus*) common in New England.

The chirping of these insects, which begins in midsummer, is produced by rubbing a file-like ridge of one wing over a scraping surface of the other. Only the males have these organs, and it

Indies, it has become popular with the natives. In America, it is played in certain portions of the United States and in the larger cities of Canada. The rules which govern the game all over the world are those made by the Marylebone Cricket Club of London, and from time to time

REPRESENTATIVE CRICKETS.

1. Common black cricket (*Gryllus neglectus*). 2. A wingless cricket (*Ceuthophilus maculatus*). 3. A tree-cricket, the small green or 'snowy' cricket (*Ecanthus niveus*), female. 4. Same; male. 5. A mole cricket (*Gryllotalpa borealis*).

is generally agreed that the sounds serve either to call or excite the mute females. A certain Sicilian species is said to make a noise audible a mile away. The apparatus and the musical characteristics of the sound have been exhaustively studied by S. H. Scudder, who says that the notes of the black field-cricket are pitched at E natural, two octaves above middle C. The songs of other sorts of crickets vary from this, each in its own way. To this same group belong some curious forms of the tropics in which "the front of the head is produced into a leaf-like projection." Another group are of very diminutive size, and resemble minute roaches; one genus (*Myrmecophila*) dwells altogether in the nests of ants, both in Europe and in America, our representative being *Myrmecophila pergandi*. Other species are among the insects inhabiting caves. Consult: Howard and Marlatt, "Principal Household Insects of the United States," in *United States Department of Agriculture, Division of Entomology, Bulletin 4, new series* (Washington, 1896). See CAVE ANIMALS and SYMBIOSIS, and compare LOCUST; KATYDID; MOLE-CRICKET; and TREE-CRICKET.

CRICKET (probably from OF. *criquet*, stick used as a marker in the game of bowls). The national game of England is played wherever Englishmen have colonized, and in many of Great Britain's possessions, notably in the West

are regulated at meetings of this club. This has always been the custom since the club was founded, about the year 1744. Philadelphia, which is the home of cricket in America, has more clubs than any other place in the United States or Canada, and the four larger clubs, Germantown, Belmont, Merion, and Philadelphia, compete annually for the Halifax Cup. Two other cups are also competed for by some fifteen minor clubs and second elevens from the principal clubs. Cricket in Philadelphia is controlled by the Associated Cricket Clubs of Philadelphia, in an organization composed of three delegates from each of the four large clubs. This organization publishes a periodical, the *American Cricketer*, founded in 1877. The Metropolitan District Cricket League regulates the matches within twenty miles of the City Hall in New York, and there is also a New York Cricket Association, which has assumed more importance of late years. The other organizations in the United States are the California Cricket Association, the Northwestern Cricket Association, with headquarters in Chicago, and the Massachusetts Cricket Association. International matches are played annually between the United States and Canada, and on three occasions teams from Philadelphia have visited England, while in 1900 a team was sent from Haverford College to play a series of matches against English colleges and

schools. Almost annually, in recent years, either an English, Australian, or Irish eleven has visited Philadelphia, New York, and Toronto. The Intercollegiate Cricket League is composed of teams representing the University of Pennsylvania, Harvard, and Haverford.

The game is played between two teams of eleven men each, on a level grass-field, but the exigencies of climate in Australia and the Pacific Slope of California sometimes necessitate a cement-based, matted stretch. In the centre of the field a wicket is pitched; i.e. three stumps of wood about $1\frac{1}{2}$ inches in diameter and 27 inches high are placed in a line so that with the space between them they cover eight inches; on the top of these are two light wooden bails. Twenty-two yards in a direct line from and opposite these, three similar bail-topped stumps are erected. A line from each wicket or set of stumps is drawn in white chalk, extending right and left from them about three feet. This is the bowling-crease, beyond which the bowler must not pass when delivering the ball. In front of the stumps, four feet from them, and parallel with them, another white line is drawn, called the popping-crease, within which is the batsman's domain. The bat used must not be longer than 38 inches or wider than $4\frac{1}{4}$ inches. The ball is 3 inches in diameter and weighs about $5\frac{1}{2}$ ounces. An umpire is appointed by each team, and, before starting a match, they settle what shall be considered boundaries and other conditions of play. Then the captains toss for the right to select which team shall go to the bat first. The team which so elects sends two men in, one to each wicket; the other team sends a bowler to one end and disperses the other ten men about the field in such positions as the captain's knowledge of the kind of bowler, and the kind of batter, indicates to him as likely to be most efficacious. The umpire then calls 'play,' and the bowler bowls, not throws, the ball from the end opposite the batter. If it is a ball which the batsman can reach, he either blocks it or hits it to some part of the field; if he thinks he can run to the opposite wicket and the other batsman change places with him before the ball is returned and either wicket thrown down with it, he runs; and a 'run' is scored each time the batsmen cross each other. The bowler bowls four, five, or six balls (four in a three days' match) from one end; and then the ball is handed over to a second bowler, who bowls an equal number of balls from the opposite end. The batsman may be put out in any of the following ways: if he fails to defend his wicket and the bowled ball knocks off the bails ('bowled'); if a fielder catches a batted ball before it touches the ground ('caught'); if the batsman fails to have his bat or any part of his person within the popping-crease before his wicket is thrown down with the ball ('run out'); if he steps out of his ground to play a ball, misses it, and the wicket-keeper throws his wicket down with it before he can step back ('stumped'); if when a straight ball has been bowled to him, which in the judgment of the umpire would have hit his wicket had he not prevented it by interposing any part of his body except his hand ('leg before wicket'); if in playing at the ball he knocks down his own wicket ('hit wicket'); or if he willfully obstructs the fielders. When a batsman is put out another takes his place, and the

game proceeds until the tenth man is out. Then, there being no more batsmen to come, the eleventh man's innings comes to an end, he being 'not out.' The total number of runs made off the bats, with a few penalties added which it is not necessary to detail here, make up that side's score. Then the other side goes in to bat. Each eleven has normally two innings taken alternately, the total score of each side determining the result of the match.

The bibliography of cricket is extensive. Lilly-white, *Cricketers' Annual*, and Wisden, *Cricket Almanack*, are the standard authorities on the rules for the enrent years. For general history and annals, consult: Steel and Lyttelton, *Cricket* (London, 1889); Lyttelton, *Cricket* (London, 1890); Murdoch, *Cricket* (London, 1893); Lyttelton, *Outdoor Games: Cricket and Golf* (London, 1901); Prince Ranjitsinhji, *The Jubilee Book of Cricket* (Edinburgh, 1897); Read, *Annals of Cricket* (London, 1897).

CRICKET-FROG. A small frog (*Acris gryllus*); northern specimens are variety *crepitans*) abundant throughout the warmer parts of the United States, east of the plains, and noted for its rattling cricket-like cries in spring. (See Colored Plate with TOAD.) It is about an inch long, brownish, with a blackish triangular patch (apex backward) between the eyes, the borders of which are light-colored, continued as a dorsal band to the rear end of the body; throat in spring yellow, and legs barred; but all these colors change with surroundings, as the species possesses the power of metachrosis in a high degree. "The note of this species," says Cope, "may be exactly imitated by striking two marbles together, first slowly, then faster and faster, for a succession of about twenty or thirty beats. The noise cannot be heard at a very great distance. . . . It keeps on the high grass in and around marshy places, seldom if ever ascending trees or bushes. When pursued it leaps with prodigious agility and hides under water." Their eggs are deposited in April, in little masses attached to the blades of coarse grass. A short time afterwards all the great numbers which make the marshes so noisy in April and May die off, so that until the eggs hatch and the young 'peepers' develop late in August, the species is practically extinct. Consult Abbott, "Notes on the Habits of the Savannah Cricket-Frog," in *American Naturalist* (Philadelphia, 1882).

CRICKET ON THE HEARTH, THE. A Christmas tale by Charles Dickens (1845), in which a cricket on the hearth and a tea-kettle play an important part.

CRIEFF, krē'vōn. A police burgh and health resort in Perthshire, Scotland, on the Earn, 17 miles west of Perth (Map: Scotland, E 3). It is beautifully situated at the foot of the Grampians, near the entrance to the Highlands. Its healthful climate makes it a summer resort of invalids, for whom there is provided a high-class hydropathic establishment. There are numerous handsome country seats in the vicinity. The greatest Scotch cattle market was held here till 1770, when it was removed to Falkirk. Population, in 1901, 5208.

CRILLON, krē'vōn. LOUIS DES BALBES DE BERTON DE (1541-1615). A celebrated French general, surnamed 'L'homme sans peur,' and 'Le Brave.' He was born at Murs, in Provence, and

was trained for war under François de Lorraine, Duke of Guise, then the model of military chivalry. In 1558 he gave proof of his valor at the siege of Calais, and soon afterwards at the capture of Guines. In the religious wars he fought against the Huguenots, and distinguished himself at the battles of Dreux, Jarnac, and Moncontour. He was likewise present at the battle of Lepanto, in 1571, and, though wounded, was appointed to carry the news of the victory to the Pope and the French King. He disapproved strongly of the massacre of Saint Bartholomew, but in 1573 he took part in the siege of La Rochelle. He accompanied Henry of Anjou to Poland, and after the latter's accession as Henry III. continued faithful to his sovereign in his struggle with the Catholic League. Henry IV. found in him a sincere friend and adviser, and called him 'Le Brave des Braves.' After the peace with Savoy, Crillon retired to Avignon, and, after the fashion of a true Catholic warrior, ended his days "in the exercise of piety and penance."

CRIM. CON. An abbreviation for CRIMINAL CONVERSATION, which is the technical term for adultery with another man's wife. It is no defense to an action by the husband, in such a case, that the wife freely assented to the defendant's request, for the husband does not sue for a wrong done to her, but to himself. The gist of the action is the shame which has been inflicted upon him, and the hazard, to which he is subject, of maintaining spurious issue. It is, therefore, quite distinct from the wrong of enticing the wife away from the husband, although, like seduction (q.v.), it is looked upon as a personal injury to the husband. He may condone the wife's offense, and thus lose his right to secure a divorce, without affecting his right to damages against the paramour. It has been judicially declared that the law will not hold a party remediless for an injury of this kind because, through the exercise of Christian virtue, the influence of family interest, or even in the want of what may be regarded as true manly spirit, he forgives an erring wife, and trusts in her reformation and promise of future good conduct and virtue. He may forgive the wife without forgiving the author of the defilement, and of his loss, wrong, and injury. See ADULTERY, and consult the authorities there referred to.

CRIME (OF., Fr. *crime*, It. *crimine*, from Lat. *crimen*, accusation, from *cernere*, Gk. *κρίνω*, *krinō*, to decide). *Crime* has been defined as "disobedience to a command or prohibition made with reference to a matter affecting public peace, order, or good government to which a sanction is attached by way of compensation for the injury which the act or omission may have caused to an individual."

The same act, e.g. assault and battery, may subject the actor to a criminal prosecution by the State, and to a civil action in tort by the injured individual. Such an act is at once a breach of the public peace and an invasion of the injured person's rights. In England and in each of our States certain offenses are crimes at common law, while others are made so by statute. Criminal offenses against the United States, however, are all of statutory origin. The common-law classification of crimes was into

treason (q.v.), *felony* (q.v.), and *misdemeanor* (q.v.); treason being separated from other high crimes because of its character, its mode of trial, and its punishment, and the chief distinction between a felony and a misdemeanor being that the former occasioned the forfeiture of lands and goods, while the latter did not.

CRIMINAL INTENT. In order that an act shall amount to a crime, it must be committed with a criminal intent. It is not a crime to take the life of a human being if this is done pursuant to a legal command, as in the case of a sheriff inflicting capital punishment upon a duly convicted and sentenced criminal; nor if it is the result of accident. In neither case does the person causing the other's death intend to commit a criminal act. But criminal intent is not necessarily synonymous with actual intent to become a criminal. A general criminal intent exists when the actor has an intellectual apprehension of the nature of the act which the law pronounces criminal, and voluntarily assents to its commission. In most crimes, no other intent is required. At times, however, the law requires a specific intent, as in the case of the transfer of one's property with intent to defraud his creditors, or sending poison to another with intent to injure him. Here, something more than knowingly and voluntarily disposing of the property, or sending the poison, is necessary to the commission of the crime, viz. the disposition or the sending with the specific intent to defraud or to injure. Insanity (q.v.) relieves its victim from criminal liability when it renders him incapable of forming a criminal intention. Voluntary drunkenness, even when causing temporary insanity, does not so relieve its victim, although it may be taken into account in crimes requiring a specific intent on the part of the actor, in determining whether he did the particular act with the specific intent. Infancy also relieves from criminal liability when the infant is incapable of forming a criminal intent. (See AGE.) Analogous to insanity and infancy, as an excuse for an act otherwise criminal, is coercion or duress (q.v.) when of such a character as to destroy the voluntary nature of the act. See ACCESSORY; PRINCIPAL; PUNISHMENT; also CRIMINAL LAW; CRIMINOLOGY, and the authorities there referred to.

CRIME AND PUNISHMENT. A novel by Dostoyevsky, published in 1866. It is a study of the gradually weakening intellect and final insanity of a young Russian artisan whom want has led to commit murder.

CRIMEA (Russ. *Krim*, *Krym*, Lat. *Chersonesus Taurica*). A peninsula in the south of Russia, forming part of the Government of Taurida, and comprising the districts of Perekop, Eupatoria, Simferopol, Yalta, and Feodosia (Map: Russia, D 5). It is united to the mainland by the very narrow isthmus of Perekop, between the Black Sea and the Sea of Azov, and separated from the peninsula of Taman, on the east, by the narrow Kertch Strait. The Crimea is thus almost surrounded by water—on three sides by the Black Sea and on the fourth by the Sea of Azov; while a trench 70 feet wide and 25 feet across the isthmus of Perekop cuts it off from the mainland. The Crimea is quadrilateral in shape: but a long, narrow peninsula juts out on the east which increases the extreme length of the terri-

tory from east to west to nearly 200 miles, the breadth being 110 miles. The area is about 9800 square miles. The coast is very much broken and indented, particularly on the side bordering on the Sea of Azov. The northern portion is a continuation of the southern Russian steppes, and is of argillaceous formation. Along the side facing the southeast there is a highland region, the Yaila Mountains, forming the watershed. These mountains rise to a height of over 5000 feet, their most interesting peak being the Tehtarir Dagh (Tent Mountain), the *Monts Trapezus* of the ancients. The streams rise in the southeast coast highlands, and while a few very short ones flow toward the east and southeast, most of the drainage goes into the Bay of Kalamita, the Gulf of Perekop, and the Sivash or Putrid Sea, which is a portion of the Sea of Azov almost cut off from it by the tongue-like peninsula of Arabat. The northwest section of the Crimea has but little fluvial drainage. The southern district of the peninsula rises with steep slopes from the sea, while spurs and secondary chains extend northward. These are richly wooded, but the beautiful intermediate valleys gradually sink into the uniform and desolate steppe which forms the northern and much greater part of the peninsula. The southern district of the Crimea is well cultivated, and is adorned by many country-seats of the nobles, with parks and gardens surpassed by none in Europe. The famous Imperial country-seat of Livadia is situated near the southern extremity of the peninsula. Tatar villages, mosques, and Greek convents are to be seen in most picturesque situations among the woods and rocks, with many ruins of ancient fortresses.

The southeast highland region produces a rich and varied flora. On the northern slopes and valleys grow hardy fruit and various forest trees; in the central mountain region are forests of oak, beech, elm, and other deciduous trees of central Europe; while on the higher southern slope the pine occurs, and at lower altitudes the vegetation is Mediterranean in character and the vine and the olive flourish. Grain of various kinds is produced abundantly, and silk, wax, and honey. Some small rodents, hares, and foxes are the chief mammals; reptiles and insects are not numerous. Much attention is bestowed upon horses, oxen, and sheep, in which no small part of the wealth of the country consists. The northern part of the Crimea is in every way a contrast to the southern. Apart from the general sterility of the region, the air is contaminated by exhalations from marshes, and from the Sivash. The climate of the Crimea varies considerably for such a slight extent in latitude. The northern part has cold winters and hot summers, while in the southern part the winters are warm and the heat of the summer is tempered by proximity to the sea.

The chief industry of the Crimea is agriculture. The raising of cereals is carried on mostly by the Russians and the colonists, chiefly Germans, while the Tatars and Greeks are engaged primarily in gardening. Owing to the scarcity of labor and the prevalence of large holdings, agriculture in the Crimea is based on modern lines, and the use of agricultural machinery is probably more prevalent there than in any other part of the Empire. The chief cereals raised are wheat, rye, barley, oats, and corn. The Crimea is one of

the principal tobacco-producing regions of Russia, the product being noted for its high qualities. The cultivation of fruit is extensively developed, the annual exports amounting to over \$1,000,000. Vine-growing is one of the oldest industries of the region, and the native vines are widely exported. The rearing of live-stock (which includes camels) is extensively carried on, and bee-keeping and the raising of silk-worms are among the industries. The manufacturing industries are insignificant. Large quantities of salt are obtained from the salt lakes, which are very numerous. The population, 583,893 in 1897, is remarkably heterogeneous. In the country districts the bulk of the inhabitants are Tatars; height, 1.644 meters; cephalic index, 80. They are muscular and noted as porters. Cleanliness and morality are proverbial among them. Among the other non-Russian inhabitants are Greeks, Armenians, and Germans. An interesting element in the population are the Karaite Jews. The two principal cities of the Crimea are Sebastopol, a great fortress and naval station, and Simferopol, the capital of the Government of Taurida. An interesting town is Bakhtchisarai, celebrated as the ancient capital of the Tatar Khans.

HISTORY. To the ancients Crimea was known as *Chersonesus Taurica*, from the Tauri, a mountain tribe of the south, who are supposed to have been the remnants of a Cimmerian people driven out by the Scythians in the seventh century B.C. In the sixth century B.C. the Greeks of Miletus founded flourishing colonies at Nymphæum, Theodosia, and Panticapæum (the present Kertch). About B.C. 500 these cities, together with several other towns, united to form the Kingdom of Bosphorus, which existed till the fifth century A.D., and embraced, at the period of its greatest extent, the entire peninsula and the eastern coast of the Sea of Azov. The Chersonesus stood in close commercial and social relations with the Greeks of Europe, and especially with the Athenians, who exported from the country great quantities of grain and hides, as well as many slaves. In the first century B.C. Parosades, the ruler of Bosphorus, hard pressed by the Scythians, acknowledged himself the vassal of Mithridates of Pontus, and when the latter's son, Pharnaces, was deprived of his possessions in Asia Minor by the Romans, he established himself in the Chersonesus. Under the nominal suzerainty of the Romans, and later of the Byzantines, the Kingdom of Bosphorus prospered, till about the beginning probably of the fifth century, when it fell before the Huns. The country, with the exception of the southern coastland, which was held by the Byzantines, was henceforth devastated by a succession of barbarian invasions. About the middle of the seventh century the Khazars, a fierce tribe from the region of the Volga, took possession of the peninsula and established a powerful kingdom there, chiefly remarkable for the fact that the ruler, the entire nobility, and large numbers of the people became zealous adherents of the Jewish faith. In the thirteenth century the country was conquered by the Mongols, and it constituted till about 1430 a part of the Kbanate of Kiptchak (q.v.). At the same time the Genoese founded a number of trading colonies on the southern coast, which was known as Gothia. Among these were Caffa (Kaffa), on the site of Panticapæum, which be-

came a great emporium of the commerce between Europe and Asia. After forming a part of the independent Khanate of Krim for about forty-five years, the Crimea was conquered in 1475 by the Turks, and was ruled by a Khan under the suzerainty of the Sultan. In 1571 the Khan raided Moscow and sacked the town. Russian aggressions on the Crimea began in 1735, and in the following year an army under General Münich laid the country waste. By the Treaty of Kutchuk-Kainardji, in 1774, the Porte was forced to recognize the independence of the Khan. In 1783 the country was incorporated with Russia. In 1854-56 the Crimea was the scene of conflict between the Russian armies and the allied forces of England, France, Sardinia, and Turkey. (See CRIMEAN WAR.) Consult: Telfer, *The Crimea and Transcaucasia* (London, 1872); Wood, *The Crimea in 1854 and 1894* (London, 1895); Beaulieu, *The Empire of Tsars and the Russians* (New York, 1893).

CRIMEAN WAR. The name given to the war of 1854-56 between Russia on the one hand, and Turkey with her allies, France, England, and Sardinia, on the other. It was ushered in by the struggle between Russia and Turkey, which broke out in 1853, the immediate occasion of which was the assertion by Russia of a protectorate over the Greek Christians in the Turkish dominions. Coupled with this was a dispute between Russia and France over the guardianship of the holy places in Palestine. The real ground, however, for the attitude assumed by France and Great Britain was resistance to the aggressive policy of the Russian Emperor, Nicholas I. The latter believed that the other Powers of Europe were not in a position to interfere, and saw an opportunity to continue the Russian advance which had Constantinople for its objective. Accordingly, in the spring of 1853 he submitted to the Porte, through Prince Menshikoff, an ultimatum in regard to the Greek Christians and other matters. England and France prepared to sustain the Sultan against Russia, and stationed their fleets in Besika Bay. In July the Russian forces advanced into the Danubian principalities. The Vienna Note, prepared by Austria and signed by the neutral Powers as a basis of settlement, was so modified by Turkey as to be unacceptable to Russia, and on October 4, 1853, Turkey declared war. The English and French fleets thereupon passed through the Dardanelles. Though the Turks were at first victorious upon land, the Russian admiral, Nakhimoff, won an important naval victory at Sinope, November 30; on March 12, 1854, France and Great Britain concluded an alliance with Turkey, and two weeks later they declared war against Russia. Prussia stood firmly neutral. Austria, though desirous of checking the Russian advance across the Danube, dared not become involved in a war on the east, leaving its western frontiers open to possible attack by Prussia and other States of the Germanic Confederation, and contented itself, therefore, with mobilizing an army on the southern frontier. The allied Western Powers determined to assist the Sultan by a naval expedition against Kronstadt, in the Baltic, and by a combined attack with land forces in the south. The Baltic expedition proved a complete failure, achieving nothing beyond the capture of Bomarsund on August 16.

Early in the summer 20,000 English troops, under Lord Raglan, and 50,000 French soldiers, under Marshal Saint-Arnaud, assembled at Varna, on the Black Sea. Against the advice of the Turks, who wished to drive Russia out of the Caucasus, Saint-Arnaud and Raglan decided upon the siege of Sebastopol, Russia's stronghold and depot in the Crimea. The war was thus narrowed down to a limited sphere, and was fought in a long siege and a series of stubborn engagements. The first of these occurred at the river Alma, on September 20, 1854, six days after the landing of the Allies. Saint-Arnaud died on September 29, and was succeeded by General Canrobert. At the beginning of October the Allies began the regular siege of Sebastopol, the defense of which was directed by Todleben. On October 25th the Russians attacked the British at Balaclava (q.v.). The engagement was marked by bad generalship on the British side, and by the gallant but ill-advised charge of the Light Brigade. The Russians followed this up with an unsuccessful attack at Inkermann on November 5. The severe winter caused the suspension of active operations, and the English and Turks endured terrible hardships because of the inadequate commissary arrangements. During the winter an international conference attempted to adjust matters, but without avail. Austria entered into an alliance with France and Great Britain; but as Prussia could not be drawn into action unfavorable to Russia, Austria refrained from entering into hostilities. Sardinia, on the other hand, joined the Allies in January, 1855, and sent 10,000 men of her new army, under General La Marmora, to the Crimea. (See CAVOUR and ITALY.) The Russians resumed activities in February, assailing the Turkish positions at Eupatoria, but without result. After the death of the Emperor Nicholas and the accession of Alexander II., in March, 1855, Prince Michael Gortchakoff succeeded Prince Menshikoff in command of the Russian forces.

Operations were renewed with great vigor in the spring, the Allies having 174,000 men in the field and the Russians about 150,000. General Pélissier succeeded Canrobert in command in May, and General Simpson succeeded Lord Raglan, upon the latter's death in June. A Russian army, advancing to the relief of Sebastopol, was defeated at the Tchernaya on August 16. From the 19th of August to the 8th of September a terrible bombardment of the besieged city was kept up, and was followed on the latter day by a general assault, in which the French took the Malakoff Tower and the British took the Little Redan. Gortchakoff now blew up the southern fortifications and evacuated the city, retiring into the hills. General Muravieff captured Kars, in Armenia, on November 28. All the parties were ready for peace, which was signed at Paris, where a congress of the Powers had been in session, on March 30, 1856. The integrity of the Ottoman Empire was guaranteed by the Powers, which also renounced all right of intervention in Ottoman affairs; reforms were promised by the Sultan; Russia renounced her protectorate over the Danubian principalities, and ceded a strip of Bessarabia to Moldavia; the navigation of the Danube was declared free to all nations under the supervision of a commission of members from the bordering States; the Black Sea was neutralized. The Congress

united in the Declaration of Paris (q.v.), which laid down certain principles of international law. Consult: Hanley, *The War in the Crimea* (London, 1891), the best short treatment in English. M. and E. Aveling (London, 1897); Lodomir, *La guerre de 1853-56* (Paris, 1857); Lysons, *The Crimean War from First to Last* (London, 1895); "Russian Side of the Crimean War," *National Review* (November, 1864); Kovalevski, *Der Krieg Russlands mit der Türkei in den Jahren 1853-54* (Leipzig, 1869).

CRIME DE SYLVESTRE BONNARD, krém de sêl'vês'tr' bôn'nâr', LE. A graceful romance by Anatole France (1881). The hero, M. Bonnard, is an old member of the Institute, whose 'crime' consists in releasing a young girl from a boarding-school in which she was unhappy, and bringing about a happy marriage for her.

CRIMINAL LAW. A phrase signifying the body of legal rules which define criminal offenses, prescribe their punishment, and provide for the apprehension and trial of persons charged with crime. The tendency at present is to codify this branch of the law. In New York, for example, the substantive part of criminal law—that is, the part which defines criminal offenses and their penalties—is embodied in a Penal Code, while the adjective part, or the part regulating the arrest and trial of offenders, constitutes the Code of Criminal Procedure. The Constitution of the United States and the various State constitutions contain important provisions relating to criminal procedure. See especially the Fifth and Sixth Amendments of the United States Constitution, and similar clauses in the State constitutions, securing a jury trial, indictment by a grand jury, and other rights to persons charged with crime.

The more important criminal offenses are dealt with under their respective titles.

CRIMINOL'OGY (from Lat. *crimen*, crime + Gk. *λογία*, *logia*, account, from *λέγω*, *legein*, to say). The science which treats of the nature and causes of crime. As a separate study it is of comparatively recent growth, and the credit for its foundation as an independent branch of

knowledge is usually given to Cesare Lombroso (q.v.), an Italian professor in the University of Turin, who in 1876 published a remarkable book entitled *L'uomo delinquente* (Criminal Man). Since its appearance, quite a number of eminent scientists—physicians, jurists, economists, and sociologists—have taken up the study of crime and criminals. There is, however, such a difference of opinion concerning the fundamental causes or factors of crime that criminologists are divided into several groups. These groups may be classified under two large divisions, their difference turning upon the emphasis laid upon the individual causes of crime, on the one hand, or upon its social causes, on the other hand. The criminal, one party asserts, is born, not made; he is a criminal by nature, and the circumstances of education or environment have little or nothing to do with his law-breaking career. The opposing party maintains that social organization, education, environment—causes lying outside the individual—really determine whether or not he will become a criminal. As a rule, those who adhere to the former point of view conceive the study of crime as a part of anthropology, a part of the study of man; while those who believe that social conditions furnish the causes and explanation of crime consider this study a part of sociology. Thus the two terms usually applied to criminology, 'criminal anthropology' and 'criminal sociology,' each indicate a prejudice in favor of one or the other of the tendencies characterized above.

