KEY TO PRONUNCIATION.

<p>ā as in ale, fate. Also see ě, below. â " " senate, chaotic. Also see ě, below. â " " glare, care. ă " " am, at. â " " arm, father. à " " ant, and final <i>a</i> in America, armada, etc. In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short <i>u</i> (ū). a " " final, regal, where it is of a neutral or obscure quality. a " " all, fall. ē " " eve. ē " " elate, evade. ē " " end, pet. The characters ě, ā, and â are used for <i>ē</i> in German, as in Gärtner, Gräfe, Hähnel, to the values of which they are the nearest English vowel sounds. The sound of Swedish <i>ä</i> is also indicated by ě. ē " " fern, her, and as <i>i</i> in sir. Also for <i>ō</i>, <i>oe</i>, in German, as in Göthe, Goethe, Ortel, Oertel, and for <i>eu</i> and <i>ou</i> in French, as in Neufchâtel, Crèveœur; to which it is the nearest English vowel sound. e " " agency, judgment, where it is of a neutral or obscure quality. ī " " ice, quiet. ī " " quiescent. ī " " ill, fit. ī " " old, sober. ō " " obey, sobriety. ō " " orb, nor. ǒ " " odd, forest, not. o " " atom, carol, where it has a neutral or obscure quality. oi " " oil, boil, and for <i>eu</i> in German, as in Feuerbach. oo " " food, fool, and as <i>u</i> in rude, rule. ou " " house, mouse. ū " " use, mule. ū " " unite. ū " " eut, but. u " " full, put, or as <i>oo</i> in foot, book. Also for <i>ü</i> in German, as in München, Müller, and <i>u</i> in French, as in Buchez, Budé; to which it is the nearest English vowel sound. û " " urn, burn. y " " yet, yield. n " " the Spanish Habana, Cordoba, where it is like a <i>r</i> made with the lips alone, instead of with the teeth and lips. ch " " chair, cheese.</p>	<p>d as in the Spanish Almodovar, pulgada, where it is nearly like <i>th</i> in English then, this. g " " go, get. G " " the German Landtag, and <i>ch</i> in Feuerbach, buch; where it is a guttural sound made with the back part of the tongue raised toward the soft palate, as in the sound made in clearing the throat. H as <i>j</i> in the Spanish Jijona, <i>g</i> in the Spanish gila; where it is a fricative somewhat resembling the sound of <i>h</i> in English hue or <i>y</i> in yet, but stronger. hw " " <i>wh</i> in which. K " " <i>ch</i> in the German ich, Albrecht, and <i>g</i> in the German Arensburg, Mecklenburg; where it is a fricative sound made between the tongue and the hard palate toward which the tongue is raised. It resembles the sound of <i>h</i> in hue, or <i>y</i> in yet; or the sound made by beginning to pronounce a <i>k</i>, but not completing the stoppage of the breath. The character <i>k</i> is also used to indicate the rough aspirates or fricatives of some of the Oriental languages, as of <i>kh</i> in the word Khan. n as in sinker, longer. ng " " sing, long. N " " the French bon, Bourbon, and <i>m</i> in the French Etampes; where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce 'onion' without touching the tip of the tongue to the roof of the mouth. The corresponding nasal of Portuguese is also indicated by <i>N</i>, as in the case of São Antão. sh " " shine, shut. th " " thrust, thin. TH " " then, this. zh as <i>z</i> in azure, and <i>s</i> in pleasure. An apostrophe ['] is sometimes used to denote a glide or neutral connecting vowel, as in tá'b'l (table), kǎz'm (chasm). Otherwise than as noted above, the letters used in the respellings for pronunciation are to receive their ordinary English sounds. When the pronunciation is sufficiently shown by indicating the accented syllables, this is done without respelling; as in the case of very common English words, and words which are so spelled as to insure their correct pronunciation if they are correctly accented. See the article on PRONUNCIATION.</p>

- DANTE. Dr. Frederic Taber Cooper.
- DANTON. Professor Edwin A. Start and others.
- DARWIN. Professor Charles B. Davenport and Mr. Ernest Ingersoll.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

CLASSIS (Lat., assembly). In the Reformed Church of Holland and America, the name of an ecclesiastical body, made up of ministers and elders representative of churches, corresponding to a presbytery. The Classis hears appeals from the consistories, which are the official boards of local churches, and the Synod hears appeals from the Classis. The Classis also confirms and dissolves pastoral connections, ordains and deposes ministers, and sends delegates to the local and general synods. See REFORMED CHURCH IN AMERICA, THE.

CLAS'TIC ROCKS (Fr. *elastique*, from Gk. *κλαστός*, *klastos*, broken, from *κλάν*, *klan*, to break), or FRAGMENTAL ROCKS. A petrographic division which includes all rocks composed of fragmental materials. See EOLIAN ACCUMULATIONS; AQUEOUS ROCKS; BRECCIA.

CLAT'SOP. An Amerind tribe of the Chinookan stock. See CHINOOK.

CLAUDE, klôd, JEAN (1619-87). A French Protestant preacher and controversialist. He was born at La Sauvetat-du-Droît, southwest France (ancient District of Agenais). He studied at Montauban, became pastor at Nîmes in 1654, and was also professor of theology in the Protestant college there, where in 1661 he was forbidden to preach, on account of his opposition to the proposed union with the Roman Catholics. In the next year he obtained a post at Montauban, but was removed from it also. He then went to Paris, and was pastor at Charenton from 1666 until 1685. On the revocation of the Edict of Nantes (1685), he was ordered to leave France within twenty-four hours, and being welcomed by William of Orange, preached at The Hague until his death, January 13, 1687. He was the greatest leader of the French Reformed churches, their ablest disputant, their favorite preacher, and their truest representative. He is especially notable for the polemic he carried on against the school of Port-Royal. His works include: *A Defense of the Reformation* (1671, English translation, 1815), written in reply to an attack on the Calvinistic faith by Pierre Nicole, the celebrated Jansenist writer; *Complaints and Cruel Prosecutions of the Protestants* (1686; English translation, 1707); and especially, as more familiar to English readers, *Essay on the Composition of a Sermon* (1778-79, 2

vois.)—a much-used manual of homiletics, frequently reprinted, from the edition of Charles Siméon. His son published *Œuvres posthumes de Jean Claude* (5 vols., Amsterdam, 1688). Consult Ladevèze (Amsterdam, 1687).

CLAUDE LORRAINE, klôd lôr'rân'. See GELÉE, CLAUDE.

CLAU'DIA GENS (Lat., Claudian family). A patrician and plebeian clan in Rome, of Sabine origin. The patrician family names, always distinguished for their arrogance and pride, are Cæcus, Candæx, Centho, Crassus, Pulcher, Regillensis, and Sabinus. The plebeian names are Asellus, Canina, Centumalus, Cicero, Flamen, and Marcellus. Consult Mommsen, "Die patricischen Claudier," in *Römische Forschungen*, vol. ii. (Berlin, 1865). See APPIUS CLAUDIUS CRASSUS.

CLAU'DIAN HARBOR. A harbor at the mouth of the Tiber, two miles west of Ostia, constructed in the face of great natural difficulties by the Emperor Claudius. Its area exceeded 6,000,000 square feet with a depth of 15 feet to 18 feet, and was inclosed by two jetties 2400 feet long. The massive breakwater was constructed by filling with concrete the great ship which had transported the Vatican obelisk from Egypt, sinking her, and from this foundation building above the level of the water. On the breakwater rose a lighthouse 200 feet high, built in imitation of the Pharos of Alexandria. In time the Claudian harbor became inadequate to the needs of the city and an inner harbor was constructed by Trajan, now two miles inland. The Claudian harbor, which is now inaccessible on account of the marshes, is depicted on a bas-relief discovered in 1863.

CLAU'DIA'NUS, CLAUDIUS. A Latin poet who lived in the end of the fourth and the beginning of the fifth century, born at Alexandria. He came to Rome in the year 395 and there secured the patronage of Stilicho and, through him, of the Emperor Honorius. For the great Vandal leader the poet entertained a love and admiration which is voiced in a number of his minor poems. He wrote first in Greek, which appears to have been his native tongue (though he was originally of Roman extraction); but, as Gibbon says, he "assumed in his mature age the familiar use and absolute command of the Latin language; soared above the heads of his

feeble contemporaries: and placed himself, after an interval of 300 years, among the poets of ancient Rome." His poems brought him into such repute that, at the request of the Senate, the emperors Arcadius and Honorius erected a statue in his honor in the Forum of Trajan. The productions of Claudianus that have come down to us consist of two epic poems—*The Rape of Proserpine*, and the incomplete *Battle of the Giants*, besides panegyrics on Honorius, idyls, epigrams, and occasional poems. Claudianus displays a brilliant fancy and rich coloring, with variety and distinctness in his pictures; but he is often deficient in taste and gracefulness. There are several manuscripts of *The Rape of Proserpine*, of which two, from the twelfth and thirteenth centuries, are in the Laurentine Library at Florence. The best editions are by Birt (Berlin, 1892) and Koeh (Leipzig, 1893). A poor English translation was executed by Hawkins (London, 1817). Consult Hodgkin, *Claudian; The Last of the Roman Poets* (London, 1875).

CLAUDIANUS MAMERTUS (?-c.474). A Christian poet and philosopher. A younger brother of Saint Mamertus, Bishop of Vienne, he was consecrated by the latter to the priesthood, and became his assistant. He systematized the liturgy, and was the author of the hymns known as the *Small Liturgies*, sometimes heard in Catholic churches during the services preceding Ascension Day. The hymns *Contra Poetas Varios* and *Punge lingua gloriosi laurcam certaminis* have also been ascribed to him. In his famous philosophical treatise, *De Statu Animæ* (published by Mosellanus, Basel, 1520, and, with notes, by C. Barth, Zwickau, 1655), he shows that "thought is inseparable from the essence of the soul, and that its spiritual activity is indestructible" (Neander, *History of Dogmas*). His complete works were edited by Engelbrecht, and published in *Corpus Scriptorum Ecclesiasticorum Latinorum*, vol. xi. (Vienna, 1885). Consult Engelbrecht, *Untersuchungen über die Sprache des Claudianus Mamertus* (ib., 1885).

CLAUDIA QUINTA. A Roman woman who disproved the charge of unchasteness brought against her, when the ship carrying the image of Cybele was brought to Rome from Pessinus in B.C. 204. The vessel grounded on a shoal at the mouth of the Tiber, and when the soothsayers declared that it could be moved only by a pure woman, Claudia came forward and, seizing the rope, towed the ship to Rome.

CLAUDIO. (1) In Shakespeare's *Much Ado About Nothing*, a young Florentine lord. He is in love with Hero; but his affection is not strong enough to prevent his believing the scandal against her. (2) In Shakespeare's *Measure for Measure*, the lover of Juliet.

CLAUDIUS. (1) In Shakespeare's *Hamlet*, the King of Denmark, who poisons his brother, Hamlet's father, and marries the widow. He is slain by Hamlet, when the Queen, by mistake, drinks the poisoned wine. (2) A servant whom Brutus accuses of calling out in his sleep, after the appearance of the ghost of Cæsar, in Shakespeare's tragedy *Julius Cæsar*.

CLAUDIUS I. (TIBERIUS CLAUDIUS NERO DRUSUS; officially TI. CLAUDIUS CÆSAR AUGUSTAVUS GERMANICUS) (B.C. 10-A.D. 54.) Roman Emperor (A.D. 41-54). He was the youngest son of Nero Claudius Drusus, stepson of the Emperor Augustus, and was born at Lugdunum

(Lyons), B.C. 10. Being naturally sickly and infirm, his education was neglected, or left to be cared for by women and freedmen. His supposed imbecility saved him from the cruelty of Caligula; but Claudius, in his privacy, had made considerable progress in the study of history, and wrote in Latin and Greek several extensive works now lost. After the assassination of Caligula, Claudius was found by the soldiers in a corner of the palace, where, in dread, he had concealed himself. The Pretorians carried him forth, proclaimed him Emperor, and compelled his recognition by the Senate and many citizens who had hoped to restore the Republic. By his payment of the troops, who had raised him to the throne, Claudius I. gave the first example of the baneful practice which subjected Rome to a military despotism under the succeeding emperors. The first acts of his reign seemed to give promise of mild and just government; but in the year 42, when a conspiracy against his life was detected, his timidity led him to yield himself entirely to the guidance of his infamous wife, Messalina, who, in concert with the freedmen Pallas and Narcissus, practiced cruelties and extortions without restraint. Claudius meanwhile lived in retirement, partly occupied in studies, and expended enormous sums in building, especially in the construction of the famous Claudian Aqueduct, Aqua Claudia. This great work occupied 30,000 laborers during 11 years. Abroad, the armies of Claudius were victorious. Mauretania was made a Roman province, the conquest of Britain was commenced under the personal command of the Emperor, and some progress was made in Germany. After the execution of Messalina, Claudius married his niece, Agrippina (q.v.), who exercised as unlimited influence over him as had his former wife. Under her inspiration he deprived his son Britannicus of the succession to the Imperial power and adopted Domitius Ahenobarbus Nero, the son of Agrippina by Gnaeus Domitius Ahenobarbus. When Claudius showed some inclination to deprive Nero of the succession Agrippina caused him to be poisoned with a dish of mushrooms. After his death, Claudius was deified, giving occasion to Seneca's bitter satire, *Apocolocyntosis*, or *Gourdification*.

CLAUDIUS II. (MARCUS AURELIUS CLAUDIUS, better known as Claudius Gothicus) (214-270), Roman Emperor (268-270). He had been Governor of Illyria, and, after the death of Gallienus, in 268, was proclaimed Emperor by the soldiers. In the same year he overthrew his rival, Aureolus, and conquered the Alemanni; in the following year he defeated a great host of Goths that menaced Mœsia, and 50,000 of them perished in battle, whence the title *Gothicus*. Claudius died of the pest, at Sirmium, April, 270.

CLAUDIUS, ARCH OF. A triumphal arch at Rome, erected in A.D. 43 on the Via Lata, to commemorate the victories of Claudius in Britain. It was destroyed in the seventeenth century.

CLAUDIUS, MATTHIAS (1740-1815). A German poet and author, known as 'Asmus,' or 'Der Wandsbecker Bote,' born at Reinfeld, Holstein. He studied from 1759 to 1763 at the University of Jena; from 1771 to 1775 was editor, under the name of 'Asmus,' of the newly established *Wandsbecker Bote* (whence his surnames), and in 1776 of the *Landzeitung*, at Darmstadt. In the following year he returned

to Wandsbeck, where he henceforth lived. He was appointed in 1778 auditor of the provincial bank of Altona, by the Crown Prince Frederik of Denmark, who also, in 1785, granted him a small annuity. His collected works, published in 1775-1812 (eight parts), with the quaint title *Asmus Omnia Sua Secum Portans*, were in great part taken from his contributions to the *Wandsbecker Bote*. His prose is shrewd, aphoristic, with a certain naïve humor; his verse, now buoyantly merry, now patriotic, now in the best sense religious, is always fresh, simple, and sincere. Many of his lyrics, such as *Der Mond ist aufgegangen* and the *Rheinweinlied* ('Bekränkt mit Laub'), have continued to be popular favorites throughout Germany. He also translated into German Fénelon and other writers, French and English. The collected works have been excellently edited by Redlich (12th ed., Gotha, 1882). For his biography, consult Herbst (Gotha, 1878) and Gerok (Darmstadt, 1881).

CLAUDIUS CÆCUS, APPIUS. A Roman patrician of the fourth and third centuries B.C. When censor, in B.C. 312, he gained many adherents by invading the traditional rights of the patricians, and admitting men of low birth to senatorial rank; but his nominations were quickly set aside. He is more memorable for having at the same time undertaken the construction of the great Appian Way from Rome to Capua, and also of the first aqueduct (Aqua Appia) to bring a supply of water into the city. In order to complete these works, he arbitrarily continued his censorship beyond the legal limits. He was elected consul in B.C. 307 and 296, and met with success in several campaigns against the Samnites and Etruscans. When Pyrrhus of Epirus sent Cineas to Rome with terms of peace unfavorable to Roman greatness, it was only the eloquence of the aged Claudius that prevented the Senate from accepting them. In his old age Claudius is said to have become blind, whence his cognomen, 'Cæcus.' He was the author of works in both prose and verse, of which almost nothing is known. Consult Mommsen, "Die patrieischen Claudier," in *Römische Forschungen*, vol. ii. (Berlin, 1865).

CLAUDIUS CRAS'SUS, APPIUS. See APPIUS CLAUDIUS CRASSUS.

CLAUDIUS NERO. See NERO.

CLAUDIUS OF TURIN (Lat. *Claudius Turinensis*) (?-839). A Spanish-Italian bishop. At first a preacher at the Court of Louis the Pious, he became Bishop of Turin in 820. He was one of the most radical iconoclasts of his time, and protested against the use of images, the invocation of saints, and the veneration of relics. His attitude kept him in constant controversy with Pope Paschal I. Claudius wrote an *Apologium*, directed against the Abbot Theodemir, of the Convent of Psalmody, near Nîmes. The abbot's part was taken by Dungal, an Irish scholar and teacher, who called upon the King to "crush the tail of the serpent in Claudius, as Charlemagne had so well crushed the head in his master, Felix of Urgel." Jonas of Orleans, at the request of the Emperor, also wrote against Claudius, but both Louis and Claudius died before the publication of his work.

CLAUS, KLOUS, KARL FRIEDRICH WILHELM (1835-99). A German zoölogist, born in Cassel.

He studied the natural sciences in Giessen, under Leuckart; in 1863 became professor of zoölogy in Marburg, in 1870 in Göttingen, and in 1873 in Vienna. He was also director of the zoölogical station at Triest. He was very active in the investigation of the Crustacea, and is also widely known because of his *Text-Book of Zoölogy*. Of his numerous works, the following are important: *Die freilebenden Copepoden* (1863); *Beiträge zur Kenntniss der Ostracoden* (1868); *Grundzüge der Zoölogie* (1868); *Ueber den Bau und die Entwicklung der Cumaceen* (1870); *Die Metamorphose der Squilliden* (1872); *Ueber die Entwicklung Organisation und systematische Stellung der Arguliden* (1875); *Lehrbuch der Zoölogie* (6th ed., 1897; trans. into English, under the title of *Text-Book of Zoölogy*, by Claus and Sedgwick, London, 1897).

CLAUSEL, kló'zēP, BERTRAND (1772-1842). A French marshal, born at Mirepoix, in the Department of Ariège, December 12, 1772. He entered the army at an early age, and commanded a brigade in the Italian campaign of 1799. He was made a general of division of the Army of the North, in 1804; distinguished himself in the campaign of 1809 against Austria and subsequently in the war in Spain, where, after the battle of Salamanca, July 22, 1812, he succeeded Marmont in the chief command. He conducted the very difficult retreat from Portugal, with the greatest circumspection, fighting a succession of battles. Although he stood by Napoleon to the last, Louis XVIII., in 1814, named him inspector-general of infantry. When Napoleon returned to France in 1815, Clausel immediately declared for him, was made a peer, and received the command of the Army of the Pyrenees. On the return of the Bourbons he was declared a traitor. He escaped to the United States, and lived several years at Mobile, where he wrote his *Exposé justificatif*. During his absence he was condemned to death, but was subsequently permitted to return to France, was elected Deputy in 1827 and 1830, and after the July Revolution was put in command of the troops in Algeria. For his services in that capacity he was made marshal of France in 1831, but was soon afterwards recalled. He was appointed Governor-General of Algeria in 1835, and once more recalled in 1837. He returned to France and defended himself, though not quite successfully, both through the press and from the tribune, against the attacks made upon him. He died near Toulouse, April 21, 1842. See ALGERIA.

CLAUSEN, klou'zen, THOMAS (1801-85). A German astronomer, born at Nübel, in Schleswig. He early devoted himself to the study of astronomy, was for several years assistant at the observatory of Altona, and from 1842 to 1872 was connected with the Observatory of Dorpat (now Yurjev), first in the capacity of observer, later as director. During his scientific career Clausen made many important contributions to astronomy, and carried out elaborate calculations of the paths of comets.

CLAUSENBURG, klou'zen-burg. See KLAUSENBURG.

CLAUSEWITZ, klou'ze-vits, KARL VON (1780-1831). A Prussian general and eminent military writer, born at Burg. He entered the army in 1792, took part in the campaigns on

the Rhine in 1793-94, and attended the Berlin Academy for young officers in 1801-03, when he attracted the attention and won the favor of Scharnhorst. He was adjutant to Prince Augustus in 1806, was captured with him by the French at Prenzlau, and, after being exchanged, served until 1812 as major in the Prussian General Staff, being employed after 1809 in the Ministry of War, under Scharnhorst. In 1810-12 he was also military instructor to the Crown Prince of Prussia, and to Prince Frederick of the Netherlands. At the outbreak of the Russian War in 1812, he entered the Russian service, and aided Diebitsch in concluding the convention of Taurroggen. He accompanied Blücher as Russian staff officer during the campaign of 1813, the history of which he wrote, at the instance of Gneisenau. He reentered the service of Prussia in 1814, was appointed chief of staff under Thielmann in the following year, and remained in that position at Coblenz until 1818, when he was made major-general and director of the 'Allgemeine Kriegsschule.' Finally, he was appointed, in 1831, chief of staff to Field-Marshal Gneisenau, and served first in Berlin, then on the Polish frontier. His writings are of great value, and have led to a considerable change in the theory of war. They were published after his death as *Hinterlassene Werke über Krieg und Kriegführung* (10 vols., 1832-37), of which the most noteworthy are: *Vom Kriege; Der Feldzug von 1796 in Italien; Uebersicht des Feldzuges von 1813; Der Feldzug von 1815; Ueber das Leben und den Charakter von Scharnhorst.*

CLAUSIUS, klou'zê-us. RUDOLF JULIUS EMANUEL (1822-88). A German physicist, born at Köslin. In 1855 he became professor in the Polytechnic Institute of Zurich, in 1867 professor in the University of Würzburg, and in 1869 professor at Bonn. Clausius is one of the founders of the modern science of thermodynamics (q.v.), and in a paper before the Berlin Academy of Sciences (1850) stated the second law of thermodynamics, that "heat cannot of itself pass from a colder to a hotter body." The theory of electrolysis advanced by Clausius has also played a conspicuous part in electricity. He assumed that the ions are not in complete union, but that a part of them are free to unite with other ions. These uncombined ions, accordingly, are brought together under the action of the current at the anode and cathode. Clausius was one of the most celebrated mathematical physicists of the nineteenth century, and his researches and writings in heat, electricity, and molecular physics of the greatest value. His most important works are: *Die mechanische Wärmetheorie* (1876); *Die Potentialfunktion und das Potential* (1859); and *Ueber das Wesen der Wärme, verglichen mit Licht und Schall* (1857). For a biography of Clausius, consult Riecke, *Rudolf Clausius* (Göttingen, 1889).

CLAUSON-KAAS, klou'zôn-kâs'. ADOLF VON (1826--). A Danish promoter of manual training. He was born near Altona, of Danish parents, and after serving in the Danish cavalry devoted himself entirely to the advancement of education. In 1870 he founded the Danish Clubs for Home Industry. On the occasion of the international exhibitions of 1873 and 1878, he gave a series of public lectures on manual training in several cities of Germany, Holland, Russia, France, and elsewhere, and also

established a series of teachers' courses. In this way he encouraged the revival of working-schools for boys, his primary aim being the mechanical development of the hand and of the eye in association with mental training. He conducted a number of training-schools in Saxony, and introduced a course of modeling and drawing in the institution for the blind at Dresden.

CLAUSTHAL, klous'tâl (Ger., closed valley, from Lat. *clausum*, p.p. of *cludere*, to close + Ger. *Thal*, valley). An important mining town in the Prussian Province of Hanover, situated on a bleak plateau of the Upper Harz, about 1800 feet above sea-level, and 25 miles northeast of Göttingen (Map: Prussia, D 3). Among its public buildings the most noteworthy is the Church of the Holy Ghost, built of wood in 1639, and considered the largest structure of its kind in the world. The mines of Clausthal yield silver, lead, copper, iron, and zinc, and are among the most valuable and productive in Germany. They are owned and operated by the Prussian Government, which has established in connection therewith a mining academy, with an experimental laboratory, model workshop, and a library of over 30,000 volumes. The greater portion of the male population finds employment in the mines and smelting-works, while the women are largely occupied in the knitting-mills. Population, in 1890, 8736; in 1900, 8565. Clausthal was founded by the dukes of Brunswick, in the sixteenth century.

CLAVARIA (Neo-Lat. nom. pl., from Lat. *clava*, club). A genus of fungi of the division Hymenomyces, subdivision Clavati. The spores are produced equally on all parts of the surface. The species are numerous, some of them simple and club-shaped, some branched. *Clavaria botrytis*, a species common in oak and beech woods in Germany, growing on the ground among moss, grass, heath, etc., is gathered when young, and used as food, having a very agreeable sweetish taste. It ceases to be edible when it becomes old. Another German species, *Clavaria flava*, which grows on sandy ground in fir-woods, is used in the same way. Other species appear to possess similar properties, and Liebig found them to contain the saccharine substance called mannite. *Clavaria botrytis* is the *Keulenpilz*, and *Clavaria flava* the *Ziegenbart* (goat's-beard) of the Germans. See Colored Plate of EDBLE FUNGI.

CLAVERACK, kläv'-êr-ak. A town in Columbia County, N. Y., 30 miles south of Albany, on the Boston and Albany Railroad. The chief industries are agriculture and the manufacture of knit goods. The town has a public library, and is the seat of the Hudson River Institute, established in 1854. Among the points of interest are a Dutch Reformed church, built in 1767, and an old court-house, erected in 1784. Settled as early as 1660, Claverack (named Klauver Raehen, 'lover reaches,' by the Dutch) was organized as a town in 1788, and was the county-seat from 1786 to 1806. The government is administered by town meetings, held every two years. Population, in 1890, 4518; in 1900, 4416.

CLAVERHOUSE. See GRAHAM, JOHN.

CLAVICHORD, kläv'î-kôrd (Fr. *clavicorde*, Med. Lat. *clavichordium*, from Lat. *clavis*, key + *chorda*, string). An instrument of the harpsichord family, and an important step in the evo-

lution of the pianoforte. Its history previous to the fifteenth century is unknown. The clavichord was shaped like the square pianoforte, having a keyboard of white and black keys, and strings of brass wire set in vibration by the action of tangents or 'jacks' covered with metal. Its tone, though weak, was delicate, and, unlike the harpsichord, or spinet, in which the strings were plucked or twanged by quills or pieces of hard leather, it responded to the gradations of the player's touch. The clavichord was used in Germany until the beginning of the nineteenth

CLAVICHORD.

century. Bach preferred it to the pianoforte of his day, and wrote an essay for his son, *Versuch über die wahre Art Klavier zu spielen*, for this instrument. Mozart used the clavichord in composition, and Beethoven preferred it to other keyed instruments; for upon it, he said, "one could best control tone and expressive interpretation." See HARPSICHORD; SPINET.

CLAVICLE (Lat. *clavicula*, a little key, dim. of *clavis*, key), or COLLAR-BONE. A long bone, curved somewhat like the italic letter *f*, and placed at the upper and anterior part of the thorax, in a nearly horizontal position. In connection with the scapula or shoulder-blade, the clavicle forms the shoulder, and is the only bony connection between the upper extremity and the trunk. The inner extremity of the clavicle articulates with the sternum (breast-bone) and the cartilage of the first rib, while the outer extremity articulates with the scapula. The range of motion in the clavicle is extensive—especially in a vertical direction—and the various movements of the arm are in this way readily accommodated. In the female the clavicle is smoother, slender, and presents a less marked curve. The length, also, is slightly less, and the position more nearly horizontal. Manual labor, which brings the shoulder into constant exercise, renders the clavicle thicker and tougher, and therefore in right-handed people the right clavicle shows greater development.

Since the clavicle favors the lateral movements of the upper extremities, we do not find it in animals whose fore limbs are used only for progression; but it is present in almost all animals whose anterior extremities are clawed and used for prehension.

The clavicle is frequently fractured by direct violence, and also by indirect force, as in falling upon the hand. Dislocations are of less frequent occurrence.

Ossification of the clavicle begins very early—even as soon as the thirteenth day, according to Beclard—and at birth this process is almost complete. Consult: Gray. *Anatomy*, edited by Pick

(London, 1893); Holden, *Human Osteology* (New York, 1885).

CLAVIER, klä-fër' (from Lat. *clavis*, key). The German name for the pianoforte, and the prototype of the clavichord (q.v.). In French, 'clavier' designates the keyboard of an organ or pianoforte. For the practice clavier, see PIANO-FORTE.

CLAVIJERO, or **CLAVIGERO**, klä'vé-nä'rô, FRANCISCO XAVIER (1731-87). A Mexican historian, born in Vera Cruz. He early entered the Order of the Jesuits, and became a teacher of rhetoric and philosophy. He lived among the Indians in various parts of Mexico as a missionary for many years, and made himself fully acquainted with the languages, traditions, and antiquities of the aboriginal tribes. On the expulsion of the Mexican Jesuits by Spain, in 1767, he sailed for Italy, and with others of his Order settled in Bologna, where he founded an academy. He wrote, in Spanish, a work on early Mexican history; but, in order to publish it, he was obliged to translate it into Italian. The work finally appeared as *Storia antica del Messico* (1780); it is a comprehensive and valuable history of the Aztec Period. An English translation was made by Cullen (London, 1787). Clavijero also wrote *Storia della California* (1789), and works on physics and philosophy.

CLAVIGO, *Span. pron.* klä'vë'gò. A play by Goethe (1774), based on an episode in the life of José Clavijo y Fajardo, a Spanish official and journalist.

CLAVIJO, klä'vë'nô, DON. A character in *Don Quixote*, delivered by Don Quixote from the form of a crocodile, into which he had been changed by enchantment.

CLAVIJO, RUY GONZALEZ DE (? -1412). A Spanish traveler in the Orient. He was born in Madrid, and in 1398 and 1403 was sent by Henry III. of Castile as ambassador to Tamerlane. The route followed by him from his point of departure, Cadiz, took him to Trebizond, Armenia, Persia, and Khorasan. He arrived at Samarkand in 1404, and was well received at the Court of Tamerlane. After his death, his suite returned alone, after an absence of three years. The 'journal' of Clavijo was published under the title *Historia del gran Tamerlán é itinerario y narración del viaje*, etc. (1582; reprinted in 1782). It is valuable, not only because of its high literary merit, but also for its historical importance.

CLAVILEÑO, *Sp. pron.* klä'vé-lä'nyô, EL ALIGERO. The wooden horse, said to have been constructed by Merlin, which was managed by a wooden pin in its forehead; whence its name, 'the winged pin-timber.'

CLAY (AS. *clæg*, Ger. *Klei*; ultimately connected with Lat. *glus*, *gluten*, gluc, Gk. γλοῦς, *gloios*, gum, OCh. Slav. *glčnū*, slime). A term applied to earthy material or soil which shows plasticity when wet, thus permitting it to be molded into any desired form, which it retains when dry. Its distinguishing character is a physical one; for clay varies widely in other respects, being made up of fine mineral fragments, the most prominent of which may be the mineral kaolinite, a hydrated silicate of alumina. Clay is formed primarily by the decomposition of feldspathic rock *in situ*, and such a

clay is said to be residual in its nature. The material, however, is often washed down into the lakes or ocean by the surface-waters, and there spread out over the bottom as an aluminous sediment: such a clay deposit being known as a sedimentary one, which is not only stratified, but may also be more extensive than a residual. Sedimentary clay sometimes becomes consolidated by the pressure of other sediments which have been deposited on top of it, and it is then termed shale. These shales, on grinding and mixing with water, develop the same plasticity as does soft clay.

The chief chemical constituents of clay are silica and alumina; but, in addition to these, variable quantities of iron oxide, lime, magnesia, alkalies, water, and even rarer substances are often present. These ingredients affect the physical properties of the clay; such as its color when burned, air and fire shrinkage, refractoriness, plasticity, and thus indirectly its uses. The lime, magnesia, iron oxide, and alkalies exert a fluxing action in burning, and the greater their quantity the lower the fusing-point of the clay. Silica decreases the air and fire shrinkage of a clay, while alumina and water have the reverse effect. The property of plasticity, together with that of hardening under fire, makes clay an article of great value in the plastic arts. Those clays which are low in plasticity are said to be 'lean,' while the highly plastic varieties are 'fat.' Clay does not fuse suddenly, but softens gradually under the influence of heat. In very fusible clays this sintering may begin at 1500° or 1700° F., while in very refractory kinds it does not take place until a temperature of 5000° F. or more is reached. The red color of a burned clay is due to considerable iron oxide, while buff is produced by a small quantity of iron, or by an excess of lime. The following table gives the composition of several grades of clay:

	1	2	3	4	5	6
	%	%	%	%	%	%
SiO ₂	62.40	45.78	54.23	68.54	63.31	60.59
Al ₂ O ₃	26.51	36.46	32.80	18.49	16.57	12.46
TiO ₂	1.14	1.08	.21	3.38	4.06	5.79

Moisture.....	2.05	1.52	3.76	1.46

(1) Crude kaolin, Webster, N. C.; (2) Washed kaolin, Webster, N. C.; (3) Fire-clay, Wympe's Gap, Pa.; (4) Paving brick shale, Kansas City, Mo.; (5) Brick-clay, Indianola, Iowa; (6) Calcareous slip clay, Albany, N. Y.

Clay is used in the manufacture of common, pressed, and paving brick; terra-cotta, fireproofing, terra-cotta lumber; roofing, floor, and glazed tile; firebrick, retorts, crucibles, muffles, and other refractory goods; all grades of pottery, stoves, sewer-pipe, door-knobs, electrical insulators, turbine-wheels, closets, and bathtubs and washtubs; filters, mineral paint, food-adulterants, Portland cement, paper-fillers, emery-wheels (as a cement therein), ultramarine, modeling, soap, etc.

Clay is widely distributed geographically, and also geologically—i.e. in the rock-formations of different ages. In the United States deposits are found at a great number of localities. The Cretaceous clays of New Jersey are much used in the manufacture of refractory goods and white-

ware, while the Carboniferous clays of Pennsylvania and Ohio are also extensively employed for making firebrick. Kaolin is quarried at several points in North Carolina, Georgia, Maryland, and Wisconsin; much white ball-clay is found in Florida, and stoneware-clay in Illinois and Missouri. Clays suitable for brick, terra-cotta, and sewer-pipe occur at many points all over the United States. In the Central States, clays suitable for the manufacture of vitrified paving-brick are actively worked. With all this supply, however, much ball-clay and kaolin is imported, the material coming chiefly from England. About \$70,000,000 worth of clay products are produced annually in the United States alone.

The different varieties of clay are as follows: KAOLIN (q.v.) or CHINA-CLAY. A very white burning clay, used in the manufacture of porcelain and white earthenware. It is of residual origin, and often occurs in the form of veins.

FIRE-CLAYS (q.v.). Clays containing a low percentage of fluxes, and hence capable of resisting high temperatures. They are used in the manufacture of all classes of refractory goods, and sometimes also for making pressed brick and terra-cotta.

FLINT-CLAY. A dense, hard, non-plastic fire-clay, often found in the Carboniferous formations.

PIPE-CLAY. A term applied to many smooth, highly plastic clays.

BRICK-CLAY. A term including almost any impure clay which can be molded into bricks.

TERRA-COTTA CLAY. A grade of clay used for making terra-cotta (q.v.). It includes many varieties.

SLIP-CLAY. An easily fusible clay, which melts to a translucent glass, and is used for glazing the cheaper grades of pottery.

POTTERY-CLAY. A term applied to any clay used in the manufacture of pottery.

SAGGAR-CLAY. A grade of fire-clay used for making saggars, or vessels in which fine pottery is placed during baking in the kiln.

ALUM-CLAY. A clay containing a large amount of alum.

MARLY CLAY. A clay containing from 20 to 30 per cent. of lime carbonate.

GUMBO CLAY. A very plastic, sticky clay, found in many localities in the Central States, and often used in the manufacture of railroad ballast.

BALL-CLAY. A plastic, white burning clay, used as a bonding ingredient in white-ware and porcelain bodies.

CLAY MINING AND WORKING. The preparation of clay for use in the plastic arts is a simple process, owing to the accessibility of clay-banks and strata, and the ease with which the material can be separated from the other substances with which it is commonly found. After preliminary exploration and testing, the first thing to be done is to remove in cars, wagons, or carts the top layer of dirt. The digging out of the clay itself is usually done in successive pits, the dirt from the pit under excavation being thrown into the pit that has just been dug. In digging clay, a gouge-spade is used, which differs from the ordinary spade in having the blade cylindrical and the upper edge broader. A platform of boards is placed beside the pit, on which the clay is thrown and sorted. Two

workmen handle each spadeful of clay; the first merely loosens it up, while the second cuts out any nodules of pyrite or other foreign matter, and then throws the clay onto the platform, where it is sorted for ware, brick, or whatever product it is best suited. When clay is very hard, it is first loosened with a pick. Dynamite is sometimes employed to break up a bank into loose pieces. Occasionally, mining underground is necessary to reach a desired quality of clay; and this method will be more and more common as the best grades of superficial clays are exhausted. The clay having been mined and sorted, it is transported to the factory for further manipulation.

Clay-working or tempering of some sort is generally required before clay can be used, and particularly before it can be molded into brick, pottery, sewer-pipe, or tiles. Reduction to a plastic state may be effected by wet or dry grinding, screening, pugging, washing, or by the more natural process of weathering; or, a combination of two or more of these methods may be employed. The screening and washing may be so arranged as to remove foreign material. It must be understood that the term 'clay-working,' as here used, is limited to the preparation of the raw material for molding or forming, the other processes being treated separately, under the various clay products, as will be the matter of drying; while burning, for the most part, will be discussed under **KILNS**.

Weathering is a self-explanatory term. The time involved may range from months to years, but is more often the shorter period. With improvements in machinery and methods, less dependence is placed on this process than formerly.

Soaking, like weathering, is a natural process, but it is now used only under primitive conditions, and where the clay is molded in a soft form, without other working. The clay is simply shoveled into pits, say 4 × 6 feet in extent, and soaked in water over night.

Ring-pits are 25 to 30 feet in diameter, 3 feet deep, lined with brick or boards. An iron wheel is passed over or through the clay, back and forth, mixing in the sand, in case any is used. Clay for some 30,000 bricks may be tempered in six hours.

DRY-PAN CLAY-GRINDING MACHINE.

Grinding is accomplished by passing the clay between rolls, or in dry pans, the former process

being particularly applicable to shales. The pans are 7 to 9 feet in diameter, with either perforated floors or sides, through which the material falls as soon as it has reached the desired fineness. The pan revolves horizontally and by means of friction motion is imparted to two iron wheels, mounted in the pan, 6 to 14 inches wide, weighing 2000 to 6500 pounds each. A pan with one-eighth-inch holes has an average capacity of 100 tons of clay per day of ten hours.

Screening is sometimes employed for clay which has passed the dry pan. Screens may be inclined sieves, either fixed or shaking, and rotary cylindrical or octagonal in form. They demand much attention to prevent clogging, and require heavy repairs, but nevertheless are cheap and simple in operation.

Wet pans are much like dry pans, only their bottoms are not perforated, and scrapers are placed in front of the wheels, to throw up the clay. They may be discharged through a trap-door or by means of an automatic shovel. One of their chief advantages is rapidity, only two or three minutes being required to temper a charge for brick and four or five minutes for sewer-pipe.

Pug-mills appear to be used more than other classes of tempering machines. They are either vertical or horizontal, but in either case they have a central revolving shaft, fitted with radial knives extending nearly to the surrounding cyl-

COMBINED MIXING AND PUGGING MACHINE.

inder in which the clay is placed, or else fitted with a worm screw. Both knives and screw force the clay forward, as well as work it thoroughly, and by changing the angle of the adjustable knives the speed of the passing clay may be regulated. Water is admitted as desired and needed. When the clay is deficient in redness after burning, hematite may be added to the pug with clay. Pug-mills are compact, and require less power than ring-pits.

Washing is effected by a variety of processes, ranging from simple to complex. All of them involve a reduction of the clay in water to a semi-fluid state, or even to a state of suspension, which may be brought about by revolving paddles or blades, mounted on a shaft in a cylinder or trough, or by any thorough stirring. The heavier, coarser impurities may be deposited in a vat by sedimentation. The water, with the remaining clay, may be removed by siphoning or carefully poured off, and the clay allowed to settle. This process is sometimes called ebullition, particularly where it is repeated many times to recover fine-grained material. The process of sedimentation may be altogether too slow, especially where large quantities of clay are to be treated, and in such a case the clay and water, after being reduced, as described, to what is known as slip, may be passed through shaking-screens of wirecloth, having forty meshes to

the incl. It is then sent to an agitator, or large tank fitted with revolving paddles, to prevent sedimentation, from which tank the screened slip is forced by means of compressed air into a series of canvas-lined compartments, known as a press, where the water is expelled by the force of the air. The press being loosened, the clay is removed in sheets or cakes one to two inches thick, weighing 30 to 40 pounds each, after which it is ready for the pug-mill. Washing is used in the preparation of some sorts of clay for making into pottery.

CLAY, CASSIUS MARCELLUS (1810-1903). An American abolitionist and politician, born in Madison County, Ky. He graduated at Yale in 1832, returned to Kentucky to practice law, and was elected to the State Legislature in 1835, in 1837, and in 1840, but in 1841 failed of reelection on account of his strong anti-slavery opinions. In 1844 he made speeches in the Northern States in advocacy of the election of Henry Clay to the Presidency, and in the following year opposed the annexation of Texas, and established at Lexington, Ky., *The True American*, a vigorous anti-slavery paper, which, however, was suppressed by a mob, but was revived by Mr. Clay, and was published thereafter in Cincinnati. He

volunteered for service in the Mexican War in 1846, and was taken prisoner. In 1850 he left the Whig Party, and was the Anti-Slavery candidate for Governor. In 1860 he supported Lincoln, and in 1861 was appointed Minister to Russia, but returned to the United States in 1862, and was made major-general of volunteers. In 1863, however, he resigned, and was again appointed Minister to Russia, where he remained until 1869. He supported Greeley in 1872 and Tilden in 1876, but went over to the Republican Party to vote for Blaine in 1884. In the campaign of 1896 he was in the gold-standard wing of the Democratic Party. Consult his *Life, Memoirs, Writings, and Speeches* (Cincinnati, 1886).

CLAY, CLEMENT CLAIBORNE (1819-82). An American politician, born at Huntsville, Ala. He graduated at the University of Alabama in 1835, and was admitted to the bar in 1840. From 1842 to 1845 he was a member of the State Legislature, from 1846 to 1848 was judge of the Madison County Court, and in 1853 was elected to the United States Senate. Upon the secession of his State he withdrew from the Senate, and was forthwith elected to the Confederate Congress. Having taken refuge in Canada at the overthrow of the Confederacy, he later gave himself up, and in 1865-66 was imprisoned at Fortress Monroe with Jefferson Davis.

CLAY, FREDERICK (1840-89). An English musician. He was born in Paris, received his education under Molique in Paris and Hauptmann in Leipzig; returned to England in 1860, and wrote several operas and operettas, which were successful. His works include: *Constance* (1865); *Happy Arcadia* (1872); *Don Quixote* (1875); *Princess Toto* (1875); *The Golden Ring* (1883); and the *Black Crook*, with Jacobi (1873); also incidental music to *Twelfth Night*, songs, part-songs, and cantatas.

CLAY, GREEN (1757-1826). An American soldier. He was born in Powhatan County, Va.; became a pioneer settler in Kentucky, then a part of Virginia, about 1776; represented the district for some time in the Virginia Legislature, and was a member of the State Constitutional Convention of 1799. In 1813 he led the force of 3000 which relieved General Harrison, then besieged by the British and Indians at Fort Meigs, and afterwards defended that fort against General Proctor and Tecumseh. He was the father of Cassius Marcellus Clay, and a cousin of Henry Clay. See FORT MEIGS.

CLAY, HENRY (1777-1852). An American statesman, known for his skill in devising compromises, as the 'Great Pacificator.' He was born April 12, 1777, in a neighborhood called 'The Slashes,' in Hanover County, Va. His father, a Baptist clergyman in humble circumstances, died when Henry was only four years old; and his mother, who seems to have been a woman of forcible character, was left ill provided for. Mrs. Clay married again in a few years, and her second husband secured for Henry the position of clerk in a retail shop in Richmond. This careful stepfather, however, noting the brightness and promise of the lad, used his influence in obtaining for him an appointment in the office of the clerk of the High Court of Chancery, where he remained for four years. Here he attracted the notice of the Chancellor, George Wythe, and

was employed by him to copy documents. The intimate association with Chancellor Wythe was an important influence on Clay's life and development; for he had received almost no schooling, and he never studied regularly, save for one year in the office of Robert Brooke, then Attorney-General of Virginia. Clay was admitted to the bar at twenty, but he soon left Richmond, and sought the fuller opportunities of the West, at Lexington, Ky. Here his attractive personality and his skill as a speaker won him friends, and made him a leading jury-lawyer. It was not long before he turned his attention to politics, and when, in 1799, the revision of the Kentucky Constitution was undertaken, Clay was found playing an active and honorable part with the minority, and risking his personal prestige by his advocacy of the gradual abolition of slavery. This stand might have cost him dear, had he not soon afterwards been able by his eloquence to aid his State heartily in opposing the Alien and Sedition Laws. He married in 1799, rose steadily in his profession, and was elected to the State Legislature in 1803. In 1806, having been appointed to represent Kentucky for an unexpired term in the United States Senate, he took from the first a conspicuous part in the public business, bringing in a number of resolutions and sitting on several committees. His first speech—one on the bill for a bridge across the Potomac—indicates his future course as one of the most earnest advocates of the policy of internal improvements. Scarcely had he returned to Kentucky when he was reelected to the State Legislature and made Speaker. It was at this time that, sharing the rapidly growing hostility toward England, and desiring to foster domestic manufactures, he introduced the resolution that all members of the Legislature should wear no clothing made in foreign countries—a proposal that Humphrey Marshall, a Federalist, stigmatized as the utterance of a demagogue. Angry words were passed, a challenge followed, and in the duel that was fought both parties were slightly wounded. In the winter of 1809-10 Clay was again sent to fill a vacancy in the Senate, where he continued to be the champion of the protection of home manufactures. When the question of chartering the United States Bank came up, Clay opposed the measure as corrupt and unconstitutional; and his remarks on this occasion were treasured up to be used with great effect against him when, in 1816, a revival of the matter made manifest an alteration in his views.

Entering the National House of Representatives in 1811, Clay was chosen Speaker as soon as he appeared, and as leader of the vigorous democracy sprung up since the Revolution, he practically forced the war with England, speaking with rash confidence of the ease with which Canada could be overrun by his fellow Kentuckians. He supported the war with all his eloquence, in and out of Congress, and was in consequence known as the 'War Hawk'; he advocated an increase of the army, and aroused much enthusiasm for his measures. When the war seemed nearly a failure, he was one of the commissioners to arrange terms, resigning the Speakership in January, 1814. In spite of the disappointment the war had brought to his hopes, he contributed much to the success of the commissioners, who were far superior to the British representatives opposed to them, and who secured the best

possible terms in the Treaty of Ghent. He resisted especially the British claim to the right of navigating the Mississippi. On his return in 1815, Clay, as the leading war statesman, was royally welcomed. During his absence he had been reelected to the House of Representatives, and, declining the offer of the mission to Russia, he took his seat and was chosen Speaker—an office which the later tender of a Cabinet place did not induce him to resign. The tariff of 1816, which was moderately protective, was urged by Clay, on the ground that certain industries must be built up for the nation's safety during war. This same year he advocated the rechartering of the National Bank to renew specie payments and to prevent further distress, and with Calhoun he helped to pass the bill for internal improvements vetoed by Madison. The Fifteenth Congress met December 1, 1817, and Clay was again elected Speaker. In this session he continued to assert the power of Congress to construct internal improvements, and he pleaded earnestly for the recognition of the South American republics, a cause always dear to his warm heart.

Clay was again chosen Speaker on the meeting of the Sixteenth Congress and continued to be its leading member, frequently criticising Monroe's administration in hard terms. This was the period of the great contest over the admission of Missouri.

Clay, though not the author of the Missouri Compromise of 1820, did bring about the compromise of the next year, by which it was agreed that Missouri should be admitted (without restriction as to slavery) on her promise not to prevent citizens of other States from settling within her borders. Declining reelection to the following Congress, he did not appear in active politics again until 1823, when he reoccupied the Speaker's chair. In the election of 1824 he was a candidate for the Presidency, together with Crawford, Jackson, and Adams.

The Electoral College failing to elect, the choice between the three highest candidates fell to the House, where Clay, who had come fourth and was thus not eligible for election, cast his strength for Adams. Soon after the latter's inauguration, Clay was appointed Secretary of State—a fact which gave point to the cry of 'Bargain and corruption,' which, though baseless, and again and again refuted, never ceased to injure him in his political career. His relations with Adams were denounced by John Randolph as the "combination of the Puritan with the blackleg," language which provoked a challenge from Clay; but neither party was wounded in the duel that ensued, Randolph refusing to fire at his adversary the second time. The Secretaryship of State, formerly regarded as the stepping-stone to the Presidency, proved an obstacle to Clay, and though he made an excellent officer, he regretted his long absence from Congress, where he could always lead. A strong opponent of General Jackson as a candidate for the Presidency, he retired with Mr. Adams after the latter's defeat in 1829. Two years later he was elected to the Senate. Here, in the difficult rôle of Senator and Presidential candidate, he was prominent in his advocacy of the protective system, which he dubbed unreasonably, but successfully, the 'American system.' Unanimously nominated by the Whigs, Clay was overwhelmingly defeated by Jackson

(1832), largely on account of his tariff ideas, and his unwise choice, as a party issue, of the defense of the National Bank. When the Nullification controversy came up, Clay's compromise of 1833 prevented a resort to arms by satisfying South Carolina with regard to the reduction of the obnoxious tariff and rendering the Force Bill unnecessary. In the subsequent anti-slavery agitation he occupied a moderate position, but lost few opportunities of opposing the administration of Jackson. Throughout this period of his career Clay shared the honors of the Senate in its time of meridian glory with Daniel Webster, John C. Calhoun, and T. H. Benton.

During Van Buren's Presidency, Clay unsuccessfully opposed the administration measure of an independent treasury system, desiring in its stead the establishment of a national bank; but after Harrison's election he procured its repeal, the apparent victory proving, however, far from permanent. In the election of 1840 he was chagrined at not receiving the Whig nomination, but supported Harrison, and after the latter's death endeavored to carry out the Whig policy, especially with regard to rechartering a national bank. In this attempt he was thwarted by the vacillation and ambition of President Tyler.

After the breach between the 'Tyler men' and the 'Clay Whigs' became apparently irreconcilable, Clay resigned his seat in the Senate and retired to private life (1842). He was nominated for President in the campaign of 1844, and defeated by James K. Polk. Clay's defeat was due to his injudicious writing of letters, in which he did not take a stand upon the question of the admission of Texas that satisfied the more extreme opponents of slavery. He was again and for the last time spoken of as an aspirant for Presidential honors in the convention that nominated General Taylor in 1848. Meanwhile he had on the whole lived in retirement, but had watched with anxiety the growth of friction between North and South consequent upon the Mexican War. In 1848 he was reelected to the United States Senate.

Taking his seat in the Senate in the winter of 1849, and still more alarmed at the fierce display of sectional feeling on the slavery question, Clay interposed in the cause of peace with the series of resolutions subsequently known as the Compromise of 1850 (see COMPROMISE MEASURES); and, in a stirring speech, delivered in spite of his advanced age and increasing infirmity, with all his accustomed energy and fire, he appealed with great effect to the patriotism of his hearers for the restoration of harmony and the preservation of the Union—an effort which was rewarded by the triumph, for a time at least, of his pacific policy. His last speech in the Senate was on the subject of a revision of the tariff of 1846. Unable to occupy his seat for more than a few days of the session of 1851-52, owing to his failing health, he continued to the end to manifest an interest in public affairs. The last incident of importance in his career was his interview with Kossuth, when, a short time before his death, he warned the Hungarian patriot of the futility of soliciting the interference of the United States in the internal affairs of Europe, and declared the true policy of this country in dealing with foreign nations to be that set forth by Washington in his Farewell Address. Sinking rapidly after this, he died in

Washington on June 29, 1852, in the seventy-sixth year of his age.

Clay is one of the most attractive figures in American history. No statesman has possessed more magnetism or been a more gallant party leader. The wisdom of many of his policies may be doubted, but his own zeal, integrity, and brilliancy as an advocate cannot be denied. His oratorical powers have been traditional only, because his speeches, partly on account of his lack of culture, have not held the attention of readers; but both in the Senate and on the platform he yielded in fire and charm of eloquence to none of his great rivals. His patriotism is above suspicion, but he was unfortunate in living in a border State and in occupying a middle position between the irreconcilable extremes of freedom and slavery. This fact made him 'The Great Pacificator,' but it probably cost him the Presidency, and has somewhat lowered his standing in history. In private life Clay was not free from some of the vices so prevalent among the men of his comparatively coarse period, but he was essentially of a fine nature and made hosts of loyal friends. Perhaps the impression he made upon his contemporaries cannot be better described than by the statement that Clay was Abraham Lincoln's "beau ideal of a statesman."

For the most complete edition of his speeches and writings, consult: Colton, *Life and Times of Henry Clay* (revised edition, 6 vols., New York, 1864); and for his biography, Schurz, *Henry Clay*, "American Statesmen Series" (Boston, 1887). See also the histories of Schouler and Rhodes.

CLAYBORNE, WILLIAM. See CLAIBORNE, WILLIAM.

CLAY CENTRE. A city and the county-seat of Clay County, Kan., 87 miles west by north of Topeka; on the Republican River, and on the Union Pacific, the Chicago, Rock Island and Pacific, and other railroads (Map: Kansas, E 2). It contains a private hospital and a fine court-house. The principal industrial establishments are flour-mills, cigar-factories, foundry and machine-shop, steel-tank factory, brick-works, broom-factory, etc. The city has good water-power, which is utilized by the electric light and power plant, and by some of the manufacturing factories. There are two large greenhouses, which make extensive shipments all over the State. Population, in 1890, 2802; in 1900, 3069.

CLAY IRONSTONE. The name applied to compact, argillaceous varieties of siderite, the carbonate of iron. It frequently occurs in the form of concretions, which may be so close together in some particular layer as to form a continuous band. They are especially abundant in some beds of the Carboniferous, and at times serve as a low grade of iron ore. See IRON; BLACKBAND IRONSTONE.

CLAY-MARL. A calcareous variety of clay, containing from 40 to 60 per cent. of carbonate of lime. It is used as a fertilizer, and also in the manufacture of Portland cement. Clay-marls are found in many parts of New York, New Jersey, Michigan, Illinois, Indiana, and other Northern States, and in the West. They grade into true marls. See MARL; SOILS.

CLAY-PLANTS. The early stages of vegetation on clay soil resemble those on rock areas, and are treated under the head of ROCK-PLANTS.

The late stages are Mesophytic (q.v.). See FORESTS; GRASS-LANDS.

CLAYPOLE, NOAH. A character in Dickens's *Oliver Twist*. A fellow-apprentice of Oliver's at Mr. Sowerberry's, the undertaker. He marries Charlotte, robs his master's till, and joins Fagin's company of pickpockets in London. He is the spy on poor Nancy, who causes her murder by Sikes, and afterwards turns King's evidence.

CLAYS, klās, PIERRE JEAN (1819-1900). A Belgian painter, born at Bruges. He studied in Paris under Gudin, and, like his master, became a painter of marine scenes. After his return to Belgium, he sent pictures to the Salon almost annually. His works are notable for their breadth, luminosity, and sincerity. As an interpreter of water, whether stormy or calm, he had few equals. He was awarded a second-class medal at the Exposition of 1878, and received the decoration of the Legion of Honor in 1875. Among his best paintings are: "A Squall on the Scheldt;" "Canal in Zealand;" "Beached Near Amsterdam;" "Calm in Zealand;" and "Open Sea" (1889).

CLAY-SLATE. See SHALE.

CLAYTON, AUGUSTINE SMITH (1783-1839). An American jurist, born at Fredericksburg, Va. He graduated at the University of Georgia in 1804, and in 1819 was elected judge of the Superior Court of the Western Circuit in Georgia. While holding that office he supported the State authorities in their occupation of territory of the Cherokee Nation, but the United States Supreme Court decided against the legality of the State's action. For differing with the Legislature on one point of the controversy, however, he was removed from office. He was elected to Congress in 1831, served two terms, took an active part in the opposition to the tariff and to the United States Bank. He was reputed to be the author of *Crockett's Life of Van Buren*.

CLAYTON, ESTELLE. An American actress and dramatic writer. She was born in New York. Her family name was Evesson. After the death of her father, she went upon the stage (1878) with a traveling company, and later in that year she attracted notice as Agnes Wickfield, in *Wilkins Micawber*. She was with Augustin Daly in 1879-80, and later for a time with Dion Bouicault. In 1882-83 she appeared as Nora in *Esmeralda*, at the Madison Square Theatre; also in *Hazel Kirke*, and as Constance in *Young Mrs. Winthrop*. In 1885 she produced her play of *Tric-trin*, at the Madison Square. She became the wife of Charles W. Durant in 1888. The same year she produced a dramatization of *The Quick or the Dead*, with which she afterwards toured successfully in the South. She is the author also of the texts of the operas *Paulita* (1890); *The Viking* (1895); and of *A Puritan Romance*, a comedy produced at the London Vaudeville, in 1897.

CLAYTON, JOHN (1693-1773). An American botanist. He was born in Fulham, England, but in 1705 emigrated to Virginia, where for fifty-one years he was clerk of Gloucester County. Two great volumes and a *hortus siccus* of Virginia plants were left by him; but the manuscripts were destroyed by fire, together with the records of Gloucester, at the beginning of the Revolution.

CLAYTON, JOHN MIDDLETON (1796-1856). An American jurist and politician, born in Dagsborough, Del. He graduated at Yale in 1815, was admitted to the bar in 1818, and became a leading lawyer in his State. He was for many years (1829-37, 1845-49, and 1851-56) a prominent member of the United States Senate, and in 1849 became Secretary of State in the Cabinet of President Taylor. In 1850 he negotiated with the British Government the famous Clayton-Bulwer Treaty (q.v.), which guaranteed the strict neutrality of any interoceanic canal that might be built across the American Isthmus.

CLAYTON, POWELL (1833-). An American soldier and politician, born in Bethel, Pa. He followed his profession of civil engineering at Leavenworth, Kan., and at the outbreak of the Civil War became captain in the First Kansas Infantry, in the Federal Army. He rose to the rank of brigadier-general during the struggle, and at its close became a planter in Arkansas, of which State he was chosen Governor in 1868. He was a member of the Senate from 1871 to 1877, and was a member of every National Republican Convention from 1872 to 1896. He was appointed Minister to Mexico in 1897.

CLAYTON-BULWER TREATY. A treaty between the United States and Great Britain, signed, after prolonged negotiations between Secretary of State John M. Clayton (q.v.), on the one side, and Sir Henry Bulwer, special Ambassador of Great Britain, on the other, on April 19, 1850, the ratifications being exchanged on July 4. Its aim was, mainly, to facilitate the construction of an interoceanic canal across the American Isthmus, and incidentally to prevent the encroachment of either contracting power upon the territory of the Central American States; and its main provisions were as follows: (1) Neither power was ever to "obtain or maintain for itself any exclusive control over the said ship-canal," or to "occupy, or fortify, or colonize, or assume or exercise any dominion over Nicaragua, . . . or any part of Central America." (2) The two powers formally agreed to guarantee the protection and neutrality of the canal. (3) They further agreed to invite friendly powers "to enter into stipulations with them similar to those they had entered into with each other," and also to enter into treaties with the Central American States "for the purpose of more effectually carrying out the great design of this convention." (4) Vessels of the two powers were, while traversing the canal in time of war, to be exempt from detention, blockade, or capture. (5) The protection of the two powers was extended to any other practicable communications across the Isthmus, whether by railroad or canal, the intention being "to establish a general principle," as well as to settle one particular object. At the time the ratifications were exchanged, both powers issued explanatory declarations, Great Britain announcing that "her Majesty's Government do not understand the engagements of that convention as applying to her Majesty's settlement at Honduras, or its dependencies;" the United States, that the treaty was not understood "to include the British settlement in Honduras, commonly called 'British Honduras,' as distinct from the State of Honduras, nor the small islands in the neighborhood of that settlement, which may be known as its dependencies." Disputes arose over the terri-

torial claims of Great Britain in Central America, and her assumption of a protectorate over the Mosquito Indians, conflicting interpretations being placed on various provisions of the treaty by the two powers. Another treaty, the Dallas-Clarendon treaty, designed to settle the pending disputes, was signed in October, 1856, and was ratified by the Senate soon afterwards, with the addition of various amendments, which, however, the British Government refused to accept. Disputes continued almost up to the time of the Civil War; but in 1860 Great Britain concluded treaties with Honduras and Nicaragua, which provided for the cession to the former of the Bay Islands, and the relinquishment of the British protectorate over the Mosquito Indians. President Buchanan thereupon announced, in his message for 1860, that "the discordant constructions of the Clayton-Bulwer Treaty between the two Governments . . . have resulted in a final settlement, entirely satisfactory to this Government." Nevertheless, after the close of the war, controversies again arose, and in 1881 the treaty was the subject of a compromise between Lord Granville and Secretary of State Blaine, the latter contending that any inter-oceanic canal across the American Isthmus should be under the political control of the United States; that the United States would view with grave concern the interference of European powers; and that the treaty should be so modified as to make it conform to conditions which had materially changed since 1850. Secretary of State Frelinghuysen, who succeeded Blaine, in December, 1881, went further, and contended that the treaty had become obsolete, and was in reality no longer binding on either power; while, on the other hand, Lord Granville asserted that the treaty had never been abrogated, and was still in force. Finally, by the Hay-Pauncefote Treaty, which was ratified by the United States Senate in December, 1901, the Clayton-Bulwer Treaty was formally annulled. Consult Travis, *The History of the Clayton-Bulwer Treaty* (Ann Arbor, Mich., 1900)—vol. iii. of the "Publications of the Michigan Political Science Association."

CLAYTONIA (after John Clayton, a Virginian botanist), or **SPRING BEAUTY**. One of the most beautiful of the early spring flowers of the United States. The plants are low, succulent herbs, growing in rich ground of bottom-lands. The delicate, rose-colored flowers are striped with pink veins, and the leaves are linear or oblong. Two species, *Claytonia Virginica* and *Caroliniana*, are common in the United States. *Claytonia perfoliata* is found on the Pacific Coast, and in Mexico and Cuba. Other species of this genus are known in Europe and Asia, one of them, *Claytonia tuberosa*, affording tubers which are eaten by the peasants of Siberia.

CLAZOMENE, klā-zōm'ē-nē (Lat., from Gk. Κλαζομεναι, *Klazomenai*). One of the twelve cities of Ionia, on the west coast of Asia Minor. It was situated on the south shore of the Hermæan Gulf, west of Smyrna. Apparently about the time of the formation of the League of Delos, a part of the inhabitants seem to have moved to an island near the coast. Alexander the Great connected the island with the mainland by a dike, and the city subsequently extended over the peninsula thus formed. The city was famous as the birthplace of the philosopher Anaxagoras

(q.v.). The modern Vurla is near the site of Clazomene. Consult Labahn, *De Rebus Clazomeniorum* (Greifswald, 1875).

CLÉANTE, klé'ānt'. (1) A character in Molière's *Malade imaginaire*, in love with Angélique. (2) In Molière's *Tartuffe*, the high-minded brother-in-law of Orgon. (3) In Molière's *L'Acare*, the son of the miser Harpagon. Both father and son desire to marry Mariane; but the miser prefers the recovery of his gold to the lady, who becomes the wife of Cléante.

CLEAN'THE. In Fletcher's *Mad Lover*, the sister of Siphax of Paphos.

CLEANTHES, klé-ān'thēz (Lat., from Gk. Κλεάνθης, *Kleanthēs*) (c.300-220 B.C.). A Stoic philosopher. He was born at Assos, in Troas. His poverty was such that he had to work all night at drawing water, in order to obtain money for his support, and to pay his class fee while attending the lectures of Zeno, whom he succeeded as head of the Stoic School about B.C. 263. He died of voluntary starvation when about eighty years old.

None of his writings are extant, except a *Hymn to Zeus*, much admired, preserved by Stobæus (Ecl. i. 2, 12). It is an admirable union of religious feeling and philosophic thought. The fragments have been collected by Wachsmuth, *Commentatio de Zenone et Cleanthe* (1874). Consult: Ritter and Preller, *Historia Philosophiæ Græcæ* (Gotha, 1888); Zeller, *Philosophie der Griechen* (Leipzig, 1869-82).

CLEANTHES. (1) In Dryden's *Cleomenes*, the friend of Cleomenes. (2) In Massinger, Middleton, and Rowley's play, *The Old Law*, the son of Leonides, who shows his filial piety by preserving his aged father from the operation of a law condemning to death all men over eighty years of age.

CLEAR, CAPE. See CAPE CLEAR.

CLEARANCE. In the mercantile marine, a permission from the custom-house officers, or the emigration officers, or both, for the departure of a ship from a port, showing that all the formalities have been observed, and all dues, etc., paid. If a foreign vessel, she must also be certified by the consul of the nation to which she belongs. Hence the expression 'cleared out' originally used in reference to the departure of a particular ship.

CLEARCHUS, klé-ār'kūs (Lat., from Gk. Κλέαρχος, *Klearchos*). A Spartan commander of the fifth century B.C., the son of Ramphias. After serving in the Hellespont and at the battle of Cvziens, he became Governor of Byzantium, where he ruled with tyrannical harshness. During his absence in Asia, the town was surrendered to the Athenians, and Clearchus was punished by a fine. He was afterwards sent to Thrace to protect the Greek colonies there; but, being recalled by the ephors, he proceeded to the Hellespont in defiance of their orders, and was condemned to death. He joined the younger Cyrus, for whom he levied an army of Greek mercenaries, and whom he accompanied on the famous 'March of the Ten Thousand.' He alone, of the Greeks, knew the real intentions of Cyrus; but it was not until they had proceeded too far to retire with safety that he disclosed them. At the battle of Cumaxa (B.C. 401) he commanded the right wing of the Greeks, and was tacitly recog-

nized as commander-in-chief when the retreat had begun. He was, however, treacherously seized by the Persian general, Tissaphernes, and put to death.

CLEAR/FIELD. A borough and the county-seat of Clearfield County, Pa., 172 miles east by north of Pittsburgh; on the west branch of the Susquehanna River, and on the Pennsylvania Railroad (Map: Pennsylvania, C 2). It is situated in a fertile agricultural region, in which there are also deposits of coal, limestone, and fire-clay, and has several lumber-mills, flouring-mills, brick-yards, and ships out foundry products, tanned leather, etc. Clearfield was settled in 1805, and in 1840 was incorporated as a borough. Population, in 1890, 2248; in 1900, 5081.

CLEARING-HOUSE. Clearing-house associations are unions of banks, for the purpose of securing a speedy settlement of the claims of banks against one another. The oldest of these is the London Clearing-House, which appears to have been established about 1775. The most important clearing-house in the United States is that of the city of New York, which was established in 1853. Before the establishment of clearing-houses, the process of settling the mutual claims of banks upon one another was cumbersome and tardy. Each bank was forced to send out runners, carrying to every other bank the checks and claims that it had upon them. As each bank settled periodically its bills with every other bank, there was a continual interchange of money between them. All this has been obviated by the establishment of clearing-houses, in which representatives of the several banks meet daily, for the purpose of adjusting the claims of the banks upon one another.

An insight into the workings of clearing-houses can best be obtained by a brief description of the methods pursued in the New York Clearing-House, which may be taken as typical of all the rest. The banks represented send daily to the clearing-house at least two clerks—a delivery-clerk and a settling-clerk. At the clearing-house, each bank has a desk at which the settling-clerk or clerks are seated. They bring to the clearing-house in bundles the checks, drafts, and other obligations due them from other banks, each bank being represented by a separate package. They bring also a list of the amounts due them from each of the banks in question. Before clearing begins, transcriptions of these lists are handed to the inspector. The sum total represents the aggregate amount to be settled for the day. Promptly at 10 o'clock, the delivery-clerks begin passing from one desk to another, delivering to each the package of claims of all sorts that their banks have against other banks. These claims are accepted in bulk, without examination of the items. As soon as all of the packages have been delivered, they are carried back to the banks, where an examination of the items takes place; and if there are any that are not valid, the adjustment takes place between the bank which has received them and that which presented them, without intervention of the clearing-house or rectification of the accounts drawn up there. When all of the packages have been received by the settling-clerks at the clearing-house, the latter draw up a statement of the demands made upon them. As these never balance the claims made

by their banks, it is obvious that at the close of each day's business some of the banks will be entitled to receive money and others obliged to make payments, to settle the accounts. When each clerk has made up his account, he forwards a statement of the aggregates, with the amount of the balance to be paid or to be received. When all have forwarded their accounts to the manager, and the accounts are proved by the equality of the debit and credit aggregates and balances, the manager certifies the amounts which each bank owes to the associated banks, or is entitled to receive from them.

In the London Clearing-House, for the settlement of balances a different rule prevails. Debit balances are settled by checks on the Bank of England in favor of the associated banks, and credit balances by similar checks drawn by the associated banks in favor of the creditor banks. In New York the amounts due by debtor banks are paid in cash to the clearing-house manager, who in turn pays the creditor banks. For this purpose gold certificates issued by the United States Government are used, and also clearing-house gold certificates, which represent gold coin deposited with the clearing-house, and which are valid only in the settlement of clearing-house balances.

By the aid of the clearing-house, each bank can settle all of its relations to the banks of the city by a single payment, instead of adjusting its relations with each bank separately. Furthermore, settlements are effected by the transfer of a much smaller quantity of cash than would be otherwise required. Thus, in the first year of the New York Clearing-House, average daily clearings of \$19,104,594.94 were effected by average daily payments of \$988,078.06—but 5.17 per cent. In some years the percentage of balances paid in money has fallen as low as 3 per cent., and during the entire history of the New York Clearing-House has never reached so much as 7 per cent. The aggregate New York clearings were \$5,750,455,987 in 1854, and \$77,020,672,494 in 1901—the year of maximum exchanges. The aggregate exchanges reflect not only the growth of the city in importance as a commercial centre, but also the business conditions throughout the country—rising in times of notable prosperity and sinking in eras of depression. Thus, we may contrast the clearings of \$35,461,052,826 in 1873, \$48,565,818,212 in 1881, and \$37,660,686,572 in 1890, with clearings of \$22,000,000,000 in 1874, \$25,250,791,440 in 1885, and \$24,230,145,368 in 1894.

The New York Clearing-House is by far the most important in the United States. The excellence of the system embodied in it and the facilities which it affords to banks have been so generally appreciated that the institution has been widely copied, even in some of the smaller cities. On September 30, 1901, there were in the United States no fewer than ninety clearing-house organizations, which had, in the year ending on that date, transacted clearings to the extent of \$114,190,226,021. It must be said, however, that five-eighths of the aggregate belonged to New York City. Abroad, the London Clearing-House transacted business in 1901 to the amount of \$9,561,169,000. Clearing-houses exist on the Continent of Europe, though the use of checks in daily life is far less frequent there than in England and in the United States, and the clear-

ings are not so important. On the other hand, the institution is widely known in Canada, Australia, and other English colonies.

In the United States, the clearing-house associations not only furnish the facilities for settlements among banks which have been described, but also enable the banks to act as units in matters of banking policy. They establish rules of banking practice in the interest of the banks, as a whole, which individual banks would not be strong enough to maintain. Thus, many associations fix the rates to be charged for the collection of out-of-town checks. Certain associations prohibit the issue of certified checks by the members. Many details of practice are thus regulated by clearing-house rules. These associations, too, foster among the banks a feeling of solidarity of interest, and furnish an organ through which this can find expression. In times of financial distress, it may be a matter of supreme importance to all the banks that none go to the wall; for such an occurrence may cause a run upon all the banks and a general catastrophe. The stronger banks, under such circumstances, come to the aid of their weaker brethren.

Nowhere is the function of the clearing-house in sustaining the interests of the banks, and the general credit of the community, more apparent than in the issue of clearing-house loan certificates. The ordinary clearing-house gold certificate differs from a Government gold certificate only in the fact that the clearing-house, and not the Government, is the custodian of the gold. It is preferred over the Government certificate because it can be issued in denominations better suited to the needs of the banks. With these certificates the loan certificates have nothing in common. They are issued only in times of panic, to meet temporary emergencies, and are called in and canceled as soon as their work is done. In times of panic there is an unusual demand for means of payment. Under the national banking system of reserves, which permits the country banks to deposit a portion of their legal reserves in the commercial centres, this strain is felt quite severely in the money centres. It is only to a limited extent that such emergencies can be met by restricting discounts. In preparation for a demand which can be foreseen, this usually takes place; but at the moment of the crisis, credits must be expanded and loans discounted freely, if the storm is to be weathered. Where free banking exists, this is usually done through increased note issues; but the banking system of the United States does not admit of such an increase. The clearing-house loan certificate relieves the situation by substituting certificates based, not on cash, but on securities for the cash ordinarily used in clearing-house operations—thereby placing this cash at the disposal of the banks for the use of their customers.

The clearing-house requires a deposit of securities with a committee, and issues certificates bearing a relatively high interest—in New York City, six per cent., up to a certain per cent. of the securities deposited, generally 75 per cent. It generally provides that any loss arising from the issue of the certificates shall be assessed pro rata, either upon the capital and surplus or upon the average clearings of the banks. Thus the entire credit of the associated banks is pledged for the redemption of the certificates. The interest charge makes it to the advantage of the

banks to redeem as soon as possible the certificates issued to them, and they rarely last more than a few months. This expedient was first tried by the New York Clearing-House in 1860, and has been repeated in 1862, 1863, 1873, 1884, 1890, and 1893. In the latter year the issue began June 21 and ceased September 6. The issue, the largest in the history of the clearing-house, was \$41,490,000. The last certificate was redeemed November 1, a little more than four months after the first issue. While, since 1860, these issues in New York have amounted to over \$168,000,000, there has been no loss upon them. The example set by New York was pretty generally followed by other clearing-houses in 1873, and such issues have since been authorized by other associations to meet a general financial stringency or a local emergency.

BIBLIOGRAPHY. Cannon, *Clearing-Houses* (New York, 1900); White, *Money and Banking* (New York, 1902); Jevons, *Money and Mechanism of Exchange* (London, 1875); *Report of the Comptroller of the Currency* (1896).

CLEAR LAKE. A body of water in Lake County, Cal., about 90 miles north of San Francisco (Map: California, B 2). It is about 25 miles long by from two to six miles wide; there is a contraction in its southern part, which is known as 'Lower Lake.' It is situated in an elevated and picturesque region, which is a popular resort for field and water sportsmen. Lakeport is on the west shore, and Lower Lake at the southeastern end.

CLEARNESS. A quality in painting, in which light and shade (see CHIAROSCURO) is successfully achieved without a sacrifice of purity of color.

CLEARSTORY, or CLERESTORY. The upper part of any building lighted by a row of windows; or, more strictly, the upper part of the central nave of a church, in which windows were cut above the roof of the side-aisles. The object of the clearstory is to give direct light to the nave. Clearstories appear in all early Christian basilicas, and in a different form in Byzantine churches—as, e.g. that around the base of the dome of Saint Sophia. They are lacking in a certain class of early Romanesque churches with tunnel vaults and early groin vaults, especially in the south of France, Burgundy, and Lombardy, because the builders, who were then experimenting with vaulting, were afraid of its thrust, and did not dare to raise the spring of the main vault sufficiently above the supporting side-vaults to allow of the insertion of a line of windows below the spring. Such were San Ambrogio at Milan (groin vaults), Saint Etienne at Nevers, and Saint Sernin at Toulouse (tunnel vaults). After the twelfth century clearstories were again the rule.

CLEARWING. Any of the small moths of the family *Egeriidae*, with transparent wings, the caterpillars of which bore into the stems of trees or plants, and hibernate there. Many of the clearwings are so small, brilliantly colored, and unlike moths, that they are easily mistaken for wasps or flies. The most common is the currant-borer (*Egeria tipuliformis*), imported to America from Europe, and sometimes highly destructive to currant and gooseberry bushes. The peach-borer (*Sanina exitiosa*) is a pest in peach orchards.

CLEAVAGE (from *cleave*, AS. *clēofan*, Ger. *klieben*, to cleave, Lat. *glubere*, to peel, Gk. *γλύφειν*, *glyphēin*, to hollow out). In geology, a property induced, under certain conditions, during deformation in a rock by virtue of which the rock may be readily split into parallel layers or rods, i.e. parallel to a plane or line. It is a property possessed also by certain original gneisses that have not undergone deformation since their first solidification. Cleavage, in rare cases, may be parallel to planes of bedding that may be present in the rock-mass. The essential condition of rock-cleavage is a parallel dimensional arrangement of the constituent mineral particles of the rock. In certain minerals, such as mica, parallel dimensional arrangement carries with it a parallelism of the mineral cleavage. The cleavage of a rock may be observed to occur parallel to the greater diameters of the mineral particles, or to the parallel mineral-cleavages. When the two coincide, as in the case of mica, the rock-cleavage produced is parallel to one plane. Where they do not coincide, two rock-cleavages may be produced at angles to each other, as in the case of feldspar, although one may be conspicuous and the other obscure. The property of rock-cleavage is observed in rocks that have yielded to pressure by deformation without conspicuous fracture. This deformation can be induced only where the rock is under such great pressure from all sides that it flows rather than fractures. The planes or lines of rock-cleavage are further observed to be normal to the directions in which the rock-masses have been most shortened.

A number of processes probably coöperate to induce the parallel arrangement of mineral particles during the shortening of the rock-mass. Chief among these is the recrystallization of old mineral particles and the crystallization of new particles through the agency of contained water. This process results in the elongation of the mineral particles of the rock in the plane or line of greatest elongation of the rock-mass as a whole, and in shortening normal to this direction: in other words, it results in the flattening of the mineral particles through solution and deposition of mineral material. Other processes which produce rock-cleavage are the rotation into parallel position of previously existing particles whose axes have unequal length, and the flattening *in situ* of original mineral particles through the process known as gliding—i.e. differential movement along certain definite planes and crystals without fracture. Cleavage is found in almost all varieties of rocks which, under pressure, have been made to flow, although as a rule it is shown to best advantage in the finer-grained rocks. Rocks possessing the property of cleavage are called 'slates' or 'schists.'

(Basel, 1878); Tyndall, "Comparative View of the Cleavage of Crystals and Slate-Rocks," in *Philosophical Magazine*, 4th series, vol. xii. (London, 1856); Daubrée, *Géologie expérimentale*, vol. i. (Paris, 1879); Van Hise, "Principles of North American Pre-Cambrian Geology," in *Sixteenth Annual Report of the United States Geological Survey* (Washington, 1896).

CLEAVAGE OF CRYSTALS. Most crystals, owing to the regular arrangement of the molecules, possess directions along which cohesion is at a minimum. They, therefore, tend to fracture along planes normal to these directions, which are called 'planes of cleavage.' The tendency of a crystal to cleave is necessarily the same for any plane as for any other parallel plane; in other words, cleavage-planes have direction rather than position. Cleavage-planes, in their relative perfection and number, conform to the symmetry of the crystal in which they occur. Tendency to cleave along special planes determined in position as well as in direction is described as 'parting.' See **CRYSTALLOGRAPHY; MINERALOGY.**

CLEAVE LAND, MOSES (1754-1806). An American pioneer, the founder of Cleveland, Ohio. He was born in Canterbury, Conn.; practiced law, served in the Revolutionary War, and became a brigadier-general of militia in 1796. In 1795 he joined a number of others in purchasing from Connecticut, for \$1,200,000, the tract in Ohio known as the 'Connecticut Western Reserve.' He directed the surveyors who laid out the site of the present Cleveland, which was named after him. The form of the name was altered, in 1831, to Cleveland, by a newspaper editor, who wished to economize space for a headline.

CLEAVELAND, PARKER (1780-1858). A distinguished mineralogist. He was born in Rowley, Mass.; graduated at Harvard in 1799, was tutor in mathematics there from 1803 to 1805, was chosen professor of mathematics and natural philosophy and lecturer on chemistry and mineralogy in Bowdoin College—a position which he retained until his death, although many professorships in other colleges and the presidency of his own were offered to him. He gathered a valuable collection of minerals, and published a treatise on *Mineralogy and Geology* (1816, 3d ed. 1856), which earned for him the title of 'Father of American Mineralogy.'

CLEAVERS. See GOOSE-GRASS.

CLEBSCH, klēpsch, RUDOLF FRIEDRICH ALFRED (1833-72). A German mathematician, born at Königsberg, Prussia. He studied at Königsberg, where he was a pupil of Hesse, Richelot, and F. Neumann. He held the chair of theoretical mechanics at the polytechnic school in Karlsruhe from 1858 to 1863; was made professor of mathematics at Giessen in 1863, and at Göttingen in 1868. His attention was drawn to algebra and geometry by the study of Salmon's works. In 1868 he founded, with Neumann, the *Mathematische Annalen*. His vast contributions to the theory of invariants; his use of the notion of the deficiency of a curve; his applications of the theory of elliptic and Abelian functions to geometry and to the study of rational and elliptic curves, have secured for him a pre-eminent place among those who have advanced the science of geometry. His works upon the general theory of algebraic curves and surfaces began with the determination of those points upon an algebraic surface at which a straight line has four-point contact. Clebsch undertook to render the notion of 'deficiency' fruitful for geometry—a notion found first in Riemann's *Theorie der Abelschen Funktionen* (1857). By 'deficiency' of a curve is meant the difference between the number of its double points and the

maximum number possible in such a curve. (See CURVES.) Clebsch and Cremona studied the representation of cubic surfaces on a plane through a one-to-one correspondence—a notion that has led to the study of higher correspondences between surfaces by Cayley (q.v.) and Nöther. Clebsch solved, by aid of the addition theorem of elliptic functions (see FUNCTIONS), the generalized form of Malfatti's Problem. He also solved (1862) the so-called 'Pfaflian Problem' of differential equations, by making it depend upon a system of simultaneous linear partial differential equations whose statement is possible without integration. Clebsch took a leading part in showing the great significance of the theory of invariants for the theory of hyper-elliptic and Abelian functions; and to him is due the transformation of the theory of binary to that of ternary forms. (See FORMS.) He died at Göttingen, November 7, 1872. Vol. vii. of the *Mathematische Annalen* contains an excellent article on Clebsch, in which the value of his works is estimated by Brill, Gordan, Klein, Mayer, Nöther, and other contemporaries. His *Vorlesungen über Geometrie* were edited by Lindemann (Leipzig, vol. i. 1875-76, vol. ii. 1891).

CLEBURNE. A town and the county-seat of Johnson County, Tex., 55 miles southwest of Dallas; on the Gulf, Colorado and Santa Fe Railroad (Map: Texas, F 3). It has a large trade in grain, live stock, cotton, wool, hides, and produce, besides considerable interests as a distributing centre. The town contains cotton-compresses, cottonseed-oil mills, flour-mills, foundry and machine-shop, etc.; and division offices and shops of the Gulf, Colorado and Santa Fe Railroad. Population, in 1890, 3278; in 1900, 7493.

CLEBURNE, PATRICK ROXAYNE (1828-64). An American soldier, prominent as a Confederate officer during the Civil War. He was born in County Cork, Ireland; studied medicine for a time at Trinity College, England; ran away from home, and served for several years in the British Army. In 1855 he emigrated to the United States, and settled in Helena, Ark., where he studied law, was admitted to the bar, and practiced with considerable success. On the outbreak of the Civil War, he enlisted in the Confederate Army as a private, but by March, 1862, rose to the rank of brigadier-general. He commanded a brigade at the battle of Shiloh; was wounded in the battle of Perryville, Ky., on October 8, 1862; was promoted to be major-general in December of that year; was distinguished for gallantry at Murfreesboro, and at Chickamauga led a brilliant charge, and earned the title, 'The Stonewall of the West.' In the battle of Missionary Ridge he commanded the right wing of the Confederate army; subsequently took a conspicuous part, as division commander under Johnston, against Sherman, and as a corps commander under Hood, in the Atlanta campaign against Sherman, and later, in the Tennessee campaign against Thomas and Schofield; and at the battle of Franklin, on November 30, 1864, he was killed while leading a charge on the Federal works. He was one of the organizers of the 'Order of the Southern Cross,' and was one of the first men in the Confederacy to advocate the use of colored troops. Consult the biographical sketch, by General Gordon, in *Southern Historical Society Papers*, vol. xviii. (Richmond, 1889).

CLECK/HEATON. A town in the West Riding of Yorkshire, England, two and one-half miles southwest of Bradford (Map: England, F 3). It has manufactures of woollens, worsteds, and blankets. Population, in 1891, 11,800; in 1901, 12,500.

CLEDON/ISMAN'CY. See SUPERSTITION.

CLEETHORPE WITH THRUNS'COE. A progressive town and railway-junction in Lincolnshire, England, two and one-fourth miles east-southeast of Grimsby (Map: England, F 3). It owns a new market and recreation-grounds. There is an electric-lighting plant. Population, in 1891, 4300; in 1901, 12,600.

CLEF (Fr. key). A musical symbol, which is placed on the staff, to fix the pitch of one note, and thereby also to determine that of the succeeding notes. There are three kinds of clefs—viz. the G (treble), and C (tenor), and the F (bass). The G clef is placed on the second line, thus:

the C clef on the third line, thus:

and the F clef on the fourth line, thus:

The C clef is a fifth below the G clef, and a fifth above the F clef, thus:

The C clef is also placed on the fourth line for some instruments, and for the tenor part in vocal music, thus:

and in old vocal music the C clef placed on the first line was used for the soprano. The tendency at present, in vocalization, is to do away with

the C clef. The signature  is a descendant of

G, through many stages of transformation. The development of the two other clef-symbols from the letters C and F, though not so obvious to the eye, is as much a matter of history as is the former case.

CLEISHBOTHAM, klēsh'bōTH-am, JEDEDIAH. The imaginary 'collector' in Scott's series of novels, *Tales of My Landlord*. He claims to be schoolmaster and parish clerk of Gandercluch, in which capacity he meets Peter Pattieson, the equally fictitious writer of the stories.

CLEISTHENES, klis'thē-nēz. See CLISTHENES.

CLEISTOG'AMOUS FLOWERS (Gk. κλειστός, *kleistos*, that which may be closed, from κλείειν, *kleíein*, to close + γάμος, *gamos*, marriage). Relatively inconspicuous and never-open flowers, which occur, along with the ordinary flowers, in many plants, representing all of the principal alliances of the flowering plants. Cleistogamous flowers are seldom in a conspicuous position. One of the best-known illustrations is in the stemless species of violets. In these, in addition to the well-known conspicuous flowers, cleistogamous flowers occur more or less concealed near the base of the cluster of leaves and

flower-stalks. Since these flowers are never open, they are necessarily self-pollinated; but they are very fertile, and produce an abundance of seed. The significance of this dimorphism in the flowers of so many plants is not clear. It has been suggested that, in case cross-pollination is not secured by the showy flowers, the presence of self-pollinating cleistogamous flowers makes seed-production secure. However, some plants with cleistogamous flowers, as grasses and rushes, are anemophilous (wind-pollinated), so that it is not a habit entirely related to the uncertainties of pollination by insects. In comparing the development of the cleistogamous and ordinary flowers, it is discovered that the former are like the latter at various stages of development.

The following quotation from Darwin's *Different Forms of Flowers* presents some detailed differences: "In cleistogamous flowers, the petals are rudimentary or quite aborted; their stamens are often reduced in number, with anthers of very small size, containing few pollen-grains, which have remarkably thin, transparent coats, and generally emit their tubes while still inclosed within the anther-cells; and, lastly, the pistil is much reduced in size, with the stigma in some cases hardly at all developed. These flowers do not secrete nectar or emit any odor: from their small size, as well as from the corolla being rudimentary, they are singularly inconspicuous. Consequently, insects do not visit them; nor, if they did, could they find an entrance. Such flowers are, therefore, invariably self-fertilized; yet they produce an abundance of seed. In several cases, the young capsules bury themselves beneath the ground, and the seeds are there matured. These flowers are developed before, or after, or simultaneously with the perfect ones."

CLEISTOGAMY.

A plant of *Polygala polygama*, showing ordinary flowers on erect aerial stems, and numerous cleistogamous flowers on underground stems.

CLEISTOG'AMY. Flowers which remain closed through the blooming period, and hence for the most part exclude pollen from other

flowers (cross-pollination) are said to exhibit cleistogamy. See CLEISTOGAMOUS FLOWERS; POLLINATION.

CLE'LAND, WILLIAM (c.1661-89). An English Covenanting poet. He is supposed to have been born in Lanarkshire, Scotland. After leaving Saint Andrew's University, he joined the Covenanters, and at Bothwell Bridge acted as captain. He was afterwards made lieutenant-colonel of the Cameronian Regiment, under Lord Angus Cameron, which was sent to put down the uprising that followed the fall of Claverhouse at Killiecrankie. The Cameronians held out after a whole day's fighting at Dunkeld (August 21, 1689) against heavy odds; but during the action Cleland was killed. He wrote *Secular Poems and Verses*, which appeared posthumously in 1697; but he is better known through his connection with the Cameronian Regiment.

CLÉLIE, klá'lé'. The heroine of a romance of the same name, by Mademoiselle de Soudéry, originally issued under her brother's name (1656).

CLÉMANGES, klá'mánzh', NICOLAS DE (c.1360-c.1434). A French theologian—one of the ablest Roman Catholic theologians of the Middle Ages. He was educated in Paris, where he studied theology under Pierre d'Ailly. He was chosen rector of the university in 1393, and was esteemed, with his teacher and Gerson, the glory of the institution. He was an ardent advocate of reform in the Church, wrote strongly against the immoral lives of many of the higher clergy, and labored, with great pertinacity, to heal the schism then existing—especially by preventing the election of another Antipope in place of the so-called Clement VII. But when Pedro de Luna (q.v.) was elected by the Avignon Cardinals in 1394, taking the name of Benedict XIII, Clémanges became his secretary, thinking that in this position he could render a service to the divided Church. When, in 1407, it came to a breach between Benedict and the French Court, Clémanges, unjustly suspected of being the author of the bull of excommunication launched by Benedict against the King, left Avignon, and went first to his canonry at Langres, and then into the retirement of the Carthusian monasteries at Valprofonds and Fontaine-du-Bosc. Here he pursued his studies, and produced several important works upon the study of the Bible, and upon the corruptions then existing in the Church. In 1415 he exercised a great influence on the Council of Constance, though never present in person, and made a strong plea for Church unity and purity. In 1425 he returned to Paris and to his lectures on rhetoric and theology in the university, and there died, probably in 1434. His collected works, with a life by J. M. Lydius, appeared at Leyden in 1613. The often-quoted *De Ruina Ecclesie seu de Corrupto Ecclesie statu*, while frequently attributed to Clémanges, is demonstrably not his. Consult Müntz, *Nicolas de Clémanges, sa vie et ses écrits* (Strassburg, 1846).

CLEM'ATIS (Gk. κληματις, klēmatīs, brush-wood, from κλίμα, klēma, vine-shoot, from κλῖν, klan, to break). A genus of plants of the natural order Ranunculaceæ, having four colored sepals, petals small or none, and numerous one-seeded achenes, with long, generally feathery, awns. The species, which number about 150, are

herbs or shrubs, generally with climbing stems, mostly natives of temperate climates, and much scattered over the world. They possess more or less active properties. The long awns of some species give the plants a beautiful appearance even in winter. The flowers of many species are also beautiful. *Clematis vitalba*, the common traveler's-joy, is the only native of Great Britain, where it is common in the south, but becomes rarer toward the north, and is scarcely found in Scotland. The stems are capable of being made into baskets. It rapidly covers walls or unsightly objects. The fruit and leaves are acrid and vesicant; the leaves are used as a rubefacient in rheumatism, and those of other species are also employed in the same way. About twenty species are indigenous to North America, and of these *Clematis Virginiana*, or virgin's-bower, is very widely distributed and is common along wooded river-banks and roadside walls, making a very showy appearance with its graceful sprays of white flowers. Its fertile flowers are succeeded by fruit with conspicuous feathery tails. *Clematis verticillaris*, with peduncles bearing large, single, bluish-purple, and drooping flowers, is a rare species, found in rocky woods, from Maine to western New England, and thence to Virginia, Wisconsin, and northwestward. *Clematis viorna*, popularly called leather-flower, has very thick purplish sepals, ovate or oblong leaflets, fruit with very plumose tails, and grows in rich soils in the Middle and Southern States. *Clematis Pitcheri*, a species found along the Mississippi from Illinois southward, has a bell-shaped calyx, dull, purplish sepals, and noticeably reticulated leaves. *Clematis ochroleuca*, a rare species, found in Long Island, Pennsylvania, and New Jersey, has simple and entire leaves, silky beneath, and fruit with very plumose tails. Among the many species seen in our gardens are *Clematis viticella*, with its solitary, bell-shaped blossoms, and *Clematis florida* and *Clematis patens*, with large blue and purple flowers, natives of Japan. One of the most pleasing, an evergreen, with large white flowers, is *Clematis indivisa*, a native of New Zealand. Some species, as *Clematis flammula*, are found in southern Europe and in the mountainous parts of northern Africa. The colors of the blossoms in this genus vary from pure white to yellow, deep purple, and ruby or scarlet. Some species are propagated by young cuttings, or by layers; others by grafting the year-old shoots in spring on the roots of common species, or they may be raised from seed in any light soil. Numerous hybrid and otherwise improved varieties are in cultivation. A serious disease affecting clematis is due to attacks of nematode worms on the roots. The disease seems worst in houses and along protected walls. Fresh soil, or soil in which the worms are killed by heat or cold, is about the only remedy.

CLÉMENCEAU, klám'än'só', GEORGES BENJAMIN EUGÈNE (1841—). A French politician, born at Vendéc, in the Department of Vendée, September 28, 1841. While studying medicine in Paris, Clémenceau engaged in political intrigues, and his extreme republican views cost him his privileges as a student. He went abroad for some time, and paid a short visit to the United States. On his return to France in 1869, he finished his medical course and began the practice of his profession.

There he acquired great political influence, and after the fall of the Empire was chosen mayor of the Eighteenth Arrondissement (Buttes-Montmartre), and member of the Commission of Education. In 1871 he was elected to the National Assembly, where he voted throughout with the Extreme Left. During the stormy period of the Commune, Clémenceau acted with moderation and good sense. After unavailing efforts to bring about a reconciliation between the Government and the Commune, he resigned his office of mayor, and gave up his seat in the Assembly. In July, 1871, he was elected to the Municipal Council, and rose to be president of that body; in 1876 he became a member of the Chamber of Deputies, and soon acquired considerable prominence as the leader of the Extreme Left, and the opponent, successively, of Gambetta, Ferry, and the Boulangists. The Panama disclosures of 1892 had a damaging effect on Clémenceau's political reputation, and he lost his seat in the Chamber. For the last ten years he has figured more as a journalist than as a politician, devoting himself mainly to the editing of the radical journal *La Justice*, founded by him in 1880. He published *Les massacres d'Arménie* (1896); "L'iniquité," "Contre la justice," and "Vers la réparation" (1899-1900), reprints of articles in *L'Aurore* on the Dreyfus Affair, championing Dreyfus; and also several works of fiction and one or two social studies. In 1902 he was elected a member of the Senate. Consult Pelletan. *Célébrités contemporaines* (2 vols., Paris, 1888).

CLEMENS, klém'enz, JEREMIAH (1814-65). An American lawyer and politician. He was born at Huntsville, Ala., and graduated at the University of Alabama in 1833. He was admitted to the bar in 1834; served for several terms in the State Legislature, and distinguished himself in the Mexican War. He was United States Senator from 1849 to 1853; was Presidential Elector in 1856, and during the Civil War accepted office under the Confederacy, though he never favored secession. In 1864 he became a Unionist, and advocated the reelection of Lincoln. He was the author of several novels, including *The Rivals: A Tale of the Times of Aaron Burr and Alexander Hamilton* (1859); and *Tobias Wilson: A Tale of the Great Rebellion* (1865).

CLEMENS, SAMUEL LANGHORNE (1835—). An American novelist and humorist, better known as 'Mark Twain'—a name derived from calls used in taking soundings on the Mississippi, and first employed by Mr. Clemens in newspaper work in 1863. It had previously been taken as a pen-name by Capt. Isaiah Sellers, in the New Orleans *Picayune*. Mr. Clemens was born at Florida, Mo., November 30, 1835. He received the common-school education of a frontier town, entered a printing-office in 1848, and, becoming an expert compositor, worked at this trade in Saint Louis, New York, and other cities. In 1851 he gave up printing, and became a steam-boat pilot on the Mississippi, accumulating a fund of experience that he was later to turn to unique literary account. The Civil War closed this livelihood to him. He joined a volunteer squad of Confederate sympathizers, remaining with the command for a few weeks, but seeing no active service. Then he went to Nevada with his brother, who had been appointed Territorial

Secretary, and at Virginia City became a reporter and staff writer for the *Territorial Enterprise*, revealing here first to the public his powers of humorously exaggerated description and sarcastic wit. From Nevada he followed the trend to San Francisco, tried mining in Calaveras County, made a voyage to the Sandwich Islands, and attracted attention as a humorous lecturer and writer of localized fiction. The success of his lectures and a book called by the name of the first story, *The Jumping Frog of Calaveras County* (1867), led to his participating, with journalistic intent, in an excursion to the Orient. His letters about his trip, in revised form, became the well-known *Innocents Abroad* (1869), which won him fame on both continents. Then for two years (1869-71) Clemens edited the *Buffalo Express*. In 1872 he gathered reminiscences of far-Western life in *Roughing It*. He moved to Hartford and became a frequent contributor to magazines and journals, chiefly in a vein of exaggerated humor. His next book was *The Gilded Age* (1873), written in collaboration with Charles Dudley Warner, and afterwards successfully dramatized. Then came *The Adventures of Tom Sawyer* (1876). A second trip to Europe furnished material for *A Tramp Abroad* (1880); then followed *The Stolen White Elephant* (1882); *The Prince and the Pauper* (1882), an historical romance; *Life on the Mississippi* (1883); and *Huckleberry Finn* (1885). In 1884 he engaged in the publishing enterprise of Charles L. Webster and Company, the failure of which, about a decade later, led him to make a lecture tour around the world (1895-96), by means of which he reestablished his fortune and more than cleared his commercial honor. For ten years after 1890, Mr. Clemens lived chiefly in Europe. During this period he published *A Connecticut Yankee at King Arthur's Court* (1889); *The American Claimant* (1892); *Merry Tales* (1892); *The £1,000,000 Bank Note* (1893); *The Tragedy of Pudd'nhead Wilson* (1894); *Tom Sawyer Abroad* (1894); *Personal Recollections of Joan of Arc* (1896); *More Tramps Abroad* (1897); *Following the Equator* (1897); *The Man that Corrupted Hadleyburg* (1900); and since his return to America *A Double-Barreled Detective Story* (1902). A uniform edition of his works is issued by the Harpers. Although popularly known as a humorist, Mr. Clemens has a thoroughly serious side to his character, as has been shown by his discussion of political questions. He is also gifted with literary acumen, as he showed in a review of Professor Dowden's *Life of Shelley*, and in other papers subsequently collected in book form. But his best, and perhaps his most permanent work, has been done as a picaresque novelist in the *Adventures of Tom Sawyer* and the *Adventures of Huckleberry Finn*. No other writer has so vividly portrayed the irresponsible American boy, or so given his readers an adequate impression of the large, homely, spontaneous life led by native Americans in the great Valley of the Mississippi.

CLEMENS, klēmēnz, TITUS FLAVIUS. See CLEMENT OF ALEXANDRIA.

CLEMENT (Lat. *clemens*, merciful, Gk. κλήμης, klēmēs). The name of fourteen popes. CLEMENT I., commonly known, in historical theology, as 'Clement of Rome,' is probably not identical with the Clement mentioned in Phil. iv. 3. After

the Apostles, however, no one stood in higher honor among the early Christians; in fact, he is sometimes, as by Clement of Alexandria, called an 'apostle.' In the lists of bishops which began to be produced in the latter half of the second century, Clement stands third from Peter in the Roman succession—the best order being Linus, Anacletus, Clement. The provisional dates assigned to him by the best modern historians are A.D. 88-97; but there is much uncertainty about them. According to Jerome, Clement lived until the third year of Trajan (A.D. 101). His Epistle may be dated with high probability in the year 95 or 96. It was written in the name of the church in Rome to that in Corinth, and contains fraternal advice and counsel in view of disturbances which had arisen in the latter church. It is an important source for the history of Primitive Christianity. It was for a long time honored as 'Scripture,' and read in public worship as late as the fourth century. The other documents which bear Clement's name are not from him. What is known as II. Clement appears to be a second-century homily, of unknown origin. Several spurious epistles are attributed to him, besides the pseudo-Clementine 'Recognitions and Homilies,' on which see CLEMENTINA. Consult: J. B. Lightfoot, *The Apostolic Fathers*, part i.; *Saint Clement of Rome* (London, 1890); Knopf, *Der erste Clemensbrief* (Leipzig, 1899); Gregg, *The Epistle of Saint Clement, Bishop of Rome* (London, 1899); Krüger, *History of Early Christian Literature* (New York, 1897); Harnack, *Chronologie der altchristlichen Litteratur* (Leipzig, 1897); Brüll, *Der erste Brief des Clemens von Rom an die Corinthier* (Freiburg, 1883).—CLEMENT II., Pope 1046-47. He was a Saxon, Suidger by name, and Bishop of Bamberg. The Emperor Henry III., whose Chancellor he had been, made him Pope on the setting aside of the three rival claimants, Benedict IX., Gregory VI., and Sylvester III.; and he crowned Henry the next day. He was a determined opponent of simony, against which he held a synod a few months before his death.—CLEMENT III., Pope 1187-91. He was a Roman by birth, and Cardinal-Bishop of Palestrina. He settled some of the troubles between the Popes and the Roman people, incited Philip Augustus and Henry II. of England to undertake the Third Crusade, and in 1188 made the Scottish Church directly dependent upon Rome, removing it from the jurisdiction of the archbishops of York. The title of CLEMENT III. was also assumed by Wibert (Guibert), Antipope from 1080 to 1099 (died 1100).—CLEMENT IV., Pope 1265-68. Gui Foulquois le Gros, born at Saint Gilles, on the Rhône, of a noble Provençal family, at first a soldier, later Archbishop of Narbonne and Cardinal-Bishop of Sabina. He supported Charles of Anjou in his claim to the crown of the Two Sicilies, against Manfred, the natural son of the Emperor Frederick II. He was a man of austere piety, and set his face steadfastly against nepotism. He encouraged and protected Roger Bacon.—CLEMENT V., Pope 1305-14. Bertrand de Goth, Archbishop of Bordeaux. He was strongly under the influence of Philip the Fair, at whose bidding he suppressed the Order of Templars (see **TEMPLAR KNIGHTS**), and was the first of the Popes to reside at Avignon, which continued to be the seat of the Papacy for nearly

seventy years. Consult Rabanis, *Clément V. et Philippe le Bel* (Paris, 1858); Lacoste, *Nouvelles études sur Clément V.* (Bordeaux, 1896).—CLEMENT VI., Pope 1312-52. Pierre Roger, Archbishop of Rouen, and like his three predecessors a Frenchman. He too was entirely under French influence, and refused to return from Avignon to Rome, in spite of a formal invitation delivered by a delegation headed by Petrarch. He excommunicated the Emperor Louis of Bavaria, and compelled him to submit to the most humiliating conditions. As suzerain of the Kingdom of Naples, he acquitted Queen Joanna of the murder of her husband, and purchased the territory of Avignon from her for 80,000 crowns. He maintained the ecclesiastical jurisdiction against the encroachments of Edward III. of England, and made some negotiations for a reunion with the Eastern Church. He lived in great splendor, and contributed largely to the beautifying of the Avignon residence.—CLEMENT VII., Pope 1523-34. Giulio de' Medici, born about 1475. Before his elevation, he had acquired some reputation for capacity in affairs which the unfortunate events of his pontificate showed to have been ill-founded. His worldliness and lack of insight into the tendencies of the age disqualified him from comprehending the great upheaval which threatened the Church, while his timidity and indecision no less disabled him from following a consistent policy in secular affairs. He was at first attached to the Imperial interest, but by the overwhelming success of the Emperor Charles V. in the battle of Pavia was terrified into joining the other Italian powers in a league with France. But his zeal was soon cooled, and by want of foresight and unreasonable economy he laid himself open to an attack from the turbulent Roman nobles, which obliged him to invoke the mediation of the Emperor. When this danger seemed past, he veered back to his former engagements, and ended by drawing upon himself the army of the Constable de Bourbon. On May 6, 1527, followed the memorable and terrible sack of Rome by the Imperial troops. The Pope retired to the Castle of Sant' Angelo, where he was kept a prisoner for over six months. He was released upon very onerous conditions, and fled immediately to Orvieto. The following year he returned to Rome, and in 1529 he made his peace with Charles V., who undertook to assist in the restoration of the Medici in Florence, and whom the Pope crowned at Bologna in 1530. For several years Clement followed a policy of subservency to the Emperor, on the one hand endeavoring to induce him to act with severity against the Lutherans of Germany, and on the other striving to elude his demand for a general council. The loss of half of Germany to the Church, and the breach with England, occasioned by the Pope's refusal to sanction the divorce of Henry VIII., made this a most unfortunate pontificate. Consult: De' Rossi *Memorie storiche del pontificato di Clemente VII.* (Rome, 1837). The title of CLEMENT VII. was also assumed by Robert of Geneva, Antipope (see ANTIPOPE), 1378-94.—CLEMENT VIII., Pope 1592-1605. Ippolito Aldobrandini, born about 1536. He brought about the reconciliation of Henry IV. of France with the Church (1593), and, on the extinction of the male line of the house of Este, annexed Ferrara, the last addition of importance to the States of the Church. He acted as medi-

ator in the negotiations which resulted in the Peace of Vervins. The last years of his pontificate were occupied, among other important questions, by the controversy between the Jesuits and Dominicans on the question of grace, which led him to establish in 1597 the celebrated *Congregatio de Auxiliis Divine Gratie*. He was a man of marked piety; he confessed daily to Saint Philip Neri, and after the latter's death to his successor in the headship of the Oratorians, Cardinal Baronius. His love for letters was shown by his promotion of a number of learned scholars to the purple, and the issue of revised editions of the Vulgate, the breviary, and the liturgical books. The title CLEMENT VIII. was also assumed by Egidius Nuñez, Antipope, 1425-29.—CLEMENT IX., Pope 1667-69. Giulio Rospigliosi. He was born in 1600 and studied in the Roman Seminary. As Nuncio to Spain, he acquired an insight into political affairs, and an influence which enabled him, after his elevation to the Papal throne, to bring about the peace of Aix-la-Chapelle (1668) between France and Spain. He endeavored to adjust the Jansenist difficulties in France, but his efforts failed to bring about a permanent peace.—CLEMENT X., Pope 1670-76. Emilio Altieri, born 1590. He was the immediate successor of Clement IX., who had made him a cardinal but a few months before his death, and with his last breath designated him as his choice for the Papal throne. In consequence of his advanced age, he left much of the government to his nephew, Cardinal Paluzzo Paluzzi.—CLEMENT XI., Pope 1700-21. Giovanni Francesco Albani, born 1649. He was employed in many important diplomatic affairs, and made cardinal a few months before his election to the Papacy. His pontificate was troubled by many disputes, with Prussia, with the Empire, and with the recalcitrant Jansenists in France, against whom he launched the famous constitutions *Vincam Domini Sabaoth* (1705) and *Unigenitus* (1713). Another important decision by this Pope forbade the Jesuit missionaries in China to employ certain native ceremonial forms in China and India which they had adopted in their mission work to overcome native prejudices.—CLEMENT XII., Pope 1730-40. Lorenzo Corsini, born 1652, made cardinal 1706. He was more distinguished as a wise and kind-hearted temporal sovereign, who did much for both art and industry in his dominions, than as a great international power. In 1738 he condemned the Freemasons.—CLEMENT XIII., Pope 1758-69. Carlo Rezzonico, born 1693; made cardinal 1737, on the recommendation of Venice, his native State. His reign was occupied with unceasing struggles for the rights of the Church, and for the preservation of their ardent champions, the Jesuits, against the liberalizing governments of his day, such as those controlled by Pombal in Portugal and Choiseul and Madame de Pompadour in France. He witnessed, however, the expulsion of the Jesuits from Portugal, France, and Spain. It was believed that he was about to yield to the demand for the suppression of the Order, when he died, leaving these thorny questions to his successor, Clement XIV.—CLEMENT XIV., Pope 1769-74. Giovanni Vincenzo Antonio Ganganelli, born 1705 at Sant' Arcangelo, near Rimini, where his father was a physician. At the age of eighteen he entered the Order of Minorites, and studied philosophy and theology,

which he afterwards successfully taught. His merits were appreciated by the keen-sighted Benedict XIV., who appointed him to the important post of counselor to the Inquisition, and under Clement XIII. he was made a cardinal. No Pope had ever confronted greater difficulties on his accession. The kings of Portugal, France, Spain, and Naples were at variance with him, chiefly on account of his support of the Jesuits; Venice wished to reform the religious orders without his interference; Poland was seeking to diminish his influence; the Romans themselves were discontented. He first set about reconciling the monarchs; he sent a nuncio to Lisbon, suspended the bull *In Cena Domini*, and entered into negotiations with Spain and France. After several years of negotiation he signed, on July 21, 1773, the famous brief *Dominus ac Redemptor noster*, suppressing the society of the Jesuits. The motive assigned in the brief is, "regard to the peace of the Church." From this time he showed signs of constant inquietude and uncertainty as to whether he had acted rightly in this grave matter, and his strength gradually gave way. He died of a scorbutic disease, September 22, 1774. Clement XIV. was remarkable for liberality of mind, address as a statesman, sound learning, and mildness of character. He cherished the arts and sciences, and was the founder of the Clementine Museum, which, by the additions of Pius VI. and Pius VII., became the chief ornament of the Vatican. Consult: A. Theiner, *Geschichte des Pontificats Clement XIV.* (Paris, 1853); Von Remmont, *Ganganelli (Pope Clement XIV.), seine Briefe und seine Zeit* (Berlin, 1847); Ravignan, *Clément XIII. et Clément XIV.* (Paris, 1854).

CLEMENT OF ALEXANDRIA (Lat. *Clemens Alexandrinus*, Gk. Κλήμης Ἀλεξανδρείος, *Klēmēs Alexandreios*) (c.150-c.215). Titus Flavius Clemens, a celebrated Greek father of the Church. He was probably of heathen parentage, and his birthplace is unknown. He received a liberal education, and sought out many teachers in his search for truth. He finally resorted to the Christian Pantænus, who presided over the catechetical school at Alexandria, and here he entered the Church. He was ordained a presbyter, and succeeded Pantænus as head of the famous school, which was destined to achieve much greater renown because of the influence of his own and Origen's teaching. During the persecution in the reign of Septimius Severus (c.203 A.D.), Clement left Alexandria. We hear of him afterwards in Palestine and Asia Minor; but his later life is veiled in obscurity, and we know neither the place nor the date of his death.

Clement was a man of wide learning, and was proficient in Greek philosophy, literature, and history. Jerome called him 'the most learned of men;' but this is mere friendly exaggeration. As a theologian he ranks high, although inferior to his famous pupil, Origen (q.v.). According to his system, the divine Logos exhorts, educates, and perfects the true Christian gnostic, through a gradual process which is marked out, in three stages, in Clement's chief works—the *Exhortation to the Greeks*, the *Instructor*, and the *Stromata* ('miscellaneous'), which together form a kind of trilogy. The first is a defense of the faith, designed to win converts. The second contains instructions in manners and morals for

every-day life. In this Clement has not hesitated to draw freely from Stoic sources. The third is an unsystematic discussion of various points of doctrinal theology, designed to guide the mature Christian to a perfect knowledge (gnosis). Appended to the *Stromata* is one of the earliest Christian hymns, familiar to the modern world in the version beginning, "Shepherd of tender youth." Of Clement's other writings the best known is the tractate, *Who is the Rich Man that Shall be Saved?* In his interpretation of Scripture Clement followed the allegorical method, so much in vogue in Alexandria. The best edition of Clement's works is by Potter (Oxford, 1715), reprinted in Migne's *Patrol. Græc.*, viii. and ix. (Paris, 1857).

An English translation may be found in the *Ante-Nicene Fathers*, vol. ii., ed. by A. C. Coxe (New York, 1885). Consult in general, the article "Clement," in Smith and Wace, *Dictionary of Christian Biography* (London, 1877-87); Charles Bigg, *The Christian Platonists of Alexandria* (Oxford, 1886); F. R. M. Hitchcock, *Clement of Alexandria* (London, 1899); and Eugène de Faye, *Clément d'Alexandrie* (Paris, 1898).

CLÉMENT, klá'mäx', JACQUES (c.1567-89). The assassin of Henry III. of France. He was born at Sorbon, in the Department of Ardennes, and in early life seems to have been a soldier. Later he entered a Dominican convent in Paris. Ignorant, passionate, and probably also demented, Clément became a fanatic partisan of the League in its struggle against the French King and Henry of Navarre. After the murder of the Duke of Guise and his brother, at Blois, in 1588, Clément began to think of himself as the instrument selected by Heaven to overthrow the "tyrant," that is, Henry of Valois, and to avenge the death of the two great leaders of the League. He is said to have confided his plan to assassinate the King to Bourgoing, the prior of his convent, and to have received the latter's approbation. It is asserted also by historians friendly to the cause of Henry of Navarre that the plan was brought to the knowledge of the Cardinal of Mayenne and his sister, the Duchesse de Montpensier, and that it was, in fact, carried out with their assistance; but historians friendly to the League deny that its leaders had any previous knowledge whatever of Clément's murderous scheme. Letters of introduction to the King were obtained for Clément from the president, Harlay, and the Count de Brienne, who were then prisoners of the League in Paris. On July 31, 1589, Clément set out for Saint Cloud, from where Henry III. was directing the operations against the capital. On the morning of August 1, he was admitted to the presence of the King as the bearer of an important letter, and while the King was reading it, stabbed him. Henry threw the knife into the assassin's face, exclaiming: "Oh! the wicked monk; he has killed me! Put him to death!" Clément was immediately cut down and his body was subsequently quartered and burned. The King died the next day. By the zealots among the Leaguers, the deed was received with undisguised rejoicing, and according to Daubigné, a Protestant, the act of Clément was praised from the pulpit, and the monk declared a martyr. De Thou, a partisan of Henry IV., asserts that Pope Sixtus V. lauded Clément, but both Daubigné's and de Thou's statements

have no authority beyond their own assertion. For a defense of the assassination of Henry III., consult Pinsolot, *Le martyre du frère Jacques Clément* (Paris, 1589).

CLÉMENT, JEAN PIERRE (1809-70). A French political economist and historian, born at Draguignan. He was an official in the Ministry of Finance, and wrote, with the aid of original documents, a number of authoritative works on finance, particularly French financial administration. These include: *Histoire de la vie et de l'administration de Colbert* (1846); *Histoire du système protecteur en France depuis Colbert jusqu'à la révolution de 1848* (1854); and *Etudes financières et d'économie sociale* (1859).

CLEM'ENT, JUSTICE. An 'old merry magistrate' in Jonson's *Every Man in His Humour*, who threatens Cob with jail because "he depraves and abuses an herb so generally received into the courts of princes"—i.e. tobacco.

CLEMENTI, klā-mēn'tē, JACOPO DI, DA EMPOLI (often called CHIMENTI) (1554-1640). An Italian painter of the Florentine school, born at Empoli. He was a pupil of Tommaso di San Friano (or Tridano), and was influenced by the works of Andrea del Sarto and other Florentine masters. In his own canvases his manner is severe to rigidity, his treatment often realistic, and his color pleasing. Among his chief paintings are "Christ in Gethsemane," in the Prado Museum, Madrid; "Saint Ives," and the "Sacrifice of Isaac" in the Uffizi Gallery, Florence. He was also a painter of still life.

CLEMENTI, klā-mēn'tē, MUZIO (1752-1832). An Italian piano virtuoso and composer, born in Rome. His father, a goldsmith and fervent music-lover, placed him under a relative, Baroni, for lessons in piano and harmony, and in 1761 Clementi became an organist. Later on, Carpani taught him counterpoint; and Sartarelli, singing. In 1766 an Englishman, Beckford, delighted with his playing, took him to England, where he continued his musical studies until 1770. He was now a finished virtuoso, and published three piano sonatas (Op. 2)—the first works of this kind that bear the modern form. His success as a performer in London was extraordinary, and in 1777-80 he was cembalist (conductor) at the Italian opera there. His first tour (1781) included Strassburg, Munich, and Vienna, where his public contest with Mozart became an historic event, though the palm was awarded to neither. He aroused great enthusiasm in Paris (1785), but, in spite of it, decided to enter business. He returned to London, secured an interest in the publishing and piano-manufacturing firm of Longman & Broderip, and after its failure formed a partnership with Collard. The mechanical perfection of the piano absorbed most of his energies, yet he found time to write theoretical works, and to give instruction—a field in which he had no rival. His concert tours in Russia (1802), and afterwards in Germany and Italy, were wonderfully successful; but his enterprises in London, by which he amassed a fortune, claimed most of his attention. He retired in old age to his estate at Evesham, near London, and died there March 10, 1832. Among Clementi's pupils, Field, Cramer, Moscheles, Kalkbrenner, and Meyerbeer are the most noteworthy. Even Beethoven owes much to Clementi in his works for the piano. His style as a performer was that

of a virtuoso, characterized by polish, vigor, and brilliancy, and a beautiful singing tone; and he especially excelled in improvisation. Of his works the sonatas are brilliant and melodious, while his series of exercises, *Gradus ad Parnasum* (1817), remains an indispensable work in every pianist's equipment. Consult: Ferris, *Great Violinists and Pianists* (New York, 1894); Shedlock, *The Pianoforte Sonata* (London, 1895); Frojo, *Muzio Clementi, la sua vita, le sue opere e sua influenza sul progresso dell' arte* (Milan, 1878).

CLEM'ENTINA, or PSEUDO-CLEMEN-TINE (sū'dō-klēm'en-tin) **WRITINGS** (Lat. nom. pl., from Gk. Κλημέντια, *klēmēntia*, from Lat. *Clemens*, Clement). A collection of discourses and stories, bearing the name of Clement of Rome (q.v.), of uncertain authorship and date, but in their present form not earlier than the beginning of the third century. The first external testimony to their existence is found in the writings of Origen (died c.254). The groundwork upon which the compilation rests may, perhaps, date from the second century. The pseudo-Clementine literature includes twenty *Homilies*, ten *Recognitions*, and an *Epitome*, which were all written in Greek. The last is relatively unimportant. In the *Homilies* and *Recognitions* we have what purports to be the story of Clement's career, in company with his teacher, the Apostle Peter. The bulk of the narrative consists of an unsystematic and frequently interrupted account of the experiences of Peter with the arch-heretic Simon Magus, with whom he carries on doctrinal and ethical discussions, and whom he victoriously follows from place to place, founding churches on the way.

The theological position of the writer is clearly discernible. He is a Jewish Christian Gnostic, perhaps of the sect of Elkesaites (q.v.). He ignores (some would say, opposes) Paul, and exalts the person of James, "the Lord's brother." It is for the sake of the teaching contained, rather than for the sake of any historical narration, that the *Clementina* exist. This purpose appears most plainly in the *Homilies*. The *Recognitions* traverse the same general ground, but with variation of treatment and with greater attention to the events themselves. Historical criticism has not yet reached definite conclusions on all the problems presented by these curious writings. That there has been more or less working over of earlier material is generally conceded. Recent opinion inclines toward Syria as the probable home of the work on which the writings are based (Uhlhorn), and toward Rome as a possible source for the books in their present form (Harnack). But we have thus far no means of constructing even a plausible hypothesis as to the person or persons by whom they were recast.

BIBLIOGRAPHY. Among editions of the pseudo-Clementine writings may be mentioned: the edition of the *Homilies* by Lagarde (Leipzig, 1865); of the *Recognitions* by Gersdorf (Leipzig, 1838); of the *Epitome* by Dressel (Leipzig, 1859); Eng. trans. in the *Ante-Nicene Fathers*, ed. by A. C. Coxe, vol. viii. Consult, in general: G. Krüger, *History of Early Christian Literature* (Eng. trans., New York, 1897); Harnack, *Geschichte der altchristlichen Litteratur*, i. (Leipzig, 1893); C. Bigg, *The Clementine Homi-*

lies, in *Studia Biblica et Ecclesiastica*, ii. (Oxford, 1890).

CLEMENTINA, klā'mēn-tē'nā, LADY. In Richardson's novel *Sir Charles Grandison*, an Italian infatuated with Sir Charles.

CLEMENTINES (Lat. *Clementinæ*, se. *leges*, laws, from *Clemens*, Clement). A collection of Papal decrees and constitutions published by Pope Clement V. in 1313. They constitute five books and 52 titles in the *Corpus Juris Canonici*, and were separately edited and published by the Benedictines in 9 vols., with an appendix (1885-92).

CLEMENT'S INN. An Inn of Chancery, attached to the Inner Temple, in London. It received its name from the neighboring Saint Clement's Well, and originally served as a place of entertainment for those who made use of the waters. *Master Shallow*, in Shakespeare's *Henry IV., Part II.*, tells of an event happening "before I came to Clement's Inn."

CLEOBULUS (Lat., from Gk. Κλεόβουλος, *Kleoboulos*). One of the Seven Wise Men of Greece. He was the son of Evagoras, and a native of Lindus, in Rhodes, over which town he was ruler. He lived between B.C. 628 and 558, and was perhaps the first to give a literary form to riddles, in which line he was followed by his daughter, Cleobuline. He also wrote lyric poetry. Diogenes Laërtius ascribes to him a riddle on the year, the epitaph on the tomb of Midas, and a letter to Solon, all of which Diogenes has preserved for us. Consult Bergk, *Poeta Lyrici Græci* (Leipzig, 1900).

CLE'OFAS, DON. The Spanish student for whose benefit Asinodens exposes to view the secret life of all Madrid by unroofing the houses, in Le Sage's *Le diable boiteux*.

CLÉOMADÈS, klā'ō'mā'dēs', THE ADVENTURES OF (Fr., *Les aventures de Cléomadès*). A French poem, of some 20,000 lines, written by Adenès le Roi, toward the close of the thirteenth century. Its plot is built upon the phenomenon of a wooden horse capable of transporting its rider to any destination.

CLEOM'BROTUS I. (Lat., from Gk. Κλεομβροτος, *Kleombrotos*) (? -371 B.C.). A king of Sparta (B.C. 380-71). He was a son of Pausanias and succeeded his brother, Agesipolis I. He commanded the Spartan army which was sent against Thebes in B.C. 378, and which returned home without accomplishing anything; and two years later he led into Bœotia a second equally unsuccessful expedition. He was defeated and killed in the battle of Leuctra (B.C. 371).

CLEOMEDES, klē'ō-mē'dēs (Lat., from Gk. Κλεομήδης, *Kleomēdēs*). A Greek writer on astronomy of the first or second century A.D. After the manner of the later Stoics, he devoted himself to the study of meteorology and astronomy, and composed a treatise, *The Circular Theory of the Heavenly Bodies* (Κυκλική θεωρία τῶν μετεώρων, *Kyklikē theōria tōn metēōrōn*), which contains many truths of modern science—the spherical shape of the earth, the revolution of the moon about the earth, etc. The best edition is that by Ziegler (1891).

CLEOMENES (klē-ōm'ē-nēs) I. (Lat., from Gk. Κλεομένης, *Kleomenēs*). A king of Sparta. He was the son of Anaxandrides, and came to the

throne not later than B.C. 518 or 517. In compliance with the mandate of the Delphic Oracle, he in B.C. 510 assisted the Athenians in expelling from their city Hippias, the last of the Pisistratidæ. Shortly after this event, he joined Isagoras, the head of the Oligarchical Party at Athens, in an attempt to overturn the Clisthenian Constitution. Clisthenes was driven from the city, and seven hundred families, partisans of Clisthenes, were sent into exile; but the undertaking, as a whole, proved unsuccessful. Later he made another attempt to aid Isagoras, but again without success. At the time of the Ionic revolt, he was appealed to in vain by Aristagoras to join the Grecian cause. In the war which broke out between Sparta and Argos, about the time of the capture of Miletus by the Persians, Cleomenes, having by a piece of stratagem defeated the Argives near Tiryns, treacherously slew a number of the survivors, and destroyed the rest by setting fire to the grove in which they had taken refuge. No fewer than six thousand Argive citizens perished at this time, in and after the battle. On his return to Sparta, Cleomenes was impeached for not having attacked Argos, but was acquitted. He afterwards, by bribing the Delphic Oracle, secured the dethronement of his colleague, Demaratus, and in his later years became insane, finally taking his own life.

CLEOMENES III. (? -219 B.C.). A king of Sparta. He was the son of Leonidas II, and the last of the Agidæ. He became King about B.C. 235. Cleomenes was the inheritor of the aspirations of King Agis IV.; his aim was to do away with the ephorate at Sparta, and reassert the power of the kings, and then to raise Sparta to the position of leader in Greece. The furtherance of his plans brought him into opposition to the Achæan League. War broke out between Sparta and the League in B.C. 227, and in the following year Cleomenes twice defeated the Achæans in battle—once at the foot of Mount Lyeæus, in Arcadia, and a second time at Leuctra, in the territory of Megalopolis. After this he proceeded to introduce his changes in the Spartan Constitution; he abolished the ephorate, restored the prerogatives of the kings, made a redistribution of the lands, and extended the franchise. In the year B.C. 224 he utterly defeated the Achæans in a battle at Dyme, near Hecatombræum, but in B.C. 221 was himself defeated at Sellasia by the combined forces of the Macedonians and Achæans, under the command of Antigonus and Philipemen. Fleeing to Egypt, he there later endeavored to head an insurrection of the people, but, failing in that, took his own life. Cleomenes was the last great statesman that Greece produced.

CLEOMENES, OR THE SPARTAN HERO. A play by Dryden and Southerne, produced in May, 1692. The title character is an exiled monarch, who seeks the assistance of a foreign ruler to restore him to his throne. The subject caused some opposition to the presentation of the play, as it was thought to have a disagreeable Jacobite significance.

CLE'ON. The governor of Tharsus, in Shakespeare's *Pericles*, who, with his wife, is hurried to death for planning the murder of Marina, daughter of Pericles.

CLEON (Lat., from Gk. Κλέων, *Kleōn*) (? -422 B.C.). An Athenian demagogue, who

lived in the early part of the Peloponnesian War. He was a son of Cleonetus, and was by trade a leather-dealer. He first came into prominence as a public speaker who was opposed to the policy of Pericles; and in B.C. 427, when the matter of the treatment of the inhabitants of Mytilene came up for consideration in the Athenian Assembly, he advocated the utmost severity tolerated by custom of war. In B.C. 425, when envoys arrived at Athens to treat of the release of the Spartan citizens shut up on the island of Sphacteria and to suggest peace, the Athenians, instigated by Cleon, imposed such terms upon Sparta that peace was found to be impossible. Later in the same year, owing to a casual remark made in the public assembly to the effect that, if he were general, the Athenians would not long remain in front of Sphacteria, Cleon himself was placed in charge of the operations against the island. He promised to end the siege within twenty days; and, in conjunction with Demosthenes, he did this. In B.C. 422 Cleon was sent to oppose Brasidas, the Spartan general, in Macedonia and Thrace, and to recover the city of Amphipolis. He was successful in taking the towns of Torone and Galepsus, but was defeated and slain in the battle which took place beneath the walls of Amphipolis. Cleon is described by Thucydides and Aristophanes as an insolent and venal politician, and a demagogue of low type. It is generally admitted that some of the details of Aristophanes's picture may be out of proportion; but whether Thucydides's estimate of Cleon's character is a thoroughly just and unprejudiced one is a mooted question. Cleon was a persuasive speaker, a clever hand at managing public business in a popular way, and a strong advocate of war. Consult Grote, *History of Greece*, vol. vi. (London, 1888).

CLÉONTE, κλέωντ'. A character in Molière's *Le bourgeois gentilhomme*, in love with Lucille.

CLEOPATRA (Gk. Κλεοπάτρα). The name of several queens and princesses of Egypt of the family of the Ptolemies (q.v.). The most famous of them, **CLEOPATRA VI.**, daughter of Ptolemy XIII., Auletes, was born in B.C. 69 or 68. Her father died in 51, leaving a will wherein he appointed as his successors his elder daughter, Cleopatra, and his elder son, Ptolemy, and requested the Roman people to see his testamentary dispositions carried into effect. The will was duly ratified by the Roman Senate, and Cleopatra, then about seventeen years old, and her brother, Ptolemy XIV., a child of about twelve years, succeeded jointly to the throne of Egypt, with the understanding that they should shortly marry. In the third year of their reign, Ptolemy, urged by his advisers, assumed sole control of the government and drove his sister into exile. She promptly gathered an army in Syria, and prepared to assert her claims. It was at this time that Pompey, seeking refuge with the King of Egypt, after his defeat at Pharsalia, was murdered by the King's advisers. Cleopatra seems to have been unable to make good her claim by force of arms; but, shortly after Pompey's death, Cæsar arrived at Alexandria and, yielding to the fascinations of the Egyptian Queen, became her lover and espoused her cause. He was for a time hard pressed by the Egyptians, but ultimately triumphed and Ptolemy lost his life. Arsinoë, the younger daughter of Ptolemy Auletes, was

carried off to grace Cæsar's triumph at Rome. Cleopatra now nominally married her younger brother, Ptolemy XV., and, after settling their joint government upon a secure basis, went to Rome, where she lived as Cæsar's mistress until his assassination in B.C. 44. After Cæsar's death, having, it is said, poisoned her brother, Ptolemy XV., she returned to Egypt, where she associated with her on the throne her son by Cæsar, called Cæsarion. In the civil war following Cæsar's death, Cleopatra having hesitated to take sides with either party, Antony, after the battle of Philippi (42), summoned her to meet him at Tarsus in Cilicia to explain her conduct. When she appeared upon the Cydnus on a splendidly adorned vessel, in the garb of the goddess Aphrodite, the Roman triumvir fell a victim to her charms, and returned with her to Egypt. After living with her for some time, in the course of which she bore him twin children, Antony was compelled to return to Rome, where he married Octavia, a sister of Octavius. When, in 36, he went to the East in command of an expedition against the Parthians, he sent for Cleopatra, and she joined him at Antioch, and after his defeat she met him in Syria with troops and supplies. In 34, after a more successful campaign against the Parthians, he celebrated his triumph at Alexandria and continued to reside in Egypt. In 32 Octavianus declared war against Cleopatra, and Antony, in revenge, divorced his wife Octavia. Against the counsel of Antony's advisers, Cleopatra insisted on taking part in the ensuing campaign. At the naval battle of Actium (31), believing Antony's defeat to be inevitable, she withdrew her fleet from action, and fled to Alexandria. Her lover, beholding her flight, made no further effort to retrieve his fortunes, but retired from the battle and followed her. On the approach of Octavianus, Antony, deceived by the false report of the Queen's death, fell by his own hand. Cleopatra made some attempts to bring Octavianus under the influence of her charms, but, failing in this, and hearing that he intended to exhibit her in his triumph at Rome, she killed herself (B.C. 30), probably by poison, and according to an old tradition, by the bite of a venomous serpent. Cleopatra combined rare intellectual gifts with physical charms, and she is immortal as one of the most fascinating women of all time; so that ever since her death, she has been a constant theme for artists, dramatists, and poets. There is no authentic portrait of Cleopatra extant, except in her effigy upon coins. A composite photograph has been made of these by Goringe in his book *Egyptian Obelisks* (New York, 1865).

Cæsarion, her son by Cæsar, was put to death by Octavius. Of her three children by Antony, her daughter **CLEOPATRA** married Juba, King of Mauretania, who was allowed by Octavius to take under his protection his wife's two brothers, Alexander and Ptolemy. In A.D. 40, Ptolemy, son of Juba and the younger Cleopatra, was slain by Caligula, and with him ended the line of the Ptolemies. (See **PTOLEMY**.) Consult: Strack, *Die Dynastie der Ptolemäer* (1896); Mahaffy, *The Empire of the Ptolemies and History of Egypt Under the Ptolemæic Dynasty* (1899); Lombroso, *L'Egitto dei Greci e dei Romani* (1895).

CLEOPATRA'S NEEDLES. The name given to two Egyptian obelisks of red syenite, which

were transported from Heliopolis to Alexandria about the year B.C. 14, and remained there until 1877, when they were presented to the governments of Great Britain and the United States by the Khedive Ismail Pasha. Of the two companion monoliths, one now stands on the Thames Embankment, London, the other in Central Park, New York. The latter is 69 feet high, with a base 7 feet 7 inches in diameter, and weighs 200 tons. It is supported on four bronze crabs, reproductions from the originals preserved in the neighboring Metropolitan Museum. The obelisk bears inscriptions of Thothmes III. (about B.C. 1500) and Rameses II. See **OBELISK**. Consult, Gorringe, *Egyptian Obelisks* (New York, 1885).

CLEPSYDRA (Gk. κλεψύδρα, *klepsydra*, from κλέπειν, *kleptein*, to steal + ὕδωρ, *hydōr*, water). An ancient instrument for measuring time by the efflux of water through a small orifice. Two kinds have been in use. In the simplest form the water was allowed to escape from one vessel into another. This form was used in the Athenian courts, where a speaker was allowed a certain number of *amphoræ* of water for his speech, the quantity depending on the importance of the suit. The more complicated form was said by some to have been invented by Plato, while others gave the honor to Ctesibius of Alexandria. In this form the water was allowed to flow at a uniform rate into a receptacle, on which was marked a scale of hours. Both forms are said to have been introduced into Rome in B.C. 159, and were widely used. Athenæus (iv. p. 174) applies the name to a variety of the hydraulic organ.

CLERC, klâr, JEAN LE. See **LE CLERC**, JEAN.

CLERC, LAURENT (1785-1869). A French deaf mute and educator, born near Lyons. He was a favorite pupil of the Abbé Sicard at the institution of the deaf and dumb founded in Paris by the Abbé de l'Épée, and after eight years of study became himself a teacher. In 1816 he came to the United States at the request of Dr. Gallaudet (q.v.), and the next year the two opened an institution for the deaf and dumb in Hartford, Conn., where Clerc successfully taught deaf-mutes for more than forty years. He married a deaf mute, who bore him several children, all of whom had the sense of hearing and could speak. See **DEAF MUTE**.

CLERESTORY. See **CLEARSTORY**.

CLERFAYT or **CLAIRFAIT**, klâr'fâ', CHARLES DE CROIX, Count (1733-1798). An Austrian field-marshal, born at the Castle of Bruille, Hainaut, Low Countries. He entered the Austrian service in 1753, fought with distinction in the Seven Years' War, and was advanced to the rank of colonel. During the Turkish war of 1787-91 he was commander of an army corps which defeated the Moslem troops at Mehadia and Kalafat. In 1792 he commanded the Austrian corps sent to the assistance of the Duke of Brunswick in the war with France, and defeated the French at Croix-aux-Bois (September 15). Having withdrawn into Belgium, he defeated the French at Aldenhoven (March 1, 1793), relieved Maastricht, decided the battle of Neerwinden (March 18), and took Le Quesnoy (September 11). After this series of brilliant victories he met with reverses at Wattignies (October 15 and 16), Mouseron (April 29, 1794), and Hoogeleele (June 13). In 1795 he was ap-

pointed field-marshal and commander-in-chief of the Imperial armies on the Rhine, in which capacity he defeated Jourdan at Hœchst (October 11), and relieved Mainz, storming the almost impregnable works of the besiegers, which were defended by an army of 80,000 men. After concluding an armistice with the French Republic, he returned to Vienna, where he was hailed as the savior of the Empire. Because of differences with the Imperial Minister Thugut, he afterwards resigned his position.

CLERGY (OF, *clergie*, Lat. *clericus*, from Gk. κληρικὸς, *klērikos*, clergyman, from κληρος, *klēros*, lot). A term very generally applied to the ministers of the Christian religion, in contradistinction to the laity (q.v.). This use of the term is very ancient, and appears to have gradually become prevalent, as the ministers of religion more and more exclusively, instead of the members of the Christian Church equally, began to be regarded as God's 'heritage' and 'priesthood' (1. Pet. ii. 9, and v. 3), consecrated to Him, and peculiarly His. The distinction between the clergy and the laity became more marked through the multiplication of offices and titles among the clergy, the ascription to them of a place in the Christian Church similar to that of the priests and Levites in the Jewish Church, with peculiar rights and privileges, their assumption of a peculiar dress and of official insignia, the growth of monastic institutions, and the introduction of celibacy. In harmony with the notions on which this distinction is founded is that of an indelible, sacramentally stamped character derived from ordination, so that a renunciation of the clerical office is either viewed as an impossibility or a sort of apostasy. These notions in their highest degree belong to the Church of Rome. In the Protestant churches the distinction between clergy and laity is much less wide; and, although the same terms are often used, it is rather conventionally than in their full signification. The employment of official robes by the clergy preceded their assumption of a peculiar ordinary dress, and is not so intimately connected with any peculiar pretensions. Among the privileges accorded to the clergy by the Roman emperors, and in the Middle Ages, was exemption from civil offices; among the rights asserted by them, and which caused much dispute, was exemption from lay jurisdiction, even in cases of felony. (See **BENEFIT OF CLERGY**.) The clergy were distinguished into the *higher* clergy and the *lower* clergy; the latter including ostiarii, acolytes, lectors, exorcists, etc. The term *secular* clergy is the designation of priests of the Church of Rome who are not of any religious order, but have the care of parishes. Monks who are in holy orders are designated *regular clergy* (from *regula*, rule). See **ORDERS**, **HOLY**; **BISHOP**; **PRIEST**; **DEACON**.

CLERGY, **BENEFIT OF**. See **BENEFIT OF CLERGY**.

CLERICUS, JOHANNES (1657-1736). See **LE CLERC**, JEAN.

CLERIDÆ. See **CHECKERED BEETLES**.

CLERK (AS, *clerc*, *cleric*, from Lat. *clericus*, clergyman). In the Middle Ages, an appellation for an ecclesiastic, extended at a later period to mean a complimentary title for men of learning, whether of the Church or not. In modern times it indicates any one who makes and keeps rec-

ords, public or private; but 'clerk in holy orders' is still in England the legal designation of a minister of the Established Church. See CLERGY; BENEFIT OF CLERGY.

CLERK, NAVAL. There are two classes of clerks in the United States Navy, called 'paymaster's clerks' and 'captain's clerks.' Both formerly were civilians, and the paymaster's clerk is still one. He is appointed at the request of the pay-officer, and serves until his appointment is revoked. While in service he wears a uniform similar to that of warrant officers, and messes with the junior officers. The pay varies from \$1000 to \$1300, according to the class of ship on which he is serving; on certain receiving-ships, and on shore, at certain navy-yards, the pay of the principal pay-clerk reaches \$1800.

CLERK, PARISH. See PARISH CLERK.

CLERKENWELL (clerks' well, Lat. *Fons Clericorum*, from its well which was a meeting-point for the parish clerks of London). A parish of London (q.v.), England, north of Saint Paul's Cathedral, between Holborn Viaduct and Islington. It is a noted district for the manufacture of metal articles, watches, and optical instruments.

CLERK-MAXWELL. See MAXWELL.

CLERMONT, klär'môn' (ML. *Clarus Mons*, fair hill, from *clarus*, clear, and *mons*, mountain). An ancient town in the Department of Oise, France, 36 miles north of Paris (Map: France, J 2). The town hall and Church of Saint Samson date from the fourteenth century, and the hill on which the town is built is surmounted by an old castle of the tenth or eleventh century, used in modern times as a penitentiary for women. Clermont was an important place in the Middle Ages. It was frequently taken and retaken in the wars with the English, and in 1487 it was surrendered to them as a ransom for the French leader La Hire. Population, in 1901, 5723.

CLERMONT-FERRAND, -fër'rân'. The capital of the Department of Puy-de-Dôme, France, 215 miles south-southeast of Paris (Map: France, K 6). It is finely situated, on a gentle elevation, between the rivers Bedat and Allier, at the foot of a range of extinct volcanoes, crowned by the peak of Puy-de-Dôme, about five miles distant from the town. It consists of the two towns of Clermont and Montferrand, connected by a fine avenue of trees. It contains several remarkable buildings; such as the old Gothic cathedral, the corn and linen hall, the theatre, and the Hôtel-Dieu or hospital, various educational and scientific institutions, and a public library, in which are over 55,000 printed volumes and 1100 manuscripts. The manufactures of the place are manifold, and include woolen and linen goods, machinery, straw hats, chocolate, and needles, while there is an extensive traffic in the produce of the district, and considerable transit trade between Paris and the south of France. There are two hot mineral springs in the town, which are used for bathing. Clermont-Ferrand is the seat of a bishop. Population, in 1896, 50,870; in 1901, 52,933. A multitude of Roman antiquities attest the antiquity of the city. In the Middle Ages Clermont was the residence of the counts of the same name, and the capital of the Province of Auvergne, and became the seat of one of the oldest bishoprics of

France. Several ecclesiastical councils were held here, the most remarkable of which was that in 1095, at which the First Crusade was decreed by Urban II. Among its monuments is a statue to Pascal, who was a native of Clermont.

CLERMONT L'HÉRAULT, lâ'rô', or CLERMONT DE LODÈVE. The capital of a canton in the Department of Hérault, France, situated on a castle-crowned hill, rising from the banks of the Ydroniel, 10 miles south of Lodève by rail. Its Romanesque Church of Saint Guelhelm-le-Dessert is a fine building of the thirteenth and fourteenth centuries. Clermont is noted for its woolen manufactures, especially army clothing, which date from 1678; it has also tanneries, potteries, manufactures of cutlery, lime and stone quarries, and a considerable trade in agricultural and commercial products. Population, in 1901, 5280.

CLERMONT TONNERRE, tô'nâr'. A well-known French family. It originated in Dauphin in the eleventh century. STANISLAS MARIE ADELAÏDE, Count de (1757-92), was born at Pont-à-Mousson. He entered the States-General in 1789 as representative of the nobility, and there, as well as in the National Assembly, acquired great influence. He was moderate in his views, argued for the English system of two legislative houses, and for the King's right to veto. With Malouet and others he founded, in 1790, in order to counteract the Jacobins, the Club des Amis de la Monarchie, and with Fontanes he published the *Journal des Impartiaux*. He perished in the massacre of August 10, 1792.—ALMÉ MARIE GASPARD, Marquis, and afterwards Duke de (1779-1865), born in Paris, was a French general and minister. He was educated at the Ecole Polytechnique, entered the army and served in the campaigns in Italy, Germany, and Spain. He was made aide-de-camp to Napoleon's brother Joseph, King of Spain. After the restoration of Louis XVIII, he became Minister of Marine, and later Minister of War. After the July Revolution he refused the oath of allegiance to the new government. He died in retirement January 8, 1865.

CLÉRY, klâ'tê', JEAN BAPTISTE ANTOINE HANET (1759-1809). The valet de chambre of Louis XVI. He was born near Versailles. By his own choice he followed the King to the Temple, and attended him with the greatest devotion. After his death he remained in imprisonment for some time, and then rejoined the royal family in Germany. In London he published his popular account of Louis's captivity, *Journal de ce qui s'est passé à la tour du Temple pendant la captivité de Louis XVI, roi de France* (1798), which has passed through many editions.

CLÉSINGER, klâ'zân'zhâ', JEAN BAPTISTE AUGUSTE (1814-83). A French sculptor. He was born at Besançon, October 22, 1814; studied with his father, and made his appearance in the Salon of 1843. His first work that attracted attention was "The Woman Bitten by a Serpent" (1847). He executed "Louise of Savoy" for the Garden of the Luxembourg. In 1877 he exhibited "The Dance with Castanets," a bronze statue, and in 1867, "Cleopatra Before Cæsar." He occasionally exhibited paintings of scenery and architecture. He married a daughter of George Sand. He died in Paris, January 7, 1883.

CLEVEDON, klēv'don. A watering-place in Somerset, England, on the Bristol Channel and Severn Estuary, nine miles northeast of Weston-super-Mare. It has a fine beach, marine promenade, a pier, and a coast-guard station. It is noted for literary associations with Coleridge; also with Hallam, the historian, and his son Arthur, commemorated by "In Memoriam," whose graves are in the parish church of Saint Andrew. Population, in 1891, 5412; in 1901, 5898.

CLEVELAND (ME. *clif*, *clef*, pl. *clives*, *cleres*, cliffs + *land*). A hilly region with some picturesque fertile valleys, forming the eastern part of the North Riding of Yorkshire, England, between Whitby and the Tees. Since 1851 it has become a populous mining district, owing to the discovery of ironstone. See MIDDLESBROUGH.

CLEVELAND. The county-seat of Cuyahoga County, Ohio, the largest city of the State, and the seventh in the United States, and an important industrial and commercial centre, situated on the south shore of Lake Erie, at the mouth of the Cuyahoga River, in latitude 41° 30' 5" N., longitude 81° 42' 6" W. (Map: Ohio, G 2). It is 138 miles northeast of Columbus, and 244 miles northeast of Cincinnati; 357 miles east of Chicago, 623 miles west by north of New York, and 527 miles northwest of Washington.

The city, 689 feet above sea-level, and, at its highest point, 302 feet above the lake, is beautifully situated on elevated land, which slopes gently toward the lake, and occupies an area of over 34 square miles, with a lake-frontage of 10 miles, and extending back more than half that distance. It is divided unevenly by the Cuyahoga River, the larger portion lying on the east side of that stream, and it is intersected also by Kingsbury and Walworth 'runs,' the east and west tributaries of the Cuyahoga. The land bordering the river is low and flat, and here lie many of the industrial works—lumber and coal yards, ore-docks, etc.—almost hidden from view. Owing to the variation in level of different parts of the city, there are several elevated viaducts and many bridges (a number of which are owned by the municipality) spanning the Cuyahoga, and uniting the sections of the city. The most remarkable of these is Superior Street Viaduct of stone and iron, completed in 1878, at a cost of \$2,250,000, 3211 feet long, with a central draw-bridge 68 feet above the water-level. The Central Viaduct, completed in 1888, crosses the river and is 2838 feet long. The Abbey Street Viaduct, crossing Walworth Run, is 1092 feet long. A smaller one (835 feet) spans Kingsbury Run.

Cleveland has features of beauty in its broad streets, ranging from 40 to 132 feet in width, which are so abundantly shaded with maples and elms that the city has acquired the name of the 'Forest City.' There are about 573 miles of streets, 252 miles of which are paved, brick and asphalt being extensively used. The public park system includes about 1440 acres, distributed in areas of varying extent throughout the city, and its suburban districts to the east and west are thoroughly accessible by the street railways, which operate about 220 miles of track. In contrast with its extensive industrial and commercial interests, Cleveland has very few large tenements, with congested population; even apartment houses are a recent development. Detached houses with gardens are the rule.

The lake-shore front, the valley of the Cuyahoga and the area along the Cleveland and Pittsburg Railroad from Wason Street southeast to the city limits are centres of the manufacturing industry, while the business area extends from the lower part of the river east along Superior Street, which is 132 feet wide, and along Euclid Avenue to Erie Street. The Public Square, or Monumental Park, containing the statue of Gen. Moses Cleaveland and the Soldiers' and Sailors' Monument, forms a park of 4½ acres about the intersection of Superior and Ontario Streets; from this centre and from Ontario Street, which extends north and south, the principal streets of the east side of the city diverge. The far-famed Euclid Avenue, 83 to 90 feet wide, begins at the southeast corner of the Public Square and extends beyond Lake View Cemetery, through the suburb of East Cleveland, the continuation beyond there being Euclid Road. From Monumental Park to some distance east of Erie Street this Avenue is one of the main business thoroughfares, but for the remainder of its length is built up with handsome private residences, surrounded by tasteful and well-shaded grounds. Other fine residence streets are Willson, Case, East Madison, Amesbury, Ingleside, Bolton, Lake, Jennings, and Franklin avenues, Prospect, East Prospect, and Detroit streets, and Overlook Road, the first two being 99 feet wide.

BUILDINGS. The more prominent buildings of the city include the City Hall, County Court-House, Chamber of Commerce, New Central Armory, Cleveland Grays' Armory, Public Library, Adelbert College, Medical College of Western Reserve University, Case School of Applied Science, Northern Ohio Insane Asylum, Union Depot, Young Men's Christian Association, and the New Sheriff Street Market, 400 feet long by 120 feet wide. The Arcade, 400 by 180 feet, built in 1889, at a cost of \$850,000, has a fine interior; arranged on both sides of a central court are the several tiers of stores and offices fronted by balconies. On Euclid Avenue, opposite Bond Street, and extending through to Prospect Street, is the Colonial Arcade Building, at the Prospect Street end of which is the Colonial Hotel. Other structures worthy of note are the Williamson, New England, Society for Savings, Citizens, American Trust, Schofield, Rose, Perry-Payne, Garfield, Cuyahoga, and Caxton buildings. The Plymouth and Pilgrim (Congregational), the First Methodist Episcopal and Epworth Memorial, First Presbyterian ("Old Stone Church"), Euclid Avenue Baptist, and Saint Paul's (Protestant Episcopal) churches, and the Roman Catholic cathedral, are among the finest ecclesiastical edifices.

Recently a plan has been projected systematically to beautify the city by grouping the public buildings that are to replace the present edifices, some of which are rented, and which on the whole are architecturally indifferent—an undertaking to which \$20,000,000 will ultimately be devoted. The public buildings will be arranged in a quadrangle inclosing a mall, the whole occupying a plot of land in the heart of the city one-eighth of a mile wide by one-half of a mile long. The scheme of the "group plan" consists in placing the new Post-Office, now under construction, and the proposed Public Library at the south end of the Mall; at the north end of the Mall and on its axis a monumental union railroad station will be placed, flanked

on either side by the County Court-House and the City Hall. An imposing Court of Honor will join these two groups of buildings.

PARKS AND CEMETERIES. Among the many fine parks belonging to the city, the largest is Rockefeller Park, of 260 acres, a part of which was given by the millionaire whose name it bears. It includes the Valley of Doan Brook, with several smaller parks and parkways, and is connected with Gordon and Wade Parks by the boulevard which extends also between these two. Gordon Park, on the lake-front, comprises 112 acres, and, with Wade Park (83 acres) to the southeast, is noted for its gardens. The latter contains the statue of Commodore Perry, formerly in Monumental Park, and a zoölogical garden. Edgewater Park (126 acres) has well-kept lawns, walks, and a beach with facilities for boating and bathing. Brookside Park (149 acres); Garfield Park (163 acres); Woodland Hills Park (102 acres); Shaker-Heights Park, just outside the city limits, and named from the community which once occupied the land; Lakeview Park, on the lake shore; Lincoln Park; and the Circle on the west side of the river, are also worthy of mention. Besides Euclid Avenue, the more attractive drives are the boulevard system of 33 miles, connecting the parks, and Lake Avenue and Clifton Boulevard.

Cleveland has a number of cemeteries, the largest of which are Woodland, Riverside, and Lakeview. The last, one of the most beautiful in the country, contains more than 300 acres, with great natural advantages skillfully improved. Here, on an eminence 250 feet above the level of the lake, stands the Garfield Memorial, completed in 1890 at a cost of \$225,000—the balcony near the top, 165 feet high, affording a fine view of the city and its suburbs. It is built principally of Ohio sandstone, and contains a chapel with symbolical panels and reliefs of scenes from the President's career, and his statue. His remains lie in a crypt beneath.

In Lakeview Cemetery is situated the Wade Memorial Chapel, which cost more than \$350,000.

EDUCATIONAL INSTITUTIONS AND LIBRARIES. Cleveland has the normal equipment of a great city in the matter of public schools, with a sufficient number of high and manual-training schools, besides numerous private and parochial institutions. The public-school system is conducted under what is coming to be known as the 'Cleveland Plan,' which prohibits all punishment, eliminates mechanical methods, introduces manual and domestic training to some extent in all grades, and practically abolishes stated written examinations—the teacher's judgment being accepted as the general basis of promotion. Cleveland was one of the first cities in the United States to establish a free high school, and the first west of the Alleghany Mountains, the date being July 13, 1846. The city is the seat of Western Reserve University (q.v.), with its departments of Adelbert College, Women's College, and schools of medicine, law, and dentistry; Case School of Applied Science (q.v.); and Saint Ignatius College (Roman Catholic). It contains also Saint Mary's Theological Seminary (Roman Catholic), Baldwin University Law School, Cleveland College of Law, Cleveland College of Physicians and Surgeons (Ohio Wesleyan University), Cleveland Homeopathic Medical College, and Cleveland School of Pharmacy.

In addition to libraries of the various educational institutions, Cleveland has a Public Library of over 236,000 volumes, the Case Library (subscription) of 50,000 volumes, Cleveland Medical Library Association, Law Library Association, and the Western Reserve Historical Society.

CHARITIES. The State institution for the insane, founded in 1855, has 98 acres of ground and buildings that accommodate 1250 patients. The City Infirmary and Hospital treat annually 3400 patients, and maintain a department for out-door relief. Among several other hospitals may be noted the Lakeside Hospital, Federal Marine, Cleveland General, Cleveland Homeopathic, Saint Alexis, Saint Claire, Saint John's, and Saint Vincent's Charity hospitals. Other institutions are a house of correction, industrial schools, homes for the aged, and Jewish, Roman Catholic, and Protestant orphanages. Prominent in the charitable work of Cleveland is the Goodrich House, incorporated in 1897—a social settlement in the poorer part of the city, which contains clubs, kindergartens, a gymnasium, bath, sewing-rooms, a public laundry, and parlors and reading-rooms. With this equipment the Goodrich House, constructed at a cost of \$80,000 and expressly for its work, stands among the foremost institutional houses in the United States. It is estimated that the charitable institutions, the more prominent being the Alta House and the Hiram House, control property exceeding in value \$3,500,000.

CLUBS, THEATRES, AND HOTELS. The Union, Roadside, Tavern, Colonial, Rowfant, Excelsior, and the Euclid and Country clubs, all owning the houses in which they are installed, the last-named being six miles distant to the east on the lake-front, are representative organizations. Among the principal places of amusement are the Euclid Avenue Opera House and Keith's, Lyceum, Empire, and Colonial theatres. The more prominent hotels include the Hollenden, Colonial, Hotel Euclid, Forest City, Baldwin, Tavistock, American, Kennard, and Hawley House.

COMMERCE AND INDUSTRY. The construction of the Ohio Canal—completed in 1832—connecting Lake Erie with the Ohio River, the northern terminus being the Cuyahoga River, gave Cleveland commercial advantages over other cities on Lake Erie; and, though the canal has since declined greatly in importance, the city has now other and greater advantages by virtue of its location. Chief of these is its proximity to the coal and oil fields of Ohio and Pennsylvania and to the iron-producing regions of Lake Superior, Cleveland being one of the most convenient points for the collection and distribution of the products of both districts. The city has thus become an important commercial centre, and also a manufacturing place of the first rank.

The bulk of the lake traffic consists of coal and iron. The receipts of coal in 1902 amounted to 5,860,000 tons, or three times that of 1890; and the shipments for the same year were 2,505,000 tons, or twice that of 1890. The coal is distributed among the various lake ports farther west and north. The receipts of iron ore in 1902 were 4,993,000 tons, as against 3,823,000 in 1900 or 1,950,000 tons in 1890. Lumber and grain are next in importance. Cleveland is the largest market for fresh-water fish in America.

The city has remarkable advantages for the accommodation of its shipping—two parallel

Railroads. —————

Street Car Lines. - - - - -

piers, built out 1500 feet into the lake, form a channel 200 feet wide and 21 feet deep at the mouth of the Cuyahoga; and the many windings of the latter afford 16 miles of river-frontage, over five of which are docked. A branch of the Cuyahoga flowing westward, not far from the lake, and parallel with it, has been dredged so as to afford room for excellent ship-yards and docks. In 1878 the United States Government began a breakwater to inclose a harbor of refuge 360 acres in extent, with an opening of 500 feet, opposite the mouth of the river. Later plans and appropriations, however, provide for an opening of 700 feet and a breakwater 4 miles in length, inclosing a harbor of 800 acres; over 2 miles of breakwater have been completed at a cost of \$3,200,000, and the remaining 2 miles, now under contract, will cost about \$2,000,000. The harbor is being dredged to 25 feet. In the number of tons of freight received and shipped by vessel, Cleveland ranks fourth among the ports of the Great Lakes. Cleveland is on nine railways, some of which are the leading trunk-lines of the country: the Lake Shore and Michigan Southern; the New York, Chicago and Saint Louis; and the Pennsylvania.

Cleveland is now the second largest manufacturing centre on the Great Lakes and is rapidly gaining on Cincinnati, its only rival within the State. During the decade 1890-1900, the value of its product increased from \$113,240,000 to \$139,849,000, or 23.5 per cent. In the latter year there were employed 58,800 wage-earners. As above intimated, the most important group of manufactures consists of iron and steel, and the large number of industries which depend upon iron and steel as their raw material. According to the census of 1900, the iron and steel products were valued at \$24,276,000, and the foundry and machine-shop products ranked second with a product estimated at \$15,428,000. Other important industries are the production of wire and wire nails, in which Cleveland outranks all other American cities, and hardware, in which it takes second place; bridges, electrical apparatus and supplies, car-wheels, printing-presses, sewing-machines, bolts, nuts, washers, and rivets. Another industry of this group is shipbuilding. From an early date Cleveland led in the construction of wooden vessels for the lake traffic, and, with the change from wood to iron, has continued in the lead, producing to-day more steel merchant vessels than any other American city. The chief industries which depend upon agricultural resources are slaughtering and meat-packing, and the manufacture of malt liquors, the former exceeding a value of \$7,500,000 and the latter \$4,000,000, according to the census of 1900. The Standard Oil Company has here one of its principal refining establishments. Cabinet works and clothing-factories are important. Cleveland makes more paint than any other city in the world.

GOVERNMENT, FINANCE, ETC. A new charter was obtained in 1891, in which the distinction between executive and legislative functions was clearly drawn, the new plan being known as the Federal System. But a new municipal code was enacted by the Ohio Legislature October 22, 1902. It provides for a City Council of 32 members. The Mayor, the Vice-Mayor (who is president of the Council and has the deciding vote), the three members of the Board of Public Service,

the solicitor, and the treasurer are elected biennially by the people. The Board of Public Safety of two members is appointed by the Mayor, subject to the approval of two-thirds of the Council. The School Council of 7 members (who elect the director of schools and the superintendent), and the city auditor, police judge, and the clerk of police court are elected by the people. Firemen and policemen are under civil service regulations.

In 1900 the total indebtedness amounted to \$15,258,295, for which a sinking-fund provided \$2,575,935. The net per capita debt was \$37.52. The total tax-rate is \$30 per \$1000, of which \$10.20 is for school purposes, \$13 for city purposes, \$3.90 for county, and \$2.90 for State purposes. The total actual income for 1900 was \$5,077,400, of which the property tax was \$3,564,000. The total expenditures for maintenance and operation were \$5,976,000, and for construction and other capital outlay, \$4,332,000.

The ample water-supply formerly was pumped into reservoirs from two tunnels sunk 90 feet deep, and running out for one and one-half miles to a crib on the lake bottom. A new crib and tunnel have recently been constructed, the crib four miles from shore. These works were originally constructed and are still owned and operated by the city.

POPULATION. Cleveland rose during the decade 1890-1900 from tenth to seventh rank among the cities of the United States, and is now the third largest city west of the Alleghanies, and the second largest of the Great Lakes cities. The following gives her population by decades: in 1830, 1076; in 1840, 6071; in 1850, 17,034; in 1860, 43,419; in 1870, 92,829; in 1880, 160,146; in 1890, 261,353; in 1900, 381,768. There are few negroes, but many foreigners, the foreign-born in 1900 numbering 124,600, or nearly one-third of the total. Among the foreign-born the Germans are predominant, constituting in 1890 about 41 per cent., as against 13 per cent. for the Irish, and 11 per cent. each for the Bohemians and English. The native whites of foreign parents numbered 163,500. Thus, the native whites of native parents and the negroes together constitute less than one-fourth of the total.

HISTORY. In 1795 the Connecticut Land Company bought from Connecticut a large part of that State's Western Reserve (q.v.), and in the following year sent out a party under Gen. Moses Cleaveland to survey their purchase. Cleaveland selected the mouth of the Cuyahoga as the site for a settlement, and in July, 1796, laid out on the east bank a village, which took his name, though the spelling was changed in 1831 to meet the exigencies of a newspaper editor's head-lines. In 1800, by act of Congress, the Western Reserve was included for administrative purposes in the Northwest Territory, and Trumbull County was erected to include the land about the mouth of the Cuyahoga. Of this, Cleveland, then having a population of about 57, became the county-seat in 1809. In 1814, Trumbull County having previously been subdivided, the village of Cleaveland, in the county of Cuyahoga, was incorporated with a population of less than 100. In 1818 the first newspaper, *The Cleveland Gazette and Commercial Register*, began publication, and in 1827 the Ohio Canal, which five years later was completed to the Ohio, was opened between Cleveland and Akron, giving such an impetus to the former that her population increased tenfold

(from 600 to 6000) between 1825 and 1835. In 1836 Cleveland was chartered as a city. In the early fifties it was first connected by rail with the East and with the other cities in Ohio, and from this period dates its marvelously rapid growth. In 1853 Ohio City, which had been founded in 1817, and for many years had been a great rival, was united to Cleveland. During the Civil War a number of manufacturing establishments were set up here, and in the interval 1861-65, owing to its ability to supply articles for which there was then an extraordinary demand, Cleveland attracted many investors; its lake traffic was doubled, and its population increased 50 per cent. In 1872 it annexed East Cleveland, in 1873 Newburg, and in 1893 West Cleveland and Brooklyn.

Consult: Robison, *History of the City of Cleveland* (Cleveland, 1887); Avery, *Cleveland in a Nutshell* (Cleveland, 1893); Howe, *Historical Collections of Ohio* (Columbus, 1889-91); Kennedy, *History of Cleveland* (Cleveland, 1896).

CLEVELAND. A city and the county-seat of Bradley County, Tenn., 30 miles east by north of Chattanooga; on the Southern Railroad (Map: Tennessee, G 5). It is the seat of the Centenary Female College. The city is in a fertile agricultural district, has considerable trade, and contains woolen-mills, flour-mills, stove-works, a chair-factory, etc. Settled about 1820, Cleveland was incorporated about 1880. The government is administered under a revised charter of 1898, which provides for a mayor, biennially elected, and a municipal council. Population, in 1890, 2863; in 1900, 3858.

CLEVELAND, CHARLES DEXTER (1802-69). An American educator, born in Massachusetts. He graduated at Dartmouth in 1827, and was professor of Latin and Greek in Dickinson College, and of Latin in the University of the City of New York. From 1861 to 1867 he was United States consul at Cardiff, Wales. He was a voluminous writer, but will be remembered only for his compendiums of *English Literature* (1850), *American Literature* (1858), and *Classical Literature* (1861); *English Literature in the Nineteenth Century* (1851); an edition of *Milton's Poetical Works*, with a *Life* (1851).

CLEVELAND, JOHN (1613-58). An English Cavalier poet. He was born at Loughborough, Leicester, and educated at Cambridge, where, in 1634, he became a fellow of Saint John's. Six years later he strenuously opposed Cromwell, and in consequence lost his fellowship in 1645. Joining the Royalists, he was appointed judge-advocate in the King's army. In 1655 he was seized at Norwich and imprisoned at Yarmouth for three months, when he was released by Cromwell. After that he lived in retirement. Cleveland had a great reputation as a wit and satirist. A volume of his poems in circulation before 1656 was reissued in that year. In 1677 appeared his collection entitled *Clevelandi Indiciæ: or Cleveland's Genuine Poems*, etc. It is incomplete. Cleveland still awaits a competent editor. Thomas Fuller describes him as "a general artist, pure Latinist, exquisite orator, and eminent poet."