The subject of criminology is a complicated and difficult one. It is only within the present generation that the possibility has arisen of conducting the study of criminal problems on anything approaching an exact and scientific basis. Before the introduction of a system of criminal statistics it was impossible to ascertain whether crime was increasing or decreasing, what transformation it was passing through in consequence of the social, political, and economic changes constantly taking place in all highly organized societies, and what was the effect of punishment on the criminal population. Statistics, moreover, even when carefully collected, often mislead. Suppose, for example, that the number of convictions for crimes and misdemeanors has increased in Belgium from 22,359 in 1870 to 40,372 in 1890; this does not necessarily mean that crime has increased, for the total population may have increased more rapidly than the number of offenses, and in such an event criminality has really diminished. The larger number of convictions in 1890 may, perhaps, be due to an increase in the number of punishable offenses because of the enactment of severer laws; certain acts legally permissible in 1870 may have become misdemeanors in 1890. Another possible explanation of a merely apparent increase in criminality is offered by the fact that perhaps the police have become more efficient or more vigilant, and that therefore many offenders who escaped in 1870 are now brought before the courts and condemned. These three possible explanations are sufficient to show how careful we must be in the employment of criminal statistics. Particularly when we go beyond the statistics of a single nation and attempt to compare two or more nations with a view to their relative criminality, we must be even more cautious. In no two countries is the criminal law the same,

and an act which is perfectly harmless when committed in one country is considered in another as a contravention of the law. Each country has also a nomenclature of crime and methods of criminal procedure peculiar to itself. In each country the police are organized on a different principle and act on a different code of rules. Great differences of opinion exist also among different nations as to the gravity of certain offenses. Whenever it shall be possible to collect criminal statistics in the several nations according to a uniform system, then criminology will have the necessary inductive basis for fruitful comparisons between nations.

The narrow legal definition of crime as a violation of the law is scarcely of any value for philosophical purposes; and a scientific definition which shall include all acts which at any time have been called crimes, but include none other—which shall, moreover, specify their common characteristics—remains yet to be found. It seems highly probable that the study of primitive religious ideas and primitive social organization will throw considerable light upon the problem of discovering the essential nature of crime. It should be noted, meanwhile, that originally the question whether a certain act was criminal or not, and if criminal, how the perpetrator should be punished, was answered by the offended party—individual, family, or clan—and not by the political organization of the whole people (the State). That the State should determine these matters and reserve to itself the right to judge and to punish is a result of quite recent evolution. Even to-day, the State is far from being the only coercive institution; duels, and, in a measure, lynching, are survivals of the previous status.

The question whether crime is increasing has been very widely discussed, pro and con; there appears to be a general opinion among experts that it is increasing. Certainly criminal statistics everywhere seem to bear out this view, with the possible exception of England; and even there, Mr. W. D. Morrison maintains, in his book on *Crime and Its Causes*, the total volume of crime is on the increase. According to the eleventh census of the United States, it appears that the criminal class in our country has increased from 1 in 3500 of the population in 1850 to 1 in 786.5 in 1890, or 445 per cent., while the total population has increased but 170 per cent. in the same period.

CAUSES OF CRIME. The factors responsible for crime may conveniently be divided into three great categories—cosmic, social, and individual. The cosmic factors of crime are climate and the variations of temperature; the social factors are the political, economic, and moral conditions in the midst of which man lives as a member of society; the individual factors are those attributes inherent in the individual, such as descent, sex, age, bodily and mental characteristics. It is often extremely difficult to disentangle these factors; many of them, indeed, are indirectly at work where they appear to be absent. Heredity, for example, seems to belong clearly to the individual factors; but if we trace an inherited characteristic back through a long line of ancestors, it may finally be found to have its origin in the circumstances of environment or education. It has been aptly remarked that a

man's education should begin with his grandfather.

COSMIC FACTORS. How profoundly the physical structure, and likewise the mental life of man, is affected by his natural surroundings, by climate, seasons, soil, the configuration of the earth's surface and the nature of its products, is illustrated by the low type of life exhibited by the primitive inhabitants of inhospitable, barren countries. Concerning the influence of climate on crime, statisticians have concluded that crimes against the person, as assault and homicide, are relatively more numerous in warm climates, while crimes against property are more frequent in colder regions. The statistics of homicide in Europe show that the warmer countries, Italy and Spain, head the list in the proportion of murders to the population, while England, Scotland, and Holland stand at the bottom of the list. Prof. Enrico Ferri, after a thorough examination of French judicial statistics for a series of years, concludes that a maximum of crimes against the person is reached in the hot months, while crimes against property come to a climax in the winter. Crimes against the person are unduly high in the south and west of the United States; but here we have to consider not merely climate, but also race conflicts, pioneer conditions, and uncertain legal control.

SOCIAL FACTORS. Concerning the social factors of crime, it must be observed that the action of society upon the individual is so complex that it will here be impossible to discuss, even briefly, all these factors.

Considering, first, the conjugal condition of criminals, it appears that there is a higher ratio of criminality among the unmarried and divorced than among the married. A partial explanation of this fact may lie in the circumstance that married men and women, being subject to the restraining influences of home life, are much less apt to yield to those anti-social tendencies which manifest themselves in crime.

Considering, secondly, occupation, prison statistics show that the higher the character of a man's daily pursuits the greater the unlikelihood of his falling into crime. An examination into the previous occupations of criminals shows that a very large percentage were engaged in unskilled labor. According to the census of 1890, of 52,894 convicts, 31,426 were ignorant of any kind of trade. The economically low position of the unskilled laborer exposes him to frequent unemployment and want, and hence to the desperation which often leads to crime. French official statistics summarizing the results of over fifty years indicate the following number of indictments for every 100,000 members of each class: Agriculture, 8; liberal professions and proprietors, 9; industry, 14; commerce, 18; domestic service, 29; vagabonds and without trade or regular occupation, 405.

Thirdly, and closely related to occupation, is the influence of rural or city life on crime. In his *Prisoners and Paupers* (New York, 1893), Mr. H. M. Boies declares that our cities furnish 90 per cent. of our criminals. City life, with its crowded slums and tenements, he considers one great cause of crime. Cities are hotbeds of lawlessness as compared with rural neighborhoods. The city is the refuge and hiding-place of questionable characters; it intensifies the

struggle for existence, and by the sharp contrast it offers between rich and poor, between luxury and penury, excites envy and class hatred. According to Levasseur, urban population in France has a criminality double that of the rural population: while according to Mr. W. D. Morrison, London, with less than one-fifth of the population of England and Wales, furnishes one-third of the indictable crimes.

A fourth point of great importance is the influence of poverty. If poverty in itself were a decisive factor, we would expect poor countries to produce the most criminals; but poor countries like Ireland, Spain, and Hungary show a smaller ratio of theft in the population than rich England. It is rather where great poverty exists side by side with great wealth that temptation is greatest and crime most frequent, especially crimes against property. Swift and unexpected industrial and commercial changes and hard times put character to unusual strains and increase the number of law-breakers. Inventions and progress in industrial processes often make it more difficult for men to support existence in their accustomed ways. There can be no doubt, moreover, that the keen struggle for existence imposed upon the poor classes disorganizes the family and destroys many of the beneficent influences of home life. It may reasonably be maintained, on the other hand, that excessive wealth, with the idleness that it frequently begets in the possessor, is quite as apt as destitution to lead to viciousness and crime. A wealthy criminal has, of course, more numerous and efficient means for escaping detection and punishment than a poor offender. Humanitarian novelists have accustomed the general public to the belief that hunger and pressing want frequently lead to theft. This belief does not by any means coincide with such facts as we possess; French criminal statistics indicate, for example, that thefts of food—bread, flour, meat, etc.—constitute only $5\frac{1}{2}$ per cent. of the total number committed during the period from 1830 to 1860.

Among the other factors of crime which may properly be classed as 'social' are: the influence of social theories which tend to engender contempt for human life and the institution of private property; the absence of a widespread, deep-seated religious spirit which restrains men from yielding to evil impulses; the corruption of partisan politics which permits the worst elements of the population to become the official guardians of the public peace and prosperity; lynching and public exhibitions of cruelty which debase human character; detailed accounts of crimes in the daily press; the influence of association and suggestion by which gangs of shiftless men or boys form centres of criminal life under the leadership of unscrupulous chiefs; social disturbances like war, crises, revolutions, and expositions, which disturb the even tenor of social progress and relax the social bond.

INDIVIDUAL FACTORS. Finally the individual factors of crime should be briefly considered. They have been carefully studied by a score of scientists, beginning with Lombroso, the founder of criminology, who was disposed at first to overlook all but the individual factors. *See*.—In all civilized nations women are less addicted to crime than men, and girls less than boys. Among most European peoples between five and six males are tried for offenses against the law to

every one female. Women are less inclined to acts of violence than men on account of their physical weakness, but when women do become criminals their crimes are frequently characterized by a cruelty and relentlessness not found in male offenders. The crimes of women are mostly infanticide, abortion, poisoning, domestic theft. They are addicted equally with men to the perpetration of parricide, and more frequently convicted than men of parricide. Women are also more hardened criminals than men, probably because a woman may regain her rank in society only with the greatest difficulty. *Age*.—In proportion to the population crime is, as we should expect, at its lowest level from infancy till the age of sixteen. From that age it goes on steadily increasing in volume till it reaches a maximum between thirty and forty. Females do not enter upon a criminal career so early as males, and the criminal age is earlier in coming to a close for women than in the case of men. *Education*.—The question whether education reduces or increases criminality is far from being conclusively answered. Those States which have the best systems of education have also the most criminals in their jails and prisons. But as a rule the proportion of our prison population unable to read or write is considerably higher than in the free population. M. Henri Joly, an eminent French criminologist, maintains that most frequently passions and vices which have nothing to do with instruction are the veritable motives of crime. It seems reasonably certain, however, that the lack of instruction in manual and trade processes and the absence of personal, moral, and spiritual influences accounts for much of the tendency to crime. *Drunkenness*.—All authorities agree that intemperance is a serious cause of crime. It weakens the will, leads to evil associations, dulls the conscience. Statistical information concerning this point is usually non-official and of little scientific value. *Hereditary*.—Individual degeneracy, which Dr. Ferri has shown to be closely connected with crime, is frequently passed on from generation to generation. The diagrammatic history of eight families given by Dr. Strahan in his book on *Marriage and Disease* illustrates the degenerate tendencies transmitted from father to children throughout several generations. Similarly, Dugdale, in his book on the Jukes, has traced the posterity of a criminal and found that the great majority of his descendants possessed vicious or criminal instincts.

Lombroso and his disciples attribute criminality to anatomical, physiological, and psychological peculiarities of the individual, and have inaugurated the study of the criminal as a being separate and different from normal man and woman. The biological peculiarities of the criminal are so marked that Lombroso speaks of a 'criminal type,' and enumerates the characteristics which constitute this type: height and weight above the average; asymmetry of the skull, brain, and face; brain lighter in weight than the normal; light hair; scant beard; retreating forehead; projecting eyebrows and ears; long arms; insensibility to physical pain; pointed skulls; heavy lower jaws; defective lungs; tendency to diseases of the heart and of the sexual organs, etc. Criminal anthropologists, however, are far from agreeing upon these anomalies, and often reach conclusions divergent

from and sometimes contradictory to those of Lombroso. The French sociologist Tarde has very aptly suggested that perhaps the characteristics of the criminal are rather the consequence of his career than the cause; that just as clergymen, military men, and other distinct social professions acquire distinctive traits, so criminals come to adopt certain methods of life and thought which stigmatize them. Etude sociale* (Paris, 1894); Marsh, *Crime and the Criminal* (London, 1899); Drählms, *The Criminal, his Personnel and Environment* (New York, 1900), with a list of works on Criminology; Forel and Mahain, *Crime et anomalies mentales constitutionnelles* (Geneva, 1902); and Hall, *Crime in its Relation to Social Progress* (New York, 1902). See LOMBROSO; PENOLOGY; PRISONS; REFORMATORIES.

CRIMMITSCHAU, krīm'mit-shou. A town of the Kingdom of Saxony, on the Pleisse, about 39 miles south of Leipzig (Map: Germany, E 3). It is an important industrial centre, with extensive cotton and woolen mills and machine works. Population, in 1890, 19,972; in 1900, 22,840.

CRIMP (from Dutch *krimpen*, OHG. *chrimpan*, *krimfan*, to bend together, from *chrampf*, Ger. *Krampe*, Engl. *cramp*). The name given to an agent for supplying ships with seamen. They are usually in league with the most disreputable class of lodging-house and saloon keepers and with prostitutes in the endeavor to fleece the sailors as rapidly as possible. The latter can then be forced aboard ship. There are numerous laws for the protection of seamen against the extortion of crimps and their dealings with masters of vessels who need crews, but these laws are unable to reach a very large proportion of cases; and some of the laws, while not greatly injuring the crimp, seriously affect the interests of a sailor who is not in need of legal protection, and those of the honest lodging-house keeper.

CRIMSON. See RED.

CRINED, krīnd (from archaic Engl. *crine*, from Fr. *crin*, Lat. *crinis*, hair). A term in heraldry. When the hair of a man or an animal differs in tincture from the rest of the charge, the object is said to be *crined* of such a metal or color.

CRINGLE, krīn'g'l. TOM. The hero of Michael Scott's sea tale *Tom Cringle's Log* (q.v.).

CRINGLES (Ger. *Kringel*, Icel. *kringla*, circlet, dim. of *kringr*, pulley, *kring*, round). Short pieces of rope, with each end spliced into the bolt-rope of a sail, commonly confining an iron or brass ring or thimble. Smaller ropes are passed through them to aid in managing the sails. See KNOTTING AND SPLICING.

CRINOIDEA (Neo-Lat. nom. pl., from Gk. *κρinoειδής*, *krinocídēs*, like a lily, from *κρῖνόν*, *krinon*, lily + *ειδος*, *eidos*, form). A class of pelmatozoan echinoderms related to the Cystoidea and characterized by the regular pentamerous arrangement of the polygonal plates of the body-wall, that form a usually stalked calyx, and by the presence of five generally well-de-

veloped flexible arms. The graceful flower-like appearance of the stalked crinoids has given them the names of 'sea-lilies' for the living species, and 'stone-lilies' for the fossil varieties. The group is of great interest both to the zoölogist and paleontologist, but the complex modifications of the plates of the calyx, and the usually imperfect conditions of preservation, make their study a matter of considerable difficulty. At the present time the group is on the decline, and most of the modern species, those free-swimming kinds like *Antedon* and *Actinometra*, are regressive descendants from earlier stalked forms. Although about 300 living species of crinoids are known, the developmental stages of only one genus, *Antedon*, a stemless form, have been worked out, and the habits of the living stalked crinoids are little known.

STRUCTURE AND DEVELOPMENT. The crinoid animal consists essentially of two parts, the

EXISTING CRINOIDS.

Representative species from the Atlantic: 1. *Actinometra pulchella*; 2. *Rhizocrinus Lofotensis*. (After A. Agassiz.)

head, or calyx, and the stem or column. The calyx bears five or ten generally forked pinnulated arms attached to its sides, has upon its upper ventral surface a central mouth and an eccentric or lateral anal opening, and is itself supported by the column attached to its lower or dorsal surface. The calyx is a spherical or cup-shaped box made up of polygonal stony plates that are arranged in more or less regular horizontal series, and in vertical series according to the plan of pentamerous bilateral symmetry so prominent in the higher Pelmatozoa. The calyx contains the body-cavity, in which are the vital organs consisting of the simply coiled alimentary canal, and the central portions of the nervous, generative, and water-vascular systems. Prolongations of these latter systems extend into the arms. These are outgrowths of certain vertical rows of the calyx plates, termed the 'radials,' and are capable of free movement. In many of the earlier, more primitive crinoids, like *Pisocrinus*, the arms are simple: in the more specialized forms, *Pentacrinus*, they are quite complex and fork frequently. In all crinoids the arms bear pinnules and are provided with

cilia. The feathery branches of the arms screen food from the water, while the ciliated grooves transport the food to the mouth through the food-grooves, which are continued over the ventral surface from the bases of the arms to the mouth-opening.

The ventral surface of the calyx in modern genera is usually covered by a tough skin, but in the Paleozoic forms it was often covered by a superficial 'vault' or 'tegmen' of calcareous plates. The mouth is then underneath the tegmen or ventral covering and communicates with the food-grooves of the arms through closed stony tubes. In these genera the plates of the vault are often so arranged as to form an elevated 'proboscis' (*Batocrinus*), at the summit of which is the anal opening, which is thus placed above the ends of the arms. The crinoid stem is attached to the base of the calyx, and consists of calcareous plates loosely joined together to allow of a considerable degree of flexibility. Increase in the length of the stem is accomplished by the growth of new columnar plates between the base of the calyx and the top of the column. In form the columnar plates are discoid, and of circular or pentagonal outline, and all are pierced by a central cavity through which passes the neuro-vascular canal of the column. Most crinoid stems are furnished at their lower ends with root-like branches that serve to anchor the animal in muddy or sandy bottoms; others, *Apioerinus*, have a disk-like expansion that is cemented to rocky surfaces. Several genera, especially in later geologic and modern times, have columns supplied with lateral branches, called 'cirri,' which are similar in construction to the stem itself. The pentacrinids have the longest stems known, some of the fossil forms from the Upper Lias rocks of Württemberg having been found with stems ranging from 15 feet to the extraordinary length of 50 feet. Some forms of crinoids, such as *Agassizocrinus* of the Carboniferous, *Untacrinus* of the Cretaceous, and *Antedon* of recent seas, have no stem and are free-swimming animals, using their arms for locomotive purposes. *Untacrinus* is the most remarkable of these, for with a body only two or three inches in diameter, it has delicate feathery tentacles nearly six feet long, that served both as swimming-organs and as food-screens. Living *Antedon*, without a stem, has a whorl of cirri at the base of the calyx, and by means of these it anchors itself to the bottom. In other stemmed forms, as *Woodocrinus* from the Carboniferous, the base of the stem appears never to have been attached, as it ends in a simple point.

The development of Crinoidea is known for only one genus, *Antedon*, the feather-star, and this cannot be considered as typical of the class as a whole, as it presents a case of regressive development. *Antedon* appears from the egg as an elliptical free-swimming larva that is crossed by four transverse ridges, has a posterior bundle of bristles and a lateral mouth, and that resembles in many respects an annelid larva. This larva increases in size, and inside of it develops an animal with the form of a cystoid, with a head of loosely jointed perforated plates, a column, and a basal columnar plate. For a time this stalked larva is attached, and it resembles a primitive crinoid, but soon the stem is absorbed and the animal assumes the form

of the adult free-swimming *Antedon*. Almost nothing is known of the ontogeny of the host of fossil crinoids.

HABITS AND DISTRIBUTION. The modern Comatulide, like *Antedon*, *Actinometra*, etc., have a very wide distribution, and are usually found in waters less than 150 fathoms in depth, although one species of the *Antedon* has been dredged from the great depth of 2900 fathoms. The habits of *Antedon* are best known. It is a gregarious animal and Verrill has obtained 10,000 individuals in a single trawl in the North Atlantic. It lives mostly in the upper layers of the water, but when exposed to the direct rays of the sun, it curls up its arms and sinks. When clinging by its cirri to a coral or rocky point and disturbed, it releases itself immediately and swims away by graceful movements of the arms, or crawls on its arms like a spider over the bottom. Sudden changes of temperature stun it; it sinks to the bottom and soon dies. When these animals find themselves in uncomfortable surroundings, as when taken in the dredge and placed in aquaria, they drop off their arms, which break at specially fused joints, called 'syzygies,' but the arms are restored through regeneration if the crinoid survives. The stalked crinoids are also gregarious animals, but they are more restricted in their distribution, and inhabit deeper waters. The majority of fossil stalked crinoids are found in rocks that were undoubtedly comparatively shallow-water deposits, and because the calcareous plates of the calyx, and to a lesser degree those of the stem, fall readily apart after the death of the animal, perfect specimens are quite rare finds. The food of crinoids has been ascertained to consist of minute crustaceans, diatoms, spores of algae, foraminifera, and radiolarians.

Fossil Crinoids. About 175 genera and 2000 species of fossil crinoids are known. They appear first as very simple forms in Ordovician rocks, and they increase rapidly, becoming important elements of the faunas in the Silurian, Devonian, and Carboniferous periods. In some regions they were exceedingly abundant, for their fossil remains form great beds of limestone known as 'crinoidal' or 'crinoidal limestone,' which are found in formations of various ages. In the Silurian system alone, about 400 species, distributed among 70 genera, have been obtained from mostly three localities: the island of Gotland, the Wenlock of England, and the Niagara group of North America. Some of the more characteristic genera are *Pisocrinus*, *Crotalocrinus*, *Calceocrinus*, *Calli-*

EXPLANATION OF PLATE.

1. An encrinite (*Encrinus*), fossil in the Trias.
2. Larva of a feather-star (see Figs. 10 and 7).
3. *Batocrinus pyri-formis*, fossil in the Subcarboniferous of Iowa.
4. *Pisocrinus flagellifer*, fossil in the Silurian of Gotland; a, posterior view, of a perfect calyx; b, calyx seen from one side.
5. Type of calyx with a coriaceous skin in which calcareous plates are imbedded.
6. A free-swimming crinoid (*Sacomya pectinata*), fossil in the Upper Jurassic lithographic slates of Bavaria.
7. Diagram of arrangement of principal pieces in the calyx of a crinoid: b, basals; ib, infra-basals; r, radials; cd, centrodorsal (compare Fig. 2 where the letters are the same, plus o, orals).
8. *Woodocrinus macrodactylus* from the Carboniferous of Yorkshire, Eng.
9. *Apocrinus*, A, longitudinal section through the uppermost stem-joints of *Apocrinus Parkinsoni* (Oöllitic), showing empty spaces between them; B, restoration of the base of another species (*Apocrinus Rossianus*, Upper Jura).
10. A feather-star (*Antedon rosacea*) now living on European coasts; Fig. 2 is the base of this, showing developing plates (see Fig. 7) of the calyx. See article FEATHER-STAR.
11. An existing deep-sea 'stone-lily' (*Metacrinus interruptus*).

CRINOIDS

erinus, and Eucalyptocrinus. In the Devonian system some localities have yielded good material. The Lower Carboniferous rocks of the upper Mississippi Valley are the most renowned sources of fossil erinoids. The shaly limestone beds at Burlington, Iowa, and Crawfordsville, Ind., have furnished hosts of finely preserved specimens, which are to be seen in geological collections all over the world. The Mesozoic rocks of Europe, especially the Liassic and Jurassic, have furnished some fine examples of Eucrinus, Apioerinus, and the pentacrinids, but the rocks of this era in America hold only rare occurrences of members of this class. The only find of note—and that was one of great importance—was that of Uintacrinus in the Cretaceous chalk of western Kansas. The Tertiary rocks seem to be poor in fossil remains of this group.

BIBLIOGRAPHY. General descriptions of the class, and notes on the habits of the animals, can be found in: Agassiz, *Three Cruises of the Blake*, vol. ii. (Boston and New York, 1888); Walther, *Einleitung in die Geologie als historische Wissenschaft* (Jena, 1893-94); Neumayr, *Die Stämme des Thierreiches*, vol. i. CRINOLINE (Fr., from Lat. *crinis*, hair + *linum*, flax). A name originally given by French dressmakers to a fabric made of horsehair, capable of great stiffness, and employed to distend women's attire: it is also applied in a general way to those structures of steel wire or hoops by means of which women some years ago were able to wear skirts of extraordinary size at the bottom. The first device for producing an expansion of the dress-skirt is the *fardingale*, introduced by Queen Elizabeth. Walpole, in his fancy descriptions of her, speaks of her "enormous ruff and vaster fardingale." The upper part of the body was incased in a cuirass of whalebone, which was united at the waist with the equally stiff fardingale of the same material, descending to the feet, without a single fold, in the form of a great bell. In the end of the reign of James I. this fashion gradually declined, and, as a result of the Puritan feeling in the time of Charles I.

and Cromwell, it quite disappeared. It is next heard of in 1711 as 'that startling novelty the hoop petticoat,' which differed from the fardingale in being gathered in at the waist. About the year 1796 hoops were discarded in private life, but were still the mode at Court, where they flourished until the time of George IV., when they were abolished by royal command.

The next development of this fashion, about the middle of the nineteenth century, began with crinoline in its original and proper sense, first in the form of the 'bustle' in the upper part of the skirt, then the whole petticoat. The hoops were sometimes made with a circumference of four and even five yards. At last, after indignation and ridicule had for years assailed the monstrosity in vain, and when people had ceased speaking about it, the inflation began, about 1866, without any apparent cause, to collapse: and, rushing to the opposite extreme, ladies might be seen walking about as slim as if merely wrapped in a morning gown. At the close of the nineteenth century the name crinoline was applied to a cotton gauze stiffened with a dressing of glue and sold by the yard for use by milliners and dressmakers.

CRINUM (Neo-Lat., from Gk. *κρίνον*, *krinon*, lily). A genus of bulbous-rooted plants of the natural order Amaryllidaceæ, having long tubular flowers. It contains a considerable number of species, natives of different tropical and subtropical countries, generally with umbels of large and beautiful flowers, some of them among the most admired ornaments of our hot-houses. *Crinum amabile*, an Indian species, is much esteemed. The plants are mostly cultivated in greenhouses, although *Crinum longifolium* is semi-hardy and, with slight protection, will endure the winters as far north as Washington. Numerous hybrids have been produced, some of them of exceeding beauty and possessing exquisite perfume. *Crinum Americanum* is a native of Florida.

CRIPPLE CREEK. A town and county-seat of Teller County, Col., 30 miles west-southwest of Colorado Springs; on the Midland Terminal Railroad, connecting with the Colorado Midland Railroad, and on the Florence and Cripple Creek Railroad (Map: Colorado, E 2). It was founded in 1890 as a mining town, developed rapidly after 1893, and was nearly destroyed by fire in 1896. The district in which it is situated is a complete network of gold-bearing veins, and mining gave rise to the subsequent founding of Anaconda, Victor, Altman, Lawrence, and other near-by towns. The value of the production of this section, six square miles in extent, has increased from \$200,000 in 1891 to \$2,400,000 in 1893, \$7,200,000 in 1895, \$12,500,000 in 1897, \$19,743,000 in 1899, and \$22,500,000 in 1900, the output being almost entirely gold. The mines have attracted world-wide attention from metallurgists, owing to the peculiar nature of the ores, which has necessitated new methods of treatment. A noteworthy feature in connection with the industrial activity of the district is the extensive use of electrical power. Cripple Creek, at an elevation of 9800 feet among the mountains, is known also for its attractive scenery. Population, in 1900, 10,147, though the whole district contains about 50,000.

CRIPPLEGATE. An ancient London gate probably dating from the restoration of the walls by King Alfred in 886. It is said to have taken

its name from the lame beggars who congregated there, in A.D. 1010, to touch the body of Edmund the Martyr, as it was passing through. It was twice rebuilt, and was pulled down in 1760. The name was also applied to the district round it.

CRIPPLE OF FEN'CHURCH, THE. The second title of *The Fair Maid of the Exchange* (q.v.), a play by Heywood.

CRISIS (Lat., from Gk. κρίσις, *krisis*, decision, from κρίνω, *kriainō*, Lat. *cernere*, to decide). A name used by the older physicians to denote the rapid or sudden determination of an acute disease in the direction of convalescence or of death. It is opposed in signification to lysis (*lūo*, I relax), which denotes the gradual subsidence of the symptoms and improvement in condition in most chronic and in some acute diseases. The doctrine of crises was closely bound up with that of a *materies morbi*, or material of disease, in the blood, which was presumed to be undergoing changes, during the whole course of the malady, tending to an evacuation of some kind from the system in the form of a critical discharge (*apostasis* or *abscess*), which, when observed, was supposed to contain the matter of disease in a state of *coction*, and to be the direct cause of the sudden relief of the patient. Thus, according to the character and seat of the critical discharge, it was common to speak of a crisis by sweating, by diarrhoea, by expectoration, by urine, by parotid swellings, etc.; and no crisis was considered regular that was not attended by some symptom of this kind. Another curious doctrine associated with that of crises was the belief in certain days as ruling the beneficent or injurious, the complete or incomplete character of a crisis. The seventh, fourteenth, and twentieth (according to some, the twenty-first) days of the disease were regarded as eminently critical; less so, but still favorably critical, were the third, fifth, eleventh, and seventeenth; the fourth day was the *indicator* of a complete crisis on the seventh; the sixth day was the *tyrant*, notorious for unfavorable crises; the second, eighth, tenth, thirteenth, and the rest were non-critical. Few physicians now use the term, except in periodic diseases such as malaria, or in diseases which run a certain course, such as typhoid fever.

CRISIS. A series of patriotic writings, fourteen in number, published by Thomas Paine at Philadelphia during the Revolution. They appeared at intervals from 1775 to 1783.

CRISIS, ECONOMIC. A term employed by economic writers somewhat loosely to designate either the acute phase or the whole course of the disturbances in economic life which have characterized the last century, and which have recurred with such frequency as to make them appear inevitable results of the modern industrial order. The phenomena involved are so complex that they must be described rather than defined.

The salient fact in the economic history of recent times is the alternation of prosperity and depression, of good times and bad. A period of prosperity with expanding business, great activity in production and commerce, is brought suddenly to a close, generally by the failure of a prominent banking house, bringing with it the fall of other financial and mercantile concerns. Business is paralyzed, creditors demand the payment of claims, and debtors find it next to impossible to secure the means of payment. Panic rules, and

for a time the whole mercantile structure threatens to collapse. From such a shock business recovers but slowly, its activity is reduced to the lowest ebb, and some time elapses before the restoration of confidence takes place. This period of depression is much more prolonged than the acuter phase which precedes it. After a time business revives and begins to expand. Prices rise and activity becomes greater. A wave of prosperity again appears which seems to carry everything before it until it, in turn, is checked suddenly, and a new crisis is at hand. Lord Overstone, in an oft-quoted passage, describes these successive phases as follows: "State of quiescence, improvement, growing confidence, prosperity, excitement, overtrading, convulsions, pressure, stagnation, distress ending again in quiescence."

In the absence of any general term to designate this related sequence of phenomena, the term crisis has frequently been used to embrace them all. Strictly speaking, it should doubtless be confined to the acute stage when the collapse which has been slowly preparing actually takes place. In like manner, the term panic applies to the same movement, but expresses it more subjectively, emphasizing how men feel and act rather than the conditions which give birth to those feelings and actions. But as we cannot well break the sequence and discuss in isolated fashion one of its members, it will not be deemed inappropriate to discuss in this article crises, their antecedents, and their consequences.

Crisis are designated as financial, commercial, and industrial. These qualifying phrases mark the places in the economic organism where the disturbance is felt. In a purely financial crisis the stock market is the storm-centre, the disturbance affecting but slightly commercial or productive enterprises. A commercial crisis is of wider area, and embraces the trading classes, while an industrial crisis extends its baneful influence to producers in all lines of agriculture, manufactures, and the like. These expressions do not designate so much different classes of crises as crises of different degrees of intensity, inasmuch as an industrial disturbance will always imply disturbance in trade and the money market, while trade upheavals imply commotion in the money market, though a financial panic does not necessarily imply the others.

While crisis and depression are usually associated, this is not always the case. Panic and crises may occur, and after a brief interval affairs may prosper as before. This is particularly true of the purely financial crises, which are not deep-rooted enough to affect wider areas. The crisis in its larger sense, however, is invariably followed by hard times. On the other hand, depression may occur without a panic. It is hardly correct to say that it is ushered in without a crisis, for the phenomena of such a period can usually be observed even if they lack the spectacular elements which so frequently accompany them. It should be observed, moreover, that crises may be local or general, and while they have many points in common, it is particularly the latter with which we have to deal.

General crises affecting the economic situation of an entire country, and extending themselves to other countries which have trade relations with the former, are peculiarly a mark of the modern organization of business. A century ago

bad harvest or other calamities might cause local distress, or speculation such as was exhibited in the days of the South Sea Bubble and the Mississippi Scheme might cause a panic, but such occurrences did not show the pertinacity and wide-reaching effects which characterize the modern industrial disturbances. That such crises are inevitable consequences of modern methods of doing business and inseparable from the economic activities of our times, seems to be well established by their frequent recurrence and by their greater severity in the most advanced nations.

Crises more or less pronounced occurred in England in the years 1815, 1825-26, 1836-37, 1847, 1857, 1866, 1873, and 1890, while in the United States like disturbances were felt in 1814, 1818-19, 1837, 1857, 1873, 1884, and 1893. The periodicity of these occurrences is marked, and certain writers have gone so far as to establish a normal interval of ten or twelve years between crises. The facts as far as we know them do not warrant us in fixing any absolute rule, though the history of these crises reveals many common features.

It will further be observed that the dates given for Great Britain and our own country coincide in several instances, and if space permitted us to draw upon the history of Belgium, Holland, France, and Germany, further coincidences would be obvious. Certain crises, notably that of 1873, were felt quite generally. The actual crash did not occur in the same month, or even in the same year, in all the countries involved, but it is a frequent occurrence that local circumstances may hasten or postpone an event for which the general conditions are preparing.

The concrete manifestations of a crisis can best be studied in an historical instance, and none is better adapted for this purpose than the crisis of 1873 in the United States. With the close of the Civil War an extraordinary activity in all lines of enterprise was manifested. The public lands had been thrown open to settlement, and large tracts had been granted to the Pacific railroads. This, together with the return of the army to the pursuits of peace, and an enormous increase in immigration, was the condition for an era of speculative development in the Western States. The impulse which had been given to manufactures, not only by the highly protective duties which marked the war tariffs, but also by the depreciation of the currency, which acted as a check upon foreign competition, caused a similar activity in the manufacturing States of the East. Business prospered: prices and profits were high. The census of 1870 showed in every branch of industry a great advance over that of 1860, and the greater part of this advance was in the latter half of the decade. Nowhere was this confidence in the future shown more than in railroad-building and in the iron industry. In 1867 there were 2249 miles of railway constructed; in 1869, 4615; in 1871, 7379. A like expansion of railways had marked the approach of the panic of 1857. In like manner, the outlay for constructing railways rose from \$271,310,000 in 1864-68 to \$841,260,000 in 1869-73. The consumption of pig-iron, which had been 1,416,000 tons in 1868, rose to 2,810,000 tons in 1873. High prices ruled. The maximum prices in the period following 1860 were, it is true, attained in 1866, but if they fell in the years 1867 and 1868 it was only to rise again to a point nearly equal to that of 1866 in 1871 and 1872. The activity in the commercial

centres is reflected in the rise of clearings in the New York Clearing House from twenty-eight billions of dollars in 1868 to thirty-five billions in 1873. The foreign trade of the United States showed a like activity, the aggregate of exports and imports rising from \$609,000,000 in the fiscal year 1868 to \$1,164,000,000 in 1873. But even more significant of the expansion of activity in the United States was the fact of increased importations from abroad. In 1870 the imports exceeded the exports by \$43,000,000, but in 1872 this excess had become \$182,000,000, and in 1873 \$119,000,000.

The crisis of 1873 is usually dated from the failure of Jay Cooke & Co., September 18. The Stock Exchange of New York was closed on the 20th and was not reopened until the end of the month. Clearing House loan certificates were issued in large quantities. There had been certain premonitory symptoms of the approaching collapse. Railroad-building reached its highest point in 1871, pig-iron its highest price in September, 1872. The crisis lasted a few months only, the last Clearing House loan certificates being redeemed January 14, 1874. But there followed a long period of depression, which reached its lowest point three years later. The activities which had marked the previous era were not entirely stopped, enterprises begun had to be finished to save what was already invested, the daily needs of the people must be met, but all enterprise was timid and cautious. The buoyancy of the previous years was gone, and new enterprises were not undertaken. Railroad construction fell off, and in 1875 reached a minimum of 1711 miles, while in the period 1874-78 the outlay for construction was only \$357,000,000. Prices fell until 1879, to rise thereafter until 1882. The consumption of pig-iron declined until it reached 1,900,000 tons in 1876. Clearings in New York City fell off from \$35,000,000,000 in 1873 to \$23,000,000,000 in 1874, and reached their lowest point since 1863 at \$22,000,000,000 in 1876. In foreign trade the excess of imports disappeared in 1874.

As the year 1873 marks the outbreak of the crisis, so the year 1876 serves to mark the lowest point in the subsequent depression. The whole story of the crisis, its antecedents and results, is succinctly told in the statistics of business failures, as reported by R. G. Dun & Co., as follows:

YEAR	Number	Liabilities
1860.....	2,799	75,054,054
1870.....	3,546	88,242,000
1871.....	2,915	85,252,000
1872.....	4,069	121,056,000
1873.....	5,183	228,499,900
1874.....	5,830	155,239,000
1875.....	7,740	201,000,000
1876.....	9,094	191,117,786
1881.....	4,735	65,752,000
1882.....	6,738	101,547,564
1883.....	9,184	172,874,172
1884.....	10,968	226,343,427
1885.....	10,637	124,220,321

Every crisis, panic, and depression is marked by analogous characteristics. Whatever data are appropriate to show expanding conditions and an inflated condition of business at any particular time and place will exhibit a similar showing. In the United States, particularly since 1840, railroad construction has been a favorite index

of conditions, but before the crisis of 1837 similar activity was shown in canal construction. Before the panic of 1825, in England, there were large investments in manufacturing establishments, while the panic of 1893 was preceded by reckless investments in foreign countries.

A period of depression cuts down the existing stock of goods, and the retrenchment of production, coupled with the constant increase of population, creates a void in the market. To fill this there is a renewed activity; as prices begin to rise, existing plants find it difficult to meet the demand. Plants are remodeled and extended. Preparation for future production on a large scale takes place. Large investments of fixed capital are made in buildings, machinery and the like, and those branches of industry which chiefly serve the purposes of construction, such as the iron industry, make extraordinary advances. Mills and railroads are built to supply an anticipated demand. This is usually overdone, and the facilities of production increase more rapidly than the effective demand for products. Credit is unduly expanded, and it is natural that the money markets feel the first shock when the inevitable readjustment takes place.

While the phenomena of a crisis and its attendant consequences are generally recognized, the widest variety of opinion exists as to the causes of such economic disturbances. Writers are prone to lay stress upon local or temporary conditions, and to generalize from them. In truth, the phenomena of a crisis are so complex, and the conditions which may aggravate it so numerous, that it is not surprising to see the latter considered as primary causes. Thus, speculation, the currency, the tariff, bad harvests, have all been made responsible for crises. These are frequently concomitant forces impelling a crisis, but crises are so numerous that there must be some deeper underlying cause. It has already been noted that panics are most severe in the most advanced and most rapidly developing countries. They are apparently an incident of a *changing* economic organization. Stationary nations do not feel them. A change in the economic organization of a nation is not the result of plan, but the resultant of individual initiation in trade and industry. The adoption of new machinery, of new motive power, and new means of communication displaces the old, and renders some portions of capital useless. This waste of capital, and its absorption in enterprises not immediately remunerative, disturbs the normal relations of capital to employment and causes crises. We come, in short, to the conclusion that crises are caused by a lack of coincidence in the laws of growth, of production, and consumption. Changes in the former are rapid, those of the latter slow and gradual. Production is always prone to advance more rapidly than consumption. This proposition seems at variance with accepted theories of political economy, but in reality it harmonizes with them. The struggle for existence which lies at the root of economic life is a contest between Nature's limitations and potential consumption, which is unlimited. But concrete consumption and potential consumption are two different things. Indeed, we seem to be drawing near the familiar proposition that crises are caused by overproduction. This proposition has been vigorously opposed by those who have taken it in an absolute sense, and have revolted at the

idea that production could ever outstrip man's needs, as implying man's incapacity for further development. But if we understand overproduction as a false distribution of products over a series of years in comparison with man's actual consumption, and a false choice of objects of production in comparison with man's potential consumption, we need not revolt at the statement that overproduction—along certain lines—is the cause of crises. Such a statement of the causes of crises seems to lack the precision which characterizes the attribution of crises to definite phenomena, but it must be remembered that the more complex the phenomena to be accounted for, the more general must, of necessity, be the cause to which they are ascribed.

BIBLIOGRAPHY. Consult the First Annual Report of the United States Commissioner of Labor, on "Industrial Depressions" (1886); Jones, *Economic Crises* (New York, 1900); Barton, *Financial Crises and Periods of Industrial and Commercial Depression* (New York, 1902). The two works last named contain bibliographies of the subject.

CRISP, CHARLES FREDERIC (1845-96). An American jurist and politician. He was born in Sheffield, England, but came to the United States when a child. He served in the Confederate Army from 1861 to 1864, when he was made a prisoner. He was admitted to the bar in 1866, and served as Solicitor-General of Mississippi from 1872 to 1877, and as judge of the Superior Court from 1877 to 1882. From this time until his death he was a Democratic member of Congress, and from 1891 until 1895 was Speaker of the House.

CRISPI, KRÉSPÉ, FRANCESCO (1819-1901). An Italian statesman, born at Ribera, in Sicily, October 4, 1819. He studied law at Palermo and was admitted to the bar there, and in 1846 at Naples. He took an active part in the Sicilian uprising of 1848, and after its disastrous issue engaged in journalism in Piedmont. In 1860 he aided Garibaldi in his expedition for the deliverance of the Two Sicilies. He became the first representative of Palermo in the Italian Parliament, began immediately to play a prominent rôle, and after having been the leader of the radical Left, became an exponent of monarchical constitutionalism. In 1876 he was elected president of the Chamber of Deputies. To promote the interests of his country, he visited the European courts in the following year, and soon after was made Minister of the Interior. Denounced by his opponents on a charge of bigamy, he was obliged to resign in 1878, and, although acquitted, did not take office again until 1887, in the Cabinet of Depretis, after whose death, in the same year, he became head of the Cabinet and Minister of Foreign Affairs. He was an earnest advocate of the Triple Alliance (q.v.) between Germany, Italy, and Austria, and in his endeavor to strengthen it visited Bismarck at Friedrichsruhe in 1887, and accompanied King Humbert to Berlin in 1889, conferring also with Caprivi at Milan in the following year. His policy was approved by an overwhelming majority of the electors in 1890, but his Ministry was overthrown on a matter of financial policy in February, 1891. He now resumed his law practice in Rome, and, in the Chamber of Deputies, led the Opposition against his successor in office, the Marquis di Rudini. In 1893 he resumed the

office of Premier, and held it till the defeat of the Italians in Abyssinia in 1896, when he was again succeeded by Rudini (q.v.). In March, 1898, he resigned his seat in the Lower Chamber as a result of the charges brought against him in connection with extensive swindles perpetrated on the Banca d'Italia. Save for a few articles which he published in favor of the Triple Alliance, he took no further active interest in affairs, and he died on August 11, 1901, at Naples. Crispi was the greatest statesman that southern Italy gave to the united kingdom. In his lifetime he was much misunderstood and maligned. Distrusted by the Conservatives as a Radical and Republican, he incurred the hostility of the Republicans by his famous dictum in his letter to Mazzini, March 18, 1865. "Monarchy unites us, while a republic would separate us." From that time he was a firm supporter of the monarchy, but never a friend of the Court. Consult: Stillman, *Francesco Crispi, Insurgent, Exile, Revolutionist, and Statesman* (London, 1899), which contains an estimate as just as a contemporary estimate of a complex character can well be.

CRISPIN. A saint and martyr of the third century, who was descended from a noble Roman family. With his brother Crispinianus, he fled during a persecution of the Christians from Rome to Gaul, where he worked as a shoemaker in Soissons, and distinguished himself by his exertions for the spread of Christianity, as well as by his works of charity. According to the legend, his benevolence was so great that he even stole leather to make shoes for the poor! From this, charities done at the expense of others have been called Crispinades. In the year 287 he and his brother suffered a cruel martyrdom. Both brothers are commemorated on the 25th of October. Crispin is the universally recognized patron saint of shoemakers. Consult: *The Accurate History of Crispin and Crispinianus, the Royal Shoemakers* (Dublin, 1816); and *Saint Crispin and the Gentle Craft* (London, 1868).

CRISPIN. (1) The old name for shoemakers, applied to them from the fact that Saint Crispin was their patron saint. (2) A conventional character in French comedy; introduced, probably, by Poirin in 1654 from Italian comedy. A witty, intriguing, impudent valet-de-chambre.

CRISPIN, RIVAL DE SON MAÎTRE, krě'spān', ré'vāl' de sōn mā'tr' (Fr. Crispin, his master's rival). A lively comedy by Le Sage (1707), with an exceedingly improbable plot and sparkling with wit.

CRISPINEL/LA. A bright, witty girl, a foil to her modest sister Beatrice, in Marston's play *The Dutch Courtesan*.

CRISPINUS. A character in Ben Jonson's comedy *The Poetaster*, representing an inferior poet, intended as a satire on Marston, with whom Jonson was quarreling at the time.

CRISTINOS, krě'stī'nōz (Sp., adherents of Christina). A political party in Spain during the regency of Queen Maria Christina, mother of Isabella II. They were opposed to the Carlists and upheld the Pragmatic Sanction of Ferdinand VII. (q.v.), by which the crown of Spain was made inheritable in the female line.

CRISTOFORI, krě'stō'fō-rē, or **CRISTOFALI,** -fā-lē, BARTOLOMMEO (c.1651-1731). An

Italian harpsichord-maker, and the inventor of the hammer action used in the modern pianoforte. He was born in Padua. After manufacturing instruments in that city until about 1687 he was persuaded by Prince Ferdinand, son of the Grand Duke Cosimo III., to remove to Florence. The instrument invented by Cristofori is well described by Maffei, who also furnishes an illustrative engraving of the action, according to which the regulated rebound of the hammer must undoubtedly be ascribed to him. An authentic grand pianoforte made by the inventor in 1720 is said still to be preserved in Florence. A tablet was erected to the memory of Cristofori in Florence in 1876.

CRITES, krī'tēz. A character in Jonson's play *Cynthia's Revels*, supposed to be 'Jonson's idea of Jonson.'

CRITIAS, krish'i-as (Lat., from Gk. Κριτίας, *Kritias*) (?-403 B.C.). An Athenian orator and poet, the pupil both of Socrates and of Gorgias of Leontini. He was a leader in the oligarchical party at Athens, and was exiled after the downfall of the Four Hundred in B.C. 411, but after the subjugation of Athens by the Spartans he returned, and, in B.C. 404, became head of the Committee of Thirty, known as the Thirty Tyrants. In 403 he was killed in the general revolt against their excesses. His literary activity was varied in the fields of oratory, tragic and elegiac poetry, and historical prose. Fragments of his elegies are in Bergk, *Poeta Lyrici Graeci*, vol. ii. (Leipzig, 1900); of his historical work, in Müller, *Fragmenta Historicorum Graecorum*, vol. ii. (Paris, 1868-83).

CRITIC, THE. A three-act farce by Richard Brinsley Sheridan in imitation of Buckingham's *Rehearsal*, produced at Covent Garden in 1779. It contains a mock tragedy called *The Spanish Armada*, supposedly written by and rehearsed before Puff, one of the principal characters.

CRITICAL ANGLE. See LIGHT, where under *Refraction* this subject is treated.

CRITICAL PHILOSOPHY, or **CRITICISM.** The name applied to Kant's philosophy, because it was not willing to accept all *dieta* that seemed to have the support of reason (see DOGMATISM), but sought to investigate the conditions of the possibility of knowledge and rejected all so-called knowledge that did not conform to these conditions. Consult the authorities referred to in the article KANT.

CRITICAL POINT. Experience shows that there is for every gas a certain temperature above which it cannot be liquefied, no matter how great the pressure exerted upon it. Thus, above 31.1° C. (87.98° F.) it is impossible to liquefy carbonic-acid gas; water cannot exist in the liquid state above 370° C. (698° F.), etc. Such temperatures are termed the critical points or critical temperatures of substances. The vapor-tension of a liquid at its critical temperature is termed the critical pressure, and the specific volume of the fluid at the critical temperature and under the critical pressure is termed the critical volume.

The following table gives the critical temperatures and pressures for some of the more common substances (the critical pressures in terms of pounds per square inch may be obtained by

multiplying the pressures given in the table by 15):

SUBSTANCE	Critical temperature (centigrade)	Critical pressure (in atmospheres)	According to:
Acetic acid.....	+321.5°	57.0	Pawlewski
Acetone.....	+232.8	52.2	Sajoschewski
Acetylene.....	+ 37.1	68	Dewar
Alcohol.....	+243.6	64.34	Ramsay & Young
Ammonia.....	+130	115	Dewar
Carbonic acid.....	+ 31.1	77	Dewar
Carbonic oxide.....	-141	35	Wroblewski
Chlorine.....	+146	93.5	Knietseh
Chloroform.....	+268	54.9	Dewar
Cyanogen.....	+124	61.7	Dewar
Ether.....	+194	35.65	Ramsay & Young
Ethyl acetate.....	+249.5	39.65	Nadejdin
Hydrochloric acid.....	+ 52.3	86	Dewar
Hydrogen.....	-234.5	20	Dewar
Laughing Gas.....	+ 36.4	73.07	Janssen
Marsli Gas.....	- 81.8	54.9	Olzewski
Nitrogen.....	-146	35	Dewar
Oxygen.....	-113	50	Dewar
Sulphurous acid.....	+155.4	78.9	Sajoschewski
Water.....	+370	195.5	Strauss
Wood Alcohol.....	+232.76	72.85	Hannay

Most of these figures must be regarded as correct approximately, for different investigators disagree as to their precise value. As to the critical volume, it must be remembered that when a liquid is ordinarily heated, it expands as the temperature rises, i.e. its density continually diminishes: at the same time the density of its vapor continually increases; with rising temperature, therefore, the densities of liquid and vapor tend to equalize, and finally, at the critical temperature, the densities become exactly equal. The surface of separation between liquid and vapor then disappears, and the substance assumes the form of a perfectly homogeneous fluid.

The critical point of substances can be taken advantage of for passing from the gaseous to the liquid state of aggregation and conversely in a 'continuous' way, i.e. without having to deal, at any moment during the process, with a mass consisting partly of liquid, partly of vapor, and hence having two different specific volumes. Thus, remembering that the critical temperature of carbonic acid is 31.1° C. and its critical pressure 77 atmospheres, let it be required to transform continuously a given amount of the gas into liquid. To accomplish this we may first heat the gas, say, to 35° C., raise the pressure, say, to 80 atmospheres, and then, keeping the pressure unchanged, let the temperature fall, say, to 20° C.; we will then find the substance entirely liquid; for a sudden liquefaction of the entire mass will have taken place when, during the process of cooling, the temperature of 31.1° is reached; but at no moment will liquid have existed simultaneously with gas. Similarly, if it should be required to transform continuously a given amount of liquid carbonic acid into gas, we might proceed as follows: lower the temperature, say, to 20° C., raise the pressure, say, to 80 atmospheres, and then allow the temperature to rise, say, to 35° C.; we would then find the substance entirely gaseous, without, however, the mass having at any moment during the process consisted partly of liquid, partly of gas.

Continuous changes like those just described have great importance in physical chemistry, because they permit of extending the laws of gases

to liquids, and thus break down the barrier that long seemed to exist between the two states of aggregation. Consider, for example, carbonic-acid gas without reference to its critical point. At a temperature, say, of 18° C. this gas follows pretty closely the law of Boyle and Mariotte, i.e. unless the pressure is too great, the volume is inversely proportional to the pressure. But when the pressure attains 60 atmospheres partial liquefaction sets in, and then the inverse proportionality between pressure and volume is completely destroyed; we might diminish the volume by causing more vapor to turn to liquid, but as long as any vapor at all remains the pressure would remain constant. If we should cause the substance to liquefy entirely, we would find that the pressure could again be raised and the volume of the liquid thus further diminished. Careful investigation would show that there is a certain definite relation between the volume of the liquid and the pressure exerted upon it, but the law expressing this relation would be seemingly different from the law of Boyle and Mariotte. It would therefore seem that the liquid and gaseous states follow entirely different laws, separated from each other by the interval during which a substance is partly liquid, partly gaseous, and during which there is no connection at all between pressure and volume. But from what we said above, it may be seen that the change from gas to liquid, as well as the converse change, can be made to take place continuously, through the critical point, and that such a continuous process involves no interval during which the dependence of volume on pressure is destroyed; for when the critical temperature is reached during the continuous process, the substance is at one instant entirely gaseous and at the very next instant entirely liquid. The specific volumes of liquid and vapor at the critical point being equal, the sudden liquefaction involves no change of volume, and hence the law governing the liquid must evidently form an immediate continuation of the law governing the gas. Consult Van der Waals, *La continuité des états gazeux et liquides* (translation from German by Dommer and Pomey, Paris, 1894; German translation from original Dutch, by Roth, Leipzig, 1881). See GASES, GENERAL PROPERTIES OF; HEAT.

CRITICISM (Fr. *criticisme*, from Lat. *criticus*, Gk. *κριτικός*, *kritikos*, critic, from *κρίνειν*, *krinein*, to judge). Criticism, as the art of judgment, whether favorable or adverse, is applicable in all fields of human accomplishment, and all inventions, all institutions, all life are, broadly speaking, within its scope. It is, however with literature and with art that criticism has most significantly busied itself, with the result that the term has come to mean the interpretative study of these greatest expressions of man's nature. The *Poetics* of Aristotle has for centuries been regarded as the first important work of criticism, and the rules there laid down have maintained their value to this day. Aristotle's manner of approach was the scientific method of induction, and his understanding of the fundamental laws of human nature, his perception of those traits, emotions, and desires which, transcending any one age, belong to the men of all ages, underlaid and formed the firm basis of his criticism. Briefly summarized, Aristotle's chief doctrines were that all art and literature should

have as function the pleasure-giving representation or 'imitation' of what was universal—appertaining to all human nature, and not particularly or insignificantly individual; and that great art was measured by the high and lasting pleasure it afforded to society. To study the impressive works that have stood the test of time—the Bible, Homer, Vergil, Dante, Shakespeare, Milton, and lesser but well-loved poets—in the light of Aristotle's illuminating laws, is to discover how striking in its essence is the similarity in the greatest art; the sameness of man's soul, its passions and aspirations, remaining the keynote of art as it is of life.

The technical side of criticism—questions of metrical and dramatic construction and minor points of style—was approached by Aristotle, and the systematic nature of the *Poetics* is probably the chief reason for the reaction that has now and again set in against what is sometimes termed purely academic criticism. Yet it is just because Aristotle appreciated and showed that all art must have laws that the student will find him so useful; more so even than Plato, whose lightning flashes of interpretation must be ranked with the highest creative critical literature. The critical writers after Aristotle are so numerous—Greek, Byzantine, Latin—and for the most part so occupied with the linguistic phase of composition, that one is glad to pass swiftly by all their rhetorical treatises until there looms up in the third century the figure of Longinus, whose refreshing enthusiasm for the beauty of letters places him above the mechanical student of rules. The most important of his successors were Cicero, Horace, and Quintilian, whose observations on style have been of permanent service. From the time of Quintilian to Dante there is no great name in criticism; nor is this to be wondered at when one reflects that the mediæval attitude toward literature was, on the whole, that of distrust and disapprobation. Dante's poetry has so overshadowed his critical treatises that there are probably many lovers of the *Divine Comedy* who have no conception of the interest of the master's reflections on poetic form and beauty, nor any knowledge of his limitations of the subject-matter of great poetry to love, war, and virtue, or moral philosophy. Of more service than Dante's treatises were the writings of the poets and critics of the Italian Renaissance. Through them the classical tradition was passed on to England and to the rest of Europe; in art and literature, as in science and in politics, the Italy of the Renaissance was the great rejuvenator and originator in the realm of the intellect.

In more modern times the names of Corneille, Boileau, Voltaire, Diderot, Hugo, and Sainte-Beuve in France; of Kant, Schiller, and Lessing in Germany; of Sidney, Pope, Addison, Dryden, Wordsworth, and Shelley in England, represent differing views and opinions. Boileau's *Art poétique*, reminiscent of Horace's *Ars Poetica*, and Pope's *Essay on Criticism* have their distinct value as volumes of often authoritative formal instruction furnishing useful analyses of the different kinds of verse compositions. Of far more worth is Sir Philip Sidney's *Defence of Poesie* (an essay richly reminiscent of the Italian Renaissance), wherein he quaintly reminds us that "though the poet cometh to you with words set in delightful proportion," yet "it is not rhyming and versing that maketh a poet."