CLEVELAND, (STEPHEN) GROVER (1837—). The twenty-second and twenty-fourth President of the United States. He was born at Caldwell, Essex County, N. J., March 18, 1837. In 1841

his father, the Rev. Richard F. Cleveland (Yale, 1824), a Presbyterian minister, removed with his family to Fayetteville, near Syracuse, N. Y., and afterwards to Clinton, N. Y., in the schools of which places Grover Cleveland was a scholar. The death of his father in 1853 obliged him to earn his own living, and the first position that he held was that of a teacher in the New York Institution for the Blind. A little later he started for Cleveland, Ohio, where he expected to study and practice law. While passing through Buffalo, however, he was induced to remain there by his uncle, Lewis F. Allen, who secured for him a position with a prominent law firm. He was admitted to practice in 1859; became assistant district attorney for Erie County in 1863; was the Democratic candidate for district attorney in 1863, but was defeated at the polls; and in 1870 was elected sheriff of the county. At the conclusion of his term of office of three years, he resumed the practice of law, with marked success. In November, 1881, he was nominated as Democratic candidate for Mayor of Buffalo. The city was strongly Republican, but long-continued tenure of office had engendered flagrant corruption, and good men of all parties joined to uproot it. Cleveland, being elected by a handsome majority, reorganized the departments under his charge on business principles, overcame corrupt combinations, and promptly vetoed all measures that savored of extravagance or dishonesty. His notable service in that office was recognized in 1882, when he received the Democratic nomination for Governor of New York. His opponent was Charles J. Folger (q.v.), then Secretary of the Treasury under President Arthur. The Republican Party in the State was divided, and among the independent voters there was strong dissatisfaction with the methods that had secured Mr. Folger's nomination. Mr. Cleveland's reputation as a reformer was strongly in his favor, and he was elected by the extraordinary plurality of 192,854. His conduct as Governor was marked by integrity, independence, and good judgment, and he was early spoken of as a candidate for the Presidency. At the Democratic National Convention, July, 1884, he was the leading candidate on the first ballot, and in spite of a zealous minority of delegates from his own State, secured the necessary two-thirds of all the votes on the second ballot. A large body of Independent Republicans declared themselves in his favor; but the accession of this new element was partly offset by the defection of many Democrats. Cleveland received 219 electoral votes against 182 for his opponent, James G. Blaine. Besides the Southern States, he carried Connecticut, New York, New Jersey, and Indiana. He was inaugurated March 4, 1885. On June 2 of the following year he married Miss Frances Folsom. His term was characterized mainly by his bold advocacy of a reduction of tariff duties, and by his opposition to what he considered unworthy bills. During his term he vetoed or 'pocketed' 413 bills, 297 of which were private pension bills. During the first session of Congress he directly antagonized the Senate by refusing to give to that body his reasons for removing certain officers, or to deliver up the papers ordering such removals; on the ground that, under the Constitution, the President is not amenable to Congress for such acts, and that the papers were not official documents. His supporters maintain that, considering

the immense difficulties surrounding such an undertaking, his civil-service reform pledges were carried out as consistently as possible. He was renominated for the Presidency at Saint Louis, June 7, 1888, but was defeated, receiving only 168 electoral votes to Harrison's 233, though his popular vote exceeded by more than 100,000 that of his opponent. On the expiration of his term of office he resumed in New York City the practice of law, but still kept in touch with the political interests of his party. At the National Democratic Convention of June, 1892, although opposed by the delegation from his own State, he was nominated for the Presidency on the first ballot, and in November was elected, receiving 277 electoral votes against 145 for Harrison (Republican) and 22 for Weaver (Populist). During his second term, in the face of the violent opposition of the mass of his own party, he exerted himself unflinchingly for the maintenance of the gold standard. To this end he called an extra session of Congress in the summer of 1893, and secured the repeal of the Sherman Act of 1890, requiring the Government to make large purchases of silver bullion. He maintained the gold reserve by successive issues of Government bonds. When the Democratic majority of Congress passed a tariff act, he allowed it to become a law without his signature, considering it inadequate in many of its provisions. During the great railroad strike at Chicago in 1894 he ordered out the United States troops to "prevent the obstruction of the mails," although Governor Altgeld, of Illinois, who had not asked for the troops, protested vigorously against the measure. In the domain of foreign affairs, Mr. Cleveland's second administration was signalized by his withdrawal from the Senate of the Hawaiian Annexation Treaty negotiated by President Harrison; the upholding and advancement of the Monroe Doctrine by his vigorous and successful insistence upon the submission to arbitration of the long-standing boundary dispute between Great Britain and Venezuela; and the promulgation of the Bering Sea arbitration award. In consequence mainly of Mr. Cleveland's position on the currency question, his administration was not endorsed by the Democratic National Convention of 1896. In the ensuing Presidential campaign he supported General Palmer, the candidate of the Sound-Money Democrats. Since his retirement he has lived at Princeton, N. J. He has of late delivered, at Princeton University, two lectures annually on questions of public policy, which have been printed. Consult: Whittle, *Grover Cleveland* (London and New York, 1896); and an appreciation in Peck, *The Personal Equation* (New York, 1897).

CLEVENGER, SIOBAL VAIL (1812-43). An American sculptor, born at Middletown, Ohio. He first became known through his work as a stone-carver in Cincinnati, and afterwards opened a studio in New York. He executed busts of Clay, Webster, Van Buren, Allston, Everett, and others. His portrait bust of Webster has been used on a United States postage-stamp, and is considered the best likeness of that statesman. He realized his own deficiencies in artistic education, and took advantage of an opportunity to go to Rome in 1840. While there he produced his "North American Indian," which is characterized by the sincere, bold treatment and skill in handling his material shown in all Clevenger's work. But for

his early death, which occurred while he was on his way home, he would probably have attained high rank in his profession.

CLEVES, klévz (Dutch *Kleefs*, Ger. *Kleve*, Fr. *Clèves*). A German town of Dutch origin, and former capital of a duchy of the same name, situated in the Rhine Province of Prussia, about five miles from the frontier of the Netherlands (Map: Prussia, B 3). It is built on three hills, and has still retained some of its Dutch characteristics. It contains an old palace, the former abode of the Dukes of Cleves, now used as a law-court and prison; an old Rathaus, with a number of antiquities and paintings; and an old Catholic church, built in Gothic style, and containing the tombs of the counts of Cleves. In the vicinity of the town are situated chalybeate springs. Cleves is frequented as a summer resort by the Dutch. Population, in 1890, 10,409; in 1900, 14,684. The Duchy of Cleves, which arose in the Middle Ages, and which at the time of the Reformation was united with the duchies of Jülich and Berg, passed in the seventeenth century into the possession of Brandenburg. It was wrested from Prussia in the course of the Napoleonic wars, but restored in 1815.

CLEW. See SAILS.

CLEWS, HENRY (1830—). An American banker, born in Staffordshire, England. He entered mercantile pursuits in New York City in 1845, became a member of various firms, and in 1877 organized the firm of Henry Clews and Company. He was a founder of the Union League Club, New York City, and also long treasurer of the American Geographical Society and of the Society for the Prevention of Cruelty to Animals. He has published *Twenty-eight Years in Wall Street* (1888), and *The Wall Street Point of View* (1900).

CLICHÉ, klé'shá' (Fr., stereotyped). An electrotype plate, the impression of a die in a mass of fusible metal. It is employed by medalists and die-sinkers to make proofs of their work, and in order to judge the stage of their work before the die is hardened. The term is also applied to any stereotype plate used in modern reproductive processes, such as photographic proofs on glass, either positives or negatives.

CLICHY, or **CLICHY-LA-GARENNE**, klé'shé'lá-gá'rén'. A northwestern suburb of Paris, France. Population, in 1901, 39,291.

CLICK-BEETLE. A beetle of the family Elateridae, also known as elater, snapping-bug, and skip-jack, on account of its acrobatic performances. When disturbed these beetles curl up their legs and fall to the ground, where they lie rigid on their backs for some moments, and then begin a series of springs into the air, accompanied by a clicking sound. When the beetle succeeds in landing on its feet, it runs off. In regard to the springing, Le Conte says: "This is effected by extending the prothorax so as to bring the prosternal spine to the anterior part of the mesosternal cavity; then, suddenly relaxing the muscles, so that the spine descends violently into the cavity, the force given by this sudden movement causes the base of the elytra to strike the supporting surface, and by their elasticity the whole body is propelled upward." The larvae, known as wireworms, are hard, brownish-yellow,

and may live several years before gaining maturity. Most of them are found under bark and in rotten wood, but some live on the ground on the roots of grass, Indian corn, and other grains, as well as on those of certain vegetables. When numerous enough they may do considerable damage. Fall plowing is said to be the most effective remedy against them. Of the 7000 described species of elaters 500 occur in North America. The most conspicuous click-beetle found in the United States is the eyed elater (*Alaus oculatus*), a grayish black beetle with two large black eye-like spots on the prothorax; its larvæ live in rotting stumps. In the tropics of America there are luminous species belonging to the genus *Pyrophorus*, as the cucuyo (*Pyrophorus noctilucus*) and others.

BIBLIOGRAPHY. De Candeze, *Monographic des Elaterides* (4 volumes and 3 supplements, Liège, 1857-1881); Le Conte, "Revision of the Elateridæ of the United States," in *Transactions of Philosophical Society*, vol. x. (Philadelphia, 1853); Horn, *Papers in Transactions American Entomological Society*, vols. xii., xiii., xviii. (Philadelphia, 1885, '86, '91). See FIREFLY.

CLIDOMAN'CY. See SUPERSTITION.

CLIENT (Lat. *cliens*, *eluens*, hearer, from *cluere*, Gk. κλύω, *klyein*, Skt. *śru*, to hear; connected ultimately with AS. *hlūd*, Engl. *loud*). In law, one who consults or retains an attorney or counselor-at-law for advice, or to prosecute, manage, or defend an action at law, or to represent him in any proceedings or business matters. The client's relations with the attorney are in the highest degree confidential, and the client is protected by the most stringent rules of law in making disclosures of his private affairs to his legal adviser. See ATTORNEY; PRIVILEGED COMMUNICATION.

CLIFF (AS. *clif*, Icel., OS., Dutch *klif*, from Icel. *klifa*, ME. *cliven*, to climb). A precipitous slope of the land surface. Cliffs may be formed in three ways: (1) by the erosive action of water; (2) by the disintegrating influence of rain, frosts, and the atmosphere, or weathering; (3) by dislocations of the earth's crust. On rocky coasts cliffs are carved out by the force of waves, which beat against the shore-line, and by weathering of the rock that lies above the reach of the waves. The cliffs of Dover and of the Orkney and Shetland islands are notable examples of sea-cliffs. Gorges, cañons, and ravines, which are characterized by steep walls, are excavated by the erosion of running water; they are usually found along the upper courses of rivers. Cliffs may mark the line of outcrop of stratified rocks, and in such cases are usually to be traced to differential weathering of hard and soft strata. In regions of disturbance, cliffs are formed by faulting, which exposes a vertical rock-face or scarp. Many of the notable elevations in the Adirondacks are characterized by faulted scarps. See SHORE; CAÑON; FAULT; etc.

CLIFF-DWELLER. A name frequently used to designate the supposed extinct builders of the numerous ancient cliff ruins scattered throughout the cañons and mesas of the arid Southwest, along the upper waters of the Colorado and Rio Grande—in Utah, Colorado, Arizona, and New Mexico. The ruins are either upon the summits of the mesas or on shelves in the rock-walls of the cañons. For a long time their origin was

a subject of much speculation; but recent ethnologic investigation has proved that these ruins are not the work of any extinct or distinct race, but were built by the immediate ancestors of the modern Pueblo Indians (q.v.), some of whom, in fact, notably the Hopi, still have their villages upon the summits of almost inaccessible mesas for better protection against the wilder Navajo and Apache, by whom they are surrounded. Cliff-dwellings are divided into two types: (1) Habitations built in niches or clefts in the cañon-walls; and (2) domiciles excavated in softer beds between hard ledges in the cliffs, sometimes called 'caveate lodges.' See ARCHEOLOGY, AMERICAN. For illustration, see CASA GRANDE.

CLIFFORD, GEORGE, Earl of Cumberland (1558-1605). An English naval commander and buccaneer, born in Westmoreland. He took the degree of M.A. at Cambridge in 1576, and in 1588 commanded the *Elizabeth Bonaventure*, in the actions against the Spanish Armada. Thenceforward he was active chiefly in fitting out and conducting piratical expeditions. Of these the most important were one undertaken with seven sail, in 1589, which captured several rich prizes, and one with twenty sail, in 1598, which took San Juan de Puerto Rico, but failed in an attempt to intercept the Spanish treasure-galleons.

CLIFFORD, LUCY LANE (Mrs. William Kingdon). An English novelist. She was the daughter of John Lane of Barbados, in the British West Indies, and in 1875 married William Kingdon Clifford, the distinguished mathematician, who died four years later. Mrs. Clifford is best known by *Love Letters of a Worldly Woman* (1891) and *Aunt Anne* (1892). Among her other popular books are: *Any How Stories* (1882; reissued with additions, 1899); *Mrs. Keith's Crime* (1885); *The Last Touches* (1893); *A Wild Proxy* (1894); *A Flash of Summer* (1895); *Merc Stories* (1896); *The Dominant Note and Other Stories* (1897); and *Margaret Vincent* (1902).

CLIFFORD, PAUL. The hero of Bulwer's novel of the same name, a highwayman who is finally reformed through love.

CLIFFORD, NATHAN (1803-81). An American jurist, born in Rumney, N. H. He graduated at the Hampton Literary Institution, was admitted to the bar, and commenced practice in York County, Maine, in 1827. He was a member of the State Legislature from 1830 to 1834, was Speaker of the House for the last two years, and was Attorney-General from 1834 until 1838. He served in Congress from 1839 to 1843, and in 1846 was Attorney-General in President Polk's Cabinet. At the close of the Mexican War he went as a special United States envoy to Mexico, and negotiated a treaty by which California and other territories became a part of the United States. In 1858 he became, by President Buchanan's appointment, an associate justice of the United States Supreme Court, and in 1877 was president of the Electoral Commission (q.v.) that decided the Hayes-Tilden Presidential controversy. He published *United States Circuit Court Reports* (1869).

CLIFFORD, WILLIAM KINGDON (1845-1879). An English mathematician and physicist, born at Exeter. He was educated at a school in his native town, at King's College, London, and at Trinity College, Cambridge, where he was second

wrangler in the mathematical tripos of 1867. In August, 1871, he was elected to the chair of mathematics and mechanics at University College, London, which post he retained until his untimely death at Madeira, March 3, 1879. Clifford first established his reputation as an original thinker with the faculty of expressing scientific thought in plain and simple language by a lecture at the Royal Institution, *On Some of the Conditions of Mental Development*. He was a valued member of the London Mathematical Society, contributing to the *Proceedings*; for a time he acted as secretary, and afterwards vice-president of the mathematical and physical section of the British Association; he also lectured to the Sunday Lecture Society on such subjects as *Ether*; *Atoms*; and *The Sun's Place in the Universe*, and took an active interest in popularizing science. The versatility of his mind in philosophical and scientific discussion was further shown by his varied contributions to periodical literature. Besides these articles, and many papers on mathematics, he issued the first part of a larger text-book, *Elements of Dynamics* (1878). See Clifford's *Lectures and Essays*, edited by Leslie Stephen and F. Pollock (London, 1879), which contains a biographical sketch by the latter editor.

CLIFFORD'S INN. An inn of Chancery, attached to the Inner Temple, in London, built in 1345, and named after Robert de Clifford, who lived in Edward II.'s reign. Like the other Inns of Chancery it is now used for office and business purposes.

CLIFF-PLANTS. A group of drought-plants, xerophytes (q.v.), found chiefly on river, lake, or sea cliffs. See ROCK-PLANTS.

CLIFF-SWALLOW, or EAVES-SWALLOW. A swallow (*Petrochelidon lunifrons*) familiar throughout North America as one of those that make their nests about barns and outhouses. (See BARN-SWALLOW.) It is distinguished from other semi-domestic swallows by its short, square tail, reddish rump, grayish breast and collar, and white forehead; and by the fact that it places its flask-shaped nests of mud always on the *outside* of the building, unlike the fork-tailed true barn-swallows, which go inside the building to nest. This swallow originally nested in colonies wherever a rocky cliff afforded a chance to fasten their nests in close companies upon its face. (See Plate of FAMILIAR SWALLOWS.) These nests were globular, with a spout-like neck, forming the entrance, and were formed of pellets of mud, and lined with grass and feathers. As soon as human settlements began near their resorts, these swallows abandoned the cliffs for the more secure, better-sheltered place under the eaves of such buildings as they were permitted to occupy; and as the spread of civilization has finally covered most of the range of the species, only a few places in the remote West remain where these birds may be seen nesting after their primitive habit. In the eastern part of the country interesting modifications of habit have followed their long-continued association with man—among others, a disposition to make a much simpler style of nest, leaving off the domed roof and flask-like entrance, and forming little more than a cup in its place, since the overhanging eaves keep off the rain and conceal the sitting bird. This genus is almost cosmopolitan, has similar habits nearly everywhere, and in all countries attaches itself

to and is welcomed by civilization. Consult Ingersoll, *Wild Life of Orchard and Field* (New York, 1902).

CLIFTON. A beautiful and favorite watering-place in the southwest of Gloucestershire, England, forming the western suburb and part of the Parliamentary borough of Bristol (Map: England, D 5). It has a tepid spring of 73° F., which contains carbonic acid and salts of magnesia, and was brought into notice about 1695. The deep valley of the Avon is here spanned by a graceful suspension bridge. Population, in 1891, 44,700; in 1901, 44,400. See BRISTOL.

CLIFTON, or SUSPENSION BRIDGE. Former name of the town of Niagara Falls (q.v.), Ontario, Canada.

CLIFTON SPRINGS. A village in Ontario County, N. Y., 39 miles southeast of Rochester; on the Lehigh Valley and the New York Central and Hudson River railroads (Map: New York, C 3). It is situated amid beautiful scenery, and is famous for its sulphur springs and the well-equipped Clifton Springs Sanitarium. The village has two public parks and libraries. Settled about 1850, Clifton Springs was incorporated as a village in 1859. It owns and operates its water-works. Population, in 1890, 1297; in 1900, 1617.

CLIM, klím, or CLYM OF THE CLOUGH, Kluf (Clim of the valley, Teel. *klofi*, ravine, from *klüfa*, to split, AS. *clēofan*, to cleave). An English archer, said to have lived one generation previous to Robin Hood. He is known through the old ballad *Adam Bell, Clym of the Cloughe, and Wyllfum of Cloudestlee*. The story runs that these three men were outlawed for stealing venison, and passed through many adventures and hard fights with the sheriffs, justices, and mayor of 'Merrie Carlile.' They went to the King for pardon; but he would have hanged them if the Queen had not interceded for them. The ballad is far older than the oldest copy extant, which is the standard version, printed by Copeland about 1550. A fragment of an older one exists, recovered by Payne Collier. It is curious to notice that in this ballad William of Cloudestlee shoots an apple from his son's head at six score paces, in the presence of the King and Queen, after the manner of William Tell, of the Continental legend.

CLIMACTERIC YEAR (Lat. *climactericus*, Gk. *κλιμακτηρικὸς*, *klimaktērikos*, climacteric, from *κλιμάκτηρ*, *klimaktēr*, round of a ladder dangerous point in life, from *κλίμαξ*, *klímaz*, ladder, staircase). The year in the life of a woman during which she undergoes what is commonly called the 'change of life,' and which generally falls between her forty-fifth and fiftieth years. The term 'climacteric years' was once applied also to certain years in man's life, which were long believed by the disciples of astrology to have a peculiar significance, and to be the critical points of his health and fortune. Crises of this kind were, namely, supposed to be reached in the twenty-first, the thirty-fifth, the forty-ninth, and the sixty-third years of man's life. The most important of all was the sixty-third year, which was called—by way of eminence—the climacteric year, or the 'grand climacteric.' This year was supposed to be fatal to most men, owing to the fact that sixty-three is the product of the two mystical numbers seven and nine.

CLIMATE (OF. *climat*, from Lat. *clima*, Gk. *κλίμα*, *klima*, region, slope, from *κλίνω*, *klinein*, to incline). A word used in meteorology to indicate the summation or general result of all the solar and terrestrial influences that affect animal or vegetable life. It is possible, in fact, to disregard the relation to life, and consider only the meteorological phenomena as such, or the phenomena that affect any phase of our activity. Thus, one may ask, How does the climate favor navigation by sailing vessels, or the use of the wind as a motive power? In one region the climate may favor the development of a certain disease; in another, it may favor the development of special varieties of plants or animals. The specific features that favor the growth of either plants or animals, enabling them to make a specific spot their home, are oftentimes so obscure as to elude our observation and record; therefore, climatology is, in many respects, still an unsatisfactory study; but it has made such progress in the past fifty years as to have become exceedingly important to many classes of industries, as well as to physicians, naturalists, and agriculturists. Some varieties of plants are so dependent upon the nature of the soil in which they grow that Dr. Milton Whitney, of the United States Department of Agriculture, has advocated defining climatology as that which concerns the soil around the roots of the plant; but this is too narrow a view of the subject.

According to the usage of classic Greek, climate concerned principally the temperature of a place as regulated by the altitude of the sun at midday. As this varies with latitude, the ancients divided the known globe into zones two degrees broad in latitude, each of which was supposed to have its climate. At the present time, by combining the accumulated work of thousands of observers, we divide the globe into irregular regions, each of which differs from its neighbor in some important climatic condition as to temperature, rainfall, pressure, moisture, or the inclination of the sun and the amount of cloudiness. In the extensive works of the most eminent writers on climatology, especially those of Dr. Julius Hann, of Vienna, a large number of meteorological items are enumerated as being essential to a complete study of the climate of any place. These items include not merely the mean temperature, rainfall, cloudiness, the barometric pressure and relative humidity, but also the variations of these quantities, viz. their highest and lowest values each day, or month, or year, and the liability to sudden rises or falls. For navigation and the use of windmills, we need to know the average velocity of the wind, and perhaps especially the number of hours during which the wind exceeds a specified limit. With reference to the growth or importation of tender plants, the agriculturist needs to know the mean dates of the last frost of spring and the first frost of the autumn, the difference between which is ordinarily called the growing season. Since the establishment of the fact that the germination of seed, the growth of the plant, and the ripening of the harvest requires a certain amount of heat or molecular energy, efforts have been made to determine the thermal constants for many plants, and for each phase in growth. This 'thermal constant' is usually expressed as the sum total of the average daily temperatures when such temperatures are

above 42° F. There is also a 'rainfall constant' peculiar to each species of plant, the nature of which has been investigated by Linsser, who has shown that plants are able, by gradual evolution, to change their own thermal and aqueous constants, and eventually adapt themselves to a change in climate. Linsser's laws serve as a guide to those who would transplant a species from one part of the world to another of different climate.

In the study of climate with reference to navigation, we have to consider the frequency of destructive storm-winds. Charts showing this factor have been published for all the oceans and seas by the hydrographic offices of England, France, Holland, Russia, and the United States. In addition to this, for the special benefit of sailing vessels, Galton has shown how to prepare charts showing, for each square degree, the progress that a vessel of a certain size and rig would make if her sails were set so that she should go in a certain direction. From the point of view of insurance, both life insurance and fire insurance, the destruction by wind, hail, and lightning has been studied; these data, being plotted on charts, show the climate of the country from that point of view. Perhaps the most general idea of the distribution of climate is given by charts which show the frequency per month or year with which storm-centres pass over a given locality, and the direction in which they pass. A map of such frequency for the eastern portion of the United States was first published in the Statistical Atlas of Gen. Francis A. Walker in 1874, and the most extensive publication of this kind was published in 1893 as *Weather Bureau Bulletin 4*, showing the frequency of storm-paths for all parts of the Northern Hemisphere. The wind, rain, and temperature are so distributed around a storm-centre that, when its location is known, the distribution of all the others can be closely estimated. In general, in the Northern Hemisphere, the regions that lie to the south of the paths of the storm-centres have prevailing warm, moist, southerly winds followed by occasional sudden changes to cool, dry, westerly winds. This change occurs with every passing storm-centre, but the prevailing weather is clear and pleasant. Stations lying on the north of the paths of the storm-centres have prevailing easterly winds, with cloud and rain followed by cool northwest winds; but the time occupied by the trying easterly winds is proportionately larger.

It is diligent to describe or exhibit the climatic peculiarities of any region without the use of charts. Elaborate publications of this kind, for United States weather, have issued from the Weather Bureau at Washington; the *Climatic Charts for the Years 1870-99* show the normal precipitation for each quarter of the year, the normal percentage of sunshine, the normal barometric pressure, reduced to sea-level, the normal temperature of the air at the surface of the earth, the mean maximum and mean minimum temperatures, the highest and lowest recorded temperatures. In addition to these, charts of first and last frost and of prevailing winds have also been published. The ordinary popular textbooks on meteorology are very largely occupied with climatology, properly so called. Of these, that by Prof. Frank Waldo (New York, 1896) is probably the most complete for America; the treatises of Angot, *Traité élémentaire de météo-*

rologie (Paris, 1899) and Hann's *Handbuch der Klimatologie* (Stuttgart, 1893) are the most complete for European data. But in almost all respects, the most careful work of the kind ever published is entitled *Atlas of Meteorology*, vol. iii. of Bartholomew's *Physical Atlas* (London, 1899). In this we have a general text on climatology accompanied by about four hundred maps illustrating the climate and the weather of all parts of the globe for each month and for the whole year, and also an admirable bibliographical list of more important modern publications on this subject. A table of about forty columns of numerical data would seem to be necessary in order to present the complete idea of climate as imagined by Hann, in his great text-book on Climatology; but most of these are included in the plates and diagrams collected in Bartholomew's *Physical Atlas*.

Perhaps the most important feature controlling plant-life is the relative distribution of temperature and rain from month to month during the year. Climatic types have been elaborated by Harrington, Henry, and others, based upon this distribution of rain. Thus, in one region we have the prevailing summer rains; in another, the prevailing winter rains; while in still other places, the rains are divided into two seasons with dry weather between. Professor Hinrichs introduced the idea of a climatic distinction based upon the law governing the number of light and heavy rains that had fallen within a given space in a year's time. As the largest falls occurred least frequently, and so also the smallest falls, there is some intermediate rainfall that is most likely to happen. By counting up these different quantities, one obtains a series of numbers that may be represented by the equation of probabilities, and the constant term in this equation becomes the so-called 'Hinrichs Climatic Factor.'

The influence of climate on crops is a matter of continued investigation in the various agricultural experiment stations throughout the civilized globe, and the reader may refer to the *Experiment Station Record*, published regularly by the United States Department of Agriculture, for the latest information on the subject. A summary of this work has led some authorities to the conclusion that cereal crops are raised successfully only by means of careful special cultivation, so that the resulting crop is not so much an evidence of the influence of climate as of the influence of human skill and husbandry in modifying and assisting climate. In the interior of continents, the clear, dry air facilitates great ranges of temperature, both diurnal and annual; the soil is dry, evaporation rapid, and delicate plants do not survive the rigors of cold and drought. On the other hand, an oceanic or insular climate is more uniform as to temperature, moisture, and cloudiness, and more favorable to the development of animals and plants. The influence of climate in disease is principally secondary in that climatic conditions affect the growth of germs, fungi, and noxious animals, through which man suffers.

There is no well-authenticated case of an appreciable change of climate within the past two thousand years. The researches of Eginitis on the climate of Greece seem to establish this principle beyond doubt. Neither is it possible that any change on the surface of the earth due to

man—such as deforestation, reforestation, agriculture, canals, railroads, or telegraph lines—can have had anything more than the slightest local effect, if any, on climatic phenomena that depend upon the action of the whole atmosphere. On the other hand, it is probable that appreciable changes have taken place in the course of the very long intervals known as geological periods or æons. The phenomena of the flora, the fauna, the erosion, and the geological stratification, all agree in showing that there have been times when the Lake Region and the Saint Lawrence Valley, the Middle States and New England, were covered with ice and glaciers; a similar condition has prevailed over northwestern Europe. Such changes may have been produced by changes in the elevation of the land and distribution of the ocean, by periodic changes in latitude, by changes in the composition of the earth's atmosphere, or by changes in solar radiation. All of these are plausible causes; but at present there is no agreement of authorities as to the real cause of the changes in so-called geological climate. To these changes in the continents and the climates, we may plausibly attribute the development of a great variety of flora and fauna, the migratory habits of birds, the traditions of the early history of the human race, and the extinct plants and animals of paleontology. See EVOLUTION.

One of the most evident causes of the differences of climate is the relation of the wind to the land and ocean. When the prevailing wind is from the ocean, the land experiences moist and usually cloudy or rainy weather. This is due essentially not so much to the temperature of the water as to the mere fact that water of any temperature will evaporate largely into the air, and fill it with moisture. Thus, it is an error to say that the climate of Great Britain and western Europe is affected by the Gulf Stream, or that the climate of California and British Columbia is controlled by the Japan Current: in both these cases it is the moist ocean wind that brings cloud and rain, and the amount of this latter is not influenced in the slightest degree by the Gulf Stream or the Kuro Siwo. Another important consideration in climatology is the relation of the wind to the mountain ranges. Thus, on the windward side of a range, there is ascending air which causes damp weather with cloud or rain; whereas, on the leeward side of a mountain range there is descending air, which is always dry and clear, and frequently quite warm.

The relation of climate to physiography has been essentially a relation of cause and effect. The surface features of the land, as we now know them, present to us hills and valleys which we may easily recognize as the result of erosion by wind and water, continued for many ages, and assisted by frost and the varying hardness of the different kinds of rock and soil. These features, as we now see them, are usually all that remain after a depth of many thousands of feet of soil and rock has been broken down and carried into the sea. Geology tells us what strata and masses must, at one time, have existed; but physiography shows how 'all this material has been carried away by the action of the frost, wind, and rain, which constitute prominent features of the climate.

Among the works that treat of meteorological climate, the first place must be given to Bartholomew, *Atlas*, vol. iii. *Meteorology* (London,

1899). For the United States specifically, consult the various publications of the Weather Bureau, and Waldo, *Elementary Meteorology* (New York, 1896). For the world in general, consult: Hann, *Handbuch der Klimatologie* (Stuttgart, 1897); Woeikof, *Die Klimate der Erde* (Jena, 1887); and Hann, *Lehrbuch der Meteorologie* (Stuttgart, 1901).

CLIMATOLOGICAL ASSOCIATION, AMERICAN. A society for the study of climatology, balneology, and the diseases of the respiratory and circulatory organs. It was organized in New York City in 1884, and is composed of physicians residing in the United States and Canada. It consisted, in 1901, of 133 members.

CLIMATOLOGY, CLIMATOGRAPHY. See CLIMATE.

CLIMBING FERN, or **HARTFORD FERN** (*Lygodium palmatum*). A species of fern found, rarely, from Massachusetts to Kentucky and southward, remarkable for climbing or twining around weeds and shrubs. The leaves are broadly palmate, and the fertile frondlets form a panicle upon the upper portion of the stem. It is prized for interior decoration of houses. For illustration, see Plate of FERNS.

CLIMBING FISH. One of the small Oriental fishes of the family Anabantidæ, interesting because of the modification of the upper portion of their branchial apparatus into a series of leaf-like structures, adapted for retaining small quantities of water. This water is sufficient to keep the gills moist for a considerable time, thus enabling the fish to subsist in mud or out of water. For a special account of this apparatus, consult Dobson, *Proceedings of the Zoölogical Society of London*, 1874, p. 312. The numerous species live in fresh water in southeastern Asia and its neighboring islands, and in South Africa. The

HEAD OF CLIMBING PERCH.

a, Gills; b, Leaf-like apparatus serving as air-breathing lungs.

best-known and typical species is the climbing perch (*Anabas scandens*), which is widely distributed in the Orient, and especially abundant in the Ganges valley. It is about six inches in length, somewhat resembles a perch, and has large scales and a spiny dorsal fin. It has been reported to climb palm-trees, but this needs verification. It often, however, leaves pools which are in danger of drying and travels over land in search of water, usually during the night or early morning, while the dew is still on.

CLIMBING HEMPWEED. See MIKANIA.

CLIMBING PLANTS. See LIANAS.

CLINCH. See KNOTTING AND SPLICING.

CLINCHANT, klän'shän', JUSTIN (1820-81). A French general, born at Thiaucourt (Meurthe). He studied at the military college of Saint Cyr, entered the infantry service in 1841, and fought in the Crimea, in the Italian campaign of 1859, and in Mexico. As commander of a brigade of the Third Army Corps, he participated in the battles before Metz. Having escaped from imprisonment after the capitulation, he was appointed to the command of the Twentieth Army Corps of the Army of the East, with the rank of a general of division. He succeeded Bourbaki (q.v.) as commander of the Army of the East, and, intercepted by the Germans under Von Manteuffel in an attempt at retreat, was compelled, with his 84,000 troops, to withdraw into Switzerland. He subsequently commanded the Fifth Army Corps of the Army of Versailles against the forces of the Commune, and in 1879 was appointed Military Governor of Paris.

CLINCHER. A 'prentice who apes the man-about-town in Farquhar's comedies, *The Constant Lover* and *Sir Harry Wildair*.

CLINCHER-BUILT, or **CLINKER-BUILT.** See BOAT.

CLINCH RIVER. A tributary of the Tennessee River, rising in Russell County, Virginia, and flowing in a southwestern direction through Virginia and Tennessee (Map: Virginia, B 5), joining the Tennessee River at Kingston. Its length is estimated at over 200 miles.

CLINEDINST, BENJAMIN WEST (1860—). An American illustrator, born at Woodstock, Va. He studied at the Virginia Military Institute (Lexington), and became known as an artist for periodicals and books. In oils and water-colors he has executed several portraits and genre pictures. He was awarded the Evans Prize of the American Water-Color Society in 1900.

CLINGMAN, THOMAS LANIER (1812-97). An American politician and soldier, born at Huntsville, N. C. He graduated at the University of North Carolina in 1832, and was elected to the State Legislature. From 1843 to 1858, with the exception of one term, he was a Whig member of Congress, where he became known as a brilliant debater. In 1858 he was selected by the Governor of his State to fill a vacancy existing in the United States Senate, whence, in 1861, he withdrew to become a colonel in the Confederate Army. He was promoted to be brigadier-general, served throughout the war, and in 1863 was a delegate to the National Democratic Convention. The existence in North Carolina of diamonds, rubies, corundum, platinum, and mica was first made known by him. He published *Follies of the Positive Philosophers* (1878) and a volume of speeches (1878).

CLINGMAN'S DOME. One of the two highest peaks of the Smoky Mountains, situated in Tennessee, just across the border from North Carolina (Map: North Carolina, A 4). It is 6613 feet above the sea-level. It was named after Thomas L. Clingman.

CLINIC (Lat. *clivnicus*, Gk. κλινικός, *klinikos*, pertaining to a bed, from κλίνη, *klīnē*, from κλίνειν, *klīneîn*, to incline). An institution or a department of a medical college, which is devoted to the examination and free treatment of patients. Notwithstanding the derivation of the

term, 'clinical' lectures have for many years been delivered, not at the bedside, but in lecture-rooms, to which patients are able to come from their homes. The term 'clinic' is often applied also to institutions where free medical treatment is furnished to patients who are able to walk in and return to their homes, but where there are no beds, as in a hospital. (See DISPENSARY.) The term *clinical medicine* is applied to the branch of medicine occupied with the investigation of diseases at the bedside.

CLINIC BAPTISM. In the ancient Church, baptism administered to a person on a sick-bed or death-bed. As such a baptism was irregular and the usual rites could not be observed, the question was discussed whether it was valid. In the third century Novatian declared that such baptized persons should not be ordained, and in 314 the Synod of Neo-Cæsarea so ordered, and this prohibition was renewed by the sixth Synod of Paris in 829. Saint Cyprian insisted strongly on the validity of such baptism.

CLINK, THE (Ger. *Klinke*, Dan. *klink*, Swed. *klinka*, bolt, latch, from Ger. *klingen*, OHG. *chlingan*, Dan. *klinge*, Swed. *klinga*, to clink, to jingle). An old prison at Bankside, London, in the jurisdiction of the Bishop of Winchester, used for criminals of that part of the Manor of Southwark which was known as 'The Liberty of Clink,' and not embraced in the original grant to the city of London (about 1327). The later grant was made expressly for the purpose of securing jurisdiction over the malefactors of the city of London who fled to Southwark. The name has come to mean the 'guard-house,' in the modern parlance of 'Tommy Atkins.'

CLINKER, HUMPHREY. The hero of Smollett's novel of the same name. He is brought up in a workhouse, and then enters the service of Mr. Bramble, his natural father.

CLINKER-BUILT. See BOAT.

CLINKERS (from *clink*, Ger. *klingen*, to jingle). The scales or globules of black oxide of iron, obtained from red-hot iron under the blows of a hammer. The same term is applied to the slag of iron-furnaces, to the calcined products of cement kilns, and, generally, to the slag-like refuse of furnaces of all kinds. The cinder-like masses which form the crust of some lava-streams are called clinkers by geologists.

CLINKSTONE. See PHONOLITE.

CLINOMETER (from Gk. *κλινειν*, *klinein*, to incline + *μετρον*, *metron*, measure; cf. Fr. *clinomètre*). An instrument used by geologists for ascertaining the dip or inclination from the horizontal of bedded rocks or veins. It consists of a graduated arc, with a pendulum or plumb-line hung at the centre. When the instrument is placed on a horizontal surface, the pendulum points to 0°, while on an inclined surface the pendulum assumes a position corresponding to the angle of inclination. The clinometer is sometimes attached to a compass, which latter is required for determining the direction of out-crop or strike of rocks.

CLINOSTAT (from Gk. *κλινειν*, *klinein*, to incline + *στατός*, *statos*, placed, from *στηναι*, *histanai*, to stand). An apparatus for rotating plants, periodically or constantly, in any desired plane, for the purpose of eliminating or equalizing the effect of any directive stimulus, such as

light or gravity. (See IRRITABILITY.) It consists essentially of a strong clockwork, driven by a spring or weight, with vanes or other device for controlling the speed of the mechanism, which may usually be adjusted to make one rotation in 10 to 30 minutes. Suitable tables and clamps for holding the vessel containing the plants are provided. The intermittent clinostat is so arranged that at given intervals the mechanism is released, and permitted to impart a quarter or a half rotation to the plant.

CLINT, ALFRED (1807-83). An English artist. He was born in London, and was the son of the well-known painter and engraver, George Clint. His work consists of portraits, and particularly studies of the scenery in Guernsey and Jersey, which have furnished the subjects for many charming landscapes. In 1869 he was made president of the Society of British Artists.

CLINTON. A town in Huron County, Ontario, Canada, 13 miles from Goderich, on a branch of the Grand Trunk Railroad (Map: Ontario, B 4). In and near the town are valuable salt-wells and a deposit of rock salt 20 feet thick. Clinton is the headquarters of the Canada Salt Association, has several factories, and a large trade in grain and produce. The town contains a collegiate institute and a model school, and is electrically lighted. The United States has a consular agent here. Population, in 1891, 2635; in 1901, 2547.

CLINTON. A city and the county-seat of Dewitt County, Ill., 22 miles south of Bloomington, on the Illinois Central Railroad (Map: Illinois, D 3). It is the centre of a fertile agricultural region. Clinton is governed, under a State law, by a mayor, elected for two years, and a city council. The city owns and operates its water-works. Population, in 1890, 2598; in 1900, 4452.

CLINTON. A city and the county-seat of Clinton County, Iowa, 138 miles west of Chicago, Ill.; on the Mississippi River, and on the Chicago and Northwestern; the Chicago, Milwaukee and Saint Paul; the Chicago, Burlington and Quincy, and other railroads (Map: Iowa, G 3). The Mississippi is crossed at Clinton by three bridges, one of which is three-fourths of a mile long. The city contains two academies, business colleges, and Wartburg College (Lutheran), founded in 1850. Its manufactures are extensive, including lumber in various products, machinery, boilers, carriages, flour, mattresses, spring beds, brooms, etc. Lumber and grain are largely exported. The city of Lyons, which in 1390 had 5799 inhabitants, was annexed to Clinton in 1895. Population, in 1890, 13,619; in 1900, 22,698.

CLINTON. A town in Worcester County, Mass., 12 miles northeast of Worcester; on the Nashua River, and on the Boston and Maine and New York, New Haven and Hartford railroads (Map: Massachusetts, D 3). It has manufactures of ginghams and plaids, machinery, wire-work, worsteds, Brussels and Wilton carpets, etc. The town owns and operates its water-works, and has a public library of 25,000 volumes, and a park. Clinton was a part of Lancaster until 1850, when it was incorporated as a separate town. Its government is administered by town-meetings, which are convened quite frequently. The board of selectmen, who are elected for three

years, appoint the chief of police, engineers, etc. Population, in 1890, 10,424; in 1900, 13,667.

CLINTON. A town in Hinds County, Miss., nine miles west-northwest of Jackson; on the Alabama and Vicksburg Railroad. It is the seat of Mississippi College (Baptist), organized in 1852; of Hillman College, established in 1853; and Mount Herman Seminary for colored students. Population, in 1900, 354.

CLINTON. A city and the county-seat of Henry County, Mo., 90 miles southeast of Kansas City; on the Missouri, Kansas and Texas, the Saint Louis and San Francisco, and the Kansas City, Clinton and Springfield railroads (Map: Missouri, C 3). It has potteries, flour-mills, and iron-rolling mills, and exports hogs, cattle, coal, and agricultural products. There is an artesian well, which has a considerable flow of white sulphur. Baird College is situated there. Settled in 1835, Clinton was incorporated as a village in 1840, and at present is governed under a general law, revised in 1899, which provides for a mayor, who holds office for two years, and a city council. Population, in 1890, 4737; in 1900, 5061.

CLINTON. A village in Oneida County, N. Y., nine miles west-southwest of Utica; on Oriskany Creek and on the New York, Ontario and Western Railroad (Map: New York, E 2). It is the seat of Hamilton College (q.v.), Houghton Seminary, and the Clinton Preparatory School. There are mineral-springs here. Iron-mining and smelting are the leading industries. Population, in 1890, 1269; in 1900, 1340.

CLINTON, DE WITT (1769-1828). An American statesman. He was born at Little Britain, Orange County, N. Y., March 2, 1769, the son of James Clinton, and was educated at Columbia College, graduating with high honors in 1786. Choosing the law for his vocation, he studied under Samuel Jones, and was admitted to the bar in 1788. He entered immediately into political life, opposing the adoption of the Federal Constitution, and becoming an ardent supporter of his uncle, George Clinton (q.v.), who was then Governor of the State, and a leader of the Anti-Federalist Party. In 1797 he was elected to the State Assembly as a representative of New York City, where he made his residence, and the next year was chosen State Senator for four years. He also became a member of the Council of Appointment. Up to this time the Governor had exercised the exclusive right to make nominations; but Clinton vigorously attacked the system, succeeded in 1801 in procuring an amendment to the Constitution giving the members of the Council of Appointment equal rights of nomination with the Governor, and by this means introduced the 'spoils system' into New York politics. During this period he found time to devote himself to scientific and social questions—especially the use of steam in navigation, and the abolition of slavery and its kindred barbarism, imprisonment for debt. In 1802, when but thirty-three years of age, he became a member of the United States Senate, but soon resigned to accept the office of Mayor of New York—an appointment made by his uncle, the Governor, and the Council of Appointment; and this position he held, with two short intermissions, until 1815. While Mayor, he was also at various times State Senator, a member of the Council of Appointment, a

commissioner on the Erie Canal route, and from 1811 to 1813 Lieutenant-Governor of the State. After the retirement of his uncle from active participation in State politics in 1804, he speedily became the leader of the Republican Party in New York, and in 1812 was chosen as its candidate for President. Madison was nominated by the Republican Congressional Caucus; but the New York section of the party, tired of Virginian control, insisted on running Clinton, and made a coalition with the Federalists for that purpose. Clinton, however, received only 89 electoral votes to 128 for Madison. The canvass had been hardly creditable to Clinton, and he was not henceforth an important figure in national politics; but as a great benefactor of his State in his later years, he won fame and success. He took a leading part in establishing the free-school system of New York City, and in the establishment and promotion of various institutions of science; in the improvement and modification of criminal laws; in the extension of agriculture and manufactures; in the relief of the poor, and the improvement of morals. But his greatest service was his promotion of the Erie Canal project. As citizen and commissioner, his zeal, energy, and optimism in planning and urging on the completion of this great waterway inseparably connected his name with the enterprise, both in the minds of its friends and in the minds of those who sneered at 'Clinton's Folly.' The canal became a political question, and on this issue Clinton was elected Governor in 1817. One of his first duties as Governor was to break ground for the canal at Rome. He was reelected in 1820, but declined a hopeless nomination in 1822. His political opponents, led by Martin Van Buren and the 'Albany Regency' (q.v.), sought to end his political career, and in 1824 removed him from the office of canal commissioner. This partisan act provoked a storm of public indignation, which elected Clinton Governor in that year—an office which he held until his death. The next year he opened the Erie Canal. He died suddenly, February 11, 1828, at Albany. Among his works are: *Discourse Before the New York Historical Society; Memoir on the Antiquities of Western New York; Letters on the Natural History and Internal Resources of New York; Speeches to the Legislature*, and many historical and scientific addresses. Consult: *Lives*, Hosack (New York, 1829) and Renwick (New York, 1840); also Campbell, *Life and Writings of De Witt Clinton* (New York, 1849).

CLINTON, GEORGE (1739-1812). An American statesman, born in Little Britain, N. Y. In the French and Indian War he served as a lieutenant in the expedition against Fort Frontenac, and after the war entered law and politics. He was chosen to the Colonial Assembly and to the Continental Congress, was made brigadier-general in the Revolutionary Army, and in 1777 was elected first Governor of New York. He was reelected and occupied the executive chair for eighteen years, and in 1801 was chosen for one more term. From 1805 until his death he was Vice-President of the United States. While Governor, his discretion in civil affairs and his military services were of great value to the State. He opposed the ratification of the Federal Constitution in the belief that it granted too great powers to the national officers, and while presid-

ing officer of the Senate, during his term as Vice-President, defeated by his deciding vote the rechartering of the United States Bank (1811).

CLINTON, Sir HENRY (c.1738-95). A British general in the American Revolution. He was the son of Admiral George Clinton (Governor of Newfoundland from 1732 to 1741, and of New York from 1741 to 1751), and the grandson of Francis, sixth Earl of Lincoln. He was a member of Parliament for Boroughbridge and Newark from 1772 to 1784, during which time he was also in the army in America. He served as major-general at the battle of Bunker Hill, and took possession of New York after the defeat of Washington's forces in the battle of Long Island (August 27, 1776). For his part in that battle he was promoted lieutenant-general and knighted. In 1778 he succeeded Sir William Howe as commander-in-chief, and, on his march from Philadelphia to New York, fought with Washington the unsuccessful battle of Monmouth (q.v.). In December, 1779, he led an expedition to South Carolina, and on May 12, 1780, captured Charleston, with General Lincoln's army of 6000 men. Replaced in command by Sir Guy Carleton in 1782, Clinton returned to England. Soon afterwards he published his *Narrative of the Campaign of 1781 in North America* (1783), in answer to an account which Cornwallis had published of that campaign. He was again in Parliament (1790), and from 1793 until his death was Governor of Gibraltar.

CLINTON, HENRY FYNES (1781-1852). An English classical scholar, born at Gamston, in Nottinghamshire. He graduated at Oxford in 1805, and was a member of Parliament from 1806 to 1826. His two great works are the *Fasti Hellenici* (1824-34), and *Fasti Romani* (1845-50), the civil and literary chronologies of Greece, Rome, and Constantinople, which set classical chronology upon a solid and scientific basis. Consult *The Literary Remains of Henry Fynes Clinton*, by his brother (London, 1854).

CLINTON, JAMES (1736-1812). An American soldier, born in Ulster County, N. Y. He was a brother of George Clinton (1739-1812), and the father of De Witt Clinton. He early entered the English Army; served as a captain in the French and Indian War, and distinguished himself at the capture of Fort Frontenac. On the outbreak of the Revolution, he took the side of the Colonies and was made a colonel. He accompanied Montgomery to Quebec as brigadier-general, and in 1777 was in command of Fort Clinton when it was captured by the British, after a brilliant defense, in which he received a bayonet wound. He was engaged against the Indians in General Sullivan's Iroquois expedition (1779), and was present at the siege of Yorktown. He was delegate to the New York Convention which ratified the Federal Constitution, and was afterwards a commissioner to adjust the boundary line between Pennsylvania and New York.

CLINTON STAGE. A name given to a subdivision of the Silurian system. The Clinton stage takes its name from the type locality at Clinton, N. Y.; but the strata are widely distributed in the eastern part of the United States, occurring along the Appalachians from New York to Alabama, and also in Ohio, Indiana, and Wisconsin. The prevailing rocks are sand-

stones, limestones, and shales, which attain a maximum thickness in the aggregate of about 1000 feet. A noteworthy feature of the Clinton stage is a persistent bed of oolitic iron ore that is the basis of an active mining industry in New York and Alabama. See article SILURIAN SYSTEM.

CLINTON STATE PRISON. A prison located in Dannemora, Clinton County, N. Y. It was begun in 1844, and comprises a number of buildings inclosed in a stockade which surrounds thirty-seven acres of land. This location was chosen for the purpose of employing convicts in the mining and manufacture of iron, there being abundance of that ore on the tract belonging to the prison or to the State. It is also in a densely wooded region, and the timber furnishes the charcoal used in the furnaces.

CLIO (Lat., from Gk. Κλειῶ, *Kleiō*, from κλείν, *klein*, to celebrate, from κλέος, *kleos*, glory). In Grecian mythology, one of the Nine Muses (q.v.). When the individual muses were assigned specific functions, Clio was at first called muse of epic poetry, but later, and more commonly, muse of history. In ancient art her common attribute is a partly opened roll.

CLIO. A prominent genus of pteropod mollusks. See PTEROPODA.

CLIO. A pen-name of Addison, suggested by the letters 'C' 'L' 'I' 'O' with which, respectively, he signed his articles in the *Spectator*, according as he wrote at Chelsea, London, Islington, or 'The Office.'

CLIP HOOKS. Two hooks, with points lying in opposite directions, made in such a manner that they overlap and fit closely so as to form a single eye when the necks are lashed together; the eyes of the separate hooks are in the same thimble or on the same pivot, and also fit closely to each other when the necks are brought together.

CLIPPER (probably connected with Dutch *klepper*, fast horse, from *kleppen*, to run swiftly, and thus with Eng. *clap*). A sailing vessel built with very sharp lines, more or less raking masts, and great spread of canvas, with a view to speed; a development of a model for the mercantile marine, first built in this country at Baltimore, and called the *Baltimore Clipper*. The clippers, becoming famous for quick runs, and occasionally making better time than the steamers, were especially employed in the South American trade, in the China trade (for tea and opium), and in the early California trade, via Cape Horn. For many years the 'fruit clippers' were celebrated for their rapid passages; and the 'opium clippers' and 'slavers' attained an unenviable notoriety for speed. A 'clipper ship,' as compared with the ordinary sailing ship, is longer, and generally of less beam in proportion to her length; very sharp at the bows, which are hollowed more or less below the water-line; gracefully fined away toward the stern, which is almost always

CLIP OR SISTER
HOOK.

elliptical; and, in fact, the comparison of the race-horse to the beast of burden holds good in comparing the clipper to the ordinary sailing ship. The first American clipper was the *Rainbow*, a vessel of 750 tons, built in 1843 for the China trade. The largest of these craft was the *Great Republic*, 325 feet in length, 53 feet beam, and 37 feet depth of hold, of 4000 tons capacity. The Aberdeen builders and Mr. Scott Russell, in England, built some of the most magnificent clipper ships that have sailed the ocean. Among the fastest passages are those made by the *Flying Cloud* in 1851, New York to San Francisco in 89 days and 18 hours, making 374 miles in one day. This record, however, was reduced by the *Comet*, which made the same trip in 83 days; in 1854, by the *Lightning*, Boston to Liverpool, 2827 miles, in 13 days, and Melbourne to Liverpool, 12,190 miles, in 64 days; in 1865, by the *Nightingale* from Melbourne to New York, 12,720 miles, in 73 days; the *Thornton*, Sandy Hook to Liverpool, 3000 miles, in 13 days, 9 hours; this record was equaled by the *Dreadnaught* in 1859; 1869, the *Golden Gate*, an iron clipper ship, from Liverpool to San Francisco, 13,800 miles in 100 days. The clipper, which was at its prime during the period from 1840 to 1855, at the advent of the steamship underwent numerous transformations as the ends of commerce demanded a greater cargo-carrying capacity at the expense of speed, and as a type gradually passed away; changes were made in the lines and rig, and smaller crews were carried, with the object of increasing tonnage capacity and competing with steamships by lower freight-rates. The effect of the model, however, was shown in many subsequent ships and yachts.

CLIPPER-BOW. The overhanging bow, with short bowsprit (chiefly ornamental), which is found in some wooden steamers. The bow of most steamers has a vertical stem. The clipper-bow differs from the old sailing-ship bow in rising in a smooth curve from the cutwater to the scroll-head, while the latter had a reverse curve as it approached the bowsprit.

CLISTHENES, klis'thē-nēs (Lat., from Gk. Κλεισθένης, *Kleisthenēs*). An Athenian statesman. He was a member of the celebrated family of the Alæmonidae, and grandson of the Sicyonian Clisthenes. He took a prominent part in the expulsion of Hippias in B.C. 510. He made important changes in the Athenian Constitution, which he rendered more democratic. The basis of his reform was a redistribution of the people; instead of four tribes, or phylæ, which had previously existed, he made the number ten, and distributed among these the demes into which the Attic territory was divided. He also instituted ostracism, and was the first to suffer therefrom. When Isagoras, the head of the oligarchical party at Athens, called in Cleomenes, King of Sparta, Clisthenes, with 700 heads of families, was forced to retire from the city, but was afterwards recalled.

CLITANDRE, klē'tān'dr'. A favorite name with Molière, who calls four different characters by it: (1) The sensible lover of Henriette in *Les femmes savantes*. (2) The lover of Angélique in *Georges Dandin*. (3) A titled lover of Célimène in *Le misanthrope*. (4) The lover of Lucinde in *L'amour médecin*, who pretends to be a physician in order to cure her.

CLITH'EROE (Welsb *Cled-dwyr*, cliff near the waters). A town of Lancashire, England, on the Ribble, and at the foot of the Pendle Hills, about 28 miles north of Manchester (Map: England, D 3). Its notable buildings include the Church of Saint Michael's, the ancient grammar-school founded by Queen Mary in 1554, and the ruins of an old castle built by one of the De Lacy family in the twelfth century. The town maintains a free public library, and expends a considerable sum on technical education. Its industries consist of cotton and paper mills, and in the neighborhood are extensive limestone-quarries. Near Clitheroe is the Jesuit College of Stonyhurst. Population, in 1891, 10,800; in 1901, 11,400. Clitheroe and Pontefract were the two seats of the De Lacy family in Norman times.

CLITOM'ACHUS (Gk. Κλειτόμαχος, *Kleitomachos*, or possibly Κλειστόμαχος, *Kleistomachos*) (c.190-c.110 B.C.). A Greek philosopher of the New Academy. The most important among the pupils of Carneades, whose spoken philosophy he put in writing, and whom he succeeded as leader of the school. He was a Carthaginian by birth; was called Hasdrubal in his own tongue; came to Athens about 147, and became head of the New Academy in 129. Of his many works none remain save in translations given by Cicero, who praises Clitomachus highly. He was well known at Rome, if we are to believe Cicero's statement that Crassus heard him lecture at Athens in 111, and that he dedicated one of his books to the poet Lucilius and one to Lucius Censorinus, consul in 149 B.C.

CLIT'US (Lat., from Gk. Κλείτος, *Kleitos*) (?-B.C. 328). The foster-brother of Alexander the Great. He was the dearest friend of the King, whose life he saved at the battle of the Granicus. He held high positions in the Macedonian armies, and in 328 was made satrap of Bactria. At a banquet given by Alexander in honor of the Dioseuri, the King, goaded to madness by the censures of Clitus, who reproached Alexander with slothfulness, seized a spear, and in his drunken rage slew him. Alexander bitterly repented his death, and showed his grief in the most extravagant manner.

CLITUS. In Shakespeare's *Julius Cæsar*, the servant of Brutus, who appears only in Act v. Scene 5, and who refuses to hold the sword for his master to fall upon.

CLIVE, CATHERINE (1711-85). A noted English actress, familiarly called 'Kitty Clive.' She was a daughter of William Raftor, an Irish gentleman of reduced circumstances, living in London. There is a doubtful story about her having been overheard singing while scrubbing a doorstep where there were some members of the Beef-steak Club, and so securing a chance to begin her career. At any rate, during Colley Cibber's management of Drury Lane, she made her appearance there as a page, with a song, in Lee's tragedy of *Mithridates*, probably in 1728. She made a great hit, which she repeated in 1729 as Phillida in Cibber's *Love in a Riddle*. About 1732 she was married to George Clive, second cousin of the famous Lord Clive. In 1742 she sang the part of Delilah in Handel's *Samson*, then first produced. She left Drury Lane in 1743, during Fleetwood's management, but resumed her connection with that theatre when Garrick took its direction, three years later. Her

last appearance was in 1769, as *Violante* in the comedy of *The Wonder*, Garrick himself, out of compliment to her, taking the part of Don Felix. Mrs. Clive's talents were seen to best advantage in comic parts, to which, however, she was not always satisfied to restrict herself. Her vigorous wit and sound sense made her the welcome companion of some of the notable people of her time. In her later life she was an intimate friend of Horace Walpole, who gave her a house at Strawberry Hill. She died December 6, 1785, and was buried at Twickenham. (New York, 1886); Doran, *Annals of the English Stage* (London, 1888).

CLIVE, ROBERT, Baron Clive of Plassey (1725-74). An English general, whose achievements laid the foundations of the British Indian Empire. His father, a lawyer and small land-owner, came of an ancient Shropshire family, whose manor-seat, Styche, near Market Drayton, dates from the reign of Henry II. There Clive was born September 29, 1725, the eldest of thirteen children. He spent several years with an uncle at Hope Hall, near Manchester, and at various schools showed more aptitude for pugilism, pluck, and mischievousness than for study, although one of his masters predicted his future celebrity. At eighteen years of age he shipped to Madras as a writer to the East India Company. The ship, driven out of its course to Brazil, was detained there for nine months, which Clive utilized by learning Portuguese, a language of service to him during his Indian administration. After his arrival in Madras the climate and monotonous drudgery of his duties made him unsuccessfully attempt suicide. But with the outbreak of the great struggle between the French and English in India his opportunity came. He applied for and obtained an ensign's commission, and distinguished himself in Boscawen's unsuccessful siege of Pondicherry in 1748. His dauntless courage, previously exhibited in a duel which forms the idealized subject of Browning's poem "Clive," now had scope for development. English influence was almost extinct in India, through the prestige of the French and their allies. In 1751, with 500 mixed English and Sepoy troops, Clive marched from Madras and captured Arcot, a city of 100,000 inhabitants, garrisoned by 1500 of Chunda Sahib's best troops. The daring displayed in the capture of Arcot was equalled by the intrepidity and fortitude exhibited in its successful defense by Clive and his little band, reduced to 200 men, against a besieging army of 7000 natives and French, and impressed the natives with the strength and prowess of Britain. The succeeding campaign, in which successes and personal escapes were of a most dramatic character, included the victories of Arni and Kaveripak, and the capture of Kovilam and Chingalpat. Henceforward Clive's name was a local tower of strength; the natives sur-named him 'Sabat Jung' or 'the Daring in War'; and Pitt described him as "the youth of twenty-seven years" who had done the deeds of a "heaven-born general." In 1753, with his bride, Margaret Maskelyne, sister of the astronomer, he visited England, and received a diamond-hilted sword and the warm thanks of the India Company. Possessed of a moderate fortune, ob-

tained from prize-money, he expended part in redeeming the paternal estate, and relieving his father from pecuniary embarrassment. The rest soon disappeared in an unsuccessful Parliamentary contest and the maintenance of a costly establishment. He returned to India in 1755, and in 1756 was called to avenge the Black Hole atrocity perpetrated by Siraj-ud-Daula, Nawab of Bengal. Clive advanced against the Nawab, and in January, 1757, the English were again in possession of Calcutta. A peace was arranged; but Clive, bent upon a brilliant exhibition of his powers, and eager for the riches of Bengal, soon returned to the struggle. To insure his success, he entered into a plot for the elevation to the throne of Bengal of Siraj-ud-Daula's general, Mir Jafir, who was to desert his chief, and who promised to shower wealth on Clive and the East India Company for his services. On June 23, 1757, Siraj-ud-Daula was overthrown in the battle of Plassey. This victory decided the ascendancy of England over France in India, and was followed by the rapid building up of a British Indian empire. Mir Jafir was placed upon the throne of Bengal, and kept his promises. From shares in these and other spoils, and from presents and territorial grants from native princes, Clive amassed vast wealth, which yielded an annual income of £40,000. After managing the affairs of the East India Company at Calcutta for some years, and winning fresh victories, he returned to England in 1760, and was loaded with thanks and honors. He became Parliamentary member for Shrewsbury, was raised to the Irish peerage as Baron Clive of Plassey, and in 1764 was created Knight of the Bath. Through the dishonesty of its servants, high and low, the affairs of the Company became greatly involved after his departure from India, and in 1765 he was sent out to set them right. He proved as competent an administrator as a warrior; and in less than eighteen months, by his uncompromising and resolute attitude, "restored perfect order and discipline in both the civil and military services, and brought back prosperity to the well-nigh ruined finances of the Company." He returned to England in 1767, and was received with the distinction to which he was entitled. But the energy he had displayed in righting Indian affairs antagonized many who suffered pecuniarily from the suppression of dishonest practices; and they, possessing influence, employed it in raising English feeling against Clive. His Indian administration was made the subject of animadversion in Parliament in 1772, which he at first ignored, but subsequently replied to in a vigorous and eloquent speech, which elicited Pitt's admiration. A Parliamentary inquiry, the following year, failed to find that Clive had acquired wealth by abuse of power; and the only questionable incident in his government was proved to be a trick to match Oriental duplicity. At some of the supposedly incriminating evidence, Clive indignantly asserted himself with the celebrated exclamation, "By God, Mr. Chairman, I stand astonished at my own moderation!" A qualified acquittal, which acknowledged his "great and meritorious services," was not satisfactory to Clive, who never recovered from the disgrace implied in the trial; this, with sickness, recourse to opium to alleviate his sufferings, and mental depression, led to his suicide, November 22, 1774.

CLOACA, klô-â'kâ (Lat., sewer). The *cloaca* or drains were subterranean passages, usually built of stone, devised to carry off the spring or waste water and the refuse of a Roman city. In Rome the early city was naturally drained by streams running through three valleys between the hills. Three main channels were built to confine these streams, receive the drainage, and carry it to the Tiber. The largest of these, crossing the Argiletum, Forum, and Velabrum, was called, from its size, the Cloaca Maxima, though that of the Vallis Murcia and that near the Circus Flaminius rival it in size and solidity. A network of smaller passages empty into these main channels. The system was largely due to the Tarquins. The Cloaca Maxima was built with three large arches, one within the other. The space inclosed by the innermost vault was upward of 13 feet in width, and of corresponding height. The arches were built of large blocks of stone, fixed together without cement, of the uniform size of rather more than five feet five inches long and three feet high. The flooring is paved like a Roman road, and the side walls are built of Gabii stone, in blocks measuring sometimes 45 cubic feet. The sewer was kept in a state of efficiency by a continuous stream of superfluous water from the aqueducts. Large portions of the cloacæ remain in some places still visible, but generally buried by the accumulation of soil, at a considerable depth below the present level of the streets. The mouth of the Cloaca Maxima at the Tiber is still visible. During the Republic the surveillance of the Roman cloacæ was one of the duties performed by the censors. The Cloaca Maxima was repaired by Cato and his colleagues in the censorship. Agrippa, when edile, obtained praise for his exertions in cleansing and repairing the cloacæ, and is recorded to have passed through them in a boat. Under the Empire, officers called *curatores cloacarum urbis* were appointed for their supervision. So thoroughly was the city undermined by these large sewers that Pliny calls it *urbs pensilis*, a city suspended in the air rather than resting upon the earth. Drains of the same description, but of smaller dimensions, existed in other ancient Roman cities.

CLOCHES DE CORNEVILLE, LES, lâ klôsh' de kôr'n'-vêl'. A very popular operetta, in three acts, produced at the Folies Dramatiques in 1877. The amusing libretto is by Clairville and Charles Gabet, the music, from which many airs have become popular, by Robert Planquette.

CLOCK (AS. *clucge*, Icel. *klukka*, Ger. *Glocke*, bell, from ML. *clocca*, bell, from OIr. *clocc*, Ir. Gael. *clog*, bell, clock, Welsh, Corn. *cloch*, Manx *clugg*, bell). A mechanical instrument for measuring and indicating the time of day, usually by a mechanism consisting of two distinct portions: First, a train or succession of toothed wheels for transmission to a definite point of a motive force, produced by a weight or spring; and, second, an escapement to regulate the expenditure of this

motive force with uniformity and requisite slowness. A watch is simply a portable clock, to be worn on the person, in which the motive force is a spring. A marine chronometer is a watch of unusual size, constructed and mounted with especial care, for determining longitude at sea. See WATCH; CHRONOMETER.

HISTORICAL DEVELOPMENT. Among the predecessors of the clock, as time-measurers, are the sun-dial, the clepsydra or water-clock, and the hour-glass. (See DIAL; CLEPSYDRA; HOUR-GLASS.) The clepsydra was a graduated transparent vase, in which water trickled through a hole in the bottom at such a rate that the receding water marked the passage of time. In the hour-glass sand was substituted for water. Among Eastern nations a great many curious mechanical devices were introduced into the construction of the clepsydra: the water was made to flow in tears from the eyes of automata; a floating statue, falling with the liquid, pointed to the passing hours, as indicated on the side of the glass; finally, a mechanism was introduced by which the water, as it fell, drop by drop, turned a little wheel, which moved the hands on the face of a dial, and so marked the hour. The next step was the construction of a time-indicator, whose hands were moved by the action of falling weights instead of that of falling water. When this step was taken, and the first true clock constructed, is uncertain. Its invention is claimed by many peoples, from the Chinese, B.C. 2000, to the Germans of the eleventh century. Certain it is that clocks were in general use in churches and monasteries throughout the latter part of the Middle Ages, and that these ancient tower-clocks were the progenitors of all our modern timekeepers.

The oldest clock of which we have a complete description was set up in the tower of the palace of Charles V. of France, in 1379, by a German named Henry De Vick. This primitive clock was constructed on the mechanical principle which is the basis of all modern timekeepers. This principle, as formulated by E. A. Marsh, is "that the power stored up in a raised weight or coiled spring shall be communicated to a train of wheels which are set revolving, and that the force or motion shall be cut up into a succession of minute but equal impulses by converting a rotary into a vibratory motion. The last and quickest wheel of the train shall have its teeth so formed that they are caught and escape alternately, and hence the wheel is called the 'scape-wheel,' and, from its resemblance to a crown, the 'crown-wheel.' The bar and staff, which, with its projections, catch and release the teeth, is termed the 'escapement,' and it is through this device that the rotary is converted

FIG. 1. MECHANISM OF DE VICK'S CLOCK.

into the backward and forward motion." The accompanying sketch of De Vick's clock is useful not only from its historical interest, but also because, from its comparative simplicity, it will form a groundwork for further explanation of the mechanism of clocks in their more complicated form. It will be readily understood, from a glance at the annexed figure (Fig. 1), that as the weight A tends to uncoil the cord and set in motion the cylinder B round its axis, the motion will be successively communicated to the various toothed wheels in the figure, and finally

FIG. 2. BALANCE AND ESCAPEMENT OF THE FIRST CLOCK. P P, Pallets.

it is manifest that the heavy weight A would go rapidly to the ground, causing the wheels to rotate, the balance to vibrate, and the hands to go round with increasing velocity. In order to prevent this rapid unwinding of the clockwork, and adjust it to the more deliberate measurement of time, the balance is, in De Vick's clock, loaded with two weights, *m, m*;

FIG. 3. DE VICK'S OLD BALANCE CONVERTED INTO THE PENDULUM. p p, Pallets.

known as its *isochronism* (q.v.) constitutes its value to clock-mechanism—that, when a suspended body is swinging, any increase or

to the crown-wheel or escapement-wheel, I; the teeth of which so act on the two small levers or pallets, *b b*, projecting from and forming part of the suspended upright spindle or vertical axis, KM, on which is fixed the regulator or balance, LL, that an alternating or vibratory instead of a circular motion of the balance itself is the result. The hands of the clock are attached to the wheel N, also set in motion by the cylinder B. Now, unless there were some check upon the motion,

and the farther these are removed from the axis or spindle, KM, the more heavily they will resist and counteract the escapement of the levers, and the rapidity of the rotation of the escapement-wheel, till the clock be brought to go neither too quick nor too slow.

Upon this simple plan it is probable that all clocks were constructed until the seventeenth century, when the principle of the pendulum was applied to the science of horology. The property of a pendulum

decrease in its speed will not change the number of vibrations it makes in a given time, but only the length of the arc it describes. This law of the pendulum was discovered by Galileo, and was first applied (probably) to clockwork by Huygens, about 1657. The two accompanying cuts show how the horizontal swing of the balance, as maintained in De Vick's clock, was converted into the vertical swing of the pendulum. By taking off one of the weights and hanging the balance in an upright position, it becomes a pendulum. Ten years later Dr. Hooke invented an escapement which enabled a weaker support to carry a heavier pendulum. Subsequent improvements in the escapement and pendulum (see ESCAPEMENT; PENDULUM), and in the use of the spring (see WATCH) in place of the pendulum, have brought the mechanism of timekeepers down to the present degree of perfection.

STRIKING APPARATUS. The principal function of a clock, according to the mediæval conception, was that it should be a reliable instrument for automatically calling out the hours, particularly the hours for devotion. This conception of the clock is shown in the word itself, which originally meant 'bell'—a meaning which has been retained in the French word *cloche*. A striking apparatus was, therefore, early invented, and it is interesting to note that the striking mechanism of De Vick's clock is similar to that used in some modern timepieces. A striking clock contains one or more extra trains of wheels to control the striker. In De Vick's clock twelve pins projected from the wheel on which the hand was attached. At each hour one of these pins, by pushing a lever, released the striking-train, which lifted the hammer that strikes the bell. The number of strokes was determined by the position of the notches around the edge of a locking-plate, which held the lever controlling the striking-train. These notches were so placed that at one o'clock the catch in the lever entered a notch as soon as one blow had been struck. At two o'clock there was a longer space before the notch was reached, so that the bell was struck twice; at three o'clock the bell struck three times before the train was locked, and so on. The chief objection to this striking apparatus is that it is thrown out of order and strikes wrong every time the clock happens to run down.

FIG. 4. DR. HOOKE'S ESCAPEMENT.

The *rack and snail repeating mechanism* has been used for two centuries. It is a peculiar and intricate piece of mechanism. In ordinary clocks, the impelling power is a weight similar to that which moves the time-measuring mechanism itself; but the pressure of this weight on the striking machinery is only permitted to come into play at stated periods in course of the workings of the timekeeping apparatus—viz. at

the completion of every hour; when the minute-wheel, which revolves once in an hour, and carries the minute-hand of the clock along with it, brings it into action by the temporary release of a catch or detent, permitting the weight wound up on the cylinder of the striking apparatus to run down a little, in doing which the hammer is forced into action, so as to strike the bell. Whether the strokes shall be one or many is determined principally by two pieces of mechanism, one called a 'snail,' from its form or outline, with twelve steps, and the other a 'rack,' with twelve teeth. The time during which the striking-weight is allowed to descend varies according to the turning of the twelve steps of the snail on its axis, and the position of the twelve teeth of the rack at different hours of the day, being sometimes only long enough to permit one blow to be given by the hammer on the bell, and at another time long enough for twelve such blows.

It is not known when the alarm or when the striking mechanism of the clock was first applied. The alarm was adopted for the use of the priesthood, to arouse them to their morning devotions. The first striking clock probably announced the hour by a single blow, as they still do, to avoid noise in churches. During the seventeenth century there existed a great taste for striking clocks, and hence a great variety of them. Several of Tompion's clocks not only struck the quarters on eight bells, but also the hour after each quarter; at 12 o'clock 44 blows were struck, and between 12 and 1 no fewer than 113. Many struck the hour twice, like that of Saint Clement Danes, in the Strand, London. Before the fifteenth century chimes had been introduced. (See CHIMES; also an article in the *Journal of the Society of Arts* (London, March 29, 1901), on "Clocks, Carillons, and Bells.")

CLOCKS PROVIDED WITH AUTOMATONS. The desire to construct clocks which shall perform automatically many other things besides simply recording the time of day is as old as clockmaking, and was developed to a wonderful degree in the ancient clepsydre of Oriental nations. Indeed, the automatons of the ancient Chinese and Arabian clocks were the models upon which all those of mediæval Europe, including the famous Strassburg clock, were based. Among the earliest of these automatons or 'jacks of the clock' built in the tower-clocks of Europe were those of the clocks at Dijon, Cambrai, and Linden, in each of which two figures appear and strike the hourly bell. In 1495 the clock at Lübeck was built in which the figures of the Twelve Apostles were introduced.

Probably the most widely known of these tower-clocks is the one in Strassburg Cathedral. This famous clock has been reconstructed twice. The first Strassburg clock was built in 1352, under the direction of John, Bishop of Liechtenberg. It contained a calendar, an astrolabe, and a set of chimes composed of several cymbals. There were automatic figures of the Virgin, of the three Wise Men who bow before her, and a cock, which moves its beak, crows, and flaps its wings. The second Strassburg clock was built in 1570. Its mechanical works were constructed by Isaak and Josias Habrecht, of Schaffhausen, Switzerland. Early in the nineteenth century it was found that the clock required reconstruction, and the task was consigned to Charles

Schwilgué, who consumed four years in its completion. Only a few of the original movements were restored by Schwilgué, most of the present mechanism being of his own design.

The following description of the present Strassburg clock indicates its most important features: It is 30 feet high and 15 feet at the base. On one side of the main portion is a flight of winding stairs, surmounted by five columns. On the other side is a Gothic pillar, the panels of which are filled with figure paintings. At the base of the main

FIG. 5. STRASSBURG CATHEDRAL CLOCK.

portion of the clock is a celestial globe, indicating sidereal time, and showing the rising, passing over the meridian of Strassburg, and setting of all stars that appear above the horizon, visible to the naked eye. Behind the globe is a calendar, showing the day of the month and the fixed and movable feasts. A statue of Apollo points out the day of the month. The calendar is in the form of an annular band, so arranged as to show many other astronomical events besides the day of the month. Above the cal-

endar are figures drawn in chariots, one appearing each day. On Sunday Apollo appears, drawn by horses of the sun. On Monday Diana, emblem of the moon, drawn by stags, appears. She is succeeded in turn by Mars, Mercury, Jupiter, Venus, Cupid, and Saturn. Above these figures is the dial which tells the time of day. On each side of this dial sits a figure, one of which strikes the quarter-hours, and the other holds an hour-glass, and turns it every sixty minutes. The next story is devoted to a planetarium, and the next is a globe for showing the phases of the moon. Above this are movable figures, which in succession strike the quarter-hour. The first figure is an infant, which strikes the bell with a rattle; the second is a youth; the third an old man; the fourth is a figure of death, which strikes the bell with a bone. In the highest compartment is a figure of Christ. Each day at noon a procession of the Apostles passes before Him; while a cock, perched above, appears and flaps its wings and crows three times.

The clock at Beauvais, France, is almost as wonderful a piece of mechanism as the Strassburg clock. It is composed of 14 different movements, includes 90,000 different pieces, and weighs 35,000 pounds. There are about 50 dials for indicating different astronomical events. The clock is 36 feet high, 16 feet broad, and nearly 9 feet deep.

The clock in Lyons Cathedral is much like the Strassburg clock. The old clock of Prague was built by one Harausck; and so jealous were the citizens of Prague lest he should build a similar clock in some other city—so the story goes—that they put out his eyes. This clock also contains various mechanical figures. The hour is rung by a skeleton, with the bell-rope in his hands.

Another monumental clock is that in the clock-tower on the Piazza San Marco, Venice. A Madonna sits on a platform between two doors overlaid with gold. When the time for certain religious festivals occurs, an angel comes out from one of these doors, blows a trumpet, bows to the Virgin, and passes out at the other door. The hour is struck by two giants.

Belfry clocks with automatons began to wane in popularity during the seventeenth century, and very few have been constructed since. House-clocks with automatons were first made in the fifteenth century; but the height of their popularity was during the Renaissance, when wonderful skill and great artistic talent were expended in their construction. A favorite design for these clocks was that of a ship, whose crew performed numerous automatic functions. Perhaps the most beautiful as well as famous of these automatons is the ship-clock of Charles V. of France, now in the Cluny Museum. This clock was mounted upon rollers, on which its mechanism caused it to advance and recede. Another favorite design was a mounted huntsman, who, at the stroke of the hour, moved his head and arms, while the head and tail of the horse also moved. During the eighteenth century clocks with mechanically singing birds were popular. Within recent years automaton house-clocks have come to be regarded as interesting examples of mechanical ingenuity and skill, to be occasionally produced and admired, rather than as necessary or desirable articles of furniture.

The United States has produced its share of

automaton clocks, though most of them have been smaller than the great tower-clocks of Europe. The 'Rittenhouse clock,' made in 1767 by David Rittenhouse, of Philadelphia, has six dials, each marking off different astronomical events. The 'Columbus clock,' made by a citizen of Columbus, Ohio, is 18 feet wide and 11 feet high. Like the clocks already described, this one records many astronomical events; in addition, miniature figures perform various movements. Three towns of Pennsylvania—Donaldson, Hazleton, and Wilkesbarre—have possessed citizens who have added to their fame by their remarkable clocks.

In 1880 a clock was placed on exhibition in New York that was a striking illustration of the elaborateness to which clockwork may be carried. It was the work of Felix Meyer, who spent more than ten years in its construction. The clock is 18 feet high, 8 feet wide, and 5 feet deep. It has 2000 wheels, runs by 700-pound weights, and is wound up once in twelve days. When the clock is in operation, it shows the local time in hours, minutes, and seconds; the difference in time at Chicago, Washington, San Francisco, Melbourne, Pekin, Cairo, Constantinople, Saint Petersburg, Vienna, London, Berlin, and Paris; the day of the week, calendar day of the month, month and season of the year, the signs of the zodiac, revolutions of the earth on its own axis and around the sun; also the phases of the moon and the movement of the planets around the sun. The quarter-hour is struck by an infant, the half-hour by a youth, the three-quarter by an old man, and the hour by death, as in the Strassburg clock. As the hour strikes, a figure of Washington rises from a chair and extends its right hand, presenting the Declaration of Independence. A door is opened by a servant, and all the Presidents, as far as and including Hayes, each dressed in the costume of his time, advance across the platform, salute Washington, and retire through another door.

TOWER-CLOCKS. As already pointed out, the earliest European clocks were all tower-clocks—the house or 'chamber' clock being a later invention, closely connected with the invention of watches. Among the early clock-builders, ingenuity and complication of mechanism, as displayed in the automatons, was considered of more importance than accuracy as a timekeeper; but within recent years much scientific skill has been used to construct tower-clocks which, in spite of their enormous size and great height, with the accompanying atmospheric disturbances at so great a distance from the earth, shall still be accurate timekeepers.

One of the largest clocks in the world is the 'Westminster clock,' in the British House of Parliament, which was put in operation in 1860. Its four dials, situated 180 feet above the ground, are 22½ feet in diameter. Each minute-hand is 14 feet long, and the hour-figures on the clock are 2 feet long. The pendulum is 13½ feet long, and weighs 700 pounds. There are 5 bells, weighing respectively 21 cwt., 26 cwt., 33½ cwt., 78 cwt., and 13 tons 11 cwt., for striking the first, second, and third quarters and the hour. These bells are hung from massive wrought-iron framing, in a chamber above the dial. The largest, the hour-bell, popularly known as 'Big Ben,' is 9 feet in diameter, and is struck by a hammer

weighing 4 cwt., which is lifted 9 inches vertically from the bell before it falls. This bell and the great bell of Saint Paul's Cathedral are tolled on the death of members of the royal family of Great Britain. In the 'Westminster clock,' as in all the tower-clocks formerly constructed, the mechanism which drives the clock is located in the tower directly back of the face. But in the city-hall clock erected in Philadelphia in 1899 the clockwork is located in the main part of the building, and is connected with the dial-mechanism in the tower by means of compressed air. The whole is based on the fundamental principle of all modern mechanisms—the governing of great forces by comparatively feeble ones. The primary clock is an astronomical clock, constructed with the greatest care, so as to be free from all disturbances from dust, moisture, and vibrations, and is so constructed that without interfering with its delicacy and accuracy it can operate four sets of hands, each weighing 500 pounds. The dials are the largest in the world, having a diameter of 25 feet. The total height of the tower is 547½ feet, and the centres of the dials are 362 feet above the pavement. The hour-hand is 12 feet long, and is entirely different in shape from the minute-hand, so they never can be mistaken. The face of the dial is made up of several pieces, and the usual numerals are omitted from the face, not being of service at so great a height. The clock was designed by Warren S. Johnson; a detailed description of its mechanism was written by him, and published in the *Journal of the Franklin Institute* (Philadelphia) for February, 1901.

ELECTRIC CLOCKS. An electric clock is one whose mechanism is, in some way, either actuated or controlled by electricity. There are two types of electric clocks—(1) Independent clocks, whose mechanism is kept in operation by electricity; (2) systems of clocks which are connected with a central or primary clock by an electric circuit, and are so arranged that either (a) the primary clock regulates its movements, at stated intervals, by forcibly moving the hands by an electric current into the proper position, or (b) the primary clock directly runs the hands of the secondary clocks, which are simply dials without independent machinery.

Clocks of the first class usually have some electromagnetic attachment applied to the mechanism, which keeps them constantly wound up; in other words, they are constructed like ordinary clocks, except that they are self-winding. The first self-winding clocks were made as early as 1855 by Alexander Bain, who applied electromagnetic attachments to the bob of the pendulum, which, in obedience to contacts connected with the pendulum itself, attracted it to and fro. Since that time many other means of applying the electric current to keep a clock running have been devised, and hundreds of patents for the same have been taken out in England and America: but, as yet, this form of electric clock has proved of little practical value. Another form of independent electric clock was put in operation in 1896, in the laboratory of Durham College, North Carolina. The clock is run directly by electromagnets, which are actuated by a current from an earth battery. The pendulum is swung by the electric current, and it is this which moves the clock. The works

and dial are placed on the pendulum and swing with it.

In the second class of electric clock the object is to keep a system of clocks correct by an automatic connection with a central and standard timekeeper. It is probable that this method of time-service will be rapidly extended, until not only public buildings, but private offices are supplied with time from a central clock, as they now receive a common service in heat, light, power, water, etc. Instead of employing the central clock simply as a regulator, it may be adopted as an actual propeller of the clocks on its circuit, and the secondary clocks become mere dials for indicating time.

FIG. 6. ASTRONOMICAL CLOCK IN PHILADELPHIA CITY HALL.

Certain difficulties have been encountered in the electric connection between the main and secondary clocks, due, among other things, to induced currents from crossed telephone or other electric wires. In view of these difficulties, it has been proposed by prominent electricians that the Marconi wireless system be applied to clocks, and thus obviate the faults of the old system. Though the general adoption of electrically controlled clocks is a development of the close of the nineteenth century, they have long been the subject of experimentation. In 1837 Alexander Bain began to experiment on electrically driven synchronous clocks, and in

1846 his system was in use between Glasgow and Edinburgh.

PNEUMATIC CLOCKS. A system of synchronous clocks which are connected with the central controlling clock by compressed air instead of electricity is called pneumatic. The clockwork in the City Hall at Philadelphia, described above, is of this type. The movement of the central clock compresses air in the connecting tubes, and causes a bellows to expand at each dial, thus moving the hands.

ASTRONOMICAL CLOCKS. An astronomical clock is one built with the simplest and most accurate mechanism possible, and with every possible protection against outside disturbances, so that its movements will be sufficiently accurate for astronomical calculations. One of the most important considerations for an accurate timekeeper of this class is that it should be maintained at a constant temperature, and often in astronomical observatories, rooms are specially constructed for this particular purpose. It will be noticed, from the accompanying cut of the astronomical clock in the City Hall at Philadelphia, that the dial has three circles—the minute-circle above the centre, the twelve-hour circle beneath the centre, and the hour-circle upon the circumference of the dial. A clock regulated to keep sidereal time is sometimes called an astronomical clock, as is also a clock having a dial on which the movements of the heavenly bodies are shown.

CLOCKS AND WATCHES EXPORTED FROM THE UNITED STATES
(From the Statistical Abstract of the United States for 1900)

YEAR	Watches	Clocks	Total
1891.....	\$275,707	\$1,304,457	\$1,580,146
1892.....	208,743	1,020,873	1,229,616
1893.....	241,758	962,423	1,204,181

1900.....	787,620	1,190,074	1,977,694

CLOCK-MANUFACTURE IN THE UNITED STATES. American clocks were first manufactured in Connecticut, about 1800, by Eli Terry. His clocks soon became popular, and he continued in business until his death, when his sons succeeded him, under the name of the 'Terry Manufacturing Company.' Many neighboring establishments were soon engaged in clock-manufacture, and Connecticut is still the centre of the industry in the United States. According to the census of 1850, there were 1436 clock-factories and 2901 watch-factories in the United States. At first the movements were constructed of wood, and in the better clocks the pendulum was of wood overlaid with gold-leaf. In 1814 Terry invented the 'short-shelf clock,' which rapidly displaced the long or hanging clocks previously made. Brass-wheel clocks were not made in the United States until 1837. American manufacturers introduced the system of cutting out the parts from sheet brass with a die, instead of casting them—a method which at once insured greater accuracy as well as cheapness in the product. The adoption of the die and of other forms of automatic machinery in the manufacture of clocks has now been carried to such an extent that nothing is left for the skilled

hand-laborer but the collocation of the parts. Coiled springs, instead of pendulums, had been used in European clocks for two hundred years before their use was introduced into American factories; but they were placed only in the most expensive clocks: the invention of a reliable but cheap steel spring, which could be placed in the least expensive clocks, is due to American enterprise, and its introduction has revolutionized the clock-making industry. The small spring clocks can be manufactured and sold for less than one dollar, and are very popular.

BIBLIOGRAPHY. The following are general works on horology: Saunier, *Treatise on Modern Horology in Theory and Practice*, trans. from the French, by Julien Tuppiet and Edward Rigg (London, 1897); Kendall, *History of Watches and Other Timekeepers* (London, 1897); Grin-thorge, *Rudimentary Treatise on Clocks, Watches, and Bells* (London, 1883). In the *Journal of the Society of Arts* (London) for March 7, 1890, is an interesting article by Julien Tuplin, on "Recent Progress in British Watch and Clock Making." The Supplement of the *Scientific American* for September 19, 1896, contains an article translated from the French on "Clocks Provided with Automaton." The Philadelphia City-Hall Clock is described in the *Journal of the Franklin Institute* (Philadelphia) for February, 1901. *The Electrician* (London) for December 22, 1899, contains an article by F. Hope Jones, on "The Electric Time-Service." See WATCH; TIME-SIGNALS; TIME, STANDARDS.

CLOCK BELL-METAL. An alloy used for the making of bells in clocks, which may have the following composition: 72 parts copper, 26.56 parts tin, and 1.44 parts silver. The silver is added to give sweetness to the tone. In some cases, bismuth and antimony are added in small quantities; but while they are said to produce a better tone, they make the alloy more brittle.

CLODIA. The infamous sister of Clodius, and wife of Quintus Metellus Celer, whom she is supposed to have poisoned. She is identified with the Lesbia to whom Catullus addressed his love-poems. Her younger sister Clodia married Lucullus, but was put away on account of her conduct.

CLODIUS PULCHER, klō'dī-ŭs pul'kēr, PUBLIUS. A Roman demagogue. He appears in history, in B.C. 70, serving under Lucullus in Asia. In 69 he impeached Catiline for extortion in Africa; but Catiline bribed his accuser and escaped. Clodius appears to have been avaricious and unscrupulous. Near the close of the year 62 he was said to have had an intrigue with Pompeia, wife of Julius Cæsar, on the occasion of the celebration of the rites of the Bona Dea in Cæsar's house. Clodius was tried for violation of the sacred mysteries, but was acquitted, it was charged, because he had bribed the judge. He was elected tribune in 59, and one of his first acts was to exile Cicero, who had refused to defend him in the trial for sacrilege; but the great orator was soon afterwards recalled, in spite of Clodius's opposition. He went on from bad to worse, gathering around him the worst elements of the people, until he became a candidate for the pretorship (B.C. 53) in opposition to Milo. Both candidates worked with reckless energy.

The contest was ended in an unexpected manner, January 20, B.C. 52. Milo set out on a journey to Lanuvium. On the way he met Clodius, who was on his road to Rome. Both were accompanied by armed followers, but passed each other without disturbance. However, some of the men in the rear-guard of each party began to quarrel; a fight followed, and Clodius was killed. See *Milo*; and consult Cicero's oration, *Pro Milone*, which, however, is polemical and exaggerated.

CLODPATE, JUSTICE. A country justice in Shadwell's comedy *Epsom Wells*.

CLODT - JÜRGENSBURG, klôt-yur'gens-böörk. PETER KARLOVITCH, Baron (1805-67). A Russian sculptor, born at Reval. He studied at the artillery school of Saint Petersburg, and was for a short time in the army. He had his art training at the Academy of Saint Petersburg, where he was appointed a professor, and became particularly skillful in his depiction of horses, especially as seen in vigorous action. The horses executed for the quadriga group on the triumphal arch erected at Saint Petersburg in 1838 are excellent specimens of this feature of his work. The four colossal groups of "Horse-Tamers," in bronze, on the Anitchkov Bridge, Saint Petersburg, are also by him. Replcias of two of these are in the grounds of the Schloss in Berlin.

CLELIA, klê'li-ä. A maiden given by the Romans as a hostage to King Porsenna. She escaped from the Etrurian camp with some companions, swam the Tiber, and returned to Rome. The Romans, however, bent upon keeping good faith, sent the fugitives back to Porsenna, who, in admiration of this generous action, freed Clelia and her fellow-hostages, and allowed her to take with her some of the Etrurian youths. A statue was erected in her honor on the Via Sacra.

CLELIA GENS. A patrician clan of Rome, tracing its name to Clolius, one of the companions of Æneas. It was supposed to have been originally a noble Alban house. The name is also spelled Cluilia, and, in its ancient form, Cloulia.

CLOG ALMANAC. A form of rude calendar, said to be of Danish origin, and consisting of a square stick notched for months and days, and showing the saints' days, moon's phases, and other features of the almanac. Specimens are to be seen in the British Museum and other collections.

CLOISONNÉ, klwä'zô'nä'. See *ENAMEL*.

CLOISTER (from OF. *cloistre*, Fr. *cloître*, from ML. *claustrum*, inclosure, from *claudere*, to close). Strictly, the entire space inclosed by the main encircling wall of a religious establishment (Germ. *Kloster*, monastery), including church, dormitories, and all other buildings. Thus, all the buildings for the body of canons attached to a cathedral were included in the term 'cloister.' A 'cloistered monk' is one living within monastic precincts. But common usage has recently limited the term to those rectangular courts, in the centre of the main group of monastic or canonical buildings, which are surrounded on all sides by a covered arcade. These cloisters are the centre of monastic life; from their arcades the refectory, chapter-house, dormitories, and church are reached. In their central open space or *garth* are the well and garden. Cathedrals had their cloisters—usually attached to the north side of the church, the south side

being reserved for the episcopal palace. But in monasteries the main cloister was in the south flank. Many large monasteries had more than one cloister; one for the lay brothers, open to all (sometimes in front of the church); one for the monks; a third, smaller, for the abbot. In such great early Benedictine monasteries as Saint Gall there was a cloister for the artisans.

The earliest examples of rudimentary cloisters are in the monasteries of the fourth, fifth, and sixth centuries, in Syria; the earliest in the West have disappeared, none being earlier than the eleventh century. From that time until the fifteenth century Romanesque and Gothic cloisters abound everywhere. With the advent of the Renaissance and the decay of the orders in the fifteenth and sixteenth centuries, cloisters are rarer, except in Italy.

The general type of cloister is a colonnade resting on a high parapet, usually with a single opening in the middle of each side of the quadrangle leading into the central garden. In earlier cloisters the columns are single, heavy, and short, and the galleries are more ordinarily covered with a wooden roof than vaulted. Above these galleries rises a second story, either a second gallery or a solid construction (dormitory); in consequence of reconstructions, this upper story is very seldom preserved. During the twelfth century the single columns gave way to coupled shafts, slenderer and higher than those of the preceding style. Sometimes, especially in the North, piers supplemented or replaced columns. The cloister followed the changes of style of other buildings. The finest Romanesque cloisters are in southern France and Italy; Germany and England enter the field particularly during the Gothic period; Italy, with few exceptions, furnishes the only fine Renaissance examples. Saint Trophine in Arles is a rich, and Le Puy in Velay is a plain, example of French Romanesque cloisters, while those of Thoronet and Silvacane show the French Cistercian severity, and those of Fontfroide and Laon show transition to Gothic. In Italy at the same time there was far greater variety and richness. The northern examples at Verona (cathedral), Pomposa, and Bologna (San Stefano) are simple; but farther south the twelfth century developed richer types, as in the Oriental examples at Salerno, Ravello, and Amalfi, and the gem at Monreale (Palermo), with varied columns and mosaic decoration. These were soon to be followed by exquisite examples of the Roman school (Fossanova, Saint Paul, and the Lateran, Rome). In fact, Rome possesses an unrivaled series, from the heavy cloister of the Tre Fontane and San Lorenzo to the delicate cloister of Saint Paul, through all intermediate stages. Gothic cloisters were beautiful everywhere, but the finest specimens are those of the north of Europe, especially France. The arcades are surmounted by rich tracery, by which the galleries, now usually covered with lofty groin vaulting, are well lighted. In cooler climates the tracery, sometimes the entire gallery, was glazed. The cloisters of Noyon, Semur, Soissons—the last-named exquisitely rich—of Mont-Saint-Michel (with its novel tripod arrangement of shafts), of Rouen, with a beautiful second story, express the ideas of the Golden Age of the thirteenth century in France; while those of the fourteenth and fifteenth centuries are

poorer and inferior, as at Bordeaux and Narbonne. In Germany the most interesting are the Cistercian cloisters, like those of Maulbronn, Altenberg, and Heiligenkreuz. In England, though there are some good early Gothic examples—as at Salisbury—the best are late, as at Gloucester, Hereford, and Canterbury.

CLOISTER AND THE HEARTH, THE. An historical novel of the time of the early Renaissance, by Charles Reade (1861). The scene is laid chiefly in Holland and Italy. The book should be read and contrasted with George Eliot's *Romola*, which appeared almost simultaneously, and which in part deals with a like theme.

CLONMEL' (Ir., honey-meadow). A municipal borough in Tipperary and Waterford counties, Ireland, on both banks of the Suir, 14 miles south-southeast of Cashel (Map: Ireland, D 4). It stands chiefly on the Tipperary side of the Suir, and on one of the isles of the river. Among its industries are flour-milling, brewing, and tanning. The chief exports are agricultural produce and cattle. Barges of 20 to 50 tons ply on the Suir to Waterford. Clonmel was an important place in Danish times. In the thirteenth century the Franciscans established universities in the town. In 1650 Cromwell besieged the town and demolished the castle. Clonmel was the birthplace of Laurence Sterne, the novelist. Clonmel is still a great tourist resort, but there has been a gradual decrease in its population. In 1871 it numbered about 10,000; in 1900, about 8000.

CLONTARF' (Ir., bull's meadow). A town of Ireland, about three miles east-northeast of Dublin (Map: Ireland, E 3). It is much frequented during the summer months for sea-bathing, and there are many handsome villas in the vicinity. Clontarf is celebrated as the place where, in 1014, Brian Boróimhe (q.v.) met his death while winning a great victory over the Danes. Population, in 1900, about 5000.

CLOOTS, klōts, or **KLOOTZ**, JEAN BAPTISTE DU VAL-DE-GRÂCE, Baron (1755-94). A free-thinking philosopher and republican enthusiast of the French Revolution, generally referred to as 'Anacharsis Cloots, the Orator of the Human Race.' He was born June 24, 1755, at Gnadenthal, near Cleves, the son of a German baron of Dutch extraction, and was sent to Paris to be educated when he was only eleven years of age. There he seems to have imbibed extremely rationalistic ideas on religion and politics, which were strengthened by a short residence in Berlin, where he came in contact with the Potsdam philosophers, one of whom was his uncle, Cornelius de Pauw. Returning to France at the age of twenty-one, Cloots began the campaign of Reason by an attack on revealed religion, and published a curious book, entitled *Certitude des preuves du Mahométisme*—a satirical work, which fell somewhat flat. A visit to England, where he became intimate with Burke, was followed by an extended tour on the Continent, which his income of 10,000 livres a year allowed him to make in ease and comfort. Everywhere he took occasion to preach his doctrines of liberty, equality, and fraternity, and in several countries he barely escaped imprisonment. From Portugal the news of the outbreak of the French Revolution sent him post-haste to Paris, where he at once began to play an im-

portant part. He was instrumental in spreading republican principles in Brittany, and on June 19, 1790, he appeared at the bar of the National Assembly at the head of a throng of Parisians from the slums dressed up in fantastic costume to represent the nations of the earth, and delivered a magniloquent oration in behalf of 'Universal Republicanism.' To show the sincerity of his principles, he discarded his rank and titles (though not his income) and stood forth before the world as 'Anacharsis Cloots, Orator of the Human Race, Representative of the Oppressed Sovereign Peoples of Mankind.' Cloots was made a French citizen, and in 1792 was elected to the National Convention. He urged a war of republican propaganda against Europe, and voted for the death of the King, 'in the name of the human race.' He was popular with the visionaries and with the lower orders of Paris, but incurred the enmity and suspicion of Robespierre. In consequence, Cloots was expelled first from the Jacobin Club, and subsequently from the Convention. He was finally arrested in 1794, and after a summary trial was sent to the guillotine, together with Hébert and his followers, March 24, 1794. He left a number of pseudo-philosophical and political works, the chief of which are *L'orateur du genre humain* (1791) and *Base constitutionnelle de la république du genre humain* (1793). For his life, consult: Avenel, *Anacharsis Cloots, l'orateur du genre humain* (Paris, 1865); Gallois, *Histoire des journaux et des journalistes de la révolution française*, vol. ii.; Bax, *Outlines from a New Standpoint* (London, 1891).

CLORIDANO, klō'rê-dî'nò. A young Moor, in Ariosto's *Orlando Furioso*, the friend of Medoro, with whom he seeks the body of King Dardinello on the battlefield.

CLORIN'DA. (1) In Tasso's *Jerusalem Delivered*, a leader of the forces opposing the Crusaders at the siege of Jerusalem. Tancréd falls in love with her, but accidentally kills her in a combat at night, and administers Christian baptism to her before her death. (2) In Fletcher's *Faithful Shepherdess*, a beautiful character on which Milton drew in *Comus*.

CLO'RIS. A maiden in love with Prince Prettyman, in Buckingham's *The Rehearsal*, who commits suicide when he weds old Joan.

CLOSE (from OF. *clos*, p.p. of *clorre*, to shut, from Lat. *claudere*, to close). A term in heraldry. When the wings of a bird are down and close to the body, it is described as close. The word is used only with reference to birds addicted to flight. See HERALDRY.

CLOSE. A space inclosed by a wall or fence; a court, yard, or quadrangle; a narrow side-street or passage leading to a court; especially the precincts of a cathedral or a monastery.

In a legal sense, it is a parcel of land in which some one has an interest, amounting at least to a right to present possession, and which in fiction of law is considered as inclosed by an ideal or invisible, if not real, boundary. Breaking or entering another's close is a trespass. The term is not in general use in the United States. See CURTILAGE; FEE; TRESPASS.

CLOSE POLLINATION. See POLLINATION.

CLOSE (klōs) **TIME**. A portion of the year during which game or fish may not be killed or caught. See GAME-LAWS.

CLOSET, klô-zê' (OF. *closet*, dim. of *clos*, close). In heraldry (q.v.), the half of the bar.

CLOSTER-SEVEN (KLOSTER-ZEVEN). See WILLIAM AUGUSTUS, Duke of Cumberland.

CLOSURE, or **CLÔTURE**, klô'tur' (OF. *clôture*, Fr. *clôture*, from Lat. *clausura*, a closing, from *claudere*, to close). A rule of procedure adopted in the English Parliament, for the purpose of terminating prolonged discussion, and bringing matters under debate to an issue. It had its origin in 1882, when the policy of obstruction adopted by the Irish members made legislation impossible. It was decided then that, at the request of 40 members, the Speaker might declare debate closed, and call for a vote on the question under discussion. As modified in 1887 the rule now stands that the Speaker may cut off discussion at the request of 200 members, or at the request of 100 only, if less than 40 members vote in the negative. In France the *clôture* has also been frequently used, since the *coup d'état* of 1851. In the United States House of Representatives, and in the State Legislatures, the same object is attained by moving the 'previous question.'

CLOT, klô, ANTOINE BARTHÉLEMY, or **CLOT BEY** (1793-1868). A French physician, born at Grenoble. He studied at Montpellier, and for several years practiced medicine and surgery at Marseilles. After 1822 he lived mostly in Egypt, where by order of Mehemet Ali he established hospitals and medical and pharmaceutical colleges and organized the medical service of the Army and Navy. In 1832 he was given the rank of an Egyptian bey, and in 1836 that of a general. After the death of Mehemet Ali, Clot left Egypt and resumed the practice of medicine at Marseilles. In 1854 he returned to Egypt, and became physician-in-ordinary to the Viceroy, Saïd Pasha. Clot's great activity as an organizer did not prevent him from carrying out important scientific observations and gathering large scientific collections. His published works include: *Relation des épidémies de choléra-morbus qui ont régné à l'Égypte, à Suez et en Egypte* (1832); *De la peste observée en Egypte* (1840); *Coup d'œil sur la peste et les quarantaines* (1851); *Mehemet-Ali, Vice-roi d'Égypte* (1862); *De Pophthalmie, du trichiasis, de l'entropion et de la cataracte observés en Egypte* (1864); and *Un dernier mot sur la non-contagion de la peste* (1866).

CLOTAIRE, klô'târ', I. and II. See MEROVINGIANS.

CLOBUR. See COCKLEBUR.

CLOTEN. The stepson of Cymbeline, in Shakespeare's *Cymbeline*—a malicious character.

CLOTH. See WOOLEN AND WORSTED MANUFACTURES; WEAVING.

CLOTHES - MOTH. Any of several small moths of the genus *Tinea*, the larvæ of which feed on woolen fabrics and furs. In the United States the depredations wrought by clothes-moths, or 'moth,' are caused by at least three different species, which differ both in structure and habits. One (*Tinea pellionella*) is a small brown moth, with darker brown spots on the fore wings, whose larvæ live within a case composed of bits of the food-material bound together with silk. As the larvæ increase in size, the

silk cases are lengthened, and when the case becomes too narrow it is split open and a new part is inserted, as may be demonstrated by changing the caterpillar from time to time to differently colored materials. The larva of another, the carpet-moth (*Tinea tapetzella*), lives within a winding gallery made up of bits of carpet or other cloth held together with silk. Its fore wings are blackish and yellowish white; the hind wings and head are dark gray. The straw-colored species (*Tinea biselliella*) has a naked larva that spins a little silk over its food-material, but makes neither a case nor a gal-

CLOTHES-MOTH.

a, The moth; b, feeding larva; c, pupa in case.

lery. When ready to pupate a cocoon is spun, which, like the larval cases of the foregoing, is composed of fragments of cloth bound together by silk. In the spring or early summer woolen clothes and furs should be thoroughly brushed and subjected to direct sunlight. They should then be carefully packed away in cloth bags or tight boxes, together with naphtha-balls or tobacco-leaves. Tared paper and plenty of newspapers are useful for wrapping up rugs. Bits of camphor-wood or cedar are also helpful in keeping out moths. A few drops of carbon bisulphide allowed to evaporate in a tight compartment containing infested goods will kill moths and eggs; but as it is very inflammable and the fumes are injurious to man, it should be used with caution. Benzine and gasoline are also useful but rather dangerous moth-killers, and printer's ink is poisonous. The best preventive for rugs, etc., is constant use and 'kicking about,' for small garments and furs, inclosure in tight cloth bags. Consult Marlatt, *Household Insects of the United States* (Department of Agriculture, Washington, 1896).

CLOTHO (Lat. from Gk. Κλωθώ, *Klôthô*, the Spinster, from κλώθειν, *klôthein*, to spin). One of the three Fates. See PARCE.

CLOTILDA, SAINT (c.475-545). A daughter of Chilperic, King of Burgundy, and wife of Clovis, King of the Franks. Her father and mother were murdered by her uncle, Gundebald, who spared the child and educated her. She was married to Clovis (q.v.), who through her influence was converted to Athanasian Christianity in 496. He avenged the murder of her family by reducing Gundebald to subjection. After the death of Clovis Clotilda persuaded her sons to renew the quarrel, and a war followed that ended in the union of Burgundy with the Frankish kingdom. Clotilda retired to Tours, and practiced the austerities of a devotee until her death. She was buried in the Basilica of Saint Peter, which she had built in Paris, and was canonized by Pope Pelagius. There is a statue

of her in the Luxembourg, and a fine church in her honor was built in Paris between 1846 and 1856.

CLOUD, THE. One of Percy Bysshe Shelley's best-known poems (1820).

CLOUD, CLOUDINESS (AS. *clūd*, mass of rock, hillock, which a cloud often resembles). In general, anything that obscures the vision through a clear atmosphere, as clouds of dust, smoke, or moisture. The clouds of smoke over cities and from forest fires and the clouds of dust over the plains of India have an important temporary influence on local climate. In meteorology, the terms denote the moisture of the atmosphere precipitated from an invisible state of vapor into minute globular particles that float for a long time in the air. These particles are so small that they cannot descend rapidly through the ordinary atmosphere, even when perfectly still, on account of its viscous resistance or so-called internal fluid-friction. The gentlest ascending current or the slight vertical component of a nearly horizontal current suffices to keep the cloudy particles from falling to the ground.

The condensation of the invisible moisture of the air into particles of water cannot be accomplished in the free atmosphere without a decided reduction of temperature; and this may occur in three ways: (1) If air comes in contact with a cold solid, the latter may be covered with dew; but if two masses of warm-moist and cold-moist air come together, a slight condensation and haze or cloud may be formed where they mix with each other. These clouds by mixture have been extensively studied by Brilouin. (2) If moist air is cooled by radiation of heat, the coolest portions will soon fall to the temperature of the dew-point, and the vapor therein begin to become visible as a fog; these foggy particles radiate rapidly, thereby increasing the coolness of the air and stimulating the formation of more fog. (3) But the principal method by which cooling is effected in order to form cloud is the process called dynamic cooling, first expounded by Espy, Kelvin, Reye, and Peslin, and developed in detail by Bezold and Bigelow. Air expands when it is brought under lower barometric pressure; it may be by being pushed up over a mountain, or it may be by rising up because of its own buoyancy. In either case, the expansion takes place against the adjacent air, and presses the latter to one side. This operation constitutes work done on the resisting air, and work involves the action of some force

which, in the present case, is almost invariably the expansive force due to the heat that is latent in the atmosphere—viz. in the air and vapor combined, or the so-called thermal content.

The work done in expansion is said to be done at the expense of the internal heat of the air; or, heat is abstracted from the expanding air in order to do work on the air that is being pushed aside. Consequently, the expanding air grows cool in proportion to the work done. When it is thereby cooled to the dew-point, the vapor begins to condense upon dust particles as solid nuclei and forms liquid drops; this involves the giving up of a large amount of heat known as the latent heat of vaporization, which has to be lost by radiation from the drop, wherefore the cooling of the mass becomes much slower. In this process of condensation, a given amount of cooling requires a much larger amount of expansion, and therefore of work done, than in the previous stage before cloudy condensation began. This stage is illustrated in the formation of the cumulus clouds seen with showers or thunder storms or especially in hail weather. On these occasions, the cumulus clouds grow rapidly upward to great heights. The upper parts of these clouds can be at such a low temperature as to contain snow or hail in place of water particles. The forms and the quantities of clouds, the direction and velocity of their movements, the apparent changes they undergo, and many other peculiarities have for a century past formed an item of increasing importance in the study of meteorology.

The first step toward simplifying and harmonizing the old meteorological records was taken by Luke Howard, in 1802, in his proposed classification of clouds into three primary forms (*cirrus*, *cumulus*, *stratus*), and three intermediate forms (*cirrocumulus*, *cirrostratus*, and *cumulostratus*), and these have been almost universally adopted by modern observers; but experience has shown that they do not give a sufficient range of terms to enable one easily to classify and describe all the varieties of clouds that are to be observed. Probably no simple system of nomenclature would suffice to do this, and Cleveland Abbe has proposed for special students a system of symbols based on the methods of formation of the various kinds of clouds. The many other modifications and new terms that have been suggested are well compared and discussed in a memoir by Mr. H. H. Clayton, of the Blue Hill Meteorological Observatory, near Boston, Mass.

MEAN HEIGHTS AND VELOCITIES OF CLOUDS AT WASHINGTON, D.C., APRIL, 1896, TO MARCH, 1897.

The descriptive abbreviations and classification introduced by the International Meteorological Congress, held at Munich in 1891, is that which is now adopted more or less completely by all the national weather bureaus. Systematic observations upon the heights and movements of all clouds were made at many stations throughout the world in concert from May 1, 1896, to July 1, 1897. From these observations a general idea of the heights of the respective kinds of clouds may be gathered, as shown in the preceding list, compiled from Professor Bigelow's *Report on International Cloudwork of the United States Weather Bureau*, page 20. The titles and descriptions of the clouds are as used by the International Committee.

CIRRUS (Ci.). Isolated feathery clouds of fine fibrous texture, generally brilliant white, frequently arranged in bands which spread like the meridians on a celestial globe over a part of the sky, and converge in perspective toward one or two opposite points of the horizon. (In the formation of such bands, cirro-stratus and cirro-cumulus often take part.)

CIRRO-STRATUS (Ci. S.). Fine whitish veil, sometimes quite diffuse, giving a whitish appearance to the sky, and called by many 'cirrus haze,' and sometimes of more or less distinct structure, exhibiting tangled fibres. The veil often produces halos around the sun and moon when seen through it.

CIRRO-CUMULUS (Ci. Cu.). Fleecy cloud. Small white balls and wisps, without shadows, or with very faint shadows, which are arranged in groups and often in rows.

ALTO-CUMULUS (A. Cu.). Dense fleecy cloud. Larger whitish or grayish balls, with shaded portions, grouped in flocks or rows, frequently so close together that their edges meet. The different balls are generally larger and more compact (passing into strato-cumulus) toward the centre of the group, and more delicate and wispy (passing into cirro-cumulus) on its edges. They are very frequently arranged in lines in one or two directions.

ALTO-STRATUS (A. S.). Thick veil of a gray or bluish color, exhibiting in the vicinity of the sun and moon a brighter portion, which, without causing halos, may produce coronæ. This form shows gradual transitions to cirro-stratus; but, according to the measurements made at Upsala, was of only half the altitude.

STRATO-CUMULUS (S. Cu.). Large balls or rolls of dark cloud, which frequently cover the whole sky, especially in winter, and give it at times an undulated appearance. The stratum of strato-cumulus is usually not very thick, and blue sky often appears in the breaks through it. Between this form and the alto-cumulus all possible gradations are found. It is distinguished from nimbus by the ball-like or rolled form, and because it does not tend to bring rain.

NIMBUS (N.). Rain-clouds. Dense masses of dark, formless clouds, with ragged edges, from which generally continuous rain or snow is falling. Through the breaks in these clouds there is almost always seen a higher sheet of cirro-stratus or alto-stratus. If the mass of nimbus is torn up into small patches, or if low fragments of cloud are floating much below a great nimbus, they may be called *fracto-nimbus* (the 'scud' of the sailors).

CUMULUS (Cu.). Woolpack clouds. Thick clouds, whose summits are domes with protuberances, but whose bases are flat. These clouds appear to form in a diurnal ascensional movement, which is almost always apparent. When the cloud is opposite the sun, the surfaces which are usually seen by the observer are more brilliant than the edges of the protuberances. When the illumination comes from the side, this cloud shows a strong actual shadow; on the sunny side of the sky, however, it appears dark, with bright edges. The true cumulus shows a sharp border above and below. If often torn by strong winds, the detached parts (*fracto-cumulus*) present continual changes.

CUMULO-NIMBUS (Cu. N.). Thunder-cloud; shower-cloud. Heavy masses of clouds, rising like mountains, towers, or anvils, generally surrounded at the top by a veil or screen of fibrous texture ('false cirrus'), and below by nimbus-like masses of cloud. From their base generally fall local showers of rain or snow, and sometimes hail or sleet. The upper edges are either of compact, cumulus-like outline, and form massive summits, surrounded by delicate false cirrus, or the edges themselves are drawn out into cirrus-like filaments. This last form is most common in 'spring showers.' The front of thunder-storm clouds of wide extent sometimes shows a great arch stretching across a portion of the sky, which is uniformly lighter in color.

STRATUS (S.). 'Lifted fog' in a horizontal stratum. When this stratum is torn by the wind or by mountain summits into irregular fragments, they may be called *fracto-stratus*.

In general, the cirrus, cirro-stratus, and cirro-cumulus are the highest and swiftest; the alto-stratus, alto-cumulus, strato-cumulus, and cumulo-nimbus are median; the nimbus, cumulus, and stratus are lowest and slowest. These three groups are also generally distinctive as to their appearances and methods of formation.

There are some rarer forms of clouds that have received special or local names, such as the following: *Phosphorescent*, sometimes called iridescent, opalescent, or luminous night clouds. These are seen even at midnight in Europe as distant, pure white clouds, near the horizon. Measurements appear to show that they are from 10 to 20 miles above sea-level; they may possibly be self-luminous or phosphorescent, but it is more likely that they shine by reflecting the light from a distant twilight. *Hoods*, or false cirri, enveloping a mountain-top, or the summit of a cumulus dome. These are formed in the air that is pushing upward over the obstructing mountain. The *tablecloth* of Table Mountain at Cape Town is formed somewhat like the hood, but covers the whole flat top of the mountain and hangs down a little way over the leeward cliffs with frayed edges as the cloud-matter evaporates back into invisible moisture.

The *helm-cloud* and *helm-bar* are stationary clouds, formed at the summits of standing waves of air. When an east wind blows over the Crossfell Range, in Cumberland, England, there is formed not merely a cloud or hood or helmet with rain at the summit of the range, but a series of undulations to the leeward, one or more of which may rise high enough as a standing wave to form a cloud at its summit; through this cloud, in fact, the wind is blowing, and the cloud-particles formed on the windward side are

4. NIMBUS.
5. CUMULUS.
6. STRATUS.

carried up through the cloud and down again on the leeward side, evaporating and disappearing as they descend at about the same level as when they were formed on the windward side. *Tornado cloud* and *waterspout cloud* are the distinctive, cloud-like form that reaches down nearly to the surface of the earth or ocean from the main cloud-mass above, and marks the central axis of a whirling mass of air. Within such a whirl, the barometric pressure is reduced by reason of centrifugal force, and any air that is drawn inward expands, cools, and forms cloud, just as it would do if it rose upward into regions of lower pressure. When the whirl ceases, the cloud immediately disappears. *Globo-cirrus*, a cirrus cloud having a globular form, from which stream downward fibres or filaments, as though the particles of the globular mass were being pulled out by the wind, or were settling down by their own weight into air-currents of a different velocity horizontal. *Mammato-cumulus*, protuberances or pockets on the under side of an otherwise flat-bottomed cloud, as though the heavier portions of the cloud were settling down in groups from the main cloud. This formation may also sometimes represent the central portions of adjacent whirls of air rising up into the clouds; but this latter phenomenon, which has been seen by Abbe, is probably not so frequent as the former.

The study of the movements of the clouds is our principal source of information relative to the general motion of the air at considerable heights above the sea or land. During the past fifty years an increasing amount of attention has been given to this matter, and the use of the nephoscope and photogram-meter has greatly increased the accuracy of observation. By international agreement, special observations were made in many countries in 1896 and 1897, the results of which were published during the years 1898-1901; of these reports the most important is that by Prof. F. H. Bigelow, published in the *Annual Report of Prof. Willis L. Moore*, chief of the United States Weather Bureau.

The average area covered by clouds, taking the globe as a whole, is about one-half of its surface. They, therefore, play a very important part in the distribution of solar heat over the earth's surface and within the atmosphere, and the consideration of this influence alone is a very important but difficult problem in the determination of the motions of the atmosphere. See DEW; EVAPORATION; NEPHOSCOPE; RAIN; SNOW.

CLOUDBERRY (ME. *cloud*, mass of rock, hill, AS. *clūd*, round mass, mass of rock + *berry*) (*Rubus chamaemorus*). A plant of the same genus with the dewberry, which it resembles. It has a trailing habit of growth, and never attains a height of more than 8 to 10 inches; the leaves, few, large, lobed, and somewhat kidney-shaped; the flower large and white, male and female flowers on separate plants, the female plant producing an orange-red fruit equal in size to a dewberry, and of an agreeable flavor. It is a native of the northern parts of Europe, Asia, and America. In Great Britain it is chiefly confined to elevated moors; in Norway and Sweden it is much more abundant, and the fruit is highly valued and made into excellent preserves. In America it is found only sparingly south of the Canadian boundary, but it is common and greatly prized in Newfoundland,

Labrador, Nova Scotia, and northern Quebec. It is abundant through northern Canada, extending from the Atlantic to the Pacific and north to the Arctic Circle. Unfortunately, the plant is of difficult cultivation, and no attempt to make it produce fruit freely in our gardens has yet been successful. Somewhat similar to the cloudberry is *Rubus geoides*, which yields a very agreeable fruit, as large as a raspberry, one of the few native fruits of Tierra del Fuego and the Falkland Islands.

CLOUDBURST. A term first applied in the United States about 1840, and in India about 1860, to a sudden extraordinarily heavy local rain. No definite rate or amount of rainfall, or area covered by it, has been assigned as a limit proper for distinguishing cloudbursts from ordinary heavy rains. Many special cases of cloudbursts have been described in English and American meteorological journals, especially in the *United States Monthly Weather Review*, from which it may be seen that the term is rarely used unless six or more inches of rain fall, and at the rate of 10 or more inches per hour. Thus, in one case, 10 inches fell in an hour; in another, the extreme case, 21 inches. Nothing definite is known as to the areas covered by these heavy rains; but it is not likely that the heaviest cover more than an acre, or that the lighter ones cover more than a square mile. Several cloudbursts have occurred on the eastern slope of the Rocky Mountains; but the great rains that cause the heavy floods along the eastern slope of the Appalachians from Georgia to Pennsylvania sometimes attain the intense local character that is ordinarily attached to the term cloudburst. Professor Ferrel has explained how a mass of water can be held within the cloud by means of rapidly ascending currents; but there is scant evidence of the actual existence of the strong ascending wind required by this explanation, and it seems equally possible that cloudbursts may result from the sudden formation of a large mass of rain in a very tall cloud, rather than from the gradual accumulation of rain in the clouds. Consult: Ferrel, *Recent Advances* (Washington, 1885), and his *Popular Treatise on the Winds* (New York, 1893).

CLOUD ON TITLE. An apparent defect in the title to real estate, based on a written instrument, judgment, or order of court, which purports to create an interest or lien in or an incumbrance upon the land in question. The person whose land is so affected may have the 'cloud' removed by appropriate proceeding in equity, instituted by a bill in the nature of a bill to quiet possession, known specifically as a 'bill to remove cloud on title.' The judgment of the court may direct the obnoxious instrument to be delivered up and canceled, or the record of such incumbrance or lien canceled, or may by decree declare a judgment, order of court, or proceedings under an invalid tax-levy, to be void and of no effect so far as the land in question is concerned.

In order to obtain this remedy, however, the instrument or act purporting to create the cloud on title must have apparent validity. A deed or mortgage void upon its face does not create a cloud, and cannot be attacked by such a proceeding. See BILL IN EQUITY; INCUMBRANCE;

TITLE; and consult the authorities referred to under the last-mentioned reference.

CLOUDS, THE. The most famous of the comedies of Aristophanes, produced in B.C. 423, when it took the third prize. It is a satire on the Sophists, and unjustly attacks Socrates as their representative.

CLOUDY BAY. An inlet of Cook Strait, to the northeast of South Island, New Zealand. Cloudy Harbor, on its north shore, is well known (Map: East India Islands, L 7). The south shore is bold and lofty. The rivers Awatere and Wairau flow into the bay.

CLOUET, klou'ā'. A French family of painters, originally Flemish. JEHAN, the first Clouet, lived in Brussels about 1475, and does not seem to have left his country. His son, JEHAN, called JEHANNET (c.1485-1541), came to France, and settled at Tours, where he married Jeanne Boucault. Afterwards he went to Paris, where, about 1518, he became Court painter and valet-de-chambre to Francis I. Two portraits of the King are attributed to him—one representing him as a young man, in the Louvre, and the other representing him as a middle-aged man, in the Pitti Palace, Florence. This latter was also supposed to be by Holbein, and may possibly be by François, Jehannet's son. Both works have the hall-mark of the Flemish School—a certain dryness and elaboration of detail and great delicacy of treatment.—FRANÇOIS, also called JEHAN or JEHANNET (c.1510-72), was probably born at Tours. He succeeded his father as Court painter and valet-de-chambre to Francis I., and afterwards held the same position under Henry II., Francis II., Charles IX., and Henry III. There are several allusions to him in the Court documents of the time, and we learn from them that he molded the wax funeral effigies of Francis I. and Henry II. Despite the influence of the Italian artists, whom Francis and his successors patronized, Jehan was considered the first painter of his day. The poets Ronsard and Du Bellay both speak of his portraits. Many of his works have been mistaken for those of Holbein, and only two of his portraits, those of Charles IX. and Elizabeth of Austria, have been positively identified as his. He preserves the Flemish realistic method and love of detail, carried to an extreme, in his treatment of such accessories as jewels and lace, along with precision and delicacy in flesh-painting. Other pictures probably by him are portraits of Francis II. as a child, in the Antwerp Museum, and of the Duke of Anjou, Berlin Museum, and a portrait called Sir Thomas More, in the Brussels Museum. His subjects are usually small full-lengths, with a background of greenish blue. A large number of drawings are also attributed to him. Many portraits in the style of Clouet were produced by copyists and imitators. There is supposed to have been still another Clouet, a brother of François; but of him nothing is known. Consult: Laborde, *La renaissance des arts à la cour de France* (Paris, 1855); Woltmann and Woermann, *Geschichte der Malerei*, ii. (Leipzig, 1879-82); Pattison, *The Renaissance of Art in France* (London, 1879); Gower, *Three Hundred Portraits by Clouet at Castle Howard* (London, 1875).

CLOUGH, kluf. ARTHUR HUGH (1819-61). An English author. He was born in Liverpool, but when only four years old was taken by his

father, a merchant, to Charleston, S. C. He returned to England, however, in 1828, and was at Rugby under Doctor Arnold, whose strenuous appeal to moral responsibility in boys probably had an unhappy effect upon Clough's temperament, naturally high-strung, with a tendency to more or less morbid introspection. His Oxford career had an even more decisive influence on his life. He entered the university at the height of the 'Tractarian Movement,' with one of whose most brilliant men, William George Ward, he was intimate. For a time he was carried away by the new current, but the reaction took him further in the opposite direction. He held a fellowship at Oriel College from 1843 to 1848, but relinquished it when it became clear to him that he could no longer subscribe to the religious doctrines involved—becoming later an examiner under the Education Department, like Matthew Arnold, with whom he had much in common. His temperament was essentially skeptical—in no mere negative sense, but in that of reverent and anxious seeking for the truth at all costs. It is this characteristic which dominates the whole of his literary work, whether verse or prose. In his three longer poems, *Dipsycheus*, *The Bothie of Tober-na-Vuolich*, and *Amours de royage*, the analysis of character disturbed by spiritual conflict is the main interest; though he shows a perfect consciousness that the habit of self-analysis and suspense of judgment may be carried too far. After his death, which occurred on a tour in Italy, he was commemorated in one of the noblest elegies in the English language—Arnold's *Thyrsis*; and Lowell (whom, with Emerson, Longfellow, and other eminent men, he had met on a visit to America) expressed the feeling that he would "be thought a hundred years hence to have been the truest expression in verse of the moral and intellectual tendencies, the doubt and struggle toward settled convictions, of the age in which he lived." His *Poems and Prose Remains*, with letters and a memoir by F. T. Palgrave, were published the year after his death.

CLOUGH-LEIGHTER, kluf'-lā'tēr, HENRY (1874—). An American organist and composer. He was born in Washington, and was educated at Columbia University (1887-89) and at Trinity University, Toronto, Canada. So rapid was his progress, that at the age of fifteen he received an appointment as organist at Saint Michael and All Angels' Church, Washington, and in 1892 he became organist at the Church of the Epiphany and the Jewish synagogue in that city. In 1899 he removed to Providence, where he was for one year organist of Grace Church. He was professor of musical ethics and theory at the Howe School of Music, Boston, Mass., in 1902. He has written several excellent compositions, among which are the following: *Festival Service in D Major* (1896); *Te Deum Laudamus, G Major* (1898); *Ave Vinum* (1901); *Wassail* (1901); *Like a Rose Should Be* (1901).

CLOUS, JOHN WALTER (1837—). A German-American soldier, born and educated in Germany. He came to the United States in 1855, enlisted in the United States Army in 1857, and served until 1862, when he was appointed second lieutenant of the Sixth Infantry. He fought in the Civil War, and greatly distinguished himself at Gettysburg, for which conduct he received the brevet of first lieutenant and captain. He was

made a captain in the Thirty-eighth Infantry in 1867, and from 1868 to 1888 was engaged in frontier service, and became conspicuous for his bravery and skill in engagements with the Indians. In 1886 he became major and judge-advocate in the United States Army, and served until 1890 as assistant to the Judge-Advocate-General. He subsequently served successively as professor of law at West Point; staff officer to Major-General Merritt (1896-98); staff officer to Lieutenant-General Miles during the Spanish-American War; brigadier-general of volunteers; secretary and recorder of the Commission for the Evacuation of Cuba; deputy judge-advocate-general on the staff of Major-General Brooke, and judge-advocate-general. He published a series of *Lectures on Military and Martial Law*. At his own request he was retired, with the rank of brigadier-general, May 24, 1901.

CLOVE AND ORANGE. An Elizabethan 'Tweedledee-and-Tweedledum,' occurring in Jonson's *Every Man Out of His Humour*; "the Gemini of foppery, that, like a pair of foils, are fit for nothing but to be practiced on."

CLOVE - BARK. The bark of *Dicypellium caryophyllatum*, a little-known Brazilian tree, also found in the West Indies. As marketed, clove-bark resembles cinnamon cylinders about one-half foot long and about one inch in diameter, consisting of several pieces telescoped together. The bark is usually dark brown, smooth or slightly wrinkled, with a mucilaginous, aromatic, pungent taste, which suggests a mixture of cloves and cinnamon. In medicine it is known as *Cassia caryophyllata*, and is used like, but considered inferior to, cloves. A similar bark is said to be obtained from the *Myrtis caryophyllata* of Linnaeus, which grows in Ceylon. The eulilawan (sometimes eulilawang) of the Moluccas, which is sometimes confounded with clove-bark, is derived from *Cinnamomum* or *Laurus eulilawan*.

CLOVER (AS. *clafre*, trefoil, of unknown origin), or **TREFOIL** (*Trifolium*). A genus of plants of the natural order Leguminosæ, suborder Papilionaceæ, containing a great number of species, natives chiefly of temperate climates, abounding most of all in Europe, although about sixty species are indigenous to the United States; some of them very important, in agriculture, as affording pasturage and fodder for cattle and as a means for improving cultivated soil. The name 'clover' is also popularly applied to certain plants, which have compound leaves with three leaflets like the clovers, and also belong to the order Leguminosæ, but which are not included in the genus *Trifolium*—such as sweet or Bokhara clover (*Melilotus*), bur clover (*Medicago*), prairie clover (*Petalostemon*), bird's-foot clover (*Lotus*), and a number of others. The true clovers (*Trifolium*) have herbaceous, not twining stems; roundish heads or oblong spikes of small flowers, the corolla remaining in a withered state till the ripening of the seed; the pod inclosed in the calyx, and containing one or two, rarely three or four seeds. About seventeen species belong to the flora of Great Britain. The species of most importance to the farmer is the common red clover (*Trifolium pratense*). (For illustration, see Plates of DICOTYLEDONS and of BROODROOT.) This is a

growing in meadows and pastures. It stands in the front rank of forage plants for good yields, nutritive value, and adaptability to various climates and soils. It is a perennial, but is generally treated as if it were a biennial. Its heads of flowers are oval or nearly globular, very compact, about an inch in diameter, purple, more rarely flesh-colored or white; the tube of the calyx is downy; the stipules run suddenly into a bristly point. The leaflets have very often a whitish horseshoe mark in the centre. It is supposed that clover found its way into England from the Netherlands about the time of Queen Elizabeth; but it was not until the close of the last century that it was introduced into Scotland, where it is now universally prevalent. Perennial red clover (*Trifolium pratense pervicax*) is a somewhat harder form than the ordinary forms of common red clover and of longer duration, lasting for two years or more. The zigzag clover (*Trifolium medium*), also called meadow clover, marl-grass, and cow-grass, much resembles the common red clover, but is easily distinguished by the smooth tube of the calyx, and by the broader, less membranaceous, and gradually acuminate stipules. The stems are also remarkably zigzag, and are more rigid than in *Trifolium pratense*; the heads of flowers are larger, more lax, more nearly globose, and of a deeper purple color, and the leaflets have no white spot. It is a common plant in Great Britain and most parts of Europe, and is also grown to some extent in the United States. White or Dutch clover (*Trifolium repens*) is also a common native of Great Britain, and of most parts of Europe as well as of North America. When a barren heath is turned up with the spade or plow, white clover almost always appears. It is more permanent than common red clover, and it grows on nearly all soils, but its yield is small. White clover is seldom grown alone, but usually in mixtures of grasses and other clover. The flowers of all kinds of clover are the delight of bees, but those of white clover perhaps particularly so. Alsike or Swedish clover (*Trifolium hybridum*), a perennial, regarded as intermediate in appearance between the common red clover and the white clover, was introduced into Great Britain from the south of Sweden in 1834. It is also becoming common in North America. Crimson clover, or Italian clover (*Trifolium incarnatum*), an annual, native of the south of Europe, with oblong or cylindrical spikes of rich crimson flowers, is much cultivated in Continental Europe, and is also pretty extensively grown in some parts of England and the United States. Moliner's clover (*Trifolium Molineri*) very much resembles crimson clover, but is biennial and has pale flowers. It is cultivated in Europe. Alexandrian clover, or Egyptian clover (*Trifolium Alexandrinum*), an annual species, a native of Egypt, universally cultivated in its native country, where it is the principal fodder for cattle, is supposed to be one of the best kinds of clover for warm climates—such as, for instance, the Southern United States. It has oval heads of pale-yellow or whitish flowers. Yellow clover, or hop-trefoil (*Trifolium procumbens*), is common in dry, gravelly soils, but is not much esteemed. It has smaller leaves and flower-heads than has any of the cultivated species. The flowers are yellow, and the heads resemble miniature hop-strobiles.

Clovers are of great value to agriculture, on account of the many different ways in which they may be utilized. Clover is fed as hay, as green fodder, and as silage, and it is used for pasturage, for green-manuring, and as a cover-crop. It is chiefly valuable as a means of enriching the soil, being capable of appropriating free nitrogen from the air by means of its roots. It has long been recognized that clover-growing has a beneficial effect on the soil; but this phenomenon was not understood until about 1888, when scientists discovered that leguminous plants, through the agency of bacteria living in the characteristic tubercles or nodules on the roots, take up free atmospheric nitrogen. In the soil this nitrogen is oxidized to nitric acid, which forms nitrates, and in this form the nitrogen is assimilated by growing plants. In addition to their power of taking up free nitrogen, clovers are very valuable because of the large and deep development of their root systems, which effects a marked improvement in the physical condition of the soil, and thus indirectly increases its fertility. Plowing clover under for green manure is a most effective method of adding humus to the soil. During recent years crimson clover is recommended in the United States as a cover-crop for orchards, to be sown late in summer when the soil is no longer cultivated, and to be plowed under the following spring. In this way the soil is kept moist, its surface is kept from hardening, and much available plant-food is afforded the trees for the following season's growth. In general, the common red clover is the most important in the United States.

Feeding Value.—On an average red clover (green crop) has the following percentage composition: Water, 70.8; protein, 4.4; fat, 1.1; nitrogen-free extract, 13.5; crude fibre, 8.1; mineral matter 2.1. Red-clover silage contains—water, 72.0; protein, 4.2; fat, 1.2; nitrogen-free extract, 11.6; crude fibre, 8.4; ash, 2.6 per cent. Red-clover hay contains—water, 15.3; protein, 12.3; fat, 3.3; nitrogen-free extract, 38.1; crude fibre, 24.8; and ash, 6.2 per cent. Other clovers and their cured products resemble the above quite closely. Clover forage is relatively highly nitrogenous, is relished by all farm animals, and is capable of replacing in part more expensive concentrated feeding-stuffs—such as bran, linseed meal, etc.

Clover is very important for soiling, as it is available early in the season, and is relished.

Pigs do well on clover pasture, building good bone and framework, and fatten rapidly later on when given concentrated feed. Clover is very succulent in the green, uncured state, and therefore, like all such feeds, liable to cause bloat, if too much is eaten. Animals should not be turned on clover pasture when very hungry, or while the dew is on the clover. Some dry fodder should be placed in racks in the pasture, as this is said to relieve bloat.

Clover hay is not usually considered a satisfactory coarse fodder for horses, as the dust it carries proves detrimental. A limited amount may, however, be fed to all kinds of horses, with favorable results. It is a very satisfactory coarse fodder for milch cows. It furnishes the protein essential for milk, and is relished by the animals. By feeding clover hay as one-half to two-thirds of the coarse fodder of a ration, the amount of concentrated feed required may be

diminished, and thus the cost of the ration lowered. For calves and young stock, clover hay is very important. No other coarse fodder is superior for sheep.

As shown by experiments with ruminants, the following percentages of the nutrients in red-clover forage are digestible: Dry matter, 66.1; protein, 67.0; fat, 64.5; nitrogen-free extract, 77.6; crude fibre, 52.6; and ash, 55.0 per cent.

Red-clover hay has the following digestibility: Dry matter, 57.4; protein, 58.0; fat, 55.2; nitrogen-free extract, 64.4; crude fibre, 54.2; and ash, 29.1 per cent. In this respect it compares favorably with other coarse-fodder crops, both green and dry.

Clover Diseases.—There are two important fungus diseases of clover—a 'rust,' and what has been designated as the 'clover-rot.' The rust (*Uromyces trifolii*) is said to have first been noticed in South America, and to have come to the United States by way of Europe, where it is quite destructive. It infests the leaves, leaf-stalks, and stems, producing definite brown spots. The fungus passes through three phases—the first on the white clover, upon which minute cups are formed, filled with orange-colored spores; the other two phases, red and black (so called from the color of the spores occurring on red clover), are quite destructive. When a portion of a field is found affected, it is best to cover the clover with straw and burn it to prevent further spread. The 'clover-rot' (*Sclerotinia trifoliorum*) occurs on crimson clover in the United States, although common on red and other clovers in Europe. It also occurs on alfalfa, sainfoin, fenugreek, Bokhara clover, etc. Its presence may usually be noted by all plants being killed in patches a foot or more in diameter. Small black bodies will be seen at the base of the wilted stems in the autumn, followed by the appearance of small mu-hroom-like bodies in the spring. Burning, as mentioned above, and rotation of crops, are recommended for its suppression. A leaf-spot disease (*Pseudopeziza trifolii*) is sometimes quite destructive to clover and alfalfa. The diseased leaves show on their upper surfaces small black specks, which enlarge and extend through the leaf, destroying it. When present, this disease is liable to become epidemic, causing considerable loss. Burning over fields in autumn and frequent cutting prevent serious loss to the crop. Another destructive parasite of clovers, although not a fungus, is the dodder (q.v.).

CLOVER - INSECTS. Various insects injuriously affect cultivated clover, of which the following are prominent: The roots are attacked by borers, and the stems by a gall-making beetle (*Languria Mozardi*); also by a cutworm, the larva of the zebra-moth (q.v.). Weevils do great injury to clover in various parts of the plant; the worst species (*Hylesinus trifolii*) is an importation from Europe. These minute beetles pair in early spring, and then the female gnaws a cavity in a root of two-year-old clover and places it in four to six eggs. The larvæ, as soon as hatched, bore along the axes of the roots of the clover, causing the plants to weaken and often to die. Another beetle (*Phytonomus punctatus*), called the clover leaf-beetle, sometimes appears in swarms, coiling about the tips of the leaves. The leaves are also attacked by a midge or gall-gnat and the seeds by another (*Cecidomyia legu-*

minicola), the latter of which is very destructive. It lays its eggs in the blossoms of red clover in May and June, and these hatch into small reddish or yellowish maggots, which destroy the forming seed. Upon reaching full growth, they wriggle out from the floret and fall to the ground, transforming to pupæ within delicate, spherical cocoons, from which the adults issue the following spring. The larvæ leave the florets just before the time of cutting the first crop of clover for hay, so that if the time of cutting for this crop be advanced two weeks, the insect will be destroyed. Another enemy to the seeds is the greenish caterpillar of a moth (*Grapholitha interstinctana*), which devours florets and seed-vessels. The clover-hay worms, caterpillars of pyralid moths, especially *Asopia costalis*, affect particularly stored hay in which clover is mixed.

CLOVES (from Fr. *clou*, from Lat. *clavus*, nail, so called from the shape). The dried flower-buds of the clove-tree, *Caryophyllus aromaticus*, of the natural order Myrtaceæ. The clove-tree is from 15 to 40 feet high, evergreen, with a beautiful pyramidal head. The flowers are small, but produced in great profusion in cymes. The leaves, flowers, and bark have an aromatic odor. The ripe fruit resembles an olive in shape, but is not quite so large; it is of a dark-red color; it sometimes appears in commerce in a dried state, under the curious name of 'mother cloves': it has an odor and flavor similar to cloves, but much weaker; the broken fruit-stalks are sometimes also used for the same purposes as cloves, but the flower-buds themselves are the principal product of the tree. They are gathered, and are dried by exposure to the smoke of wood-fires, and afterwards to the rays of the sun, or by the latter alone. When first gathered they are reddish, but become of a deeper-brown color. The unexpanded corolla forms a little round head at the end of the calyx-tube, which is about half an inch long, and thus the appearance is not unlike that of a little nail, whence the name. The clove-tree is a native of the Spice Islands, but is now cultivated in Sumatra, Bourbon, Mauritius, some parts of the West Indies, and elsewhere. For illustration, see Plate of FLAVORING-PLANTS. The wild clove-tree of the West Indies is *Pimenta acris*. See MYRTACEÆ.

The properties of cloves depend chiefly on an essential oil—oil of cloves—which forms one-fifth or one-sixth of the whole weight, and is used for flavoring dessert dishes and articles of confectionery. The oil of cloves is obtained by repeatedly distilling cloves with water, when two oils pass over, one of which is lighter and the other is heavier than water. The oil has a hot, acrid taste, is light-yellow when pure, and browned when not so carefully prepared. It has a characteristic odor, and is soluble in ether, alcohol, and the fixed oils. When taken internally in small quantities, it has the effect of aiding digestion and of stimulating the appetite. It is sometimes used in medicine as a stomachic, carminative, and antispasmodic, and is often added to scammony and castor-oil to prevent the griping that is likely to be caused by those substances. Oil of cloves is further employed in scenting soaps, and by the distiller. The chief constituents of the oil are eugenol, or eugenic acid, $C_{10}H_{12}O_2$ and a terpene, $C_{15}H_{24}$.

CLOVES, OIL OF. See CLOVES.

CLOVIO, klôv'è-ò. GIULIO, called MACEDO (1498-1578). A miniature painter, born in Croatia. He went to Italy as a youth, and rapidly won favor by his paintings and by engravings on medals and seals. He received some instruction from Giulio Romano in Rome, and Girolamo de Libri in Verona. About 1527 he became a monk, and afterwards lived principally in Mantua and Perugia. His works were executed for the princes of the day; and, despite the many figures and exquisite finish of the illuminations, he produced a great number of them. The most famous is a breviary, with twenty-six scenes, done for Cardinal Farnese, and now in the Naples Museum. A marvelous production is the life of Frederick of Urbino, in the Vatican Library. This work shows Clovio's qualities as an historical painter and portraitist, the genre in which he is most successful.

Consult: Sakeïnski, *Das Leben des Giulio Clovio* (Agram, 1852); and Bertolotti, *Don Giulio Clovio, principe dei miniatori* (Modena, 1882).

CLOVIS, CHLODWIG, or CHLODOVECH (c.466-511). A king of the Franks, of the line of the Merovingians. By the death of his father, in 481, he became King of the Salian Franks, whose capital was at Tournai, in what is now the Belgian Province of Hainault. His first achievement was the overthrow, in 486, of the Gallo-Romans under Syagrius, near Soissons, after which he extended his conquests to the Loire. Clovis did not dispossess the inhabitants, as the Franks were only few in numbers, and the public lands were sufficient for them. About 493 Clovis married Clotilda, daughter of a Burgundian prince. Clotilda was a Christian, and earnestly desired the conversion of her husband, who, like most of the Franks, was still a heathen. In a great battle with the Alemanni, in 496, Clovis was hard pressed, and, as a last resource, invoked the God of Clotilda, vowing that he would become a Christian if he obtained the victory. The Alemanni were routed, and on Christmas day of the same year Clovis and 3000 of his army were baptized by Remigius, Bishop of Rheims. Love of conquest concurring with zeal for the Orthodox faith, Clovis marched to the southwest of Gaul against the heretic Visigoth, Alarie II., whom he defeated and slew at Vouillé, taking possession of the whole country as far as Bordeaux and Toulouse (507-10). Clovis now took up his residence in Paris, where he died in 511. His great aim had been the subjugation of all the Frankish princes and the union of the whole Frankish people into a single powerful kingdom. The means he employed to secure this end were cruel and unscrupulous; but the end itself would have been beneficial, if he had not frustrated it at his death by redividing the newly organized realm among his four sons, and exposing it to the very perils from which he himself had rescued it. An account of the deeds of Clovis may be found in Gregory of Tours, *Historia Francorum*, Book II., edited by Guadet and Turanne (Paris, 1836-38). Consult, also, Junghaus, *Geschichte der fränkischen Könige Childerich und Chlodwig* (Göttingen, 1857).

CLOWES, klouz, WILLIAM LAIRD (1856—). An English naval critic, who wrote under the name of 'Nauticus.' He was born at Hampstead, and was educated at King's College, London, and

at Lincoln's Inn for the law, which he abandoned for journalism. He served on the *Standard* (1885), *Daily News* (1887-90), and *Times* (1890-95), and contributed largely to English and foreign magazines. His articles on needs of the navy, battle-ships, torpedo-boats, etc., became widely known. He was editor and part author of *The Royal Navy: A History from the Earliest Times to the Present* (6 vols., 1897-1901). Among his numerous works are: *The Naval Pocket-Book* (an annual); *Confessions of an English Hachish-Eater* (1883); *Black America: A Study of the ex-Slave and His Late Master* (1892); *Blood is Thicker than Water* (1894); a volume of poems entitled *Eclorges* (1899).

CLOWN. See JESTER; PANTOMIME.

CLUB. A word said to be derived from the Saxon *clōfan*, to divide—a club being an association, the expenses of which are shared among the members. Societies of somewhat the same nature existed in ancient Greece and Rome, and mention of them is made in Aristotle, Cicero, Plutarch, and other ancient writers. The modern club, however, had its origin in the London taverns and coffee-houses. Thomas Oeeleve, who wrote in the reign of Henry IV., mentions 'La Court de Bonne Compagnie,' of which he was a member; but the first celebrated club in London is that to which belonged Shakespeare, Fletcher, Raleigh, Beaumont, and other brilliant men of letters who met at the Mermaid Tavern in Bread Street. Ben Jonson founded a club which met at the Devil Tavern, for which he is supposed to have written his *Leges Courivales*. The Calves' Head, so named in allusion to Charles I., was a famous London club, which existed in the latter part of the seventeenth century and the early part of the eighteenth century, and whose members banqueted on January 31 on a calf's head.

In 1659 the first political club, the Rota, was established and met at the Turk's Head in New Palace Yard. The famous 'Octoberale' served at the October Club was another political institution of which Swift became the leading spirit after his conversion to Toryism. The Literary Club, established in 1764 by Sir Joshua Reynolds and Dr. Johnson, of which Goldsmith, Gibbon, Garrick, Burke, and other celebrated men of letters were members, afforded a meeting-place for congenial spirits, where they could freely discuss the merits of the contemporary literary productions and their authors. Its membership was limited, and Garrick found it difficult to gain admission. This club still exists in London. It is usually called the Literary Club, but its members have always claimed for it simply the title of 'The Club.' The King's Head Club, founded by the unscrupulous Shaftesbury, and the Mug House Club, so called on account of the ale-mugs used by its members, were noted political clubs of the early part of the eighteenth century. The Kit-Kat, established about 1700, was named after Christopher Katt, a noted mutton-pie man. Its members toasted some celebrated beauty, whose name was inscribed on the toasting-glass in verse. The Dukes of Marlborough and Devonshire, Sir Robert Walpole, Congreve, Granville, and Addison were members of the Kit-Kat. About the same time existed the Tattler's Club in Shire Lane, and the famous Beefsteak Society, whose members wore badges inscribed with the motto, 'Beef and Liberty.' Its members were called 'Steaks.' Hogarth, Fox,

Sheridan, and the Duke of Clarence were among its noted members. As already said, these clubs had their origin in the taverns and coffee-houses of London. To this class belonged Almack's, established in 1764, and White's, established in 1698, as White's Chocolate House, and removed in 1755 to Saint James Street. Brooks's was established in 1764, and Boodle's, a famous resort for country squires and hunting-men, in 1762.

It is, of course, very easy to understand the genesis of clubs such as White's and Brooks's. In those days men's personal associations depended chiefly on party affiliation. Tories lived with Tories, and Whigs with Whigs. Intermarriages between persons of different political families were not common. Hence, men flocked to those taverns and public-houses where they would meet members of their own party. The next step was easy and obvious. The proprietor would agree, of course for a consideration, to exclude persons whose company would not be agreeable to the habitués of the place. It was thus that White's and Brooks's were formed, White's being a Tory and Brooks's a Whig club. These clubs are known as 'proprietary clubs,' to distinguish them from those of which the members were the owners. The latter class of clubs is, of course, the more recent.

About 1815, after the termination of the Napoleonic wars, the restaurant or dining-room was introduced into the clubs. Many army and navy officers, being no longer needed in active service, were placed on half pay, and were thus compelled to observe a strict economy. By combining their resources, they could live well and much more cheaply than when having their meals alone. From that time on, the number of clubs in England increased, until at the present day there are more than one hundred prominent clubs in London. These may be roughly divided into the following classes: Purely social clubs, to which belong Arthur's (established in 1765), with a membership of 600; the Bachelor's Club (established in 1881), with a membership of 920, admitting ladies as visitors; the Grosvenor (established in 1883), with a membership of 3000; the Junior Athenæum (established in 1864), with a membership of 500; the Piccadilly (established in 1893), with a membership of 1500, admitting ladies as visitors; the Union (established in 1822), with a membership of 1000; the Wellington (established in 1885), with a membership of 1400; the Travellers' Club (established in 1819), with 800 members. To this last club no one may belong who has not traveled for 500 miles in a direct line from London. This rule was made just after the cessation of the Napoleonic wars, during which traveling on the Continent was difficult. Among the clubs whose main purpose is political is the Carlton (established in 1832), which has a membership of 1800, and is Conservative; the Conservative (established in 1840), with a membership of 1300; the Constitutional (established in 1883), with a membership of 6500; the Junior Carlton (established in 1864), with a membership of 2100, and strictly Conservative. The Junior Conservative and the Junior Constitutional have each a membership of 5500, and are Conservative; the Primrose, established in 1886, has a membership of 5000, and is Conservative; the Reform, established in 1837, has a membership

of 1400, and is Liberal; the City Liberal, established in 1874, has a membership of 900, and is Liberal.

Among the literary, musical, artistic, and scientific clubs stand out preëminently the Athenæum, founded in 1824 by Sir Walter Scott and Thomas Moore, its members numbering 1200. It is devoted to art, science, and literature. The Press Club, established in 1882, is strictly journalistic; the Garrick, established in 1831, is the home of actors and of the patrons of the drama; the Royal Societies, established in 1894, is composed of 1700 members belonging to the learned associations. The principal clubs patronized by military and naval officers are as follows: The Army and Navy (established in 1837), with 2400 members; and the Junior Army and Navy (established in 1869), with 2000 members, including among them officers of the army, navy, marine, yeomanry, and militia.

The two principal commercial clubs are: the City of London (established in 1832), with a membership of 800, the home of merchants and bankers; and the Gresham (established in 1843), with a membership of 475, and with a like clientèle.

Some of the leading athletic and sporting clubs are: The Alpine (established in 1857), devoted to mountain exploration; the Automobile (established in 1897), and interested in motor locomotion, with a membership of 1036; the Hurlingham, whose members number 1200, devotees of polo and pigeon-shooting. The M. C. C. (Lord's) Club (established in 1787) is the headquarters for cricket, and has a membership of 4700; the Prince's Racquet and Tennis (established in 1833), with a membership of 1500, devoted to the practice of these games; the Renelagh, devoted to polo, golf, etc. (established in 1894), with a membership of 1900. The Leander and the Thames are among the principal rowing clubs in England. The New Oxford and Cambridge, composed of the members of those universities, was established in 1884 for the purpose of bringing graduates of those institutions into closer social relations, and has a membership of 900; the United University, also composed of Oxford and Cambridge men, has the same aim in view; the University for Ladies (established in 1887) is composed of women educated at universities and medical colleges. These are the principal university clubs of England. The Saint James Club, established in 1857, has a membership of 650, and is the rendezvous for diplomats. The Royal Yacht Squadron is the leading yacht club, and is a very exclusive institution. These clubs are all housed in buildings that are remarkable for their architectural magnificence and for the completeness of their interior appointments. They combine the comforts of a home and the service of a hotel without the responsibility of the one or the publicity of the other, and are conducted at a comparatively moderate expense to the individual members.

Attempts to introduce clubs in Continental Europe long met with little success. In Germany, such associations were discountenanced by law. The first club established in France in 1782 had politics for its main object, and went by the name of 'Le Club Politique.' Among the clubs that played an important part in the French Revolution may be noted the Jacobins; the Feuillants; the Montrang, of which Mirabeau

and Latoutche were prominent members; the Cordeliers, and others. Purely social clubs have also been established in Paris. First among them are the Jockey Club and the Cercle Royal, the most fashionable and exclusive clubs in Paris. The Club de Boston was established in 1885.

In the United States clubs were first introduced in the latter part of the eighteenth century. The Hoboken Turtle Club, organized in 1797, is still in existence. Such a club was, however, of slight importance in the social life of the town. In the city of New York the pioneer club, in a modern sense, is the Union Club, established in 1836. It is one of the oldest and most exclusive in New York City. Its membership is limited to 1500, and its object is purely social. The Century Club, organized in 1846, has the promotion of art and literature in view. Membership is limited to authors, artists, and amateurs in letters and the fine arts, and must not exceed 1300. The Union League Club was founded in 1863 for the purpose of discountenancing any attempt to impair the integrity of the United States. The New York University Club, composed of college and university graduates, was incorporated in 1865. None except degree-holding persons are eligible for membership. Its aim is literary and artistic. One of the most exclusive clubs in New York, the Knickerbocker, was organized in 1871. Its purpose is purely social. The Lotus Club, organized in 1870, is the home of journalists, authors, artists, musicians, and friends of literature. Resident membership is limited to 500. The Catholic Club of the City of New York has for its primary interest the promotion of Roman Catholic interests in New York, and has existed since 1863. The Calumet, a purely social organization, was established in 1879. Its membership is limited to 500. The Manhattan Club is a powerful factor in Democratic politics of New York. Its membership is limited to 1500, and it has an actual enrolled membership of 1200. It was organized in 1864, in opposition to the Union League Club. The Reform Club has for its object the promotion of good government and the abolition of the protective tariff. It was organized in 1878. The United Service Club was organized in 1889 for the promotion of military science. Membership is limited to military and naval officers. The Players' Club was organized in 1888, to promote social intercourse between the different members of the dramatic profession. This club was founded by Edwin Booth, who left the house, with its furniture and pictures, to the association.

Social clubs have also been formed exclusively for women. It would seem that these should have a *raison d'être*, especially in the United States, where ladies' luncheon-parties, at which the company of no man is expected or desired, are so popular. Women's clubs are, however, ancient institutions. There were a number of them in ancient Rome, among them an assembly of matrons known as the 'Minor Senate.' This institution received imperial recognition. It was chiefly occupied with questions of etiquette—such as the kind of dress that ladies should wear, according to their social position; the question as to who might be driven in carriages drawn by horses and who should be compelled to drive mules; whose sedan-chairs should have ornaments of ivory and whose

of silver, and other weighty problems. The modern ladies' clubs have, therefore, the authority of a very ancient example. They would seem to have a reason for existence in the gregarious and social instincts of the sex; but it is probable that the popularity of these clubs has been affected by the admission of ladies to certain of the privileges of the men's clubs—a privilege which renders special clubs for women less necessary.

There is still another class of clubs, such as the *Liederkrantz* and the *Arion* in New York, the original purpose of which was musical. These clubs have one point of special interest; they are German in their origin rather than English. If the English public-house, to which, of course, it was not the custom to admit women, is to be taken as the origin of the typical club of the present day, the German beer-garden may be viewed as the origin of such clubs as the *Liederkrantz* and the *Arion*. The German went to the beer-garden in company with his wife and daughter, or his sweetheart; and so, in the modern German clubs of New York, the men are usually accompanied by the women.

It seems to be a recent tendency of clubs, particularly in the United States, to facilitate, so far as is possible, the admission of ladies to club privileges. In many of the clubs it is possible for members to bring ladies to dine—a thing unheard of in England until twenty years ago, and at that time scarcely known in America. The Bachelors' Club in London, founded about twenty years ago, admitted ladies as visitors under certain conditions; and that club is one of the most successful in London. Other clubs have been founded which have the same characteristic; but the innovation has not proved so popular in England as in the United States.

The degree to which ladies are to be permitted to share the privileges of men's clubs is becoming an interesting subject. During certain hours the club must, in the nature of things, always remain sacred to men. They cannot have that comfort and unrestraint when ladies are present which they can have by themselves. During the morning hours it is natural that the ladies should be excluded. And there are also many men to whom the presence of women in the clubs in the evening would not be agreeable. The division of men into those who prefer to spend their evenings in their domestic circle and those who prefer to pass them with other men seems to be inevitable and permanent.

As we have seen, the modern club, originating in England, has spread all over the world. It is necessary, of course, that the club in each country shall have to some extent the characteristics of that country. For instance, in a French club, a newcomer must ask to be introduced to the members of the club, that being, in general, the French habit. His failure to do so would be resented by the members. In England, on the contrary, a man newly admitted would never think of asking to be introduced personally to the members. Certain differences between English and American society appear in the club life of the two countries. In general, it may be said that there is greater sociability in American than in English clubs. Indeed, the ideals of club life in the two countries are, or at any rate were, essentially dissimilar. Early in this century Englishmen found that it was possible for an individual to live at a club for £600 a year as

well as he could live at home for £6000. In the club he could have everything that he could have at home except the privacy of his own house. If he could not quite have that, he wished to have something as near it as might be. Hence the original character of the English club was somewhat solitary and unsocial. Another difference between English and American clubs was originally this: The men who founded the great English clubs were either without occupation or at most half employed. The club was, therefore, with them a place to live in and to spend a large part of the day. The American clubs, on the contrary, were originally founded by men fully employed, for purposes of social relaxation. Their early equipment, as a rule, was two or three rooms, where business men could meet outside of business hours and talk. From such a nucleus as this have grown up in our cities the great houses with library, restaurant, billiard-rooms, baths, and other appliances of luxurious living.

The present tendency, however, seems to be for English and American clubs to assimilate in character. In England the clubs have extended through all the classes of the community, so that in many of them membership consists fully as much of business men as it does here. In the United States, on the other hand, the number of unemployed or half employed men is very much on the increase, so that the men who use clubs as places to live in have greatly increased in number. It is said, by those who are in a position to know, that the sociability which has characterized American clubs has extended to these societies in England and is on the increase among them.

Regarded from a legal point of view, a club may be incorporated or unincorporated; but it is essential to its character as a club that it shall not be instituted for trading purposes, and shall not carry on any occupation having gain for its object. Social clubs, as we know them, are of English origin and have usually been unincorporated, the earliest—such as White's, Brooks's, 'The Beefsteak,' and other celebrated resorts in London—being of the proprietary kind, one person furnishing the club premises and all accessories, in consideration of an entrance fee and fixed annual subscriptions, the members being mere licensees and not co-proprietors. This type of club still survives in England and has of late become quite common in convivial and sporting circles in New York, Chicago, San Francisco, and other large cities of the United States. Gaming clubs are usually conducted on this principle.

The more usual and familiar type of club at the present time, however, is the 'members' club,' in which the persons constituting the association are, by virtue of their membership, co-owners of the property of the club and equally entitled to share in its privileges. The legal relation between the members is that of mutual contracting parties, the terms of the agreement creating their mutual rights and obligations being contained in the articles of association and in the rules and regulations adopted thereunder. These articles and rules also fix the powers and determine the authority of the governing board and other officers and committees of the club, each member being bound to submit to such authority by his express or implied assent to the rules and regular proceedings of the club. Every new member becomes a party to the con-

tract of association, whether he formally subscribes to its articles or not, though it is usual to make such subscription.

The proceedings of social clubs have not often come before the courts for review, and when they have, it has usually been in connection with the exercise of the right of expulsion of an obnoxious or offending member. This is generally provided for and regulated by the rules of the club, and, in general, it may be said that any member who brings himself by his conduct within the condemnation of the rules may be expelled in the manner provided by them, or, in the absence of any express provision, by the vote of a majority of its members. But the courts are not blind to the serious consequences of an expulsion, especially in the forfeiture of the property rights which it involves, and will see that the offending member has fair play. He is entitled to a hearing and to reasonable notice, whether the rules of the club provide for it or not. The governing committee is a quasi-judicial tribunal and must act as such. But if the proceedings have been regular and fairly conducted, the courts will usually make no further inquiry. They will not, under ordinary circumstances, undertake to control the discretion of the association or its committee, or to determine what is and what is not proper conduct on the part of a member. Doubtless, however, if it appeared to the court that a member against whom proceedings have been taken was the victim of unreasonable prejudice or of a conspiracy, it might order his reinstatement.

Generally speaking, the individual members of unincorporated clubs are not liable for the debts of the concern, unless they have authorized the transactions out of which such debts arose—a voluntary club not being a partnership and no agency being presumed; but the assent necessary to bind the members individually may be given by resolution under the rules. Of course, where no agency or ratification can be shown, the steward or house committee or other officer making or directing a purchase becomes personally liable upon the obligation incurred, the club, as such, having no legal status. An incorporated club, however, like any other corporation, may sue and be sued in its corporate capacity; and its officers and members, so long as they have complied with the law, are equally free from individual liability for its debts. For this and other reasons it has become a common practice to incorporate clubs of this character. But incorporation does not involve the existence of a capital stock, in the ordinary sense of that term, nor of corporate shares, nor has a club-member usually a transferable interest. (For a remarkable exception to this rule, see STOCK EXCHANGE.) For the dissolution of an incorporated club, legal proceedings are necessary; but a voluntary, unincorporated association may be dissolved informally by mutual agreement of its members, and thereupon the property of the club is distributed equally among them.

Although a club is not a place of public entertainment, i.e. neither a tavern nor a hotel, within the meaning of excise legislation, it may nevertheless be brought by statute under public regulation. Of course, the proprietor of a 'proprietary club' is subject to the same laws as any other persons buying and selling intoxicating liquors. It has been held, however, that the fur-

nishing of wine, beer, etc., to a member of a 'member's club' is not 'giving or selling' liquors within the excise laws. A club may also be a common gambling-house under the law if its members in considerable numbers habitually congregate there for purposes of gaming. See CORPORATION; JOINT STOCK ASSOCIATION; VOLUNTARY ASSOCIATION; and the authorities there referred to. See, also, BOYS' CLUBS; GIRLS' CLUBS; WOMEN'S CLUBS; WORKING MEN'S CLUBS; WORKING WOMEN'S CLUBS. Consult also Wertheimer, *Law Relating to Clubs* (2d ed., London, 1889).

CLUB, THE. A group of discontented Whigs in the Scotch Convention of Estates, led by Montgomery, Annandale, Ross, and Hume, who for a time during 1689 and 1690 succeeded in blocking all legislative business.

CLUBFOOT (in Lat., *talipes*). A deformity of the foot, due to a distortion of one or more of the joints, and characterized by extreme extension, flexion, adduction, abduction, or rotation. Surgeons recognize several varieties: a turning in of the foot (*talipes varus*), a turning out (*talipes valgus*), an elevation of the heel so that the weight is borne on the ball of the foot and the toes (*talipes equinus*), and a depression of the heel with the front of the foot raised from the ground (*talipes calcaneus*). Two of these forms are frequently combined (*equinovarus*). We may also mention here the deformities flatfoot (*pes planus*), where the arch of the foot is lost, and its opposite (*pes cavus*), where this arch is unduly exaggerated.

Clubfoot is either congenital or acquired. When acquired, the deformity is usually due to infantile paralysis (anterior poliomyelitis). The changes involve the muscles, tendons, bones, and ligaments. The treatment is manual, mechanical, or operative. Considerable improvement can be obtained in congenital cases by the first method, but those of long standing require splints or special apparatus, or surgical interference with sections of the tendons and frequently removal of parts of the bones. The first operation for clubfoot was done in 1731, by Stromeyer. Consult Gould and Pyle, article "Talipes," in *Cyclopaedia of Medicine and Surgery* (Philadelphia, 1901).

CLUB-HOUSE. A building used as the headquarters of a club. While of no particular importance in European countries, the club-houses of England and the United States are, for architecture and comfort, one of the foremost classes of contemporary buildings. The University Club in New York has perhaps the most magnificent halls and fittings.

CLUB-MOSS. The common name of the species of Lycopodium and Selaginella. The plants resemble coarse mosses, and frequently bear club-like cones (strobili) of spore-bearing leaves. They are also sometimes called ground-pines. See LYCOPODIALES; PTERIDOPHYTES.

CLUBROOT, or ANBURY. A disease to which turnips, cabbages, cauliflowers, rutabagas, and allied plants are liable, and which often proves of serious importance to farmers, destroying the crop of entire fields. It is called clubroot because of the knobs or tubercular excrescences which form upon the root. The root often becomes divided into a number of parts, each in some small degree swelling separately by itself; whence the popular name, 'finger-and-toe disease.'

The disease is caused by *Plasmodiophora brassicae*, a fungus of low order, which multiplies with great rapidity in the cells of the host. This acts as a stimulus, causing the roots to assume their strange appearance. The fungus can remain in the soil for a number of years. On this account, care should be taken to rotate crops, so that no cruciferous plants shall be grown on the infested land for several years. The seed-bed is often a source from which the disease is spread, and it should receive attention. The application of lime to contaminated soil, at the rate of 75 bushels per acre, has given promising results. No cure is known.

CLUB-RUSE. See SCIRPUS.

CLUGNY. See CLUNY.

CLUMBER SPANIEL. See SPANIEL; and Plate of TERRIERS, SPANIELS, ETC., under DOG.

CLUMSY, SIR TUNBELLY. A boorish country squire in Vanbrugh's play *The Relapse*. He also appears in Sheridan's *Trip to Scarborough*.

CLUNCH. Old Madge's husband in Peele's *Old Wives' Tale*, who brings home three travelers to form an audience for his loquacious better half.

CLUNIACS, or CONGREGATION OF CLUNY. A branch of the Benedictine Order, founded at Cluny in France about 910, by William, Duke of Aquitaine. He placed at its head Berno, who had made a great reputation by his conduct as abbot of the monasteries of Gigny and Baume. It spread rapidly, and at one time had more than 2000 convents, mainly in Italy and France, all connected with the house at Cluny. In England the first Cluniac house was founded in 1077. At the time of the suppression of the monasteries there were thirty-two houses. The Congregation in France was dissolved in 1790 by the Constituent Assembly; the town of Cluny purchased the magnificent Abbey Church for 100,000 francs and pulled it down. When, a few years later, the citizens invited Napoleon to visit them, he dismissed them contemptuously, calling them vandals. In Paris the present Hôtel de Cluny was begun in the fifteenth century (on the site of the old palace of the early Frankish kings) by the Congregation of Cluny, but is now a rich museum owned by the city of Paris. The Congregation was reformed by Peter the Venerable (q.v.), and in 1131 Innocent II. dedicated the great church of Cluny; which was one of the wonders of the world. Among the great men whom the Congregation has produced are Popes Gregory VII., Urban II., and Paschal II.

CLUNY, klŭ'nĕ', or CLUGNY (Lat. *Cluniacum*, probably connected with Oir. *chain*, Ir. *clon*, meadow, Gk. *κλέρος*, *klepos*, moisture, Lith. *slāpius*, wet). A town in the Department of Saône-et-Loire, France, 12 miles northwest of Macon. It has manufactures of pottery, paper, etc. Population, in 1901, 4108. Its architectural attractions include, besides the celebrated abbey, the Church of Notre Dame, dating from the thirteenth century; the Church of Saint Marcel, with a beautiful Romanesque steeple of the twelfth century; the ruins of Saint Mayeul; portions of the ancient fortifications; and picturesque houses, dating from the twelfth century and later, all classed among the historical monuments of France. Before the erection of Saint Peter's at Rome, the Abbey Church at Cluny, which was begun in 1089, was the largest building of its kind

in Europe, being 650 feet long by 130 wide. It is now in ruins, having been destroyed by order of the town, to which it was sold after the convent was suppressed by the Constituent Assembly in 1790. (See CLUNIACS.) A model of it is preserved in the town museum, which was once a part of the abbot's palace. Consult: Bernard, *Les chartes de l'abbaye de Cluny* (Paris, 1876-94); Duckett, *The Archives of the Ancient Abbey of Cluny* (n.p. 1886).

CLUNY, klŭ'nĕ', HÔTEL DE. A fine Gothic edifice in Paris, built during the fifteenth and sixteenth centuries by the abbots of the Benedictine Abbey of Cluny, on the site of an ancient Roman palace. In 1515 it was occupied by Mary, the widow of Louis XII., and in 1537 James V. of Scotland was married in it. It passed into the hands of the nation after the Revolution, was acquired in 1833 by the antiquarian Du Sommerard, and in 1842 was purchased with its collections by the State. The museum established in it is important for its antiquities, particularly of France.

CLUPEIDÆ (Neo-Lat. nom. pl., from Lat. *clupca*, small river-fish + Gk. *εἶδος*, *eidos*, shape, form). An important family of soft-rayed fishes, including the herring, shad, sardines, alewives, etc. (q.v.). The body is usually elongated and compressed; the head naked; the body covered with rather large scales, usually easily lost. The lateral line is wanting. There is only one dorsal fin, and the tail is forked. There are about 30 genera and 150 species found in all seas, and usually in immense shoals. Many species are anadromous, while some remain in fresh water permanently. See FISHERIES and FISH CULTURE.

CLUSERET, klŭ'z-râ', GUSTAVE PAUL (1823-1900). A French soldier and Communist, born in Paris. He was educated at Saint-Cyr, distinguished himself during the insurrection of 1848 in Paris, served in the Crimean War and in Africa against the Kabyles, and became a captain in 1855. In 1858 he resigned his commission, and in 1860, as commander of the French volunteers, joined Garibaldi in the expedition to Sicily and Naples. At the outbreak of the American Civil War in 1861 he came to the United States, entered the Union Army, served on the staffs of McClellan and Frémont, and became brigadier-general in 1862. Two years later he was editor of *The New Nation* in New York, advocating the nomination of Frémont for the Presidency. Returning to Europe, he took part in the Fenian revolt of 1867, went back to France in the same year and wrote for several radical papers, but was condemned for certain publications and compelled to take refuge in England. On the proclamation of the Republic in September, 1870, he took part in the insurrectionary attempts at Lyons and Marseilles, whence he fled to Geneva. In January, 1871, we find him in Paris where, after the establishment of the Commune, he was appointed delegate of the War Department, and endeavored to improve the military organization of the Communist troops, but soon gave offense to the Central Committee, was accused of treachery, and was imprisoned at Mazas. When the Government troops entered Paris, he escaped to England, thence to Mexico, and finally to Switzerland. In 1872, during his absence, he was formally sentenced to death; he returned to France in 1881, two years after the amnesty, and

was elected to the Chamber of Deputies in 1888, 1889, and 1893. He died August 21, 1900, near Toulon. He published *Mémoires du général Cluseret* (1887-88).