Lessing's great achievement was to disperse the fog that Corneille had raised around the dramatic principles of Aristotle, and by clarifying the classic doctrines, to make possible their application to all art under modern conditions. And here, without going into any details concerning any present-day doctrines, even though they be so interesting as the evolutionary theories with which we readily connect the name of M. Brunetière, it may be well to suggest the wider paths open to criticism through modern conditions. The Greek and Roman critics had only their own work to study. We of to-day have the dramas, the epics, the novels of many nations and ages. The study of comparative literature, now possible, opens up opportunities for tracing those influences which affected the literatures of all Europe, and affords the student the chance of building up from varying yet interrelated sources a standard of criticism. The differences due to national character and individual genius will teach him the limitations of hard and fast formal rules, while his faith in the fundamental canons of great art can only be made firmer by such comparative study. He will learn that criticism is of use as a method of judgment for the reader, rather than an inspiring guide to the poet, whose highest achievements are never the result of the rules whose vitality they attest. The critic who disregards the universal message of great art, and, maintaining that there is no disputing concerning taste, claims for his personal opinion as much value as can attach to any judgment, rejects for his impressionistic mess of pottage the birthright of many ages of culture. The subjective element of criticism is not, however, precluded by the positive laws revealed through the inductive method applied to works of art. As Lowell pointed out in his essay on *Don Quixote*, a book is great in proportion to what can be gotten from it, and many an artist has builded better than he knew. The individual critic can be so keen and yet true in his interpretations and so inspiring in his expression as to make his criticism itself creative literature. The qualities which are necessary to the ideal critic are, therefore, not alone knowledge of human nature and of the characteristics of the literature which has endured; he must himself have true power of intuition, sympathy combined with impartiality in judgment, a rational appreciation of the relative importance of form and content, the sense of beauty which will enable him to judge style, and the capacity for making others see what he sees. Method and technique are always valuable, and we of America have much reason to thank Child and Ticknor and Longfellow, who introduced scholarship into our country; for we must think of criticism first of all, not as a formidable and narrowing system, but indeed as a broad view-point, occupying the same relation to literature that literature holds to life; and as law is the condition of true liberty in life, so criticism is the bar to anarchy in literature. "We do not possess what we do not understand," said Goethe. The true critic, like the rhapsodist of old, can be the connecting link between the artist and the public, leading his readers to understand the beauty of a work, and so to possess it. The technical beauty may well be a matter of formal development, but the emotional beauty and appeal rest on the basis of the essen-

tial oneness of human nature, whether in the days of Athens, of Rome, of London, or of New York.

Criticism thus understood is freed from the charges to which certain critics have exposed it. It is not, on the side of form, a narrowing method of petty rules, but a rational study of fitting construction and adequate expression: on the side of content, its most lasting dicta are opposed to the contention of those who, like Ruskin, would make art a handmaiden of morality. It does not restrict genius, because genius precedes it, and genius connotes the sense of form and beauty, and can but be aided by reference to the simple laws of formal beauty. As the art of judgment concerning the fairest flowering of the human spirit, criticism has one of the highest of judicial functions; as the art of interpretation, admitting individual intuition and inspiring teaching, it has a creative function of wide and lofty worth. Consult: Aristotle, *Poetics*; Horace, *Ars Poetica*; Kames, *Elements of Criticism*, latest ed. (London, 1895); Gayley and Scott, *Introduction to the Methods and Materials of Literary Criticism* (Boston, 1899); Saintsbury, *History of Criticism* (London, 1900 et seq.); Courthope, *Life in Poetry, Law in Taste* (London, 1901); Woodberry, *A New Defence of Poetry* (New York, 1900).

CRITIQUE DE L'ÉCOLE DES FEMMES, krê'ték' de lá'kôl' dá fám (Fr., criticism of the school for wives). An amusing comedy by Molière, produced June 1, 1663, written in defense of his earlier comedy, *L'école des femmes*, which had been attacked by Le Visé, editor of *Le Mercure galant*, in the third series of his *Nouvelles nouvelles*. It consists of a discussion of the merits of the former piece, chiefly carried on between a hypercritical marquis and an amiable chevalier.

CRITIQUE OF PURE REASON (Ger. *Kritik der reinen Vernunft*). A great philosophical work by Immanuel Kant (1781), the basis of modern German philosophy.

CRITO (Lat., from Gk. Κρίτων, *Kritôn*). A wealthy friend and disciple of Socrates. He arranged for his master's escape from prison, but Socrates refused to take advantage of the plan. The philosophic dialogues which he is said to have written are now wholly lost. Plato's dialogue representing the last conversation between Socrates and Crito bears the latter's name.

CRITOLA'US (Lat., from Gk. Κριτόλαος, *Kritolaos*). A Greek philosopher, born at Phaselis, in Lycia, in the second century B.C. He succeeded Ariston of Ceos as the head of the Peripatetic School at Athens and acquired a high reputation as a philosopher and orator. About 155 B.C. he went to Rome, and, with Carneades and Diogenes, obtained a remission of the fine of 500 talents which the Romans had imposed upon Athens for the destruction of Oropus.

CRITTENDEN, GEORGE BIBB (1812-80). An American soldier, the son of J. J. Crittenden (q.v.). He was born at Russellville, Ky., graduated at the United States Military Academy in 1832, served with distinction in the Mexican War and was promoted to be lieutenant-colonel (1856). He resigned and joined the Confederate Army in 1861, was appointed major-general, and was placed in command of southeastern Kentucky and a part of Tennessee. For his defeat at Mill

Spring (1862), however, he was censured. He subsequently served as a volunteer, and from 1867 to 1871 was State Librarian of Kentucky.

CRITTENDEN, JOHN JORDAN (1787-1863). An American statesman, born near Versailles, Ky. He graduated at William and Mary College in 1807; served in the War of 1812; and was a United States Senator from 1817 to 1819; United States District Attorney from 1827 to 1829, and a United States Senator again from 1835 to 1841. In 1841 he was appointed Attorney-General by President Harrison, but resigned when Tyler became President, and was again in the Senate from 1842 to 1848, after which he was Governor of Kentucky from 1848 to 1850. He was again Attorney-General under President Fillmore, and in 1855 was a fourth time sent to the Senate. Although a Southerner, Crittenden consistently devoted his energy and eloquence to the preservation of the Union, and he exerted every effort, first, to avert the impending Civil War, and later to assist the Administration in its prosecution. In the Senate (1860-61) he urged unsuccessfully his famous compromise. (See CRITTENDEN COMPROMISE.) Retiring from the Senate in 1861, he served one term in the House, and in that body also strove for the supremacy of the Constitution. Consult *The Life of John J. Crittenden*, by his daughter, Mrs. Chapman Coleman (Philadelphia, 1871).

CRITTENDEN, THOMAS LEONIDAS (1815-93). An American soldier, the son of John Jordan Crittenden, born in Russellville, Ky. He was a private in the Kentucky Volunteers in 1836, studied law, and in 1842 became commonwealth's attorney. During the Mexican War he served as lieutenant-colonel under both General Taylor and General Scott, and when the former became President, was appointed United States consul at Liverpool. He entered the Federal Army at the beginning of the Civil War, became a brigadier-general of volunteers in October, 1861, and for gallantry at Shiloh, where he commanded a division, was raised to the rank of major-general (July 17, 1862). He afterwards commanded a division under General Buel, and took a prominent part in the battles of Murfreesboro and Chickamauga, but resigned from the service in December, 1864. He entered the regular army as colonel of the Thirty-second Infantry in 1866, was brevetted brigadier-general in 1867 for gallantry at Murfreesboro, and served on the frontier until his retirement in 1881.

CRITTENDEN COMPROMISE. In American history, a measure proposed in Congress in 1860 by Senator J. J. Crittenden (q.v.) as a means of preventing the secession of the Southern States, through the adoption of certain constitutional amendments. These amendments were five in number, and provided: (1) That the right to property in slaves was to be recognized and that slavery was to be permitted and protected in all the common territory south of 36° 30', and prohibited north of that line, while the land remained in its territorial status; (2) that Congress was not to have power to abolish slavery in the places under its exclusive jurisdiction which lay within a State where slavery existed; (3) that Congress was to have no power to abolish slavery in the District of Columbia so long as it existed in either Maryland or Virginia, and then only after the owners of the slaves had been compen-

sated; (4) that Congress was to have no power to prohibit or hinder the transportation of slaves from one State to another, or to a Territory where slavery was legal; (5) that Congress might provide that in cases where escaped slaves were rescued, or their arrest prevented by mobs, the owners should be compensated by the United States, which in turn might recover damages from the county in which the illegal act occurred. All of these amendments were to be permanent and 'unamendable.' The compromise was defeated in a committee of the Senate, and failed of consideration in the House.

CRIVELLI, krê-vê'lê, CARLO. A Venetian painter of the fifteenth century. His art was formed under the influence of the School of Padua, but he gradually developed a style of his own, and worked in several cities of the Roman Marches, especially at Ascoli, where he finally settled. His work, while somewhat angular and stiff, is characterized by tenderness and interesting richness of detail. He introduced agreeable landscape backgrounds and was particularly fond of giving fruits and flowers as accessories. Among his works are: "Madonna Enthroned," in the Cathedral at Ascoli; "Magdalen," in the Berlin Museum; "Madonna with Saints," "Crucifixion," and "Coronation of the Virgin," in the Brera Gallery at Milan.

CROAKER. See **DRUM**; **GRUNT**.

CROAKER AND CO. The pseudonym adopted by Joseph Rodman Drake and Fitz-Greene Halleck in the *Croaker Pieces*, in the *New York Evening Post* (1819).

CROAKER, Mr. and Mrs. An oddly assorted couple in Goldsmith's *The Good-natured Man*; she is as merry in her cynicism as he is lugubrious in his.

CROATAN, krô-â'tan. An island off the coast of North Carolina, south of Roanoke Island, at the time of the first English attempt at colonization, about 1585. By the shifting of the sands it is now probably a part of Hatteras or Ocracoke Island. A colony of 117 persons landed by Sir Walter Raleigh upon Roanoke Island in 1587, and of whose ultimate fate nothing definite was ever afterwards learned, is supposed to have taken refuge with friendly Indians upon Croatan Island, and to have eventually become absorbed into that tribe. Recently, new interest has been given to the story through the claim of descent from these colonists, asserted by a considerable body of mixed-blood stock in Robeson County, in the southern part of the State. Although their claim has probably no sound historical basis, they have been officially recognized by the State as a separate people under the name of 'Croatan Indians.'

CROATIA (krô-â'shî-â) AND **SLAVONIA** (Slav. *Hrvatska i Slavonija*, Hung. *Horvát-Slavonország*, from Croat, *Hrvat*, OChurch Slav. *Khrŭvatinŭ*, Slov. *Kurrat*, Pol. *Karwat*, Russ. *Khorvate*, Croat, and OChurch Slav. *Sloricieninŭ*, Russ. *Slavyaninŭ*, MGk. Ἑσκαλαβηνός, *Esclabēnos*, a Slav, whence Ger. *Sklave*, Engl. *slave*). A kingdom of Austria-Hungary, constituting one of the lands of the Hungarian Crown (Map: Hungary, D 4). It is separated by the Drave and the Danube from Hungary proper on the northeast, by the Save from Servia and Bosnia on the south, has Dalmatia and the Adriatic on the southwest, and Styria, Carniola, and Istria

on the west. Croatia constitutes the southwestern portion; Slavonia, the northeastern part. Its area is 16,770 square miles.

A large part of the surface consists of mountain chains ranging in height from about 2000 to 4000 feet, principally spurs of the Julian and Styrian Alps. In Croatia are the Agram highlands, the Croatian Karst (see **KARST**), with an elevation of about 500 feet, the two ranges of Great and Little Kapella, the former reaching a height of about 500 feet, and the Velebit range, whose highest summit is about 5750 feet. On the borders of Carniola are the Uskok Mountains. The beautiful mountain region on the northwest is called Croatian Switzerland. The interior part along the Save consists of an extensive and fruitful valley. The eastern part is interspersed with fertile, well-cultivated valleys, while the western part is covered with forests. There are several small rivers flowing into the Save and Drave, and a number of lakes on the coast.

The climate is generally moderate, but very raw in the coastland of Croatia, which is exposed to the currents from the Adriatic and to the fierce ravages of the Bora, a cold northeastern wind, very destructive in its effects and greatly feared by the inhabitants. In this western portion of the province the winters are long and the summers dry. In parts of Slavonia the climate is very insalubrious, on account of numerous swamps. The annual average temperature of the province fluctuates between 48° and 52° F. The soil is fairly fertile and the range of vegetation very wide. About 31 per cent. of the productive area is arable land, 25 per cent. is in meadows and pastures, and over 36 per cent. is under forests. The common European cereals are raised extensively, especially wheat and corn. The yield of potatoes is considerable. Fruits of different kinds are grown in abundance, notably apples, plums, nuts, and grapes in the southern part of the country. Hogs are raised in large numbers.

The mineral production of Croatia and Slavonia is unimportant. Some coal, iron, marble, copper, and sulphur figure in the exports. The manufacturing industries are only slightly developed. There are some silk-mills, glass and sugar mills, a few ship-building, milling, paper, and leather establishments in the coast districts, and a number of distilleries. The plum brandy of Slavonia is famous under the name of *Slivowitz*. There is a considerable transit trade, largely carried on through the ports of Fiume, Zengg, and Porto Ré. The chief articles of export are grain, fruits, wine, lumber, and flour. The province is well provided with railway facilities, and the two navigable watercourses of the Save and Danube contribute largely to its commercial importance. Much traffic is also carried on with Bosnia over the mountain roads.

The Ban, appointed by the Emperor, as King of Hungary, with the approval of the Hungarian Prime Minister, is at the head of the provincial administration. In its local administration the province is autonomous. It has a Diet (*Landtag*) composed of the Church dignitaries, magistrates, and representatives of the towns and rural communities, the last being elected indirectly. In the Hungarian Diet, the province is represented by forty Deputies in the Lower House and three in the Upper House. It is entitled to one min-

ister in the Hungarian Cabinet, who countersigns all important acts affecting the province. The finances are administered partly by the Hungarian and partly by the provincial Government. In 1900 the budget nearly balanced at 18,500,000 kronen. For administrative purposes the province is divided into eight counties. Very adequate facilities are provided for both elementary and secondary education. About 65 per cent. of the children attend schools. Agram (q.v.), the capital, offers excellent higher instruction. The population in 1900 was 2,397,249, as against 2,186,410 in 1890. About 89 per cent. of the people are Croats and Serbs, 3 per cent. Hungarians and 5 per cent. Germans. Seventy-one per cent. are Roman Catholics, 26 per cent. belong to the Greek Orthodox Church, and the rest to the Evangelical and other Reformed Churches.

HISTORY. Croatia and Slavonia were included in the Roman Province of Pannonia. The Croats are a southern Slavic people, speaking a language which differs but slightly from that of their neighbors the Serbs. They came down in the seventh century from the Carpathians and occupied Croatia and Slavonia. In the ninth century the Croats adopted Christianity of the Latin rite, separating them from the Serbs, who received Christianity from Constantinople. About the year 900, Croatia asserted its political independence of the Byzantine emperors, and, under its own king, extended its power over Bosnia and Dalmatia. A great part of Croatia was annexed to Hungary toward the close of the eleventh century, and in 1102 Koloman of Hungary had himself crowned King of Croatia and Dalmatia. The country was involved in the dynastic struggles and wars for self-preservation which were the lot of Hungary for centuries, and always maintained whatever position seemed favorable to its own nationality. In the Hungarian national rising of 1848, Jellachich, Ban of Croatia, was an active agent of the Austrian Imperial Government, which stirred him up to a campaign against the Hungarians. This action on the part of Croatia was a national movement as much as that of Hungary. The general principle of decentralization, as embodied in the *Ausgleich* of 1867 (q.v.), was partially applied to the relations of Croatia-Slavonia and Hungary by the compromise of 1868. A strong national party has continued to exist, cherishing the project of a greater and independent Croatia, to include all of the ancient kingdom, and joined to the Austrian Empire only by a personal union. Consult: Matkovič, *Kroatien und Slavonien nach seinen physischen und geistigen Verhältnissen* (Agram, 1873); Krauss, *Die vereinigten Königreiche Kroatien und Slavonien* (Vienna, 1889); Starč, "Die Kroaten im Königreiche Kroatien mit Slavonien," in *Die Völker Oesterreich-Ungarns*, 10, ii. (Vienna, 1882); Csaplovicz, *Slavonien und Kroatien* (Pest, 1819); De Worms, *The Austro-Hungarian Empire* (2d ed., London, 1877); De Laveleye, *The Balkan Peninsula* (London, 1887). See AUSTRIA-HUNGARY.

CROCE, krō'châ, GIULIO CESARE DELLA (1550-1620). An Italian author, born at Persiceto, near Bologna. He wrote a number of romances and plays, of which the principal is the always-popular *Bertoldo and Bertoldino*. This is probably an old folk-lore tale retold. It has been translated into many languages. The original titles of the two parts were: *Astutic sottilissime di Bertoldo*

(1620), and *Le piacevoli e ridicolose simplicità di Bertoldino figliuolo del già astuto e accorto Bertoldi* (1620).

CROCHET, krō-shâ' (Fr. *crochet*, hook, dim. of *croce*, hook, from Icel. *krókr*, hook, perhaps from Gael. *crocan*, Welsh *crwg*, hook, and connected with Lat. *crux*, cross). A form of fancy work where threads of linen, cotton, worsted, or silk are looped with hooks called *crochet-needles* to form various decorative and useful articles. Endless varieties of patterns may be formed, and lightness and elegance attained, by twisting the thread one or more times in taking up the loop, while openwork is formed by passing one or more loops.

CROCID'OLITE (from Gk. *κροκίς*, *crokís*, nap on cloth; connected with *κροκή*, *croké*, thread, from *κρέκειν*, *krekein*, to weave + *λίθος*, *lithos*, stone). A sodium iron silicate that occurs in fibrous or asbestos-like filaments, and also sometimes massive or earthy. It has a silky lustre, and in color varies from golden yellow to yellowish brown, indigo to greenish blue, light green, and dull red. The best specimens are found in Griqualand, in the Orange River country, South Africa. This mineral frequently contains a siliceous base, such as ferruginous quartz, and when cut *en cabochon*, with a high summit and the longer diameter of the oval at right angles to the direction of the fibres of which the mineral is made up, yields the cat's-eye ray, in consequence of which the mineral is popularly known as *tiger-eye*, and has some value as a gem stone, being used when polished for umbrella-handles, charms, etc. In the United States specimens are found in North Carolina, Pennsylvania, New York, and Rhode Island, but these are of no value for ornamental purposes.

CROCK'ER, FRANCIS BACON (1861—). An American electrical engineer. He was born in New York City, graduated at Columbia in 1882, and in 1889 was there appointed professor of electrical engineering. In 1892-95 he was president of the New York Electrical Society, and in 1897-98 of the American Institute of Electrical Engineers. He published *The Practical Management of Dynamos and Motors* (3d ed. 1894); and *Electric Lighting* (3d ed. 1899).

CROCKERY. See POTTERY.

CROCKET (from OF. *croquet*, variant of *crochet*, hook). A bit of ornamentation projecting alone and boldly from a plane surface, in Gothic architecture; usually in the form of a single heavy stem ending in leafage or flower, attached to a gable, pinnacle, bell of a capital, cornice, etc.

CROCK'ETT, DAVID (1786-1836). An American pioneer and politician, born in Tennessee. He was a typical backwoodsman, unlettered but shrewd, skillful as a hunter, and inordinately fond of an out-of-door life. He served under Jackson in the war against the Creek Indians, and in 1826, 1828, and 1832 was elected to Congress, where his oddities of dress attracted considerable attention and caused much comment. At the close of his third term he enlisted with the Texan forces, then in arms against Mexico, and in 1836 was one of the defenders of the Alamo (q.v.), where on March 6 he, with the rest of the garrison, was killed by Santa Anna's troops. Crockett's well-known maxim was: "Be sure you are right, then go ahead." He wrote

A Narrative of the Life of David Crockett (1834); *A Tour to the North and Down East* (1835); *Exploits and Adventures in Texas* (1836); and *Sketches and Eccentricities* (1847), all of which are characterized by crude wit, lack of grammar, and shrewd common sense.

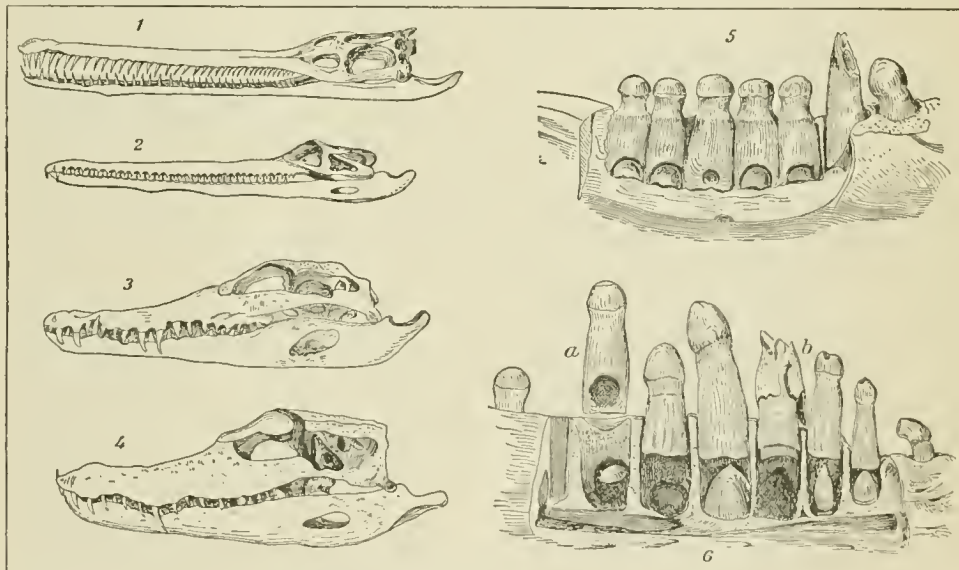

CROCKETT, SAMUEL RUTHERFORD (1860—). A Scotch novelist, born at Duchrae, New Galloway. He graduated at Edinburgh University in 1879, and for several years traveled in Europe, North Africa, and Asia. His first publication, *Dulce Cor*, a book of poems, appeared in 1886. He went to Penicuik in 1886, where he was a Free Church minister until the close of 1894, when he resigned his charge to devote himself wholly to literature. His most popular works are: *The Stickit Minister* (1893); *The Raiders* (1894); *Mad Sir Ughtred of the Hills* (1894); *The Lilac Sunbonnet* (1894); *The Play-Actress* (1894); *Boj-Myrtle and Peat* (1895); *The Grey Man* (1896); *Lad's Love* (1897); *The Standard Bearer* (1898); *The Black Douglas* (1899); *Kit Kennedy* (1899); *Joan of the Sword Hand* (1900); *The Dark o' the Moon* (1901); and *The Banner of Blue* (1902).

CROCODILE (Lat. *crocodilus*, Gk. κροκόδειλος, *krokodeilos*). An aquatic lacertiform carnivorous reptile, comparatively gigantic in size (several feet in length), representing the extensive subclass Crocodylia, regarded as the most highly organized of reptiles; more strictly one of the type-genus *Crocodylus*, of the family Croco-

the internal anatomy generally is much advanced. The heart has four distinct chambers, preventing an admixture of arterial and venous blood; and the organs of sense are well developed. Their limbs are of much more use to them in walking than are those of either turtles or newts, yet their real home is in the water, where they swim by means of twisting strokes of their compressed tails, which are also powerful weapons, and of aid in gaining food, since animals standing at the edge of a piece of water deep enough to permit a crocodile to swim close to the shore unobserved are frequently swept into the stream by a blow of the tail, then seized and drowned.

All crocodylians are oviparous. The eggs are about the size of those of a goose, and are buried in the sand or mud to be hatched by the heat of the sun alone. The females of some, if not all the species, guard them and take care of their young; yet the eggs and very young are preyed on by civets, a monitor-lizard, and many other enemies. In warm countries crocodiles bury themselves in mud in times of drought, and in cold countries during winter. They feed on fish, birds, and mammals, and many human beings lose their lives to them in certain regions. The necessity of taking small pieces of food, induced by their rigidly articulated jaws and unelastic throat, compels them to sink all their large prey and keep it until it is sufficiently macerated to be torn into small pieces.

All the species have a voice, described as a loud short bark or croak, heard at night, or when

SKULLS AND TEETH OF CROCODYLIANS.

1. *Teleosaurus* (extinct). 2. *Gavial*. 3. Nile crocodile. 4. American alligator. 5. Back part of the series of teeth of the lower jaw of an alligator, with the inner wall of the alveolar groove cut away, showing the absence of partitions and the germs of the successive teeth. 6. Middle part of the same series, showing the partitions, forming here distinct sockets from which the teeth are raised to show germs of successive teeth and dentiparous cavities; *a*, a tooth turned around to show the effect (a hole) of the new germ on its base; *b*, shell of an old tooth and two successors.

didide, typical of the order Eustachia. Crocodylians differ from lizards in many points of structure, and prominently in the horny plates within the thick skin which form a dorsal armor, and the firm setting of the strong teeth into alveoli, the fourth tooth often being much enlarged as a seizer. The skull has greater solidity and

the reptile is angry. The age to which they live is unknown, but they arrive at reproductive maturity when about ten years old, and seem to continue to grow for a century or more. Captives, and those often alarmed, show an ability to learn from experience.

"The recent geographical distribution of the

various kinds of Crocodilia loses its mystery," says Gadow, "when we recollect that during the Tertiary period alligators, crocodiles, and long-snouted gavials existed in Europe. The solitary species of alligator in China is the last living reminder of their former Periarctic distribution. The group, taken as a whole, is otherwise now intertropical, crocodiles alone inhabiting the Paleotropical region, together with long-snouted forms in the Oriental subregion, while alligators and caymans, with a few crocodiles, live in America."

The order Eustachia contains the crocodilians, ancient and modern. Two other (extinct) orders are recognized by Gadow (1902), both small and peculiar groups known only in late Mesozoic rocks. The genus *Etosaurus* represents the order Pseudosuchia, and *Belodon* the order Parasuchia. These and other Mesozoic crocodiles were marine, and seem to have been descended from some terrestrial dinosaurian stock. "So far as modern reptiles are concerned, only the Chelonia and *Sphenodon* are related to the Crocodilia, while monitors and other lizards resemble them only superficially."

The crocodilians (Eustachia) fall into seven families: (1) Teleosauridae, fossil in the Lias and Oolite of Europe; marine, and of the general appearance of gavials, with very long and slender snouts (see Figure 1). (2) Metriorhynchidae, fossil in the Upper Oolite of Europe; marine. (3) Macrorhynchidae, fossil in fresh-water deposits of Wealden, etc., of Europe. (4) Gavialidae, the gavials (see GAVIAL) fossil and recent. (5) Atopsauridae, fossil in the Upper Oolite of France; diminutive alligator-like reptiles only about a foot long. (6) Goniopholidae, large fossil crocodiles of the late Mesozoic. (7) Crocodilidae, true crocodiles and alligators.

Of the crocodiles proper (which are characterized by their narrow, elongated heads and much-webbed feet), the best and longest-known is the celebrated *Crocodilus vulgaris* of the Nile, which was revered, protected, and when dead embalmed by certain sects of the ancient Egyptians. Crocodile-worship, according to Flinders-Petrie, was indigenous, and one of the oldest worships of Egypt. It was most prevalent in Fayum, 'the Lake of the Crocodile,' whose marshy shores were especially favorable to that reptile, and which was the seat of the crocodile-god Sebek. Up the Nile, other places were devoted to this primitive worship, while at neighboring towns, such as Denderak, Apollinopolis, and Heracleopolis, it was detested. In the very earliest times the crocodile was regarded as a minister of vengeance, but not divine. Nowadays these animals are so much hunted that few remain in the lower Nile, but in its upper waters, and in other African rivers, crocodiles are still dangerously plentiful. The reptiles also abound in Madagascar; but the 'common' one on the West Coast, from Senegal to the Congo, is *Crocodilus cataphractus*. Two species inhabit the fresh waters and estuaries of India (see MUGGER), one ranging to Ceylon, and eastward to China, the Malay Islands, and Australia. A local species also inhabits northern Australia and Queensland. There are three crocodiles in North and South America and the West Indies. One (*Crocodilus Americanus*) ranges as far north as Florida.