CLUSIUM, κλω'shī-ūm. An ancient town of Italy, the modern Chiusi (q.v.).

CLUSTER-CUP. See **ÆCIDIUM**; **UREDINALES**.

CLUSTERED PIER, or **COLUMN**, or **COMPOUND PIER**. A form of architectural support characteristic of the Middle Ages, though not absolutely unknown to the ancient East, as is shown by the Babylonian cluster of four columns found at Telloh. It was not used in the Classic, Early Christian, or Byzantine style, nor until the development of the vaulted Romanesque in the eleventh century. It probably originated in the attempt to vary the plain square pier which was then being used in place of the classic column, and to connect it with moldings of the arcades and the ribs of the vaulting. These Romanesque piers had a square or rectangular core, to each face of which a semi-column or engaged shaft was attached; this simplest form was varied by the addition of minor shafts and re-entrant angles. Very rich effects were thus obtained, especially in central France and England during the twelfth century. The developed Gothic style of the thirteenth century adopted the clustered pier as its regular support in interior architecture. The Gothic pier differed in being usually far slenderer, more varied in plan, and in a majority of cases based on a circular or polygonal instead of a square core. The larger shafts were sometimes—especially in England—separated from the core, to which they were fastened only at the base and at the capital and by intermediary molded bands. But this form was found unsatisfactory and was abandoned except in England for the solid pier, which was a better support. Its simplest form with circular core is shown in the nave of Amiens Cathedral, but its variations are infinite, being determined largely by the number, form, the grouping of the vaulting ribs and moldings above, by connecting with which the effective sweep of architectural lines is continued from floor to vaulting ridge. The neo-classicism of the Renaissance put an end to the clustered pier almost entirely except in its simplest rectangular forms.

CLUTTERBUCK, CAPTAIN CUTHBERT. A retired officer, the fictitious editor of Scott's *The Abbot*, *The Monastery*, and *The Fortunes of Nigel*.

CLUVER, κλω'vēr, or **CLÜVER**, κλυ'vēr, PHILIPP (1580-1622). A German antiquarian and geographer, born in Danzig. He first studied law in Leyden, but soon forsook it for archaeology and geography, whereupon his father withdrew all support and he was obliged to take service in the Austrian Army. From 1607 to 1613 he traveled through Norway, England, Scotland, France, Germany, Switzerland, and Italy, and in 1615 he settled in Leyden, where he was made 'Geographus Academicus.' In 1617-18 he roamed once more through Italy and Sicily, on foot and under great hardship. He was the founder of historical geography and author of *Germania Antiqua* (1616); *Sicilia Antiqua* (1619); *Italia Antiqua* (1624), his principal work, and *Introductio in Universam Geographiam* (1624).

CLYDE (called *Glotta* by Tacitus, connected with Olr. *Cluad*, name of a river, Gk. κλύζειν, *klyzein*, to wash out, Lat. *cluere*, to purify, Goth. *hlūtrs*, AS. *hlāttor*, Ger. *lauler*, pure). The third in size, commercially the most important, river in Scotland, widely celebrated for the romantic beauty of its scenery (Map: Scotland, D 4). It is formed by several large streams of the semicircular range of the Lead, Lowther, and Moffat hills, and drains the counties of Lanark, Renfrew, and Dumbarton, flowing past Lanark, Hamilton, Glasgow, Renfrew, and Dumbarton, near which town it opens into the Firth of Clyde. In this course it receives a number of streams, and flows through a fertile, wooded valley, often extending into level plains, and often having bold, wooded banks. From two miles above to four miles below Lanark are the celebrated Falls of the Clyde—a series of cascades and rapids, the largest in Scotland; the total descent in the course of six miles being 230 feet, over Old Red Sandstone rocks, amid very picturesque scenery. Corra Linn, the grandest fall, forms three distinct leaps—in all 84 feet high. Below Glasgow the Clyde expands into an estuary, navigable by the largest vessels, and at Greenock it attains a breadth of about four miles. Opposite this point it communicates with the Gareloch, and a little below, with Loch Long on the north, and turning, expands into the Firth of Clyde, which extends between Argyll, on the west, and Renfrew and Ayrshire, on the east, until it becomes identified with the North Channel at the island of Ailsa Craig, where its breadth is about 30 miles. In the Firth of Clyde are the islands Arran, Bute, Great Cumbrae, and Little Cumbrae. In the north a narrow arm, called Loch Fyne, extends far into Argyllshire. The Clyde from its source to Glasgow is, by its windings, 75 miles long, and from Glasgow to the south end of the peninsula of Cantyre the distance is about 90 miles. The basin of the Clyde occupies 1500 square miles. Floods sometimes raise its waters 20 feet. Clydesdale, or the Valley of the Clyde, is noted for its coal and iron mines, orchards, and horses. Bell, in 1812, launched on the Clyde the first boat in Europe successfully propelled by steam. The Clyde forms the centre of the ship-building industry in Scotland. Consult Millar, *The Clyde from Its Source to the Sea* (London, 1888).

CLYDE, LORD. See **CAMPBELL**, SIR COLIN.

CLYDEBANK. A town in Dumbartonshire, Scotland, on the Clyde, 7 miles northwest of Glasgow (Map: Scotland, D 4). It has extensive yards for building iron and steel ships. Population (police burgh), in 1901, 18,654.

CLYDESDALE or **PAISLEY TERRIER**. See **TERRIER**.

CLYM (klīm) **OF THE CLOUGH**, κλυ'. See **CLIM**.

CLYMENE, κλυ'ē-nē. (1) The daughter of Oceanus and Tethys, and mother, by Japetus, of Atlas, Prometheus, and Epimetheus. (2) The mother of Phaëthon.

CLYMENIA (Neo-Lat. nom. pl., from Lat. *Clymene*, Gk. Κλυμένη, *Klymenē*, name of a nymph, originally p.p. of κλυειν, *klyein*, to hear). A genus of goniatitoid cephalopods, found in the Upper Devonian rocks of Europe and North America, and distinguished from the other goniat-

tites by the dorsal position of its siphuncle. The shell of this genus is a flattened spiral, the whorls of which are closely coiled so that each whorl clasps the outer half of that next inside it. The suture-lines are simply curved or lobed. In some beds of the European Upper Devonian the shells of this genus are so abundant as to give the name 'Clymenienkalk' to the limestone containing them. Consult Foord and Crick, *Catalogue of the Fossil Cephalopoda in the British Museum of Natural History*, part iii., pp. 14-32 (London, 1897). See also GONIATITES; CEPHALOPODA; DEVONIAN SYSTEM.

CLYMER, klī'mēr, GEORGE (1739-1813). An American patriot, one of the signers of the Declaration of Independence and a prominent member of the Constitutional Convention of 1787. He was born in Philadelphia, was orphaned when only one year old, was educated at the College of Philadelphia (now the University of Pennsylvania), and became a merchant in his native city. In 1772 he was appointed by Governor Penn to the position of 'Justice of the Court of General Quarter Sessions of the Peace, and of the County Court of Common Pleas of Philadelphia.' On the approach of the Revolutionary War, he became an active member of the patriot party, and was chosen successively a member of the Committee of Correspondence (1774) and of the Provincial Congress of Pennsylvania (1775). From July, 1775, to August, 1776, he served as one of the two treasurers of the Continental Congress; from October, 1775, to July, 1776, he was a leading member of the Pennsylvania Committee of Safety; and in July, 1776, he was one of the five men who were appointed by the Pennsylvania Legislature in place of the Pennsylvania delegates who had opposed the Declaration of Independence, which document he signed on August 2. He was a prominent member of the Constitutional Conventions of Pennsylvania in 1776 and 1779; served as captain under Cadwalader at the battle of Princeton; was a member of the Pennsylvania Assembly in 1777 and 1778; was reelected to the Continental Congress in March of 1778; was sent to Valley Forge by Congress as a special commissioner to inquire into the alleged maladministration of the Commissary Department; and in 1778 was one of the special commissioners sent by Congress to treat with the Indians at Fort Pitt (Pittsburg). In May, 1780, he co-operated with Robert Morris and others in founding the Bank of Pennsylvania to facilitate the furnishing of supplies to the army, and in both 1780 and 1781 he was reelected to the Continental Congress, by which in 1782 he, with Edward Rutledge, was sent as special commissioner to the Southern States, to secure the payment of funds due to the national treasury. From 1782 to 1785 he lived at Princeton, N. J., but returned to Philadelphia in the latter year and from then until 1789 was an influential member of the Pennsylvania Assembly. He took a prominent part in the Constitutional Convention of 1787; was a member of Congress from 1789 to 1791; was appointed by Washington in 1789 Supervisor of the Internal Revenue for Pennsylvania, in which capacity he was charged with the collection of the tax on spirits which brought on the Whisky Insurrection (q.v.); and in 1796 was one of the special commissioners appointed by Washington to treat with the Creeks and

Cherokees in Georgia. Subsequently, though taking no further part in public life, he took an active interest in public enterprises of various kinds, devoted much of his time to reading and study, and was president of the Philadelphia Bank and of the Academy of Fine Arts. He was one of the foremost leaders during the Revolutionary period, and had a wide reputation for ability, learning, and patriotism. Consult Dickenson, in the *Magazine of American History*, vol. v. (New York, 1880).

CLYSTER, klis'tēr (Lat., from Gk. κλυστήρ, *klystēr*, a syringe, from κλύζειν, *klyzein*, to purify). An old term for a medicine administered in the liquid form by the rectum, or lower end of the intestines. See ENEMA.

CLYTEMNES'TRA (Lat., from Gk. Κλυταμένηστρα, *Klytainmēstra*). In Greek legend, the daughter of King Tyndareus and Leda, and the twin sister of Helene. She became the wife of Agamemnon (q.v.), and bore him a son, Orestes, and three daughters, Iphigenia, Electra, and Chrysothemis. During the absence of Agamemnon on his expedition to Troy she formed an adulterous connection with Ægisthus (q.v.), murdered her husband on his return, and reigned for seven years with Ægisthus, till she was murdered by her own son, Orestes.

CLYTIE, klish'tī-ē (Lat., from Gk. Κλυτιή, *Klytiē*). A Greek maiden beloved by Helios (the sun). When he deserted her for Leucothea, she betrayed the latter to her father, who put her to death. As her lover did not return, she gazed after him, until in pity the gods changed her to a flower, called by the Greeks ἡλιοτρόπιον, *heliotropion*, of the same family as our heliotrope. The so-called Clytie of the British Museum is only the portrait of a Roman maiden.

CNIDUS, nī'dūs, or GNIDOS (Lat., from Gk. Κνίδος, *Knidos*). An ancient city on the western extremity of the promontory of Triopion (now Cape Krio), in Caria, Asia Minor, founded as a colony from the east coast of the Peloponnesus, hence said to be both Laconian and Argolic, and one of the six cities of the Dorian League. Cnidus (according to Strabo) had two ports, one of which was a closed harbor for war vessels. The original settlement was on an island, but the city later spread to the mainland, and a mole was built to unite the two parts. The southern port was formed by two moles carried into the sea to the depth of nearly 100 feet, one of which is nearly perfect at the present day. The city was famous for its worship of Aphrodite, and in one of its temples was the famous nude statue of the goddess by Praxiteles. The Cnidians valued this work so highly that they are said to have refused the offer of Nicomedes of Bithynia to pay their large public debt in exchange for this statue. Off Cnidus, the Athenian admiral Conon defeated the Spartan fleet in B.C. 394, and thus broke the power of Sparta in Asia Minor. The site is still covered with ruins, and in 1857-58 Sir Charles T. Newton excavated the sacred precinct of Demeter, discovering the fine seated statue of the goddess now in the British Museum. Consult: Newton, *Discoveries at Halicarnassus, Cnidus, and Branchidæ* (London, 1862-63), and *Travels and Discoveries in the Levant* (London, 1865).

CNOSUS, *nō'sūs*, or **GNOSUS** (Lat., from Gk. *Κνωσός*, *Knōsos*, or less correctly *Κνωσός*, *Knōssos*). An ancient city of Crete, on the north side of the island, 3 miles from the coast, near the modern Candia (q.v.), famous in legend as the home of King Minos (q.v.). The Diætanæ cave in the neighborhood was a legendary birth-place of Zeus, though in later times somewhat supplanted by the Iðæan cave on Mount Ida as a seat of worship. Here also legend placed the famous labyrinth (q.v.), in which the Minotaur was confined. In later times Cnosus was inhabited by Dorians, and shared with Gortyna the chief power in the island. Of late the site has become important from the excavations made by A. J. Evans during 1899-1900 and the following years. These have shown that the site of the early town was abandoned near the end of the Mycænean period, never to be reinhabited. A village of the Mycænean period has been discovered, and also a palace of far greater size and splendor than any yet known, bearing witness to the great power of the rulers of Cnosus in the heroic age. The decorations include wall-paintings on stucco, and reliefs of an artistic merit hitherto unsuspected in so remote a period (about B.C. 1500-1200) outside of Egypt. The art, however, is not Egyptian, but must be attributed to the pre-Dorian civilization of Greece. In the palace were also found a great number of clay tablets bearing inscriptions in two varieties of writing, neither of which can be read, though it seems clear that some of the tablets contain inventories of chariots, shields, and other stores. See **ARCHÆOLOGY**; **MYCÆNEAN AGE**.

COACH (Fr. *coche*, Ger. *Kutsche*, probably from Hung. *koesi*, coach, named after a little place called Koes (pronounced Koch) in western Hungary). A heavy inclosed four-wheeled carriage for the conveyance of passengers. The construction of the coach differs from that of other inclosed vehicles in the following particulars: (1) The roof forms a part of the framing of the body, and in this respect the construction is different from other covered carriages in which the roof is simply a canopy supported by iron rods or wooden pillars. (2) Coaches from the earliest times were suspended on springs. The coach sent by Ladislas, King of Hungary, to Charles VII. of France, is described as a carriage the body of which 'trembled.' (3) A coach is always designed with more than one seat for passengers.

According to Thripp (see Bibliography below), coaches were first made in the town of Koes, Hungary, and were so called from the name of the town, just as landaus and berlins are named from the towns which produced them. The same author traces their development from the huge agricultural wagons used on the Continent in the twelfth and thirteenth centuries, which were so constructed that, by different adjustment, they could carry a long timber, a cask of wine, a load of hay, or a family. The coaches of the Middle Ages were very elaborate affairs, used only by royalty and nobility, and for purposes of state. As late as 1550 there were only three coaches in Paris; one of these belonged to the Queen, another to Diana of Poitiers, and a third to a nobleman who was too corpulent to ride a horse. In 1631 a 'glass coach,' that is, a coach with glass windows, was built for the Infanta of Spain.

The first coach ever seen in England was made

in 1555 by Walter Rippon for the Earl of Rutland; in 1564 the same builder made a showy vehicle for Queen Elizabeth. Later in her reign the royal coaches were constructed with sliding panels, so that the Queen could show herself to her subjects whenever she desired.

STATE COACHES. The Romans during the Empire had a system of public vehicles for hire which traveled over definite routes and probably at stated times. During the Middle Ages no such system of public conveyance prevailed. Toward the end of the sixteenth century wagons began to travel regularly between the principal towns of England to carry goods and people. These wagons were called stages. They were soon superseded by coaches. In 1662 we find a writer condemning this innovation because "these coaches make country gentlemen come to London on small occasion, which otherwise they would not do but on urgent necessity; nay, the convenience of the passage makes their wives often come up, who, rather than make such long journeys on horseback, would stay at home. Here, when they come to town, they must be in the fashion, get fine clothes, and by this means get such a habit of idleness and love of pleasure that they are uneasy ever after." In spite of such protests coaches became more and more popular, and by 1750 an elaborate system of routes had been established. In 1784 these coaches began to carry the mail. The flourishing period of the stage-coach was at the opening of the nineteenth century. About this time an extensive good-roads movement had been inspired by the systems of Macadam and Telford. The stage-coaches acquired a speed of ten miles an hour on the most important English routes. In America stage routes, although established between some of the principal cities, were never developed to the extent to which they were in England. The introduction of transportation by steam proved a speedy and successful rival. This form of carriage—the railway-car—has been given the name of coach, and, indeed, the early passenger-cars were modeled in shape after the coaches. For further history, see **COACHING**.

At the beginning of the twentieth century coaches are built both for public and private use, and in design they are closely akin to those in use in England during pre-railroad days. They may be described as consisting of two parts—the *carriage* and the *body*. The former comprises the axles, perch (or reach), futehells, and transom (or bed), and many minor component parts, which together with the wheels form a complete vehicle or carriage upon which the body part is supported by the springs. The latter are secured to the bed and body by clips, and are always made of several stiff plates, because of their greater elasticity as compared with one plate of steel of the same length. The pole fits between the inside futehells, and completes the carriage part. In the best-made carriages the dimensions of a pole are: $3\frac{1}{2}$ inches wide, and $4\frac{1}{4}$ deep, measured at a point 2 feet from the splinter-bar. For horses averaging between 15 and 16 hands, the length of the pole is usually 9 feet from the front of the splinter-bar to the cross-head or the pole-head; for smaller horses, cobs, etc., about 3 inches shorter. The *body* is practically the same in all coaches, and is usually 4 feet 10 inches in length, 4 feet wide, and 4 feet 2 inches high. It is built as lightly as pos-

sible, so as not to detract from the centre of gravity of the coach. The roof is almost flat, in order that seats may be built on it, or for baggage, and the sides have a 'cant' in a horizontal direction, and the 'turn under' in a vertical direction. There are two *boots*, the one in front being a few inches higher on the body than the hind boot, which latter is about two feet long (the front one three feet), and two feet deep. Both these boots are a little narrower than the body. The *box* and *driving seat* are placed on the front part of the front boot, and are supported by solid ends or risers. The shape of the seat is made by the cushion, and not by the seat itself, which is always flat. All modern coaches have brakes, but a good driver rarely has recourse to them, except in emergencies. (See *DRIVING*.) A complete set of tools is carried in case of accidents to horses or vehicle. The weight of a road coach varies from 2200 to 2600 pounds. Builders generally contrive to throw more of the whole weight into the carriage part, in order to keep the centre of gravity low, and because it has to withstand the bulk of the strains. The cost of a coach depends very largely upon its finish and the country in which it is built. Approximately, average prices are: in America, \$2400; England, 300 guineas; and France, 8000 francs.

The typical American coach is the Concord coach, so called from Concord, N. H., where many of them are built. Its principal constructive features are three parallel straight perches connecting the hind axle with the front transom bed, which steady a very rigid, rectangular frame. At each of the four corners of this frame are placed stiff iron standards carrying at their upper ends square iron shackles. Connecting with these shackles are strong leather straps, upon which rests the body of the coach, a mode of suspension common to European carriages before the use of springs. These latter are entirely absent in the Concord coach. The so-called *Hackney coach* is a smaller four-wheeled vehicle for hire. Consult: Adams, *English Pleasure Carriages* (London, 1837); Thrupp, *History of the Art of Coach-building* (London, 1877). See *CARRIAGES*; *COACHING*.

COACH-DOG, or **DALMATIAN CARRIAGE-DOG**. A dog of medium size, related to the hounds (q.v.), and having the form and smooth coat of a pointer, which properly is used only to follow a carriage, as an ornamental part of the equipage, and as a watch-dog about the stable. This dog should, therefore, be capable of endurance on foot, trim of form, well groomed, and 'stylish' in appearance. The coat must be pure white, evenly spotted with small, round, *distinct* spots, from half an inch to an inch in diameter, either perfectly black or pure brown. The head should be long, fine, and like that of a pointer, but not so deep. This dog is commonly said to have been first bred in Dalmatia, but the same breed seems to have been common in Spain as far back, at least, as the sixteenth century. It is often used in Denmark to draw carts. See *Dog*.

COACH-HORN. A straight tapering horn made of brass or copper, and used to sound certain simple calls. There are no keys and the range is limited to the six open notes (c^1 - g^1 - c^2 - e^2 - g^2 - c^3), of which the high c is exceedingly

difficult. The coach-horn varies considerably in length, a short (42-inch) horn giving more brilliant notes, and a long (56-inch) horn giving a softer, richer tone. The various calls sounded with the coach-horn have a well-recognized place in coaching; and in addition to those used universally, as in the case of the examples noted below, there are others employed by particular coaches and routes. A few of the best-known calls are as follows:

Get Ready.

The Start.

Clear the Road.

Off Side.

Near Side.

To the Right.

To the Left.

Change Horses.

COACHING. Driving or being driven in a coach (q.v.) drawn by four or more horses. The driving of a coach requires great skill, coolness, judgment, and a knowledge of horses on the part of the driver; and, where indulged in as a sport or pastime, may be said to derive its greatest attraction from that fact alone. The history of coaching is naturally part of the history of the coach, for which see article *COACH*. The first stage in England was put on the road in 1659 and traveled between London and Coventry. At the beginning of the eighteenth century there were many coaches employed throughout the country; but the slowness of travel was such that it took a week to go from London to York, and proportionately for all lesser distances. The royal mail, which had been carried by a system of post-boys under a contract speed of five miles an hour, was, in 1784, undertaken by Palmer's mail-coach service, which carried mail as well as passengers, and grew to such a success that the average speed-rate of mail coaches was brought up to 10 miles an hour. This, however, was due almost entirely to the improvements in road construction instituted by Macadam and Telford.

In 1836 coaching had become so important an institution that 54 coaches were employed in England, 30 in Ireland, and 10 in Scotland. The British Government exercised a rigid supervision

and discipline over the stage-coach service, because of its connection with the post-office system, and exacted a military punctuality and regularity in its running and general management. The landed and country gentry, generally, maintained a zealous watchfulness over the condition of the roads, and consequently much competition was indulged in by the people of the countryside, to attract coaches to some particular route, and among the coaches themselves, to establish the best records. The drivers were frequently gentlemen, and often members of the aristocracy. The 'Brighton Age,' in its palmy days, numbered among its professional drivers Charles Jones, Sir Saint Vincent Cotton, Dick Brackenbury, and many others; while such distinguished men as the Duke of Beaufort, Lord Chesterfield, and Prince Henry Battlyányi were among the amateur drivers of that and similar coaches. Professional drivers would frequently receive as much as \$3000 and \$4000 per year for their services; an immense salary for those days, and the best indication of the importance attached to the position. After 1840 coaching as a public necessity ceased to be; and with diminishing business, decay set in rapidly.

In America, even in Colonial times, four-horse stage-wagons were in regular employment throughout the country, the most important (1760) plying between Philadelphia and New York. Owing to the absence of regular roads, the saddle-horse was the favorite means of transport. Coaching as a recreation or amusement began in England about 1868—a revival which spread to America as well as throughout Continental Europe. In England it had as its leading supporters men who remembered the pre-railroad coaching days, and desired to save the institution from the oblivion which threatened it. A more or less successful effort had been made to keep alive the old spirit of coaching on one or two of the older routes; but at the time of the so-called revival, the Four-in-Hand Club, established in 1856, and Sir Henry Peyton, were the only interested ones. The results were not very permanent so far as England was concerned; for in 1880 there were only four coaches running—a state of things, however, which has since considerably improved.

In 1877 the 'Old Times' was again put on the road between London and Saint Albans; the Four-in-Hand and the Coaching Clubs afterwards became permanent organizations, and their 'meets' have come to be regarded as among the social events of the London season. The first English coaching club was the B. D. C., or Bensington Driving Club, limited originally to sixteen members, and first organized in 1807. In 1823 the annual club meets were abandoned, and in 1856 the club ceased to exist. The Four-Horse Club, frequently but inaccurately referred to as the Four-in-Hand Club, was formed in 1808, and, after a varied career, disbanded in 1830. Amateur coaching in the United States may be said to have antedated the English revival by two or three years. Mr. August Belmont putting the first coach on the road in 1864. Mr. Leonard Jerome is credited with the distinction of driving the first American-built coach, and he, together with a number of other gentlemen, founded in 1875 the New York Coaching Club. Since then coaching has been a regular feature of fashionable New York and Newport

life, the number and equipment of the coaches employed comparing most favorably with those of either London or Paris. Indeed, modern coaching in both England and France has received no little impetus from American lovers of the pastime.

At the present day coaching is confined almost exclusively to such great centres and cities of the world as are most frequented by the wealthy and leisure classes, as London, New York, Paris, Berlin, Vienna, etc., and is generally employed in connection with racing and other recreational meetings. The following is a list of the principal road coaches of New York, London, and Paris, past and present, together with their routes and time taken. *New York*: Brunswick Hotel to Pelham Bridge, 15.5 miles in 1½ hours; Brunswick Hotel to Yonkers, 18 miles in 1¾ hours; Holland House to Ardsley Casino, 25.8 miles in 2½ hours. *London*: Northumberland Avenue to Box Hill, 25 miles in 3 hours; Northumberland Avenue to Virginia Water, 26.5 miles in 3¼ hours; Northumberland Avenue to Windsor, 30 miles in 4 hours. *Paris*: New York Herald Office to Cernay-la-Ville, 29 miles in 3 hours; New York Herald Office to Pontoise, 26.3 miles in 2¾ hours; New York Herald Office to Maisons LaFite, 19.4 miles in 2 hours; New York Herald Office to Versailles, 14.5 miles in 1¾ hours. Of the 'two-day' trips, or routes which require an entire day each way, the most important in the United States is that from the Plaza Hotel, New York, to Tuxedo Park, 47.5 miles, which is covered in 7½ hours. In England, the journey from the White Horse Cellar, Piccadilly, to Brighton (54 miles) is accomplished in 6 hours; while in France the distance from the New York Herald Office, Paris, to Fontainebleau (60 miles) is accomplished in 7 hours. *Stages*: Under the best conditions a change of horses would be made every seven miles, but ordinarily it has to be done to suit the available stabling accommodations of the route. The best authorities agree that a fast coach, running out and in, is best served by having a horse to each mile of the road. Thus 30 horses would be necessary to run a coach out and in once a day, between points 30 miles apart. An illustration of the distance between stages under normal conditions, over a route 28 miles long, would be as follows: First stage 7, second stage 8, third stage 7, fourth stage 6 miles, each team serving one stage each way. On hilly roads longer stages are frequently made, but at a greatly reduced rate of progress. It is common experience that 'pace' rather than 'pull' is responsible for the disablement of the average coach-horse. The bibliography of coaching is somewhat limited, but the following works are both interesting and comprehensive: Nimrod (C. J. Apperley). *Essays on the Road* (London, 1876); the Duke of Beaufort, *Driving* (London, 1887); Rogers, *A Manual of Coaching* (Philadelphia, 1909).

COACH-WHIP SNAKE. See WHIP-SNAKE.

COAGULATION (Lat. *coagulatio*, from *coagulare*, to curdle, from *coagulum*, rennet, from *co-*, together + *agere*, to drive). The amorphous solidification of a liquid, or part of a liquid, as when the casein of milk is solidified by rennet in making cheese (q.v.), or the white of an egg by boiling. The process varies in various substances. Albumen, or the white of an egg, co-

agulates at a temperature of 160°. Milk is coagulated or curdled by the action of rennet or by acids. The fibrin in the blood, chyle, and lymph of animals is coagulated after the separation of these fluids from the living body.

COAHUILA, kō'ā-wē'lā (named from the Mexican tribe *Coahuiltees*). A northern State of Mexico, separated from Texas on the north and east by the Rio Grande, and covering an area of 63,570 square miles (Map: Mexico, H 4). With the exception of the eastern part, which is somewhat mountainous, the surface forms an elevated plateau, with a general incline toward the Rio Grande. The western part is taken up by the Bolson de Mapimi, a semi-desert region, only partially explored, with many lagoons and vast mineral resources. The climate is moderate and healthful. The chief occupation is cattle-raising, although the soil is well adapted for the growing of cereals and European vegetables, to which more and more attention is being paid. In the southwest some vines and cotton are cultivated. The State is traversed from north

types being connected by all degrees of intermediate stages. In Carboniferous times certain regions were covered by rank and luxuriant vegetation which grew upon swampy land slightly raised above the level of the sea. As the plants died, their remains fell into the water of the swamp, and slowly formed an accumulation of vegetable matter of increasing thickness. By slow subsidence this thick layer of vegetable matter sank below the water, and became gradually covered by sand, mud, or other mineral sediments, washed out from the shore. Successive elevations and depressions, with intervening accumulations, may thus have yielded successive beds. Subsequent elevation, folding of the earth's crust, and accompanying metamorphism, followed by erosion of the surface, has exposed to view the edges of the once deeply buried beds of coal.

COMPOSITION. The following analyses of peat, lignite or brown coal, and true coal indicate the changes which vegetable matter undergoes by decay and pressure:

COAL (AS. *col*, OHG. *kolo*, Ger. *Kohle*; ultimately connected with Skt. *jval*, to blaze, and probably with Ir., Gael. *qual*, coal). A mineral fuel of solid character, found and used in many countries. The name is a word common to all the languages of the Gothic stock, and seems allied to the Latin *calere*, to be hot; as also 'to glow,' and 'kiln.' The word 'coal' has often prefixed to it some qualifying word, to distinguish different kinds of coal; such as cannel coal, stone coal, pea coal, etc.

ORIGIN. Coal is one of the most important economic minerals, and is of vegetable origin. When vegetable matter accumulates under water it undergoes a slow process of decomposition, gradually giving off its nitrogen, hydrogen, oxygen, and some carbon, the result of which if carried far enough is the formation of a mass of carbon. Peat (q.v.), the material so often found underlying swampy tracts in north temperate zones, represents the first stage in the coal-forming process, and the further stages are obtained by the burial of these vegetable deposits under great loads of sediment, where they become subjected to pressure, and at times to heat also. This effects a series of changes, especially consolidation and loss of oxygen, and gives a series of products, whose nature depends on the degree to which the original vegetable matter has been changed. The products are known as *lignite*, *bituminous coal*, and *anthracite coal*; these three

These analyses bring out well the general relations of the different elements, and the increase in carbon toward the anthracite end of the series; still they give but little information concerning the commercial value of the coal. The usual custom in making a commercial analysis is to determine the form in which these elements occur—that is, the amount of water, volatile hydrocarbon, fixed carbon, sulphur, and ash. This proximate analysis is also used as the basis of classification of coals. Thus:

COMPONENTS	Peat	Lignite	Bituminous coal	Anthracite
	%	%	%	%
Moisture.....	78.89	13.29	1.30	2.94
Volatile hydrocarbons.....	13.84	59.86	20.87	4.29
Fixed carbon.....	6.49	18.52	67.20	88.18
Ash.....	0.78	8.32	8.80	4.04
Sulphur.....	2.36	1.83	0.65

A proximate analysis like the above is of practical value, since it gives us a better conception of the coal worth. Thus the freedom of burning increases with the amount of volatile hydrocarbons, while the heating power depends on the amount of fixed carbon present. Sulphur is an injurious constituent when the coal is to be used in the manufacture of gas or for metallurgical purposes; while ash is undesirable, since it displaces so much carbon, and if it contains fusible impurities such as iron, lime, or alkalis, it causes clinkering. Moisture retards the heating power of the coal until it is driven off. Since

COPYRIGHT, 1902, BY DODD, MEAD & COMPANY.

the heating power of coal is its most important property, this is often tested by means of an apparatus known as a 'calorimeter.' (See CALORIMETRY.) The principle of the test depends on the determination of the weight of water which can be converted into steam at 212° F. under atmospheric pressure with one pound of coal. (See also HEAT.) In addition to the varieties of coal given above, there may be mentioned *semi-bituminous coal* and *cannel coal*. The properties of the different varieties are as follows:

Anthracite contains 84 per cent. or more of fixed carbon, and also little ash, sulphur, and moisture. It has great heating power, and burns with a smokeless flame. Owing to its comparative scarcity, it commands a higher price than the bituminous. Anthracite is dense, has a shining lustre, and usually breaks with a smooth conchoidal fracture. It is estimated by some geologists that about ten inches of peat is required to make one inch of anthracite coal. In the United States anthracite coal is confined chiefly to the eastern edge of the Appalachians in Pennsylvania, where the folding of the rocks has been very intense, and where the coal-seams have been subjected to great pressure. It is also known in Colorado, near Crested Butte, where the bituminous coals have been locally changed to anthracite by the heat of basalt intrusions. It is mined extensively in England, and large quantities are known in China.

Bituminous Coal contains 50 to 75 per cent. of fixed carbon, and 25 to 30 per cent. volatile hydrocarbons. It burns with a rather long and smoky flame, and is also much used for steaming purposes. Many bituminous coals have the property of coking or caking (see COKE) when heated to redness. Most of the Carboniferous and many of the Mesozoic coals of the United States are bituminous.

Semi-Bituminous Coal resembles bituminous coal in appearance, but is intermediate between it and anthracite. It contains from 70 to 84 per cent. of fixed carbon, and is considered of superior value for steaming purposes. This variety is obtained from Pennsylvania, Maryland, and West Virginia.

Cannel Coal is a variety of coal very rich in volatile hydrocarbons, and found sparingly in parts of Kentucky, Ohio, and Indiana. Its chief use is as a gas-enricher, since it yields 8000 to 15,000 cubic feet of gas per ton. Cannel coal is so called because it burns with a bright flame like a candle, and the name parrot coal was given to it in Scotland, from the crackling or chattering noise it makes while burning. It is very compact in texture and may even have an oily look; certain forms found in England admit of being polished, and ornamental articles have been made from them and sold under the name of jet.

Lignite, or Brown Coal, is a partially formed coal, containing much moisture and volatile matter. It often shows the woody structure of peat and burns very easily, but gives off little heat.

HISTORY AND USE. The value of coal does not seem to have been known to the ancients, nor is it well known at what time it began to be used for fuel. Some say that it was used by the ancient Britons; at all events, it was an article of household consumption to some extent during the Anglo-Saxon period as early as A.D. 852. There seems to be reason for thinking that Eng-

land was the first European country in which coal was used in any considerable quantities. In America the deposits near Richmond, Va., were discovered in 1701, and mining was begun in 1750, while anthracite was first produced in 1793. Extended coal-mining in the United States did not really begin, however, until about 1820. Since that time up to the present, the increase has been about 3500 per cent. In 1822 the amount of coal mined in Virginia was about 48,000 long tons. Now the production for the United States is about 270,000,000 short tons, or greater than that of any other country of the world.

Coal is used largely for domestic purposes, either as fuel or, in the form of gas, for illumination. Its use for the latter purpose is, however, not so widespread as formerly, water-gas having superseded it to a considerable extent. In the production of steam for motive power it also finds important applications. It is furthermore widely employed in the metallurgical industry in the form of either coal or coke, and in this connection may serve both as a fuel and as a reducing agent. Coke (q.v.) is made only from bituminous coal. Lignite seldom has much value as a fuel, owing to the large percentage of moisture that it contains. Because of this moisture it tends to crack in drying, and must therefore be used soon after mining, and in localities where it does not require long transportation from mine to market. This is true, for instance, of some of the lignite deposits in Colorado which are near the Denver market, and therefore possess commercial value. Lignite has sometimes been successfully used in the manufacture of producer gas, and indeed even peat has been found adaptable for this purpose.

COAL AREAS. The leading coal-producing countries of the present day are the United States, Great Britain, Germany, France, Belgium, Austria-Hungary, and Russia. The Russian coal-fields are probably the most extensive in Europe. In the Far East coal is known in India, the Malay Archipelago, Japan, and China. The coal-fields of the last-named country are probably the greatest in the world, and may become a source of European supply. Up to the present time they have not been developed in a systematic manner. Italy, Spain, Sweden, Australia, New Zealand, Borneo, the Philippine Islands, and many countries in Africa also produce coal; while in America deposits are worked in Canada, Mexico, Chile, and Argentina, and are known to occur in Colombia and Peru.

UNITED STATES. The coal-fields of the United States are especially extensive; indeed, in some instances the deposits of a single State exceed those of Germany or France in area. They are separable into several regions, the divisions being geographical and not geological. The geological ages of the coals in 1, 2, 3, 4, and 6 (table on next page) are all Carboniferous, except small Triassic areas in Virginia and North Carolina. Those of 5 are Cretaceous and Tertiary.

By far the most important of these regions is the Appalachian, which takes in portions of Pennsylvania, Ohio, West Virginia, Virginia, Maryland, Eastern Kentucky, Eastern Tennessee, Georgia, North Carolina, and Alabama. It is about 750 miles long, and 70 to 80 miles wide. The coals are all bituminous or semi-bituminous with the exception of those at the northeastern end, in Pennsylvania, where close folding of the rocks

has changed the bituminous into anthracite coal. In general, the rocks at the upper or northern end of the Appalachian belt are folded, while

among three districts—the Warrior, Cahawba, and Coosa, named after the rivers that drain them. The anthracite district of Pennsylvania occupies an area of about 470 square miles on the left bank of the Susquehanna. The strata between Pottsville and Wyoming, which belong to the lowest portion of the coal-measures, are probably about 3000 feet thick; but it is difficult to make an exact estimate, because of the numerous folds and contortions. There are from 10 to 12 seams, each over three feet in thickness. The principal one, known as the Mammoth or Baltimore vein, is 29 feet thick at Wilkesbarre, and in some places exceeds even 60 feet. Many of the Appalachian coals, notably those of western Pennsylvania, West Virginia, and Alabama, produce excellent coke. The Ohio coals do not yield good coke. In most of the other coal-fields of the country the coal-beds lie comparatively flat, and the basins are quite shallow.

The Michigan area is a small one in the lower peninsula of Michigan. It forms a circular basin with a diameter of about 50 miles. The coals are bituminous, non-coking, and are mined chiefly for local use. The seams range from a few inches to three feet in thickness.

The Central area includes parts of western Kentucky, Indiana, and Illinois, and lies chiefly within the latter State. These coals are all bituminous, of Carboniferous age, and are used chiefly for steaming. The thickness of the Carboniferous System varies from 1200 to 1400 feet in southern Illinois, to about 600 feet in Indiana, and the workable coal-seams vary in number from 7 to 12 in Illinois, and their thickness from three to eight feet. The 'block coal' of Indiana has quite a reputation. The Western Central area includes Iowa, Missouri, Arkansas, Indian Territory, Kansas, and part of Texas. Here again there is an abundance of hituminous coal, which has been developed chiefly in Iowa and Missouri, while Kansas is now coming into prominence. The coals of this area are chiefly adapted to smithing and steaming purposes, and, so far as tried, Kansas yields the only coking varieties.

those of the lower end, as in Alabama, are often faulted in addition, so that the coal-miner frequently finds the coal-seam suddenly broken off. The Carboniferous section of this region has

CROSS-SECTION OF ANTHRACITE COAL MEASURES (PENNSYLVANIA).

been described in the article CARBONIFEROUS SYSTEM, from which it may be seen that the coal-beds occupy more or less well-marked stratigraphic positions. The maximum thickness of strata is from 2500 to 3000 feet; the seams measuring 120 feet near Pottsville, 62 feet at Wilkesbarre, and 25 feet at Pittsburg, showing a gradual diminution in a westward direction. The most persistent coal deposit is the Pittsburg seam, which is known over an area measuring 225 by 100 miles, and has a thickness varying from 2 to 14 feet. In Alabama the deposits are distributed

The Cordilleran area comprises the coal regions of Colorado, New Mexico, Utah, Wyoming, South Dakota, North Dakota, Montana, California, Oregon, and Washington. In this field are found many varieties grading between lignite and anthracite. They are all of either Tertiary or Cretaceous age, and their discovery showed the incorrectness of the old classification, which included all post-Carboniferous coals under lignite. Colorado is perhaps the most important producer, having a number of good bituminous seams. Those in the vicinity of

COAL-MINING

1. THE OLD WAY—With hand pick.

2. THE MODERN WAY—With machine pick.

Crested Butte have been changed locally to anthracite by the metamorphic action of igneous intrusions. Excellent coking coals are found near Trinidad. The New Mexican coals are in part an extension of the Colorado veins, and bear a good reputation, as do also many of the Wyoming coals. California has little fuel of good quality, and has for many years drawn on Australia for its coal-supply, but in recent years the coals of Oregon, Washington, and British Columbia have become a source of supply.

The rocks of the small Rhode Island area have been so highly metamorphosed that the coal has been altered to graphitic anthracite. It is sold on the market as amorphous graphite, and has little value as a fuel.

CANADA. The Acadian field includes deposits in Nova Scotia and New Brunswick, the former being quite important. The coals are bituminous and of good quality. In the mountain ranges of British Columbia extensive coal-seams have been discovered, and they are now under development. A good quality of coke is made from the coal of Crow's Nest Pass, which finds a market at the British Columbian smelters. The most productive mines of the Pacific Coast are located on Vancouver Island, whence large shipments of bituminous coal are made to San Francisco and other ports in the Western United States.

SOUTH AMERICA. Coal, probably of Carboniferous age, is found in the Brazilian provinces of São Pedro, Rio Grande do Sul, Santa Catharina, also in the neighboring Republic of Uruguay. Very little development work has been done in the fields, and the output is inconsiderable. In Argentina and Chile, where Cretaceous coal occurs, there is more activity; but these countries still depend largely upon Great Britain for their supplies. In Peru both Cretaceous and Carboniferous deposits are found at various points in the interior, the former occupying a position on the first rise of the Andes, while the latter occurs in higher ground and at a greater distance from the coast.

UNITED KINGDOM. Next to the coal-fields of the United States, those of the United Kingdom are of the greatest economic importance. Within the limits of England, Scotland, and Wales there are more than twenty areas underlain by seams of anthracite, bituminous, and cannel coal. The largest of these areas is that of South Wales, in Monmouthshire and Pembrokeshire, which has a length of about 50 miles and a width of nearly 20 miles. The coal-measures form an elliptical basin, and are several thousand feet in thickness. Coal is found in three horizons, of which the upper has no less than 82 seams, measuring 180 feet in all. The lowest horizon yields valuable steam and blast-furnace coal. In the north of England the coal-fields of Lancashire, Derbyshire, and Yorkshire are the largest. The Lancashire field is of irregular quadrilateral form, with a width of about 18 miles from north to south, and a length from east to west of more than 50 miles. It includes about 100 feet of coal in workable seams, which dip at a high angle and are much broken by faulting. The Yorkshire and Derbyshire measures occupy a single area that extends for a distance of about 60 miles from Bradford on the north to near Derby on the south, and has a breadth of from 3 to 32 miles. They yield bituminous coal, excellent for steaming and iron-making purposes.

North of the Yorkshire field is the large basin of Northumberland and Durham, from which steaming, coking, and house coals are produced. In Scotland the coal-measures are extensively developed in Ayrshire, Lanarkshire, Stirlingshire, and Fifeshire. The productive coal-fields of the United Kingdom belong to the Carboniferous period; brown coal of Jurassic or Tertiary age is known to occur, but the seams are too small to be profitably exploited. The exports of coal from this country are of great importance, amounting in 1900 to 51,638,000 short tons, valued at \$193,032,000. Much of the coal goes to Italy, Russia, Holland, and to the European countries that possess small resources of the mineral, while the remainder is exported to the more remote parts of the world.

Further details regarding the distribution of coal will be found under the titles of countries.

OUTPUT. The world's annual production at the present time is about 850,000,000 short tons; the output in 1900, according to *The Mineral Industry*, was distributed as follows:

COUNTRY	SHORT TONS
United States.....	268,315,433
Great Britain.....	252,176,352
Germany.....	164,850,131
Austria-Hungary.....	43,020,049
France.....	36,673,945
Belgium.....	25,863,003
Russia.....	16,500,000
Canada.....	5,608,636
Japan.....	4,189,490
India.....	6,852,803
Spain.....	2,847,199
Sweden.....	278,132
Italy.....	528,989
Africa.....	546,563
New South Wales.....	6,168,337
New Zealand.....	1,225,603
Queensland.....	556,939
Victoria.....	237,052
Tasmania.....	56,822
Other Countries.....	2,755,750
Total.....	843,247,288

It is interesting to follow the progress of the United States as a coal-producer. In 1868 Great Britain produced 3.6 times as much coal as the United States, while Germany's product that year was 15 per cent. greater than that of the United States. In 1871 the United States exceeded Germany's output by about 10 per cent., but afterwards fell back to third place until in 1877 she once more sprang forward, and gained on both Germany and Great Britain. In 1899 the United States led the world, and supplied nearly 32 per cent. of its production.

The average price of bituminous coal at the mines in the United States, per short ton, varied between 1893 and 1900 from \$0.80 to \$1.04; while that of anthracite was between \$1.41 and \$1.59 for the same period. The total number of laborers employed during 1900 was 449,181, of which number 144,206 were anthracite miners.

During the closing years of the nineteenth century European countries have been confronted with a most serious problem—the exhaustion of their coal-supply. This condition was emphasized in 1899 and 1900 by the occurrence of strikes in the Wales coal regions, by war in South Africa, and by a stimulation of industries in Germany which required much additional coal. Prospecting having shown but little reserve material, the most natural result was to look to the United States, and in 1900 there began a movement of coal to Europe, which may

before many years assume large proportions. Ocean freights are the present great drawback.

MINING OF COAL. The presence of coal in paying quantities having been determined by prospecting and geological surveys, the next consideration is to extract this coal from seams. No definite rules can be given for the selection of a method of mining that will cover all conditions; each mine furnishes a distinct and separate problem. Every system of mining, however, aims to extract the maximum amount of the deposit in the best marketable shape and at a minimum cost and danger. Speaking broadly, all methods of mining come under the head of either open working or closed working. Open working is employed when the deposits have no overburden of barren rock or earth, or where this overburden is of such small depth that it can be easily and cheaply removed, leaving the coal deposit exposed. The mining of such exposed seams of coal is really a process of excavation or quarrying, and the machines used in making open-pit excavations and in quarrying are applicable to the work. Closed working is adopted when the depth of the overburden is so great that the mining must be conducted underground. The first task in opening up underground coal-seams is to secure access to the seam by means of shafts, slopes, or tunnels. Shafts are vertical openings from the ground surface to the coal-seams. In the United States shafts are usually made square or rectangular in form. This practice is largely due to the fact that timber is used for lining shafts. In Europe round or oval shafts are frequently employed with linings of brick, iron, or masonry.

Generally the shafts are divided into two or more compartments, in each of which is installed an elevator for hoisting the coal-cars to the surface. The number of compartments in a shaft and their arrangements depend upon the particular use to which the shaft is to be put, the number of shafts employed, and their depths. Where the seams are comparatively near the surface, it is usually cheaper to sink a number of two or three compartment shafts than it is to haul all the ore to one large shaft; while, when the shafts are very deep, it is preferable to sink a smaller number of four or six compartment shafts and extend the underground haulage to a single shaft over a great area of the workings. Where timber lining is employed, a stronger construction is obtained by placing the compartments side by side in a long, narrow shaft than by grouping them in a square shaft. In shallow mines separate shafts are often employed for hoisting and for pumping, ventilation and ladder-ways. One of the largest coal-mine shafts in America is situated at Wilkesbarre, Pa.; it is 1039 feet deep, 12 × 52 feet in size, and has five compartments. The methods of sinking mine shafts are essentially the same as those used in sinking shafts for tunnels. (See TUNNEL.) Slopes are openings begun at the outcrop of an inclined seam, which they follow down into the earth. Slopes are usually made with three compartments side by side, two of which are used as hoistways and the third for the traveling-way, piping, etc. When the dip of the slope is under 40 degrees the slope is made about seven feet high, but when the dip exceeds 40 degrees cages have to be used and a great height is necessary. Slopes are usually

lined with timber. Tunnels are nearly horizontal passageways beginning on the side of a hill or mountain and extending into the earth until they meet the coal-seam; they are built for both haulage and drainage purposes, and are constructed like railway tunnels, except that the cross-section is usually much smaller, and that it is lined with timber instead of with permanent masonry. The forms of timbering used in coal-mining are various, and are of interest chiefly to the practical miner; special treatises should be consulted by those interested in the details. In a general way, it may be said that timber used for underground support in mines should be of a light and elastic variety of wood. Oak, beech, and similar woods are heavy and have great strength, but when they do break it is suddenly and without warning, thus bringing disaster to the miners who might escape if a tough wood were employed which gives warning of rupture by bending and cracking. It is a very common practice to employ preserved timber in mining work. See FORESTRY.

The systems of working the coal-seams after access is attained to them by the means described are two, known as the room-and-pillar and the long-wall systems. The room-and-pillar method—also known as the pillar-and-chamber or board-and-pillar method, which may include the pillar-and-stall system—is the oldest of the systems, and the one very generally used in the United States. By this system, coal is first mined from a number of comparatively small places, called rooms, chambers, stalls, boards, etc., which are driven either square from or at an angle to the haulageway. Pillars are left to support the roof. In the long-wall method the whole face of the coal-seam is taken out, leaving no coal behind, and the roof is allowed to settle behind as the excavation progresses, care being taken to preserve haulageways through the falling material. Both the room-and-pillar and the long-wall methods are employed in various modifications, for the details of which special treatises on coal-mines should be consulted. The coal is cut from the seam by hand or by some form of coal-cutting machine. In America machine cutting is used extensively. There are four general types of machines in general use: Pick machines, chain-cutter machines, cutter-bar machines, and long-wall machines; the machines most used in America are pick machines and chain-cutter machines. Both compressed air and electricity are used for operating coal-cutting machines. Pick machines are very similar to a rock-drill; chain-cutter machines consist of a low metal bed-frame upon which is mounted a motor that rotates a chain to which suitable cutting teeth are attached. The ventilation of the workings, owing to the presence of gases, is a very important feature of coal-mining, and great care is taken to lay out the workings so as to facilitate ventilation. Mechanical ventilation by means of fans and blowers (see BLOWING MACHINES) is usually employed. Hoisting in mines is accomplished by means of cages running up and down the shafts, and operated by large hoisting engines on the surface. There are two general systems of hoisting in use—hoisting without attempt to balance the load, in which the cage and its load are hoisted by the engine and lowered by gravity, and hoisting in balance, in which the descending cage or a spe-

2. SULLIVAN ELECTRIC CHAIN MACHINE, Cutting across face of room.

cial counter-balance assists the engine to hoist the loaded ascending cage. Haulage in mines is accomplished by animal power or by steam hoisting engines operating a system of rope haulage or by mine locomotives operated by steam, electricity, compressed air, or gasoline.

The preparation of mined coal for the market consists in screening the coal over bars and through revolving or over shaking screens, together with breaking it with rolls to produce the required market size. The large lumps of slate or other impurities are separated by hand, while the smaller portions are picked out by automatic pickers or by hand by boys or old men seated along the chutes leading to the shipping pockets or bins. When coal contains much sulphur, this is frequently removed by washing it with water in special washing plants.

COAL APPLES. The name given to some curious specimens of spheroidal anthracite coal found in the Mammoth seam of Pennsylvania. They vary from one-fourth inch to ten inches in diameter, but are usually about the size of a hen's egg. They are thought to be due to jointing.

COAL-BREAKER. A structure containing machinery for the purpose of crushing, sorting, and cleaning anthracite coal. The breaker is often as much as 150 feet high, and rarely less than 80 feet. The coal, as it is hoisted out of the mine, is carried up to the top of the breaker and discharged into a hopper, whence it passes

downward over bars, through screens and crushers, and is finally discharged into bins at the bottom. The admixed slate is separated partly by special screens, and the slaty coal (bone coal) is picked out by boys as it slides down the chutes. In the more modern breakers water-jigs are used very successfully to separate the slate and coal. The sizes produced are described in the article on ANTHRACITE. The capacity of a coal-breaker is commonly about 1000 tons per day, but some exceed 2000 tons in output. Consult Chance, "Report on Coal-Mining," *Report AC of the Second Geological Survey of Pennsylvania* (Harrisburg, 1883).

COALFISH (so named from its color). (1) The pollack (q.v.). (2) A singular and interesting eliid fish (*Anoploma fimbriata*) of the North Pacific, which is usually slaty-black above and white below, but variable with age and place. It is about 18 inches long, allied to the rock-trout, and called in California beshow, candlefish, and skilfish.

COAL-GAS. See GAS, ILLUMINATING.

COALING SHIP. In modern naval vessels coaling ship has become an operation of importance. Special machinery is provided for handling it, and the men are drilled at coaling expeditiously. Notwithstanding all that can be done in the way of drill and the improvement of appliances, the operation of coaling must take many hours, and in time of war may necessitate a trip to the nearest coaling-station. This loss of time may prove most serious and defeat the plans of a campaign. Means of coaling at sea without leaving station, or while en route to a place, are therefore sought. Several plans have been devised, in the most successful of which a steel hawser runs between the collier and the vessel to be coaled, starting from a high point on the collier's mast. This serves as a stay on which bags, carried by a trolley, pass to and fro, very much after the fashion of a cableway (q.v.).

COAL-MEASURES. See COAL; CARBONIFEROUS SYSTEM.

COAL-OIL. See PETROLEUM.

COAL-TAR, or GAS-TAR. The thick, black, opaque liquid that comes over and condenses in the pipes when gas is distilled from coal. It is slightly heavier than water, and has a strong, disagreeable odor. Coal-tar is a mixture of many distinct liquid and solid substances, and the separation of the more useful of these constitutes an important branch of manufacturing chemistry. By distilling from wrought-iron stills, the tar is first broken up into five fractions, which are then further subjected to fractional distillation separately:

(1) *Crude Naphtha* or *Light Oil* is the fraction distilling over before the temperature of the tar has risen to 170° C. This portion contains a number of valuable hydrocarbons, including benzene, toluene, xylene, etc. Another important product obtained from this fraction is the so-called solvent or burning naphtha of commerce, which is largely used for burning in lamps, as a solvent for india-rubber and gutta-percha, and for a variety of other purposes. The benzene obtained from this fraction is also used as a solvent, though most of it is converted into aniline, all of the vast amount of aniline manufactured at present being derived from nitro-

benzene, which is, in its turn, made from benzene. To separate its constituents, the crude naphtha is first divided into three fractions by distillation; each of these fractions is washed successively with sulphuric acid and caustic soda, as well as with water, and subjected to further fractional distillation.

(2) *Middle Oil* or *Carbolic Oil* is the crude fraction distilling over from tar between the temperatures of 170° and 230° C. This fraction contains large quantities of naphthalene and carbolic acid, the former separating out in the form of a crystalline mass, while the latter remains liquid. The naphthalene thus obtained is purified by washing with caustic soda and sulphuric acid, and distilling. On the other hand, the crude liquid is treated with caustic-soda solution, which takes up all of the carbolic acid and from which the latter is separated by adding sulphuric acid; the impure carbolic acid thus obtained is further purified by distillation. Naphthalene is extensively used in the manufacture of colors. Carbolic acid is extensively used as a disinfectant and for the manufacture of picric acid.

(3) *Creosote Oil* is the crude fraction distilling over from coal-tar between the temperatures of 230° and 270° C. This somewhat heavy oil is largely used for the preservation of timber. See CREOSOTE.

(4) *Anthracene Oil* passes over above 270° C. This fraction yields all the anthracene of commerce; the anthracene crystallizes out from the oil, and is somewhat purified by washing with the solvent naphtha obtained from the first fraction. Anthracene is extensively employed in the manufacture of the beautiful alizarin dyes, which were formerly made from madder-root. See ALIZARIN.

(5) The *Pitch* remaining in the stills after the above fractions have passed over is used for making asphalt and varnishes, for protecting wood and metal work, etc.

Coal-tar is produced in large quantities in the manufacture of illuminating gas, and while scarcely half a century ago it was looked upon as nothing but an offensive waste product, at present it constitutes the source of innumerable substances of the greatest value to both science and the industries. See BIBLIOGRAPHICAL REFERENCES under COAL-TAR COLORS; GAS, ILLUMINATING; and see the articles on the various products mentioned above.

COAL-TAR COLORS. Coloring matters artificially prepared from coal-tar, chiefly from the hydrocarbons extracted from it. (See COAL-TAR.) The first observation of a colored compound of this class was made by Runge in 1834; but the real beginning of the great modern color industry dates from 1856, when W. H. Perkins obtained a violet dyestuff by oxidizing impure aniline with chromic acid, took out a patent for it, and commenced manufacturing it in England. Many other dyes were subsequently obtained from aniline and the substances related to it, by A. W. Hofmann, Gries, Girard, Lauth, and many others. But the most sensational step was the preparation by Graebe and Liebermann (1868) of a natural dyestuff—viz. the coloring principle of madder-root, from the anthracene of coal-tar. In 1880 indigo was first prepared, not from coal-tar products, but by a purely synthetic method, and other natural colors have

since been prepared in a similar manner; so that natural dyestuffs reproduced by artificial means need not necessarily originate from coal-tar. The artificial indigo and alizarin are not mere substitutes for the natural indigo and madder; they are chemically identical with them, and surpass them in purity, and their adaptability to special methods in dyeing and printing often makes them even more desirable. But as the cost of manufacture is high, they compete with the natural products on about equal terms. The color industry was first developed in England and France, but the more thorough technical instruction at the German universities produced a body of skilled manufacturers and investigators who soon took the lead. At present, in addition to the great factories near Berlin, Frankfurt, Elberfeld, and Mannheim, and a host of smaller ones in various parts of Germany, German capital controls many of the establishments in France, Russia, and other countries. The United States possess few independent factories, and the list of their products is rather limited; indeed, American dyers appear to call for a smaller range of dyestuffs than those of other countries. A peculiar development of the last fifteen years is the extension of the methods of the dye industry to the production of artificial drugs, such as antipyrin, antifebrin, etc., many of which are manufactured in the same establishments which control the dye patents.

CLASSIFICATION. Artificial colors were formerly classified merely according to the sources from which they were obtained. Thus, many of them, including magenta, 'aniline blue,' 'aniline green,' 'aniline yellow,' etc., were grouped together as *aniline colors*. At present somewhat different systems of classification are used by different authors, but all systems are based exclusively on the chemical constitution of the dyes.

Many attempts have been made to find a general answer to the question. What must be the chemical nature of a carbon compound in order that it may be a dye? An all-embracing answer to this question has not yet been found. But experience has shown that the true dyestuffs exhibit peculiar groupings of the constituent atoms. Such 'chromophore' groupings produce, however, only a *tendency* toward color, but not necessarily colors; indeed, many compounds containing them are perfectly colorless, and the majority of true dyes become colorless if deprived of the small amount of oxygen they contain, although their chromophore groups may not be in the least affected. If, however, a chromophore group is combined with certain other atomic groups, the result is a dye. For example, the so-called *azo-group* ($-N=N-$) is chromophoric; the compound called azobenzene, $C_6H_5-N=N-C_6H_5$, although colored red and evidently containing the azo-group, is not a dye; but it becomes one when the so-called *amido-group* (NH_2) also is introduced into its molecule, the compound $C_6H_5-N=N-C_6H_4NH_2$, called *amido-azobenzene*, being a true dye. If, instead of the amido-group, a hydroxyl group (OH) is introduced, the result is again a dye (an orange one). Further, the tints of dyes are produced by variation in the 'substituting' groups which replace hydrogen in the primitive molecule. Thus, the introduction of the

COAL-MINING

1. INCLINED PLANE FROM MINE TO BREAKER.

2. VIEW OF TYPICAL BREAKER.

methyl group (CH_3) generally increases the violet tendency; the phenyl group (C_6H_5) produces bluish tints; the naphthyl group (C_{10}H_7) a tendency toward brown-red, etc. The relative position of the groups likewise plays a large part in the determination of color. But, as we have already observed, a definite and all-embracing rule does not exist. Frequently compounds must enter into combination with a base or an acid before they will fix themselves upon the fibre, and then the tints are frequently affected by the different bases or acids to a varying degree. For example, alizarin dyes red with the hydroxide of aluminum, and black with the hydroxide of iron.

For the purposes of the present sketch, the coal-tar colors may be grouped in five classes: viz. the azo-colors; triphenyl-carbinol derivatives; quinone derivatives; diphenyl-amine derivatives; and indigo dyes.

Azo-COLORS. The characteristic compound of this class is azo-benzene, $\text{C}_6\text{H}_5\text{N}=\text{NC}_6\text{H}_5$, already mentioned above. We have seen that the introduction of either NH_2 or OH in place of a hydrogen atom produces a coloring matter—yellow in the former, orange in the latter instance. Replacing either or both of the phenyl groups (C_6H_5) by more complex hydrocarbon groups deepens the tone (with a tendency toward the redder tints), increases the affinity for fibres, and diminishes the liability to fade. The earlier dyes of this class, such as 'aniline yellow,' 'Bismarck brown,' 'chrysoidin,' etc., were singularly brilliant, but were not fast; whereas the browns and the many reds, ranging from scarlet to purple, which are now produced under the names of ponceaux or bordeaux, congos, quinoline red, etc., are exceedingly permanent. In manufacturing this class of dyes, nitrous acid is allowed to act upon an ice-cold solution of the salt of any primary base (like aniline), and the 'diazosalt' formed is allowed to act on another base or a phenol; an endless variety of combinations is thus possible.

TRIPHENYL-CARBINOL DERIVATIVES. These represent the first discoveries in the aniline dyes, and some of them are still produced on the largest possible scale. The fundamental compound of the class is triphenyl-carbinol (C_6H_5)₃COH, and its derivatives are properly subdivided into *rosanilines*, *rosolic acids*, and *phthaléins*.

In the rosaniline group, two or three amido-groups (NH_2) are introduced in place of hydrogen atoms of the phenyls (C_6H_5). The *di-amido*-compounds are green; the *tri-amido*-compounds are red, violet, or blue. Strictly speaking, the compounds thus obtained are not themselves dyes, but are bases which must first be combined with suitable acids, and thus brought into a soluble form. Their salts are beautifully crystalline bodies in the solid condition, showing colors quite different from those of the solutions, and having peculiar lustres like those of beetles' wings. The solutions have very intense colorations and stain animal fibres readily and permanently, although they do not fix themselves easily upon cotton or linen. They are the most brilliant and lively dyes, but are strongly affected by sunlight, and are consequently less useful than some dyes of other classes. They are generally manufactured by oxidizing processes at a comparatively high temperature, whereby two or three simpler compounds are welded, as it

were, into compounds of complex molecular structure. Thus, in the manufacture of the well-known magenta dye (a tri-amido-compound) approximately equal quantities of aniline, ortho-toluidine, and para-toluidine are heated from 8 to 10 hours with arsenic oxide to 190°C ., in large iron kettles. A very thick mass results, which can be extracted with hot water, and the compound thus obtained is found to be made up of molecular quantities of aniline, ortho-toluidine, and para-toluidine, chemically combined.

Rosolic acid and its derivatives are made by the condensation of various phenols, three phenols being condensed into one compound of the rosolic acid group, just as three bases are condensed into one compound of the rosaniline group. The comparatively few dyes of this group give various shades of red. The hydroxyl groups, and hence the acid character of the phenols, remain unchanged in the products of condensation; the latter therefore combine with bases, and then they readily go into solution.

The phthaléins differ from the rosolic acids in so far as one of the three phenyls of the triphenyl-carbinol is connected in them with a carboxyl group (COOH), the other two phenyls having one or more hydroxyls apiece, as in the rosolic acids. The phthaléins were discovered by Adolph Baeyer, and are chiefly remarkable for the fluorescence of their alkali salts in solution. They are prepared by heating phenols with phthalic anhydride and a little sulphuric acid; when resorcin is taken as the phenol, a very well-known compound is obtained, which has been called *fluoresceïn*, while its sodium salt is known as *uranin*. Solutions of the latter are yellow by transmitted light, but bright green by reflected light. This fluorescence is so intense that it is distinctly noticeable in extremely dilute solutions; so that this salt has been used to trace subterranean watercourses supposed to connect two neighboring bodies of water, the dye being thrown into one of these and fluorescence being subsequently noticed in the other. The potassium salt of a brominated fluoresceïn is *eosin*, $\text{C}_{20}\text{H}_6\text{O}_6\text{Br}_2\text{K}_2$, with a magnificent red and yellow fluorescence. These fluorescences disappear on the fibre, but eosin and analogous substances impart very brilliant flesh-tints to silk and wool.

THE QUINONE DERIVATIVES. These contain the characteristic nucleus—

and are almost invariably colored, although they become suitable for dyes only when they also contain several hydroxyl groups. By far the most important substance of this class is alizarin (q.v.), which was already mentioned as identical with the active principle of madder. Anthracene (q.v.), a coal-tar hydrocarbon, is converted into anthraquinone by heating with potassium bichromate and sulphuric acid; the anthraquinone is acted upon by fuming sulphuric

acid, and the resulting compound is melted with caustic soda, yielding a sodium salt of alizarin. This is soluble in water with a fine red color, but does not fasten upon any kind of fibre. If, however, cotton is previously impregnated with salts of aluminum, iron, or chromium, the alizarin will form insoluble salts ('lakes') with these metals; and as the precipitation occurs within the pores of the fibre, subsequent washing cannot remove it. Colors of this class of dyes are not suitable for silk and wool, but are very intense and permanent when properly applied to cotton.

THE DIPHENYL-AMINE DERIVATIVES. These include many varieties of dyes, such as the indulins, indophenols, thiagins, etc. Their chemistry is too involved to be disposed of in a few words. It may, however, be mentioned that their characteristic groups are similar to anthraquinone, excepting that the oxygen of the latter is replaced by sulphur, imido-groups, etc. The more important dyes of this class include 'methylene blue' and 'aniline black.'

INDIGO DYES. By far the most important of these is indigo itself, a vegetable dye obtained from a tropical plant cultivated in India since the earliest times. The sap of this plant, when fermented under conditions excluding oxygen, yields *indigo white*, a soluble material having the formula $C_{16}H_{12}N_2O_2$; if the fermentation proceeds in the open air, *indigo blue*, $C_{16}H_{10}N_2O_2$, is produced. This substance is a derivative of the base called indol, C_8H_7N , which occurs ready-formed, in small quantities, in many animal and vegetable secretions. It can be prepared artificially from aniline and chloraldehyde. When indigo was found to consist of two indol molecules joined together and oxidized, the clue for the production of artificial indigo was at hand. It has since been found that any benzene derivative having a nitrogenous group and a two-carbon group in the 'ortho' position may give rise to the formation of indigo. The first practical method, devised by Baeyer in 1880, involved the action of potassium hydroxide on ortho-nitropropionic acid; but many other methods have been devised since then, such as the action of melted potassium hydroxide on bromacetanilid, the action of halogenated acetone on aniline, etc. Indigo is one of the most reliable dyestuffs, both as to brilliancy and permanency, and there is little difference in these respects between the natural and artificial products. The finished compound can, however, only be applied after reduction to the soluble indigo-white, and this makes its use in dyeing and printing somewhat cumbersome. In some of the methods for preparing artificial indigo, the fibre can be impregnated with one ingredient and the other applied either in the dye-vat or from the printing-rolls; consequently, indigo can be and is often directly prepared in the quantities and in the places in which it is needed. See **INDIGO**.

LIST OF COLORS. The following are some of the best known commercial coal-tar colors, their molecular formulas, and the principal methods employed in their manufacture.

Aldehyde Green.—See Aniline Green below.

Aniline Black, $C_{20}H_{12}N_3$, made by the oxidation of aniline with mineral salts.

Aniline Blue (triphenyl-rosaniline hydrochloride), $C_{24}H_{18}N_3Cl$, made by heating rosaniline, benzoic acid, and aniline, and subsequently adding hydrochloric acid.

Aniline Brown, Bismarck Brown, or Phenylene Brown (triamido-azobenzene), $C_{12}H_{13}N_3$, made by the action of nitrous acid on metaphenylenediamine.

Aniline Green, or Aldehyde Green, $C_{22}H_{27}N_3S_2O$, made by the action of ordinary aldehyde on an acid solution of rosaniline sulphate and the subsequent addition of sodium hyposulphite.

Aniline Orange.—This name is applied to various compounds made by the action of amidosulphonic acids on phenols. The name is often applied to the so-called Victoria Orange, $C_7H_6N_2O_3$.

Aniline Red.—See Fuchsin below.

Aniline Scarlet, $C_{18}H_{15}N_2O_4SSa$, made by the action of diazoxylene on naphthosulphonic acid.

Aniline Violet.—See Mauvein below.

Aniline Yellow (hydrochloride), $C_{12}H_{12}N_3Cl$, made by the action of nitrous acid on an excess of aniline.

Alizarin, $C_{14}H_8O_4$, made artificially by successive treatments of anthracene with chromic acid and fuming sulphuric acid, and melting the product with potassium hydroxide. Among the dyes allied to alizarin are: *Alizarin Black*, $C_{10}H_6O_4.NaHSO_3$; *Alizarin Blue*, $C_{17}H_6NO_4$; *Alizarin Orange*, $C_{14}H_7NO_6$; and *Alizarin Violet*, or Gallein, $C_{20}H_{10}O_7$.

Auramin (hydrochloride), $C_{17}H_{24}N_3OCl$, made by the successive action of phosgene gas (carbon oxychloride) and ammonia upon dimethylaniline.

Aurantia (ammonium salt of hexanitro-diphenylamine), $C_{12}H_6N_7O_{12}.NH_4$, made by the action of nitric acid on methyl-diphenylamine.

Aurin, $C_{19}H_{14}O_3$, made by the action of oxalic and sulphuric acids on phenol.

Benzaldehyde Green.—See Malachite Green below.

Benzidine Red.—See Congo Red below.

Benzopurpurins, dyes of various scarlet shades. They are chemically allied to Congo Red (which see below), and are made by treating salts of toluidine (which is made from nitrotoluene, and is analogous to benzidine) with nitrous acid, and combining the resulting salts with α - and β -naphthylamine sulphonic acids.

Bismarck Brown.—See Aniline Brown above.

Blackley Blue.—See Indulin below.

Bordeaux.—See Ponceaux below.

Chrysoïdin (hydrochloride), $C_{12}H_{15}N_4Cl$, made by the action of diazo-benzene chloride on metaphenylenediamine in aqueous solution.

Congo Red, or Benzidine Red, $C_{22}H_{22}N_6S_2O_6Na_2$, made by the action of nitrous acid and then of sodium naphthionate on benzidine hydrochloride.

Eosin, $C_{20}H_6O_5Br_4K_2$, or $C_{20}H_6O_5Br_4Na_2$, made by the action of bromine on fluoresceïn.

Erythrosin, $C_{20}H_6O_5I_4Na_2$, made by the action of iodine on fluoresceïn.

Fluoresceïn, $C_{20}H_{12}O_5$, made by the action of phthalic acid anhydride on resorcin.

Fuchsin, Rosaniline Hydrochloride, Magenta, or Aniline Red, $C_{20}H_{20}N_3Cl$, made by the oxidation of toluidine and aniline in the presence of acids.

Gallein.—See Alizarin above.

Helianthin.—See Methyl Orange below.

Indigo.—See text of the article above.

Indulin, or Blackley Blue, $C_{11}H_{15}N_3$, made by heating aniline salts with amidoazobenzene.

Magenta.—See Fuchsin above.

Malachite Green, Benzaldehyde Green, or Victoria Green, $3C_{23}H_{25}N_2Cl_2 \cdot 2ZnCl_2 + H_2O$, made by the condensation of benzaldehyde with dimethylaniline, and the subsequent addition of hydrochloric acid and zinc chloride.

Martius's Yellow, $C_{10}H_7N_2O_3SNa$, made by the action of nitric acid on α -naphthol-monosulphonic acid.

Mauveïn (hydrochloride), or Aniline Violet, $C_{27}H_{25}N_4Cl$, made by the action of chromic acid on aniline containing some toluidine.

Methyl Orange, $C_{13}H_{12}N_2SO_3Na$, made by the successive action of nitrous acid and methyl-aniline upon para-amidobenzene-sulphonic acid; it is the sodium salt of helianthin.

Methyl Violet, $C_{23}H_{23}N_3Cl$, made by oxidizing dimethyl-aniline with metallic salts.

Methylene Blue, $C_{16}H_{18}N_3SCl$, made by heating amido-dimethylaniline with sulphide of iron.

Naphthol Yellow, $C_{10}H_6N_2O_3SK$, made by the action of nitric acid on α -naphthol-trisulphonic acid.

Nigrosin, $C_{15}H_{15}N_3$, made by heating aniline salts with nitrobenzene.

Night Blue, $C_{28}H_{31}N_3O$ (the hydrochloride of this is the commercial dye), made by heating pararosaniline with aniline and benzoic acid.

Pararosaniline (chloride), $C_{13}H_{13}N_3Cl$, made by oxidizing a mixture of para-toluidine and aniline with arsenic acid, or nitrobenzene.

Phenylene Brown. See Aniline Brown above. *Ponceaux*, or *Bordeaux*.—Various derivatives of azonaphthalene. "Ponceau 3R," $C_{10}H_{16}N_2O_7S_2Na_2$, is made by combining diazo-eumene chloride with β -naphthol-disulphonic acid.

Primulin, $C_{11}H_{12}N_2S(?)$, made by the action of sulphuric acid on thiotoluidine.

Resorcin Yellow, or *Tropæolin*, O, $C_{12}H_{10}N_2O_5S$, made by the action of diazobenzene-sulphonic acid on resorcin.

Rhodamine (hydrochloride), $C_{28}H_{31}N_2O_3Cl$, made by the action of phosphorus trichloride on fluoresceïn, and treatment of the product with diethylamine.

Roccellin, $C_{20}H_{13}N_2O_4SNa$, made by the action of β -naphthol on the diazo-compound of naphthionic acid.

Rosaniline.—See Fuchsïn above.

Rose Bengale, $C_{20}H_7Cl_2I_2O_5K_2$, made by the successive action of chlorine and iodine upon fluoresceïn.

Rosolic Acid, $C_{20}H_{10}O_3$, closely allied to aurin; neither aurin nor rosolic acid is specially valuable.

Safranin, $C_{21}H_{21}N_4Cl$, made by the oxidation of a mixture of toluylene-diamine and aniline or toluidine.

Tropæolin.—This name is applied to various compounds made by the successive action of nitrous acid and phenols upon amidobenzene sulphonic acids. See Resorcin Yellow above.

Uranin, $C_9H_{10}O_5Na_2$, the sodium salt of fluoresceïn (which see above).

Victoria Green.—See Malachite Green above.

Victoria Orange.—See Aniline Orange above.

The most important dyestuffs will be found described in some detail under their special names. See also DYEING; TEXTILE PRINTING.

COALVILLE. A town of Leicestershire, England, 16 miles northwest of Leicester, in the midst of a coal district. Population, in 1901, 15,300.

COALVILLE. A city and the county-seat of Summit County, Utah, 40 miles southeast of Ogden; on the Union Pacific Railroad (Map: Utah, B I). It is in a coal-mining region. Population, in 1890, 1166; 1900, 808.

COAN, kō'an, Trus (1801-82). An American missionary, born in Connecticut. He was ordained as a Congregational minister in 1833, and in that year made a trip of exploration to Patagonia, where he wished to establish a mission. Circumstances were unfavorable, and he returned, but soon afterwards went to the Hawaiian Islands, and for forty-seven years was stationed as a missionary at Hilo. Besides his work as a missionary, Dr. Coan published many valuable papers on the volcanoes of Hawaii, and two books entitled *Adventures in Patagonia* (1880) and *Life in Hawaii* (1881).

COANZA, kō-än'zä. See KUANZA.

COASTAL PLAIN. In physiography, the name given to a portion of the North American Continent bordering the Atlantic Ocean and the Gulf of Mexico. From New York to Georgia the Coastal Plain includes the strip of low-lying lands that is limited on the east by the Atlantic and on the west by the first foot-hills of the Appalachian Mountain system. In northern Alabama the Coastal Plain passes around the southern limit of the Appalachians, after which it widens out and reaches northward as far as the Ohio River. West of the Mississippi River it extends with decreasing width southwestward into Mexico. The peculiar features of the Coastal Plain are its low elevation and the predominance of stratified rock-formations of recent geological age. On the outer border the surface is flat and raised but little above sea-level; toward the interior there is an increasing diversity of relief owing to the higher elevation and the extensive erosion by streams. The western limit of the plain, where the horizontal strata give way to the upturned and eroded rocks of the Appalachians, is marked by a sharp slope and by numerous cataracts. Geologically the Coastal Plain consists of Cretaceous, Tertiary, and Quaternary beds, which still retain the relative positions they acquired during deposition, although they have since been elevated above sea-level. Consult Mill, *The International Geography* (New York, 1900). See AMERICA; UNITED STATES.

COAST AND GEODETIC SURVEY, UNITED STATES. A bureau of the Treasury Department which has for its object, first, the survey of the coasts of the United States, principally for the benefit of commerce; and, second, the task of determining the magnetic elements, exact elevations, and geographical positions of the interior. The origin of the survey dates from recommendations made by President Jefferson in 1807 in his message to Congress. As the result of these recommendations an act of Congress, approved February 10, 1807, authorized a survey of the coast of the United States and appropriated \$50,000 to pay for beginning the work. On March 25, 1807, a circular letter from the Secretary of the Treasury requested plans for the execution of the work. Nothing was immediately done beyond the consideration of these plans, and no further action was taken until April 16, 1811, when F. R. Hassler (q.v.), whose plans had been approved by President Jefferson, was sent to Europe to procure the necessary instruments. Mr. Hassler's proposed plan, briefly stated, was to determine the positions of certain prominent points of the coast by astronomical observations and to connect these points by trigonometrical lines from which to make a geodetic survey. Mr. Hassler sailed for Europe on August 29, 1811, and owing largely to the war between England and the United States which intervened, he spent four years in England and on the Continent, returning to the United States with his outfit complete on October 16, 1815. Field work was actually begun on August 6, 1816, under the direction of Mr. Hassler as superintendent. From this time until April 14, 1818, operations were continued in the vicinity of New York City. A base line was measured in the valley of English Creek, May 7, 1817, and one of verification, twice measured, was completed on December 6 of the same year. The triangulation connecting these measured lines represents the nucleus of the work of the Coast Survey and embodies its first tangible results. The trigonometric work now spans the country from the Atlantic to the Pacific and from Maine to Mobile; it covers the entire coast and promises ultimately through the cooperation of Canada and Mexico to encompass the continent from Acapulco to the Arctic Ocean. On April 14, 1818, it was enacted by Congress that so much of the law relating to the survey of the coast as authorized the employment of other persons than those belonging to the army and navy be repealed. Between 1818 and 1832 little work was done. The instruments, records, and funds were transferred to the War Department, and the Coast Survey may therefore be considered as in army service during this period.

In 1823, 1824, and 1825 efforts were made by the Navy Department to establish a hydrographic corps, but public sentiment favored a return to the ideas of Jefferson. Bills were introduced in Congress in 1828 and in 1831, and one was finally passed, on July 10, 1832, carrying into effect the original law of 1807. On August 9 of the same year Mr. Hassler was again appointed superintendent. Field work was resumed in April, 1833. Less than a year later, March 12, 1834, the administration of the Survey was transferred from the Treasury Department to the Navy Department. Mr. Hassler, however, remaining in charge. These conditions

held for two years, when a transfer was effected on March 25, 1836, and the Treasury Department again assumed control. Operations continued without interruption until March 30, 1843, when a Board of Reorganization was convened with Mr. Hassler as chairman. The plan submitted by this board practically continued in force the plans which had been formulated and acted upon in former years by Mr. Hassler. The scientific organization of the Survey may, therefore, be properly said to date from 1832. The minor details of the organization have been changed at various times so that the present is in part the result of a gradual evolution. Mr. Hassler died on November 20, 1843, having held the office of superintendent twice, from August 3, 1816, to April 14, 1818, and from August 9, 1832, to November 20, 1843. During his incumbency of office the original triangulation in the vicinity of New York City was extended eastward to Point Judith, Rhode Island, and southward to Cape Henlopen, Delaware. Altogether the area included in this triangulation amounted to 9000 square miles, and determined the positions of about 1200 stations to be used in the delineation of about 1600 miles of shore line. Mr. Hassler was succeeded by Prof. A. D. Bache (q.v.), who became superintendent on December 12, 1843. Professor Bache extended the triangulation along the South Atlantic Coast and among the Florida Keys. He also instituted regular and systematic observations of the tides and the Gulf Stream and investigated magnetic forces and directions.

The Civil War practically stopped the survey, although many of its officers were assigned to service on Federal war vessels, where their knowledge of the coast waters proved of great service in the various naval operations which were conducted by the Northern fleets. In 1867 Professor Bache died and was succeeded by Prof. Benjamin Pierce, of Harvard University, who served until February 17, 1874. Since then the successive heads of the Survey have been: Carlisle Patterson, who served until his death in 1881; Prof. Julius E. Hilgard, who resigned in 1885; Frank M. Thorn, who resigned in 1889; Prof. T. C. Mendenhall, who resigned in 1894 to become president of Worcester Polytechnic Institute; Gen. W. W. Duffield, who resigned in 1898; Prof. Henry S. Pritchett, who resigned in 1900 to become president of Massachusetts Institute of Technology, and O. H. Tittman, who was appointed superintendent in 1901.

Turning now to the present organization of the Survey, the original and the principal purpose of the organization is a survey of the coasts of the United States primarily for the benefit of commerce. It is charged with the duty of publishing all results of such a survey that may be useful to the public. There has been added to its original duty, by legislation, that of determining the magnetic elements, exact elevations, and geographical positions of the interior. In 1878 the name of the organization was changed by Congress from Coast Survey to Coast and Geodetic Survey, in recognition of the extension of its functions to include triangulations in the interior.

The Coast and Geodetic Survey is a bureau of the Treasury Department; the head of the bureau, known as the superintendent, reports to the Secretary of the Treasury. The superintendent is charged with full responsibility in

every respect for all the work of the bureau. He is aided in such of his duties as cannot be delegated to officers of lower rank by an assistant superintendent, who acts as superintendent in his absence. Eight officers or groups of officers report directly to the superintendent and assistant superintendent, viz.: (1) The assistant in charge of the office; (2) the inspector of hydrography and topography; (3) the inspector of geodetic work; (4) the inspector of magnetic work; (5) the disbursing officer; (6) the editor; (7) the chiefs of field parties; (8) the heads of sub-offices. The first four of these officers have a general supervision over all the operations of the Survey both in the field and office, each acting as an advisory officer to the superintendent in regard to specified portions of the work. The functions of the fifth and sixth officers are stated fully further on. The officers in groups seven and eight have direct charge of all operations in the field. Each field party is a temporary organization which is created for a specific operation by an order of the superintendent, which makes one of the officers of the field force the chief of party, and, if necessary, assigns to him as subordinates one or more other officers from the same force. The party is disbanded when the work assigned to it has been completed. If the party is for duty on land the remainder of the organization of the party, the hiring of recorders, laborers, drivers, etc., is left entirely to the chief of party. If the party is for duty on a vessel, the assignment of an officer of the field force to command the vessel carries with it, necessarily, the command of the whole force on board the vessel, including watch and deck officers as well as crew. There were, in 1901, 60 officers on the field force. These officers are subject to office duty between field seasons. The Survey has its own fleet of 12 steamers and 6 sailing vessels, aside from launches and other small crafts. There are at present three sub-offices, each in charge of a field officer reporting directly to the superintendent, viz.: at Seattle, Wash.; San Francisco, Cal.; and Manila, P. I. The purpose of these sub-offices is to aid in the prompt dissemination of information, to serve as storage depots, and to save traveling expenses by providing points at which field officers may be temporarily assigned to office duty between the seasons. At the Manila sub-office the publication of preliminary charts is authorized.

The inspector of hydrography and topography, reporting directly to the superintendent, has a general supervision over the classes of field work indicated in his title, places before the superintendent plans for such work, makes the necessary inspection in the field to insure that the superintendent's orders are carried out economically and effectively, and is especially charged with the supervision of all matters relating to the ships and their personnel. *The Coast Pilot*, a publication giving full description of the coast from the mariner's point of view, sailing directions, warnings as to dangers to navigation, and other information of special value to navigators, is prepared under his direction. The inspector of geodetic work, reporting to the superintendent, is charged with the duty of preparing plans for the field operations of triangulation, astronomical determinations and precise leveling, and of making inspections of parties in the field, and of records and correspondence received at the of-

fice from field parties, with a view of insuring that the field operations are in accordance with the superintendent's orders, are of the desired degree of accuracy, and are efficient and economical.

The inspector of magnetic work, reporting to the superintendent, is charged with similar duties in regard to the magnetic work of the Survey. The assistant in charge of the office, reporting to the superintendent, has charge of the office at Washington, is responsible for the safety and arrangement of archives and property, and receives all money paid to the Survey for charts and other publications. As the official head of the office, the chiefs of the following divisions of the office force report to him: Computing division, magnetic division, tidal division, drawing and engraving division, chart division, library and archives division, and instrument division. Each of these divisions, under the direction of the assistant in charge of the office, prepares replies for the superintendent's signature to such parts of the correspondence as fall within its particular field, and also furnishes such information and equipment to field parties as it is within their power to furnish. In the computing division, all computations in connection with triangulation, astronomical determinations, and precise leveling are made, appropriate registers of results are kept, and the results prepared for publication as rapidly as possible. The magnetic division and the tidal division deal similarly with the computations and publication of magnetic and tidal results, respectively.

The drawing and engraving division is divided into five sections: (1) the photographing section, engaged in reducing, enlarging, and reproducing drawings for various purposes; (2) the drawing section, engaged in making from the original topographical and hydrographical field sheets, the office drawings, which are the original from which charts are produced, either by engraving on copper or by photolithography; (3) the engraving section, engaged in copper-plate engraving; (4) the electrotype section, engaged in producing, from the original engraved copper plates by electrotype process, the copper plates actually used in printing the charts; (5) the printing section, engaged in printing charts from the copper plates (the lithograph printing is done by contract outside of the organization). The chart division is divided into two sections. The hydrographic section is engaged in completing unfinished hydrographic sheets sent in from the field, corrections of charts especially with reference to aid to navigation (lights, buoys, etc.), preparation of *Monthly Notices to Mariners* in regard to this matter, and the inspection of charts in their various stages of preparation. The chart section is engaged in applying such hand corrections to charts at the last opportunity before issuing, as have become necessary on account of such changes, principally in the aids to navigation, as have taken place after the chart was printed; and with the clerical work connected with the issue and sale of charts. The library and archives division has charge of the library of the Survey and the archives in which all hydrographic and topographic sheets and all the original records and computations are stored.

The instrument division has charge of all the instruments and general property. Many of the best of the new instruments for the Survey are made in this division and it is continually en-

gaged in the repairing and remodeling necessary to keep the instrumental outfit at a high standard of efficiency. The accounting division, at the head of which is the disbursing officer, is not a division of the office in the sense of reporting to the assistant in charge of the office. This disbursing officer makes all disbursements on account of the Survey, with the approval of the superintendent, renders a quarterly account of all such disbursements to the first auditor of the Treasury Department for auditing by him, renders a statement of expenditures and balances to the superintendent whenever required to do so, suspends returns for correction or disallows all items of expenditure irregular in form or in contravention of law or regulations, and refers to the first comptroller of the Treasury, for decision, all apparently excessive or unnecessary charges. The editor, reporting to the superintendent, compiles the administrative part of the annual report and acts as editor in connection with all other publications of the Survey except the charts.

COAST ARTILLERY, or FORTRESS ARTILLERY. Under this head are included the heavier guns and mortars, which are used for the armament of permanent works, usually on the sea-coast, and which are mounted on carriages not intended for transporting the guns, but only as supports from which they are to be fired. These carriages are designed so that the guns may be pointed in any direction at various angles of elevation and depression. They are classified as barbette, casemate, and flank defense, according to their use, and into front pintle (the pintle being the pivot or bearing containing the axis of rotation) and centre pintle according to the manner of traversing. Barbette carriages are intended to be fired over an open parapet, and are of two forms—fixed and disappearing. Disappearing carriages are hidden behind the parapet except when firing. They are of two classes—disappearing carriages proper and the gun-lift carriages. Casemate carriages are those mounted in a covered emplacement and fired through an embrasure (q.v.).

The modern seacoast cannon in the United States service are the 8, 10, and 12-inch breech-loading rifles and the 12-inch breech-loading mortar. In addition there is a 12 cm. (4.7 inch) rapid-fire gun, using a projectile weighing 45 pounds propelled by smokeless powder. The 8-inch rifle weighs 32,480 pounds and fires a 300-pound projectile with a charge of 125 pounds of powder. The 10-inch rifle weighs 67,200 pounds and fires a 575-pound projectile with 250 pounds of powder. The 12-inch rifle weighs 128,719 pounds and fires a 1000-pound projectile with 487 pounds of powder. These guns are mounted on barbette carriages. The barbette carriages are non-disappearing and disappearing. The 12-inch breech-loading rifled mortar weighs 29,000 pounds and fires a 1000-pound projectile with 105 pounds of powder. The illustration shows in detail a typical gun and mortar for coast defense as used in the United States service. Other illustrations, including one of a United States disappearing gun, will be found in the article ORDNANCE.

The 16-inch breech-loading rifle of the United States system is one of the largest guns ever constructed. The Italian 17.7-inch, the French 16.5-inch, and the Armstrong 16.25-inch guns,

do not compare in point of energy and range with the recent American gun. With smokeless powder the gun requires a charge of 576 pounds (of the old black powder 1176 pounds would be needed) and fires a projectile 5 feet 4 inches long, weighing 2400 pounds, with a muzzle velocity of 2300 feet per second, developing a muzzle energy of 88,000 foot-tons, which gives a penetration of 42.3 inches of steel at the muzzle. These figures will be considerably increased when a suitable slow-burning powder is secured, but even now the gun shows an enormous superiority to any of the large guns mentioned above. The Italian gun, for instance, with a projectile weighing 2000 pounds and a muzzle velocity of 1700 foot-seconds (feet per second), develops only 40,000 foot-tons muzzle energy, not half that of the American gun. The French gun projectile weighs 1700 pounds, and with 1700 foot-seconds muzzle velocity, develops a maximum muzzle energy of only 36,000 foot-tons, while the English gun projectile of 1800 pounds, with a muzzle velocity of 2100 foot-seconds, gives a muzzle energy of 51,000 foot-tons. It is seen, therefore, that the maximum energy of the Italian gun is 45 per cent., that of the French gun 41 per cent., and that of the English gun 65 per cent. that of the United States gun. The maximum range of this enormous gun is 20.978 miles, the projectile reaching a height of 30,516 feet in this flight. The total length of the gun is 49 feet 2.9 inches; its weight about 130 tons.

England uses both breech and muzzle-loading cannon in her coast defense. Her largest guns are the four 100-ton guns at Malta and Gibraltar. Probably the most powerful gun in the English system is the wire-wound 12-inch breech-loading rifle, Mark VIII., which is 37 feet 1 inch long, weighs 46 tons, and fires an 850-pound projectile, with a muzzle velocity of 2367 foot-seconds. The coast artillery guns are the rifled muzzle-loading 64-pounders, 80-pounders, 7, 9, 10, 10.4, 11, 12, 12.5, 16, and 17.72 inch guns. The breech-loading, 4, 5, 6, 8, 9.2, 10, 13.5 inch and 32-pounder smooth bore. In all, England has 920 guns of various types mounted in her seacoast forts.

Coast defense in France is intrusted to 17 batteries, each including 4 officers, 129 men, and 4 horses, four of which are at the different rendezvous for the fleet. The guns actually mounted along the coast are of about 12 types, varying from a 58-ton, 34-cm. (13.8 inches) gun, firing a projectile of 924 pounds with a 440-pound charge of powder, giving a muzzle velocity of 2450 foot-seconds, to the 8-ton, 19-cm. (7.48) gun, firing a projectile weighing 165 pounds, with a 35-pound charge of powder, and giving a muzzle velocity of 1410 foot-seconds.

Italy's fortress artillery has various arms, from 45-cm. guns (18.1-inch) weighing 101 tons and firing a 2200-pound projectile, formerly supposed to be the most powerful gun in the world, down to Nordenfeldts and double-barreled mitrailleurs. In Belgium there are two brigades of fortress artillery having 58 active and 12 other batteries. The fortress artillery in Russia has a variety of guns, which include the following: 4.2-inch steel guns, 6-inch, 8-inch, 14-inch, 11-inch, 10-inch, the 10-barreled Gatling, and the 8-barreled Maxim automatic machine gun.

A description of the various guns and mortars

1. EIGHT INCH BREECH-LOADING RIFLE ON BARBETTE CARRIAGE.
2. END VIEW OF CARRIAGE.
3. TWELVE INCH BREECH-LOADING RIFLED MORTAR ON SPRING RETURN CARRIAGE.

used in the United States will be found in a publication of the War Department, *Modern Guns and Mortars* (Washington, 1895), which was prepared for the instruction of artillery gunners. Consult, also, Bruff, *Ordnance and Gunnery* (New York, 1900), and *Drill Regulations for Coast Artillery United States Army*, which are published from time to time by the War Department.

The construction of coast artillery and other cannon, together with their carriages or mounts, is described and illustrated under **ORDNANCE**, which should be read in connection with this article, while the historical development of coast artillery as well as of cannon of all forms is discussed under **ARTILLERY**. The use of coast artillery as a means of defense is treated under the title **COAST DEFENSE**, where the tactics of coast artillery are described. The forts and other defenses in which coast guns are mounted are discussed in the article **FORTIFICATION**.

COAST DEFENSE. The defense of a sea-coast involves the principles of both strategy and tactics. In considering the principles of strategy applicable to coast fortification it is essential to take into account the navy as our first line of defense. Every nation possessing a coast line has commercial interests, to protect which she requires a navy. Her fleet, whatever its strength, will require points of support on the home coast, to serve as a basis of operation in attack or defense. These points of support contain all the material necessary for building or equipping ships; they furnish all the needed men and supplies to the navy, and must offer for a beaten fleet, or one which on the outbreak of war has not yet completed its equipment, a safe harbor to repair damages or complete equipment. The material of a navy is very expensive and is difficult or impossible to secure after war has begun; consequently, the greater part must be prepared in time of peace and collected at the points of support, for which purpose extensive depots, magazines, and other constructions must be erected. To prevent all these constructions from being demolished at one blow, and to guard the fleet, while still taking in supplies or completing its equipment, against surprise, these points of support must be protected by suitable means, and this is the purpose of fortifications.

The only points of a coast that fulfill the conditions imposed by these considerations are the larger harbors (always bays and mouths of rivers), and they must be fortified not only against attack by sea, but also against land attack, for the late war between Japan and China showed conclusively that important naval ports (Port Arthur and Wei-hai-wei, for example) may be taken by forces landed on the coast without risking an attack on them by sea.

In applying the principles of land tactics to the selection of sites for, and the construction of, sea-coast forts, some modifications must be introduced, due to the fact that the enemy in the latter case is confined to the navigable channels, so that all his possible flanking attempts can be foreseen and provided against. The principles of tactics which find application here are: (1) To obstruct the enemy's advance, while leaving free that of the forces of the defense for offensive movements; in other words, so to obstruct the water approaches against the enemy as to leave free entrance and exit for the defending fleet. (2) To

be superior to the enemy at the point of attack; that is, to bring to bear on the channels of approach a heavier fire of high-power guns and howitzers and mortars than any fleet able to operate there can bring to bear on the defenses. (3) To place the isolated units for most effective action so as to be mutually supporting; this is accomplished by scattering the forts to prevent the enemy from concentrating his fire, at the same time arranging them so that fire can be concentrated on him. (4) To protect well the flanks of the position and compel the enemy, if he attacks at all, to make a direct frontal attack. This is done by closing all unnecessary channels, by protecting the obstructions by means of rapid-firing guns and the operators by means of bombproofs, and at night by illuminating the obstructed field with search-lights. (5) To provide means for offensive returns against countermine operations, either by means of a swarm of torpedo-boats, or by batteries for operating movable torpedoes from the shore.

There are two systems of guns in use in coast artillery: the flat trajectory, high-power guns, designed to pierce the side armor of battle-ships, and the high angle pieces (howitzers or mortars) whose projectiles are designed to fall on the decks. Both are necessary, and each has its proper sphere of action, the former having by far the greater accuracy, and the latter attacking the battle-ship at its weakest point. In Europe howitzers are generally preferred; but the recent tests of mortars near Portland, Maine, have proved the greater value of the latter. The calibre of the fort guns must be at least equal to that which the depth of water in the channel will enable the enemy to bring against the defenses and sufficient to pierce his armor at the outer mine field, or at about two-mile range. The greatest thickness of Kruppized steel used in the latest battle-ships is about 12 inches at the belt, and to penetrate this at the required range will require a 10-inch gun. The average thickness of deck armor most in use at present is about 3 inches of hardened nickel steel, and to penetrate this a high-angle gun (howitzer or mortar) 12 inches in calibre will be required. These, then, are the maximum calibres required against battle-ships, but to prevent distant bombardment of cities, etc., there is a 12-inch rifle and for close ranges also an 8-inch rifle. Armored cruisers have from 5 to 6 inches of hardened nickel-steel armor, and to penetrate their armor within the mine field (where they first come seriously into play) will require a 5-inch or 6-inch rapid-fire gun. The smaller vessels have but little armor protection, but as they come into action at the outer mine field (about 3330 yards) the smaller calibre guns to fight them must have the necessary penetration at that range, consequently must be about 2.5 to 3 inches in calibre.

The number of guns of each calibre should be at least half of, and preferably equal to, those the enemy can bring to bear. The latter is determined by noting on the map the length of channel (within three miles of the fort considered) which the enemy's fleet can occupy, and allowing from five to ten ships to the mile. From the depth of channel the ships of the enemy which can go there can be determined, and from their armor and armament the kind and number of guns required. If the enemy's armament is not known, then in deep channels from 30 to 60 guns of 6-inch calibre and over must be allowed to the mile (Abbot).

The outer mine line is derived by the intersection of the curves representing the limit of armor-piercing ranges of the guns on either side of the entrance, so that these torpedoes are under the effective fire of all the guns in the harbor; the inner line is usually at the narrowest part of the entrance.

The battle tactics of coast defense comprise defense against blockade, bombardment, and attack by sea.

DEFENSE AGAINST BLOCKADE.

The object of a blockade is the isolation of the port concerned in order to close all commercial communication by way of the sea, and presupposes the defeat of the enemy's fleet, which may also be shut up in the port. The observation of the movements of a daring enemy thus shut in is one of the most difficult problems which fleets have to encounter, and history shows that it is almost impossible. "For example, in 1759, the French fleet succeeded in breaking through the blockade of Dunkirk without being observed by the English fleet consisting of 66 ships." "In 1805 Nelson was in continuous observation of the harbor of Toulon. In spite of this fact the French fleet succeeded in running out, returning again because of injuries at sea, again leaving the harbor and joining the Spanish fleet, the combined fleets then sailing for the West Indies. Only after their return was Nelson enabled to seize them." The defender will naturally resist the blockade as long as possible and try to fit his fleet for active service again as promptly as he can. His first duty, then, is to keep the blockading fleet as far out as possible, and this duty will fall to the coast artillery, which must be constantly prepared, the guns ready for immediate action, the stations and range-finders continually manned, and the search-lights constantly at work. The plentiful use of electric light as a fighting agent is a passive factor, but one of very high value. His next duty is to inflict as much damage as possible on the blockading fleet, and this duty falls to the fleet stationed in the harbor, which must at all times be ready for action, and single torpedo-boats should be sent out under cover of darkness, to attempt the destruction of the enemy's ships. When the defeated fleet is ready for sea again the coast artillery will open a heavy fire on the enemy's ships, and, aided by their own artillery fire, the home fleet will endeavor to break through. This will naturally lead to a purely naval engagement, which need not be further considered here.

DEFENSE AGAINST BOMBARDMENT.

Bombardments aim chiefly at the destruction of the naval establishments of a fort, such as the arsenals, docks, magazines, and ships of the fleet lying in the harbor, but also secondarily at the destruction of cities and establishments other than those purely naval, in order to produce a depressing effect on the people. Bombardments are applicable only under special circumstances and not against every harbor; indeed, the latter must be a true roadstead. But even then the fortifications and armament must be either weak or obsolete. From this fact, and because of the limited supply of ammunition carried by ships, a bombardment will but rarely be justified. If it is attempted, however, the attacking fleet will set aside a small portion of its artillery to attack the coast artillery, reserving the greater part to attack the establishments lying within the harbor.

The defender will attempt to hold the open sea as long as possible with his fleet, but when driven in he will assemble his ships in rear of the outer obstructions, or at least attempt to hold that line with his torpedo-boats. The coast artillery will endeavor to keep the enemy as far as possible from the harbor. The object being to prevent, if possible, a bombardment of the harbor or city, all guns should take part, and when the enemy's fleet approaches the proper range, high-angle fire, with deck-piercing shell, will be used. The gun-boats and coast defenders or monitors of the home fleet can materially assist the coast artillery by the fire of their guns, but they must be protected from the enemy's torpedo-boats by a number of destroyers. As in case of blockade, the guns must be kept constantly manned and ready for action, and at night the search-lights must be constantly at work. Should the enemy be forced to retire, the home fleet must advance to the attack. See BOMBARDMENT.

DEFENSE AGAINST ATTACK BY SEA.

In attacking a hostile coast a fleet may either direct its efforts against a fortified harbor, or attempt to take possession of unfortified coast regions. The problem for the defense, therefore, naturally resolves itself into the defense of fortified places, and the defense of unfortified coast regions. The phases of the attack by sea in the first case are, in order, the removal of the outer obstructions, the reconnaissance, the artillery duel, the removal of the inner obstructions, the forcing of the entrance, and, finally, landings to obtain full possession of the forts. The phases of the defense will correspond.

Before endeavoring to ascertain the position of the guns of the defender, the attacking fleet will seek to destroy outer obstructions, in order to get possession of the outer bay, and, if the opportunity should offer, to force the passage. The torpedoes of the mine fields and the guns of the batteries on shore are complementary means of defense, each inadequate without the other. The obstructions are a passive means, but only become real obstacles when protected by the coast artillery; on the other hand, the latter alone, without the obstructions, cannot prevent the enemy from entering the harbor. The outer mine field is so important that there will be a serious struggle over it, for, once the attacking fleet passes over it, its further work is greatly simplified.

The defender, therefore, must be constantly on the alert, especially at night, when the search-lights are continually in use lighting up the foreground beyond the mines. All approaching ships are fired upon by the artillery, and since the enemy will probably not attempt to remove the mines with any but his smaller vessels, such as torpedo-boats (since the outer mine field is placed intentionally in the field of greatest effect of the guns on shore, both vertical and horizontal), rapid-fire guns should be used, because these small vessels move rapidly, offer but a small target, and their work, by the time their purpose is known on shore, can be done promptly. Moreover, since the attack may be directed on several points of the mine field at the same time, it is best to assign the rapid-fire batteries to particular sectors of the mine field to insure prompt action on all the enemy's vessels. The torpedo-boats of the defense remain close up to the mine fields in order to fight the enemy's torpedo-boats while they are

endeavoring to remove the mines. The counter-attacking torpedo flotilla must be followed by one or two mine-laying ships, for repairing the damaged mine lines.

The attacker's object in reconnaissance is to obtain full and accurate knowledge of the location and power of the defender's guns of all calibres and kinds, the position of the torpedo batteries and mine observation stations, and finally to find out what new gun positions have been erected for the war. The defense, therefore, endeavors to veil all his batteries that cannot be readily seen from the sea, and to still further deceive the enemy he erects a number of small batteries. Batteries with disappearing carriages and mortar batteries have here a great tactical advantage, because they can be readily concealed. While the fleet is reconnoitring, therefore, beyond the outer mines, only such guns of the defense open fire as cannot be concealed, but as the ships come near the mines, and take up the formation in column, the other batteries open fire and with armor-piercing projectiles. Each battery is assigned to a different ship, on which it concentrates its fire, and which it follows until it is sunk or gets beyond armor-piercing range. The coast artillery is assisted in this work by the guns of the ships that may be in the harbor, these vessels moving inside the mine field on lines perpendicular to the enemy's line of advance, making the greatest possible use of their artillery, the torpedo-boats making counter-attacks when possible. The infantry garrison of the fortified place is posted on outpost along the shore, and prevents the enemy from landing reconnoitring parties, or fires on torpedo-boats sent along the shore to reconnoitre. In case the mine obstruction was removed by the enemy before his reconnaissance, the defender's larger vessels cannot take so advanced a position close up to the mine field, and as soon as the attacker approaches the latter the defender must bring all his guns into action.

The object of the artillery attack is to silence all coast forts and batteries commanding the harbor entrance, to put out of action all guns mounted in them, and to destroy all positions flanking the obstructions. It is the preparation for the final assault. The main strength of the defense in this phase of the action will be the coast artillery, and since the enemy, because of his limited supply of ammunition, will probably endeavor to gain the upper hand as rapidly as possible, this artillery will require an energetic, decisive, and rapid service, and should be assisted by the artillery fire of the ships of the defense that may be in the harbor. The targets to be attacked are mainly the large, heavy battle-ships, of which the vital parts are protected by powerful armor. The latter must be destroyed to put the ship out of action, and this is a task set for the heavy guns. The conduct of the coast artillery must be systematic, and hence the command of fortified places is under a fortress commander, under whom are the district commanders, and these again control the group of battery commanders and the search-light stations. The heavier armor of a battle-ship is on her belt, extending above and below the water-line, while the deck is but slightly protected. The large calibre, flat-trajectory guns are used for piercing the heavy side armor, and with the new United States explosive D (or another of equal value, Maximite), and the delay-action fuse of the Ordnance

Department, the destructive effect is expected to be enormous. Howitzer or mortar shells are used for piercing deck armor; rapid-fire guns for firing on unprotected parts and clearing decks and tops.

The naval battle of Santiago clearly illustrated the value of a good artillery, and if such a magnificent action is possible from aboard ship, a far more favorable effect is to be expected from the land. But this battle also shows how dangerous it is to neglect all preparations on the part of the coast artillery, and the Spanish coast artillery must bear a large portion of the blame for the sacrifice of Cervera's fleet. Special attention must be paid to the equipment of the observation stations of the district artillery commanders. Good telescopes and photographs and plans of the enemy's ships must be on hand for immediate use, to enable them to recognize the different ships, and in the group and battery commanders' stations there must be more detailed plans of the ships to determine the projectiles to be used at various ranges. Works are now published giving, in silhouette, the appearance (to the naked eye, at a particular distance) of every important war-ship.

The inner obstructions consist of lines of mines, sea barricades, and occasionally also of a submarine dike. The decisive engagement for the possession of the harbor will be fought at this barrier, for which reason it is protected by numerous rapid-fire and torpedo batteries. The reconnaissance of the inner obstructions, and even their partial removal, may be attempted by the enemy during the artillery duel, hence the defender must make constant use of his search-lights to detect such a move. The assailant will first attempt to destroy the inner obstructions by means of torpedo-boats, then he will try to break them up by artillery fire, and finally he may attempt to land detachments at night to blow them up, or send a drifting mine-destroyer against them. The inner mines are usually within the effective armor-piercing range of the heavy guns, as well as under the fire of the rapid-fire batteries; the former act against the armored ships, the latter against the small and fast torpedo-boats or unarmored vessels.

The forcing of the entrance is the closing act of the assailant's undertaking, and its object is the final occupation of the disputed harbor. At the head of the final assault are torpedo-boats which, acting as a patrol, make a final attempt to break through the obstructions. These, as well as the torpedo flotilla following them, should be greeted with a hail of projectiles from the rapid-fire guns of the shore batteries. All other coast guns and howitzers should be directed against the battle-ships of the attacking fleet, and should fire especially at the leading ship. As the attacking vessels enter the harbor the fire of the coast guns is concentrated more and more against the vessels following. This artillery battle is continued until each fort in succession is taken by the enemy. The home fleet inclosed in the harbor should now attempt to break through the lines at all hazards, and this can best be done at night. Unfortified coast regions are subjected to attack by the enemy's fleet, the purpose being either to support the operations of a land army, or to attack a fortified harbor from the land side.

Military history proves that it is by no means easy to capture a well-defended harbor by the

means at the disposal of a fleet. The success of Farragut in the Civil War appears to contradict this statement, but it must be remembered that the condition of the navy on the one hand, and that of the coast artillery on the other, were at that time more favorable for forcing a harbor than they are to-day. Nevertheless, on many occasions, Farragut himself, while attacking a seacoast, called for assistance from the artillery on the land side. Wars are so short nowadays, and decisive battles are sought so quickly in the interest of the countries concerned, that the cooperation of a strong land army is now deemed essential to support the naval attack; indeed, the land attack will generally be the principal one. This was shown to be the case in the China-Japanese War as well as in the Spanish-American War. The best protection of a seacoast of a country lies in the possession of a powerful navy, but should the latter meet with misfortune the coast must be protected to prevent landings. The defense of the unfortified portions of the coast will be intrusted to a special coast guard corps, strong enough to oppose the enemy at all points with superior forces. To determine what this strength should be, the landing of the Japanese for the purpose of attacking Wei-hai-wei furnishes some useful data. The army of 27,000 men was landed in thirty-six hours, consequently, with the better means available to-day, about 20,000 men can be landed in twenty-four hours, hence a coast defense corps of equal strength should be able to appear at the landing-place in that time, and considering the necessary detachments to be left at various points, it will take about 30,000 men to guard the coast between two fortified forts not over a day's cruise apart.

Consult Abbot, *Defense of the Seacoast of the United States* (New York, 1888); and Wisser, *Tactics of Coast Defense* (Kansas City, 1902). For a description of the ordnance used in modern coast defense, see COAST ARTILLERY and ORDNANCE, the historical side of the subject being treated under ARTILLERY. The article on FORTIFICATION discusses the history and construction of coast defenses, together with the scheme adopted for the defense of the coast of the United States, and should be read in this connection.

COAST GUARD. The coast-guard service of Great Britain was originally established as a means of revenue protection, but was reorganized and transferred to the Admiralty in 1856. It now partakes of the character of a naval reserve, life-saving, and signal service in addition to its duties in connection with the customs. It is under the control of the Admiral Superintendent of Naval Reserves, who has a captain in the navy as his assistant. The coasts of the United Kingdom are divided into nine districts—Hull, Harwich, Newhaven, Weymouth, Holyhead, Leith, Clyde, Limerick, and Kingstown—each presided over by the captain of the coast-guard station ship of the district, which vessels are usually old-type armored rams, though in 1901 two of them were protected cruisers. In addition there were (in 1901) eleven gunboat cruisers of 461 to 810 tons, seven small steam cruisers of 300 to 520 tons, five sailing cruisers (four yawls, one cutter) of 120 to 131 tons, five sailing cruisers (cutters) of 70 tons, and seven sailing cruisers (cutters) of 70 to 60 tons. The districts are subdivided into 81 divisions in charge of inspecting officers consisting at present of 32 commanders, 36 lieutenants, and

the remainder of subordinate coast-guard officers. The divisions are divided into 238 stations, each in charge of a chief officer who is about equal in rank to a warrant officer. The coast between stations is patrolled at all times, day and night, and means of signaling to vessels is kept ready for instant service. The regulations of entry vary from time to time, but the men are all good-conduct men who have completed a long term of service in the navy and are not above a certain age. According to the budget of 1901-02, the number of commissioned officers attached to the coast-guard service is 89, exclusive of officers regularly serving on board the vessels of the navy acting as station ships and gunboats. There are also 238 chief officers of stations and 3873 petty officers and seamen, making a total of 4200 persons.

COASTING. An outdoor winter game, supposedly of Russian origin. The sport consists of sliding down a slippery bank or other inclined grade of snow or ice, by means of a sled. (See TOBOGGANING.) The rider may make the trip either sitting, lying, or kneeling on one knee, each method having its own advantages, but the most general is that of sitting sidewise on the rear of the sled, and steering with one leg, which is trailed behind. Coasters are not supposed to utilize hills which are used for traffic, even supposing such a prohibition is not a matter of local law. For the various kinds of sled used, see SLED.

COASTING TRADE. The commerce carried on by sea between the different ports of the same country. In Great Britain, 'coastwise' is defined to mean 'from any one part of the United Kingdom to any other part thereof.' Vessels engaged in this commerce are subject to different rates and regulations from over-sea traders, and the masters must keep their books showing that their cargoes come strictly within the definition of coasting trade. Formerly, no goods or passengers were allowed to be carried from one port of the United Kingdom to another except in British vessels; but this restriction was repealed in 1854, and the coasting trade in Great Britain is now open to all the world, though the share of foreign nations is inconsiderable. This is seen in the fact that in 1898 the shipping cleared from British ports to other British ports amounted to 30,504,091 tons, but of this only 134,551 was foreign shipping.

Owing to the length of coast, this trade in the United States is far more extensive than in any other country. Of the forty-nine States and Territories (exclusive of Alaska), eighteen border on the Atlantic Ocean and the Gulf of Mexico, and three border on the Pacific Ocean, to which may be added the enormous coast-line of Alaska, Hawaii, and Porto Rico. The extensive commerce of the Great Lakes is also included in the coasting trade. In the time of the early settlements such trading was done in small shallops, sloops, and schooners, and there was very little of it. This trade is restricted to American vessels, and with the growth of the country in population the trade has grown enormously. At the present time many hundreds of steamers and many more hundreds of sailing craft are constantly plying from Maine to Texas, transferring the cotton, sugar, and rice of the South to Northern, and the lumber, grain, and manufactured goods of the North to Southern markets. The swift propeller brings the oranges and strawberries of Florida to Maine, and takes

back the ice of the Penobscot. In summer these coasting steamers do a large share of the passenger as well as trade traffic. The thoroughness of the coast survey, and the introduction of the weather service whereby mariners are duly forewarned of danger, have done much to prevent the disasters which were common not long ago, and even the dreaded Cape Hatteras has lost much of its terror. There are no records of the volume of business which is done in the coasting trade, but the fact that the licensed tonnage in the coasting trade and fisheries grew from 3,160,917 tons in 1860 to 4,338,145 in 1900, coupled with the fact that the tonnage of steam vessels increased from 770,641 tons in 1860 to 2,289,825 tons in 1900, attests its growth. Moreover, the fact that 816,795 tons of American shipping registered in 1900 in the foreign trade were represented by 4,006,114 tons in the statistics of tonnage cleared, gives us by way of comparison some idea of the enormous business which must be done in the coasting trade. The reports of the United States Commission of Navigation contain a wealth of material relating to all shipping questions.

COAST LINE. See SHORE.

COAST PILOT. A pilot licensed to conduct vessels from one part of the coast to another. He is expected to be familiar with all bnoys, beacons, lighthouses, and other aids to navigation along the part of the coast for which he pilots, and to have such a knowledge of the soundings, currents, weather, etc., as to enable him to conduct safely a vessel in thick or bad weather or at night. Upon reaching the entrance to a port the local pilots take charge of the vessel. The term is also applied to a series of volumes published by the United States Coast and Geodetic Survey, which give information in regard to the coast of the United States in great detail.

COAST RANGE. The system of uplifts which extends along the Pacific Coast with interruptions from southern California to the Strait of Juan de Fuca in Washington (Map: California, B 1). The name is also given to the range of mountains that defines the coast line of British Columbia and which is flanked by the Island Range on the west and merges into the Cascades toward the east. The Coast Range of the United States has its beginning in the San Jacinto Range of southern California. Thence the line of elevations is continued in a general northwesterly direction by the Santa Ana, San Bernardino, San Gabriel, and Sierra Madre ranges, and by the San Rafael Range, the last being joined by a spur of the Sierra Nevadas lying to the east. From this point (about latitude 35° N.) northwest to the Bay of San Francisco there are two well-defined ranges, the one known locally as the 'Coast Range' rising abruptly from the shore line, and the other (Monte Diablo) paralleling the coast but lying some fifty miles inland. Both ranges are interrupted by the indented trough of San Francisco Bay.

Throughout northern California the Coast Range is formed by more or less disconnected mountain groups, which near the Oregon boundary diverge to the east and connect with the Cascade Range. Further north, in Oregon and Washington, the uplifts are less marked, the elevations averaging only from 1000 to 3000 feet.

The Olympic Mountains, however, near the Strait of Juan de Fuca in Washington, include several peaks of considerable elevation, the highest being Mount Olympus, with an altitude of 8150 feet. The culminating points of the Coast Range are found in southern California, where are located San Bernardino Mountain, 11,600 feet; San Jacinto Mountain, 10,987; Tehachipi Peak, 9214, and Mount Pinos, 9214. In central and northern California, the extreme elevations are attained in Mount Diablo, 3849 feet, and Inaqua Buttes, 3580 feet. Except in southern California, the Coast Range presents no marked barrier to the drainage of the coastal region. This is due both to the interrupted character of the range and to its low altitude. The principal rivers crossing it are the Chehalis, Columbia, Umpqua, Rogue, Klamath, Eel, Sacramento, and Santa Maria. The Salinas River occupies the valley between the parallel ranges of southern California and flows into the Bay of Monterey. See topography of CALIFORNIA, OREGON, WASHINGTON; and for Coast Range of British Columbia see topography of BRITISH COLUMBIA.

COAST-RANGE TROUT. A local name in California for the rainbow trout (q.v.).

COATBRIDGE, kōt'brīj. A prominent and prosperous town of Lanarkshire, Scotland, nine miles east of Glasgow (Map: Scotland, D 4). The town is in the centre of a mineral district, and contains malleable-iron works, and many other works connected with the iron industry. Owing to the great increase in the iron trade, Coatbridge has grown rapidly in size and prosperity. Population, in 1841, 1599; in 1901, 36,981.

COATESVILLE. A borough in Chester County, Pa., 39 miles west of Philadelphia; on the Pennsylvania and the Philadelphia and Reading railroads. It contains a fine Y. M. C. A. building, and is noted as an industrial centre, the establishments including iron and steel-works, steel-plate mills, boiler-works, brass and iron foundries, silk-mills, etc. Settled about 1800, Coatesville was incorporated in 1867. The government is vested in a burgess, elected every three years, and a borough council chosen on a general ticket. There are municipal water-works. Population, in 1890, 3680; in 1900, 5721.

COATI, kō-ā'tē, or COATI-MONDI. The native Brazilian name of certain tropical raccoons of the genus *Nasua*. They are not unlike the typical raccoons in many of their characteristics, but the body is more elongated. They are from two to three feet long, and are chiefly remarkable for the elongation of the snout, which is a sort of flexible proboscis, and is used in search of food, and in rooting up the earth to obtain worms and insects. They are often domesticated in South America, and are very affectionate, active, troublesome, and amusing. They are arboreal in their habits, and besides insects, eat birds and their eggs. Only two species are known, the Mexican coati (*Nasua narica*) and the Brazilian red coati (*Nasua rufa*). The former is brownish-gray and is found from Panama northward to southern Mexico. The other is reddish-brown and occurs throughout South America east of the Andes. Consult: *Pop. Science Monthly*, vol. ii. (New York, 1872); *American Naturalist*, vol. x. (Boston, 1877); *Proc.*

U. S. National Museum (Washington, 1899). See Plate of MINOR CARNIVORES.

COATICOOK, kô-ät'î-kuk. A town and port of entry in Stanstead County, Quebec, Canada, on the Coaticook River and the Grand Trunk Railway, 120 miles southwest of Quebec (Map: Quebec, E 5). It is a manufacturing and industrial centre and has a United States consulate. Population, in 1891, 3086; in 1901, 2880.

COAT OF ARMS. As understood in heraldry, at the present day, a relic of the ancient armorial insignia which were formerly embroidered upon a coat or vest worn over the armor, to render a knight conspicuous in battle. See HERALDRY.

COAT OF ARMS, NATIONAL. The coats of arms whose use has obtained official sanction by modern national governments represent in most cases the family heraldic insignia of their sovereigns. As such their treatment falls most appropriately under Heraldry. See HERALDRY.

COAT OF MAIL. In the armor of the Middle Ages, a suit made of metal scales or rings, linked one within another. See ARMOR.

COATZACOALCOS, kô-ät'sá-kô-äl'kôs. A port in the State of Vera Cruz, Mexico, on the Gulf of Campeche, at the mouth of the Coatzacoalcos River, 170 miles northeast of Oaxaca (Map: Mexico, M 8). It is the residence of a United States consular agent. The exports consist chiefly of rubber and timber. Population, 3000.

COATZACOALCOS. A river of Mexico rising in the Sierra Madre, flowing most of the distance across the Isthmus of Tehuantepec, and emptying into the Gulf of Mexico (Map: Mexico, M 9). One of the possible routes for a trans-isthmian canal is partly along its course. It has a length of about 150 miles and is navigable for a short distance from its mouth.

COB. OLIVER. A character in Ben Jonson's *Every Man in His Humour*, one of the water-carriers who distributed water in London before the city had its public water-supply.

COBALT (Ger. *Kobalt*; possibly the same as *Kobold*, goblin). A metallic element discovered by Brandt in 1735. The word cobalt is found in the works of Paracelsus and other early writers, and was used to designate minerals that suggested the appearance of metallic ores, but when smelted failed to yield any metal; hence, the name 'cobalt,' signifying *sprite*, was given to such minerals on account of the illusive character of their metallic constituents. It was also applied to certain blue pigments containing cobalt as far back as the times of the Greeks, but it was not until Brandt investigated the blue coloring of smalt that the elementary character of the metal was established. The element is found free only in meteorites, but it usually occurs in nature with arsenic or sulphur, and with nickel and other metals, as *smaltite*, a cobalt diarsenide; as *skutterudite*, a cobalt triarsenide; as *cobaltite*, a cobalt sulpharsenide; as *asbolite*, a wad containing oxide of cobalt; and as the earthy minerals *noumcite* from New Caledonia, and *garnierite* from Oregon. The metal itself may be prepared by igniting the oxalate, when the carbon and oxygen pass off, leaving the cobalt behind.

Cobalt (symbol Co, atomic weight 59) is a

steel-gray lustrous crystalline metal that is nearly white when polished, somewhat malleable, ductile at a red heat, and highly magnetic, with a specific gravity of 8.5 to 8.9. It melts at 1500° C. The metal has no uses by itself, although it forms alloys with copper, iron, and manganese, and it may be deposited on metals by electroplating as a fine, lustrous coating, which is said to be harder, more tenacious, and of greater beauty than that obtained with nickel. Cobalt combines with oxygen to form a monoxide or cobaltous oxide, and a sesquioxide or cobaltic oxide. Its principal commercial salts are pigments. Of these the most important is the *cobalto-cobaltic* oxide, which is a mixture of both oxides, corresponding in character to the magnetic oxide of iron. This is obtained commercially from the ores of cobalt and from *speiss* in the separation of nickel; in the latter case the *speiss* is fused with fluor-spar and chalk so as to yield a richer matt containing less iron; the matt is ground and oxidized by thorough roasting, which also serves to expel arsenic and sulphur; it is then dissolved in hydrochloric acid and diluted with water. From this solution cobalt oxide is precipitated by the addition of bleaching-powder. This oxide is used for the preparation of various salts of cobalt and for making the smalt employed by enamellers and potters for the production of the finest blue glaze on porcelain. When heated with alumina it yields a fine blue pigment which is called variously *cobalt blue*, *cobalt ultramarine*, and *Thénard's blue*; and when heated with zinc oxide it yields the pigment called *cobalt green* or *Rimann's green*. *Smalt* is a permanent blue pigment consisting essentially of cobalt silicate and potash; it is also called *bleu d'azur* and *bleu de saxe*. *Zaffre* is an impure oxide obtained by roasting cobalt ore and mixing with several parts of coarse sand. During 1899, 10,230 pounds of cobalt oxide were mined in the United States, having a value of \$18,512.

COBALTITE. A mineral cobalt sulpharsenide, whose composition is CoAsS. It crystallizes in the isometric system, has a metallic lustre, and is silver-white, tending to red, in color. It occurs in association with other metallic sulphides, especially those of lead and silver, and is found in Sweden, where excellent crystals are known; also in Norway, and at various localities in Silesia, but not in the United States to any extent. It has occasionally been cut as a gem, and then resembles a flesh-colored pyrite. When present in sufficient quantities it is a valuable ore of cobalt.

COBÁN. kô-bän'. The capital of the Department of Alta Verapaz, Guatemala, on the Rio Cojabón, about 90 miles north of the city of Guatemala (Map: Central America, B 3). It is picturesquely situated on the slopes of a hill, and is irregularly built. Its modern buildings are of some merit. The town has minor manufactures, and is the centre of a fertile district producing coffee, cacao, vanilla, and sugar-cane. Population, in 1900, 24,475.

COBB, HENRY IVES (1859—). An American architect. He was born in Brookline, Mass., and was educated at the Massachusetts Institute of Technology and at Harvard, where he graduated in 1880. He has been architect of numerous public buildings, notably in Chicago. Among

these are the Opera House, the Newberry Library, and the Church of the Atonement. In 1893 he was one of the National Board of Architects for the World's Columbian Exposition buildings, and afterwards was retained as special architect by the United States Government.

COBB, HOWELL (1815-68). An American politician. He was born in Jefferson County, Georgia, graduated at Franklin College in 1834, and was admitted to the bar in 1836. From 1837 to 1840 he was Solicitor-General of his State, and from 1843 to 1851 was a member of Congress. In 1849, after a long and bitter contest, he was elected Speaker of the House. He was one of the leaders of the Southern Party in Congress, and favored the extension of slavery into the territory acquired from Mexico. He was chosen Governor of Georgia in 1851, and was again sent to Congress in 1855. He was Secretary of the Treasury in Buchanan's Cabinet, but resigned in 1860 to join the South in the approaching war. He was the president of the congress that drafted and adopted the Confederate Constitution, but antagonism to Jefferson Davis compelled his retirement from the Secession Administration. He was appointed major-general in the Southern Army, but did not take part in any considerable military operations. After the declaration of peace he bitterly opposed the reconstruction policy of the Federal Government.

COBB, SYLVANUS (1799-1866). An American minister of the Universalist Church, born at Norway, Maine. He edited *The Christian Freeman* for twenty years and published *The New Testament, with Explanatory Notes* (1864); *A Compend of Divinity, and Discussions*. He was prominent in anti-slavery and temperance movements. His name is more widely known through the writings of his son SYLVANUS (1823-87), a prolific and very popular writer of tales and sketches of adventure, who published also the *Memoir* accompanying his father's *Autobiography* (Boston, 1867).

COBB, THOMAS REED ROOT (1823-62). An American lawyer and author. He was born at Cherry Hill, Ga., graduated in 1841 at the University of Georgia, and from 1849 to 1857 was a reporter of the State Supreme Court. During a part of the Civil War he served in the Confederate Congress, where for a time he was chairman of the Committee on Military Affairs. He afterwards became a general in the Confederate Army and fell at Fredericksburg. He published *Digest of the Laws of Georgia* (1851); *Inquiry into the Law of Negro Slavery in the United States* (1858); and *Historical Sketch of Slavery, from the Earliest Periods* (1859).

COBBE, KÖB, FRANCES POWER (1822-1904). An English philanthropist and author. She was born in Dublin in 1822, and was the great-granddaughter of Charles Cobbe, Archbishop of Dublin. Though brought up in an atmosphere of evangelical piety and sent to a fashionable boarding-school, which proved to be torture to her vigorous, independent spirit, yet her early study of theological, ethical, and religious subjects finally brought her to the acceptance of the doctrines of theism. In 1857, after a year of travel in Italy, she joined Mary Carpenter at Bristol in conducting schools and reformatories for girls. She contributed articles to *Macmillan's* and other magazines and weeklies, and, be-

ginning in 1867, was for seven years an editorial writer for the *Echo*, a London daily. Later she wrote for the *Standard*. During this period her special subjects were the suffrage and property rights for women, and vivisection. She was long one of the foremost opponents of vivisection in England, and, when the columns of the newspapers were closed to her for the discussion of this subject, she established a monthly periodical for that purpose. Her published works make a long list. They are all characterized by a remarkably fluent and forcible style. Among them are *Intuitive Morals* (1855); *Broken Nights* (1864); *Darwinism in Morals* (1872); *Hopes of the Human Race* (1874); *Duties of Women* (1880); *The Scientific Spirit of the Age* (1888); *The Modern Raek: Papers on Vivisection* (1889); and a charming *Autobiography* (2 vols., London, 1894).

COB'BETT, WILLIAM (1762-1835). An English political writer. He was born March 9, 1762, at Farnham, Surrey, where his father, a peasant farmer, trained him in habits of industry and self-dependence. He took a dislike to rural occupations, and at sixteen years of age went to London, where he was employed as a copying clerk; but, this becoming distasteful, he enlisted in the Fifty-fourth Regiment of infantry, which shortly afterwards went to Nova Scotia. He remained in the regiment eight years, and by good conduct, activity, and intelligence became sergeant-major. During this period he devoted his leisure to self-education. On his return to England in 1791 he obtained his discharge through the kind offices of Lord Edward Fitzgerald, married, and later went to France, where he learned the language. In the following year he went to America, and, failing in an attempt to obtain a Government position, supported himself for a time at Wilmington, Del., teaching English to French emigrants, Talleyrand being one of his pupils. He settled in Philadelphia and became a political writer. Under the signature of 'Peter Poreupine' he was as keen a Tory as in later life he was a Radical, and, being stung by disparaging criticism of his mother country, he lashed American democracy and French republicanism with coarse, bitter, and personal scorn. Twice prosecuted for libel, he left America in June, 1800, and returned to England, where, in January, 1802, he started his famous *Weekly Political Register*, which continued uninterruptedly until his death. At first Tory, the *Register* gradually changed its politics and became the determined opponent of the Government and the uncompromising champion of Radicalism. Having previously been found guilty twice of libel on certain members of the Government, he was in 1810 fined £1000 and sentenced to two years' imprisonment in Newgate for his severe comments in the *Register* upon the flogging of five militiamen by Hessian mercenaries. In sore financial straits, and again in danger of imprisonment for free speech, Cobbett returned to America in 1817, and for two years farmed on Long Island, transmitting his articles for the *Register* with unflinching regularity. On his return to England in 1820, his strange whim of transporting the bones and relics of Thomas Paine, whom he had formerly reviled and now fulsomely eulogized, met with contempt and ridicule. He established a seed farm at Kensington, and for some years engaged in agriculture. In 1829-30 he traversed England and

Scotland on horseback, delivering political lectures in the principal towns, and he was received everywhere with enthusiasm as the most powerful advocate of the people's rights. In 1832 he was returned to the first Reform Parliament as member for Oldham. His first speeches did not add to his reputation, but caused amusement, Peel blandly informing him that they would receive the attention due to any 'respectable member,' but he eventually gained a respectful hearing. He was engaged in a debate on the malt tax just before his death at Normandy Farm, near Guildford, June 18, 1835. Cobbett was the compiler of the *Parliamentary History* (London, 1806), which after 1812 was published as Hansard's *Debates*, and originated Howell's *State Trials* (London, 1809-28). Among his best-known works are his *Grammar of the English Language* (1819); *Rural Rides* (1830); *Cottage Economy* (1822); and *Advice to Young Men and Women* (1829). His *History of the Protestant Reformation* (2 parts, 1824-27) attacks the Reformers, defends Roman Catholicism, and, often translated, has been extensively circulated in France and Italy. His sons published an annotated abridgment of his political works (9 vols., 1848). While not a man of the first order of intellect, and excluded from the higher refinements of thought, in matters of common sense Cobbett exhibited vigor far surpassing that of any other writer of his day. Despite crotchets, he rendered lasting service to the cause of the people. Consult: His autobiographical *Life and Adventures of Peter Porcupine* (Philadelphia, 1798); E. Smith, *Life of Cobbett* (2 vols., London, 1878); Huish, *Life of Cobbett* (London, 1836); Waters, *Cobbett and His Grammar* (New York, 1883); Watson, *Biographies of Wilkes and Cobbett* (London, 1870).

COBBLER, or COBBLER-FISH. (1) See KILLIFISH. (2) See THREADFISH.

COBBLER OF PRESTON, THE. A musical burlesque by Charles Johnson, produced in 1716 and altered a century later. Its plot was suggested by the adventures of Christopher Sly in Shakespeare's *Taming of the Shrew*.

COB'BOLD, THOMAS SPENCER (1828-86). An English scientist, born at Ipswich. He studied anatomy under Crosse and later took the regular medical course at the University of Edinburgh. In 1857 he went to London, and from 1857 to 1861 he lectured on botany at Saint Mary's Hospital. In 1861 he began his lectures at the Middlesex Hospital, and subsequently, while practicing medicine, also lectured on geology at the British Museum. In 1873 he was made professor of botany and later acted as professor of helminthology at the Royal Veterinary College. Although he was a scientist in the broadest sense of the term, his investigations were chiefly in the field of helminthology—the science of parasites; and his published works deal chiefly with subjects of this science. His writings include: *Entozoa: An Introduction to the Study of Helminthology, with Reference More Particularly to the Internal Parasites of Man* (1864, and supplement, 1869); *Tapeworms* (1866, and several subsequent editions); *Worms* (1872); *Parasites* (1879); *Human Parasites* (1882); *Parasites of Meat and Prepared Flesh Foods* (1884); also a large number of original memoirs published in various scientific periodicals.

COB'DEN, RICHARD (1804-65). An English statesman and economist known as the Apostle of Free Trade. He was born in the hamlet of Ileyshott, near Midhurst, in Sussex, on June 3, 1804, of a family which for centuries had been settled in the place. His father was a sweet-natured, incapable man, who proved unequal to the task of supporting his family. In 1814 the farm was sold and young Cobden was sent off to be educated at a Yorkshire school, where he learned nothing and suffered much for five unhappy years. In 1819 he entered his uncle's warehouse in Old Change, London, and devoted himself with great energy to his new business, finding time, nevertheless, at nights, for study and reading. At twenty-one he was a commercial traveler for his uncle's house, and loved the business for the opportunities it gave him of studying men and things. In 1828 he set up as the commission agent of a large manufacturing house in Manchester on a capital consisting mainly of energy, ability, and his good name. In 1831 he and his partners had prospered sufficiently to start in business for themselves as calico-printers at Sabden, near Clitheroe, and in the following year branches were established in London and Manchester. The 'Cobden prints,' tasteful and original in design, became famous, and the partners were speedily on the way to the accumulation of a large fortune. In 1832 Cobden settled in Manchester, and from that time his private affairs became secondary to the interest which he displayed in the broad practical principles of economics and public education. From 1832 to 1835 he must have been busy educating himself, for this was the only time during his early life when he could have found the leisure to acquire the profound knowledge of political history and economics for which he was distinguished. Reading and foreign travel continued to the last to be a great passion of his life.

In 1835 Cobden published a pamphlet entitled *England, Ireland, and America, 'by a Manchester Manufacturer,'* and this was followed in 1836 by another pamphlet on *Russia*. These two pamphlets were epoch-making, in that they boldly challenged the prevalent ideas of foreign policy and foreign trade in England. It would seem that the sober-minded Cobden, an enthusiast in his way, had become convinced that commerce was the great torch-bearer of civilization and the great foundation of national prosperity. Anything, therefore, which interfered with the free exchange of commodities between nation and nation was harmful, and for this reason protection, which dammed the current of trade, and war, which sought entirely to destroy it, were pernicious. He attacked the historical English policy of intervention in European affairs, on the ground that it bred interminable wars in Europe, while it crushed the English taxpayer with the burden of an enormous debt. The balance of power, the political ideal for which so many sanguinary contests had been fought, Cobden ridiculed as an impossible adjustment which, in spite of centuries of bloodshed and diplomacy, still left statesmen facing an obstinate, unstable equilibrium. He strongly deprecated, too, the prevailing spirit of hatred for Russia, the great bugbear of English statesmen. Summed up, his plea was for the principles of peace, non-intervention, and a policy of retrenchment and

free trade as a means of husbanding the national resources for the great economic struggle that was fast approaching with the entrance of the United States into the markets of the world. In 1835 he made a brief tour in the United States and Canada. In the winter and spring of 1836-37 Cobden traveled in Spain, Turkey, and Egypt. On his return he entered into Manchester municipal politics, being one of those who secured the incorporation of that city in 1838. Popular education was a subject of great interest to him, and he discussed it in many public speeches. In 1837 he was a candidate for Parliament at Stockport, but was defeated.

The history of Cobden's connection with the anti-Corn Law agitation began in October, 1838, when an anti-Corn Law association was founded in Manchester. (See CORN LAWS.) Cobden was one of its earliest members and soon became its guiding spirit. He converted the Manchester Chamber of Commerce to his views and made it a powerful instrument of agitation. Anti-Corn Law associations were founded in many towns of the north, and in London, in March, 1839, the delegates of the various associations united to form the Anti-Corn Law League (q.v.), of which Cobden and six others constituted the council. From the first he was the soul of the movement, and to the people at large he seemed to be the embodiment of the cause. With magnificent talents for organization, with an unequalled gift for popular oratory, and above all, with his kindling enthusiasm and tremendous capacity for work, he was what would be called in modern parlance campaign manager, press bureau, and stump speaker all in one. The history of the anti-Corn Law agitation belongs properly elsewhere, but Cobden's activity is so identified with the work of the League that the two can hardly be separated. Wonderful instances are quoted of the sudden conversion of hostile audiences in country and town, as they listened to Cobden's simple, sincere, and irrefutable arguments; and his success in his 'campaign of education' was all the more rapid in that his teachings confined themselves to driving home the elemental truth that food is a desirable thing for people who starve. In 1841 he entered Parliament from Stockport. His reception in the House was not friendly; but his evident sincerity and his straightforward, unanswerable arguments always gained him a hearing. At the beginning of the session, Mr. Charles Villier's annual motion to consider the repeal of the Corn Laws was rejected by a vote of 393 to 90, yet within five years after he had entered Parliament, Cobden had converted Sir Robert Peel and his party to free trade. In 1843 considerable odium was heaped upon his name as the result of an attack on the Government, which Peel unjustly took to be an exhortation to personal violence against himself. Cobden, however, was undaunted, and continued to plead, in Parliament and out, against the "system of legislative murder" which "starved people to death." On March 13, 1845, he delivered an especially powerful speech in the House, at the end of which Peel is said to have muttered, "Those may answer him who can, I cannot do it." The famine in Ireland came to the aid of the Anti-Corn Law League. On December 5, 1845, the Prime Minister pronounced for the total repeal of the Corn Laws and in 1846 the battle had been won. Speaking in

Parliament in that year, Peel declared that to Cobden was due the honor for the great reform which had just been enacted. That the intense earnestness which animated Cobden throughout the struggle was something more than enthusiasm for a principle in economics is shown in the following words of John Bright, his life-long friend and supporter, spoken at the unveiling of Cobden's monument at Bradford in 1877. It was in September, 1841, and Bright was mourning over the dead body of his young wife when Cobden came to him saying: "There are thousands of houses in England at this moment where wives, mothers, and children are dying of hunger. Now, when the first paroxysm of your grief has passed, I would advise you to come with me, and we will never rest until the Corn Law is repealed." The struggle and the triumph are thus described by Mr. Bright: "We were joined, not by scores, but by hundreds, and afterwards by thousands, and afterwards by countless multitudes; and afterwards, famine itself, against which we had warred, joined in. A great minister was converted, and minorities became majorities, and finally the barrier was entirely thrown down, and since then, though there has been suffering, and much suffering, in many homes in England, no wife, and no mother, and no little child has been starved to death as a result of famine made by law."

During the agitation for the repeal of the Corn Laws, Cobden had neglected his own affairs entirely, and at the end he was a poor man. A popular subscription of more than £75,000 was made up for him and he went abroad for rest. His nature, however, was opposed to rest, and during his long travels in France, Spain, Italy, Germany, and Russia, he did not cease to advocate in public speeches and interviews with sovereigns and statesmen the great principles of free trade, peace, and non-intervention. During his absence he was elected to Parliament from the West Riding of Yorkshire (1847), and on his return to England he allied himself with numerous peace societies and subsequently attended a number of international peace congresses in Paris, Frankfurt, and London. In 1849 he moved in Parliament that action be taken toward the establishment of international arbitration, and in 1851 he proposed a general reduction of armaments. He was active in combating the periodic outbursts of anti-Gallic and anti-Russian fever such as that which spread over the country in 1853, and lost thereby that immense popularity which he had acquired in the struggle against the Corn Laws. He bitterly assailed Palmerston's policy of active intervention in European affairs, and with John Bright opposed the war against Russia in 1854, for which he was virulently assailed by the unanimous voice of a war-mad nation. Far from considering the preservation of Turkey as desirable, Cobden maintained that the downfall of the Ottoman Empire in Europe would redound to the welfare of the Christian peoples of the Balkans and to the cause of civilization. In 1857, as the result of an attack by Cobden on the Chinese policy of the Cabinet, the Palmerston Ministry was outvoted and forced to appeal to the country. Cobden stood for Huddersfield, but his unpopularity on account of his attitude toward the war recently ended was still great and he was defeated. In 1859 he came to the United States,

this being his second visit after a lapse of twenty-four years. On his return the post of President of the Board of Trade was offered him by Palmerston, with a place in the Cabinet. Against the urgent advice of his friends, Cobden declined the offer, refusing frankly to take sides with a man from whom he differed *toto caelo* on matters of foreign policy. At the suggestion of M. Chevalier, the eminent champion of free trade, Cobden went to France in 1859 to attempt the negotiation of a commercial treaty between that country and England. He possessed the support of none of the English ministers save Gladstone, but his reputation was such that in his unofficial capacity he succeeded in converting the French Emperor and his ministers to his views. In January, 1860, Cobden was clothed with official authority and in the same month the treaty was concluded. He remained in Paris until November, accomplishing the tremendous labor necessary in the minute adjustment of a new tariff schedule. On returning to England, he declined the offer of a baronetcy and resumed his activity in Parliament. With John Bright he earnestly supported the cause of the North in the Civil War, and in Parliament severely criticised the course of the Government in permitting the equipment of Confederate cruisers for the purpose of preying on American commerce. His last speech in Parliament was delivered in July, 1864. He contracted serious bronchial trouble as the result of exposure in traveling on a public mission to London, and died there July 2, 1865. His death was acknowledged as a national loss by men of such widely differing opinions as Palmerston, Disraeli, and John Bright, and was received with sorrow in France and other countries of the Continent.

Cobden's *Speeches on Questions of Public Policy* were published by his friends John Bright and Thorold Rogers in 1870. The best biography is that by John Morley, *Richard Cobden's Life* (London, 1881). Consult also Garnier, *Richard Cobden, les liqueurs et la ligue* (Paris, 1846); Bastiat, *Cobden, et la ligue ou l'agitation pour la liberté du commerce* (Paris, 1848).

COBDEN CLUB. An association of leading free-traders instituted in London in 1866, in honor of Richard Cobden (q.v.), with the object of diffusing in all parts of the world those principles with which his name is connected. For this purpose it has published tracts, pamphlets, and books, for free circulation, especially in Great Britain, the United States, and the British colonies.

COBEGO, kô-bâ'gô, or **KAGUAN**, kâ'gwân. The native name of a singular group of East Indian flying insectivores, constituting the family Galeopithecidae and genus Galeopithecus, having one species (*Galeopithecus volitans*) and perhaps another. They are known in the Malayan region as cobegos, colugos, kaguans, kubongs, etc., and in many books as flying lemurs, this aberrant and puzzling group having at first been considered lemuroids. They are slender, long-limbed, large-clawed, long-tailed, fox-headed animals, about 18 inches in length, clothed in exquisitely soft, short and protectively mottled fur, and provided with a folded extension of the skin which extends from the neck nearly to the tip of the tail and includes the feet, which are fully webbed. This parachute thus equals that of the best furnished bats in ex-

tent, but it is furry both above and below. The dentition, the pectoral position of the teats, to which the single young one (born so incomplete as to suggest marsupial affinities) is attached, and the habit of clinging to a support head downward, are other resemblances to the bats; in flight the cobego does not equal them, but it can sail longer distances, and come nearer to guiding its course, than do any other 'flying' mammals. It is wholly arboreal in its life, and active mainly in the evening and early morning, disliking the glare of day, and impeded by the darkness of midnight. It spends most of its time scrambling about the branches and seems to feed upon anything that comes in its way, but mostly upon leaves and fruit. In sleep it hangs head downward, clinging with its hind feet, and by means of the prehensile free tips of its tail, when it is nearly invisible among the flickering lights of the leaves. Consult: Wallace, *Malay Archipelago* (London, 1869); Moseley, *Notes by a Naturalist on the 'Challenger'* (London, 1879).

COBET, kô-bêt', CAREL GABRIEL (1813-89). A brilliant Dutch classical scholar. He was born in Paris and studied from 1831 to 1836 in Leyden, where, after a scientific journey to Italy at Government cost in 1840-45, he became a professor in 1847. Cobet was one of the most sagacious and acute of modern critics in the department of Greek philology. He published, besides other works of high merit: *Oratio de Arte Interpretandi* (his inaugural address) (1847); *Variae Lectiones* (1854); *Novæ Lectiones* (1858); *Miscellanæ Criticæ* (1876); *Collectanæ Criticæ* (1878); works on Dionysius of Halicarnassus, and Xenophon; and editions of Diogenes Laërtius, Xenophon's *Anabasis* and *Hellenicæ*, Lysias, and Cornelius Nepos. See TEXTUAL CRITICISM.

COB'HAM, LORD. See OLDCASTLE, SIR JOHN.

CO'BIA, or CRAB-EATER. See SERGEANT-FISH.

COBIJA, kô-bê'já. A seaport in the Province of Antofagasta, Chile, about 70 miles north of Antofagasta (Map: Chile, D 8). It was formerly a considerable town, but has lost its commerce and now contains a population of but 500. Cobija, once known as Puerto la Mar, was part of Bolivia and its only seaport until ceded to Chile in 1883. It suffered from an earthquake and tidal wave in 1877.

COBLENZ, or **KOBLENZ**, kô'blénts (corrupted from the Latin name *Confluentia*, or *Confluentes*, from *confluere*, to flow together, from *con-*, together + *fluere*, to flow). The capital of the Prussian Rhine Province, about 57 miles southeast of Cologne, beautifully situated at the junction of the Rhine and the Moselle, both of which are crossed here by bridges (Map: Prussia, B 3). It consists of the old town, along the Moselle, and the new town, farther up the Rhine. In the old town many of the streets are irregular, narrow, and dirty; but in the new, they are generally well built, moderately wide, and clean. Among the principal buildings are the Church of Saint Castor, founded early in the ninth century, containing the tomb of Archbishop Kuno of Falkenstein; the so-called Kaufhaus, built in 1477 as a town-hall; the ancient Burg, erected by the Archbishop of Treves in 1276, recently restored by the town; and the large Electoral Palace, now a royal palace, completed in 1786. On the extreme point of the city, at the junction

of the rivers, stands the splendid equestrian statue of Emperor William I. erected by the province. Coblenz has numerous and excellent educational institutions, including a royal gymnasium, a teachers' seminary, and a conservatory of music. Its chief industry is the production of the sparkling Moselle wine. There are also manufactures of machinery, pianos, and lacquered wares. Coblenz, with its system of forts, including Ehrenbreitstein on the opposite bank of the Rhine, constitutes a strong fortress. Population, in 1890, 32,664; in 1900, 45,146. Coblenz was known to the Romans as *Confluentes*. In 1018 it was conferred by Henry II, upon the archbishops of Treves. After 1789 it was the headquarters of the French Emigrés, and in 1794 it passed to France. In 1815 it was ceded to Prussia.

COBOURG, kō'börg. The capital of Northumberland County, Ontario, Canada, on Lake Ontario and the Grand Trunk Railroad; 69 miles northeast of Toronto (Map: Toronto, E 4). It is a port of entry, with a commodious harbor and regular steam communication with United States and Canadian lake ports, and has woolen mills, car-factory, and breweries. The town is well built and contains a college, and owns a public hall and municipal gas, electric lighting, and water works. Population, in 1891, 4289; in 1901, 4239.

CO'BRA, or **COBRA DE CAPELLO**, kō'brā dā kā-pēl'ō (Port., hooded snake). One of a group of Oriental venomous snakes constituting the proteroglyphic genus *Naja*. There are six or seven species, dwelling in Asia and Africa. Of the African species the best known is the asp (*Naja haic*); see ASP. The Asiatic cobras are not large, except the 'giant' cobra (*Naja bungarus*), which is sometimes 13 feet long. (See HAMADRYAD.) Several species belong mainly to the Malayan region and are comparatively small and harmless. None is American, the 'cobras' of Brazil being something else, usually harmless.

The cobra de capello (*Naja tripudians*) is the most interesting one, as it is exceedingly numerous throughout India and Ceylon, thence westward to the Caspian, and eastward throughout the Malay Peninsula and into southern China; and is justly regarded as the most deadly of venomous serpents—certainly the most harmful considered in the aggregate, the annual mortality from its bite in India alone exceeding 5000 human beings, besides a great quantity of live stock. Little can be done to prevent this, because of the religious veneration with which the 'blacksnake' (the native name) is regarded by the larger part of the population. This species rarely exceeds six feet in length and is a rather slender, brownish snake (bluish beneath) with lighter cross-bars; but the markings are variable. The head is small, without the triangular and separated appearance of the vipers; but when the snake is angry or excited and about to strike, it lifts from the ground a third of its length, and spreads the nuchal ribs until the neck expands into a broad, shell-like hood of terrifying appearance; and the back of this hood displays a yellow mark, more or less of the shape of a pair of spectacles.

These cobras wander even up to elevations of 8000 feet in the Himalayas, but are most common in the lowland jungles, where they are able to climb trees, although seldom doing so; and as they can swim well they often enter the water after frogs, fish, etc. They are attracted to vil-

lages, enter gardens and houses in search of mice and other small mammals, or of eggs and young poultry, and are likely, especially during the rainy season, to take up their residence in old houses, broken walls, fodder-stacks and rubbish-heaps, and remain there. It is about such places, especially at night, that they are most often trodden upon, and fatal bites are received. They are sluggish and strike rarely except when provoked or endangered; and they may be killed by a slight blow. Their bite, when well delivered by a vigorous snake, is almost surely fatal; men have been known to perish within half an hour, and in such cases all so-called remedies are useless. The immunity this snake receives among the Hindus is due to a belief that it once spread its hood as a shade over Buddha while he slept, and was blessed by the saint, who placed the spectacle-mark upon its back as a warning to the kite not to molest it. Little headway can be made against this superstition in efforts toward extermination of this deadly reptile, which occasionally penetrates even the gardens and parks of large towns. Its natural enemies are few, chiefly the kite, the mungoos (q.v.), and cattle (by tramping).

BIBLIOGRAPHY. For these and other poisonous snakes of the Old World, consult authorities referred to under SNAKE; also Favre, *Thanatophidia of India* (London, 1874); Ewart, *Poisonous Snakes of India* (London, 1878). See PROTEROGLYPHA; and Colored Plate of FOREIGN VENOMOUS SERPENTS.

COBRE, kō'brā. A small town in the Province of Santiago, Cuba, about 9 miles from Santiago de Cuba. It is the centre of a copper-mining district, and derives its name from that metal. Cobre dates from the sixteenth century, the mines having been exploited first in 1558. Population, 1899, 1028.

COBURG, kō'boorik (Lat. *Melocobus*). The capital of the Duchy of Coburg, and, alternately with Gotha, the residence of the Duke of Saxe-Coburg-Gotha, picturesquely situated on the left bank of the Itz, a tributary of the Main, about 26 miles north-northeast of Bamberg (Map: Germany, D 3). Its principal public buildings are chiefly found on the Marktplatz and Schlossplatz. The former, adorned with a statue of Prince Albert, contains the old Rathaus, the handsome Government buildings, and the arsenal, with the Ducal Library of 60,000 volumes. The Schlossplatz contains the large palace erected in 1549 and restored in 1693, two smaller ducal palaces, and the theatre. The Church of Saint Moritz, a handsome late Gothic structure, dating from the fifteenth century, contains some fine monuments and brasses. On a hill about 500 feet above the town stands the ancient castle of the Dukes of Coburg, dating from the eleventh century. It has recently been restored and fitted up as a museum. The rooms which Luther occupied, when in concealment here in 1530, are still exhibited to the visitor, as well as the pulpit from which he preached in the chapel of the castle. There are flourishing industries of beer-brewing, the weaving of woolen and linen fabrics, and the manufacture of porcelain and basket ware. Population, in 1890, 17,106; in 1900, 20,459. The town of Coburg grew up around the castle, and is mentioned for the first time in 1207. In 1485 it passed to the Ernestine line of Saxon Dukes, and became in 1735 the capital of Saxe-Coburg.

COBURG FAMILY. An old German ducal family, dating from the fifteenth century, which has contracted various alliances with the English and Continental royal houses. Queen Victoria's mother was a sister of Duke Ernest I. of Coburg. The first wife of Ernest's brother, Leopold I., King of Belgium, was a daughter of George IV., of England, and his second wife was a daughter of Louis Philippe. Albert (q.v.), the son of Ernest I., was the husband of Victoria.

COBURG PENINSULA. A peninsula on the north coast of Australia, lying west of the Gulf of Carpentaria. It extends in a northwesterly direction toward Melville Island, from which it is divided by Dundas Strait (Map: North Australia, E 1). On its northeast side is the bay known as Port Essington, at the head of which, about latitude $11^{\circ} 22'$ S., longitude $132^{\circ} 10'$ E., was established, in 1839, the settlement of Victoria—abandoned, on account of its insalubrity, six years later. The district abounds with swamp buffaloes which were originally imported from Java.

COBWEB. The web woven by spiders, principally by small, slim spiders of the family Theridiidæ. See SPIDER.

COBWEB. One of the four fairies that appear in Act iii., Scene 1. and Act iv., Scene 1, of Shakespeare's *Midsummer Night's Dream*; a dainty creation who speaks just three words during the entire play.

CO'CA (So. Amer. name), *Erythroxylon coca*. A shrub of the natural order Erythroxylaceæ, of which the leaves are much used by the inhabitants of Peru and Bolivia as a narcotic and stimulant. (For illustration, see Plate of CORNFLOWER.) The dried leaves are chewed with a little finely powdered unslaked lime or with the alkaline ashes of the quinoa (q.v.), or certain other plants. The principal constituents of coca are cocaine, and several derivatives, hygrine, cocatannic acid, etc. As a local anæsthetic the alkaloid cocaine is unexcelled. The common forms of administering are in the wine of coca, a fluid extract, and the alkaloid cocaine. The properties and effects of coca resemble those of opium, although it is less narcotic, while it possesses the property of dilating the pupil of the eye, which opium does not possess. It also lessens the desire for ordinary food, and for some time, at least, enables the person who uses it to endure greater and more protracted exertion than he otherwise could, and with less food. The leaves are sometimes mixed with forage for mules, when especially long trips are taken. It is especially remarkable for its property of preventing the difficulty of respiration, so common in the ascent of long and steep slopes at great elevations. But when used habitually and in excess, it weakens the digestion, produces biliary and other disorders, and finally induces a miserable ruin both of body and mind. It has been in use from a very remote period among the Indians of South America, and was extensively cultivated before the Spanish conquest. Many of the Indians of the Peruvian Andes are to this day excessively addicted to it, and its use prevails also to a considerable extent among the other inhabitants of the same regions. Its culture and use have extended into Brazil. (See COCAINE.) The shrub is extensively cultivated in various parts of South America and in Ceylon,

India, and Java. It could probably be grown in parts of Florida and California. The shrub is 3-6 feet high, with rusty branches and leaves somewhat like tea-leaves, which are borne on the ends of the branches, the small yellow flowers some distance below. The annual production of leaves in South American trade is estimated at 30 to 50 million pounds. There are many other species of *Erythroxylon* in addition to *Erythroxylon coca*. The name is from the red wood of some species.

COCADRILLE, kô'kâ-dril. A monster described by Sir John Mandeville as living on the island of Silha, and corresponding to the crocodile, of which the word is an early form.

COCAINE, kô'kâ-in, $C_{17}H_{21}NO_4$. An alkaloid derived from coca-leaves. The hydrochlorate, $C_{17}H_{21}NO_4HCl$, produces temporary insensibility when applied to the conjunctiva, mucous membranes, or denuded surfaces, or when injected beneath the skin. It is not absorbed by the unbroken skin, however. It also causes a temporary contraction of the blood-vessels of the region anæsthetized, but this is followed by congestion. Applied to the conjunctiva, it causes anæsthesia, dilatation of the pupil, diminution of intraocular tension, and some interference with accommodation. For dilating the pupil it is sometimes employed in combination with homatropine (q.v.). As a local anæsthetic for regions covered by skin it is injected in solution, by a hypodermic needle, into the tissue which is to be anæsthetized. The toxic dose varies greatly, some persons being unfavorably affected by a small amount. The only result may be restlessness and excitement, or there may be headache, rapid respiration, delirium, coma, or convulsions, with wide dilatation of the pupils. Persons addicted to the cocaine habit use the drug internally or by hypodermic injection. Its prolonged use causes digestive disturbance, general weakness of mind and body, muscular twitching, and insomnia.

Within recent years cocaine has been successfully employed as an anæsthetic in major surgical operations; if injected into the spinal column, cocaine has the remarkable effect of producing complete insensibility to pain in the entire part of the body below the point where it is injected, but no effect at all above that point. The advantage of not causing anæsthesia where it is unnecessary is obvious; nor does cocaine, in the hands of an expert surgeon, produce any disagreeable after-effects. See ALKALOIDS.

COCANADA, kô'kâ-nâ'dâ (corrupted from Telugu *kakinadi*). The capital of the Godavari District, Madras, India, 315 miles north-northeast of Madras, and after that city, the principal port on the Coromandel coast (Map: India, D 5). Navigable canals connect it with the Godavari River at Dowlaishwaram. The commercial establishments and docks of the town are on the banks of one of these canals which leads to the protected roadstead in Coringa Bay. It has a lighthouse visible fourteen miles. Large quantities of cotton are exported, and there are exports also of rice, sugar, oil-seeds, and cigars. Population, 41,000.

COCCAJO, MERLINO. See MERLINO COCCAJO.

COCCEIANS, kôk-sé'yanz. The name given to the adherents of Johannes Coccejus, the seventeenth-century theologian (q.v.), who held

that the future history of Christianity was to be found foreshadowed in the Old Testament.

COCCEIUS, NERVA, or NERVA MARCUS (2-33). The grandfather of the Emperor Nerva—elected consul A.D. 22. His legal learning is extolled by Tacitus and he is frequently mentioned in the *Digest*. He was the originator of the tunnel (Grotta di Posillipo) on the road leading from Naples to Baiae, and had charge of public works under Tiberius, to whom he was a constant companion. Notwithstanding the Emperor's entreaties, he starved himself to death in the year A.D. 33, because of continual ill health.

COCCEJI, kók-tsā'yé, HEINRICH VON, Baron (1644-1719). A German jurist. He was born at Bremen, and studied jurisprudence and philosophy in Leyden and afterwards in Paris and Oxford. He was made professor in Heidelberg in 1672 and in Utrecht in 1688, and two years later was appointed to a similar office in Frankfort-on-the-Oder. In 1712 he was created a baron of the realm. As an erudite jurist, Cocceji was the oracle of many courts, and his work on German civil law, *Juris Publici Prudentia* (1695), was almost universally used as a textbook for this branch of jurisprudence.

COCCEJI, SAMUEL VON, Baron (1679-1755). A German jurist, born in Heidelberg, son of the preceding. He became Prussian Minister of State and of War (1727), director of ecclesiastical affairs and curator-general of the universities of the kingdom (1730), president of the High Court of Appeals (1731), chief of the Prussian judiciary (1738), and Chancellor (1747). He exerted the greatest influence upon the development of Prussian law. The legal codes prepared by him, and respectively entitled *Projekt des Codicis Fridericiani Pomernieci* (1747), and *Projekt des Codicis Fridericiani Marchici* (1748), remained in operation until 1780.

COCCEJUS, kók-tsā'yōōs, or KOCH, JOHANNES (1603-69). A German Protestant theologian. He was born in Bremen, and made his first studies there. In 1625 he went to Hamburg, and acquired a thorough knowledge of Oriental languages under the guidance of a learned Jew. Returning to Bremen in 1630, he taught Hebrew there, and was appointed professor of theology in Franeker in 1643, and in Leyden in 1650. Coccejus's chief work is the *Lexicon et Commentarius Sermonis Hebraici et Chaldaici Veteris Testamenti* (Leyden 1669), the first tolerably complete dictionary of the Hebrew language. In spite of his great learning, Coccejus held very peculiar hermeneutical principles, which enabled him to discover the whole New Testament in the Old. The representation abundantly employed in the latter of a covenant between God and man, he carried out in his interpretation of the New Testament, and made it the centre of his theology. This idea of there being two covenants—one of grace, that after it—was first broached by William Ames (died 1633); but Coccejus elaborated it, and so became the virtual founder of the federal theology (q.v.). the theology of the Westminster standards, and long accepted by all the Reformed. The most complete exposition of his views is in his *Summa Doctrinae de Federe et Testamento Dei* (1648). His collected works

were issued in Amsterdam (1675), with a life by his son.

COC'CIDÆ (Neo-Lat. nom. pl., from Lat. *coccum*, Gk. κόκκος, *kokkos*, berry). A family of bugs, including the scale-bugs or bark-lice, the mealy bugs, and others without popular names. This family not only departs the most widely from the Hemiptera, but in it the most anomalous forms among insects are found; and the most extraordinary diversities occur, even in the two sexes of the same species. The habit of secreting a shell or covering of some sort is common to all the Coccidæ, most frequently in the form of a scale made up of cast skins and excreted matter. Sometimes, as in the case of the mealy bugs, the covering is white and powdery; and in the 'ground-pearls' it is glassy or shell-like, and may entirely encase the insect. A few gall-forming species occur in Australia. The young mite-like females at first have the power of locomotion. The perfect male has only one pair of wings, like flies. Sexual reproduction is the normal method, while parthenogenesis and viviparous reproduction, so common in the aphids, is a rare method among the Coccidæ. Almost complete histolysis may occur in the female, lasting for several years. The young of both sexes sink the rostrum into plants, suck the sap, and secrete a waxy coating or shield of some sort, under which they undergo subsequent development. Coccidæ occur on bark, leaves, and fruits of various trees, and as they are sap-suckers they may greatly impoverish or kill the plant. The black or brown scale-like spots on oranges and lemons are really scale-insects, and by such transportation they gain world-wide distribution. Honey-dew is secreted by the Coccidæ, but usually not so plentifully as by the Aphidæ, yet Réaumur records a case where it dripped to the ground and tasted sweet. The 'man' still used by the Arabs for food is probably the manna of Exodus, and is secreted by a coccus. White wax is secreted by a species in India, and another produces in China the wax commercially known as China wax. The shelly resinous scale produced by another form is the lac or shellac of commerce, while the body of the lac-producing insect affords the red dye known as lake. Other Asiatic and European species furnish dyes. The tropical American *Coccus cacti*, however, yields the most famous of the insect dyes, known as cochineal (q.v.). Axin and axinic acid are produced by another Mexican coccus. For the latest information concerning the family, consult: Green, *Coccida of Ceylon* (London, 1896-99); Newstead, *Monograph of the Coccida of the British Isles* (Ray Society, London, 1900); also publications of the United States Department of Agriculture, and articles by Cockerell in the *Canadian Entomologist*. See LAC-INSECT; SCALE-INSECT.

COCCIUS, kók'tsé-ōōs, ERNST ADOLF (1825-90). A German oculist, born near Leipzig. He studied medicine at the universities of Leipzig and Prague, and practiced several years in Leipzig, where he became connected with the university in 1851. He was made full professor of medicine there in 1867. Coccius made contributions of great value to the diagnosis of the diseases of the eye. His published works include: *Ueber die Anwendung des Augenspiegels nebst Angabe eines neuen Instruments* (Leipzig, 1853);

Ueber die Neubildung von Glashäuten im Auge (1857); *Der Mechanismus der Akkomodation des menschlichen Auges nach Beobachtungen im Leben* (1867); *Ueber Augenverletzungen und ihre Behandlung* (1871); *Ophthalmometrie und Spannungs-messung am kranken Auge* (1872); *Ueber die Diagnose des Schpurgurs im Leben* (1877).

COC'CO (West Indian name), COCOA-ROOT, TARO, or EDOOES. Plants of the genus *Colocasia*, and of the nearly allied genus *Caladium*, of the natural order Araceae, very generally cultivated in tropical and sub-tropical countries for their roots, or flat underground corms, which abound in starch, and are used as articles of food, being deprived by roasting or boiling of the characteristic acidity of the order—which, indeed, some of them possess in a comparatively small degree. They are totally different from the true yams. The names coco, cocoa-root, and eddoes, perhaps more strictly belong to *Colocasia antiquorum*, a stemless plant with ovate leaves, and flowers inclosed in a cylindrical erect spathe. The taste of its roots is like that of potatoes, and the plants are much cultivated. *Colocasia macrorrhiza* is a closely related species of the South Sea Islands. In the Himalaya these plants form the principal food of many of the inhabitants. The root in its fresh state is stimulant, diaphoretic, and expectorant. In Hawaii, and the South Sea Islands generally, taro is one of the staple sources of food for the natives. The rootstock is roasted, after which it is pounded in wooden trays with water into a thick dough. This is allowed to ferment, and may be eaten in that state or prepared in a number of ways. Its native name in Hawaii is poi. In Japan, Porto Rico, etc., the rootstocks are utilized as we use potatoes.

COCCOSTEUS, kōk-kōs'tā-ūs (Neo-Lat., from Gk. κόκκος, *kōkkos*, berry + ὀστρα, *ostron*, bone). A genus of heavily armored fishes, of the order Arthrodira, fossil remains of which are found in the Devonian rocks of Europe and North America. The head and the forward part of the trunk were covered with strong, bony plates, and the plates of these two regions articulated by a hinge-joint that admitted of free movement of the head upon the trunk. The skull had large orbits, placed well forward, and in the middle of the frontal surface was a pit that indicated the position of the pineal body. The jaws were strong, and the mandibles or lower jaws were furnished with conical teeth. The trunk of *Coccosteus* was shark-like in form, and was provided with a single dorsal fin, an anal fin, and a pair of rudimentary pelvic fins. It was probably covered by a soft skin that readily decomposed after the death of the animal, and that hence escaped fossilization. The vertebral column shows an interesting progressive stage in the evolution from the cartilaginous backbone of the earlier fish to the completely calcified skeleton of the later genera. The neural arches and the spiny processes of the vertebrae have alone become calcified, so that in well-preserved specimens they appear as two rows of bony processes, with an intervening empty canal that represents the cartilaginous centra or 'bodies' of the vertebral elements. All the species of the *Coccosteus* are small, none of them having been found with a length greater than 20 inches. The best-known species and the type of the genus is *Coccosteus*

decipiens, which is common in the Old Red Sandstone of the Scottish Devonian. A few specimens, though none so perfect as the Scottish, have been found in the North American Devonian. See FISH; DIPNOI; LUNG-FISH.

COC'ULUS IN'DICUS (Neo-Lat. *cocculus*, dim. of Lat. *cocum*, berry, and Lat. *indicus*, Indian). The name given to a very poisonous seed brought from the East Indies, which is used for various medicinal purposes, and illegally, it is said, for imparting a bitter flavor to malt liquors. It possesses acrid and intoxicating qualities. It is used in India for stupefying fish, that they may be taken by the hand. When the seeds, known as 'fish-berries,' are thrown into a stream, any fish in the neighborhood are quickly stupefied. It contains a most poisonous principle, called 'picrotoxin,' while the pericarp contains another called 'menispermim,' equally poisonous. It is the seed of the *Anamirta paniculata*, a beautiful climbing plant, of the natural order Menispermaceae. The action of picrotoxin, when taken internally in poisonous doses, resembles that of strychnine (see NUX VOMICA); the most noticeable symptoms being uneasiness, restlessness, and tetanic convulsions. The drug is used to destroy lice and the parasite ringworm. It has been employed internally, in small doses, to check the night sweats of phthisis. Poisoning occasionally occurs from drinking the drug, as it is sometimes prepared as a domestic parasiticide—the bottle being filled with equal volumes of the berries and rum, and allowed to stand after shaking. Absorption through broken skin also causes poisoning at times. The genus *Anamirta* is closely allied to the genus *Cocculus* (see CALUMBA), in which it was formerly included. The fruit of several allied species possesses properties analogous to those of the *Anamirta paniculata*.

COC'CYX. See SPINAL COLUMN.

COCHABAMBA, kō'chā-bām'bā (*Cocha*, lake + *bamba*, plain). The capital of the Department of Cochabamba, Bolivia, situated on the Río de la Rocha, in a fertile valley, about 8000 feet above the sea-level (Map: Bolivia, D 7). It is laid out with wide and regular streets, and contains several pretentious structures, notably the theatre, Government building, and the hospitals of Viedma and San Salvador. Cochabamba has a college and secondary schools. The city manufactures cotton and woolen goods, leather, soap, and earthenware, and besides carries on considerable trade, especially in grain. Population, in 1896, 29,530. Cochabamba was founded in 1563, and was called Oropesa. In 1847 it was created an episcopal see.

COCHEM, kō'kēm. The capital of a district in the Rhine Province, Prussia, at the confluence of the Moselle and Ender, 24 miles southwest of Coblenz. It is noted for its picturesque situation, near the entrance to the Emperor William Railway Tunnel, two and two-thirds miles in length, the longest in Germany. Cochem has steamboat and railway stations, interesting mediæval houses, and a beautiful riverside park, in which is a war monument by Schies. The ancient episcopal castle of the archbishops of Trèves, destroyed by the French in 1689 and restored since 1868, crowns a hill to the south of the town. Population, in 1900, 3586.

COCHERY, kôsh'ré', LOUIS ADOLPHE (1819-1900). A French statesman. He was born in Paris, where he practiced law, and occupied the post of Chief of Cabinet in the Ministry of Justice during the Revolution of 1848. He was subsequently editor of the *Avenir National*, and in 1868 established the journal entitled *L'Indépendant de Montargis*. As a member of the Legislative Assembly, he declared against the war with Germany, and after September 4, 1870, acted as General Commissioner of the National Defense in the Department of Loiret. Under Dufaure, he became under-secretary of the finances, and from 1875 to 1884 he was minister of the postal and telegraphic service.

COCHIMI, kô-chê'mé. A tribe, possibly of Yuman stock, formerly occupying the northern and central portions of the peninsula of Lower California, Mexico. According to the account of the Jesuit Baegert, who labored among them for some years in the middle of the eighteenth century, they, like the Guaicuru and Perien, who occupied the southern part of the peninsula, were in the lowest grade of culture, naked, without agriculture of any kind, and with no permanent shelters, depending entirely upon fishing, hunting, and wild fruits for subsistence. The dead were first buried, and after a certain time the remains were dug up, the bones cleaned and painted red, and preserved in ossuaries.

COCHIN, kô-chên' or kô'ehin (Tamil *kœi*, Telugu *kœi*, harbor). Once the capital of the principality of the same name, but now a seaport of the District of Malabar, Madras, British India (Map: India, C 7). It stands on the south side of the principal channel between the open ocean and a lagoon known as the 'Back-water.' This lagoon, 120 miles long, is, even in its lowest state, always navigable for canoes, and forms a valuable means of communication with the interior. Cochin is one of the chief cities on this coast for ship-building and maritime commerce. Here the Portuguese erected their first fort in India, in 1503. They were supplemented by the Dutch in 1662. Under the Dutch Cochin was a great emporium of trade. In 1796 the town was captured by the British, and again in 1806, when its fortifications and public buildings were destroyed and its private dwellings very much damaged. Notwithstanding this check, the place continued to flourish. It has a safe harbor, citadel, and arsenal. It is the see of a Roman Catholic bishop and of two Syrian bishops. Among the buildings is a church erected by the Portuguese in the early part of the sixteenth century. The population, numbering about 17,600, is very heterogeneous, including Hindus, descendants of the Portuguese and Dutch, Armenians, Arabs, Jews, and Persians. The Black Jews of Cochin occupy a separate suburb. The trade consists chiefly in the export of cocoa oil, cocoa-fibre, teak-wood, cardamoms, etc. Water is brought from a distance of 18 miles. The average temperature is 78° F. Adjoining Cochin is a native town of the same name, nearly as populous, in the State of Cochin.

COCHIN, kô-chên'. A native State, tributary to Madras, India (q.v.), bounded northwest, north, and northeast by Malabar and Coimbatour; east and south by Travancore, and west by the Indian Ocean (Map: India, C 6). It has an area of 1362 square miles, consisting chiefly of low-

land, lying between a narrow stretch of raised coast-line and the Western Ghâts (q.v.), part of which are included in the State and separate it from inner India. Behind the coast-line lies the shallow backwater, 120 miles long, and varying in breadth from a few hundred yards to ten miles; it has three connections with the ocean, and is fed by the variable mountain torrents of the Ghâts. During the wet season the backwater forms a navigable channel. The region is one of the most humid in the world, especially during the southwest monsoon of June, July, August, and September; even during the remainder of the year dry weather is comparatively unknown. The cocoanut is the most valuable product of the country; the forests also produce red cedar, teak, and other hard woods, but these are becoming scarce. Rice, pepper, cardamoms, ginger, betel-nut, yams, arrowroot, sweet potatoes, and coffee are cultivated in the low country. There are manufactures of salt on the coast. The capital is Ernakolam, although the ruler's palace is situated at Tripunthora; the chief seaport, besides the British town of Cochin (q.v.), is Malipuram. Population, in 1891, 723,000; in 1900, 815,200, consisting chiefly of Hindus; there are a few Mohammedans and a large number of Christians and Jews. The Jews are classified into white and black; and the Christians, estimated at one-fifth of the population, are divided between the Syrian and Romish churches; they trace their origin partly to the Portuguese conquest and partly to the missionary labors of Saint Thomas, the Apostle. Consult: Day, *Land of the Pearls: or, Cochin, its Past and Present* (Madras, 1863).

COCHIN (from *Cochin-China*). A breed of large domestic fowls, highly esteemed as producers of flesh and large eggs. They are known in black, buff, partridge (variegated), and white varieties, have yellow-feathered legs (except in the black variety), and single erect combs. See FOWLS, and Colored Plate of FOWLS.

COCHIN, kô'shân'. CHARLES NICOLAS (1715-50). A French engraver and art critic, born in Paris. He was the most celebrated of a prominent family of engravers and painters, and was the son of Charles Nicolas Cochin (1688-1754) and Louise Madeleine Hortemels, who was an etcher of note. He became engraver to the King in 1739, and in this capacity executed a series of Court subjects, such as "The Marriage of the Dauphin" (1755). His designs include vignettes, frontispieces, ornamental letters, and a number of portraits. His works were catalogued by Jombert in 1770. Among them are etchings for Joseph Vernet's *Ports de France* (1760-67), and designs for the *Orlando Furioso* (1775-83) and the *Jerusalem Liberata* (1783-86). He was made perpetual secretary to the Académie des Beaux-Arts in 1755. His criticisms on art have been printed under the title *Œuvres diverses* (1871); and he also wrote *Voyage d'Italie* (1758), and some *Mémoires secrets* (1881).

COCHIN-CHI'NA, kô'ehin-chi'ná. A possession of France, in the extreme south of the peninsula of Indo-China, lying between Cambodia and Annam on the north and the China Sea (Map: Asia, K 7). Its area is estimated at 23,160 square miles. It is traversed by the Mekong, which forms an extensive delta. The country is mainly a low plain, of alluvial origin.

There is a region of granitic highlands in the northeast, representing the last spurs of the Anam chain, and reaching a height of 2300 feet. The Mekong separates into three arms in Cochinchina, and together with many smaller rivers forms a network of waterways. The Province of Saigon is watered by the rivers Saigon, Donnai, and the two Vaicos. The delta-land, almost wholly covered with rice-fields and gardens, is frequently inundated, and the peninsula of Camau is like a great deserted swamp.

Cochin-China lies in the region of the monsoons. Typhoons frequently work great destruction. The healthfulness of the climate varies inversely with the frequency of the rains. The severest heat is in the spring of the year. Places near the seacoast are most favorable to Europeans. The flora is like that of Indo-China in general. The gamboge-tree abounds, but palms are few. The vast forests are rich in the finest kinds of timber. There is game of every sort, from the elephant, rhinoceros, tiger, deer, and wild boar, to the smallest rodents. Among the birds are the peacock, partridge, snipe, woodcock, and pheasant. The rivers contain fish of many species; alligators are numerous. There is little mineral wealth, except phosphate of lime and salt. Most of the inhabitants are agriculturists and fishermen. About one-fifth of the area is cultivated, and the chief product is rice, which amounted in 1900 to 607,800 tons. The coffee-culture is rapidly growing. There were 429,228 coffee-plants in 1899, mostly belonging to Europeans. Sugar-cane, mulberry-leaves, pepper, betelnuts, cotton, tobacco, maize, and various valuable grasses, seeds, gums, and drugs are also produced. There are 200,000 water-buffaloes and 150,000 zebus employed in labor. There are no native industries worthy of mention, except the manufacture of salt and of coarse silk stuffs.

There are few good roads; but the innumerable little streams give easy access to all parts of the country, and new canals have been excavated by the French to facilitate commerce. There are 51 miles of railway. Concessions have been granted to build a line from Saigon to Tan-linh. In 1896 there were 2276 miles of telegraph. The chief article of commerce is rice. The minor exports consist of fish, cotton, silk, hides, and pepper. The articles imported are textiles, metals and metal implements, and liquors. The imports and exports for 1900 amounted to 121,675,000 francs and 107,350,000 francs respectively. The principal commercial port of the colony is Saigon (q.v.), the capital. In 1900 573 vessels cleared here, with 770,422 tons. Trade is almost entirely in the hands of the Chinese. There are five banks at Saigon. The local annual budget of 1901 balanced at 4,204,244 piastres.

The colony is represented by a Deputy in the French Parliament. It is divided into four large provinces—Saigon, Mitho, Vinh-long, and Bassac—and twenty districts or inspectorates. The municipalities of Saigon and Cholon are officially designated as 'provinces'. The Lieutenant-Governor is assisted by a Privy Council, composed of all the heads of departments as official members and several unofficial members. Under the Executive is a Colonial Council of fifteen members, seven of whom are natives, partly elected by the residents. The smaller councils in the arrondisse-

ments are often composed entirely of natives. Municipal councils, part French and part native, rule in Saigon and Cholon. Every chief town has a citadel and garrison, and the collection of revenue and the suppression of robbery are secured by military posts in the interior. Besides a varying number of French troops, a force of 2405 native soldiers is maintained. The population in 1898 was estimated at 2,323,499, of whom 4451 were Europeans, 2,054,851 Annamites, 183,659 Cambodians, 65,801 Chinese, and 6374 Mois. The Catholic population numbers about 75,000, and the Buddhist 1,700,000. In 1897 there were 376 schools, with 804 teachers and 18,760 pupils. Cochinchina before the second half of the nineteenth century constituted a part of China, Cambodia, and Annam successively. In 1861 the French took Saigon, and by treaty in the following year acquired the provinces of Saigon, Bienhoa, and Mitho. Hostilities continued until 1879. In 1888 the colony became a part of the Governor-Generalship of Indo-China. The name Cochinchina was formerly applied to the whole eastern division of the Indo-Chinese Peninsula, including Tongking, Annam proper, and Lower Cochinchina. Consult: Lemire, *La Cochinchine française* (Paris, 1887); De Lanessan, *L'Indo-chine française* (Paris, 1888); Norman, *Peoples and Politics of the Far East* (London, 1895); Baurac, *La Cochinchine et ses habitants* (Saigon, 1896-99).

COCHINEAL, kōch'ī-nēl (from Sp. *cochinilla*, cochineal, wood-louse, from Lat. *coccineus*, scarlet, from *coccum*, berry, or from Sp. *cochina*, sow; so called either from the color, or, if the second derivation be preferred, from the shape). A scale-insect used as a dyestuff for scarlet and crimson, and in the preparation of carmine and lakes. Cochineal consists of the bodies of the females of a coccid (see COCCIDÆ) called *Coccus cacti*, because it feeds upon plants of the cactus family, particularly on one known in Mexico as the nopal (*Opuntia cochinillifera*), nearly allied to the prickly pear. (See CACTUS.) These insects are minute, 70,000, it is said, being required to weigh a pound in a dried state—when not adulterated by red lead or other heavy dust. The male is of a deep-red color, and has white wings. The female, which is wingless, is deep-brown, covered with a white powder; flat beneath, convex above. Branches of nopal covered with insects are cut off before the rainy season sets in, and carefully sheltered in a covered building. From these supplies the plantations are stocked at the close of the wet season, about the middle of October. When warmed by the sun the females soon begin to lay eggs, each female producing more than 1000 young, which soon spread themselves over the plants. The males are very few—not more than 1 to 100 or 200 females—and are of no value as a dye. The first crop of females is picked off about the middle of December, and until May successive generations are gathered from time to time. The females, full of young, lose about two-thirds of their weight in drying. The process of gathering the insects is extremely tedious, a day's picking amounting only to about two ounces of cochineal. The killing is done in three ways: (1) By placing on a hot iron; (2) by placing in a hot oven; and (3) by dipping in a basket into boiling water, which is considered the best method. When killed and dried, they

may be kept for any length of time without injury. The name 'cochineal' is limited to that species first cultivated in Mexico, but long transplanted successfully to the Canary Islands, Java, and other warm parts of the Old World. Other species were known to the ancient Hebrews and Egyptians, and were largely cultivated on a species of oak. Among the Arabs this insect is known as *kermes*, 'red dye,' and it is largely cultivated in Algeria (*Knowledge*, London, 1991). Cochineal was formerly much used for coloring wool or silk a scarlet or crimson; but, owing to the cost of its production, and to the fact that the colors, although brilliant, are not very enduring, this dye has been greatly replaced by cheaper coal-tar products; and, for this reason, the cochineal industry has been rapidly declining. See CARMINE.

COCHITUATE (cô-chit'û-ât) LAKE. A lake in Middlesex County, Mass., 17 miles west of Boston. It is very narrow and irregular, with a length of about four miles, and has an area of little more than one square mile. From this lake and the connecting ponds, the city of Boston draws its principal supply of water (Map: Massachusetts, E 3).

COCHLEA, kôk'lê-â. See EAR.

COCHLEARIA, kôk'lê-â'rî-â. See SCURVY-GRASS.

COCHRAN, JOHN (1813-98). An American soldier and lawyer. He was born in Palatine, N. Y., graduated at Hamilton College in 1831, served as Surveyor of the Port of New York from 1853 to 1857, and from 1856 to 1862 was a Democratic member of Congress, where he took a prominent part in the debates on land reform, revenue, and other public questions. At the outbreak of the Civil War he became colonel of the First United States Chasseurs, which he commanded in the Peninsular campaign. In June, 1862, he was appointed brigadier-general of volunteers, but resigned his commission in June, 1863, on account of failing health. In 1864 he was nominated for the Vice-Presidency on the ticket with John C. Frémont. As leader of the New York delegation to the Cincinnati Convention in 1872, he was instrumental in securing the nomination of Horace Greeley (q.v.) for the Presidency.

COCHRANE, kôk'ran, THOMAS, tenth Earl of Dundonald (1775-1860). A British admiral, familiarly known as Lord Cochrane. The son of the ninth Earl of Dundonald, he was born at Annsfield, Lanarkshire, December 14, 1775. His father, a scientist, ruined himself by experimental invention, and Thomas received such desultory education as was volunteered by the village minister and schoolmaster. He was destined for the army, but in his seventeenth year joined his uncle's ship, on which he had been enrolled five years previously, and, in consequence of this priority, received rapid promotion. After serving in the Norway fiords and on the North American station, he won recognition in 1801 by a successful series of daring exploits in the Mediterranean, the most brilliant being the capture of a Spanish frigate of 600 tons and 319 men, which had been sent in quest of his small brig of 158 tons and 54 men. Shortly afterwards his vessels were captured by three French line-of-battle ships, after several hours' resistance, but he was himself immediately released on parole. In 1802 he took advantage of the peace to repair his defective early education by a six months' assiduous course at Edinburgh University. He had imprudently offended Lord Saint Vincent by a comparison, and at the renewal of hostilities in 1803 he was maliciously appointed to the stagnant Orkney station to protect non-existent fisheries. But with a change of admiralty in 1804, he received a new ship, and within ten days captured several prizes. By a daring ruse he cleverly evaded a squadron of French battle-ships and sailed his prizes into Plymouth Harbor, three golden candlesticks, each five feet high, decorating his mastheads as specimens of spoil. In 1806, after a rejection, owing to his refusal to bribe the electors, he was returned as member of Parliament for Honiton. The next year he was elected for Westminster, but his indiscriminate exposure of naval abuses led to his being immediately ordered off to the Mediterranean. During four years he added to his reputation by a sequence of minor naval exploits, and in 1809 was selected to burn out the French fleet which Lord Gambier had blockaded in Aix Roads, near Rochefort. He drove almost the whole squadron ashore, and destroyed four ships; but, as he was unsupported by his superior, Gambier, who deliberately ignored his signals, the victory was incomplete. Cochrane received the Knighthood of the Bath, but he emphatically expressed his disgust at the incompetency of Gambier, who demanded a court-martial. Through influence and a friendly court, Gambier was exonerated, while Cochrane, discredited, was forced to retire on half pay. In Parliament Cochrane continued his unsparing criticism of naval corruption, and thereby he made enemies who were glad to encompass his downfall, when, through a French officer who had applied to him for service, and whom he delivered to justice, he was implicated in an attempt to influence the stock market by spreading the rumor of Napoleon's death. His uncle and another were found guilty and punished; and Cochrane, although innocent, was fined £1000, struck off the navy list, expelled from Parliament, degraded from his knighthood, sentenced to a year's imprisonment, and to stand for an hour in the pillory. Owing to popular indignation, the pillory punishment was omitted. His Westminster constituents remained his friends and reflected him. He escaped from jail in 1815, took his seat in the House, but was expelled by force, imprisoned for the rest of his term, and fined anew £100. Disgusted with vain attempts at justification, he accepted an invitation to organize the Chilean Navy, and in 1818 proceeded to Valparaiso. He put the wretched Chilean vessels into the best possible condition, and gained a series of remarkable successes over the Spanish fleet. In 1820 he took Valdivia and carried San Martin's army to Peru, having previously destroyed Spanish commerce on the Pacific coast, and performed a brilliant exploit in cutting out the Spanish frigate *Esmeralda* from under the enemy's guns at the Castle of Callao. Non-fulfillment of contracts and the refusal of arrears of pay caused him to resign, and soon afterwards he became admiral in the Brazilian Navy. During this appointment (1823-25) he compelled the Portuguese to evacuate Bahia, reduced Maranhão, and for his services received the marquisate of Maranhão; but the same causes as in the Chil-

ean service led to his resignation from the Brazilian. His next appointment was the command of the Greek Navy (1827-28); but an insufficiency of ships and men prevented the accomplishment of anything of importance. In 1831 he succeeded to the Dundonald peerage; in the following year, William IV. satisfied a general wish by granting him a free pardon for the offense of which he had been convicted, and in 1847 Queen Victoria reinstated him in the Order of the Bath and to his naval rank. In 1877 his heirs received compensation for his unjust condemnation in a restoration of eighteen years' loss of pay and allowances as a naval officer. From 1848 to 1851 he was commander-in-chief of the North American and West Indian stations, and became rear-admiral of the United Kingdom in 1854. To an advanced age he busied himself with scientific inventions for the navy, and early recognized the advantage of steam-power and of the application of the screw propeller to warships. He published: *Notes on the Mineralogy, Government, and Condition of the British West India Islands* (1851); *Narrative of Services in the Liberation of Chile, Peru, and Brazil* (1859); and an *Autobiography* (2 vols., 2d ed., 1860); the same completed by the eleventh Earl and H. R. Fox Bourne (2 vols., London, 1869). He died at Kensington, and was buried in Westminster Abbey. Consult: Fortescue, *Dundonald* (London, 1895), and Atlay, *Trial of Lord Cochrane Before Lord Ellenborough* (London, 1897).

COCINERO, kō'sè-ná'rō (Sp., cook). The name of various species of West Indian crévalle (q.v.).

COCK, THE. A primitive tavern or alehouse on Fleet Street, near Temple Bar, London, with decorations of the period of James I. It is a famous resort, and is well known through Tennyson's "Will Waterproof's Lyrical Monologue." The same name was borne by several other London taverns, of which one on Threadneedle Street was specially renowned.

COCKADE (Fr. *coarde* or *coquarde*, from *coq*, cock). A word first found in the works of Rabelais, and in the early part of the seventeenth century used to designate a cocked hat or cap set jauntily on the head. Later on, however, it acquired a more restricted meaning, and was applied to the clasp or knot of ribbon which decorated the loop or cock of the hat. The word is now employed to designate a rosette or knot of ribbon, leather, or other material worn on the hat as a badge or ornament. Cockades have always been used as party badges and insignia since the War of the Spanish Succession, when the red and white cockade was adopted by the French. In England the Stuart cockade was white, the Hanoverian was black, and frequent references to the rival colors are to be met with in the literature of the time. As early as 1767, a regulation in France provided that every French soldier should 'mount the cockade,' the color being white; and a later decree, in 1782, restricted the wearing of cockades to the military. From this period till the outbreak of the French Revolution the cockade was an exclusively military emblem, and 'to mount the cockade' was synonymous with becoming a soldier, both in France and England. After the meeting of the States-General of France in 1789, cockades of green were worn by the advanced party, but

these soon gave way to the more popular red, white, and blue—the tricolor of the Revolution. See **TRICOLOR**.

Every nation of Europe has its own cockade. In Germany, black, yellow, and white, and black, red, and gold have been used; in Austria, black and yellow; in Russia, green and white. In England the cockades worn are always black—the old Hanoverian color; but being used, generally, as part of the livery of coachmen and footmen, they have lost all special significance. Consult: *Genealogical Magazine*, vols. i-iii. (London, 1897-99); Racinet, *Le costume historique* (6 vols., Paris, 1888).

COCKAIGNE, kōk-ān'. A name given to an imaginary land of good things—of idleness, luxury, and perfect happiness. The word appears in a variety of spellings in English and French, and means the 'land of abundance.' In it the rivers flowed with wine, the houses were built of dainties, and cooked fowls offered themselves for eating. Its English synonym is 'lubberland.' It is the subject of a popular satirical poem of the thirteenth century, *The Land of Cockaigne*, and is a burlesque term applied to London and to Paris.

COCK AND THE FOX, THE. A modernized version of Chaucer's *Nun's Priest's Tale*—made by John Dryden and published, with other translations, under the title of *Fables*, in 1699, shortly before his death.

COCK'ATIEL (from Dutch *kakatielje*, from Port. *cacatillo*, *cacatello*, cockatoo). One of the small, long-tailed Australian parrots of the genus *Calopsitta*, sometimes called 'cockatoo parakeets,' or 'ground parakeets,' particularly the favorite cage-bird *Calopsitta Nova-Hollandia*. This pretty species is found wild nearly all over Australia, where it goes about in flocks, and nests in hollow trees. It is about 12 inches long, half of which belongs to the tail, which ends in two prolonged and sharply pointed feathers. "The prevailing hue is dark-gray, . . . the forehead and cheeks are lemon-yellow, while the feathers of the crest, which cannot be depressed, are yellow at the base and gray above. A bright patch of reddish orange on the ear-coverts occupies the middle of the yellow area, and the . . . wings are ornamented with a broad band of white." See **COCKATOO**, and Plate of **PARROTS AND PARAKEETS**.

COCK'ATOO' (Hind. *kākātāu*, Malay *kakātāu*, onomatopoeic from its cry). A bird of the family *Cacatuidæ*, of the order *Psittacæ* (q.v.). They are closely related to the true parrots, and by some ornithologists are regarded as merely a subdivision of that family. The bill is high and curved from the base, and the tail is long, broad, and rounded. The head is also large, and in the true cockatoos is surmounted by a crest of long and pointed feathers, with their tips directed forward, which can be erected and expanded like a fan or depressed at the pleasure of the bird. The true cockatoos (*Cacatua*) are generally whitish in color, often finely tinged with red, orange, or other colors. The name 'cockatoo,' however, is also commonly extended to nearly allied genera, as *Calyptorhynchus* and *Microglossus*, in both of which the plumage is generally dark, and to which belong the black cockatoos of Australia and of the Indian Archipelago.

COCKATOOS AND MACAWS

1. ROSEATE COCKATOO (*Cacatus roseicapillus*).
 2. WESTERN BLACK COCKATOO (*Calyptorhynchus stellatus*).
 3. BILL OF NO. 2—front view.

4. GREAT BLACK COCKATOO (*Microglossus aterrimus*).
 5. BLUE-FRONTED MACAW (*Ara chloroptera*).
 6. GREEN-WINGED MACAW (*Ara nobilis*).
 7. SLENDER-BILLED COCKATOO (*Lichmetis nasica*).

The genus *Microglossus*, one of which is the great black cockatoo or ara (q.v.) of New Guinea (*Microglossus alarrimus*), the largest of all the Psittaci, is remarkable for the structure of its tongue, which is cylindrical, tubular, capable of being greatly protruded from the mouth, and terminates in a cloven, horny tip. All the cockatoos are natives of the Philippines, New Guinea, and adjacent islands, and especially of Australia and Tasmania, where they formerly abounded, and were hunted for food by the natives. They live on fruits and seeds, insect larvæ, etc. Some of them are frequently to be seen in confinement in Europe, particularly the lesser sulphur-crested cockatoo (*Cacatua galerita*), which, although of comparatively tame plumage, is a general favorite on account of its docility. None of the cockatoos learn to speak many words. Their name is derived from their cry. See Plate of COCKATOOS AND MACAWS. Compare PARROT.

COCKBURN, Kōbūrn. Sir ALEXANDER JAMES EDMUND (1802-80). Baronet. Lord Chief Justice of England. Born December 24, 1802, the son of Alexander Cockburn, who was at one time British Minister to Colombia, he was brought up on the Continent, and in 1822 entered at Trinity Hall, Cambridge, and was called to the bar in 1829. He was very successful as a practitioner, and in 1841 was made a Queen's counsel. His early practice was largely in connection with election petitions, in which he was very successful. In 1847 he was elected to Parliament as a Liberal from Southampton, and distinguished himself by the ardor and eloquence with which he supported the vigorous foreign policy of Palmerston. From this time on his promotion was rapid. In 1850 he was appointed Solicitor-General, and in the next year was promoted to the Attorney-Generalship. In 1854 he was made recorder of Bristol; in 1856 he was appointed Chief Justice of the Court of Common Pleas, and in June, 1859, he became Lord Chief Justice of England. In 1858 he succeeded to the baronetcy of his uncle, the Dean of York. It fell to his lot, as a judge of the Queen's Bench, to conduct the trial of the celebrated Tichborne case (q.v.). His distinguished position as the head of the British bench was emphasized by his appointment in 1871 to represent Great Britain in the international court of arbitration convened for the settlement of the long-standing controversy between that country and the United States over the Alabama claims (q.v.). For a sketch of his life, consult the *Law Magazine* for 1851, page 193, and 4th series, vol. vi., page 191; also *Law Times*, vol. xx., pages 68-88.

COCKBURN, ALICIA, or ALISON RUTHERFORD (1712-94). A Scotch ballad-writer. In 1731 she was married to Patrick Cockburn, of Ormiston, an advocate, and subsequently became acquainted with Burns, Hume, Lord Monboddo, and other celebrities of the day. Her lyric, "I've Seen the Smiling of Fortune Beguiling" (to the air of "The Flowers of the Forest"), has long been famous. She was one of the belles of Edinburgh, a graceful dancer, and an indefatigable letter-writer. A relative of Walter Scott's mother, she all of her life sustained friendly relations with the poet and novelist.

COCKBURN, CATHERINA TROTTER (1679-1749). An English dramatist and philosophical

writer, born in London. She wrote several plays, among which may be mentioned: *Agnès de Castro* (1696); *Fatal Friendship* (1698); *Love at a Loss* (1701); and *Revolutions of Sweden* (1706). She is also known for her defense of the philosophy of Locke, and later for championing the views of Dr. Samuel Clarke. A collection of her prose works was published with a *Memoir* by Birch (London, 1751).

COCKBURN, Sir GEORGE (1772-1853). An English naval officer. His operations against Martinique brought about the surrender of that island in 1809. He was active in the war with the United States in 1812-15, planning and executing with General Ross the marauding expeditions along the shores of Chesapeake Bay, and burning the public buildings in Washington. His last noteworthy sea employment was to convey Napoleon to Saint Helena, where he remained in 1815-16 as governor and commandant. He rose to the rank of admiral, was several times returned to Parliament, and was one of the Lords of the Admiralty.

COCKBURN, GEORGE RALPH RICHARDSON (1834—). A Canadian educator and member of Parliament. He was born in Edinburgh, Scotland; graduated at the university there in 1857; studied for several months in Germany and France, and in 1858 went to Canada, where in 1861 he became principal of Upper Canada College, which office he held for twenty years. From 1887 to 1896 he was a member of the Canadian Parliament. He has always warmly advocated British imperial federation. In 1893 he was chief commissioner from Canada to the World's Fair at Chicago.

COCKBURN, HENRY THOMAS, Lord (1779-1854). A Scottish advocate and judge. He was born in Edinburgh in 1779, and was educated at the high school of Edinburgh and afterwards at Edinburgh University. He was called to the Scottish bar in 1800, and seven years later was appointed one of the advocates whose duty it is to assist the Lord Advocate in the prosecution of criminal offenders, but was dismissed after holding office four years. Not till the introduction of jury trial in civil causes into Scotland, in 1816, did Cockburn find opportunity for remunerative professional employment. His powers were better adapted for success with a popular than with a professional tribunal. Under the Grey Ministry of 1830 he was appointed Solicitor-General for Scotland; and four years later he was made one of the judges of the Scottish supreme civil and criminal courts, and took the title of Lord Cockburn. He died April 26, 1854, at his residence of Bonaly, in the neighborhood of Edinburgh.

Lord Cockburn contributed to the *Edinburgh Review* a series of articles on the reform of the Scotch legal procedure, which had considerable influence. Late in life he undertook the task of writing the biography of his friend Francis Jeffrey, the celebrated Scotch essayist and judge. This was published in 1852. Cockburn will be best remembered by the *Memorials of His Time*, which appeared posthumously in 1856. It is a kind of autobiography, into which have been interwoven numerous anecdotes illustrating old Scotch life, and numerous sketches of the men who composed the brilliant circle of Edinburgh society at the beginning of the nineteenth century.

For details of his life, consult his *Memorials of His Own Time*, and Chambers's *Biographical Dictionary of Eminent Scotsmen*.

COCKCHAFFER. See CHAFFER.

COCKER. A small dog. See SPANIEL.

COCKER, EDWARD (c.1631-75). An English engraver and teacher. He was born probably in Northamptonshire, and died in London. The first edition of his famous arithmetic (which was the first to confine itself to commercial questions only) was published posthumously in 1678, by John Hawkins. At one time it was thought (following De Morgan's belief) that Hawkins wrote this work, but the evidence is against this view. Its popularity lasted nearly a century, and its sale probably exceeded 100 editions. The expression 'according to Cocker' became proverbial through its frequent use on the title-pages of arithmetical treatises following his method. Cocker's chief works are: *Tutor to Arithmetic* (1664); *Compleat Arithmetician* (before 1669); *Arithmetic*, edited by Hawkins (1678); and numerous contributions to methods of calligraphy.

COCKERELL, kōk'ēr-el, CHARLES ROBERT (1788-1863). An English architect, born in London. In 1810-17 he visited Greece, Italy, and Asia Minor to study ancient architectural remains, made excavations at Ægina and other places, and enriched the British Museum with many rare and valuable fragments, notably from the temple of Jupiter Panhellenius at Ægina and Apollo Epicurius, near Phigaleia. He became surveyor of Saint Paul's Cathedral in 1819, chief architect of the Bank of England in 1833, and a member of the Royal Academy in 1836. From 1840 to 1857 he was professor of architecture in the Royal Academy. He was the designer of many public buildings, such as the Hanover Chapel in London, and the Taylor Buildings at Oxford. His works include: *The Temple of Jupiter Olympius at Agrigentum* (1830); *Ancient Sculptures in Lincoln Cathedral* (1848); and *Iconography of the West Front of Wells Cathedral* (1851).

COCKERILL, kōk'ēr-il, JOHN (1790-1840). An English manufacturer, born at Haslingden. With his brother, Charles, he established in Berlin a successful woolen-factory, and subsequently at Seraing, near Liège, Belgium, an iron-foundry and machine-shop, which became the largest on the Continent. King William I, of the Netherlands was for a time a partner in this business.

COCK'ERMOUTH. A town of Cumberland, England, at the confluence of the Cocker and Derwent, 25 miles southwest of Carlisle (Map: England, C 2). It is situated in an agricultural district, and in the vicinity are extensive coal-mines. On the left bank of the Cocker are the ruins of a castle built in the eleventh century and destroyed by the Parliamentarians in 1648. Near by is a tumulus, with a Roman camp and ditch, where many ancient relics have been found. The town was the birthplace of the poet Wordsworth. It has woolen and flax mills and manufactures hats, paper, hosiery, etc. Population, in 1891, 5464; in 1901, 5400.

COCK-FIGHTING. This is a sport of the highest antiquity, and to-day is the great pastime of millions, in the place of its origin, the far Orient, as well as a favorite sport in many

Western nations, including practically all Latin America. It is noted in the earliest records of China, it was a common pastime of the Persians long before the Greek invasion, it existed in ancient Rome, and Fitzstephen vouches for it in England in the twelfth century. Ascham, the tutor of Queen Elizabeth, was charged with being "too much given to dieing and cock-fighting," and is known to have had the intention of writing "a book of the Cock-pitte." Cock-pits existed in the metropolis of England (as they did in New York) well into the nineteenth century. Pierce Egan describes the Cock-pit Royal in Fulton Street, Westminster, as a large, lofty, and circular building with seats rising as in an amphitheatre. In the middle of it was a round, matted stage of about 18 to 20 feet in diameter, rimmed with an edge 8 or 10 feet high, to keep the cocks from falling over into the auditorium in their combats. There was a chalk ring in the centre of the matted stage, about a yard in diameter, and another chalk-mark within it, much smaller, which was intended for the setting-to when the birds become too exhausted to make hostile advances toward each other; they were then placed back to back within the inner mark. A large and rude branch candlestick was suspended low over the mat on the nights of battle. This description will practically suffice for all cock-pits.

GAME-COCK, WITH STEEL SPURS.

The origin of the breed of game-cocks is lost in an obscurity as dim as that of the origin of the sport. The jungle-cock of India may have been its progenitor; he has the constitutional instinct of fighting highly developed. To-day there are various strains—'Warhorses,' 'Fannie Carters,' 'Eslin Red Quills,' 'Arkansas Travelers,' 'Gordons,' 'Cotton Bolls,' 'Transatlantics,' and 'Hustlers,' are only a few of those which are favorites in the Carolinas, Virginia, and Georgia.

The 'Warhorse' strain is generally admitted to rank the highest, though 'Eslin Red Quills' and 'Gordons' run them close. The 'Warhorses' are the product of a cross between brown and black birds imported from Ireland, and called 'Irish Gelders,' and some dark-gray Irish birds. The resulting birds soon after their introduction fought all through the South, defeating the then fashionable 'Shawnecks,' 'Baltimore Topknots,' and 'Dominiques.' The breed is still maintained in its integrity, and its reputation has spread from the Southern States to Mexico. The cocks are mostly gray, and they are preferred to the red ones; the hens are nearly all jet-black.

The game-cock needs neither education nor experience to teach him to fight, and his capacity for giving and taking punishment till dead has passed into a proverb. The principal qualities to be desired are (1) cutting, i.e. the ability to hit with their heels, about every time they rise, and to rise every time their opponents do; (2) hard hitting—the blows of the heels driven home by the force of the wings applied to them as the cocks rise; (3) rapidity of fighting. Cocks may be good cutters which are not hard hitters, but disable or kill their antagonists without apparently heavy blows. Others are what are called wing-fighters, from making a great noise and shuffling with their wings, but scarcely using their legs at all; these are practically worthless.

A good breed is not the only prerequisite to victory: the birds must be judiciously strengthened and hardened by a course of diet and physical training to stand the great exertion necessary. This period used to extend over six weeks, but modern methods have reduced it to ten days, during which time they are restricted to a prescribed diet, and exercised in running and sparring. Then they are 'cut out,' i.e. have their wings trimmed to spread diagonally, the tail cut about one-third of the distance from the end, and the hackle and feathers about the rump shortened. If they fight with 'short heels' the gaffs or spurs are $1\frac{1}{2}$ inches long; if with 'long heels' $2\frac{1}{2}$ inches long; these gaffs or spurs are of steel, though some of the old aristocrats had them made of silver. The birds are matched by weight; those within two ounces of each other's weight are matches. The fights are conducted according to the local rules of the district, which vary considerably, although the variations are all modifications of the old English rules. Distinct sets of rules govern the United States and Canada; another set, England; yet others, France and Belgium.

When the pairs have been matched they are taken to the ring, examined and certified, and turned down to fight, on the ground (matted or carpeted or otherwise as the case may be). After that the setters-to are not to touch them, unless they either hang in the mat, or on each other, or on the edge of the pit, until they leave off fighting as long as a person can count a prescribed number aloud. Then the setters-to take up the cocks, carry them into the middle of the pit, deliver them on their legs, beak to beak. After each cessation of the combat, they are set to again in the same manner, and continue the fight until one cock refuses or is unable to fight, or is killed.

Large sums used to be staked, as much as \$5000 a match and \$25,000 a main having been

laid by the Earl of Derby in 1830. His birds are a famous breed to the present day. The Welsh main (now discontinued) was the most sanguinary form of fighting; as many as sixteen cocks would be matched; then the eight victors, then the four survivors, then the final two, until but a single cock remained alive.

During the latter half of the nineteenth century the sport of cock-fighting was made illegal throughout Great Britain. In America it is similarly prohibited in nearly all the States of the Union, either expressly or by laws for the prevention of cruelty to animals. In some States, where it is not forbidden by the statutes of the State, it is in some instances made illegal by local laws.

For early history, consult: Markham, *The Pleasures of Princes, or Goodmen's Recreations* (London, 1614); Fairfax, *Complete Sportsman* (London, 1764); Blain, *Rural Sports* (London, 1853).

COCK LANE GHOST, TIE. A supposed ghost, whose manifestations occurred in 1762 in Cock Lane, London, in connection with a young girl named Parsons and her parents. Investigation disclosed a conspiracy against a former resident, Mr. Kent, whose wife had died, and who was supposed to be accused by her ghost of murder. Parsons and his wife were punished. Among the investigators was Dr. Johnson, who described the mysterious occurrences in the *Gentleman's Magazine*, and who, because of his connection with the matter, was made the object of attack in Churchill's poem, "The Ghost." Consult Lang, *Cock Lane and Common Sense* (London, 1894).

COCKLE, kōk'l (Fr. *coquille*, shell, from Gk. *κογχύλιον*, *konchylion*, dim. of *κογχύλη*, *konchylē*, from *κόγχη*, *konchē*, shell, Lat. *concha*, Skt. *śankha*, shell), *Lychnis*. A genus of plants of the natural order Caryophyllaceae. The common cockle or corn-cockle (*Lychnis githago*) is a frequent weed among crops of grain, a native of Europe or the west of Asia, but now to be found in almost all parts of the world. For illustration, see Plate of CRANBERRY. It is an annual plant, clothed with long, white, appressed hair; three feet high, branched, with large, solitary, terminal reddish-purple flowers. The root, stem, leaves, and seed were formerly used in medicine; the seed is still sometimes sold in Germany under the name of 'black cumin' (Schwartz-kümmel). The corn-cockle is a very troublesome weed in some parts of Great Britain and the United States. The seed can hardly be screened from wheat, and in some localities millers reduce the grade of grain on account of the presence of cockle. Sowing clean seed is about the only means of combating it, aside from pulling the plants from the field.

COCKLE. A globose marine bivalved mollusk, especially of the family Cardiidae, often called 'heart-cockle' because, viewed endwise, the outline of the shell is like that of the ace of hearts. Cockles are usually gregarious, and vast numbers are found half-buried on sandy and muddy banks. The common European cockle (*Cardium edule*) is a valuable shell-fish, extensively sold in Great Britain; other species are less commonly eaten elsewhere. The number of known species is great; they are most numerous within the tropics, and particularly in the Indian Ocean, where some have shells very

beautiful in sculpture and coloring. The shell upon which Venus is represented, in ancient art, as riding upon the sea is a cockle; and several other genera, such as Venus, Cytherea, Selene, etc., are named in reference to this myth. Consult Lovell, *Edible Mollusks of Great Britain*, etc. (London, 1884); and see Colored Plate of CLAMS AND EDDIBLE MUSSELS.

COCKLEBUR, or **CLOTEUR**. A name given to the species of Xanthium, a genus of Compositae, of which there are but few species, but these are widely distributed. Three species are all too common in the United States—Xanthium spinosum (called spiny clotbur) and Xanthium strumarium, both of which were probably introduced from the Old World, and the native species, Xanthium Canadense. For illustration, see Plate of CORNFLOWER. They are coarse, annual, branching plants, one to three feet high, with alternate, rough, heart-shaped leaves. The stem is frequently spotted with brown or purple. The flowers are in separate groups, the female ones furnishing the well-known burs, which are about an inch long and covered with stout hooked prickles. These are troublesome to animals, especially to sheep, the wool of which is often seriously depreciated by their presence. The seeds contain two cells with an ovule in each. These retain their vitality for a long time, and both do not germinate in the same season. Being an annual, this weed can be exterminated if it be prevented from seeding for a number of years. In the south of Africa stringent laws for its eradication were enacted on account of the injury to the wool industry.

COCKLOFT, **PINDAR**. The *nom-de-plume* used by Washington Irving in *Salmagundi*.

COCK'NEY. A word of disputed origin, used as a general term for a Londoner, more specifically for one "born within the sound of Bow-Bells." It has been connected with cognac or cockaigne, and with the Thames, which is said to have been called the Cockney.

COCKNEY SCHOOL OF POETRY. A nickname which John Gibson Lockhart tried to fasten upon a school of writers, including Leigh Hunt, Keats, and Hazlitt, whom he thought vulgar. Their productions were said "to consist of the most incongruous ideas in the most uncouth language." Consult the articles "On the Cockney School," in *Blackwood's Magazine* (Edinburgh, October and November, 1817), where the expression was first used; also the article on Keats's "Endymion," in *Quarterly Review* (London, April, 1818).

COCK-OF-THE-PLAINS. See GROUSE.

COCK-OF-THE-ROCK (so called from building its nest on rocks). A remarkable bird of northern South America, representing a sub-family (Rupicolinae) of the cotingas, three forms of which are known. The most familiar is *Rupicola crocea*, inhabiting the Lower Amazon Valley; it is about the size of a large pigeon, almost purely orange in plumage, and has a remarkable flat-sided crest. Two other species (or varieties) are found higher up the Amazon, and in Ecuador. In each case the female is dull olive-brown and uncrested. They inhabit rocky water-courses and bushy hillsides, where they remain close to the ground and build their nests, largely of mud, on some rock. They are among the birds which court the females by assembling for

'dances' in certain cleared spaces, each displaying its showy plumage by queer antics until chosen by some observant hen.

Great numbers of these splendid birds are shot annually, as their skins not only command a high price for millinery purposes, but are much employed by the Indians in making a variety of beautiful decorations, and they are thus becoming rare. A large state mantle, formerly worn by the Emperor of Brazil, was entirely composed of their feathers; and in some districts of South America, it is said, the natives are, or were, compelled to bring a certain supply of skins as tribute. Their flesh is well-flavored, but of a very peculiar color, being bright orange-red. The cock-of-the-rock is much valued by residents of the Amazon Valley as a cage-bird. Consult Hudson, *A Naturalist in the La Plata* (London, 1892). See Plate of COINGAS.

COCK-OF-THE-WOODS. See CAPERCAILLIE.

COCKPIT. In old sailing men-of-war the apartment in which the wounded were placed during the engagement. It was ordinarily below the water-line on the orlop deck, and served, under ordinary circumstances, as a broad passageway to the storerooms on each side of it. At one time the warrant officers were quartered in the forward cockpit, and occasionally other officers, for whom there was no room on the decks above, were quartered in staterooms opening from the after one, where storerooms were ordinarily placed.

COCK-PIT, **THE**. A London theatre of the seventeenth century, changed from a cock-pit, on Cockpit Alley, the present Pitt Place. It was succeeded by the Phoenix Theatre, which in turn was replaced by the Drury Lane Theatre.

COCKRAN, kōk'ran, WILLIAM BOURKE (1854—). An American lawyer and politician. He was born in Ireland, was educated in that country and in France, shortly after his arrival in the United States, in 1871, was appointed teacher in a private academy, and subsequently became principal of a public school in Westchester County, N. Y. He studied law at the same time, was admitted to the bar in 1876, and soon took a prominent part as a Democrat in State politics. In 1882 he became counsel to the sheriff of New York City, and was reappointed in 1885. He was elected to Congress in 1886 and again in 1891; opposed the nomination of Cleveland for the Presidency; in 1896 supported McKinley; and in 1900, advocated the election of Bryan. He is an eloquent and polished, though somewhat florid, speaker.

COCK'RELL, FRANCIS MARION (1834—). An American lawyer and politician. He was born in Johnson County, Mo., graduated at Chapel Hill College in 1853, and practiced law for some time at Warrensburg, Mo. During the Civil War he served in the Confederate Army, in which he rose to the rank of brigadier-general, and since 1874 has been a Democratic member of the United States Senate.

COCKROACH, or **ROACH**. An orthopterous insect of the family Blattidae, several species of which are household pests throughout the civilized world. Those most common are: (1) The Croton-bug (*Blatta Germanica*), so called from its becoming noticeable in New York when Croton water was introduced, but which is of

foreign origin, and of cosmopolitan range, having followed civilized man to all parts of the globe; it is of medium size, brown or yellowish, with wings, in the adult, extending beyond the abdomen. (2) The Oriental or proper cockroach (*Periplaneta Orientalis*) is also a widely distributed pest, introduced from the East. Although it is not at all related to the beetles (Coleoptera), its British name 'black beetle' well describes its dark, shining, robust appearance; its wings are characteristically shorter than the abdomen. (3) The American cockroach (*Periplaneta Americana*) probably originated in tropical America, whence it long ago spread to most of the seaport cities of the world; it is large and reddish brown, with very long wings. (4) The Australian cockroach (*Periplaneta Australasiae*), much like the American, but smaller. In addition to these, which frequent houses, bakeries, warehouses, and shipping, there are a large number of wood-cockroaches but rarely seen.

that they serve as scavengers to a small degree, and are the enemies of bedbugs.

Consult: for extended illustrated accounts of species above mentioned, Marlatt, *Household Insects* (Department of Agriculture, Washington, 1896; revised reprint, 1902); for general account of the Blattidae, De Saussure, *Mélanges Orthoptérologiques*, fascicule ii. (Geneva, 1878); for structure, Carpenter, *Insects: Their Structure and Life* (London, 1899).

Fossil Forms. During the latter part of the Paleozoic era cockroaches seem to have been very abundant, and to have formed the dominant feature of the insect life of that time. Their remains are present, though much less abundantly, in the Triassic rocks also, and some have been found in the Tertiary. The total number of fossil species is about 225, of which number 193 species are Paleozoic, and of these 133 are American. The Paleozoic cockroaches are as a rule larger, and have broader bodies than do the modern species. Their wings are quite common

COCKROACHES INFESTING HOUSES.

1, The American cockroach (*Periplaneta Americana*). 2, Egg-capsule or 'pod' of the same (somewhat enlarged); a, side view; b, end view; the dotted figure shows the natural size. 3, Australian roach (*Periplaneta Australasiae*); natural size. 4, Croton-bug, or German roach (*Blatta Germanica*); natural size. 5, Its egg-capsule; double size. 6, Oriental cockroach, or 'black beetle' (*Periplaneta Orientalis*); natural size.

Roaches as a group prefer warm, moist places. They go abroad mainly at night, and thus often escape notice even where they are abundant; and their excessively flattened body permits them to creep into very narrow crevices—below baseboards, in table-drawers, etc., where the eggs ('nits') are laid, surrounded by a peculiar 'pod;' but they are often carried by the female until nearly ready to hatch. The new-born young have nearly the same shape as the adult, but are wingless and pale in color. They are practically omnivorous, injuring all kinds of provisions, eating parts of books, blackened boots, and even the nails and eyelashes of sleeping children. The loss caused to provisions by their appetite is far surpassed by the remaining food being rendered unfit for human use, on account of the nauseous 'roachy' odor noticed wherever they congregate in large numbers. Their only claim to credit is

in the shales of the Coal Measures and Permian at several localities, such as Richmond, Ohio; Cassville, W. Va.; Mazon Creek, Ill.; and Commeny, France. At a few localities the larval forms (nymphs) have been found and described under the generic name *Dipeltis*. The cockroach wings of the Coal Measures are usually found in shales that are replete with the leaves of ferns. One of the commonest ferns is *Neuropteris*, and the insect's wings so closely resemble the leaflets of this fern that the likeness has been remarked upon and explained as a case of protective mimicry, adopted by the insect to enable it to elude its pursuers by hiding among the fallen fern-leaves.

For a full history of these insects, with recommendations for their suppression as a pest, consult: Howard and Marlatt, "Principal Household Insects of the United States," in *United States Department of Agriculture, Division of Entomol-*

ogy Bulletin 4, new series (Washington, 1896); also Maill and Denny, *The Structure and Life History of the Cockroach* (London, 1887).

COCKS, RICHARD. A grocer and merchant-adventurer of Coventry, England. He was one of the charter members of the East India Company (1600), merchant at Bayonne, France (1603-08), and one of the seven Englishmen who accompanied Capt. John Saris to Japan, on the first voyage of Englishmen thither. He established the British factory on the island of Hirado in 1613, and began June 1, 1615, to keep a journal, which is now of the greatest value as a contribution to the history of Japan and the foreigners there during the first quarter of the century, and as a picture of manners and customs. The *Diary* ends March 24, 1622. The great hope of the English was to open commerce with China, but they could not successfully compete with the Dutch, who undersold them, and in the end starved them out of the country. In April, 1623, the dissolution of the English factory was decided upon, and Cocks and the other Englishmen arrived at Batavia January 27, 1624. Cocks made many travels through Japan, even to Yedo, meeting Iyeyasu and many native notables and the Korean Embassy. He introduced white potatoes into Japan from Java, and 'Java potato' is still the name applied to this tuber by the Japanese. The diary of Richard Cocks, carefully edited and annotated by Edward Maunde Thompson, with introduction and index, was published in two handsome volumes by the Hakluyt Society (London, 1883).

COCKSCOMB (from its crest, resembling the comb of a cock), *Celosia cristata*. An annual plant of the natural order Amarantaceae, a native of the tropics, and formerly much grown in greenhouses and gardens. It grows with an upright stem, which becomes flattened upward, divides, expands, and forms a sort of wavy crest, covered with pointed bracts, and bearing on its surface many very small flowers. There are both tall and dwarf forms, and a number of colors of each. The plant is of easy cultivation. See AMARANTH.

COCK'S-FOOT GRASS. See ORCHARD GRASS.

COCKSPUR GRASS. See BUR GRASS.

COCKSPUR THORN. See CRATEGUS.

COCKSWAIN. See COXSWAIN.

COCK'TON, HENRY (1807-53). An English humorous novelist, born in London. His works, of which *Valentine Vox*, *the Ventriloquist* (1840), is the best, were very successful in their day. *Stanley Thorne* was illustrated by so distinguished a trio as George Cruikshank, Alfred Crowquill, and John Leech.

COCLE, kō'klēz. HORATIUS, 'the one-eyed.' One of the mythical heroes of ancient Rome. Aided by Lartius and Herminius, he defended the Sublician Bridge against a great army under Lars Porsena, keeping the enemy at bay until the Romans behind them destroyed the bridge. When the bridge was about to fall, Cocles sent his two companions back; and when it had fallen, sheathing his sword and praying the river to favor him, he plunged in and swam safely to the shore. He received for a reward as much land as he could draw a plow around in a day, and a statue in the Comitium. No hero was held in higher honor, and Roman writers never wearied of tell-

ing what Macanlay repeats in his spirited *Lays of Ancient Rome*, "How well Horatius kept the bridge, in the brave days of old."

COCOA, kō'kō. See CACAO.

COCOA BUTTER. A pure white solid fat, obtained from the seeds of *Theobroma Cacao*, having a specific gravity of .945 to .952. It is used in cosmetics and other pharmaceutical preparations, and in the manufacture of confectionery. See CACAO; OILS.

COCOANUT, or COCONUT (Fr. *coco*, Gk. *κοῦκι*, *kouki*, cocoa-tree, from Anc. Egypt. *kuku*, cocoa-tree). The well-known fruit of a species of palm (*Cocos nucifera*), perhaps originally a native of the Indian coasts and South Sea Islands, although there is evidence of its prehistoric occurrence on the west coast of Central and South America. (For illustration, see Plate of PALMS.) It is now diffused over all tropical regions. The coconut palm belongs to a genus having pinnate leaves, and male and female flowers on the same tree, the female flowers at the base of each spadix. There are about 30 known species, nearly all of which are natives of South America. Many of the species prefer dry and somewhat elevated districts. The coconut palm, on the contrary, is seldom found at any considerable distance from the seacoast, except where it has been introduced by man, and generally succeeds best in sandy soil near the sea. It is always one of the first of the larger plants to establish itself in the low islands of the Pacific Ocean, as soon as there is soil enough. It has a cylindrical stem, about 2 feet in diameter, and from 60 to 100 feet high, with many rings marking the place of former leaves, and bearing at its summit a crown of from 16 to 20 leaves, which generally curve downward, and are from 12 to 20 feet in length, with numerous leaflets, 2 to 3 feet long. The flowers proceed from within a large pointed spathe; the fruit grows in short racemes, which bear, in favorable situations, from 5 to 15 nuts; and 10 or 12 of these racemes, in different stages, may be seen at once on a tree, about 80 or 100 nuts being its ordinary annual yield. The tree bears fruit in from seven to eight years from the time of planting, and continues productive for seventy or eighty years. Of the three round, black scars at one end of the shell, the largest one through which an opening is commonly made to get out the *milk* is the destined outlet of the germinating embryo, which is situated there, the kernel consisting generally of the endosperm destined for its nourishment. The thick husk is remarkably adapted to the preservation of the seed, while the nut is tossed about by the waves, until it reaches some shore far distant from that on which it grew.

The coconut affords to the inhabitants of many tropical coasts and islands a great part of their food; it is not only eaten as it comes from the tree, both ripe and unripe, being filled in a young state with a pleasant, milky fluid, but is also prepared in a variety of ways, as in curries, etc.

The kernel of the coconut contains more than 70 per cent. of a fixed oil, called coconut oil, or coconut butter. The oil is itself an important article of commerce, being much employed for the manufacture of 'stearin candles,' and also of a 'marine soap' which forms a lather with

sea-water. It is also employed as an article of food, so long as it remains free from rancidity—to which, however, it is very liable. It is obtained by pressure of the bruised kernel, or by boiling over a slow fire, and skimming off the oil as it floats on the surface. A quart, it is said, may be obtained from seven or eight cocoanuts. It is liquid at the ordinary temperature of tropical countries, but in colder climates becomes a white, solid, butter-like oil. It becomes liquid about 74° F. It can be separated by compression into a liquid portion called 'olein,' and a more solid part termed 'stearin,' or 'cocosin,' which is of complex constitution. The cake resulting from the pressure of the endosperm for its oil is an important cattle-food. Cocoanut oil is not a good lamp-oil, as it chars on the wick and burns with a smoky flame.

The root of the cocoanut palm possesses narcotic properties, and is sometimes chewed instead of the areca-nut. When the stem is young, its central part is sweet and edible; but when old, this is a mass of hard fibre. The terminal bud (palm-cabbage) is esteemed a delicacy, and trees are often cut down for the sake of it. The saccharine sap of the flower-spathes before they open is a source of toddy and palm wine, and by distillation the liquor arrack. In the East Indies the juice is often boiled down to yield sugar (jaggery).

The dried leaves of the cocoanut palm are much used for thatch, and for many other purposes, as the making of mats, screens, baskets, etc., by plaiting the leaflets. The midribs of the leaves supply the natives of tropical coasts with oars. The wood of the lower part of the stem is very hard, takes a beautiful polish, and is employed for a great variety of purposes, under the name of porcupine-wood. The fibrous centre of old stems is made into cordage. By far the most important fibrous product of the cocoanut-tree is coir (q.v.), the fibre of the husk of the somewhat immature nut. If the nuts are allowed to ripen, the coir is coarser and more brittle. The husk of the ripe nut is used for fuel, and also, when cut across, for polishing furniture, scrubbing floors, etc. The shell of the cocoanut is made into cups, goblets, ladles, etc., and is often finely polished and elaborately ornamented by carving.

Cocos butyracea, one of the South American species of this genus, is a very large tree, and its nut abounds in an oil and butter of similar quality to that obtained from the cocoanut. The double cocoanut of the Seychelles Islands is the fruit of a palm of a different genus (*Lodoicea sechellarum*). *Cocos Weddellianum* is the species most commonly cultivated in greenhouses and in the open as an ornamental. For illustration, see PALMS.

COCOANUT or ROBBER CRAB. A large terrestrial macrurous crab (*Birgus latro*), of the East Indies, which feeds on cocoanuts. Although allied to the hermit, it has the abdomen symmetrical and covered above, with a series of bony plates, so that it requires no borrowed shell or other artificial protection. It is found in the islands of the Indian and South Pacific oceans, and may reach a size larger than that of any other land crab, enabling it to handle the largest nuts; and Forbes says that "one of its pincer-claws is developed into an organ of extraordinary power, capable, when the creature is enraged, of

breaking a man's arm." Its flesh is edible. It digs and inhabits burrows and long tunnels, lined with fibres stripped from cocoanuts. In these it lurks during the day, going abroad, as a rule, only at night. It feeds mainly upon fallen cocoanuts, not gathering them from the trees, as has been asserted, although it often climbs into the palms. "To get at the contents of the nut, the crab first tears away the fibre overlying the three 'eyes,' and then hammers away with its claws at the latter until a hole is made, when it extracts the kernel by means of its smaller pincers." This crab has its gills so modified as to function as lungs. It occasionally visits the water, and periodically resorts to the sea to spawn, where the young pass through their developmental stages in the water like other crabs. Several species are known. Consult: Darwin, *A Naturalist's Voyage* (London, 1860); Forbes, *A Naturalist's Wanderings in the Eastern Archipelago* (New York, 1885). See PLATE OF CRABS.

COCOA-PLUM. An edible drupaceous fruit growing on a shrub (*Chrysobalanus icaco*) of the order Rosaceae, in Florida and the West Indies. It is yellow, purple, or black, and is much like a large plum in appearance. The skin is thin, and the sweet white pulp adheres firmly to the stone.

COCOA-ROOT. See COCCO.

COCOA-TREE CLUB, THE. A London club, developed about the middle of the eighteenth century from the Tory Cocoa-Tree Chocolate House, which flourished during the reign of Queen Anne. It was a gathering place of Jacobites, and was frequented by many leading men of the day.

COCOMA, kô-kô'mâ. An important tribe of Tupian stock, anciently living at the junction of the Hualaga and Marañon (Amazon), but now lower down at Nauta, at the entrance of the Ucayali, northeastern Peru. Before the Jesuits established missions among them, about 1680, they had the custom of eating their dead relatives and grinding their bones to powder to drink in a native liquor, assigning as a reason that "it was better to be inside a friend than to be swallowed up in the cold earth." They are described as shrewd, provident, and industrious, good boatmen, and braver fighters than most of the civilized Indians.

COCONUT. See COCOANUT.

COCOON' (from Fr. *cocoon*, dim. of *coque*, shell, from Lat. *concha*, shell). The pupa-case of an insect. See INSECT; BUTTERFLIES and MOTHS; and ANT.

COCO'PA. An agricultural tribe, supposed to be of Yuman stock, formerly holding the country about the mouth of the Colorado River and the head of the Gulf of California, in Mexico, and sometimes ranging northward into Arizona. They still number about 500, but are rapidly wasting away from contact with American civilization. Their present habitat is on the Colorado River from the Gila to its mouth.

CO'CO RIVER, WANKS, or SEGOVIA. A river in Central America, forming a portion of the boundary line between Honduras and Nicaragua (Map: Central America, M 5). It runs in a generally northeasterly direction, and enters the sea at Cape Gracias a Dios. Its total length is about 300 miles, and it is navigable through a portion of the course.

COCY'TUS (Lat., from Gk. *Κοκυτός*, *Kōkytos*, river of wailing, from *κωκυεύω*, *kōkyein*, to wail, Skt. *kū*, to cry). A tributary of the Acheron in Epirus, now called *Βαβύς*, *Bābos*. Coeytus was also the name of a river of the infernal regions, a branch of the Styx.

COD (origin obscure; possibly from *cod*, shell, husk, or from Flem. *kodde*, club, from the rounded shape of the fish). A fish (*Gadus callarias*) of the family Gadidae, which almost rivals the herring in its importance to mankind. The body is elongate, slightly compressed, and tapers toward the tail, so that with the rather large head it appears heavy anteriorly. The body is covered with small scales. There are three dorsal and two anal fins. From the end of the lower jaw hangs a well-developed barbel. The general color varies greatly, being greenish, brownish, or even yellowish and reddish. The back and sides have numerous round, reddish-brown spots. The fins are dark. It will attain a weight of four to five pounds in about three years, and may ultimately reach a weight of 150 to 200 pounds, but the usual weight of large specimens is from 15 to 30 pounds.

The home of this fish is in the shallower parts of northern seas. "The southern limit of the species," on the American side of the Atlantic, according to Goode, "may safely be considered to be Cape Hatteras, in latitude 35° 10'. Along the coast of the Middle States, New England, and British North America, and upon all the offshore banks of this region, cod are usually found in great abundance during part of the year at least. . . . and it is more than probable that they occur in the waters of the Arctic Sea to the north of the American continent." It no doubt extends around the northern shore of the continent to Bering's Strait, and thence into the North Pacific, for the cod of the coastal waters and shallows off Alaska, Siberia, and thence down to Vancouver Island and Japan are the same in appearance and habits, and probably specifically identical. On the European side of the Atlantic it frequents the Scandinavian and Spitzbergen coasts, the North Sea, and the waters about Great Britain and Iceland. Its favorite haunts are the ocean banks, down to about 120 fathoms, but it frequently approaches close to the coast, enters bays, and ascends the estuaries of large rivers. It is a powerful swimmer, predatory, having strong teeth upon the vomer, and one of the most voracious denizens of the sea. It eats anything and everything it can, capturing other fishes, squids, etc., in large numbers, and devouring great quantities of deep-sea clams, which it swallows whole. The stomachs of cods have supplied to conchologists great numbers of rare shells, and before the days of deep dredging many conchological specimens were obtainable only in this way.

These fish are very prolific, 9,000,000 eggs having been taken from a single female weighing 75 pounds. The spawning season lasts from October to April, but the eggs of any given female do not all ripen at once. "Impelled by the spawning instinct, the cods seek the shoal waters of the coast or banks in shoals consisting of both sexes." Here the eggs are extruded, float to the surface, and toss about until they hatch, and the fry escape to become the prey of innumerable foes. It appears, however, that many (some say most) cod void their eggs in deep

water, whence they rise and drift toward the shore. The destruction of eggs and young through various agencies must be very large; since, in spite of the enormous numbers produced, comparatively few reach maturity, so that the number of cod is limited, and liable to be materially reduced by persistent fishing. This diminution began to be felt, in fact, long ago, the cod almost disappearing from easily accessible inshore resorts, so that the fishermen have been obliged to go to the more distant oceanic banks. To compensate for this loss, the species has long been extensively propagated, both in Europe and America, more than 100,000,000 fry having been hatched and planted during the year 1897 alone by the United States Fish Commission. For the methods and results of these efforts, see FISH-CULTURE; for the methods, extent, and value of the products of cod-fishing, see FISHERIES; and for portraits of important species, see Plate of CODFISH AND ALLIES.

Several other species, important as food, belong to this family, such as tomcod, haddock, ling, etc., which are elsewhere described. The 'codfish' of the San Francisco markets, however, is an entirely different fish, a chirid (*Ophiodon elongatus*), for which see CULTUS-COD.

For the most complete history of the cod family, consult G. Browne Goode, in *Fisheries and Fishery Industries of the United States*, Tenth Census (Washington, 1884), in which other books are mentioned. See COD-LIVER OIL.

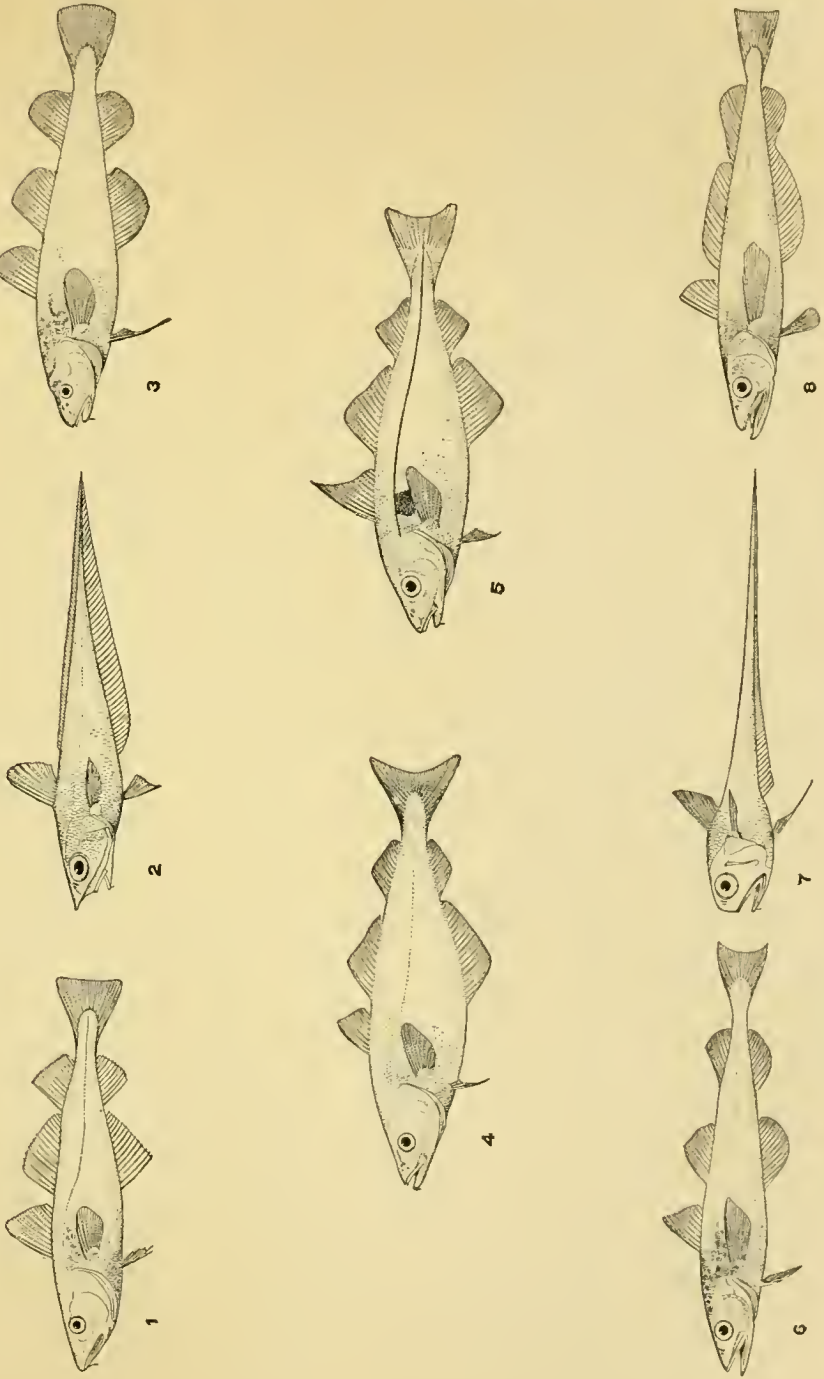

COD'A (It., tail, end). The concluding passage of a musical composition. Originally a single phrase intended as a winding-up cadence, it grew in importance in the sonata, rondo, etc., becoming in some cases an independent movement.

CODAZZI, kō-dāt'sē, AGOSTINO (1792-1859). An Italian traveler, engineer, and geographer, born at Lugo, near Ferrara. He entered the army as a volunteer, and afterwards set up as a merchant at Constantinople, whence he made extensive journeys through Europe. In 1817 he went to the United States. He served in the Venezuelan Revolutionary Army, and later entered the Colombian service, in which he rose in 1826 to be a lieutenant-colonel. From 1831 to 1838 he prepared maps of the State of Venezuela, being compelled, for the purpose of topographical surveys, to explore the deserts of Guiana, and to penetrate nearly to the sources of the Orinoco. The results of this undertaking he published in Paris in 1841, under the title *Resumen de la geografia de Venezuela* (with an atlas). He subsequently made surveys of the Isthmus of Panama, with reference to the possibility of an interoceanic ship-canal.

CODDE, kōd'de, PIETER (c.1598-1678). A Dutch painter, born in Amsterdam. He is of the school of Frans Hals, and is known to have completed one of the latter's pictures. His subjects, generally groups of people drinking, singing, or dancing, are brilliantly painted and have much spirit. The best of them is "The Ball" (1633). His treatment of costume is especially good. It is only recently that his works have been clearly identified and their value understood.

COD'DINGTON, WILLIAM (1601-78). One of the founders, and the first Governor, of the Colony of Rhode Island. He was born in Boston,

CODFISH AND ALLIES

- 1. CODFISH (*Gadus callarias*),
- 2. A PELAGIC GADOID (*Cœlorhynchus carminatus*),
- 3. TOMCOD (*Microgadus tomcod*),
- 4. POLLOCK (*Pollachius virens*),

- 5. HADDOCK (*Melanogrammus aeglefinus*),
- 6. ALASKAN POLLOCK (*Theragra chalcogramma*),
- 7. A MACRURID (*Hymenocephalus caveriosus*),
- 8. SILVER HAKE (*Merluccius productus*),

Lincolnshire, England; came to Plymouth Colony in 1630 with a commission as magistrate, landed at Salem, and was for some time a trader in Boston. He undertook the defense of Ann Hutchinson, and opposed similar persecution in other cases, but without success. In 1638, with eighteen others, he removed to the island of Aquidnek (later Rhode Island), and founded a colony which was to be "judged and guided by the laws of Christ." Coddington was elected Governor in 1640, and held the office until the Colony was incorporated in the charter with Providence Plantations in 1647. He went to England in 1649, and two years later obtained a commission to govern Aquidnek and Conanicut for life. His opponents in the Colony, through Roger Williams and John Clark, succeeded in having this revoked (1652); but Coddington did not finally submit until 1655. He became a Quaker in 1666, and from 1674 until his death was again in office as Governor. He left a work entitled, *Demonstration of True Lore unto the Rulers of Massachusetts* (1674). Consult "William Coddington in Rhode Island Colonial Affairs," No. 4 of the *Rhode Island Historical Tracts* (Providence, 1898).

CODE (from Lat. *caudex* or *codex*, trunk of a tree, tablet for writing). The word *code* is often loosely employed to describe: (1) A set of rules of any sort, as when we speak of the moral code or of the code of honor. (2) Any compilation of legal rules, from a collection of early customs like the Salic law down to the building laws of a modern municipality.

As a modern legal term, the word *code* (Fr. *code*, It. *codice*, Sp. *código*, Ger. *Gesetzbuch*) may be defined as an orderly presentation, in statutory form, of some distinct branch or fairly extensive portion of the law. On the Continent of Europe and in Latin America there are regularly in each State: (1) A civil code, setting forth the law of persons, domestic relations, property, obligations, and succession; (2) a commercial code; (3) a penal, or criminal, code; (4) a code of civil procedure; and (5) a code of criminal procedure. Systematic arrangements of other and less extensive portions of the law, resembling the English Consolidation Acts, are sometimes termed codes, but more commonly laws. For European and Latin-American civil codes, see paragraph VIII. of the subtitle *History*, in the article *CIVIL LAW*.

In Great Britain, the statutes of the realm have been revised by eliminating obsolete and repealed enactments (Revised Statutes, 1870, 1885); and statutes relating to certain subjects have been brought together in consolidation acts, of which, perhaps, the most important are the statute-law revision and civil-procedure acts of 1881 and 1883; but the only important acts in which the statutory and common-law rules relating to a given subject have been combined are: The Bills of Exchange Act (1882); the Partnership Act (1890); and the Sale-of-Goods Act (1893). In British India codification has been carried much further. Not only have the general and provincial statutes been revised, but there are codes of civil and criminal procedure (1859 and 1861, new codes 1882 and 1898), a penal code (1860), and acts nearly equivalent to codes governing contracts (1872), and transfers of property, easements, and trusts (1882). Ceylon and the Straits Settlements have adopted

or adapted some of the Indian codes. Canada, New South Wales, Victoria, New Zealand, and Queensland have criminal codes.

In the United States the general or public statutes of the Federal Government, and those of a great majority of the States, are periodically revised, and these revisions are sometimes called codes. When (as is usually the case) the revision is passed by the Legislature, it replaces the original acts. The Revised Statutes are grouped according to the subjects with which they deal, and the arrangement of subjects is sometimes systematic, but more often alphabetical. Under either arrangement these compilations ordinarily contain more or less complete codes of criminal law and procedure, and sometimes codes of civil procedure. Nearly one-fourth of the States have separate codes of procedure; a small number have separate penal codes. The Revised Statutes rarely include anything approaching a complete civil code, and only four States (California, Louisiana, North Dakota, and South Dakota) have separate codes of this character: for in most of the States the substantive private law, especially the law of personal property and of contracts, is still in the main common law. In Louisiana, where the common law has never obtained, there has been a civil code since 1808; but no State has yet passed a civil code which completely supersedes the common law. The first attempt to combine common and statutory law in a civil code was made in Georgia in 1860, in connection with a general revision of the law; but this code was not meant to be a complete enactment of the common law. Iowa, Ohio, and Texas have gone further than most of the other States in enacting common-law rules, but not so far as Georgia. The nearest approach to a complete enactment of the common law is found in a civil code which was drafted in New York, but which was not adopted in that State. It was adopted in the Territory of Dakota, 1865, and in California, 1872; and many of its provisions have passed into the laws of Montana, Utah, and Wyoming. This code, although frequently revised, has not completely superseded the common law. Consult *Estate of Apple*, 66 Cal. 432.

The question of codification, in England and in the United States, is practically a question of the advisability of transforming common law into statutory law. The conditions are different from those which have prevailed on the Continent of Europe. There the earlier modern codifications were provincial; and they were made partly to protect existing customs against the Romanizing tendencies of the courts, and partly to substitute, for the Roman laws, civil and canon laws written in the vernacular. The great codes now in force in France, Italy, and Germany were constructed to replace the earlier local provincial and State codes and to establish uniform national law. The codification movement in Switzerland has the same purpose: it proposes to substitute federal law for cantonal law. (See *CIVIL LAW, History*, VIII.) In England the existing common law is national, and codification by act of Parliament will simply change its form and the mode of its future development. In the United States, also, the common law is national; but inasmuch as the United States Congress cannot codify the common law for the States, codification is possible only in the form of State codes;

and even if the State codes were uniform at the outset, it would be impossible to keep them uniform. Codification in the United States accordingly means the deliberate creation of a diversity of laws similar to that which has made national codification necessary in Europe. An opposite movement, toward uniformity, is represented in the United States by the Negotiable Instruments Act, drafted in 1896 by commissioners from the several States and already enacted in a considerable number of States and Territories.

CODE NAPOLÉON. Properly, the entire body of French law as contained in the so-called Five Codes promulgated between 1804 and 1810. In general usage, however, the term is restricted to the first of these, the code of civil or private law enacted in 1804 and still in force. The relation of this code to the general development of European law is indicated in **CIVIL LAW, History**, VIII. At the outbreak of the Revolution (1789) there was great diversity in the laws by which different parts of France were governed, and the establishment of a general or national code was one of the reforms urgently demanded. Such a code was promised in the Constitution of 1791, and the Convention caused a code to be draughted in 1793; but this draught was rejected because it contained "no new and grand ideas, suitable to the regenerated France." It was not until the revolutionary storm had spent its force and Napoleon, as First Consul, had established a strong government that the work could be pushed through. In July, 1800, the task was intrusted to a commission consisting of the most eminent jurists in France, chief among them being Bigot-Préameneu, Malleville, Portalis, and Tronchet. These men completed their work in four months. After the proposed code had been approved by the principal courts of justice, it was discussed in the Council of State, where Napoleon displayed great interest in the work and made many shrewd suggestions, and it was then submitted, title by title, to the legislative body. Here it encountered opposition, because it was considered too conservative; and it was not passed until the legislature had been reformed into docility. The entire code was promulgated March 21, 1804, as *Code civil des Français*. In 1807 the title was changed to Code Napoléon. These two designations have since prevailed alternately, according to the form of government. After the completion of the civil code, other codes were adopted, dealing with civil procedure, penal law, criminal procedure, and commerce.

The Code Napoléon introduced little new law. It was a compromise between the customary law of the northern provinces, which was substantially German, and the law of eastern and south-

ern France, which was mainly Roman. It consists of three 'books.' The first deals with persons, including family relations. The second deals with rights in things, but does not include the law of pledge and mortgage. The third, entitled "Various modes of acquiring ownership," includes succession, by testament and *ab intestato*; matrimonial property law; the law of liens and mortgages; and the rules regarding proscription.

The great merits of the code are simplicity (sometimes secured by superficiality) and clearness of statement. In spite of these merits, the code has aroused the usual amount of controversies, some of which are still unsettled, and has required no little judicial interpretation. To contemporary jurists it seemed fairly complete; but experience has revealed many 'open places' which have been filled, in part by judicial decisions and in part by supplementary legislation. There has been also considerable legislative amendment.

The Code Napoléon, as a result of French conquests, was introduced before 1814 into many parts of central and southern Europe. In most instances independent national codes have since been substituted; but the Code Napoléon is still in force in Belgium, in Holland, in several Swiss cantons, and in Italy the newer codes are largely based upon the French. The same is true of the code of Louisiana, of most of the Central American and South American codes, and of the Spanish Code of 1889. The Code Napoléon is contained in Roger and Sorel, *Codes et lois usuelles* (15th ed. Paris, 1883). There are commentaries by Marcade and Pont, *Explication théorique et pratique du code civil* (Paris, 1874-94); Mourlon, *Répétitions écrites sur le Code Napoléon* (12th ed. Paris, 1885).

CODEINE (from Gk. κώδεια, *kōdeia*, a poppy-head), $C_{17}H_{19}NO_5$. One of the alkaloids found in opium, in which it exists in relatively small quantities. In chemical constitution it is closely allied to morphine, from which it is now usually prepared. Its physiological action is similar to that of morphine, and it is used in medicine to diminish sensibility to pain; it is also sometimes prescribed in diabetes. Codeine is a white crystalline substance sparingly soluble in water, freely soluble in alcohol, ether, chloroform, and other organic liquids. It may be readily identified by dissolving a small quantity in strong sulphuric acid and adding a trace of ferric chloride solution, which produces a blue coloration. The medicinal dose of codeine is from one-quarter to two grains.

CO'DEX (Lat., trunk of a tree, tablet). The name 'codex' seems to have been applied first to books that were made by laying sheets one on another, like tablets, in sets of three, four, or more. Each one of such sets, when folded and stitched together, constituted a book (liber) in the more technical sense. Any number of these 'books' might be bound together in a large book or codex. In distinction from the codex, the volume or roll was made by pasting or stitching the separate sheets together edgewise, thus forming a long ribbon which had to be rolled in order to be easily handled.

The word is at present used almost exclusively for manuscript copies of the whole or parts of the Bible or of the Greek and Roman classics.

Some of the most important of the former are noted in the article on the New Testament text. (See BIBLE.) About A.D. 200 the codex form began to supplant the roll form. The earlier codices appear to have been larger than the later ones. It was perhaps in imitation of the appearance of the open roll, with its several parallel columns of reading matter, that the early codices were written with three or even four columns on a page. Later it was more usual to write but two, and finally but one. Codices were of either paper or parchment—of various grades—the latter being always the more common. The oldest codices were written in uncial script—that is, in semi-capitals; the letters being, as a rule, separate from each other. They are without word-divisions, punctuation, breathings, or accents. The separate books have only the simplest titles. In the fifth and sixth centuries the text was broken up into large sections beginning with large capital letters, accents and breathings were introduced, the titles enlarged, and more or less of introductory matter added. Some slight attempts at decoration were also indulged in. Late uncial codices, from the seventh to the tenth century, were frequently elaborately decorated with the parchment colored purple and the text written in gold or silver letters—e.g. the Codex Rossanensis. In the monasteries of the Middle Ages decorated or illuminated manuscripts were manufactured in large numbers. In the tenth century the uncial hand gave way to the cursive or running hand. Codices so written are called minuscules, in distinction from the majuscules or uncials. For other particulars, see BIBLE: BOOK; PALEOGRAPHY; TEXTUAL CRITICISM.

Consult: F. H. A. Scrivener, *Introduction to the Textual Criticism of the New Testament* (London, 1894); Gregory, *Textkritik des neuen Testaments* (Leipzig, 1900); Birt, *Das antike Buchwesen* (Berlin, 1882); Wattenbach, *Paläographie* (Leipzig, 1877-78).

CODIÆ'UM. See CRÖTON.

CODICIL (Lat. *codicillus*, little book or writing, dim. of *codex*, code). A supplement to a will, whereby anything omitted is added, or anything in the body of the will is revoked or explained or changed, as to provide for altered circumstances of the testator or beneficiaries. A codicil is authenticated or executed in the same manner as the will, and is considered a part of the will.

There may be as many codicils to a will as a testator cares to make, and where a provision in a codicil is inconsistent with a provision in a will, the provision in the codicil governs, as the purpose of making the codicil is to express the testator's latest wishes as to the disposition of his property after his death. By the Roman and early English law a codicil was an informal will, made without the appointment of executors, which was considered necessary in a valid will; but the term is no longer used in this sense. See WILL, and the authorities there cited.

CODIFICATION. See CODE.

CODLING. A squirrel-hake (see HAKE), or some other species of the genus *Phycis*.

CODLING MOTH. A small tortricid moth (*Carpocapsa pomonella*), the most serious pest of the apple (q.v.). The females issue from their cocoons in the spring and lay their eggs in

the early evening upon the upper sides of the leaves and occasionally upon the forming fruit. The eggs hatch in about eleven days, and the young larvæ penetrate the fruit usually by way of the calyx. In about twenty days they reach full growth, leave the fruit, crawl to a twig and thence down on the trunk of the tree, where they spin their cocoons and transform to pupæ. The moths issue in two weeks. The moth has a wing expanse of less than three-fourths of an inch. The general color is grayish brown with coppery metallic markings. It lays eggs for a second generation usually upon the fruit, and hibernates in the cocoon. The best remedy consists in spraying with an arsenical mixture such as Paris green or arsenate of lead. Two sprayings in the early part of the season are advised: one a few days after the blossoms have fallen and the other two weeks later. If necessary, subsequent sprayings are made. The banding of the trees with bagging affords the larvæ convenient places for transforming. The bands are examined from time to time and the cocoons destroyed. Consult Simpson, *The Codling Moth*, Bulletin No. 4, new series, Division of Entomology, United States Department of Agriculture (Washington, 1903).

COD-LIVER OIL (*Oleum Morrhue*, or *Oleum Jecoris Aselli*). One of the most valuable therapeutic agents at the disposal of the medical practitioner. It is a pale-yellow fixed oil, obtained from the livers of the cod (*Gadus callarias*) and of other related species of fish that are caught in the northern parts of the Atlantic Ocean. Cod-liver oil is a better food and is more rapidly absorbed than any other oil; its value as a food is due mainly to its being much more readily oxidized than other oils. The benefit derived from it in disease associated with loss of flesh cannot be overestimated. It is given in tuberculosis, in rickets, in tertiary syphilis, in chronic bronchitis, chronic eczema, in many nervous diseases, in general feebleness, etc. It should, however, be administered with some caution, and in moderate quantities, larger doses being liable to cause sickness and diarrhœa. In those cases in which the oil is rejected by the stomach, it may be rubbed into the skin, through which it is readily and certainly absorbed; this treatment is, of course, disagreeable on account of the nauseating smell of the oil. The taste of the oil may be masked to some extent by taking it in coffee or in whisky, or by adding to a dose of the oil a few drops of ether and a drop of oil of peppermint. The taste is completely abolished by taking the oil in soft gelatin capsules now prepared by many manufacturing houses: after remaining in such capsules for some time, the oil turns rather dark, but does not seem to be thereby deteriorated. Cod-liver oil is often taken in the form of emulsions. An emulsion recommended by many medical men contains, besides cod-liver oil, the yolk of an egg, powdered tragacanth, elixir of saccharin, sodium bicarbonate, tincture of benzoin, oil of bitter almonds, chloroform, alcohol, and water. With malt extract, too, cod-liver oil makes an excellent emulsion. The common dose of the pure oil is from a dessert-spoonful to a table-spoonful three times a day.

MANUFACTURE. In preparing the oil for medicinal purposes, only perfectly healthy livers should be used, and the green-colored (or spot-

ted), diseased livers rejected. In former times the oil was obtained as follows. The fishermen would stow away the livers in barrels, which were kept unopened till the end of the fishing season; that is to say, from one to four months. During that time the livers would undergo putrefaction, their hepatic cells, containing the oil, would burst open, and the escaping brownish-yellow oil (called *pale oil*) would rise to the top of the barrels and be drawn off. The livers would then be allowed to undergo further putrefaction, and a quantity of dark-brown oil (called *light-brown oil*) would again be drawn off. Finally, by heating the disintegrated liver-residues thus obtained above the boiling temperature of water, a last quantity of oil (called *brown oil*, though really black) would be obtained. This primitive method, a knowledge of the details of which would render the oil too repulsive to most patients to swallow, is still employed to some extent. By far the greater quantity of the oil, however, now reaching the market is prepared in a much cleaner way by the steam process first introduced by Möller in 1853. Instead of allowing the livers to undergo putrefactive decomposition, Möller obtained the oil by simply heating for about three hours the fresh livers, which were carefully selected, cleaned by washing with water, and separated from the gall-bladders.

To avoid delay, the livers are often heated on board vessels, in wooden apparatus, steam being conducted directly into the mass of livers. Usually, however, the livers are heated in tinned sheet-iron vessels, either single or double walled. The single-walled apparatus is heated over large water-baths; the double-walled by passing steam into the space inclosed between the interior and the exterior walls. In all these apparatuses the temperature is about that of boiling water. An improvement recommended during recent years consists in heating the livers at a considerably lower temperature, for a much shorter time, and as far as possible out of contact with the air: it is asserted that in this manner the oxidation of the oil may be almost completely prevented and that the oil would, therefore, not become rancid, nor acquire the disagreeable property of causing eructations.

COMPOSITION. Besides a large proportion of fats, cod-liver oil has been shown to contain (1) a peculiar principle called *gadin* ($C_{30}H_{46}O_9$); (2) a crystalline substance called *morrhual*; (3) traces of bromine and iodine; (4) biliary principles; and other substances. The brown oils contain also considerable quantities of ptomaines, which cannot but be injurious to health; bleaching brown oil by sunlight only masks the presence of such substances without destroying their injurious properties, and should therefore not be resorted to. It is generally believed that the great benefit derived from cod-liver oil in tuberculosis is due to the specific action of some active principle that must be contained in the oil. It is probable, however, that the effect is due to nothing but the food-value of the fatty constituents of the oil. These fats are commonly assumed to consist, like other natural fats, of the glycerides of oleic, palmitic, and stearic acids. Möller's chemist, P. M. Heyerdahl, states, on the contrary, that cod-liver oil contains a little palmitic, but no oleic or stearic acid; according to him it consists mainly of the glycer-

ides of therapeutic and jecoleic acids ($C_{17}H_{30}O_2$ and $C_{19}H_{36}O_2$, respectively), two unsaturated organic acids which are not known to exist anywhere else in nature, and to which the therapeutic action of cod-liver oil is due. The solid fat that is sometimes removed by freezing the oil is, according to Heyerdahl, also composed mainly of those glycerides; so that its removal appears to serve no purpose whatever. In view of the readiness with which the fats of cod-liver oil undergo oxidation, the oil should be kept out of contact with the air. Cod-liver oil is now prepared in Norway, the United States, Canada, Newfoundland, Great Britain, Iceland, and Russia. By far the greater proportion of the oil reaching the market comes from Lofoten and Romsdal in Norway.

CODOGNO, kô-dô'nyô. A city in the Province of Milan, north Italy, 30 miles east of Pavia (Map: Italy, D 2). It is the principal export market for Parmesan cheese, and has tanneries and linen, silk, and majolica factories. Population (commune), in 1881, 11,444; in 1901, 11,594.

CODRINGTON, Sir EDWARD (1770-1851). A British admiral, born in Gloucestershire. He entered the navy in 1783, and at Trafalgar (October 21, 1805) was captain of the *Orion*. He afterwards served in the Mediterranean and in North America, and rose to the rank of vice-admiral in 1821. In 1826 he was appointed commander-in-chief of the Mediterranean Squadron, and commanded the English, Russian, and French fleets against the Turks at the battle of Navarino (q.v.), immediately after which he was recalled for having exceeded his orders. He was made admiral in 1837. Consult the *Memoir of the Life of Sir Edward Codrington*, edited by his daughter, Lady Bonchier (London, 1873-75).

CODRINGTON, Sir WILLIAM JOHN (1804-84). An English general, son of Sir Edward Codrington. He entered the army in 1821. During the Crimean War he commanded a brigade at the battle of the Alma and at Inkerman, and in 1855 succeeded Sir James Simpson as commander-in-chief in the Crimea. He was elected to Parliament in 1857, was Governor of Gibraltar from 1859 to 1865, and in 1863 was appointed general.

CO'DRUS (Lat., from Gk. Κόδρος, *Kodros*). The reputed last King of Athens. He was the son of Melanthus, and is supposed to have lived about B.C. 1060. He is said to have sacrificed his life for his country when the Dorians once invaded the Attic territory. An oracle having declared that Athens would be saved if its ruler should perish by the hand of the enemy, Codrus, in the disguise of a peasant, entered the Dorian camp and was struck down in a quarrel of his own making. His son Medon was the first Archon chosen for life.

CO'DY, WILLIAM FREDERICK (1845—). An American scout and showman, known as 'Buffalo Bill.' He was born in Scott County, Iowa, and became one of the riders of the Pony Express (q.v.) at its establishment in 1860, and at the beginning of the Civil War was a Government scout and guide. In 1863 he enlisted in the Seventh Kansas Cavalry, and at the close of the war contracted with the Kansas Pacific Railroad to furnish buffalo-meat to its laborers building

the line, in this way earning the name 'Buffalo Bill.' He was again with the army as scout from 1868 to 1872, when he was elected to the Nebraska Legislature. He served in the Fifth Cavalry in the Sioux War of 1876, and in the battle of Indian Creek killed Chief Yellow Hand. In 1883 he organized his 'Wild West Show,' a representation of actual life on the plains, and in 1887 took the 'show' to Europe for the first time.

COEDUCATION (Lat. *co-*, together + *educatio*, education, from *educare*, to bring up, to educate). The association of the sexes in the same classes for instruction is a system that prevails generally in the public elementary schools of the United States and quite extensively in Europe. Except in a few large Eastern cities, as New York and Boston, the free public elementary school in the United States is a mixed school. On the other hand, somewhat less than half the private elementary schools in this country are either for boys, or for girls, exclusively, and in 1899-1900 about 9 per cent. of the pupils receiving elementary instruction were in such schools. The English elementary schools have since 1891 become practically free, and largely coeducational. In France each commune having more than 500 inhabitants must establish a separate elementary school for girls, unless a mixed school is sanctioned by the departmental council. In Prussia the *Volkschulen*, or people's schools, were, according to the law of 1871, advised to separate the sexes wherever possible, except when there were only two teachers in a school. Nevertheless, in 1896 the mixed schools exceeded the others by more than half. In Switzerland the elementary schools are very largely mixed schools: but the course of study and the length of the course in some cantons vary for the sexes, while in Basel the boys' and girls' schools are separate. In Sweden practically all, and in Austria 85 per cent. of the public elementary schools, are coeducational; while in Italy the reverse is true, only about one-fifth of the schools of this grade having such a character.

When, however, we turn to secondary education, we find that in Europe the sexes are almost universally separated. In Prussia the various classes of *Gymnasium* and *Realschulen* are, with the exception of a few girls' gymnasias, for boys exclusively. Elsewhere in Germany, where girls are given public secondary education, as in Bavaria, Saxony, and Baden, their schools are separated. The French public secondary school system consists of State lycées and communal colleges for boys and girls separately. The secondary schools of Switzerland and for the most part those of Sweden keep the sexes apart. England has no public secondary schools for girls. The private secondary schools are, to a slight extent, coeducational when they are predominantly day schools or contain younger children. In the United States the contrast is striking. In 1899 there were 5495 public high schools, of which 5439 were coeducational, 22 for girls only, and 34 for boys. Of 1957 private secondary schools, 1092 were coeducational, 541 for girls, and 324 for boys, exclusively. The public normal schools in 1898-99 numbered 166. Of these, two were distinctly for women; twelve had no men in attendance, though presumably coeducational; the rest contained both sexes. Of the 165

private normal schools five prepare kindergarten teachers and have no men in attendance, one is distinctly for women, while two others have no men, and three no women in attendance. The rest have a mixed attendance. The English training-schools for teachers, the French primary and superior normal schools, and the Prussian normal schools separate the sexes.

An examination of the facts stated above will show that so far as Europe is concerned they bear out the general theory current there, that the sexes should be separated as far as possible in education. Wherever separate schools can be maintained, the French and Prussian systems require them, and they are plainly favored by the English. Since, however, elementary instruction has come to be regarded as necessary for both sexes, wherever financial considerations prevent separate schools, the elementary school is mixed. And it is this financial consideration that has most largely been the occasion of mixed schools in the United States. Through the efforts of Horace Mann, a system of town coeducational high schools was in 1826 initiated in Massachusetts, and from that time on such schools spread, at first slowly, then rapidly, throughout the Republic, until to-day they are almost within reach of all. The victory of public secondary education was in general the victory of coeducation.

The Civil War placed both elementary and secondary education largely in the hands of women teachers. There accordingly followed a demand on their part for better opportunities for instruction. Oberlin Collegiate Institute in Ohio had, in 1833, admitted women. In 1855 Antioch College, also in Ohio, was founded—coeducational from the beginning, and having as its first president Horace Mann, the ardent advocate of this system. The following State universities were from the beginning coeducational: Utah, opened in 1850; Iowa, opened in 1856; Washington, opened in 1862; Kansas, opened in 1866; Minnesota, opened in 1868; and Nebraska, opened in 1871. The State universities of Indiana and Michigan admitted women in 1868 and 1870 respectively. To-day, of the thirty-two State universities, all except those of Virginia, Georgia, and Louisiana are coeducational. Of private colleges, Cornell, after an investigation and stimulated by a generous offer from Henry W. Sage, admitted women in 1872. Other private institutions were, however, somewhat slow to follow. Boston University, founded in 1873, admitted women from the first, and in 1883 the Massachusetts Institute of Technology became coeducational. To-day, of fifty-eight leading colleges and universities, four are independent colleges for women, three are women's colleges affiliated with colleges for men, thirty are coeducational, and of the remaining twenty-one, five have affiliated women's colleges. In addition, all the great university foundations, except Harvard and Princeton, admit women to graduate instruction. Only twelve of the fifty-eight institutions admit women to none of their departments; and these are, with one or two exceptions, on the Atlantic seaboard. Women are also rapidly gaining ground in the professional colleges. In 1899 eighty out of 149 colleges of medicine, sixty-four out of eighty-six colleges of law, forty-four out of fifty-six colleges of dentistry, and forty-eight out of fifty-two col-

leges of pharmacy in the United States were coeducational.

In Canada, McGill University was opened to women in 1883. To-day all the Canadian universities, six in number, admit women. The leading universities of Australia admit women not only as students, but as lecturers and professors. In 1878 the University of London opened all degrees, honors, and prizes to students of both sexes on equal terms. Victoria University and the University of Wales give similar privileges to women. The University of Durham excludes women from only the degree in theology. Cambridge admits women to nearly all university and college lectures and grants a titular degree to such as fulfill the regular conditions. This degree, however, does not admit them to the governing board of the university. At Oxford women are admitted to nearly all university and college lectures, except those in medicine. They may take the examinations, and the results are announced, but they do not receive a degree. The four universities of Scotland, Aberdeen, Saint Andrews, Edinburgh, and Glasgow admit women to all degrees except in law, and Aberdeen even to that. The Royal University of Ireland grants equal privileges to both sexes. In France women are admitted to lectures on the same terms with men, professors, however, having a discretionary power of exclusion.

In Germany the struggle of women for admission to the universities has been especially stubborn, and resistance has now to a very considerable extent given way. To be admitted, a woman must obtain consent from the Minister of Instruction, the rector of the university, and the professors whose courses she wishes to attend. Ordinarily only the courses of the philosophical faculty are thrown open to them, but in a few cases women have attended courses in medicine and law. Heidelberg, Freiburg, and Göttingen were among the first to grant the degree of Ph.D. to women; but in 1898 Berlin, perhaps the most conservative of all in this respect, bestowed this degree on Fräulein Neumann. In 1898-99, 315 women, mostly foreigners, attended the German universities. In Austria, since 1878, women have been admitted to the eight universities as hearers, and recently, in the case of foreigners, as matriculated students. During the winter of 1899-1900 forty women were registered at Vienna, and in 1897 the degree of M.D. was granted to Fräulein Possauer. In 1895 the three Hungarian universities were thrown open to women, and graduates of the medical departments are allowed to practice. The Italian universities have, since 1876, all been open to women on the same terms with men, and the female attendance is large. The medical faculties of the Swedish universities were opened to women in 1870, and those of law and philosophy in 1873. In 1899 six women had taken the degree of Licentiate in Philosophy, and one that of Doctor of Laws. The latter, Fräulein Eschelsson, was made privat-docent (q.v.), to lecture on civil law. In Switzerland the universities are all open to women, and in most cases on the same terms as to men. At Zurich women were formally admitted in 1872, and they are even permitted to hold professorial chairs. There were, in 1895, 200 women in attendance, and a woman was lecturer on Roman law. Women have been admitted on the same terms as men to the Uni-

versity of Copenhagen since 1875. The Spanish universities and those of the Netherlands are equally open to both sexes. Russian higher education for women has had a stormy history. The medical schools were opened to them about 1860, then closed, and again in 1872 reopened on account of the Nihilism that sprang up among women who went abroad, and particularly to Switzerland, to study. A separate medical school for women was established at Saint Petersburg in 1872, suppressed in 1882 on account of Nihilism, and in 1897 reopened. The universities are now closed to women, but there are higher courses given to them at Saint Petersburg under the Minister of Public Instruction.

Investigations made by the University of Wisconsin, and in 1893-94 by the University of Virginia, have shown that in coeducational institutions, according to testimony gathered in the United States and England, women equal or even surpass men in excellence of scholarship. Up to 1898 54 per cent. of the women taking examinations for matriculation at the University of London had passed, as against 53 per cent. of men for the same period. Nor has the percentage of withdrawals from college on account of health been greater with women than with men. Investigations into the health, etc., of college women are given under COLLEGIATE EDUCATION FOR WOMEN. In the West, where coeducation is practically universal, no evil consequences have sprung from it, and there is but slight demand for separate schools. The main objection of both male and female students to coeducation is that it implies more restraint than exists where the sexes are apart. Of the many arguments for coeducation, doubtless that of economy has been most effective. It is noteworthy that in a report of the Massachusetts Society for the University Education of Women the fact that the University of California had a preponderance of women students was taken as a sign of the need for a separate college. Indeed, it may be said that having won, in most cases, their contention for admission to institutions for men, the advocates of higher education for women are turning their attention more and more toward separate schools, and that the privilege of separate education is, particularly in the East, coming to be sought and preferred by women rather than by men. Consult: Clarke, *Sex in Education* (Boston, 1873); Fairchild, "Coeducation of the Sexes," in *Report of United States Commissioner of Education* (Washington, 1898), and *Circular of Information*, No. 2 (1883), on coeducation in the public schools; A. Sohman Smith, "Coeducation of the Sexes in the United States," with bibliography, in *Report of United States Commissioner of Education* (Washington, 1891-92); "Coeducation," in *Report of United States Commissioner of Education* (Washington, 1894-95).

COEFFICIENT (Lat. *co*, together + *efficere*, to work out, produce). In algebra, any factor of an expression is called the coefficient of the rest of the product. The word, however, is usually applied only to some factor whose numerical value is expressed or known, and which appears first in the product—e.g. in the expression $3ax$, 3 is the coefficient of ax , and $3a$ is the coefficient of x . Vieta seems to have introduced the use of the word in this sense (1591). Since $a = 1 \cdot a$, the coefficient 1 may be understood be-

fore any letter. The coefficients in any algebraic equation of the form

$$x^n + a_1x^{n-1} + a_2x^{n-2} + \dots + a_n = 0$$

are related to the roots; thus,

$$r_1 + r_2 + \dots + r_n \equiv \Sigma r_1 = -a_1, r_1r_2 + r_1r_3 + \dots + r_{n-1}r_n \equiv \Sigma r_1r_2 = -a_2, \dots, r_1r_2 \dots r_n = \pm a_n$$

See EQUATION; for differential coefficients, see CALCULUS; and for binomial coefficients, BINOMIAL THEOREM.

DETACHED COEFFICIENTS. In many operations with algebraic functions, in which the letters are involved in ascending or descending powers, the required calculation may be performed with coefficients only—e.g. to multiply

$$x^3 + 3x^2y + 3xy^2 + y^3 \text{ by } x^2 + 2xy + y^2$$

$$\begin{array}{r} 1 \quad | \quad 1 + 3 + 3 + 1 \\ 2 \quad | \quad 2 + 6 + 6 + 2 \\ 1 \quad | \quad 1 + 3 + 3 + 1 \\ \hline 1 + 5 + 10 + 10 + 5 + 1 \end{array}$$

Hence $x^5 + 5x^4y + 10x^3y^2 + 10x^2y^3 + 5xy^4 + y^5$ is the product.

INDETERMINATE COEFFICIENTS. Many functions may be expanded to any desired number of terms by assuming arbitrary coefficients whose values are determined from resulting equations

—e.g. to expand $\frac{1}{1-x}$ to 4 terms, assume

$$\frac{1}{1-x} = a + bx + cx^2 + dx^3 + c \dots$$

Then,

$$1 = a + (b-a)x + (c-b)x^2 + (d-c)x^3 + \dots$$

If $a = 1$, then

$$b - a = 0, c - b = 0, d - c = 0 \dots$$

That is to say, if $a = 1$, $b = a = 1$, $c = b = 1$, $d = c = 1$, etc. Substituting these values in our assumed equation, we find:

$$\frac{1}{1-x} = 1 + x + x^2 + x^3 + \dots$$

The method is old as literal algebra.

In physics, a constant expressing the measure of some property of a substance is often called a coefficient—e.g. the *coefficient of elasticity* is the quotient of the stress by the strain, or the quotient of the applied pressure by the voluminal compression produced. The *coefficient of simple rigidity* is the ratio of the shearing stress to the shearing strain. The *coefficient of refraction* (often called the index of refraction) is equal to the ratio of the speed of light in the first medium to its speed in the second. This ratio for air and water has the value 1.336, representing the refractive power of water. The *coefficient of friction* is the quotient of the resistance due to the sliding of one substance on another and the pressure producing the contact. The *coefficient of expansion* is the amount of expansion of a body of unit magnitude due to an increase of 1° in temperature.

COEFFICIENT OF EXPANSION. See HEAT.

COEFFICIENT OF EXPANSION FOR GASES. See GASES, GENERAL PROPERTIES OF.

COEFFICIENT OF FRICTION. See FRICTION.

COEFFICIENT OF SELF-INDUCTION, and **COEFFICIENT OF MUTUAL INDUCTION.** See ELECTRICITY, and INDUCTION.

COEHOORN, kō'hörn. A small mortar, usually made of bronze, and formerly used in boats and small vessels and on the gangways of larger

ships. It threw a shell of 12 to 14 pounds weight. Its name is derived from that of its inventor, Coehoorn (q.v.). For illustration, see ARTILLERY.

COEHOORN, kō'hörn, **COEHORN,** or **CO'HORN,** MENNO VAN (1641-1704). A Dutch military engineer. He was born near Leeuwarden, and after studying at the University of Franeker, entered the Dutch service at the early age of sixteen, as captain in an infantry regiment. He distinguished himself at Maestricht, Graave, and Senefle, in 1673-74. It was at the siege of Graave that he used with effect a mortar of his own design, later called after him. After the peace of Nimeguen (1679) he was employed to fortify the various Dutch strongholds. In 1685 he published his important work on fortification, *Nieuwe vestingbouw*, which was speedily translated into French and German. Coehoorn was actively employed during the wars of William of Orange against French aggression, and at Kaiserswerth, Bonn, Fleurus, and Namur he showed himself no mean opponent of the great Vauban. He was made a lieutenant-general in 1695, and after the Peace of Ryswick (1697) was employed to refortify several of the Dutch towns. When the War of the Spanish Succession began, Coehoorn was at once dispatched to the front, and, by his brilliant and energetic generalship, reduced six of the chief French strongholds. In 1704, while hastening to confer with Marlborough at The Hague, he was stricken down by apoplexy, March 17th. Consult: De Peyster, *Life of Coehoorn* (New York, 1860); Bonomer, *Essai général de fortification* (Paris, 1814).

CŒLEBS (sē'lēbz) **IN SEARCH OF A WIFE.** A novel by Hannah Moore (1809), giving a bachelor's idea of a model wife.

CŒLEENTERATA, sē-lēn'tē-rā'tā (Neo-Lat. nom. pl., from *caeleteron*, from Gk. *κοῖλος*, *koilos*, hollow + *έντερον*, *enteron*, intestine). One of the phyla of the animal kingdom, usually ranked as next to the lowest of the types of Metazoa; the polyps and jelly-fishes. It is characterized by the absence of a body-cavity and a separate circulatory system, both of these being functionally replaced by the system of chambers or tubes into which the mouth opens. Owing to the fact that this system is not only digestive, but that it takes the place of the body-cavity, it is sometimes called the *caeleteron*. More commonly the *caeleteron* is called the gastro-vascular cavity, since it not only serves as a stomach for digestion, but, by means of its branches, as a vascular or circulatory system in conveying food (and perhaps oxygen) to all parts of the body. All of the *Cœlenterata* are more or less perfectly radially symmetrical, and generally on the number 4 or 6; that is, they can be divided in either four or six vertical planes, and the resulting halves will be approximately similar. The *Cœlenterata* may therefore be defined as radially symmetrical, unsegmented Metazoa, having a gastro-vascular cavity. In most *Cœlenterata* there is no anus, waste matter from the digestive system being ejected through the mouth. Between the endodermal lining of the gastro-vascular canals and the ectodermal covering of the body is a structureless layer, known as the supporting layer or 'mesoglaea.' This may be very thin and firm, or it may be very thick and gelatinous. It

contains scattered nerve and muscle cells, skeletal cells, and pigment-cells.

The mouth is usually surrounded with a circle of tentacles, which function both as organs of touch and as capturing organs. The number of these oral tentacles varies from two to several hundred, and their size and shape vary quite as much. On these tentacles, and often on other parts of the body, there are batteries of remarkable stinging cells. (See NEMATOCYST.) These are wanting in only one class, the Ctenophores (q.v.). The sense-organs of the Cœlenterata are very simple, as a rule, and many forms have no other sense than that of touch. Pigment eyes and positional organs of several kinds occur in the free-swimming forms.

FEATURES OF CŒLENTERATA.

1. General anatomy: *a*, mouth; *s*, gullet; *b*, cavity of the body (enteron); *e*, integument, composed of ectoderm and endoderm, separated by a space; *c c*, convoluted cords (craspeda) containing thread-cells (see 2), and forming the free edges of the mesentery (*m*); *t t*, tentacles; *r*, reproductive organ contained within the mesentery. 2. Thread-cell or stinging-cell (nematocyst) of a hydra, undischarged; *a*, formative matrix (cnidoblast); *b*, coiled thread within the cell; *c*, trigger hair (cnidocil). 3. The same everted and discharged by rupture of the cell following a touch upon the cnidocil.

The sexes are separate, and the eggs are set free and fertilized in the water. In their life history the Cœlenterata show some of the most interesting phenomena in the whole animal kingdom. To understand them we must remember that these animals not only reproduce by means of eggs, but even more frequently, like plants, by budding, and that oftentimes, as in plants, the buds do not become detached, but remain connected with the parent stock as long as they live. Moreover, in the type of Cœlenterata we have two very different sorts of individuals—those which are bell-shaped and free-swimming, known as medusæ (q.v.), and those which are more or less cylindrical, and are attached to

some object, known as polyps (q.v.). Now, it so happens that the polyp form of a species may give rise to a medusa by budding, and that medusa breaks away and becomes free-swimming; it gives rise to eggs which in turn develop into attached polyps. This process is simple *alternation of generations* (q.v.)—that is, each generation is like its grandparents, and not like its parents. The process may become simplified, until the medusa generation is entirely lost, by the medusa bud never getting free from the polyp and ultimately losing even the appearance of a medusa. Or the process may become very much complicated by additional generations produced by budding coming in between the others. The forms which produce the eggs are of course the *sexual* generations, while those that produce the buds are the *asexual*.

The interesting and important question as to whether the first Cœlenterata were medusoid or polypoid forms has been vigorously debated, but is by no means fully determined yet. Owing to the fact that the buds so often remain intimately connected with the parent, we find more or less complicated colonies or stocks very common. These may be free-swimming, as in the siphonophores (q.v.), having then arisen from medusæ; or they may be fixed as in all corals (q.v.), and in such cases have arisen from polyps. In most such colonies, owing to the division of labor that has taken place, we have differently appearing individuals in one colony, some being adapted to locomotion, some to capturing prey, some to digesting food, some for defensive purposes, and some simply for reproduction.

The Cœlenterata are a large group, of many hundred species, widely distributed in the oceans of all parts of the world. Only three or four species are known as occurring in fresh water. As individuals most of the species are small, though a few sea-anemones and some medusæ reach a diameter of over a foot; in colonies, however, some of the reef-building corals cover an extraordinary area. As for color, the Cœlenterata are among the most gorgeous of animals; no shades are too exquisite or delicate. Nearly all are carnivorous, though perhaps some forms may use vegetable matter in part. The only species of any direct use to man are the precious and the lime-producing corals.

In classification the Cœlenterata present difficulties. The ctenophores are so different in some important ways from other cœlenterates, that some zoologists prefer to regard them as a separate type, especially since two genera are known that connect them directly with the flatworms (Platoda); but as they are radially symmetrical and have a gastro-vascular system, they really come within the definition of cœlenterates. The type then may be divided into three great classes: (1) *Hydrozoa* (q.v.), which have no gastral filaments and have an endodermal œsophagus, if any; (2) *Scyphozoa* (q.v.), which have endodermal gastral filaments and give rise to medusæ; (3) *Actinozoa*, or *Anthozoa* (q.v.), which are polyp-form, possess mesenteries, and never give rise to medusæ; and (4) *Ctenophora* (q.v.), distinguished by having eight meridional rows of swimming-plates.

Fossil Forms. The Cœlenterata comprise some of the oldest fossils found in the Lower Cambrian rocks (*Archæocyathus* and *Ethmophyl-*

lum); they increase rapidly in variety, and attained already, early in the Silurian, great importance as rock-builders in the reef-building corals (see CORAL ISLAND; LIMESTONE; DOLOMITE), which persisted through all formations to the present time, their remains often forming the greater part of whole mountain ranges, as in the Southern Alps. Medusoid impressions, representing not only the Hydromedusæ, but also the Scyphomedusæ, occur as early as the Cambrian in Bohemia, Sweden, and North America, and are known from later rocks. (See MEDUSA; JELLY-FISH.) Those suborders of the Hydromedusæ, whose species possess either chitinous-calcareous or calcareous skeletons—viz. the Hydrocorallinæ and Tubulariæ—are also found in the condition, though only sparingly and not until the Mesozoic and Tertiary formations. The most important representatives of the first suborder are the calcareous skeletons of Millepora, appearing in the Eocene, and of the second sub-order, the masses of calcareous concentric lamellæ with supporting pillars, which have been described as Ellipsactinia from the Alpine Jurassic, and as Parkeria and Porosphara from the Cretaceous. Similar calcareous concentric lamellose forms, but without larger apertures on the surface, the Stromatoporoidea (see STROMATOPORA), are extremely common in the Silurian and Devonian systems, where they were reef-builders and important rock-making organisms, being associated with the corals. Their real systematic position being unknown, they are provisionally allied with the Hydromedusæ.

A like relation to the Hydromedusæ is held by the graptolites (see GRAPTOLITA), which, forming chitinous hydroid-like colonies, swarmed, either as holoplanktonic or pseudoplanktonic organisms, in the Silurian seas. They differ in some important features, as the possession of a sicula and virgula, from the hydroids. On account of the world-wide distribution of their species and their short range, they are most important horizon-markers or index fossils.

For bibliography of fossil forms, see the articles on CORAL; GRAPTOLITA; MEDUSÆ; STROMATOPORA; JELLY-FISH; etc.

(Boston, 1862); Agassiz, A. *Monograph of North American Acalephæ*, and other papers in the *Memoirs of the Museum of Comparative Zoölogy*; and Fewkes, "Aid to Collectors of Cœlenterata," etc., *Bulletin of Essex Institute*, vol. xxiii. (Salem, 1893).

CŒLE-SYRIA, sē'lē-sī'ŕī-ā (Lat., from Gk. Κοιλὴ Συρία, Koilē Syriā, hollow Syria). A geographical term used by Greek writers in three different senses: (1) Originally, in the first century of the Seleucid era, Cœle-Syria was the name given to the region lying between the Lebanon and Anti-Lebanon mountains in Syria (cf. I. Esdras iv. 48). 'The Valley of Lebanon' denotes the same district. (2) Later, in the second century B.C., it was used to designate all the Syrian regions in the southwest—i.e. East and West Palestine, the Lebanon region, and other adjacent lands except Phœnicia. Such is its significance in most instances in I. Esdras

and in the First and Second Maccabees. (3) In Roman times Cœle-Syria did not include West Palestine, certainly not Samaria and Judea, and probably not Galilee. It then signified that portion of Syria of which Damascus was the metropolis—i.e. the Lebanon countries, the territory about Damascus, and East-Jordan Palestine. Some ancient writers, as Polybius and Josephus, at times use the term in a loose way, as including all southern Syria as far as the Egyptian border.

COELHO, kô-ã'lyô (Port., rabbit), or CONEJOS. The rabbit-fish (*Promethichthys Prometheus*) of the Middle Atlantic, so called in Madeira. See RABBIT-FISH.

COELHO, GONÇALO. A Portuguese navigator, the commander of a ship on the coast of Senegambia about 1488. He is supposed to have been the leader of the expedition of 1501 to explore the Brazilian coast. Afterwards he was placed in command of six ships sent out from Lisbon in 1503 to seek a passage to the East Indies around the southern part of Brazil, the extent of South America being at that time unknown. After suffering shipwreck and becoming separated from a part of his fleet, Coelho continued his journey of exploration in the remaining ships beyond the present site of Rio de Janeiro, returning to Lisbon in 1506.

COELHO DE ALBUQUERQUE, dâ ãl'bôô-kêr'kâ, DUARTE (1537-c.79). A Portuguese governor. He was born at Olinda, Pernambuco, and was the oldest son of Duarte Coelho Pereira, whom he succeeded as Captain-General of Pernambuco in 1554, which possession, after completing his education in Europe, he governed personally from 1560 to 1572. On his return to Portugal he accompanied Dom Sebastião to Africa, was captured by the Moors, August 4, 1578, and died in captivity at Fez.

CŒLICA (Lat. nom. pl., celestial, from *cælum*, heaven). A collection of short poems by Fulke Greville (1633).

CŒLIC'OLÆ (Lat., worshipers of heaven). A sect condemned in decrees issued by Theodosius II. in 408 (*Cod. Theodos.* 16, 5, 43) and in 409 (*Cod. Theodos.* 16, 8, 19) as marked by a "new and unwonted audacity," and, as heretical, ordered to conform within a year or take the consequences. Augustine alludes to it in a letter (*Ep.* xlv., cap. vi., § 13) written in 398. Consequently the sect was extant in the fourth and the fifth centuries. It seemingly did not last much longer. Its exact nature is difficult to determine, but probably it presented a combination of Jewish and Christian doctrines and practices, among which the most prominent was the use of baptism along with circumcision.

COELLO, kô-ã'lyô. ALONZO SANCHEZ (c.1515-90). A Spanish painter of Portuguese descent, born near Valencia. His first work was done probably under some minor Flemish master in Madrid. Afterwards he went to Lisbon with Antonio Moro, and worked there until he succeeded that artist as Court painter to Philip II. of Spain. He became a great favorite with Philip, and executed many portraits of the King, his children, and the personages of the Court. Among his best works are portraits of Don Carlos and the Infanta Isabella in the Prado; of two unknown ladies, life-size, in the Museum of Vienna, and that of

Alexander Farnese in the Hermitage at Saint Petersburg. In the Escorial there are some far less interesting pictures of saints by him, and there is a "Martyrdom of Saint Sebastian" in the Prado, which is one of his best subject pictures.

COELLO, CLAUDIO (1621-93). A Spanish painter, born in Madrid. He studied under Francesco Rizi, and afterwards under Carreño de Mirado, who was a pupil of Velazquez. Coello was in Rome for some time and returned to Spain in company with the painter José Donoso. Together the artists painted many large pictures for churches, and decorations in fresco for various palaces. All of these works have disappeared. Their designs for the triumphal arches raised to celebrate the marriage of Charles II. with Marie Louise d'Orléans brought Coello to the notice of the King, and a few years later he became Court painter. At this time he painted his greatest picture, "Charles on His Knees Among the Nobles of His Court." In this there are more than fifty portraits. Coello was now the foremost painter of his time, but the rise of Luca Giordano discouraged him and he lost his prestige. Coello's mature style was based on that of Rubens and Titian, and his best work is of extraordinary power. His finest pictures are in the galleries at Toledo, Salamanca, and Madrid. Two of his large religious compositions are at the Prado. In the Hermitage at Saint Petersburg there is a portrait of Coello by himself.

CŒLORYNCHUS, *selô-rin'kûs* (Neo-Lat., from Gk. *κοίλος, koilos*, hollow + *ῥύγχος, rhyngchos*, nose). A genus of small deep-sea fishes of the family Macruridae (q.v.), allied to the cods, which inhabit the deeper parts of various oceans and seas. There are many species, of which a common one is the silvery gray *carminatus* of the West Indian region. See PLATE OF CODFISH AND ALLIES.

COEN, KŌEN, JAN PIETERSZON (1587-29). The founder of the Dutch colonial power in the East Indies. He entered the service of the East India Company in 1607, and was Governor-General in 1618-23 and again in 1627-29. During his first term he fought successfully against the English and the native princes, and in 1619 destroyed the town of Jacatra, on the site of which he soon afterwards founded Batavia. He succeeded in compelling the English to withdraw nearly all their factories from the archipelago and in shutting them out from the trade of the islands.

CŒNOBIA (Neo-Lat. nom. pl. of *caenobium*, Gk. *κοινόνιον, koionobion*, life in a community, from *κοινός, koinos*, common + *βίος, bios*, life). A term applied to certain colonies of cells among the algae, remarkable for their regularity of form. They are developed inside mother cells whose contents divide into the required number of daughter cells, which group themselves in the interior. In some forms (*Volvocales*) the individual cells are ciliated, so that the entire colony swims through the water. The colony of *Volvox* may have as many as 22,000 cells. Other colonies are motionless, and contain a small number of cells arranged with beautiful symmetry (*Pediastrum*, *Scenedesmus*, etc.). The water-net (*Hydrodictyon*) is an immense *caenobium* of 700 to 20,000 cells.

CŒNOCYTE (Gk. *κοινός, koinos*, common + *κύτος, kytos*, cavity). The body of an unpartitioned plant, and also a segment of the body of an incompletely partitioned plant, found chiefly among certain algae and fungi. It differs from a single cell, which has one nucleus, in that the contained protoplasm contains many nuclei. The protoplasm lies in a continuous cavity where portions of it containing the nuclei and other structures slowly circulate. Excellent illustrations are presented by the molds among the fungi, and by the order Siphonales among the algae. For details, see ALGÆ; FUNGI.

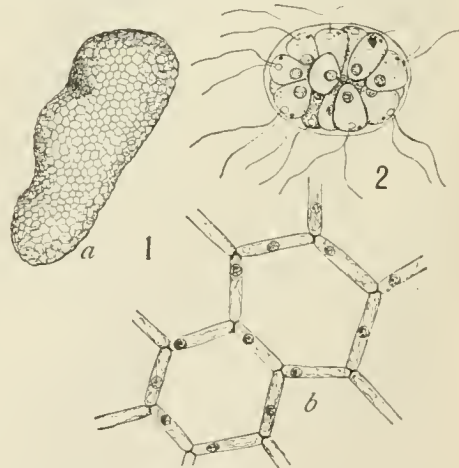

COERCION (from Lat. *coercio*, from *coercere*, to restrain, from *co*, together + *arcere*, to confine). In law, such a degree of physical force, or threatened personal violence, or intimidation, applied to a person as constrains or induces him to do some act which, but for such constraint, he would not have done.

Under some circumstances coercion applied to a person's wife, husband, or near relative, or injury to his property, will be held to have the same effect as if it were applied to the person himself.

The consequences of an act done under coercion may generally be avoided by a person, as it is not the product of his will and he is not considered responsible for it. In the United States, generally, where a person commits a crime under such coercion that he has a reasonable apprehension of instant death or serious bodily harm he is excused from the consequences. A less degree of coercion will render a civil act voidable. See DURESS.

COERCION ACTS. See IRELAND, *History*.

CŒUR, KĒR, JACQUES (c.1395-1456). A celebrated French merchant and financier, born at Bourges. As early as 1433 he began to trade with the Levant. In 1436 Charles VII. made him master of the mint in Paris, and in 1441 he was ennobled. Three years later he was sent as one of the royal commissioners to preside over the new Parliament of Languedoc, and in 1448 he represented the French King at the Court of Pope Nicholas V., who treated him with great

CŒNOBIUM.

1a, water-net (*Hydrodictyon*); 1b, the same with two meshes enlarged; 2, *Pandorina*.

distinction and granted him a special license to traffic with the infidels. The power and fame of Cœur were now at their highest. He had represented France in three embassies, and had furnished much of the money for the war which had driven the English from Normandy. He was invested with various offices of dignity, and possessed the largest fortune that had ever been amassed by a private French citizen. The sea was covered with his ships and he carried on trade with England, Flanders, Spain, Italy, Turkey, Asia, and Africa. His fall, however, was sudden. In February, 1450, Agnes Sorel, the King's mistress, died; and Cœur, who was one of her executors, was accused of having poisoned her. There was no reasonable ground for such a charge; nevertheless the needy and unscrupulous King, in July, 1451, ordered his arrest and the seizure of his goods, reserving for himself a large sum to carry on the war in Guicenne. Cœur was tried and convicted by men whose business it was to convict him without regard to the evidence or to justice, and he was condemned to pay to the King an enormous sum and to remain a prisoner until the judgment was fully satisfied. All his property was confiscated, and he was subject to exile during the royal pleasure. In 1454 he managed to escape, and, though pursued, succeeded in reaching Rome, where he was well received by the Pope. He died at Chios. Consult Clément, *J. Cœur et Charles VII.* (Paris, 1886).

CŒUR D'ALÈNE, kēr dā-lōn' (Fr., awl-heart: the French translation of the Indian tribal name Skitswish). A lake in Kootenai County, Idaho (Map: Idaho, A 2). It lies in a wild region surrounded by the mountains of the same name. It is about 30 miles long and from two to four miles wide. Its waters are cool and clear and afford excellent fishing. It receives the Saint Joseph River from the east at its southern end, and has for its outlet the Spokane River, which flows west from its northern end.

CŒUR D'ALÈNE. A Salishan tribe formerly holding the territory about the lake and river of the same name in northern Idaho, and now settled upon a reservation in the same country. The name, signifying 'awl-heart,' is said to have been originally given to a chief of the tribe in derision of his stinginess. The natives call themselves Skitswish, the Skeetsomish of Lewis and Clark. They now number 450.

CŒUR DE LION, de l'ōn' (Fr., Lion-hearted). A title given to Richard I. King of England, for his exploits, mainly in the Crusades.

COFFEE (Turk., Ar. *qahwa*, the coffee beverage). A beverage made of the roasted seeds of the coffee-tree, *Coffea Arabica*, a native of Abyssinia and Arabia, now naturalized in many tropical countries. The genus *Coffea* comprises a number of species, but the *Coffea Arabica* is the species widest known which possesses valuable properties: the seeds of *Coffea Mauritiana*, prepared in the same way, are bitter and slightly emetic. In the wild state *Coffea Arabica* is a slender tree 15 to 25 feet high, with few branches; in cultivation it is seldom allowed to become more than 6 to 10 feet high, and is made to assume a sort of pyramidal form, with horizontal branches almost from the ground. The leaves are evergreen and leathery; the flowers are small, fragrant, and snow-white; and the whole appear-

ance of the tree is very pleasing. The fruit, when ripe, is of a dark-scarlet color, and the seeds are horn-like and hard. The seeds are commonly termed coffee-beans, a name derived not from any resemblance of the seeds to beans, but from the Arabic word *bunn*, which means 'coffee.' The seeds are also sometimes, but very incorrectly, designated coffee-berries. For illustration, see BEVERAGE PLANTS.

The earlier history of the coffee-tree is not very clear. It was not known to the Greeks or Romans, but in Arabia it was certainly in use in the fifteenth century. Toward the end of the seventeenth century, plants were carried from Mocha to Batavia by Wieser, a burgomaster of Amsterdam, and from the botanical gardens at Amsterdam the Paris Garden obtained a tree. A layer of this was carried out to Martinique in 1720, where it succeeded so well that in a few years all the West Indies could be supplied with young trees. The following sorts are particularly distinguished from one another in commerce: *Mocha coffee*, which comes from Arabia, and is known by its small gray beans inclining to greenish; *Jara* or *East Indian coffee*, which has large yellow beans; *Jamaica coffee*, with beans somewhat smaller and greenish; *Surinam coffee*, which has the largest beans; *Bourbon coffee*, with beans pale yellow and almost whitish. The coffee-tree succeeds where the temperature of the year ranges from 60° to 90° F. It does best in a sandy or gravelly soil, well drained, and on high lands or hill ranges from 1000 to 3000 feet above the sea. In Peru and Ecuador it is acclimatized at an elevation of 6000 feet, where, however, frost never occurs. The fruit ripens in hot-houses. Coffee plantations are laid out pretty much in the same way everywhere. One-year-old trees 12 to 16 inches high are set from the nursery. They need shade at first and in a hot dry climate should be shaded at all times. They are pruned to the same height, and the ground between them is carefully kept clear of weeds. Where the climate is dry, abundant irrigation is necessary, but the supply of water is cut off as the fruit begins to ripen, in order to improve its quality. The tree yields its first crop in the third year, and the crop from a full-grown tree may amount to two pounds of coffee-beans. The life of a tree is about forty years. As the coffee-tree continues flowering for eight months, its fruits are of very unequal ripeness: in the West Indies and Brazil three gatherings are made annually. The beans are placed on mats or large floors specially adapted for the purpose, where they are dried by the sun's rays, being meanwhile frequently turned. They are passed between rollers to remove the dried pulp of the bean, and the membrane which incloses the seeds themselves, and the coffee is afterwards freed from impurities by winnowing, and conveyed in bags to the seaports. As equal care is not, however, bestowed upon the preparation of it in all places where it is cultivated, there are great differences in quality and price. The use of coffee as a beverage was introduced from Arabia, in the sixteenth century, into Egypt and Constantinople. Leonhard Rauwolf, a German physician, was probably the first to make coffee known in Europe, by the account of his travels printed in 1573. Soon after the first introduction of

coffee, coffee-houses arose almost everywhere. The first in Europe was established at Constantinople in 1551. In London the first coffee-house was opened in Newman's Court, Cornhill, in 1652, by a Greek named Pasqua. This Greek was the servant of an English merchant named Edwards, who brought some coffee with him from Smyrna, and whose house, when the fact became known, was so thronged with friends and visitors to taste the new beverage, that to relieve himself from annoyance, Edwards established his servant in a coffee-house. The first coffee-house in France was opened at Marseilles in 1671, and in 1672 there was one opened in Paris, which soon had several competitors. In the East coffee is not usually prepared as a beverage in the same way as in Europe, except by Europeans. A decoction of the unroasted seeds is there generally drunk; and for the 'Sultan's coffee,' the pericarp, with the dried pulp roasted, is employed.

The great demand for coffee has led to the employment of a number of cheaper substitutes, of which chicory (q.v.) root is the best known. Of others, dandelion root, carrot, the seeds of the common yellow iris, cereals, and sweet potatoes may be mentioned. They are prepared by roasting like coffee. The seeds of *Astragalus beticus* are known on the Continent of Europe as Swedish coffee, and are said to be the best substitutes for coffee yet discovered. But all the substitutes lack the most important constituent of true coffee, viz., caffeine (q.v.), and are therefore very different from it in their qualities. Coffee is subject to great adulteration, most of the articles specified as substitutes being employed for this purpose. The chief substance of mixture is chicory, the use of which is not injurious, however. The chief effect of adding chicory is to deepen the color. A variety of coffee known as *Liberian coffee*, a native of Western Africa, is being introduced into some countries, particularly in Ceylon. It is a much coarser variety, but thus far it has withstood the ravages of the leaf disease that had nearly destroyed the coffee plantations of that country. The leaves of the coffee-trees are used in the western part of Sumatra instead of the seeds. They are prepared by quick drying in a manner similar to that in which tea-leaves are prepared; and in this state contain even a larger proportion of caffeine than the coffee-beans of our shops. It seems not improbable that the use of the coffee-leaf may yet extend very much.

Unroasted coffee has on an average the following percentage composition: water, 11.2; protein, 12.1 (including caffeine, 1.2); fat, 12.3; nitrogen-free extract, 42.3; crude fibre, 18.2; ash, 3.9. Roasted coffee contains per cent.: water, 1.1; protein, 14.0 (including caffeine, 1.2); fat, 14.5; nitrogen-free extract, 45.8; crude fibre, 19.9; ash, 4.7. Of the total material, some 25 per cent. is soluble in water, half of this being nitrogen-free extract. When the beans are roasted till they assume a reddish-brown color, they lose 15 per cent. by weight, and gain 30 per cent. in bulk; when roasted till they become chestnut-brown, they decrease 20 per cent. by weight and increase 50 per cent. in bulk; while if the roasting is continued till the beans become dark-brown, they lose 25 per cent. in weight and acquire 50 per cent. in bulk. The beans should never be darker than a light-brown color, which is quite sufficient to bring out the excellent aroma and other qual-

ities of the coffee; when the roasting is carried further, more or less charring is the result and a disagreeable burned smell is produced, which tends to overcome the natural pleasant aroma. The improvement in flavor by roasting is probably due, in part at least, to the formation of caramel. Coffee does not retard the action of the bowels, as strong infusions of tea tend to do, partly because there is less of the astringent principle, and also owing to the presence of the aromatic oil which tends to move the bowels. The important offices which coffee fulfills are, to allay the sensation of hunger; to produce an exhilarating and refreshing effect; and possibly to diminish the amount of wear and tear, or waste of the animal frame, which occurs more or less at every minute. (See NUTRITION.) The grounds of coffee are nutritious, containing considerable protein, and some of the Eastern nations take advantage of this. The coffee is ground very fine and allowed to remain in infusion, being consumed with it. In most respects coffee possesses properties similar to those of tea (q.v.).

An endless variety of apparatus has been contrived—some of them of great complexity—for preparing coffee for the table. The chief object aimed at by Western nations is, to obtain the liquor free from all sediment. In France and elsewhere a very popular beverage is prepared known as *café au lait*. Coffee and milk are boiled separately and mixed in equal proportions immediately before serving. In the so-called French coffee-pot, boiling water is poured very slowly upon the freshly and finely ground coffee, and then allowed to drip through two strainers into the bottom of the pot. This process makes excellent coffee, but is rather slow. Another and much quicker method, used by the Germans, is to infuse coffee like tea, and this has the advantage of bringing out the flavor. In using the Vienna coffee-pot, the water is poured through a pipe into a lower compartment of the pot. A drum with a strainer at the top is then fitted over the pipe, and in this drum the coffee is placed. A glass cover is adjusted over the pot, which is then placed over an alcohol flame. When the water boils, it rushes through the coffee and through the strainer and pours over the sides of the drum into the upper compartment of the pot, from which it is poured into the cups. The glass cover acts as a condenser of the steam and prevents the aroma from escaping. The nations of the Orient, generally, either follow the usage of the Turks, who drink their coffee thick with sediment; or the nomadic Arabs, who make it from the dried pulp, in much the same manner as tea is prepared in Occidental countries. A more curious method is that of the Somali, who boil the berries in oil, and soak maize in the mixture.

The trade in coffee is of great importance. Brazil leads in its production, exceeding all other countries combined. Large exportations are also made from Mexico, Central America, Java, Sumatra, India, Ceylon, Arabia, Hawaii, and the West Indies. The exportation of coffee in 1898-99 was 891,000 tons. Of this amount, Europe consumed 525,000 tons. The annual consumption of coffee in the United States is above 367,000 tons. The importation into the United States during the years 1895-99, inclusively, averaged 734,558,816 pounds, of the annual value of \$76,562,265.

Deducting the amount exported, the average consumption per capita is over 9 pounds.

Many sorts of cereal coffee are on the market. They are made of such materials as parched grains, peas, etc. On an average, they contain per cent.: water, 6.2; protein, 13.3; fat, 3.4; total carbohydrates, 72.6; ash, 4.5. Only a portion of this material is soluble and enters into the infusion. It is perhaps a fair statement that the infusion of genuine coffee and cereal coffee each contain on the average 98 per cent. water and 2 per cent. nutritive material. See ADULTERATION.

COFFEE-BUG. Any of several sorts of scale-insect which live on the coffee-tree. The pest is encountered in all parts of the world, and spraying with insecticides, or other means of eradication, are often necessary to save the crop. It is stated that some years ago the experiment was tried in Ceylon of introducing into the plantations a red ant (*Formica smaragdina*), abundant in many of the gardens and jungles of the island, which feeds greedily on the coccids; but the fierce assaults of the ants on the naked skins of the laborers made them threaten to leave the estates, so that the ants were not further encouraged.

COFFEE-HOUSE POLITICIAN, THE. A play by Fielding (1730).

COFFEE-HOUSES. Places of refreshment, first opened in the sixteenth century in Constantinople. In London they were, so to speak, club-houses free to all who could buy a cup; and yet each was known for its special circle of visitors, literary, scientific, religious, or political. In the absence of newspapers they were a great means of spreading news and of discussing public questions. Nearly all of the middle and higher classes attended them daily, and they came to exert so powerful an influence in politics that in 1675 Charles II. attempted to suppress them, but in vain. Consult Macaulay, *History of England*, vol. i. (New York, 1858).

COFFERDAM. A dam built to cut off a small body of water from the adjacent bay, river, etc. It consists of rows of piles, or piles and planking, the space between the rows filled in with clay, cement, or other material. The term is also applied to iron or steel air-tight inclosures used in digging under water tunnels or excavations. (See FOUNDATIONS, under *Cofferdam Process*.) On board modern ships the term is applied to inclosures designed to keep out water. They occasionally surround hatches, but their most important use is to form a continuous double wall to the sides of a ship. Above the protective deck the cofferdam is fitted as a continuous tank (with numerous bulkheads dividing it into sections), extending from that deck to several feet above the water-line. It is packed, in the United States Navy, with compressed corn-pith cellulose, which is designed to check the influx of water through a shot-hole, which it does by swelling up, as soon as wetted, and closing the hole. If the hole made is not too large or the pressure of water too great, it operates very satisfactorily.

COFFEYVILLE. A city in Montgomery County, Kan., 170 miles south by west of Kansas City; on the Verdigris River, and on the Missouri Pacific, the Atchison, Topeka and Santa Fé, the Missouri, Kansas and Texas and other railroads (Map: Kansas, C 4). It contains a

fine Railroad Y. M. C. A. building with a library. The city carries on an extensive trade with Indian Territory, and has strawboard, planing, and flour mills, brick and pottery works, and a plow-factory. Settled in 1869, Coffeyville was incorporated two years later. The government, under a charter of 1887, is administered by a mayor elected biennially and a city council. The water-works and the electric-light plant are owned and operated by the municipality, and there is a natural-gas plant operated under franchise. Population, in 1890, 2282; in 1900, 4953.

COFFIN. In ordinary sense, a burial-case; usually a box or chest, in which the dead are inclosed for interment, or sometimes for cremation. In modern times the ordinary material of the case is wood, usually with metallic attachments; lead, copper, iron, glass, terra-cotta, stone, etc., are sometimes employed. In earlier times the coffin was chiefly symbolic rather than merely utilitarian, and the material and form varied widely; and the early customs find parallels and interpretations among those of primitive peoples still surviving. Perhaps the simplest type of burial-case is that of the Seri Indians (q.v.); among them the body of a deceased matron is dressed and decorated, folded in small compass in a shallow grave (perhaps floored with a large turtle plastron), supplied with food and implements, and then covered with a large carapace; this shell of a tutelary deity being regarded as a protection, both actual and symbolic. Among the Papago Indians a corpse is merely enshrouded in all the habiliments of life, and then placed in a miniature 'house of the dead' made of stone or wood in imitation of a dwelling; and this type grades among various peoples into eists (q.v.) of slabs, rock-hewn sepulchres, ornate tombs, and massive sarcophagi. Among riparian and maritime peoples of lowly culture the canoe or boat is the symbol of the home, and the body of a deceased owner may be placed in his vessel, which is portable, and may be borne to a chosen place of sepulture; and it is this type of burial-case which can be traced through the customs of many peoples to the ordinary coffin of modern times. See BURIAL; MUMMY-CASE; SARCOPHAGUS; and MAN, SCIENCE OF.

COFFIN, CHARLES CARLETON (1823-96). An American war correspondent, novelist, and juvenile writer, born at Boscawen, N. H. Beginning as a farmer's boy, he tried civil engineering; then returned to farming, then became an expert telegrapher, and finally undertook journalism in Boston. He first attained distinction during the Civil War, as correspondent in the field for the *Boston Journal*. He served that newspaper also during the Austro-Prussian War of 1866, and in a journey round the world. On his return he became popular as a lecturer, and was a member of the Massachusetts Legislature (1884-85). Among his many books are: *The Great Commercial Prize* (1858), advocating a transcontinental railroad corresponding with the present Northern Pacific; *Days and Nights on the Battlefield* (1864); *Following the Flag* (1865); *Winning His Way* (1865); *Four Years of Fighting* (1866); *Our New Way Round the World* (1869); *The Seat of Empire* (1870); *Calch Krinkle* (1875); *History of Boscawen* (1877); *Boys of '76* (1879); *Story of Liberty*

(1879); *Old Times in the Colonies* (1880); *Life of Garfield* (1880); *Building the Nation* (1883); *The Drum-Beat of the Nation* (1887); *Marching to Victory* (1888); and *Freedom Triumphant* (1891). Coffin was distinguished for his interest in labor legislation and economic questions. He had a facile style and a vein of characteristically New England humor that secured for his books a wide popularity. Consult Griffin, *The Life of Charles Carleton Coffin* (Boston, 1894).

COFFIN, SIR ISAAC (1759-1839). A British admiral, born in Boston, Mass. He entered the British Navy in 1773, served in the American Revolution, and rose through all grades to the rank of admiral (1814). In 1818 he was elected to Parliament, where he remained until 1826. In the latter year he founded and endowed, on the island of Nantucket, a school which is still called by his name.

COFFIN, JAMES HENRY (1806-73). An American mathematician and meteorologist, born at Williamsburg, Mass. He graduated in 1828 at Amherst College, and in 1829 opened at Greenfield, Mass., the Fellenburg Manual Labor Institution, the first school of the sort in New England, and probably in the country. From 1846 until his death he held the chair of mathematics and astronomy at Lafayette College. His scientific attainments were notable. He erected on Mount Greylock, at a height of about 4000 feet above sea-level, an observatory, where careful observations were made by means of a self-registering anemometer of his own device. In 1846 he was appointed one of the first collaborators in the work of the Smithsonian Institution, under whose auspices he published *Winds of the Northern Hemisphere* (1853)—his chief volume, based on data collected from more than six hundred stations on land and at sea; *Psychometrical Tables* (1856); and *The Orbit and Phenomena of a Meteoric Fire Ball* (1869). The theory of atmospheric circulation, known on the Continent as the Buys-Ballot (q.v.) Law, was announced by him in 1853 at a meeting of the American Association for the Advancement of Science. His further works include *Solar and Lunar Eclipses* (1845), and *Elements of Conic Sections* (1849).

COFFIN, JOHN HUNTINGTON CRANE (1815-90). An American astronomer. He was born in Wiscasset, Maine, graduated at Bowdoin College in 1834, and in 1836 was appointed professor of mathematics in the United States Navy. In 1844 he was detailed to the Naval Observatory. He was professor of astronomy and navigation in the United States Naval Academy from 1853 to 1865, and from 1866 was in charge of the *American Ephemeris and Nautical Almanac*. He published a number of papers, mostly on astronomy.

COFFIN, JOSHUA (1792-1864). An American antiquarian, born at Newbury, Mass. He graduated in 1817 at Dartmouth College, and afterwards became an instructor of the poet Whittier, who paid tribute to his memory in the poem "To My Old Schoolmaster." He was a founder of the New England Antislavery Society, of which he became the first recording secretary. He published a *History of Ancient Newbury* (1845).

COFFIN, LONG TOM. A simple, daring sailor in *The Pilot*, by J. Fenimore Cooper, one of the strongest delineations of a sailor character in literature.

COFFIN, WILLIAM ANDERSON (1855—). An American landscape painter, born at Allegheny, Pa., January 31, 1855. He studied at the Yale Art School, and was afterwards a pupil of Bonnat in Paris. His work represents the different moods of nature in rural scenery, and his first successes were in depicting moonlight effects in the country—placid farmhouses and hillsides in lunar light. His picture, the "Rain," was purchased by the Metropolitan Museum. The success of many art movements has been due to Mr. Coffin's activity in organization. He was the art director of the Pan-American Exposition of 1901, at Buffalo. He has been the recipient of various medals at American exhibitions, and obtained a bronze medal at the Paris Exposition of 1889. He is well known as a writer on art topics in the leading magazines.

COFFINHAL, kō'fê-nâl', JEAN BAPTISTE (1754-94). A French Revolutionist. He was born at Aurillac, Cantal, and after studying medicine and the law, became a lawyer in Paris. He was for some time president of the Jacobin Club, and in 1792 was successively appointed justice and vice-president of the Revolutionary Tribunal. It has been said that in sentencing Lavoisier to death he used the words, "The world has no longer any use for chemists." Later he became implicated in the fall of Robespierre, and although he succeeded in effecting his escape to the Ile des Cygnes, he was betrayed by a friend, summoned before the Revolutionary Tribunal, and shortly afterwards condemned and executed.

COGALNICEANU, kô-gâl-nê-châ-ân', MICHAEL (1817-91). A Rumanian statesman and historian. He was born at Jassy, and was educated at Lunéville (1834) and Berlin. Upon his return he became one of the most active members of the party agitating for the union of Moldavia and Wallachia into a single Rumanian principality, a party which subsequently supported him faithfully. In 1840 he founded the journal *Dacia Literara*, and somewhat later the powerful unionist organ, *Stena Dunărci*. Upon the establishment of the union under Prince Cusa (1859) he was prominent in national affairs, and as Minister of Public Instruction he founded in 1860 the University of Jassy. Under Charles of Hohenzollern, Cogalniceanu was Minister of the Interior from 1868 to 1870; was Minister of Foreign Affairs at the time of the Russo-Turkish War (1877-78), participating in the Congress of Berlin; again Minister of the Interior in 1879-80, and Minister plenipotentiary at Paris (1880-81). He distinguished himself by his zeal in the cause of educational, legislative, and political reform.

COGHETTI, kô-gêt'tê, FRANCESCO (1804-75). An Italian painter. He was born at Bergamo, was a pupil of Camuccini in Rome, where he settled permanently, and was for a number of years president of the Academy of San Luca. He devoted himself especially to the study of Raphael, and is recognized as the head of the modern Italian school, which strove to restore the classical styles of painting. He executed many altar-pieces for churches, and fresco-paintings for palaces in Bergamo, Rome, and

Savona, notably "The Exploits of Alexander the Great," in the Villa Torlonia, Rome; "The Triumph of Bacchus," "Battle of the Amazons," and "The Four Elements," in the Palazzo Torlonia, Rome; "The Myth of Cupid and Psyche" and "The Parnassus of Famous Men," in the Villa Torlonia at Castel Gandolfo. His frescoes in the Basilica at Savona also deserve especial mention.

COGHLAN, kŏg'lan, CHARLES FRANCIS (1841-99). A comedian, of Irish parentage. He was born in Paris, France, and educated for the bar, but adopted the stage, making his first appearance at the Haymarket, London, in April, 1860. After having been leading man of the Prince of Wales's Theatre, he came to America in the autumn of 1876, and played at the Fifth Avenue Theatre, New York City, under Augustin Daly. He was leading man at the Union Square Theatre during the run of *The Celebrated Case*. He appeared at Wallack's Theatre with his sister, Rose; played engagements with Mrs. Langtry (1885-91); created Alec d'Urberville in Mrs. Fiske's production of *Tess of the d'Urbervilles* (1897) and successfully produced (1898) his *The Royal Box*, a version of Dumas's *Kean*. Among his other plays are: *Lady Baxter*; *A Quiet Rubber*; and *Citizen Pierre*. The last he produced without success in the year of his death, which occurred in Galveston, Tex. Coghlan was one of the most graceful yet forceful of modern actors, equally at home in old English comedy and in modern emotional rôles. Consult Clapp and Edgett, "Players of the Present," in the *Dunlap Society Publications* (New York, 1899).

COGHLAN, ROSE (1853—). An English American actress, sister of Charles Coghlan. She was born at Peterborough, England, and her theatrical career began at the Greenock Theatre, Scotland, where she appeared as one of the witches in *Macbeth*. She was first induced to come to America by E. A. Sothern in 1871, and appeared in burlesque at Wallack's Theatre, New York, during the season of 1872-73. From 1873 to 1877 she was again in England, where she played for a time with Barry Sullivan, and had very successful runs in *Twelfth Night* and a piece called *All for Her*. In 1877 she reappeared at Wallack's; the following year she was the Countess Zicka in the first American presentation of *Diplomacy*. In 1880 she made a great hit as Stephanie in *Forget-Me-Not*. She remained at Wallack's Theatre most of the time till 1888, when she played Lady Teazle in *The School for Scandal*. Her répertoire there included a wide range of characters, which she acted with great resource of feeling and technique. Since then she has starred and has appeared in several large melodramatic productions. Consult: McKay, *Famous American Actors of Today* (New York, 1896); Strang, *Famous Actresses of the Day in America* (Boston, 1899).

COGIA HASSAN ALHABBAL, kŏgyâ hās'sân al-hāb'bāl. One of the tales of the *Arabian Nights*. The hero is a rope-maker who becomes wealthy by finding a large diamond inside a fish.

COGIA HOUSSAN, hŏōs'sân. In the story of "Ali Baba and the Forty Thieves," in *The Arabian Nights*, the captain of the Forty Thieves, detected and slain by Morgiana.

COGNAC, kŏ'nyák' (Lat. *Condac*, Gall. *Condac*, confluence, from *con*, Lat. *cum*, together + *de*, Skt. *dhā*, to place). A town in the Department of Charente, France, picturesquely situated on an old castle-crowned hill overlooking the river Charente, 31 miles west of Angoulême by rail (Map: France, F 6). Cognac is celebrated as the place where the famous Cognac brandy is manufactured. The cultivation of the vine and distillation of brandy form the chief industry of the inhabitants of the district. Francis I. was born here in 1494. Population, in 1901, 19,483.

COGNATE (Lat. *cognatus*, cognate, from *co*, together + *gnatus*, born, from *nasci*, to be born; connected with Gk. *γενεσθαι*, *gignesthai*, Skt. *jan*, to be born). A term applied to relatives of the female branch of a family. It is most commonly employed in the civil (Roman) law, and in its technical sense did not come into general use in the English law. In many systems of law cognates rank next after agnates in the inheritance of property. The term is not generally used in the United States. See AGNATE; DESCENT; INHERITANCE.

COGNIARD, kŏ'nyār'. CHARLES THÉODORE (1806-72) and JEAN HIPPOLYTE (1807-82). Two French dramatists and theatrical managers. They were brothers, and wrote in collaboration a great number of fairy plays, vaudevilles, and other light pieces, which were unusually successful. Their first success was *La cocarde tricolore* (1831), which was played nearly two hundred times. Among the operettas produced at the Variétés, under the management of Hippolyte Cogniard, were *La belle Hélène*; *Barbe-bleu*; *Périchole*; and *la Grande Duchesse*.

COGNIET, kŏ'nyá'. LÉON (1794-1880). A French painter, born in Paris. He studied under Guérin, and won the Prix de Rome in 1817. His work attracted no particular attention until his "Marius Among the Ruins of Carthage" was exhibited in 1824. This picture was bought by the French Government. "Saint Etienne Carrying Help to a Poor Family" (1827) is another excellent example of Cogniet's style. His other works include a ceiling in the Louvre, "The Expedition to Egypt," and his masterpiece, "Tintoretto Painting the Portrait of His Dead Daughter" (1845). His portraits include those of Maréchal Maison (1831), Louis Philippe, Pierre Guérin (1831), and of M. de Crillon (1852). He was a noted teacher and the founder of a well-known school, the painter Bonnat having been one of his pupils.

COGNIZANCE (Lat. *cognitio*, investigation, inquiry, from *con*, with, and *nosco*, know). (1) An old term of the common law signifying jurisdiction, acknowledgment.

Cognizance of Pleas was jurisdiction of causes, a privilege granted by the King to a city or town to institute a tribunal for the trial of suits. Sometimes such a jurisdiction was conferred to the exclusion of that of the regular tribunals of the kingdom. It was by such a grant that the universities of Oxford and Cambridge acquired their legal jurisdiction. It is in this sense that the expression *claim of cognizance* is used, when one court intervenes to assert jurisdiction over a cause which has been wrongfully instituted in another court. The term is not employed in this special significa-

tion in the United States, though it occurs in the general sense of jurisdiction, as in the expression "to take cognizance of a cause of action." See JURISDICTION.

In pleading, cognizance signifies a formal acknowledgment of an act alleged, as in replevin, an acknowledgment of the taking of the goods sought to be recovered; and in the fictitious process known as 'levying a fine,' an acknowledgment by the defendant that the lands claimed are the property of the claimant. See FINE; REPLEVIN; PLEADING.

(2) A term in heraldry, used in a loose manner, sometimes to signify a crest (q.v.) and sometimes a badge (q.v.) or other distinguishing mark.

COGNO'MEN (Lat., from *co-*, together + *nomen*, name, Gk. *ὄνομα*, *onoma*, Skt. *nāman*, Ger. *Name*; connected with Lat. *gnoscere*, Gk. *γινώσκειν*, *gignōskein*, Skt. *jñā*, Ger. *kennen*, Engl. *know*). Equivalent to family name or surname. A Roman of social position ordinarily had three names, the last being his cognomen and the name by which his family was known. In Marcus Tullius Cicero, the first name is the *prænomen*, or personal name; the second the *nomen*, or name of the gens; and the third denotes the family, or branch of the gens.

COGNOSCEN'TI. See CONNOISSEUR.

COGNO'VIT (Lat., he has acknowledged). A written confession of liability by the defendant in an action authorizing the plaintiff to enter judgment for a specified sum, either absolutely or upon terms as to time of entry or payment. It is given only after the action is begun, and before the defendant has answered or otherwise pleaded, and in this respect differs from a confession of judgment, now used in England and in most of the States of the United States, which is given before the action is commenced, but is about the same in form. As originally used, the *cognovit* is superseded in almost every jurisdiction to-day by an order of the court entered on consent. It is still in use in some of the States of the United States where common-law pleading is still retained.

COGS'WELL, JOSEPH GREEN (1786-1871). An American librarian and bibliographer. He was born in Ipswich, Mass., graduated at Harvard in 1806, and studied law, but preferred to teach, and became a tutor at Harvard in 1814. With George Ticknor he spent two years (1816-18) at the University of Göttingen, where he paid special attention to the methods and principles of instruction. In 1820 he was made professor of mineralogy and geology and librarian of Harvard College, and in 1823, with George Bancroft, founded the Round Hill School at Northampton, Mass. He removed to New York, to become editor of the *Review* in that city, in 1836; continued in that work until 1842; became a personal friend of John Jacob Astor, and was appointed one of the trustees of the fund to create the Astor Library. He was, besides, the chief adviser of the philanthropist in planning this library. He became superintendent in 1848, and went abroad to purchase volumes for the collection. His general bibliographical knowledge was of great service to the library, one great work undertaken by him being the preparation of an analytical and alphabetical catalogue of the collection. He contributed valu-

able papers to periodicals, and numerous specimens to the botanical and mineralogical collections at Harvard. Consult Ticknor (editor), *Life of Joseph Green Cogswell, as Sketched in His Letters* (Cambridge, Mass., 1874).

COGSWELL, MASON FITCH (1761-1830). An American physician, adopted son of Samuel Huntington, president of the Continental Congress. He was born in Connecticut, graduated at Yale in 1780, and settled in Hartford, where he was instrumental in establishing the first asylum for the deaf and dumb in America. He was also a founder of the Connecticut Retreat for the Insane at Hartford, and introduced into America the methods of removing a cataract from the eye, and of tying the carotid artery (1803).

COG-WHEEL. See GEAR-WHEEL.

COHABITATION (from Lat. *cohabitatio*, from *cohabitare*, to dwell together, from *co-*, together + *habitare*, to dwell. The act of a man and woman in living together as husband and wife. Cohabitation does not necessarily involve the notion of sexual intercourse, and, in a strict legal sense, as applied to husband and wife, may mean only *consortium*, and not *concubitus*; but the term is commonly held, even in law, to carry with it the latter implication, and this is always so where the parties are unmarried. It raises a legal presumption of marriage between the parties cohabiting, which may, however, be rebutted by other evidence. See MARRIAGE, and the authorities there referred to.

COHEN, kō'en. EMIL (1842—). A German mineralogist, born in Jutland. He studied in the universities of Berlin and Heidelberg, and from 1867 to 1872 was assistant in mineralogy in the latter university. He then spent a year and a half in South Africa, and after devoting the following years to mineralogical studies and to the preparation of works descriptive of his African explorations, became professor of petrography in Strassburg in 1878. In 1885 he was made professor of mineralogy in Greifswald. His published works include the following: *Geognostisch-petrographische Skizzen aus Südafrika* (1874); *Erläuternde Bemerkungen zur Routenkarte einer Reise von Lydenburg nach den Goldfeldern und von Lydenburg nach der Delagoabaai im östlichen Südafrika* (1875); and *Sammlung von Mikrophotographien zur Veranschaulichung der mikroskopischen Struktur von Mineralien und Gesteinen* (1881-83; 3d ed., 1899).

COHEN, HENRI (1808-80). A French numismatist, born at Amsterdam, Holland. For a number of years, he held the post of curator of the numismatic collection in the National Library in Paris. He is known as the author of two highly valuable works, *Description générale des monnaies de la république romaine* (1857), and *Description historique des monnaies frappées sous l'empire romain* (7 vols., 1859-68; 2d ed., prepared by Feuardent, 1880 et seq.).

COHEN, HERMANN (1842—). A German philosopher, born at Cösing. As one of the leaders of the Neo-Kantian movement (see NEO-KANTIANISM), he did perhaps as much as any other follower of Kant to make the Critical Philosophy better known to students. This he has accomplished by banishing the 'thing-in-itself' from his system, and bringing philosophy

into closer connection with the sciences. His contributions to the interpretation of Kant's writings are of permanent value. His works include *Kant's Theorie der Erfahrung* (2d ed. (1895); *Kant's Begründung der Ethik* (1877); *Platon's Ideenlehre und die Mathematik* (1879); *Ein Bekenntniss und die Judenfrage* (1880); *Die Nächstenliebe im Talmud* (1884); *Kant's Begründung der Aesthetik* (1889).

COHERER (from *cohere*, from Lat. *cohære*, to cling together, from *co-*, together + *hære*, to cling). An instrument invented in 1890 by Professor Branly, of Paris, for the detection of so-called 'electrical waves,' that is, of waves in the ether produced by electrical oscillations. (The principle of this action had been discovered before by Varley and Calzecchi-Onesti.) It consists essentially of a tube containing minute filings of some metal, into each end of which a wire enters for a sufficient distance. It has been observed that under ordinary conditions such a tube does not allow an electric current to pass; but, if electrical waves fall upon it, a current can be passed most easily, thus affording a simple means of telling when electrical waves are passing. One explanation is that, when put in the tube loosely, the filings do not make electrical connection, owing to thin surface layers of condensed gases, etc.; but under the action of the electrical waves these layers are cleaned off, possibly by minute sparks passing between the filings, and thus establishing metallic connection through the tube. If, after the waves have passed, the tube is tapped forcibly, the filings are knocked apart, and the tube again becomes a non-conductor. The metals whose filings are used ordinarily are silver and nickel. Others might be used, but it has been shown that with some substances the electrical resistance is increased by the waves, not decreased. See WIRELESS TELEGRAPHY.

COHESION (Fr. *cohésion*, It. *coesione*, from Lat. *cohære*, to cling together). The name given to that property of matter observed when two portions of the same matter are brought closely into contact; thus one speaks of the cohesion of water, meaning the forces manifest at any point in water owing to the mutual action of the molecules. Sometimes the word is used to express the phenomenon observed when two pieces of a solid are stuck together, such as two pieces of glass, two pieces of lead, etc. The forces of cohesion in a liquid are greatly affected by having substances dissolved in it, and, in short, by anything which affects the molecules or their arrangements.

COHN, kōn, FERDINAND JULIUS (1828-98). A German botanist, born at Breslau. He studied at the universities of Berlin and Breslau, became connected with the latter institution in 1850, and was made full professor there in 1872. His investigations concerned chiefly the physiology and morphology of plants, to our knowledge of which he made numerous contributions of the highest importance. Besides a number of papers on special topics of his science, his published works include the following: *Zur Naturgeschichte des Protococcus pluvialis* (1850); *Untersuchungen über die Entwicklungsgeschichte der mikroskopischen Algen und Pilze* (1853); *Neue Untersuchungen über Bakterien* (1872-75); *Die Pflanze, Vorträge aus dem Gebiete der Bo-*

tanik (2d ed., 1895-97). He also edited the *Beiträge zur Biologie der Pflanzen und der Kryptogamenflora Schlesiens*. One of his best-known contributions to science was the demonstration that bacteria are vegetal organisms. Consult Pauline Cohn, *Ferdinand Cohn, Blätter der Erinnerung* (Breslau, 1901).

COHN, GUSTAV (1840—). A German political economist. He was born at Marienwerder, and studied at Berlin and Jena. His tour through England in 1873 gave him the materials for his work, *Untersuchungen über die englische Eisenbahnpolitik* (1874). In 1884 he became professor of political science at Göttingen, and in 1892 served as a member of the Imperial Commission appointed to investigate the affairs and regulations of the Stock Exchange. His more important works include: *System der Nationalökonomie* (1885 and 1889; Engl. trans. in the *Economic Studies* of Chicago University) and *Zur Geschichte und Politik des Verkehrswezens* (1900).

COHNHEIM, kōn'hīm, JULIUS FRIEDRICH (1839-84). A German pathologist, born at Demmin in Pomerania. After studying medicine at several universities, including those of Berlin and Würzburg, he became connected with the pathological institute of the Charité, Berlin. In 1868 he was made professor of pathology at Kiel, from 1872 to 1878 was professor at Breslau, and during the last years of his life held a similar position at Leipzig. His published works include the following: *Untersuchungen über die embolischen Prozesse* (1872); *Neue Untersuchungen über die Entzündung* (1873); *Vorlesungen über allgemeine Pathologie* (1877-80); *Die Tuberkulose vom Standpunkte der Infektionslehre* (1881). Cohnheim was the first to demonstrate that pus consists largely of white blood-corpuscles, thus throwing much light on the nature of inflammations. Consult: Ponfiek, *Gedächtnisrede auf Cohnheim* (Breslau, 1884); also, Kühne's biographical sketch published with the *Gesammelte Abhandlungen von J. F. Cohnheim* (Breslau, 1885).

CO'HO (American Indian). A local name in Alaska for the silver salmon (*Oncorhynchus kisutch*). See SALMON.

COHOES, kō-hōz'. A city in Albany County, N. Y., nine miles north of Albany; at the junction of the Mohawk and Hudson rivers, and on the Delaware and Hudson and the New York Central and Hudson River railroads (Map: New York, G 3). The Erie and Champlain canals also pass through the city, uniting a short distance to the south. In this section of the Erie Canal there are several locks which lift the boats from the lower level of the Hudson Valley to that above the Mohawk Falls. The city is furnished with abundant water-power by the Mohawk, here crossed by a long railroad bridge affording a fine view of the falls, which are 75 feet high and 900 feet wide. A dam above the falls stores the water which is supplied by canals to the mills and factories. Cohoes is noted as a manufacturing centre, its industries including large cotton-mills, woolen-mills, knitting-mills, axe-factories, rolling-mills, and many other industrial establishments. Cohoes was for many years a part of the Rensselaer Manor. Its first settlers were Dutch, and probably came as early as 1630. It was incorporated as a

village in 1848, and in 1870 was chartered as a city. Population, in 1890, 22,509; in 1900, 23,910.

CO'HORT (Lat. *cohors*, originally meaning inclosure, connected with Gk. *χορτός*, *chorotos*, garden. OIr. *gort*, sedge. Ger. *Garten*, garden. AS. *geard*, Engl. *yard*). A portion of a legion in the ancient Roman armies. Usually there were 600 men to a cohort, and ten cohorts to a legion (q.v.). See CENTURION.

CO'HOSH. The American Indian name of black snakeroot (*Cimicifuga racemosa*). It occurs in the United States from Maine to Wisconsin and south to Florida. The rhizomes, which are employed in medicine, contain resin, wax, tannin, and a crystalline principle. Alterative, sedative, and emmenagogue properties are attributed to it. See Plate with article SANGUINARIA.

COIF (from OF. *coife*, Fr. *coiffe*, It. *cuffia*, from ML. *cofia*, *coif*, from OHG. *chuppa*, cap under the helmet, from *chupf*, Ger. *Kopf*; connected with AS. *cuppe*, Engl. *cup*). (1) A covering for the head in general, but more especially for the circular portion on the crown, which certain of the Roman Catholic clergy in monastic orders are in the habit of shaving. (See TONSURE.) A special signification refers to the distinguishing mark of sergeants-at-law, which, though nothing but an insignificant black patch on top of the legal wig, is now the only reminiscence of the tonsure among English lawyers. On attaining the degrees of the coif, or becoming a sergeant, a barrister retires from the Inn of Court by which he was called to the bar and becomes a member of Sergeants' Inn.

(2) In the armor of the Middle Ages, a defensive hood, usually surmounted by a helmet, sometimes continuous with the hauberk, and sometimes separate.

COIMBATORE, kô-îm'bhâ-tôr', or **KOIMBATUR**, kô-îm'bhâ-tôor' (Telugu, also *Koimpadî*, *Koibmutur*, *Koiamutura*). A city in Madras, British India, capital of the district of the same name, situated near the left bank of the Noyel, a tributary of the Kavery, in latitude 11° N., longitude 77° 1' E. (Map: India, C 6). It lies 304 miles southwest of Madras, with which it is connected by rail. It occupies the south declivity of the Nilgiri, 1483 feet above the sea, and has a cool and healthful climate. The adjacent low-lying plains, however, are malarious and dangerous to health. The suburban Pagoda of Perur is an important archaeological structure. Population, in 1891, 46,400; in 1901, 53,000.

COIMBRA, kô-êm'brâ. A city of Portugal, capital of a district of the same name, in Beira, picturesquely situated, partly on a steep rock and partly in a plain, amid vineyards and orange orchards, on the right bank of the river Mondego, 110 miles north-northeast of Lisbon (Map: Portugal, A 2). The upper town is badly built, its streets being steep, narrow, and dirty. Of the public buildings, the most noteworthy are the cathedral, the churches of São Francisco and São Salvador, and the convents of Santa Cruz and Santa Clara. There is here a fine aqueduct of twenty-one arches, which dates from the sixteenth century. The famous University of Coimbra (q.v.) is the only university in Portugal. Coimbra has manufactures of linen, woolen, earth-

ware, and combs. Population, in 1890, 17,329. Coimbra was the Conimbrica of the Romans. In 1064 it was taken from the Moors by Ferdinand I., and for two hundred and fifty years (1129-1383) was the capital of Portugal. It was the scene of prolonged fighting between Masséna and Wellington in the campaigns of 1810 and 1811.