The eggs of crocodiles are prized by some people as food, the musk-glands are taken for

perfume, and the skin and fat are articles of considerable commercial value.

Consult Gadow, *Amphibia and Reptiles* (London and New York, 1902); and authorities on Egypt, Central Africa, India, Ceylon, and Australasia. See ALLIGATOR.

Fossil Forms. Fossil ancestors of the crocodilians are known from rocks as old as those of the Triassic, and they are found throughout the later rocks of Jurassic, Cretaceous, and Tertiary time. The more primitive forms, comprising the totally extinct sub-order Parasuchia, are represented by *Belodon*, from the upper Keuper of Württemberg and the Triassic sandstones of North America; *Stagonolepis* of the Triassic of Scotland, and *Parasuchus* from the Gondwana series of central India. These three have long, narrow snouts, produced by the elongation of the premaxillary bones, and in the structure of their skulls they present some points of resemblance to the primitive dinosaurs and to the rhychocephalians. The Mesosuchia of Jurassic age, mostly reptiles of small size, have both long and short snouted forms, that differ from the Eusuchia in respect of the form of the palate, Eustachian tubes, and vertebrae. The principal genera are *Pelagosaurus*, *Metriorhynchus*, *Theriosuchus*, *Notosuchus*, *Teleosaurus*, *Stenosaurus*, from the Jurassic of Europe. The Eusuchia, also with both broad and long-snouted species, range from the Upper Jurassic through the Cretaceous and Tertiary, and comprise all the recent species, in which the Eustachian tubes are inclosed by bone and the vertebral centra are proœlous. Direct ancestors of the Malayan genus *Tomistoma* are found in the Miocene beds of the eastern Mediterranean region of south Europe. During the Eocene, typical gavials lived in the seas of England, but they migrated southward during subsequent Tertiary time, and their remains are found fossilized in the Pliocene deposits of the Siwalik Hills of India. The largest known crocodile was probably the genus *Rhamphosuchus*, from the Pliocene of the Siwalik Hills, India, with a length of over fifty feet.

CROCODILE, Lady KITTY. A lady of fashion in Foote's *A Trip to Calais*, distinguished for her hypercritical dealings. The character was a satire directed against the Duchess of Kingston, who caused the withdrawal of the play.

CROCODILE-BIRD. A plover (*Pluvianus Egyptianus*) of the Nile Valley, sometimes placed among the coursers (genus *Cursorius*). It is remarkable for its association with the crocodile,

and now is usually identified with the *trochilus* or 'leech-eater' of Herodotus, whose account of it, long regarded as fabulous, is quoted by Stejneger as follows: "As the crocodile lives chiefly on the river, it has the inside of its mouth constantly covered with leeches; hence it happens that, while all other birds and beasts avoid it, with the trochilus it lives at peace, since it owes much to that bird, for the crocodile, when he leaves the water and comes out upon the land, is in the habit of lying with his mouth wide open, facing the western breeze; at such times the trochilus goes into his mouth and devours the leeches. This benefits the crocodile, who is pleased and takes care not to hurt the trochilus." Modern writers wholly denied this, but it is now known to be mainly true: that is to say, these birds do run about the bodies of crocodiles asleep or basking on the sand, in search of the insects or crustaceans clinging to their hides; and may at favorable moments pick parasites and particles of food from their lips, teeth, and gums. This has been actually seen by such good observers as Alfred Brehm and others, and has also been asserted of a related bird, the Egyptian lapwing. A very complete account of the evidence of this fact, and for identifying this species with the bird of the Herodotus tradition, will be found in Newton's *Dictionary of Birds* (London, 1894), article "Plover." The colors of this species are lavender and cream, strikingly marked with black on the crown and on the sides of the head, the black stripes joining and passing broadly along the back, and also extending down the sides of the breast. Consult: Shelly, *Birds of Egypt* (London, 1872); *The Field* (London, September 2, 1883). See Plate of PLOVERS.

CROCODILE RIVER. See LIMPOPO.

CROCODILE TEARS. Hypocritical, forced expressions of grief. This use of the term has sprung from the fiction of travelers that crocodiles shed tears over their prey. The conceit of *crocodiles' tears* (the animals have large lachrymal glands) was common in Shakespeare's time, and Spenser (*Faerie Queene*, i. 14-18) describes them.

CROCOITE (from Gk. *κροκόεις*, *krokocis*, saffron-colored, from *κρόκος*, *krokos*, saffron). A lead chromate. It crystallizes in the monoclinic system, has an adamantine to vitreous lustre, and occurs in various shades of bright red. It is found in crystals in quartz veins or in intersecting gneiss or granite, and is commonly associated with gold pyrite and other metallic ores. Crocoite occurs in the Urals, Hungary, Brazil, and with wulfenite in Maricopa County, Arizona.

CROCUS (Lat., from Gk. *κρόκος*, *krokos*, saffron). A genus of the natural order Iridaceæ. The species have much general similarity, and are natives chiefly of the south of Europe and of the East. They set seed, but since the seed-pods are under ground and are frequently overlooked, and since production of flowers from seed-sown plants is slow, they are chiefly propagated by their corms. Saffron prepared from the stamens of *Crocus sativus* is used medicinally and for dyeing; for the latter purpose, however, aniline colors are replacing it. Some of the species are much cultivated in gardens for the beauty of their flowers, particularly those which, as *Crocus vernus* and *Crocus imperati* and the Dutch hy-

brids of *Crocus asiaticus*, flower very early in the spring. The saffron crocus and some other species flower in autumn. The flowers of some species are fragrant. It is necessary frequently to take up crocus-roots and plant anew, on account of the manner in which the corms multiply—the new forming in some species above the old, thus, in time, raising the corm to or even above the surface of the ground. When planted in lawns the bulbs must be replaced every two or three years, because they soon become smothered by the grass. The autumn-flowering species are seldom cultivated in the United States. See Colored Plate with IRIS.

CROCUS OF ANTIMONY, or **CROCUS METALLORUM**. The bright-red antimony oxy-sulphide that is found native as *kermesite*.

CROCUS OF MARS, or **CROCUS MARTIS**. A polishing substance consisting of finely powdered ferric oxides.

CRÆSUS (Gk. *Κροῖσος*, *Kroisos*). A Lydian king of the Μερμανδᾶ line. The son of Alyattes, whom he succeeded, he flourished in the sixth century B.C. He came to the throne about the age of 35 (B.C. 560), and found the wrangling Æolians, Dorians, and Ionians an easy prey, but he did not press his advantage as conqueror beyond the exaction of tribute. Save Lycia and Cilicia, all Asia Minor west of the Halys fell before him. His ability in practical affairs soon made him the richest of monarchs, and 'rich as Cræsus' was a hyperbole formerly more apt than in our day of fabulous wealth. His capital, Sardis, became the brilliant centre of arts and letters, and Cræsus was a munificent patron. The great-souled law-giver of the Greeks was one of his visitors, Herodotus informs us, and when questioned by the King whether the possessor of so great riches might not be deemed the happiest of men, Solon replied in a frank philosophy, the value of which could not then be appreciated. When the long peace of the kingdom was evidently about to be disturbed by the encroaching Persians, Cræsus formed a league with the Lacedæmonians. He sought to propitiate the gods by bestowing rich gifts upon Apollo's shrine, and, encouraged by the oracle's deliverance that he "would destroy a great empire," he determined to take the offensive. With his Lydian forces only, he joined battle with the enemy, but achieved no advantage, a failure which he attributed to the inadequate support of his mercenaries. Returning to Sardis, he called upon the Lacedæmonians for their promised aid, and invited the assistance of the Egyptian King, Amasis, meaning to renew the contest early in the next year. For this Cyrus did not choose to wait, but decided upon immediate action. Cræsus, almost totally unprepared, met a certain defeat at Thymbra, and, after a short siege of Sardis, surrendered his capital. After a reign of fourteen years he gave up his crown to the Persian. The oracle spoke truth—he destroyed a great empire, but it was his own. Herodotus further relates that as the Lydian awaited the fire which, by command of Cyrus, was to consume him, he remembered his conversation with the Athenian philosopher, and called out "Solon, Solon, Solon!" Desiring to know the reason of the exclamation, Cyrus heard the story, and straightway commanded that the victim be spared. But Apollo's intercession was required

to save him from the flames now raging about him. A merciful rain fell, and Cresus, given a residence near Ebatana, was taken into his conqueror's favor, and later into that of Cambyses. To both monarchs he is said to have rendered valuable service as a counselor, and both he survived. Just what his end was is not known.

CROF'FUT, WILLIAM AUGUSTUS (1836—). An American journalist and author, born at Redding, Conn. During the Civil War he was first a soldier and then a correspondent in the field for the *New York Tribune*. Afterwards he became editorially connected with various journals, and was executive officer of the United States Geological Survey, whose publications he edited for some time. He is the author of *The War History of Connecticut* (1867); *A Helping Hand for American Homes* (1868); *A Midsummer Lark* (1882); *The Vanderbilts* (1886); *Folks Next Door* (1892); *The Prophecy and Other Poems* (1893); a volume of poems, *Bourbon Ballads* (1880); the opening ode for the World's Columbian Exhibition (1893); and *Deseret*, the libretto for the opera by Dudley Buck.

CROFT (AS., small field). A piece of land connected with a humble kind of dwelling, whose inhabitant, the renter of the land, is called a 'crofter,' and this method of letting small pieces of land, either for tillage or the rearing of cattle, is known as 'the crofting system.' This kind of petty farming was formerly common in Scotland, more particularly in the Highlands.

CROFT, króft, Sir HERBERT (1751-1816). An English writer. He was educated at University College, Oxford; took orders, and was appointed to the living of Prittlewell, in Essex, which he retained till his death, passing, however, much of his time abroad. He wrote extensively, but is mainly remembered by his *Life* of the poet Young, which he contributed to Johnson's *Lives of the Poets* (1779-81). He succeeded capably in imitating Johnson's style. A novel in letter form called *Love and Madness* (1780) became notorious on account of the insertion of certain letters of Chatterton obtained under false pretense.

CROFT, or **CROFTS**, WILLIAM (1678-1727). An English musician. He was born at Nether Easington, Warwickshire, and studied music in the choir of the Royal Chapel, then under the direction of Dr. John Blow. He was organist of Saint Anne's, Westminster, from 1700 to 1711. In 1707 he was also appointed organist at the Chapel Royal, and it was in this capacity that he produced the beautiful anthems which have perpetuated his fame. In 1724 he published his *Musica Sacra* (2 vols.), containing a collection of thirty anthems and a burial service. According to the preface of the composer, this was the first attempt made in England to print the score of a sacred composition from engravings on plates. Among the best anthems of Dr. Croft are the following: *I Will Give Thanks* (1704), for the thanksgiving after the battle of Blenheim; *The Soul of the Righteous* (1714), for Queen Anne's funeral; *The Lord is a Sun and Shield* (1714), for the coronation of George I.; *O Give Thanks* (1715), for the suppression of the rebellion.

CROFT'ANGRY, CRYSTAL. The imaginary editor of Scott's *Chronicles of the Canongate*.

He is said to have been intended for Scott's father.

CROFTER. A term designating a class of small tenants of the Scottish Highlands and islands who hold arable land in severalty, and usually certain rights of pasture in common. The crofter is for the most part a descendant of the lowest class under the early clan system; and the rights of common pasturage are traceable to the communal proprietorship of the clan. After the breaking up of the clans, the legal status of the crofter became that of a tenant at will; by custom, however, he was usually accorded certain fixity of tenure.

During the first half of the eighteenth century the chieftain of the clan, while losing his political leadership, came to be regarded as the proprietor of the soil. In some districts the chieftains who had been at war with the royal power were displaced, and the land granted to supporters of the King. In either case the followers of the chieftain became tenants, owing rent for their land instead of personal services and dues, as formerly. Nevertheless, their economic position was fairly satisfactory, especially in the islands. But with the expansion of the woolen industry it became profitable for the landlord to turn his estate into sheep-runs; accordingly, wholesale evictions of the crofters took place in many of the Highland districts. Moreover, natural increase of population had necessitated a reduction in the size of the individual holdings; so that at the end of the eighteenth century the whole class of crofters had been reduced to a condition of abject poverty. In the early part of the nineteenth century emigration of the crofters to America and the British colonies was officially encouraged; work-houses were established and extensive measures for relief in time of famine were undertaken; but no permanent improvement was thus secured. In 1883 a Parliamentary commission was appointed to investigate the conditions of life of the crofters. As a result of the investigation, the Crofters' Act of 1886 was passed. By this act the crofter is granted permanence of tenure, so long as he does not violate the specified conditions of his tenure; rents are fixed by a commission; compensation is allowed for improvements which the tenant may make, and the tenant has a right to demand the assistance of the landlord in making other permanent improvements. In order to remedy the evil effects of the excessive subdivision of holdings, the crofter is empowered to call upon the landlord to rent him additional land when the original holding is deemed by the commission to be insufficient.

Since the passage of this act the position of the crofter has materially improved. Rents have been lowered; and the crofter, assured that improvements which he may make will not have the effect of raising his rents, and will not be taken from him through eviction, has advanced appreciably in methods of agriculture and industry.

Consult: Dalriad, *The Crofter in History* (Edinburgh, 1888); Guemier, *Les crofters écossais* (Paris, 1897).

CROFTS, krófts, ERNEST (1847—). An English painter, born at Leeds. He studied under A. B. Clay in London, where he afterwards came to live, and with E. J. Huxton in Düsseldorf. Among his chief works are "Cromwell at Marston Moor" (1877); "At the Farm of Mont

Saint Jean, Waterloo" (1882); and "Marlborough at Ramillies." All these are distinguished for accuracy and truth of detail, but the action with which a French painter would have managed such scenes is lacking. They are primarily historical studies rather than works of art. However, Crofts stands among the first of the few English battle-painters. He was made a Royal Academician in 1896.

CROGHAN, krō'gan, GEORGE (1791-1849). An American soldier, born near Louisville, Ky. He graduated at William and Mary College in 1810, entered the army in 1812, distinguished himself under General Harrison at Fort Meigs, and on August 1-2, 1813, defended Fort Stephenson (on the present site of Fremont, Ohio) against the attack of a greatly superior force of British and Indians, for which he received the thanks of Congress and a gold medal. In 1814 he was promoted to be lieutenant-colonel, but resigned in 1817 and was appointed postmaster at New Orleans in 1824. He became inspector-general with the rank of colonel in 1825, joined General Taylor's forces in Mexico in 1846, and took a prominent part in the battle of Monterey.

CROISSET, krwā'zā', MARIE JOSEPH ALFRED (1845—). A French classical philologist, born in Paris. He was appointed professor of Greek at the Faculté des Lettres in 1885 and became a member of the Academy of Inscriptions in the following year. He is the editor of various Greek authors, and the author of *De Personis apud Aristophanem* (1873); *Xénophon, son caractère et son talent* (1873); *La poésie de Pindare et les lois du lyrisme grec* (1880); and, in conjunction with Maurice Croiset, *Histoire de la littérature grecque* (1887-99).

CROISSET, MAURICE (1846—). A French classical philologist, brother of the preceding, born in Paris. He became professor of the Greek language and literature at Montpellier in 1876, and professor of the Greek language and literature at the Collège de France in 1893. He is the author of *De Publicæ Eloquentiæ Principiis apud Græcos in Homericis Carminibus* (1874); *Des idées morales dans l'économie politique de Démosthène* (1874); *Essai sur la vie et sur les œuvres de Lucien* (1882); and, in conjunction with Alfred Croiset, *Histoire de la littérature grecque* (1887-99).

CROIX, krwā, CARLOS FRANCISCO, Marqués de (1699-1786). A Spanish general and administrator. He was born at Lille, French Flanders, and after serving in the Spanish Army was appointed commandant at Ceuta, whence he was transferred in the same capacity to Puerto de Santa María. He afterwards became Captain-General of Galicia, and was Viceroy of New Spain (Mexico) from 1766 to 1771. He was distinguished by strict integrity and high administrative ability. During the last fifteen years of his life he was Viceroy and Captain-General of Valencia.

CROIX, TEODORO DE (c.1730-91). A Spanish soldier. He was born at Lille, French Flanders, and was a brother of the Viceroy of New Spain, who appointed him Governor of the interior provinces of the country and of Sonora. During his brief term as Viceroy of Peru (1784-90) he did much to ameliorate the condition of the Indians and enacted several laws for their pro-

tection. He died soon after his return to Madrid.

CROIZETTE, krwā'zēt', SOPHIE (1847-1901). A French actress. She was born in Saint Petersburg. After two years at the Conservatory she obtained the first prize for comedy. In 1869 she appeared at the Théâtre Français as Queen Anne in *Un verre d'eau*, and four years afterwards was made a 'sociétaire.' Mlle. Croizette rarely appeared in classic rôles. Her best work was in the *Sphinx* (Octave Feuillet), *L'étrangère* (Dumas fils), *Fourchambault* (Emile Augier), and *La princesse de Bagdad* (Dumas fils), her last and greatest creation. She retired from the stage at the height of her success, in 1885.

CROKER, B. M. An English novelist. She was a daughter of William Sheppard, rector of Kilgefin, Roscommon, Ireland; was educated in England; married John Croker, of the Royal Munster Fusiliers, and traveled extensively in India and other parts of the East. Mrs. Croker has written some good Irish peasant stories, as *Terence* (1899), and excels in depicting Anglo-Indian life, particularly the fashionable feminine world. The scenes of *Jason and Other Stories* (1899), comedy running into farce, are laid in India, Australia, and England. Her novels are commonly translated into French and German. Besides those above, may be cited *Proper Pride* (1882); *Pretty Miss Neville* (1883); *Diana Barrington* (1888); *Mr. Jervis* (1894); *Village Tales and Jungle Tragedies* (1894); *In the Kingdom of Kerry* (1896); *Beyond the Pale* (1897); *A State Secret* (1901); *Angel* (1901).

CROKER, JOHN WILSON (1780-1857). An English writer and politician. He was born at Galway, Ireland. Educated at Trinity College, Dublin, he entered Lincoln's Inn as a student in 1800, and two years later was called to the Irish bar. In 1804 he published *Familiar Epistles*, a clever satire in verse on the Irish stage, and *An Intercepted Letter from Canton*, a satire in prose on Dublin society. Both ran through several editions. In 1808 he issued a treatise on the *State of Ireland, Past and Present*—a pamphlet on Catholic emancipation—which brought him to the notice of politicians, and in the same year he was elected member of Parliament for Downpatrick. A warm defense in Parliament, in 1809, of the Duke of York, charged with corrupt administration, helped Croker in the same year to the office of Secretary to the Admiralty, a post which he held for more than twenty years. He was one of the founders of the *Quarterly Review*, and contributed many violent party articles to its pages, as well as a large number of personal and abusive reviews, one of the most famous being on Keats's *Endymion*. As Rigby he was caricatured by Disraeli in *Coningsby*. In Parliament he steadily opposed the Reform Bill in all its stages, and after its enactment he refused to enter Parliament again. He took an active part in the establishment of the Athenæum Club, and rendered good service to literature by his annotated edition of Boswell's *Johnson* (1831), famous for Macaulay's savage review of it, and by his publication of the *Suffolk Papers* (1823) and Lord Bervey's *Memoirs of the Court of George II.* (1848). His *Stories from the History of England for Children* (1817) supplied

Scott with the idea of *Tales of a Grandfather*. He also continued for a time to write verse. His *Battle of Talavera* (1809) pleased Wellington and was praised by Scott. Consult *Jennings, Diaries and Correspondence of Croker* (London, 1884).

CROKER, RICHARD (1843—). An American politician, well known as a leader of Tammany Hall in New York City. He was born at Black Rock, Ireland, but when two years of age was brought by his parents to America, and for a short time attended the public schools in New York City. He was then for seven years employed as a machinist, became prominent in the New York volunteer fire department, and took an active interest in local politics, and about 1865 identified himself with the Tammany Hall organization. From 1868 to 1870 he served as an alderman; was reelected in 1872, but was forced out of office by Tweed, and acted for several months, on Mayor Havemeyer's appointment, as city marshal, his special duty being the collection of arrears in taxes. He was elected city coroner in 1873, and again in 1876, was appointed fire commissioner in 1883 and was reappointed to that position by Mayor Abram S. Hewitt in 1887. During this time his influence in Tammany Hall had gradually increased, and in 1886, on the death of John Kelly (q.v.), he became chairman of the Finance Committee of that organization and its recognized leader. From April, 1889, to February, 1890, he was City Chamberlain. He conducted the successful mayoralty campaigns of Hugh Grant, Thomas F. Gilroy, and Robert A. Van Wyck in 1889, 1893, and 1897 respectively, and during the Presidential campaign of 1900 was conspicuous as a supporter of the Democratic candidate, W. J. Bryan. In 1902, soon after the election of Seth Low to the mayoralty of New York, he resigned his position as leader of Tammany Hall.

CROKER, THOMAS CROFTON (1798-1854). An Irish author and antiquarian. He was born in Cork, January 15, 1798. He early devoted himself to the collection of legends and songs of the Irish peasantry; and in 1824 he published his *Researches in the South of Ireland*, characterized by a happy blending of humor and sentiment with archæological learning. The work was followed by the *Fairy Legends and Traditions of the South of Ireland* (1825); *Legends of the Lakes* (1829); and *Popular Songs of Ireland* (1839). Croker also edited *Memoirs of Joseph Holt, General of the Irish Rebels*, wrote two novels, and contributed to the magazines. He devoted much time to archæology, being member of many antiquarian societies. Through the influence of John Wilson Croker, a friend, but no relative, he obtained at the age of twenty-one a clerkship in the Admiralty, a position which he held till 1850. He died August 8, 1854. Consult *Life*, by his son, prefixed to *Fairy Legends* (London, 1859). The *Popular Songs* were edited by Morley (London, 1886).

CROLL, KRÖL, JAMES (1821-90). A Scotch geologist. He was born at Whitefield, Perthshire, and received only the usual brief schooling of a peasant's son. He studied philosophy and physical science, and published a treatise on the *Physical Cause of the Change of Climate During the Glacial Period* (1864). He was appointed an officer of the geological survey of Scotland,

and in that post (1867-81) prosecuted researches which resulted in works including the treatise on *Climate and Time in Their Geological Relations* (1875), in which he ascribed climatic changes during geological epochs to secular variations in the eccentricity of the earth's orbit; and *Climate and Cosmology* (1886), containing a discussion of the origin of the sun's heat and the probable development of the nebulae and stars. Though considerable difference of opinion exists as to the real value of these views in relation to the establishment of a sound geological theory, there is general recognition of the value of his works as stimulating and directing inquiry. In his later life he returned to the field of philosophical speculation and published *The Philosophie Basis of Evolution* (1890), in which he discusses the fundamental principles underlying the doctrine of evolution.

CROLY, DAVID GOODMAN (1829-89). An American journalist, born in New York and educated at the New York University. He was associated with the *Evening Post* and the *New York Herald* (1854-58), and then became city editor and subsequently managing editor of the *New York World*. From 1872 to 1878 he was editor of the *Daily Graphic*. His published works include *Scymour and Blair: Their Lives and Services*, with an appendix containing a *History of Reconstruction* (1868).

CROLY, GEORGE (1780-1860). An Irish author and clergyman. He was born in Dublin and was educated at Trinity College there. In 1810 he was ordained a priest of the English Church, and in 1845 became rector of Saint Stephen's, Walbrook, London. His first work was a poem, entitled *Paris in 1815*, which appeared in 1817. From this time up to within a short period from his death he wrote almost incessantly as dramatic critic of the *New Times*, as a contributor to *Blackwood's* and the *Literary Gazette*, and as the author of numerous satires, romances, and biographies. Among his works are: *The Angel of the World* (1820); *Tales of Saint Bernard* (1829); the novel *Marston* (1846); and the poem *The Modern Orlando* (1846). He was an imitator of the grandiose style of Byron and Moore, yet *Salathiel* (1829), his chief publication, contains many effective scenes and is still good reading. It was reprinted in New York in 1901 as *Tarry Thou till I Come*.

CROLY, JANE CUNNINGHAM (1831-1901). An American author and journalist, better known as JENNIE JUNE. She was born in England, came to the United States when a girl, and at an early age became a contributor to newspapers and magazines. She called the first congresses of women in the United States in 1856 and 1869; organized Sorosis in 1868; founded the New York Women's Press Club (of which she was later president), in 1889; and in 1892 became professor of journalism and literature in the Rutgers Women's College, which institution conferred upon her the degree of L.H.D. She was married to David G. Croly in 1856. Her works include: *For Better or Worse* (1875); *Jennie Juneiana*; *Talks on Women's Topics* (1864); *Thrown on Her Own Resources*; *Cookery-Book for Young Housekeepers* (1866); *Knitting and Crochet*; and a *History of the Woman's-Club Movement in America*. She was editor of *Demorest's Magazine*

from 1860 to 1887, and later was editor of the *Cycle* (which she founded) and the *Home-Maker*.

CRO-MAGNON, *kró'má'nyōn'*. A type of mankind supposed to have inhabited southwestern Europe at the end of the Magdalenian epoch, at the close of the Pleistocene. They were marked by the most dolichocephalic of crania, elongated at the back (index 63-74.8), with low face and orbits, but by good stature. In 1858 workmen unearthed, in the cave called Cro-Magnon, near Les Eyzies, in the Department of Dordogne, France, imperfect skeletons of three men, two women, and a child. A peasant found a human bone in a rabbit-hole, and at the Cave of Aurignac the remains of seventeen persons were recovered. At Laugerie Basse, in the Vézère Valley, another discovery was made. In the Cave of Baumes Chaudes, in Lozère, thirty-five crania were collected, all of this long, low-faced type. At other places the same marks have been noted, both on the dead and on the living, in Africa and in Europe. To this type, wherever found, the name of Cro-Magnon is given. Consult: Mortillet, *Le préhistorique* (Paris, 1882); Deniker, *Races of Man* (London, 1900); Ripley, *The Races of Europe* (New York, 1899); and, for critical observations, Sergi, *The Mediterranean Race* (London, 1901).

CROMARTY FIRTH, *króm'ēr-tī fērth* (from Gael. *crom*, OIr. *cromb*, Welsh, *crom*, Bret. *crom*, crooked + OIr. *art*, Gall. *artos*, stone, and *firth*, *frith*, from Icel. *fjörðr*, ford; ultimately connected with Lat. *portus*, port, Skt. *par*, to cross). A landlocked inlet of the North Sea, on the northeast coast of Scotland, just northwest of the Moray Firth, 18 miles long, 3 to 5 miles broad, and 5 to 35 fathoms deep (Map: Scotland, D 2). The entrance is between the North and South Soutars, two high wooded headlands, and is 1½ miles across, with 12 to 30 fathoms of water, and with the Three Kings Reef about half a mile off land. Near the firth are the towns of Dingwall, Invergordon, and Cromarty. In the red sandstone, near the entrance, Hugh Miller discovered the fossil fishes *Pterichthys*, *Osteolepis*, etc.

CROMARTYSHIRE. See ROSS AND CROMARTY.

CROM'DALE (from Gael. *crom*, crooked + Engl. *dale*). A village in Inverness-shire, Scotland, on the eastern bank of the Spey, scene of a battle fought May 1, 1690, between the Scotch Jacobites and 800 of William III.'s troops, in which the latter were victorious (Map: Scotland, E 2). The event is celebrated in a song entitled, "The Haughs of Cromdale."