COIMBRA, UNIVERSITY OF. The State University of Portugal, and the only university in that kingdom. With some 1600 students in theology, law, medicine, mathematics, and philosophy, its library, hospitals, observatory, museums, and laboratories, it is an institution of great national importance. Its history is long and checkered. Founded in 1290 by the poet-king, Diniz, at Lisbon, a supplementary charter was issued in 1308, transferring it, because of dissensions between town and gown, to Coimbra, the first of a long series of migrations which make it unique among universities. From 1308 to 1380 it vibrated between Coimbra and Lisbon, in the latter year being settled at Lisbon. In 1537 it migrated again to Coimbra, where it has since remained. It was at the beginning of this last period that it reckoned Camoëns (see CAMÕES) among its members. Alone among Continental universities to-day, it preserves the mediæval academic dress; and in this, as in its architecture, traditions, and customs, it finds its only rivals in picturesque interest in Oxford and Cambridge. Consult Braga, *Historia da Universidade de Coimbra* (Lisbon, 1892).

COINAGE (from Engl. OF. *coin*, wedge, piece of money, from Lat. *cuneus*, wedge; connected with Gk. *κῶνος*, *kōnos*, cone, Skt. *sāna*, whetstone, from *śā*, to sharpen). Coins are pieces of metal designed to circulate as money, whose weight and fineness are certified by the impressions they bear. These impressions are the symbols of the authority by whose orders the coins are issued, but they also bear an important function in maintaining the integrity of the coin. To insure constancy in the weight of the coin it is necessary to protect it against clipping and against unnecessary wear and tear, or abrasion. The form of the coin is, in itself, a guaranty. Convenience of carriage, as well as greater durability, has given the preference to a rounded, generally a circular coin, over other shapes. Where, as in Japan, we find oblong coins, the corners are generally rounded off. The symmetry of outline guarantees the coin. This is heightened by milling the edges. Raised inscriptions serve the same purpose and do so better than incised letters, which are also used. The design upon the face of the coin is usually protected by raised edges, which project as much as the highest part of the design.

The importance of these features of modern coins in maintaining intact the weight of the coin by showing at once any attempted clipping, and by preventing the wearing off of surfaces by use, can best be appreciated by comparing them with the crude, irregular disks from which early coins were made, and the high relief of many of the designs upon them.

Gold and silver were used in settling accounts before coins were invented, but scales were a necessary adjunct of such transactions. Just as gold dust is weighed in the mining regions, so all exchanges effected by the metals before the introduction of coinage involved

weighing the metal used. The prevalence of exchange by weight is reflected in the correspondence, at least in their origin, between coins and measures of weight. To go back no further than the origin of English money, it is sufficient to recall that the monetary pound was once a pound weight of silver. This system was derived from the money of Charles the Great, and while in the subsequent development they departed widely from the original source, the monetary systems of modern Europe all trace back to the pound of silver.

The invention of coins, which, in classical antiquity, seem to have been first used in Lydia, did away in a measure with the necessity of weighing. In the multiplicity of Grecian States, coins were numerous, and while this was removed by the Roman Empire, it reappeared with the break-up of the Empire of Charles the Great. Not only did each nation make its own coins, but with the disintegration of central authority, nobles and cities usurped this right or had it conferred upon them by feeble monarchs. The multiplicity of coins restricted the area within which they were current. Outside of such areas they had no legal validity; they did not pass by count, but, if at all, only by weight. Certain coins, however, bore such an excellent reputation for uniformity and excellence of workmanship that they acquired an international circulation and passed generally by count or tale. As modern centralized States became strongly rooted, a unification of the coinage took place, and the numerous units disappeared. Improvements in the processes of coinage have made effective the certification of weight and fineness which coinage implies.

The right to coin money is a prerogative of the State and one of the foremost marks of sovereignty. The circulation of coins rests, in the first instance, upon the authority of the State; but that authority must be exercised in good faith. Coinage issued by individuals would lack authority and lack also the guaranty of good faith. There have been occasions of great dearth of money where private persons have issued coins. Such issues are known as tokens, and gain circulation either from their similarity to legal coins or from the promise of redeeming them. Their total lack of uniformity gives a picture of what might be expected were the issue of coins left wholly to private initiative. Almost equally obvious is the necessity for the manufacture by the State of the coins which it issues. To delegate the manufacture of its coins to a private establishment, as was done in France before 1879, requires such a minute control of all its operations by State officials that the plan has generally been abandoned. The greater integrity of a national mint over a private enterprise is further illustrated by the fact that the mints of the leading nations are frequently called upon to execute the coinage for smaller States which have no mints of their own. Thus, in 1901, the United States Mint executed a gold coinage for Costa Rica.

The metallic circulation of a country usually consists of standard coins and token coins, with respect to whose issue different rules prevail. The first are those of the standard monetary metal, and their coinage is usually free. This means that such coins are freely issued to individuals who bring bullion to the mint for

coinage. There may be a coinage charge or this transformation may be made gratuitously by the State. Gratuitous coinage, which prevails in England and the United States, is favored because it promotes the transformation of bullion into coin to meet the demands of trade. A coinage charge, as in France (7 francs 44 centimes per kilogram of gold, or 3437 francs), is justified on the ground that the value of the coin is greater than that of the bullion by the cost of production; and, further, that the policy of the Government should be to give reasonable ease to the transformation, but not to favor a constant oscillation between coin and bullion. The English language knows but one name, *seigniorage*, for such coinage charges, whether they merely cover the cost of coinage (Fr. *brassage*) or are high enough to involve a profit. High seigniorage charges upon the standard money metal defeat the purposes of free coinage and are no longer customary. See SEIGNIORAGE.

Token coins are those whose metallic value is less than their nominal value. As such coinage involves a profit to the State, the State reserves the right of issue to itself. (See MONEY for an exposition of the principles of such issues.) In the United States this applies to the silver, nickel, and bronze coins. The metallic value of the coin is no protection against its unauthorized issue by individuals, but this protection is secured by the laws punishing counterfeiting. The processes of manufacturing a good counterfeit are so complex and require such heavy machinery that the secret manufacture can hardly escape detection.

Important considerations in coinage legislation, apart from the larger monetary aspects, are to secure uniformity in the coin at its manufacture and to maintain the integrity of the coin in circulation. Absolute accuracy in weight and fineness for every coin issued is out of the question. The law therefore allows, in the manufacture of coin, a certain tolerance both of weight and fineness. Variations within these limits, over or under the standard fixed by the law, do not disqualify the piece from issue. In former days these limits were often set quite wide, and by systematically getting under rather than over the average, considerable profits were stolen from the coinage. This was one of the abuses of the old régime in France which awakened the ire of the legislators of the Revolution when they took the reform of the coinage in hand. It should of course be the object to make these limits as narrow as possible, with the idea that the deviations, one side or the other, should balance, so that for the mass of the coinage the legally established standard should prevail. In the United States the standard fineness for both gold and silver is 900, and no gold ingot showing a greater deviation than one-thousandth, or silver ingot with a greater deviation than three-thousandths can be used in coinage. As to weight, the rule for single pieces prohibits deviations of more than one-half a grain for the double eagle (516 grains legal weight) or eagle, or more than a quarter of a grain for the half-eagle. The law also provides that in "weighing a number of pieces together, when delivered by the coiner to the superintendent, and by the superintendent to the depositor, the deviation from the standard weight shall not exceed one-hundredth

of an ounce in \$5000 in double eagles, eagles, and half-eagles."

Every effort is made by watching the process of manufacture to insure the observance of these rules. Trial pieces of every lot of coin which passes through the mints must be reserved. Once a year an Assay Commission is appointed for the examination of these sample pieces, which are both weighed and assayed. The accuracy of the work of the United States mints is shown by the report of the Assay Commission for 1901 that the fineness of gold coins varied from 899.5 to 900.2, the legal limits being 899 to 901, while that of silver coins varied from 898.2 to 900.9, the legal limits being 897 to 903.

In the circulation of coins from hand to hand, the friction gradually wears the impressions off and reduces the weight of the coin. It is, therefore, customary for coinage legislation to determine the point at which the coin loses its legal validity. In the United States gold coins which have lost more than one-half of one per cent. of their weight in twenty years from date of issue, or proportional amounts for less periods, are legal tender only by weight. All such coins received by the Government must be recoined. The depreciation of coins by abrasion has, in earlier times, been a serious problem. By a familiar monetary law (Gresham's Law), full-weight money is always preferred for export, while the worn coin remains at home. If the home circulation is much worn, there is a great temptation to 'sweat' all the new coins which come from the mint for the profit of the transaction. Hence the necessity from time to time of general recoinage of the money in circulation. The Government calls in all outstanding coins of certain dates and replaces them with new coins, declaring, moreover, that after a certain date the coins not presented shall lose their legal-tender quality.

In England, coining, although a prerogative of the Crown, is regulated by Parliament. By the Constitution of the United States the power of coining money, regulating the value thereof, and of foreign coin is granted to Congress, and the several States are prohibited from coining money as well as from making anything but gold and silver coin a tender in payment of debts. The uttering of spurious coin, therefore, is a crime against the United States. It is also punishable by a State government as a cheat. Coin has been judicially defined as "a piece of metal stamped and made legally current as money." A counterfeit coin is one made falsely in imitation of the genuine, and intended to resemble or to pass for it. The mutilation or debasement of United States coin, as well as the fraudulent importation or use of spurious foreign coin, is a crime under Federal statutes. See COUNTERFEITING.

The works cited under MONEY contain much information in relation to coinage. Consult also *Reports of the Director of the Mint*, and *Coinage Laws of the United States*. See MINT; MONEY; NUMISMATICS; LEGAL TENDER.

COIR (Tamil *kayiru*, cord), or COCOANUT FIBRE. The fibre of the husk of the coconut palm. Coir is a corruption of a word meaning rope. Its manufacture has become an important industry, both in England and America. The fibre of the husk is divided into two classes—the ordinary fibre converted directly into mats, and

the so-called brush fibre, which lies just under the skin. The latter is packed under great pressure, and then shipped to the manufacturer. It is spun by special machinery, and produces a perfectly cabled yarn, which is woven into doormats or ordinary yard-matting. In 1901 the coir imported into the United States amounted to 3,901,384 pounds, valued at \$141,830. The refuse from coir is used for stuffing mattresses, and also in horticulture as a protection against insects for vines and young trees.

COIRE, kwär. See CHUR.

COIT, JAMES MILNOR (1845—). An American teacher, born at Harrisburg, Pa. He received his education at Hobart College, was connected for some time with the Cleveland Tube Works, and has for many years taught natural science at Saint Paul's School, Concord, N. H. He is a member of several learned and patriotic societies, and his publications include the following interesting works: *A Manual of Chemical Arithmetic* (1886); *Treatise on the X-Rays and Their Relation to Medical and Surgical Sciences* (1897); and *Liquid Air* (1899).

COIJTER, VOLCHER (1534-90). A Dutch anatomist, born at Groningen. He studied in France and in Italy, where he heard the lectures of Fallopius at Pisa, was city physician of Nuremberg, and later was attached as surgeon to the army of Johann Kasimir, Count Palatine of the Rhine. He is considered one of the founders of the science of pathological anatomy. Numerous anatomical discoveries are credited to him, including that of the superior muscles of the nose. His studies in osteology and myology are partially set forth in the volumes *Tabula Externarum et Internarum Humani Corporis Partium* (1573) and *Lectiones Gabrielis Fallopii* (1575), which are also interesting as revealing one of the earliest attempts at an examination of the internal structure of birds. Indeed, his table, *De Differentiis Avium*, included in the latter, is among the first ornithological classifications.

COJUTEPEQUE, kô-noo'tá-pá-ká. The capital of the Department of Cuscatlán, Salvador, about 15 miles east of San Salvador (Map: Central America, C 4). It is situated north of the volcano Cojutepeque, and near Lake Ilopango. The city has considerable transit trade. Cojutepeque, for a few years after 1854, when San Salvador was destroyed by an earthquake, was the seat of government of the Republic.

COKE (probably connected with *cake*). A hard, brittle, porous solid, of a blackish-gray color and more or less metallic lustre. It does not soil the fingers when rubbed, and gives no smoke when burning. It absorbs moisture from the air to a very great extent. In general, the operation of making coke consists of expelling by heat the gaseous elements of bituminous coal. The residue resulting consists chiefly of pure carbon, mixed with varying amounts of ash containing sulphur and phosphorus, and is known as coke. In the manufacture of illuminating gas, coke is produced as a by-product (see GAS, ILLUMINATING); but this method is inadequate to produce the requisite quality and amount, and the manufacture of coke is itself an industry of great and rapidly increasing importance. Coke, charcoal, and anthracite coal are the fuels most used in metallurgy, and of these coke possesses the advantages and is without the dis-

advantages of the other two. Its hardness enables it to sustain the weight of furnace charges, and its porosity helps to make it readily combustible. Charcoal is too soft, while anthracite coal, which is in reality a natural coke, is hard enough, but is so dense in structure that its combustion is slow and its calorific energy moderate. The superiority of coke is due to its cellular structure. The walls are hard and vitreous, and the tiny passages between afford free course for the oxidizing gases of the blast-furnace. Besides its use in metallurgy, coke is an important fuel in other industrial operations, and it is being adopted for locomotives on some railroads. In 1899 the Boston and Maine Railroad began using coke as a fuel. Its advantages are that it is smokeless and does not produce sparks, thus decreasing the number of fires caused by the locomotives. Coke is also employed as a filtering material in water and sewage purification, being used extensively for the latter purpose, particularly in English practice.

Not all bituminous coals can be made into coke, and much experiment and research on the part of chemists have been devoted to ascertaining the necessary constituents of a good coking coal. It appears that the coking property of coal is independent of the constituents, such as moisture, fixed carbon, ash, and sulphur, which it contains, and depends wholly upon the relations and volumes of the elements composing the *volatile combustible* matters of the coal. Just what these relations and volumes are has not been definitely shown. In Continental Europe, where the manufacture of coke has been very highly developed, only a poor quality of coal is available, and much ingenuity has been expended in constructing furnaces suitable for this inferior grade of material. In America there has been as yet an abundant supply of coal of the very best quality for coking purposes, the supply having been drawn chiefly from the Connellsville coal of Pennsylvania and the Pocahontas coal of Virginia. But with the increasing demand for coke for metallurgical and other purposes, the poorer grades of coking coal must be drawn upon.

The preliminary preparation of coal for the manufacture of coke is chiefly a cleansing and separating process. Some of the best coking coal requires no special treatment, but is charged into the coke-ovens direct from the mines. It is usually found advantageous, however, to break up the coal into small pieces, in order that the volatile matter may be utilized to the utmost extent. When the coal is not uniform in size, it is found that it cokes unevenly, the finer portion fusing much more rapidly. When there is much slate in the coal, it is necessary to wash it; the slate separating itself from the coal in the process of washing, on account of its greater weight. Fire-clay also will be separated and washed out. Before washing, however, it is necessary carefully to sort the coal according to size. Various machines of great efficiency have been devised for crushing, sorting, and washing coal ready for the ovens, which are described in great detail, as are also the different forms of coke-ovens, by John Fulton in his *Treatise on the Manufacture of Coke* (Scranton, Pa., 1895). Three general methods have been followed in the process of transform-

ing coal into coke. The first was the primitive and wasteful process, borrowed from the charcoal-burners, of *open-air burning*. The coal is simply piled in a rectangular heap on the ground, with longitudinal and vertical flues running through it, in which enough wood is placed to ignite the whole mass of coal. The fire is lighted at the base of the vertical flues, and gradually extends through the mass. When the mass ceases to flame it indicates that the gaseous matter has been expelled, and the fire is partially smothered by covering the heap with fine dust. Last of all, the mass is sprinkled with a hose, the water being at once converted into steam, which permeates the whole mass. This process of coke-making requires from five to eight days.

The second method of making coke, and one which is still largely employed, is in the *beehive oven*, many improvements in its construction having been made from time to time. As late as 1893, all of the 44,201 coke-ovens in the United States were constructed on the beehive plan. The chief advantage claimed for it is that it produces from prime coking coals the best quality of metallurgical fuel. A minor advantage is that water is applied to cool it, while the coke is still in the oven, after which the oven heat reduces the amount of moisture in the coke. The great disadvantage of the beehive oven is that, as ordinarily constructed, the valuable by-products—ammonia and tar—contained in the volatile matter are entirely lost. This oven is not adapted to inferior grades of coal. It derives its name from the dome shape of its interior. It is usually built of stone masonry, on a firm foundation, with its interior lined with specially designed fire-brick. The beehive oven is usually about 12 feet in diameter and 6 to 7 feet high in the centre. The coal is charged through a hole in the centre of the roof, and is leveled off to an even depth of about 23 inches. The fresh charge is fired by the heat remaining in the walls from the previous charge, and the combustion is supported by air admitted through the front door, over the top of the charge. The volatile matter in the coal is driven off by the heat and burned in the top of the oven, along with a portion of the fixed carbon. The source of heat being at the top, the coking process proceeds downward, and is effected by the partial combustion of the charge itself. In England, and in a few American plants, the volatile matter is gathered into a conduit and carried under boilers, to raise steam for pumping water and other purposes; but usually the gases escape directly into the open air and are wasted.

As early as 1766 attempts were made in Germany to save the by-products from coke-ovens. It is now accomplished in the *retort oven*, which was devised in Europe for the double purpose of saving the by-products and for utilizing for coke-making inferior grades of coal. Very slow progress was made in developing the process, and it was not until 1883 that it was put upon a paying basis. This was due to the unsatisfactory design of the early coke-ovens and to the low price of the by-products, on account of the supply from gas-works. In 1856 Knab of France built a group of retort coke-ovens which had for their object, in addition to the making of coke, the double purpose of separating the tar and ammonia from the gases generated, and of

then returning these gases to be burned in the flues to heat the ovens. The principal defect of these ovens was the failure to proportion the several parts to the quality of coal to be coked. This mistake was corrected by Carvès of France in the Knab-Carvès oven of 1873, which has proved a model for later ovens. Subsequent improvements were made by Albert Huessner in Germany and G. Siebel in France, in 1881. Coke produced in by-product ovens was regarded with distavor till Dr. Otto introduced improvements which were patented in 1883 and are embodied in the Otto-Hoffmann coke-oven, to which the Siemens regenerator is applied. In 1887 the Semet-Solvay oven for coking dry coals, or a mixture of pitchy and dry coals, came into notice. The Belgian ovens, designed for coking poor grades of coal, are also widely used in Europe.

The retort oven used in the Semet-Solvay process is a long, narrow chamber from 30 to 33 feet long, about 6 feet high, and from 15 to

the last traces of tar and ammonia are removed. The gas is now returned to be burned in the flues of the coke-oven; but as this consumes little more than half of that generated, the rest is available for other purposes. The tar is collected into tanks, and the ammonia is concentrated into a strong crude liquor or into sulphate of ammonia. A ton of coal will yield from 15 to 25 pounds of sulphate and 5 to 14 gallons of tar. The demand for these by-products is rapidly becoming greater, and in some of the most recent coke-ovens their manufacture is considered of more importance than the coke itself.

In Germany, 12,000 Otto-Hoffmann coke-ovens are in operation, of which 400 save the by-products and the remainder do not. There were, in 1901, in America, either completed or in course of construction, about 2000 such ovens. Of these only those in three plants attempt to save illuminating gas.

The accompanying table gives the yield in coke and other products of certain standard coals:

YIELDS OF VARIOUS COALS IN OTTO-HOFFMANN OVENS

AVERAGE OPERATING RESULTS	Coke, per cent.	Tar, per cent.	Sulphate, per cent.	Total Gas per 2000 pounds, cubic feet
Everett, Dominion coal.....	72.83	4.99	1.010	About 9,000
Glassport, Youghiogheny coal.....	75.60	5.07	1.100	" 9,000
Germany, Westphalian coal.....	74.50	3.70	1.280	" 9,600
DISTILLATION TESTS				
Connellsville coking coal.....	76.34	6.14	1.223	" 8,924
Pittsburg " ".....	68.25	4.38	.908	" 8,884
Eastern Pa. " ".....	85.00	2.00	.900	" 8,400
Virginia " ".....	66.01	4.70	1.070	" 10,090
Kanawha " ".....	73.60	6.40	1.000	" 10,289

20 inches wide, depending on the quantity of the coal to be coked. The ovens are built in blocks of from 25 to 34, separated by flues in which gas is burned, the heat from which cokes the coal. The charge is introduced through several openings in the top, the ovens are nearly filled, and then tightly sealed. As the heat in these ovens comes from the sides instead of the top, as in the beehive oven, the flow of gases generated is from the sides to the centre, while the free expansion of the coke is somewhat checked. As a result, some coals that in a beehive oven make a coke that is too soft and spongy for blast-furnace use, are hardened and strengthened in the retort oven so that they are able to bear the furnace burden. The ovens being so much narrower, the process of coking requires only half as much time as in the beehive furnace. When the charge is coked it is pushed out by means of rams through doors at each end, the doors are immediately closed, and the oven is ready for a recharge with almost no loss of heat. The coke is quenched as soon as it leaves the oven. The gases are conducted from the oven, through an opening in the top, into a collecting main. This is a hydraulic main, like that used in illuminating-gas works. The gas bubbles through the water, and a part of the tar and ammonia is condensed and separated as the gas cools, and then collected. The gas next passes through tubular condensers, where it is cooled by contact with a series of tubes through which cold water is flowing. During this process more ammonia and tar are condensed. The gas now goes through an exhauster, and, last of all, to a scrubbing apparatus, where

For a complete discussion of the coke industry, reference should be made to the "Mineral Resources of the United States," which form a part of the *Annual Reports of the United States Geological Survey*; and to Platt, "Special Report on Coke Manufacture," *Pennsylvania Second Geological Survey Report of Progress L* (Harrisburg, 1876); Fulton, *Coke: A Treatise on the Manufacture of Coke and the Saving of By-Products* (Scranton, 1895); Parker, *Manufacture of Coke in 1896* (Washington, 1897); Weeks, "Coke," in *United States Census Office Eleventh Report on Manufacturing Industries* (Washington, 1895). See AMMONIA; GAS; and TAR.

COKE, kuk or kōk. Sir EDWARD (1552-1634). A distinguished English lawyer and judge. He was born at Milham, in Norfolk, on February 1, 1552. Educated at the free grammar school at Norwich, and at Trinity College, Cambridge, he passed thence to Clifford's Inn, and subsequently to the Inner Temple, to study law, and was called to the bar in April, 1578. His great ability, legal learning, and the tact he exhibited in the conduct of his cases, secured him a large practice on the very threshold of his career. In 1586 he was appointed recorder of Norwich, in 1592 recorder of London, a position he resigned the same year for the Solicitor-Generalship. In the following year he was elected member of Parliament for the county of Norfolk, and was chosen Speaker of the House of Commons. In 1594 he was made Attorney-General, and it was in this capacity that he conducted the prosecution in the famous State trials of Southampton

and Essex in 1601, of Sir Walter Raleigh in 1603 (in which he exhibited a brutal rancor and bitterness), and of the Gunpowder plotters in 1605. He held this office until 1606, when he was appointed Chief Justice of the Common Pleas, the duties of which position he discharged in a manner that secured for him a great reputation. Upright and independent, with a high notion of the dignity and importance of his office, he did not, in an age of judicial sycophancy, hesitate to oppose any illegal encroachment by royalty. At the suggestion of Bacon (between whom and Coke there was a long-standing hostility), James I., in order to bring him over, appointed Coke, in 1613, Chief Justice of the King's Bench, and shortly afterwards Privy Councillor. But here he proved equally incorrigible, among other things maintaining, in the *Comendams* case, that the King had no power to stay the proceedings in a court of justice, even after his more pliable colleagues had retracted and begged the royal pardon on their knees for having entertained and expressed that opinion.

This was too much. Coke, in a few months (November, 1616), was relieved from his Chief-Justiceship. His ardent and unflinching support of liberal measures in Parliament, especially of the right of freedom of debate, soon brought him into further trouble with the Court party, and in 1621-22 he suffered nine months' imprisonment in the Tower. In the third Parliament of Charles I. (1628) Coke took an active part in framing the celebrated *Petition of Right*, and it was in a great measure owing to his advocacy that the Lords were induced to agree to it. He died September 3, 1634. He had an extraordinary popularity, and his utterances and courage did much to contribute to the final result in the struggle between the Crown and the Commons. Yet he was of an intolerant disposition, and in religious matters and in his fear of the growth and influence of the Papal power he was fanatical. He is now best known for his law treatise, *Coke Upon Littleton*; or, *the First Institute*, a work of extraordinary learning and of great acumen, which is still, perhaps, the most influential and authoritative treatise on English law. His other works are the *Second, Third, and Fourth Institutes*; *The Complete Copyholder*; and *Reading on Fines*; while his collection of law reports, which made an epoch in the history of law on their appearance, are still of great value to the profession. Consult: Johnson, *Life of Sir Edward Coke* (2d ed., London, 1845), which is somewhat untrustworthy; also Woolrych, *The Life of Sir Edward Coke* (London, 1826); and the sketches of his life in Foss, *Judges of England*, vol. vi. (London, 1857), and in Campbell, *The Lives of the Chief Justices of England*, etc., vol. i. (London, 1849).

COKE, THOMAS (1747-1814). The first bishop of the Methodist Episcopal Church. He was born at Brecon, Wales; was educated at Oxford, and took orders in the Church of England in 1770. About 1772 he was converted, and showed great fervor; in 1776 he met Wesley for the first time, and after that began open-air preaching. In consequence of his revivalism, he was dismissed from his curacy of South Petherton, and attached himself to the Methodist Society. In 1782 he was appointed president of the Irish Conference, and two years later he was

made superintendent for America, with power to confer ordination, by the laying on of hands administered by John Wesley and two other clergymen of the Church of England. Charles Wesley, who had not been aware of the ceremony, and heartily disapproved of it, wrote the well-known epigram:

So easily are bishops made
By man's or woman's whim;
Wesley his hands on Coke hath laid,
But who laid hands on him?

In 1787, both Coke and Asbury, whom Coke had ordained, assumed the title of bishop, much to John Wesley's displeasure. They traveled together among the various conferences until the middle of 1785, when Coke returned to England. He made in all nine visits to America, and spent the rest of his life in active missionary work, in personal visitation in the United Kingdom and in America, and in the encouragement of enterprises for the Christianizing of Asia and Africa. After Wesley's death Coke was secretary of the British Conference, and, with Asbury, he edited *The Doctrine and Discipline of the Methodist Episcopal Church of America* (1787). In 1813 he applied unsuccessfully to Lord Liverpool and William Wilberforce to be appointed bishop for India. He was consumed with a desire to spread Christianity in India, and as the Government was unfavorable to missions by Dissenters there, he believed he could work more effectively in connection with the Church of England, to which, like many Methodist ministers, he himself belonged; but when he went, he represented the Conference. In the same year (1813) he sailed for Ceylon, but died of apoplexy on the voyage, May 3, 1814. He was of a very energetic disposition, and of remarkable executive abilities. He had the advantage of considerable personal means, which he spent freely in the cause. Among his works are a *Life of John Wesley* (1792); a commentary on the Scriptures (6 vols., 1803-08); *History of the West Indies* (3 vols., 1808-11). For his life, consult Etheridge (London, 1860).

COKES, BARTHOLOMEW. A well-drawn picture of a simpleton in Jonson's *Bartholomew Fair*.

COL, kôl (Fr., neck). In geography, a depression or pass in a mountain range. In those parts of the Alps where the French language prevails, the passes are usually named *cols*—as the Col de Balme, the Col du Géant, etc.

COLADA, kô-lá'dà. One of the two swords of the Cid, taken from the Count of Barcelona.

COLA-NUT, or KOLA-NUT. The seed—not properly the nut—of *Cola acuminata*, a large tree of the natural order Sterculiaceæ, native to western tropical Africa, cultivated in the West Indies, Brazil, and other tropical countries, where it has, to some extent, become naturalized. The seeds average about an inch in length, are brown or reddish-gray, slightly mottled, have an odor resembling nutmeg, and a bitter flavor when fresh, which becomes mildly aromatic with age. In the tropics, especially in the Sudan, where they are known as gurnuts, they are employed as a stimulant and as a remedy for tropical diarrhœa. The nuts contain from 0.7 per cent. to 2 per cent. of alkaloid caffeine (q.v.), and small amounts of tannin and theobromine. According to Knebel and Hilger, fresh cola-nut probably contains no caffeine at

all, but a glucoside, the fermentative decomposition of which yields caffeine, glucose, and colared.

COLBAN, kōl'bān, ADOLPHINE MARIE (1814-84). A Norwegian novelist, whose literary genius was developed late and by necessity. She was born in Christiania, December 18, 1814. Left a widow without resources in 1850, she went to Paris, where a friend published part of her correspondence as *Lettres d'une barbare*. These were received with such favor that she was led to essay fiction, and between 1869 and 1881 published seven volumes of tales, most of which were translated into German. *Jeg lever* (1877) is the most characteristic, but nearly all are charming for their sympathetic insight into Norwegian character.

COLBERG, kōl'bérk. See **KOLBERG**.

COLBERT, kōl'bár', JEAN BAPTISTE (1619-83). A French statesman, Minister of Finance under Louis XIV. He was born at Rheims, August 29, 1619, and served his apprenticeship in a woolen draper's shop. He afterwards went to Paris, and soon obtained a position in the War Office, where his tireless activity brought him into notice. He became secretary to Le Tellier, then at the head of the War Office, and through his influence was made a counselor of the King and introduced to Mazarin, who soon employed him in important affairs of State. On his deathbed Mazarin recommended Colbert to the King, who in 1665 appointed him Comptroller-General of the Finances. Colbert found the finances in a ruinous condition, and immediately entered upon an elaborate programme of reform. Fouquet, the Superintendent of Buildings under Mazarin, was found guilty of maladministration, and was imprisoned for life. The new Comptroller instituted a council of finance and a chamber of justice, to call to account the farmers of the State revenues, who were forced to yield up all the wealth of the Crown of which they had fraudulently possessed themselves. In twenty years the revenue rose to 116,000,000 livres, of which but 23,000,000 were spent in collection and administration, whereas before Colbert took the finances in hand the revenue had amounted to only 84,000,000 livres, of which 52,000,000 were absorbed in collection. Colbert did not rest satisfied with being a financial reformer, but in various ways developed the industrial activity of the nation by State support. He was created Minister of Marine in 1669, and shortly afterwards he acquired control of commerce, the colonies, and the royal expenditure. French trade was extended, and roads and canals—including the great canal of Languedoc—were built. Certain features of his economic policy, such as a too stringent regulation of commerce, high protective duties, and the maintenance of the corporation system, have been frequently criticised, but they were rather the faults of the age than of the man. He organized anew the colonies in Canada, Martinique, and Haiti, and founded those of Cayenne and Madagascar.

Perhaps the most successful of all Colbert's reforms was the creation of a French navy. He found France in 1669 with a few old hulks, and provided her in three years with a fleet of sixty ships of the line and forty frigates. The mercantile marine was also developed, and boun-

ties were given on ships built in France. Colbert revised the Civil Code, introduced a code of marine law, as well as the so-called *Code Noir* for the colonies. Statistical tables of the population were first made out by his orders. Men of learning and genius found in him a generous patron. The academies of inscriptions, science, and architecture were founded by him. In short, he appears as the promoter of industry, commerce, art, science, and literature—the founder of a new epoch in France. Notwithstanding his remarkable ingenuity, the unbounded extravagance of his master forced him to raise money in ways objectionable to his reason, and to maintain war taxes in time of peace. The last years of his life were a constant struggle to find money for Louis's ruinous wars, and he died September 6, 1683, bitterly disappointed because his great services were but ill appreciated by the King, whose confidence in Colbert had been undermined by the favorite Louvois. The people of Paris, enraged at the oppressive taxes, would have torn his dead body to pieces, but for the intervention of the military and his burial by night. He left large estates in France, and some of his offices descended to his sons, one of whom became Minister of Marine and another Superintendent of Buildings. A third was made Archbishop of Rouen. It is not the least of Colbert's merits that he saw the wisdom of Richelieu's tolerant course toward the Huguenots, and restrained the King from that fatal policy of persecution which began with the revocation of the Edict of Nantes (q.v.) soon after the great Minister's death. Among Colbert's posthumous papers were found *Mémoires sur les affaires de France* (c.1663), and a fragment, *Particularités secrètes de la vie du Roy*, which have been published several times.

Consult: Clément, *Vie de Colbert* (Paris, 1846); id., *Lettres, instructions, et mémoires de Colbert* (9 vols., Paris, 1861-82); id., *Histoire de Colbert et son administration*, edited by Mme. Clément (Paris, 1874); Gourdault, *Colbert, ministre de Louis XIV.* (Tours, 1885). Sargent, *Economic Policy of Colbert* (London, 1899), contains a bibliography of works relating to Colbert and his time. See **FRANCE**; **LOUIS XIV.**

COLBERT, JEAN BAPTISTE, Marquis de Seignelay (1651-90). A French statesman, Minister of Marine, and son of the famous Minister of Finance. In 1683 he succeeded his father as the head of the navy, and successfully continued the policy which raised that branch of public defense to high efficiency. He was ambitious of attaining success both as diplomatist and warrior, and personally led a naval expedition against Genoa in 1684.

COLBURN, kōl'búrn, WARREN (1793-1833). An American educator, born in Dedham, Mass. He graduated at Harvard in 1820, and in the same year opened a private school in Boston. His taste turned to mathematics, and in 1821 he published *First Lessons in Intellectual Arithmetic*, the sale of which far exceeded that of any previous mathematical work. It was translated into nearly all the languages of Europe, and into some of those of India. From teaching, Colburn went into manufacturing, and was superintendent of large establishments in Waltham and Lowell; but much of his time was

devoted to lecturing on commerce, natural history, physics, and astronomy. He published a *Sequel* to his arithmetic (1824), and an *Algebra* (1827).

COLBY, FRANK MOORE (1865—). An American editor and writer, born in Washington, D. C. He studied at the Columbian University in that city, and afterwards at Columbia University, New York, where he graduated in 1888 and received his master's degree in 1889. He was acting professor of history at Amherst College from 1890 to 1891, lecturer on history at Columbia and instructor in history and economics at Barnard College from 1891 to 1895, and professor of economics at New York University from 1895 to 1900. From 1893 to 1895 he was a member of the editorial staff of *Johnson's Cyclopaedia*, in the department of history and political science. In 1898 he became editor of the *International Year-Book* and one of the editors of the *International Cyclopaedia*, and two years later one of the editors of the *New International Encyclopaedia*. His other literary work has included editorial writing for the *Commercial Advertiser* (New York), critical articles for the *Bookman* and other magazines, and *Outlines of General History* (New York, 1900).

COLBY, THOMAS FREDERICK (1784-1852). An English engineer, connected with the British ordnance survey for forty-five years. He invented the 'compensation bar,' an apparatus used in base-measurements, consisting of a rod of brass and iron, the ends of which remain always at the same distance in spite of changes of temperature. In 1824 he planned, and from then until 1846 supervised, the survey of Ireland, an undertaking of great magnitude and importance. Consult Portlock, *Memoirs of the Life of General Colby* (London, 1869).

COLBY COLLEGE. An institution of higher education, founded by the Baptists of the District of Maine, and situated at Waterville, Maine. It was chartered by the Legislature of Massachusetts in 1813, and was known as 'The Maine Literary and Theological Institution' until 1820, when its name changed to Waterville College. In 1867 the name was again changed to Colby University, in honor of Mr. Gardiner Colby, whose gifts to the college amounted to \$200,000. The name of the institution was changed in 1899 to Colby College. The principal buildings of the college include Memorial Hall, Champlin Hall, Colburn Hall, the Shannon Observatory, and Chemical Hall. Colby College offers courses leading to the B.A. degree, without requiring Greek for entrance. Men and women are admitted on equal terms and pursue the same studies, though in separate classes. The courses are largely elective after the first year. The library numbers 37,000 volumes and 20,000 pamphlets. The number of students is about 200. The endowment funds of the college amount to over \$450,000, and the value of the college property is \$250,000.

COLCHAGUA, kól-ehä'gwá. A province of Chile, bounded on the north by the provinces of Santiago and O'Higgins, on the east by Argentina, on the south by the Chilean Province of Curicó, and on the west by the Pacific (Map: Chile, C 10). Area, 2795 square miles. The eastern and western parts are traversed by the Andes and the Coast Range respectively, while the middle section forms a part of the central valley

of Chile, the best-cultivated part of the country. The soil is well watered and of exceptional fertility, yielding corn, wheat, oats, and beans. Cattle-raising is carried on extensively. The province is traversed by the Santiago-Valdivia Railway. Population, in 1895, 157,566. Capital, San Fernando.

COLCHESTER, kól'chēs-tēr. A Parliamentary and municipal borough and river port of Essex, England, on the south bank of the Colne, 12 miles from the sea, and 51 miles northeast of London (Map: England, G 5). It is partly surrounded by the remains of an old Roman wall. The most notable building is the castle erected in the reign of William Rufus, with walls from 10 to 30 feet thick. The Norman keep is said to be the largest in England. The ruins of Saint Botolph's Priory are an interesting bit of Norman workmanship, and in the Holy Trinity Church Saxon features are found. The streets are well paved and lighted by electricity, supplied by the town, which also owns the water-supply. The town also maintains baths, recreation grounds, and markets. Its educational institutions include the Albert School of Science and Art and a public library. Colchester derives a considerable revenue from the oyster fishery in the Colne. Its corn markets are important, and its manufactures include boots and shoes. It has a quay for vessels of 150 tons at the suburb called Hythe. Population, in 1891, 34,600; in 1901, 38,400. Colchester is the *Camulodunum* of the British and Romans and the later *Colneceaster* (Colne Castle) of the Saxons. Great quantities of Roman remains have been found here, bushels of coins of many emperors, vases, urns, lamps, pavements, and baths. The town was ravaged by the plague in 1348, 1360, and 1665. In the Civil War, Colchester held out for the King, but was captured by General Fairfax after a three months' siege. Old King Cole of merry memory, according to the legend, gave the town its modern name. Consult: Cutts, *Colchester* (London, 1889); Round, "Colchester During the Commonwealth," in *English Historical Review*, vol. xv. (London, 1900).

COLCHESTER. A town in Chittenden County, Vt., containing the village of Winooski (Map: Vermont, B 3). Winooski is a manufacturing village, two miles from Burlington, on the Central Vermont Railroad. It is in an agricultural district, and has manufactures of cotton and woolen goods, metal goods, lumber and woodenware, carriages and wagons, screens, etc. Population (Winooski village, in 1890, 3659; in 1900, 3783); town, in 1890, 5143; in 1900, 5352.

COLCHESTER, first Baron. See **ABBOTT, CHARLES.**

COLCHICINE (Fr., from Lat. *colchicum*, Gk. *κόλχικόν*, *kolchikon*, the poisonous meadow-saffron, from Gk. *Κολχίς*, *Kolchis*, a country on the Black Sea), $C_{11}H_{15}NO_6$. A bitter alkaloid, the active principle of colchicum root, the corm of *Colchicum autumnale* (Linné), growing in southern and central Europe. It is a crystalline substance soluble in water, alcohol, and chloroform. Colchicum preparations are used in medicine to relieve pain in gout. In larger doses colchicine is poisonous, and even in medicinal doses may act as a powerful gastro-intestinal irritant and heart depressant, in which case its administra-

tion must be temporarily discontinued. The medicinal dose of colchicum root, which contains about 0.5 per cent. of colchicine, is from 2 to 8 grains, in powder. The dose of colchicum seed, which contains less of the alkaloid than the corn, is from 1 to 5 grains.

COLCHICUM, kól'kí-kúm (Lat., from Gk. κολχικόν, *kolchikon*, the poisonous meadow-saffron). A genus of plants of the natural order Liliaceæ, native to Europe and to the Mediterranean region. The species, of which there are about thirty, are stemless, with flowers half subterranean like the crocus, only the limb of the perianth and part of the tube rising above ground. The flowers much resemble crocus-flowers. The only British species is *Colehium autumnale*, the meadow-saffron, sometimes also, but incorrectly, named autumn crocus, which is plentiful in meadows and pastures in some parts of England and of the Continent of Europe. The flowers are pale purple; they appear in autumn unaccompanied by any leaves; the leaves, which are large and broadly lanceolate, appear in spring, when the stalk which bears the ripening fruit rises among them. The whole plant is very acrid and poisonous, chiefly owing to the presence of colchicine. Cattle are not infrequently injured by it in pastures where it abounds. It is, however, not difficult to extirpate, the repeated pulling of it by hand, as it appears above ground, being sufficient for this purpose; the roots soon become exhausted and die. It is a valuable medicinal plant, the parts chiefly used for medicinal purposes being the corn (popularly called the root) and the seeds. The seeds are round, brown, and rather larger than mustard-seed; and fatal accidents have occurred from their poisonous nature. Other species of *Colehium* appear to possess similar properties. (See COLCHICINE.) *Colehium autumnale* is common in flower borders, and a number of other species are employed in the same manner. Most of the species are autumn-blooming, a few flowering in spring along with the crocuses, snowdrops, etc. *Colehium luteum* is one of the finest of spring-flowering species, and *Colehium Parkinsoni*, *Colehium speciosum*, and *Colehium autumnale* of autumn-blooming species. For illustration, see Plate of CORNFLOWER.

COLCHIS, kól'kís (Lat., from Gk. Κολχίς, *Kolchis*). In ancient geography, a region on the east coast of the Pontus Euxinus or Black Sea, situated north of Armenia and south of the Caucasus. It corresponded very nearly to the Russian Government of Kutais. It was celebrated in the very earliest times as the native country of Medea (q.v.), and the goal of the Argonauts (q.v.), and was afterwards better known to the Greeks as the seat of some colonies of the Milesians. It was noted for its wine and fruits. The Colchians seem to have differed ethnologically from their neighbors, which led Herodotus to argue that they were descended from Egyptian invaders. Darius Hystaspes made them tributary to Persia; subsequently, they threw off their allegiance, and were ruled by kings of their own; the country then came under the dominion of Mithridates, King of Pontus; afterwards, there were princes of Colchis dependent on the Romans. The principal town was Dioscurias (called under the Romans Sebastopolis and now

Iskuriah); the principal river was the Phasis, now the Rion.

COLCOTHAR. See IRON, THE OXIDES OF.

COLD. See CATARRH.

COLDBATH FIELDS PRISON (named from *Coldbath Fields*, Middlesex). A London jail, erected in the time of James I., and sometimes referred to as the English Bastille. It is mentioned as the meeting-place of the rioters in Dickens's *Barnaby Rudge*. The prison became inadequate and was closed in 1886.

COLD CREAM. A term applied to preparations of fatty substances, which are used as mild and cooling dressings for the skin. The composition of an excellent cold cream is as follows: spermaceti (125 parts); white wax (120 parts); expressed oil of almonds (600 parts); strong rose-water (190 parts); and sodium borate (5 parts). Cold cream softens the skin and promotes the healing of wounds and of chapped hands.

COLDEN, kól'den. CADWALLADER (1688-1776). A Scotch physician who emigrated to America in 1708 and became well known in his profession. He practiced for ten years in Philadelphia, and then, in 1718, settled in New York City. He was the first surveyor-general of the Colony of New York, was a member of the provincial council, and in 1761 was appointed Lieutenant-Governor, which office he held until his death. As the Governors were often changed, Colden was frequently called upon to act as chief executive, and in this capacity came into conflict, upon many occasions, with the radical element of the 'patriot' party. He devoted much attention to the study of the sciences, and especially of botany, and was the first to introduce the Linnean system of classification into America. He published a *History of the Five Indian Nations of Canada* (1727), a work of great value, and a less important work on *The Principles of Action in Matter* (1752).

COLDEN, CADWALLADER DAVID (1769-1834). An American lawyer and politician. He was born near Flushing, L. I., and was a grandson of Cadwallader Colden. He studied law and attained considerable eminence at the New York bar. In the War of 1812 he was a colonel of volunteers. In 1818 he was chosen to the State Assembly, and in the same year succeeded De Witt Clinton as Mayor of New York City. He was elected to Congress in 1821, and from 1824 to 1827 was a member of the State Senate. Colden was one of Clinton's strongest supporters in the work of internal improvements, and was conspicuous in the cause of public education, the reformation of juvenile offenders, and other matters of moral and social betterment. He wrote a *Life of Robert Fulton* (1817); *Memoir of the Celebration of the Completion of the New York Canals* (1825); and *Indication of the Steamboat Right Granted by the State of New York* (1819).

COLD FRAME. See FRAME.

COLD HARBOR, BATTLE OF. One of the most sanguinary battles of the Civil War in America, fought June 1 and 3, 1864, at Cold Harbor, Va., about 10 miles northeast of Richmond, between the Federal Army of the Potomac, numbering about 102,000, under General Grant, and the Confederate Army of Northern Virginia, numbering about 65,000, under General Lee.

After fighting the battles of the Wilderness and Spottsylvania (q.v.), Grant proceeded toward Richmond, crossed the Pamunkey on May 28, and on June 1 found himself again face to face with General Lee. On the afternoon of May 31, the Federal general, Sheridan, with his cavalry, carried a position known as Old Cold Harbor, and held it in spite of the stubborn attacks of the Confederate general, Fitzhugh Lee, until night. On the following day he was relieved by General Wright with the Sixth Corps of the Army of the Potomac and Gen. W. F. Smith with the Eighteenth Corps of the Army of the James, who at 6 P.M. attacked Lee with great vigor in face of a terrible fire, and, with a loss of about 2000, succeeded in capturing a large part of the first line, the Confederates making a counter-assault, but with little effect, on the position of the Federal Fifth Army Corps under General Warren. Confederate attacks during the night failed to alter the relative positions of the two armies, and the following day was spent in readjusting the Federal lines. Warren being moved to the left to connect with Smith, Hancock being stationed on Wright's left, and Burnside taking up a position in reserve at Bethesda Church. At about 4.30 A.M. on the 3d, an assault was made 'all along the line,' the Federals fiercely attacking the impregnable entrenchments of the Confederates, but being driven back with terrific loss in less than thirty minutes. Most of the fighting ceased within an hour, the Federals having made comparatively little impression on the defenses, but having advanced their lines somewhat closer to the Confederate works. In their brief charge the Federals lost in killed, wounded, and missing fully 7000 men, more probably falling in the first ten minutes than in any other similar period throughout the war. General Hancock's corps suffered most severely. The two armies remained in their positions until the 12th, when Grant began his march for the James River. (See PETERSBURG.) The total loss sustained by the Federals during these twelve days, but chiefly on the first and third, was fully 12,700; while that of the Confederates, though never accurately ascertained, probably did not exceed 2500. For several days after the attack of June 3, great numbers of dead and wounded lay wholly unattended to between the two lines. Grant and Lee being unable to agree upon any plan for furnishing the needed relief. The battle considerably discouraged the Army of the Potomac, whose loss had not been atoned for by any corresponding gain; and military critics are almost unanimous in the verdict that the assault was the great mistake of Grant's career. General Grant himself afterwards said of it: "Cold Harbor is, I think, the only battle I ever fought that I would not fight over under the circumstances" (Young, *Around the World with Grant*, ii., 304, New York, 1879), and "I have always regretted that the last assault at Cold Harbor was ever made" (*Memoirs*, last ed., ii., 171). The battle of Gaines's Mill (q.v.) was fought in 1862 nearly on the site of that of Cold Harbor. Consult: *Personal Memoirs of U. S. Grant* (last ed., New York, 1895); Humphreys, *The Virginia Campaign of 1861 and 1865* (New York, 1883); and Johnson and Buel (editors), *The Battles and Leaders of the Civil War*, vol. iv. (New York, 1887).

COLD HARBOUR. An old London edifice near the Thames, once the property of a line of wealthy merchants, purchased about the middle of the sixteenth century by the Earl of Shrewsbury, and renamed Shrewsbury House. It was soon afterwards torn down, and the small buildings erected on its site became a place of refuge for debtors and bad characters.

COLDING, KÖLDING, LUDWIG AUGUST (1815—). A Danish engineer and physicist. He was born at Arnakke, studied at the Polytechnic Institute of Copenhagen, and was appointed a professor there in 1865. He also became connected with the water-system of Copenhagen in 1847, as inspector, and in 1858 as an engineer. In addition to many contributions to the *Reports* of the Scientific Society of Copenhagen and to scientific journals, he published *Tropical Cyclones* (1871), and other works.

COLD SPRING HARBOR. A village and summer resort in Suffolk County, N. Y., on Cold Spring Harbor, an inlet of Long Island Sound, noted for its fine scenery and an extensive trout hatchery.

COLDSTREAM. An historical border village of Berwickshire, Scotland, on the left bank of the Tweed, 15 miles southwest of Berwick, and on one of the main routes from Scotland to England (Map: Scotland, F 4). Population (police burgh), in 1901, 1482. Near Coldstream is the famous ford of the Tweed, where the Scotch and English crossed in former times, before the erection of Berwick Bridge. Here General Monk, 1659-60, raised the regiment still known as the Coldstream Guards (q.v.). Being a border town, Coldstream, like Gretna Green, was formerly celebrated for its clandestine marriages. About four miles to the south of Coldstream is Flodden Field (q.v.).

COLDSTREAM, Lady CATHARINE. A canny old watch-making Scotchwoman, who appears in Foote's *The Maid of Bath*.

COLDSTREAM GUARDS. A regiment of foot guards in the British Army, forming part of the Royal Household Brigade. It is one of the oldest regiments in the British service, dating from 1659. In that year General Monk, who after the death of Cromwell took sides with the Parliament and the army, organized the regiment at Coldstream, a border town of Berwickshire, Scotland, whence the name of the regiment, and marched with it into England. It has seen service in every British campaign of any magnitude, and has emblazoned on its regimental colors the names of many of the most brilliant victories of British arms. It was first known as Monk's Regiment, but when Charles II. ascended the throne, Parliament gave the regiment to him as part of his Household Brigade, and it has since borne its present name. See FOOT GUARDS; HOUSEHOLD TROOPS.

COLDWATER. A city and county-seat of Branch County, Mich., 125 miles west-southwest of Detroit, on the Lake Shore and Michigan Southern Railroad (Map: Michigan, H 6). It has manufactures of shoes, Portland cement, flour, and liniment. It is the seat of the State School for Dependent Children, and has a public library of 15,000 volumes. The city owns and operates its water-works and electric-light plant. Settled in 1830, Coldwater was incorporated in

1862. It is governed by a mayor, elected annually, and a city council. Population, in 1890, 5247; in 1900, 6216.

COLD WAVE. A term first applied by the United States Weather Bureau in 1872 to the areas of cold, clear, dry air that flow near the ground from Canada southward over the United States and become the so-called 'northers' when they reach the Gulf States, or 'Nortes' when they reach the Gulf coast of Mexico and Yucatan. The northers of Colon may possibly have a different origin. The cold stratum of air, being quite shallow, keeps to the lowlands and rarely rises to the 5000-foot level; there are but one or two cases on record in which it attained the altitude of Cheyenne or Santa Fé; often it is not deep enough to overflow the 3000-foot level of the Appalachian Range. The cold wave advances with a well-defined front, marked by a sudden fall of temperature and an outflowing wind that undoubtedly curls upward and overflows backward, forming an advancing border of clouds with spits of rain or snow. The barometric pressure underneath this cloud is a few hundredths of an inch higher than in front of it, and it is this difference of pressure that causes the mass of cold air to underflow and lift up the warmer air as it spreads southward toward the equator. This excess of pressure is in part caused by gravity or the hydrostatic pressure due to the weight of the air in the rear, and is also in part the result of the diurnal rotation of the earth on its axis, giving a centrifugal force to the denser cold air greater than that of the neighboring warm air. The progress southward or southeastward of the front of a cold wave is so steady that, having charted its position at several successive moments by means of telegraphic reports, the Weather Bureau has almost always been able to forecast its future progress with satisfactory accuracy, thereby enabling all interested in the matter to make provision against sudden drops in temperature, which often exceed 30° in twenty-four hours. According to the technical definition adopted by the Weather Bureau, the forecast of a cold wave (as made by hoisting the cold-wave flag) implies that there will be a drop of at least 20° within twenty-four hours, and that the temperature will go below freezing. Similar sudden changes in the warmer half of the year, when temperatures do not go below freezing, are simply cool waves.

COLE, COLESEED. See RAPE.

COLE, KING. A British king of the third century, who is said to have taken Camulodunn from the Romans and to have named it after himself Colchester. According to some of the old chroniclers, he was the father of the Empress Helena, mother of the Emperor Constantine. He is the subject of the well-known nursery rhyme, "Old King Cole was a merry old soul."

COLE, Mrs. In Foote's play *The Minor*, a character modeled on Mrs. Douglass, a notorious woman of the eighteenth century, who lived in Covent Garden. She feigns repentance, and her sudden change in character is designed to ridicule the Methodists.

COLE, Sir HENRY (1808-82). An English official, art critic, and editor. He was born at Bath, and was educated at Christ's Hospital.

Appointed assistant keeper of the records by Lord Langdale in 1838, he contributed by his writings to the establishment of a general record office. In 1845 he won the prize offered by the Society of Arts for a tea-service, and the design submitted by him afterwards became exceedingly popular. In 1846 he became a member of the Society of Arts, and by his efforts promoted those exhibitions of art manufactures (1847-48-49) which led to the great Crystal Palace exhibition in 1851. He was also one of the principal founders of the National Training School, which was opened May 17, 1876, and was subsequently reorganized as the Royal College of Music (1882). Under the pseudonym of Felix Summerly he wrote the works entitled *The Home Treasury* (1843-44); *A Handbook for . . . Westminster Abbey* (1842); *What Is Art Culture?* (1877).

COLE, SAMUEL WINKLEY (1848-). An American musician. He was born at Meriden, Conn., and studied at the New England Conservatory of Music, Boston, Mass. He was organist of Clarendon Street Baptist Church, Boston, from 1882 to 1884, and became teacher and superintendent of sight-singing at the New England Conservatory in 1883; supervisor of music at Brookline, Mass., in 1884, and at Dedham, Mass., in 1886. His publications include *The New England Conservatory Course in Sight-Singing* (3 vols.).

COLE, THOMAS (1801-48). An American landscape painter. He was born in Lancashire, England, February 1, 1801. He passed his early childhood in Ohio, in which State his father settled on coming to America. Cole possessed a temperament susceptible to the beautiful in nature; but his love for art was awakened by the portrait painter Stein, who, passing through the village, gave him some instruction in the rudiments of painting. After a few years of varied success at landscape work, Cole reached New York, where he received the encouragement of Durand and Trumbull. He visited and painted in many countries of Europe, but he preferred the scenery of America to that of the Old World. His picture of the "White Mountains" is in Wadsworth Gallery, Hartford. He is best remembered by his allegorical pictures of the "Voyage of Life." His style of painting, in spite of his industrious study of nature, remained to the last artificial. He employed it more for portraying allegorical themes than with any sincere desire to interpret Nature herself. The Metropolitan Museum of Art owns his work "In the Catskills." He died near Catskill, N. Y., February 11, 1848. Consult: Tuckerman, *Book of the Artists* (New York, 1827); Clement and Hutton, *Artists of the Nineteenth Century* (Boston, 1884); Hartmann, *History of American Art* (Boston, 1902, vol. i.).

COLE, TIMOTHY (1852-). An American wood-engraver, born in London. He came to the United States when very young, and in 1875 began to illustrate for the Century Publishing Company, in New York City. His first series of "Old Italian Masters" was finished in 1892. This was followed by the Dutch and Flemish series in 1896, and the English in 1900. The "Old Spanish Masters" was begun in 1902. By many critics Mr. Cole is considered the best of modern engravers. Several of the French en-

gravers may be his equals, or technically cleverer than he, but there is none whose work is more substantial. He is especially effective in his use of the white line and in reproducing textures; his results in general are produced by conservative methods, in the employment of which he has gained breadth and power and appreciation of light and of the personality of his subject. He gives the intimate qualities of each school, so that there is no mistaking one for another, and yet he retains his own individuality.

COLEBROOKE. See GRAND FALLS.

COLEBROOKE, HENRY THOMAS (1765-1837). An eminent English Orientalist. He was born in London, June 15, 1765. In 1782 he went out to India, and after serving in various civil capacities under the East India Company, was appointed professor of Sanskrit in the newly founded college at Fort William. Afterwards he became a judge at Mirzapur, and subsequently held the appointment of president of the Board of Revenue. During his residence in India he gained an extensive knowledge of the literature of the Vedas and of the Sanskrit grammarians, metaphysicians, and mathematicians. A sound critical judgment marks all his writings. He was a director of the Royal Asiatic Society of Bengal; and many of the most valuable essays in the *Asiatick Researches* were contributed by him. These, with other papers by him, were republished as his *Miscellaneous Essays*, in 2 vols. (1837). He likewise made translations from Sanskrit works on Hindu law, mathematics, religion, and philosophy, which have remained as important contributions to our knowledge of India (consult his *Miscellaneous Essays*, London, 1837; new ed., 1873). Colebrooke wrote a Sanskrit Grammar (1805), and contributed to Sanskrit lexicography by his edition of the *Amarakośa* (Serampur, 1808). After his return to England he was made director of the Royal Asiatic Society. He died in London.

COLEMAN, JOHN. An English actor and theatrical manager. He was born in the Midlands, and is said first to have been attracted to the stage when Macready was manager of Drury Lane. He himself won distinction as an actor, his best part, perhaps, being Henry V., but his career has been chiefly that of a manager. He was long the lessee of what was known as the Yorkshire Circuit, and brought out many well-known plays, among them *It's Never Too Late to Mend*, *Foul Play*, and *Put Yourself in His Place*. In London he has been lessee of the Olympic, the Queen's, and Drury Lane theatres. In 1897 he produced in Birmingham his own play of *Soggarth Aroon*, appearing himself in the title rôle.

COLEMAN, JOHN (1803-69). An American editor and clergyman of the Protestant Episcopal Church, born in Baltimore, Md. He was ordained priest in 1836, and from 1836 to 1856 was rector of Trinity Church, Philadelphia, Pa. For a time he was associated with the Rev. P. Ogilby in the editorship of the *Banner of the Cross*, published in Philadelphia. He prepared an edition (1840; with an introduction) of George S. Faber's *Difficulties of Romanism* (1826), and one (1840) of Dr. W. H. Wilmer's *Episcopal Manual* (1815; 2d ed., 1822).

COLEMAN, LEIGHTON (1837—). An American clergyman of the Protestant Episcopal

Church. He was born in Philadelphia, Pa., graduated in 1861 at the General Theological Seminary (New York City); took orders as deacon in 1860, and as priest in 1862, and from 1861 to 1879 was rector of churches successively at Bustleton, Pa., Wilmington, Del., Mauch Chunk, Pa., and Toledo, Ohio. After residence in England from 1879 to 1887, he was rector at Sayre, Pa., in 1887-88, and in the latter year was consecrated bishop of Delaware. His publications include *The Church in America* (1895); and *A History of the Church in the United States* (1901, in the Oxford Church Text series).

COLEMAN, LYMAN (1796-1882). An American educator and author, born at Middlefield, Mass. He graduated at Yale in 1817, was tutor there from 1820 to 1825, and later studied in Germany, and taught German at Princeton. From 1861 to 1868 he was professor of Greek and Latin at Lafayette College, and from 1868 until his death professor of the Latin language and literature. He published *Ancient Christianity* (1852); *Historical Text-Book and Atlas of Biblical Geography* (1854; revised, 1859); *Prelacy and Ritualism* (1869); and other works.

COLEMAN, WILLIAM TELL (1824-93). An American pioneer. He was born in Cynthiana, Harrison County, Ky., and was educated at Saint Louis University. In 1849 he went to California, and eventually settled in San Francisco, where he engaged in the shipping and commission business. After opening a branch in New York, he established a steamship line between that city and San Francisco in 1856. He was president of the vigilance committees (1851 and 1856) in San Francisco, and during the labor troubles of 1877 he again organized a force of several thousand men to preserve order. One of his most noteworthy achievements was the embellishment and extension of the town of San Rafael, Cal. See VIGILANCE COMMITTEES.

COLENSO, JOHN WILLIAM (1814-83). An English bishop, born in Saint Austell, Cornwall. He was educated at Cambridge, was fellow and tutor in Saint John's College; became rector of Forneett Saint Mary, in Norfolk, in 1846, and in 1853 was appointed first Anglican Bishop of Natal, South Africa. The first of his works that attracted especial attention was *A Translation of the Epistle to the Romans, Commented on from a Missionary Point of View* (1861). The *Pentateuch and Book of Joshua Critically Examined* (7 vols.), in which the authorship of Moses and the accuracy of many statements in the books were questioned, and the inspiration of the Old Testament denied, appeared in 1862-79. Colenso was deposed by his Metropolitan, the Bishop of Cape Town, but the deposition was declared void by the Privy Council. The trustees of the Colonial Bishops Fund then stopped his income, but the Court of Chancery ordered it to be paid, with arrears and interest. The see of Grahamstown was erected in place of that of Natal, in order to carry out the effect of the spiritual sentence without conflict with the State; and for the rest of his life Colenso occupied a schismatic position. He published also *Ten Weeks in Natal* (1855), and translated the Bible into the Zulu language. Consult Cox, *Life of Bishop Colenso* (London, 1888).

COLEOPTERA (Neo-Lat. nom. pl., from Gk. *κολέπτερος*, *kolépteros*, sheath-winged, from *κολέος*, *koléos*, sheath + *πτερόν*, *ptéron*, wing). An order of insects, comprising beetles, and characterized primarily by the possession of wing-covers. See BEETLE.

COLEPEPER, kól'pép-ēr, JOHN, Lord (?-1660). An English politician, prominent as a supporter of the Stuart Kings against the Parliament. He was born at Wigsell, in Sussex, and after travelling abroad began to play an active part in county politics. In 1640 he became a member of the Long Parliament, and, a zealous adherent, at first, of the popular party, gradually passed over to the side of the King, who, in 1642, made him Chancellor of the Exchequer. With Falkland and Hyde, he played an important part in the negotiations between King and Parliament, preceding the outbreak of hostilities. He fought in the battle of Edgehill (October 23, 1642), and in January of the following year was made master of the rolls, leaving the Chancellorship to Hyde, of whose influence he was exceedingly jealous. On the downfall of the Royalist fortunes in 1645, Charles I. intrusted Colepeper with the care of the person of the Prince of Wales, with whom in the following year he went to France. Later he lived with Prince Charles in the Netherlands and remained one of his principal advisers, going in his behalf on a mission to Russia (1650) and accompanying him to the peace congress of the Pyrenees in 1659. He returned to England after the Restoration, but died soon after. Colepeper was one of the ablest debaters and politicians of his time in England, but his influence suffered from a certain lack of confidence in his own opinions. He was given, too, to violent outbursts of temper.

COLEPEPPER, kól'pép-ēr, Captain JOHN. A bully and murderer, nicknamed 'Poppercul,' in Scott's *Fortunes of Nigel*, who is killed in a fight in Enfield Chase by Richie Moniplies, just after the murder of Lord Dalgarno.

COLER, ALWIN GUSTAV EDMUND VON (1831—). A German physician, born in Groningen. He studied medicine in Berlin, entered the Prussian Army in 1856, was made surgeon-general in 1874, and head surgeon of the general staff in 1889. General Coler's activity resulted in improvements of the highest importance in army hygiene, reforms in the military hospital service, the establishment of corps of sanitary officers, and the introduction of antiseptics into military surgical practice. He was also largely instrumental in formulating medical regulations for the German Army, which have since been adopted by the armies of all civilized nations. In 1892 he was made professor at the University of Berlin. He wrote, jointly with Langenbeck and Werner, *Die transportable Lazarettbaracke* (1890).

COLER, BIRD SIM (1868—). An American politician, born in Illinois. He established himself as a stock-broker in New York City, became prominent in municipal and State politics, and served as first Comptroller of Greater New York during the administration of Robert Van Wyck as Mayor. In 1902 he was the Democratic nominee for Governor of New York, but was defeated by a small plurality in spite of the enormous vote cast for him in the city of New York. He published *Municipal Government* (1900).

COLERAINE, kól-rān'. A Parliamentary and municipal borough and seaport, in the county of Londonderry, Ireland, on the Bann, four miles from the sea, and 47 miles north-northwest of Belfast, with which it is connected by railway (Map: Ireland, E 1). It consists of a central square and several diverging streets. The town has considerable manufactures of soap, linen, paper, and leather, and its port is accessible to ships of 200 tons. Population, 6800.

COLERIDGE, ERNEST HARTLEY (1846—). An English author, grandson of Samuel Taylor Coleridge. He was graduated from Balliol College, Oxford, in 1870; served as tutor from 1872 to 1893, and became secretary to the Lord Chief Justice of England in 1894. He edited *Letters of S. T. Coleridge* (1895); *Anima Poeta*, selections from note-books of Coleridge (1895), and *Poetical Works of Byron* (1898-1901); and published a volume of graceful poems (1898).

COLERIDGE, HARTLEY (1796-1849). An English poet, born at Clevedon, Somersetshire, the eldest son of S. T. Coleridge. He studied at Oxford, and was elected to a fellowship at Oriel College, from which he was removed by the authorities in 1826 on the charge of intemperance. For two years he resided in London. Then he returned to the Lake Country, and after having twice attempted school-teaching, first privately at Amble-side, and later at the grammar school of Sedbergh as an assistant in 1837 and 1838, settled at Grasmere. An almost constant wanderer about the vales, this diminutive figure, prematurely gray and old, became familiar to the peasantry as 'Little Hartley.' He was a scholar of rare attainment, a poet of exquisite taste and easy felicity, to whom, in the words of Dowden, "good thoughts came as of free grace." But lacking will and the capacity for sustained application, he remained despondent, fragmentary, ineffectual. His longest literary work was in the preparation of an edition of the dramas of Massinger and Ford, with biographies of those authors (1840). He also wrote a series of lives of the Worthies of *Yorkshire and Lancashire* (1836; originally as *Biographia Borealis*, 1833). He is best known, however, for his verse, which, if it distinctly lacks as to power, is singularly fine in mood and happy in expression. Of the sonnet, a form, as Dr. Garnett observes, "which precisely suited both his strength and his limitations," he composed some of the finest examples in English. Such are "Whither," "To Shakespeare," "Prayer," "May, 1840," "Regrets," and "Ideality." His brother, Derwent, edited four volumes of his literary remains (two volumes of poetry and two of prose, London, 1851). Selections are to be found in all important anthologies. Hartley Coleridge was, his life long, a friend of Wordsworth, whose "To H. C.: Six Years Old," seems strangely prophetic.

COLERIDGE, HENRY NELSON (1798-43). An English man of letters, nephew of Samuel Taylor Coleridge. He was born at Ottery Saint Mary, Devonshire; graduated at Cambridge, and studied law. Soon afterwards he made a trip to the Barbados, which he describes in *Six Months in the West Indies* (1825). In 1829 he married his cousin, Sara Coleridge. He was his uncle's literary executor, and prepared the second edition of the latter's political and dramatic works (London, 1834). He edited *Literary Re-*

mains (London, 1836-39); *Confessions of an Inquiring Spirit* (ib. 1840, with notes by Sara Coleridge, 1849); and published *Table Talk* (1835), notes which he had collected during several successive years, and gathered into a volume. His son, HERBERT COLERIDGE (1830-61), born at Hampstead, was a philologist. He was appointed secretary of a special committee of the Philological Society for the purpose of collecting material for a new English dictionary. This was the origin of the dictionary published by the Clarendon Press, under the editorship of Dr. J. A. H. Murray.

COLERIDGE, JOHN DUKE, Baron (1820-94). An English jurist, nephew of Samuel Taylor Coleridge. He was born in London; graduated at Oxford in 1842; was called to the bar in 1846, and soon became prominent in his profession. He was a member of the House of Commons from 1865 to 1873; was knighted in 1868, became Attorney-General in 1871, was appointed Chief Justice of the Court of Common Pleas in 1873, and in the same year was raised to the peerage as Baron Coleridge of Ottery Saint Mary. On the death of Sir Alexander Cockburn in 1880, he succeeded him as Lord Chief Justice of England. In 1883 he visited the United States and was cordially received, especially by the bench and bar.

COLERIDGE, SIR JOHN TAYLOR (1790-1876). An English judge and author, a nephew of Samuel Taylor Coleridge. He was born at Tiverton; graduated at Oxford in 1812, was called to the bar in 1819, and was made a judge of the King's Bench in 1835 and a Privy Councillor in 1858. On the retirement of Gifford in 1834, he became for a short period editor of the *Quarterly Review*. He published an annotated edition of *Blaekstone's Commentaries* (1825), and a *Life of Keble* (1869). He was a friend of the latter, as well as of Wordsworth, Pusey, and Newman.

COLERIDGE, SAMUEL TAYLOR (1772-1834). An English poet, philosopher, and critic. He was born at Ottery Saint Mary, Devonshire, and educated at Christ's Hospital, where Charles Lamb was a school-fellow. He was an omnivorous reader, even as a boy, and gaining access to a library through a chance acquaintance, he read "right through the catalogue." He soon gained a remarkable knowledge of Greek, and before he was fifteen plunged boldly into the sea of metaphysics. The sonnets of W. L. Bowles, which fell into his hands at this time, gave him his first impulse toward poetry. In 1791 he entered Jesus College, Cambridge. At the university his whole mind was given to classics, and he obtained a prize for a Greek ode. During his second year there, in a fit of despondency, he went up to London and enlisted in the Fifteenth Dragoons, under the name of Silas Tomkyn Comberback, or Cumberbatch—remaining faithful to the initials S. T. C., which were afterwards to be so familiar among the readers of his period. His identity was discovered through an accident, and his friends intervened to procure his discharge. He returned to Cambridge in 1794, but never took a degree. During a visit to Oxford he became acquainted with Southey, and in the same year, after a trip through Wales, visited him at Bristol. The two young men and some of their friends now formed a scheme for emigrating to the United States, where, on the banks of the Susquehanna (the melody of the name seems to

have been one of the inducements), they were to found a colony where the laws of equality and fraternity were to prevail, and the Golden Age was to be ushered in. They, with Wordsworth and other generous youths of the time, were deeply impressed with the proclamation of liberal principles in the French Revolution, though they afterwards drew back, alarmed by its excesses, some into extreme Toryism. The establishment of their ideal 'Pantisocracy' was delayed by the lack of capital; and a year or two later the dream faded away.

At Bristol, Coleridge became acquainted with his future wife, Sara Fricker, to whose sister Southey was engaged. Joseph Cottle, a bookseller in Bristol, had offered Coleridge thirty guineas for a volume of his poems, and promised him a guinea and a half for every hundred lines he should write after finishing it. On this prospect he married in October, 1795, and settled in a cottage at Clevedon. After many delays, his volume of *Juvenile Poems* appeared in April, 1796. His earlier work is all in the stereotyped style of the eighteenth century, and shows little trace of the powers which were to make him famous. In the early part of 1796 he began the publication of a weekly review, the *Watchman*, devoted to literature and politics, but met with little success and abandoned the undertaking after the tenth issue. In the winter of 1796 he settled at Nether Stowey, near Bridgewater, whither Wordsworth removed in the following year. He was freed from the material cares of life by the generosity of Charles Lloyd, the son of a Birmingham banker, who had become a devoted disciple of Coleridge, and Thomas Poole, who conferred on him a small annuity. At Nether Stowey, inspired perhaps partly by the beautiful scenery, and still more by the strengthening companionship of his friend, he composed his finest poems, including the "Ancient Mariner," and the first part of "Christabel," and "Kubla Khan," though the two latter were not published until eighteen years afterwards. The two authors had many discussions on the principles of their art, which resulted in the publication, in 1798, of their epoch-making *Lyrical Ballads*. This little book, published anonymously, though a total failure at the time, was decisive in its influence on the future of nineteenth-century poetry, freeing it finally from the conventional trammels which had long bound it. The work of the two poets is singularly complementary, Coleridge treating supernatural subjects in such a way as to give a strong impression of their reality, while Wordsworth so handled the simplest themes as to disclose unsuspected elements of mystery and awe. Coleridge's contribution to the *Ballads* comprised the *Ancient Mariner*, the *Nightingale*, and two scenes from his play *Osorio*. In the edition of 1800 there was added *Introduction to the Tale of the Dark Ladie*.

Coleridge, who had become a Unitarian at Cambridge, preached frequently during this period in the chapels of that body, and had thoughts of becoming a regular minister. To deliver him from this necessity, two brothers named Wedgwood settled on him an annuity of £150, and this enabled him to carry out the long-cherished plan of going to Germany to study. In September, 1798, he sailed for Hamburg with Wordsworth, and after acquiring the language went to Göttingen, remaining, in all,

nearly a year. This was a period of vast importance in his development, and he said himself that there was no time of his life to which he looked back with such unmingled satisfaction. He came under the influence of what Shairp calls "an impulse, the most original, the most far-reaching, and the most profound which Europe has seen since the Reformation." The first result of his new knowledge of German thought was not in philosophy, but in poetry; on his return to England he published his noble translation of Schiller's *Wallenstein*. He also contributed fitfully to the *Morning Post*, to the end of 1802. Before that time, however, he had settled at Greta Hall, Keswick, in the Lake district, attracted by the proximity of Wordsworth and Southey, who were to share with him the designation of Lake Poets, given in derision by the *Edinburgh Review*. Here, in 1800, he wrote the second part of "Christabel." Driven from the north by rheumatism in 1804, he went to the Mediterranean, acting for some months as secretary to the Governor of Malta, and spending several more at Rome.

On his return to England, he delivered some lectures on poetry and the fine arts at the Royal Institution, London, and began the publication of *The Friend*, a periodical which contained too much abstruse philosophy to be popular, and lived less than a year. During part of 1811 he was connected with the *Courier*, contributing articles of a general political nature. In 1813 his play *Remorse* was successfully produced at the Drury Lane Theatre and helped to relieve his distressed financial condition. His enslavement to opium, which he had begun to take as a relief from his rheumatic pains, was now increasing, and in De Quincey's opinion "killed him as a poet." His constitutional indolence and dislike for steady application completed his unfitness for meeting the demands of life. Roving between London and the Lakes, where his family was generally under Southey's care, he spent a number of baffled and disappointed years.

From 1816 until his death, July 25, 1834, he lived in the house of Mr. Gillman, at Highgate in London, where he received the kindest and most judicious care, and at least to some extent mastered his craving for opium. Though he projected far more than his habits ever allowed him to accomplish, he left as the result of those years no inconsiderable bulk of critical and philosophic writing; the *Biographia Literaria* (1817) is especially noteworthy. It was, however, as a talker, discoursing with an inexhaustible flow of ideas to admiring visitors, that he shone most brilliantly in his latter years. Talk was his best medium for showing himself to others. His style in prose writing was cumbersome and his matter involved. In reading his written work of this class, we feel instinctively that the critic was greater than the criticism.

No man had ever appeared in England who united in so eminent a degree the three functions of critic, philosopher, and poet. With all his defects, Coleridge must be recognized as being, in Mill's phrase, the greatest "seminal mind" of his time. The present generation does not realize how much it owes to him in many fields of thought—how many impulses, still powerful, he set in motion. In criticism, he was the father of modern Shakespearean study, laying, in a few pregnant sentences, a broad basis for criticism, in contrast to the narrow canons of Johnson and the eighteenth-century school. His *Aids to Re-*

flection and some of his other theological writing inspired Maurice and Stanley and the 'Broad-Church Movement' as a whole. His aphorisms are often decisive—it is to him we owe what are now commonplaces, the distinction between genius and talent, fancy and imagination, wit and humor. Detached phrases of his are still upon the lips of many who do not remember their source—like "Every man is born either an Aristotelian or a Platonist," or "Prose is words in their best order; poetry is the best words in the best order." In philosophy, originally a fervent disciple of Hartley (q.v.), who had been a member of his own college, he passed on through the theories of Berkeley and Leibnitz; and, after falling under the influence of the German and other mystics, came to a point where, he says, the works of Kant took hold of him as with a giant's hand. He adopted and based all his teachings on Kant's distinction between the Understanding and the Reason; and while he has not as a philosopher left any complete system, yet he rendered excellent service by his insistence, in such a period as his, on the reality and preëminence of the spiritual verities. His introduction into England of German literature and philosophy, so powerfully seconded by Carlyle, is alone enough to give him a high place among the forces that determined the course of nineteenth-century thought among English-speaking people. But it is as a poet that he must hold the highest rank, though no other poet has ever attained such a place on so small a volume of first-class work. "Christabel," "The Rime of the Ancient Mariner," and "Kubla Khan" (which so good a judge as Swinburne has called "for absolute melody and splendor the first poem in the language") cannot be put in any but the highest class. Moreover, his influence on his successors must be taken into account. The Pre-Raphaelite Movement, which Theodore Watts-Dunton defines as "the Renaissance of the Spirit of Wonder in poetry and art," owes more to him than to any other English poet. One can only regret that so much was wasted of the greatest powers which for generations had been granted to any Englishman.

Consult: the *Complete Works*, ed. by Shedd (7 vols., New York, 1884); his *Poetical Works*, ed. by Campbell (London, 1893); *Poems*, a facsimile reproduction of the proof and MSS. of some of the poems, ed. Campbell (London, 1899); *Lyrical Ballads*, centenary edition by Hutchinson (London, 1898); *Anima Poetae*, from his unpublished note-books by his grandson (London, 1895); lives by Gillman (London, 1838), Traill ("English Men of Letters" series, London, 1884), Dykes (London, 1894), and Hall Caine (London, 1887); Cottle, *Early Recollections* (London, 1837); Brandl, *Samuel Taylor Coleridge und die englische Romantik* (Berlin, 1886; English translation by Lady Eastlake, London, 1887); and a thorough and luminous discussion in Shairp, *Studies in Poetry and Philosophy* (Edinburgh, 1868). Consult also: E. H. Coleridge, *Letters of Samuel Taylor Coleridge* (London, 1895); and Beers, *English Romanticism in the Nineteenth Century* (New York, 1900).

COLERIDGE, SARÁ (1802-52). An English author, born at Greta Hall, near Keswick. She was the only daughter of Samuel Taylor Coleridge, and married her cousin, Henry Nelson Coleridge (1829). The early part of her life was spent with her uncle, Robert Southey. After

the death of her husband she continued the editing of her father's works, and this was her principal literary work. Her intelligence and learning are shown in various translations and some original work, of which the tale *Phantasmion* (1837) is the most important. Consult her *Memoirs and Letters*, edited by her daughter (London, 1873).

COLERIDGE-TAYLOR, SAMUEL (1875—). An English composer of music, born in London. He is of African descent, through his father, who was a native of the West Coast of Africa (Sierra Leone). His mother was an English-woman, and he himself was brought up under English influences. After a distinguished career at the Royal Academy—which he entered at fifteen, winning the composition scholarship in 1893, and studying under Villiers-Stanford until 1896—he devoted himself entirely to composition. Up to 1902 his best work was a musical setting to Longfellow's *Hiawatha*, arranged for soprano, alto, and baritone soloists and mixed chorus. His other published and manuscript works include an idyll for orchestra; a ballade for violin and orchestra; a symphony in A minor (1896); an operetta, *Dream Lovers*; and several songs and anthems.

COLES, KÖLZ, COWPER PHIPPS (1819-70). An English naval officer. He served as flag-lieutenant to Sir Edmund Lyons in the Mediterranean (1853), and at the bombardment of Sebastopol (October 17, 1854). In 1856 the plan of defensive armor for battle-ships began to engage his attention. The idea originally proposed had been that of a raft and shield, and this idea was modified by Coles into that of a vessel with a low freeboard surmounted by a series of turrets equipped with heavy guns. The similarity of this conception to the monitor type elaborated by Ericsson was such that the respective claims of the two men eventually led to a bitter controversy. A vessel was finally constructed in accordance with Coles's specifications. She was commissioned under the name of *The Captain*, in 1870, and on September 7 of that year capsized in a gale off Cape Finisterre, and almost everybody on board, including Coles, was drowned.

COL'ET, JOHN (c.1467-1519). An English theologian, born probably in 1467 in London. He studied at Oxford, traveled in Paris and Italy (1493-96), and became acquainted with Budæus and Erasmus. Returning to England, he took up his residence at Oxford, and there lectured upon the Epistle to the Romans, displaying originality and independence of the schoolmen. The next year he lectured in the same fashion on First Corinthians, and so upon other New Testament books, until, in 1505, he was appointed dean of Saint Paul's, London. Having inherited from his father a large fortune in 1509, he founded Saint Paul's School in London, of which William Lilly was the first master. His religious opinions were so much more liberal than was common at the time that he was subjected to considerable persecution. As dean of Saint Paul's he made a great point of expounding the Bible, disapproved of auricular confession and the enforced celibacy of the clergy, denied the efficacy of pilgrimages and the worship of images, and denounced corruption in the Church. His influence is traceable as paving the way for

the Reformation, although it is probable that, like other humanists, he would not have left the old Church. He died in London (or at Sheen, a few miles southeast of London), September 16, 1519. Aside from his *Latin Grammar* and his *Daily Devotions*, his works did not appear until the nineteenth century, edited by Rev. J. H. Lupton, with English translations. Consult his biography by J. H. Lupton (London, 1887); and F. Seebohm, *Three Oxford Reformers: Erasmus, Colet, and More* (3d ed., London, 1887).

COLET, KŌLÁ', LOUISE RÉVOIL (1810-76). A French poet and novelist. Among her verses are *Les fleurs du midi* and *Penserosa*. The *Musée de Versailles* and *Les funérailles de Napoléon* are more sustained flights, the former crowned by the Institute. A comedy, *La jeunesse de Goethe* (1839), and two novels, *La jeunesse de Mirabeau* (1841) and *Les cœurs brisés* (1843), deserve mention, but nothing that she composed equals in interest her publication, in defiance of a legal injunction, of the correspondence of Madame Récamier with Benjamin Constant (1849).

COLEWORT (from *cole*, AS. *cāwel*, *cānl*, OHG. *kōl*, Ger. *Kohl*, cabbage, from Lat. *caulis*, cabbage, Gk. *καυλός*, *kaulos*, stalk + *wort*, AS. *wyrt*, plant, Ger. *Wurzt*, root; ultimately connected with Lat. *radix*, root). A name given to some of the many cultivated varieties of Brassica oleracea, and applied, like the names borecole and kale, to varieties differing from the cabbage (q.v.) in their open heads of leaves, which are used as greens, especially in the winter months. The same name is also given to cabbages cut for use before their leaves have fully closed into heads.

COLFAX, KŌL'fäks. A city and county-seat of Whitman County, Wash., 78 miles south of Spokane; on the Palouse River, and on the line of the Oregon Railroad and Navigation Company (Map: Washington, II 3). The centre of a fertile agricultural country, it controls a considerable trade in live stock, grain, fruits, and lumber. There are also several industrial establishments. The city owns its water-works. Population, in 1890, 1649; in 1900, 2121.

COLFAX, SCHUYLER (1823-85). An American statesman, born in New York City. He removed to Indiana in 1836, where he studied law, and in 1845 became editor of the *Register*, a Whig newspaper at South Bend, which, under his management, became the most powerful organ of its kind in that part of the State. After a defeat in 1851, he was elected to Congress in 1854, served seven consecutive terms, and was Speaker from 1863 to 1869. He was Vice-President of the United States from 1869 to 1873. In the John C. Frémont campaign of 1856, a speech made by him was used for party purposes, and half a million copies were distributed over the country. He introduced several important acts for the reform of the postal system, in which he took an especial interest, and in 1862 framed the law which made fraudulent contractors felons. Charges of corruption were brought against him at the time of the Crédit Mobilier scandal (q.v.), in 1873, but were never proved. Consult Hollister, *Life of Schuyler Colfax* (New York, 1886).

COLGATE, KŌL'gát, JAMES BOORMAN (1818—). An American financier. He was born in

New York City, and received his first commercial training in the house of Boorman, Johnston & Co. He later established the banking house of Trevor & Colgate, afterwards known as J. B. Colgate & Co. His extensive loans to the Government and sound financial policy during the financial crisis of 1873 contributed materially to the reestablishment of confidence both in the United States and in the markets of Europe. He was one of the founders of the New York Gold Exchange, and was for several years its president. As trustee and president of Colgate (formerly Madison) University, he for thirty years made almost annual donations to that institution, the development of which is due chiefly to his constant care and valuable advice.

COLGATE, SAMUEL (1822-97). An American manufacturer and philanthropist, born in New York City. He became widely known as a soap-maker, and the manufactory he built in Jersey City has developed into one of the largest establishments of the kind in the world. He was also prominent in philanthropical work. For more than thirty years he was trustee of Colgate University, and for many years he was president of the New York Baptist Education Society, president of the Society for the Suppression of Vice, and a member of the Executive Committee of the American Baptist Missionary Union and of the American Tract Society. One of his most noteworthy achievements was the collection of 30,000 volumes of reports (now in the Colgate University Library), comprising the documentary records of the Baptist denomination. Conjointly with his brother, James B. Colgate, he gave large sums to Colgate (formerly Madison) University, which in 1889 was named in honor of the Colgate family.

COLGATE UNIVERSITY. An institution of higher education, situated at Hamilton, N. Y. It was founded by the Baptist Education Society in 1818, for the education of Christian ministers. The collegiate and preparatory departments were incorporated in 1846, under the name of Madison University, leaving the management of the theological department with the Baptist Education Society. Under the administration of President Ebenezer Dodge (1868-90), the endowment fund of the college increased from \$150,000 to \$500,000. In 1890 the name of the institution was changed to Colgate University, in honor of William Colgate and his sons, who established the 'Dodge Memorial Fund' of \$1,000,000. In 1893 Hamilton Theological Seminary—since 1846 under the control of the Baptist Education Society—became part of Colgate University. The attendance, including the theological department, is about 220. The elective system has been introduced in the senior year, and largely in the junior year. The library numbers about 35,000 volumes, besides the famous Baptist Historical Collection, the gift of Samuel Colgate. Colgate Academy, originally a part of the institution, is now located in a separate building, but forms an integral part of the corporation. Colgate University offers courses leading to the bachelor's and master's degrees in arts, philosophy, and science, and to the bachelor's degree in divinity. It offers also courses in education which enable students to obtain college graduates' professional certificates. The university endowments amount to over \$1,600,000, and the total value of the university property to \$2,160,000.

COLIC (from OF., Fr. *colique*, ML. *colica*, colic, from Gk. *κολικῆ*, *kōlikē*, colic, from *κῶλον*, *kōlon*, colon). A name employed by physicians to denote severe pain of the abdomen, spasmodic in character and dependent upon irregular contraction of the muscular coat of the intestines. Intestinal colic is a symptom of neuralgia of the intestines, caused by cold; of mild enteritis, caused by irritating food or purgative medicine; of toxic conditions such as lead poisoning, poisoning by the bacterial toxins of shell-fish, etc.; of peritonitis, appendicitis, and other diseases. If warmth, an aperient (such as castor-oil), or peppermint, or tincture of ginger, fails to give relief, a physician should be summoned. Renal colic is pain over the kidney and through the abdominal wall, due to passage of a calculus, or stone, from the kidney through the ureter into the urinary bladder. Hepatic colic is the pain caused by the passage of a gall-stone from the gall-bladder into the intestines.

COLIC IN ANIMALS. A disease most frequently occurring in horses and mules. It assumes several forms, such as spasmodic, flatulent, and habitual. Spasmodic or cramp colic is caused by spasm of the small intestines and is due to the presence of foreign bodies in the intestines, to large draughts of cold water, to exposure to cold, or to hard work too soon after eating. It is most frequent in high-bred horses. This form of colic always begins suddenly. The horse looks backward, shows acute pain, paws, lies down and gets up frequently. As the pain becomes more intense the animal throws himself down with great violence and strikes with the feet. These spasms are interrupted by intervals of quiet, but the intervals become shorter and shorter. This form of colic ordinarily yields promptly to appropriate treatment. Perhaps the best remedy is one ounce of chloral hydrate in a pint of water given as a drench. Cannabis indica gives good results, as also ether and laudanum. Flatulent colic is sometimes used as synonymous with bloat (q.v.). Baking-soda in doses of two to four ounces is a good remedy. Any alkaline substance neutralizes the acid fermentation and should be administered at once. In severe cases the bowels may be punctured at the most distended part by means of a trochar and canula. Enemas of lukewarm water, to which a little soap has been added, are useful in both forms of colic, as are also cathartics, such as aloes in full doses.

COLIGNY, kō'l'nyé', or COLIGNI, GASPARD DE (1517-72). An Admiral of France and Huguenot leader, born at Châtillon-sur-Loing, February 16, 1517. He came of a noble family, his father having been Marshal Gaspard de Coligny, his mother Louise de Montmorency. He was introduced at Court at the age of twenty-two and served under Francis I. in Italy, where he evinced great bravery, especially at the battle of Ceresole (1544). Under Henry II. he was made colonel-general of the infantry, and in 1552 he became Admiral of France. In all the wars in which he took part he showed himself a born general and leader. On the death of Henry II., 1559, Coligny, who had previously adopted the Reformed faith, became, with the Prince of Condé, one of the great leaders of the Huguenots. In this capacity he was remarkable alike for his

prudence and his bravery. Opposed to the Huguenot chiefs was the powerful Catholic party headed by the Duke of Guise and the Constable de Montmorency. At the disastrous battles of Dreux (1562) and Jarnac (1569), Coligny's skill saved the remnants of the Protestant army. Condé was slain on the field of Jarnac and Coligny assumed the sole leadership until he gave way to the young Prince of Navarre. (See HENRY IV.) Together they besieged Poitiers, but the Huguenot forces were again routed on the bloody field of Moncontour (October 3, 1569). When peace was concluded in 1570, Coligny went to Court, and was apparently well received by Charles IX., but the enmity of the Catholic party, by whom Coligny was unjustly accused of having murdered the Duke of Guise at the siege of Orléans, was stirred up against him, and an attempt was made to assassinate him on the street, August 22, 1572. This was but preliminary to the general massacre of Huguenots which took place two days afterwards and in which Coligny perished. While upholding the Huguenot cause at home Coligny exerted himself to secure a safe asylum for his coreligionists in the New World, and sent repeatedly expeditions (Ribault in 1562, Laudonnière in 1564) to colonize what is now the southeastern part of the United States. Among his papers, burned by order of Catherine de' Medici, was his *History of the Wars of Religion in France*. Consult: Tessier, *L'Amiral Coligny* (Paris, 1872); Delaborde, *Gaspard de Coligny* (3 vols., Paris, 1879-82); Bersier, *The Early Life of Coligny* (translation by Annie H. Holmden, London, 1884); Blackburn, *Life of Coligny* (Philadelphia, 1869); Besant, *Life of Coligny* (London, 1892).

COLIMA, kô-lé-má. The capital of the State of the same name, Mexico, on the Colima River, about 40 miles from the Pacific Coast (Map: Mexico, G 8). It is situated at an altitude of 1400 feet, is generally well built, and has fine plazas and a number of pretentious buildings, among which are the Government building and town hall, the Hospital de San Juan, and the market. The town has connections by rail and water with the port, Manzanillo, and is the seat of considerable trade. Colima was founded in 1522 by Gonzalo de Sandoval. Population, in 1895, 18,977. About 40 miles to the northeast of the town, in the State of Jalisco, is the volcano of Colima (nearly 13,000 feet), which has recently been in a state of eruption.

COLIN CLOUT. (1) A poetical satire on the clergy by John Skelton. (2) The *non-de-plume* adopted by Spenser, suggested by the above. (3) A shepherd in Gay's pastoral *The Shepherd's Week*.

COLIN CLOUT'S COME HOME AGAIN. A pastoral poem by Edmund Spenser, and dedicated to Sir Walter Raleigh, in a letter dated Kilkolman, December 27, '1591' (probably 1595). In it he thanks that knight for sundry "favours and good turnes done to me at my late being in England."

COLINS, ALEXANDER (1526-1612). A Flemish sculptor, born at Mechlin. In 1563, at the summons of Emperor Ferdinand I., he went to Innsbruck, where he executed twenty reliefs on the tomb of Maximilian, in the Hofkirche. Subsequently he was appointed Court sculptor to the Emperor. Among his other works is the fine

monument to the Archduke Ferdinand of Tyrol, in the Silver Chapel of the Hofkirche. Consult the monograph, by von Schönleber, in vol. ii. (Heidelberg, 1889) of the *Mitteilungen zur Geschichte des Heidelberger Schlosses*.

COL'ISE'UM. See AMPHITHEATRE.

COLL, kôl. One of the Inner Hebrides, or western isles of Scotland, situated northwest of the island of Mull, Argyllshire. It is 14 miles long from northeast to southwest, with an average breadth of two and a half miles (Map: Scotland, B 3). More than a third of it is cultivated, or in pasture. The isle is low and rocky, and composed of gneiss. Population, 600, engaged in agriculture and fishing.

COLLAB'ORA'TION (Fr., from Lat. *collaborare*, to work together, from *con-*, together + *laborare*, to labor, from *labor*, work). The united labor of two or more persons on a literary production, as in the arrangement of a drama, or the compilation of a book requiring knowledge from different sources. Thus, Charles Reade and Dion Boucicault wrote *Foul Play*; Charles Dudley Warner and Mark Twain, *The Gilded Age*. Walter Besant and James Rice also long worked in collaboration upon numerous novels. The collaboration of Messrs. Ereckmann and Chatrian (q.v.), in French, produced many delightful works. Perhaps most famous of all is the literary partnership of Beaumont and Fletcher (q.v.).

COL'LAMER, JACOB (1792-1865). An American lawyer and politician, born in Troy, N. Y. He removed when very young to Vermont, graduated at the University of that State in 1810, was admitted to the bar in 1812, and soon became one of the leading lawyers of the State. From 1833 to 1841 he was associate justice of the State Supreme Court. He was a member of Congress from 1842 to 1848, and in President Taylor's Cabinet was Postmaster-General, which position, however, he resigned on the death of the President. In 1850 he was elected judge of the Supreme Court of Vermont, and four years later was elected to the United States Senate, where he was chairman of committees on post-offices, post-roads, and the library. He remained in the Senate until his death.

COLLAR (OF. *coler*, *colier*, Fr. *collier*, from Lat. *collare*, collar, from *collum*, neck; ultimately connected with AS. *heals*, with OHG. *hals*, Ger. *Hals*, neck). A band around a column or other architectural member; the necking of the capital in the Doric, Ionic, and Tuscan orders.

COLLAR-BONE. See CLAVICLE.

COLLARCO, kôl-lâr'kô (It., with the bow). In music, a term signifying that the notes over which it is placed are to be performed with the bow, in contradistinction to *pizzicato* (q.v.).

COLLARED LIZARD. One of a genus (*Crotaphytus*) of iguanid lizards, characteristic of the dry, open regions of the southwestern United States. They are often called 'collared' or 'ring-necked' lizards, because of the double black collar around the wrinkled neck of the common Texan species (*Crotaphytus collaris*). This species is found from the Ozark Mountains to Nevada and southern California, and is entirely insectivorous. In the deserts of the Colorado Valley there lives a second species, called 'leopard lizard,' which is larger, has no collar, and

its noted for its fierce and greedy disposition. It eats not only blossoms, leaves, and insects, but also young horned toads, and all sorts of smaller lizards, killing and swallowing some two-thirds

HEAD OF COLLARED LIZARD, SLIGHTLY ENLARGED.

of its own size. It will even kill and devour smaller individuals of its own species. This lizard is remarkable for the fact that not the male, as is usual among lizards, but the female, undergoes a change of color in the breeding season (mid-summer), becoming salmon-red on the whole abdominal region. Consult Merriam and Stejneger, *Death Valley Expedition* (Department of Agriculture, Washington, 1893).

COLLATERAL (Fr. *collatéral*, It. *collaterale*, from ML. *collateralis*, collateral, from ML. *con-*, together + *lateralis*, relating to a side, from *latus*, side). In law, supplemental or related to the principal thing in consideration, especially: (a) Given by way of security in addition to a principal obligation. (b) Descended from a common ancestor but not from one another—a sense used to describe the character of relationship of individuals for legal purposes.

Collateral Security is either: (a) Something of intrinsic value actually delivered over and pledged to the creditor, the value of which is to be applied on the debt in case of default; or (b) an additional obligation, given to guarantee performance of a debt or duty. The term is more frequently used to designate a pledge of stocks, bonds, negotiable paper, or other evidences of obligation, as distinguished from a pledge of chattels. The practice in case of a default is for the creditor, upon notice to the debtor, to sell the securities and apply the amount received therefrom toward the satisfaction of his claim and charge the debtor with the deficiency, or credit him with the surplus, if any. See MORTGAGE; PLEDGE; FORECLOSURE; and consult the authorities cited under PLEDGE.

Collateral Relatives, more frequently spoken of as 'collaterals,' are those who are descended from the same common ancestor, but not from one another, as lineal descendants are. Thus, an uncle is a collateral relative of a nephew, both being descended from a common ancestor, but the nephew not being a lineal descendant of the uncle. The term includes those in the relationship of brothers and sisters, aunts and uncles, nephews and nieces, and cousins. Collateral relatives are included in the term heir, real property descending in the first instance to lineal descendants, if any, and then to collaterals in the order of their relationship or as prescribed by statutes. See CONSANGUINITY; DESCENDANT; HEIR; LINEAL; DECEDENT; and consult the authorities referred to under DESCENT, etc.

COLLATERAL INHERITANCE TAX. See INHERITANCE TAX.

COLLATERAL WARRANTY. See WARRANTY.

COLLATION (OF. *collacion*, from Lat. *collatio*, collection, from *con-*, together + *latus*,

borne, connected with *tolerare*, Gk. *τλῆναι*, *tlēnai*, OHG. *dulten*, Ger. *dulden*, to endure). In law, a collecting or bringing together of all the assets of an estate into one common fund for distribution among the heirs or next of kin; a term more particularly used where heirs who have received property from the deceased ancestor by way of advancement return it to the estate in order that a more equitable division of the whole may be made. The term is used in the civil law, and in England it is called *hotchpot* (q.v.). The term is not in general use in the United States, but the law in most States provides that advancements made to an heir shall be considered as a part of the decedent's estate in order to determine whether such heir shall receive anything further. See ADVANCEMENT.

In English ecclesiastical law the term *collation* is used to denote the presentation of a clergyman to a benefice by the patron and bishop. See BENEFICE.

In maritime law *collation* is used in the sense of contribution or average (q.v.).

COLLATION OF MANUSCRIPTS. See BIBLE, *Textual Criticism*.

COLLÉ, kōl'lā', CHARLES (1709-83). A French dramatic author and song-writer, born in Paris. He became the secretary of the Duke of Orleans, the grandfather of Louis Philippe, and wrote plays for the theatre of the Palais Royal, and for the Comédie Française, of which several are still produced. 'Soldat de fortune dans les lettres,' as he has been called, he declined to become a member of the Academy, though his songs have made him famous in French literature. His plays have been collected under the title *Théâtre de société*, and his verses as *Les chansons de Collé*. His interesting *Journal historique* was edited by Barbier (Paris, 1807), and his *Correspondance inédite* by Bonhomme (Paris, 1864).

COLLE, kōl'lā', RAFFAELLO DAL (c.1490-1530), usually called RAFFAELLINO. An Italian painter, born at Colle, near Borgo San Sepolero (Tuscany). He was a pupil of Raphael, and afterwards worked with Giulio Romano. He was employed by Raphael to assist in painting the Loggia of the Vatican, and portions of the story of Moses are from his brush. After his master's death he worked with Giulio Romano in Rome, and in the Piazza del Te at Mantua. Still later he assisted Bronzino and Vasari in various decorative schemes. He opened a bottega in Borgo, San Sepolero, and several of his scholars became fair artists, but none rivaled 'little Raphael.' He painted in the manner of his master, but was not a servile imitator. His style is pure, his figures very noble, and he manages drapery in that grand way characteristic of the Roman School. In general it may be said that no other painter carried on the traditions of that school so successfully as Colle. His principal works are "The Resurrection," in the Church of San Rocco, Borgo San Sepolero; the same subject in the cathedral; the beautiful "Assumption" in the Church of the Conventuali; an "Annunciation," in San Francisco at Cagliari; "Twelve Apostles," in the cathedral at Urbino (very Raphaellesque); and several works in the chapel of the Olivet monks at Gubbio.

COLLECT. A brief, comprehensive prayer varying (like the epistle and gospel, which it

immediately precedes) with the season of the Church year. Such prayers are found in all the earlier Christian liturgies, and most of those now used come from the sacramentaries of Saint Leo, Gelasius, and Saint Gregory. The name (which, however, does not occur in the Roman missal, where the word *oratio*, prayer, is used) is also of great antiquity. It probably comes from *collecta*, in the sense of *collectio*, a gathering, the prayer being originally designated *oratio ad collectam*. In the oldest liturgies only a single collect was used, but with the growth of the calendar it became customary to 'commemorate' a festival which was displaced by one of greater importance with the use of its collect; the sacred number of seven, however, might never be exceeded. In the Roman missal two other prayers, the *secretæ* and the *communio*, are of similar structure to that of the collect, and, like it, vary with the day. These were not retained in the Anglican prayer-book, which has almost literal translations of the Latin collects for nearly all its services. In the morning and evening prayer of this book, as in all the offices of the Roman breviary except prime and compline, the collect for the day is repeated, to link the other offices with the eucharistic service. The structure of the collect is simple and uniform. It begins with a form of address nearly always to God the Father, generally including a commemoration of the special event celebrated, then offers as a rule a single petition for some grace or blessing, and ends normally 'through Jesus Christ our Lord, who with Thee and the Holy Ghost liveth and reigneth, one God, world without end.'

COLLECT, THE, or COLLECT POND. Formerly a large pond in the city of New York, part of whose site is now occupied by the Tombs prison. It drained the district later known as the Five Points, and discharged into the Hudson River by a channel through the present Canal Street. The name 'Collect' was a corruption of the Dutch 'Koleh Hoek,' meaning 'shell point' (Fiske, *Dutch and Quaker Colonies*, 1899).

COLLECTA'NEA (Lat. nom. pl. collected, sc. *dicta*, sayings). A name given to literary collections of any description, as, for instance, sayings of noted men, aphorisms, jests, miscellaneous anthologies, and chrestomathies.

COLLECTIVISM (Fr. *collectivisme*, from *collecter*, ML. *collectare*, to collect, from Lat. *collecta*, collection, assembly, from *colligere*, to collect, from *con-*, together + *legere*, to gather). A scheme for economic reform which would, in place of the competitive system of to-day, based on the individual ownership and control of the means of production, transportation, and distribution, substitute an arrangement by which all or part of these functions would be undertaken systematically by collective action. Generally, the organization proposed for this collective undertaking is the city or State; and in such a case Collectivism is synonymous with State Socialism. The advocates of Collectivism maintain that competition, which is wasteful and self-destructive, should give way to conscious co-operation; they point to the present public management of the postal system as an example of Collectivism, and urge the application of the same method to the production, transportation, and distribution of all the necessities of life.

COL/LEEN BAWN, THE (Ir. *cailin*, girl, dim. of *caille*, girl, and Ir. *babhun*, Gael. *babhunn*, bawn, inclosure of a castle, barn-yard), or THE BRIDES OF GARRY-OWEN. A play by Dion Boucicault, produced September 10, 1860, based on Griffin's *The Collegians*. It was republished in the form of a novel in 1861.

COLLEGE (Fr. *collège*, Lat. *collegium*, assembly, from *collega*, associate, from *con-*, with + *legare*, to send on an embassy, from *lex*, law, connected with *legere*, AS. *liegan*, Ger. *liegen*, Engl. *lie*, Gk. *λέγος*, *lechos*, couch). In its early Roman use, 'college' signified any association of persons having a common purpose or performing a specific function. In some respects it was synonymous with *corpus*, a corporation or body of members, with *universitas*, a whole as contrasted with its parts, and with *societas*, a partnership. The Roman college was required to be incorporated by public authority, could possess common property, and could sue or be sued in the name of its manager. Many of these colleges were mercantile in character or were organizations of artisans similar to the mediæval guilds; but there were others having religious or political objects, such as the college of augurs, pontiffs, etc. In modern usage the term has similar applications, as college of cardinals, college of bishops, college of presidential electors, etc. It is also, especially in Great Britain, applied to associations of scientific or literary purposes, such as College of Physicians, College of Surgeons, College of Heraldry.

In educational usage the term 'college' commonly indicates a stage of instruction intermediate between the high school or preparatory school and the university; but there are some noteworthy exceptions, especially the Collège de France in Paris. The word 'college' in this sense is nearly equivalent to *lycée* and *gymnasium*. The early colleges grew out of the monastic care of the indigent, sick, and feeble, and were at first, in connection with *hospitia*, established by the various orders. In 1180 a foundation for eighteen 'scholar-clerks' was made in the 'Hospital of the Blessed Mary of Paris,' commonly known as the Hôtel-Dieu. Other foundations devoted solely to this purpose soon followed. During the same period it was customary for groups of students to organize for the purpose of renting rooms, providing board, etc. Such organizations were self-governing, though ordinarily, and soon by compulsion, their governors were masters in the university. Sometimes, too, as at Bologna, alien needy students had national boarding-houses under this name, as the College of Spain, etc. Under the influence of the mendicant orders and the example of Robert de Sorbonne, who about 1255 founded the college which bears his name for students who had already taken the earlier degree, colleges became more numerous, assumed the teaching function within their own walls, and tended to become co-extensive with the university. In time, both in Paris and in the English universities, every member of the university had to attach himself to some college, and every person admitted to a college had to matriculate at the university. In this way the colleges became the constituent members of the university, supporting not only the students and fellows, but the professors as well. For a more detailed account, see CAM-

BRIDGE, UNIVERSITY OF; OXFORD; PARIS, UNIVERSITY OF, etc.

In this relation, the college becomes a sub-corporation. The English universities hold the examinations and grant the degrees, while the colleges provide for the lodging of the students, to a certain extent for their support, and for their instruction. Students in one college may receive instruction in other colleges. In Scotland and in America the distinction between the college as the member and the university as the body has been neglected; and we consequently hear of the one and the other indiscriminately granting degrees, a function which in the English and in the original European view of the matter belonged exclusively to the university. *Barnard College*, *Columbia*, and *Sibley College*, *Cornell*, however, besides many correlated professional colleges, may be said to illustrate the older usage. Where there is but one college in a university, as is the case in the universities of Scotland, the two bodies are of course identical, though the functions which they perform are different. The University of Dublin and Trinity College are also virtually the same. In Germany there are no colleges in the English sense; and the verbal confusion between the college and the university is avoided by the latter's performing the functions of both in its own name, as two separate parts of its proper duties. In France, *collège* has a meaning totally different from that which we attach to the word; it is a school, corresponding, however, more to the *gymnasia* (q.v.) of Germany than to the grammar schools of this country. All the colleges are placed under the University of France, to which the centralizing tendencies of that country have given a meaning which also differs widely from that which the term university bears in England. See also COEDUCATION; COLLEGES, AMERICAN; COLLEGIATE EDUCATION FOR WOMEN; DEGREE; DUBLIN, UNIVERSITY OF; EDINBURGH UNIVERSITY; HARVARD UNIVERSITY; SORBONNE; YALE UNIVERSITY; and the names of individual colleges, universities, and other higher institutions.

COLLÈGE DE FRANCE, *kôlèzh' de frâns* (Fr., College of France). A college in Paris, founded between 1518 and 1545 by Francis I., who tried in vain to secure Erasmus for its head. From the beginning, it has been autonomous. The successive kings upheld its independence, notwithstanding the vigorous efforts of the University of Paris to secure control: this independence has been maintained, and though now under the charge of the Minister of Public Instruction, it has no connection with the University of France. From this has resulted its distinguishing characteristic: freedom of teaching and the encouragement of scientific research. The *collège* has had varying fortunes, but its activity has been continuous; even during the Revolution, although it had been the royal college, its reputation saved it from suspension. Originally founded for the teaching of Hebrew, Greek, and Latin only, it has now forty different chairs. Instruction is gratuitous, no examinations are held, no diplomas given. The *collège* is specially designed to attract pupils other than the ordinary university students. In its long roll of illustrious teachers are included the names of Ramus, Gassendi, Rollin, Sylvestre de Sacy, Barthélemy Saint-Hilaire, Laboulaye, Renan, Michelet, and Gaston. Consult: Goujet, *Le*

Collège Royal de France (Paris, 1758); *Bouchon-Brandely, Le Collège de France* (Paris, 1873); *Lefranc, Histoire de Collège de France* (Paris, 1892); *Renan, Questions contemporaines* (Paris, 1868).

COLLEGE JOURNALISM. See JOURNALISM, COLLEGE.

COLLEGE OF ARMS. See HERALDS COLLEGE.

COLLEGE OF ELECTORS. See ELECTORAL COLLEGE.

COLLEGE OF HERALDS. See HERALDS' COLLEGE.

COLLEGE OF THE FOUR NATIONS (Fr. *Collège des Quatre Nations*). An appellation given to the *Collège Mazarin*, founded 1661, from the fact that that university was founded for the free education and support of sixty sons of gentlemen residing in the provinces of Pignerol, Alsace, Flanders, and Roussillon.

COLLEGE PARK. A village in Prince George County, Md., 8 miles northeast of Washington, D. C., on the Baltimore and Ohio Railroad. It has a fine situation, as a suburb of the capital, and is the seat of the Maryland Agricultural College and Experiment Station, established 1850. Population, in 1900, about 300.

COLLEGES, AMERICAN. The offspring of European colleges, and possessing at first the same general form of organization. American colleges have gradually undergone changes which make them distinctive. Harvard (q.v.), the oldest, was founded in 1636, under the influence of men who for the most part had received their education at Emmanuel College, Cambridge University. The second American college, William and Mary (q.v.), founded in 1693, and the third, Yale (q.v.), founded in 1701, were modeled on similar lines. The numerous institutions founded since then have followed very closely the same traditions. During the eighteenth century there were 21 such institutions founded, 9 before the Revolution and 12 afterwards. From 1800 to 1830 there were 33 such foundations; from 1830 to 1863 there were 180; from 1865 to 1900 there were 244, making a total of 480 degree-conferring institutions of college rank.

The early colleges were separate institutions of learning, each offering a single prescribed course of study leading to the degree of A.B., and, with some additional work, to that of A.M. This course was intended to furnish a liberal education, and to prepare the student for the Christian ministry or other learned profession. Both Harvard and Yale came under the control of self-perpetuating corporations, and relied for their support on tuition and private endowments. Most of the earlier and many of the later colleges were controlled in the interest of certain religious denominations, it being frequently part of the organic law of such institutions that the president and trustees should be members of the Church that dominated the school.

The leading changes in the early college system have been the outcome of a demand for a wider circle of studies in the liberal programme; the development of better systems of secondary instruction, to which could be intrusted a large part of the work formerly done by the college; the growth of specialized instruction preparatory to the various professions not only of law, medicine, and theology, but also of the various fields

of applied science; and the appearance of higher institutions under the support and control of the States, notably in the West and the South. In many of the colleges, also, e.g. Harvard, Yale, and Columbia, the influence of the sectarian element in control has largely disappeared. The development about the nucleus of a college of liberal arts of colleges for special professional instruction has led to the university, so called, although many institutions bearing that name give very little attention to graduate instruction of the true university character.

At first, the Colonial colleges took from the grammar schools students who had barely attained a fair knowledge of Latin. As the character of secondary instruction grew better, the entrance requirements of the colleges grew severer. As a result, the average age of entrance of students increased, until at Harvard it is at present over nineteen, an age at which students were commonly graduated in the earlier history of the institution. The curriculum, originally limited to Latin, Greek, a little mathematics, logic, metaphysics, rhetoric, and theology, was extended by the introduction, in the latter part of the eighteenth century, of astronomy and natural philosophy, and, early in the nineteenth century, of modern languages and the elements of the natural and political sciences. This process of expansion led, by the middle of the nineteenth century, to the elective system (see ELECTIVE COURSES), fostered by President Wayland of Brown University, and later by President Eliot of Harvard, President Barnard of Columbia, and President Tappan of Michigan. Certain work was still prescribed to the student, but new work was offered from which he was allowed to make a choice. Then, at many colleges, various courses were established, among which election could be made. The required subjects in each course were from some general field, as science, literature, modern languages, or classics, and distinct degrees, as B.S., Ph.D., B.L., etc., were bestowed upon the graduates of the different courses. Brown, Michigan, and Western institutions, generally, illustrate this plan. Finally, at Harvard in 1869, the right of election was extended to all subjects beyond the first year, the degree of A.B. being given to all graduates of the college of liberal arts. To emphasize the equality of different lines of work thus elected, the Stanford University has adopted the policy of granting this degree even to those whose work has been almost entirely in the sciences. Cornell, too, has in this, as in many other respects, assumed the most liberal attitude in its educational aims.

Along with the development of broader curricula, and elective subjects and courses, has come the establishment of special professional colleges and colleges of applied science. Medical schools had appeared at the University of Pennsylvania and at Columbia and Harvard in the eighteenth century. Law schools were founded early in the nineteenth century, and scientific schools soon after. Some of these institutions were affiliated with older colleges, others were established independently. The year 1846 saw the foundation of the Union College of Civil Engineering, the Sheffield Scientific School, Yale; and the next year the Scientific School at Harvard was established. Finally, there appeared the extension of the work of the liberal

arts college into further fields of scholarship and research, the organization of which has given rise to the graduate departments, the universities proper of the United States. (See UNIVERSITY.) But the distinction of the university from the college or group of colleges for undergraduates has not yet been clearly made. Some institutions calling themselves universities are merely colleges; others consist of several undergraduate colleges; in a few cases the name 'university' is restricted to purely graduate departments.

It must be added that the professional colleges of law, medicine, and theology are coming to have more and more the character of graduate schools. In 1896 Harvard required all students entering the law school to be college graduates. A similar requirement exists in its medical school, and practically in its divinity school as well. Like steps are being taken at Columbia, and the matter is being agitated generally throughout the country. It must be noted, however, that so far no important movement has been set on foot to make the colleges of applied science graduate schools. In case they follow in the path of the schools of law, etc., the special preparation for the higher professions, together with higher training in research and scholarship, will be left to the university, while the college will represent a higher liberal course preparatory to these. As it is, the word college is applied either to (1) liberal arts colleges, or (2) professional colleges admitting undergraduates; and colleges of either type may be parts of universities or separate institutions.

The character of the influences and the life surrounding the student in the college which has grown into a large university is essentially different from that to be met with in the smaller colleges which have continued to work in the spirit of the old Colonial institutions. The smaller college affords less opportunity for election, thus bringing about greater uniformity in the work pursued. While it does not allow so much for individual peculiarities, it provides greater chance for intimate social intercourse among students, and between them and the faculty, and for a firmer grip of the latter in discipline. The educational aim is frankly liberal and social rather than special and individual. Fraternities are an important feature in the social life, athletics prosper, and college spirit is strong. The faculty is even more a teaching body than a learned one, the reverse of which tends to be the case in the larger universities. Many believe that the smaller college affords a better liberal education for one who will later take up a profession or pursue special lines of research at a university. Again, the entrance requirements of the smaller college are often not quite so severe as at the university college, and this makes possible a shortening of the long period of preparation for a profession. On the other hand, the attendance at the smaller college is not increasing in proportion to that in the collegiate departments of the universities. The length of the liberal college course has been a matter of much agitation. Many advocate its reduction to three years; and President Butler, of Columbia, in his first annual report to the trustees of that university, proposed to award the B.A. degree at the end of the second year of undergraduate study. According to the present sys-

tem, a student, beginning at six years of age, and progressing at the normal rate, will enter the college at eighteen, and not until twenty-two begin his special professional training. To gain time, in many universities, the senior collegiate year is allowed to be partly spent in professional work. At Chicago the specialized work may begin in the junior year. The system of credits, too, generally in vogue, by which the satisfactory completion of a certain amount of work entitles a student to his degree, without regard to the time required to accomplish it, often renders graduation possible in less than four years.

The entrance requirements and curricula of the colleges have varied widely. Many colleges, especially in the West and the South, are yet little more than high schools. Some of the States have, however, interfered to determine what institutions shall be authorized to grant degrees, and it is highly desirable that this example should be universally followed. Attempts have also been made among the better colleges to insure greater uniformity in entrance requirements. The colleges of the Middle States and of Maryland united in 1899 in the formation of a general entrance examination board. In the West, the State universities set the standard for collegiate entrance requirements within their several commonwealths.

It remains to mention a few new methods of control that have come to prevail over American colleges. Originally, they were all governed by corporations or boards of trustees, and were chartered either by the King or by Colonial legislatures. The older institutions have retained these charters, with the obvious modifications necessary after the Revolution. A little later, a movement was set on foot to take the colleges under State supervision and control, but it was checked by the decision in the Dartmouth College case, by which States were prevented from assuming control over the property of corporations existing by virtue of a charter sanctioned by their legislatures. The result was that the older Eastern foundations remained under private management, while in the West and the South the system of State universities—usually merely colleges—grew up. These institutions are controlled by regents appointed in various ways, often by the Governor of the State, although in Michigan they are elected by the people. In some of the Eastern institutions also the State has come to exercise a voice in the governing board. Ordinarily, the control of these private colleges is in the hands of a self-perpetuating board, which controls the finances, appoints the instructors, makes laws for the government of the institution, and confers degrees. The instruction and discipline of the students, their admission and dismissal, and the recommendations for degrees are left in the hands of the faculty as a matter of immemorial custom. Much general power is lodged in the hands of the president, and in the university colleges the deans are intrusted to a large extent with the control and direction of the students. In 1899-1900 the number of students (men and women) in institutions of higher learning, including technical and professional schools, was 98,923. This is an increase of over 100 per cent. in actual attendance within the period of ten years, and of over 100 per cent. in the ratio of students to popula-

tion within the period of twenty-seven years. The ratio of increase is highest with graduate students and with women, thus indicating the lines of present development in the work of higher education. The total number of professors and instructors in the same institutions amounted at the given date, in round numbers, to about 14,000. The value of their property was estimated at \$360,594,525, and the annual income was \$28,558,463. See COLLEGIATE EDUCATION FOR WOMEN; ELECTIVE COURSES; UNIVERSITY; and the various colleges.

COLLEGE VIEW. A village in Lancaster County, Neb., a few miles south of Lincoln, the State capital. It is the seat of Union College (Seventh-Day Adventist), opened in 1891. Population, in 1900, 865.

COLLEGEVILLE. A village in Stearns County, Minn., 10 miles west by north of Saint Cloud; on the Great Northern Railroad (Map: Minnesota, D 5). It is the seat of Saint John's University (Roman Catholic), opened in 1867. Population, about 130.

COLLEGEVILLE. A borough in Montgomery County, Pa., 25 miles northwest of Philadelphia; on the Perkiomen River and on the Philadelphia and Reading Railroad (Map: Pennsylvania, F 3). It is the seat of Ursinus College (German Reformed), opened in 1870; has a bridge over one hundred years old; and manufactures boilers and machinery. Collegeville was incorporated as a borough in 1895. Population, in 1900, 611.

COLLEGIANS, THE. A novel by Gerald Griffin (1829). An edition appeared in 1861 under the new title, *The Colleen Bawn, or the Collegian's Wife*, illustrated by Phiz.

COLLEGIANTS (from Lat. *collegium*, assembly). A branch of the Dutch Calvinists, who called their assemblies for worship 'colleges.' The sect was founded in 1619 by the brothers John, Adrian, and Gilbert van der Codde, at Rijnsburg, a couple of miles north of Leyden; hence they were also called the Rijnsburgers. They rejected creeds, and had no regular ministry, nor any form of church government. They adopted baptism by immersion, but their communion was open to all. They were not unlike the Plymouth Brethren of the present day. They opposed war and office-holding by Christians. They became extinct in the eighteenth century.

COLLEGIATE CHURCHES (from Lat. *collegiatus*, member of a college, from *collegium*, assembly). A title applied to certain churches other than cathedrals to which is attached a body of clergy living in community. (See CAXON: CHAPTER.) Of the numerous collegiate churches which flourished in Germany as early as the time of Charlemagne, that of Aix-la-Chapelle was especially famous. In England after the Reformation the title was retained, without much of the organization, as in the cases of Westminster, Windsor, Wolverhampton, Heytesbury, Southwell, Middleton; also Brecon in Wales, and Galway in Ireland. Ripon and Manchester have been constituted the cathedrals of new dioceses. The term is also applied to churches with an associated body of clergy, without episcopal supervision. The best-known instance is the Collegiate Reformed Dutch Church of New York City.

COLLEGIATE EDUCATION FOR WOMEN. A system of education which originated in the United States, and may be said to have sprung from the seminaries for young women. Although at first these were frequently concerned with somewhat superficial accomplishments, the trend was rapidly toward a sounder and broader scholarship. Their development, and later, that of the coeducational public high schools, led to the establishment of women's colleges and to the admission of women to colleges for men.

In 1808 Mrs. Emma Willard (q.v.) opened a school for young women at Middlebury, Vt. In 1819 she removed by invitation to Waterford, N. Y., and ten years later founded the celebrated Troy Female Seminary. By earnest and effective advocacy, notably by the publication of her *Plan for Improving Female Education*, she succeeded in getting the recognition and to some extent the aid of the State of New York in her efforts to give to women the same educational opportunities as to men. In 1819 Rev. Joseph Emerson opened a female seminary at Byfield, Mass., where such instruction was given as is done in academies for men. One of his students, Miss Zilpah P. Grant, became in 1824 the first preceptress of Adams's Female Academy at Derry, N. H. In 1828 she became the principal of a seminary at Ipswich, Mass., associating with her her fellow pupil at Byfield and assistant at Derry, Mary Lyon (q.v.). It was the latter's efforts, aided by the advice and plans of Miss Grant, that led to the founding and endowment in 1837 of Mount Holyoke College (q.v.) at South Hadley, Mass. This institution gave a three years' course nearly equivalent to that of the better colleges for men. Another prominent woman in the early history of advanced education for women was Miss Catherine E. Beecher (q.v.), who opened in 1827 a seminary for girls at Hartford, Conn., and in 1829 published an influential pamphlet on *Suggestions Respecting the Improvement of Female Education*. Later she turned her attention to the West, and through a national board and society did much for improving the facilities as well as for developing a sentiment for the higher education of her sex. In 1821 Wesleyan Seminary and Female College was founded at Kent's Hill, Maine, and in 1834 a similar institution was established at Granville, Ohio. Georgia Female Seminary at Macon (now Wesleyan Female College) was chartered with collegiate powers in 1836, and in 1839 it was opened, offering a four years' course. Monticello Female Seminary, at Godfrey, Ill., was opened in 1838 on the plan of colleges for men, and it soon gained great reputation and influence. Elmira College, at Elmira, N. Y., claims to be the first women's college in the United States, and probably in the world, to establish the same standard as in colleges for men. It was founded in 1855 and offered a four years' course. Vassar College (q.v.) was opened in 1865 at Poughkeepsie, N. Y.; Wellesley College (q.v.) at Wellesley, Mass., and Smith College (q.v.) at Northampton, Mass., in 1875; and Bryn Mawr College at Bryn Mawr, Pa., in 1885. These four, with the Woman's College (q.v.), Baltimore, are to-day the wealthiest of the female colleges in the United States. In 1888 Mount Holyoke College established a full collegiate department, and in 1893 the seminary was dropped. Wells College (q.v.) opened at

Aurora, N. Y., in 1868 as a seminary, became a college in 1870, and in 1896 dropped the preparatory department. Besides these institutions, there were in 1898 139 institutions for women in the United States calling themselves with more or less correctness colleges. This represents a decline in number as compared with the preceding ten years, but it has been far more than made up by the increased attendance at the better women's colleges and the coeducational institutions. The latter are discussed in the article on COEDUCATION.

An additional class of schools offering higher instruction to women are the colleges affiliated with institutions for men. Of these the earliest to be established in the United States was Radcliffe College (q.v.), instruction in which is carried on by certain members of the Harvard faculty. It was founded by the Society for the Collegiate Instruction of Women in 1879, and assumed its present name with power to grant degrees in 1894. Barnard College (q.v.), founded in 1889, and at first affiliated with Columbia as Radcliffe is with Harvard, was made in 1900 an undergraduate college of the university, graduate work in that institution being thrown open to women. Brown University has a women's college that began work in 1892. The College for Women of Western Reserve University, at Cleveland, Ohio, was established in 1888, and in connection with Tulane University at New Orleans, La., there was opened in 1886 the H. Sophie Newcomb Memorial College for Women. Evelyn College, connected with Princeton University, was opened in 1887, but ceased to exist in 1897.

The attitude of the universities of Europe toward the admission of women is described in the article on COEDUCATION. In Great Britain there are many women's colleges connected with the great universities. At Cambridge, Girton College was opened in 1869 and Newnham College in 1871. At Oxford, Somerville Hall and Lady Margaret Hall were opened in 1879, and Saint Hugh's Hall in 1886. At the University of London, University College and King's College have departments for women. Bedford College for Women was opened in 1849, and Royal Holloway College in 1886. There are also numerous local colleges affiliated with various universities in England and Wales. In Ireland, Queen's College, Belfast; Queen's College, Cork; and Queen's College, Galway, are affiliated with the Royal University of Ireland. In Scotland, University College at Dundee is a college for women affiliated with the universities of London, Saint Andrews, Edinburgh, and Glasgow. At Glasgow, Queen Margaret College was in 1892 affiliated with the university at that place. On the Continent, however, women's colleges have not been established. Private training and 'finishing' schools suffice for those who do not enter the universities. In the various professions women find no chance for instruction to any extent in separate institutions except in the case of medicine. In the United States there were in 1898 seven medical schools for women. In London there is one, and Edinburgh has two; several are in Canada, and one at Saint Petersburg.

The development of opportunities for the higher education of women has been actively promoted by a number of organizations, prominent among which are, in the United States, the

Massachusetts Society for the University Education of Women, founded in 1877, and the Association of Collegiate Alumnae, founded in 1882; and in England the Girls' Public Day School Company, founded in 1874, and the Cambridge Association for the Promotion of the Higher Education of Women, established in 1879. An organization for similar purposes was in 1898 formed in Berlin. The development of opportunities for the university education of women has also had a favorable reaction upon facilities for their secondary instruction not only in the United States, but also in England and France, and to-day even the meagre system of girls' gymnasia in Germany is beginning to feel the influence of a demand that women shall be prepared for the universities. In 1898, however, the Prussian Minister of Education refused an application for the establishment of a girls' school in Breslau, saying that university education for women is only for exceptional cases, and that the Government will not undertake to prepare them for this.

Three statistical investigations into the health of college women have been undertaken, two in America by the Association of Collegiate Alumnae in 1885 and 1900, and one in England by Mrs. Henry Sidgwick in 1897. In America the health of the college women compared favorably with that of working women, and in England with that of non-college sisters and cousins. Nor does the marriage rate of college women seem to be less than that of their sisters. On the other hand, a large proportion of them are self-supporting, the principal occupation being teaching, which in 1895 was the business of 37 per cent. of the graduates of Vassar, and in 1898 of 49 per cent. of the graduates of Radcliffe College.

Consult: Thomas, "Education of Women," in Butler, *Monographs on Education in the United States* (New York, 1900); Fitch, "Women and Universities," in *Educational Aims and Methods* (New York, 1900); Lange, *The Higher Education of Women* (New York, 1900); French, "Educational Status of Women in Different Countries" (with bibliography), in *Report of United States Commissioner of Education* (Washington, 1894-95). See COEDUCATION.

COLLENCHYMA, kōl-lēn'kī-mā (Neo-Lat., from Gk. κόλλα, *kolla*, glue + ἔγχυμα, *enchyma*, infusion, from ἐν, *en*, in + χέω, *chein*, to pour). A supporting tissue in certain plants, usually developed just beneath the epidermis, and recognized by the prominent thickenings in the angles of the cells. See HISTOLOGY (OF PLANTS).

COLLEONI, kō'lyā-ō'nē, or **COLEONE**, kō'lā-ō'nā, BARTOLOMMEO (1400-75). An Italian general, born at the Castle of Solza, near Bergamo. He distinguished himself in the war between the Venetians and the Milanese. During the last thirty years of his life he was generalissimo of the Venetian State, in which capacity he is reputed to have displayed much strategical ability. A fine equestrian statue, executed by Andrea del Verrocchio, was erected to his memory near the Church of San Giovanni e Paolo in Venice.

COL'LES, CHRISTOPHER (1738-1821). An Irish engineer, the pupil of Pooceke. He was born in Ireland, but came to America before the Revolution and delivered lectures in New York on pneumatics, gunnery, and inland navigation. One of the first steam-engines made in the coun-

try was designed by him; and he was among the first to propose water-supply by reservoirs for the city of New York. As early as 1784 he presented to the New York Legislature a plan to connect Lake Ontario with the Hudson River by canals and such natural channels as could be used, and with this purpose in view he surveyed the Mohawk River.

COL'LETT, JAKOBINE CAMILLA (1813-95). A Norwegian novelist. The keynote of her work is the emancipation of woman. In addition to her first and most popular novel, *The Magistrate's Daughters* (1855), she wrote *Tales* (1861); *In the Long Nights* (1863); *Against the Stream* (1879; 2d series, 1885); *Last Leaves, Recollections, and Confessions* (1868, 1872, and 1873).

COLLET'TA, PIETRO (1775-1831). An Italian Minister of War and historian. He served with distinction in the army under Joseph Bonaparte upon the latter's accession to the throne of Naples in 1806, and was retained in his military dignities by Ferdinand I. In 1820 he was dispatched to suppress the insurrection in Sicily. Appointed Neapolitan Minister of War in 1821, he was afterwards imprisoned by the Austrians, but was finally permitted to reside in Florence, where he wrote his well-known historical work, *Storia del reame di Napoli, 1734-1825* (first published in 1834; German trans. by Leber, 8 vols., Grimma, 1849-50).

COL'LEY, SIR GEORGE (1835-81). An English soldier. He was educated at the Royal Military College, Sandhurst, served in Cape Colony as a lieutenant, was a border magistrate there in 1857-58, was ordered to China, and as captain participated in the taking of the Taku forts in 1860. He was subsequently professor of military administration and law at the Staff College, Sandhurst. In 1875 he was promoted to a colonelcy for efficient service in Ashanti, and from 1876 to 1880 he was private secretary to Lord Lytton, at that time Viceroy of India. He was sent to succeed Sir Garnet Wolsley as Governor and commander-in-chief of Natal in 1880. In January, 1881, he commanded against the Boers at Laing's Neck and Ingogo, and on February 27 his detachment was annihilated at Majuba Hill (q.v.), and he himself fell.

COL'LIÉ. The Scotch shepherd dog. See SHEEP-DOG.

COLLIER, kōl'yēr, JEREMY (1650-1726). A non-juring English clergyman, born at Stow Qui, or Quire, in Cambridgeshire, September 23, 1650. He went to Cambridge in 1669, took his degree of M.A. in 1676, and entered the ministry. At the revolution of 1688 he plunged into the stormy waters of controversy, his foeman being Gilbert Burnet, afterwards Bishop of Salisbury. For a publication of his at this time, entitled *The Desertion Discussed* (1688), which maintained the invalidity of King William's regal authority and gave offense to the Government, he was sent to Newgate, where he remained several months. On his release he rushed anew into party contentions, and distinguished himself by the publication of several controversial works. Suspected of being a partisan of the Stuarts, he was again arrested in 1692 and imprisoned for a short time in the King's Bench. From this period his life was a perpetual literary strife, the

Government being the principal object of his attack. In 1713 he was consecrated a bishop among the non-jurors, and was their leading man after the death of Hickes in 1715. He died in London, April 26, 1726. Collier wrote many books, including the *Great Historical, Geographical, Genealogical, and Poetical Dictionary* (4 vols., 1701), founded on Moreri's, and *Ecclesiastical History of Great Britain to the End of the Reign of Charles II.* (2 vols., 1708-14). The best edition of the latter work is by T. Lathbury (9 vols., London, 1852). It is a work of great learning, the first of its kind except Fuller's that had appeared. But the work by which he is best known is his *Short View of the Immorality and Profaneness of the English Stage* (1698), in which he attacked Dryden and Congreve as vigorously as D'Urfey, and which had a marvelous success. For his life, consult the *Ecclesiastical History*, edited by Lathbury (London, 1852).

COLLIER, JOHN PAYNE (1789-1883). An English Shakespearean critic and commentator. He was born in London. In 1820 he published *The Poetical Decameron*. From 1825 to 1827 he superintended a new edition of Dodsley's *Old Plays*; and in 1831 appeared his best work, a *History of English Dramatic Poetry, and Annals of the Stage*. From 1835 to 1839 he published three volumes on Shakespeare entitled *New Facts, New Particulars, and Further Particulars*, followed by an edition of Shakespeare in eight volumes (1842-44). Not content with these efforts for the illustration of his favorite author, Collier, in 1852, published a volume entitled *Notes and Emendations to the Text of Shakespeare's Plays, from Early Manuscript Corrections in a Copy of the Folio of 1632, in the Possession of J. P. Collier*. This volume is now known as the Perkins Folio, as 'Tho. Perkins his Booke' is inscribed on the cover. The publication excited great commotion in the literary world: opinion was divided, and the *Emendations* were furiously applauded or furiously assailed. It has since been proved that all the marginal notes are forgeries. In 1862 he published an excellent edition of Spenser; and the next year he began a series of reprints of our early poets and pamphleteers. Of his later publications, the most interesting is *An Old Man's Diary* (1871-72). For a list of Collier's forgeries, and the bibliography of the subject, consult: Lee, *A Life of Shakespeare* (3d ed., London, 1900); and Warner, *Catalogue of MSS. of Dulwich College* (London, 1881).

COLLIMATION. See MERIDIAN CIRCLE; TRANSIT INSTRUMENT.

COLLIN, kō'lĕn', HEINRICH JOSEF VON (1772-1811). An Austrian dramatist and song-writer, born in Vienna. He became celebrated as the author of the patriotic *Wehrmannslieder* (1809), which insure him a permanent rank among those who by their songs stirred the heart of Germany to resistance against foreign oppression in the War of Liberation. His collected works were published by his brother (6 vols., Vienna, 1812-14).

COLLIN, kō'lān', LOUIS JOSEPH RAPHAEL (1850—). A French painter. He was born in Paris and studied there at first under Bouguereau, and then under Cabanel. In 1873 he obtained a second-class medal with "Le sommeil." After that he exhibited constantly at the Salon.

and in 1887 received the Grand Prix de Rome. His portraits are particularly fine, and he has painted in an admirable manner on faience; but Collin is especially noted for his painting of the nude in the open air, the best example of which is "Floréal" (1886), in the Luxembourg. The Museum of Arras has an "Idyl" by him, and the Museum of Alençon his "Daphnis and Chloe" (1877).

COLLIN D'HARLEVILLE, kō'lān' dār'l'vĕl', JEAN FRANÇOIS (1755-1806). A French dramatist. He was born at Mévoisins, near Maintenon, and after studying law devoted himself entirely to literature. His numerous character-plays, which occasionally suggest the influence of Regnard, are noted for their gaiety, wit, and comic episodes. The more popular are *L'inconstant* (1786); *L'optimiste* (1788); *M. de Crac dans son petit castel* (1791); *Le vicieux célibataire* (1793), usually considered his best production; *Les châteaux en Espagne* (1803). The best edition of his dramatic works is that by Andrieux (Paris, 1822).

COLLINEARITY. See CONCURRENCE.

COLLINE (kō'lĭn) GATE, THE (Lat. *Porta Collina*, hill-gate, from *porta*, gate, and *collinus*, hilly, from *collis*, hill). An ancient gate of Rome on the Quirinal, beside which Fulvius encamped, B.C. 211, to oppose the entrance of Hannibal. According to Ovid, the Carthaginian general rode up to it and hurled a spear into the city. The victory won here by Sulla over the Marian forces (mainly Samnites), in B.C. 82, made his power supreme in Rome. The gate was discovered in 1873, but was destroyed in building the Treasury.

COLLINGWOOD. A suburban municipality of Melbourne (q.v.), Victoria, Australia (Map: Victoria, E 4). Population, in 1891, 35,100; in 1901, 32,800.

COLLINGWOOD. A town and port in Simcoe County, Ontario, Canada, on Georgian Bay, Lake Huron, 94 miles northwest of Toronto (Map: Ontario, C 3). It is important as the terminus of the Northern Railway on the line of travel to and from Lake Superior. It has tanneries, breweries, and flour-mills, a large lumber and grain trade, and regular steamer communication with other lake ports. It has a United States consulate. Population, in 1891, 4939; in 1900, 5755.

COLLINGWOOD, CUTHBERT, Lord (1750-1810). A British admiral, born at Newcastle-upon-Tyne. He went to sea as a midshipman at the age of eleven, and in 1775 took part in the battle of Bunker Hill and was made a lieutenant for his services. He became a commander in 1779 and a rear-admiral in 1799. Among the great naval victories in which he bore a prominent part were those of Lord Howe off Brest in June, 1794; of Lord Jervis off Cape Saint Vincent in 1797; and of Nelson at Trafalgar in 1805, where he held the second command. In the last-named engagement his ship was the first to break through the line of French and Spanish vessels, and after Nelson had received his death-wound he assumed the chief command. For his gallant conduct in this battle he was raised to the peerage.

COLLINS, ANTHONY (1676-1729). An English author, a noted free-thinking writer on reli-

gious questions. He was born at Isleworth or at Heston, near Hounslow, in Middlesex, June 21, 1676. He studied at Eton, and King's College, Cambridge, and in the Temple in London. In 1707 he published his *Essay Concerning the Use of Human Reason*; and in 1709, his *Priestcraft in Perfection*, which disturbed the churchmen of that time exceedingly. The controversy excited by this last work induced Collins to sum up several previous pamphlets in his *Historical and Critical Essays on the Thirty-nine Articles* (1724). He had published a *Defense of the Divine Attributes* (1710), in reply to the Archbishop of Dublin, who asserted the compatibility of divine predestination and human freedom. Collins was a philosophical necessitarian, and afterwards advocated his opinions more fully in his *Philosophical Inquiry Concerning Liberty and Necessity* (1715). In 1711 he went to Holland, where he made the friendship of Le Clerc and other eminent *litterati*. On his return to England, he published his *Discourse of Freethinking* (1713), the best known and the most important of all his works, which Swift assailed in one of his best pieces of irony, while Bentley disposed of its pretensions to scholarship. In 1718 he was made treasurer for the county of Essex; and in 1724 appeared his *Grounds and Reasons of the Christian Religion*, which gave occasion to no less than thirty-five replies. He defended himself in his *Literal Scheme of Prophecy*; and in 1727 published his last work, *A Letter to the Rev. Dr. Rogers on Occasion of His Eight Sermons on the Necessity of Revelation and the Truth of Christianity*. Collins died December 13, 1729. He was a friend and correspondent of Locke, who declared that Collins had as much love of the truth for the truth's sake as ever he had met in anybody. His character for integrity and benevolence stood very high.

COLLINS, JOHN (1625-83). An English mathematician, born at Wood Eaton, in Oxfordshire. He was a man of great natural ability and devoted to mathematics; was a member (1667) of the Royal Society of London, and carried on an extensive correspondence with the leading mathematicians of his day. Writers are much indebted to his *Commercium Epistolicum* (published by the Royal Society in 1712) for information on contemporary discoveries, as well as on the great controversy of Newton and Leibnitz. Consult: Rigaud, *Correspondence of Scientific Men of the Seventeenth Century* (Oxford, 1862).

COLLINS, JOHN CHURTON (1848—). An English educator and author. He was born at Bourton-on-the-Water, Gloucestershire, and graduated at Balliol College, Oxford, in 1872. He contributed largely to the reviews, strenuously opposing the philological method of literary study, and was active in the university extension movement. He is a writer of great force and wit, and combines accurate scholarship with a lucid and luminous literary style. Besides editions of Cyril Tourneur (1878), Lord Herbert of Cherbury (1881), Robert Greene (1899), and other English authors, he published *Sir Joshua Reynolds as a Portrait-Painter* (1874); *Bolingbroke and Voltaire in England* (1886); *Study of English Literature* (1891); *Illustrations of Tennyson* (1891); *The Early Poems of Tennyson*, with bibliography and various readings

(1900); *Ephemera Critica* (1901); *Dan Swift* (1893); and *Essays and Studies* (1895).

COLLINS, JOSEPH WILLIAM (1839—). An American pisciculturist. He was born at Isleboro, Maine, and when very young was employed on a fishing vessel. He afterwards became established at Gloucester, Mass. He prepared statistics on the New England fisheries for the Tenth Census, and also submitted the results of his investigations to the United States Fish Commission. He represented the United States at the International Fisheries Expositions held at Berlin in 1880, at London in 1883, and at Bergen, Norway, in 1898; and he was director of the Department of Fisheries during the Columbian Exposition. In 1884 he organized the section of naval architecture in the United States National Museum, and was curator of the department for nearly ten years. He was appointed president of the Commercial Fisheries Association in 1894.

COLLINS, MORTIMER (1827-76). An English poet and miscellaneous writer, born at Plymouth. He was master of mathematics for a time at Queen Elizabeth's College, Guernsey, but resigned in 1856, and devoted himself thereafter wholly to literature. His publications include: *Idyls and Rhymes* (1865); *Sweet Anne Page* (1868); *The Secret of Long Life* (1871); and *The British Birds, from the Ghost of Aristophanes* (1872). His wife, Frances, published *Letters and Friendships of Mortimer Collins, with Some Account of His Life* (London, 1877).

COLLINS, PATRICK ANDREW (1844—). An American lawyer and politician. He was born in Fermoy, Ireland, but was brought to the United States in 1848, and settled in Chelsea, Mass., where, while working as upholsterer, he prepared himself for the study of the law. In 1871 he graduated at the Harvard Law School, and in the same year was admitted to the bar. He was a member of the State Legislature in 1868-69 and State Senator 1870-71, served three terms in Congress (1883-89), and later, from 1893 to 1897, was Consul-General at London. He was an active Fenian and was chosen the first president of the Land League in 1884. He was elected Mayor of Boston in 1901.

COLLINS, REV. MR. A conceited and fawning character in Jane Austen's *Pride and Prejudice*.

COLLINS, WILLIAM (1721-59). An English poet. He was born at Chichester, where his father was a hatter, and received his education at Winchester College and at Oxford. In 1742 he published a small volume containing the *Persian Eclogues*, and in 1743 the *Epistle to Sir Thomas Hanmer*. These are not so characteristic of his talent as his later writings. Leaving Oxford, probably early in 1744, he went to London, resolved upon a literary career. Here, from time to time, he published other poems, consisting chiefly of odes; but misfortunes, occasioned by his indolence and irresolution, finally rendered him a prey to melancholy, which at times deepened into insanity. He died at Chichester. The poems which Collins left are comparatively few; but they entitle him to high rank among the poets of the eighteenth century. He was essentially a lyricist; and it is upon his odes that his reputation is principally founded. His most popular ode is *The Passions*. The

personification of the passions is true and striking, and the variation of the measure is well adapted to the various emotions to be expressed. Among his poems may be mentioned the odes, *To Liberty, To Mercy, To Evening, On the Death of Mr. Thomson*, the ode, written in 1746, beginning, "Hew sleep the brave who sink to rest," and the *Song from Cymbeline*. Not only is much of Collins's poetry exquisite, but it marks the beginning of English romanticism. This is particularly true of the *Ode on the Popular Superstitions of the Highlands of Scotland*, completed in 1749, but not published until 1788. Consult: Johnson, sketch of Collins in *Lives of the Poets* (Oxford, 1781); *Poems*, ed. Bronson (Boston, 1898); and Beers, *English Romanticism in the Eighteenth Century* (New York, 1899).

COLLINS, WILLIAM (1788-1847). An English painter of genre, born in London. His father was a journalist, but helped to eke out his living by dealing in pictures. Young Collins spent some time in the studio of Morland, but subsequently went to Italy, where he painted some Italian landscapes. His true love, however, was for child life, and he painted that in every phase; in the course of forty years he exhibited 121 pictures at the Academy. Among the most popular of these are his "Happy as a King," "The Little Flute-Player," "The Sale of the Pet Lamb," and "Boys with a Bird's Nest." He portrayed home life in various ways, and children were always introduced. The chief criticism against Collins's children is that they lack the unconscious air of childhood, and look as if they were on their good behavior. His technique resembled that of his master, Morland. In later years he attempted some religious subjects: "Christ in the Temple with the Doctors," and "The Two Disciples at Emmaus"; but afterwards wisely returned to his earlier style, for which he had much more gift. Others of his works are: "Scene in a Kentish Hop-Garden," "Sunday Morning," "Prawn-Catchers," and "Fishermen on the Lookout." He died in London. Consult: W. Wilkie Collins, *Memoirs of the Life of William Collins, Esq.* (London, 1849); Koehler, *English and American Painters* (New York, 1883).

COLLINS, WILLIAM WILKIE (1824-89). An English novelist. He was the eldest son of William Collins (q. v.), a landscape and portrait painter, and he received his favorite name from Sir David Wilkie. Born in London, he was educated privately at Highbury, and accompanied his father to Italy (1836-38). On his return to London he became a clerk in a London firm of tea-merchants (1841-46), and afterwards studied law at Lincoln's Inn, whence he was called to the bar (1851). He was already drifting toward literature. Even while in the London warehouse he turned his knowledge of Italy to good account in an historical romance entitled, *Antonina; or, the Fall of Rome* (not published till 1850): on the death of his father, he prepared an excellent memoir in two volumes (1848); and a visit to Cornwall resulted in a series of popular sketches called *Rambles Beyond Railways* (1850-51). Some time in 1851 he met Dickens, and this event decided his career. Thenceforth the two novelists were intimately associated, working at times in collaboration.

To *Household Words*, edited by Dickens, Collins contributed many tales, including the capital series of short stories known as *After Dark* (1856); and for *All the Year Round*, which was also conducted by Dickens, *The Woman in White* (1860), which met with instant success at home and abroad. In the meantime had appeared *Basil: A Story of Modern Life* (1852); *Hide and Seek* (1854); *The Dead Secret* (1857); and *The Queen of Hearts: A Collection of Stories* (1860). And among the numerous novels that followed are: *No Name* (1862); *Armada* (1866); *The Moonstone* (1868); *Man and Wife* (1870); *The New Magdalen* (1873); *The Frozen Deep, and Other Stories* (1874); *The Law and the Lady* (1875); *The Two Destinies* (1876); *The Fallen Leaves* (1879); *Heart and Science* (1883); *The Legacy of Cain* (1888); and *Blind Love* (1889). In 1873-74 Collins visited the United States, where he gave public readings from his own short stories. His last years were spent in seclusion. He died in London, and was buried in Kensal Green.

Soon after his acquaintance with Dickens, Wilkie Collins began to evolve a new type of novel, in which the study of character counts for little, and in which the main effort is given to the construction of a mystery so involved in details and circumstances as to baffle the reader. Of this kind *The Woman in White* and *The Moonstone* are masterpieces. Their literary value has indeed been questioned; but it must be admitted that, within his sphere, Collins had no equal among his contemporaries, several of whom—and Dickens among them—attempted to do the same thing and failed. For an appreciative study, consult Swinburne, *Studies in Prose and Poetry* (London, 1894).

COLLINS, PETER (1694-1768). An English naturalist. One of his pursuits was the naturalization of plants, flowers, and trees. He sent English plants to America and brought American plants to his own country, successfully introducing many species. He is also credited with first suggesting grape cultivation in Virginia.

COLLINS, SIR RICHARD (1811-83). An English naval officer. He entered the navy in 1823, in 1840 was appointed to the *Wellesley*, on which he served during the Chinese war, and in 1842 was promoted to be commander. In 1849 he commanded the *Enterprise*, which, with the *Investigator*, Commander McClure (q.v.), was sent by way of Bering Strait for the relief of Sir John Franklin. Near Cape Horn the vessels were separated by storm, and they did not again speak each other. Collinson wintered in 1850 at Hong Kong, in 1851 in Prince of Wales Strait, and in 1853 in Camden Bay. He arrived at Point Barrow in August of 1854. In 1858 he was awarded the gold medal of the Royal Geographical Society. He was appointed admiral on the retired list in 1875. He edited *The Three Voyages of Martin Frobisher in Search of a Passage to Cathaia* (1867), for the Hakluyt Society.

COLLISION. See IMPACT.

COLLISIONS OF VESSELS (from Lat. *collisio*, from *collidere*, to dash together, from *con-*, together + *ladere*, to dash). To prevent vessels running against one another in passing, there are 'rules of the road' (q.v.) at sea as well

as on land. In both the United States and Great Britain regulations are laid down which, though not having the force of law, are recognized by the admiralty courts, and govern the decisions in cases of collisions. In general, they are analogous to the rules observed by pedestrians in crowded thoroughfares, and by vehicles on highways. It is at night that the danger of collision is greatest; and hence the necessity for a well-arranged system of lights and other precautions. Of 3575 casualties of all kinds on and near the coasts of the United Kingdom in 1880-81, 713 were due to collisions; of these 69 resulted in total loss. The transatlantic steamers running between Queenstown, or the Channel ports, and New York have adopted the 'lane system,' first advocated by Lieutenant Maury, U. S. N., and afterwards developed by the Hydrographic Office, U. S. Navy, and approved by the Marine Conference held at Washington in 1889. This consists in the assignment of a definite lane or track to each separate line of steamships, along which route their vessels are required to maintain their course.

It has been held by American courts that, if a collision happens without fault, and no blame can be charged to those in charge of either vessel, each party must bear its own loss. In case both parties are at fault, neither can have relief at common law: but maritime courts aggregate the damage to both vessels and their cargoes, and divide the amount equally between the two. In case of inscrutable fault, that is, by a fault of those in charge of one or both vessels, and yet under such circumstances that it is impossible to learn who is at fault, the rule of equal division is also adopted. Where the fault is on the part of one vessel and no fault on the other, the owners of the vessel at fault must bear their own loss, and are also liable for the damage to the other vessel. In some cases the personal liability of owners is limited to the value of the vessel and freight. Strict laws, rules, signals, etc., are adopted by all nations to prevent collisions. (See NAVIGATION LAWS.) But, no matter how exacting may be the rules, cases will occur when their following would result in disaster. No vessel should unnecessarily incur the probability of collision by strict adherence to the rules. If it is clearly in the power of one vessel to avoid collision by departing from the rules, she will be held bound to do so; but a vessel is not required to depart from the rule when she cannot do so without danger. A proper lookout must be kept: the absence of such a lookout is in itself evidence of negligence. In some cases certain lights must be kept. Losses of a vessel injured by a collision are within the ordinary policy of insurance: but when the collision is the fault of the insured vessel, or of both vessels, the insurer is not ordinarily liable for injury done to the other vessel which may be decreed against the vessel insured, although recent policies provide that the insurer shall be liable in such case.

COLLO'DION (Neo-Lat., from Gk. κολλώδης, *kollōdēs*, glue-like, from κόλλα, *kolla*, glue + εἶδος, *eidos*, form). A solution of pyroxylin in a mixture of alcohol and ether. For its manufacture a convenient form of cellulose, such as cotton wool, is immersed in a mixture of nitric and sulphuric acid with a little water, or in a mixture of potassium nitrate with sulphuric

acid. The resulting product is washed in water and dried. The pyroxylin thus obtained is then treated with ether, to which alcohol is added until the substance is completely dissolved. The solution is a clear, colorless liquid that does not mix with water or alcohol, but readily mixes with ether; when exposed to the air it dries up, leaving a transparent film, which becomes electric by friction and may be exploded by heat, pressure, or percussion. Mixed with substances sensitive to light, collodion is extensively used in photography; the mixture is spread over a glass plate, on which it forms, when dried, a sensitive film. Collodion is also used in surgery, the tenacious and transparent film left by its evaporation preventing the access of air to the injured surface and protecting it from infection. Pills and other medicinal preparations may be coated with it so as to render them tasteless. Among the medicinal collodions that are official is *blistering* or *vesicating collodion*, which consists of cantharides dissolved in collodion: the solution is applied to the skin when it is desired to raise a blister. Wood, paper, and fabrics may be rendered waterproof by being covered with collodion. Small balloons are made from it by pouring a solution into a flask of the desired dimensions, which is then turned about so as to spread the liquid uniformly over the surface, and then inverted to allow the excess to run out. The solvent is then allowed to evaporate, and the edges of the remaining film are loosened from the glass by attaching a glass tube to the neck of the flask and withdrawing the air, whereupon the collodion balloon detaches itself, contracts, and is easily withdrawn. See also CELLULOSE.

COLLOIDS (from Gk. κόλλα, *kolla*, glue + εἶδος, *eidos*, form). A name applied by Graham to a group of substances, including ferric oxide, alumina, silicic acid, starch, dextrin, gum, albumin, gelatin, tannin, caramel, agar-agar, and others. These substances, though not by any means belonging to the same class chemically, behave alike in certain respects when obtained in solution in water or in some other solvent. In the first place, they diffuse, when dissolved, very much more slowly than most other substances ordinarily met with. In the second place, their presence in solution has scarcely any effect on the freezing-point or on the vapor-tension of the solvent, while most other substances have the effect of notably lowering both the freezing-point and the vapor-tension. Again, colloids often spontaneously deposit from their solutions in the form of gelatinous masses that cannot, in many cases, be re-dissolved and that usually retain mechanically a large amount of water. Such 'gelatinized solutions' are now used for a variety of purposes in the arts, advantage being taken of the mass being in a semi-solid condition, while the liquid retained by it may be used for the same purposes as when in the free state; such masses are used in photography by the 'dry' process, in making 'dry' electric batteries, in the manufacture of certain valuable explosives, etc. In scientific researches gelatinized solutions are now used for the purpose of studying the relative rates at which various substances diffuse in water. For this purpose it is important that the solutions should remain absolutely undisturbed for a considerable length of time, and this is accomplished best by

adding to them a certain amount of agar-agar or some other colloid, and causing them to 'gelatinize,' the 'dry' solutions thus obtained showing precisely the same rates of diffusion as ordinary aqueous solutions.

Another important property of colloids is their incapacity of traversing parchment paper and animal membranes. This permits of the separation of colloids from non-colloids (called 'crystalloids') without any difficulty; the process of separation being known as *dialysis*. Thus, to dialyze a solution containing common salt (a crystalloid) and silicic acid (a colloid), the solution may be placed in a bag of parchment paper and immersed in pure water: the salt will then readily pass through the paper, while the silicic acid will remain behind.

The properties of colloids are undoubtedly due to the comparatively very large size of their molecules. Thus, while the molecular weight of water is only 18, and that of most organic substances only a few hundred, the molecular weight of starch has been shown to be about 25,000, and that of silicic acid is at least 50,000.

COLLOPH'ANITE (from Gk. κόλλα, *kolla*, glue + φαίνω, *phainō*, to show). Amorphous hydrated calcium phosphate. It has a banded structure, resembling opal, and a conchoidal fracture. In color it is snow-white or yellowish-white. This mineral is found chiefly on the island of Sombbrero, having been formed in the elevated coral reef by infiltration of salts from the overlying guano.

COLLOP MONDAY. An old English term used to designate the Monday before Lent, from the custom of those days (when fasting was much stricter than at present) of cutting meat into strips or collups and salting it to keep until Lent was over.

COLLOT D'HERBOIS, kô'lô' dâr'bwâ'. JEAN MARIE (1750-96). A French Revolutionist. He was born in Paris, and passed his early life as an actor. After visiting Holland and acting as the director of a troupe at Geneva, d'Herbois took to play-writing. Most of his productions were adaptations from English and Spanish, and one, *Le paysan magistrat* (1777), was popular for a time. In 1789 d'Herbois, who was then living in Paris, wrote *La famille patriote ou la fédération*, a revolutionary drama, and followed up this success by bringing out the *Almanach du Père Gérard*, for which he was awarded a prize by the Jacobin Club. Elected as the third deputy from Paris to the Convention in 1792, he became, in the following year, president of that body, and a member of the Committee of Public Safety. In November, 1793, he was sent to Lyons to complete the work of pacification begun by Couthon. There he showed himself merciless in the service of the Republic, and caused 1600 persons to be put to death. On returning to Paris he found himself, owing to his popularity, an object of suspicion to Robespierre, and, after an attempt to assassinate him had failed, Robespierre's jealousy increased. Collot d'Herbois took part in the conspiracy which led to Robespierre's downfall, but the reaction was fatal to himself. He was expelled from the National Convention, and in April, 1795, was sentenced to deportation to Cayenne, where he died of fever, January 8, 1796. Consult: Anlard, *Les orateurs de la Législative et de la Convention*

(Paris, 1885-86); Morse-Stephens, *The French Revolution* (London, 1891), and *Statesmen and Orators of the French Revolution* (Oxford, 1892).

COLLUSION (Lat. *collusio*, from *colludere*: to defraud, to play together, from *con-*, together + *ludere*, to play). In law, a species of fraud (q.v.), and consisting in an agreement between two or more persons to defraud a third, or to accomplish some illegal purpose; thus, it is collusion for a failing debtor to transfer property to another, who receives it to enable him to defraud some or all of his creditors; or for husband and wife, by mutual agreement or understanding, to institute a suit to procure a divorce without legal cause. Such transactions or proceedings are voidable because of their fraudulent character.

COLLU'THUS (Lat., from Gk. Κόλλουθος, *Kollouthos*). A Greek poet of the fifth century; a native of Lycopolis in Upper Egypt. He is believed to have been the author of a poem in 392 verses, entitled, 'Ἑλένης Ἀρπαγή, *Helenēs Harpalē*, or the *Rape of Helen*, which was discovered by Cardinal Bessarion, in Calabria. The text has been edited by Lehrs. in the Didot collection (1841). No other of his poems is extant.

COLL'YER, ROBERT (1823—). An American clergyman of the Unitarian Church. He was born at Keighley, Yorkshire, England; at eight years of age he was a mill-hand; at fourteen, a blacksmith; and in 1849 became a local preacher of the Methodist Church. In 1850 he came to America and began work as a hammer-maker, at Shoemakertown, Pa. At the same time he continued to officiate as a local preacher. In 1859 he formally joined the Unitarian Church, in the same year went to Chicago as a missionary of that denomination, and shortly after organized and became pastor of Unity Church. He was called in 1879 to assume charge of the Church of the Messiah, New York City, of which, after a long and successful active pastorate, he became senior associate minister. His publications include two volumes of sermons, *Nature and Life* (1865; 11th ed., 1882) and *The Life that Now Is* (1871; 10th ed., 1882), written in a style noteworthy for its effective use of an Anglo-Saxon vocabulary. *The Single Truth* (1877), *History of Ilkley* (1883; with Horsefall Turner), and *Things New and Old* (1893), may also be mentioned.

COLMAN, kôl'man, BENJAMIN (1673-1747). An American Congregational clergyman, prominent in the Colonial period. He was born in Boston, graduated at Harvard in 1692, preached and studied theology for three years, and spent the years 1695-99 in England. After his return he became first pastor of the newly organized Brattle Street Church, a position which he filled until his death. He exercised a great influence both in religious and secular affairs, and, in spite of his slightly heterodox views, was widely popular as a preacher. In 1724 he refused the presidency of Harvard College. Besides a collection of sermons, in three volumes (1707-22), he published a number of poems and a pamphlet advocating inoculation for the smallpox. Consult Turell, *Life and Character of Benjamin Colman* (Boston, 1749).

COLMAN, GEORGE, called THE ELDER (1732-94.) An English dramatic author and theatrical

manager. He was born in Florence, was educated at Oxford, and was called to the bar in 1755, but soon abandoned law for literature. In 1760 his first dramatic piece, entitled *Polly Honeycomb*, was produced at Drury Lane with great success. This comedy was followed the next year with *The Jealous Wife*, and in 1766 with *The Clandestine Marriage*, written in conjunction with Garrick. In 1767 he became one of the purchasers of the Covent Garden Theatre, and held the office of acting manager for seven years. In 1777 he purchased the Haymarket Theatre. Colman wrote and adapted upward of thirty dramatic pieces. He also translated Terence, edited Beaumont and Fletcher, and wrote considerable other verse and prose. Consult Peake, *Memoirs of the Colman Family* (London, 1841).

COLMAN, GEORGE, called **THE YOUNGER** (1762-1836.) An English dramatist, son of George Colman. His bent lay in the same direction as his father's, during whose last years he acted as manager of the Haymarket Theatre, and on the death of the elder Colman George III. transferred the patent to his son. After 1824 Colman held the office of examiner of plays. In industry he rivaled his father, and he received large sums for his plays, of which the best known are *John Bull* and *The Heir-at-Law*. He wrote many humorous verses, among which were *Broad Grins* (1802) and *Poetical Vagaries* (1812). In 1830 he published an amusing autobiography, *Random Recollections*.

COLMAN, NORMAN J. (1827—). The first Secretary of Agriculture of the United States. He was born on a farm near Richfield Springs, N. Y., May 16, 1827. In 1847 he removed to Louisville, Ky., and he afterwards practiced law in New Albany, Ind., and in Saint Louis, Mo. He served in the Union army during the Civil War as lieutenant-colonel of volunteers. In 1874 he was elected Lieutenant-Governor of Missouri, and in 1885 was appointed United States Commissioner of Agriculture. Toward the end of his term he was appointed Secretary of Agriculture, under the law reorganizing the Department of Agriculture.

COLMAN, SAMUEL (1832—). An American landscape painter. He was born in Portland, Maine, and studied first in New York and later in France, Italy, and London. After traveling extensively, he returned to New York and was one of the founders of the American Water Color Society, and its first president (1866-71). As an artist, Colman is noted for American and foreign landscapes in oil and water colors, and for vigorous etchings.

COLMAR'. See **KOLMAR**.

COLNE, kōln. A market town of Lancashire, England, on the Colne, near the Leeds and Liverpool Canal, 32 miles north of Manchester, at the junction of the Lancashire and Yorkshire and Midland railways (Map: England, D 3). Colne was incorporated in 1895, but long before had obtained control of its gas and water supply. It has established an excellent modern system of sewage disposal, and maintains a public library, markets, and slaughter-houses. It has manufactures of cotton, calicoes; and mousselines-delaïne. There are also numerous collieries and stone-quarries in the vicinity. Population, in

1891, 16,800; in 1901, 23,000. Colne is an ancient place, by some supposed to be the *Colunio* of the Romans.

COL'OCA'SIA. See **Cocco**.

CO'LOCO'LO. A wildcat of South America, related to the ocelot (q.v.).

CO'LOCCTRO'NIS. See **KOLOKOTRONIS**.

CO'LOCYNTH (OF. *coloquinte*, from Lat. *colocynthis*, from Gk. *κολοκύνθις*, *kolokynthis*, *colocynth*, from *κολοκύνθη*, *kolokynthē*, pumpkin), or **BITTER APPLE**. A well-known medicine, much used as a purgative. It is the dried pulp of the colocynth gourd, *colquintida*, bitter apple, or bitter cucumber, a globose fruit about the size of an orange, of a uniform yellow color, with a smooth, thin, solid rind. The plant which produces it, *Citrullus colocynthis*, is allied to the cucumber (q.v.). It is common in Turkey, the Grecian Archipelago, various parts of Asia, and in Africa and Spain, which last country supplies no small part of the colocynth of commerce. The fruit is gathered when it begins to turn yellow, peeled, and dried quickly either in a stove or in the sun. It is chiefly in the form of a dry extract that it is used in medicine. It owes its properties to a bitter principle called *colocynthin*, a glucoside. It is a curious, though not unique, fact that the seeds of the colocynth-plant, produced in the midst of its medicinal pulp, are perfectly bland, and they even form an important article of food in the north of Africa. The name false colocynth is sometimes given to the orange gourd (*Cucurbita aurantia*), sometimes cultivated as an ornamental plant in our gardens, on account of its globose, deep orange fruit. The pulp of the fruit possesses the properties of colocynth, but in a milder degree. Colocynth is generally administered in the form of pills, in which the extract is associated with aloes, scammony, and in some cases with calomel, or with extract of hyoscyamus. In small doses colocynth acts as a safe and useful purgative; and, when accompanied by hyoscyamus, the latter prevents much of the pain and griping which are attendant on the use of colocynth by itself. It is a drastic purgative, acting upon the whole intestine, and is used only in obstinate cases of chronic constipation. Colocynth is an ingredient of some powders for destroying moths. In large doses colocynth is a poison, causing severe inflammation of the stomach and intestine. The medicinal dose of colocynth is from 2 to 8 grains; that of the official extract of colocynth, from ½ to 2 grains; that of the compound extract of colocynth, from 5 to 15 grains. It is sometimes administered in the form of pills.

COLOGNE, kō-lōn' (Ger. *Köln*; the *Colonia Agrippina* of the Romans). The largest city of Rhenish Prussia, on the left bank of the Rhine, in latitude 50° 56' N., longitude 6° 58' E. (Map: Prussia, B 3). Cologne is a fortress of the first rank, its fortifications forming a semicircle, with the Rhine as its chord, and the former town of Deutz (now included in Cologne) on the opposite bank, as a tête-de-pont. It is connected with this suburb by a bridge of boats and a fine iron bridge 1362 feet in length, for railway and carriage traffic. In the old quarter the streets are narrow and crooked, but the main residential quarter presents a thoroughly modern aspect.

COLOGNE
CATHEDRAL RATHAUS

The Ringstrasse, a stately boulevard four miles long, occupies the site of the ancient walls, dismantled in 1881-85. A new line of fortifications established beyond the Ringstrasse covers 1000 acres, and has doubled the city's area.

Among the public buildings the churches claim the greatest share of attention, the splendid specimens of the Romanesque period being more numerous than in any other city in the world. The oldest is the Church of Saint Gereon, said to have been founded by the Empress Helena; the choir, with its two square towers, was added in the eleventh century, and the decagonal nave dates from 1219-27. Saint Maria im Capitol, consecrated in 1409, is a cruciform basilica of imposing appearance. The interior is decorated with fine frescoes. The Apostles' Church, a remarkably fine basilica, presents the best specimen of the highly developed style of architecture, in which the ecclesiastical enthusiasm and civic love of splendor found expression toward the end of the twelfth century; and the Church of Saint Cunibert, dating from the middle of the thirteenth century, is a prominent example of the transition style. The Church of Gross Saint Martin was consecrated in 1172; its massive eastern portion has an imposing tower, 270 feet high. The Jesuits' Church, erected in 1618-29, may be mentioned as an excellent specimen of the mingled style peculiar to that order. The Church of Saint Peter is celebrated for the altar-piece of the crucifixion of Saint Peter by Rubens, and that of the Minorites for containing the tomb of the famous scholastic Duns Scotus. Saint Ursula is another church of historic interest. Most of these edifices underwent complete restoration during the nineteenth century.

The chief object of interest in the city, however, as well as its greatest ornament, is the cathedral, the noblest specimen of Gothic architecture in Europe. It is said to have had its origin in a structure erected at the beginning of the ninth century, by Archbishop Hildebold. This was burned in 1248, and the present cathedral was begun in the same year. The choir, the first part completed, was consecrated in 1322. The work was carried on, sometimes more actively, sometimes more slowly, till the era of the Reformation, when it was suspended, and, during the subsequent centuries, not only was nothing done to advance it, but the uncompleted structure was suffered to decay. In the beginning of the nineteenth century, however, attention was attracted to its unrivaled beauties, and it became the subject of an enthusiasm extending over all Germany, giving birth to a multitude of associations for the supply of the necessary funds to repair and complete it according to the original designs. Funds were also forthcoming from other parts of Europe. On September 4, 1842, the King of Prussia, who had contributed largely to the funds, laid the foundation stone of the transept, from which time great progress was made. The naves, aisles and transepts were opened in 1848. The magnificent south portal was completed in 1859, and in 1860 the iron central spire was added. With the exception of the towers, the whole was finally completed in October, 1863. The towers were finished in 1880, and on the 15th of October the completion of this grand work was celebrated with great splendor in the presence of Emperor William I. and most of the sovereign princes of the German Empire. The

cathedral has a length of 443 feet and a width of 200 feet; the height of the roof is 201 feet, that of the central tower over the crossing 357 feet, and of the two main towers 512 feet.

The most noteworthy secular edifices are: the Rathaus, the central and oldest portion of which dates from the fourteenth century and contains the handsomely restored Hansa Saal, in which the first general meeting of the Hanseatic League was held in 1367. The graceful portico in Renaissance style, and the splendid five-storied tower, deserve attention. South of the Rathaus rises the imposing structure of the Gürzenich, erected in 1441-52 as a festive hall for the entertainment of distinguished guests by the City Council, and first used for that purpose at the grand festival held in honor of Emperor Frederick III. in 1475. Thoroughly renovated in 1856, it is now the most splendid among the old secular structures, and since 1875 was used as the Stock Exchange. The Templars' Lodge, once the residence of the Overstolzen, a distinguished family of mediæval Cologne, is a fine Romanesque building of the twelfth or thirteenth century, now used by the Chamber of Commerce. Of the numerous modern public buildings the most prominent are: the palatial Government buildings (1830); the Municipal Museum (1855-61); the Stadttheater (1872); the Court of Justice (1886-93), an extensive Renaissance structure, with an impressive façade and handsome staircase; the imposing new Post-Office (1893); and the Reichsbank (1897).

Cologne is administered by an *Oberbürgermeister*, appointed for a period of twelve years and assisted by twelve assessors. The municipality operates successfully its own gas and water works, as well as an electric-lighting plant. The street railways are operated by a private company, whose franchise expires in 1916, when the lines will be turned over to the municipality without compensation. The municipality also owns and maintains a pawnshop and slaughter-houses. The educational establishments of Cologne include three gymnasia, one *oberrealschule*, a theological and a teachers' seminary, and a conservatory of music, supported by the municipality. The municipal library contains 115,000 volumes, and the museum has a number of valuable collections. Cologne has a fine municipal theatre. The zoological garden is one of the finest in Europe. The industries of Cologne are extensive and varied. The industrial establishments include sugar refineries, tanneries, machine-shops, paper-mills, flour-mills, breweries, distilleries, and several factories producing the celebrated eau de Cologne. The commerce, both by rail and by Rhine steamboats, is very great. A fine modern harbor, with extensive quays, has been constructed since 1897. The population of Cologne has greatly increased since 1888, when outlying districts began to be annexed to the city. In that year the population numbered 144,772; it rose to 281,681 in 1890, and 372,229 in 1900.

Cologne was originally a town of the German tribe of the Ubii (*Oppidum Ubiorum*). It received the name of Colonia Agrippina, A.D. 50, when Agrippina, the wife of the Emperor Claudius, planted a colony of Roman veterans on the spot, which was her native place. It grew to be an important city under the Romans, and retained its prominence under the Frankish sway. The

Bishopric of Cologne, instituted in Roman times, was elevated to the rank of an archiepiscopal see by Charles the Great in 785. At this time the city was a busy seat of commerce. It entered the league of the Hansa towns in the beginning of the thirteenth century, and contended with Lübeck for the first rank. The archbishops acquired considerable territory, and some of them distinguished themselves as politicians and warriors. They took their places among the great princes and electors of the Empire, but were involved in a protracted contest with the citizens of Cologne, who successfully asserted against them the independence of the city. Within the city a bitter contest was carried on all through the Middle Ages between the small number of merchant princes and the trade guilds. The Reformation made little progress in Cologne, and the Protestants were treated with intolerance. With the sixteenth century began a process of steady decline, which remained unchecked till after the end of the Napoleonic wars, when a new period of industrial prosperity set in. In the course of the wars of the Revolution the city lost its independence, to become part of France, and on the downfall of Napoleon it was annexed to Prussia. The archbishopric was secularized in 1801-03, and the Congress of Vienna assigned all of its territories to Prussia. A new archiepiscopal see was created in 1824. Consult: Heldmann, *Der Kölngau und die Civitas Köln* (Halle, 1900); Paget, "Cologne, the Rome of the Rhine," in 116: 235, *Temple Bar* (London, 1899).

COLOGNE, EAU DE. See EAU DE COLOGNE.

COLOGNE, THE THREE KINGS OF. The three wise men, or magi, by name Melchior, Kaspar, and Balthazar, who followed the star from the East to where it rested above the new-born Jesus. Their bones are said to have been placed in Cologne Cathedral, and their skulls were exhibited there as late as the eighteenth century. Those who touched them were supposed to be healed of their diseases. The names of the three kings were also used as a charm.

"Ye three holy Kings,
Kaspar, Melchior, and Balthazar,
Pray for us now, and in the hour of death,"

was written on a paper found on the body of a dead murderer at Chichester, England, in 1749.

COLOGNE YELLOW. A yellow pigment made by precipitating a mixture of lead and calcium nitrates with sodium sulphate and potassium chromate. It is essentially a chrome yellow in which the intensity of the color is lessened by the calcium salt.

COLOM'BA. A story of Corsica, by Prosper Mérimée (1840). It is considered his masterpiece.

COLOMBAT DE L'ISÈRE, kó'lón'bá' de lé'zár' (1798-1851). A French physician, born at Vienne, Department of Isère. He devoted himself to the study of defects of speech and established in Paris an institute for the correction of stuttering, on the principle of rhythmic pronunciation. His best-known work, entitled, *Traité de tous les vices de la parole et en particulier du bégaiement* (1830), passed through several editions. In recognition of his fruitful services, the Academy of Sciences awarded him a prize of 50,000 francs.

COLOMBES, kó'lón'bé'. A town in the Department of Seine, France, suburban to Paris, three

miles northwest of the city-walls. It has manufactures of starch, gelatin, and woollens; there are also petroleum-refineries, etc. Population, in 1901, 23,061.

COLOM'BIA (so called in honor of Christopher Columbus). A republic in South America, occupying the northwest corner of the continent and bounded by the Caribbean Sea and Venezuela on the north, Venezuela and Brazil on the east, Ecuador on the south, and the Pacific and Costa Rica on the west. It lies between latitudes 3° S. and 12° 30' N., and between longitudes 67° 30' and 83° W. The area is variously estimated at from 463,000 to 513,000 square miles. It is the only South American country bordering on both oceans.

TOPOGRAPHY. The bulk of Colombia may be divided into two physiographic regions, the Andean Cordilleras, and the great plains or llanos of the east. The highlands of Panama and Darien are only indirectly connected with the Andes. Entering Colombia from Ecuador, the Cordilleras are continued in a general northerly direction by three diverging ranges, which spread out over the entire western section of the country. The Western Cordillera constitutes a long mountain ridge, with summits 10,000 to 11,000 feet in altitude, which is defined on the east by the valley of the Cauca River. In the northern part the chain is flanked on the west by the Cordillera del Chocó. The Central Cordillera, the continuation of the Eastern Cordillera of Ecuador, contains the highest peaks in Colombia, including the volcanoes Huila, Puracé, and Tolima, the last reaching an altitude of over 18,000 feet. The Eastern Cordillera, separated from the central range by the Magdalena River, attains an extreme elevation of about 16,000 feet, and has great table-lands that are the most thickly populated regions in the Republic. This chain divides at the north, the eastern range extending into Venezuela, and the western, known as the Sierra de Perijá, running northward and merging into the Sierra Nevada de Santa Marta, near the coast. There are a number of high passes, among which is the famous Inca or Quindia Pass, across the Central Cordillera, 11,500 feet. The llanos east of the Cordilleras have a surface tilted toward the Atlantic. Here there are great stretches of nearly level ground, covered with luxuriant growths of grasses in the north and heavily forested in the south.

Colombia has a coast line of over 3600 miles, of which more than 1600 miles are on the Pacific. The shores are very irregular and form a number of good harbors both on the west and north. Notwithstanding the mountainous surface, the region abounds in long navigable rivers. The Magdalena traverses the country northward through almost its entire length, and receives numerous tributaries, the Cauca being the most important. The Atrato also flows north not far from the west coast and enters the Gulf of Darien. The eastern plain belonging to the basins of the Orinoco (which forms part of the eastern boundary) and the Amazon is crossed by many long rivers. The chief affluents of the Orinoco are the Guaviare and the Meta; of the Amazon, the Uaupés, and the Japurá (or Caquetá).

The climate is of extraordinary variety. In the Cordilleras it is moderate in the upper regions, but very hot in the valleys. Along the valley of

the Magdalena the thermometer is frequently above 100°. The llanos have an exceedingly hot climate, while on the Pacific coast the temperature is greatly modified by sea-breezes. On the table-lands of the Cordilleras the mercury occasionally falls as low as 44°. In the mountainous parts there are two rainy seasons: on the coast, rains occur at any time of the year. Generally speaking, the country is healthful.

FLORA. The variety of climatic conditions and the very irregular formation of the surface naturally produce a varied flora. In the lower regions plant life is purely tropical and includes the common plants of South America. The palms are very numerous, and include the lofty wax-palm (*Ceroxylon Andicola*). Of the more useful forest trees of this region is the rubber (*Castilloa elastica*). The mountain slopes are mostly clothed with thick forests, the timber-line being above 10,000 feet. Cinchona-trees of several species are found between 7000 and 9000 feet above the sea, and the aloe, the sarsaparilla, and other medicinal plants grow in abundance. Cacao, coffee, sugar, and indigo are largely cultivated.

FAUNA. The fauna is also of great variety, and includes the larger South American mammalian types, such as the jaguar, puma, tapir, ant-eater, sloth, several species of monkey, and one or more species of red deer (on the plateaus). The condor, vulture, numerous toucans and parrots, and a variety of humming-birds (some of them confined to the snowy regions of the volcanoes) are a part of the rich avifauna. Serpents of several kinds are found in the torrid regions; the venomous forms are rarely found above 6000 feet.

GEOLOGY. The mountain regions here have long been the seat of great volcanic activity. The chief formations in the central range are granite, gneiss, basalt, and eruptive rocks, while in the eastern range Cretaceous formations predominate. The geological structure of the Western Cordillera has not yet been fully investigated. The entire portion east of the Cordilleras is occupied by the llanos—vast treeless plains having an altitude of from 1000 to 1500 feet, and well adapted for pasturing. The isthmus section is partly hilly and partly low and swampy.

MINERAL RESOURCES. Colombia is very rich in minerals, especially in precious metals. Gold is found mostly in alluvial deposits and in the streams. During the Spanish régime the proceeds from the gold-mines constituted the chief revenue; but the extracting was carried on by most primitive means. Modern methods were introduced only during the last quarter of the nineteenth century, though the principal mines have long been operated by English companies. The chief centre of gold-mining is Antioquia, which yields about \$200,000 per annum. The leading silver-mines are in Tolima and Cauca. The annual silver output of the country amounts to nearly \$4,000,000. The other mineral resources—iron, copper, platinum, lead, and salt—are little developed. Emeralds are mined chiefly in the Department of Santander, the mines of Muzo being the most noteworthy. Salt-mining, a Government monopoly, is carried on chiefly around Zipaquirá and Nemocón, where salt is found both in rock form and in springs. Coal exists in the Eastern Cordillera and in many other parts, but is as yet scarcely touched.

AGRICULTURE. The principal industry of Colombia is agriculture, which is greatly favored by the soil and climate, but is carried on by primitive methods. Cultivation is confined mainly to the elevated plateau of the western part. These sections are best adapted to settlement by European immigrants, on account of the salubrious climate. In the hot districts the chief plants are coffee, tobacco, sugar, cacao, etc. Tobacco, and especially coffee, are largely exported. In the less torrid regions the agriculture is more European in character, wheat, corn, and barley being leading crops. The banana-tree is found all over the Republic, and the fruit is exported in large quantities, mostly to the United States. The absence of adequate transportation facilities and the sparseness of population are such hindrances to agriculture that the total yield of the food crops is not sufficient to satisfy the home demand, and the deficiency has to be made up by imports. The rubber-tree and the copaiba-tree grow wild and are tapped but not cultivated. The uplands are the home of the tolu, well known for its balsam. Cattle-raising is conducted on a considerable scale, especially on the llanos. In 1901 the number of cattle in the Republic was estimated at 3,450,000. Both cattle and hides form prominent items of export.

MANUFACTURES. The manufacturing industries are insignificant. The Indians make pottery, cotton fabrics, and straw matting, as well as the famous 'Panama' hats. The sugar-mills are of the most primitive kind. The industry of wood-carving and horn-carving, once well developed among the aboriginal population, is gradually dying out. The distilling of liquor from sugar is a Government monopoly.

TRANSPORTATION AND COMMUNICATION. Owing to its mountainous surface, Colombia is very deficient in roads. Communication is mostly maintained by means of narrow paths accessible only to pack-mules, and even the principal roads are usually in an almost impassable condition. The lack of good roads is partly remedied by the navigable waterways. The Magdalena chiefly, and the Atrato, Cauca, and a number of minor streams, are utilized for transportation, while through the river Meta communication is had with the Orinoco. The construction of railways in the Republic has been very slow and irregular. There were in 1901 about 400 miles in operation. The most important line is the Panama-Colón (48 miles), owned by an American corporation. Other lines are also operated by American companies. Some are managed by the States with the assistance of the Central Government. These short lines—ranging from 25 to 100 miles in length, and scattered all over the country—have little influence on the general economic conditions of the Republic. There are a number of new lines and extensions surveyed and projected, but they will hardly be built until the political conditions become more stable. There are nearly 9000 miles of telegraph line. About 1000 vessels of 1,300,000 tons annually enter and clear the ports. The Republic is in regular communication with Europe and the United States by means of ten lines of mail steamers.

COMMERCE. The commerce of Colombia, like its industries, is hindered by lack of transportation facilities, the frequency of political disturbances, and the heavy export and import

duties. Chief exports are coffee, gold bars and dust, cattle, hides, tobacco, silver ore and bars, food articles, etc. Chief imports are salt, petroleum, flour, cottons, wine, iron and steel wares, drugs and chemicals. From 1894 to 1898 the value of the imports fluctuated from 10,711,207 to 19,722,098 gold pesos; the exports, from 15,088,406 to 19,157,788—the largest total volume of trade being in 1897. Owing to the civil war, the only trade statistics accessible for 1899 and 1900 are those for the port of Barranquilla. Of the exports, it is estimated that about 27 per cent. in value goes to the United States; 25 per cent. to Great Britain; 17 per cent. to France; 16 per cent. to Germany. The trade of the United States with Colombia since 1860 has been as follows: the average for the decade of 1860-70, \$836,000; 1870-80, \$6,110,800; 1880-90, \$4,036,000; and 1890-1900, \$3,684,000. The commerce between Colombia and the other South American countries, excepting Venezuela, is insignificant. The inland trade, owing to the great variety in the products of the different portions of the Republic, is active, and carried on chiefly by means of weekly markets. The transit trade through the ports of Panama and Colón, east and west, is considerable, the largest item representing goods bound for New York.

GOVERNMENT. Colombia has practically had a republican form of government since 1819. The present Colombian Constitution (the seventh since 1821) dates from 1886, and, in contrast with the preceding instruments, which recognized the sovereignty of the constituent States, it provides for a very strong centralization of power.

Administration.—The President, according to the Constitution, is elected indirectly for a period of six years, and is assisted by six ministers, who are theoretically responsible to the Senate. There is a State Council of six members. The legislative power is vested in Congress, consisting of the Senate and the House of Representatives. In the former each of the nine departments is represented by three Senators, elected for a period of six years; while in the latter (sixty-six members) the departments are represented at the rate of one member (elected for four years) for every 50,000 inhabitants. Both Senators and members of the House of Representatives are elected indirectly by voters restricted by an educational and property qualification. The departments, except Panama, which is ruled directly by the National Government, are administered by governors appointed by the President and removable at his pleasure. The departments have councils elected by the people at the rate of one member for every 25,000 inhabitants, and are divided into provinces presided over by prefects appointed by the Governor. For the administration of justice, there are a Supreme Court of seven judges, appointed by the President with the consent of the Senate, district supreme courts, and provincial courts. Military service is obligatory in time of war, while in time of peace the army is recruited by lot, but substitutes are admitted. The size of the army in time of peace is regulated by Congress, and was fixed at 1000 in 1898.

Finance.—The finances of the Republic have always been in a deplorable condition. The public debt has constantly increased. The consoli-

dated and floating internal obligations amounted in 1899 to 11,359,071 pesos. The external debt, held chiefly in Great Britain, amounted in 1896, with arrears, to £3,514,442 (\$17,080,188). By an arrangement with the bondholders in 1897, the Government was able to cut the external debt down to £2,700,000 (\$13,122,000), and new bonds were issued to that amount at 1½ per cent. interest, the rate to be gradually increased to 3 per cent. This programme was satisfactorily carried out until the civil troubles of 1899. By the middle of 1901 the arrears of interest amounted to about \$500,000. The revenue is derived chiefly from the import and export duties, and from monopolies (salt, liquors, cigars, and meat). The budget is estimated for two years, and fluctuates as a rule from 30,000,000 to 40,000,000 paper pesos. The revenue for 1901-02 was estimated at about 29,000,000 paper pesos, as against expenditures of over 40,000,000. The departments are independent in their internal financial affairs, and derive their revenues chiefly from monopolies. The currency of the country consists of depreciated paper pesos, of which there are about 40,000,000 in circulation. In 1894 a provision was made for their redemption by the free coinage of gold, but the scheme proved unsuccessful and gold is at a high premium.

POPULATION. No census of the population has been taken since 1870, when the inhabitants numbered 2,951,323. According to an official estimate in 1881, the number was 3,878,600. At the close of the century it was supposed to exceed 4,000,000, or about eight inhabitants per square mile. The language and civilization are Spanish; the assimilation of the aborigines, with the exception of those in the more secluded parts of the country, has been complete. Capital, Bogotá (q.v.). The following is a list of the departments:

	Area, English Square miles	Population 1881
Antioquia.....	22,316	470,000
Bolívar.....	21,345	280,000
Boyacá.....	33,351	702,000
Cauca.....	257,462	621,000
Cundinamarca.....	79,810	569,000
Magdalena.....	24,440	90,000
Panama.....	31,571	285,000
Santander.....	16,400	555,600
Tolima.....	18,069	306,000
Total.....	504,773	3,878,600

EDUCATION AND RELIGION. Education is free, but not compulsory, and is to a large extent maintained by the State. Besides the university at Bogotá, there are a national institute for working people, a school of arts and trades, and a national school of music. The secondary schools are mostly in the hands of the Roman Catholics. Altogether there were, in 1897, over 2000 public educational institutions, with an attendance of nearly 150,000, or about 4 per cent. of the population. Religious toleration and free speech are guaranteed by the Constitution; but the Roman Catholic Church, to which most of the inhabitants belong, is recognized as the national Church.

HISTORY. The northern coasts of Colombia were visited by Ojeda and Vespucci in 1499. Three years later Columbus explored a section

of the country, and attempted to found the first Spanish colony on the American mainland. Between 1511 and 1517, Balboa and Pedrarias explored and settled both coasts of the Isthmus. As early as 1515 Pizarro and Gaspar de Morales had explored the Pacific coast as far south as 'Biru,' a term from which the present territory of Peru gets its name, although lying considerably beyond Pizarro's 'Biru.' Between 1536 and 1540, Ximenes de Quesada conquered the Chibchas, or Muyscas, the principal nation, and the country became thoroughly settled as a dependency of Spain. It was known as the Province of New Granada till 1718, when it was made a viceroyalty. In common with the other Spanish possessions, it rose in revolt in 1810, and in 1819 became independent, joining with Venezuela (1819) and Ecuador (1822) to form the Republic of Colombia. This union was dissolved in 1829-30, and New Granada was founded as a separate republic in 1831. After several changes in the Constitution (in 1843, 1851, and 1853), a new Constitution was adopted in 1858, by which the separate 'Provinces' were changed into 'States,' associated under a federal government, known as 'Confederación Granadina,' and similar to that of the United States of North America. The States were made self-governing in all internal affairs. In 1860 another revolution broke out, and for more than two years the country was devastated by civil war. Finally, in 1863, the nine States again agreed upon a Constitution, organizing themselves under the name of United States of Colombia. Another revolution, begun in 1884, was terminated in 1886 by the promulgation of a new Constitution, which transformed the loose federal union into a strongly centralized State. A rebellion in 1895 was promptly suppressed. In 1899 the insurrectionary elements reappeared, but were suppressed before they had gathered headway. A year later there was a more formidable outbreak, with severe fighting at Panama. The insurrection was due in great measure to a general feeling of discontent aroused by the corrupt conduct of the Conservative Party, which was then in power. In August, 1900, the Vice-President, Marroquin, made himself master of the Government, and carried on an energetic campaign against the Liberals. During 1901 it was supposed, with good reason, that the rebels were receiving aid from Venezuela and Ecuador, where the Liberal elements were in power, and were aiming at the overthrow of the Conservative Party and the ultimate restoration of the old Republic of Colombia, embracing the present commonwealths of Colombia, Venezuela, and Ecuador. Severe fighting occurred around Panama in 1901 and 1902.

Consult: Perez, *Geografía general física y política de los Estados Unidos de Colombia* (Bogotá, 1886); Velasco, *Nueva geografía de Colombia* (ib. 1892); Child, *The Spanish-American Republics* (New York, 1891); Nuñez and Jalhay, *La république de Colombie: Géographie, histoire, organisation, etc.* (Brussels, 1893); Regel, *Kolumbien* (Berlin, 1899); Seruggs, *The Colombian and Venezuelan Republics* (New York, 1900); Restrepo, *Gold and Silver Mines of Colombia* (ib. 1886); Wheeler, *The Agricultural Condition of Colombia* (London, 1889); Röthlisberger, *El Dorado: Reise- und Kulturbilder aus dem südamerikanischen Kolumbien* (Berne, 1897).

The standard work on the history of Colombia is Pereira, *Les Etats-Unis de Colombie* (Paris, 1883). There are numerous narratives of events of the war against Spain, written by English officers serving with the Revolutionists, of which the best are, perhaps: Hall, *Present State of Colombia* (London, 1825), and the anonymous *Recollections of a Service in Venezuela and Colombia* (London, 1828).

COLOMBO, kô-lôm'bô. The capital and chief seaport of Ceylon, situated on the western coast of the island, on a rocky headland, in latitude 6° 54' N. and longitude 79° 51' E. (Map: India, C 7). The European part of the city is magnificently laid out, with broad avenues shaded by tropical trees and lined by modern buildings of fine architecture. The business part of the European city occupies the site of an old Dutch fort, and is still known as the 'Fort.' Its chief thoroughfare is Queen Street, on which are situated the palace of the Governor, the chief mercantile houses and banks, and the post-office, the finest public building on the island. The residential section of the European city covers an area of about 20 square miles. The part nearest to the water is occupied by numerous clubs, with all the accessories of their European prototypes, such as golf-links, cricket-grounds, race-courses, etc. Farther inland it is crossed by beautiful roads bordered with bungalows embosomed in luxuriant gardens. The native part of the city, or *Pettah*, is dirty and crowded, with crooked and narrow streets, always thronged with motley crowds of different types and nationalities. The houses are without doors or windows, and the passer-by can freely observe the private life of the natives. Colombo owes its commercial importance chiefly to its artificial breakwater, one of the largest structures of its kind. It has a length of 4000 feet, and shelters a water area of 500 acres. Begun in 1875, it is still uncompleted, the northern arm and the graving dock still being in process of construction. The shipping of the port of Colombo is very extensive, amounting to about 3,500,000 tons annually. Colombo is one of the most important coaling-stations for British and foreign steamers on the Australian and East Asiatic routes. Almost all the staples of the island find their outlet through Colombo, which is also the centre of coconut, tea, and several other industries. It is connected with Kandy and Pointe-de-Galle by railway. It is the seat of a United States consulate.

The population of Colombo in 1901 was 158,093 (127,836 in 1891), including about 5000 Europeans, chiefly Englishmen and descendants of the Dutch. The natives are mostly artisans and laborers, while the Europeans are either owners of large plantations or merchants.

The early name of Colombo, Kalan-totta, the 'Kalany ferry,' derived from its proximity to the river, the Moors corrupted into Kalambu, and by this designation it was described about A.D. 1340 as the finest city of Serendib. At the arrival of the Portuguese, in 1517, Kalambu had merged into Kolamba, or Columbu, which they henceforth wrote Colombo, in honor of Christopher Columbus. It was taken by the Dutch in 1656, and by the British in 1796. Consult Cave, *Golden Tips* (London, 1900).

COLÓN, kô-lôn', or ASPINWALL. A town in the Department of Panama, Colombia, situated

on the Caribbean shore of the Isthmus of Panama, 49 miles northwest of the city of Panama (Map: Colombia, A 2). It is the northern terminus of the Isthmian Railway, and of the proposed Panama Canal, and has a deep harbor (Navy Bay), which is exposed, however, to violent wind-storms from the north. Its position, as the intermediary point for the Atlantic and Pacific trade, has increased its importance at the expense of its rival, Panama. Its growth has been retarded by its unhealthy site, though this has been remedied somewhat by drainage. The town received the name of Aspinwall from one of its founders, who also built the railway across the Isthmus; but it is now better known as Colón, in honor of Columbus, to whom a magnificent statue was erected in 1870. Population, estimated, 3000.

COLÓN (Sp., Columbus). A town in the Province of Matanzas, Cuba, about 52 miles southeast of Matanzas, connected by rail with Havana, Matanzas, Cardenas, and other important cities. It is the centre of extensive sugar-refineries. Population, in 1899, 7175.

CO'LO'N (Lat., from Gk. *κῶλον*, *kolon*). The portion of the large intestine that extends from the cæcum (q.v.) to the rectum, which is the terminal portion of the intestinal canal. It is divided into the ascending, the transverse, and descending colon, and the sigmoid flexure. See ALIMENTARY SYSTEM.

The whole length of the colon, from its commencement in the cæcum to its termination in the rectum, is rather more than four feet. It is retained in its position by the serous membrane, which envelops, more or less, all the intestinal viscera, and is termed the peritonæum (q.v.). Its structure is essentially the same as that of the rest of the intestinal canal, which is described in the article DIGESTION, ORGANS AND PROCESS OF; but in consequence of a peculiar arrangement of the longitudinal muscular fibres, the interior of the colon is divided into sacculi, which serve to retain its contents for a longer period than if it were a uniform tube, and thus, by extracting water from them, to reduce them to a more solid consistence, such as is possessed by normal excrement. It is also devoid of villi, and it is of much greater size than the small intestine. In some animals, as in the horse and sheep, the shape of the fæces is completely molded in these cells.

COLON BACIL/LUS, or **BACILLUS COLI COMMUNIS**. A micro-organism discovered by Escherich in 1885, and since demonstrated to be a normal inhabitant of the intestinal tract in man and some of the domestic animals. It is a short bacillus with rounded ends, is somewhat motile, has a few flagellæ, and does not form spores. The main interest which attaches to this organism at present is due to its close resemblance to the typhoid bacillus, with which it is morphologically identical, but from which it may be distinguished by its biological peculiarities. Some investigations made within the last few years tend to show that this bacillus, while of normal occurrence in the healthy intestine, may, under certain conditions, migrate to other organs of the body, and there be associated with pathological processes.

COLONEL, *kēr'nel* (originally *coronel*, *coronell*, from Sp. *coronel*, *colonel*, It. *colonello*,

Fr. *colonel*, *colonnel*, from Sp. *colonello*, column at the head of a regiment, dim. of *colonna*, column, from Lat. *columna*, column; the first *l* is changed to *r* either through dissimilation, or through popular confusion with Lat. *corona*, crown). A military title, ranking in the United States Army between lieutenant-colonel and brigadier-general. The command appropriate to the grade is a regiment. In Europe the title has more of an honorary than a practical value, it being in most instances an honorary distinction bestowed upon royal and other distinguished personages. In England, the custom prior to 1888 was to give the appointment of colonel to retired general officers as a reward for long service. Since that date no officer can obtain the rank except as a brevet, and then only for distinguished service, or on such appointments as the colonel commanding a territorial district depôt. See RANK AND COMMAND.

COLONEL CHABERT, *LE*, *lc kó'ló'ně' shá'bâr'*. A story by Balzac (1832), the tale of a soldier of the Grand Army, who comes back from a German hospital to find his wife married to another. She denies his identity, and he succumbs in the struggle to prove his legal rights.

COLONEL JACK, **HISTORY OF**. A novel by Defoe (1722). Beginning life as a thief, the hero goes to Virginia, and finally becomes a respectable planter and slave-owner.

COLONIA, *kó-ló'ně-á* (Sp., colony). The capital of the department of the same name, Uruguay, on the Rio de la Plata, nearly opposite Buenos Ayres. It has a good harbor, docks, and a dry dock, and is a place of some commerce, particularly with Buenos Ayres (Map: Uruguay, F 10). Population, about 1500. Colonia was founded by the Portuguese about 1680 under the name Colonia del Sacramento. Owing to its nearness to Buenos Ayres, it gave rise to many conflicts for its possession between the Spanish and the Portuguese. In the course of one of these struggles it was almost totally destroyed in 1777. In 1806 the English, in a desperate attempt to secure the La Plata region, captured Colonia and held it for some months.

COLO'NIA AG'RIPPI'NA. The Roman name of Cologne (q.v.).

COLONIAL CORPS. A term formerly applied specifically to colonial troops of the British Empire, but now in general use as referring to similar troops of other nations. They are usually raised for service in the colony to which they belong, and not for foreign operations. An exception to this rule is the use made of the West Indian regiments of Great Britain, in the frequent punitive expeditions on the west coast of Africa. Colonial corps are officered entirely by the regular army officers of the nation to which the colony is subject. English colonial corps are the British Central Africa Rifles, the West African regiments (negroes), the Hong Kong Regiment, and Chinese Regiment (at Wei-hai-wei). In the French colony of Madagascar one-half the total number of troops are colonial corps, natives of Madagascar. The Philippine Scouts served a similar purpose in the United States army.

COLONIAL DAMES OF AMERICA, **NATIONAL SOCIETY OF THE**. A women's patriotic society, organized in Wilmington, Del., in 1892.

It is composed of State societies, of which there is one in each of the thirteen original States and in the District of Columbia, together with associated societies in the non-colonial States of California, Illinois, Michigan, Minnesota, Iowa, Ohio, Colorado, Maine, Missouri, Wisconsin, Tennessee, Louisiana, Kansas, Indiana, Alabama, Texas, Arkansas, West Virginia, Mississippi, Oregon, and Vermont. The objects of the society are the collection and preservation of manuscripts and relics of Colonial days; the restoration of historic buildings; the more general diffusion of information concerning the Colonies, and the stimulation of a spirit of true patriotism. Membership in the society is limited to women who are especially invited, and who are descended from some ancestor of worthy life who came to reside in an American colony prior to 1750. Much valuable historical work has been accomplished by various State societies in locating and preserving sites by means of tablets and other memorials. The total membership of the society is about 5000.

COLONIAL DAMES OF AMERICA, SOCIETY OF. A women's patriotic society, organized in New York City in 1890, incorporated in 1891, and having for its purposes the collection of manuscripts, traditions, relics, and mementos of Colonial and Revolutionary times, and the commemoration of the success of the Revolutionary War. Membership in the society proceeds by invitation, and is restricted to women who are directly descended from some ancestor of distinction who came to reside in an American colony before 1776. This society was the first organization of women to be founded for patriotic purposes, and now has chapters in New York, Philadelphia, and Baltimore.

COLONIAL EDUCATION. See EDUCATION, COLONIAL.

COLONIAL WARS, SOCIETY OF. A patriotic society, organized in New York City in 1893. It consists of a general society made up of general officers and of delegates from the various State societies as follows, in the order of their institution: New York, Pennsylvania, Maryland, Massachusetts, Connecticut, District of Columbia, New Jersey, Virginia, New Hampshire, Vermont, Illinois, Missouri, Ohio, Nebraska, Minnesota, Kentucky, California, Colorado, Iowa, Georgia, Michigan, Wisconsin, Delaware, Rhode Island, Washington, and Maine. The various State societies have, for their general object, to perpetuate the memory of Colonial events, and of the men who, in military, naval, and civil positions of high trust and responsibility, by their acts of counsel assisted in the establishment, defense, and preservation of the American Colonies. With this end in view, they seek to collect and preserve records of every kind relating to the Colonial period of American history and to inspire in their members the fraternal and patriotic spirit of those who made American freedom and unity possible. They admit to membership male descendants of those who assisted in the establishment, defense, and preservation of the American Colonies. The publications of the general society include general registers and historical papers and registers by the various local societies. The general society has caused the erection of a monument at Louisburg, on Cape Breton Island, and memorial

tablets have been placed by the New York society on the sites of Fort Oswego and Fort Ticonderoga. The membership is about 4000.

COLONIES OF PLANTS OR ANIMALS. See COENOBIA and POLYP.

COLONIZATION SOCIETY, THE NATIONAL, OF AMERICA. An association organized in 1816, by Robert Finley (q.v.), "to promote a plan for colonizing (with their consent) the free people of color residing in our country, in Africa, or such other place as Congress may deem most expedient." Branches were established throughout the country and an active propaganda was conducted in almost every State, the official agents of the society speaking frequently in public and soliciting the coöperation of the various State legislatures. The first colonists were sent out to Sherbro Island, Africa, in 1820; and two years later Liberia was founded. Bushrod Washington, Charles Carroll, James Madison, Henry Clay, and J. H. B. Latrobe served successively as presidents of the society, while such men as Bishop Hopkins, Rufus King, Dr. Channing, Benjamin Lundy, Gerrit Smith, and James G. Birney were at one time zealous members. After about 1831, however, when the movement for abolition may be said to have first attracted general attention, the inadequacy and impracticability of the society's aims became increasingly apparent, and many of its more influential members withdrew their support. Its persistent refusal to interfere in any way with slavery, moreover, and its apparent encouragement of the racial prejudices of the whites against the blacks alienated many others who, though strongly opposing the radicalism of Garrison, believed in a policy of gradual abolition, and had faith in the negro's capacity for improvement. The general idea of colonization seems to have originated with the Rev. Samuel Hopkins, of Newport, in 1770. Consult: Wilson, *History of the Rise and Fall of the Slave Power in America*, vol. i. (Boston, 1875); and Alexander, *A History of Colonization on the Western Coast of Africa* (Philadelphia, 1846).

The shortcomings of the society's aims, judged from an abolitionist standpoint, are admirably set forth in Garrison, *Thoughts on Colonization* (Boston, 1832); Birney, *Letter on Colonization* (New York, 1834); and Jay, *An Inquiry into the Character and Tendency of the American Colonization and Anti-Slavery Societies* (New York, 1834).

COLONNA. A celebrated Italian family, prominent in the history of Rome from the twelfth century to the sixteenth. They were hereditary enemies of the Orsini (q.v.), and their numerous strongholds around Rome made them at all times formidable enemies to the Papacy, and on occasion its masters. To Rome, the Colonnas gave a pope, thirty cardinals, and a great number of senators and military commanders. The name of the family was probably derived from Colonna, a small settlement near the fortress of Palestrina; and Pietro of the Column, lord of Palestrina in 1100, is commonly regarded as the ancestor of all the princely branches of Colonna, comprising at present the houses of Colonna-Paliano, Colonna di Sciarra, and Colonna-Stigliano.—EGNO COLONNA was born at Rome about 1247. He entered the Augustine Order and pursued the study of theology at Paris, where he

was preceptor to Philip the Fair. He became general of the Order in 1292, and in 1296 was made Archbishop of Bourges. He was the author of a political treatise entitled *De Regimine Principum*, dedicated to Philip the Fair, and noteworthy for its systematic treatment of the art of war. He died in Avignon in 1316 and was buried at Paris. Of his works, which are marked by a good deal of dull erudition, part have remained unpublished.—LANDOLFO COLONNA was a canon of Chartres in the first half of the fourteenth century. There are attributed to him a manual of history from the creation to the pontificate of John XXII., a history of the Popes, and a Latin work, *De Statu et Mutatione Romani Imperii*.—SCIARRA COLONNA was a bitter enemy of Pope Boniface VIII. War broke out between the two in 1297 over the possession of Palestrina. Sciarra was excommunicated and deprived of all his honors, and after the destruction of Palestrina by the Papal forces in 1298 was compelled to flee to France. He gained the favor of Philip the Fair, and, returning in the company of the French Chancellor Nogaret in 1303, resumed hostilities with the Pope, and on September 7th took the aged pontiff prisoner at Anagni. (See BONIFACE VIII.). He became Senator of Rome in 1313. He embraced the cause of Louis the Bavarian, whom he crowned Emperor in Saint Peter's in 1328, but on the latter's departure was forced to flee from Rome. He died in exile in 1329.—STEFANO COLONNA, brother of Sciarra, was made Governor of Bologna in 1289. Involved in the struggle against Boniface VIII., he fled to France at about the same time as his brother. He returned after the death of Boniface and assumed a leading part in Roman politics, acting in opposition to Rienzi (q.v.), who drove him from the city in 1347. Stefano was a friend of Petrarch, who speaks of him in the *Trionfo della fama* and in his sonnets.—GIOVANNI COLONNA led an insurrection against Boniface IX. in 1404, and after the election of Innocence VII. joined forces with Ladislaus of Naples, driving the Pope from the city in 1413. He was killed in 1417.—OTTONE or ODDONE COLONNA was Pope from 1417 to 1431. See MARTIN V.—FABRIZIO COLONNA joined Charles VIII. of France in the invasion of Naples in 1494, but soon went over to the enemy and was made Grand Constable of Naples. He defended Capua against the forces of Louis XII. and took part in the battle of the Garigliano (1503). In the Holy League against France he was commander of the Papal forces, and, with his Spanish allies, was defeated by Gaston de Foix at Ravenna in 1512. He died in 1520. His military talents are lauded by Machiavelli in his *Arte della guerra* and by Ariosto in the *Orlando*. His daughter was Vittoria Colonna. (See COLONNA, VITTORIA).—POMPEO COLONNA, one of the ablest generals of his time, fought under Gonsalvo de Cordova against the French. In 1513 he defeated the Venetian General Alviano in the neighborhood of Vicenza. He took Milan from the French in 1521, and in the following year gained the victory of La Bicocca over Marshal Lautrec, and captured Genoa. In 1523 he held Milan against the French, but was struck down by disease, and died toward the end of the year of fast living.—Another POMPEO fought in the wars of the great Cordova, distinguishing himself at Cerignola (1502) and the Garigliano (1503). He entered the Church after the death of Alexander

VI., and in 1517 was made Cardinal. He took an especially active part in political affairs during the pontificate of Clement VII., whose enemy he was. He was made Viceroy of Naples in 1530, and died suddenly June 23, 1532.—ASCANIO COLONNA, the son of Fabrizio, shared the family hatred for Clement VII. With the support of the Spaniards he stormed Rome September 20, 1526, and sacked Saint Peter's and the Vatican. Entering the service of Charles V. he was made Grand Constable of Naples, but toward the end of his life fell into disgrace. He died in prison in 1557.—MARC ANTONIO COLONNA was exiled from Rome by Pius IV. and entered the military service of Spain, whose forces he successfully commanded against the Papal States in 1556. He was thereupon recalled and commanded the Papal galleys in the battle of Lepanto, October 7, 1571. He was made Viceroy of Sicily, and died in 1584.—FABIO COLONNA, born at Naples in 1567, was a botanist of some eminence. He was the author of *Storia naturale del Messico*, a work based on that of Hernandez. He died in 1651. Consult: Cirocco, *Vite de alcuni cardinali de casa Colonna* (Foligno, 1635); Agostino, *Storia de casa Colonna* (Foligno, 1608); Coppi, *Memorie Colonesi* (Rome, 1855); Gregorovius, *The History of the City of Rome in the Middle Ages* (London, 1895-1900).

COLONNA, GIOVANNI PAOLO (1640-95). An eminent Italian composer. He was a pupil, in Rome, of Carissimi, Benevoli, and Abbatini, became chapel-master of San Petronio in Bologna, and was repeatedly president of the Accademia Filarmonica there. One of the most distinguished Church composers of the seventeenth century, he is remembered as the head of the Bolognese School, which produced many famous musicians. His best works for the Church, including masses, psalms, litanies, motets, etc., for from three to eight voices, were published in twelve collections (1681-94). He also produced the oratorio *La profezia d'Eliseo* (1688), and an opera *Amilcare* (1693).

COLONNA, VITTORIA (1490-1547). An Italian poet. She was the daughter of Fabrizio Colonna, the Grand Constable of Naples, and was born in the Castle of Marino near Rome. Her youth was passed among the greatest literary spirits of Italy, and from them she gathered a love of learning, and in that atmosphere composed her first poems. At seventeen she married Francesco Ferrante d'Avalos, Marquis of Pescara, to whom she had been betrothed since childhood. He became a favorite general of Charles V., and her verses until his death, which occurred from wounds received at the battle of Pavia (1525), are concerned with his repeated absences, and finally with her grief at his loss. The beginning of her friendship with Michelangelo probably came about this time; certainly it was not until her widowhood that their relations became such as to have immortalized her in Angelo's unpolished, powerful sonnets. Just what the relationship was is a debated question. Only a few of her letters to him remain, and those are never lover-like. "Magnificent master," she calls him in one of them, and in another, thanking him for a picture of the Descent from the Cross, she says: "I rejoice greatly that the angel on the right is so beautiful, because it seems to me that it is

in some way a promise that Saint Michael will on the last day place you, Michelangelo, on the right hand of Our Lord." Such is the strain in which they are couched. She spent about ten years in Naples and Ischia, often visiting Rome, where she constantly saw the sculptor. In 1541 she went to Orvieto, and then to Viterbo. During her last visit to Rome she was taken ill, and died in the Colonna Palace. Reginald Pole, the cardinals Contarini and Bembo, and Castiglione and Bernardo Tasso, were among her friends, and Charles V. came to visit her. Her influence was felt throughout the first half of the sixteenth century, but she is better remembered for a kind of grace she gave that brilliant but brutal and coarse age than for the quality of her poetry. The second series of her poems, known as the *Rime Spirituali*, is better than the earlier one; all of them have been collected under the title *Rime della divina Vittoria Colonna*, and published a number of times. The best edition is that by Ercole Visconti (1840). Her letters have also been collected as *Lettere inedite ed altri documenti relativi ai Colonnese* (1875); *Alcune lettere inedite* (1884); and *Carteggio* (1888). Consult: Saltini, *Rime e lettere di Vittoria Colonna* (Florence, 1860); Reumont, *Vittoria Colonna: Leben, Dichten, Glauben im sechszehnten Jahrhundert* (Freiburg, 1881); Lawley, *Vittoria Colonna: A Study with Translations* (London, 1889); Roscoe, *Vittoria Colonna: Her Life and Poems* (London, 1868).

COLONNA, CAPE. See CAPE COLONNA.

COLONNADE' (Fr., from It. *colonnato*, row of columns, from *colonna*, Lat. *columna*, column). The name given to a series of columns placed at certain regular intervals in a row, according to the style and order of architecture employed. The term includes not merely the columns, but their superstructure, which must be a straight architrave. Where a row of columns similarly arranged supports a series of arches it is called an arcade (q.v.).

COLONNA PALACE. The palace of the Colonna family at Rome. It contains an important gallery of pictures, and has a beautiful garden containing remains of the Baths of Constantine, which occupied the site.

COLONNE, kô'lôn', JULES JUDE, called EDUARD (1838—). A French orchestra leader and violinist, born at Bordeaux. He was a pupil, while at the Conservatory in Paris, of Sauzai, Elwart, and Ambrose Thomas. After taking the prize in harmony, and the first *prix de violon* at the Conservatory, M. Colonne became first violin at the opera house, but gave that up in order to establish a series of Sunday concerts at the Odéon, known later as the Association Artistique. He gave Paris its first hearing of works by Tschaiikowsky, Greig, Wagner, and Raff, but his chief claim to distinction is that he forced the French public to do justice to the genius of Berlioz.

COLONNE DE LA GRANDE ARMÉE, de là grân dâr'má'. A Doric column near Boulogne, France, commemorating Napoleon's project of invading England and founding a republic there. It is 172 feet in height, and surmounted by a bronze statue of Napoleon. It was begun in 1804, but was not finished until 1841.

COL'ONNETTE' (Fr., dim. of *colonne*, column). In architecture, a small column used

more for decorative than constructive purposes. It is seldom found in ancient monuments, being a characteristic feature of the Middle Ages. The façades and apses of Tuscan churches (Pisa, Lucca), and the interior galleries of French Gothic cathedrals, show how rich an effect can be obtained by long lines of such colonettes, connected by arches and either free-standing or placed against a wall.

COL'ONSAY. One of the Inner Hebrides, or Western Isles of Scotland, off the southwest mainland of Argyllshire, in the Firth of Lorne, between the isles of Islay and Mull, with the small isle of Oronsay, of the southern end, separated by a narrow sound, dry at low water (Map: Scotland, B 3). Colonsay and Oronsay are together 12 miles long from northeast to southwest, and one to three miles broad. The surface is irregular, and composed of mica-slate. Half the surface is cultivated. Next to Iona, Colonsay contains the most extensive remains of religious edifices in the Western Isles. On Oronsay stands a large stone cross and the ruins of a monastery founded in the fourteenth century. Population, 500.

COLONY (Lat. *colonia*, from *colonus*, a husbandman, colonist, from *colere*, to till). In its proper sense, colony denotes a body of immigrants living in a foreign land under the laws and protection of the mother country; but the term has been used loosely to describe all classes of distant territories dependent in any form on a ruling power, from mere military posts like Gibraltar or Port Arthur to practically autonomous States like Canada or Australia. The Greeks were preëminently a colonizing people. They established communities in Asia Minor, in Thrace and the Crimea, on the coast of Africa, in Italy and Sicily, and in Gaul. Marseilles was a Greek town, founded by the inhabitants of Phœcia about six centuries before the Christian Era. The first great colonization movement of the Greeks followed as a consequence of the so-called Dorian migration, when the conquered peoples were driven from their lands and compelled to find new homes. The second movement, which took place in the period between the eighth and the sixth centuries B.C., was due to political disturbances at home, the necessity of drawing off the surplus of population, and military and commercial interests. When it had been determined to send out a colony, the oracle was consulted, and a leader, called *oikist*, *oikistês*, was duly appointed; fire was taken from the sacred fire that burned in the Prytaneum, and the new society, though politically independent, patterned itself after the mother city. The relation between the two communities was one of mutual affection only; but, if the new colony undertook itself to found a colony, it went, through custom, for its *oikist* to the mother city. Differing from the colony as thus described was the *cleruchy* (*κληρουκία*, allotment or apportionment, from *κλήρος*, lot, and *ἔχειν*, have), the members of which remained in close connection with the mother city and did not form an independent community. The Athenian cleruchies, the only ones of which we have any detailed knowledge, possessed a certain measure of autonomy, but only in internal affairs. The citizens were still citizens of Athens, with the rights and duties of

the position. In the case of a cleruchy, the conquered territory was divided into parcels and assigned to the poorer citizens by lot. The original inhabitants, though, according to circumstances, differently treated, were generally made dependents of the settlers. The first Athenian cleruchy was sent to the land of Chalcis in Eubœa, about B.C. 506.

It was one of the triumphs of the organizing genius of the Romans to develop the colony to its most perfect form. It was a principle of Roman policy that not only every conquered territory, but every district where Roman citizens settled, should be an integral part of the Empire. The *colonia* was one of the municipal institutions of the Empire, having its own governing corporation dependent on Rome. There were various grades of colonies—some where there was the high privilege of Roman citizenship, and others where the citizenship was of a humbler grade. Corresponding with the consuls in Rome, there were municipal officers in the colonies (*duumviri, quatuorviri*), in whom were preserved, after the Empire was formed, the old republican institutions. The Romans appointed men of very high rank to the government of their provinces or colonies—men who had held such offices as the consulship or pretorship at home. It was a feature of the Roman system to limit their period of government, lest they should become independent of the Empire and establish separate States.

After the fall of Rome, centuries passed before colonization recommenced; for the various tribes who broke into the Empire were not connected with any parent State, and the Normans who spread themselves over Europe at a later period were utterly unconnected, in the countries where they settled, with the government of the northern States whence they migrated. When Venice and Genoa were at the height of their power, they sought to advance their commercial interests by the establishment of colonies in the islands of the Mediterranean and on the shores of the Hellespont and the Black Sea. At the close of the Middle Ages the Portuguese and Spaniards became the great colonizing nations of Europe. Portugal was first in the field, establishing settlements along the western coast of Africa in the fifteenth century. After the rounding of the Cape of Good Hope by Bartholomew Dias in 1488, which was followed ten years later by the voyage of Vasco da Gama, she extended her settlements along the eastern coast and into India, finally penetrating to the islands of the Pacific. The Emperor Charles V., who ruled Spain when at the height of her power, aimed not only at the restoration of the Roman Empire in Europe, but at the creation of a new empire in America. Neither Spain nor Portugal followed the policy of developing the agricultural resources of the regions which they occupied, but merely used the colonies as a basis of profitable trade with the home country and as an asylum for high-salaried officials. Portugal established mere trading factories. The Spanish colonies were chiefly concerned with mining. They were governed by an official hierarchy, under the general direction of an executive department in Spain. The other governments of Europe—Great Britain, France, Holland, and the minor States—subsequently colonized in America, the East Indies, and Africa.

The earlier British colonies arose in the reverse order to those of Spain—the colonists went first, the dignitaries followed. This was especially true of the New England colonies. Before 1630 the British race had gained a firm foothold in America. The settlers were organized as privileged companies with royal letters patent, which in practice made them virtually independent of the Government at home; and as they were, for the most part, dissenters seeking a place of refuge from what they considered the grievances of the E-established Church and the Government, they took care not to convey the grievance with them. The northern colonists, indeed, acted as if they were a sort of private corporation. The policy of Great Britain toward her American colonies was the result of the accepted economic philosophy of the times (see POLITICAL ECONOMY), according to which it was thought that the trade with colonies must be strictly confined to the home country. The idea was that the colonies should supply raw materials to the mother country, and in return should purchase from the latter its manufactured products. Shipping was to be in the hands of the home country. This policy was no more characteristic of England than of other European States, and the reason why it encountered such vigorous opposition in the Anglo-American colonies was that the latter were settled by men who deliberately planned to establish homes in the New World, whereas those who made up the colonies of Spain, Portugal, or France were seeking wealth and prestige with which to re-establish their position in Europe.

During the eighteenth century Great Britain rose to a foremost position among colonial powers, and in the nineteenth century she firmly established her primacy. Rich compensation for the loss of the Thirteen Colonies—a loss which for a time seemed to threaten the dissolution of her empire—was found in the vast realm built up in India and in the flourishing colonies of Canada and Australia. In Africa, which became the principal scene of colonial activity for the European powers in the last quarter of the nineteenth century, Great Britain holds possession of Cape Colony and the former Boer republics, and of immense tracts of territory in Central and Eastern Africa. Coupled with her pre-eminence in Egypt, this would seem to assure to England a splendid colonial development in the Dark Continent. Spain's colonial empire attained its fullest development in the seventeenth century, declined in the eighteenth, and disappeared in the nineteenth. The Treaty of Paris, in 1763, deprived France of her possessions in America, and put a quietus on French colonization, Algeria excepted, for more than one hundred years, until the statesmen of the Third Republic initiated a new policy of expansion in Africa and the Far East. The Dutch establishments in the East were founded in great part upon the ruins of the colonial power of Portugal. At the time of the French Revolutionary wars, Holland was shorn of some of her possessions (Ceylon, Cape Colony), which went to increase the colonial domain of Britain. The annals of Dutch dominion in the East Indies have until recent times been the history of a nation seeking to enrich itself at the expense of downtrodden peoples. With the loss of Brazil in 1822, the importance of Portugal as a world-

THE WORLD SHOWING COUNTRIES AND THEIR COLONIES.

power departed. By its victory over Spain in 1898, the United States took its place among the colonial powers of the world; and through the solution of the problems presented by the necessity of reconciling the element of autocracy inherent in the administration of foreign possessions with the republican theory of American institutions, the term colony, already loose in meaning, has attained a still broader application. See the articles on the various countries for detailed accounts of their colonies.

COL'OPHON (Lat., from Gk. Κολοφών, *Kolophōn*). An ancient Greek city of Ionia in Asia Minor. It was situated on the river Hales, about nine miles north of Ephesus, was the native city of Mimmermus, and claimed to be the birthplace of Homer. The expression, 'to put the Colophon,' meaning 'to give the finishing stroke,' is explained by Strabo as arising from the belief that the cavalry of Colophon was so excellent that it always decided the contest. Hence, *Colophon* of a device at the end of a book.

COL'QUIN'TIDA. See COLOCYNTH.

COLOR (Lat., connected with Lat. *celare*, Gk. κἀλλπτειν, *kalyptein*, Ger. *hehlen*, to hide, Ir. *celim*, I conceal, Skt. *śarana*, refuge). The color of an object in nature depends upon several conditions; the character of the light which illuminates it, the phenomena which take place in the body itself, the individual peculiarities of the eye which views the body. It has been shown by Sir Isaac Newton that ordinary white light may be regarded as a mixture of many colors; that is, it may be analyzed into parts, each part producing a different color-sensation. In scientific language, the sensation white, as perceived by looking at any ordinary 'white' object, is due to the incidence upon the eye of trains of ether-waves of different wave-numbers,

varying continuously between certain limits; while, if a train of waves of a definite wave-number enters the eye, the sensation of color (if any) will be of a definite hue. Thus we speak of yellow light, of red light, etc., meaning those ether-waves which produce these sensations of yellow or red in a normal eye. When the ether-waves fall upon an object, some of the energy goes into reflected waves *at the surface*, the rest goes into the entering waves; there will in general be absorption in the interior; but if the body is transparent there will be transmitted waves, and also, in general, waves reflected and scattered by little particles in the interior of the body. The color of a green leaf is due to the fact that when viewed in ordinary daylight, out of all the waves which enter the leaf, only those which combine to produce the sensation green are transmitted, the others being absorbed by the coloring matter of the leaf; thus, those waves which are scattered by the minute interior parts traverse a layer of this coloring matter, and only green light emerges from all sides. The light which in this case is reflected at the surface is simply diffuse white light. An object whose color is due, as here, to what is called 'body absorption,' appears of the same color when viewed by reflected light or by transmitted: that is, if we look *through* it at the source of light, or look at it from the same side as is the source. The colors of almost all natural objects are due to this body absorption.

The colors of metals, however, and some aniline dyes, are due to what is called 'surface absorption.' When white light is incident upon a piece of gold, yellow light is reflected *by the surface*, thus giving the yellow color. If, however, the gold is hammered out exceedingly thin, it will be found to transmit greenish-blue light; so that in the case of surface color, the colors by reflection and transmission are different.

The energy of the waves which are absorbed in bodies generally goes to producing heat effects; but in some cases it is spent in producing other ether-waves, thus giving rise to other colors. These bodies are called 'fluorescent.' (See FLUORESCENCE.) In these cases, then, the color as seen by transmission and by looking at the bodies sidewise will be different.

The color of the blue sky, of fine smoke, and of water in many lakes is due to the scattering of light by extremely small particles—generally minute solid particles: for the short waves—that is, blue light—are reflected by minute particles, while the other waves simply pass around them. In all these cases it is evident that if the incident light is altered, so will be the color perceived. A green leaf in a yellow light would appear black. For an excellent treatise on color, consult Rood, *Modern Chromatics* (New York, 1879). See LIGHT.

COLOR. In art, either the pigment employed to produce a certain effect to the eye, or the effect thus produced—i.e. the tint of a picture. In the former sense it is treated of in this work under the names of the colors themselves. In the latter sense it may be defined as the general effect of all hues entering into the composition of the picture.

The sensation of color is produced by waves of light setting into vibration fibres of the optic nerve, and the length of these light-waves is

the cause of the different hues. For example, when the light-wave is $\frac{1}{380000}$ of an inch long, red is the color produced, and as the waves decrease in force, we see yellow, green, blue, and so on through the spectrum. According to the theory of Chevreul, now generally accepted, white light is the union of all colors, and its decomposition by an object reveals the color separated from the rest. Thus, a rose absorbs all colors but red, which it reflects; while a white substance, rejecting all colors, is therefore colorless. Correctly speaking, there are but six colors—three primary (red, blue, and yellow), and three secondary (orange, violet, and green). Orange is composed of purple and yellow, violet of red and blue, green of yellow and blue. All other colors are compounds of these.

Complementary Colors are those which, combined with another color or colors, make up the three primary colors constituting white light. If the given color be primitive, its complement is composed of the other two primitive colors. For example, the complementary color of blue is orange—that is to say, red and yellow. If the given color be a secondary, its complementary is the remaining primitive color—as, for instance, the complementary color of green (blue and yellow) is red. In painting, brilliancy of coloring may be obtained by placing complementary colors side by side, because each lends to the other a favorable halo, while the juxtaposition of non-complementary colors has the opposite effect of dullness. This method of heightening and softening colors was used with great effect by Delacroix, and is to-day much practiced by French and Spanish painters.

It is also usual in the studios to divide colors into warm tones and cool, according as they approach or depart from the colors of sunlight. Reds, oranges, and yellows are regarded as warm; blues, greens, and violets as cool. In painting it has long been customary to relieve warm colors by placing them near cool. This is especially marked in Correggio's pictures, which have a central point of warm color with the surroundings cool. The Florentines reversed this process, while the Venetians intermixed warm and cool tones, and Rubens placed them side by side.

Contrast of Color is either simple or compound. Each of the primitive colors forms a contrast to the other two. Thus, blue forms a simple contrast to red and yellow. But if red and yellow were mixed together, the complementary colors to blue would be produced—viz. orange, which is the most powerful contrast to blue. This was the earliest and simplest way of obtaining color effects. It was almost universal among the Italians of the Renaissance, as witness the reds and blues in the garments of the Madonna and the saints. In modern times it has been much used, but not with the same success, by the pre-Raphaelites in England and the followers of Ingrès in France.

Harmony of Color is more difficult to attain, and is based rather upon the accord than upon contrast or the use of complementary colors. In nature there are few sudden contrasts of color, but rather gradual transitions and delicate gradations. Harmony endeavors to preserve the same tones in a painting as exist in nature. It discriminates between the same color seen in sun-

light and in shadow, near or at a distance; or, in other words, between the values of colors. No matter how different the colors of the pictures, they must all accord with the dominant color-tone.

The mastery of color is the most difficult achievement of painting, and it has been truly said that the colorist, like the poet, is born and not made. Few even among the great painters have attained it. Concerning the Greeks, it is impossible to make statements with surety, since all their best work has perished. The East Indians attained it in the harmonious colors in their beautiful fabrics. Among the Italians of the Renaissance, the artists of Parma and Venice were distinguished as colorists, chief among whom were Correggio, Titian, and Veronese. Many of the old Dutch and Flemish painters were fine colorists, Rembrandt and Rubens being foremost among them. In the English school Turner was the only really great colorist; while the French school shows a stately array, including such names as Watteau, Chardin, Delacroix, Fromentin, Rousseau, Diaz, Millet, etc. In Spain the greatest colorists were Velasquez, Goya, and Fortuny. The American school of the past few years has produced a number of good colorists, among them La Farge, Sargent, and Whistler.

Consult: Van Dyke, J. C., *Art for Art's Sake* (New York, 1901); Blanc, *Grammaire des arts du dessin* (Paris, 1870); Reynolds, *Discourses Before the Royal Academy* (London, 1831).

COLOR. Specifically, in anthropology, the quality and degree of pigmentation of skin and other integuments. See ETHNOLOGY; ANTHROPOMETRY.

COLOR. In law, in a figurative sense, a semblance or appearance of something, implying that the thing to which the term is applied has not the quality or character claimed; as, *color of title* means an apparent but not valid title.

Formerly in common-law pleading in England, when the defendant, pleading by way of confession and avoidance, confessed that the plaintiff had, or gave him credit for having, a *prima facie* or apparent right, the 'confession' was said to give 'color,' and the defendant then pleaded matter by way of avoidance—i.e. to show that the facts pleaded by the plaintiff did not in law give ground for recovery against the defendant. See CONFESSION AND AVOIDANCE.

Color of Office is the semblance or pretense of authority, by virtue of an official position, assumed or claimed by an officer when he does some act outside of his actual jurisdiction. The term includes acts done under an honest but mistaken belief of power, as well as where one knowingly exceeds his authority from a corrupt motive. All such acts are void, and an officer who is thus guilty of an abuse of power is liable for any damages which may result from it. See CONVERSION; DE FACTO; FALSE IMPRISONMENT.

Color of Title is that which on its face appears to be proof of ownership, but which, by reason of some defect not easily discoverable, does not in law constitute a valid title. The term is generally used to describe documents purporting to give title to some one, but has sometimes been applied to a claim of ownership by adverse possession. A conveyance by one so claiming title gives the vendee only such rights as the vendor

has—i.e. the possession of the property under whatever muniments of title the vendor had, and a right to 'tack,' or add, the period of possession to make up the time necessary to gain absolute title by adverse possession. See ADVERSE POSSESSION; TITLE (to property).

COLOR, IN PLANTS. The great majority of plants show distinct coloration, especially in aerial or aquatic organs. The absence of color is an index of parasitic or saprophytic life, but it must be borne in mind that many parasites and saprophytes are highly colored. The most common coloring matter in plants is chlorophyll, which manifests itself in various shades of green. Light of some strength has been shown to be necessary for the development of chlorophyll, though recent experiments show that it may develop in various seedlings germinated in perfect darkness, and that the synthesis of carbohydrates may take place vigorously under a dense layer of cork. The presence of plastids and favorable conditions of nutrition are necessary for the proper development of chlorophyll. Yellow coloration in plants is also commonly associated with plastids, and is due to the relative abundance of xanthophyll or carotin present as compared with the true chlorophyll. The phenomenon of yellowness is most common in dying leaves, and is especially well shown in autumn. However, in many young leaves, especially where the nutrition conditions are unfavorable, yellow leaves also appear. Unfavorable nutrition is probably the cause of yellowness in most cases. In dying leaves the part near the veins usually remains green longest. In young leaves the green parts are longer and much better developed internally than are the yellow or white parts.

Red or blue coloration in plants is not directly associated with plastids, but is due to pigments that are scattered through the cell-sap. The coloring substances are called anthocyanins, erythrophyll if red, cyanophyll if blue. Blue colors occur most commonly in flowers, while the reds occur abundantly in leaves, as well as in flowers. The red coloration of leaves has been much discussed in literature, and deserves further mention. While in some plants, as coleus, red colors are more or less permanent, in most cases redness is periodic. Perhaps the three most common examples of color display are: (1) in the young actively growing leaves of seedlings or perennial shoots; (2) in wintering leaves, especially of rosette plants; and (3) in dying leaves, especially in autumn leaves. All kinds of causes have been assigned to account for periodic coloration, but by far the most satisfactory is one proposed by Overton in 1899. He has shown experimentally that an excess of sugar in nutrient solutions causes an early and rich development of color, while an absence of sugar retards this development. In the summer the products of a day's photosynthesis are commonly carried off before another day begins; but in the cool autumn nights this transfer is checked, and sugars accumulated in the leaf unite with tannin substances and cause the production of the pigments. A similar explanation, plus the great flow of sap, would account for red leaves in spring. Mechanical injury, which prevents the carbohydrate transfer, also causes an excess of sugar and gives rise to red colors. Light seems to favor color development, perhaps

because it favors the increased production of carbohydrates.

Much has been said as to the ecological significance of red colors. Stahl and Kny, as a result of experiments, hold that red colors increase the available supply of heat, and thus prolong the leaf activities in fall and enlarge them in spring. Kerner has also held the 'protective' theory of color. If red colors do have any such function—and this is by no means proved—it must probably be regarded as quite incidental. In no case can the need for protection be regarded as a cause of the development of pigment, as one might suppose from reading various treatises on the subject of color. See CHLOROPHYLL; PHOTOSYNTHESIS; LEAF. Consult Overton, "Beobachtungen und Versuche über das Auftreten von rothem Zellsaft bei Pflanzen," in *Jahrbuch für wissenschaftliche Botanik*, vol. xxviii. (Berlin, 1899).

COLORADO, kōl'ō-rā'dō (Sp., colored red) ('the Centennial State'). A State of the American Union, the twenty-fifth in order of admission. It lies between latitudes 37° and 41° N., and longitudes 102° and 109° W., and is bounded on the north by Wyoming and Nebraska, on the east by Nebraska and Kansas, on the south by Oklahoma Territory and New Mexico, on the west by Utah. Length from east to west, 380 miles; breadth, 275 miles; land area, 103,645 square miles; water area, 280 square miles.

TOPOGRAPHY. Colorado lies upon the great watershed of the continent, and is, after Wyoming, the most elevated State in the Union. A number of the most prominent ranges of the Rocky Mountain system traverse the State in a northerly and southerly direction, spreading magnificently over more than half the surface. The eastern section lies in the plain of the great Mississippi Basin, rising gradually from an elevation of about 3000 feet at the eastern boundary to a considerably higher altitude in the west. In the longitude of Denver and Colorado Springs the surface becomes broken by irregular chains of foot-hills. Back of these rise abruptly the lofty ranges of the Rockies. Entering the State from the north, they are called the Medicine Bow Range, and continue south as the Front Range to Pike's Peak, west of Colorado Springs. This is the most famous mountain in the State, but not the highest, being one of a score that range between 14,000 and 14,500 feet in elevation. West of these ranges are three valleys called North, Middle, and South Parks. North Park is inclosed on the west by the Park Range, and is separated from Middle Park by a ridge, extending from the east to the west, called the Divide. The North Platte River rises on its northern slope; on its southern, the Rio Grande. Between the Middle and South parks the Front Range meets the Saguache, the loftiest of them all. For miles its crest towers above the 13,000-foot level, surmounted by the impressive Holy Cross Peak, the Princeton, Harvard, Yale, and other mountains whose heights exceed 14,000 feet. To the southeast the range is continued in the Sangre de Cristo and Culebra, which extend into New Mexico. West of these latter ranges lies another valley called the San Luis Park, while west of this rise the San Juan Mountains. In the remainder of the western portion of the State there is a confusion of broken mountains, pla-

teaus, and valleys, with a general slope to the westward.

Of the many mountain passes, 13 are over 10,000 feet in altitude, the Argentine reaching 13,100 feet. The great valleys or parks above mentioned inclosed by mountains are a distinguishing feature of the scenery. San Luis Park contains 8000 square miles (the most level land in the State, though elevated 7500 feet). Other important valleys are the Arkansas (q.v.), Rio Grande (q.v.), White Grande, and Gunnison. There are over 39,964 square miles of park and valley lands. The North Platte and South Platte unite to form the Platte of Nebraska. The source of the South Platte is 11,176 feet above tide, and its fall in the short distance to Denver is 6000 feet. The Arkansas rises 10,176 feet above the sea in the west central part of the State, rapidly falling to 7877 feet, and flows southeast and east into Kansas, passing through the 'Royal Gorge' cañon, 3000 feet deep. The Rio Grande rises in the Saguache Range and flows through San Luis Park into New Mexico. The largest streams on the west are the Yampah and White, tributaries of the Green River, Utah; the Grand, one of the main affluents of the Colorado; and its tributaries, the Gunnison, Dolores, and San Miguel. None of these streams is navigable. No other State contains the headwaters of so large a number of rivers. From near the centre of the Commonwealth rivers flow outward in many directions, and the waters are distributed in almost equal proportions to the Atlantic and to the Pacific Ocean. The only lake of consequence, San Luis, about 60 miles long and a quarter of a mile wide, lies in San Luis Park, and receives several small streams, but has no visible outlet. The lofty peaks and deep-lying parks are equaled in grandeur by the river cañons; those of the Arkansas, Grand, Black Cañon of the Gunnison, Little Colorado, and Uncompahgre, varying in depth from 1000 to 3000 feet. 'The Garden of the Gods' and 'Monument Park' are filled with castellated buttes that rise out of green meadows, or with grotesquely shaped pillars and towers of red sandstone, carved by erosion. A large area in Saguache County has been reserved as a State park.

CLIMATE AND SOIL. The high altitude of the State premises a cool temperature; but, save on the higher elevations, extremes are rare, the climate being generally mild and remarkably salubrious. The days are sometimes hot, but the nights are cool and free of humidity. The yearly mean temperature at Denver (5182 feet) in January is 28.2° F.; July, 71.7° F.; Pueblo (4675 feet), January, 28.7° F.; July, 74° F. Frosts do not occur until late in the autumn and disappear early in the spring; but snows are heavy and lasting on the mountains, yet in the low levels are seldom deep, and very soon melt away.

The mean annual rainfall for the State is 14.8 inches. This fall, although light, is well distributed, and in many sections of the 'Great Divide' cereals are grown without irrigation. The heaviest rainfall is in the mountains. At Pike's Peak the mean precipitation is 29.7 inches; at Climax (10,304 feet), 34.8 inches. On the plains it is much less. At Denver the mean fall is 14.3 inches; at Colorado Springs (6032

feet), 14.5 inches; at Las Animas (3899 feet), 11.9 inches.

The atmosphere is so dry and pure that fresh meats are preserved by the simple process of drying. The late summer is almost rainless. The climate and air of Colorado are considered of great benefit to asthmatic and pulmonary sufferers, and the charming parks are likely to become the great natural sanatoriums of North America. Thousands of people flock to Denver, Colorado Springs, and other sections of the State to regain their health. The various mineral springs are also adjuncts to the remedial nature of the climate. The hot sulphur springs of Middle Park and Wagon-Wheel Gap, and the hot iron and soda springs of Manitou, Cañon City, Glenwood Springs, and Idaho Springs are famous.

The soil along the river-bottoms is largely alluvial. In the eastern part of the State it is a light loam. In some places siliceous and micaceous substances abound, while here and there clay formations crop out. The forests of the State cover about 10,500,000 acres of land, and are restricted mainly to the mountains.

For flora and fauna, see the paragraphs under **ROCKY MOUNTAINS** and **UNITED STATES**.

GEOLOGY. The geological structure of Colorado is extremely varied. In the less elevated region east of the Rocky Mountains, Cretaceous and Tertiary strata are exposed in nearly horizontal position and in great thickness. On the eastern flank of the Rocky Mountains these strata are succeeded by older sediments, including Silurian, Carboniferous, and Jura-Trias, which are upturned and in places intensely folded. The axis of the mountain system is formed by granites and other igneous rocks, more or less metamorphosed, of Archean age, with a great variety of later volcanic rocks. On the western edge of the system Paleozoic strata again appear, and are overlaid in the extreme western part of the State by Cretaceous, Jura-Trias, and Tertiary beds. The Carboniferous rocks, unlike those along the Appalachian Mountains, inclose no coal-seams. Coal occurs, however, in great abundance in the Laramie group of the Cretaceous. The great upheavals accompanied by volcanic activity along the Rocky Mountains have favored the formation of ore deposits, some of which are of great economic importance. Cripple Creek on the slopes of Pike's Peak, Leadville, Boulder, Ouray, Rosita, Silverton, Gilpin, Lake City, and Gunnison are important centres of gold, silver, and lead mining. Copper, zinc, manganese, and iron ores also occur in extensive deposits.

MIXING. Colorado is best known as a mining State, ranking first in the mining of precious metals, and surpassed only by Pennsylvania in the total mineral output. This is due largely to the State's great productivity of gold and silver ores. Colorado produces twice as much of these two metals as any other State, and more than one-third of the total output of the United States. The production of gold increased in value from \$4,150,000 in 1889 to \$28,760,000 in 1900. In 1897, for the first time, the gold product exceeded that of California, while the output for 1900 was twice that of the rival State. Silver-mining reached its maximum output in 1892, and then decreased until 1895; since which time it has slightly increased. The com-

mercial value of silver mined in 1900 was \$12,500,000. Colorado has for a number of years produced about one-fourth of the total lead output of the United States. The product steadily increased until 1883, when it was valued at \$6,000,000; in the succeeding years the annual output approximated \$5,000,000 until 1893, when it began to decrease. In 1898 it gave signs of revival, and in 1900 amounted to \$7,700,000. Increasing quantities of copper and iron are mined, and the advantage of a proximity to fuel and flux is giving Colorado steel and iron the control of the entire trans-Missouri market. Coal-mines are also rapidly developing, the State ranking eighth in the value of her output of coal, and fourth in the amount of coke produced. Nearly one-half of the coal is mined in Las Animas County, in the south, while an equal proportion of the mineral production is credited to Teller and Lake counties in the central part of the State, including the famous Cripple Creek district (q.v.).

AGRICULTURE. Colorado, with its extreme elevation and aridity, was long thought to be fit only for mining and grazing. But it has been found possible to utilize many of the water-courses, which are distributed so liberally over the State, for purposes of irrigation, and by this means large portions of the State have been brought into profitable cultivation, the total area irrigated in 1900 being greater than in any other State. Fourteen and three-tenths per cent. of the land surface was included in farms in that year, and 3.4 per cent. or 2,273,968 acres were improved, of which 1,611,271 acres, or 70.9 per cent., were irrigated. During the decade ending in 1900 the actual irrigated area increased 80.9 per cent. The main canals and ditches had a total length of 737.4 miles. The largest irrigated area lies to the east of the Rocky Mountains in the north central part of the State. The supply of water is here obtained from the tributaries of the South Platte River. The storage system is being adopted whereby the flood waters of this section are conserved. The Arkansas, Rio Grande, and the other streams are also drawn upon for purposes of irrigation, and every county contains some irrigated land. The eastern plain between the South Platte and Arkansas valleys is one of the least irrigated regions of equal extent in the State. By the application of improved methods, irrigation can be extended to a much greater area than has yet shared its advantages. Colorado is unlike California in that its irrigated area is devoted almost wholly to the less intensively cultivated crops. The value per acre of the product is therefore not so great as in the latter State, while the average size of the irrigated farm is much greater, being 35.4 acres, of which 9.1 acres are actually irrigated. Considerably over one-half of the crop acreage is devoted to hay and forage, the acreage of this kind of crop having nearly doubled in the last decade of the nineteenth century. Alfalfa constitutes nearly half of this amount, almost the entire acreage of alfalfa being irrigated. Its yield is very great, and in a large measure it is made to take the place of grain as feed for stock. The acreage in wheat exceeds that of all other cereals combined, and more than doubled in the decade ending in 1900. The flour manufactured from Colorado wheat ranks first in the market.

Oats and corn, respectively, rank next in importance, the acreage of the former having decreased and the latter having increased during the last census period. Increasing quantities of barley are raised. Irish potatoes are a very prominent crop in the northern part of the State. Hundreds of car-loads of muskmelons are annually shipped from the Arkansas River region. They include the famous Rocky Ford cantaloups, named after the town of Rocky Ford. The production of sugar-beets bids fair to become an important industry. In the last decade of the century remarkable progress was made in fruit-culture. The apple-trees, which constitute 69.3 per cent. of the total number of fruit-trees, increased during that period from 77,790 to 2,004,830, and the per cent. of increase of other varieties was equally great. The western slope of the State seems to be especially well adapted to the production of superior grades of fruit.

STOCK-RAISING developed before tillage was attempted, and for some time had almost the whole field to itself. The introduction of mixed farming has not been detrimental to this industry, but, on the contrary, has resulted in an increase in the number of animals raised. What is more, the long-horned Texas steer has given place to one with a pedigree. Large herds receiving little attention are being supplanted by many small herds carefully looked after. For every decade since 1870 the number of cattle has more than doubled. Sheep-raising, which is largely confined to the southern counties, made large gains in the last decade of the century. Horses and mules are raised in sufficient numbers to supply the local needs. The number of dairy cattle is rapidly increasing, and dairying is becoming a prominent industry. The tables appended show the relative importance of the different varieties of live stock and crops and the tendencies in their development:

Year	Wheat (acres)	Oats (acres)	Corn (acres)	Barley (acres)	Hay (acres)	Potatoes (Irish) (acres)
1900	294,949	120,952	85,256	21,949	952,214	44,075
1890	126,999	87,959	119,310	12,086	481,621	31,454

Year	Dairy Cows	Meat Cattle	Horses	Mules and Asses	Sheep	Swine
1900	100,116	1,333,202	236,546	12,297	1,352,823	101,198
1890	76,948	640,913	155,170	7,139	717,990	64,358

MANUFACTURES. Manufacturing yields precedence to mining and farming, although 4.6 per cent. of the population is engaged in this occupation. But manufacturing is growing, owing to a combination of favorable circumstances, chief of which is abundance of raw materials. This State produces more coal than any other State west of the Mississippi River, and, excepting Minnesota, three times as much iron ore as all of these States combined, consequently a large amount of coke, iron, and steel products is manufactured. The presence of coal makes possible the smelting and refining of copper and lead ores, which has rapidly developed, these ores being imported from neighboring States for such purposes. Further advantage is given the

State from the more extensive development of its railways and its position as a distributing centre. In those manufactures in which freight rates are an important consideration, Colorado's great distance from the manufacturing centres of the East is another advantage. The foundry and machine-shop products, which have had a rapid growth during the past decade, consist largely of mining machinery, in the production of which the State holds high rank. An increase in the flouring and the meat-packing industries is a natural consequence of the growing importance of agriculture. The following figures from the census of 1890 and of 1900 show the number of establishments and wage-earners, and the value of the total gross product for these years:

\$795,000 resources and \$524,000 deposits. No savings banks were reported.

CHARITABLE AND PENAL INSTITUTIONS. There are an insane asylum at Pueblo and a soldiers' and sailors' home at Monte Vista. The State also maintains homes for its deaf and blind and for its dependent and neglected children. Boards of county commissioners make annual appropriations for the support of the poor, county homes being provided in some counties. There is a State penitentiary at Cañon City. The entire expense of maintaining the institution from 1876 to 1900, inclusive, was \$2,296,899. The earnings of the prison during the same period were \$516,333. Much of the labor of the convicts has been on roads and irrigation ditches. The State has an indeterminate sentence and parole law. First

TRANSPORTATION AND COMMERCE. Colorado has better railroad accommodations than any other Rocky Mountain State. In 1899 there were 4616 miles of track, most of which was constructed prior to 1890. The Union Pacific, Missouri Pacific, Atchison, Topeka and Santa Fé, the Denver and Rio Grande, the Colorado and Southern, and the Rock Island Route, with their branches, are the principal railroads. These railroad facilities are important, not only in developing the resources of the State, but in augmenting its commercial importance by making it a collecting and distributing centre for the West. There are no navigable streams.

FINANCES. In 1900 the total debt of the State was \$2,700,000. The total receipts and disbursements for the two years ending November 30, 1900, were respectively \$3,199,000 and \$3,089,000.

BANKS. In October, 1900, there were 40 national banks in operation, with a capital stock aggregating \$4,387,000, the outstanding circulation being \$3,337,000; deposits, \$24,500,000; and reserve, \$10,900,000. In July of the same year there were 30 State banks, with \$9,800,000 total resources, \$1,430,000 capital and \$8,100,000 deposits. There were also 13 private banks with

offenders between the ages of sixteen and thirty are sent to the State Reformatory at Buena Vista, where the cultivation of a farm is the chief occupation. The parole system is used at this institution. The State also has an industrial school for youthful offenders at Golden. It is without 'locks, bars, and cells,' and endeavors to treat its wards as students, not as criminals. Each of the charitable and penal institutions is under the jurisdiction of a board of control. The State Board of Charities and Correction is an inspecting and advising body.

POPULATION. Colorado is the most populous of the Rocky Mountain States. The following gives the population by decades: 1860, 34,277; 1870, 39,864; 1880, 194,327; 1890, 412,198; 1900, 539,700, of which only 10,654 were colored. The foreign born in 1900 numbered 91,155, about one-half of whom came from the United Kingdom and Canada. In 1880 two-thirds of the population were males, but with the development of agriculture and more settled conditions of life the population is rapidly becoming normal; in 1900 the male population constituted less than 55 per cent. of the total. There is a marked tendency to segregate in towns, as is usual in

mining regions. There are eight places of over 4000 inhabitants, constituting 41 per cent. of the population. Three Representatives are sent to the Lower House of the National Congress.

The principal cities of the State are Denver, the capital, with a population (1900) of 133,859; Pueblo, 28,157; Colorado Springs, 21,085; Leadville City, 12,455; Cripple Creek, 10,097.

RELIGION. Numerically, the Roman Catholic Church ranks first. Of the other denominations, the Methodist and Presbyterian are the strongest.

EDUCATION. Colorado maintains a high standard of education. But six States have a longer school year, and none of these are west of the Appalachians. Seventy-six per cent. of the population between the ages of six and twenty-one are enrolled in the public schools. High school advantages are provided in the towns. The teachers receive higher salaries than those generally paid in the West. Women are eligible to school district boards and may vote at school elections. There is a normal school at Greeley. Higher institutions of learning are: Colorado College, established at Colorado Springs in 1874; University of Colorado, opened in Boulder in 1877; School of Mines at Golden, and School of Agriculture at Fort Collins; Presbyterian College at Del Norte; Denver University; also Rocky Mountain University and College of the Sacred Heart at Denver. There are medical schools at Boulder and Denver. The enrollment for all higher institutions of learning is about 2300. The National Government has an Indian school at Grand Junction.

GOVERNMENT. The Constitution was adopted by a vote of the people August 1, 1876. By a two-thirds vote of each House, a proposed amendment may be referred to popular vote; but amendments must be voted upon separately. A proposal for a constitutional convention may also be referred to the people by a two-thirds vote of each House, and if a majority of the people approve, the next session of the Legislature must provide for such convention. It must consist of twice as many delegates as there are members of the Senate, and the Constitution drawn up must be submitted to the people for ratification. The Constitution specifies a six months' residence in the State as a prerequisite to voting, and authorizes the Legislature to make other time requirements. Either sex may vote at school-district elections, or hold school-district offices. Suffrage rights may be further extended to women by legislative enactment approved by a vote of the people. In the State elections in 1893 the people voted in favor of woman suffrage. An educational qualification may be imposed by law. The rights of citizenship can be denied an individual only during a period of imprisonment.

LEGISLATIVE. State elections are held on the first Tuesday in October of even years, and the Legislature meets on the first Wednesday of the following January. Senators and Representatives are elected for terms of four and two years respectively. The aggregate number of Senators and Representatives can never exceed 100. No bill can be so altered or amended on its passage through either House as to change its original purpose. Revenue bills must originate in the House of Representatives. Ordinary expenses only can be included in general appropriation

bills. A member cannot vote on a bill in which he has a personal or private interest. Impeachment charges are brought by the House, and tried before the Senate.

EXECUTIVE. The executive officers are a Governor, Lieutenant-Governor, Secretary, Auditor, Treasurer, Attorney-General, and Superintendent of Public Instruction, the term of each being two years. Their salaries are determined by law, and neither Treasurer nor Auditor can be his own immediate successor. A two-thirds vote of both Houses overrules the veto of the Governor. The Governor may veto any item of a money appropriation bill. He may grant reprieves, commutations, and pardons, and convene the General Assembly in special session. The Lieutenant-Governor, who is President of the Senate, succeeds to the Governorship in case of vacancy, and he in turn is succeeded by the President pro tem. of the Senate and by the Speaker of the House.

JUDICIAL. The judicial power of the State as to matters of law and equity, except as in the Constitution otherwise provided, is vested in a supreme court, district courts, county courts, justices of the peace, and such other courts as may be provided by law. There are three supreme court judges, elected for nine years; the district judges—one or more for each judicial district—elected for six years; and a judge for every county, elected every three years. A district attorney is elected triennially in every judicial district.

LOCAL GOVERNMENT. Three county commissioners (five in counties exceeding 10,000) are elected in every county, the term of office being three years. Other county officers, elected on the first Tuesday in October of the odd years, are: clerk, sheriff, coroner, treasurer, superintendent of schools, surveyor, and assessor. At the same election the small precincts elect one justice of the peace and the constable, and precincts of over 5000 a proportionately larger number. Towns and cities may be classified into not more than four classes, and the powers of each class may be defined by general laws.

MILITIA. There are two regiments of infantry of 550 men each, a squadron of cavalry with 200 men, and a battery of artillery with 75 men. The males of militia age number (1900) 142,000, 60,000 being liable to military duty.

HISTORY. Prehistoric remains, consisting of numerous cave-dwellings and the ruins of extensive pueblos, similar in character to those discovered in New Mexico and Arizona, have been found in southern Colorado. In the second half of the eighteenth century a number of expeditions into the limits of the present State were undertaken by the Spaniards. The most important of these was the one headed by Francisco Escalante, who in 1776 traversed the southwestern corner of the State, and explored the region of the Dolores and Gunnison rivers. But though Spain laid claim to the region, she made no attempt to settle it. The country, a portion of which was included in the Louisiana Purchase (1803), was partially explored in 1806 by Lieutenant Pike, of the United States Army, and in 1819 by Colonel Long. Further exploration was carried on by Frémont in 1842 and 1844, and before the Mexican War fur-trading stations had been built on the Arkansas and Platte rivers. In the Treaty of Guadalupe-Hidalgo (1848) Mexico relinquished her territorial rights

in favor of the United States. Parties of prospectors and emigrants from Georgia and Kansas entered Colorado in 1858. In 1859 the discovery of gold near Boulder and Idaho Springs was followed by a large immigration and the sudden rise of the mining towns of Denver and Boulder. After sending representatives to the Legislature of Kansas, 'Arapahoe County,' as the region was then called, together with lands taken from Nebraska and New Mexico, was organized into the Territory of Colorado on February 28, 1861. From 1864 to 1870 wars were carried on with the Cheyenne and Arapaho Indians. The Utes ceded the mountain and park regions between 1863 and 1880. In 1864 and 1868 unsuccessful attempts at organizing a State Government were made. The final enabling act was passed by Congress on March 3, 1875, and on August 1, 1876, Colorado, the Centennial State, was admitted into the Union. Gold-digging was on the decline in 1878, and many mining towns were being deserted, when it was discovered that from the masses of carbonates thrown aside by the gold-seekers, silver and lead might be extracted. Immigrants flocked to Leadville, and soon the value of the lead and silver output came to be many times that of the yield of gold. As a result, the people of the State, in 1892, declared enthusiastically for the free coinage of silver at the ratio of 16 to 1. Serious strikes broke out among the miners in 1894 and 1896-97, and recourse was had to military force to restore order. From 1876 to 1888 Colorado was Republican in national politics, but in the three Presidential elections after 1888 the silver interests of the State made it decidedly Democratic. In 1896 and 1900 especially, the Democrats; Populists, and Silver Republicans, in fusion, controlled a large proportion of votes in the State.

Consult: Bancroft, *History of the Pacific States*, vol. xx. (San Francisco, 1890); Hayes, *New Colorado and the Santa Fé Trail* (New York, 1880); Pabor, *Colorado as an Agricultural State* (ib. 1883); Fossett, *Colorado: Its Gold and Silver Mines, etc.* (ib. 1880); *The Resources, Wealth, and Industrial Development of Colorado* (Denver, 1883).

COLORADO. A town and the county-seat of Mitchell County, Tex., 245 miles west by south of Dallas. on the Colorado River and on the Texas and Pacific Railroad (Map: Texas, D 3). It is the commercial centre of an agricultural and stock-raising region, with a consider-

able trade in cattle and hides, and has also extensive salt-works. Population, about 2000.

COLORADO, *Sp. pron.* kō'lō-rá'pō. A name given by the Spaniards to various unrelated tribes in different parts of Spanish America, including Texas, owing to their custom of painting the body with red pigment. Of the tribes thus known, one of the most noted was that of the Sacchas, 'men,' as they call themselves, of whom a few still survive in the upper valleys of the Daule and Chones rivers, in northwestern Ecuador. They go naked, and are naturally light-skinned, almost blond, but paint their whole bodies with a red paint. They belong to the Barbaecan stock.

COLORADO, UNIVERSITY OF. An institution of higher learning, situated at Boulder, Colo. It was incorporated by the Territorial Legislature in 1861, and in 1876 the Constitution of Colorado provided for its erection as a State university. At the formal opening of the institution, in 1877, it consisted of the college and a preparatory department. The Medical School was organized in 1883, the Law School in 1892, and the School of Applied Sciences in 1893. In 1902 the University of Colorado comprised the following colleges and departments: (1) The College of Liberal Arts, offering courses leading to the degrees of B.A., Ph.B., and B.S.; (2) the Graduate Department, conferring the degrees of M.A., M.S., and Ph.D.; (3) the Colorado School of Applied Science, conferring the degree of B.S. in civil, electrical, and mechanical engineering; (4) the School of Medicine, conferring the degree of M.D.; and (5) the School of Law, conferring the degree of LL.B. Women are admitted to the university on equal terms with men. The university library contains 25,000 volumes, besides pamphlets. The total registration in 1901-02 was 510, excluding the preparatory department. The university is maintained by a direct State tax, and its government is vested in a State board of regents.

COLORADO COLLEGE. An institution of higher education, founded in 1874 and situated at Colorado Springs, Colo. The college offers courses leading to the bachelor's degree in arts, science, and philosophy, and has an attendance of 650 students. There are also connected with the college a preparatory school and a conservatory of music, and a department of fine arts. The buildings include Palmer Hall, the library building, and a science building, erected, with its equipment, at a cost of \$350,000. The library numbers about 35,000 volumes. The institution has an endowment of \$450,000.

COLORADO DESERT. An arid region of southern California (Map: California, F 5). It extends from the eastern base of the coast ranges of San Diego County eastward to the Colorado River, and embraces the Coahuila Valley, which extends toward the northwest between the San Bernardino and San Jacinto Mountains. A considerable portion of the desert, including part of the Coahuila Valley, is below sea-level. At some prehistoric period part of this region was included in the Gulf of California, from which it was separated by the growth of the delta of the Colorado River. Later it formed the basin of a fresh-water lake, and in recent times a considerable portion of the area has been flooded from the river, so as to produce a temporary

shallow lake, known as Salton Sea. The Southern Pacific Railroad crosses the northern part of this desert and traverses the Coahuila Valley. The Colorado Desert is but a portion of the great desert region of the southwestern United States, which includes also the Yuma and Mohave deserts.

COLORADO, RIO, *rê'ô*. A river of Central Argentina, rising in the Andes and flowing southeast. It empties into the Atlantic in about latitude 39° 50' S. (Map: Argentina, E 11). Its entire length is about 700 miles, but it is navigable for light vessels for only a couple of hundred miles. The upper course is through a desert.

COLORADO RIVER. A large river flowing through the plateau region of the southwestern United States. It is formed in the southwestern part of Utah, by the junction of the Green River from the north and the Grand from the northeast, the former rising in southwestern Wyoming and the latter in the north central part of Colorado. Both of these headstreams receive numerous tributaries from the well-watered regions of the Rocky Mountains. Below their junction, the Colorado passes through what is in some respects the most remarkable region on the earth, not only for its natural scenery, but also for the great interest which it possesses for geologists, as it gives on a grand scale the clearest exemplifications of the action of erosive forces in shaping the contour of the land. In the Eocene epoch the whole region of Arizona, Utah, and Nevada was subjected to a vast upheaval, and what was formerly the bottom of the ocean was raised to a height of more than 10,000 feet above sea-level. This region, consisting chiefly of horizontal strata of the Paleozoic and Mesozoic systems, was subjected to extensive denudation by wind and water, and again to successive upheavals accompanied by volcanic action. In the northwestern part the strata were faulted into huge blocks, running north and south, giving the present shape to the mountains of Nevada. The result of the uplifting and erosion was the washing away of the weaker and softer strata, especially to the west of the present course of the Colorado, while those rocks that were protected by harder layers were left standing as extensive plateaus with precipitous escarpments. In some places lavas had been thrust up through the strata by volcanic action, and these localities are now marked by the isolated *mesas* so characteristic of the country. Since this region is almost or quite rainless below an elevation of 8000 feet, denudation proceeds slowly except along the river-courses, where chasms or cañons are cut deeply into the rock foundations. Such is the case with the Colorado and all the tributaries from its headwaters to the great escarpment called the Grand Wash, on the western boundary of Arizona.

The largest and deepest of these is the famous Grand Cañon, where the Colorado cuts through the Kaibab and Unikaret plateaus, from 7000 to 9000 feet high, in the northern part of Arizona. The cañon is five to six miles wide at the top and 5000 to 6000 feet deep, falling in several successive escarpments, indicating pauses in the upheaval of the plateau. In the middle is the narrow and gloomy cañon proper, with a sheer precipitous depth of 2000 to 3000 feet, at the

bottom of which rushes the river. The length of the Grand Cañon is over 200 miles. After the river emerges from the cañon it turns abruptly south, and, forming the western boundary of Arizona, it flows through a low desert region, receiving almost no tributaries, and diminishing in volume by evaporation and absorption. Leaving United States territory near its mouth, it empties into the Gulf of California. The total length of the river is about 900 miles, and with the Green, 2000 miles. It is navigable for light steamers for several hundred miles from its mouth, but navigation is much impeded by rocks and sand-bars, as well as by the ever-changing volume of its water and the shifting of its bed. The river was discovered in 1540 by Fernando Alarcón, and the perilous descent through the cañon was first made by James White in 1867. Valuable additions to geological science have resulted from expeditions into the cañon, conducted by the United States Geological Survey. See J. W. Powell, *Exploration of the Colorado River of the West and its Tributaries*; and Dutton, *Tertiary History of the Grand Cañon of the Colorado*, *Monograph II., United States Geological Survey, 1882.*

COLORADO RIVER. A river rising in the western part of Texas, near the southeastern boundary of New Mexico (Map: Texas, F 5). It flows in a generally southeast direction across the State, and empties into the Gulf of Mexico through Matagorda Bay. It receives a number of tributaries, chiefly from the south; among these are Sulphur Creek, and the Concho, San Saba, and Llano rivers. The chief towns on its course are Bay City, Wharton, Columbus, Lagrange, Bastrop, and Austin. It is about 900 miles long, and in winter is navigable for river steamboats to Austin.

COLORADO SPRINGS. A city and county-seat of El Paso County, Colo., 73 miles south of Denver; on the Atchison, Topeka and Santa Fé, the Denver and Rio Grande, and other railroads (Map: Colorado, E 2). Its location, 6000 feet above the level of the sea, near the base of Pike's Peak and the celebrated mineral springs at Manitou, with a healthful climate, have combined to make the place a much-frequented resort. It is the seat of Colorado College, founded in 1874, and of State institutions for the deaf-mute and blind. Settled in 1870, Colorado Springs was incorporated in 1872, and is governed under a charter of 1878 (revised 1901), which provides for a mayor, chosen biennially, and a city council, elected by wards. Standing and special committees are appointed by the Mayor; also the chief and members of the fire department, members of the police department, market master, street commissioner, and health officer. Other offices are filled by the council. The water-works are owned and operated by the municipality. Population, in 1890, 11,140; in 1900, 21,085.

COLORADO STATE AGRICULTURAL COLLEGE. A scientific school of agriculture, situated at Fort Collins, Colo., organized in 1876. The college received 90,000 acres of the lands granted to the State in 1862, and since its inception has been supported chiefly by a State tax. Its gross income is about \$100,000. It offers courses leading to the B.S. and M.S. degrees. Women are admitted on equal terms with

men. The library contains about 11,000 volumes. The attendance is over 350.

COLORATION IN ANIMALS. See BIRD; INSECT; PROTECTIVE COLORATION; MIMICRY.

COLOR-BLINDNESS, ACHROMATOPSIA, OR DALTONISM. An incurable defect of vision, owing to which some persons are unable to distinguish certain colors. The name Daltonism is after Dalton, the English chemist, who suffered from the defect. Acquired color-blindness is a symptom of diseases of the optic nerve and retina. Congenital color-blindness usually affects both eyes, and is often hereditary. It is found in from 3 to 4 per cent. of men and less than 1 per cent. of women. It occurs in eyes whose power of vision is otherwise (as to form and distance) perfect. It is usually partial, being a failure to distinguish one or two of the fundamental colors—red, green, and blue. The eyes of persons having this defect of vision have been carefully examined after death without the discovery of any peculiarity. Color-blindness therefore has its seat in the sensorium, not in the visual apparatus. The Hering theory is that the retina contains three pairs of visual materials—white-black, red-green, and blue-yellow. Color-blindness is accounted for by the supposed absence of one or two of these substances. According to the Young-Helmholtz theory, there are three primary color-perceptions—for red, green, and violet. In the absence of one of these, a color appears composed of the others. The most common forms of color-blindness are red blindness, green blindness, and red-green blindness. To detect the defect, the method of having the patient name colors is not satisfactory, because colors may be differentiated by apparent differences of brightness. Professor Holmgren of Upsala, Sweden, devised a series of test wools which furnish the best means of recognizing defects. These are skeins of wool of certain colors ('test colors'), various tints and shades of the same colors, and so-called 'confusion colors.' When the patient attempts to match the colors with the other skeins, the confusion colors are often added also, and it may be noticed that there is some hesitancy in making the selections.

The question has received serious legislative attention, and in most of the States of the Union stringent laws have been passed regarding the examination of the vision of all who depend on colors for their guidance. It is a crime in color-blind persons to pursue any calling when their defect, known to them, is liable to injure others, and it might be added that it is foolish for a color-blind painter, tailor, or milliner to attempt to compete with those who have perfect vision.

The safety of the traveling public depends in large measure upon the accuracy with which green or red signals are observed by employees of railways and ships. Yet in but few countries is the matter of examination of color-sense demanded by statute. In Sweden, since 1877, only men with normal color-vision have been employed in the railway service. In Holland the Government controls the matter efficiently. In Italy, while there is no special law, the employees are tested. In France, in the absence of law about examination, Holmgren's test is usually employed. In Germany examination of color-sense is prescribed by law. In Austria, on the State

railroads, examination is made. In England there is no Government regulation, and the tests employed by certain companies are inefficient. Only three of the States of the United States—Ohio, Massachusetts, and Alabama—have enacted laws to control the matter. In some other States the railroad commissioners formulate regulations requiring the examination of employees, as in New York State. That the traveling public does not demand stringent laws compelling examination of color-sense in all countries is astonishing, and can be explained only by the fact that the prevalence of color-blindness and the possibility of its detection have been understood by the people only since 1875. In 1892 there were employed by the different railroad companies of the United States a total of 821,415 men, while the number of miles of railroad reached 171,563.25. Accepting 3.69 as the percentage of color-blindness among men, the startling number of 30,310 color-blind men were in positions of some sort among the employees mentioned. In some cases the proportion of employees with color-blindness is very small, owing to the adoption by companies of adequate tests and the proper selection of men. In 1880 the officers of the Pennsylvania Railroad invited Dr. William Thomson, professor of ophthalmology in Jefferson Medical College, Philadelphia, to advise and assist them in the examination of the sight of their 40,000 employees, scattered over more than 5000 miles of track, of whom 12,000 were actually dependent upon colored signals for their guidance. A system was devised by which men attached to each division of the road were examined, each in his own locality, by intelligent laymen, with Holmgren's skeins, arranged on what is called 'Thomson's stick,' and the cooperation of employees was secured. Reports were sent to the surgical expert, whose decision, after a final examination, was decisive. About 4.2 per cent. were found defective in color-sense. At a later examination, of 25,158 men, only 481, or about 2 per cent., were found color-blind, many men having left the company's employ before being detected, thus being able to secure positions on roads not requiring color-tests. In 1887 the same system of examination was adopted by the Philadelphia and Reading Railroad, with about 15,000 employees on 2200 miles of track, after a serious conflict between officials and employees, which was settled by Dr. Thomson. Of these men, 3.5 per cent. were declared color-blind. The Midland Railway and the London and Southwestern in England adopted the same method. In 1896, from responses to a circular addressed to one hundred of the most important railroad corporations of the country, controlling in all 129,970 miles, inquiring if examinations were made as to color-blindness of employees, it was learned that 35 roads, controlling 54,465 miles, were using Thomson's or other methods; 31 roads, controlling 29,428 miles, were making no test. No reply was received from 34 roads, controlling 46,077 miles. The New York Central Railroad began examining its employees about 1890, requiring them to report for tests of sight at either New York or Buffalo at stated times. This method being found disadvantageous, two physicians were employed about 1899, whose duty it is to travel over the system, examining and reexamining the men from time to time in their own localities.

This road, in June, 1901, employed about 40,000 men, and controlled 7137.31 miles of track, inclusive of the leased lines, such as the New York and Putnam; West Shore; Fall Brook; Boston and Albany, etc.; but exclusive of the great lines, such as the Lake Shore and Michigan Southern, included in the 'Vanderbilt system.'

(Philadelphia, 1896); and Thomson and Weiland, "Detection of Color-Blindness," in Morris and Oliver's *System of Diseases of the Eye*, vol. ii. (Philadelphia, 1897).

COLORED HEARING, or **CHROMÆSTHESIA**. The anomalous association of colors with sounds. It is the commonest type of synæsthesia, or the formation of unusual connections between sensations of different sense departments. While colored hearing is relatively frequent (statistics record one person in eight), it is exhibited in very varied forms. These may, however, be grouped, in the first place with regard to the nature and intensity of the photism (the color which is induced), and secondly with regard to the nature of the inducing sound. The induced color may, in rare cases (see works of Gruber and Whipple, indicated in the bibliography at the end of this article), be of hallucinatory intensity, so as to be seen objectively when the eyes are open. Usually the intensity is less—the photism is localized (Flournoy), though not projected. In the third grade the photism is 'imagined'—the color is really present as a visual sensation, but has no definite place; e.g. all soprano voices may be white, all tenor voices green. Fourthly, photisms may be simply 'thought,' no visual sensation being present. Finally, certain persons possess 'negative photisms'—they cannot say what color a sound has, but can say what colors it 'ought not' to have. Any auditory impression may serve as the inducing agency. The sources may, therefore, be grouped, for convenience, as (1) musical tones and noises (subdivided into single notes, chords and discords, musical selections, etc., each with further arrangement according to pitch, intensity, clang-tint of instrument), and (2) articulate speech (vowels, consonants, words, sentences).

Can we find any uniform relation between these two series of variables, the inducing sound and the induced color? Certain investigators, using the questionnaire method, have answered in the affirmative. Thus, Bleuler and Lehmann that "sharply demarcated, small, bright, or pointed photisms are aroused by high-pitched sounds. Red, yellow, and brown are frequent colors; violet and green are rare; blue stands midway in frequency. The tendency to secondary sensations (synæsthesia) is inheritable." Other investigators (e.g. Whipple), who have made detailed experimental studies of a few individuals, contend that the questionnaire method is inadequate, and that there is a considerable degree of variation, not only between individuals, but also for the same individual at different times, so that "generalization is at present to be avoided."

The explanation of colored hearing is usually found in the persistence in adult life of certain curious and useless connections between sensations. Childhood is characterized by the forma-

tion of countless mental combinations. Of these, only the useful or meaningful normally survive. The persistence or recrudescence in the mature individual of anomalous though not abnormal auditory-visual connections is the condition of chromæsthesia. The association may be direct (habitual or specific connection of sensations) or indirect (connections of sensations through the organic complex embodied in a feeling). The absence of abnormality is attested by the facts that colored hearing is no more frequent among neurotic than among normal individuals, and that the associations do not interfere with mental operations. They may, indeed, furnish positive sources of pleasure to their possessor.

COLORED METHODIST EPISCOPAL CHURCH OF AMERICA. See **METHODISM**.

COLOR-GUARD. A military escort for regimental colors. (See **COLORS**.) Formerly a position of great honor and considerable danger, when on active service; now used only on regimental parades, reviews, and inspections. The United States Infantry Drill Regulations define the composition of a color-guard as "one sergeant, who is the color-bearer, and two experienced soldiers, selected by the colonel."

The color is kept at the office or quarters of the colonel, unless required on parade, in which case it is escorted by the color-guard, marching in one rank, the color-bearer in the centre. It is returned in like manner.

COLOR PHOTOGRAPHY. The reproduction by photography of natural objects in their own colors. There is no means known at present by which, using ordinary photographic processes, this is possible. When a photograph is taken with a camera and a sensitive plate, the developed negative shows an image of the object in various shades of gray, which depend upon the sensitiveness of the photographic plate to the ether-waves characteristic of the colors of the natural object. It is possible so to stain a photographic plate that it is more or less sensitive to all colors; but the developed negative is always gray, except possibly for certain accidental colors which have not the faintest connection with those of the object photographed. To reproduce the colors, therefore, other methods are essential, and there are at the present time two quite distinct processes.

One of these is based upon the work and a suggestion of Prof. J. Clerk Maxwell (1831-79), of the University of Cambridge. He showed that if there were produced simultaneously in the normal eye three sensations—viz. definite shades of blue, green, and red—the eye could be made to perceive any desired color of the spectrum by properly adjusting the intensities of these three component sensations. Thus, if by any means—e.g. by sets of mirrors—the eye can be made to see at one time three ordinary photographs of any natural object, looking at one through a piece of red glass, another through a piece of green glass, and the third through a piece of blue glass, the

eye will see the object in its natural colors, provided the intensity of the deposit of silver on the original three negatives is so adjusted for each negative that the intensities of these red, green, and blue sensations are exactly such as to produce the proper color-sensations. To secure this intensity on the photographic plates, three photographs of the object must be taken, each through such a colored screen as will transmit enough light of all wave-lengths to produce the desired result on the plate. Thus, one plate is exposed in a camera in front of which is a screen which allows to pass a great deal of red and small amounts of yellow and green; the second is exposed with a screen which is transparent to the green and slightly to yellow and blue; the third is exposed with a screen which is transparent to blue and slightly to green and violet. It is a question of the most careful experimenting to find what photographic plates should be used, and what colored screens give the proper intensity with them.

There are three processes of color photography based upon this general idea. In the Ives process, the three photographs of identical sizes are taken simultaneously on three plates, each through its proper 'taking' screen. From these three negatives, three positives are made by contact; and these positives, each with its proper 'viewing' screen of pure red, green, or blue, placed in a so-called 'kromskop' in such a manner that sunlight is reflected through them and their screens, and all three pictures are seen superimposed apparently on each other. In another process invented independently by Professor Joly, of Dublin, and Mr. McDonough, of Chicago, the three colored screens through which the photographs are taken are combined by having a series of lines of these three compound colors ruled very closely together on a piece of glass, every fourth line having the same color. A single photograph is taken through this composite screen; a positive is taken of this, and a viewing screen, consisting of a series of lines, one a pure red, the next pure green, the next pure blue, with the same spacing as in the taking screen, is superimposed on the positive, so that the colored lines come in exactly the proper positions; and this compound plate is used as a transparency by holding it up to the light, or by looking through it at a piece of white paper which is brightly illuminated.

Quite a different process, although of the same general principle, has been invented by Professor Wood, of Johns Hopkins University. It depends for the production of the pure colors, red, green, and blue, upon the phenomena of diffraction gratings (q.v.), by means of which white light may be dispersed into pure colors. It is necessary to have three gratings ruled on glass, with grating spaces such that one gives the same deviation for the green as the other two do for the red and blue respectively. Three negatives are taken of the natural object, each through its own compound color screen; on these the three glass gratings are superimposed each on the proper one; positives are then taken through these compound negatives: the three images being superimposed by suitable lenses, thus forming a composite positive of the natural object overlaid with parallel lines suitably spaced and placed. By viewing a source of white light through this plate and using proper optical means, the object will be seen in its natural

colors, the dispersed colors of the three gratings serving in place of the viewing screens of the former processes.

An entirely different physical principle is made use of in the Lippmann method of color photography; it depends upon the fact that the colors seen by the eye are caused by ether-waves of different wave-number; and so, under proper precautions, it is possible to have 'stationary vibrations,' so called, produced. If one vibrates rapidly the end of a long rope, the other end of which is fastened to a wall, waves are sent along the rope; reflected waves are produced; and, as the direct and reflected waves are thus superimposed, there are certain points, regularly spaced, where the two waves neutralize each other's action, while in between these 'nodal' points the string vibrates exactly as if it were an ordinary string stretched between two fixed pegs. This is called a stationary vibration; and the distance between two nodal points equals half the wave-length of the train of waves which is the original cause of the vibration. The same phenomenon may be produced by ether-waves if allowed to fall upon a mirror. In Lippmann's process a photographic plate of particularly fine grain is placed so as to form one side of a bath containing mercury, the film side being away from the mercury. If light of a definite color falls upon the photographic plate, the waves enter the film, reach the mercury, are reflected, and form stationary vibrations. In between the nodes there will be chemical action, which is thus confined to plane surfaces, parallel to each other and very close together, their distance apart depending upon the wave-number of the light. If this photographic plate is now suitably developed, the nodal planes will be dissolved out largely, thus forming of the film a pile of parallel plates at minute intervals. If such a pile of plates is viewed with white light, it will appear to be of the same color as that of the light which produces the chemical action, owing to the phenomena of interference (q.v.). Similarly, if the colored light from any natural object falls upon the film in its original condition, each color will produce its own stationary vibration and its own set of parallel planes, where there is chemical action; and so, when developed and viewed in white light, the image will have the proper colors of the object itself. (The above explanation of the Lippmann process is not complete; it offers but a rough idea as to what takes place. In fact, a satisfactory explanation of all the phenomena is not known.)

To print in the natural colors the photograph of any colored object is perfectly possible by a simple modification of the method of Ives or of Joly-McDonough, which will be found discussed under THREE-COLOR PROCESS. For additional information upon the subject of color photography, the reader may consult: Wood, *Philosophical Magazine*, vol. xlvii. (London, 1899); Joly, *Nature*, vol. liii. (London, 1895-96); Lippmann, *Proc. Royal Society of London*, vol. lx. (London, 1896); Wiener, *Smithsonian Report* (Washington, 1896); Bolas, Tallent, and Senior, *A Handbook of Photography in Colors* (New York, 1900).

COLOR PRINTING. See THREE-COLOR PROCESS; LITHOGRAPHY.

COLORS, MILITARY AND NAVAL. The term applied to the national flag or ensign wherever

it is displayed and also to other flags, banners, or guidons carried by military bodies, and usually indicating their designation. Emblems, banners, or simular devices have been in use among soldiers and sailors from remotest antiquity. They have been conspicuous in the past for their great moral as well as practical value to the troops carrying them. The older, and more historic the colors, the greater their moral value; for the soldiers of succeeding generations would vie with each other in maintaining their traditions, and adding to their glory, with the result that many of the greatest exploits of military valor have been born of this desire. In practice they were the rallying-point of the organization, the embodiment of its history, and the material symbol of headquarters. They have been in use in every army and in every age up to comparatively recent times, when they have been displaced by the necessities of modern scientific warfare. They still retain their historic value, however, and to a certain extent their moral value also. With the British, infantry colors were originally known as *ensigns* (q.v.), each company carrying its own color. This soon gave way to the system at present in use, whereby each regiment or battalion is supplied with a royal or King's color, and a regimental color. The former is a *Union Jack* and the latter a flag of the same color as the facings (q.v.) of the regiment, with the blue union in the corner and the title, number, and honors of the regiment embroidered upon its folds. Both colors are made of silk, measure about three feet nine inches by three feet, and are each mounted on a pole of about eight and a half feet in length. Cavalry regiments of the Guard carry oblong *standards*, and dragoon regiments, *guidons*. Both types are made of crimson silk. The Royal Artillery, Royal Engineers, Lancers, Hussars, and Rifle regiments do not carry colors. Since the Zulu War of 1880, British troops no longer take their colors with them when on active service. See *ENSIGN*.

The colors carried in the United States Army by the various regiments and battalions are two in number, the national flag (see *FLAG*) and the regimental color, both of which are of prescribed size and form for the various arms of the service. The battalions of engineers carry the national flag, with the title of the battalion embroidered in silver on the centre stripe; and the battalion color, of scarlet silk having in the centre a castle, with the number of the battalion placed above the castle, and the words "U. S. Engineers" below. The artillery corps have similar colors, on which the corps device of two crossed cannon are emblazoned. Infantry regiments have the same national color as artillery and engineers; the regimental color being of blue silk, the coat of arms of the United States embroidered in silk on the centre, beneath the eagle, a red scroll with number and name of regiment embroidered in white; cavalry standards in size are somewhat smaller than those carried by the infantry and consist of a national flag made of silk. The regimental standard is of yellow silk, with the coat of arms of the United States embroidered in silk on the centre, beneath the eagle a red scroll, with number and name of regiment embroidered in yellow, fringe yellow.

According to the *United States Army Regulations* (1901, sec. 244) the national color will be

carried in battle (when it is invariably with the main body or reserve), campaign, and on all occasions of ceremony in which two or more companies participate. The regimental color is carried in like cases in battle and campaign, reviews and inspections. At other ceremonies it is carried only when specially ordered. The names of battles in which one or more companies of a regiment, or of the battalions of engineers, or of the artillery corps, have borne a meritorious part are engraved upon silver rings fastened on the pikes or lances of the colors. Each troop of cavalry and battery of field-artillery has a guidon (q.v.) on which the numbers or letters designating the command are inscribed. Camp colors are small flags used to mark the location of some particular corps, post, or other institution.

In naval usage colors play an equally important part. On board old-fashioned ships they are flown at the peak of the spanker gaff, but on recent ships a special flagstaff fitting in sockets at the stern is used for the colors. In port they are hoisted at 8 A.M. and kept hoisted until sunset. On board ships of the United States Navy when the colors are hoisted they are saluted by a call on the bugle, or the band, if there is one on board, plays the "Star-Spangled Banner." While the colors are going up and the bugle or band is playing all officers and men on the upper deck face aft and salute as the colors reach the head of the staff. Dipping the colors (i.e. lowering them a short distance and then hoisting them again) is a species of compliment or salute, but United States naval vessels are forbidden to dip their colors except in returning such a salute. Colors are half-masted to express mourning and hauled down to indicate surrender or submission. When colors are carried in a funeral procession they are draped with black crape.

COLOR-SERGEANT, sār'jent or sēr'- . In the United States Army, a non-commissioned officer of the rank of sergeant detailed for the color-guard (q.v.). In the British Army he is the equivalent, in rank, of the United States Army first sergeant, but formerly was one of the non-commissioned officers constituting the color-guard, from which fact the present title is derived.

COLORS OF THIN PLATES. See *LIGHT*, *Interference* and *Diffraction*.

COLOS'Æ (Lat., from Gk. *Κολοσσαί*, *Kolosai*, also spelled *Κολασσαί*, *Kolassai*). An ancient city of Phrygia in Asia Minor, on the river Lycus, a tributary of the Mæander. Colossæ was on one of the great ancient trade routes traversing Asia Minor, and is mentioned by Herodotus and Xenophon in such a way as to imply that it was at the time a city of considerable importance. Like its near neighbors, Laodicea and Hierapolis, it probably carried on an extensive trade in the dyed woolen goods for which the region was famed. In Roman times the town had lost a large share of its former importance. Christianity made its way to Colossæ in the days of Paul, not through his personal visitation, but probably through the evangelistic work directed during his long sojourn at Ephesus (cf. Acts xix. 10). During his first imprisonment at Rome Paul sent hither two letters, one addressed to the Church of Colossæ and the other to Philemon, an individual belonging to the church. (See *COLOSSIANS*; and *PHILEMON*.) During the third century A.D. the

town seems to have been insignificant, perhaps due to its not being able to recover from the great earthquake of about A.D. 60, which laid many towns in the neighborhood in ruins. Its place was taken by Chonæ, the modern Khonas, about three miles south of the ancient town.

COL'OSSE'UM. See AMPHITHEATRE.

COLOSSIANS, *kô-lôsh'i-anz* or *kô-losh'aniz*, EPISTLE TO THE (Gk. *πρὸς Κολοσσαίς*, sc. *ἐπιστολή*, *pros Kolossais*, to the Colossians, sc. *epistolê*, epistle). One of the New Testament group of Paul's Epistles. It is addressed to the Christians at Colossæ (q.v.).

It belongs, with Ephesians and Philemon, to a closely connected group of three writings of the Apostle, addressed to this same general region and produced within the same general time, evidently at Rome during the captivity mentioned in Acts. With Philemon it is connected by an identity of personal references; to Ephesians it is bound by a significant community of contents.

Its Pauline authorship has been vigorously assailed by such individual critics as Mayerhoff (1838) and Holtzmann (1872), and by such schools as that of Tübingen (1845)—the critics holding that it gives proof of a literary imitation of other writings (Ephesians) which prevents it from being considered genuinely Paul's; the school claiming that it betrays such a presence of second century Gnostic ideas as to make it necessary to assign it to that post-Pauline age. Neither of these contentions is accepted by the best scholars of the present time. As a matter of fact, assuming, as a working hypothesis, the claim involved in the Epistle's greeting that it was written by Paul, the document shows itself throughout so consistent with the claim as to make it critically impossible to deny its validity.

Within the circle of those who accept its Paulinity, however, the chief question among critics to-day concerns the nature of the errors opposed by the Apostle. From a careful study of the Epistle the following facts are apparent: (1) The errors had not so developed as to cause separation from the Church (the phrase in ii. 19 "not holding fast to the Head" could hardly be said of full separatists). (2) The teachers were Jews, and Jews of a Judaistic type (the references to circumcision in ii. 11 and to the ordinances of the law in ii. 14 show that Paul was opposing propagandists of a Jewish legalistic character). (3) At the same time they went beyond this type (see the mention of 'Drink' in the warning of ii. 16, an element which did not enter into the restrictions of the Judaizers; see also the designation of their position as being "according to the traditions of men," ii. 8, and "according to the precepts and teachings of men," ii. 22, which would not have been Paul's way of designating the Judaistic position that rested on the authority of the Old Testament law; notice also the absence of all antithesis between faith and works and of any insistence on legalism as necessary to salvation, which were characteristics of the Judaistic propaganda). (4) In fact, there are passages which seem to show these teachers to have been open to the influence of Essenism, though they do not show them to have been Essenes (e.g. ii. 20-23, which describes their regulations as an ascetic severity toward the body—*ἀσφειδία*—though asceticism is evidently not represented as practiced

as an end in itself, as it was with the Essenes; ii. 18, which shows them to have been given to angel-worship, a cult which was more consonant with Essenism than with the practice of Judaizers, though this worship was apparently accompanied by visions which were foreign to Essenism). (5) There are passages which seem to indicate the presence of Gnostic elements in these errors (e.g. ii. 2-9, which give us characteristic Gnostic terms such as "the *mystery* of God," "all the *fullness* of the Godhead," also ii. 10, which discloses the distinctive Gnostic idea of a graded series of supernatural beings, conceived of as emanations from God—"who is the head of all principalities and powers." This idea is repeated in verse 15—"having despoiled the principalities and powers"—and appears in various forms in the long passage i. 15-20, e.g. "the first-born of all creation"—"in Him were all things created, in the heavens and upon the earth, things visible and things invisible, whether thrones or dominions or principalities or powers"—"He is the head of the body, the Church, who is the beginning, the first-born from the dead," which latter passage, together with ii. 9-11, 15, 19, shows the significant emphasis placed by the Apostle upon the supremacy of Christ, in both the physical and the spiritual worlds, and the absolute essentiality of union with Him in order to foster spiritual life and well-being. This would combat the Gnostic tendency to subordinate Him to the category of these angelic emanations, which would thus seem to have been one of the Errorists' ideas). (6) These errors, moreover, while vague and indeterminate, appear to have had with these false teachers an inter-related form and to have been promulgated in a dogmatic way (cf. ii. 4, 8, 18), being held forth as a mystery for the initiated (ii. 2-3; iii. 3).

It would thus seem that these errors constituted a teaching of a more or less systematic kind, in which the underlying speculative principles were brought to bear upon the rule and habit of life; that it was something more than mere Judaism, even Judaistic Judaism; that, in its main features, it was influenced by the Essenic attitude of mind and possessed elements which appear in the Gnosticism of the second century. The great difficulty is in historically locating such a combination as is thus presented before us.

In the effort approximately to accomplish this locating it is to be remembered: (1) That, while these errors constituted a system of teaching, the system was not a fully developed one—at least Paul does not so treat it. (2) That Gnosticism was, in reality, an attempt to assimilate Christianity and philosophy, and that its philosophic element was a mystical rather than a logical one; so that we should be prepared to find the place of its beginnings in the East rather than the West. (3) That this attempt at assimilation was made on the principle of eclecticism, Gnosticism being, in fact, a combination of Jewish, Pagan, and Christian elements, the Jewish element being furnished by Essenism, the Pagan by Hellenic philosophy and Oriental theosophy, the Christian by the evangelistic preaching. (4) That Essenism, in particular, was a thoughtful tendency working in all Jewish minds, which, while never passing, as an organization, beyond Syria, where it originated in the second century

B.C., yet, as a dynamic influence, must have been more or less present throughout the Diaspora and was not likely to have been absent even from the Jewish membership of the Christian Church. (5) That, as this Essenic tendency came in contact with Eastern speculation, it fermented, and this fermentation, going on within the Christian Church and in contact with Christianity, produced the germs of Gnosticism.

Inasmuch, therefore, as this Epistle was sent to a church of the East, in the region where and at the time when the thoughtful Jew and the philosophic Greek and the theosophic Oriental were coming together—especially to this region of Phrygia, the Jews of which had been imported out of Babylon, and from which place they may have brought with them an Oriental habit of Jewish thought—it would seem as though we had in these Colossian errors a specimen of just that process of fermentation which produced the beginnings of Gnosticism.

The attempt of Harnack and others to consider the Apostle as referring to parish difficulties of a purely practical nature, devoid of all speculative elements, results from a superficial exegesis which does not take the Epistle seriously.

COLOSSOCHELYS, kô-lôs'sô-kê'lis (Neo-Lat., from Gk. κολοσσός, *kolossos*, colossus + χέλυς, *chelys*, tortoise). A gigantic fossil turtle found in the Pliocene deposits of India. See **TURTLE**.

COLOSSUS (Lat., from Gk. Κολοσσός, *Kolosos*). A rare Greek word of unknown origin, used to denote a statue very greatly above the size of life. In English, the adjective colossal is used in a somewhat wider sense, to denote all statues which exceed the size of life. The colossal was the peculiar characteristic of Egyptian art, and innumerable colossi were raised in Egypt, mostly of the hardest stone, many of them 50 to 60 feet in height. Among the most celebrated are the two statues of Amenophis III., near Thebes, one of which was called by the Greeks 'Memnon,' and famed for its supposed vocal qualities. But it was in the artistic world of Greece that the most famous colossi appeared: e.g., the bronze statue of Pallas Athene, on the acropolis of Athens, the plume of whose helmet and the point of whose spear were landmarks to sailors between Sunium and Athens; another

statue of the same goddess, of gold and ivory, in the Parthenon at Athens; and the Olympian Zeus, of the same material, the masterpiece of Phidias, who was also the author of the two statues just mentioned. Among the seven wonders of the old world was reckoned the gigantic Colossus of Rhodes, representing Helios, the sun-god, the national deity of the Rhodians. It is said to have been the work of Chares, of Lindus, a famous pupil of Lysippus. It was erected by the Rhodians, at a cost of 300 talents, apparently as a thank-offering after the successful defense of the city against Demetrius. It is said to have been of bronze, cast in separate pieces, and to have occupied the artist twelve years. It was set up about B.C. 280, but fifty-six years later was overthrown by an earthquake, and lay in ruins, until in A.D. 653 the Arabs captured the city and sold the metal to a Jewish merchant. The height is variously stated, but was probably about 90 feet. The Hellenistic age seems to have taken delight in colossal statues and groups, and the Romans followed the Greeks. We hear of a statue of Jupiter on the Capitol made from the spoils of the Samnites, of such a size as to be visible from the Alban Hills. More celebrated was a Colossus of Nero, executed in marble, of the enormous height of 110 or 120 feet, from which the neighboring amphitheatre is believed to have derived the name of 'Colosseum.' At the death of Nero the head was changed to that of the sun-god. It was subsequently moved by Hadrian to make room for his temple of Venus, and finally disappeared during the Middle Ages. Its later pedestal was discovered in 1828, and may be seen between the Colosseum and the temple built by Hadrian. In modern times many colossal statues have been set up. Especially celebrated are the "Bavaria," at Munich, the "Germania," at the Niederwald on the Rhine, the equestrian statue of Peter the Great in Saint Petersburg, and the Bartholdi statue of "Liberty Enlightening the World," in New York Harbor.

COLOS'TRUM (Lat.). A term applied to the first milk yielded after the birth of the young. It differs materially from ordinary milk in appearance and composition, and is ordinarily considered unfit for consumption or manufacture. When examined under the microscope it is found to contain, in addition to the ordinary fat globules of milk, peculiar aggregations of very minute fat granules, which are known as colostrum corpuscles, and which are probably the debris of the cells of the mammary gland. The chief chemical differences between colostrum and milk are a larger percentage of total solids (20-30), a much greater proportion of albumin and ash, and much less milk-sugar. The fat differs somewhat in character from that of normal milk, containing considerable cholesterol. Colostrum exerts a purgative effect upon the newborn infant, and thus removes the meconium which has accumulated in the fetal intestine. Colostrum disappears as such within a few days after parturition, gradually assuming the characteristics of normal milk.

COLPEO. A fox-dog (*Canis Magellanicus*) of Patagonia and Tierra del Fuego, larger, redder, and more wolf-like than the other South American species. See **FOX-DOG**.

COLPORTAGE (from Fr. *colporteur*, to carry on one's neck, from *col*, Lat. *collum*, neck + *porter*, Lat. *portare*, to carry). The distribution of religious publications, books, tracts, and periodicals, by carriers called *colporteurs*.

COLQUHOUN, kó-hóon'. ARCHIBALD ROSS (1846—). An English traveler, born at sea off the Cape of Good Hope. He became associated with the Indian Department of Public Works in 1871. After acting as secretary of the British Commission to Siam, he in 1881-82 and 1883-84 made extensive tours of exploration in order to find a convenient route for a railway between India and China. He became administrator of Mashonaland in 1890, and subsequently visited Central America as a representative of the Panama and Nicaragua canal projects. His publications include *Across Chrusé* (2 vols. 1883); *The Opening of China* (1884); *English Policy in the Far East* (1885); *The Key of the Pacific* (1895); *China in Transformation* (1898); *Overland to China* (1901); he was also joint author of a *Report* on railway communication between India and China (1885) to the establishment of which he has devoted his best energies.

COLQUHOUN, Joux (1805-85). A Scottish writer on sport. He was born at Edinburgh, and was educated at the university in that city. In 1840 he recorded his manifold adventures as a sportsman in the extremely interesting and popular volume entitled *The Moor and the Loch*, which has passed through six editions.

COLQUHOUN, PATRICK (1745-1820). An English police magistrate and writer, distinguished for his efforts in behalf of administrative reform and the amelioration of the condition of the poor. He was born at Dumbarton, and at an early age went to Virginia, where he became a successful merchant. Returning to Glasgow in 1766, he became prominent in public affairs, and in 1782 founded the Glasgow Chamber of Commerce, the oldest institution of its kind in Great Britain. He removed to London in 1789, and published there in 1795 his famous *Treatise on the Police of the Metropolis*, in which he advocated a complete reform of the police system of that city. Several of the recommendations made by him in the work, which passed through seven editions, were subsequently adopted. In consequence of the numerous important municipal reforms introduced by him, he was appointed magistrate at Westminster, London, in 1798.

COLQUHOUN, Sir PATRICK, or MAC CHOMBAICH DE (1815-91). An English lawyer. He was a great-grandson of Patrick Colquhoun (q.v.) and was educated at Westminster, Cambridge, and Heidelberg. He was for many years a member of the diplomatic service, more particularly in Saxony, where he was counselor of legation until 1866. He also held the position of Chief Justice of the Supreme Court of the Ionian Islands while these were under British rule (1861-64). His principal work is the *Summary of the Roman Civil Law* (1849-60).

COLQUITT, ALFRED HOLT (1824-94). An American soldier and politician, the son of Walter T. Colquitt (q.v.). He was born in Walton County, Ga., graduated at Princeton in 1844, and was admitted to the bar in the following year. He volunteered for service in the United States Army at the beginning of the Mexican War; was

soon afterwards appointed major, and served as an aide to General Taylor at the battle of Buena Vista. From 1853 to 1855 he was a prominent Democratic member of Congress, but at the expiration of his term declined a renomination. On the approach of the Civil War he became an active secessionist, and was a prominent member of the Georgia secession convention. He enlisted in the Confederate Army early in 1861; quickly rose from the rank of captain to that of major-general; was engaged in most of the operations in Virginia; distinguished himself at Antietam and Petersburg, and was in command at the battle of Olustee, Fla. After the war he was Governor of Georgia from 1876 to 1882, and was a member of the United States Senate from 1882 until his death.

COLQUITT, WALTER T. (1799-1855). An American lawyer and politician, born in Halifax County, Va. He studied at Princeton, read law at Milledgeville, Ga., was called to the bar in 1820, and practiced with eminent success, first at Sparta and later at Cowpens. In 1834 and 1837 he was a member of the State Senate of Georgia, and from 1839 until his resignation in 1840 occupied a seat in the Federal House of Representatives. In 1842-43 he was again in Congress, and from 1843 until his resignation in 1848 was a United States Senator. He was originally a States-rights Whig, but became a Van Buren Democrat. During the Mexican War he was strongly opposed to the Wilmot Proviso (q.v.).

COLT, kólt, SAMUEL (1814-62). An American manufacturer, inventor of the revolver. He was born in Hartford, Conn., where he worked in his father's factory. Obtaining a knowledge of chemistry, he lectured on that subject in the United States and Canada, and in 1835 secured patents for a revolving pistol, a wooden model of which he had made while at sea when a boy. In the same year the Patent Arms Company was formed for the manufacture of his invention, but became insolvent in 1842 through insufficient demand for its product. In 1847 Colt contracted to make 1000 weapons for General Taylor, and the improvement of the revolver, together with the increased demand for it, set the business on a stable footing, while new improvements were constantly made in the weapon. In 1852 he built a large armory in Hartford, where, besides firearms, machinery is made for their manufacture in other places, notably at the English and the Russian arsenals. He invented a battery for submarine harbor defense, and in 1843 laid and successfully tested in New York Harbor the first submarine telegraph cable. His line was insulated with a combination of cotton yarn, beeswax, and asphaltum, incased in a lead pipe, gutta-percha not then having been discovered.

COLTON, kólt'on, WALTER (1797-1851). An American writer. He was born in Rutland, Vt., graduated at Yale and Andover, and for several years was professor of moral philosophy and belles-lettres in the Middletown (Connecticut) Academy. In 1831 he became chaplain in the navy. He was made alcalde of Monterey, Cal., in 1845, and founded the *Californian*, the first newspaper published in that State. He also built the first school-house and made the first announcement of the discovery of gold. Colton edited newspapers in Washington, Charlestown, Mass., and Philadelphia, and published *Ship and*

Shore in Madeira, Lisbon, and the Mediterranean (1835); *A Visit to Athens and Constantinople* (1836); *Three Years in California* (1850); and *Deck and Port* (1850), besides other lively stories of travel and the sea.

COLTSFOOT. See TUSSILAGO.

COLU'BRIDÆ (Neo-Lat. nom. pl., from Lat. *coluber*, serpent). The largest and most scattered family or group of snakes. It is variously limited by systematic authors, and has served as a residuary group for all serpents not easily classified elsewhere, so that a definition is difficult. The group, however, may be said to include the 'common' small, harmless serpents everywhere. The garter-snakes, water-snakes, hog-nose, etc., are North American representatives of this family, to which, indeed, all non-venomous American snakes belong except a few species along the Mexican border.

COLUGO, kó-lóo'gò, or KAGUAN. See COBEGO.

COLUM'BA, SAINT, SAINT COLUM-CILLE, or SAINT COLM (521-597). An Irish missionary, one of the greatest names in the early ecclesiastical history of the British Isles. He was born at Gartán, County Donegal, northwest Ireland, December 7, 521. His father was Fedhilmidh, of the powerful Clan O'Donnell, and related to several of the rulers of Ireland and West Scotland; his mother was Eithne, who also boasted royal ancestry. He studied first at Moville, County Down, five miles south of Bangor, on Belfast Lough, under Bishop Saint Finnian, and was ordained deacon by him; next under another Saint Finnian, at Clonard, who ordained him a priest. He was early distinguished by his piety, and the name Columba, i.e. dove, was recognized as an appropriate one. He showed rare monastic zeal. In 545 he founded the church and monastery of Derry, and in 553 those of Durrow, not far west of Dublin. The latter became of great importance, and in both places the saint is still commemorated by a well and a stone. He founded other monasteries, the chief of which was Kells. In 561 he embroiled himself in the civil strifes of his country and was charged with having incited the bloody battle of Culdreimhne (now Cooladrummon), because he appealed to his tribe to defend by force of arms the copy of the Latin Psalter which he had made from one borrowed of his old teacher, Saint Finnian of Moville. But for being thus the occasion of bloodshed he was censured by 'an Irish ecclesiastical synod, and recommended to do penance by foreign missionary labor. Accordingly, in 563, he headed a little company of twelve disciples and sailed across to the west coast of Scotland, and landed upon the little island of Hy, since called I-colum-eille, but better known as Iona. It lies just opposite Oban. There he began the great work of converting the Picts, to which he owes his fame. His missionary operations were probably very simple, consisting of persistent personal appeals. In the legends which are told about him, as in the life of him by Adamnan and in the *Book of Deer*, a Celtic MS. of the eleventh or twelfth century, preserved at Cambridge, England, edited by John Stuart for the Spalding Club (Aberdeen, 1869), the miraculous cures. Many miraculous occurrences are narrated of him, whose traditions still linger in the scenes of his labors. He promoted monasticism, overcame the opposition of the Druids, made

many converts, including royal personages, and founded many churches. As in Ireland, so in Scotland, he took part in secular affairs, and at least one battle is said to have been incited by him. He died at Iona at midnight between June 8 and 9, 597, and left an imperishable name. With loving care his bones were enshrined, and his relics—the stone pillow on which he slept, the books he loved so well, the staff which was the symbol of his pastoral authority, and other objects which he had used—were long preserved and exhibited. Columba was a poet, and three Latin hymns now extant are attributed to him. In one of them, the "Altus Prosator," published with an English paraphrase, by John, Marquis of Bute (Edinburgh, 1872), each strophe begins with a different letter, in alphabetical order. Besides these, some Celtic poems are attributed to him, and a Rule (printed in Celtic and English in Haddon and Stubbs, *Councils and Ecclesiastical Documents*, ii. 119, and in English only in Skene, *Celtic Scotland*, ii. 508).

Columba was an ascetic, capable of any amount of deprivation. He was an eager student and made copies with his own hand of documents which fell in his way. Two of these—the *Book of Kells* and the *Book of Durrow*—were long preserved. His energy sometimes led him to harsh actions, but that he was tender-hearted the affection of his monks evinces. He seems to have had original ideas upon Church government; for Bede writes of Iona that its ruler was "an abbot, who is a priest, to whose direction all the province, and even the bishops, contrary to the usual method, are subject, according to the example of their first teacher [Columba], who was not a bishop, but a priest and a monk" (*Eccles. Hist.*, iii. 4). Bede then criticises the Columban monks because they did not, until 715, keep Easter after the Western manner, but upon the 14th of Nisan, or whatever day it came, as the Eastern Church did. Other peculiarities of the Columban monks, presuming that they followed the Irish models, was that they lived in huts grouped around a church and surrounded by a wall; each hut had its head, but all were under the abbot, who performed episcopal functions though not usually a bishop, and was a spiritual father to all the community, and when he pleased summoned all the members to him by ringing a hand-bell, one of the insignia of his office. The monks dressed in an undergarment covered by a coarse woollen wrapper fastened around the waist by a rope. They shaved the front part of their heads from a line drawn over the top from ear to ear. Their religious services were numerous and strictly attended to, but the rest of their time was spent in labor, either in working upon their fields and tending cattle (for they raised what they needed for their support), or in copying books, particularly the Bible, or in studying or in teaching others. Latin was spoken as well as Celtic, and was employed by them in writing. Some of the monastic communities contained famous schools, where Greek and even Hebrew were taught. The continuance of the memory of Saint Columba in Scotland is shown by the fact that his is one of the commonest names given to a church, even to-day, among the Presbyterians. The life of Saint Columba was written by two of his successors in the abbacy of Iona—Cuimíne Ailbhe, seventh abbot (657-69), whose *De Virtutibus*

Sancti Columbae (printed by Pinkerton, London, 1789; Paisley, 1889) was incorporated in the *Vita Sancti Columbae* of Adamnan, the ninth abbot (679-704). But both these writers are concerned not so much with the life as with the prophecies, miracles, and other unusual phenomena which were ascribed to their subject, and so the amount of real biographical facts is very small. This 'life' by Saint Adamnan is, however, one of the best of the mediæval lives of saints. It has been edited in a very superior manner, first by W. Reeves (Dublin, 1857), and again upon Reeves's edition by J. T. Fowler (Latin text and English notes, Oxford, 1894; English translation of the text, 1895).

COLUM'BÆ (Lat. nom. pl. of *columba*, dove). An order of birds, containing the pigeons (Columbidae and allied families) and the dodos (Didiidae). See DODO; DOVE; PIGEON.

COLUM'BAN, or **COLUMBA'NUS**. SAINT (543-615). One of the most learned and eloquent of the many missionaries whom Ireland sent to the Continent during the Dark Ages. He was born in Leinster. Having studied under Saint Congall, in the great monastery of Bangor, in Ulster, he passed over to France, accompanied by twelve companions, and in Austrasia and Burgundy, near the southern extremity of the Vosges Mountains, founded the monasteries of Anegray, Luxeuil, and Fontaine. His adherence to the Irish rule for calculating Easter involved him in controversy with the French bishops about 605; and a few years later the courage with which he rebuked the vices of the Burgundian Court led to his expulsion from France. Passing through Switzerland into Lombardy, he founded, in 612, the famous Monastery of Bobbio, in the Apennines, where he died on November 21, 615. The writings of Saint Columban, which are wholly in Latin, consist of a rule for the government of his monastery, a few poems, several letters on ecclesiastical affairs, and sixteen short sermons. His monastic rule has been printed more than once; but the most complete edition of his works is in Patrick Fleming's *Collectanea Sacra*, published at Augsburg in 1621, and at Louvain in 1667. It is reprinted in Migne, *Patrol. Latina*, lxxx. Of the sermons of Saint Columban, M. Guizot remarks that "the flights of imagination, the pious transports, the rigorous application of principles, the warfare declared against all vain or hypocritical compromise, give to the words of the preacher that passionate authority which may not always and surely reform the soul of his hearers, but which dominates over them, and, for some time at least, exercises paramount sway over their conduct and their life." The town of San Colombano, in Lombardy, takes its name from the Irish monk, as the town and Canton of Saint Gall (q.v.), in Switzerland, perpetuate the name of the most favored of his disciples. For his life, consult: Jonas, who was almost a contemporary and one of his successors as the Abbot of Bobbio, in Migne, *Patrologia Cursus Completus* (Paris, 1857-60); also W. F. Besser, (Leipzig, 1857); and J. K. Zimmermann (Saint Gall, 1865).

COLUMBARIUM (Lat., dove-cote, from *columba*, dove). From a fancied resemblance to a dove-cote, the name given to the niches in Roman burial-places arranged in rows around the walls of the sepulchral chambers to receive the little

urns or sarcophagi of marble or terra-cotta containing the ashes of the deceased: finally, to the sepulchral chamber itself. Tombs of this description were chiefly used by the poorer classes who could not afford separate tombs, and were erected by great families for their slaves and dependents, or by funeral associations or corporations under the Empire. Several perfect examples have been found near Rome; among them, those of the Vigna Codini, at the Licinian Gardens. Others exist at Naples and elsewhere in Italy. The *ustrina*, or places for incinerating the bodies, were attached to the columbaria. In recent times the term columbarium is applied to a room or hall connected with a crematory, and provided with niches for the cinerary urns.

COLUM'BA'S ISLE. The poetic name for the island of Iona, on the western coast of Scotland, where Saint Columba, 'The Apostle of Caledonia,' founded a monastery about 565, and was buried in 597.

COLUM'BIA (Neo-Lat., from *Columbus*). The name under which the United States is usually personified.

COLUMBIA. A name formerly applied to the region, west of the Rocky Mountains, embracing British Columbia and the States of Washington and Oregon.

COLUMBIA. A city and county-seat of Boone County, Mo., 144 miles west-northwest of Saint Louis; on the Wabash Railroad, and connected by a branch with the Missouri, Kansas and Texas system (Map: Missouri, D 3). It has flouring and planing mills, elevators, and manufactures of agricultural implements; also farming, fruit-growing, and stock-raising interests. The city is the seat of the State University, organized in 1842; State Agricultural College; and of institutions for women, Christian College (Christian), established in 1851, and Stephens College (Baptist), founded in 1856. The monument to Thomas Jefferson originally erected in Monticello, Va., is located here, also a State hospital and a United States Government experiment station. Settled in 1820, Columbia is governed by a mayor, elected biennially, and a city council. Population, in 1890, 4000; in 1900, 5651.

COLUMBIA. A borough in Lancaster County, Pa., 28 miles southeast of Harrisburg; on the Susquehanna River, here more than a mile wide, and on the Pennsylvania and the Philadelphia and Reading railroads (Map: Pennsylvania, E 3). It is an important industrial centre, its manufactures including boilers and engines, iron, laundry machinery, silk, lace, shirts, wagons, brushes, flour, novelties, malt liquors, stoves, etc. Wrightville, on the west bank of the river, is connected with the borough by one of the longest bridges in the United States. The place was founded in 1726 by English Quakers from Chester County, and was for many years called Wright's Ferry. In 1789 it was proposed to locate the capital of the United States here. In June, 1863, the original bridge was burned to prevent the Confederate troops from marching on Philadelphia. Population, in 1890, 10,199; in 1900, 12,316.

COLUMBIA. The capital of South Carolina, and county-seat of Richland County, on the east bank of the Congaree River below the junction

of the Broad and Saluda rivers, 84 miles north-east of Augusta, Ga., and 137 miles northwest of Charleston; on the Southern, the Atlantic Coast Line, and the Seaboard Air Line railroads (Map: South Carolina, D 2). It is at the head of steam navigation on the river, and is on the Columbia Canal, which furnishes abundant water-power (13,000 horse-power). The city is handsomely laid out with streets well shaded and crossing at right angles, and has a fine park. Among the prominent buildings are the Capitol, court-house, city hall, the State insane asylum, and the State penitentiary. The city maintains a municipal hospital and a public library. The educational institutions include the South Carolina College, opened in 1805; Presbyterian Theological Seminary; Columbia Female College (Methodist Episcopal, South), opened in 1859; Presbyterian College for Women, opened in 1890; Allen University (African Methodist Episcopal), opened in 1881; and Benedict College (Baptist) for colored students. Columbia is the seat of a very considerable manufacturing industry, principally in cotton; and there are also sash and door factories, iron-works, foundries, and machine-shops, etc. The government of the city, under a charter of 1854, revised in 1894, is administered by a mayor, who holds office for two years, and a city council elected by wards. The executive appoints one trustee in public schools; and the city clerk, auditor, engineer, police commissioners, and clerk of market are all selected by the council. The water-works are owned and operated by the municipality. Population, in 1890, 15,353; in 1900, 21,108.

In response to a demand for a more central place of government than Charleston, the Legislature in 1786 ordered Columbia, which had been settled about 1700, to be laid out, and in January, 1790, it met there for the first time. On February 17, 1865, General Sherman, at the head of the Union army, entered Columbia, and that night a fire broke out, raging for a day, which destroyed three-fifths of the city, including the old State House and its library of 25,000 volumes, a convent, several churches, the railroad depot, and much cotton. After the war, however, Columbia rapidly recovered its prosperity.

COLUMBIA. A city and county-seat of Maury County, Tenn., 45 miles south of Nashville, on Duck River, and on the Louisville and Nashville, the Nashville, Chattanooga and Saint Louis, and other railroads (Map: Tennessee, D 5). It is the centre of a fertile agricultural region, and an important grain and live-stock market. It controls large phosphate interests, and has cotton and flouring mills, pump-factory, etc. A United States arsenal is located here. Settled in 1811, Columbia was first incorporated in 1822. It is governed under a revised charter of 1893, which provides for a mayor, elected every two years, and a council elected on a general ticket. Population, in 1890, 5370; in 1900, 6052.

COLUMBIA, BRITISH. See BRITISH COLUMBIA.

COLUMBIA, DISTRICT OF. See DISTRICT OF COLUMBIA.

COLUMBIA CITY. The county-seat of Whitley County, Ind., about 100 miles north by east of Indianapolis; on the Wabash and the

Pittsburg, Fort Wayne and Chicago railroads (Map: Indiana, D 1). Population, in 1890, 3027; in 1900, 2975.

COLUMBIAD. A heavy gun invented by Colonel Bomford and combining some of the features of the gun, howitzer, and mortar, answering in this respect to the modern breech-loading

COLUMBIAD.

rifled mortar or howitzer. It appeared early in the nineteenth century and was in use until after the War of the Rebellion. See ARTILLERY; also BALLISTICS; GUNS, NAVAL; and ORDNANCE.

COLUMBIAD, THE. A lengthy poem, by Joel Barlow (1807), enlarged from his previous *Vision of Columbus* (1787), and incorporating also some of his other poems.

COLUMBIAN EXPOSITION. See WORLD'S COLUMBIAN EXPOSITION.

COLUMBIA or **OREGON RIVER.** One of the largest rivers of North America, rising in the eastern chain of the Rocky Mountains in British Columbia, in about latitude 50° N. and longitude 116° W. (Map: Washington, E 4). It flows at first northwest as far as latitude 53°, and then turns sharply on itself and flows south into Washington. Just before crossing the boundary, it is joined by the Pend Oreille River (Clarke's River or Fork), a large branch from the east. In Washington it flows in a winding course, at first south (to its junction with Spokane River), then west, then south, and then southeast to the Oregon line in about longitude 119° W. Near the Oregon boundary it is joined by its largest branch, Snake River, which rises in Yellowstone Park. Below the point of junction the river flows in a westerly direction, forming the boundary between Oregon and Washington over the remaining distance to the Pacific, being joined on its way by the John Day, Deschutes, and Willamette rivers from the south. Its head-waters drain the Rocky Mountain region on the west from about latitude 54° N. to about latitude 42° N. Its length is 1300 to 1400 miles. Its drainage area is fully 300,000 square miles, and its low-water flow at the Dalles, Oregon, is 108,000 cubic feet per second. The river is broken by falls and rapids into many separate portions; the first navigable reach is that from its mouth to the Dalles, 190 miles in length. From Celilo, 13 miles above the Dalles, it is navigable to Priest Rapids, 198 miles, and for several shorter stretches farther up, the total navigable length amounting to 756 miles. The total navigable mileage of the Columbia and its branches is 2132 miles. The important city of Vancouver, Wash., is built on its northern bank, just above the entrance of the Willamette, and Astoria, Oregon, is situated at the mouth of the river. The value of the river as a waterway is lessened by the fact that the entrance to its mouth is obstructed by a bar. Large vessels, however,

ascend the Columbia to Vancouver, and also the Willamette to Portland. The tide ascends to the cascades about 150 miles from the sea, which are overcome by vessels through a lock constructed by the United States Government. (See JETTY.) The Columbia is famous for its salmon fisheries. This great river was long vaguely believed to exist. Its mouth was discovered only in 1792, by Captain Gray, of Boston, Mass., who gave it the name of his own vessel in place of the name Oregon. It was explored by Lewis and Clark in 1804-05.

COLUMBIA SALMON. See QUINXAT. •

COLUMBIA UNIVERSITY. One of the oldest educational institutions in the United States, situated in New York City. The first step toward its foundation was the authorization in 1746 by the Colonial Assembly of public lotteries for the establishment of a college in the Province of New York. The proceeds, amounting in 1751 to £3443 18s., were vested in a board of ten trustees, of whom seven were members of the Church of England. The preponderating English influence thus represented, and the application of the trustees for a royal charter, excited much opposition in New York, where it was thought that the college should be entirely an American institution. Nevertheless, a charter for 'King's College' was obtained from George II. in 1754, and the management of this college was vested in a corporation composed of the Archbishop of Canterbury, the Governor of the Province, and other Crown officers *ex officio*, the rector of Trinity Church, the ministers of the Dutch Reformed churches, and twenty-four gentlemen of New York. In the following year Trinity Church conveyed a considerable plot of land to the college on condition that its presidents should always be members of the Church of England, and that the Church Liturgy should be read in the college mornings and evenings. Dr. Samuel Johnson, of Connecticut, was installed as the first president; and in 1756 the erection of a college building was begun near what is now West Broadway and Murray Street. In 1764 Dr. Johnson was succeeded by the Rev. Myles Cooper. Under President Cooper the college prospered, and a medical department was founded in 1767; but President Cooper was a Royalist, and, becoming involved in 1774 in a political controversy with Alexander Hamilton, then still an undergraduate, was presently mobbed at his house, and soon after sailed for England. In 1776 the college buildings were seized by the Committee of Safety for hospital purposes, and the college exercises were practically suspended until 1784, when the institution reopened as Columbia College, under a State charter, vesting its control largely in political officers. This, however, proved unsatisfactory; and in 1787 a new charter was granted similar to the original one except as to the denominational clause, and the management of the institution was vested in a self-perpetuating board of twenty-four trustees. About this time the income of the college was £1330, while its faculty numbered six, three giving instruction in medicine and three in the arts. New life was given to the institution in 1792 by a grant from the State of £7900 outright and of £750 for seven years. The faculty was enlarged, and Mr. James Kent, afterwards the famous Chancellor Kent, was elected to a

professorship of law. But the State refused further funds in 1799, and the college suffered seriously in consequence. In 1813 the medical school was incorporated with the College of Physicians and Surgeons.

In 1814 the Legislature granted the college a strip of land known as the Hosack Botanical Garden, extending from Forty-seventh to Fifty-first Street, and from Fifth Avenue to nearly Sixth Avenue, as a reimbursement for lands in New Hampshire belonging to the college which were ceded by the State on the settlement of the New Hampshire grants. For many years this property yielded no income; but at present it is an important source of revenue. In 1823 Professor Kent was reappointed to the chair of law and delivered his famous lectures, which were, in 1826, published as *Kent's Commentaries*. In 1830 the contemplated establishment of a rival institution in the city of New York spurred on the board of trustees to new activity. The full course was enlarged, and scientific and literary courses were instituted, designed for special students. In this Columbia would seem to have anticipated its future development as a university. But the time for such a project was not ripe, and the special courses were discontinued in 1843, though their major subjects were continued in its full course. In 1857, owing to the rapid growth of the city, the college was removed to the site bounded by Forty-ninth and Fiftieth Streets and Madison and Fourth Avenues, and a postgraduate course, combining all the features of a university, was projected as part of a general plan of expansion. In 1858 a law school was established. Beginning with 35 students, it had an attendance of 171 in 1864. In 1860 a nominal union was effected with the College of Physicians and Surgeons. To meet the increasing need of mining and other engineers, Columbia College established, in 1864, the School of Mines and Metallurgy.

Dr. Frederick A. P. Barnard succeeded President King in 1864 and a new era of progress began. Dr. Barnard was a friend of classical learning, but he held that a system of education not supported by popular sanction can never be made an efficient instrument of culture; and when the attendance at the college fell to 116 in 1872, the fact was attributed by him to the rigidity of the college curriculum. In 1880 the School of Political Science was established, and in 1881 a department of architecture was instituted in the School of Mines. In 1883 a course of study under the general supervision of the college faculty was designed for women, and in 1887 women were authorized to receive the degree of B.A., but this practice was discontinued on the establishment of Barnard College (q.v.) for women in 1889. When President Barnard entered upon his duties as president, Columbia College consisted of the college, an inchoate School of Mines, the Law School, and a nominally associated Medical School. Twenty-five years later, at the close of President Barnard's administration, Columbia College comprised the college, the School of Law, the School of Political Science, and the School of Mines and Metallurgy, including the Schools of Civil and Sanitary Engineering, Applied Chemistry, and Architecture. The university had increased greatly in size, and the elective system had been largely introduced.

Upon President Barnard's death, in 1889, the

Hon. Seth Low was elected as his successor. He found several flourishing but loosely connected schools, whose work he correlated, reorganized, and consolidated. In 1891 the College of Physicians and Surgeons surrendered its charter and became an integral part of Columbia College. In 1890 the School of Philosophy was established, taking charge of the advanced work in philosophy, psychology, education, ancient and modern languages and literature. In 1892 departments of mathematics, mechanics, physics, mineralogy, chemistry, etc., combined to form the School of Pure Science. The several schools of engineering were in 1896 organized into the School of Applied Sciences. In the same year the name 'Columbia University' was adopted to designate the institution as a whole, and the name 'Columbia College' was restricted to the undergraduate department. In 1898 Teachers College (q.v.) became affiliated with Columbia, and in 1900 Barnard College became a part of the university. On President Low's resignation in 1901, Professor Nicholas Murray Butler was elected to succeed him.

Columbia University at present comprises the following schools and colleges: (1) Columbia College. The college confers the degree of B.A. and offers a wide range of subjects, mostly elective. Its students register under any of the university faculties in their fourth year, thus practically shortening the college course, in the case of students who take up professional courses, to three years. In 1902, the date for all the statistics of attendance quoted, the number of students in the college was 492. The college offers 72 scholarships of the value of \$150, and a number of prizes. (2) Barnard College. This is an undergraduate school for women, and its management is vested in a separate board of trustees. It offers courses leading to the B.A. degree. Graduates of Barnard College are admitted to the university as candidates for the M.A. and Ph.D. degrees; but the professional schools of Columbia University, except Teachers College, are as yet not open to women. Barnard College has an attendance of 339. (3) The School of Law, which offers courses covering a period of three years and leading to the degree of LL.B. On certain specified conditions its students may also earn the LL.M. and A.M. degrees. Twenty scholarships are available for students; its attendance is 400. (4) The College of Physicians and Surgeons. With this are connected Vanderbilt Clinic, one of the finest hospitals in the world, and the Sloane Maternity Hospital. It confers the M.D. degree, and under special conditions its students also may earn the M.A. degree. It has an attendance of 809 students. (5) The Schools of Political Science, Philosophy, and Pure Science. These have charge of the graduate courses in the departments of mathematics, natural sciences, public law, history, literature, philology, philosophy, psychology, anthropology, and education. Their courses lead to the A.M. and Ph.D. degrees. The student registration is 508. (6) The School of Applied Science, which is composed of the schools of Chemistry, Mines and Engineering, and offers courses covering periods of four years, leading to the degrees of E.M., Met.E., B.S., C.E., E.E., and Mech.E., also graduate courses leading to the A.M. and Ph.D. The total attendance is 626. (7) The courses in fine arts, comprising the course in architecture,

leading to the degree of B.S., and the courses in music, were placed in 1902 under the administrative control of the president of the university. (8) Teachers College, one of the leading schools for the training of teachers in the world, offers courses leading to the B.S. degree and to the several Teachers College diplomas. It is open to men and women on equal terms. It constitutes a separate corporation. It has an attendance of 634 students. (9) The Summer School of the university, designed especially for teachers, was organized in 1900 and has become a permanent feature. The attendance in 1902 was 643.

The government of the university is divided between a board of 24 trustees, of which the President is a member, having charge of the financial affairs of the institution; the University Council, composed of the President, the Dean, and a delegate from each school or college, to whose care are confided the educational interests of the university, subject to the reserved power of control of the trustees and the several faculties in charge of the respective schools. The total valuation of the university property and endowments is about \$20,000,000. The receipts of the university in 1901 were \$836,108.56, and the expenses \$844,329.85. The library numbers about 315,000 volumes, including the Avery Architectural Library and the famous Phoenix collection, but exclusive of unbound pamphlets. A number of societies make it the depository of their rare collections of books. In 1897 Columbia University removed to its new buildings on Morningside Heights. The principal buildings, grouped around the library, the gift of ex-President Low, are the Havemeyer, Fayerweather, and Schermerhorn Halls, and the Engineering Building and Earl Hall. The gymnasium is part of the building of the Alumni Memorial Hall. Barnard College and Teachers College occupy buildings of their own outside of the campus. Earl Hall represents the religious interests of the university.

Columbia University is intimately connected with many of the educational institutions of New York. Lectures are delivered by Columbia professors at the American Museum of Natural History, the Metropolitan Museum of Art, and at Cooper Union. Students of botany are permitted to pursue lines of research at the New York Botanical Garden, where courses in special investigation are conducted by Columbia University professors. The university offers free tuition to students in the several theological seminaries in New York and its vicinity, and these institutions reciprocate the privilege. The university also offers 26 fellowships, ranging from \$500 to \$1300 a year, and 34 graduate scholarships of the value of \$150 each. The total number of students attending the university is 3632. Under the auspices of the Columbia University Press, established in 1893, are published a large number of works, monographs, and serial studies, written by professors and post-graduate students, and exhibiting the results of original research in various of the university departments. There are also published the *Political Science Quarterly*, and the *Columbia University Quarterly*, formerly the *Columbia Bulletin*. The presidents of the university have been: Samuel Johnson, D.D. (1754-63); Myles Cooper, S.T.D., LL.D. (1763-76); William S. Johnson, LL.D. (1787-1800); Charles H. Wharton, S.T.D.

(1801-11); William Harris, S.T.D. (1811-29); William A. Duer, LL.D. (1829-42); Nathaniel F. Moore, LL.D. (1842-49); Charles King, LL.D. (1849-64); Frederick A. P. Barnard, S.T.D., LL.D. (1864-89); Seth Low, LL.D. (1890-1902); Nicholas Murray Butler, Ph.D., LL.D. (1902-).

Pine, *Charter, Acts, and Official Documents of Columbia College* (New York, 1895); Brander Matthews, *American Universities* (New York, 1895); N. F. Moore, *An Historical Sketch of Columbia College*; J. Howard Van Amringe, *Universities and their Sons* (Boston, 1898); *Circular of Information No. 3, 1900, Bureau of Education* (Washington, D. C., 1900).

COLUMBIAN UNIVERSITY. An institution of higher education, situated at Washington, D. C. The university was founded in 1821 by members of the Baptist Church and until 1873 was known as Columbian College. At its inception the university comprised a theological, a classical, and a medical department. A law school, which was organized in 1826, was discontinued in 1827 and was not reopened until 1865. Differences that had arisen among the trustees caused, in 1827, the abandonment of the theological department. In the same year the financial troubles of the institution reached such an acute stage that all the departments were suspended. The college, however, reopened in 1828, and since then has maintained a steady growth. In 1843 it was freed from indebtedness, but it had still no permanent endowment. At the outbreak of the Civil War the greater part of the students left and the buildings were partially converted into Government hospitals. In 1884 a scientific school was established, named the 'Corcoran Scientific School,' in honor of Mr. W. W. Corcoran, one of the university's greatest benefactors; in 1887 a dental school was organized in connection with the university. At present Columbian University comprises the following schools: (1) Columbian College, offering courses partially elective, leading to the degrees of B.A. and B.S.; (2) the Corcoran Scientific School, conferring the B.S. degree; (3) the School of Graduate Studies, which confers the degrees of M.A., M.S., Ph.D., E.E., C.E., and Mech.E.; (4) the Law School, which confers the LL.B. and M.P.L. degrees; (5) the School of Jurisprudence and Diplomacy, which confers the degrees of M.Dip., D.C.L., and LL.M.; and (6) the Medical and Dental Schools, conferring the degrees of M.D. and D.D.S., respectively. The university has a registration of 1420 students and a faculty of 180. Owing to the vast educational resources which the capital affords, including the National Library, the archives, and many special collections, the university is enabled to carry on its work on an endowment of \$200,000. The property value of the university is about \$1,000,000 and the library, which is mainly departmental, numbers about 20,000 volumes.

COL'UMBINE (Fr., It. *Columbina*, from Lat. *columbinus*, dove-like, from *columba*, dove). (1) A conventional character in old Italian comedy and the pantomime, first appearing about 1560. She was the daughter of Pantaloon and the object of Harlequin's adoration, and so ap-

pears in English pantomime. See PANTOMIME. (2) A wild flower, emblematic of forsaken lovers, in old English verse.

"The columbine in tawny often taken,
Is then ascribed to such as are forsaken."

(Browne's *British Pastorals*. 1613).

COLUM'BITE. A mineral columbate containing some manganese and crystallizing in the orthorhombic system. It has a bluish iridescence, and is of an iron-black, grayish, or brownish color. This mineral occurs in granitic and feldspathic veins in the form of crystals, crystalline granules, and cleavable masses. It is found at various localities in Bavaria, Italy, Finland, Greenland, and in the Ural region; in the United States it is found in greater or less abundance in nearly all of the States bordering along the Appalachian Mountain system, in the Black Hills of South Dakota, and in California and Colorado. It has some slight economic value for the preparation of salts of columbium and tantalum, but as only small quantities of these salts are used, the mineral is in but little demand. It is interesting to mention that the first occurrence of columbite in America was made known from a specimen sent by Governor Winthrop of Connecticut to Sir Hans Sloane, then President of the Royal Society of Great Britain.

COLUM'BIUM (Neo-Lat., from *Columbia*, United States of America) or **NIObIUM**. A metallic element discovered by Rose in 1846. It is found in the minerals columbite, from Hadam and Middletown, Conn., and tantalite, from near Falun and elsewhere in Sweden; also in small quantities in other minerals. In order to obtain the element the mineral is fused with acid potassium sulphate; the resulting mass, which is washed and boiled with concentrated hydrochloric acid, yields the hydroxide, which is then reduced. Columbium (symbol *Cb* or *Nb*, atomic weight 94) is a steel-gray powder with a specific gravity of 7.06. It forms three oxides with oxygen, of which the pentoxide, Cb_2O_5 , forms salts called *columbates* or *niobates*.

COLUM'BUS. A city and county-seat of Muscogee County, Georgia, 135 miles southwest of Atlanta, at the head of navigation on the Chattahoochee River and on the Central of Georgia, the Southern, and the Seaboard Air Line railroads (Map: Georgia, B 3). The city, from its important manufactures called the 'Lowell of the South,' is the centre of a fertile agricultural region, and has vast water-power, the river having at that place a fall of 120 feet in three miles. The trade with adjoining States is extensive. Columbus receives annually 150,000 bales of cotton, and its manufactures of cotton goods are correspondingly large. It has also foundries and machine-shops, cottonseed-oil mills, refineries, barrel-factories, etc. There is a public library, besides one, the Eagle and Phenix, for mill operatives. The government is administered under a charter of 1890 by a mayor, elected for two years, and a city council whose members are elected on a general ticket. The executive has the power of appointment only in standing committees; all other officials are chosen by the council. Population, in 1890, 17,303; in 1900, 17,604.

Columbus was laid out in 1828 and incorporated in 1829. During the Civil War it was

an important Confederate depot of supplies and was only surpassed by Richmond in the quantity of manufactured articles furnished to the Confederate Army. It was captured by Federal forces April 16, 1865.

COLUMBUS. A city and county-seat of Bartholomew County, Indiana, 41 miles south by east of Indianapolis; on the east fork of the White River, and on the Pennsylvania and the Cleveland, Cincinnati, Chicago and St. Louis railroads (Map: Indiana, D 3). It has extensive manufactures of pulleys, tanned leather, threshing and sawmill machinery, tools, starch, flour, furniture, etc. Settled in 1821, Columbus was chartered as a city in 1864. The government is vested in a mayor, elected biennially, and a city council. The water-works and electric-light plant are owned and operated by the municipality. Population, in 1890, 6719; in 1900, 8130.

COLUMBUS. A city and the county-seat of Cherokee County, Kan., 50 miles south of Fort Scott; on the Saint Louis and San Francisco; the Missouri, Kansas and Texas; and the Kansas City, Fort Scott and Memphis railroads (Map: Kansas, H 4). It is the centre of a farming and a mining region, has a considerable trade in agricultural products, and contains machine-shops, canning factory, and an extensive brick-making plant. The water-works are owned and operated by the municipality. Population, in 1890, 2160; in 1900, 2310.

COLUMBUS. A city and the county-seat of Lowndes County, Miss., 125 miles west of Birmingham, Ala.; on the Tombigbee River, which is navigable six months of the year, and on the Mobile and Ohio and the Southern railroads (Map: Mississippi, J 3). It is the centre of a coal and iron region, and has cotton and oil mills, foundries and machine-shops, stove-works, and lumber-mills. The city has a public library, and is the seat of the State Industrial Institute and College for young women, Franklin Academy, for white, and Union Academy, for negro children. Columbus was settled in 1830, incorporated in 1832, and is governed at present under a charter of 1884, which provides for a mayor, elected every two years, and a council, elected on a general ticket. The water-works are owned and operated by the city. Population, in 1890, 4559; in 1900, 6484.

COLUMBUS. A city and the county-seat of Platte County, Neb., 92 miles west by north of Omaha; on the Loup River a short distance above its confluence with the Platte, and on the Union Pacific and the Burlington and Missouri River railroads (Map: Nebraska, G 2). It is of importance as a railroad junction, and has flour-mills, foundry, brewery, shoe-factory, etc. Population, in 1890, 3134; in 1900, 3522.

COLUMBUS. The capital of Ohio, county-seat of Franklin County, and the fourth city of the State in population, situated on both sides of the Scioto River, 100 miles northeast of Cincinnati and 140 miles southwest of Cleveland, near the geographical centre of the State (Map: Ohio, D 6).