CROME, JOHN (1768-1821). An English landscape painter, founder of the Norwich school. He is usually called Old Crome, to distinguish him from his son of the same name. Born on December 22, 1768, he passed his youth in humble circumstances, acquiring his taste for painting during an apprenticeship to a sign-painter. Together with Robert Ladbrook, a printer's apprentice, he rented a garret and started upon his career as a painter. The two artists spent their leisure time sketching in the field, endeavoring to reproduce nature exactly. Crome's pictures thus became 'exact views' of the places he loved. His technique is that of the Dutch masters, whom he studied in the houses of the Norfolk gentry, in his capacity as a drawing

teacher, and in a visit to Paris. Hobbema, in especial, was his favorite master. Crome's pictures contained the usual brown tone of the Dutch school, and although they are occasionally marred by over-attention to detail, they always contain a true feeling for light and air. He painted trees with great force and individuality. His "Oak at Poringlam" and the "Willow" are highest masterpieces of their kind. His works are mostly in private possession, especially among the gentry of Norfolk. The National Gallery contains two good examples, "Mousehold Heath" and "Chapel Fields, Norwich." His favorite subjects were taken from the scenery about his native home, but he was capable of adapting himself to the livelier tones of French landscape, as is indicated in his "Fishmarket at Boulogne" and his "Boulevard des Italiens, Paris." Although he followed etching as a pastime only, he was an excellent etcher, working with great care and detail, though sometimes not achieving tone and atmosphere. His etchings were published after his death, in 1834, under the title of *Norfolk Picturesque Scenery*, and again in 1838 and 1850. Crome seldom exhibited in London, but he displayed at different times no less than 288 pictures in the Norfolk Society of Artists. This society he himself founded in 1803, becoming its president in 1808. He died April 22, 1821, at Norwich, where nearly all of his life had been passed.

CROME, JOHN BARNEY (1794-1842). An English painter, son and pupil of John Crome, usually called Young Crome. His pictures are distinguished for merit, the best resembling those of his father. Consult: Heaton, "Life of John Crome," in the appendix to Cunningham's *Lives of the British Painters* (London, 1882); Wodderspoon, *John Crome and His Work* (Norwich, 1850).

CROMER. A seaport and watering-place on the north coast of Norfolk, England, 21 miles north of Norwich (Map: England, H 4). It stands on the top of one of the highest cliffs on the coast. Nearly all the old town, called Shipden, with one of the churches, was swept away by the sea about the year 1500. The sea is gaining on the land, and vessels have to load and unload on the open beach. In 1825 some cliffs 200 feet high fell into the sea. Seamen call Cromer Bay the Devil's Throat, from its dangers to navigation. Population, in 1891, 2500; in 1901, 3800.

CROMER, EVELYN BARING, first Earl (1841—). An English diplomatist and administrator, born at Cromer Hall, Norfolk, and educated at Woolwich Academy. After a brilliant career in the Royal Artillery, he served as private secretary to the Earl of Northbrook, Governor-General of India, from 1872 to 1876; was Commissioner on the Egyptian public debt from 1877 to 1879; was Controller-General of Egyptian finances from 1879 to 1880; and was Finance Minister of India from 1880 to 1883, when he became Consul-General and Minister Plenipotentiary in Egypt, which positions he still held in 1902. He was created first Baron Cromer in 1892, first Viscount in 1899, and Earl in 1901. He became virtually British Viceroy of Egypt, and his efficient administration won for him the appellation of 'Maker of Modern Egypt.' He rescued it from bankruptcy; re-

placed corrupt administrators by honest officials; reduced taxes; reformed the army; increased trade, and greatly extended railway, postal, and telegraph facilities.

CROMER, MARTIN (1512-89). A Polish historian, born at Biecz, near Cracow, and educated at the academy in that city. He was secretary to the eldest son of King Sigismund I., and was intrusted with diplomatic missions to Pope Paul V. and to the emperors Charles V. and Ferdinand I. In 1578 he was appointed bishop of Ermeland. His history of Poland, from its beginning to the year 1506, *De Origine et Rebus Gestis Polonorum* (1555; frequently reprinted), is a valuable source of information on this subject. Another important work is the geographical and statistical publication *Polonia* (in Latin, 1586; German trans. 1741).

CROMLECH, króm'lek. See **DOLMEN**.

CROMPTON. A town in Lancashire, England, four miles northeast of Oldham, and eleven miles northeast of Manchester. It has important cotton manufactures. Population, in 1901, 13,400.

CROMPTON, SAMUEL (1753-1827). An English inventor, whose spinning-mule revolutionized the cotton-weaving industry. In his youth he was largely occupied with weaving at home, and it was the dissatisfaction caused by the machine he used that led to the perfection of his invention in 1779. Unable to bear the expense of taking out a patent, he exploited his machine by private arrangement with manufacturers, some of whom later denied their obligations to him; so that for his valuable invention he received less than £70. In 1812, after much labor, he secured from the House of Commons a grant of £5000, the only official recognition bestowed upon him. Consult French, *Life and Times of Crompton* (London, 1860).

CROMPTON'S SPINNER. See **SPINNING**.

CROMWELL. A dramatic work by Victor Hugo (1827). It was not intended for the stage. The preface to its first edition has since become famous as containing the breviary of French dramatic 'Romanticism.'

CROMWELL, BARTLETT (1840—). An American naval officer, born in Nebraska. He attended the Naval Academy for three years (1857-60). During the Civil War he served in the South Atlantic blockading and Eastern Gulf squadrons, and rose to the rank of lieutenant-commander. He was promoted commander in 1874, and as such was intrusted with the navigation of the flag-ship *Ticonderoga* during Admiral Schufeldt's voyage around the world in 1879-81. He thereafter successively became captain in 1889, commodore in 1898, and rear-admiral in 1899. After the liberation of Cuba from Spain, Cromwell was ordered to take charge of the naval station at Havana. In 1901 he was appointed to the command of the United States fleet in South American waters.

CROMWELL, HENRY (1628-74). The fourth son of Oliver Cromwell. At the age of sixteen he served as a soldier in the Parliamentary army. In the Barebones Parliament he was one of the six Irish members. In 1655 he went to Ireland as a major-general, and was appointed Lord Lieutenant in 1657. His rule was popular, and his moderation to Royalists received the approval of Charles II., who, at the Restoration, confirmed

his Irish estates under the Act of Settlement. His latter years were passed as a farmer. His great-grandson, the last representative of the house of Cromwell, died in 1821.

CROMWELL, OLIVER (1599-1658). Lord Protector of England. He was born at Huntingdon, April 25, 1599, and was the only surviving son and heir of Robert Cromwell and Elizabeth, daughter of William Steward, whose family, tradition notwithstanding, has no connection with the royal house of Stuart. The Cromwell family sprang from Katherine, who was the sister of Thomas Cromwell, the Hammer of the Monks, and who married Morgan Williams, a Welsh brewer of means. Their son Richard took the surname Cromwell, and, profiting by his uncle's influence, rose to wealth and honor in the service of Henry VIII., retaining his sovereign's favor even after his uncle's fall in 1540. The family continued to be prominent from that time, and was noted for its lavish entertainment of royalty, but owing to the extravagance of Oliver's uncle of the same name, the fortunes of the family had been squandered, and in 1627 the family seat at Hinchinbrook was sold to Sir Sidney Montague. Oliver's father was the second son of Henry, the Golden Knight, and the grandson of Richard (Williams) Cromwell, and he therefore represents a younger branch of the family, whose income was never large.

Little is known of Cromwell's early life. He was educated at the free school of Huntingdon under Dr. Thomas Beard, an austere Puritan. In 1616 he entered Sidney Sussex College at Cambridge, a stronghold of Puritanism, but soon withdrew, probably owing to his father's death, in 1617. There is no foundation for the reports by royalist biographers of wildness and profligacy in his early years, though he was boisterous and only moderately successful at his studies. He probably studied law for a short time at Lincoln's Inn. In 1620 he married Elizabeth Bourchier, daughter of a London merchant, and she seems to have brought him a considerable dowry. The few glimpses that we have of his life before the beginning of his active public career, which may be said to date from the meeting of the Long Parliament in 1640, leave no doubt as to which side he would espouse in the approaching struggle. For some years he was in the throes of a religious conflict, from which he emerged in a triumphant conversion. Throughout the rest of his life he was deeply religious, an ardent though tolerant Puritan. The earliest letter from his pen which has come down to us (1636) is a solicitation for a subscription to maintain a lectureship, by which means the Puritans supported preachers, owing to the neglect of this function by the established clergy. He was elected to the Parliament of 1628, where his only recorded speech is directed against the opponents of Puritanism. He watched the career of Gustavus Adolphus with eager sympathy, and it is thought that his own early military successes were in part a result of his careful study of Gustavus Adolphus's campaigns. He took less interest in purely political matters, but we know of three instances where he championed the poorer inhabitants of his districts whose rights of pasturage were threatened. He was fined £10 in 1630 for having neglected to be knighted, but we have no record of his having resisted the forced loan or the payment of ship-money. Yet there can be no doubt that he was

OLIVER CROMWELL

FROM AN ENGRAVING BY JAMES CALDWELL AFTER A PAINTING BY ROBERT WALKER

dissatisfied with Charles's arbitrary rule, and there is a tradition which corresponds well with circumstances, that he once intended to emigrate to New England. If this is true, it was probably between 1631 and 1636, and it may have been prevented by a legacy which fell to him in the latter year. He was elected to the Short Parliament in 1640, and to the Long Parliament in the same year.

Cromwell played a subordinate part in the deliberations of the Long Parliament. He had no share in the impeachment of Strafford. He was rather more interested in the constitutional reforms, but most of all in ecclesiastical matters, and joined Sir Henry Vane and Hampden in demanding the abolition of the episcopacy, 'root and branch.' On the outbreak of the Irish insurrection of 1641, it was he who proposed that Parliament should assume control of the militia. When the Civil War broke out in 1642, he was very active in securing the authority of Parliament in the eastern counties, and commanded a troop of horse in the battle of Edgehill, October 23, 1642. In 1643 the war everywhere went against Parliament except in the Eastern Association, where Cromwell not only kept the royalists at bay, but even gained ground. His one troop had grown to ten, and afterwards grew to fourteen, forming two regiments of the best-drilled cavalry in England. For his services in the Eastern Association, Parliament made him Lieutenant-General of the Army of the Eastern Association (1644), and appointed him a member of the Committee of both Kingdoms. In the battle of Marston Moor, July 2, 1644, he commanded the Parliamentary horse, whose final charge decided the fortunes of the day. Hitherto, the Parliamentarians had been inferior in cavalry, whose military importance was greater in those days than now. It was due to Cromwell that this inferiority was overcome. It is at about this time that the division of the Puritans into two parties clearly appears. The Presbyterians, who were largely in the majority in Parliament, were alarmed at the growth of religious sects in the army, and they were anxious for an accommodation with Charles in order to be free to suppress Independency. The army, on the other hand, had become the stronghold of Independency, and desired religious toleration and a vigorous prosecution of the war. Cromwell was the spokesman of the party of toleration. He impeached Manchester for half-heartedness in the prosecution of the campaign, and found support with the Commons, but not with the Lords. He then disinterestedly proposed the reorganization of the army under new leaders, and on the adoption of the New Model (q.v.), and the Self-Denying Ordinance (q.v.), assumed that his military career was over. On the contrary, he was appointed lieutenant-general in command of the cavalry, and by a charge of the Parliamentary horse, decided the day at Naseby, the last battle of the First Civil War, June 14, 1645. The distrust between the Presbyterian Parliament and the Independent army became an open breach when the Parliament not only proposed to disband the army without paying the arrears due to the men, but made overtures to Charles which seemed to the army a surrender of what they had been fighting for. Cromwell, now the recognized leader of the army, hesitated, as was his wont, and tried to mediate between the two parties, but

in the end threw in his lot with the army. It was he who ordered the abduction of the King from Holmby. In the Second Civil War, a consequence of this rupture, in which the King played off one party against the other, Cromwell defeated the Scots under Hamilton, who were over twice his number, in a remarkable three days' battle near Preston, August 17-19, 1648. The army now clamored for the life of the King, whose duplicity had caused the renewal of the war. For a time Cromwell held back, but when his mind was once made up no legal technicality could stop him. "I tell you we will cut off his head with his crown upon it," he cried roughly, in answer to an argument denying the jurisdiction of the High Court of Justice. He had nothing to do with Pride's Purge, being absent at the time, but he accepted the result of it, and was foremost in all the events leading up to the King's execution (January 30, 1649).

On the abolition of the monarchy, the position of the Commonwealth was extremely perilous. It was torn asunder by partisan strife, and it was without a friend in Europe. Scotland, alienated by the execution of the King and hostile to the dominant Independent and Military party, proclaimed Charles II. King, not only of Scotland, but of England and Ireland as well. Ireland demanded immediate attention, for the Second Civil War had its counterpart there, and a coalition of the various parties had all but driven the Parliamentary forces out of the island. Cromwell accepted the command of the forces destined for its reconquest on March 10, 1649, and landed at Dublin, August 13, with three regiments. At Drogheda, 'being in the heat of action,' he ordered the famous massacre of the garrison of 2800 men, which had refused to capitulate (September). This was in accordance with the strict rules of war of the time, though it had not been put into practice in England. Cromwell explained that it was a just punishment for the outrages of 1641, which he looked upon as entirely wanton and without provocation. The immediate military effect of the massacre was advantageous, since for a time town after town surrendered with little resistance, but its unfortunate political effect lasts until the present day. At Wexford there was another massacre, though not by Cromwell's order. In May, 1650, the resistance was so nearly broken that Cromwell left the completion of the conquest to his successors, Ireton and Ludlow, and hastened back to confront the danger from the side of Scotland. He swept away with impatience Fairfax's legal objection that the Scots had a right to choose their own King, for he saw clearly that England must either coerce the Scots or be coerced by them. He defeated one Scotch army at Dunbar, September 3, 1650, and another, commanded by Charles II. in person, exactly one year later at Worcester. While he had to be on his guard from this time forth against plots and uprisings, Worcester marks the end of armed resistance to his rule. He brought Scotland and Ireland (or the Protestant part of Ireland) into legislative union with England, the first union of the three kingdoms, and gave them free trade and a better administration of justice, but the taxes to support the English garrisons were heavy. In addition, Ireland groaned under the attempt to transplant her Catholic population, or, as the plan was afterwards modified, her Catholic land-owners, to the

wilds of Connaught in order to make way for English settlers. Cromwell's treatment of Ireland was pitifully harsh, but it was caused principally by his complete ignorance of Irish affairs, though his ignorance was not greater than that of his countrymen.

The problem which now confronted the leaders of the Commonwealth was the substitution of a permanent constitutional government in the place of the provisional Rump. The withdrawal of the Cavalier party on the outbreak of the Civil War, and the expulsion of the Presbyterian members in the Pride's Purge, had left only sixty or seventy members in habitual attendance in Parliament, whose power depended solely upon the support of the victorious army. Not only had they made themselves very unpopular by their harsh measures, but they refused to give way to a newly elected and more truly representative Parliament which the army desired, unless they were made members of the new Parliament without election, and clothed with power to exclude undesirable new members, especially those of royalist sympathies. In the course of the prolonged dispute, they were guilty of what Cromwell considered a breach of good faith, whereupon he angrily dissolved them on April 20, 1651, to the great satisfaction of the English nation. According to Cromwell's view, the army was the only constitutional authority left standing, and as the head of the army, he and his officers constituted the Nominated or Barebones Parliament (q.v.) of 149 members (of whom five represented Scotland; and six Ireland), who had been nominated for the purpose by the Congregational churches. This Parliament soon showed such a readiness to adopt radical and impossible measures, and was so torn asunder by party strife, that when the Moderates rose, early on the morning of December 12, 1653, and voted its dissolution, Cromwell was greatly relieved, though he had no previous knowledge of the conspiracy. The officers thereupon adopted a written Constitution, called the *Instrument of Government* (q.v.), which is of great interest from the point of view of institutional history, under which Cromwell, on December 16, assumed the title of Protector. An elected Parliament of one House was provided for, whose powers were defined by the Instrument. The first Parliament which met under its provisions, on September 3, 1654, is of great importance to a correct understanding of the Protector's treatment of his Parliaments. He invited a revision of the Instrument, but in the debates on it the Parliament showed signs of making itself perpetual, of taking away liberty of conscience, and of reducing both the army and the Protector to its exclusive control, thus breaking down the balance of power between the Protector and Parliament which the Instrument had sought to establish. Cromwell interfered by force and excluded from the House all who refused to sign an agreement not to alter the Instrument in these 'four fundamentals.' This incident is crucial in the appreciation of Cromwell's Parliamentary difficulty. It should be remembered that he was never, like Pym and Hampden, a champion of Parliamentary institutions as such, but rather of Puritanism. He opposed the King, not because he believed in the rights of the majority, a conception foreign to his point of view, but because he was opposed to the Laudian ecclesiastical system. There is

therefore nothing inconsistent in his opposing a Parliament which was trying to make itself supreme, or which was endangering religious toleration and the highest interests of Puritanism. Furthermore, his demands were moderate, for, says Mr. Gardiner, "his *four fundamentals* have been accepted by the Nation and are at this day as firmly rooted in its conscience as Parliamentary supremacy itself." The problem was insoluble in his day, for the reason that there was no nation standing back of both Protector and Parliament to which appeals might be made, partly because the nation was disaffected, and partly because it was not sufficiently educated in political thought. Cromwell dissolved the Parliament without coming to an agreement with it, and without receiving the necessary supplies. In the year following, Penruddock's rising drove the Protector to acts as illegal as any of which Charles I. had been guilty. He divided England into ten military districts, over which he placed major-generals, with extensive police powers backed by military force, the estates of royalists being taxed by his own arbitrary power to support the scheme. It was a success as a police measure, but the nation groaned when Cromwell used this method to enforce a stricter standard of Puritan morality than the people were ready to accept. The foreign wars made new supplies necessary, and in 1656 the Protector called his last Parliament, from which his council first excluded one hundred undesirable members. Upon the discovery of a plot against the Protector's life, Parliament drew up a new Constitution called the *Humble Petition and Advice*, providing for an Upper House and offering Cromwell the title of King. Cromwell hesitated for some weeks, but finding the title unpopular with the army, he at last declined it. The *Petition and Advice* was then passed with the title Protector substituted for that of King, and was adopted in place of the *Instrument of Government*. Upon the second session of the Parliament in January, 1658, it was found that the promotion of Cromwell's supporters to the Upper House had given the republicans a majority in the Lower House. They not only insisted upon revising the Constitution anew, but were forming conspiracies of a dangerous sort, whereupon Cromwell dissolved them, February 4. He had failed to transform the military into a civil State.

The vigor with which Cromwell conducted England's foreign affairs has been much admired. He had little to do with the Dutch War, which he disliked as a war against a Protestant power. This he brought to a successful conclusion April 5, 1654. The two leading nations of Europe were at war and bidding for his alliance. He was at first inclined to favor Spain, partly from his sympathy for the French Huguenots and partly because France supported Henrietta Maria and the Stuart cause. Spain, however, had prohibited English ships from sailing in West Indian waters, even though bound for an English colony. In December, 1654, Cromwell sent out a badly equipped expedition under Penn and Venables, which suffered a disastrous repulse in an attack against Santo Domingo, but seized Jamaica, whose importance was little appreciated at that time. This attack naturally precipitated a war with Spain in Europe in which Blake, having previously brought the Bey of

Tunis to terms (April 4, 1655), destroyed one Spanish treasure-fleet at sea (September 8, 1656) and sank another in the harbor of Cadiz (April 20, 1657). Two treaties were signed with France, the first on October 24, 1655, providing for the expulsion of the Stuarts from French territory, the second on March 23, 1657, providing for a joint attack upon the Spanish Netherlands, in which the English greatly distinguished themselves before Dunkirk, in the battle of the Dunes, June, 1658, and secured Mardick and Dunkirk as their share of the spoils. But while Cromwell succeeded by force of arms in making England universally feared, he was very ignorant of European politics and his aims were faulty. He was completely under the illusion that the Catholic powers were on the point of combining to crush Protestantism and he was constantly negotiating with Charles X. of Sweden, whom he erroneously regarded as a second Gustavus Adolphus, to form a counter Protestant league, not knowing that it was impossible to reconcile, for religious purposes, either Sweden and Holland on the one hand, or France and Spain on the other. Nor should it be forgotten that his foreign enterprises greatly increased the burdens of a heavy taxation which alienated the people of England from his rule. He died on September 3, 1658.

BIBLIOGRAPHY. The chief source of information in forming an estimate of Cromwell's character will always be his own words, first collected by Carlyle, *Letters and Speeches of Oliver Cromwell* (London, 1845). The speeches are to be found in Stainer, *Speeches of Oliver Cromwell, 1644-58* (London, 1901). His Parliamentary career is to be followed in *Parliamentary History*, vols. ix.-xxi. (London, 1760-62), together with the numerous memoirs, of which those of Whitelock and Ludlow deserve special mention. The *Calendars of State Papers, Domestic Series*, together with the great collections of Rushworth, Clarendon, Somers, and Carte, are rich mines of material, while the *Thurloe State Papers* (London, 1742) contain the greater part of the diplomatic correspondence. Gardiner, *Const. Docs. of the Puritan Revolution* (London, 1899), is invaluable. Of the older writers, Guizot and Ranke are still useful, but they are largely superseded by the great works of Gardiner, *History of England, 1603-42* (10 vols., London and New York, 1883-84); *The Great Civil War* (London and New York, 1895); and the *History of the Commonwealth and Protectorate* (London and New York, 1894-1901). Gardiner has summarized the results of his researches in *Cromwell's Place in History* (London and New York, 1897) and *Oliver Cromwell* (London, 1901). Hardly inferior to Gardiner's work is Firth, *Oliver Cromwell and the Rule of the Puritans in England* (London and New York, 1900). The biographies by Harrison (London, 1888) and Morley (New York, 1900) are brilliant, but not authoritative. The *Oliver Cromwell* of Theodore Roosevelt (New York, 1900) is brief and readable. Gardiner and Mullinger, *Introduction to the Study of English History*, part ii. (London, 1894), contains an account of the literature of the period, both contemporary and modern.

CROMWELL, RICHARD (1626-1712). Lord Protector of England. The third and eldest surviving son of Oliver Cromwell; he was born at Huntingdon, October 4, 1626. When Oliver be-

came Protector, he wished to train his son as his successor. Richard entered Parliament; was appointed First Lord of Trade and Navigation, and became Chancellor of Oxford. But of an amiable temperament, he was more addicted to pleasure and sport than statecraft, and after his father's death in 1658, retained the Protectorship for not quite nine months, until his willing demission in May, 1659. He lived in retirement on the Continent during twenty years, and returned to England in 1680. He died at Cheshunt July 12, 1712. Consult Guizot, *History of England Under Richard Cromwell* (London, 1856).

CROMWELL, THOMAS, Earl of Essex (c.1490-1540). An English statesman and Henry VIII.'s prime agent in effecting the Reformation. He was born at Putney, near London, where his father engaged in the varied pursuits of blacksmith, brewer, innkeeper, fuller, and shearer of cloth. After a meagre education, he went to Antwerp as a clerk in a factory, and successfully devoted his spare time to learning languages. He spent some time in Italy as a soldier and trader. He returned to England in 1513, and, while following the paternal vocations, developed into a money-lender, a lawyer, and an influential citizen. He received a trusted appointment from Cardinal Wolsey, and under his patronage entered Parliament, where his able speeches attracted attention. He successfully defended his master against the bill of impeachment; and Henry VIII., appreciating his talent, made him his private secretary. He received a succession of honors, which, after knighthood in 1513, included the Chanceryship of the Exchequer (1533), Mastership of the Rolls and Vicarship-General of Ecclesiastical Affairs (1535), the office of Lord Privy Seal (1536), and that of Lord Chamberlain (1539), and culminated in his creation as Earl of Essex in 1540. For seven years, by subservience to the King, he held supreme sway in the royal council and controlled all the administrative departments. He carried out faithfully the monarch's schemes to establish the Reformation. His methods in suppressing the monasteries earned him the designation of *malleus monachorum*, the Hammer of the Monks. He was very unpopular, and after promoting the marriage of Henry with Anne of Cleves, the King's aversion to the Queen was extended to the instigator of the union. Henry assented to a bill of attainder for treason on a long indictment of offenses, and, after a piteous entreaty for mercy, Cromwell was clumsily beheaded on July 28, 1540. Froude praises his character. Consult: Drayton, *Historie of the Life and Death of the Lord Cromwell* (London, 1609); Hook, *Lives of the Archbishops of Canterbury*, vol. vi. (London, 1868); Froude, *History of England* (London, 1881-82); Merriam, *Life and Letters of Thomas Cromwell* (Oxford, 1902).

CROMWELL, THE LIFE AND DEATH OF THOMAS, LORD. A play of unknown authorship, once attributed to Shakespeare, and entered at Stationers' Hall in 1602. It was founded on the tragic fate of the Earl of Essex. See THOMAS CROMWELL.

CRONACA, kró'ná-ká, IL. See POLLAIUOLO.

CRONEGK, kró'něk, JOHANN FRIEDRICH, Baron von (1731-58). A German poet. He

was born at Ansbach (in the principality of that name), was educated at Leipzig and Halle, and from 1754 was a councillor of the principality. His best-known work is his tragedy *Codrus* (1757), in rhymed Alexandrines—a somewhat rhetorical but sonorous imitation of the French classic manner—which was awarded the prize offered by the bookseller Nicolai for the best German tragedy. His ode *Der Krieg* (1756) was praised by Lessing. He was among the first to direct German scholarship toward the study of Spanish literature. Consult the biography by Gensel (Leipzig, 1894).

CRONENBERG, krō'non-bērĕk. See KRONENBERG.

CRONHOLM, krōn'hōlm, ABRAHAM PETER (1809-79). A Swedish historian. He was born at Landskrona, was educated at Lund, and in 1849 became professor of history in that city. His works, which are based upon a careful personal study of the archives of Stockholm, Copenhagen, Berlin, Dresden, Vienna, and of other leading European cities, include the following: *Formordiska Minnen* (1833-35); *Catholska Ligan och Huguenoterne* (1839); *Skånes politiska historia* (1847-51); *Sveriges historia under Gustaf II. Adolphi regering* (1857-72).

CRONJE, krōn'yc, PIETRUS ARNOLDUS (1835—). A Boer soldier. In the campaign of 1881 against England, he distinguished himself at Doornkop and at Majuba Hill, where he was second in command. In 1896 he dispersed the raiders led by Dr. Jameson into the Transvaal. At the outbreak of the war against England in 1899, he was stationed with 6000 troops on the western frontier. At Modder River (November 28) he fought an indecisive battle with Lord Methuen, who was marching with his division to the relief of Kimberley, in which he inflicted terrible loss on the enemy, and at Magersfontein (December 11) he won a brilliant victory over the same general. Immediately upon the beginning of Lord Roberts's invasion of the Orange Free State, in 1900, he sent a portion of his army to the north, and with the remainder sought to oppose the English advance on Pretoria. At last surrounded, he entrenched himself at Paardeberg, and, under a scathing artillery fire, sustained that position until the failure of food and ammunition compelled him to surrender, with some 4000 troops and six guns, on February 27—the anniversary of Majuba Hill. He was thereupon sent as a prisoner of war to Saint Helena. He was known as one of the most sagacious of the Boer leaders, and, in addition to his military command, held civil office as a member of the Executive Council of the South African Republic.

CRON'OS. See SATURN.

CRONSTADT, krōn'stāt. See KRONSTADT.

CROOK, krūk. A coal-mining town in Durham, England, 4½ miles northwest of Bishop Auckland. Population, in 1901, 11,470.

CROOK (ME. *croke*, *crok*, Icel. *krōkr*, hook). In musical instruments, such as the French-horn or trumpet, a circular tube, which fits into the end of the instrument next the mouthpiece, for the purpose of lengthening the tube of the instrument and thus altering the pitch to suit the key of the music. The notes of the parts of these instruments are always written in the natural

key of C, with the name of the key of the piece marked in letters.

CROOK, GEORGE (1828-90). An American soldier, born near Dayton, Ohio. He graduated at West Point in 1852, and spent the next nine years in California. He became colonel of the Thirty-eighth Ohio Volunteers and captain of the Fourth Infantry in the Federal Army in 1861, served throughout the Civil War, and in March, 1865, was brevetted brigadier-general and major-general for gallant and meritorious services during the war. In 1866, as lieutenant-colonel in the regular army, he was sent to Idaho, where he remained until 1872, in almost constant warfare with the Indians there. He subdued the tribes in Arizona in 1872, and in 1875-77 completely crushed the power of those in the Northwest, after Custer's defeat at their hands. He protected the Apaches (1882) from the encroachments of the Mormons and others on their lands, and defeated the Chiricahuas in 1883. Obtaining sole charge of all the tribes, he encouraged them in their industries, and made them self-supporting communities. He was promoted to the rank of brigadier-general in 1873, and to that of major-general in 1888.