The city is built on generally level ground at an altitude of 750 feet, and has broad, well-paved streets. Among public buildings the most prominent is the State Capitol, a large stone structure fronting on a public square near the centre of the city. The Ohio penitentiary is situ-

ated here. Columbus, well known for the number of its charitable and educational institutions, is the seat of the Ohio State University, founded in 1870 (q.v.); Capital University (Lutheran), established in 1850; Ohio Medical University; Starling Medical College; Columbus Law School, and Columbus Art Institute; and contains five public hospitals—Emergency Hospital, Columbus Hospital for the Insane, Deaf and Dumb Asylum, Blind Institute, Institute for Feeble-minded Youth, and the County Infirmary. In addition to those of the several institutions of learning, there are in the city the State Library and State Law Library, City Library, Public School Library, and Engineers' Institute and Library. Other features of interest may be found in the State fair grounds, which adjoin the city, and in the public parks, bridges, and monuments. There are five parks, including from 10 to 100 acres each, and numerous smaller ones; several street and railway bridges span the Scioto; and monuments have been erected in honor of Salmon P. Chase, William T. Sherman, Edwin M. Stanton, James A. Garfield, Philip H. Sheridan, Ulysses S. Grant, and Rutherford B. Hayes.

Columbus is an important commercial and manufacturing centre. It has excellent transportation facilities, more than a dozen railroads entering the city, including great trunk lines: the Baltimore and Ohio, the Cleveland, Cincinnati, Chicago and Saint Louis, and roads of the Pennsylvania system. In the vicinity are the coal and iron fields of the State, an advantage which has contributed largely to the development of manufacturing industries. There is considerable trade in bituminous coal, and the city is an important distributing centre with large wholesale interests. It exports extensively its principal manufactured products, among which are vehicles of various kinds, wheelbarrows, scrapers, agricultural implements, mining machinery, shoes, uniforms, and regalia. There are also many smaller industries.

The government is administered by a mayor, chosen every two years and ineligible to serve three terms in succession, a unicameral city council, elected by wards, and a board of public works appointed by the executive. This board, composed of directors of law, accounts, public improvements, and public safety, constitutes a legislative body in which all important measures must originate and be approved before action by the municipal council. The director of law is acting mayor in case of the mayor's absence or disability. Officials of other departments are chosen by the people: the board of education, consisting of a representative from each ward; police judge and clerk; and four civil magistrates (justices of the peace). The annual budget of the city approximates \$3,000,000.

Population, in 1830, 2435; in 1850, 17,882; in 1870, 31,274; in 1880, 51,647; in 1890, 88,150; in 1900, 125,560, including 12,300 persons of foreign birth and 8200 of negro descent.

Columbus was laid out in 1812, the Legislature having selected the site for the capital city, and in 1816 it was incorporated and supplanted Chillicothe as capital of the State. It became the county-seat of Franklin County in 1824. In 1833, and again in 1849-50, it suffered greatly from ravages of cholera. Consult Howe, *Historical Collections of Ohio* (Columbus, 1889-91).

COLUMBUS. A city and the county-seat of Colorado County, Tex., 110 miles southeast of Austin; on the Colorado River and on the Southern Pacific Railroad (Map: Texas, F 5). It has a considerable trade in cotton, agricultural produce, live stock, hides, etc. Population, in 1890, 2199; in 1900, 1824.

COLUMBUS, BARTHOLOMEW (BARTOLOMEO COLON) (c.1445-1514). A brother of Christopher Columbus. He was a sailor by profession, and in the year 1480 joined Christopher at Lisbon. In 1489 he was sent to England by his brother to seek assistance from Henry VII. for the execution of his project. He was taken by pirates and landed in England in a destitute condition, and on presenting himself at Court was unfavorably received by the King. He then sought help at the Court of Charles VIII. in France, with like success. In January, 1494, he returned to Spain and was given command of a fleet of three caravels sailing for Española. He arrived there in June of the same year, just in time to render effectual assistance to his brother, who was being hard pressed by the unruly members of the little Spanish colony. From that time on he became the most devoted follower of the Admiral, who in 1495 made him *adelantado*, or governor, of Española, a title which was confirmed by the Crown in 1497. In March, 1496, he assumed command of the colony on the departure of his brother. He founded the town of San Domingo and effectually repressed a native insurrection. During the hardships of the last voyage of Christopher Columbus, Bartholomew proved of invaluable assistance. At Puerto la Gloria in 1504 he repressed a mutiny among the sailors. Late in life he received some recognition for his services from the Crown, which bestowed on him the island of Mona, near Española, as a possession. He died at Seville in December, 1514.

COLUMBUS, CHRISTOPHER (the usual English form, adopted from the Latinized form of the Italian Colombo, which was the original spelling of the family name. After the discoverer entered the Spanish service he became known as Cristóbal Colón) (c.1446-1506). The discoverer of America. Columbus was born in 1445 or 1446. The best authorities surmise that his birth took place in the village of Terrarossa, near Genoa, to which city his father, Domenico Columbus, removed about 1451, in order to be nearer the centre of the wool trade, from which he derived his livelihood. The exact date of Columbus's birth has been a subject of debate, opinions varying from 1436 to 1457, but the most trustworthy evidence seems to show that he was born not long before March 25, 1446. He was early apprenticed to his father's trade, and is referred to in legal documents dated 1472 and 1473 as living in Genoa or Lavona, and engaged in the wool trade. There is probably no foundation in fact for the stories which describe him as having received a university education at Pavia. He probably left home and went to sea in 1473, visiting various Mediterranean ports and eventually reaching Lisbon, where he lived until 1484 or 1485. After he had become famous, stories relating exploits of his early youth as a corsair and pirate, or as pilot or commander of a war vessel belonging to René d'Anjou, Count of Provence, became current, but most of the details

of these stories are inconsistent with known historical facts. The Portuguese were at this time the most skillful sailors in Europe, and among them Columbus may easily have acquired all the knowledge and skill which his later career reveals. He engaged in the business of map-making, besides participating in several expeditions to Guinea, on the African coast, to the eastern Mediterranean, and to England, all of these being voyages which Portuguese merchant vessels were accustomed to make frequently. Slightly more unusual and adventurous was a voyage, to which the definite date 1477 is assigned, to the island of Thule or Iceland.

Columbus's interest in cartography explains his writing a letter concerning the shape of the earth to the learned Italian Toscanelli, accompanying it with one of his globes to illustrate his queries. This elicited the famous reply from Toscanelli, which is ordinarily accepted as marking the time when Columbus began to devote himself to the problem of a direct route from Europe to the Asiatic spice-lands. During one of his Mediterranean voyages he revisited Genoa, it is sometimes maintained, and tried to secure financial assistance which would enable him to test his theories of a direct ocean passage across the Atlantic to Asia, but without success. It is reported also that he tried to enlist help in Venice, and there is nothing improbable in the story. In Portugal, where he had married Philippa Moniz or Muñiz, who is said to have been a daughter of Bartholomé Perestrelo, the first governor of Porto Santo, in the Madeiras, and a prominent figure in the history of Portuguese expansion, Columbus secured the ear of the King, who evinced much interest in his plan. The would-be discoverer, however, demanded so large a share of the prospective benefits that the King, who would have had to stand all the financial risk and the burden of popular disappointment in case of failure, was unable to make terms with him. As no compromise could be arranged, the King was persuaded by his courtiers to test the plan of Columbus by sending a vessel to see if the Atlantic offered any insuperable difficulty to the proposed voyage. An adventurer from Madeira, Fernam Dominguez do Arco, had petitioned the King for a grant of the lordship over an island in the west which persistent rumor declared could be seen from the Azores at certain seasons. Dominguez do Arco was therefore sent off to search for his island, and when he returned unsuccessful, with terrifying tales of the dangers of the great ocean, the King was convinced that the scheme of Columbus was chimerical. Columbus felt that an attempt had been made to cheat him of his great idea, and so he hastily went to Spain, in the winter of 1484-85, leaving his wife and young children behind.

During the next five years Columbus was in constant attendance about the Spanish Court, practicing his profession of cartographer and seeking to gain the royal interest in his plans. During 1486 and 1487 he succeeded so far as to have two important councils held, at Salamanca and at Granada, at which his propositions were discussed by the principal ecclesiastical and political dignitaries. The consensus of opinion was strongly against him, and Columbus, thoroughly discouraged, reopened negotiations with Portugal, which he revisited in 1488, being present at the return of Dias from the Cape of Good

CHRISTOPHER COLUMBUS

FROM THE BUST IN THE CAPITOLINE PICTURE GALLERY, ROME

Hope. It is supposed that his wife had died before this time, for his son Ferdinand, by Beatriz Henriquez, was born at Cordova in August, just before his visit to Portugal. Realizing the hopelessness of securing assistance in Portugal, Columbus induced his brother Bartholomew to go to England to lay his plans before King Henry VII., while he himself determined to try his fortune in France. The famous story is well authenticated which tells how he started off afoot with his little son Diego and stopped at the convent of La Rábida to ask for food. The prior, Juan Perez de Marchena, entered into conversation with the stranger, grew interested in him, called in a neighbor who was learned in maritime affairs, and eventually became convinced that Spain ought to benefit by the idea with which Columbus had become possessed. A messenger was sent off to the Court, Queen Isabella's interest was aroused, and Spanish America was the result. As soon as the royal support was granted, preparations for the voyage were hurried forward. The Pinzon brothers, merchant sailors of Palos, furnished the money for the share in the expense which Columbus had undertaken to provide, and the royal contribution of Queen Isabella was advanced by the Treasurer, Santangel, from his private resources. The story that the Queen pawned her jewels to secure this money is rendered unlikely by the fact that she had pledged everything she possessed, several years before, to assist in the war against the Moors.

On August 3, 1492, everything was ready and Columbus, on the carack *Santa Maria*, accompanied by the caravels *Niña* and *Pinta*, sailed from Palos. A short stop was made at the Canaries, and then a course was steered due westward. Several days of calms followed, during which Columbus, foreseeing trouble with his crew, began to announce each day as the number of leagues sailed about three-fourths of the real distance. On September 14th he noticed that the compass, which had previously, as in European waters, pointed to the east of the pole-star, was beginning to point west of it. This discovery of the variation of the needle is the first of a series of observations which, after the accumulated information of four hundred years, still puzzles physicists. On October 8th, on the advice of Pinzon, who was captain of the *Pinta*, the course was changed to the southwest, and on the 12th land was reached. This was an island known to the natives as Guanahani, and named by Columbus San Salvador, probably the one now called Watling's Island, one of the Bahamas. The landfall has been a subject of long dispute, and investigators have at various times advocated the modern San Salvador, Cat, Grand Turk, Samana, and Acklin islands as the land on which Columbus first set foot in the New World. From San Salvador, Columbus sailed from island to island until October 26th, when he landed on Cuba. Having convinced himself by several trips into the interior that this was a part of the Asiatic mainland, or Cathay, he started back toward Spain. On Christmas Eve, as he was crossing to Haiti, which the Spaniards named Española, the *Santa Maria* was wrecked near the harbor named by Columbus 'La Navidad.' It was therefore decided to leave at this spot, in a fort which was built there, a part of the company, to serve as a nucleus for future exploring expeditions. Forty men agreed to stay, and were left with

sufficient supplies, and on January 4, 1493, Columbus set off for Spain. On February 25th he entered the mouth of the Tagus, having been nearly wrecked in a storm which arose after the shores of Europe had been sighted. The Portuguese King welcomed him cordially and helped him to send word to Spain of his safe return. From Palos Columbus journeyed overland to the Court at Barcelona, where he arrived in April and was received with great honor by Ferdinand and Isabella.

Every assistance was promised Columbus toward equipping a second expedition. Seventeen vessels were soon ready, carrying 1500 persons, and on September 25, 1493, they set sail. The island of Dominica was reached on November 3d, and on the 27th Columbus anchored off the fort of La Navidad, which was found deserted. The garrison had been killed by the natives, whom the outrages committed by the white men had provoked beyond endurance. Abandoning this, Columbus founded a new town (Isabella) and the next two years were spent in an attempt to establish a form of government and in several exploring expeditions into the interior of Española and the neighboring islands. Many causes united to disturb the peace of the colony, and Columbus at length determined to return to Spain, where his enemies were actively trying to undermine the confidence of the sovereigns in him. Landing at Cadiz on June 11, 1496, he proceeded directly to the Court, where he was most graciously received and quickly restored to grace. He was promised whatever he desired for a new expedition, but there was a long delay, due largely to the persistent opposition of Fonseca, Bishop of Palencia, through whose hands everything had to pass before Columbus could secure his outfit. It was not until May 30, 1498, that six vessels were ready to sail. A more southerly route than before was followed and the voyage was prolonged until July 31st, when the three peaks of Trinidad were sighted. After a fortnight's rest in the Gulf of Paria, Columbus coasted the South American mainland, which he now saw for the first time, westward as far as Margarita, and then, having first decided that Paradise must be situated in the interior of the modern Venezuela, he stood across to Española. Arriving at Santo Domingo, which had become the principal town in the Indies, he learned that a number of the colonists had rebelled during his absence, and that everything was at odds. His temperament was ill-suited to dealing with the turbulent crowd who defied his authority, and he could do little toward restoring peace and order. Both sides sent agents and emissaries to Spain, with the result that, on August 23, 1500, Francisco de Bobadilla arrived at the island with royal orders authorizing him to supersede Columbus in the government. Without waiting to investigate the charges against him, Bobadilla arrested Columbus, treating him with heartless indignities for which no justification can be found in the surviving records of the colony. He was placed in irons, denied visits from his brothers and partisans, and in October sent back to Spain.

The news that the Admiral of the Ocean Seas had arrived home in chains served his cause better than any argument. He was promptly released and summoned to Court, where every favor was shown him. King Ferdinand, how-

ever, was too shrewd to restore him to the full powers of control which he claimed by virtue of his discovery. As soon as he became convinced that there was little use in trying to secure his rights, Columbus asked for a fleet with which to continue his discoveries. This was readily granted, and in May, 1502, he set sail with four caravels to seek a route to the real East. A part of the royal grant was the condition that he should not revisit Española, but on June 29th Columbus anchored off Santo Domingo. Being forbidden to enter the harbor, he refitted as best he could outside, where he successfully weathered a storm which, curiously enough overwhelmed a fleet on which Bobadilla and several of his bitterest enemies had set sail for Spain. Columbus proceeded westward, and between July 30, 1502, and January 24, 1503, he sailed along the coast of Central America, from Honduras to Veragua, where he attempted a settlement. In April, 1503, the disheartened survivors insisted on abandoning the enterprise. With the greatest difficulty the rotten ships were brought as far as Jamaica, where, in August, they had to be beached to save their cargoes. The Admiral had been confined for many weeks to his bed, with a complication of mental and bodily ailments, from which he aroused himself at moments of special danger to show his earlier courage, enthusiasm, and skill. From Jamaica a messenger, Diego Mendez, started across to Cuba in a canoe to seek help at Santo Domingo. It was many months before the pitiful survivors learned that he had not perished on the way. He reached Española in safety, but Ovando, who had succeeded Bobadilla, delayed as long as he could before permitting Mendez to hire a vessel to go to the rescue of the castaways on Jamaica. At last, in June, 1504, the survivors who had remained faithful to the Admiral through dangers and disasters were once more embarked on their way back to civilization. Refitting the vessel at Santo Domingo, Columbus proceeded to Spain, landing at San Lucar de Barrameda on November 7. Before the end of the month, Queen Isabella, upon whom all his hopes rested, died. Columbus went to Seville, where he busied himself during such intervals of freedom from pain as he had in trying to put his affairs in order, and in writing letters to all whose friendship or help he craved. In May, 1505, he vainly journeyed to Segovia to plead with the King for some recognition of his rights and those of his son. Thence he retired to Valladolid, where he died, May 20, 1506.

Columbus literature, already very voluminous, was more than doubled during the celebration of the four hundredth anniversary of his discovery of America in 1892. The chief source for information about him was for many years Navarrete's great collection of documents, published at Madrid between 1825 and 1837. This has been in a measure supplanted by a monumental work published by the Italian Government, *Scritti di Colombo* (Rome, 1892). The standard English version of the *Letters* is Major's translation in the Hakluyt Society volumes for 1848 and 1870, supplemented by Markham's translation of the *Journal* in 1843. There is a convenient edition of the *Letters* edited by W. C. Ford (New York, 1892). The great critical study of Columbus's life and family is by Harisse, in two volumes (Paris, 1884), the results of which were presented in English by Winsor (Boston,

1892). Among the best of the many shorter biographies are those by Markham (London, 1893), and by Adams (New York, 1892).

COLUMBUS (COLON), DIEGO (in It., *Giacomo*) (c.1468-1515). The youngest brother of Christopher Columbus. He was born probably at Genoa and upon the news of his brother's great discovery came to Spain. He accompanied Christopher on his second voyage, and late in 1493 was at the head of a commission intrusted with the government of Española in the absence of the Admiral. In 1496 he went to Spain to defend his brother against the charges submitted by some of the unruly members of the colony. He returned to Española, but fell into disgrace and was sent in chains to Spain in the year 1500. A number of years before his death he entered the Church.

COLUMBUS, DIEGO (c.1478-1526). Eldest son of Christopher Columbus. He was born probably at Lisbon, and came in 1484 to Spain with his father, who left him for some time with his friends at the Convent of La Rábida, while he himself went to seek aid at the Court. In 1494 he became page to the Crown Prince, Juan, and after the latter's death in 1497 he was admitted into the household of Queen Isabella, where he remained till 1504. After the death of his father he received the title of Admiral of the Indies, but was refused the viceroyalty which he claimed as his paternal right. In 1508 he married a daughter of the house of Alba, and through her influence succeeded in being made Governor of the Indies. In 1509 he arrived at Española to take possession of his office. He never desisted in his claim to the viceroyalty and to a share of the revenues from the New World due him, and in 1520 finally won his case. He was recalled, however, from his government in 1523, and though he made his peace again with the Court, did not return to the New World. He died at Montalban in 1526. His son Luis (1521-72), born at Santo Domingo, received the title of Admiral of the Indies in 1529. He finally abandoned all claims of the family to the viceroyalty and received in compensation an estate in Jamaica and one near Veragua, with the titles of Duke of Veragua and Marquis of Jamaica. In 1563 he was banished on account of his dissolute life to Oran, where he died. With Diego Colon (died 1578), a nephew of Luis and a great-grandson of Christopher, the male line of the great Admiral became extinct. The present Dukes of Veragua trace their descent from a sister of the last Diego.

COLUMBUS, FERDINAND (Fernando) (1488-1539). A natural son of Christopher Columbus by Beatriz Henriquez, of Cordova. In 1498 he became page to Queen Isabella. He accompanied his father on his last voyage to the New World, and in 1509 he sailed for Española with his brother Diego, who had been made Governor of the Indies. Returning to Spain, he settled down as a cosmographer and writer on navigation. He traveled extensively in Italy, the Netherlands, Germany, and France, and in 1522 visited England. Two years later he was a member of the board of arbitration selected to decide on the conflicting claims of Spain and Portugal to the Molucca Islands. His political career was an active one, and mainly in line with his profession as geographer. Two years before his death he

founded a school of mathematics and education at Seville. His library of more than 12,000 volumes he left to the chapter of the cathedral at Seville. Ferdinand is best known as the probable author of a life of his father, upon which all subsequent biographies of Christopher Columbus have been based. We possess this work only in the form of the Italian translation published at Venice in 1571, the original having been lost. Ferdinand's claim to the authorship of this biography has been denied by eminent authorities and just as warmly defended; the question is still a mooted one.

COLUMBUS BARRACKS. A United States military post established in 1863, and originally an arsenal. The reservation embraces 77 acres, and is one mile from Columbus, Ohio, which is the nearest railroad station. It is an important recruiting rendezvous for the United States Army and contains quarters for 25 officers and 8 companies of infantry.

COLUMELLA (Lat., dim. of *columna*, column). A descriptive term employed in several groups of plants, but especially in mosses and molds. It refers to an axis-like structure arising in the centre of a sporangium, so that the spores are forced to lie along its sides.

COLUMELLA, LUCIUS JUNIUS MODERATUS. The most learned of Roman writers on practical agriculture. He was born at Gades (Cadiz), in Spain, and flourished in the earlier part of the first century of the Christian Era. For some time he resided in Syria, but lived chiefly at Rome, and died, most probably, at Tarentum. His great work, *De Re Rustica*, in twelve books—the tenth, *On Gardening*, is versified—is addressed to one Publius Silvinus, and treats of arable and pasture lands, culture of vines, olives, etc., care of domestic animals, respective duties of masters and servants, and the like. A supplementary treatise relates to trees. This ancient *Book of the Farm* is written in good Latin, and the information is copious, though in some points of questionable accuracy. The best edition of Columella is by Schneider, in *Scriptores Rei Rusticæ*. (Leipzig, 1784-97).

COLUMN (from Lat. *columna*, column, connected with AS. *holm*, island). A pillar or post, usually cylindrical in form, made of any material, such as wood, stone, brick, or iron, and used as a support, either real or apparent. In the historic architectural styles the column has held a most important position, often determining both æsthetic and constructive forms. It is used in connection both with the arch and the architrave. Strictly speaking, a column should consist of a shaft, circular in plan, and surmounted by a distinct capital, and it should rest on a base. Exceptionally, as in the Doric style, the base is omitted. Throughout antiquity the column was used mainly as a constructive member, and only exceptionally as a decorative feature; but in the Middle Ages the column formed a large part of the rich system of decoration. Normally, columns stand free and singly, at regular intervals, supporting a superstructure, but there are many variations of such a type. (1) The half or three-quarter column, engaged in a pier or wall, came into use at quite an early date—in Egypt, for example—entered the domain of architecture permanently in the Roman style, and has been common ever since. (2) The

grouping of columns by twos or even threes hardly obtained generally until the Middle Ages, when it was a special feature of cloisters. (3) The simple circular plan was changed for a cluster of shafts in many styles—Assyro-Babylonian, Egyptian, and especially mediæval, when the grouped columnar pier was most characteristic. (4) Honorary columns were quite unconnected with any structure, and were at first entirely religious in significance, like the two columns in front of the Temple of Jerusalem (Jakin and Boaz), those in connection with Phœnician and other Oriental and even Pelasgic sanctuaries, and the many erected in Hellenic countries surmounted by figures or symbols of the gods. Afterwards they were used to commemorate the achievements of men, especially by the Romans, who surmounted them with honorary statues, the most famous being those of Trajan, Marcus Aurelius, and Antoninus Pius in Rome, of Arcadius and Theodosius in Constantinople, of Pompey in Alexandria, and the Vendôme column in Paris.

The shafts of columns were sometimes monoliths, of a single piece, or built up of superposed drums, or with a core of different material from the face. The first was the favorite form of the Romans, the second of the Greeks, the third of the Assyro-Babylonians and Etruscans, of whom the former sheathed a wooden core with metal, while the latter did it with terra-cotta—a method not unknown to the early Greeks. The materials almost universally used throughout historic times have been stone and marble. It is idle to speculate as to the origin of the stone or brick column and whether it goes back to a wooden original. It is certainly true that in the history of Greek architecture the wooden column was a primitive form, as is attested in the Temple of Hera at Olympia, as well as in literary traditions.

Columnar architecture played a very subordinate rôle in the vaulted Assyro-Babylonian style, and appears only in lighter and smaller structures, such as shrines, in antis, and in delicate second-story superstructures, where the shafts were often carried on the backs of sphinxes or lions and surmounted by proto-Ionic or bulbous capitals. The proportions approach more closely to the Hellenic than in Egypt. The Egyptians were the first to utilize columns on a grand scale, especially in the great hypostyle halls of their temples, as early as the Eleventh Dynasty (c.2500 B.C.). They used a great variety of designs and proportions, so that they can hardly be said to have had orders or eanons of proportions, though the shafts were almost invariably heavy, their height varying only from about three to five times their diameter. The shaft usually rests upon a plain, low, circular base, in the form of a plinth, immediately above which it often takes on a pronounced swelling or entasis. Its surface, even when a smooth cylinder, is almost always decorated with brilliantly colored and *caro rilievo* ornaments, in the form of hieroglyphs, patterns, or religious symbols. Often, instead of a smooth cylinder, the shaft is in the form of a bunch of palm or lotus stalks, banded together at intervals by bands of rings, and surmounted by a palm or lotus flower capital, or campaniform capital, on which a square plinth is usually superposed. Another form of shaft, popular only in the middle period

and best seen in the tombs at Beni-Hassan, is the polygonal derivative of the square pier, with sometimes as many as 16 or 32 sides, which suggests the fluting of the classic column. The material used is invariably stone, and the construction is by drums. The Oriental series closes with the Persian column, which is later than the Greco-Ionic and was formed under combined Egyptian, Assyrian, and Ionian influences. The great columnar halls of the Persian royal palaces rivaled the temple halls of Egypt, but produced a totally opposite effect, because the columns were slender and tall (60 to 70 feet), fluted like the Greek, instead of painted and carved, and widely spaced, instead of crowded. The simple Greek type, evident in shaft and base, was not followed in the elaborate three-staged capital—animals, volutes, and campaniform bulbs—evidently inspired by Assyro-Babylonian models. The columns were of stone, but, unlike the Egyptian, the lintels they supported were of wood, which made the slender proportions and wide spacing possible.

The history of the column among the Greeks reaches back to pre-Homeric days, for it appears in the Mycenaean and Achaean royal palaces and tombs in Crete, Mycenae, Tiryns, and elsewhere. No classic orders yet exist, and the shafts, strangely enough, are larger at the neck than at the base. In the seventh century B.C. the two great columnar orders, Doric and Ionic, have developed all important features and reign—the one in Sicily, Magna Græcia, and most of the Greek mainland, the other in Asia Minor and some of the islands, passing then to Attica and other semi-Ionic parts of Greece. These orders are characterized by their special entablature (q. v.), as well as column. The Hellenic appreciation of æsthetic proportions and of ideal types is shown in the early attempt of architects to establish canons for each of these orders. The most startling novelty in the Hellenic use of the column was that it was in the main for external, instead of internal, effect. In the development of Greek architecture there was a continually increasing tendency in favor of the Ionic style. The attempt to give a history of these two orders on the basis of an evolution of form has proved unsatisfactory, except in such general facts that Doric columns gradually lose much of their original heaviness. The Doric column had no separate base, but the entire row rose from a common stepped base. The shaft tapered slightly upward, and the straight outline was mitigated by an outward curve or entasis, most pronounced below the centre: it was fluted with from 16 to 20 channels, meeting in sharp edges, or *arrises*, and was joined to the capital by a grooved necking. The capital itself consists of a circular cushion, or *echinus*, surmounted by a square plinth, or *abacus*, on which the entablature rests. The heavy proportions of early Doric gave the columns a height of only four to five diameters and an intercolumniation of hardly more than a single diameter, but the height was gradually increased until it reached six to seven diameters and the intercolumniation increased—a change corresponding to a lightening of the entablature. The Doric column usually had a thin coat of stucco, painted a delicate buff. The Ionic column was far more graceful and decorative. Its slenderness allowed of far less tapering and entasis of the shaft, which rested

on a base. This base at first varied in type and was especially rich in Asia Minor before taking the normal Attic form which remained the typical base even in post-classic times. The height of the column was from eight to ten times its diameter; its shaft had 24 deep flutings, separated by narrow fillets. The capital consisted of spiral connected volutes, between which was a cyma, or ovolo, with pearl beading, and it was connected with the architrave by a thin, decorated plinth. Carving and color contribute to form the decoration. In Greek times the Corinthian style hardly rose to the dignity of an order, its only important change from the Ionic being in the different capital. It is interesting to notice that the Greeks merely blocked out their columns before erecting them, and only after the building was fully constructed were the channels, moldings, and ornaments cut. When marble came into use, in the fifth century, the surface was no longer stuccoed.

The Romans abandoned, in the third century B.C., the wooden columns with terra-cotta sheathing of the Etruscans for the solid columns of the Greeks, but introduced several variations. The principal of these variations were the frequent use of unchanneled and monolithic shafts of the brilliantly colored marbles, like the Numidian, porphyry, or serpentine; the general use of the Corinthian, instead of the two simpler capitals, and the development of a real Corinthian order; the modification of the Doric into the so-called 'Tuscan' style; the invention of the Composite capital, of high pedestals, of engaged columns, and of a rich system of sculptured decoration. The column was now, for the first time, combined with the arch, as well as with the architrave. Thus the Romans increased the uses, the size, the materials, and the types of columns, though losing much of the refinement of form and proportions of Greek art. At the same time, especially in their civil public buildings, the Romans substituted heavy piers—often with engaged columns—for the columns themselves, on account of the use of vaulting, which could not be supported by slender shafts. It was reserved for Early Christian architecture to develop the use of the column with the arch in interiors, especially in the basilicas (q.v.) and other churches, and in baptisteries. No new forms were invented in the West, where there was a gradual decline in the quality of columnar architecture; but in the East the Byzantine and other schools added to the old types of capitals many new ones, such as basket and foliated capitals, and commenced the fashion of wall colonnettes, which was so popular in the Romanesque and Gothic styles, to the great enrichment of wall surfaces. The plundering and destruction of ancient buildings, for the sake of using their materials in new constructions, helped at the same time to keep alive the knowledge of the old orders, especially in the West. The reign of the column was henceforth sharply contested by the pier, which became the principal constructive support in Byzantine art. The use of the two forms—pier and column—was about equally balanced in Italy and Germany: the pier was more popular in France and England. For a short time the Gothic style adopted the columns for its main supports, but substituted finally the grouped pier as stronger and more in constructive and formal harmony with the molded

ribbings of arch and vault. The column continued to reign, however, in nearly all other cases. There were no longer any orders or received canons of proportion. All natural forms of foliage and flowers, all known geometric and formal patterns were used in the capitals; the Ionic base, while used as the norm, was infinitely varied: the shafts were hardly ever channeled; sometimes they were monoliths, sometimes built up. Only in such Italian provinces as Rome and Tuscany did much of the old classic design survive. Certain variations in the shafts, such as twisted, spiral, knotted, foliated shafts, of which glimpses had been seen in the Roman and Byzantine periods, became common in the Middle Ages, and appear especially in subordinate structures, such as cloisters (q. v.).

The originators of the Renaissance style vacillated for a while. Brunelleschi, its founder, used the column in his two principal churches, but though it was retained in palace courts and cloisters, it was almost immediately and finally displaced by the pier—a heavier pier than the Gothic. The column became largely a decorative feature, and was used freely, engaged in piers and walls. The Neo-Classic style employed the column on a grand scale in façades resembling the Pantheon, on exteriors copied from Greek peripteral temples, and in colonnades resembling the old basilicas. In modern architecture the column plays but a very subordinate rôle, either constructive or decorative. Consult, in general: Ruskin, *Stones of Venice*, vol. i. (London, 1853); Longfellow, *The Column and the Arch* (New York, 1899); Gwilt, *Encyclopædia of Architecture* (London, 1899). For the classic orders, see Vitruvius, *De Architectura Libri* (translated by Gwilt, London, 1826); Bötticher, *Die Technik der Hellenen* (Berlin, 1874-81); Bühlmann, *Die Säulenordnungen* (Stuttgart, 1893). For the Romanesque and Gothic column, see Dehio and Von Bezold, *Die kirchliche Baukunst des Abendlandes* (Stuttgart, 1887-94).

COLUMN. As defined by the *United States Infantry Drill Regulations*, a military formation in which the elements are placed one behind another, whether these elements are files, fours, platoons, or larger bodies. When a regiment is on the march, and each company marching in column of fours, it is said to be 'in column of route.' The same formation may be adopted by any number of troops in a command. When the science of war was in its infancy, dense column formations were the usual order of battle, much reliance being placed upon it by every European nation except England, who invariably preferred its opposite, the 'line' formation. See **TACTICS, MILITARY; MARCHING; ADVANCE GUARD; ARMY ORGANIZATION; REAR-GUARD.** The composition and operation of a column of ships in naval warfare or manœuvres will be found treated under **TACTICS, NAVAL.**

COLUMNA ROSTRATA. A column set up in the Roman Forum to commemorate the naval victory of Gaius Duilius over the Carthaginians in B.C. 260. It was of marble, adorned with the prows of the captured ships. The column having been destroyed by lightning, a new column was erected by Claudius, with an inscription now preserved in the Conservatori Palace.

COLUMN OF JULY. See **JULY, COLUMN OF.**

COLUMN OF MARCUS AURELIUS. See **ANTONINE COLUMN.**

COLUMN OF PHOCAS. See **PHOCAS, COLUMN OF.**

COLUMN OF SAINT MARK. See **VENICE.**

COLUMN OF TRAJAN. See **TRAJAN'S COLUMN.**

COLUMNS OF HERCULES. See **HERCULES, PILLARS OF.**

COLUMN VENDÔME, vîn'dôm'. See **VENDÔME, PLACE.**

COLVILLE, kôl'vil (from the town of *Colville*, Wash.). A former important Salishan people, calling themselves Shwoyelpi, originally occupying the country on Columbia River about Colville and Kettle rivers, northeastern Washington. The great salmon-fishing resort of Kettle Falls was within their territory, and here, in 1846, was established the Jesuit mission of St. Paul, through the influence of which nearly all the upper Columbia tribes are now Christianized. They were put upon a reservation (Colville) in 1872, and have since rapidly decreased, having dwindled from 616, in 1870, to 298, in 1900.

COLVIN, kôl'vîn, SIDNEY (1845—). An English author, born at Norwood, Surrey. He graduated in 1867 at Trinity College, Cambridge, was elected a fellow of the college in 1868, and, having become Slade professor of fine arts at Cambridge, in 1873, held that post by successive reflections until 1885. In 1876-84 he was also director of the Fitzwilliam Museum of the university. He was appointed keeper of prints and drawings in the British Museum in 1884. His contributions to periodicals on the history and criticism of literature, and more largely of the fine arts, are numerous and valuable. His published works include the volumes on *Walter Savage Landor* (1881) and *John Keats* (1887) in the "English Men of Letters" series; *A Florentine Picture and Chronicle* (1898); *The Early History of Engraving in England* (1901); and editions of *Selections from the Writings of Walter Savage Landor* (1882; in the "Golden Treasury" series), of the *Letters of Keats* (1887), and of the *Papers of Fleeming Jenkin* (1887; with J. A. Ewing). His labors in connection with the preparation of the standard Edinburgh edition (27 volumes, 1894-98) of the works, and the edition of the collected *Letters* (2 volumes, London, 1900; preceded in 1895 by *Vailima Letters*) of his friend, Robert Louis Stevenson, made him an authority on that author. He also wrote the sketch of Stevenson for the *Dictionary of National Biography* (vol. liv.), and was to have written the authoritative *Life*, intended for publication simultaneously with the *Letters*, but was obliged to relinquish the task to Graham Balfour.

COLWELL, STEPHEN (1800-72). An American author and philanthropist, born in Brooke County, West Va. He graduated at Jefferson College, Pa., in 1819; was admitted to the bar of Virginia in 1821; and practiced in Pittsburg until 1831, when he engaged in the iron business in Philadelphia, and began writing for the press, particularly on questions of politics and social science. He gathered a large library, which he left to the University of Pennsylvania, where he also endowed a chair in social science. During the Civil War he was an active supporter of the

Union, and at its close was appointed a commissioner to revise the internal revenue system. Besides numerous contributions to commercial and financial periodicals, he published, among other works: *Politics for American Christians* (1852); *Position of Christianity in the United States in Its Relation with Our Political System and Religious Instruction in the Public Schools* (1855); and *The Ways and Means of Commercial Payment* (1858).

CO'LY. See MOUSE-BIRD.

COLZA, or COLESEED. See RAPE.

CO'MA (Neo-Lat., from Gk. *κῶμα*, *kōma*, deep sleep, from *κοιμᾶν*, *koiman*, to put to sleep, from *κείσθαι*, *keisthai*, to lie; connected with Lat. *quies*, rest). A state of profound insensibility differing from natural sleep in that the patient cannot be aroused from the stupor. The patient's eyes are closed, his pupils are either large or small, his face is generally flushed and the conjunctivæ red, the breathing deep, labored, and stertorous. Coma may accompany and be caused by alcoholic intoxication, morphine poisoning, apoplexy, Bright's disease, epilepsy, heat-stroke, certain fevers, etc. In the coma from opium or morphine the patient should be aroused if possible, and kept walking and awake, by various means; but in coma from all other causes he should be kept absolutely quiet in bed. Therefore it is very necessary to know exactly what trouble must be treated, and no layman can judge of the proper remedial measures. The coma from alcoholic intoxication is so frequent and well known that very often the coma of serious conditions is mistaken for mere drunkenness.

CO'MA BER'ENI'CES (Lat., Bergence's hair). A small and close cluster of stars near the equinoctial colure, south of the tail of the Great Bear. This cluster of stars has been measured very carefully by Chase with the heliometer of the Yale College Observatory, and photographically by Kretz, at Columbia University, New York, the measures being made upon negatives by Rutherford.

COMACCHIO, *kō-māk'kē-ō* (Lat. *Comaculum*). A fortified town in the Province of Ferrara, in northeast Italy, situated on the southernmost of the lagoons at the mouth of the Po (Map: Italy, G 3). It is built on thirteen islands that are connected by numerous bridges, and the lagoon communicates by a canal with the little port of Magnavacca, on the Adriatic. The majority of the inhabitants are engaged in the raising of fish—particularly eels—for the market, and in the manufacture of salt. Population (commune), 1881, 9974; in 1901, 10,877.

COMANA (Lat., from Gk. *Κόμανα*, *Kōmana*). (1) **COMANA OF CAPPADOCIA**, an ancient city, situated in a deep valley of the Anti-Taurus range, through which the river Sarus flows. It was celebrated as the place where the rites of the goddess Ma (the Greek Enyo, or Artemis, and the Roman Bellona) were celebrated with much solemnity and great magnificence, in a spacious and sumptuous temple, to which the city was scarcely more than an appendage. It was governed by the chief priest, who took rank next to the king. It is reported that in Strabo's time more than 6000 persons were engaged in the temple affairs. The festivals attracted large

gatherings. (2) **COMANA IN PONTUS**, an ancient city of Asia Minor, on the river Iris, the modern Tocat-su. It was an important commercial city, and the seat of the worship of the goddess of the moon, whose cult was carried on with ceremonies analogous to those employed in the Cappadocian Comana (see above). Its ruins, consisting of fragments of brick and hewn stone and remains of walls, are still to be seen near the village of Gumenek. The town is said to have been colonized from the Cappadocian Comana.

COMANCHE, *kō-mān'chē* or *kō-mūn'chā* (of unknown signification, first applied to the tribe by the Spanish Mexicans), an important tribe of Shoshonean stock, formerly ranging jointly with the Kiowa (q.v.), along the southern plains from the Arkansas River to central Texas, and extending their forays far down into Mexico. Up to the surrender of the last hostile band, in 1875, they were the constant scourge of the Mexican and Texan frontier. They are a southern offshoot of the Shoshoni proper, the language of the two tribes being the same. Like other tribes of the same stock, their organization is very loose, and they are singularly deficient in religious ceremonial. On the other hand, they bear a high reputation for honesty and direct methods. They now number 1400, in western Oklahoma, their reservation, which was occupied jointly with the Kiowa and Kiowa Apache, having been thrown open to settlement in 1901.

COMAYAGUA, *kō'mā-yū'gwā*. The capital of the Department of the same name, Honduras, on the Rio Humaya, 37 miles northwest of Tegucigalpa (Map: Central America, D 3). It is situated in a fertile valley, but has little trade. It is an episcopal see, and the cathedral, dating from the early eighteenth century, is the most notable building. Population, about 3,000. Comayagua appears first in history, under the name Valladolid la Nueva, about the middle of the sixteenth century, and Indian relics found in the vicinity testify to its antiquity. In 1827, then having nearly 20,000 inhabitants, Comayagua was sacked by the Guatemalians. Until 1880 it was the capital of the Republic.

COMB (AS. *camb*, Icel. *kamb*, OHG. *chamb*, Ger. *Kamm*, comb; connected with Gk. *γόμφος*, *gomphos*, peg, OChurch Slav. *zqdū*, Skt. *jambha*, tooth). Combs seem to have been used by the ancients rather for adjusting than for fastening the hair, the pin, or bodkin (*acus*), having chiefly been employed for the latter purpose. Both the Greek and Roman combs were generally made of boxwood, obtained from the shores of the Euxine; but later, ivory combs, which had long been used by the Egyptians, came into general use among the Romans. The precious metals were also used for this purpose, as we may infer from the golden combs ascribed to the goddesses; but this was probably rarer in ancient than in modern and mediæval times, from the circumstance of the comb not having then been used as an ornamental fastening. Of the early use of gold combs in Great Britain we have a reminder in the well-known ballad of "Sir Patrick Spens:"

"O lang, lang may their ladies sit,
Wi' their gowd kames in their hair."

Combs have been found in Anglo-Saxon graves of both men and women, showing how much attention they paid to the hair. In early times

the comb had a place in the church service. Careful ritualistic directions have been found for combing the abbot's hair in the sacristy before vespers and other services. In the tombs of the martyrs in the catacombs combs of ivory and boxwood have been found, which testify to this ancient custom of the priests arranging their hair before the altar.

An ancient Irish long rack comb is in the museum of the Royal Irish Academy. The sides are hog-backed, and between them are set the pectinated portions, varying in breadth from half an inch to an inch and a quarter, according to the size of the bone out of which they were cut. The whole is fastened together with brass pins riveted. By this contrivance, any damaged portion could easily be replaced.

Modern combs are made of tortoise-shell, ivory, horn, wood, bone, metal, india-rubber, and celluloid. The material is first made into plates of the size, shape, and thickness of the comb, and then the teeth are cut. The old method of cutting the teeth is by the *stadda* or double saw, which has two blades of steel set parallel to each other, with a space between them equal to the thickness of the intended tooth. Combs with 50 or 60 teeth to the inch may be cut in this manner. The teeth are then thinned, smoothed, and finished by means of thin, wedge-shaped files.

Many combs are now made by a method called 'parting.' By the process of cutting, above described, the material corresponding to the spaces between the teeth is of course wasted; by the method of parting, this is made available to form the teeth of a second comb. The plate of horn, tortoise-shell, etc., is cut through by means of a stamping-cutter, whose essential features consist of two thin chisels inclined to each other, which represent the edges; between these, and connecting the ends, is a small cross-chisel. When this compound cutter descends with sufficient force upon the plate it will cut one of the teeth. By simple machinery, the table carrying the plate is made to advance a distance equal to the thickness of one tooth while the cutter is rising, and thus the successive cuts are made. A slight pull is now sufficient to part the plate into two combs, the teeth of which only require filing and finishing. India-rubber combs are manufactured by pressing the caoutchouc to the required form in molds and 'vulcanizing' or combining it with sulphur afterwards. By this means a high degree of hardness can be obtained.

COMB, or COOMB. An old corn measure, containing four bushels. In many localities hollows or valleys among hills are called combs or coombs.

COMBA, kōm'ba, EMILIO (1839—). An Italian writer, born at San Germano Chisone. As professor at the Istituto Valdese, at Florence, he, in 1873, founded the review entitled *Rivista Cristiana*, a work of a somewhat polemical nature devoted to a discussion of religious topics. The history of religious reform in Italy is well described in the interesting works entitled, *Francesco Spiera, Baldo Lubertino, martire della religione e della libertà; Introduzione alla storia della riforma in Italia.*

COMBACONUM, kōm'ba-kō'nūm, or KUMBHAKONAM (Skt., jar-edge, from kumbha, jar + kōna, edge). A town of Madras, British

India, situated within the delta of the Kaveri River, about 30 miles from the sea (Map: India, C 6). It contains a number of interesting temples, gateways, and a gate pyramid nearly 150 feet high, profusely adorned with statuary in stucco. The large reservoir, which is supposed to be filled with water from the Ganges every twelve years by a subterranean passage 1200 miles long, attracts great numbers of pilgrims. The city is regarded as sacred by the natives. There is a considerable commerce and a well-developed weaving industry. The English have established a small college here. Population, in 1891, 54,300; in 1901, 59,700.

COMBAT (Fr., from combattre, to fight, from Lat. com-, together + ML. battre, to fight, from Lat. bature, to beat), SINGLE. Among the early Norsemen, a careful distinction was made between the ordinary single combat, or *einrīgi*, and the *hólm-ganga*, or island duel. The former was unencumbered with rules and traditions, and was a simple fight between two opponents. The other, which received its name from the fact that it was always held on a *hólm*, or island, generally of a river, was accompanied by very elaborate rites and rules, and could be engaged in only under certain circumstances, to be determined by the authorities. It was regarded as a sort of court of final appeal, and at the meeting of every Parliament, or *Thing*, a place for the holding of these official duels was set aside. Many old Norse warriors were famous as fighters of *hólms*, some even receiving nicknames from this circumstance. The *hólm* was abolished by the Icelandic Parliament, about 1006, probably as the result of the recent establishment of a new court of appeal, which made it unnecessary. The *hólm* continued in Norway for a few years longer. Some connection may exist between the *hólm* and the Norman tournaments, and the modern duel, with its formal procedure, represents the same idea in an unofficial form.

COMBE, kōm, GEORGE (1788-1858). A Scotch phrenologist, born in Edinburgh. He entered the legal profession, became a writer to the Signet in 1812, and continued to practice until 1837, when he resolved to devote himself to scientific pursuits. He published his *Essays on Phrenology* in 1819, five years later his *System of Phrenology*, and in 1828 *The Constitution of Man Considered in Relation to External Objects*. Combe contributed largely to the *Phrenological Journal* (20 vols., 1824-47). Besides the works mentioned, he wrote on ethics, education, politics, economics, and theology. He also traveled in America and Germany, and published *Notes on the United States of North America* (3 vols., 1841); *Notes on the Reformation in Germany* (1846); and *The Relation Between Science and Religion* (1857). In his day his writings were popular, but they have no importance now. For his *Life*, consult Gibbon (London, 1878).

COMBE, WILLIAM (1741-1823). An English author. He was born at Bristol, and was educated at Eton and at Oxford, which he left without a degree. After rapidly spending a small fortune that had been left him, he settled in London as a law student and hack writer. In 1776 he published his "*Diaboliad*, a poem dedicated to the worst man in his Majesty's dominions." By his pen he earned a precarious living, and

spent a good deal of his time in prison. He wrote upward of 200 biographical sketches, 70-odd sermons, many satires in doggerel, and an immense number of magazine articles. His most famous work, however, is *Three Tours of Dr. Syntax* (1812-21), written in verse, and illustrated by Rowlandson. It is a comic account of the adventures of a pedagogue. Consult Hotten, *The Three Tours*, ed. with a bibliography (London, 1869).

COM'BERMERE, STAPLETON COTTON, Viscount (1773-1865). An English soldier. He was born at Llewenny Hall, Denbighshire, and, after serving in several campaigns in India and South Africa, joined the army in Spain, where he greatly distinguished himself, rising to the command of the entire cavalry of the allied forces. He was commander-in-chief of the army in Ireland from 1822 to 1825, and was then sent in the same capacity to India, where he remained for five years, during part of this time acting as Governor-General. In recognition of his distinguished services, he received the title of viscount, and in 1855 was made field-marshal. A few years after his death, an equestrian statue was erected to his memory at Chester Castle. Consult *Memoirs and Correspondence*, edited by his widow and W. W. Knollys (London, 1886).

COMBES, kônb, FRANÇOIS (1816-90). A French scholar and historian, born at Alby. He became professor of history at the College of Pamiers in 1844, at the Collège Stanislas in Paris, 1848, at the Lycée Bonaparte in 1853, and in the Bordeaux faculty of letters in 1860. He published *Histoire générale de la diplomatie européenne* (1854); *La Russie en face de Constantinople et de l'Europe* (1854); *Histoire des invasions germaniques en France* (1873); *Lectures historiques à la Sorbonne et à l'Institut* (1884-85), and other useful works.

COMBES, JUSTIN LOUIS EMILE (1835—). A French statesman, born at Roquecourbe (Tarn). Educated in a Catholic seminary, he devoted himself to philosophic study, took orders, and in 1860 received the degree of doctor of letters for theses on scholastic metaphysics and on the psychology of Saint Thomas Aquinas. But he suddenly gave up his purpose to become an ecclesiastical professor, studied medicine, took his degree in 1867, and settled at Pons. Eight years later he became mayor of that town. In 1879 he was chosen to the Conseil-Général. Defeated by Jolibois in the elections for 1881, he was elected to the Senate in 1885, soon became a leader of the Democratic Left, and took a special interest in matters of hygiene and education. He was vice-president of the Senate in 1893 and 1894, but resigned from that position in 1895 to accept the Ministry of Education in the Cabinet of Bourgeois, and was viciously attacked by the press and by Waldeck-Rousseau, then more closely allied with the Clerical Party, as a turncoat who used his own ecclesiastical training to help him spy on the Clerical Opposition. But he stayed in the Ministry only a little more than six months, and only showed his readiness for educational reform, with which he had been connected before, as a member of the educational budget of 1891 and 1892, and author of a report on the condition of French schools in Algiers. In June, 1902, Combes took up the difficult task of forming a Ministry to succeed the unusually successful and long-lived cabinet of Waldeck-

Rousseau. But he did not hesitate, even in the task of carrying out to its logical extreme the Association Law of the Waldeck-Rousseau Ministry. By the terms of this law the Premier not alone required the registration of orders, but used the purely optional power of closing minor rural schools. The opposition to this apparent attack on the Church, and evident move against the anti-Republican orders, took the form of armed resistance in some of the outlying districts, especially Finistère; but the Government was firm, and the middle of September saw the excitement abated and the Cabinet secure.

COMBINATION (ML. *combinatio*, from Lat. *combinare*, to combine, from *com-*, together + *bini*, two by two). In law, specifically the union of natural or artificial persons for the promotion of their business interests. When limited to this object, and kept free from fraud, violence, or like sinister methods, it does not fall under the ban of modern law. If it is resorted to, however, for the accomplishment of an unlawful end, it becomes a conspiracy (q.v.), and subjects its promoters to civil actions for damages, as well as to criminal prosecution. Formerly combinations to raise or depress prices, as well as every form of combination in restraint of trade, were treated as conspiracies by English law.

Whether combinations by laborers to raise wages were conspiracies at common law is a question upon which the highest authorities in England differ. If not at common law, they were criminal conspiracies under a series of statutes beginning with 23 Ed. III. in 1349, and closing with 40 Geo. III. c. 60, in 1800. A radical change in legislation on this topic in England began in 1825, and at present combinations of workmen in labor organizations (q.v.) and similar associations are sanctioned by law, both in Great Britain and the United States, provided they are not accompanied by fraudulent, violent, or menacing conduct, or by boycotting or similar unlawful practices. See CONSPIRACY; BOYCOTT; INTIMIDATION; TRADE UNION; STRIKE.

Combinations of skill and capital, within proper bounds, have always received legal recognition; such as the combinations effected in a partnership, joint-stock associations, or corporations. At present the tendency to extend these combinations and to introduce new or modified forms is very marked. Trades unions (q.v.) among workmen, and trusts (q.v.) among capitalists, may serve as illustrations. The legislation relating to these forms of combination, as well as their economic and political bearings, will be dealt with under the appropriate titles.

COMBINATION. See PERMUTATION.

COMBING. See CARDING.

COMBUSTION (Lat. *combustio*, a burning, from *comburere*, to burn, probably for **comurere*, but with *b* inserted on the analogy of *ambustus*, burned; less plausibly for **co-amb-urere*, to burn, from *com-*, together + *amb*, *ambi*, Gk. ἀμφί, *amphi*, around + *urere*, to burn), or BURNING. The process by which bodies combine with oxygen, and are thus seemingly destroyed. The term is, in ordinary parlance, restricted to cases in which the process of combination takes place rapidly and is accompanied by heat and light, as the combustion of wood in a fireplace,

the combustion of a candle, etc. In its more scientific usage, however, the term may designate any possible case of direct combination with oxygen, whether rapid or slow, whether accompanied by light or not. By analogy, the term is also sometimes applied to the rapid union of substances with 'supporters of combustion' other than oxygen, such as chlorine gas, in which a candle may burn almost as well as in air.

The light and heat of combustion are utilized for purposes of every-day life, the combustible material employed, i.e. the illuminant or the fuel, being usually some product containing carbon. Thus ordinary illuminating gas contains a number of gaseous chemical compounds of carbon. Coal and wood are mixtures of carbon compounds, the former containing even a considerable amount of free carbon. Hydrogen, too, is one of the chemical constituents of most fuels and illuminants. When combustion takes place, the carbon and hydrogen, combining with oxygen, give, respectively, carbonic-acid gas (carbon dioxide) and water vapor. These are, therefore, the chief products of ordinary combustion.

The heat produced by the combustion of a given amount of material is independent of the rate at which the combustion takes place, but depends entirely upon the composition and chemical nature of the material burned. Every combustible chemical compound has, therefore, its own definite heat of combustion; that is to say, the number of heat units (say, gram-calories) produced by the combustion of one chemical equivalent (gram-molecule) of a compound, depends upon nothing but the nature of the compound. The following are the heats of combustion of a few well-known compounds of carbon: ordinary alcohol, 340,000 gram-calories; acetic acid (the sour principle of vinegar), 210,000; ethyl-acetic ester, 544,000; cane-sugar, 1,355,000; cellulose, 680,000; urea, 152,000. The combustion of a chemical compound may be conceived as taking place in two consecutive steps: first, the compound is decomposed, i.e. every one of its molecules is broken up into its constituent atoms—a process usually involving not evolution, but *absorption* of heat; secondly, every single atom capable of so doing combines with oxygen (O) an atom of carbon (C), thus yielding a molecule of carbonic acid (CO_2), and two atoms of hydrogen (H) yielding a molecule of water (H_2O). This second step of the process is accompanied by the evolution of a quantity of heat depending upon the number of carbon and hydrogen atoms in a molecule of the combustible compound. But, owing to the absorption taking place during the first part of the process, a portion only of the heat produced during the second part actually appears in the form of sensible heat, and it is that portion which is called the heat of combustion. An exact knowledge of the heats of combustion of various substances is of great importance for theoretical as well as for immediate practical purposes. Its practical importance in comparing, for instance, different kinds of fuel, is self-evident and requires no explanation. Its theoretical importance is mainly in the fact that with the aid of it the exact amount of heat evolved or absorbed during various chemical transformations can be readily calculated. According to the first law of thermodynamics, the amount of heat evolved or absorbed during any transforma-

tion whatever, is independent of the manner in which the transformation takes place. For example, the amount of heat produced by burning one equivalent weight of ordinary alcohol and one equivalent weight of acetic acid, is the same whether we burn them directly or first cause them to combine into ethyl-acetic ester, and then burn the latter. In the second case, the heat absorbed during the formation of the ester must, of course, be combined with that evolved during its combustion. But this suggests a simple way of obtaining the heat of formation of the ester by merely carrying out two combustions. The total heat of combustion of free alcohol and acetic acid is $340,000 + 210,000 = 550,000$ gram-calories (see above); that of ethyl-acetic ester is 554,000 gram-calories. The excess of 4000 gram-calories must therefore represent the amount absorbed during the combination of alcohol and the acid into ethyl-acetic ester. In a similar manner, the heat of any chemical reaction may be determined, if the heats of combustion of the reacting substances and the heats of combustion of the products of the reaction are known. In many cases this is the only certain way of determining with some precision the heat of reactions, as direct measurement during a reaction would often involve very great experimental difficulties, while the direct measurement of the heat of combustion is a comparatively simple matter. The heat of combustion is usually determined by chemists in the following manner: A known amount of the combustible substance is inclosed in an air-tight steel vessel filled with compressed oxygen and lined on the inside with platinum; the vessel is immersed in a calorimeter (see CALORIMETRY), and the substance is ignited with the aid of an iron wire heated by means of an electric current; the observer measures the rise of temperature in the calorimeter, and from this calculates the amount of heat produced. The importance of knowing the heat of chemical reactions is discussed in the article THERMOCHEMISTRY (q.v.).

Now, while the heat of combustion depends only on the chemical nature of the material burned, the rise of temperature caused by it depends to a very great extent on the manner in which the combustion takes place. If other gases, such as the nitrogen of the air, are present without themselves adding to the amount of heat produced, part of that amount goes to heat such gases, and as a result, the temperature is considerably lower than if the same substance were burned in precisely the amount of oxygen gas required for its combustion. The rapidity with which a combustion takes place is another factor on which the temperature depends; for heat may be gradually dissipated by conduction even while it is being produced, and so the actual amount remaining at any moment during a slow process of combustion may be very small. Thus, when phosphorus is exposed to the air at ordinary temperatures, a slow process of oxidation (combustion) takes place, very little heat being given out at any given moment. If ignited in the air, phosphorus burns vividly, giving out much heat and light for a short time. Finally, if ignited in an atmosphere of pure oxygen, it enters into most vivid combustion, evolving, for a very short time, a most intense heat and a brilliant light. An analogous phenomenon may be observed when coal is burned in a furnace. So long as the door of the furnace is open and there is but little

draught through the fuel, the evolution of heat is moderate and may last several hours. But when the door is shut and much air is drawn through the coal, the latter is more quickly burned; the temperature is higher because more heat is evolved during a shorter period of time, but in the long run the amount of heat produced is the same.

Since the process of combustion is a form of chemical transformation more striking and more commonly met with than any other process, it early attracted the attention of scientific observers. But since, on the other hand, it involves the consumption and formation of gases, it baffled their ingenuity for many centuries. Those light, colorless, æriiform substances had, in the first place, to be discovered; and for a long time they escaped the attention of observers, in spite of their being present everywhere and constantly interfering with experimental work. Further, the peculiar properties of gases, together with the striking appearance of flames and fires, gave birth to the erroneous idea that material bodies are capable of losing weight by combining with certain 'principles' and of gaining weight by having such 'principles' taken away from them. Thus the phenomena of combustion long hampered the progress of science. But it was the same phenomena that also finally led to truer conceptions; for their correct interpretation by Lavoisier formed the cornerstone upon which rests the gigantic structure of the chemistry of to-day. See FOOD; FUEL; THERMOCHEMISTRY; CHEMISTRY.

COMÉDIE FRANÇAISE, kô'mâ'dé' frân'sâz' (Fr., French comedy). The official name of the Théâtre Français, the national theatre of France, subsidized by the State for the advancement of dramatic art. Its history dates officially from October 21, 1680, when a decree of Louis XIV. amalgamated the two rival companies of the Hôtel de Bourgogne and the Hôtel Guénégaud, the latter being a fusion, after Molière's death in 1673, of the Théâtre du Marais and the Troupe de Molière. It thus maintains a practically unbroken tradition from the time of the great master of comedy, and is still familiarly known as the House of Molière. In 1682 the King granted to his comedians an annual pension of 12,000 livres (about \$2400), their first subsidy. In 1689 they established themselves in a new house, in what is now called the 'Rue de l'Ancienne Comédie,' and took the name of 'La Comédie Française,' under it they played until the Revolution with a succession of such artists as Baron, Adrienne Lecouvreur, Le Kain, and Mademoiselle Clairon. For a time (1770-82) they were housed in the Palace of the Tuileries itself. Later, on the performance of Chénier's antimonarchical play of *Charles IX.*, in 1789, violent political discussions arose among the performers, and ultimately they split into two sections: the Republican party, under the young tragedian Talma, establishing a new theatre under the name 'Théâtre de la République,' on the site of the present building in the Rue de Richelieu; while the Royalist section took the title 'Théâtre de la Nation.' In September, 1793, the latter was suddenly closed by order of the Committee of Public Safety, and the players imprisoned, though they were afterwards gradually released. For a few years the rivalry continued; then in 1799, for a short time, there was an absolute in-

terruption in the history of the Théâtre Français. In May of that year, however, the Comédie was once more reorganized and settled in the Rue de Richelieu. Napoleon, while at Moscow, October 15, 1812, prescribed the regulations which, modified in 1850 and 1859, still govern the company. There is an *administrateur-général* appointed by the Government. The *sociétaires* are members of the company, who, as shareholders, divide the profits according to certain rules. Before being elected as a *sociétaire*, an artist must have served in the theatre as a *pensionnaire*, upon a salary. A *sociétaire*, after twenty years of service, is allowed to retire with a pension of 4000 francs. The annual sum received from the State is 240,000 francs; and the theatre, being removed from the fear of temporary pecuniary failure, is in no sense a mere business speculation, but serves as an educator of public taste and sets a standard of dramatic training. Here many of the greatest artists of the modern French stage have won their triumphs, including Milles, Mars, Rachel, Brohan, and, for a part of her career, Sarah Bernhardt, and MM. Talma, Got, Mounet-Sully, and Coquelin. Early in 1900 the historic building adjoining the Palais Royal was partly destroyed by a disastrous fire, but was promptly rebuilt in improved fashion within the same lines. Consult: Matthews, *The Theatres of Paris* (New York, 1880); Lucas, *Histoire philosophique et littéraire du Théâtre-Français* (Paris, 1862-63); Bonnassies, *La Comédie Française, histoire administrative* (Paris, 1874); Joannides, *La Comédie Française de 1680 à 1900, dictionnaire général des pièces et des auteurs*, preface by Jules Claretie (Paris, 1901); Cochran, *The Théâtre Français in the Reign of Louis XV.* (London, 1879); and, for a discussion of many of the plays of its recent repertory, Weiss, *Autour de la Comédie Française* (Paris, 1892).

COMÉDIE HUMAINE, ŷ'mân' (Fr., human comedy). A series of novels by Honoré de Balzac, the first volume of which was published in 1829, but the general title of which was not announced until 1842. Its plan was to present a panorama of the entire life of his country and time. This colossal attempt was left incomplete on his death in 1850. But well nigh a hundred novels remain, dealing with innumerable types and situations characteristic of the France of the early nineteenth century.

COMEDY. See DRAMA.

COMEDY OF ERRORS, THE. An early play of Shakespeare, acted at Gray's Inn, December 28, 1594, and printed in 1623. It was probably suggested by the *Menæchmi* of Plautus. The plot revolves around the amusing blunders caused by the complete similarity, in person, of the twin brothers, Antipholus of Syracuse and Antipholus of Ephesus, and their twin servants, the Dromios, whom even their masters are not able to tell apart.

COMELY BANK. A suburban street leading out of Edinburgh, from the northwest of the town. Thomas Carlyle lived there at the time of his visit to Jeffrey.

COME'NIUS, or KOMENSKY, JOHANN AMOS (1592-1670). A noted educational reformer of the seventeenth century, born either at or near Ungarisch-Brod, Moravia. His parents belonged to the Moravian Brethren, and Comenius became

one of the leaders of that sect. Though on account of poverty he was unable to begin his education until late—he did not enter the Latin school at Strassnick until he was sixteen—he attended the gymnasium of Herbörn, in Nassau, and later studied at Heidelberg. In the course of his study he became acquainted with the educational reforms of Ratichius (q.v.), and with the report of these reforms issued by the universities of Jena and Giessen.

The work of Comenius included three important fields of activity. His practical work, constituting throughout his life his most immediate concern, was that connected with the Moravian Church. In 1614 he was ordained to its ministry, and four years later was given the charge at Fulnek, one of the most flourishing churches of that communion. In consequence of the religious wars he lost all his property and his writings in 1621, and six years later was compelled to flee from his native country on account of the proscription of all Protestants. Settling at Lissa, in Poland, he became director of the gymnasium there and was given charge of the Bohemian and Moravian churches. In 1641 he went to England to join a commission charged with the reform of the system of public education, but the disturbed political condition of the country interfered with his project. In the following year, at the invitation of Oxenstiern, he applied himself to the task of reorganizing the Swedish schools. He elaborated his plans at Elbing, West Prussia, where he settled in 1642. In 1648 he was elected Bishop of the Moravian Brethren at Lissa, which town he made once more his residence, and where he published a number of his philological works. He subsequently visited Transylvania, and in 1650 assisted in drawing up a plan for reforming the Protestant school of Sáros-Patak, Hungary. In 1654 he returned to Lissa; but in the war which soon after raged in Poland he once more lost all his property, including his manuscripts, and was compelled to flee (1657). He traveled through Silesia and Brandenburg, visited Stettin and Hamburg, and finally settled at Amsterdam, where he died.

Through all his wanderings and all his educational activities, Comenius's religious interests were cared for to the neglect of many of his great educational plans. The somewhat mystical bent of his mind, however, led the gifted reformer into extremes that render much of his writings valueless for modern times, and in his last years made him an easy dupe of religious impostors.

His second great interest was in furthering the Baconian attempt at the organization of all human knowledge. He became one of the leaders in the encyclopædic or pansophic movement of the seventeenth century, and, in fact, was inclined to sacrifice his more practical educational interests and opportunities for these more imposing but somewhat visionary projects. The men of affairs who aided him with funds and gave him protection and opportunity for continuing his educational investigations and writings were more interested in their immediate practical import, and insisted, in spite of the wishes of Comenius, on his devoting his energies and original insight to the work of organizing schools, and writing text-books or works on method. In 1639 Comenius had published his *Pansophia Prodomus*, and in the following year his English friend Hartlib published, without

his consent, the plan of the pansophic work as outlined by Comenius. The result of his life's work in this sphere, his *Pansophia*, was destroyed in manuscript in the burning of his home in Lissa in 1657. The pansophic ideas find partial expression in the series of text-books produced from time to time. In these he attempts to organize the entire field of human knowledge so as to bring it, in outline, within the grasp of every child.

The most permanent influence exerted by Comenius was in the practical educational work. Few men since his day have had a greater influence, though for the greater part of the eighteenth century and the early part of the nineteenth there was little recognition of his relationship to the current advance in educational thought and practice. The practical educational influence of Comenius was threefold. He was first a teacher and an organizer of schools, not only among his own people, but later in Sweden, and to a slight extent in Holland. In his *Great Didactic* he outlines a system of schools that is the exact counterpart of the existing American system of kindergarten, elementary school, secondary school, college, and university. In the second place, the influence of Comenius was in formulating the general theory of education. In this respect he is the forerunner of Rousseau, Pestalozzi, Froebel, etc., and is the first to formulate that idea of 'education according to nature' so influential during the latter part of the eighteenth and early part of the nineteenth century. The influence of Comenius on educational thought is comparable with that of his contemporaries, Bacon and Descartes, on science and philosophy. In fact, he was largely influenced by the thought of these two; and his importance is largely due to the fact that he first applied or attempted to apply in a systematic manner the principles of thought and of investigation, newly formulated by those philosophers, to the organization of education in all its aspects. The summary of this attempt is given in the *Didactica Magna*, completed about 1631, though not published until several years later. The third aspect of his educational influence was that on the subject matter and method of education, exerted through a series of text-books of an entirely new nature. The first-published of these was the *Janua Linguarum Reserata* (The Gate of Languages Unlocked), issued in 1631. This was followed later by a more elementary text, the *Vestibulum*, and a more advanced one, the *Atrium*, and other texts. In 1657 was published the *Orbis Sensualium Pictus*, probably the most renowned and most widely circulated of school text-books. It was also the first successful application of illustrations to the work of teaching, though not, as often stated, the first illustrated book for children.

These texts were all based on the same fundamental ideas: (1) learning foreign languages through the vernacular; (2) obtaining ideas through objects rather than words; (3) starting with objects most familiar to the child to introduce him to both the new language and the more remote world of objects; (4) giving the child a comprehensive knowledge of his environment, physical and social, as well as instruction in religious, moral, and classical subjects; (5) making this acquisition of a compendium of

knowledge a pleasure rather than a task; and (6) making instruction universal. While the formulation of many of these ideas is open to criticism from more recent points of view, and while the naturalistic conception of education is one based on crude analogies, the importance of the Comenian influence in education has now been recognized for half a century. The educational writings of Comenius comprise more than forty titles. In 1892 the three-hundredth anniversary of Comenius was very generally celebrated by educators, and at that time the Comenian Society for the study and publication of his works was formed. Consult: Laurie, *John Amos Comenius, Bishop of the Moravians: His Life and Educational Works* (London, 1884); Quick, *Essays on Educational Reformers* (London, 1868); Raumer, *Geschichte der Pädagogik*, vols. i.-iv. (Gütersloh, 1874-80); Müller, *Comenius, ein Systematiker in der Pädagogik* (Dresden, 1887); Löscher, *Comenius, der Pädagog und Bischof* (Leipzig, 1889).

COMET (AS., Lat. *cometa*, comet, from Gk. *κομήτης*, *komētēs*, having long hair, from *κομᾶν*, *komān*, to wear long hair, from *κόμη*, *komē*, hair). The word 'comet' had its origin in the hairy appearance often exhibited by the haze or luminous vapors, the presence of which is at first sight the most striking characteristic of the celestial bodies called by this name. The general features of a comet are: a definite point or nucleus, a nebulous light surrounding the nucleus, and a luminous train preceding or following it. Anciently, when a train preceded the nucleus—as is the case when a comet has passed its perihelion and recedes from the sun—it was called 'the beard,' being termed 'the tail' when seen following the nucleus as the sun is approached. This distinction has disappeared from all modern astronomical works, and the latter name is given to the appendage, whatever its apparent position. Neither this luminous attendant, the tail, nor the nucleus, is now considered an essential cometary element, but all bodies in the solar system are classed as comets if they have a motion of their own, and describe orbits of an extremely elongated form. There are several plain points of difference between comets and planets. The planets move in the same direction, from west to east, which is astronomically called 'direct motion;' but the movements of comets are often from east to west, or retrograde. The orbits of all the planets are confined to a zone of no great breadth on either side of the ecliptic; but the paths of comets cut the ecliptic in every direction, some being almost perpendicular to it. The orbits of all the planets are nearly circular; or, more properly speaking, are ellipses of very small eccentricity. The orbits of comets, on the other hand, present great variety of eccentricity, many of them being ellipses or elongated closed orbits of various degrees of elongation; others, though very rarely, may be hyperbolas; while the majority have a form of orbit not differing sensibly from the parabola, which is the limiting form of curve to which both the ellipse and hyperbola usually approximate. Any attraction, however, of an extraneous body, like a planet, interfering with the attraction of the sun, might change the orbit from the ellipse to the hyperbola, and vice versa, or from the parabola to either. As, however, there is only one parabola

corresponding to infinite sets of ellipses and hyperbolas, an interfering cause is not likely to change the orbit from an ellipse or hyperbola to the parabolic form. Of about 350 comets whose orbits have been obtained with more or less accuracy, 60 appear to have described ellipses, 275 orbits cannot be distinguished from parabolas, and in two cases the hyperbolic form of orbit is extremely probable. The discovery that comets are celestial bodies extraneous to our atmosphere is due to Tycho Brahe, who ascertained the fact by observations of the comet of 1577. Newton succeeded in demonstrating that their movements are subject to the same law which controls the planets in their orbits. Halley was the first, by determining the parabolic elements of a number of comets from recorded observations, to identify the comets of 1682 with one which had been observed in 1607 and with one observed by Apian at Ingolstadt in 1531, and thus confidently to predict the return, at the end of 1758 or the beginning of 1759, of a comet which would have the same parabolic elements. This prediction of the first 'periodic' comet moving in a closed oval orbit simply meant that the portion of the closed orbit lying nearest the sun, and therefore the only observable portion of the orbit, would very closely resemble the parabolas or open curves in which this comet had been supposed to be moving at its earlier appearances.

Parabolic cometary elements are the following: (1) The inclination; (2) the longitude of the node; (3) the longitude of the perihelion or point of nearest approach of the sun; (4) the perihelion distance, or nearness of approach to the sun; (5) the direction of motion, whether direct or retrograde. The first two of these elements determine the plane of the orbit. To determine these parabolic elements, three observations of the comet are sufficient; and by a table of such elements, calculated from recorded observations, it is possible at once to ascertain, as Halley did, whether any newly observed comet is identical with any that has been previously observed. However, to predict with accuracy the time of the return of a comet, a much more accurate calculation must be made of the orbit, taking into account the perturbations of the planets to whose influence it is subject. This difficult problem was solved, in the case of Halley's comet, by the joint work of Lalande, Mme. Lepaute, and Clairaut, who announced in November, 1758, just as astronomers began to look out for the return of the comet, that it would take 618 days more to return to the perihelion than on the preceding revolution. The perihelion passage was fixed about the middle of April, 1759; but Clairaut distinctly stated that, being pressed for time, he had neglected small values which collectively might amount to about a month in the seventy-six years. The comet passed the perihelion on March 12, 1759, exactly a month before the time announced, but within the assigned limits of divergence from that date. The elements of its orbit proclaimed it to be the comet of the former appearances by their similarity. For the next perihelion passage, the different calculations executed by Damoiseau and De Pontécoulant fixed the 4th, the 7th, and the 13th of November, 1835. Subsequently, observations indicated the 16th—that is to say, a deviation of only three days from

what turned out the most accurate calculation, and a deviation of twelve days from the most remote. We have adverted to the perihelion passages of this comet in 1531, 1607, 1682, 1759, and 1835. It is also now identified with a comet observed in 1456, and one in 1378, recorded by Chinese observations. There are no sufficiently reliable European observations previous to 1456, but it is conjectured that this comet is the same with the comet of 1501, with that of 1145, with a comet mentioned in 1066 by Hali ben Rodoan, with that of 989, and finally, with a comet seen in the year 12 before our era. This account of Halley's comet has been given at length, to illustrate the principles on which the calculations are made. There are, in all, eighteen comets whose periodicity is established by the fact that their return has been actually observed: (1) That of Encke, with a short period of 3.303 years; its orbit does not extend so far as the orbit of Jupiter, and a slight acceleration in its periodic times of return has suggested the possibility of space, within our solar system at least, being occupied by a resisting medium, though of extreme rarity. (2) That of Biela or Gambart, having a period of 6.692 years. During the visit of this comet in 1846, it was seen to separate into two distinct parts, which kept moving side by side till they disappeared. On the return of the comet in the autumn of 1852, the distance between the two nuclei had much increased. Since then, although many times due, it has not again been seen. (3) That of Faye, with a period of 7.566 years. The orbits of Biela's and Faye's comets extend beyond the orbit of Jupiter, but not so far as that of Saturn. (4) That of Winnecke, with a period of 5.831 years. (5) That of Brorsen, with a period of 5.456 years. (6) That of Temple (No. 1), with a period of 6.538 years. (7) That of Temple (No. 2), with a period of 5.281 years. (8) That of D'Arrest, with a period of 6.675 years. (9) That of Tuttle, with a period of 13.667 years. (10) That of Swift, with a period of 5.547 years. (11) That of E. Swift, with a period of 5.863 years. (12) That of Finlay, with a period of 6.556 years. (13) That of Wolf, with a period of 6.845 years. (14) That of Holmes, with a period of 6.874 years. (15) That of Brooks, with a period of 7.097 years. (16) That of Pons, with a period of 71.56 years. (17) That of Olbers, with a period of 72.65 years. (18) That of Halley, with a period of 76.08 years. The orbits of sixty comets appear to be ellipses. These are *probably* periodical. The paths of about two hundred cannot be distinguished from parabolas. These are *possibly* periodical, as the ellipse, when very eccentric, cannot near perihelion be distinguished from a parabola. Only about a dozen have orbits possibly hyperbolic; and, as we have said, in only two cases is the hyperbolic character of the path established upon fairly reliable evidence.

In the month of June, 1770, Messier discovered a comet which remained visible a long time, and enabled Lexell to ascertain the orbit to be an ellipse whose major axis was only three times the diameter of the earth's orbit, and corresponded to a periodic revolution of five and one-half years. This result suggested grave difficulties. It had been found impossible to identify this comet with any previously observed, and yet it was difficult to conceive that a bright

comet with so short a period of return should have previously escaped observation. What was still more remarkable, it was never seen again, though anxiously looked for in the places where Lexell's orbit would have brought it. It became popularly called 'Lexell's lost comet,' and gave occasion to many sarcasms by the wits of the day at the expense of astronomers, who had boasted of having found the key to the cometary movements. In the present day the explanation is complete. The comet was never seen before 1770, because its orbit previously had been totally different, its nearest point to the sun having been as distant as the path of Jupiter. Its appearance that year arose out of the fact that in 1767 it was in such close contact with Jupiter, moving in the same direction and nearly in the same plane, that the attraction of that planet entirely changed its orbit. But why has the comet not since been seen? Its passage to the point of perihelion in 1776 took place by day; and in 1779, before another return, it again encountered the vast body of Jupiter, and suffered a fresh orbital derangement—the attraction of the planet deflecting it into more distant regions, and so changing the form of the orbit that if it had again been visible, it would probably not have been recognized as identical with Lexell's comet.

The celebrated comet of 1680, which furnished Newton with the occasion for proving that comets revolve around the sun in conic sections, and that, consequently, they are retained in their orbits by the same force as that which regulates the movements of the planets, appears to have been about the most remarkable for brilliancy of any of which we have authentic accounts. This comet is supposed to be identical with the one that appeared about the time of Caesar's death (B.C. 44), with that which was seen in the reign of Justinian in the year 531, and with another in the year 1106, in the reign of Henry II.; the period of revolution, according to the orbit calculated for it by Whiston, being about 575 years. There is, however, some doubt among astronomers as to the real form of its orbit, the one assigned to it by Encke giving it a period of 8.813 years. The tail of a comet is nearly always away from the sun, frequently assuming a curved form. It increases in length with its proximity to the sun, but does not acquire its greatest length till after passing the perihelion. These are usual characteristics of comets, which were exemplified by this one in a remarkable degree. The phenomena might be accounted for, if we were to regard the train as vaporization produced by the intense heat to which the body of the comet is exposed in its approach to the sun. In the nineteenth century the comets most remarkable for brilliancy were the comets of 1811, 1843, 1858 (Donati's), 1861, 1880, 1881, and the great comet (b) of 1882. Spectroscopic investigation, so far as yet pursued, points to the conclusion that comets are self-luminous, and do not shine merely by reflecting solar light. It has been discovered, in determining the tracks of those streams of dark bodies that cause meteoric showers, that some of the tracks coincide with the orbits of well-known comets. From this it is inferred that star-showers and comets may be only different manifestations of the same thing. (See METEORS.) What the matter of the comets consists of is, of course, only a subject for

speculation. The composition of the nebulosity and the tail is, at all events, something of almost inconceivable tenuity, as shown by three considerations. (1) Stars seen through them suffer no diminution of brightness, though the light must have to traverse sometimes millions of miles of the cometary atmosphere. (2) Though the thickness of the tail of a comet may be millions of miles, and its length of course much greater, the comets have never been observed to cause any sensible disturbance of the planetary motions, though approaching near enough to be themselves so much affected as to change the entire character of the orbit. (3) The curvature of the tails, and the acceleration of the periodic time in the case of Eneke's comet, indicate the possibility of their being affected by a resisting medium, which has never been observed to have the slightest influence on the planetary periods, though so long observed. Even the nuclei of comets appear to be of extremely small density. This may be inferred, though with less force than regards the tails, from the two last considerations above mentioned; and, moreover, there are reliable accounts of stars of a very low order of magnitude being seen through the nuclei themselves.

Comets have been alternately regarded with terror and with welcome in the popular mind. The appearance of Halley's comet in 1456, just as the Turks had become masters of Constantinople, and threatened an advance into Europe, was regarded by Christendom with a superstitious dread, and to the Ave Maria was added the prayer: "Lord, save us from the devil, the Turk, and the comet." At Constantinople, the occurrence of a lunar eclipse at the same time, increased the portentousness of the event. The discoveries of science as to the magnitude of the space filled by their bodies and their prodigious velocity, together with the confessed impossibility of always predicting their approach, produced fears of another kind, which have sometimes been, especially in France, extravagantly exaggerated in the public mind. The groundlessness of such alarms, from the extreme improbability of collision with the nucleus, the probable innocuousness of a contact with the extremely attenuated surrounding matter, and, possibly, to the greater part of the world, of a collision with the nucleus itself, will be sufficiently evident from what has been said above. It is probable that already on many occasions some of the attenuated vapor in the tail of comets must have come within the earth's attraction, and been absorbed in its atmosphere. Whether the effect is deleterious or salubrious, or whether it has any perceptible influence at all, is only matter of speculation. The salubrity of cometary influence was at one time a popular idea; and the vintages of 1811 and 1858 were favorable seasons, whose produce was formerly advertised as the comet wines. It is scarcely worth while, however, to follow further speculation on these subjects. Consult: Guillemin, *The World of Comets*, trans. by Glaisher (London, 1881); Zöllner, *Ueber die Natur der Kometen* (Leipzig, 1883); Marcuse, *Ueber die physische Beschaffenheit der Kometen* (Berlin, 1884); Ball, *In the Starry Realm* (London, 1892); Galle, *Verzeichniss der Elemente der bisher berechneten Kometenbahnen bis zum Jahre 1894*

(Leipzig, 1894); Lynn, *Remarkable Comets* (London, 1899).

COMET-SEEKER. A telescope having a wide field of view, but a rather low magnifying power, used in searching for comets.

COMFORT, kŭm'fĕrt, GEORGE FISK (1833—). An American educator. He was born at Berkshire, N. Y., and graduated at Wesleyan University in 1857. He was one of the leaders in organizing the American Philological Association (1869), and also in establishing the Metropolitan Museum of Art in New York City (1869-72). From 1872 to 1887 he was professor of modern languages and aesthetics in Syracuse University, and in 1872 founded there the College of Fine Arts, of which he was dean from 1873 until 1893. In the latter year he became president of the Southern College of Fine Arts, at La Porte, Tex., and in 1896 organized the Syracuse Museum of Fine Arts, of which he became the director. He has published: *Art Museums in America* (1869); *Modern Languages in Education* (1870); *Woman's Education and Woman's Health* (1894); *The Land Troubles in Ireland* (1898); and a series of German text-books.

CONFREY, kŭm'frĭ (OF. *eumfrie*, *confire*, from ML. *confirma*, probably on account of its strengthening powers, from Lat. *confirmare*, to make firm, strengthen, from *con*, together + *firmare*, to strengthen, from *firmus*, firm), *Symphytum*. A genus of plants of the natural order Boraginaceæ. The species, which are not numerous, are natives of Europe and the north of Asia. They are perennial plants of coarse appearance, although occasionally to be seen in flower borders. *Symphytum officinale* (the common confrey) and *Symphytum tuberosum* are natives of Great Britain, frequent in shady and moist places. *Symphytum officinale* was formerly much esteemed as a vulnerary, on account of its astringency, and decoctions of its roots were a household remedy for diarrhœa. Its young leaves and its blanched shoots are also occasionally used as boiled vegetables. The prickly confrey (*Symphytum asperinum*), a native of Caucasus, 6 to 10 feet in height, has been highly recommended for feeding cattle. It has been extensively tried in the United States, but its cultivation is not recommended, except when a large bulk of forage is required from a limited area of rich land. It is propagated from roots.

COMICAL GALLANT, THE, OR THE AMOURS OF SIR JOHN FAUSTAFF. An adaptation, by John Dennis (1702), of Shakespeare's *Merry Wives of Windsor*.

COMICAL LOVERS, THE, OR MARRIAGE À LA MODE. A comedy by Colley Cibber (1707), based on portions of Dryden's *Secret Love* and *Marriage à la Mode*.

COMICAL REVENGE, THE, OR LOVE IN A TUB. A comedy by Sir George Etherege, played and printed in 1664.

COMINES, kŏ'mĕn' (Lat. *Cominæus*, Flemish *Comen*). A border town of France and Belgium, situated on the Lys, by which it is divided into two parts, one belonging to the French Department of Nord and the other to the Belgian Province of West Flanders. It has a number of textile-mills and tobacco-factories. The celebrated

medieval chronicler, Philippe de Comines, was born here. Population, French portion, in 1901, 8129; Belgian, in 1899, 5757.

COMINES, PHILIPPE DE (1445-1509). A French statesman and historian. He was born at the Castle of Comines, not far from Lille; received a careful education, and in 1464 attached himself to Charles the Bold of Burgundy (then Count of Charolais). In 1472 Comines entered the service of Louis XI., the rival and enemy of Charles, who made him one of his confidential advisers. He proved himself a very suitable agent for carrying out the designs of the crafty monarch; but after the death of Louis he incurred the displeasure of the regent, Anne de Beaujeu, by his adherence to the party of the Duke of Orléans (afterwards Louis XII.), and was sentenced to the forfeiture of a fourth of his estates and to ten years' banishment. This punishment, however, does not seem to have been carried out, for after a few years we find Comines again employed in important affairs of diplomacy; but though he was engaged in the service of Charles VIII. and the Duke of Orléans, he failed to win the confidence of these masters. He died at his Castle of Argenton, October 13, 1509. Comines's *Mémoires*, which are a complete survey of the political history of his time, and depict vividly the character of Louis XI., are admirably written, and afford abundant proof of an acute and vigorous mind. He seems to have looked keenly into the heart of every man who crossed him in life, and with cool and severe precision to have dissected him for the benefit of posterity. Among the many editions of his *Mémoires*, the best are those by Lenglet-Dufresnoy (4 vols., London, 1747); by Mademoiselle Dupont (3 vols.), in the *Collection de la société de l'histoire de France* (Paris, 1840-47); and by Chantelange (Paris, 1881).

COMISCO, kō-mě'sō. A city in Sicily, in the Province of Syracuse, situated about 40 miles southwest of the city of that name. It was known in Roman mythology as the location of a fabled fountain of Diana, the water of which, when drawn by women of light character, refused to mingle with wine. It is on the road between Catania and Licata, and has two churches, a theatre, and cotton and soap factories. Population (commune), in 1881, 19,333; in 1901, 21,873.

COMITÁN', kō-mě-tān', or **COMITLÁN**. A town in the State of Chiapas, Mexico, situated on the Grijalva River, about 30 miles southeast of San Cristóbal (Map: Mexico, N 9). It has a fine Dominican cloister. The town is largely engaged in agriculture and cattle-raising, but has manufactures of cotton and woolen goods, liquors, etc., and carries on a contraband trade with Guatemala and British Honduras. Comitán suffered considerably from the raids of Juan Ortega in 1855-64. Population, about 10,000.

COMITIA, kō-mish'ī-ā (Lat. nom. pl., assemblies from *com-* (*con-*), together + *ire*, to go). The legal or constitutional meetings of the Roman people, convoked by a magistrate, for the purpose of putting a question to the vote. This definition comprehends at least all the comitia except the *Comitia Calata*, where the people were present merely as spectators. There were several kinds of comitia, held for different purposes, and, according to the mode of constituting

the comitia, the preponderance lay with the patricians or with the plebeians. It was always a fundamental principle of the Roman Constitution that the supreme power was inherent in the citizens, though it might be delegated by them to hereditary or to elected magistrates. All important matters, however, had to be brought before the sovereign people, who could either ratify or reject, though without discussion, the proposals made to them. Such, at least in theory—and, during the best days of the Republic, in practice also—was the function of these popular assemblies. As may be readily understood, different elements had the ascendancy among the Roman people at different periods of their history. So far as it was possible for a State exposed to so many and such various influences to be conservative of its political traditions, Rome, whether monarchical, republican, or imperial, was essentially so. But, under the force of circumstances, from time to time innovations were introduced which very materially altered the position of the two political parties—the patricians and the plebeians—into which the State was early divided, and by whose dissensions it was long distracted, and in none of her institutions can the progress of the struggle between these rising factions be more clearly traced than in the motive and power of those assemblies, or comitia, by which the supreme authority of Rome was in succession wielded. It is usual to describe the Roman comitia as of three kinds, named from the mode in which the people were organized and in which they voted—the *Comitia Curiata*, or assembly of the curiæ; the *Comitia Centuriata*, or assembly of the centuries; and the *Comitia Tributa*, or assembly of the tribes. To these some add a fourth, the *Comitia Calata* (from *calare*, to call); but as this assembly had neither political functions nor a separate organization, it is unnecessary to do more than mention the name.

(1) **COMITIA CURIATA**. The assembly of the curiæ is believed to have been coeval with the rise of Rome itself, and its origin is therefore rightly ascribed by tradition to the mythical founder of the city. The system seems to have been an essential part of the communities, of which Rome was originally only one. Its primary object cannot now be satisfactorily determined; but the purpose for which it came to be employed is sufficiently clear. From a very early period the Roman curiæ, or 'wardships,' as they may be called, numbered thirty, being ten for each of the three once independent communities—the Ramnes, the Tities, and the Luceres—from whose amalgamation the Roman people sprang. At first, these curiæ were probably made up extensively of the freeholders, or patricians, as the freeholders were afterwards designated, on whom devolved exclusively the right and the duty of bearing arms. It has been maintained by some that the class of dependents called by the Roman writers clients, as well as the burgesses or citizens, had a right to vote in the assembly of the curiæ. No direct evidence, however, can be brought forward in support of this supposition, which, in the nature of the case, is highly improbable; and, if allowed to be present at all, they were very likely nothing more than spectators, or, as their name is said to imply, 'listeners.' In an assembly each curia had one vote, and determination was by the ma-

jority of the individual voters in the different curiæ. As the number of the curiæ was even, and no provision was made for deciding in case of there being an equal division on any question, it would seem as if this function had not been thought of in fixing the number of the curiæ, or had been subordinated to some other consideration. The purely political importance of the Comititia Curiata declined after the political distinctions between patricians and plebeians terminated. It retained, however, to a late period its original powers as to the transference of a patrician to the plebeian order and the admission of non-patricians to patrician standing.

(2) COMITIA CENTURIATA. By the operation of obvious causes, a great increase soon took place in the number and influence of the dependent members of the Roman Commonwealth. As a natural consequence, the way was paved for a reform of the Constitution, though we may well conceive that the step was hastened by the gradual thinning of the ranks of the old freeholders in the incessant wars in which Rome found herself involved with her neighbors. Thus, in the course of time a new class, the plebeians of history, arose out of the clients, preponderating in numbers, and by no means destitute of wealth. Though this class had not, perhaps, the rights of citizens, it was exempt from service in the field; and while the political inferiority of its members must have been galling, their immunity from the chances of war can hardly have been looked upon with equanimity by the ruling faction. It was to redress this twofold grievance that the reform ascribed to King Servius Tullius is generally believed to have been effected. But the whole scheme was one skillfully devised to assign duties to the plebeians rather than to bestow upon them rights, and it was evidently the work of a statesman who was in the interest of the patricians. The chief authorities for the details of the arrangement are Livy and Dionysius, whose accounts, though they differ in some particulars, agree in the main. We must bear in mind, however, that both of them describe the assembly of the centuries rather as it existed in their own day than as it was first constituted. Livy gives the whole number of the centuries as 194; Dionysius makes them 193. The voting of the assembly was by centuries, each possessing a collective vote exactly as in the case of the curiæ. It was so arranged that the eighteen centuries of *equites* and the eighty centuries of the first class voted first. If they were agreed upon a question at issue, the other side were not called upon to vote at all. As the centuries, though nominally 'hundreds,' probably contained in the first class fewer, and in some of the other classes certainly many times more than that number, it is plain that in the assembly by far the largest share of power was retained in the hands of the wealthy, of whom the original burghess element would long form the main portion. How far we have in this scheme merely a modification of an earlier arrangement, there are no means of determining. As Mommsen remarks, it is more than probable that the original assessments were laid upon land. Be this as it may, the reform of Servius was originally a new military rather than a new political organization, its author intending that the privileges of the patricians assembled in the curiæ should remain as before.

But its results were different from what had been anticipated. By a process easily understood, the rights of the curiæ gradually passed to the centuries. The assembly of the former continued, indeed, to meet; but the assembly of the latter became thenceforth the chief guardian of the rights of the Roman people.

(3) COMITIA TRIBUTA. The further development of the democratic element in the Roman Constitution, consequent on the change just described, soon led to a demand for greater changes in the same direction. The tribunes of the people, now the acknowledged leaders of the democracy, took advantage of an ancient division of the original territory of Rome into tribes to give greater prominence to this element than it had yet possessed. These tribes, thirty, and afterwards thirty-five, in number, which, as is supposed by some, had already supplied a basis for the arrangement into curiæ as well as classes, seem to have at first existed for purely local purposes. But the leaders of the people succeeded at length in forming them into a political union entitled to exercise certain functions, chief among which was the election of the inferior magistrates, and the approval and rejection of such legislative measures as affected the interests of the plebeians as a class. Whether the assembly of the tribes was composed only of plebeians, or of all, whether patrician or plebeian, living within certain limits, has not been ascertained; but the balance of opinion inclines to the hypothesis that it consisted of plebeians alone. After the rise of this new power, it became a matter of great difficulty to determine what questions were to be submitted to the tribes, and what to the centuries, each claiming to be the real representatives of the whole body of the people. A solution appears to have been sought and found in some combination of the two rival assemblies. At what time this change took place, and what was its exact nature, are matters which remain involved in the greatest obscurity. All that can be said is this: The plebeians, either by means of their own assembly, or by some use of it to counterbalance the power of the patricians in the assembly of the centuries, ultimately gained what they had so long aimed at—a position of supreme importance to the Republic. When the wealthier classes found their influence thus neutralized, they ceased to attend the comitia altogether, and the popular will was represented by the lower classes alone. A period of moral and political corruption followed, ending in the military despotism of the Cæsars. Under the first emperors the form of calling the assemblies together was still observed; but the people met no longer to control their chief ruler, but simply to receive information as to what he had done. Even this form was by and by discontinued, and in the last days of the Empire the comitia was an institution known only as one of the traditions of the past greatness of Rome. Consult Mommsen, *Römische Forschungen*, vol. i.; and see **ROME**.

COMITIUM (Lat., place of assembly). A small square in ancient Rome, between the Forum and the Senate House. It was originally the polling-place of Rome, where the Comititia Curiata met and important cases were tried. It contained the old rostra, and near by was the Græcostasis, or platform for foreign ambassadors. On it stood a number of statues, includ-

ing those of the Augur Attus Navius, Pythagoras, Alcibiades, and Horatius Cocles; the Ficus Ruminalis; and a bronze statue of the she-wolf suckling Romulus and Remus. Wooden furniture was provided when needed on special occasions, and furnished the fuel for the conflagration which destroyed the neighboring curia at the burial of Clodius.

COMITY OF NATIONS. That species of international legal courtesy by which the laws and institutions of one country are recognized and given effect to by those of another. It is often called by its Latin equivalent, *comitas gentium*. "In the silence of any positive rule," says Mr. Justice Story, "affirming, or denying, or restraining, the operation of foreign laws, courts of justice presume the tacit adoption of them by their own government, unless they are repugnant to its policy or prejudicial to its interests." From the existence of so great a number of independent States on the Continent of Europe, and of federated States in America, the *comitas gentium* is more called into play in these countries than in England, and it has consequently been more extensively discussed by their legal writers. See CONFLICT OF LAW; INTERNATIONAL LAW; and the authorities there referred to.

COMMA (Lat., Gk. *κόμμα*, *komma*, clause, piece, from *κόπτειν*, *koptein*, to strike). In the mathematical study of sound, in which tones are expressed in exact values by means of their vibration numbers, we find that by reckoning upward in two different ways to a certain note, the two results show an infinitesimal difference in pitch. This minute interval, called a comma, is only perceptible in theory, and has no actual musical value in our modern 'tempered' scale. By tuning upward four perfect fifths from a given note, and then two octaves and a major third from the same note, we reach apparently the same tone; but, calculating the vibrations, we find the first result exceeds the second in the proportion of 81 to 80. This difference is called the comma *syntonum*, or comma of Didymus. The difference obtained by tuning upward twelve fifths and seven octaves from a given tone is $\frac{531441}{521280}$, and is called the comma *ditonicum*, or comma of Pythagoras. These same figures result as the difference between six whole tones above a note and its octave.

COMMA BACILLUS. See CHOLERA.

COMMA BUTTERFLY. A North American nymphaline butterfly (*Grapta*, or *Polygonia comma*), one of the angle-wings, reddish-brown with darker spottings, and a light mark, shaped like a comma, on the hinder wing. It is widely distributed and common, feeding upon nettles, and is injurious to hops. See HOP-INSECTS.

COMMANDANT' (Fr. *commandant*, pres. part. of *commander*, to command, ML. *commandare*, to command, from Lat. *com-*, together + *mandare*, to enjoin). A relative title, incident to a military command, and applied to the commander of a garrison, fortified post, or military school, without any regard to his absolute rank. The Cavalry School at Fort Riley, Kan.; the Artillery School at Fort Monroe, Va.; the United States Military Academy at West Point; Sandhurst, Hythe, and Kneller Hall, England, are all governed by officers of varying ranks, holding the local title of commandant.

In the United States Navy the title of commandant is applied to the commanding officer of a navy-yard or naval station. The commandants of the principal navy-yards are line officers of the rank of rear-admiral; lesser stations are commanded by captains or officers of less rank. To the commandant is given full jurisdiction over all vessels lying at the yard, and he is responsible for all building and repair work. He is also responsible for the proper organization of the working forces; for the effective organization of the yard force for protection against fire; and for the care and management of all machinery, equipment, etc., under his control. He is assisted by an officer of the rank of captain, or of less rank when the commandant is not a rear-admiral, who acts as his executive officer and is called the *captain of the yard*. *Master-Commandant* was formerly the title of officers in the United States Navy next junior in rank to captains. In 1838 Congress enacted that *master-commandants* should thereafter be known as and styled *commanders* (see COMMANDER); the latter title had previously been recognized in the pay bill of March 3, 1835. The title of master-commandant was a relic of the days of transition from the time when the fighting on board ships was done by soldiers commanded by an officer of the land forces to that when the fighting and navigating forces were combined. The titles of *sailing-master*, *master*, *master's mate*, etc., were evidently of pretransition origin; *master-commandant*, on the contrary, was evidently a recognition of a new state of things in which the master-mariner had become the *naval commander*.

COMMANDER. The title of officers of the United States and British navies next junior in rank to captains. In the United States Navy it was established by law in 1838. (See COMMANDANT.) By order of the President, of June 7, 1901, a commander may serve as commanding officer of a division, or of a ship of the second or third rate. The pay of a commander is \$3000 per annum when at sea, with an addition of 10 per cent. for each five years of service, provided the total amount does not exceed \$4000; the pay on shore duty is 15 per cent. less.

COMMANDER, LIEUTENANT. See LIEUTENANT-COMMANDER.

COMMANDER-IN-CHIEF. A relative military title, pertaining to an officer in supreme local military command, as commander-in-chief of the troops in the field. In the United States, it is primarily the absolute rank and title attached to the office of President, and also the military title of many Governors of States. Under the sixty-third article of the German Constitution of 1871, the Emperor is the supreme commander-in-chief of the Army and Navy. In England, the rank, in its permanent sense, is the highest staff appointment in the service, being subject only to the ruler, through the Secretary of State for War, who is the virtual commander-in-chief.

COMMANDER ISLANDS. A group of islands of the maritime territory of Siberia, situated in Bering Sea, east of Kamchatka, between latitudes 54° 32' and 55° 24' N. and longitudes 165° 45' and 168° 12' E. (Map: Asia, Q 3). The group consists of the two large and inhabited islands of Bering (607 square miles) and

Mednj (180 square miles) and two uninhabited islets. The climate is comparatively mild; but the inhabitants, descendants of Russians and Aleuts, are few in number.

COMMANDER OF THE FAITHFUL (Ar. *ʿAmir al-Muʿminin*). A designation assumed by the Caliph Omar, the father-in-law of Mohammed, who conquered Syria, Phœnicia, Persia, Egypt, and Jerusalem, and "organized a complete military-religious commonwealth." The title was retained by his successors in the Caliphate.

COMMANDERY. A regular assembly of Knights Templars. It confers the degrees of Knight of the Red Cross, Knight Templar, and Knight of Malta. The term was first applied, about 1260, to the property of military and religious orders, administered by members of those organizations, who were known as commanders. These had charge of the income of the estates belonging to the orders, and had authority to receive gifts and alms. They were accountable to the Grand Commander, who, in the case of Knights of Saint John of Jerusalem, resided at Jerusalem.

COMMANDING OFFICER. The officer in actual command of a vessel of war. He is an officer of the line or executive corps, and is usually addressed by the courtesy title of 'captain,' without regard to actual rank, if he is permanently in command and not merely in temporary charge during the absence of a senior. The regular commanding officer, upon leaving the ship, is succeeded by the next line officer in rank, but the latter must not alter the regulations established by his superior except in case of urgent necessity. Upon the commanding officer of a modern battle-ship there rests a responsibility the like of which is placed upon few men. He is answerable for the safety of the ship and of the crew, for the preservation of the battery, engines, boilers, and other machinery in condition for instant use, and for the conduct of all those placed under him, so far as he can control it. He is required to know every detail of construction of his ship and of her equipment, as well as of the organization of the crew. He has as an assistant an executive officer, who has charge of the organization of the personnel, and of the hull and equipment; a navigating officer, who has charge of the navigation and navigating apparatus; an ordnance officer, who has charge of the guns and ordnance stores; a chief engineer, who has charge of the propelling machinery; also a surgeon and a paymaster, the latter having charge of the accounts of the men and officers and of the provisions and clothing for the men. In the military services throughout the world, the senior officer of a regiment, corps, post, or any detachment where there is not any higher local military authority, is regarded as the commanding officer. Regimentally, the officer commanding the regiment is spoken of and referred to as the commanding officer, which usage in the British Army is still further abbreviated by the use of the initials 'C. O.'

COMMANDITE, kŏ'mān'dĕt'. SOCIÉTÉ EN, or LIMITED PARTNERSHIP. See SOCIÉTÉ EN COMMANDITE.

COMMANDMENTS OF THE CHURCH. Certain rules imposed by the Roman Catholic Church on all its members, under pain of grave sin. They differ slightly in different countries;

but in general they require the observance of Sundays and festivals of obligation by attendance at mass and rest from servile work, the observance of days of fasting and abstinence, the reception once a year at least of the sacraments of penance and holy communion, contribution in proportion to one's means to the support of pastors, and the observance of regulations in regard to marriage.

COMMELIN, kŏm'lĕn' HIERONYMUS. (?-c.1598). A Flemish printer, born at Douai. He worked at Geneva, and later at Heidelberg. The best specimens of his press are the admirable editions of the ancient classics and the Church Fathers, to the text of which, often determined by a collation of manuscripts, he added learned critical notes from his own hand.

COMMELIN, JAN (1629-92). A Dutch botanist, born in Amsterdam. He was a professor of botany in the University of Amsterdam, and founded in that city the botanical gardens which soon became the most celebrated in Europe. In description of the contents of these gardens he wrote several volumes.

COMMEMORATION (Lat. *commemoratio*, from *commemorare*, to commemorate, from *com-*, together + *memorare*, to mention, from *memor*, mindful; connected with Gk. *μέμνητος*, *memnētos*, anxious, Skt. *smar*, to remember), or **EXCÆNIA** (Lat., Gk. *ἐγκαίνια*, *engkainia*, feast of renovation or consecration, a name for Easter, from *ἐν*, *en*, in + *καίνος*, *kainos*, new). The great festival of the Oxford academic year, corresponding in some respects to the commencement of American colleges. It usually takes place on the third Wednesday after Trinity Sunday, in the Sheldonian Theatre—which, like the Sanders Theatre, Harvard, and the Kent Theatre, Chicago, is a university building. From time immemorial, public exercises have been held to mark the 'act' or period when degrees were conferred on the members of the university. At the present day, the proceedings consist of a Latin oration in honor of founders and benefactors (from which the name of the whole ceremony is derived); the conferring of degrees, not only in course, but also *honoris causa*, on distinguished strangers, who are introduced to the vice-chancellor in a short Latin speech; and the recitation, at least in part, of the Newdigate or English prize poem, and the Latin and English prize essays, the three prizes being the gift of the chancellor. The large area or floor is occupied during the proceedings by masters of arts and their male friends; in raised stalls in a semicircle around one end of this area sit the vice-chancellor, doctors, and proctors; while the galleries are filled by the undergraduates and women. The undergraduates, until recent years, used to occupy a separate upper gallery; but the license claimed by them of making unofficial and often very witty comments on the proceedings—a survival of the privileges of the *Terra Filius*, or licensed jester of mediæval times—finally reached a point where it was thought better to discourage it to some extent by breaking up the compact body of students and distributing them among the women present. Commemoration Day itself is only the culminating point of a week of gayety, marked by concerts, balls, theatrical representations, etc., which make Oxford a very attractive place to the visitor; but of late years

the glories of this season have tended more and more to be eclipsed by those of the 'Eights Week,' when the college eight-oared races are rowed, early in May. See OXFORD UNIVERSITY.

COMMEMORATION ODE. An ode by James Russell Lowell, read at exercises held at Cambridge in 1865, in commemoration of the Harvard men who had served in the Civil War.

COMMENCEMENT (OF., Fr. *commencement*, from OF. *comencer*, Fr. *commencer*, It. *cominciare*, to begin, from Lat. *con-*, together + *initiare*, to begin, from *initium*, beginning, from *inire*, to enter, from *in*, in + *ire*, to go). In American colleges, the name given to the concluding exercises of the college year, when degrees are conferred upon the bachelors, masters, and doctors completing their respective courses of study. The term is applied loosely to the graduating exercises of academies, secondary schools, etc. The custom originated in the mediæval universities, though the appropriate term was 'inception.' The inception involved two elements: (1) The recognition of the graduate or new teacher by his old master and other members of the profession; (2) the formal entrance of the newly licensed teacher upon his work by the actual performance of its duties. Hence, an essential feature of the exercises was that the recipient of the bachelor's degree should 'incept' or teach, and that the recipients of the higher degrees should defend a thesis. At Oxford this occasion was called Commemoration; but at Cambridge it was, and is yet, called Commencement. The 'inceptor' was there called 'commencer'—that is, one who commenced to teach. The ceremony and the term were a part of the inheritance received by Harvard College from Cambridge University, and thus became general among American colleges. This exercise in Colonial days was held in the fall, at the commencement of the college year, and the term is often, though erroneously, supposed to refer to this fact. As the mediæval bachelor 'incepted,' or taught, the graduate of the American college delivered an oration or dissertation before receiving his degree. With the larger colleges, even this modification of the old custom is now commonly abandoned, and in many places the Commencement exercises include only the address by the president or some distinguished educator, and the conferring of degrees. See UNIVERSITY; DEGREE; COLLEGE; CURRICULUM.

COMMENDAM (ML., acc. sg. of *commenda*, trust, from Lat. *commendare*, to intrust, from *com-*, together + *mandare*, to intrust, from *manus*, hand + *dare*, to give; originally used in the phrases *in commendam dare*, to give in trust, or *in commendam mittere*, to send in trust). A term in ecclesiastical law to denote a benefice which, being void, is *commended* to the care of some sufficient clerk to be supplied until it may be conveniently provided with a pastor. In former times bishops frequently held livings *in commendam*, in order to appropriate the revenues. The practice has well-nigh ceased in Europe, and does not exist in the United States. In the Church of England, commendams were abolished in 1836. See ABBOT.

COMMENDATION (Lat. *commendatio*, from *commendare*, to intrust). In feudal customs, the act by which a free man became a vassal. See FEUDALISM.

COMMENDATION OF OUR LADY, BALLADE IX. A ballad improperly attributed to Chaucer, according to Tyrwhitt; but really the same poem as the *Invocation of Our Lady*, ascribed to Lydgate.

COMMENSALISM (ML. *commensalis*, eating at the same table, from Lat. *com-*, together + *mensa*, table). A sort of partnership or association of two different kinds of organisms by which they endure each other's presence, do each other no harm, and in many cases are of mutual advantage; such are said to be commensals or messmates. This occurs chiefly among marine invertebrates, and is different from parasitism. Many commensals are quite free to separate, yet never dwell apart, and often could not maintain a separate existence. Others grow together so completely that they cannot separate if they would, yet are not parasites, because each retains its form and faculties, while a true parasite changes these in such a manner that it is no longer capable of obtaining food until it has been elaborated for it by the functions of its host. The most familiar example of commensalism is the small crab so often met with inside the shells of oysters—the pinnothere, or oyster-crab. Similar crabs inhabit various bivalves the world over, to the mutual satisfaction of guest and host. Within the shelter of the mollusk's pearly house the little crab is safe from its enemies, yet can dash out whenever it observes any prey in the offing and bring it home to be devoured; and the crumbs may be welcome to the oyster. The most striking examples, perhaps, are found among coelenterates and crustaceans. In the midst of the trailing tentacles, covered with stinging cells, of the Portuguese man-of-war and several jelly-fishes, live small fishes, comparatively safe from pursuit of their foes; small fishes also seek refuge among the tentacles of sea-anemones and within holothurians. Mollusks live in the burrows of sea-urchins that move about in the sand, and in the holes made by the crustacean *Gebia*—a reversal of the oyster and crab.

Certain Dromia crabs carry sponges, ascidians, or sea-anemones on their backs or claws. The anemones serve to conceal, and, by means of their netting organs, protect the crab, while they get fragments of the crab's food, or, by being transported from place to place, come in contact with more food than if they were stationary. One hermit-crab (q.v.) always bears an anemone upon its claw, which is so placed that it blocks the entrance to the shell when the crab retreats within. If the anemone dies or is removed, the crab is at pains to find and transfer a new anemone to its claw. A still more curious case is that of a polyp (*Gemmaria Americana*), found in deep water off the Newfoundland coast and allied to the sea-anemones, which attaches itself to the shell of a kind of hermit-crab, and by budding gradually covers the entire shell with a colony. "It possesses the power of dissolving the shell so that no trace of it can be found. As the polyp colony increases in size as fast as the crab grows, there is no need for the latter to change its abode, while its neighbors and competitors must frequently expose themselves to the discomforts and dangers of house-hunting." Consult: Van Veneden, *Animal Parasites and Messmates* (New York, 1876); *Cambridge Natural History*,

vol. iii. (London, 1895); Semper, *Animal Life* (New York, 1881). For fishes as commensals, consult: Jordan and Evermann, *Fishes of North and Middle America*, pp. 924, 966 (Washington, 1900); Harrington, "On Nereids Commensal with Hermit-Crabs;" *Transactions of New York Academy of Sciences*, vol. xvi., 1897, p. 215.

COMMENSURABLE (Lat. *commensurabilis*, from *com-*, together + *mensurare*, to measure, from *mensura*, measure, from *metiri*, to mete). Two magnitudes which are of the same kind, and each of which contains a third magnitude an exact number of times, are said to be commensurable—e.g. a foot and a yard are commensurable, an inch or a foot being a common measure. The numbers 15 and 35 are commensurable, each being divisible by 5.

Magnitudes which have no common measure—that is, are not multiples of the same unit, however small that unit is taken, are said to be incommensurable—e.g. the side and diagonal of a square are incommensurable. The diameter and circumference of a circle are incommensurable; 2 and $\sqrt{2}$, $\sqrt[3]{5}$ and $\sqrt[4]{7}$ are incommensurable. Numbers like $\sqrt{2}$, that are not commensurable with ordinary rational numbers, are also called incommensurable. In arithmetic, numbers prime to one another are sometimes called incommensurable, since they have no common measure except the unit of counting, which, used as a multiplier or divisor, does not change the number affected. See MULTIPLE; IRRATIONAL NUMBER.

COMMENTARIES, CÆSAR'S. The title of the two extant works of Julius Cæsar, the account of the Gallic War (*De Bello Gallico*) and of the Civil War (*De Bello Civili*). The former is a concise narration of the author's campaigns in Gaul, published in B.C. 51, in seven books, to which an eighth book was added by Aulus Hirtius. The simple and untechnical language and the importance of the matter have made it the most generally known work in the Latin literature. The memoirs of the Civil War were afterwards extended by other writers to embrace the Alexandrine, African, and Spanish wars.

COMMENTRY, kō'män'tré'. A town in the Department of Allier, France, eight miles southeast of Montluçon on the *Ôil*. It stands in the centre of one of the most important coal-fields of France, and since 1850 has risen from a mere village to a busy and populous town, whose inhabitants are mostly engaged in the coal-mines and iron-works. There are, besides, manufactures of wood and mirrors. Population, in 1901, 11,169.

COMMER, FRANZ (1813-87). A German musician, born at Cologne, in which city he studied music with Leidl and Klein. After holding a position as organist of the Carmelite church there, he went to Berlin in 1832 to study with A. W. Bach, A. B. Marx, and Rungenhagen. He was *regens chori* at the Catholic Hedwigskirche; singing-teacher at numerous schools, and founder (with Küster and Kullak), in 1844, of the Berlin Tonkünstlerverein. He was, in addition, royal music director, a senator of the Berlin Akademie, and president of the Gesellschaft für Musikforschung. He edited a number of collections of old music, and composed numerous masses, cantatas, and choruses.

COMMERCE (Lat. *commercium*, commerce, interchange, from *com-*, together + *merx*, merchandise, from Lat. *merere*, to gain, Gk. *μέρος*, *meros*, share). In its general acceptation, a term denoting international traffic in goods, or what constitutes the foreign trade of all countries as distinguished from domestic trade. The first foreign merchants of whom we read, carrying goods and bags of silver from one region to another, were the Arabs, the reputed descendants of Ishmael and Esau. Their trade was by land. The first maritime carriers of goods were the Phœnicians, who dwelt on a narrow strip of land on the eastern shore of the Mediterranean, and were the founders of the great emporiums of Tyre and Sidon. The Phœnicians established an easier and securer passage between Egypt and Syria than had before been known. The corn and wine of the Nile, and the oil, silk, dyes, and spices of western Asia flowed through their hands. From carriers they became merchants, and to merchandise they added manufactures. They traversed the shores of the Mediterranean, established colonies in the Greek islands and founded Carthage, one of the most noted commercial cities of the ancient world. The power of the Phœnicians disappeared with the rise of the Greek cities—Athens, Corinth—and of their colonies; of Carthage, then in full fame; and of Alexandria, the great seaport founded by Alexander the Great.

While Rome was giving laws and order to the half-civilized tribes of Italy, Carthage, operating on a different base and by other methods, was opening trade with less accessible parts of Europe. The strength of Rome was in her legions, but that of Carthage in her ships; and her ships could reach realms where legions were powerless. Her mariners had passed the mysterious Pillars of Hercules into the Atlantic, and established the port of Cadiz. They founded Carthage and Barcelona, and had depots and traders on the shores of Gaul. This prosperity of their commerce led to wars with Rome, which ended in B.C. 146 with the destruction of Carthage. In the same year the Romans captured and burned Corinth, which was then an important commercial city. In A.D. 273 land commerce suffered a disastrous blow, when Palmyra was in great part destroyed by the Romans.

GROWTH OF COMMERCE. The repeated invasions of Italy by the Goths and Huns gave rise to the founding, for defense and for trade, of the city of Venice, about the middle of the fifth century—a city that for more than a thousand years stood foremost in the trade of the world. The Venetians traded with Constantinople, Greece, Syria, Egypt, India, and Arabia, and their vessels carried the products of the East to the ports of western Europe. They had possessions on the coast of Greece, and became rulers in the Ionian Islands and in Cyprus. Their rivals, the Genoese, planted colonies on the shores of the Hellespont and the Black Sea, the most flourishing of which was Caffa (the modern Feodosia), in the Crimea, a great emporium of the commerce between Europe and Asia. A vast commerce was carried on in the Middle Ages by the towns of the Hanseatic League, situated on the shores of the North Sea, and the Baltic, and the rivers flowing into them. When the chief objects of commerce were the skilled products of the East, the South German cities—Nuremberg

and Augsburg—through which trade flowed inland, vied with Venice as centres of the Eastern trade. The ports of France and Spain were busy distributing centres. At the close of the Middle Ages, Antwerp, having outstripped Bruges and Ghent, became the greatest mart in Christendom. The inventions and discoveries of the fifteenth century transferred the centres of trade successively to Lisbon, Amsterdam, and London. The mariner's compass made distant voyages possible on the open sea. By 1487 the Portuguese had explored the whole western coast of Africa, and in 1497 Vasco da Gama passed round the Cape of Good Hope, to land in India in the following year. Before the end of the century Columbus had thrice crossed the Atlantic, and Cabot, sent out by England, had discovered North America. Nearly all this daring enterprise had for its prime object the finding of some easy route to the fabulously wealthy East, to India and China. But a century elapsed before the English fixed their first establishment or factory in India. The discovery of the New World, however, was destined eventually to change the course and the nature of trade.

From such rapidly spreading exploration and colonization there necessarily arose new wants, new products, new manufactures, and rapidly increasing trade; interrupted more or less by wars, but in the main marching steadily and rapidly on. The nineteenth century witnessed an extension of the commercial relations of mankind to which there is no parallel in history. The history of commerce in the past century would be an epitome of the world's economic development during its most intense and active period, and any enumeration of the causes of the tremendous strides which commerce has made must be partial. The progress of colonization in the widest sense, and the improvement of the means of transportation, are primary factors which cannot be overlooked. In the nineteenth century the greater part of the North American continent was opened up to occupation, Australia and South Africa were peopled by men of white race, while large portions of Asia were brought under the influence of Western rule or Western ideas. This, together with the great increase of population in Europe, has greatly augmented the productive power and consuming power of widely distant parts of the earth, dependent upon commerce for the supply of their mutual wants. Application of steam to transportation alike by land and by water has intensified the progress of colonization as we have here used the term, and made possible the commerce which has resulted from it.

In 1819 the Atlantic Ocean was first crossed by a steam vessel, and regular transatlantic steam communication was inaugurated in 1838. Since then the increase of steam navigation has been rapid, particularly in the last fifty years, until now the greater part of maritime navigation is carried on by steamships. Their far greater bulk and greater speed have led to the gradual displacement of the old sailing ships, and have greatly multiplied the potentialities of foreign commerce. The railway has been a factor of the greatest consequence in the development of sea-borne traffic. Before its advent it was only the produce of coast regions, or of those parts adjacent to inland waterways, which could participate in the foreign trade. But the railroad

has utterly changed this condition. Of great importance, too, has been the influence of the telegraph in transmitting orders and other communications between distant points without loss of time. These developments have made it possible to transport long distances not only goods whose weight formerly debarred them from a place in foreign commerce, but also more perishable goods which, under the slower transportation of earlier days, could not be handled.

Some notion of the rapid development of commerce can be gained from the statement that the aggregate exports and imports of the United States, which in 1791 were \$43,000,000, reached in 1850 \$318,000,000, and in the fiscal year ending June 30, 1900, \$2,244,000,000. For a comparison with earlier dates, we may select a few figures for Great Britain and Ireland, which show the development of commerce in the past three hundred years:

YEARS	Imports	Exports	Combined Imports and Exports
1613.....	£2,141,151	£2,487,435	£4,628,586
1662.....	4,016,019	2,022,812	6,038,831
1703.....	4,526,579	6,644,103	11,170,682
1770.....	11,002,000	12,142,000	23,144,000
1800.....	28,258,000	34,382,000	62,640,000
1855.....	143,542,850	116,691,310	260,234,160
1890.....	420,885,695	327,880,676	748,766,371
1900.....	523,633,486	354,550,594	878,184,080

WORLD'S COMMERCE. The aggregate commerce of the world was computed in 1890, for the total of exports and imports, at approximately \$17,500,000,000. The following statement, which gives the figures, so far as they are available, for the trade of 1901, gives some notion of the relative positions occupied by some of the leading nations:

IMPORTS AND EXPORTS

COUNTRIES	Imports	Exports
United States.....	\$880,421,000	\$1,465,380,900
United Kingdom.....	2,541,476,000	1,365,048,400
Germany.....	1,420,150,000	1,130,738,900
France.....	909,907,800	804,069,800
Switzerland.....	211,937,800	160,556,600
Belgium.....	425,690,800	352,666,800
Italy (11 months).....	326,708,200	249,232,100
Austria.....	345,587,000	383,507,600
Spain (11 months).....	148,109,400	117,678,600
Bulgaria.....	13,518,500	15,974,600
Russia (9 months).....	205,556,600	272,048,200

Cape Colony (11 months).....	87,749,800	44,796,500

* Fiscal year 1900-01.

COMMERCE OF THE UNITED STATES. Turning now more especially to the commerce of the United States in recent years, we present a few figures showing the origin and destination of imports and exports, and the character of the goods imported. In the following table the figures for 1895, the year showing the smallest trade of the last decade of the nineteenth century, are given for comparison with those of the

year 1900, the maximum point in the record of the century:

In the foregoing statement the increase in the export of manufactured articles is the most striking

FISCAL YEAR ENDING JUNE 30

COUNTRIES	Imports	Exports	Imports	Exports
	1895	1895	1900	1900
United Kingdom.....	\$159,100,000	\$387,100,000	\$159,600,000	\$533,800,000
Germany.....	81,000,000	92,000,000	97,400,000	187,300,000
France.....	61,600,000	45,100,000	73,000,000	83,300,000
Total Europe.....	383,700,000	627,900,000	440,600,000	1,040,200,000
North America.....	133,900,000	108,600,000	130,000,000	187,600,000
South America.....	112,200,000	33,500,000	93,700,000	38,900,000
Asia.....	79,000,000	17,300,000	139,800,000	64,900,000
Oceania.....	17,400,000	13,100,000	34,600,000	43,400,000
Africa.....	5,700,000	6,400,000	11,200,000	19,500,000
Total grand divisions.....	\$731,900,000	\$806,800,000	\$849,900,000	\$1,394,500,000

The following expresses the same matter in percentages of the total imports and exports:

COUNTRIES	1895		1900	
	Imports	Exports	Imports	Exports
Europe.....	52.41	77.76	51.84	74.60
North America.....	18.29	13.45	15.30	13.45
South America.....	15.32	4.15	11.02	2.79
Asia.....	10.61	2.15	16.45	4.66
Oceania.....	2.39	1.62	4.07	3.11
Africa.....	.78	.79	1.32	1.39
Other Countries.....	.19	.09

It will be observed that, with larger figures throughout in 1900 than in 1895, or larger aggregate transactions, there has been little change in the relative figures. Europe supplies us with approximately one-half of our imports, and absorbs approximately three-fourths of our exports. The most marked change in the relative figures, though it is after all slight, is seen in the falling off of exports to Europe and South America, and the increase in exports to other parts of the world.

The character of imports into the United States in general is shown in the following table:

IMPORTED MERCHANDISE ENTERED FOR CONSUMPTION

ARTICLES	1890	1895	1900	Per cent. of total value		
				1890	1895	1900
Articles of food and animals.....	\$248,600,000	\$226,400,000	\$216,100,000	32.12	30.97	26.02
Articles in a crude condition which enter into the various processes of domestic industry.....	178,400,000	187,500,000	299,400,000	23.06	25.64	36.04
Articles wholly or partly manufactured for use as materials in the manufactures and mechanic arts...	84,700,000	83,700,000	80,600,000	10.94	11.46	9.70
Articles manufactured ready for consumption.....	154,500,000	140,800,000	130,600,000	19.96	19.25	15.72
Articles of voluntary use, luxuries, etc.....	107,500,000	92,700,000	103,300,000	13.91	12.68	12.51

The list of specific articles imported is very comprehensive. Some of the most conspicuous in the importations of 1900 were: Sugar (\$100,000,000), chemicals (\$53,700,000), coffee (\$52,500,000), and raw silk (\$45,300,000).

The general nature of the exports of the United States appears in the following statement of exports:

ing and important feature. In 1880 manufacturing exports were less than one-sixth as large as those of agriculture, while twenty years later they had grown to over one-half as large. In specific classes of exports the most important features of the exports of 1900 were: Breadstuffs (\$262,700,000), cotton (\$241,800,000), provisions, meat products (\$184,400,000), iron and steel and their manufactures (\$121,900,000), mineral oils (\$75,600,000), wood and its manufactures (\$51,000,000), animals (\$43,600,000), tobacco and manufactures (\$35,400,000), and coal (\$19,500,000).

BIBLIOGRAPHY. *Commerce and Navigation of the United States*, issued annually by the Bureau of Statistics, Treasury Department; the monthly *Summary of Commerce and Finance*, of the same bureau, which contains important monographs of special topics; *Consular Reports*, issued daily and monthly, and *Commercial Relations*, published annually, by the Bureau of Foreign Commerce, State Department, give information regarding trade conditions abroad, gathered by the consuls of the United States. The preliminary section of *Commercial Relations* is a review of the world's commerce, and is also published

separately. Similar official publications are issued by other governments. The consular reports of Great Britain, France, the German Empire, Austria, Italy, and Belgium are to be especially noted, as well as the annual *Statistical Abstract of Foreign Countries* issued by the British Board of Trade.

following will be found useful: Cunningham, *The Growth of English Industry and Commerce* (Cambridge, 1890); Gibbins, *History of Commerce in Europe* (London, 1891); Levi, *History of British Commerce, 1763-1878* (London, 1880). Among popular compendia of information about commerce, notice should be made of the numerous works on commercial geography which have recently issued from the press. One of the best is Chisholm, *Handbook of Commercial Geography* (London, 1890). See BALANCE OF TRADE; EXCHANGE; FOREIGN MONEY.

COMMERCIAL COURT. A court constituted of judges of the King's Bench Division, in England, for the trial of commercial causes—that is, of causes arising out of the ordinary transactions of merchants and traders, such as those relating to the construction of mercantile documents, the export or import of merchandise, affreightment, insurance, banking, mercantile agency, and mercantile usages. It was not established by an act of Parliament, but was devised by the King's Bench Division for the convenience of suitors and the more expeditious determination of mercantile disputes. While this court has no power to dispense with the ordinary rules of evidence, or to depart from the administration of the law in the ordinary way, it is able, with the assistance of parties and counsel, to dispose of commercial disputes with as much promptness as an arbitrator. Commercial cases are tried by this court upon the evidence prescribed by the orders made in chambers, without difficulty or delay, and with a great diminution of the cost incidental to actions in which the ordinary modes of litigation are followed. This court is a reminder of the Court Piepoudreux, in which the primitive law merchant (q.v.) of England was administered—the court which Lord Coke declares was “incident to every fair and market, because that for contracts, and injuries done concerning the fair or market, there shall be as speedy justice done for the advancement of trade and traffic as the dust can fall from the feet.” The connection of this court with merchants of the staple is disclosed by 27 Ed. III., c. 2, which declared that it was designed to give courage to merchant strangers to come with their wares into the realm, and that it should dispense justice according to the law of the staple, or the law merchant, and not according to the common law. Courts for the rapid settlement of trade disputes, and called Pypowder courts, were provided for in New York in 1692 (vol. i., Col. Laws, ed. 1894). (See COURT.) Consult the article, “Merchants of the Staple,” in 17 *London Quarterly Review*, 56 (London, 1901).

COMMERCIAL CRISES. See CRISIS, ECONOMIC.

COMMERCIAL EDUCATION. See EDUCATION, COMMERCIAL.

COMMERCIAL GEOGRAPHY. See GEOGRAPHY, ECONOMIC.

COMMERCIAL LAW. A popular term of varying and rather indefinite signification. It includes, ordinarily, the legal rules which relate most directly to every-day mercantile transactions, and which are based upon, or have been modified by, the usages of trade. These rules are presented in connection with the different topics of commercial law, under such titles as

BAILMENTS; INSURANCE; NEGOTIABLE PAPER; PARTNERSHIP; SALE; etc. See also LAW MERCHANT; MERCANTILE LAW.

COMMERCIAL PAPER. See BILL OF EXCHANGE; NEGOTIABLE PAPER.

COMMERCIAL REGISTERS. See MERCANTILE AGENCY.

COMMERCIAL TEMPERANCE LEAGUE. See LEND-A-HAND CLUBS.

COMMERCIAL TRAVELER. A representative of a wholesale or jobbing house, sent throughout the country for the purpose of selling goods to smaller houses in the same line of trade. The commercial traveler is the legitimate successor of the old peddler, though his operations are on a larger scale, and his manner of doing business quite different. In former days, in addition to the peddler, who carried his stock of wares with him, producers frequently came into contact with the purchasers through the great fairs which were held throughout the year in the different commercial centres, and which were a means of drawing sellers and buyers together from great regions of country. The commercial traveler sells by the aid of samples, price-lists, and the like, and carries with him no goods for sale. The system of employing commercial travelers is a natural outgrowth of the localization of interests in particular places, and of the extension of the markets for particular commodities. It is estimated by the commercial travelers themselves that their class numbered in the United States in 1890 some 300,000 persons. It is claimed by them that since that time their number has decreased, largely through the concentration of capital and the concentration of the management of business in the hands of the so-called trusts. It is claimed by the managers of trusts that one of the chief advantages of their organization has been the saving in the cost of distribution, notably in that of selling goods. It is represented that the various factories and enterprises each employ commercial travelers, whose main duty is not to induce the would-be purchaser to buy, but to persuade him to buy a particular make of goods. As the competition between the different sellers of the same goods ceases by the combination of interests, it is obvious that, instead of sending several salesmen into a district, one can transact all the business it offers. The commercial travelers in the United States are organized in various associations for the purpose of promoting their interests as a class. Of these, perhaps the most important is the Commercial Travelers' Protective League. Consult: Testimony of P. F. Dowe before the United States Industrial Commission, in vol. iv. of the commission's *Report* (Washington, 1900); also Jenks, *The Trust Problem* (New York, 1900).

COMMERCEY. kô'mâr'sé'. The capital of an arrondissement in the Department of Meuse, France, on the Meuse, 183 miles east of Paris by rail (Map: France, M 3). It is a garrison town, and has an interesting seventeenth-century castle, with literary associations of Cardinal de Retz, which also for a time was the residence of Stanislaus, King of Poland and Duke of Lorraine. A statue of Don Calmet, the historian, who was born near Commercey, stands in the town. Coal-mining constitutes the chief industry. The town

has a specialty in the manufacture of cakes known as 'madeines.' Population, in 1901, 7726.

COMMERS, *kô-mèrs'* (Ger. *Kommers*, drinking-bout, from Lat. *commercium*, trade, from *com-*, together + *merca*, merchandise). A social gathering of German students on festival occasions, such as the beginning and ending of the semi-annual term (*semester*), the anniversary of the foundation of the university, etc. The main features of these meetings consist in speeches and songs, the famous collection of German student songs, *Gaudeamus igitur*, being used. Several senior students are elected as officials (*Chargierte*), and have entire charge of the affair. Certain rules of etiquette in drinking must be strictly adhered to. Beer is the sole beverage used, and generally a great quantity is consumed. After each speech the presiding senior calls for a salamander (*ad exercitium salamandris, bibite, tergite*). All arise, and, after having emptied their glasses, pound three times vigorously with them on the tables. If a club-member dies, at the next club commers a salamander (*Trauersalamander*) is executed in his memory, and then all glasses are dashed to pieces. Each students' club arranges a large commers on the anniversary of its foundation. A great many former members visit their alma mater on this occasion, and the one present who can count the most semesters since his matriculation as a student is especially honored.

COMMUNION (Lat. *comminatio*, threat, from *comminari*, to threaten, from *com-*, together + *minari*, to threaten). The name given to a penitential service used in the primitive Church. In the early Church those who were guilty of grievous and notorious sins were put out of the Church, until, on their repentance, and after long trial, they were restored to full communion. It seems that, at least from the beginning of the eighth century, there was an office of this kind for public penitents on the first day of Lent; but from various causes the penitential discipline became extinct, both in the Eastern and Western churches, and the office for Ash Wednesday (so called from the penitents formerly coming clad in sackcloth and ashes) is the only memorial of it left. The office, as used in the Church of England, is nearly the same as the older ones found in the pre-Reformation service-books of Salisbury and York. The curses contained in Deut. xxvii. against impenitent sinners are read, and the congregation answers 'Amen' to every sentence, as acknowledging the justice of the sentences. The penitential office of the American Book of Common Prayer is without comminatory features. Consult Bingham, *Origines Ecclesiasticæ*; or, *the Antiquities of the Christian Church* (10 vols., London, 1710-22; late ed., 1838-40).

COMMISSARIAT (Fr., from ML. *commissarius*, one intrusted with a commission, from Lat. *commissus*, p.p. of *committere*, to commit, from *com-*, together + *mittere*, to send). A department of army supply. In the United States the commissariat, under the commissary-general of subsistence, provides the food for the troops, while its transport, together with the supply of clothing, etc., is the work of the quartermaster's department.

In Great Britain the commissariat and army service corps are responsible for both supply and

transport of food. Owing to the constant demands made upon it, and its peculiar importance under the present army system, this branch of the British Army is probably unrivaled by that of any other country. A similar system of commissariat to that of the United States obtains throughout Europe generally. See ARMY ORGANIZATION; FIELD COOKING; RATIONS, MILITARY.

COMMISSARY (Fr. *commissaire*, ML. *commissarius*, commissary, one intrusted with a commission). An officer of the Subsistence Department of the United States Army. This bureau is organized to provide for the distribution and expenditure of funds appropriated for the food of enlisted men, and for purchasing articles kept for sale to officers and men. The department comprises: one commissary-general; two assistant commissary-generals, with rank of colonel; three assistant commissary-generals, with rank of lieutenant-colonel; nine commissaries, with rank of major; eight commissaries, with rank of captain; 200 commissary-sergeants, post and regimental; making a total of 223, all ranks. The commissary-general furnishes lists of all articles kept for sale and gives instruction for procuring, distributing, issuing, selling, and accounting for all subsistence supplies. Purchasing commissaries make purchases of supplies and distribute them as directed; and upon direct calls of chief commissaries they transfer to commissaries of posts and stations such funds from the appropriations for the subsistence of the army and such authorized subsistence supplies as chief commissaries, under instructions from department commanders, deem necessary. Commissaries are required to make timely requisition and estimates, subject to approval by their commanding officers, for funds and supplies for the troops with which they serve, forwarding them, through the regular military channel, to the chief commissaries. *Post commissary-sergeants* are appointed from the enlisted men of the army; only those being qualified who have served at least five years, during three years of which they must have held non-commissioned rank. The appointment is usually bestowed as a reward to faithful and well-tried sergeants. At military posts and stations and in the field, the *regimental commissaries*, who are officers of the rank of captain and are appointed to the regimental staff for a term of four years by the commanding officer, assisted by regimental commissary-sergeants, perform their duties in the subsistence department at the headquarters of their regiment. *Regimental commissary-sergeants* of infantry and cavalry regiments belong to the non-commissioned staff. There is one to each regiment. The duties of the commissary, in the English Army, are performed by the Army Service Corps; and regimentally, by the regimental quartermaster, assisted by his quartermaster-sergeant.

COMMISSION (Lat. *commissio*, commission, from *committere*, to commit, from *com-*, together + *mittere*, to send). The name applied to boards created for governmental purposes, generally of a temporary nature. They have proved effective agencies for dealing with certain phases of international relations and controversies, and for this purpose are of two classes: (1) Commissions of a domestic character, created

under statute for carrying out provisions of treaties and conventions. (2) Commissions performing international functions, in the nature of conference or arbitration boards.

Examples of the first class in the United States are the commissions created (a) under the Treaty of 1819 with Spain, ceding Florida, by which the Government sought to adjust citizens' claims growing out of the preceding unfriendly relations; (b) under the Treaty of 1826 with Great Britain, to distribute the indemnity for slaves deported in derogation of Art. 1 of the Treaty of Ghent; (c) under the Treaty of 1831 with France, to distribute the indemnity paid for the Spoliation Claims; (d) under the Treaty of 1871 with Great Britain, to distribute the Alabama Claims award.

Commissions of the second class have been the usual agencies for effecting arbitrations, and, according to their purpose and the authority of their members, may be either merely for conference or for the determination of methods of reaching settlement of disputed questions, or may themselves have the power to adjudicate the issues in controversy. In the latter case they may be composed solely of representatives of the States concerned, or they may include neutral parties selected by these States to act as umpires. During the nineteenth century arbitration as a method of settling international differences steadily increased. The United States has been a party to no less than sixty-eight adjustments of this character, and except for the train of circumstances resulting in the War of 1812, all differences between this country and Great Britain have been so adjusted. See ALABAMA CLAIMS; ARBITRATION (INTERNATIONAL); BERING SEA CONTROVERSY, and consult the authorities there cited.

COMMISSION, MILITARY. A certificate of authority or rank; or both. Military rank is defined in the United States Army Regulations as "that character or quality bestowed on military persons, which marks their station, and confers eligibility to exercise command or authority in the military service within the limits prescribed by law." To such military persons commissions are granted only by the President of the United States and published through the Adjutant-General's department. Commissions in European armies are usually distributed among the graduates of the national military preparatory or training colleges, according to the results of competitive examinations. They are universally restricted, however, even in republican France, to men of good birth or wealthy heritage. In the British Army, formerly, commissions were obtainable by purchase—a condition of things which became more and more undesirable as the science of war advanced, and thorough preparatory education and training became necessary. It was not until 1871 that the system was abolished by the Gladstone Government in the face of great opposition, and the present condition of things inaugurated. The prices of commissions rose gradually from the time of Charles II. until the Crimean War of 1854, at which period they ranged in value from £450 for a commission as ensign of infantry of the line, to £9000 for that of lieutenant-colonel of Foot Guards. See ARMY ORGANIZATION; RANK AND COMMAND.

COMMISSIONAIRE, kōm-mish'ūn-ār', *Fr.* pron. kō'mě'syó'nār' (*Fr.*, commissioner). An

attendant at Continental hotels, employed to perform certain miscellaneous services, such as to attend at the arrival of railway trains and steamboats to secure customers, take charge of luggage, see it passed through the custom-house, and send it on to the hotel, etc., for all which they charge a fee. In Paris they are generally respectable and intelligent, and speak English with tolerable fluency. In other parts of the Continent, as in Germany and Austria, there is also a class called *commissionaires*, who are analogous to the American messenger boys. They are employed by companies and are unformed, but one may not call them up by telephone or signal as here, it being their custom to solicit services upon the street. A corps of *commissionaires*, consisting originally of disabled soldiers who had retired with a pension, was founded in Great Britain in 1859, the service of which now extends throughout the large cities. The men are employed in the most varied capacities where high qualifications are required, and may be engaged for permanent or temporary service. The corps numbered over 2500 in 1900.

COMMISSIONER (from *ML. commissarius*, one intrusted with a commission). Most commonly a person appointed for public service by a commission or mandate of a political authority; but also, sometimes, any one of certain officers elected by popular vote. The term is generally employed to describe an appointive officer who has charge of some branch of a department of government and who is subject to the supervision of a higher official or public board, as a commissioner of water-supply of a municipality, who is usually under the control of the mayor or common council. It is the almost invariable title of persons appointed by the Government to carry on or supervise some special public work of a transitory nature, as to investigate the conditions and resources of a colony.

COMMISSIONER OF ASSIZE, in English law, is one to whom a commission is issued by the Crown, directing him to 'take the assizes'; that is, to act as a justice in hearing certain actions in specified judicial circuits. It may issue to a barrister or sergeant at law as well as to a regularly appointed judge. The practice of appointing these commissioners arose during the reign of Edward I., because of the lack of regular courts in the various parts of the country. By the Supreme Court of Judicature Act of 1873, one exercising jurisdiction under a commission of assize is deemed to constitute a court of the High Court of Justice, having all the powers of that court. See ASSIZE; HIGH COURT OF JUSTICE.

COMMISSIONER OF DEEDS is a person authorized by the State to take acknowledgments of the execution of legal instruments and administer certain oaths voluntarily taken out of court. His powers vary in each jurisdiction, and are somewhat similar to, but usually more limited than, those of a notary public. See NOTARY PUBLIC.

COMMISSIONERS, BOARD OF NAVY. See UNITED STATES, *Navy*.

COMMISSIONERS OF THE NAVY. See ADMIRAL; also NAVIES, section devoted to Great Britain.

COMMISSION MERCHANT. A person, called also a *factor*, employed to sell goods con-

signed or delivered to him by another who is called his principal, for a certain percentage, commonly called his commission or factorage. As the goods thus received are said to be consigned, the commission merchant or agent is often called a consignee. See FACTOR.

COMMITMENT (from *commit*, Lat. *committere*, to commit). A warrant of a justice, magistrate, or other official having police jurisdiction, ordering that a person accused of a crime be held for trial, and either directing that he be sent to prison immediately or admitting him to bail to secure his attendance at that time. The term *commitment* is also sometimes used of the sending a person to jail to enforce obedience of an order or decree of a court; but the term is most frequently used where the person is to be detained for some temporary purpose, as above indicated. It is seldom employed where the prisoner is finally sentenced to a term in prison as a punishment, after having been found guilty of a crime, in which case the judgment of the court is usually considered a sufficient warrant for the sheriff or proper authorities to carry out the sentence. See JUDGMENT; SENTENCE; SHERIFF; WARRANT.

COMMITTEE (Lat. *committere*, to intrust). A group of persons, rarely less than three, to whom an organized body, legislative or otherwise, intrusts or *commits* certain matters for investigation, consideration, and decision as to their meriting the attention of the whole body. A *standing committee* is one which exercises its functions permanently and considers all matters coming within a certain allotted sphere of action. In modern parliamentary practice, immense importance attaches to the work of standing committees; and so true is this that modern legislation has been by some termed government by committee. Almost every matter brought before such bodies as the United States Congress and the legislatures of the several States is at once referred to a standing committee, which holds meetings by itself, examines the subject closely, summons witnesses, if necessary, and at length reports back to the main body its findings and conclusions, with recommendation to act favorably or adversely. The committee usually formulates its conclusions in a bill recommended to be passed if action is thought desirable. The same procedure is followed in the British Parliament. The United States House of Representatives has at least sixty committees; the Senate about fifty; these consist of not less than three, and, except in one or two cases, not more than fifteen members. The most important committees of the House are, that of Ways and Means, which considers all matters relating to the tariff, internal taxation, and, generally, the revenues of the Government, and that of Appropriations, which deals with all estimates of appropriations to be made by Congress and the framing of bills for that purpose. Other important standing committees are those of Banking and Currency, Foreign Affairs, Patents, Pensions, Judiciary, and Railways and Canals. Similar committees exist in the British Parliament. The argument in favor of the system of committees is the impossibility of a large deliberative body's examining every matter within the scope of its action in detail; the objection to it is the possibility of more

easily corrupting or deceiving a small body than a large one; but whatever be the argument against it as a matter of theory, the committee system is fully recognized as a necessity and is too firmly entrenched in parliamentary practice to be successfully argued against. A *select committee* is one appointed at a special time to consider and report on a given topic; when this has been done its powers and existence cease. The *committee of the whole* is the entire body sitting in a deliberative rather than a legislative character—for the purpose, that is, of debating and consulting upon the details of a question rather than of taking legislative action upon it. In the British House of Commons there is a regularly chosen chairman, other than the Speaker of the House, who presides over all committees of the whole; in the United States Congress any member may be chosen to preside in a committee of the whole. A *joint committee* is one made up of separate committees appointed by two bodies; in the United States, owing to the dual constitution of the legislatures, it is often necessary to appoint such joint committees to bring the two bodies to a mutual understanding and make harmonious action possible.

In law, a committee is a person or persons appointed by a court having equity or probate jurisdiction to take charge of the person, and manage the property and business affairs, of an individual who is legally incompetent by reason of lunacy, idiocy, or habitual drunkenness. The duties are much similar to those of a guardian of an infant, and the committee is under the supervision and control of the court appointing him. He must file inventories and accounts, maintain all necessary actions in behalf of his charge, and apply the income, and the proceeds of the property itself if necessary, to the support of the incompetent and his family. If the incompetent recovers, he may apply to the court to have the committee discharged and resume his personal freedom and the control of his property. The power of the committee ceases at the death of the incompetent, and his estate is administered in the usual manner. See GUARDIAN; LUNATIC; HABITUAL DRUNKARD; IDIOCY.

The term is also employed to designate a person or persons appointed to take charge of specified matters by any body organized for governmental business or social purposes, and to make a report of the result of their efforts to the appointing power. See LEGISLATURE; PARLIAMENTARY LAW.

COMMITTEE, THE. A comedy, by Sir Robert Howard, published in 1665, but played for several years previously. In 1797 Knight brought out an adaptation of it under the title of *The Honest Thieres*.

COMMODATUM. See BAILMENT.

COMMODOE, kó'mód' (Fr., *Commodus*). A play by Thomas Corneille, played at the Louvre for Louis XIV. in 1659.

COMMODIANUS. A Christian Latin poet, who lived in the third century A.D. The place of his birth is not known, but he is supposed to have been of African extraction. His extant poems, *Instructiones per Litteras Versuum Primas* (in acrostic and telestic verse), and the *Carmen Apologeticum*, both of which are aimed against the heathen and the Jews, lack poetic

fire, and present few attractions as literary productions. Although some attempt is made to imitate the general rhythm of the hexameter, the rules of quantity are utterly neglected, and the author employs a peculiar prosody, based partly on accent and partly on syllabic quantity. Consult the edition by Dombart (Vienna, 1888), and the English prose translation of the *Instructions*, in *Anto-Nicene Fathers* (Buffalo, 1886-96).

COMMODORE (probably from Sp. *comendador*, It. *commandatore*, OF. *commandeor*, Fr. *commandeur*, commander). Previous to 1862 the courtesy title of commodore was given to all captains in the United States Navy who had commanded a squadron, but no actual rank higher than that of captain existed. In July, 1862, the first captains to hold a higher office were commissioned as commodores. In 1882 the number of commodores on the active list was reduced from twenty-five to ten, and in 1899 the grade was abolished and the ten commodores on the list promoted to the rank of rear-admiral, the numbers in that grade being increased from six to eighteen. In the British Navy captains having certain important commands are officially styled commodores, and have an increase of pay while on this duty, but there is no grade of commodore on the British Navy List. See ADMIRAL.

COMMODUS, LUCIUS ÆLIUS AURELIUS. A Roman Emperor (A.D. 180-192). He was born in A.D. 161, and was the son of Marcus Aurelius Antoninus. Great pains were taken with his education. But the solicitude of his father was all to no purpose. Commodus waited only for an opportunity to exhibit as startling and detestable a mixture of sensuality, cruelty, and meanness as had ever been witnessed in Rome. When he was summoned to the throne on his father's death (March 17, 180), he plunged into the dissipations of Rome. At that period he was successfully fighting the Marcomanni and other tribes on the Upper Danube, but he hastily concluded a treaty with the barbarians, and reached the capital in the beginning of the autumn. The cruelty to which he was always prone was especially exhibited after a conspiracy by his sister Lucilla against his life had been discovered in the year 183. Nearly all who had risen to honor during his father's lifetime were sacrificed to appease his jealousy of the good and the great. Gross prodigality also marked his reign. He was proud of his own physical strength, and exhibited it in gladiatorial combats. For each of these exhibitions he charged the State an enormous sum. He used also to sing, dance, play, act the buffoon, the peddler, or the horse-dealer, and engage in all the filthy and horrible orgies of Egyptian sacrifice. A glutton, a debauchee, who wallowed in the most sensual abominations, he yet demanded to be worshiped as a god, and assumed the title of Hercules Romanus. Many plots were devised against his life, and at last one of them succeeded. His mistress, Marcia, in concert with the prefect Lætus and the Imperial chamberlain, Eclectus, after they had failed in an attempt to poison him, caused him to be strangled by Narcissus, a famous athlete. The life of Commodus, written by Lampridius, is to be found in the so-called *Augusta Historia*.

COMMON (OF. *comun*, Fr. *commun*, from Lat. *communis*, OLat. *comoinis*, common). In the law of real property, the right of one person, in common with others, to take a profit from the land of another. The person over whose land the right is exercised may be a private owner or the State. The term is somewhat loosely employed as the equivalent of *profit à prendre* (q.v.): but such a 'profit' may be exclusive, or 'several,' in which case it is not properly characterized as a common. Blackstone, however, seems to use the term in this sense, and he enumerates four species of commons, viz.: *Common of pasture*, or the right of feeding one's beasts on another's land; *common of piscary*, or a liberty of fishing in another man's water; *common of turbary*, a liberty of digging turf upon another's ground; and *common of estovers*, a liberty of taking necessary wood, for the use or furniture of a house or farm, from off another's estate. These rights, with the various other *profits à prendre*, will be considered under that head. See HEREDITAMENT; INCORPOREAL.

The term is often used to denote the common use of a piece of uninclosed ground possessed by all the inhabitants of a village or hamlet. The right of common is 'disturbed,' as the legal phrase is, when one who is not possessed of the right unlawfully infringes it, or when one possessed of the right exceeds his lawful use, or where one wrongfully prevents others possessed of the common right from exercising it, as where he incloses the land. In Great Britain the right of common was formerly possessed from time immemorial in almost every village with regard to certain pieces of land which were not held by any owner in fee, but might be fairly considered to belong to the community as a body. Statutes, both public and private, permitted the inclosing of such common land under various conditions, such as the consent of two-thirds of those exercising the right of common. By this legislation, and by acts of usurpation on the part of individuals, much of the common land has been lost; of late years the further inclosure of common land has been to some extent guarded against. In the United States the most frequent use of the term is as a substantive to denote a piece of ground set apart for public uses, such as open-air meetings, reviews, and for the general pleasure of the people at large. See PROPERTY, and the authorities there referred to.

COMMON, DOL. Subtle's mistress, in Ben Jonson's *Alchemist*, who becomes "Queen of the Fairies," or "a most rare scholar, gone mad with studying Broughton's works," as suits the occasion of the swindlers or the demands of their dupes.

COMMON, TENANCY IN. The most usual form of joint or common ownership of lands or goods. It may be constituted of two or any greater number of persons, who may have equal or unequal shares, and whose titles and interests are distinct although undivided from those of their colleagues. Accordingly, while the tenant in common cannot claim any specific portion of the property as his own, he may, nevertheless, deal freely with his undivided share, alienating or devising it at his pleasure, or he may, by appropriate legal action, compel the partition of the property; whereupon, if it be divisible in fact, his share will be set off to him, as a sepa-

rate parcel, in severalty. If it be not physically severable—as a mansion or a horse—the courts will direct its sale and the distribution of the proceeds among the several owners in the proportion of their respective interests. If the estate of a tenant in common be of an inheritable nature—as an estate in fee simple—it will, upon his death, descend, like his other real property, to his heirs. In the event of a conveyance or descent of such an interest, the new holder simply takes the place of his grantor or ancestor, and becomes a tenant in common with the surviving co-tenants of the latter.

In its incidents, the tenancy in common is at the present time not distinguishable from the estate which arose at common law by the descent of lands to two or more heirs who were entitled to share the estate. (See *COPARCENARY*.) Indeed, this is now in the United States the more usual method of creating a tenancy in common. It is, however, to be sharply distinguished from the other forms of common ownership, as joint tenancy, tenancy by entireties, and partnership, the two former of which are attended by the incident of survivorship, and the last of which is affected by the peculiar qualities of the partnership relation.

At common law, upon a conveyance of lands to two or more persons without more being said, they took the property as joint tenants, and not as tenants in common. This presumption has generally been reversed by statute in modern times, and now such a grant will vest the property in the grantees as tenants in common, unless the deed declares that they are to take as joint tenants. See *OWNERSHIP*; *PROPERTY*; and the authorities there referred to.

COMMON ASSURANCE. The technical description of the ordinary processes for conveying the title to land. The term assurance was also employed, without the qualifying adjective, in such phrases as 'a covenant to make further assurance' (meaning a covenant to protect the title conveyed by making or procuring the making of any further instrument which might be necessary for that purpose), but the instrument or act of conveyance itself was always described as a common assurance. Blackstone defines common assurances as the legal evidences of the translation or transfer of real property, and comprehends under that description the four following modes of alienation: (1) By matter *in pais* or by deed; (2) by matter of record, or an assurance transacted in the King's public courts of record; (3) by special custom obtaining in some particular places and relating only to some particular species of property; (4) by devise.

By *matter in pais* is meant a transaction to be evidenced by witnesses before a jury, and it has reference to the old common-law method of conveyance by feoffment or livery of seisin. The deed referred to is the deed of grant, which has in modern times come to supersede most of the other modes of transfer. Alienation by *matter of record* includes assurance by private acts of Parliament, the King's grants, and the awkward processes by fictitious suit, known as common recovery and fine. Under alienation by *special custom*, Blackstone describes only the peculiar mode of conveyance 'by surrender and admittance,' whereby copyhold lands were transferred. *Devise* was employed in the same sense as that which it now bears, and included any gift of

land, present or future, or of any interest in land, by last will and testament.

It will be noticed that these four modes of conveyance comprehend every form of voluntary alienation of real property, only involuntary alienations, as by forfeiture, escheat, bankruptcy, eminent domain, and the like, and the transmission of lands by descent, being omitted from the category of common assurances. See *ALIENATION*; *CONVEYANCE*; *TITLE*; and the names of the various common assurances referred to above. Consult the *Commentaries* of Blackstone, Stephen, and Kent, and the authorities referred to under *CONVEYANCING* and *TITLE*.

COMMON BENCH. The earlier name of the English Court of Common Pleas. See *COMMON PLEAS*, *COURT OF*.

COMMON CARRIERS. See *CARRIERS*, *COMMON*.

COMMON COUNCIL. The name usually applied to the local legislature in American cities. Usually a legislative body, so called, consists of only one chamber, but the term may be applied to a bicameral body as well as to one chamber in a bicameral assembly.

COMMON COUNTS. In law, in general, technical forms for stating a cause of action, used particularly in assumpsit (q.v.), in order to take advantage of proof which might vary from the particular facts and circumstances alleged and yet justify a recovery. Common counts were founded on an express or implied promise to pay money. Those in most general use were known as counts for 'goods sold and delivered'; 'work, labor, and services'; 'money paid'; 'money had and received'; 'money lent'; 'account stated'; and 'use and occupation.' Their names are somewhat descriptive of their purposes: thus under the count 'money had and received' the plaintiff could prove any circumstances under which the defendant received money which, in law, he ought to pay or return to the plaintiff. The money may have been obtained by fraud, but a fictitious promise to pay could be alleged, the fraud proved, and it was held the law implied a promise to pay on the part of the defendant. The common counts originated in England, but were abolished, together with all ancient forms of action, by the Judicature Acts. In the United States they are still used in some of the States where common-law pleading is retained. See *COMMON FORMS*; *PLEADING*.

COMMONER. In England, a term applied to all citizens except the hereditary nobility. John Hampden was called the 'great commoner,' and the title was also given to the elder Pitt before he became a member of Parliament. In Oxford University, students of the second class who pay board are called commoners, ranking between gentlemen commoners and bursars.

COMMON FORMS. In law, the forms of personal actions in common-law pleading (each action having a general form of declaration or complaint), the allegations in which were usually fictitious, but which had a recognized meaning and which would be supported by a certain line of proof. Thus, in the action of trover (Fr. *trouver*, to find) it was alleged that the plaintiff lost a chattel and that the defendant found it, and this allegation could not be traversed or denied by the plaintiff, but plaintiff could prove

any facts which in law would entitle him to the chattel and disregard the fiction of finding. These forms of pleading originated in the feudal period in England, and they arose out of the practice of granting a writ for trying the justice of some complaint for the redress of which there was no other provision in the law. The following forms of action were in general use: assumpsit, covenant, debt, detinue, replevin, trespass, trespass on the case, and trover (qq.v.). These forms were generally adopted in the United States, but the Civil Codes of many States have abolished them. They have also been abolished in England by the Judicature Acts. See COMMON COURT; PLEADING.

COMMON LAW. The great body of English unwritten law (from which also is, in the main, derived the common law of the English colonies and of the United States), as distinguished from written or statutory law, from the Roman civil law, from international law, and from the systems of law administered by courts of equity and admiralty courts. Blackstone divides the civil law of England into the *lex scripta*, or statute law, and *lex non scripta*, or common law, and defines the latter as consisting of general customs, of particular customs prevailing in certain districts, and of certain laws used in particular courts. Common law is based primarily on customs growing out of the united wisdom and experience of mankind; these customs in time become recognized as reasonable, consistent, and established, are sanctioned by the courts, and are interpreted and made binding by the decisions of the final courts of appeal. While Continental countries generally follow the carefully classified and codified system of the Roman civil law, the common law of England was a growth, gradual and in its origin complex—derived from the customs and precedents of Anglo-Saxons, of Normans, of the united England which followed the Norman rule, and including also some principles and practices derived through one of these sources from the Roman law itself. It must be remembered that even at the time of the Norman Conquest, England had a definitely established, though, of course, crude, legal system, and on that system much of the common law, though perhaps not the greater part, rests.

From its nature, the common law cannot be sought in any one book or digest; its principles are discussed in the treatises of innumerable writers of text-books and commentaries, and in the records of the decisions of the courts. Commentators cannot make law, but they may discuss and record it. The real oracle of the common law is the judge, who considers and weighs precedents, measures them by the standard of reason and public policy, and sets finally the seal of authority upon them by his decision. Great importance, therefore, is attached to precedent in ascertaining the principles of the common law; it was, it is conceded, because too much importance was attached to precedent that, side by side with the system of common law, grew up, to correct and supplement it, a system of equity law. (See EQUITY.) On the other hand, the greatest jurists of the English bench have most widely recognized the fact that precedent must be tempered by reason. Lord Mansfield, more than any other one judge, enlarged in this way the interpretation and application of common-law principles, and was accused, indeed, of

assuming legislative rather than judicial powers. But there can be no question that his view, carried out with unswerving devotion to natural justice, to the necessities of growing and changing mercantile and legal conditions, and to the true fundamental principle of precedents, did much to make the administration of law in England pliable and efficient. We may illustrate the manner in which common custom became common law by citing the recognition by courts of the already long-established principle of primogeniture: of the similar recognition of the fact that the validity of a deed depends on its being sealed and delivered; of the recognition of the principle that wills should be less strictly construed than deeds; of the sanctioning the already existing mercantile custom that three days of grace should be given in payment of notes and bills. In all these cases the law did not make the custom or principle, but found it ready made to hand, recognized its convenience and usefulness, and sanctioned it by judicial authority.

Though based so firmly on custom and precedents, the common law is not totally inelastic. The continual growth of modern civilization, the progress of invention and manufactures, and the increased complexity of business—all have demanded from the common law recognition and an adaptation of the law to the conditions of the time. The rule generally followed as to precedents is that the courts will always "abide by former precedents where the same points come again into litigation." But the decision of one of two courts of concurrent jurisdiction does not necessarily bind the other, nor will a new decision by a court of appeal always be supported by that very court in subsequent cases. It follows, therefore, that often precedents almost equal in number and authority may be quoted on both sides of a given question, and in such a case the power and authority of the court appealed to are called upon to decide as is consonant with justice and reason. In the United States, as each State has a final court of appeal, and as theoretically they are of equal authority, such a contradiction of precedents and decisions is frequent.

The United States, considered as one body politic, has no common law; Federal courts, when acting as common-law courts, follow the common law as it stands in the particular State where the action arises. As for the States themselves, the common law of England, as it existed at the time of the Revolution, together with such of its statutes as reasonably applied to the Colonies, became at that time the common law of the States. In the United States, as in England, of course, the body of the common law has developed with growing industrial conditions, and has, on the other hand, been from time to time restricted by statutes of the States or of the United States. What we have said in regard to the common law of the States has one exception—Louisiana, which, when ceded to this country, retained in the main the system of Roman civil law already existing. The common law on a given point is always superseded by a statute covering that point. Thus, in the United States the order of authority of law is: The Federal Constitution; the treaties and acts of Congress; the Constitution of the State; the statutes of the State; and finally the common law. When a statute is rescinded, the common law on that

point again becomes of force, unless there be an older unrescinded statute, in which case that revives. For a sketch of common-law courts, pleading, etc., see COURT; PLEADING; etc.

BIBLIOGRAPHY. Consult: The commentaries of Blackstone, of Kent, of Stephen (13th ed., London, 1899), of Broom (9th ed., London, 1896); Coke, *First Part of the Institutes of the Laws of England: or a Commentary upon Littleton* (any edition); Pollock and Maitland, *History of the Laws of England* (2d ed., Boston, 1899); Stephen, *History of the Criminal Law of England* (London, 1883). For a statement of the elementary principles of the common law, consult: Robinson, *Elementary Law* (Boston, 1882); Minor, *Institutes of Common and Statute Law* (2d ed., Richmond, 1876-79).

COMMONPLACE-BOOK. A sort of scrap-book for jotting down memoranda, occasional thoughts, or ideas for subsequent development. Southey, Dickens, and Charles Reade, for example, kept commonplace-books of which they made much use.

COMMON PLEA. Any civil action between individuals, as distinguished from criminal proceedings, or other cases where governmental matters are involved. See CIVIL ACTION; PROSECUTION.

COMMON PLEAS, COURT OF. One of the great historic tribunals of the common law in England. It was instituted, as a separate jurisdiction, in the reign of Henry III., under the name of the Court of Common Bench, but its real origin lies further back, in the provision of Magna Charta that common pleas (*communia placita*) should no longer follow the King's Court (*Curia Regis*) in its wanderings over the kingdom, but should be held in a fixed place (Magna Charta, 1217, s. 17). The rapid rise in power and influence of the court held by the King in person, or by his judges who attended him, combined with the necessity of bringing all causes, whether of a public or private nature, to the attention of a constantly moving court, constituted, for private suitors, a grave abuse. This was remedied by definitely establishing at Westminster, under the provision of the charter above referred to, a sufficient number of justices and barons of the King's Court to hear the private causes (common pleas) which could not conveniently follow the royal progresses. From this beginning down to the reform of the English judicature in 1875, the Court of Common Pleas at Westminster, as it was commonly called, shared with the Court of King's Bench the greater part of the common-law jurisdiction of England.

As distinguished from the King's Bench, the Court of Common Pleas was, as its title would seem to suggest, the popular and common court of the kingdom, having exclusive jurisdiction in all real actions, or suits relating to land, and in actions between private persons to try private rights; while the King's Bench was, for a long time at least, limited to pleas of the Crown, i. e. public causes, and appeals from county courts and other inferior jurisdictions. This division of business threw upon the Common Bench the great mass of litigation, so that Sir Edward Coke called it 'the lock and key of the common law,' and Sir Orlando Bridgman described it as 'the common shop for justice.' The court was

composed of a chief justice and as many common (or *puisne*) justices as the business of the court required. The number of these varied at different periods from four to eight. It was abolished by the Judicature Acts, 1873-75. See CURIA REGIS; COURT; EXCHEQUER; KING'S BENCH. The origin and history of the English courts of justice are concisely and accurately described by Inderwick, *The King's Peace: A Historical Sketch of English Law Courts* (London and New York, 1895).

COMMON PRAYER-BOOK. See PRAYER-BOOK.

COMMON RECOVERY. At common law, a mode of alienation, or process for conveying land, through the medium of a fictitious suit in the superior courts of law. There is no reason to doubt the tradition, to which Blackstone has given the weight of his authority, that this method of conveyance was "invented by the ecclesiastics to elude the statutes of mortmain." Being incapable of taking land by feoffment or deed, there was nothing to prevent them from bringing a suit for the recovery of the land of a collusive donor, alleging that the title was in them, and if he, thereupon, made default, the judgment of the court in their favor operated to vest the title conclusively in them. In form it was a judicial determination that they were the owners of the land as against the defendant. In effect it was a device for enabling the defendant to transfer his interest in the land to them. Blackstone says, further, that after the invention of common recoveries they "were encouraged by the finesse of the courts of law in 12 Edward IV. in order to put an end to all fettered inheritances, and bar not only estates tail, but also all remainders and reversions expectant thereon." This refers to the famous struggle between the great landowners, seeking to tie up their estates in their families by entailing them on their issue and making them inalienable, and the lawyers and law courts, who aimed, in the interests of public policy, to defeat the attempt. The statute *De Donis Conditionalibus* (known also as the Statute of Westminster II.), enacted by Parliament in 13 Edward I. (1285), provided that lands given to a man and the heirs of his body, known as conditional gifts, should not be alienable so as to defeat the inheritance of the issue therein nor so as to cut off the interests of those to whom the estate was to go upon the failure of such issue.

Several devices were tried to avoid the statute and break entails, but none of them was entirely successful until the year mentioned by Blackstone, 12 Edward IV. (1473), when, in the famous 'Taltarum's Case,' a common recovery was employed for the purpose. This proved to be entirely successful in barring the claims of the heir upon whom the lands were entailed, and, by a subsequent development of the action, all remainders and reversions dependent upon the fee tail were also cut off.

The process was too difficult and technical to be set forth at length here, but it may be briefly described as a collusive and fictitious suit, instituted by the person to whom the fee was to be conveyed (called the demandant) against the one who desired to bar the entail and convey the land (known as the tenant), by suing out a writ called a *precipe quod reddat*, in which the de-

mandant alleged that the tenant had no legal title to the land and that he, the demandant, had been turned out of it. The tenant defended the suit, but at a subsequent stage of the proceedings—which were in part conducted in open court—disappeared and had judgment rendered against him by default, and the lands were thus 'recovered' by the demandant. This recovery, being a supposed adjudication of the rights of the parties, bound all persons and vested a free and absolute fee simple in the recoveror. The process was known as 'suffering a common recovery.' A similar but less difficult and somewhat less efficacious proceeding was known as 'levying a fine.' The fine was by statute, in the reign of Henry VIII., substituted for the more cumbersome and expensive common recovery as a means of barring entails, and both have now been superseded by simpler and more modern conveyances. Recoveries were occasionally employed in the early history of some of the United States, but are now everywhere obsolete, and in some States expressly abolished by statute. See FINE; COMMON ASSURANCE; CONVEYANCE; TITLE. The common recovery is fully described by Blackstone, *Commentaries on the Laws of England*, bk. ii., chap. 21. See also Pigot, *Treatise of Common Recoveries, Their Nature and Use* (Dublin, 1792); Digby, *An Introduction to the History of the Law of Real Property* (5th ed., Oxford, Eng., 1900); Leake, *Elementary Digest of the Law of Property in Land* (London, 1874).

COMMONS. A name given to meals provided in English colleges and inns of court for their members. It is used occasionally in the United States for the college dining-room when that is under college control.

COMMONS, HOUSE OF. See PARLIAMENT.

COMMON SCHOOLS. Since instruction has, at least in modern times, been provided for the great majority of the people, the term common schools implies that the schools are for the masses of the people, or, where class distinctions are drawn, for the common people. The term, as used in the United States, implies, as well, that such schools are supported and controlled by the people and charge no tuition. The latter characteristic is now true for the most part of the common schools of Europe. The details of all such systems of schools are given in the article on NATIONAL EDUCATION, SYSTEMS OF.

Previous to the beginning of modern history no people ever contemplated the education of the masses, though with most ancient peoples, as well as during the greater part of the Middle Ages, there were schools that provided the rudiments of education for a limited class. With the Greeks and Romans this class was not a special educational class, the priesthood, as with most other ancient peoples, but included all those entitled to full citizenship. At Athens the elementary schools were private, and taught gymnastics and music, the latter including reading and writing. At Rome the elementary schools were introduced at a much later date than at Athens, were also private, and gave instruction in reading, writing, and calculation. During the Middle Ages such educational efforts as were made were wholly under the auspices of the Church. Schools were established and maintained by the Church, chiefly by monastic orders (see MONASTICISM), until the Renaissance of the

twelfth century. After that time we find schools frequently controlled by the secular clergy. The mediæval schools were either singing or grammar schools. The former were the elementary schools, and were designed primarily for training boys to assist in the Church service. A rudimentary knowledge of reading, and often of writing, Latin, as well as instruction in singing, was given. Such schools were very numerous before the Reformation, and offered an opportunity for an elementary education in almost every community, of which both the peasantry and the poor could avail themselves.

Until the middle of the eighteenth century the common schools still remained almost entirely under ecclesiastical direction. Later they were secularized, and attendance made compulsory. This was first accomplished on a large scale by Prussia in the latter half of the eighteenth century. In France the system of public elementary schools under the control of the State has been developed since 1833. In Scotland common schools have existed very generally since the latter part of the seventeenth century, though it was not until 1872 that these were placed entirely under the control of the State and attendance made compulsory. English common schools on any extensive scale date from the opening of the nineteenth century, and only since 1870 has there been any concerted governmental effort toward building up a common school system.