CROOKBILL. See WRYBILL.

CROOKED ISLAND. One of the Bahamas (q.v.), British West Indies. It contains 160 square miles (Map: West Indies, K 3). In common with some others of the group, it is valuable chiefly for its salt. Population, over 600.

CROOKED LAKE, or KEUKA LAKE. A beautiful sheet of water in Steuben and Yates counties, in the western part of New York, about 18 miles long and 1 to 1½ wide. It lies in a deep valley, and its outlet at the north end flows into Seneca Lake.

CROOKES, krūks, Sir WILLIAM (1832—). An English physicist and chemist, born in London. He studied chemistry, and later assisted Hofmann at the Royal College of Chemistry. In 1854 he became superintendent of the meteorological department of the Radcliffe Observatory, Oxford, and in 1855 professor of chemistry at the Chester Training College. He is the editor and proprietor of the *Chemical News*, which he founded in 1859, and has edited the *Quarterly Journal of Science* since 1864. He has been a fellow of the Royal Society since 1863, and was knighted in 1897. He is an authority of the first rank on sanitary questions, especially the disposal of the sewage of towns, and his method of producing extreme vacua rendered incandescent electric lighting a practical possibility. His original researches in chemistry and physics led to the discovery of the metal thallium in 1861. Subsequently he devoted several years to an elaborate investigation on the atomic weight of that element. Among his other discoveries may be mentioned the sodium amalgamation process for separating gold and silver from their ores (1865), and especially his new method for the spectroscopic investigation of substances—one of the numerous and brilliant results of his prolonged studies of 'radiant matter.' He also devised the radiometer (q.v.), and later the otheoscope, a greatly improved form of the radiometer. Among his publications may be mentioned: *A Practical Handbook of Dyeing and Calico Printing* (2d ed., 1883); *Select Methods*

of *Chemical Analysis* (4th ed., 1894); an English translation of Wagner's *Chemical Technology* (2d ed., 1894); and papers on radiant-matter spectroscopy. His original views on the genesis of the elements may, with the development of knowledge, form an important contribution to chemical philosophy.

CROOKES TUBE. A sealed vessel of glass from which the air has been exhausted and a high vacuum obtained, through which a current from an induction coil or other source of high-potential electricity is passed. A Crookes tube differs from a Geissler tube (q.v.) in the higher degree of its exhaustion and in several important particulars which will appear in the description of its operation given below. The name is derived from Sir William Crookes (q.v.), who was able by his improvements in the Sprengel pump (see AIR-PUMP) to obtain vacuum tubes of greater efficiency than those of previous investigators. Crookes was not the inventor of the highly exhausted tube, as Hittorf, of Münster (1869), had performed a number of experiments with tubes having a comparatively high vacuum, but it remained for the English investigator to push the experiments still further and to formulate hypotheses and theories.

A Crookes tube contains two or more electrodes known as the cathodes and anodes. These are formed by platinum wires which pass through the glass walls of the tube and terminate in metallic plates of the material and shape desired for the experiment. The exhaustion is effected by connecting the tube to a mercurial air-pump and then sealing it when the proper point is reached. The terminals are then connected with an induction coil which is set in operation. The important peculiarity of such a vacuum tube noticed by Professor Hittorf consists of a fluorescence (q.v.) or golden-green glow produced on the glass opposite the cathode. There is not the brilliancy of glow that is found throughout the tube as in the Geissler tube, and the rays which produce the fluorescence issue from the surface of the cathode in straight lines normal or perpendicular to that surface, not being bent to follow the shape of the tube, as would be seen in tubes of a less degree of exhaustion. These cathode rays have many other interesting properties. They may be deflected by a magnet, and they cause a number of substances, such as diamonds and rubies, on which they impinge, to become brilliantly phosphorescent; their energy is sufficient to heat to a high temperature a surface on which they fall and can also be exhibited in causing a small wheel with mica vanes, mounted within the tube, to revolve as a result of the impact. Crookes used cathodes of plane, convex, and concave surface, from which the rays would be emitted in beams either parallel, diverging, or converging. After studying these rays and their properties he concluded that the discharge from the cathode represented a new form of matter which he considered as existing in an ultra-gaseous or radiant state. The most important use of the Crookes tube is for the production of Röntgen rays, or X-rays (q.v.), which are the rays passing out from the tube opposite the cathode. To produce these rays a tube must be employed where the vacuum is adapted to the work in hand, and there are self-regulating tubes on the market in which this property is obtained. See ELECTRI-

CITY for an account of the passage of a current through rarefied gases.

CROOKES VACUUM. See MATTER, Section on *Theories of Matter*.

CROOKSTON, kryk'st'on. A city and the county-seat of Polk County, Minn., in the northwestern part of the State; on the Red Lake River, which affords abundant water-power, and on the Great Northern and the Northern Pacific railroads (Map: Minnesota, B 3). It contains a fine court-house and municipal buildings, Crookston and Button business colleges, a gymnasium, and a public library. The city derives a considerable trade from a tributary agricultural country, and manufactures lumber, farm machinery, wagons, carriages, sleighs, etc. Settled in 1872, Crookston was incorporated in 1879. The government is administered under a charter of 1883, which provides for a mayor, annually elected, and a municipal council. Population, in 1890, 3457; in 1900, 5359.

CROPPIES. A derisive nickname given by the Protestant Irish to their Catholic opponents in the time of the English Revolution of 1688. The name refers to the tonsure of the priests. The Roundheads were so called in 1642. There is a factional Irish song called "Croppies Lie Down!" which is a favorite with Orangemen.

CROPSEY, JASPER FRANCIS (1823-1900). An American painter, born at Rossville, N. Y. At first he studied architecture, but he abandoned it to study art under Edward Maury, and in 1847 visited Italy, where he painted "The Pontine Marshes" and other pieces. Afterwards he spent seven years in London, and exhibited at the Royal Academy. His "Autumn on the Hudson" and "Richmond Hill" were praised by John Ruskin. After his return to America he lived in New York City and at Hastings-on-the-Hudson. Cropsey's work is old-fashioned now, but he was one of the best of the so-called 'Hudson River School.' His subjects are well composed and his coloring not without merit, although hard and often crude. Other pictures by him are: "Niagara Falls;" "Peace;" "War;" "The Sibyl's Temple;" and "High Tom, Rockland Lake."

CROQUEMITAINE, krók'mé'tân' (Fr., from *croquer*, to crunch). A French monster or boggy invoked by nurses to frighten unruly children. In L'Épine's *Légende de Croquemitaine*, Mitaine, a goddaughter of Charlemagne, goes in search of the Castle of Croquemitaine, near Saragossa.

CROQUET, krô-kâ' (apparently a variant of Fr. *crochet*, hook). No other open-air game played to-day has had such strange fluctuations of fortune as croquet. It was a favorite game at the courts of kings two hundred years ago, yet by the end of the eighteenth century it had sunk into oblivion, and, except in a remote portion of Ireland, had been forgotten and unpracticed. From that country it was retransported across the Channel to England some time previous to 1860, and then the playing of the game became again so popular for twenty years as to assume the proportions of a national game. It had its national association, and in every hamlet the click of the croquet-ball was to be heard. It traveled over the Atlantic, where it was almost as popular, and by 1882 it demanded

a national convention to settle a uniform code of American rules. Yet in both countries by 1894 it had been so entirely supplanted by lawn tennis that the English national association went out of existence, and in America only a few of its votaries remained. About 1900 it again came into vogue in England, while in America, under the name of roque (q.v.), it has become a highly scientific and enthusiastically followed game.

CROQUET.

It is played either on a court of grass or closely packed earth, on which a number of arches (from six to ten) have been placed upright in a defined order. Each player has a mallet and a ball. Two can play the game, but it is a better game when played by the maximum number allowed (eight), divided into pairs of partners, each playing alternately. The object is to get the ball through every arch or hoop in due order, and to keep opponents from doing so, by interference within the rules.

The English and American methods varied from the first—in England the championship round was through six hoops arranged in a prescribed form; in America it was through ten hoops, arranged in entirely different order. In England the championship court was rectangular, in America the corners of a court 36×72

feet were cut off. Then, too, the size of the balls and the width of the hoops varied; in England the hoops were at first 15 to 18 inches wide at the base; gradually they were reduced to $5\frac{1}{2}$ inches, and ultimately to $3\frac{3}{4}$, leaving $\frac{1}{2}$ of an inch margin on either side of the ball. Even this small margin was reduced in America. In many other respects the American game has been made more difficult.

The few who have restored croquet to popularity, and made it a highly scientific game, with shorter and better mallets, specially prepared courts with rubber cushions, and more difficult hoops, played the eighteenth annual championship of the National Croquet Association, under the old name of croquet, in 1899, after which they adopted the new name roque, to mark the distinction between the two games. They made Norwich, Conn., their headquarters. Enthusiasts place the game above billiards in scientific possibilities; and, without the full admission of that claim, it may be allowed that it is the nearest outdoor game to billiards in all its essentials.

The rules of the two games, technical terms, and diagrams, will be found in *Croquet and Roque*, in Spalding's Athletic Library, New York. See also *The Complete Croquet Player* (London, 1874 and 1896); Lillie, *The Book of Croquet* (London, 1872).

CROSBY, kröz'bī, ALPHEUS (1810-74). An American educator and author. He was born at Sandwich, N. H., graduated at Dartmouth in 1827, and studied theology at Andover from 1831 to 1832. He became professor of Latin and Greek at Dartmouth in 1833, and of Greek only in 1837. From 1857 to 1865 he was principal of the Salem (Mass.) Normal School. He published a Greek grammar, an edition of the *Anabasis*, *Greek Fables*, *Greek Lessons*, *Greek Tables*; also *The Second Advent* (1850), and *First Lessons in Geometry* (1851).

CROSBY, FRANCES JANE (1820—). An American hymn-writer, born at South East, Putnam County, N. Y. She lost her eyesight when an infant six weeks old. After attending the Institution for the Blind, in New York City, for nine years, she became instructor of Greek and Roman history and of various other branches at that institution, and continued to teach there until her marriage to Alexander Van Alstyne in 1858. Her sacred publications include several thousand hymns, some of which are contained in Moody and Sankey's *Gospel Hymns*, and in Mr. Sankey's *Sacred Songs and Solos*. Among her best-known verses are: "Safe in the Arms of Jesus;" "Pass Me Not, O Gentle Saviour;" "Jesus is Calling;" and "I am Thine, O Lord." Her songs include the well-known compositions, "There's Music in the Air" and "Hazel Dell." Her secular poems have been published under the titles *The Blind Girl and Other Poems* (1844) and *Bells at Evening and Other Poems* (1898).

CROSBY, HOWARD (1826-91). An American clergyman, born in New York City. He graduated at New York University in 1851, was professor of Greek there until 1859, and subsequently held the same chair in Rutgers College. He was ordained in 1861, and became pastor of the First Presbyterian Church, in New Brunswick, N. J. From 1863 to 1891 he was pastor of the Fourth Avenue Presbyterian Church, New York, and from 1870 to 1881 was chancellor of

his alma mater. He was instrumental in organizing, and for several years was president of, the Society for the Prevention of Crime, and in this capacity was prominent in his activity against the illegal liquor traffic. He was a member of the American Committee which revised the New Testament. Besides a great many sermons and addresses, he published: *The Lords of the Moslem* (1851); *Notes on the New Testament* (1863); *Social Hints for Young Christians* (1866); *Jesus, His Life and Works* (1870); *Thoughts on the Pentateuch* (1873); and an edition of the *Œdipus Tyrannus* of Sophocles.

CROSBY, JOHN SCHUYLER (1839—). An American soldier. He was born in Albany, N. Y.; was educated at New York University; was appointed second lieutenant of the Fifth Artillery in 1861; served throughout the Civil War, and, after being three times brevetted, acted for a time as adjutant-general on the staff of General Canby. Subsequently he served as aide, with rank of lieutenant-colonel, under Sheridan and Custer against the Indians, but resigned from the army in 1871. He was United States Consul at Florence, Italy, from 1876 to 1882, was Governor of Montana Territory from 1882 to 1884, and from 1884 to 1886, when he resigned, was First Assistant Postmaster-General.

CROSBY, PEIRCE (1824-99). An American naval officer. He was born near Chester, Pa., entered the navy in 1838, and in 1861 served in Chesapeake Bay. He participated in the capture of New Orleans and the bombardment of Vicksburg, and in 1863-64 was employed chiefly in blockade duty. In 1864 he was placed in command of the *Metacombet*, and participated in the attack on Mobile. He was promoted to be captain in 1868, commanded the South Atlantic squadron, was made rear-admiral in 1882, and in 1883 was retired.

CROSBY HALL. A mediæval Gothic dwelling-house in London on Bishopsgate Street, built in 1466 by Sir John Crosby. It is the scene of a part of Shakespeare's *Richard III.* Richard of Gloucester lived here for a time, and Sir Thomas More, who purchased the house, wrote his *Utopia* in it. Some of the original chambers still remain. The hall, after having been used for a variety of purposes, is now an eating-house.

CROSIER (ME. *croser, crocer*, from *eros, crosse, croce*, cross, from Latin *crux*, cross). The pastoral staff of a bishop. Throughout antiquity a hooked or curved staff had been an emblem of civil and particularly of religious authority. Hittite, Babylonian, and other Oriental priests carried it; so did the Roman augurs. It was adopted by early Christian bishops as a symbol of authority. It took two forms: that of the *tau* with a short transverse top-piece, giving the shape of a small *crux commissa*, in which the cross appears as a symbol of the authority by which the

bishop ruled; and that of the curved end or volute, imitating the shepherd's crook, emblem of the office of the bishop to keep the Lord's sheep. The *tau* form seems the earlier, judging from extant monuments, for no records of the crook form exist as early as the Carolingian period. The *tau* often ends in the head of a lion, emblem of episcopal power; the crook often impales a serpent or a dragon, symbol of the triumph over evil. Abbots were often privileged to carry the *crozier*, as a symbol of their pastoral office, as early as the fifth century, and long before the other episcopal insignia of mitre and cross were allowed to them. Some of them still retain the *panisellum* (a small silk veil hanging to the staff), which has long disappeared from those of bishops. Consult: Barraud and Martin, *Le bâton pastoral* (Paris, 1856); Lind, *Ueber den Krummstab* (Vienna, 1863). See COSTUME, ECCLESIASTICAL.

CROSSMAN, HENRIETTA (1870—). An American actress, born at Wheeling, W. Va., September 2, 1870. She made her début in 1889 in *The White Slave*, and later was successively under the management of Daly and the Frohmans. In 1897 she was married to Maurice Campbell. In the following year she became a star. Her greatest successes have been her production of George C. Hazleton's *Mistress Nell*, October 9, 1900, in New York, where it ran for over one hundred performances, and her *Rosalind in As You Like It* (February 27, 1902), which ran for eight weeks at the Theatre Republic, New York. In the autumn of 1902 she opened her season with *The Sword of the King*.

CROSS (AS. *crūc*, OHG. *crūci, chrūze, chrūz*, Ger. *Kreuz*, Prov. *croz, croz*, OF. *crois, croix, croiz, crūz*, Fr. *croix*, It. *croce, cross*, from Lat. *crux, cross*). The cross was a common instrument of capital punishment among the ancients; and the death on the cross was deemed so dishonorable that only slaves and malefactors of the lowest class were subjected to it by the Romans. It was customary to proclaim the name and offense of the person crucified, or to affix to the cross a tablet (*album*) on which name and offense were inscribed. Malefactors were sometimes fastened on a simple upright stake, and so left to die, or they were impaled upon it, and to this upright stake the Latin name *crux* was originally and more strictly applicable; but very generally a *cross-piece* (*patibulum*) was added to the stake, to which the arms of the criminal were tied, or to which his hands were nailed. The person crucified often lived for days. When the *cross-piece* was fastened at right angles below the summit of the upright stake, the cross was called *crux inmissa* (the Latin cross); the Greek cross, where the *cross-piece* was set so low as to form four equal or nearly equal arms, is a variant of this form; when the *cross-piece* was fastened at right angles across the top of the upright stake, the cross was *crux commissa* (also called cross of Saint Anthony); and when it was formed of two beams crossing one another obliquely, it was *crux decussata* (also called cross of Saint Andrew). The cross was erected outside the gates of towns, but in places of frequent resort.

It appears that the cross was in use as an emblem, having certain religious and mystic meanings attached to it, long before the Chris-

CROSIER.

tian Era. The Spanish conquerors were astonished to find it an object of religious veneration among the natives of America. But the death of Christ by crucifixion led Christians to regard it with peculiar feelings of veneration and to adopt it as a symbol with express reference to the central fact of their religion. It was seen everywhere in Christian countries, in the home as well as in the church, where it formed an invariable ornament of the altar. The iconoclastic party contended against the worship of the cross, but the Church, while defining the sense in which worship might be offered to it, condemned their views. Though the word *latreia*, adoration, is used of the veneration paid to the cross, it is explained as only relative, and referred back to the person of the Crucified. This species of veneration, which is sometimes misunderstood on account of the restricted use of the word 'worship' in modern English, is solemnly paid in the Roman Catholic Church to pieces of the true cross (considered the most sacred of all relics) whenever exposed, and to other crosses, especially on Good Friday. The cross on the high altar, which has been wrapped in a violet covering throughout Passion-tide, is unveiled during the singing of the anthem "Behold the wood of the Cross, on which the Saviour of the world hung." It is then laid on the altar-steps, and the celebrant and other sacred ministers approach with genuflections and kiss it. After this a smaller cross is offered to the congregation, kneeling at the altar-rails, to be kissed. (See Cardinal Wiseman, *Lectures on the Offices and Ceremonies of Holy Week*, London, 1839.) The earliest account of the solemn veneration of the cross occurs in the *Peregrinatio Sanctæ Silviæ ad Loca Sancta*, recently discovered by Gamurrini and published in Rome, 1887-88, which describes a pilgrimage to Jerusalem during the episcopate of Saint Cyril, probably in the year 384 or 385. The sign of the cross has been made in Christian worship, since the second century at least, as an act of homage to God in remembrance of the Redemption, and of blessing to the person or object over which the sign is made. It is differently made in the Roman Catholic and Eastern Churches, and has been disused among most Protestants, as a ceremony of human invention tending to superstition. A cross was in the Middle Ages prefixed to most inscriptions and documents as a sort of consecration, and placed before signatures for the same reason; the latter practice is still retained by Roman Catholic bishops.

The forms given to crosses in art are endless; but the two leading types are the Latin cross, or *crux immissa*, supposed to be that on which Christ suffered, and the Greek cross, both of which are subject to many fantastic variations. The Greek cross forms the well-known cross of Saint George, which, adopted from the legends of that hero, was the national ensign of the English previous to the union with Scotland. (See UNION JACK.) The cross of Saint Andrew, or *crux decussata*, consisted of two shafts of equal length crossed diagonally at the middle. According to the legend, this was the form of cross on which Saint Andrew, the national saint of Scotland, suffered martyrdom. As the Scottish ensign, it is now blended with the cross of Saint George in the Union Jack. The Maltese cross, with its eight forked ends, was a form used by

the orders of knights. It is similar to the crosslet form where small crosses are formed at the ends.

SANCTUARY, BOUNDARY, OR MONUMENTAL CROSSES, as they are called, consist of an upright flat pillar, or obelisk, covered with sculptured devices, and set in a socket level with the ground. Occasionally they appear to have marked boundaries, but more frequently were monuments over the graves of heroes, kings, bishops, etc. In some instances they probably marked the verge of a sanctuary. The older of these crosses are said to be Scandinavian or Danish, and such are known as *runic crosses*, being inscribed with runes. We are told that the island of Iona at one time possessed 360 crosses, but all are now destroyed or dispersed, except one, called Saint Martin's Cross, standing in the grounds of the cathedral. It is a column of compact mica schist, 14 feet high, 18 inches broad, and 6 inches thick, and is fixed in a pedestal formed out of a massive block of red granite, about 3 feet high. In connection with certain ancient religious houses in Ireland, there were some very fine crosses of this kind, the most gigantic and impressive which still exists being that of Saint Luke's in the County of Louth. The prominence of such crosses extended to the East, where the Gothic and other tribes of the Caucasus, Georgia, and Armenia also used them prominently in church sculpture and in cemeteries.

MEMORIAL CROSSES are those which were erected in memory of some beloved object, or in commemoration of some event of local importance. In England there are some superb crosses of this kind: they are popularly called *Norman crosses*. This species of cross resembled a Gothic turret set on the ground, or on a base of a few steps, and was erected by Edward I. (1290) in memory of his queen, Eleanor, being placed on the spots where the body rested in its funeral progress to Westminster. Of the nine, two remain, at Northampton and Waltham.

TOWN OR MARKET CROSSES were erected as stands to preach from, or in commemoration of events regarding which it was deemed proper to evoke pious feelings. As these structures were incorporated with or surmounted by a crucifix, the term *cross* was so indelibly associated with them that it survived the religious character of the fabrics. The earliest examples of this kind consisted, probably, of tall crucifixes of wood, such as are still seen by the wayside in some Continental countries. Afterwards, stone shafts would be substituted; and according to the increase of market revenues, or progress of taste, these town crosses assumed that imposing character which they latterly possessed. Of the larger ornamental crosses of this kind, there are some striking specimens in England, such as that at Cheddar in Somersetshire, and that at Malmesbury in Wiltshire: both are open-vaulted structures, with a commodious space beneath, as a refuge for poor market-folks during rain, and surmounted with a kind of Gothic turret. At Chichester, Bristol, and Winchester, the market crosses, while similar in form, are of a higher architectural quality. Adjoining Saint Paul's in London, stood Paul's Cross, a structure which we read of as early as 1259, in the reign of Henry III. It was essentially a town preaching cross, and is associated with some interesting occurrences in history. Before this cross the

unfortunate Jane Shore, the mistress of Edward IV. from 1470 to 1483, was forced to do penance in the reign of Richard III. Here Dr. Shawe, in his infamous sermon, attempted to bastardize the children of Edward and eulogized Richard. In front of this cross sat Cardinal Wolsey, to hear fulminations against Luther; and about ten years later, by order of Henry VIII., preachers here delivered sermons in favor of the Reformation. At this cross Queen Elizabeth attended to hear a thanksgiving sermon for the defeat of the Spanish Armada. Here sermons continued to be delivered until 1643, when, with other so-called relics of popery, because they offended the Puritans, it was demolished by order of Parliament. Whatever was the original form of Paul's Cross, it was in later times a plain, pulpit-like fabric of wood, covered with lead.

The Scottish town crosses, while simple, had some distinguishing features. The more simple kind consisted of a shaft of stone, generally octangular in shape, and 12 or more feet in height. At the top was an ornamental capital, which bore a dial and vane, or the figure of a unicorn. The shaft sprang from the top of a graduated flight of circular or octangular steps. A specimen of this species of cross is seen in the market-place of Melrose. The grander market cross consisted of a tall stone shaft, such as just described, but instead of steps it sprang from the centre of an imposing sub-structure. This structure was circular, hexagonal, or octagonal, and from 10 to 16 feet high. The top formed a platform, which was surrounded with an ornamental stone parapet, and was reached by a stair inside. The sides of the building were decorated with pilasters, and bore various heraldic and other devices. Such were the crosses of Edinburgh, and such is the renovated cross of Aberdeen, the sides of which, however, are open. Losing their religious character, the Scottish market crosses were employed for royal and civic proclamations, and as places where certain judicial writs were executed. The general removal of these ancient and interesting structures has often been a matter of lamentation.

In the history of the cross as a Christian symbol, it is evident that it was used at first as a symbol of triumph, not of suffering. In the sarcophagi and mosaics from the fourth to the ninth century it often stands alone on the sacred rock from which flow the Four Rivers of Paradise. It is sometimes surmounted by the Constantinian monogram of Christ, the Labarum, and thus became the standard of victorious Christianity. It was inscribed within the circle around the head of Christ, thus forming the cruciform nimbus (q.v.). As an emblem of Christ, it preceded the crucifix, and it was not until the tenth and eleventh centuries that the figure of Christ had quite generally replaced on the cross the ornamentation which had previously been its usual decoration. Even when the monumental crucifixes had come into general use in central and southern Europe, the Northern nations (e.g. in Great Britain and Scandinavia) continued for centuries the use of the mere cross. The form of the cross given to the majority of churches in the later Middle Ages is more connected with the specific crucifixion than the mere cross, as is shown by the bend sometimes given in some church ground-plans,

imitated from the twist of the body on the cross. Consult: Stockbauer, *Kunstgeschichte des Kreuzes* (Schaffhausen, 1870); Fulda, *Das Kreuz und die Kreuzigung* (Breslau, 1878); Dobbert, *Zur Entstehungsgeschichte des Kreuzes* (1880); Bunsen, *Das Symbol des Kreuzes bei allen Nationen* (Berlin, 1876); Alger, *History of the Cross* (Boston, 1858); Mortillet, *Le signe de la croix avant le christianisme* (Paris, 1866); Zöckler, *Das Kreuz Christi* (Gütersloh, 1875).

CROSS. In heraldry (q.v.), one of the charges known as ordinaries.

CROSS, INVENTION OF FINDING OF THE. The name of the Church festival commemorative of the finding of the cross upon which Christ died by the Empress Helena, the mother of Constantine, in the year 326. As related by Socrates (*Ecclesiastical History*, I. xvii.), who wrote about 439, the story is this: In Christ's sepulchre she found three crosses, along with Pilate's tablet, and on the advice of Macarius, Bishop of Jerusalem, determined which was Christ's cross by taking the three to a sick woman, who touched the first two without avail, but was restored as soon as she had touched the third—so that was accepted as Christ's. Similar is the story in Sozomen (*Ecclesiastical History*, II. i.), who wrote a little later. From this time on for many centuries there was no question of the fact. Doubt has been cast upon it by the consideration that Eusebius, who wrote in the fourth century, and who was particularly explicit regarding everything relative to the Constantine family in his account of Helena's visit to the Holy Land (*Life of Constantine*, III. lii.), says nothing of her discovery of the crosses, nor when speaking of the erection of the church over the Holy Sepulchre (ib. III. xxviii. sqq.). It is also noteworthy that the Bordeaux Pilgrim, the author of the *Itinerarium Burdegalense*, writing in 333, says nothing in his description of the Holy Places of any cross being discovered in the Holy Sepulchre (*Itinerary from Bordeaux to Jerusalem*, Palestine Pilgrim's Text Society's Eng. trans., London, 1887, p. 24). Still Cyril of Jerusalem, writing in the Holy City in 347-348, uses this language: "He was truly crucified for our sins. For if thou wouldest deny it, the place refutes thee visibly, this blessed Golgotha, in which we are now assembled for the sake of Him who was crucified, and the whole world has since been filled with pieces of the wood of the cross" (*Catechetical Lectures*, iv. 10). And he alludes to the finding of the cross when writing to Constantius, the son of Constantine (*Ep. ad Const.*, c. 3). That Helena found three crosses and that she and many others believed that one of them was the cross of Christ may be accepted, though we have no confirmatory proof of its authenticity.

The festival of the Invention of the Cross may date from the visit of Helena, but unless it was at first local, the earliest certain mention of it is in the eighth century. In the Latin Church the day is May 3. In the Greek Church there is a festival of the Exaltation of the Cross on September 14. Consult, in favor of the story: J. H. Newman, *Essay on Ecclesiastical Miracles*; and as against it: W. C. Prime, *A History of the Invention, Preservation, and Disappearance of the Wood Known as the True Cross* (New York, 1877); and E. Nestle, *De Sancta Cruce, Ein Bei-*

trag zur christlichen Legendengeschichte (Berlin, 1889).

CROSS, JUDGMENT OF. See ORDEAL.

CROSS, ORDER OF THE HOLY. The name of several monastic or semi-monastic Orders. The origin of the first community bearing this name is lost in obscurity; but leaving aside legendary accounts, we find the Order definitely established in Italy as early as the accession of Pope Alexander III. (1150). The mother house was at Bologna, and their work was largely the care of the sick. They were confirmed by Urban III. in 1187, and spread until they numbered 200 convents in all parts of Italy; the Order declined later, so that Pius V. was obliged to reform it in 1568, and Alexander VII. to suppress it in 1656.

More important is the congregation of canons regular who were known in England as Crutched or Crossed Friars. This Order was founded by Theodore de Celles at Huy near Liège in 1211 and confirmed by Innocent III. five years later; it followed the rule of Saint Augustine, assimilated in many particulars to that of the Dominicans. It spread rapidly throughout the Netherlands, France, Germany, and England; in the latter country it possessed houses in London (1298), Oxford (1349), Colchester, Honiton, and other places. The Order was reformed from within in 1410. At the present day, while still faithful to its original spirit, it has very few houses, the principal ones being two in Holland and two in Belgium. Consult Hermans, *Annales Canoniarum Regularium Sancti Augustini, Ordinis Sanctæ Crucis* (3 vols., Bois-le-Duc, 1858).

A third association, the knightly Order bearing this name, is of some importance in the history of Bohemia. It is distinguished by a red six-pointed star in addition to the cross worn on the habit, and was originally an outgrowth of the Hospitaler brotherhood attached, in the first half of the twelfth century, to the hospital of the Poor Clares in Prague. In 1238 Gregory IX. constituted it a definite Order, under the rule of Saint Augustine. It spread throughout Bohemia and other lands now included in Austria-Hungary, and was one of the strongest bulwarks of the Church against the sectarian movements of the fifteenth and sixteenth centuries. At the siege of Eger in the Thirty Years' War they verified their knightly title by fighting at the head of the people. Their hospital at Prague was always open to new allies, and sheltered the first Jesuits in Bohemia in 1555, the Capuchins in 1599, and the Trinitarians in 1704. From 1561 to 1694 they practically supported the archbishops of Prague, who had been deprived of their possessions in the wars of religion, making them grand masters during their incumbency of the see. The Order now has less than a hundred members: its library consists of 50,000 volumes, including many *incunabula*, and manuscripts of great value for Bohemian history. Consult Jacksche, *Der ritterliche Orden der Kreuzherren mit dem rothen Stern* (Vienna, 1882).

The name is also borne by a small religious Order in the Episcopal Church in America, founded in New York, 1881, removed in 1892 to Westminster, Md., whose members occupy themselves largely in conducting missions and retreats.

CROSS, THE SOUTHERN. A constellation in the Southern Hemisphere, situated near the Antarctic Circle, and therefore never visible in northern latitudes. It consists of four bright stars, to which fancy, aided by Christian associations, gives the cruciform shape. The two brilliant stars which mark the summit and foot of the Southern Cross have nearly the same right ascension. The constellation, therefore, is almost perpendicular when passing the meridian, and these two stars act as pointers to the Antarctic Pole.

CROSS, VICTORIA. See VICTORIA CROSS.

CROSS, CHARLES ROBERT (1848—). An American physicist, born at Troy, N. Y. He graduated in 1870 at the Massachusetts Institute of Technology, and was instructor there in 1870-77. In 1877 he was appointed professor of physics and director of the Rogers laboratory. He established at the institute in 1882 the first American course in electrical engineering. He has published papers on electricity and acoustics in various scientific periodicals and in the *Proceedings of the American Academy of Arts and Sciences*.

CROSS, MARY ANN, or MARIAN. See ELIOT, GEORGE.

CROSS, MRS. GEORGE FREDERICK. See CAMERIDGE, ADA.

CROSS, RICHARD ASSHETON, first Viscount Cross (1823—). An English politician. He was born at Red Sear, Lancashire, graduated at Trinity College, Cambridge, in 1846, and in 1849 was called to the bar. He sat in Parliament as a Conservative, for Preston from 1857 to 1862, for Southwest Lancashire from 1868 to 1885, and for Newton Division, Southwest Lancashire, from 1885 to 1886. From 1874 to 1880 and in 1885-86 he was Home Secretary, and from 1886 to 1892 Secretary of State for India. He is a magistrate for Cheshire and Lancashire, and Lord Privy Council, and has published *The Acts Relating to the Settlement and Removal of the Poor* (1853) and *The General and Quarter Sessions of the Peace* (1858).

CROSS, WILBUR LUCIUS (1862—). An American educator and author, born at Mansfield, Conn. He graduated in 1885 at Yale University, and from 1894 to 1897 was instructor in English in the Sheffield Scientific School of Yale. In 1897 he was appointed an assistant professor in English, and in 1902 professor. In addition to magazine contributions on Ibsen, the novel, and other literary topics, and an edition (1900) of *Wacbeth*, with notes and an introductory essay, he has published a literary study, *The Development of the English Novel* (1899).

CROSSBILL. A bird of the genus *Loxia*, large finches with a singular bill, the mandibles—which are rather long, thick at the base, and much curved—crossing each other at the points when the bill is closed. These mandibles are capable not merely of vertical, but of lateral motion, and muscles of extraordinary power are provided for moving them: so that the crossbills readily obtain their principal food—the seeds of firs and pines—by tearing off the scales of the cones. They bring the points of the mandibles together (which they can do so as to pick up a very small seed) and insert them into the cone, when the

act of allowing the points to slip past one another exerts a powerful lateral movement, opening the scale; and the tongue, which terminates in a singular movable scoop, formed of a bone articulated to the os hyoides, or ordinary bone of the tongue, is inserted to detach the seed.

BEAK OF THE CROSSBILL.
Side view, shut and open, and top view.

The power of the bill is such that wood may be torn to pieces, and crossbills in confinement seem to take a mischievous pleasure in destroying the cage. An apple is cut to pieces almost in an instant, in order that its seeds may be reached, and flocks of these birds sometimes do great mischief in orchards. Three or four species are known, two of which are found in America, although only one, the common red crossbill (*Loxia curvirostra*), is numerous, and even this in most years is scarcely to be seen in the United States. It is a native of Europe, Asia, and North America, dwelling chiefly in evergreen forests and extending as far north as they do, not dreading the coldest climates. The American bird is generally regarded as a subspecies, and a second subspecies is found from the southern Rocky Mountain region to central Mexico. The white-winged crossbill (*Loxia leucoptera*) is the other American species, but is not so common as the preceding. Both species are red in the males and olive-brown in the females, the former species with blackish wings and the latter having wings crossed by two conspicuous white bars. They go about in small, chattering flocks, and are resident in the most northern parts of the United States and in Canada. They breed in the late winter or early spring, sometimes during very severe weather.

CROSS-BILL. In chancery or equity, a bill brought by the defendant in an equity proceeding against the plaintiff or other defendants, or both, in the same suit, either to obtain a discovery of facts in aid of the defense, or to bring the matters in dispute more completely before the court than could be done by a mere answer to the original bill. It must not introduce new parties nor new matter not embraced in the original suit, and is considered as an auxiliary suit in the nature of a defense to the original bill, the two proceeding together as one cause. However, the persons made defendants in it must answer, plead, or demur to it, or the relief demanded will be granted by default. Cross-bills are used in the equity practice of the United States and many of the State courts, and in the English chancery courts. See BILL: DISCOVERY, BILL OF; EQUITY; also PLEADING; and consult the authorities there referred to.

CROSSBOW. See articles ARBALEST: ARCHERY.

CROSS-BREEDING. See BREEDS AND BREEDING.

CROSS BUN. A small cake especially prepared for Good Friday, and in many towns of England cried about the streets on the morning of that day as 'hot cross buns.' Good-Friday buns were appropriately marked with the cross,

and hence the name. The origin of the practice is obscure. Most probably it is a relic of some heathen observance, to which the early Church gave a Christian significance.

CROSS-CUT. A term applied to a short transverse tunnel driven between two levels or gangways in a mine. In the case of parallel veins a cross-cut is often driven from one to the other, through the intervening barren rock.

CROSSE, ANDREW (1784-1855). An English physicist. He was born at Fyne Court, in the Quantock Hills, Somersetshire, and was educated at Bristol and Brasenose College, Oxford. He early devoted himself to the study of electricity, and in 1807 he commenced experiments with the view of forming artificial crystals. These experiments were quite successful, and, in the course of thirty years of quiet research, during which period he remained totally unknown to the scientific world, he obtained in this way no less than twenty-four minerals, including crystals of quartz, aragonite, carbonates of lime, lead, and copper, besides numerous other artificial minerals. These discoveries and other investigations in electricity were described at the meeting of the British Association for the Advancement of Science, at Bristol, in 1836. A few months later, while experimenting with some highly caustic solution, out of contact with atmospheric air, there appeared, as if gradually growing from specks between the poles of the voltaic circuit, certain animals of the genus *Acarus*. Crosse never affirmed that he had developed animal life out of inorganic elements, but simply that under physical conditions he could make *acari* appear, and not otherwise. This discovery aroused such violent criticism that Crosse retired from the world and for some time neglected his researches; but later he published papers on *Mode of Extracting Metals from Their Ores; On the Perforation of Non-conducting Substances by the Mechanical Action of the Electric Fluid; and On the Apparent Mechanical Action Accompanying Electric Transfer*.

CROSS-EXAMINATION. The examination of a witness on behalf of the party against whose interest he has been called and has given testimony. The object is to test the correctness of the testimony given, to disclose any prejudice, lack of intelligence, weakness of memory, or untruthfulness that may exist, and to break in any proper way the force of the direct examination. Greater latitude is allowed to counsel in cross-examination of an adverse witness than in adducing direct testimony for his own client. Thus, 'leading questions'—that is, those which in their form suggest or indicate the answer desired—are allowed in cross but not in direct examination. In the United States generally it is held that cross-examination should be limited to inquiry into matters drawn out on the direct examination, and if counsel asks questions as to new matter he thereby makes the witness his own, and, as to such questions, vouches for the truthfulness of his testimony.

Counsel must confine the questions to material and relevant matters; but the determination of whether the facts sought to be shown may be considered such is in the discretion of the court, and, when occasion seems to demand it, this is

exercised, especially in cases of cross-examination of expert witnesses, where it is necessary to show the standing and ability of the expert. Previous mistakes in collateral matters not connected in any way with the cause in issue have been allowed to be shown on this point.

The right to cross-examination should be exercised immediately after the examination-in-chief; but it is in the discretion of the court, upon good reason shown, to allow the privilege at a later stage of the trial. See EVIDENCE; EXAMINATION; TESTIMONY; WITNESS; TRIAL.

CROSS-FERTILIZATION. A term usually applied by botanists to the fertilization of flowers by insects and other means, so as to prevent too close in-and-in breeding. It has a wider significance, however, and may be applied to animals and the human races, in which latter case it is exemplified in the matter of race-crossing, or miscegenation. It is opposed to in-and-in breeding. There is no general term or word to express the fact of cross-fertilization or intercrossing between different stocks of a single species. We might adopt and extend the meaning of the word *exogamy*, used by anthropologists for marriage between members of different human tribes, and their term *endogamy* for in-and-in breeding; or coin a new word, as *hematogamy*, for unions or marriages between blood-relatives, and *chiastogamy* for cross-fertilization between members of different stocks of a single species. It is well known that in-and-in breeding among animals tends to sterility and degeneration; and, on the other hand, unions between different species, as well as members of widely distinct human races—such as marriages between the white and negro or other backward or primitive races—also tend to sterility, and assuredly to physical and moral degeneration. Race-marriage certainly is most unhappy in its results. While, as Darwin says, "nature abhors perpetual self-fertilization," the same is also true of miscegenation.

CROSS-FERTILIZATION IN PLANTS. As early as 1793 the German botanist Sprengel discovered the main facts, with many details, of the relation of insects to flowers. He observed the wonderful adaptation of the structure of many flowers to this or that species of insect visiting them; he satisfactorily proved that many kinds of flowers are cross-fertilized by insects, and that this was the object of the adaptations. He also observed that the presence of nectar and pollen attracted the insects and insured the continuance of their visits. Several later writers showed that the cross-fertilization of plants was beneficial to them. These discoveries were greatly extended by Darwin, who perceived the value of this process to the life and maintenance of the species. Darwin's observations were chiefly made on orchids, primulas, and so forth, and the subject was greatly extended by Hermann Müller, who, after many years of research, published his results on flowers and the structure and wonderful adaptations of the insects which visit them, in his elaborate volume entitled *The Fertilization of Flowers*. It was further demonstrated by Darwin that the cross-fertilization of plants results in increasing the size, height, rapidity of growth, strength, and vigor of the plant, and in increasing its fertil-

ity. As stated by Wallace (*Darwinism*, p. 309), these results were produced immediately, and not after several generations of crosses. Darwin planted seeds from cross-fertilized and self-fertilized plants on two sides of the same pot, which were exposed to exactly the same conditions. The result was that in most cases the difference in size and vigor in the two sets was marked, while the plants arising from cross-fertilized parents also produced more and finer seeds. These experiments confirmed the experience of breeders of domestic animals, where the evil effects of breeding members of the same litter of dogs, or intermarriage between blood-relatives, result in sterility and degeneration. The results of cross-fertilization between flowers of the same species, and the great interest excited by Darwin in the subject, have led to a detailed study of the various contrivances by which flowers secure cross-fertilization, and this has led to the view that at least the irregular flowers, such as those of the pea, sage, and the orchid families, are, in reality, due to the visits of insects—a subject specially worked out by the Rev. George Henslow in his *Origin of Floral Structures*.

Modes of Securing Cross-Fertilization in Plants.—Of the simpler modes there are four—viz. (1) By dichogamy, where the anthers and the stigma become mature or ready for fertilization at slightly different times on the same plant, as in the geranium, thyme, arum, and others; (2) by the flower being self-sterile with its own pollen, as in the crimson flax; (3) by the stamens and anthers being so situated that the pollen cannot fall upon the stigma, while it does fall upon some bee or moth which carries it to the stigma of another flower (malva); (4) by the male and female flowers being on different plants, as in dioecious flowers, the pollen being carried to the stigmas by the wind or by insects. See POLLINATION; BUMBLEBEE.

The more complex mode by which exogamy is brought about is seen (1) in the case of the loosestrife (*Lythrum salicaria*), a polymorphous flower, in which the stamens and pistil differ in length and position, and the different stamens in the same flower have widely different degrees of fertility when applied to the same stigma; (2) in the case of the barberry, the irritable stamens of which spring up and dust pollen upon the insect that touches them; (3) in the case of others in which there are levers or processes by which the anthers are mechanically brought down upon the head or back of an insect entering the flower in such a position as to be carried to the stigma of the next flower it visits (*Salvia*, *leath*); (4) in plants which have sticky secretion as milkwort (*Polygala*), which gets on the tongue or proboscis of an insect, and is borne to the stigma of another flower; (5) in plants which have exploding anthers and other complex adjustments which thoroughly dust the insect, as in the pea family, e.g. *Medicago falcata*; (6) the entrapping of visitors in the spathes of *Arunum* and *Aristolochia*; and (7) in the traps of the flower of *Asclepias* and *Physianthus*, which catch flies, butterflies, and wasps by their legs; also the complex arrangements of orchids, described by Darwin in his *Fertilization of Orchids*. It appears that insects are attracted to those flowers which are largest and most gayly colored, the smaller, more inconspicuous not receiving so

many visitors. Bright-red flowers attract butterflies; blue flowers are especially attractive to bees, while dull-yellow or brownish flowers attract flies.

It has been thought by Darwin, Wallace, Lubbock, and others that the markings of flowers,

PURPLE LOOSESTRIFE.

Diagrams of three forms of flowers showing modifications of relative length of pistils and stamens in adaptation to requirements of cross-fertilization: A, long-styled form; B, mid-styled form; C, short-styled. (After Wallace.)

such as lines or spots converging to the centre or nectar, serve as guides to insects; but this is not necessarily the case, since salvia, wistaria, clover, and other flowers which are each of some one color attract bees equally well. H. Müller has observed that the gentians of the lowlands are visited chiefly by bees, while those of the high Alps are adapted only to butterflies. Most species of *Rhinanthus*, to which the 'yellow rattle' of Europe belongs, are what Wallace calls 'bee-flowers,' but one species confined to the high Alps of Switzerland has been adapted to be fertilized by butterflies only. It is now known that flowers did not appear until the Mesozoic age; they are not known to have existed in the Carboniferous period. Composite flowers, allied to the sunflowers, have been discovered in the Cretaceous clays of New Jersey, and it is probable that our large and irregular flowers possibly date back to the Cretaceous period. This was the time when insects that visit flowers also originated. No pollen-eating beetles, no moths, butterflies, wasps, or bees are known to have existed in the Carboniferous, nor before the middle or end of the Mesozoic; it seems probable, therefore, that flowers and the insects which visit them appeared at about the same epoch.

We may correlate with this view the theory of Henslow that the irregular flowers, such as those of the pea, bean, etc., are due to the intermittent mechanical stimulus resulting from the visits of butterflies, moths, and bees. He depends on the Lamarckian factors of use and dis-use, and use-inheritance, to account for the beautifully irregular forms of the papilionaceous and labiate flowers, as well as the singular and gorgeous flowers of the orchids, dispensing with the theory of natural selection. However this may be, in the beginning flowers were most probably small, regular in shape, inconspicuous, and self-fertilized. Henslow, and also Wallace, take the view that many inconspicuous and imperfect flowers, including those that are wind-fertilized, such as plantains, nettles, sedges, and grasses, do not represent primitive or undeveloped forms, but have, through the neglect of in-

sects, become degenerate types, derived from more perfect forms which were originally adapted to insect fertilization.

Fertilization of Flowers by Birds.—While in the north temperate zone insects appear to be the chief means of cross-fertilization of flowers, where this is not caused by the wind, in the tropics and Southern Hemisphere, Wallace tells us, birds have in many cases led to modifications in the form and colors of flowers. Humming-birds are active in performing this office, fertilizing many such blossoms as the passion-flowers, trumpet-flowers, fuchsias, and lobelias. The *Salvia splendens* of Mexico is especially adapted to their visits; and in the Andes and in Chile, where these birds are extremely abundant, many kinds of red tubular flowers, often of great size, are apparently adapted to the long, slender bills of these hummers. The most extraordinary adaptation to bird-fertilization are the flowers of *Maregravia*, in which, says Wallace, the pedicels and bracts of the terminal portion of a pendent bunch of flowers have been modified into pitchers which secrete nectar and attract insects, while birds feeding on the nectar or insects have the pollen of the overhanging flowers dusted on their backs, and carrying it to other flowers, thus cross-fertilizing them. In the eastern tropics the sunbirds take the place of the hummers, and they are aided by the flower-peckers. (See *DICUEUM*.) In the Australian region there are two flower-feeding groups—the honey-suckers (*Meliphagidæ*) and the brush-tongued lorries (*Trichoglossidæ*).

In New Zealand the use of animal life in fer-

CROSS-FERTILIZATION BY BIRDS.

A humming-bird (*Lophornis ornatus*) feeding upon a flower of *Maregravia nepentholides*, and taking and leaving pollen by brushing against the overhanging anthers and pistils.

tilizing flowers is seen in the case of a country which is remarkably poor in species of insects, especially bees and butterflies; yet it has been shown by local botanists that no less than one-fourth of all the flowering plants of those islands are incapable of fertilization, and thus wholly

dependent on animal life for the continuance of the species.

Advantages of Intercrossing.—This brief account of cross-fertilization of flowers shows, as pointed out by Darwin and others, that we probably owe to the visits of insects and birds the peculiar and varied forms and structures of our most beautiful and attractive flowers, and that as the result of intercrossing the size, height, vigor, and fertility of the race or species is enhanced. Yet with plants, as we shall see is the case with animals, the mere act of intercrossing by itself does no good. The good depends on the individuals which are crossed differing slightly in constitution, owing to their progenitors having been subjected during several generations to slightly different conditions.

Cross-Fertilization in Animals and Man.—Intercrossing in animals, as among plants, may, within due limits, be beneficial. These limits are confined to the same variety, race, or stock. If individuals of widely different races or breeds intermix, the result is degeneracy and sterility, the outcome of such unions being of the same nature as hybrids between different though allied species. As Darwin states: "After plants have been propagated by self-fertilization for several generations, a single cross with a fresh stock restores their pristine vigor; and we have a strictly analogous result with our domestic animals." This will apply to man also. When the French aristocracy was, as the result of the Revolution, broken up and forced to intermarry with the *bourgeoisie*, the result was an increase in the population and additional vigor in the race. An old family in its decline may be rejuvenated and restored by intermarriage with a more vigorous, even if a coarser, stock or strain. The population of our cities is maintained by the constant influx of fresh blood from the rural districts.

The mixture of the European races, now so marked, has been going on from early prehistoric (Neolithic) times. The French population is highly composite. The Anglo-Saxon race is equally or still more so, and the American people so in a still more marked degree; the intermixture being the result of emigration from the countries of northern and central Europe. It is not only that the old mixes with new stock, but the latter comes from regions differing in soil, climate, etc. Intermarriages between the stocks or breeds or strains of the white race are happy in their effects, resulting in increased vigor and fertility; and so with the stocks of the yellow, brown, or black races. The same law prevails throughout the animal world; everywhere Nature abhors too close inbreeding.

Interracial Marriage.—Miscegenation, or 'métissage,' is marriage between individuals of widely different races—i.e. a high and a low race or variety. Its effects are bad physically and morally, since the product, like mules or hybrids between species, is inferior to the higher though superior to the lower race; the result is that, when general, the higher race is pulled down, or tends to degeneracy, while the lower is in a degree elevated. Hybrids, or half-castes, are notoriously inferior to either pure race, though so partly from social causes. The results, so ap-

parent in human history, show that crosses are injurious between races too far removed in physical characters and constitution, or where living under remote climatic conditions. While marriages between black or other backward races and white races are markedly evil in their effects, unions between those nearer allied, such as those between the white race and the Japanese or the Polynesian or Malayan or North American Indian, also tend to result in sterility; on the other hand crosses between the yellow and brown races, and the brown and black, are apparently fertile, and the results not harmful.

In-and-in Breeding.—The deleterious effects of self-fertilization, or of marriage between blood-relatives, are recognized both by Darwin and by Wallace. Darwin found that certain plants which had been naturally cross-fertilized for many or all previous generations suffered to an extreme degree from a single act of self-fertilization. "Nothing of the kind," he adds, "has been observed in our domestic animals; but then one must remember that the closest possible interbreeding with such animals—that is, between brothers and sisters—cannot be considered as nearly so close a union as that between the pollen and ovules of the same flower."

Consanguineous Marriages.—The bearings of the previous statements on this important subject are obvious. Yet the matter is involved in doubt, authorities differing. The popular notion is that marriages between first cousins result in disease, idiocy, insanity, sterility, etc. That the results are not, however, always deleterious is a matter of frequent observation. Darwin refers to his son's (G. H. Darwin) attempt to discover by a statistical investigation whether the marriages of first cousins are at all injurious, "although this is a degree of relationship which would not be objected to in our domestic animals." It appears from these and other researches that "the evidence as to any evil thus caused is conflicting, but on the whole points to its being very small." He concludes "that with mankind the marriages of nearly related persons, some of whose parents or ancestors had lived under very different conditions, would be much less injurious than that of persons who had always lived in the same place and followed the same habits of life. Nor can I see reason to doubt that the widely different habits of life of men and women in civilized nations, especially among the upper classes, would tend to counterbalance any evil from marriages between healthy and somewhat closely related persons."

Finally, to sum up the results thus far obtained, it appears, as concluded by Wallace, that a slight amount of crossing, attended by slight changes of the conditions of life, is beneficial; while extreme changes and crosses between individuals too far removed in structure or constitution are injurious.

CROSS-FOX. A valuable variety of the American red fox, marked by a dark line along the back, crossed by one upon the withers, whence the name. See FOX.

CROSS KEYS. A post-village in Rockingham County, Va., about 20 miles northeast of Staunton. Here, on June 8, 1862, during the Civil War, an indecisive engagement occurred between 18,000 Federals, under General Frémont, and a part of Jackson's retreating army, numbering about 8000, under General Ewell, the latter withdrawing during the night to effect a junction with Jackson. Each side lost about 500. The engagement was a strategic success for the Confederates, in that it checked the pursuit of Frémont and prevented his joining with General Shields for a combined attack.

CROSSLEY, SIR FRANCIS (1817-72). An English philanthropist, born at Halifax, Yorkshire. He succeeded to the proprietorship of the Dean Clough carpet-mills, and accumulated a vast fortune. His many benefactions included the gift to Halifax of twenty-one almshouses and an endowed public park, and to the London Missionary Society of £20,000. He was created a baronet in 1863, and published a lecture, *Canada and the United States*, in 1865.

CROSSOPTERYGII, *krōs-sōp'tēr-ij'i-i* (Neo-Lat. nom. pl., from Gk. *κροσσοί, krossoi*, fringed + *πτερυγιον, pterygion*, diminutive of *πτερυξ, pteryx*, wing). An order of ganoid fishes, numerous in former ages, but surviving only in the ganoid-like genera *Polypterus* (see BICHR) and *Calamioichthys*. They are described as "Teleostomi, in which the pectoral fin consists of a rounded basal lobe, supported by endoskeletal structures and fringed by dermal rays. There are no branchiostegal rays. The vertebral column is well ossified, and the caudal fin is diphycceral. The pelvic fins are abdominal. A spiral valve and a conus arteriosus are present and the optic nerves form a chiasma."

CROSS RIVER. See CALABAR.

CROSWELL, *krōz'wēl*, EDWIN (1797-1871). An American journalist, long prominent in Democratic politics as a member of the Albany Regency (q.v.). He was born at Catskill, N. Y., began his journalistic career on the *Catskill Recorder*, a journal established by his father, and in 1824 became editor of the *Albany Argus*, which he made the official organ of his party in the State. He was also State printer from 1824 to 1840, and from 1844 to 1847. Croswell was the great antagonist of Thurlow Weed and exerted powerful influence by his editorial utterances in both State and national politics.

CROSWELL, HARRY (1778-1858). An American journalist and clergyman, born at West Hartford, in Connecticut. In 1802 he became

editor of the *Balance*, a Federalist newspaper, at Hudson, N. Y., and later of the *Wasp*, a libelous sheet which involved him in numerous lawsuits, the most important of which resulted from an attack upon Thomas Jefferson. His defense by Alexander Hamilton was the last forensic effort of that great lawyer. In 1814 he took orders, and in 1815 became rector of Trinity Church, New Haven, Conn. He was the author of *The Young Churchman's Guide; Manual of Family Prayers* (1837); and *Guide to the Holy Sacrament* (1867).

CROT'ALA'RIA (Neo-Lat. nom. pl., from Gk. *κρόταλον, krotalon*, rattle). A genus of plants of the natural order Leguminosae, deriving its name from the inflated pods in which the seeds rattle when ripe. The species are numerous; annual, perennial, and shrubby plants, natives of the temperate and tropical parts of the world. Many of them have long, straight, slender stems and branches, and some of these yield valuable fibre, particularly the *Sunn* (q.v.), or *Sunn hemp* of India, *Crotalaria juncea*, an annual species, the fibre of which is now an important article of commerce. *Jubbulpore hemp*, also an important fibre, and regarded as stronger than *Sunn*, is the produce of *Crotalaria tenuifolia*, usually considered a variety of *Crotalaria juncea*, a perennial species about nine feet high, a native of the south of India, which, when growing in abundant space, throws out many branches; but when sown thick, grows with little branching. *Crotalaria burbia*, which naturally grows in very arid places, is also cultivated in Sindh for its fibre. There are a dozen species native of the United States, one of which, *Crotalaria sagittalis*, and perhaps others, are reputed to be injurious to horses, causing what is termed 'crotalism,' a disease something like *loeo* (q.v.).

CROTAL'IDÆ (Neo-Lat. nom. pl., from Gk. *κρόταλον, krotalon*, rattle). A family of venomous serpents, the pit-vipers, viper-like in form, but distinctively characterized by the presence of a deep pit on each side of the face between the nostril and the eye. It includes the American rattlesnakes, moccasins, and copperheads, and some Asiatic species. See RATTLESLAKE.

CROTALISM. See CROTALARIA.

CROTAPH'YTUS. See COLLARED LIZARD.