In the United States common schools were early established in most of the Colonies. Often these were private schools taught by some woman as a means of support. They were consequently called, as in England, dame schools, or sometimes, from the place where held, kitchen schools. The early colonists, however, gave greater attention to the founding of secondary or grammar schools as being of more immediate importance in the education of a ministry, this forming the chief motive to an education with them. In 1643 Massachusetts required that every township containing fifty families should have a school for all the children, the tuition to be paid either by their parents or by general provision. While in New England such common schools became free in the sense of charging no tuition during the latter part of the seventeenth century, in most of the United States the free common school is a development of the second quarter of the nineteenth century. During and since that time the system of free common schools has been systematically extended throughout all the States and Territories, and the course of instruction has been greatly enlarged. As each State has control of its own schools, there is great variety in the details of their management, but the following leading principles are the same in all: (1) A system of graded schools, embracing primary, grammar, and high schools; (2) State superintendents, who determine by examinations the qualifications of the teachers and watch over the efficiency of the instruction given; (3) uniformity of text-books; (4) public examinations; (5) school libraries and illustrative apparatus, and in many cases text-books supplied at public expense; (6) improved construction and furnishing of school-houses; (7) access to the school for all children of suitable age; (8) normal schools for the training of teachers. Some of the States have funds to aid them in supporting their schools.

In the West these funds are generally large, arising from the sale of lands granted by the General Government, and, in some instances, also by the State. Such grants by the United States for school purposes amount to 68,000,000 acres, valued at more than \$100,000,000. Before the Civil War there was no general and well-ordered system of common schools in the Southern States. But in their new constitutions they have made provision for them, and are now pressing forward the work. In 1867 a National Bureau of Education (see EDUCATION, COMMISSIONER OF) was established by Congress for the purpose of collecting statistics and diffusing information on the whole subject, so as to aid the people of the United States in the adoption and support of the best school systems, and to advance in other ways the cause of education throughout the land.

While the Massachusetts school law of 1649 had a compulsory feature, no effective system of compulsory education was ever adopted in the United States before the reform in Massachusetts that resulted from the efforts of Horace Mann (q.v.). At present (1902), thirty States, one Territory, and the District of Columbia, have laws making education compulsory, either at a public or an approved private school. In 1899-1900 there were 15,341,220 children enrolled in the common schools of the United States, out of a total of 17,544,888 enrolled in all the schools. The enrollment in the common schools is about 69 out of every hundred children of school age. The average length of the period of attendance was 98 days out of a total length of 144.6 days for the school term. There were more than 421,000 teachers engaged in the common schools, and the total expense of such schools was \$213,000,000. See EDUCATION; NATIONAL EDUCATION, SYSTEMS OF.

COMMON SCOLD. One who, by the practice of habitual scolding, disturbs the peace of the neighborhood. Scolding, in itself, is not obnoxious to the law, and, so long as it is confined to the domestic hearth, it is *damnum absque injuria*, no matter how persistent and violent it may be. It is only when the practice is indulged in public and with such frequency and under such circumstances as to threaten a breach of the peace that it becomes a public nuisance and punishable as such. The common law took cognizance of the offense and resorted to various devices, mostly of an unpleasant nature, for the punishment of those convicted of it. Among these punishments were the stocks (q.v.), the ducking-stool (q.v.), and the branks (q.v.), the last named being, during the period of its application, the most efficacious. The practice of punishing common scolds survives, sporadically, in the United States, in some of which it is recognized in the penal statutes, but the punishment has been mitigated to fine and imprisonment. Consult the authorities referred to under the title CRIMINAL LAW.

COMMON SENSATION, or COMMON FEELING. A collective name for the sensations which make up our general sense of bodily health or ill health, well-being or ill-being. It includes e.g. the diffused sensations of the tactual sense: shuddering, shivering, tingling, tickling, creeping, goose-flesh, pricking, pins and needles; sensations which can, in many cases, be set up as

concomitant sensations to squeaking or sawing noises and the like. (See references under ANTI-PATHY.) It includes, further, dizziness (see STATIC SENSE); the sensations of muscular exertion and fatigue; and the muscular and organic pains. Indeed, on the theory that pain is aroused by over-intensive stimulation of any and every sense-organ (Wuudt, *Phys. Psych.*, 1893), pain would be, literally, a sensation 'common' to the whole sensitive organism. Sometimes the two sensations of temperature are called common or general sensations; and the alimentary sensations of hunger, thirst, and nausea, as well as the respiratory sensations of stuffiness, of a 'bracing' air, etc., are also covered by the term. It is clear that the phrases 'common sensation,' 'common feeling,' 'general sense,' belong to a psychology that had not yet succeeded in analyzing the more massive complexes of organic sensations, and in referring them to specific organs within the body. In the present state of our knowledge, there is no reason for their retention. Consult: Kuelpe, *Outlines of Psychology* (London, 1895); Titchener, *Outline of Psychology* (New York, 1899). See CUTANEOUS SENSATION.

COMMON SENSE. A pamphlet by Thomas Paine, published in Philadelphia, 1776, advocating the separation of the United States from England. It was thought of sufficient importance at the time to receive public notice from General Washington.

COMMON SENSE, THE PHILOSOPHY OF. There are certain beliefs that have been supposed to be current among men in all ages. Of these, a striking illustration is the belief in an external, material world, independent of any mind to perceive it. Other such beliefs are those in the validity of the laws of identity, contradiction, and the excluded middle, in the truth of the axioms of mathematics, in the universality of causality, and in the eternal obligation of morality. The philosophical acceptance of these beliefs as self-evident and beyond the reach of criticism is called common-sense philosophy. (See also DOGMATISM.) Thomas Reid (q.v.) was the most distinguished advocate of common sense as the final court of appeal on all matters philosophical, and he has been generally followed more or less closely by the philosophers of the Scottish School—James Beattie, Dugald Stewart, Sir William Hamilton, Henry Calderwood, and James McCosh. The untenability of this position is realized as soon as it is recognized that common opinion has often been shown to be mistaken. Nor will an appeal to 'an immediate deliverance of consciousness' do as a substitute for common sense, for an hallucination is as immediate a deliverance of consciousness as an ordinary perception is. Criticism is necessary for establishing the validity of every belief. (See KNOWLEDGE, THEORY OF). Consult: Seth, *Scottish Philosophy* (Edinburgh and London, 1890); McCosh, *Scottish Philosophy from Hutcheson to Hamilton* (London and New York, 1875); Sidgwick, "The Philosophy of Common Sense," in *Mind*, N. S., vol. iv. (London, 1895).

COMMON TIME. See TIME.

COMMONWEALTH OF AUSTRALIA. See AUSTRALIAN FEDERATION.

COMMONWEALTH OF ENGLAND. The official designation of the Government of Eng-

land from the abolition of the monarchy, February, 1649, until the establishment of Cromwell's Protectorate, December, 1653. The title is generally applied to the whole period dating from the death of Charles I., January 30, 1649, to the restoration of Charles II., May 29, 1660. See CROMWELL, OLIVER.

COMMUNE' (Fr., district, from ML. *communa*, *communis*, district, from Lat. *communis*, common). The smallest administrative division of France, and the unit of local self-government. The commune is a legal body, and can buy and sell property, contract debts, and appear in the courts. The chief magistrate is the *maire* (mayor), who is assisted by one or more deputies and a deliberative assembly, called the *conseil municipal*. The *maire* unites in himself two general classes of functions resulting from the twofold nature of the commune. As the agent of the National Government he is charged with the local promulgation and enforcement of laws and decrees; and, as a member of the municipality, he has to attend to the police, the revenue, and the public works of the commune, and in general to act as the representative of the corporation. In communes which rank as the administrative centres of a department, *arrondissement*, or *canton*, or which have a population of more than 3000, the *maire* is nominated by the Central Government; elsewhere the appointment is made by the prefect of the department. The councilors are elected by the votes of the communal electors, and hold office for five years.

COMMUNE. A term applied in feudal times to a body of burghers holding a charter granting them certain privileges of self-government. These communes were found in France, England, Italy, and elsewhere. On the character of these mediæval communes, consult Stubbs, *Constitutional History of England*, chap. xi.

COMMUNE OF PARIS (1792). The revolutionary municipal government established in Paris in August, 1792. It acquired immediate ascendancy in the Assembly, through the personal pressure its leaders could bring to bear, and as its power increased it became more and more the instrument of the violent element of the Revolution and dictated the policy of France. Its history became the history of the Revolution itself. On this commune, consult Morse-Stephens, *History of the French Revolution*, vol. ii.

COMMUNE OF PARIS (1871). This is commonly referred to when the term is used without qualification. It was the insurrectionary body, or organized mob, which was in possession and control of Paris from March 18 to May 27. The German army of occupation left Paris March 3, and almost immediately signs of revolt appeared. On the 18th the Reds, as the Communists were called, with the encouragement of the *Internationale* (q.v.), rose against the French regular troops, and, supported by the National Guard, took possession of the city. Generals Lecomte and Clément Thomas were shot. Communal elections were held and the authority of the National Assembly, which was sitting at Versailles, was declared null. Peace negotiations with Germany were held in abeyance until the new National Government could establish its authority in France, and it was intimated that Germany might find it necessary to reoccupy the abandoned fortresses. Large bodies of the French

prisoners held by Germany were released to reinforce the army at the disposal of the Government for the suppression of the insurrection. The army was thus raised to 150,000 men, and on April 6 active operations were begun by the Government forces, under Marshal MacMahon, for the capture of Paris. The military administration of the Commune was notoriously incompetent, and insubordination and debauchery rendered the forces inefficient, but the available number of the National Guard approximated 100,000, and they were well armed and possessed strong fortifications, the reduction of which was not a light task. The siege of the city was pushed with energy, for the credit of the new Republican Government of France before the world hung upon its ability to maintain its authority. Before the middle of May it became evident that the Commune could not hold out much longer, and its followers began to resort to acts of vandalism. The residence and library of Thiers were destroyed, May 10; the Vendôme Column was pulled down, May 16. The Government forces penetrated the defenses of the city on May 21, obtaining possession of Montmartre on May 23, and now was enacted that saturnalia of violence and crime which has made the name of the Commune infamous. On May 24 the Communists set fire to the public buildings, the Palace of the Tuileries being destroyed. On the same day a large number of hostages, including M. Darboy, Archbishop of Paris, were massacred. On May 27 the last hand-to-hand struggle, without quarter, was fought in the Cemetery of Père-la-Chaise. On the following day all resistance came to an end, and the reign of the Commune was closed. Many of its leaders were put to death, others were punished with banishment or imprisonment. Most of the banished were pardoned in 1880. The Communal Council, the governing body of the Commune, was organized in ten committees, of which that for finance was the most efficient. At the head was a general executive committee, the authority of which was never great. It was displaced by a committee of public safety, which was expected to exercise dictatorial power, like its Revolutionary prototype; but this, too, proved a failure. The Commune was essentially lawless. Many of those who initiated the movement were honest theorists and enthusiasts, but the forces they called into action were entirely beyond their control. There is no scientific history of the Commune. The principal work is du Camp, *Les convulsions de Paris* (4 vols., Paris, 1878-79), conservative. Of Communist sympathies are Arnould, *Histoire populaire et parlementaire de la Commune de Paris* (3 vols., Brussels, 1878), and Lissagaray, *Histoire de la Commune* (last edition, Paris, 1896); there is an English translation by Aveling of an earlier edition (1886). Consult also Washburne, *Recollections of a Minister to France* (2 vols., New York, 1887); Simon, *The Government of M. Thiers* (2 vols., New York, 1878); Fetridge, *Rise and Fall of the Paris Commune of 1871* (New York, 1871); March, *History of the Commune of 1871* (London, 1896). See FRANCE; FRANCO-GERMAN WAR.

COMMUNICATIO IDIOMATUM (Lat., communication of peculiar properties). A term of ancient, and more particularly of Lutheran Christology, denoting that each of the two natures of Christ, divine and human, imparts its

peculiar properties to the other, so that they become similar, each having as a derived property what the other has as original. Consult Thomasius, *Die Christliche Dogmengeschichte*, ii. (Erlangen, 1874-76). See CHRISTOLOGY.

COMMUNION (Lat. *communio*, participation, from *communis*, common). In ecclesiastical language, that relation, involving mutual claims and duties, in which those stand who are united by uniformity of belief in one religious body or church. To exclude from this relation and its involved rights is to *excommunicate*. The most visible symbol of this relation being the partaking together of the Lord's Supper, that rite is often called the Communion. See LORD'S SUPPER; and, for communion table, ALTAR.

COMMUNION IN BOTH KINDS. A term of theology, implying that, in the celebration of the Lord's Supper, communicants partake of both the bread and the wine. It is universally acknowledged that in the Primitive Church both the bread and the cup were distributed to all who communed. Sects which, like the Manichæans, discarded the wine, were condemned as irregular. Early popes commanded the use of both kinds (e.g. Gelasius I., 492-496). As, however, there was frequent occasion to carry the consecrated elements from the church to sick persons at their homes, it became customary, for convenience, to dip the bread in the wine, administering, in this way, both in one. At length it was thought more convenient to omit the wine. In the thirteenth century, Robert Pulleyn, of Oxford, approved the custom of giving to the laity the bread only, in order, as was said, to avoid the danger of spilling the wine. This view was adopted by the scholastic theologians, who taught that Christ was wholly present in the sacrament under either form, and that, consequently, one form was sufficient for a valid observance of it. Thomas Aquinas and Bonaventura, especially, advocated the administration of the communion under one form only. As this view predominated in the course of time, it became the practice of the Church in the West to withhold the cup from the laity. Against this the heretics of the Middle Ages, as the Waldenses, and especially the Hussite sect of Calixtines (Utraquists), protested. The Protestant churches, also were united in regarding the communion in both kinds as essential to the right observance of the ordinance. The practice of the Roman Catholic Church was confirmed and made binding by the Council of Trent in 1563. It is defended on the ground that the cup is not necessary to the completeness of the sacrament. Since the whole Christ, as to His body, soul, and divinity, is not only in each species, but in every particle of both, he who receives the consecrated bread receives the whole Christ. But while this law is uniformly enforced in the Western Roman Catholic Church, those portions of the Eastern churches that acknowledge the supremacy of the Pope are allowed to retain both forms; and the same toleration has been offered to Protestants in order to facilitate their return into the unity of the Church under the Roman See. See LORD'S SUPPER.

COMMUNISM (Fr. *communisme*, from *commun*, joint, common, from Lat. *communis*, common). A system of society in which private

property is abolished and all goods are held in common, the needs of each individual being supplied from public sources. It is unfortunate that no clear distinction is made between communism and socialism. The socialists are carrying on a political agitation which may or may not lead to communism. Communists usually in theory, always in practice, have withdrawn from the general life into separate communities and then followed their plans. It is probably correct to say that communism is the radical wing of socialism. Communism should not be confused with the so-called French Communists of 1871, who were seeking political changes in the *communes*.

A great deal of unwarranted reproach has been put upon communism either through ignorance or because of vagaries attached to many plans for its realization. It is really a reaction against the evils which have, hitherto, at least, always accompanied private property. In reality, too, it is older than the present system. All historical nations, so far as known, at one time held their land in common, the individual having only the use of a portion of it for a certain period. A survival still exists in the Russian *Mir*. Cultivated land seems first to have become private property, the meadows and forests remaining common.

In ancient Greece the evils of private property called forth many suggestions of another system. These were ridiculed in the popular comedies of the day. The most famous of the proposed systems is that made by Plato, in the *Republic*. Private property and private families are the chief influences tending to exalt the welfare of the individual over that of the State. Dispense with these, put men and women on equal footing, and let fitness be the test for positions. Let the children be educated by the State. Plato never conceived of a democracy. He could not conceive of a State without slaves; these formed the substratum of his *Republic*. Plato, however, appreciated that his plan was ideal and would not be realized. His scheme went contrary to the spirit of the times and aroused only discussion. The proposal for the abolition of the private family seems to coincide with the ideas of other writers. Turning from speculative Greece to Rome, we find no such ideal proposals. Individualism was too strongly entrenched.

In the East, however, there was a different spirit. In Palestine, the Essenes and Therapeutæ held property in common, and Josephus (*Antiq.* xi., 8. 3) says that one joining the Essenes had to surrender his private property. Much is said about the communism of the early Christians. A certain degree of it existed, but it seems to have been purely voluntary, many Christians retaining their private property. In any case, the institution did not long endure. The ascetic tendencies which often manifested themselves in communistic forms among heretical and orthodox sects were introduced into the West from the East. The Manichæans believed that matter was evil. Before an inquisition at Turin in 1030 a heretic declared: "We hold all our goods in common with all men." Other heretical sects, the Catharists (eleventh century) and the Apostles (thirteenth century), held similar views. The Brothers and Sisters of the Free Spirit held that, before the Fall, men were like God, that Paradise must be reintroduced with

community of goods and of women. Many evil stories are told of their proceedings, and they were opposed by the Inquisition, but spread in secret during the fourteenth and fifteenth centuries. With these may be compared the Adamites of the fifteenth century. The great monastic orders bear close resemblance in their common property.

During the fifteenth and sixteenth centuries the Taborites (Hussites), the Moravians, and the Anabaptists arose and flourished in succession in central Europe. (For detailed descriptions, the reader is referred to separate articles under these heads.) The teachings of the Anabaptists (q.v.) were embodied, in Thuringia, in a popular movement to realize a State without government, law, or property, each to receive according to need, 'omnia simul communia.' This and the attempt at Münster to establish the new Zion were forcibly put down. As it was impossible to establish communities in secret, efforts were directed toward marriage reform. These naturally led to opposition and suppression. All of these plans grew out of, or were impelled by, distorted religious conceptions. As moral and religious movements they must be judged rather than as economic undertakings. They were overthrown by religious opposition. They had no chance to demonstrate the practicability or possibility of their proposed life.

In the next era we find a group of dreamers, theorists who prophesied a better system to supplant the present, which they felt to be unjust. How far these writers believed their systems could be realized in the near future is a question. Most of them rather try to portray the ultimate form which society shall assume. Some, however, have tried honestly and earnestly to realize their aspirations. However impracticable and visionary their proposals may seem, they are proposals, not of self-seekers, but of those who have the welfare of society at heart. As such they merit consideration.

The opening up of America made possible genuine attempts to found communistic settlements which should not be overthrown by sectarianism, but should have abundant opportunity under favorable conditions to prove or disprove their fitness to exist. Most have failed, and the reasons are usually plain. Mismanagement being left out of consideration, society cannot found itself upon such a basis as celibacy, nor, on the other hand, upon 'free love.' Nor does it seem likely that society will be regenerated by groups who isolate themselves from the common life. The strength and dignity of the life of some of the communities may well, however, stimulate all men to renewed efforts to realize the best for themselves and society.

THE UTOPISTS. The publication of *Utopia* by Sir Thomas More (1516) introduced a new element. He wished nothing of an ascetic nature, but sought a fuller and freer expression of life. His book arose from the economic changes taking place in England. The introduction of sheep-raising was destroying the small farms and bringing much suffering to the peasants. More, influenced by Plato, proposed to retain slavery, the slaves being chiefly convicted criminals. There should be community of goods: every one should be supplied from the State storehouses. Monogamy is prescribed, and the greatest freedom allowed the individual families. Men and

women are to work six hours per day. The title 'Utopia' has given the name to all such proposals. More has been followed by many writers. Campanella (*Civitas Solis*, Frankfurt, 1623) advocated community of goods and of women with universal duty to labor four hours a day, each person to be provided according to need. Vairasse (*Histoire des Sercrambes*, 1677) proposed an eight-hour working day. Among the most interesting Utopistic efforts is the charming story by Cabet, *Voyage en Icarie* (Paris, 1842), in which monogamy is preserved, each person working according to ability and receiving an equal reward. Cabet's pathetic attempts to realize his dreams will be mentioned later. Bellamy (*Looking Backward*, Boston, 1888) advocated wages in the form of annual credits at the public warehouse, at which goods are sold according to the quantity of labor required in their production. Hertzka (*Freiland*, Leipzig, 1890) and Sheldon (*In His Steps*, Topeka, 1899) may also be classed here.

In the meantime there arose many critics of existing conditions who proposed communistic remedies. Meslier (1664-1792) in his *Testament*, first published in Amsterdam in 1864, viewed society as a product of force and its evils as the results, largely, of private property. The various parishes should form large families bound mutually to assist each other; each individual to have according to his needs. Morely (*Code de la Nature*, Paris, 1755) advocated communities of about 1000 persons with common goods and distribution according to need.

These and other men found little acceptance, but the reaction of the French Revolution brought results. Saint-Simon, whose influence was in his personality rather than his writings, proclaimed the control of the 'Industrielles.' Property reform did not greatly concern him. His system was to be religious and moral, a 'new Christianity.' The occupation of each person was to be decided by the directing authority, the remuneration to be by salary proportioned to merits of the work and the individual. (See SAINT-SIMON.) Of the French communists, Charles Fourier (q.v.) probably had the greatest influence. He did not advocate abolition of private property, but believed in associations of 2000 people who should live in a 'Phalanx,' work and consume in common so far as pleased them, but who were by no means to be equally interested financially or to share equally in proceeds. Strictly speaking, Fourier's scheme might be called a cooperative corporation save for its features of common life. Buchez (1831) advised that laborers save enough to start productive associations. Louis Blanc developed this idea, saying that the State should assist the laborers in founding 'ateliers sociaux.' These would gradually overcome the capitalistic system and lead to communism.

At this time, in England, Robert Owen had become very prominent by his works and his teachings. Owen came to his ideas not by way of pure speculation, but felt himself driven by the logic of the situation in which he found himself. He was a successful manufacturer interested in his employees. He finally advocated the forming of groups of from 500 to 1000 persons, who should provide themselves all the necessities of life. The members should live in great houses surrounded by gardens, and all artificial distine-

tions between men should be thrown down. Such colonies would prove so attractive that the existing industrial system would break down because of the desertion of the workmen. In 1819 it was attempted to start such a colony at Motherwell, but the funds were not sufficient. In 1824 Owen came to America, where his presence did much to start a wave of communistic thought, and where some twelve colonies were planted, none of which lasted more than a few years. During his absence (1826) some of his friends purchased 291 acres of land at Orbiston, near Glasgow, and built a large building in which all should live, each sharing in the division according to his labors. The death of one of the founders, with other difficulties, brought an end to the plan. Similar colonies at Rahaline in the thirties and Queenswood (1841) likewise failed, the latter after five years' existence. Owen's attempts to realize communism were not successes; he did succeed, however, in establishing coöperation. (See OWEN, ROBERT.) Other notable attempts along the same line were made in England by Charles Kingsley and Thomas Hughes, to whose biographical notices in this work the reader is referred.

COMMUNISM IN AMERICA. The centre of interest in communism is henceforth in America. One of the provisions in the 'oldest American charter' (1606) was that there should be a common storehouse in which the products should be kept, and from which each should receive according to his needs. Jamestown lived under this scheme for five years, the idlers giving Capt. John Smith much trouble meantime. The Pilgrims had similar arrangements, which were soon changed, but for a long time much land was held in common. Of this custom Boston Common is a survival. These arrangements were but temporary, however. In 1774, driven by religious opposition, 'Mother Ann Lee' came from England with a small company of Quakers, who were called Shaking Quakers because of certain physical movements in religious exercises. The name was soon shortened to Shakers. They settled at Watervliet, near Albany, N. Y. Mother Ann died in 1784. In 1787 a covenant was adopted establishing celibacy and community of goods. Their communism grew out of their religion. Christianity, they say, does not admit of divisions into rich and poor; 'mine' becomes 'ours,' and riches and poverty, with their misery, disappear. The Shakers have lived happily and contentedly and have had great material prosperity. Says Professor Ely: "Economically the Shakers have been a great success." They have now some seventeen societies in different States, the largest being at Mount Lebanon, N. Y. They own some very valuable property. (See SHAKERS.) The Harmonists, or Separatists, as they were called in Germany, left the Fatherland because of sectarian opposition and settled in 1805 at Harmony, Pa., under the leadership of George Rapp. They, too, have been very successful financially. At one time they had a thousand members, but now only forty or fifty remain. They are obliged to employ outsiders to carry on their enterprises, so that they have practically become a close corporation. See HARMONISTS.

The Amana Community of seven villages in Iowa was founded by another German sect, the *Inspirationists*, who settled near Buffalo, N. Y., in 1842, moving to Iowa in 1855. Religion is

the primary thing. Yet they have prospered and possess fertile and well-improved lands. They number 1800 or more. Marriage is permitted. In 1844 yet another German sect settled at Bethel, Mo., moving later to Aurora, Ore. They have been fairly successful. (See AMANA.) The French in 1848 under Cabot, who tried to establish Icaria, were not successful. After many discouragements and disappointments they were finally settled in Iowa. Trouble followed trouble, and the end came in 1895. See ICARIANS.

All of these communities were started by foreigners, though most of the Shakers have been Americans. An American colony of some fifty members was started by John Humphrey Noyes in 1847 at Oneida, N. Y. Later a small branch was established at Wallingford, Conn. They believed in freedom from sin and were called Perfectionists (q.v.). Between 1840 and 1850, under the leadership of Albert Brisbane, Horace Greeley, Charles A. Dana, and others, Fourierism spread over the country, Greeley advocating it in the New York *Tribune*. Some thirty-four 'phalanxes' were started in various places, most of which were short-lived. The most famous was Brook Farm (q.v.), near Boston, which began as a coöperative school. The North American Phalanx, in Monmouth County, N. J., was the most successful, lasting some twelve years (1843-56). Ripon, Wis., dates back to the Wisconsin Phalanx of 1844. This association paid \$1.08 on the dollar when it dissolved. The movement gradually subsided.

In recent years a number of attempts to found communistic settlements have been made, but they have broken down largely because of internal dissensions. Among these may be mentioned Kaweah, in California (1884); Topolobampo, Mexico (1886); and the Ruskin Coöperative Colony, in Tennessee (1893). The only recent European settlement was an attempt in 1895 to realize the ideals of Hertzka's 'Freiland' in Africa. The reason for the failure of many of these enterprises is not far to seek. Lack of unity of purpose and unwise management bring sure destruction. Fourierism was a compromise. It retained gross inequalities while condemning those of the world. It was not a unifying principle. On the other hand, those which have succeeded have possessed just this unity—usually in adherence to some social or religious ideal which has made the interests of the individual the interests of the group. That material prosperity has accompanied this unity history clearly shows. The social life of the Shakers and of the Amana Community has always deeply impressed the visitor from the outside world. Howells in his *Undiscovered Country* tells of their life and makes one of his characters say, "They're what they seem; that's their great ambition." In his autobiography, Horace Greeley wrote of the Shakers: "No one will pretend that they have failed. No; they have steadily and eminently expanded and increased in wealth and every element of material prosperity, until they are at this day just objects of envy to their neighbors. They produce no paupers; they excrete no beggars; they have no idlers, rich or poor; no purse-proud nabobs, no cringing slaves. If there were no other success akin to theirs—but there is—it would still be a demonstrated truth that men and women can live and labor for general, not selfish, good—can banish pauperism, servitude, and idle-

ness, and secure general thrift and plenty by moderate cooperative labor and a complete identity of interests." No more fair and judicial view of communism has been presented than John Stuart Mill gives in his *Principles of Political Economy*. Mill recognizes the evils of private property and the desirability of remedying them. He notices the difficulties of communism, that men would evade work, that it would be hard to make a fair distribution of work. He raises the question as to whether communism gives greater freedom and liberty to the individual. The statement is summed up in: "It is yet to be ascertained whether the communistic scheme would be consistent with that multiform development of human nature, those manifold unlikenesses, that diversity of tasks and talents and variety of intellectual views which not only form a great part of the interest of human life, but by bringing intellects into a stimulating collision, and by presenting to each innumerable notions that he would not have conceived of himself, are the mainspring of mental and moral progression."

The experience of the last century is of great value. The social and economic fruits endure though the individual communities have gone. The questions of Mill have not all been answered in the affirmative nor yet in the negative. Most of the features of many of the experiments to which exception is taken—free love, celibacy, and the like—are not essential features. Private property has its evils, but it has been a powerful incentive to progress. Will communism give an equal incentive without the evils? The tendency to-day is away from the formation of isolated groups. In the middle of the last century many able and intelligent men thought to reform the world in a few years. Cabet allowed fifty years for a preparation—then complete communism. Such dreams have largely vanished. The settlements have seemed to furnish little scope for ambition, and ambition is one of the chief traits of mankind. The socialists and all who may hope for communism are now seeking it by the way of gradual political reform. In summing up American communism, Professor Ely says: "It has accomplished much good and little harm. Its leaders have been actuated by noble motives, have many times been men far above their fellows in moral stature, even in intellectual stature, and have desired only to benefit their kind. Its aim has been to elevate man and its ways have been ways of peace."

New York, 1890); Noyes, *History of American Socialism* (Philadelphia, 1869); Shaw, *Icaria* (New York, 1884). See SOCIALISM.

COMMUNISTIC SOCIETIES. Social, and frequently, religious associations based on the general principle of each member contributing all his possessions, labor, and earnings to a common stock, in which all members share alike. As

is pointed out more fully in the article COMMUNISM (q.v.), such expedients have been adopted for the benefit of groups of individuals throughout the entire course of history. In central Europe, during the Reformation, numerous communistic organizations sprang up, notably the Taborites (q.v.) and their successors, the Moravians (q.v.). Later the teachings of Fourier and Saint-Simon on the Continent and Kingsley and Hughes in England stimulated like movements. During the past century the United States has been the scene of nearly all communistic organizations, a new country furnishing the best field. They characterize that stage in social evolution during which men are forced to group together into communities in order to provide for their mutual wants, and disappear with the appearance of more complex division of labor and more advanced social conditions. The more important modern communistic societies are treated elsewhere under separate titles. See KORESHIAN ECCLESIA; SEPARATISTS; SHAKERS; PERFECTIONISTS, etc.

Of the lesser communistic societies may be mentioned: (1) The *Adonai Shomo*. This society was organized and incorporated in Petersburg, Mass., in 1876. Its religious principles are like those of the Adventists, among whom the movement originated. The communistic system is added, with recognition of an equal voice to men and women in the management. The society ceased to exist in 1897. (2) The *Altruists*. This society is non-sectarian and does not interfere with marriage or the family affairs of its members, or with their opinions. Men and women are accorded equal rights, and the governing body is chosen by the vote of the majority. (3) The *Amarna Community, or True Inspiration Congregation*. The first members of this society came from Germany, led by Christian Metz, of Strassburg, and founded the Community of Eben-Ezer, near Buffalo, N. Y., in 1842. Between 1855 and 1865 they gradually removed to their present location, near Davenport, Iowa. They have no creed but the Bible, believing in its entire inspiration, that God still inspires His people and that their leaders for the time being are possessed by this gift. They hold the doctrines of the Trinity, justification by faith, the resurrection of the dead, and purification of the wicked by fire, but not that of eternal punishment; are non-resistants, and approve of marriage. Members are classified as of the highest, middle, and children's orders, to the last of which those of the higher orders who fail are dropped till they amend. An examination of the spiritual condition of all the members is held at least once a year. Their regular religious services include singing, reading from the Bible and the inspired book, prayer, and exhortation. Temporal affairs are administered by a board of trustees chosen by the members, to which women are not elected.

COMMUNITY OF PROPERTY. In law, a condition under which property is held, having its origin in the civil law, whereby a sort of partnership or common ownership of property is created between husband and wife. It covers all personal property owned by either party before marriage or acquired during marriage, all realty and all profits and rents acquired or accruing during marriage. Property given to either by deed of gift in which the donor spe-

efically makes it the exclusive property of the donee is exempt from the operation of the doctrine. The survivor takes one-half the property after their joint debts are paid, and also has certain homestead rights. The heirs of the deceased spouse take one-half the common property remaining after the payment of debts, subject to the survivor's homestead rights, if there is no real property. This doctrine was introduced from the French and Spanish law into many of the Western States, including Louisiana, but is generally regulated and somewhat modified by statutes. (See HUSBAND AND WIFE; GANANCIAL SYSTEM.) The expression community property is sometimes used to describe the holding of property in common by communistic societies, such as the Shakers. In such communities there is a sort of general partnership in all property, each adult individual owning an equal share by virtue of his membership. The ownership is in the nature of a tenancy in common, and is not subject to the rules of the civil law above described.

COMMUTATIVE LAW. See ASSOCIATIVE LAW.

COMMUTATOR. See DYNAMO.

COMNENUS (Lat., from Gk. Κομνηνός, Κομνηνός). The name of a family, originally from Paphlagonia, of which several members occupied the throne of the Byzantine Empire, from 1057 to 1204, and that of Trebizond, from 1204 to 1461. After the fall of Constantinople one branch of the family settled in Saxony, another in Corsica; but the attempt which has been made to trace the descent of the Bonaparte family from a branch of the Comneni is not supported by valid evidence. See ALEXIS; ANNA COMNENA; BYZANTINE EMPIRE.

COMO (Lat. *Comum*). The capital of the province of the same name in north Italy, situated at the southwestern end of Lake Como, at a distance of 28 miles by rail from Milan (Map: Italy, D 2). The surrounding country is of great picturesqueness. The city is surrounded by hills covered with gardens and groves and contains some buildings of considerable architectural merit. The marble cathedral belongs to different periods and is built in different styles. It was begun in the Gothic at the end of the fourteenth century; the larger portion was constructed in the Renaissance style, mostly by Rodari during the fifteenth century, while the dome is of relatively recent origin. The interior is decorated with rare pictures and monuments; in the main entrance are placed two statues of Pliny the Elder and the Younger, both of whom were born at Como. The Basilica of Sant' Abbondio, a building of Lombard origin, rebuilt in the eleventh century and recently restored, is of great artistic value. The Church of Santissima Annunziata, situated on the promenade outside of the town, is remarkable for its rich decorations of marble and gold. Adjoining the cathedral is the city hall, a large, arched structure, built of different-colored stone, and completed in 1215. Other noteworthy buildings are the theatre, built in 1813; the lyceum, founded in 1824; and the city museum, with its collections of Roman antiquities, arms, and coins, opened in 1897. Como has extensive manufactures of silk, velvet, and knit-ware. The commerce is also of considerable importance.

The ancient Comum was a city of the Insubres, occupied by the Romans in B.C. 196, and colonized by Cæsar as a military post to repress the Alpine tribes. In the Middle Ages it was a stronghold of the Ghibellines and the 'open door of the emperors into Italy.' In 1127 it was destroyed by the Milanese, and rebuilt by Frederick I. in 1159. Later it was ruled by the Rusca family, and in 1335 came into the possession of the Visconti, from which time it shared the fortunes of Milan. In 1859 it was a centre of the agitation headed by Garibaldi.

Como is the seat of a bishop and the birthplace of Innocent XI. and Clement XIII., the historian Giovinio, and Volta. Population, in 1881 (commune), 25,560; in 1901, 38,895.

COMO, LAKE. (It. *Lago di Como*, or *il Lario*, Ger. *Comer See*, anc. *Lacus Larius*, praised by Vergil (Georg. II., 159). The most beautiful and celebrated of the Italian lakes, situated in Lombardy, at the western foot of the Bergamese Alps, 30 miles north of Milan (Map: Italy, D 2). Its elevation is 650 feet; its area, about 60 square miles; its greatest length, 30 miles; its greatest width, not quite 3 miles; and its greatest depth, 1340 feet. The southern part divides, at Bellaggio, into two arms—the eastern called Lake Lecco, the western retaining the name Lake Como, and having the city of Como (q.v.) at its extremity. Between these two arms lies the fruitful district of Brianza. The river Adda enters the northern end of the lake, and leaves at the southeastern extremity, near the charming town of Lecco. The beauty of Lake Como, with its rich shifting, marvelous colors, and its picturesque mountains (7000 feet), clothed with the vivid green of the chestnut, varied with the delicate gray of the olive, has long been extolled. The cypress, aloe, laurel, myrtle, and oleander add their effects to the luxuriant landscapes which are embellished by numberless costly villas, with gardens, terraces, and vineyards, of distinguished or wealthy families that have been attracted from many countries by the delightful region and the indulgent climate. The lake is especially the resort of the Milanese aristocracy. A number of the villas, possessing worthy art collections (including particularly several fine examples of Thorwaldsen and Canova), are opened regularly to visitors. The most attractive towns on the lake are Cernobbio, Tremozzo, Cadenabbia, Menaggio, Bellano, and Bellaggio, the loveliest point on the lake. The steamboat service is excellent. The industrious inhabitants along the shores are chiefly engaged in silk production and manufacturing. Fish are plentiful and of many varieties. The artistic articles made of olive wood and offered to the tourist at Bellaggio are well known.

COMONFORT, kō'mōn-fōrt', IGNACIO (1812-63). A Mexican statesman. He was a member of Congress in 1842, and a Senator six years later. In 1854 he assisted Alvarez against Santa Anna, and, on the latter's abdication (1855), became Provisional President. He was proclaimed President in 1857, but in 1858 was driven into exile. In 1863 he commanded an army to oppose the French invaders who intended to establish the Emperor Maximilian in power, was defeated by Bazaine near Cholula, and shortly afterwards was killed in an ambush by bandits.

COM'ORIN. See CAPE COMORIN.

COMORN, kó'mörn. See KOMORN.

COM'ORO ISLANDS. A group of four large and a number of smaller islands in the Mozambique Channel, midway between Africa and Madagascar, lying between latitudes 11° and 13° S., and longitudes 43° and 45° 30' E. (Map: Africa, J 6). The four larger islands are Comoro, Johanna, Mohilla, and Mayotta, the last of which, while belonging geographically to the Comoro group, has not usually been included with them. They have a total area of 760 square miles. They are of volcanic origin and mountainous; the highest peak rises to 8700 feet. The soil is fertile and produces fruits and some sugar. Cattle are also raised to some extent. The manufactures are coarse cloths, jewelry, and cutlery. The island of Mayotta was ceded to France in 1842, and the remaining ones added in 1886. They are a dependency of Réunion, and are ruled by native sultans, who are under the supervision of French Residents. The population is estimated at over 60,000, of mixed Arabic and negro descent, professing Mohammedanism.

COMPAGNI, kóm-pä'nyé, DINO (? -1324). A Florentine historian and statesman of the fourteenth century. He was long believed without question to be the author of a history of Florence from 1280 to 1312 (*Cronaca delle cose occorrenti ne' tempi suoi*). In 1858 Fanfani's *Piovano Arlotto* cast doubt upon the genuineness of the chronicle, and in 1874 P. Scheffer-Boichorst's *Florentiner Studien* sought definitely to prove its spuriousness. A paper war was waged over the matter, some maintaining that the work is wholly spurious, others that it is wholly genuine, while a third party contended that it is in the main genuine, but is in parts disfigured by later interpolations, abbreviations, and changes. Since the appearance of Del Lungo's *Dino Compagni e la sua cronaca* (1879-87), the last-named has been the generally-accepted opinion. Symonds (*The Age of the Despots*, London, 1875) dismisses the question in a foot-note, and thus characterizes Compagni and his work: "He was a man of the same stamp as Dante. . . . He undertook to narrate the civic quarrels of his times, and to show how the commonwealth of Florence was brought to ruin by the selfishness of her own citizens; nor can his 'Chronicle' be surpassed for the liveliness of its delineation, the graphic clearness of its characters, and the acute analysis which lays bare the whole political situation."

COMPANION (Dutch *kompanje*, Fr. *compagnie*, company, crew; influenced in popular etymology by Eng. *companion*, comrade). The skylight or cover to quarter-deck hatches through which the light passes to the deck below. Companions are usually removable. With the disappearance of old-fashioned ships, the name has fallen into disuse. The *companion ladder* is the ladder leading from the quarter-deck to the deck below, and the *companion-way* is the hatch (together with its deck-house, if there be any) through which the companion ladder leads.

COMPANY (from Fr. *compagnie*, OF. *compagnie*, It. *compagnia*, from Lat *com-*, together + *panis*, bread). A number of persons associated together in a joint enterprise, usually of a mercantile character.

CHARTERED COMPANIES. As a legal term, 'company' was first employed in connection with the great chartered companies of the period of adventure and exploration in England during the fourteenth to the seventeenth century. The essence of these companies was the possession of certain exclusive privileges conferred by royal charter, either a monopoly of trade with certain countries or regions of the earth, or more or less extensive power of colonization and government; or, as was usually the case, a combination of the two. These companies were of two distinct types, viz.: the trading company, to which individual merchants were admitted on certain conditions, and then traded each on his own account; and the joint-stock company, in which the trade was carried on in behalf of all its members by the managing board and officers of the company. The latter might be either incorporated (in which case it differed only in the extent of its powers and the character and range of its operations from the modern business corporation), or unincorporated (in which case it was simply a great partnership, of the type known to us as a joint-stock association). In all cases, however, it was usual to vest in the company, or in its officers or managing directors, legal jurisdiction over its members, and, in the case of the colonizing companies, a territorial jurisdiction as well. The famous company, known as the Merchant Adventurers of England, whose beginnings can be traced back to the year 1359, was originally of the type of trading companies, but was incorporated two hundred years later by a charter of Elizabeth. The Eastland Company, the Russia (or Muscovy) Company, the Levant (or Turkey) Company, were of the same character. The great colonizing companies under whose auspices the first English settlements in the New World were made—as the Virginia Company, chartered in 1609; the Massachusetts Bay Company, chartered in 1629—were of a composite character, being incorporated for the express purpose of founding new colonies, but organized for trading purposes on the principles of the regular trading companies. The East India Company, on the other hand, chartered in 1600 as a trading company, pure and simple, became a joint-stock company in 1612, and the Hudson's Bay Company, incorporated by royal charter in 1670 (which, shorn of most of its ancient privileges, is still in active existence), is also for trading purposes a joint-stock association.

The extensive powers of government, and even the legal jurisdiction over their own members, formerly vested in these old trading companies, have long since been resumed by the Crown. Their present significance lies in the fact that they constitute the beginnings and the foundation of the colonial empire of Great Britain. But the principles on which they were organized and conducted are, with some modifications, still recognized and acted upon in that country. Chartered companies for purposes of trade and colonization in territories not under the sway of Christian powers are still created, and some such companies of recent origin have played an important rôle in the history and politics of the past twenty years. Among these may be mentioned the North Borneo Company, chartered in 1881; the Royal Niger Company, in 1886; the British East Africa Company, in 1888, and the

British South Africa Company, in the same year. All of these companies have had qualified rights of sovereignty and powers of government vested in them, and they have all continued the rôle of the older companies in expanding the limits of the British Empire. See Anderson, *Origin of English Commerce*; Cunningham, *Growth of English Industry and Commerce*; Schanz, *Englische Handelspolitik*; Cawston and Keane, *Early Chartered Companies*; Westlake, *International Law* (London, 1880); Hall, *Treatise on the Foreign Powers Jurisdiction of the British Crown* (Oxford, Eng., 1894); and the comprehensive treatise of Bonassieux, *Les grandes compagnies de commerce* (Paris, 1892).

CITY COMPANIES. The incorporated trades or guilds of the city of London. The origin of these companies is to be traced back to the close organization and exclusive membership of the mediæval craft or trade guilds, which appeared in England in the early part of the twelfth century. These had various privileges conferred upon them from time to time by royal charter until, in the latter part of the fifteenth century, they exercised all the powers of government within the city of London, and, indeed, constituted its entire citizenship. Thereafter the 'freedom of the city' consisted in membership, as a 'liveryman,' or 'freeman,' of one of the city companies, and the franchises of the city were exercised in this fashion until 1725, when the companies were deprived of some portion of their political authority by act of Parliament. They were further restricted by the reform legislation of 1832 and 1867, but still retain the right of choosing the Lord Mayor, the Sheriff, Chamberlain, and other civic officers. Though the companies have by lapse of time entirely lost their trading character, they still retain their ancient organization, many of their exclusive privileges, and, in some cases, great wealth. There survive 12 great companies and 62 lesser ones. See **GUILD**; **LONDON**; and consult Brentano, *Guilds*; Gross, *Gild Merchant*; Norton, *The City of London* (London, 1829); and *Report of the Royal Commission on the Livery Companies* (Parliamentary Papers, 1884).

MODERN TRADING COMPANIES. In a legal sense, the term company may be applied to any association of individuals for business purposes. This may be a partnership of the ordinary type, a joint-stock association—which is commonly a large partnership formed and conducted in ways prescribed by statute—or a business or trading corporation. It is in the last sense that the term is commonly employed in England. In the United States it has no such definite legal signification. Though there is no inappropriateness in applying it here to any of the three forms of association above enumerated, it usually refers to the second or third form. The expression 'company law' may have reference either to the law of business corporations or of unincorporated associations. All of these forms of association for trading purposes are dealt with under their respective heads. See **CORPORATION**; **JOINT-STOCK ASSOCIATION**; **PARTNERSHIP**; **VOLUNTARY ASSOCIATION**, and the titles and authorities referred to thereunder.

COMPANY. In military organization, an aliquot part of a regiment or battalion, though not absolutely or necessarily so. In the United States all infantry regiments are divided into

companies, as is also the corps of engineers. Troops of cavalry and batteries of artillery generally correspond in command and organization to companies of infantry. The average strength of companies in the United States and British armies is 100 men. On the Continent of Europe the number varies from 100 to 250 men in Germany and Russia. In the former country the captain of infantry is a mounted officer, and has three subaltern officers under his command. The general trend of modern military tactics is to reduce the size of the unit of command in attack formations, largely because of the vast area over which comparatively small bodies of troops are scattered, and the corresponding difficulty of their effective control; thus the importance which heretofore has attached to the regiment or battalion is likely to attach to the company, and greatly alter its present formation and organization. See **ARMY ORGANIZATION**; **TACTICS**, **MILITARY**.

COMPANY, JOHN. The popular name for the old East India Company (q.v.).

COMPANY, SHIP'S. All persons who are regularly employed in various capacities on board a ship. In the United States Navy it is also frequently used to designate the crew only. See **COMPLEMENT**; **CREW**.

COMPARATIVE ANATOMY. For definition, scope, and bibliography, see **ANATOMY**, and **ANATOMY, COMPARATIVE**. In this work all the larger topics dealing with the anatomy and physiology of men and animals have been treated comparatively and with reference to their evolution. Such is the character of **ALIMENTARY SYSTEM**; **CIRCULATORY SYSTEM**; **EAR**; **EXCRETORY SYSTEM**; **EYE**; **FOOT**; **HAIR**; **HAND**; **INTEGUMENT**; **MUSCULAR SYSTEM**; **NERVOUS SYSTEM**; **PELVIS**; **REPRODUCTIVE SYSTEM**; **RESPIRATORY SYSTEM**; **SKELETON**; **SKULL**, and similar articles, in which the reader will find the methods of comparative anatomy exemplified.

COMPARATIVE GRAMMAR. See **GRAMMAR**.

COMPARATIVE MYTHOLOGY. See **MYTH** and **MYTHOLOGY**.

COMPARATIVE PHILOLOGY. See **PHILOLOGY**.

COMPARATOR (Lat., *comparare*, from *com-*, together + *par*, equal). An instrument used in comparing the lengths of two graduated scales and in determining accurately the amount of their difference. It consists essentially of two microscopes, each fitted with cross-hairs and capable of being moved by a micrometer screw, or else supplied with a micrometer eye-piece, or often both. (See **MICROMETER**.) These micrometer microscopes are so mounted that they may be moved both laterally and forward and backward, and through them the observer looks down on the scale which is being examined. The microscopes are then moved so that their cross-hairs are either at the end or over some division of the scale, which often is so magnified that in making a setting it is convenient to bisect the enlarged image of the mark. By means of rollers or other mechanism the platform containing the first scale is temporarily removed and a second introduced in its place. In this case the intersections of the cross-hairs are probably some small dis-

tance away from the corresponding division of the other scale, and this amount, as determined with the micrometers, is their difference at that temperature. While the operation of comparing two scales does not seem particularly complicated, nevertheless, in order to secure the desired high degree of precision, elaborate precautions are taken both in the construction and manipulation of the apparatus. The temperature at which the scales are compared is of course no unimportant consideration, and in order that this should be uniform and easily determined, they are immersed in a bath of liquid whose temperature can be maintained at some constant point. In the comparison of standards there must of course be an ultimate standard to which all measures of length are referred, and this bar is considered correct at some one stated temperature. Copies of this are made and serve as secondary standards whose coefficient of expansion, minute errors, and other constants are known. Such comparisons are performed by the International Bureau of Weights and Measures at Paris, where comparators susceptible of the most accurate results and possessing all possible refinements are employed. (See WEIGHTS AND MEASURES.) Similar but usually less precise apparatus is found also in the various national standard bureaus and physical laboratories. The *Mémoires du Bureau International des Poids et Mesures* (Paris) contain full and technical descriptions of the most accurate and approved apparatus and methods.

COMPARETTI, kôm'pâ-rêt'tè, DOMENICO PIETRO ANTONIO (1835—). An Italian philologist, born in Rome. He studied mathematics and the natural sciences, and in 1859 became professor of Greek in the University of Pisa. A few years later he accepted a similar position at Florence, and afterward went to Rome, where he conducted the lectures on Greek antiquities at the university. Aside from his Greek studies, he is distinguished as a scholar in Romance philology and in the culture-history of the Middle Ages. His most important works are: *Saggi dei dialetti greci dell'Italia meridionale* (1866); *Virgilio nel medio ero* (1872; Eng. trans. 1899); *Papiro ercolanese* (1875); *La commissione americana di Pisistrato e il ciclo epico* (1881). With d'Ancona he edited *Canti e racconti del popolo italiano* (1870-91); with others the *Rivista di filologia e d'istruzione classica*, and since 1884 has been editor also of the *Musco italiano di antichità classica*.

COMPARISON (OF. *comparaison*, Fr. *comparaison*, from Lat. *comparatio*, from *comparare*, to compare). In grammar, and as applied to adjectives (q.v.), that which marks the degree in which the quality is attributed to the object, as compared with other objects. There are three degrees of comparison. The positive indicates the quality generally, without comparison; the comparative, a higher degree of the quality than is attributed to other things; and the superlative, the highest degree that is attributed to any of the things under consideration. Sometimes the positive is not regarded as a degree of comparison. There are two ways of expressing these degrees. (1) By an inflection or change of the word: as, hard, harder, hardest; happy, happier, happiest. This mode prevails almost exclusively in Greek and Latin. (2) By

an additional word, as more happy, most happy. This may be called logical comparison, the other, grammatical. In French, with the exception of a few irregular adjectives, all adjectives follow the logical method. In English, the logical method is generally preferred when the grammatical would produce a word difficult or harsh in the pronunciation. This is generally the case in English when the simple adjective is of more than one syllable; but it is not always so. Thus, earnest, prudent, would make harsh combinations; not so polite, discreet, happier. The difference is, that in earnest, prudent, the accent being on the first syllable, two unaccented syllables of discordant character are thrown together; in polite, discreet, the unaccented syllables are separated; and in happier, though they come together, they readily coalesce. Thus, the laws of euphony determine this point, as they do much else in language. Carlyle and Ruskin use many comparative and superlative forms that are not generally recognized. In general, it is only adjectives of quality that admit of comparison; and even adjectives of quality cannot be compared when the quality does not admit of degrees; as, a circular space, a gold ring, a universal wish. Adverbs (q.v.) in English are compared exactly like adjectives, logical comparison predominating.

COMPASS (OF., Fr. *compas*, compass, from ML. *compassus*, circle, from Lat. *com-*, together + *passus*, step, from *pandere*, to spread out). The most important instrument used in the navigation of a ship. It consists of a number of magnetic needles placed with their axes parallel; a framework supporting the needles, and a circular disk marked in points and degrees, called a *compass-card*; the pivot on which the framework rests; and the *compass-bowl*, containing the compass. This latter is, in turn, mounted on gimbals in a binnacle (q.v.) and further protected by a binnacle-cover. Compasses are of two general types, *dry* and *liquid*. The best-known form of dry compass is that designed by Lord Kelvin (Sir William Thomson, before his elevation to the peerage). It consists of a central boss and outer rim, both of aluminum connected by numerous radial silk threads. The magnets, eight or more in number, are held in parallelism by threads and supported by other threads from the rim. The latter has a paper cover marked in degrees and points. This compass is very light, and therefore will be very sensitive and yet not have too much throw as the ship moves. Furthermore, the weight, such as it is, being largely in the rim, will tend to check a tendency to liveliness. The dry compass is cheap and reasonably satisfactory in other respects, and is much used. In the United States Navy and in many ships of the merchant service a liquid compass is used. The bowl is filled with alcohol and water. The compass-needles, in two or more bundles, are sealed in parallel tubes, which form the framework connecting the central boss to the rim. Both rim and boss are hollow, and, like the needle-tubes, are of white metal or aluminum alloy. The markings of the ordinary compass-card are painted upon the rim in degrees and points. The whole float, consisting of rim, boss, and magnetic tubes, is slightly heavier than the liquid, so that it rests very lightly upon an agate pivot-bearing in the boss, which is supported upon a pivot

rising from the bottom of the bowl. The liquid checks the tendency of the compass to jump when the ship has considerable motion, and the vibrations of the machinery, which are apt to disturb dry compasses, have no effect upon a liquid one.

The compass-needle is drawn away from the horizontal plane by the vertical component of the earth's magnetic force by an amount called the *dip*, or *inclination*. The *error* of the compass, which is the result of forces acting in the horizontal plane, is the angle between the direction of the needle and the true, or geographic, meridian. It is made up of the *variation*, or angle, between the true and magnetic meridians (q.v.), which represents the deflecting effect of the earth's magnetism, and the *deviation*, or angle, between the magnetic meridian and the needle, which represents the deflecting effect of the ship's magnetism.

The *variation* is due to the fact that the lines of magnetic force which affect the needle are parallel to the geographic meridian in only a few places on the earth. The direction of one of these lines at any point is the direction of the magnetic meridian there; that is, the direction in which a freely suspended magnet will lie. The variation of the compass at any point is not usually stationary, but changes from year to year, increasing to a certain maximum, decreasing to a minimum, and then increasing, in a very regular manner, so that, within limits, its amount at any future time may be predicted. It is also subject to slight monthly and daily changes. The daily change consists of a small easterly movement during the morning, reaching a maximum about 7 A.M.; then a somewhat faster westerly movement, the limit of which is reached about 1 P.M.; the return easterly movement is completed at 9 or 10 P.M. Both daily and monthly changes are small and of no importance in navigation. The average daily range is about 9.3 minutes of arc. Irregular changes of variation, occasionally amounting to 3 or 4 minutes of arc in a few minutes of time, are of frequent occurrence: they are said to be due to *magnetic storms*. See MAGNETISM. TERRESTRIAL.

Magnetic charts show the variation, dip, etc. The irregularly curved lines connecting the points of equal variation are called *lines of equal variation*, or *isogonic lines*; the isogonic line connecting points of no variation is called the *agonic line*. The lines of *equal dip* are irregular curves surrounding the magnetic pole, and are called *isoclinic lines*. The line of *no dip* is the *magnetic equator*. The dip of the needle, like the variation, is constantly changing, but the range and rate of change is less. See DECLINATION; INCLINATION.

The *deviation* of the compass is produced, as has already been stated, by the action of the magnetism of the ship in which the compass is mounted. In the days of wooden ships the deviation was usually very small, even in steamers. But steel and iron hulls produce important deviations in well-placed compasses, and excessive deviations in those badly located: it is possible, indeed, so to place a compass that the needle will point to a particular part of the ship, without regard to her heading. In placing compasses, due regard must then be paid to the magnetic forces of the ship, as well as to the convenience of the navigator and helm-man. Standard compasses are commonly placed at

some distance above the upper deck and abaft the middle of the ship. The steering compasses are placed beside the wheel, or steering apparatus. Other compasses are found in large ships.

The deviation of a compass varies as the ship turns about, or in azimuth. A portion of the hull is permanently magnetized and acts as a permanent magnet: the rest is in a variable state of magnetization, depending upon the direction in which the ship heads and the magnetic latitude. As it is important that the deviations in all directions should be known, in order to steer a correct course, they are determined by *swinging ship*. This is accomplished by successively pointing the ship in the various directions (usually every two points) and comparing the bearing of the sun or a distant object with its true bearing obtained by computation, or from prepared tables. This gives the compass *error*. Applying the *variation* to the result, we obtain the *deviation* on each point on which bearings were taken. A table of deviations is a necessary adjunct to every compass. When the deviations are considerable, as is almost invariably the case with steering compasses, and usually with standards, it is customary to correct them by reducing the deviation. The character and extent of the correction or compensation may be ascertained by magnetic observations on the ship and on shore: from which follow elaborate computations upon the results of which depend the placing of the correctors. This method involves an investigation of the whole theory of magnetization of ships. A simpler one now rapidly coming into favor is called the *rectangular method of compensating*. The deviation is determined upon adjacent cardinal points, as (magnetic) north and east. The ship is headed on north, and kept on that heading by using another compass, and a number of small magnets slipped into holes in a block or case under the compass. These magnets point fore and aft, and are inserted until a sufficient number have been put in to bring the compass to point to magnetic north. The same process is repeated when the ship is headed east, but the magnets now put in are laid athwartship. Next the ship is headed northeast (magnetic), and the soft iron spherical correctors are moved out (i.e. away from the compass) until the needle points correctly. This completes the operation, unless a Flinders bar is used: this consists of a soft iron vertical bar, placed to counteract the induced magnetism in soft vertical iron, and is placed forward or abaft the compass, as found necessary. The ship must then be *swung for residuals*; that is, turned and headed on the different points (or every two points), and the small residual errors remaining after compensation ascertained. These may be reduced by re-correcting, but are usually too small to render that necessary; a table of these deviations is, however, made out for use in laying the ship's course. In addition to the deviation of the compass produced in the manner already described, further deviations are caused by the rolling. This is corrected by a vertical magnet, placed below the axis of the compass and at such a distance as will correct a deviation produced by the inclination of the ship.

The compass-card is divided into 32 *points*. Of these, four are called the *cardinal points*, north, east, south, and west (abbreviated N., E.,

S., and W.); and four are the intercardinal points — northeast, southeast, southwest, and northwest (abbreviated N.E., S.E., S.W., and N.W.). The points half way between a cardinal and intercardinal point has a name compounded of the two, the cardinal point being given first; thus, half way between N. and N.E. is north-northeast (N.N.E.), and half way between east and northeast is east-northeast (E.N.E.). The point on each side of a cardinal or intercardinal point is designated by first giving the name of the primary point, then the word *by* and the name of the adjacent cardinal point. Thus, the point to the east of north is north by east (N. by E.); to the east of northeast is northeast by east (N.E. by E.); similarly, we have east by north, south by west, etc. Smaller angles than points are given in half-points, quarter-points, and eighth-points. These are, in addition to the full points, reckoned from north and from south toward east and west; remembering, however, that from the cardinal and intercardinal points for one point each way the fractional parts of a point are reckoned toward the adjacent cardinal point. This gives the points of the compass as follows:

To recite these points, half-points, quarter-points, and eighth-points in the proper order is called *boxing the compass*, and to do so correctly, and to understand the taking of bearings, etc., are among the requirements of a good helmsman or quartermaster (q.v.).

For the purpose of taking bearings, an *alidade* or *azimuth circle* is used. The former is usually attached to the top of the binnacle-cover, or to some form of dumb compass (a metal plate marked with compass points); it consists of a pivoted bar carrying sights, and by comparing the dumb-compass bearing with the compass heading of the ship, the compass bearing of an object may be obtained. The *azimuth circle* fits over the top of the compass bowl, and has reflecting mirrors and sighting wires; by their means the bearing of the sun or other object is ascertained directly from the compass. When the bearing of an object is taken from the north or south point, its angular distance from true north or south is called its azimuth. Thus, if an object bears northeast, its azimuth is N. 45° E.

The early history of the compass is involved in more or less obscurity. In a rough form it was

known to the Chinese at least as early as B.C. 2634, and it was used for the purposes of navigation as early as the third or fourth century A.D., and perhaps before. But the policy of the rulers and the habits and character of the people conspired to render the Chinese indifferent navigators, and the compass did not, therefore, become of the great importance to them that it did to the seafaring nations of Europe. The date of introduction of the magnetic needle into Europe is unknown; but if it came, as many suppose, from the Chinese through the Arab sailors and traders, it probably was already a nautical instrument. The first reference to it in literature is in a work by Alexander Neckam, entitled *De Utilisibus*, and written in the twelfth century. He refers to it as a needle which is placed on a pivot and when allowed to come to rest shows the mariner the direction to steer. In another work, *De Naturis Rerum* (lib. ii., c. 89), he writes as follows: "Mariners at sea,

COMPASS-CARD.

N.	E.	S.	W.
N. by E.	E. by S.	S. by W.	W. by N.
N. N.E.	E. S.E.	S. S.W.	W. N.W.

			E.

when, through cloudy weather in the day, which hides the sun, or through the darkness of the night, they lose the knowledge of the quarter of the world to which they are sailing, touch a needle with a magnet, which will turn round till, on its motion ceasing, its point will be directed toward the north" (Chappell, *Nature*, No. 346, June 15, 1876). Subsequent to this there are repeated references to the use of a magnetic needle for navigating purposes. As early as the thirteenth century it seems to have been known to the navigators of all European nations, and in 1269 its declination (or *variation* from the true north) seems to have been

observed. The division of the compass-card into thirty-two points is a natural one, and was merely continuing the subdivision until it became sufficiently minute. It seems to have been adopted early, as Chaucer writes of it as established in 1391.

BIBLIOGRAPHY. Consult: The *Admiralty Manual for the Deviations of the Compass*, by Capt. F. J. Evans, R.N., F.R.S., and Archibald Smith, M.A., F.R.S. (new editions appear at short intervals): *Naval Professional Papers of the United States Navy*, No. 22 (Washington, 1886); Cornwell, *Compass Disturbance in Iron Ships* (1887); Bowditch, *The American Practical Navigator* (Washington, 1901); publications of the Superintendent of Compasses, United States Navy.

COMPASS, SOLAR. An instrument for determining at any place an accurate north and south line. It has a latitude range of about 35°, and may be adjusted to the latitude of any place in the United States. It has a latitude arc, a declination arc, and an hour arc, each to be duly adjusted for an observation, and has been found of much service in running important boundary lines and other Government surveys. One of its recommendations is its avoidance of the perplexities caused by local attraction. It is the invention of William A. Burt, of Michigan. For illustration see Plate of **ENGINEERING INSTRUMENTS**.

COMPASSES. A mathematical instrument for transferring or marking off distances or for drawing circles. The common compasses or dividers are composed of two rods or legs joined together by a pivot-joint at one end and pointed at the other; when adapted to drawing arcs the lower parts of the legs admit of receiving a pen or pencil.

Beam compasses consist of points sliding on a bar, to which they may be clamped at any distance from each other. They are used for lengths greater than the pivot compasses can expand, and when delicately made can be used for more accurate dividing. See **GRADUATION**.

Proportional compasses have a point at each end of each leg, and the pivot between, thus forming a double pair of compasses opposite to each other. If the pivot is midway between the ends, the opening of each pair of points will be equal. If its distance from one pair of points be double that from the other, the openings will be as two is to one, and so on for any ratio. To adapt them for variable proportions, the pivot is made a clamping screw, which moves in an elongated slot in the legs, and may be fixed at any point.

Triangular compasses have three legs, so that the vertices of a triangle may all be transferred at once.

Bullet or club compasses have a ball in place of one point, adapted to turning in a hole. See also **CALPERS**; **ELLIPSE** (ellipsograph, or oval compasses).

COMPASS-PLANT (*Silphium laciniatum*). A large plant called also 'resin-weed,' because it abounds in resinous matter. It grows on the prairies, and the edges of its stem-leaves are said always to point directly, or nearly, north or south. When cultivated in gardens, this property does not always appear. The same phenomenon is exhibited by the stem-leaves of prickly

lettuce (*Lactuca scariola*). In this plant the leaves are usually considered as vertical, but this is brought about by a twist near their bases. The peculiar arrangement of the leaves of these plants is due to their adaptation to light. Both surfaces of the leaves are equally sensitive to light, and only by presenting their edges vertically and their tips to the north and south are they able to secure equal illumination to both sides of the leaves.

COMPENSATION. In law, a counterclaim or set-off: in the civil-law systems of Scotland and the Continental States, the doctrine corresponding to that of set-off in the English and American law. It provides that, where two parties are mutually indebted, their debts shall extinguish each other if equal, and if unequal, leave only a balance due. In order to avail one's self of the principle of compensation, the set-off or counterclaim must be pleaded, as it does not operate *ipso jure*; but, when pleaded, it is held to operate from the period of concurrence, the interest on either side being stopped from that time.

Compensatio injuriarum is a defense against actions of damages for slander or the like. It is not a bar to an action, but a set-off or counterclaim. In the common-law system of England and the United States, it is not permissible to set off one trespass or other wrong against another, but each injury must be compensated by a separate action; and in Scotland the leaning recently has been in the same direction. See **CONTRACT**; **TORT**; **DAMAGES**; and consult the authorities there referred to.

COMPENSATION (Lat. *compensatio*, equalization, from *compensare*, to equalize, from *com-*, together + *pensare*, to weigh, frequentative of *pendere*, to weigh). A term used in physical experiments to describe methods where sources of error or other conditions are neutralized by the introduction of factors which act in an opposite direction by an equal amount, and compensate for the original error. For example, a flint-glass convex lens, in addition to refracting rays of light, also separates them into their spectral colors. This can be compensated by combining with the convex lens a concave lens of crown glass which has less refraction but greater dispersive power. Such a lens, being opposite in its effect to the first lens, will unite the rays, but does not destroy the deviation. (See **ACHROMATISM**.) In the case of the pendulum (q.v.), an increase in temperature causes it to lengthen, and consequently oscillate more slowly. Compensation is here effected by raising its centre of oscillation with any increase in length due to a rise in temperature, and thus keeping constant the distance between its point of support and its centre of oscillation. In a chronometer the balance-wheel is compensated by constructing its rim of two metals with different coefficients of expansion. An increase in temperature tending to expand the wheel is compensated by the rim being brought nearer the centre, it being curved inward by the uneven expansion of the metals. See **WATCH**, for further description and illustration of a compensating balance-wheel.

COMPETENCE, or COMPETENCY. As a law term, used in the sense both of authority and of legal ability. It is in the former sense that

it is employed in the law of France and of other Latin countries, as the equivalent of our term 'jurisdiction,' the competence of a tribunal being its authority or jurisdiction over a given person or proceeding.

In English and American law, the word is specifically used to denote the legal fitness or eligibility of a witness to be heard, or of a judge or juror to participate in the trial of a cause. Competency, in the legal sense of the term, does not refer to mental or physical ability, but to purely legal grounds of qualification—as that a judge or juror shall not be personally interested in the issue to be tried; that a witness shall not be so related to the transaction on which the suit is based as to be incapacitated by law from giving evidence thereof. Such facts as the credibility of a witness, the relevancy of his testimony, or even his actual knowledge of the transaction in question, have no bearing upon the question of his competency. He may be competent to participate as a witness, and may yet be utterly untrustworthy or ignorant of the facts involved in the issue. So, not having been an actual, percipient witness of the facts to which he is called upon to testify, he may have his testimony excluded as mere hearsay, without thereby having his legal competency questioned. In that case it is not the witness, but the evidence offered by him, that is 'incompetent.' Competency, whether of judge, or juror, or witness, is always presumed, until it is impeached and the contrary shown. The question is one for the court, which may inquire into the facts for the purpose of arriving at a judgment upon it. The law as to the competency of witnesses will be considered under the title WITNESS. See, also, EVIDENCE; JUDGE; JURY; and the authorities there referred to.

COMPETITION (Lat. *competitio*, rivalry, from *competere*, to vie, from *com-*, together + *petere*, to seek). This term has been defined as the struggle for existence carried into human affairs. It is, in general, the conflict of efforts directed to the same goal. In this sense it is applied to the method of appointing government officials under civil-service rules, to the contests of political parties, the often amusing rivalry of one city with another for population, trade, etc., and a host of similar rivalries. In the world of economic effort it is recognized as the great regulative principle which holds in check the overreaching designs of individuals, and makes their selfish efforts contribute to the general welfare.

As self-preservation is said to be the law of nature, so may self-interest be said to be the law of industrial society. Every man labors for his own ends. To provide food and raiment, to minister to his necessities and to his enjoyments, is the motive which leads him to action. In the pursuit of his individual welfare he is not wholly unrestrained, for the influences of law and morality set bounds to his permissible actions. But within those bounds every man seeks first his own welfare. Nevertheless, at every step he comes into contact with others whose actions limit his own. If he is a seller of merchandise his interest is to secure the highest price; but other sellers are equally eager to part with their goods, and in this rivalry prices are lowered to a point at which all the goods may be transferred. If he is a buyer he offers the lowest price, but he finds

other buyers offering higher prices, and he must raise his offer to such a price that all the buyers, able to afford the first price, can be satisfied by at least a share in the goods to be sold. The rivalry of buyers and sellers is the competition of the market, which becomes an equitable adjustment of supply and demand.

The process by which the competition of individuals increases the aggregate wealth and promotes the welfare of society at large is very simple. If the producer must sell at the market price, his only chance for gain consists in lowering his costs and increasing the margin between what he obtains for his goods and what he gives for them. Competition, therefore, makes him keen to obtain the most effective results of his activity, to economize his labor, to improve his methods, to lop off wasteful practices and useless expenditures; to scrutinize, in short, every detail of the process of making and selling his goods in order that wherever possible he may effect economies. This ingenuity inures in the first instance to his own benefit; but as other producers follow the same practice, the general cost of producing goods is lowered, and with it the price of the goods. For if price be not lowered, the unusual rewards which the enterprise offers will tempt others to undertake it, and, by enhancing the volume of goods to be sold, inevitably lower their price. A decrease in the cost of production results in an increase of the volume of goods produced by the expenditure of the same effort. It is this increase which constitutes the growth of wealth for the community at large.

The same competition which regulates the price of goods governs, in large measure, the relations of capital and labor. It is the competition of employers for labor, and that of laborers for employment, that fixes at any given time the rate of wages. This competition is not so free as that between buyers and sellers. Capital may lie idle for a time without diminution, but the laborer may not cease work without starvation. Hence the contest seems at times a very unequal one, and the issue to be decided by the needs of the laborer rather than anything else. If all the competition were among laborers themselves, and if there were insufficient employment offered, workmen would be forced to make such terms as they could. But it is quite as likely that there should be an abundance of employment seeking workers, and in such cases the workman might make what terms he pleases.

It must be conceded that, important as are the workings of competition, ideal competition in which the buyer always seeks the cheapest and the seller the dearest market, in which capital is free to seek the place where labor is cheapest, and labor able to select the employment which offers the best wages, is not and cannot be realized. As tendencies, the laws of competition are valuable regulative principles in the world's economic activity, even if they cannot be fulfilled to the letter. It has, however, been found impossible wholly to overcome the inertia of custom, and impracticable to check all attempts at combination which seek to destroy the competitive principle.

Custom and sentiment are supposed to have no place in business, and in wholesale transactions this is quite true, but in the small transactions

of daily life they have a large place. They owe it to the fact that we are slow to change acquired habits, especially where the gain to be secured is slight. Thus we find everywhere customary prices for certain commodities and services. The fares of railroads, ferries, cabs, street railways, the services of physicians and lawyers, the fees of various public entertainments, are governed almost wholly by custom. These we accept or reject, but we do not haggle about them. In the long run, competition has something to do with such prices or with the goods or services they command, but in each individual transaction it hardly enters in as a factor. In the sale of completed commodities competition works out its effects most clearly. In the field of production it works amid inherent obstacles to its full development, and cannot have so absolute a scope. Capital, as we have before hinted, is not migratory; it has its permanent instruments, which cannot be easily uprooted and transplanted. The farmer is not free to leave his farm when he sees a chance of greater profit elsewhere. The workman is not free to pass from one employment to another, for he may lack the requisite training; nor is he often free to run to more remunerative fields of labor. Thus the immobility of capital and labor acts as a restraint upon the action of competition.

If the freest competition is in the interest of the community at large, it is equally true that such competition is always irksome to the competitors. It cannot be wondered that they seek means of counteracting its force through combination. Such a combination may be a tacit understanding such as frequently exists among local dealers. It may be organized in great aggregations of capital, which seek to dominate entire fields of productive effort. To a certain extent, such combinations may supplant direct competition as a regulative principle, but they cannot obliterate it entirely.

Nor is the régime of competition absolutely free from interference by law or governmental authority. Certain of the older economists vehemently denounced factory legislation as an inroad upon the domain of competition. In more recent times it is, however, recognized that, while maintaining free competition as the basic principle of industrial organization, it is in the general interest that some of the conditions of competition be fixed by State action. Consult: Nettleton (editor), *Trusts or Competition: Both sides of the great question in business, law, and politics* (Chicago, 1900). See LABOR LEGISLATION; POLITICAL ECONOMY; MONOPOLY; TRADES-UNIONS; TRUSTS; and consult the authorities there referred to.

COMPIÈGNE, κόμ'πυά'νυ' (Lat. *Compendium*). A town in the Department of Oise, France, on the river Oise, a little below its junction with the Aisne, and 33 miles east-southeast of Beauvais (Map: France, J 2). A fine stone bridge crosses the river at this point. The town is irregularly built, but is picturesque and has a remarkable Gothic Hôtel de Ville, with museum and library, and a magnificent palace built anew by Louis XV. and splendidly fitted up by Napoleon I., and again by Napoleon III., both of whom often occupied it. It contains a library, a picture gallery, and various objects of interest. The park is extensive, and adjoining the gardens is the beautiful Forest of Compiègne, ex-

tending over about 30,000 acres. The industries of the place are rope-making, boat-building, and weaving hosiery. There is considerable trade in wool, grain, and cattle. Population, in 1901, 14,009; commune, 16,503. Compiègne is mentioned in the times of Clovis under the name of *Compendium*; and it was the seat of several political assemblies and ecclesiastical councils. It was at the siege of this town, in 1430, that Jeanne d'Arc, the Maid of Orléans, was captured, and here, in 1810, Napoleon and Maria Louisa of Austria first met, on the occasion of their marriage.

COMPITALIA, or LUDI COMPITALICII (Lat., Compitalian games, from *compitum*, cross-road, from *compere*, to coincide, from *com-*, together + *petere*, to seek). A festival in Rome in honor of *lares compitales*, the divinities presiding over places where two or more roads meet. Macrobius says that Tarquinius Superbus restored the festival, which had been neglected, and sacrificed boys as a part of the services. Human sacrifices, if ever really made, did not survive the Tarquins; for, after their expulsion, garlic and poppies were offered. Consult Fowler, *Roman Festivals of the Period of the Republic* (London, 1889).

COMPLAINT, THE. A collection of poems in blank verse, by Edward Young (1742), better known under their secondary title, *Night Thoughts*. They were written after the death of his stepdaughter and her husband, who are referred to under the names of Narcissa and Philander.

COMPLAINT OF MARS AND VENUS, THE. A poem by Chaucer, written about 1380, containing an introduction and two separate poems, "The Complaint of Mars" and "The Complaint of Venus." At the conclusion, the author says it was taken from the French of 'Graunson.' The introduction tells how Venus and Mars are waked by 'Phœbus's Light,' and how, fearing his burning rays, Venus flees to a cavern in the tower of Ciclinius, who guards her from danger. While she is there, unknown to Mars, he raves about the universe, making complaint for his lost love. The complaint of Venus is hardly an answer to his complaint, but rather a regret that even the best of men are liable to jealousy.

COMPLAINT OF PITY, THE. "How Pitié is dead and buried in a gentle Herte;" a poem by Chaucer (1367).

COMPLAINT TO HIS PURSE. A short serio-comic poem of twenty-one lines by Chaucer; in which, at the end of each stanza, he entreats his empty purse to "Be heavy againe, or els mote I die." The poem was sent as an appeal to King Henry IV., and resulted in an increase of the poet's pension. It was, by some, attributed to Oeeleve.

COMPLEAT ANGLER, THE. A famous work on angling, by Izaak Walton (1653). It is written in a pleasing style; parts being in the form of conversations between Piscator, Venator, and Viator—a fisherman, a huntsman, and a pedestrian—interspersed with a few quaint old songs.

COMPLEMENT (Lat. *complementum*, that which fills up, from *complere*, to fill up, from *com-*, together + *plere*, to fill; connected with Gk. *πιμπλάναι*, *pimplanai*, Skt. *pūr*, *pur*, to fill,

Lith. *plnas*, OChureh Slav. *plnũ*, OIr. *lõn*, full. Goth. *fulls*, OllG. *fol*, *foll*, Ger. *voll*, AS. Eng. *fully*. In mathematics, that which completes a given magnitude or increases it to the value of a fixed magnitude. In angular measure it signifies the angle which, added to a given angle, produces 90°; e.g. 30° is the complement of 60. 1° is the complement of 89°, 45° is the complement of 45°, 100° of -10°, and 0° of 90°. Such pairs are called complementary angles. The arithmetic complement of an integer is the difference between the integer and the next higher power of 10; e.g. 40 is the arithmetic complement of 60, 1 is the arithmetic complement of 99, 375 of 625, and 7 of 3. The complement logarithm, or 'cologarithm,' of a number, is the logarithm of the reciprocal of the number, or the complement of the logarithm (of the given number) less 10. See LOGARITHM.

If through any point on the diagonal of a parallelogram lines are drawn parallel to the sides, four parallelograms are formed. The two of these that are not bisected by the given diagonal are called complements of the given parallelogram.

COMPLEMENT. In music, the interval which must be added to any given interval to complete the octave; for example, a fourth is the complement of a fifth, a third is that of a sixth, etc.

COMPLEMENT. In nautical language, all persons designed to be on board a ship for the purposes of navigating or fighting her, or to enable her to carry on the service for which she is intended. The complement includes the officers and crew; but the latter terms apply to the persons actually on board, while the former applies to all who *should* be on board if there are no vacancies.

COMPLEMENTARY COLORS. Colors which, when combined, produce white light. Examples of pairs of such colors are given in the following table:

Red.....	Green-blue
Orange.....	Cyan blue
Yellow.....	Ultramarine blue
Greenish-yellow.....	Violet
Green.....	Purple

These colors may be observed readily with a simple polariscope, where polarized light from a Nicol's prism (q.v.) falls upon a prism of calc-spar and glass, in which by virtue of the doubly refracting power of the calc-spar (see LIGHT, paragraph *Double Refraction*) there is furnished a double image of the aperture through which the polarized light from the Nicol passes. If a strip of selenite be interposed between the polarizing prism and the crystal, the two images referred to will be different in color, one shade being complementary to the other. These strips of selenite may be of various thicknesses, and will thus produce various colors. This follows from the well-known principle that, when plane-polarized light is transmitted through a thin plate of a doubly refracting medium, the ordinary and extraordinary rays when examined with a doubly refracting analyzer will give images brightly colored, which where they overlap are white, showing that the two colors are complementary. If two complementary colors are combined—and it must be remembered that the colors themselves, not the pigments, are here meant—

then white light is produced. This can be accomplished best, perhaps, with the Maxwell color disk where a disk of cardboard composed of segments of complementary colors is rapidly rotated. The impressions of the two colors follow each other so rapidly that the sensations are blended, and if the colors are used in the right proportions we have a gray tint produced, as the luminosity of the two colors either singly or jointly is not so great as that of a white surface with which it would be compared. Complementary colors vary with the light by which they are viewed, and are different when seen by gaslight from what they are in the daytime. The explanation is to be found in Young's theory, where the color-sensation is considered to be furnished by three groups of nerves corresponding to the red, green, and violet-blue waves. If all of these nerves are stimulated together, the sensation produced is that of white light. Consequently, a certain red acts on the red nerves while its corresponding complementary color, green-blue, would stimulate the other sets of nerves, and the result of all acting together would be the sensation of white light. For a thorough discussion of this subject, which may be appreciated by the general reader as well as the student of physics, consult Rood, *Modern Chromatics*, a new edition of which was published (New York, 1899) under the title of *A Text-Book of Color*. See VISUAL SENSATION.

COMPLEXION (OF., Fr. *complexio*, from Lat. *complexio*, combination, from *complecti*, to entwine, from *com-*, together + *plectere*, to weave). The color of the skin, existing in the epidermis and dependent upon certain pigment-cells. Those persons most exposed to the weather and least under the influence of civilization are usually of the darkest color. Light hair is the usual accompaniment of white and thin skin; while dark hair and dark complexions commonly go together. There does not appear to be any anatomical difference in the skins of persons of light and dark complexions; the differences are the result of temperature, climate, and exposure. The more decided differences in skin-color which may be called racial—the white of the Caucasian, the brown or olive of the Mongolian, the yellow or tawny of the Malayan, the red of the Amerind, and the black of the African and Australian—are apparently connected with deep-seated physiologic processes as well as hereditary causes; they are disseminated elsewhere. See SOMATOLOGY.

COMPLEX NUMBER. The steps in the growth of the number system of algebra may easily be illustrated by the roots of equations, thus:

The solution of the equation $x - 3 = 0$ is 3, a positive integer which may be represented graphically on a straight line. The solution of the equation $3x - 2 = 0$ is $\frac{2}{3}$, a fraction which may also be represented graphically on a straight line. The solution of $x^2 - 2 = 0$ is $\sqrt{2}$, a surd which may be represented by the diagonal of a square whose side is 1. The solution of $x + 2 = 0$ is -2 , a negative number, which may be represented on a straight line in the opposite direction from that of the positive number. But the solution of

$x^2 + 2 = 0$ is $\pm \sqrt{-2}$ or $\pm \sqrt{2} \cdot \sqrt{-1}$ called an imaginary number. The symbol $\sqrt{-1}$

is commonly called the imaginary unit, and is represented by i . All numbers containing the factor i are called imaginary numbers, as opposed to real numbers: e.g.

$$\pm i, \pm 2i, \pm 3i, \dots, \pm \frac{2}{3}i, \pm \sqrt{2} \cdot i$$

are imaginaries. The algebraic sum of a real number and an imaginary is called a complex number; e.g. $1 + i$, $2 - 4i$, and in general $a + bi$. A complex variable is generally expressed by $x - yi$, in which x and y are real

variables. Complex numbers are represented graphically in a plane. In the figure the real numbers are laid off on the axis XX' in the usual way, and the coefficients of i on the axis YY' . The points in the plane corresponding to these coordinates represent the complex numbers. Thus, P_1 on the axis represents the real number 2, P_2 represents the complex number $3 + 2i$, P_3 represents $3i$, and P_4 represents $-1 - 3i$. Any point and the origin uniquely determine a line-segment, or vector, called the modulus of the complex number, and this may also be taken to represent the number. In the figure, the moduli are OP_1, OP_2, OP_3, OP_4 . In general, the modulus of a complex number $a + bi$ is the diagonal of a rectangle of sides a and b ; hence its absolute value is $\sqrt{a^2 + b^2}$. Thus, the modulus of $3 + 2i$ (OP_2 in the figure) is $\sqrt{9 + 4}$ or $\sqrt{13}$. The convention as to the direction of i is a reasonable one: for since multiplying $+1$ by -1 revolves it through 180° to the position -1 , therefore its multiplication by one of the two equal factors of -1 , viz. $\sqrt{-1}$, may be interpreted as revolving it through 90° . There are other sufficient reasons for this convention, which will be evident to one who studies the subject. The complex number is a directed magnitude; that is, it has both extension and direction in its plane. This is best understood by considering $a + bi$ in the form $r(\cos \theta + i \sin \theta)$, in which r is the modulus $\sqrt{a^2 + b^2}$, and θ is the amplitude. In the figure, $\cos \theta =$

$$\frac{a}{\sqrt{a^2 + b^2}}, \sin \theta = \frac{b}{\sqrt{a^2 + b^2}} \text{ (See TRIGONOMETRY.)}$$

This method of representing the complex number as a directed magnitude in a plane was at one time thought to be due to Argand, and hence the figure is often called Argand's diagram.

Two complex numbers which differ only in the sign of the imaginary part are called conjugates; e.g. $2 + 3i$ and $2 - 3i$, or, in general, $a + bi$ and $a - bi$. Complex numbers are subject to the associative, commutative, and distributive laws, and, when combined by the fundamental operations of algebra, yield no number not already defined. For $x + yi$ represents real numbers when $y = 0$, imaginaries when $x = 0$, and complex numbers when x, y are real and not zero. Hence, $x + yi$ becomes a convenient form for representing general numbers; and instead of saying that every equation has a root, which may be real, imaginary, or complex, we may say that every equation has a root $x + yi$. If, in plotting the successive moduli of a sum, the second modulus is drawn from the end of the first, the third from the end of the second, and so on, the result is a broken line which may be closed by connecting the last point with the origin. This vector is called the sum. Since no side of a polygon is greater than the sum of the remaining sides, the modulus of the sum of any number of complex numbers is not greater than the sum of their moduli. This is expressed symbolically thus:

$$|X_n| \leq |X_1| + |X_2| + \dots + |X_{n-1}|$$

Multiplying $r(\cos \theta + i \sin \theta)$ by $r'(\cos \theta' + i \sin \theta')$ and applying the formulas for the functions of the sum of two angles (see TRIGONOMETRY), the product is $rr'[\cos(\theta + \theta') + i \sin(\theta + \theta')]$. Hence, the product of the moduli of two complex numbers is the modulus of their product, and the sum of the amplitudes is the amplitude of the product. Similarly for n complex numbers. For brevity, let $\text{re } i\theta \equiv r(\cos \theta + i \sin \theta)$, then $r_1 \text{ re } i\theta_1 \cdot r_2 \text{ re } i\theta_2 \cdot \dots \cdot r_n \text{ re } i\theta_n = r_1 r_2 \dots r_n \text{ re } i(\theta_1 + \theta_2 + \dots + \theta_n)$. This is known as De Moivre's theorem. If each of the above numbers equals the first, $(r_1 \text{ re } i\theta_1)_n = r_1^n \text{ re } i n\theta_1$, or the n th power of the complex number. The

quotient of $r_1 \text{ re } i\theta_1$ by $r_2 \text{ re } i\theta_2 = \frac{r_1}{r_2} \text{ re } i(\theta_1 - \theta_2)$,

$$\text{and } \frac{1}{r_1 \text{ re } i\theta_1} = \frac{1}{r_1} \text{ re } i \frac{1}{\theta_1}.$$

By observing the changes in the modulus and amplitude, the results of any of these operations may be represented graphically. The variation of a function of a complex variable, $x + yi$, due to the variation of x and y , is very important in the theory of equations and functions. Thus the fundamental proposition that every equation has a root is a consequence of Cauchy's theorem which asserts that the number of roots of any equation comprised within a given plane area is obtained by dividing by 2π the total variation of the amplitude of the function corresponding to the complete description, by the complex variable, of the perimeter of the area.

The first appearance of the imaginary is found in the *Stereometria* of Hero of Alexandria (third century B.C.). Diophantus (supposed to have flourished in the fourth century A.D.) met these numbers in his algebraic work, but failed to give an explanation. Bha-kara (A.D. 1114) recognizes the imaginary, but pronounces the roots involving $\sqrt{-1}$ to be impossible. Cardan (1545), in his *Ars Magna*, was the first mathematician who had the courage to use the square roots of negative numbers in computation. Bombelli, Girard, and Descartes (q.v.) formulated rules

for the use of such quantities as $a + bi$ $\sqrt{-1}$, but founded no theory. Wallis (1685) made the first attempt to give a geometric interpretation. Euler (1770) still regarded these quantities impossible. Thus it was reserved for Casper Wessel (1797), a Norwegian surveyor, to invent a graphic treatment of complex numbers. His method is contained in a memoir, presented to the Royal Academy of Science and Letters of Denmark, entitled *On the Analytic Representation of Direction*. For the early development of the subject, however, credit must be given to Argand, Gauss, Servois, and others, since Wessel's article (published in 1799 by the Royal Academy of Denmark) did not appear in French until 1897, one hundred years after its presentation. Gauss did much to establish the underlying principles. Argand's memoir (1806), unquestionably an original and independent production, supplied the graphic theory that lay neglected in the work of Wessel. François, Servois, Geronne, and Cauchy did much to correct the errors of their predecessors and to generalize the theory of directed lines.

Complex number, being the most general type of algebraic number, has come to occupy the place of highest importance in modern analysis. It has led in recent times to the establishment of the theory of functions (q.v.) and quaternions (q.v.). (Edinburgh, 1889); Hankel, *Vorlesungen über die complexen Zahlen* (Leipzig, 1867); Durège, *Theorie der Functionen einer complexen veränderlichen Grösse* (Leipzig, 1873), trans. by Fisher and Schwatt as *Elements of the Theory of Functions of a Complex Variable* (Philadelphia, 1896).

COMPLUVIUM. See ATRIUM; IMPLUVIUM.

COMPONÉ. kôm-pō'nâ (Fr., composed), or **GOBONY.** In heraldry, a term describing a field or charge bearing a row of small squares, consisting of alternate metals and colors.

COMPOSITÆ. kôm-pöz'î-tê (Lat. nom. pl., from *compositus*, p.p. of *componere*, to put together, from *com-*, together + *ponere*, to put, from *po-*, Gk. *ἀπό*, *apo*, off + *sincere*, to allow). An order of dicotyledonous plants, variously called the composite family, aster family, sunflower family, and sometimes divided and known as the chicory and thistle families, embracing nearly 1000 genera and more than 11,000 species, making it the largest family of flowering plants. Although a large order, the flowers of the Compositæ are so characteristic and distinctive as not to be confused with those of any other order, the only ones bearing even a superficial resemblance being Dipsacæ, represented with us by the teasel.

The flowers of the order Compositæ are rather small and are grouped together upon a common receptacle, surrounded by bracts which form a leafy or sealy involucre, so as to give the appearance of a single flower. The common term 'flower' is applied to the aggregation instead of to the individuals making up the so-called 'head.' The flowers, or florets, as they are usually

known, are often of two kinds, those of the central part being called disk florets, and those of the circumference ray florets. These often differ in size, shape, and color, and the disk florets are usually fertile, while those of the ray are often sterile, or at least without stamens. The calyx is united with the ovary, and its divisions crown the ovary with awns, teeth, bristles, etc., all of which are called the pappus (q.v.); or the pappus may be wholly wanting. The corolla is situated above the ovary, and is united into a tube (tubular), or may be strap-shaped (ligulate), both forms commonly occurring in the same flower, the tubular florets composing the disk, and the ligulate florets the rays of the 'flower.' The corolla may be, and usually is, divided at its summit into five teeth or lobes. The stamens are usually five in number, and are inserted upon the corolla, and are united together by their anthers into a tube around the single style, which is two-cleft at its summit. The ovary is one-celled and one-ovuled, the ovules ripening into a dry fruit called an akene or achene (q.v.). Growing among the flowers are often found numerous bracts which are spoken of as chaff or paleæ. When these are not present, the receptacle is said to be naked. The form of the receptacle may vary from flat, convex, conical, or, in some cases, elongated to the length of an inch or more. The form of the corolla, shape of the receptacle, presence and nature of the chaff, are all important characters in the classification of the members of this order. The plants are herbaceous, shrubby, or even trees, and are found in nearly all parts of the world where plant life exists to any extent, and they frequent almost every condition of soil and surroundings. The tree forms are confined to the tropics, many of the shrubby species occur in hot, dry regions, while the herbaceous species prevail in temperate climates, extending well within the colder zones. In general the leaves are alternate and without stipules, but are sometimes opposite or whorled; or they may all be radical, as in the dandelion, etc. Numerous systems of classification have been proposed from time to time, that of Hoffmann (with some modification) being the one most current at present. Hoffmann divides the order into two suborders—*Tubulifloræ*, in which the disk florets are never ligulate, and *Ligulifloræ*, in which all the florets are ligulate. The plants of the first subdivision do not bear any latex in their stems, while those of the second are conspicuous on account of the milky or reddish-colored juice which they exude when injured. The first suborder is by far the largest in number of species. The two great divisions are again subdivided into thirteen tribes, as follows: **TUBULIFLORE:** (1) *Vernonia*, represented by the genus *Vernonia*; (2) *Eupatoriæ*, embracing *Ageratum*, *Eupatorium*, and *Mikania*; (3) *Astereæ*, the principal genera of which are *Aster*, *Solidago*, *Erigeron*, *Bellis*, *Baccharis*; etc.; (4) *Inuleæ*, which contains among its prominent representatives the genera *Pluchea*, *Filago*, *Antennaria*, *Gnaphalium*, *Inula*, *Helichrysum*, etc.; (5) *Helianthæ*, represented in our flora by *Helianthus*, *Silphium*, *Iva*, *Ambrosia*, *Rudbeckia*, *Echinacea*, *Coreopsis*, *Bidens*, *Xanthium*, *Zinnia*, *Dahlia*, etc.; (6) *Heleniæ*, with *Actinella*, *Helenium*, *Tagetes*, *Gaillardia*, *Dysodia*, etc.; (7) *Anthemideæ*, which embraces *Achillea*, *Anthemis*, *Matricaria*, *Chrysanthemum*, *Tanacetum*, *Arte-*

misia; (8) *Senecionæ*, represented by Senecio, Petasites, Arnica, Cacalia; (9) *Calendulaceæ*, typified by Calendula; (10) *Arctoidæ*, represented by Arctotis, an African and Australian genus; (11) *Cynaræ*, which embraces the genera Artium, Carduus, Cnicus, Cynara, Onopordon, Centaurea, etc. (12) *Mutisicæ*, not found in the United States, but represented elsewhere by Mutisia, Gerbera, etc.; and *FIGULIFLOREÆ*, with (13) *Cichoricæ*, represented by Cichorium, Tragopogon, Pteris, Hieraceum, Leontodon, Taraxacum, Lactuca, Sonchus, Chondrilla, etc. When the large number of species of this family are considered, a small proportion only, aside from those cultivated for their flowers or foliage, are found to be of economic importance. Among the most important may be mentioned chicory, dandelion, lettuce, salsify, artichokes (both globe and Jerusalem), sunflowers, tansy, chamomile, etc. Many are grown for their flowers. When cultivated the disk flowers are often changed in form, and the flowers are then said to be doubled, as in the case of dahlias, zinnias, asters, chrysanthemums, coreopsis, etc. Medicinal properties are claimed for many, as arnica, wormwood, elecampane, artemisia, colt-foot, tussilago, blessed thistle, etc. The seeds of a number contain oil that is of importance, as the sunflower, madia, etc.

The plants of this order exhibit a number of interesting adaptations in their natural history. The Compositæ are generally considered as the highest expression of development in the plant world, and they exhibit a number of modifications by which they have become the most numerous and aggressive of all plants. In many genera the gradations between species are so confusing as to make their proper classification well-nigh impossible. The distribution of the fruit has been brought about by many special modifications. In the dandelion, thistle, and others, the calyx develops, after the fertilization of the flower, into a plumose pappus by which the fruits are scattered by the winds. In the tickseed and bur-marigold the achenes are crowned with several barbed awns that catch in the hairs of animals and the clothing of man, aiding materially in their wide dissemination. In the burdock and cockle-bur the involucre is furnished with curved hooks which serve to aid in the dispersal of these plants. Other seeds, such as those of the Madia, the tarweeds, are covered, especially upon their involucres, with a very thick adhesive exudation that adheres to anything with which the seeds come in contact, and these are carried away often to great distances.

The means devised for the fertilization of the flowers is admirably adapted to secure numerous progeny. The flowers being small and crowded together, several can take advantage of the visit of a single insect laden with pollen. Some are wind-pollinized, their close position aiding in it. The mechanism of the individual flower for pollination is curiously perfect. When the flower opens, the style, with its stigmatic surfaces closely pressed together, forces its way out through the stamen-tube, carrying the pollen out where it can come in contact with insect visitors or be blown away by the wind. At this time the flower is not ready for its own fertilization. When receptive, the style has protruded from the tube and the stigmas separate, curving backward. If they do not receive pollen from another flower

to thus secure the desired cross-fertilization, they continue to curl backward until they come in contact with the pollen, some of which still remains upon their own style, and they thus become self-fertilized. In this way the setting of seed is assured to every flower. In conclusion, the remarkable success of this order may be attributed to a number of factors, such as the massing of the flowers, resulting in greater conspicuousness, to attract insect visitors, one visitor fertilizing many flowers; a simple floral mechanism to protect and distribute the pollen, and the special devices described above to secure the dispersal of the seeds. See articles on various members of the order.

COMPOSITE NUMBERS. See PRIMES.

COMPOSITE ORDER. See COLUMN.

COMPOSITE SHIPS. Ships built with iron or steel frames and wooden planking. In some cases the framing is stiffened by keel-plates, stringers, deck-plates, longitudinals, etc. The planking is bolted to the frames, and sometimes additionally pinned edgewise to the planks on each side. It is almost invariably sheathed with copper as a protection against fouling—indeed, it is chiefly to provide against fouling that ships are composite built. See SHIPBUILDING.

COMPOSITION (from OF., Fr. *composition*, from Lat. *compositio*, connection, from *componere*, to put together). In painting, that ordered arrangement of light and shade, of color and line, which shall directly impress the beholder with the thought and idea the artist wishes to express. The most important requisite of composition is unity. Every object must form a harmonious part of the whole, and be in distinct relation to the rest of the picture. As Millet said: "A work should be all of a piece, and people and things should be there for an end." Whatever their color or shape, all objects in the picture should be seen under like conditions of light, shade, and atmosphere. There should be some object or objects of special interest, to which the remainder of the picture should be strictly subordinated.

The subject treated and the individuality of the artist usually determine the composition of a picture. There are, however, some generally accepted maxims in regard to linear composition which should be mentioned. The perpendicular line is one of dignity and severity, and its predominance in a picture produces a simple, majestic effect (e.g. the early Italian portraits). The predominance of the horizontal line produces an effect of repose or solemnity, as is seen in the composition of most landscapes. The flowing or waving line is the line of beauty and grace, and it is for this reason that the drawing of the human figure is esteemed so important.

There have been many theories of composition, more or less arbitrary. The Italians generally use the pyramidal composition, in which the Madonna forms the apex of the pyramid, with a balanced group of standing or kneeling saints on either side. As art advanced, they also used the oval composition, in which the figures form a circle on the canvas (e.g. Raphael's "Madonna della Sedia"), the arch (Correggio's "Coronation of the Virgin"), the diamond shape (Sistine Madonna), and others. In landscape the themes of composition were even more numerous. In modern composition there is greater freedom,

the artist following his own inclination. Nevertheless, he usually leans upon some well-established principles, although he may not be conscious of them, since analysis is the work of the critic rather than of the artist. Millet is an excellent example of a free and original method of composition in the modern sense. Consult: Van Dyke, J. C., *Art for Art's Sake* (New York, 1901); Blanc, *Grammaire des arts de dessin* (Paris, 1882); Burnett, *Practical Treatise on Painting* (London, 1880).

COMPOSITION AND RESOLUTION OF FORCES AND MOTIONS. See MECHANICS.

COMPOSITION WITH CREDITORS. In law, an arrangement made by a failing debtor with several or all of his creditors, by which they accept the payment of a percentage of their claims in full satisfaction and discharge of the whole. An agreement between a debtor and a single creditor that the latter will discharge the former from all liability upon the former's payment of a part of the debt is void by common law, because, it is said, this payment is no consideration for the creditor's promise to relinquish the balance of the debt, being only a payment of what the debtor already owed and was legally bound to pay. An agreement between a debtor and several or all of his creditors possesses an additional element. Such an agreement is binding upon all, it is said, because each creditor promises to release the balance of his claim, over and above the percentage paid to him, in consideration of such payment and also in consideration of the promises of other creditors to do likewise. It is held to be the substitution of a new agreement with different parties for an old debt. If any of the creditors entering into such a composition agreement stipulates secretly with the debtor for a preference to himself, his stipulation is void. Bankruptcy statutes often provide for and regulate composition proceedings between the bankrupt and his creditor. See BANKRUPTCY; CONTRACT.

COMPOST (OF. *composte*, It. *composta*, Portug. *composto*, mixture, from Lat. *componere*, to put together). A mixture of fertilizing materials which has been subjected to fermentation. Composts are usually prepared by mixing animal manures or other readily putrescible substances with peat (q.v.), straw, leaves, road-scrapings, mud, loam, etc., with a view to causing fermentation and chemical changes, which will render these substances more active as fertilizers than they were in their original condition. Similar results are sometimes brought about by the use of ashes, lime, marl (q.v.), alkali salts, etc. Frequently also preservative substances, such as gypsum, kainit, superphosphate (qq.v), etc., are added to prevent the loss of ammonia or of nitrogen in the free state, which is likely to occur during fermentation. Composting is thus not only a means of rendering the constituents of various more or less inert materials more available as plant food, but also of preventing loss of the most valuable constituent of manures, viz. nitrogen. A compost which was formerly quite popular consists of alternate layers of barnyard manure, 1 part, and peat, 1-5 parts, the proportion of the latter depending upon the fermentative power of the manure. In this mixture the peat prevents the loss of ammonia and the

valuable manure liquids, and the manure sets up a fermentation in the peat which greatly increases the availability of the inert nitrogen in which this material is comparatively rich. When lime, ashes, or lime and salt mixtures are substituted for manure in the peat compost, the alkaline character of these substances promotes the decomposition of the peat in much the same way as the manure. In case of the lime and salt mixture the reaction between the lime and the salt (NaCl) results in the formation of caustic soda (NaOH), which is especially active in bringing about decomposition of the peat. A recommended formula for this compost is 50 cords of peat, 100 bushels of lime, and 17 bushels of salt. Make a brine of the salt and slake the lime in it to a fine dry powder, using about one bushel of salt to six of lime, spread the slaked lime, while still hot, over the peat, which should be in layers about six inches thick. Continue the alternate layers of peat and lime until the heap is four to five feet high. By substituting muriate of potash for salt in the above mixture the same result is accomplished and at the same time a valuable fertilizing constituent, potash, is added to the manure. The fermenting compost heap has been utilized for the reduction of bones (q.v.) and ground mineral phosphates; and meat, fish, slaughter-house refuse, etc., are sometimes incorporated in it, but composts containing any considerable amount of the latter substances are likely to be very offensive. Moreover, these materials are less benefited by the process than more inert substances. Composting is an effective means of 'killing,' i.e. destroying the germinating power of cottonseed intended for use as a fertilizer. Innumerable formulas for composts have been proposed, some of which have attained considerable celebrity. Among these may be mentioned, in addition to the peat composts referred to above, Furman's formula for cotton, which is as follows: Barnyard manure, 750 pounds; cottonseed, 750 pounds; acid phosphate, 367 pounds; kainit, 133 pounds. The plan of composting these materials, which well illustrates the methods of composting in general, is briefly as follows: Put down on an impervious dirt floor first a layer of manure, then of cottonseed, and lastly of acid phosphate, in the proportions given, distributing the kainit throughout the different layers. Repeat the layers to any desired extent and cover the heap with absorbent earth. The heap should be kept moderately moist, and if made in the autumn should stand until spring, when it is dug down, mixed, and applied. Although composting furnishes a valuable means of converting waste materials of the farm into more active and better-balanced fertilizers, the labor involved is so great as to render the practice of doubtful economy for general agricultural purposes, especially since the general introduction of the more concentrated and active commercial fertilizers. (See MANURES AND MANURING.) Composts have been recommended especially for use on grass lands and on stiff soils, or on those deficient in humus. They find their greatest usefulness, however, in horticultural operations—for plant-beds, potting, and for use on vines, fruits, etc., which might be injured by more concentrated fertilizers. Perennial plants, or those having long periods of growth, will utilize the fertilizing matter of composts to the best ad-

vantage. Composts are not so well suited to the forcing of quick-growing crops as commercial fertilizers. For specific directions for preparing different kinds of composts, consult: Dana, *Muck Manual for Farmers* (4th ed., New York, 1858); Storer, *Agriculture in Some of its Relations with Chemistry* (7th ed., New York, 1897); Johnson, *Peat and its Uses as Fertilizer and Fuel* (New York, 1866); Sempers, *Manures: How to Make and How to Use Them* (Philadelphia, 1893).

COMPOSTEL'LA, ORDER OF SAINT JAMES OF, or ORDER OF SAINT JAMES OF THE SWORD. An order of knighthood in Spain. To defend the multitude of pilgrims that thronged to the shrine of Saint James at Compostella (Santiago), in Galicia, Spain, from the Moors, thirteen noblemen formed themselves into a military Order, under the auspices of the Pope, in 1175. With time the Order rose to immense power and wealth. It fought valorously in all the Moorish wars, and exercised great political influence. But its rich towns and abbeys tempted Ferdinand and Isabella, who took possession of its property in 1493 and held it until 1522, when a Papal bull vested the permanent grand-mastership in the Crown.

COMPOUND, CHEMICAL. See CHEMISTRY.

COMPOUND ANIMALS. Such animals as are made up of a number of morphological units, called *persons*, which are organically connected throughout life. The connection results from a budding process, in which the buds never become separated from the parent stock. Compound animals are found among protozoans, sponges, coelenterates, certain flatworms (planarians and tapeworms), bryozoans, some annelids (*Syllis*), and tunicates. The degree of connection varies. When it is loose the complex is called a stock; when close a corm, as in sponges. Most compound animals are sessile, but the siphonophores, flatworms, and some tunicates swim free. The opposite of this term is 'simple animals.'

COMPOUND DUPE TIME. See TIME.

COMPOUND FRACTURE. A fracture of a bone accompanied by a wound which opens from the surface of the body to the break in the bone. Infection of the bone being thus rendered possible, a compound fracture is more serious than a simple fracture. See FRACTURE.

COMPOUNDING OF FELONY. The offense of taking value for forbearing to prosecute a felony. This offense is punishable with fine and imprisonment. Compounding of informations upon penal statutes, and compounding of misdemeanors, are also illegal, and are punishable in a lighter degree. In Great Britain the compounding of misdemeanors is permitted in some cases with the leave of the court, especially in the case of a misdemeanor affecting private (and not public) rights. Accepting a promissory note signed by a party guilty of larceny, as a consideration for not prosecuting, is enough to constitute the offense; but the mere retaking of stolen goods by the owner is not an offense, unless it is agreed that the thief is not to be prosecuted. A note or other obligation given in consideration of stopping a criminal prosecution or an agreement not to prosecute is void. See CRIMINAL LAW, and consult the authorities referred to there.

COMPOUND INTEREST. See INTEREST.

COMPOUND MICROSCOPE. See MICROSCOPE.

COMPOUND TRIPLE TIME. See TIME.

COM'PRADOR' (Sp., Port., purchaser). In China, Japan, and the Philippines, a man who contracts for the supply of provisions to ships.

COMPRESSED AIR. See POWER TRANSMISSION; AIR COMPRESSOR; COMPRESSED-AIR ENGINE; COMPRESSED-AIR LOCOMOTIVE; PNEUMATIC TOOLS; PNEUMATIC DISPATCH.

COMPRESSED-AIR ENGINE. An engine using as a motor fluid air to which a degree of energy has been imparted by compression by mechanical means. When atmospheric air is compressed in an air compressor (see AIR COMPRESSOR) energy is stored in it which is available for work in a piston motor just as in the energy stored in steam. Any form of engine which will operate with steam as a motive fluid will also operate with compressed air as a motor fluid, that is, a steam-engine will become a compressed-air engine simply by disconnecting the steam boiler and substituting a receiver or reservoir of compressed air. Compressed air is, however, employed to replace steam only under those conditions in which it is necessary to transmit the motor fluid to motors located at scattered points some distances from the source of supply. The reason for this is that while it is not possible to convey steam through pipes or to carry it in inclosed vessels for long distances without a great loss of energy due to condensation, it is practicable to do this with compressed air, with a comparatively small loss of energy if the air be heated before it is delivered to the motors at the end of its journey. Hence, compressed-air engines are practically always motors of special forms for performing special operations, and are usually of small size. For descriptions of the various special forms of compressed-air engines in common use, see DRILLS; PNEUMATIC TOOLS; POWER TRANSMISSION; STREET RAILWAYS.

COMPRESSED-AIR LOCOMOTIVE. A locomotive engine in which air under pressure takes the place of steam as the propulsive force. Compressed-air locomotives occupy a rather limited field of usefulness at present, their chief applications being street-railway propulsion on a limited scale, mine, quarry, and tunnel haulage and haulage around cane plantations, saw-mills, cotton-presses and warehouses, textile-works, and powder-mills, where the risk of fire has to be carefully avoided. Structurally, a compressed-air locomotive has the same form of propelling mechanism as a steam locomotive, but in place of the boiler there are tanks for holding compressed air, these tanks being recharged at intervals at a stationary air-compressor plant. A brief description of the use of compressed-air locomotives for street-railway propulsion and for mine haulage will give a fair idea of the two distinctive classes of these motors.

STREET-RAILWAY LOCOMOTIVES. Numerous attempts have been made, in the United States, to employ compressed-air locomotives for propelling street-railway cars; but, with the exception of a few short lines operating under special conditions, these attempts have all resulted in commercial failures. Probably the most extensive

experiments have been conducted in New York City, on some of the railway lines crossing the city from east to west. In all of these experiments a locomotive car has been employed carrying the tanks underneath the seats or under the floor of the car. In Europe the Mekarski system of compressed-air street-car locomotion has been used apparently with considerable success in Paris, France, and Berne, Switzerland. A special feature of the Mekarski system is the heating of the air, to maintain it at a constant temperature, by passing it through superheated water at 330° F. The air thus becomes saturated with steam, which subsequently partly condenses, its latent heat being absorbed by the expanding air. The pressure used at Berne in the car reservoirs is 440 pounds per square inch. The engine is constructed like an ordinary steam tramway locomotive, and drives two coupled axles spaced 5.2 feet apart. It has a pair of outside horizontal cylinders, 5.1 by 8.6 inches; four coupled wheels, 27½ inches in diameter. The total weight of the car, including compressed air, is 7¼ tons. The storage-tanks consist of ten sheet-iron cylinders with an aggregate capacity of 64¼ feet of compressed air. The cars will run for four miles without refilling the reservoirs. On the Paris lines the pressure used is 547 pounds, and the cars make trips of seven miles without refilling the reservoirs.

MINING LOCOMOTIVES. As generally constructed, the air for mining locomotives is stored in one or two steel tanks having a cubic capacity designed for the length of run, weight of train, grades, etc. These tanks usually occupy the space that the boiler does on an ordinary steam-locomotive. The air from the main tank or tanks is conducted through copper-pipe connections to an auxiliary reservoir of suitable diameter. The pressure in this auxiliary tank can be regulated (usually 150 pounds) anywhere from 30 pounds up to 300 pounds, as required. The air is reduced and controlled from the main tank by a reducing-valve and stop-valve, and can be regulated to any pressure at a moment's notice; when once set, a constant pressure is maintained in the auxiliary reservoir. The air is fed to the engine cylinders from the auxiliary reservoir. Compressed-air locomotives for industrial uses are built substantially the same as mining locomotives.

From the preceding it will be seen that the two types of compressed-air locomotives are, the compressed-air motor car for street-railway propulsion and the compressed-air locomotive proper for mine, plantation, and factory haulage. In both forms the prime motive power is steam, whose energy as it comes from the boiler is employed first to drive the air compressors; and, second, as stored in the compressed air, to propel the car motor or locomotive proper. See AIR COMPRESSORS and COMPRESSED-AIR ENGINE.

COMPRESSED-AIR TREATMENT. A term applied to the use of air under pressure for therapeutic purposes. The treatment is administered in one of the following two ways: (1) by causing the patient to enter an air-tight chamber, in which air is forced under pressure till the desired density is obtained; (2) by causing the patient to enter a cabinet in which he is seated in such a position as to receive into his mouth the end of a tube which, passing through the front of the cabinet, connects the cavity of his

lungs with the outside atmosphere, while an apparatus on the roof of the cabinet is so arranged as to pump air out of the cabinet. In the air-tight room, the pressure upon all parts of the patient's body, including the lung-cavity, is the same. In the cabinet, the pressure within the lung-cavity is many times greater than on the rest of the body, thus causing great expansion of the lungs and chest. The latter treatment relieves collapse of pulmonary vesicles and consolidations, in many cases; the former treatment is said to cause increased absorption of oxygen and an improved function of the mucous membrane of the respiratory tract. Both methods of treatment are used in cases of tuberculosis, and the former also in chronic bronchitis and asthma, at certain water-cures. See TUBERCULOSIS; CAISSON DISEASE.

COMPRESSIBILITY (from Lat. *compressus*, p.p. of *comprimere*, to compress, from *com-*, together + *primere*, to press). That property of bodies by which they admit of being pressed into less space than they otherwise occupy. It is measured by the relative change of volume produced by the application of unit pressure. The particles composing bodies are in all cases at greater or less distance from one another; and whatever brings the particles closer together diminishes the volume or bulk of the body. This may be effected by various agencies, as, for example, by the withdrawal of heat, but the effect is called compression only when it is caused by mechanical force, as by pressure or by percussion. All bodies are compressible, but in different degrees. Solids and liquids were at one time believed to be incompressible; more accurate experiments, however, have proved that this is not the case; water, for instance, subjected to a pressure of 15,000 pounds to the square inch, loses one-twentieth of its volume. Gases, on the other hand, are strikingly compressible, and by means of a common air-pump a very large amount of air can be forced into the space of one cubic inch. The variation of the volume of a gas with the pressure is expressed by the law of Boyle and Mariotte. See GASES; MOLECULES—MOLECULAR WEIGHTS.

COMPRESSOR. An instrument used on ship-board for temporarily checking the running of the anchor-chain. It consists usually of a curved arm pivoted at one end and arranged to be swung across the under side of the chain-pipe through the deck and grip the chain by pressing it against the lip of the pipe. The term was also applied to an attachment to old-type guns for checking the recoil by squeezing two or more surfaces together and thus increasing the friction.

COMPRESSOR, AIR. See AIR COMPRESSOR.

COMPROMISE MEASURES OF 1850, or **OMNIBUS BILL.** A name popularly given to a series of measures passed by the United States Congress in 1850, directed to a general settlement of certain questions arising out of the struggle over slavery. The affirmation of American rights in the Oregon territory, by the Treaty of 1846 with England, and the acquisition of still larger territories from Mexico by the Treaty of Guadalupe-Hidalgo (q.v.), made urgent the problem of providing suitable governments for this territory, and at the same time made acute the controversy between North and South over the securing of acceptable provisions concerning

slavery in the statutes organizing such governments. One phase of this controversy ended with President Polk's approval, August 14, 1848, of a bill providing for the erection of territorial government in Oregon with a prohibition against slavery. With reference to the territory acquired from Mexico, the problem was complicated by the fact that Mexico had abolished slavery in her dominions, by the question whether the line of the Missouri Compromise (q.v.) extended to the Pacific, and also by the question whether Congress might admit into the Union a State which had not passed through the Territorial stage of organization. The necessity of an early decision was emphasized by the sudden peopling of much of this territory, incident to the discovery of gold. Under such circumstances Henry Clay offered in the Senate, on January 29, 1850, a general scheme of adjustment, which provided: that California should be admitted as a State with no restriction as to slavery; that Territorial governments should be created in the other portions of the Mexican cession without reference to slavery; that trading within the District of Columbia in slaves brought there for purpose of sale should be forbidden; that there should be a more stringent fugitive-slave law; and that Texas should release all claims on New Mexico in return for the assumption by the National Government of the old Texan debt. These proposals were attacked both by the Southern friends of slavery and by the more extreme anti-slavery element at the North. After several weeks of heated debate, including the last speech of Mr. Calhoun (q.v.) and the famous Seventh of March speech of Mr. Webster (q.v.), the whole matter was referred to a committee of thirteen, from which committee, on May 8, Mr. Clay reported three bills. The first provided, in addition to details as to the debt and boundary of Texas, for the admission of California with its anti-slavery Constitution, and for the Territorial organization of Utah and New Mexico in such form that slavery should be allowed in those Territories. The second bill provided for a modified fugitive-slave law. The third bill provided for the abolition of the slave-trade in the District of Columbia. Three months even then were occupied with animated and protracted discussions, with the result that the whole scheme of compromise seemed to have proved a failure. Mr. Fillmore, however, having succeeded to the Presidency upon the death in July of President Taylor, adopted a policy more favorable than had his predecessor to the measures proposed, with the result that practically the whole of Clay's plan eventually became law, although divided into several statutes. The Senate passed the bill for the organization of Utah on August 1, that concerning Texas on August 9, that for the admission of California on August 13, that concerning New Mexico on August 15, the new fugitive-slave law on August 26, and, finally, the law prohibiting the slave-trade in the District of Columbia on September 16. Before the end of September, all these bills had passed the House and had been signed by the President. The arrangement thus effected was accepted by both parties in the campaign of 1852, in the 'finality' planks of their platforms, and the slavery question was generally regarded as settled. The quiet was broken abruptly, however, and the whole controversy renewed with in-

creased bitterness when Stephen A. Douglas (q.v.) introduced his bill for the organization, in 1854, of Kansas and Nebraska, and thus precipitated the battle anew both on the fields of Kansas and in the halls of Congress.

In the first volume of Rhodes, *History of the United States from the Compromise of 1850* (new ed. New York, 1901), a careful review is given of all the circumstances connected with this famous compromise, including sketches of the chief participants in the debates. A shorter review of the situation is given in the fifth volume of Schouler, *History of the United States Under the Constitution* (Washington, 1889). The lives of statesmen of the period should also be consulted. See SLAVERY.

COMPTON METER. See CALCULATING MACHINES.

COMPTON, HENRY (1632-1713). An Anglican bishop of Oxford (1674) and of London (1675). He was born at Compton Wyngates, and was educated at Oxford. He was the tutor of the daughters of James II., Mary and Anne, who through his teachings became attached to the Protestant faith. In 1686, at the instigation of James, he was suspended by the high court of ecclesiastical commission from further exercises of episcopal functions, on the alleged ground of having permitted the preaching of controversial sermons within his dioceses. This suspension was reversed in 1688. Compton steadfastly held to the Protestant faith, and he crowned William III. He presided over the Upper House of Convocation in 1689, and assisted in the revision of the liturgy.

COMPTROLLER, or CONTROLLER (OF, *contrôleur*, Fr. *contrôleur*, from ML. *contratorulator*, keeper of a check roll). An officer who keeps financial accounts, or sees that they are properly kept and audited. In the United States Treasury Department the Comptroller of the Treasury supervises and reviews the actions of the various auditors of the Treasury, upon appeal; advises the heads of departments as to constructions of laws; and countersigns all warrants of the Secretary of the Treasury. The Comptroller of the Currency has charge of the execution of the laws relating to the issue and regulation of the national currency, secured by United States bonds; and has a general supervision of the national banks. State and municipal comptrollers in the United States have duties similar to those of the Federal officials.

COMPULSION. See COERCION; DURESS.

COMPURGATION (Lat. *compurgatio*, purification, from *compurgare*, to purify, from *com-*, together + *purgare*, to purge, from *purus*, pure + *agere*, to perform). An ancient method of proof in legal proceedings. It consisted in the purgation, that is, the purging or clearing, of a defendant by the sworn oaths of a certain number of persons who knew him. The procedure was singular in this, that the witnesses swore, not to their knowledge of the fact in issue, but to their faith in the defendant. The importance of the practice consists in the fact that it was a device of primitive law for mitigating the harshness of ordinary legal procedure. Thus, if the issue was one that would ordinarily subject the defendant to trial by battle or the horrors and uncertainties of the ordeal, he was

permitted to 'wage his law,' i.e. to give security to appear and abide by the results of a regular trial. Under ordinary circumstances, the oath of the defendant, supported by those of his eleven compurgators, was conclusive and resulted in clearing him. The procedure was available, in many forms of civil suit and in criminal proceedings, where the accused was on trial for the first time. Compurgation was employed as a part of the regular procedure of the ecclesiastical courts throughout Europe in the Middle Ages. It existed among the Anglo-Saxons, and was in use in the courts of the common law in England until it was gradually superseded by the jury system. Though long obsolete, it was revived in England in an action of debt as late as 1824. (*Ring vs. Williams*, 8 Barn. and Cress. 5387.) It was not until 1833 that it was finally abolished by act of Parliament (2 and 3 Will. IV. ch. 42, § 13). It never existed in the legal procedure of the United States or of the English Colonies in America. See JURY; OATH; PROOF; WITNESS. The procedure is elaborately discussed by Blackstone, *Commentaries on the Laws of England*. See also Underwick, *The King's Peace: A Historical Sketch of English Law Courts* (London, 1895); Stephen, *History of the Criminal Law of England* (London, 1883); Pollock and Maitland, *History of English Law* (2d ed. Boston, 1899).

COMSTOCK, ANTHONY (1844—). An American reformer, born in New Canaan, Conn. He was educated at high schools in his native State, and during the Civil War served in the Union Army from 1863 to 1865. Afterwards he became an active worker in the Young Men's Christian Association in New York City, and upon the organization of the Society for the Suppression of Vice in that city (1873), was appointed chief special agent. Since that time he has attained considerable prominence by his vigorous crusade against such books, papers, pictures, and establishments as he considers injurious to the public morals. He has published: *Frauds Exposed* (1880); *Traps for the Young* (1883); *Gambling Outrages* (1887); *Morals Versus Art* (1887); and numerous magazine articles relating to the same class of subjects.

COMSTOCK, CYRUS BALLOU (1831—). An American soldier and military engineer. He was born in West Wrentham, Mass., graduated at West Point in 1855, was appointed lieutenant-engineer, and from 1859 to 1861 was assistant professor of natural and experimental philosophy at the Military Academy. On the outbreak of the Civil War he was assigned to active duty as first lieutenant of engineers, and for some time was one of the assistant engineers engaged in the construction of defenses at Washington. He was assistant to the chief engineer of the Army of the Potomac from March to June, 1862; was senior engineer on General Sumner's staff in June and July; served as a member of the engineer battalion in the Maryland campaign; and from November, 1862, to March, 1863, was chief engineer of the Army of the Potomac. He was subsequently engaged in the siege of Vicksburg, was chief engineer of the Army of the Tennessee from July to October, 1863; was assistant inspector-general of the Division of the Mississippi from November, 1863, to March, 1864; and was senior aide-de-camp to General Grant from

March, 1864, to July, 1866. At the close of the war he was brevetted major-general of volunteers and brigadier-general in the Regular Army, and from July, 1866, to May, 1870, was aide-de-camp to the General-in-Chief, with the rank of colonel. Afterwards for several years he was superintending engineer of the geodetic survey of the Northern and Northwestern lakes, and in addition has been engaged as engineer on many important Government works. In 1888 he became colonel in the engineer corps, and was retired from active service in 1895. He has published: *Notes on European Surveys* (1876); *Survey of the Northwestern Lakes* (1877); and *Primary Triangulation United States Lake Survey* (1882).

COMSTOCK, GEORGE CARY (1855—). An American astronomer, born at Madison, Wis. He received his education at the University of Michigan and spent several years studying and practicing law, at the same time studying mathematics and astronomy. In 1881 he was appointed assistant astronomer at the Washburn Observatory in the University of Wisconsin. In 1885 he was made professor of mathematics at the Ohio State University, but in 1887 returned to the University of Wisconsin as associate director of the observatory, of which he was afterwards made head director. Comstock is a member of many scientific bodies, including the National Academy of Sciences. His published works include: *Method of Least Squares* and *Publications of the Washburn Observatory*.

COMSTOCK, JOHN HENRY (1849—). An American entomologist, born at Jaynesville, Wis. He was educated at Cornell University, where he became first instructor, then assistant professor, and, in 1882, professor of entomology and general invertebrate zoölogy. From 1878 to 1881 he was United States entomologist. In 1891 he became non-resident professor of entomology at Leland Stanford, Jr., University. Comstock is one of the most influential of American entomologists; his investigations deal with the morphology, classification, and economic relations of insects. In this work he has been assisted by his wife, Anna Botsford Comstock, who is herself an entomologist, and prominent in the educational movement emanating from Cornell University toward the general extension of nature study. His important publications include: *Report on Cotton Insects* (1879); *Annual Report of the Entomologist* (1879-81); *Introduction to Entomology*, part i. (1888); *Evolution and Taxonomy* (1893); *A Manual for the Study of Insects* (with his wife, Anna Botsford Comstock, 1895); *The Wings of Insects* (with J. G. Needham, 1897).

COMSTOCK, JOHN LEE (1789-1858). An American author of text-books. He was born at Lyme, Conn., and after a common-school education took up the study of medicine. He served as assistant surgeon in the War of 1812; and at its close settled in Hartford, where he devoted himself to writing and the preparation of text-books on the various sciences and history. His *System of Natural Philosophy* (1831) reached a sale of 900,000 copies, while other popular works from his pen were an *Introduction to Mineralogy* (1832); *History of the Precious Metals* (1849); and *History of the Greek Revolution* (1828).

COMSTOCK, THEODORE BRYANT (1849-1901). An American geologist, born at Cuyahoga Falls, Ohio. He graduated at the Pennsylvania State College in 1868, and at Cornell in 1870, and in 1873 accompanied Capt. W. A. Jones's Wyoming and Yellowstone Park expedition as geologist. From 1875 to 1879 he was professor of geology and paleontology at Cornell, where he established the department of economic geology. He acted in 1879-84 as general manager of a mining company at Silverton, Cal., and from 1884 to 1889 occupied the chair of mining engineering and physics at the University of Illinois. He was assistant State Geologist of Texas in 1889-91; in the latter year founded the Arizona School of Mines, which he directed until 1895, and from 1893 to 1895 was president of the University of Arizona. In 1886 he was elected secretary of the geological and geographical section of the American Association for the Advancement of Science. He published an *Outline of General Geology* (1878); *Classification of Rocks* (1877); and other works.

COMSTOCK LODGE. A remarkable compound fissure vein, rich in gold and silver, located in Storey County, Nev., on the eastern slope of Mount Davidson, a northeastern spur of the Sierras, at a point about 20 miles east of the California State line. Its discovery in 1859, when it received the name Washoe, created great excitement and led to the building up of Virginia City. The vein is about four miles in length, and varies in width from zero at the ends to 3000 feet at the middle point. It occupies a zone of displacement in igneous rocks, chiefly andesites of Tertiary age. The ore, which is of high grade, containing both silver and gold in proportion of three of the former to two of the latter, occurs in great pockets known as bonanzas, chiefly along the eastern portion of the vein. The excavations along this fissure vein have been carried to great depths, approximating 3500 feet, until operations became difficult through the inflow of hot water with a temperature of 170° F. The Sutro Tunnel, with a length of four miles, was driven with a view to draining this water, but with only partial success. The richness of the ore of this lode may be realized from the value of the product, the total value during the years 1860-90 having been \$340,000,000; the greatest output for a single year was \$38,000,000 in 1877. Since 1890 the production has declined.

Besides its economic value, the Comstock Lode is of great interest in other directions. One of the earliest classifications of igneous rocks (q.v.) was attempted in connection with the study of the geologic relations of the ore bodies by Von Richthofen in 1868; and Van Hise, Iddings, and Becker have at a later period perfected the modern classification of igneous rocks with aid of considerable information derived from the Comstock Lode and Sutro Tunnel. Also many important observations have been made on the relation between the size of grain and the rate of cooling, and upon the rate of development of crystallization in igneous rocks. Again, experiments have here been carried on by Carl Barus with the object of determining the temperature variations and electric manifestations in the deeper workings. For more precise information on the geologic features and methods of mining of the Comstock Lode, the reader is referred to the two following works: Becker, "Geology of the

Comstock Lode and Washoe District," with folio atlas; being *Monograph of the United States Geological Survey*, vol. iii. (Washington, 1882); Lord, "Comstock Mining and Miners," *Monograph of the United States Geological Survey*, vol. iv. (Washington, 1883).

COMTE, KÖNT, ISIDORE AUGUSTE MARIE FRANÇOIS XAVIER (1798-1857). A celebrated French philosopher, the founder of the positive philosophy, or Positivism (q.v.). He was born at Montpellier, and educated at the Ecole Polytechnique in Paris, from which he was expelled for his part in a protest of students against one of the instructors. From 1816 he supported himself by tutorial work. In Paris he met Saint-Simon, with whose theories he was at first greatly charmed, but from whose influence he broke away in 1824. In the following year he married Caroline Massin, but the union was unhappy. In 1826 he began a course of lectures at his own house on his system of philosophy, and had among his hearers such men as Humboldt and Blainville. Excessive work, however, ruined his health, and after the third lecture he became insane, was taken to an asylum, and tried to commit suicide. Thanks to the care of his mother and wife, he soon recovered the use of his faculties, and took up his studies and lectures again. In 1835 he got a position as examiner for entrance to the Ecole Polytechnique, which he held for some ten years, after which he was largely supported by his pupils and admirers. John Stuart Mill, with whom Comte had been in correspondence for some time, induced some wealthy English friends, Grote among them, to advance about \$1200 to Comte in 1845, and Grote sent a small sum to him afterwards. In 1848 Littré headed an appeal for a public subscription for the benefit of Comte, on the proceeds of which he subsisted for the remainder of his life. In 1845 he met Clotilde de Vaux, whose husband was serving a life sentence, and conceived an extravagant affection and admiration for her. The relation, which seems to have been platonic, was broken by her death a year later, after which Comte had a second attack of mental alienation. His death took place on September 5, 1857.

Comte published a number of important philosophic works, the most famous being his *Cours de philosophie positive* (6 vols., 1830-42), of which a condensed English translation by Harriet Martineau, approved by the author, appeared in 1853. Other works were: *Traité élémentaire de géométrie analytique* (1843); *Traité d'astronomie populaire* (1845); *Système de politique positive* (4 vols., 1851-54; English translation, London, 1875-77); *Catéchisme positiviste, ou sommaire exposition de la religion universelle* (1852). Comte's central and governing doctrine is that the human race, like the individual, necessarily passes through three intellectual stages: (1) The theological, in which a supernatural origin is sought for all phenomena, and the *deus ex machina* is the only explanation of events. (2) The metaphysical, in which the sensuously supernatural is set aside as incredible, and an effort is made to demonstrate the existence of "abstract forces or entities supposed to inhere in various substances, and capable of engendering phenomena." (3) The positive, in which the mind affirms the futility of both theological and metaphysical in

quiries, abandons all vain search after the causes and essences of things, and "restricts itself to the observation and classification of phenomena, and to the discovery of the invariable relations of succession and similitude which things bear to each other—in a word, to the discovery of the laws of phenomena." This last is the stage at which Comte conceived Europe to have arrived. Theology and metaphysics are alleged to be in their dotage, and all the anarchy of modern life to arise from the presence of these disturbing elements. To deliver us from their hurtful influence, Comte employs the principles of Positivism to organize a new social doctrine, which shall embrace the entire wants of man as an intellectual and emotional being. He thus aims at being the founder, not only of a new philosophy, but also of a new religion, and even assumed the title of *Fondateur de la religion de l'humanité*. See POSITIVISM; and consult: Littré, *Auguste Comte et la philosophie positive* (Paris, 1877); Mill, *Comte and Positivism* (London, 1865); Caird, *The Social Philosophy and Religion of Comte* (Glasgow, 1885); Gruber, *August Comte, sein Leben und seine Lehre* (Freiburg, 1889); Robinet, *Notice sur l'œuvre et sur la vie de Comte* (Paris, 1860). The first volume of Fiske, *Outlines of Cosmic Philosophy* (Boston, 1874), contains a thorough and noteworthy examination of Comte's system.

COMTE, kônt, PIERRE CHARLES (1825-95). A French artist, born at Lyons. He was a pupil of Robert Fleury, and for a long time imitated that master's loud but effective coloring. His first picture of importance was the "Visit of Charles IX. to Coligny, Wounded Two Days Before Saint Bartholomew" (1851). His compositions are almost entirely historical and are in many of the French museums. In the Corcoran Gallery at Washington, D. C. there is "A Scene at Fontainebleau" by him. His masterpiece, "Henry III. and the Duke of Guise" (second-class medal, 1855), is in the Luxembourg. His later coloring is sober, but his drawing is vigorous, and his conception always just and elevated, if not essentially dramatic.

COMTE DE BOURSOUFLE, kônt de hōōr'sōōf'l', LE (Fr., the Count of Boursoufle). A comedy by Voltaire, produced in public, posthumously, in 1862. It had been privately acted, however, at the Château de Cirey in 1734, and again at the Château d'Anet in 1747, under the title of *Quand est-ce qu'on me marie?* It was drawn from Vanbrugh's *Relapse*.

COMTE DE PARIS, de pâ'rê'. See PARIS, LOUIS PHILIPPE ALBERT D'ORLÉANS, COMTE DE.

COMTE ORY, kôn tô'rê', LE (Fr., the Count Ory). The title of an opera, the music of which is by Rossini and the libretto by Scribe and Delestre-Poirson (1828). Italian and French productions were given in London in 1829 and 1849 respectively.

COMTESSE D'ESCARBAGNAS, kôn'tēs' dē'skâr'bân'yās'. LA (Fr., the Countess of Escarbagnas). A comedy by Molière (1671), pursuing the satire on French county life which forms the subject of *M. de Pourceaugnac*.

COMUS (Lat., from Gk. *Kōmos*, *Kōmos*). A character which appears on Greek vases of the end of the fifth century n.e., and later as one of the companions of Dionysus, often as a satyr. Philostratus, in the third century A.D., describes

Comus as a winged youth slumbering in a standing attitude, his legs crossed, his countenance flushed with wine, his head sunk upon his breast, his left hand feebly grasping a hunting-spear, his right an inverted torch. Milton in his poem has represented Comus as born from the loves of Bacchus and Circe, "much like his father, but his mother more;" a sorcerer, who gives to travelers a magic draught that changes the human face into the "brutal form of some wild beast," and, hiding from them their own foul disfigurement, makes them forget all the purities of life, "to roll with pleasure in a sensual sty."

COMYN, kûm'in. A family which rose to great power and eminence in Scotland after the Norman Conquest. The name is also spelled Comin, Comines, or Cumin.—ROBERT DE COMYN, the founder of the family, was probably from Flanders, and followed William the Conqueror to England. He was made Earl of Northumberland in 1068. In 1069 he was sent to reduce the provinces of the north. He seized Durham, but the people rose against him, and he perished in the flames of the bishop's palace. The family became most prominent in the thirteenth century.—WILLIAM COMYN, who died in 1233, obtained the earldom of Buchan by marriage. WALTER, one of his sons by his first marriage, became Earl of Monteith. After the accession of Alexander III. of Scotland, Walter practically ruled the kingdom till 1255. He died in 1258.—ALEXANDER, Earl of Buchan, his half-brother, by marrying a daughter of the Earl of Winchester, acquired, in 1270, the high office of Constable of Scotland, with great estates in Galloway, Fife, and the Lothians. He was the most powerful noble in Scotland, until his death, in 1289. Within a quarter of a century, however, this great house suffered such utter misfortune that, in the words of a contemporary chronicle, "there was no memorial left of it in the land, save the orisons of the monks of Deer" (a monastery founded by William Comyn, Earl of Buchan, in 1219). The Comyns perished in the memorable revolution which placed Bruce on the throne of Scotland. Their chief, the Lord of Badenoch, was in 1291 an unsuccessful competitor for the crown, as a descendant, through King Donald Bane, of the old Celtic dynasty. His son, Red JOHN COMYN, was one of the three wardens of Scotland, and distinguished himself by his gallant resistance to the English. He fell under Bruce's dagger, before the altar of the Franciscan Friars at Dumfries, in 1306; and his kindred went down, one after another, in the struggle to avenge him.—JOHN COMYN, Earl of Buchan, was defeated by Bruce in a pitched battle near Inverury, in 1308, and his earldom was laid waste. He fled to England, and died in 1313, leaving no children. The possessions of the family, both in Scotland and England, were taken by the King. Consult Douglas, *Peccage of Scotland* (Edinburgh, 1764).

CON. An Italian preposition, meaning 'with,' much used in musical terms, as *con spirito*, *con brío*. The form *col*, a contraction of *con* and *il*, means 'with the.'

CONACHAR, kôn'â-kâr. A character in Scott's novel *The Fair Maid of Perth*, a young Highlander of the clan 'Quhele' (Ray), in love with the Fair Maid, and for a time apprenticed to Simon the Glover. He suddenly becomes chief

of his clan, and is forced, as such, to take part in the historic battle at Perth between his own clan and the clan Chattan. He is by nature a coward, and runs away rather than face Henry the Smith. He kills himself in despair.

CONANICUT. An island of Rhode Island in Narragansett Bay near its mouth. It is about 8 miles long by 1 mile wide and contains the town of Jamestown near the centre, and Conanicut Park in the northern part (Map: Rhode Island, C 4). It has several hundred inhabitants.

CO'NANT, HANNAH O'BRIEN CHAPLIN (1809-65). An American biblical scholar. She was born in Danvers, Mass., and in 1830 was married to Thomas Jefferson Conant (q.v.). In 1838 she became editor of *The Mother's Journal*, and before and afterwards was a contributor to current literature. An erudite Orientalist, she assisted her husband in translations and other literary labors, and produced original works, the chief of which are: *The Earnest Man*, an excellent biography of the missionary Judson (1855), and a *Popular History of English Bible Translation* (1856).

CONANT, THOMAS JEFFERSON (1802-91). An American biblical scholar. He was born at Brandon, Vt., graduated at Middlebury College (Middlebury, Vt.), in 1823, and was professor of Greek, Latin, and German in Waterville College (now Colby University). From 1835 to 1850 he was professor of biblical literature and criticism in the Baptist Theological Seminary at Hamilton, N. Y. He translated (1839) Gesenius's Hebrew Grammar, with the additions of Roediger, a work which became a standard text-book in the United States and England. After holding the professorship of Hebrew and biblical exegesis in the Rochester Theological Seminary from 1851, he settled in Brooklyn, N. Y., in 1857, where he died in 1891, having devoted himself until 1875 to Bible revision for the American Bible Union. He published, in 1864, a treatise on the term *βασιλευς* in the New Testament, which attracted much attention. Dr. Conant was for a number of years one of the American contingent of the Canterbury (England) Committee on the complete revision of the Authorized Version of the Bible. His works further include critical editions, with revised versions of *The Book of Job* (1856); *The Gospel by Matthew* (1860); *The Book of Genesis* (1868); and *The Book of Psalms* (1872).

CONATION (Lat. *conatio*, attempt, from *conari*, to attempt). An endeavor, a striving to attain something. The attempt, e.g. to recall a name which has slipped from memory is a conation. There is a difference of opinion among psychologists as to whether conation is an ultimate aspect of consciousness or a complex of sensation (q.v.) and affection (q.v.).

There are two typical cases of conation—the consciousness accompanying muscular exertion, and the state of active attention. (See ATTENTION.) The similarity of these two experiences has led some psychologists to deny that there is anything more in conation than the strain-sensations following upon muscular contraction plus a pleasantness or unpleasantness. In attention there are, further, the sensations or ideas attended-to and those attended-from. But it is also maintained, on the other hand, that conation

is a simple 'attitude' which mind assumes toward its objects, a peculiar 'mode of being conscious.' It is said to be common to desire, yearning, longing, craving, wishing, and willing; indeed, to all consciousnesses which have an inherent tendency to pass beyond themselves. On this definition conation is a self-determination of consciousness. In desire, e.g. consciousness endeavors to pass from the want of an object to its possession; or, if an unpleasantly toned idea enters consciousness—say the idea of an embarrassing situation—a conation arises, and consciousness makes a forcible effort to eject the unpleasant idea. These two views are not necessarily mutually exclusive, although they arise from two radically different methods of psychology. The first analyzes consciousness without regard to the offices of knowing and willing which mind fulfills—i.e. without reference to the relation of mind to the 'outside' world; the second sets consciousness into relation with its objects, and seeks to discover the 'behavior' of mind toward the world. Or, in other words, the first scrutinizes the 'feeling of effort' or 'endeavor' in an analytic way, and finds only sensations of strain and an affective quality (see AFFECTION); the second assumes that mind takes positive 'attitudes' toward its objects—that it is not only a sequence of occurrences, but a self-determining cause, directing its own contents, an agent in much the same sense that friction is an agent in the production of electricity. Consult: Stout, *Analytic Psychology* (London, 1896); Titchener, *Outline of Psychology* (New York, 1899); James, *Principles of Psychology* (New York, 1890); *Experimental Psychology* (New York, 1901). See DESIRE; EFFORT; FATIGUE; WILL.

CON'ATY, THOMAS JAMES (1847—). An American Roman Catholic prelate. He was born in Ireland, and was educated at Montreal College (1863-67), College of the Holy Cross (1869), and Montreal Theological School (1872). After a pastorate of seventeen years at the Church of the Sacred Heart, in Worcester, Mass., he was, in 1897, appointed by Pope Leo XIII. to the rectorate of the Catholic University, Washington, with the title of domestic prelate to the Pope. In the autumn of 1901 he was raised to the episcopate, with the title of Bishop of Samos *in partibus*, still retaining his position in the university. His publications chiefly comprise biblical text-books for educational institutions.

CON'CAN (Skt. *Konkana*). A territory in the Presidency of Bombay (q.v.), British India (Map: India, B 5). It is a long strip of country, about 300 miles long by 40 miles broad, between the coast of the Arabian Sea and the Western Ghats. Prior to 1818, when it was annexed by the British, it was a Mahratta principality. The modern districts of Thana (population, in 1891, 819,000; in 1901, 809,000) and Ratnagiri (population, in 1891, 1,106,000; in 1901, 1,167,000) are comprised in its area.

CON'CAVE (Lat. *concauus*, hollow, from *com-*, together + *cauus*, hollow; connected with Gk. *κῆρα*, *kyar*, hole, from *κῆν*, *kyein*, to conceive, to contain). A surface is said to be concave when its centre of curvature is toward the observer, convex when its centre of curvature is in the opposite direction to the observer. (See LENS and MIRROR.) In geometry a plane polygon is

said to be concave if any side produced cuts the polygon. A spherical polygon is said to be concave if any side produced cuts the polygon so as to leave part on one hemisphere and part on the other. A solid is said to be concave if any face produced cuts the solid.

CONCEALMENT (from *conceal*, from OF. *concealer*, Lat. *concealere*, to hide, from *com-*, together + *celare*, to hide). As a legal term, the improper suppression or withholding of facts, the covering up of crimes, or the secretion of a person or property. The effect of the concealment of facts is dealt with under such titles as DECEIT; EQUITY; FRAUD; INSURANCE (qq.v.). As an element in criminal offenses, concealment has been considered in the articles on ACCESSORY; BIRTH. **CONCEALMENT OF** (qq.v.). The concealment of goods which are subject to revenue duty, or the secretion of property for the purpose of preventing its being taken in legal process, and the concealment of a debtor to avoid the service of summons on him, are the subjects of statutory provisions, which should be consulted.

CONCENTRATION CAMPS, or DISTRICTS. In the mobilization schemes of countries whose territories are contiguous, an important feature is of necessity the district within which the mobilized forces concentrate. The term concentration camp was used in the Cuban insurrection (1896-98), during which the Spaniards concentrated all Cuban non-combatants within fixed limits; and similarly, in the British-Boer War of 1899-1902, the British collected the women and children of combatants in the field, as well as all non-combatant men, and established them in camps which were popularly known as concentration camps. In 1902 concentration camps were temporarily established by the American military authorities as an incident of the campaign in Mindanao, in the Philippines.

CONCENTRATION MARCHES. The method or means by which several bodies of troops from different directions rendezvous or concentrate at a given point. Before commencing such an operation, it is necessary to arrange and decide upon, first, the base of operations and the objective point; and, secondly, the direction, plan, and method of route. If it is necessary for the various bodies to arrive at a given or uniform time, allowance is made, according to the known or expected proximity of the enemy, and possible or known obstacles or impediments. In calculating necessary time, about 90 yards per minute are allowed for infantry (paragraph 245, *United States Infantry Drill Regulations*), and 100 yards per minute for cavalry and artillery. An average allowance of ten minutes per hour is made for halts. Speed is naturally dependent on the strength and composition of the force making the march, smaller bodies moving quicker than larger ones. A column equal to an army corps of all arms will rarely exceed an average of two miles an hour, and an army division about two and a half. Forced marches are often made in concentrating troops, particularly if a necessary preliminary to a desired engagement.

CONCEPCION, kón-sěp'sě-ōn' (Sp., *concepcion*). The capital of the province of the same name, Chile, situated on the Biobio River, six miles from its mouth (Map: Chile, C 11). The

streets of the city are clean and paved, and are traversed by a street railroad. The chief buildings are the cathedral, the town-hall, the agricultural school, and a normal school. Concepcion is the seat of a bishop. A railroad runs to Talcahuano, on the Bay of Concepcion, the port of the city, where a United States consular agent resides. The city is in a fertile district, and has an active trade, but little manufacturing. Population, in 1899, 55,458. Concepcion was founded in 1550, on the site of the present Penco, and built in its present situation in 1754, after the destruction of the former town in 1751 by an earthquake. During the Spanish occupation it was the second largest city of Chile. Concepcion has suffered severely from earthquakes, the last disastrous one having occurred in 1835, after which the city was rebuilt on a more pretentious plan. In 1818 the independence of Chile was declared here.

CONCEPCION. A seaport town of Panay, Philippines, capital of the District of Concepcion, situated on the eastern coast of the island, 104 miles northeast of Iloilo. It has a post-office and telegraph station. Population, in 1898, 5736.

CONCEPCION. A town of Luzon, Philippines, in the Province of Tarlac, 10 miles south of Tarlac. It has an important sugar industry. Population, in 1898, 13,499.

CONCEPCION DEL URUGUAY, kón-sěp'sě-ōn' del ōō-rōō-gwā'è, or **CONCEPCION.** A town in the Province of Entre Rios, Argentina, situated on the Uruguay River (Map: Argentina, F 10). It is the seat of a national college and a normal school. The town has transportation facilities by rail and water, the river being navigable for large vessels, and controls an important trade in cattle and packed meat. Population, in 1895, 6111. Concepcion del Uruguay was founded in 1778, and was formerly known as Arroyo de la Chma.

CON'CEPT (Lat. *conceptus*, thought, from *concipere*, to conceive, from *com-*, together + *capere*, to seize). A general idea resulting from abstraction (q.v.), and recognized as general. Thus, from particular ideas of this, that, and the other horse, abstraction selects those marks or qualities common to them all, and the resulting idea is the concept horse, provided it is recognized as general. Hegel and many of his followers use the term concept (Ger. *Begriff*) to denote the totality constituted by a thinking consciousness and all its objects. *Notion* was frequently used till within the last few decades as a synonym for concept, and even now it is still current in less technical treatises on logic. See LOGIC.

CONCEPTION. See EMERYOLOGY, HUMAN.

CONCEPTION, in Psychology. See IDEA.

CONCEPTION, IMMACULATE. See IMMACULATE CONCEPTION.

CONCEPTION OF OUR LADY, SISTERS OF THE. An order of nuns, founded in 1484, in honor of the Immaculate Conception, by Beatrix de Silva, sister of James, first Count of Portalegre, in Portugal. It was confirmed in 1489 by Pope Innocent VIII., who granted the sisterhood permission to follow the rule of the Cistercians; but after the death of the foundress, in 1489, Cardinal Ximenes put the nuns under

the direction of the Franciscans, and imposed on them the rule of Saint Clara. The Order subsequently spread into Italy and France. The habit consists of a white gown, a blue mantle, and a scapular on which is worn the image of the Virgin. The Franciscan Sisters of the Immaculate Conception in the United States have their mother house at Little Falls, Minn., where they were established by sisters from Italy in 1891. They conduct three hospitals, and numbered, in 1900, 48 professed sisters and 19 novices.

CONCEPTUALISM. A philosophical theory which is, in some sense, intermediate between realism and nominalism (q.v.), and maintains that, while universals have no real existence in the external world, they do exist as ideas or concepts in the mind, and are thus something more than mere words. This was Abelard's view. See ABSTRACTION; BERKELEY; LOGIC; IDEA.

CONCERTANTE. *Ital. pron. kōn'chēr-tān'lá* (It. p.p. of *concertare*, to perform a concert). An Italian word used to describe an orchestral composition in which two or more instruments or solo voices are in turn given prominent solo parts. See CONCERTO.

CONCERTINA, *kōn'sēr-tē'ná* (from It. *concerto*, concert). An hexagonally shaped musical instrument, the sounds of which are produced by free, vibrating tongues of metal, as in the accordion. The scale of the concertina is very complete and extensive, beginning with the lowest note of the violin. G. and ascending chromatically for three and a half octaves to C. There are two tongues for every tone, so that any note can be produced either by pulling the bellows open, or by pressing them together. Wheatstone, of London, invented the concertina in 1829. The instrument is capable of a great range of expression, and concertina playing by skilled performers comes rightly under the head of artistic music.

CONCERTO (Fr. *concert*, from It. *concerto*, concert, from It., Lat. *concertare*, to vie, from *com-*, together + *certare*, to contend; less probably from *conserere*, to join together, from *com-*, together + *serere*, to join). A musical composition for a solo instrument, with orchestral accompaniment, calculated to exploit the resources or possibilities of the instrument and thus to give the performer an opportunity to display the highest technical skill (see CADENZA), as well as intellectual grasp and musical culture. The concerto belongs to the cyclical or sonata (q.v.) group of musical compositions, and differs from a symphony or overture only through the special prominence given to the solo instrument. It consists, like the symphony or sonata, of three or four movements, each of which, like the whole, requires a clear development and treatment of motives, and a strict adherence to the rules of form. The earliest concertos were written for two or more instruments, being thus really in concertante (q.v.) style. From the beginning of the eighteenth century the pianoforte and the violin have been the solo instruments mostly used for the concerto. Among the oldest violin concertos are those by Tartini and his pupils. The French and Germans afterwards improved on these and fixed the forms, which all the great masters of modern times have adhered to.

CONCERT PITCH. See PITCH.

CONCH, *kōŋk* (Lat. *concha*, Gk. *κόγχη*, *kōnchē*, Skt. *śankha*, shell). The name of many

large univalve mollusks. Originally and properly it belongs to the big carnivorous strombs, and especially to the great rose-lined stromb (*Strombus gigas*) of the West Indies and Florida Reefs, more particularly designated 'queen-conch.' Shiploads of these shells are sent to Europe and the United States every year to be ground up for porcelain, burned into lime, calcined for medicinal purposes, or used as ornaments; many are perforated at the apex and

A CONCH (*Sycotypus canaliculatus*).

The attitude is that of creeping toward the left. Beneath the protruding siphon-tube, two tentacles show the place of the head, the lower one showing the black dot of the eye. On the rear of the expanded foot is the operculum.

serve as dinner-horns on Southern plantations. Cameos of an inferior sort are cut in it; and from it are derived, especially in the Bahamas, pink 'conch-pearls' of value. It is because many of them made an occasional industry of gathering these mollusks, and searching for pearls, that the poorer sort of people of southern Florida and neighboring islands are called 'Conchs.' The Indians used the columella of this shell as material for fine beads; and their remains, as well as those of many other large mollusks, abound in the coastal shell-heaps. In the East Indies the term is applied often to other large spiral shells, especially those of the closely allied family Tritonidae. These are often perforated and fitted with mouthpiece and finger-holes, and so turned into sonorous musical instruments. This is the shell adopted by artists in representations of sea-myths—

"Have sight of Proteus rising from the sea,
Or hear old Triton blow his wreath'd horn."

In the Northern States, 'conch' means either of two large, pear-shaped univalves of the Atlantic Coast, *Fulgur carica* and *Sycotypus canaliculatus*, which frequent the sandy bottoms near shore and are cast up on beaches in great numbers. Both are carnivorous and do great damage to oyster-beds. The former, which has a spiral row of short horns defining the whorls, is more common southward, while the latter, distinguished by the squarish channels between the whorls, is nearly confined to the region between Cape Cod and New Jersey. Both are abundant about Long Island and on the southern New England coast, where they are confused under the name 'periwinkle' or 'winkle.' The 'sea-necklaces,' consisting of parchment-like hollow disks apparently strung upon a long cord, which attract attention on beaches in mid-summer, are the egg-cases of these mollusks, which have been torn from their attachment to some rock or seaweed and floated ashore. It was from the column of these shells that the Indians made their white wampum. (See WAMPUM.) Consult Ingersoll,

"Natural History of Economic Mollusks of the United States." *United States Fish Commission Bulletin for 1889.*

CON'CHA, JOSÉ GUTIERREZ DE LA, MARQUES DE LA HABANA (1809-95). A Spanish soldier and statesman, born at Córdoba, Argentina. Shortly after the death of his father he went abroad and entered the Spanish Army, in which he was rapidly promoted. He was Captain-General of the Basque Provinces (1843-46), and three times Captain-General of Cuba (1849-52, 1854-59, and 1874-75), in which latter capacity he was charged with complicity in the slave-trade. He was made Senator in 1860, and successively held the positions of Minister to France (1862), Minister of War (1863), and president of the Senate (1864-68). During the absence of Queen Isabella in France, he was appointed by her the successor of Gonzales Bravo as president of the Council, September, 1868, but was immediately forced to resign, by the outbreak of the revolution which ended in the fall of the monarchy.

CONCHA, MANUEL GUTIERREZ DE LA, MARQUES DEL DUERO (1808-74). A Spanish general, brother of the preceding, who served against Don Carlos. He was promoted to the rank of field-marshal in 1840, and in 1841 joined in the revolt against the regency of Espartero. As Captain-General of Catalonia, in 1845, he suppressed, within a fortnight, an uprising of that province against conscription. Two years later, in command of the army sent to Portugal, he skillfully adjusted the dispute between the two countries without bloodshed, and was created Marques del Duero. With O'Donnell and others he petitioned Queen Isabella in 1853 for a liberal government and the immediate convocation of the Cortes. He was thereupon banished to the Canary Islands, and fled from there to France, but on the downfall of Narvaez, in the following year, returned to Spain and was reinstated in all his dignities. In the Revolution of 1868 he supported Isabella, and was placed in command of the troops in Madrid. The cause of the Bourbons, however, seeming hopeless, he contented himself with preserving order until the arrival of the victorious Revolutionary army under Serrano, to whom he relinquished the command. He then lived abroad until appointed commander of the Northern Army in the last Carlist war, when he contributed materially to the relief of Bilbao. On June 28, 1874, he was killed at the head of his troops in the assault on the Carlist stronghold of Estella.

CONCHOID (kōn'koid) (Gk. κογχοειδής, *konchoidēs*, mussel-shaped, from κογχή, *konchē*, shell + εἶδος, *eidos*, form) **OF NICOMEDES**. A 'shell-shaped' curve invented by Nicomedes (B.C. 180). It is related to the problems of trisecting an angle (see **TRISECTION PROBLEM**), of constructing two geometric means between two given straight lines, and of duplicating the cube. The curve may be constructed by drawing a straight line LM for the directrix, and through any point P as the pole drawing a pencil of lines cutting LM in R_1, R_2, \dots . The conchoid is the locus of points found by laying off a constant length each way from R_1, R_2, \dots on these rays. This constant length is called the modulus. The curve differs in general shape according as the modulus is equal to, greater than, or less than

the distance of the fixed point from the fixed straight line. The figure shows the forms of the curve in the last two cases. The loop occurs when the modulus is greater than the perpendicu-

lar distance of P and LM. When the modulus equals this distance, P is a cusp on the curve. The directrix LM is an asymptote to the two branches of the curve. If the foot of the perpendicular from the pole to the directrix be taken as the origin, and the distance be called b , and the modulus a , the equation of the conchoid is $(y + b)^2(a^2 - y^2) - x^2y^2 = 0$. Its order is the fourth, and its class the sixth unless P is a cusp, in which case its class is the fifth. (See **CURVES**.) P is, in general, a double point, and the curve meets its asymptote at four consecutive points at infinity. The curve may easily be described mechanically, and is frequently used in architecture as a bounding line of the vertical section of columns. Consult: Sundara Row, *Geometric Paper Folding* (Chicago, 1901); Klein, *Vorträge über ausgewählte Fragen der Elementargeometrie* (Leipzig, 1895), translated as *Famous Problems of Geometry* (Boston, 1897).

CONCHOLOGY, kōn-kōl'ō-jī. See **MOLLUSCA**.

CONCHOS, kōn'chōs, Rio (connected with Sp., Lat. *concha*, shell). A river in Mexico, in the State of Chihuahua, rising on the southern border of the east of the Sierra Madre, flowing in a northerly direction through the rice tableland of that region, and joining the Rio Grande del Norte at Presidio del Norte after a course of about 350 miles (Map: Mexico, G 3). It receives a number of confluent from the west, but no important tributary from the east.

CONCIERGE, kōn'syärzh' (Fr., doorkeeper). The French title of the janitor of an apartment-house. He is an important functionary in the life of most French and German cities; he sits in his little office by the main entrance and exercises a certain supervision over all those who pass in or out, opening the door to those who enter after a certain hour of the night (in Vienna as early as 10 o'clock).

CONCIERGERIE, kōn'syär'zh'ré'. LA. A Paris prison, famous as the place of confinement of political prisoners during the French Revolution. It forms a part of the Palais de Justice toward the river, and was originally the residence of the concierge of the old palace. Among the famous prisoners confined in the Conciergerie and taken thence to the guillotine were Malsherbès, Madame Roland, Danton, Desmoulins, and Robespierre. Here Marie Antoinette was confined before her execution, in a small cell, afterwards changed into a chapel. In 1840

Napoleon III. was for a time an inmate of the prison, which is now used only for the temporary detention of prisoners.

CONCLAVE (Fr., Sp., Port., It., Lat., room which may be locked, from *con-*, together + *clavis*, key, Gk. *κλεις*, *kleis*, key, from *κλειν*, *klein*, to shut). Either the place where the cardinals assemble for the choice of a pope, or the assembly itself. In 1179 a Lateran Council decreed in its first canon that a two-thirds vote of the cardinals was essential for a choice. This decree was developed, and the regulations which are, substantially, still in force established by Gregory X. at the Council of Lyons in 1274. These rules are intended to provide against unnecessary delay or precipitation in election, and against any external interference with absolute freedom of choice. The large hall is divided into a number of small apartments, two rooms being allotted to an ordinary cardinal and three to one of princely rank. People are allowed to enter freely during the first day, at the end of which all entrances are absolutely closed except one, which remains under the strict supervision of officials designated for the purpose. Food and other necessaries are handed through a window, and are subjected to a rigorous examination, in order to prevent communication with the outer world, the cardinals not being allowed to leave the place, or to receive or send out letters, until a new pope is chosen. Consult: Zöpffel, *Die Papstwahlen* (Göttingen, 1871); for a more popular treatment, Trollope, *The Papal Conclaves, as They Were and as They Are* (London, 1876). A full and graphic description of a typical conclave, that which elected Alexander VII., will be found in Shorthouse, *John Ingle-sant* (London, 1881). See POPE.

CONCOMITANCE (ML. *concomitancia*, from Lat. *concomitari*, to accompany, from *com-*, together + *comitari*, to accompany, from *comes*, companion). **SACRAMENTAL**. In the Roman Catholic Church, a term which implies that the body and blood of Christ, sacramentally, accompany each other, so that under either form, whether wine or bread, both are sacramentally received. Hence the laity in that communion, although they are not permitted to take the cup, still are held to receive Christ's body and blood.

CONCOMITANT VARIATION, METHOD OF. See INDUCTION.

CONCONE, kōn-kō'nā, GIUSEPPE (1810-61). An Italian vocal teacher, born in Turin. He is widely known for his vocal exercises—*solfeggi* and *vocalizzi*—which are unusually attractive for works of their kind, and at the same time excellent for their special purpose. For about ten years Concone resided in Paris as a teacher. Returning to Turin in 1848, he was at the time of his death organist and choir-master of the Court choir.

CONCORD, kōn'kōrd. A town in Middlesex County, Mass., 20 miles northwest of Boston; on the Concord River and on the Boston and Maine Railroad (Map: Massachusetts, E 3). It has manufactures of rubber goods and harness. The Massachusetts Reformatory is situated here. The government is administered by town meetings, held annually and at special call. Population, in 1890, 4427; in 1900, 5652.

Concord, settled in 1635, is the oldest interior

town in Massachusetts, and by the time of the Revolution had come to be "one of the great centres, not only of intellectual life, but also of political influence and power." In August, 1774, the Middlesex Convention, the first county convention assembled in Massachusetts, was held here, every town being represented; and on October 11, under the stimulus of the Revolutionary agitation, the first Provincial Congress, presided over by John Hancock, met to consider the ways and means of resisting the tyrannies of the mother country. Later large quantities of ammunition and military supplies were stored here, and in an attempt made by the British to destroy them, on April 19, 1775, occurred the memorable fight which precipitated the War of the Revolution. (See LEXINGTON.) In 1787, during Shays's Rebellion, a body of insurgents entered Concord and prevented the sitting of its courts. The town is chiefly notable for having been the home of a distinguished coterie of writers and thinkers, including Emerson, Thoreau, A. Bronson Alcott, Louisa M. Alcott, Hawthorne, and William Ellery Channing, 'the poet.' Consult: Hurd, *History of Middlesex County* (Philadelphia, 1890); Emerson, *Historical Discourse Delivered in 1835* (Concord, 1835).

CONCORD. A city, capital of New Hampshire, and county-seat of Merrimack County, 75 miles north-northwest of Boston; on the Merrimack River and on the Boston and Maine Railroad (Map: New Hampshire, J 9). It has wide streets, shaded and well paved, and a good water-supply, owned and operated by the municipality. Among the principal buildings are the State House, built of granite, United States Government building, court-house, and city hall, State prison, State insane asylum, the Margaret Pillsbury Hospital, State Library, and Saint Paul's School (Episcopal) for boys. There are several parks: White's, Rollins, Fiske, Cottoocook River, and Pennacook. In the State-house park is a bronze statue of Daniel Webster, and at Pennacook, a monument to Hannah Dustin. In the vicinity are extensive quarries of fine-grained white granite, the quarrying of which is one of the leading industries. The repair-shops of the Boston and Maine Railroad are situated here. The manufactures include carriages, silverware, harness, furniture, flour, cotton and woolen goods, leather belting and leather hose, pianos, shoes, etc. Industrial statistics for 1900 give the following figures: Number of industries, 81; invested capital, \$1,959,238; value of production, \$3,252,302; persons employed, 1829. Under the charter of 1853, as amended, Concord is governed by a mayor, chosen every two years, and a bicameral city council. The assessors and the school board are chosen by popular election; other appointments are controlled by the Mayor and Board of Aldermen, and the Council. Population, in 1890, 17,004; in 1900, 19,632.

Concord was founded in 1725, on the site of Pennacook, the chief village of the Pennacook Indians, and bore that name until 1733, when it was incorporated as Rumford. It suffered greatly in all the Indian wars and was the scene of a massacre in 1746. In 1765 Rumford was renamed 'Concord.' On the adoption of a State constitution it became the capital of New Hampshire, and in 1853 was incorporated as a city. Consult: Moore, *Annals of Concord, N. H.* (Con-

cord, 1824); and Bouton, *The History of Concord* (Concord, 1856).

CONCORD. A city and county-seat of Cabarrus County, N. C., 21 miles northeast of Charlotte; on the Southern Railroad (Map: North Carolina, B 2). It has foundries and machine-shops, and extensive manufactures of cotton. First incorporated in 1793, Concord is governed at present under a charter of 1851, revised in 1891, which provides for a mayor, elected biennially, and a city council. Population, in 1890, 4339; in 1900, 7910.

CONCORD, IN MUSIC. See CONSONANCE.

CONCORD, BOOK OF (translation of Ger. *Concordienbuch*, Lat. *Liber Concordiarum*). A collection of confessions of faith published in 1580, generally accepted by the Lutheran Church. Its contents are: (A) The three ecumenical creeds—the Apostles, the Nicene, and the Athanasian. (B) The six particular confessions of the Lutheran Church—(1) the Augsburg Confession; (2) the Apology of the Augsburg Confession; (3) the Schmalkald Articles; (4 and 5) the Larger and Smaller Catechisms of Luther; (6) the Formula of Concord. The last-named division, the Formula of Concord, appeared in 1580, after protracted conferences, and was acceded to by 86 of the States of the German Empire. Its topics are: The Rule of Faith and the Creed; Original Sin; Free Will; Justification; Good Works; The Law and the Gospel; The Third Use of the Law; The Lord's Supper; The Person of Christ; The Descent of Christ into Hell; The Customs of the Church; Predestination and Election; and an appendix concerning heresies and sectaries. The best editions are: In German, Jubilee edition (Saint Louis, 1880); in Latin, that of S. F. Francke (Leipzig, 1847); in English, that of H. E. Jacobs (Philadelphia, 1882).

CONCORD, TEMPLE OF (so called). A Doric temple at Girgenti, the ancient Agrigentum, in Sicily, and one of the most perfectly preserved of ancient temples. Its 34 columns are still standing.

CONCORDANCE (ML. *concordantia*, agreement, from Lat. *concordare*, to agree, from *com-*, together + *cor*, heart). A book arranged in alphabetical order, and showing in what passages all, or at least all of the more important, words in any work occur. For writings of universal import from which passages are continually being adduced to prove or support principles affecting our daily life and action, such a handbook is indispensable. The necessity for such a book upon the Bible was doubtless early felt, but the first Bible concordance was made by the famous Saint Anthony of Padua (q.v.), who in the early part of the thirteenth century published it under the title *Concordantia Morales in Sacra Biblia* (best edition, de la Haye, Paris, 1641). His example was followed by Cardinal Hugo de Saint Cher in 1244 with his *Concordantie Jacobi*, so called because made in the Convent of Saint James in Paris. Both these works were of course based on the Vulgate, as were several similar ones before the invention of printing. The earliest printed concordance to the Vulgate is by Joannes de Segovia and Sebastian Brant (Basel, 1496), and it is the basis of that published and edited by Robert Stephens (Paris, 1555). A concordance to the Greek Bible (Old and New Testament) was made by Euthalius of Rhodes

about 1300; it has never been printed, but a manuscript copy was seen in Rome in the seventeenth century. One to the Septuagint was compiled by Conrad Kircher (Frankfort, 1607); and to the Greek New Testament by Nystus Betuleius (Basel, 1546), which, as amended by Robert Stephens and his son Henry, was published by the latter (Paris, 1594). Rabbi Isaac Nathan finished in 1448 a concordance to the Hebrew Bible (Venice, 1524), which in amended form by Marius de Calaris was published (Rome, 1621-22); another was begun by the elder and finished by the younger Johann Buxtorf (Basel, 1632). The first work of this kind in English was a concordance to the New Testament printed and in all probability prepared by Thomas Gibson (London, 1535); but the first concordance to the entire English Bible was by John Marbeck (London, 1550). Luther's German Bible had to wait till 1610 before a concordance to it appeared at Frankfort. The author was Conrad Agricola.

But all these works are now superseded by the vastly better modern works. For the Hebrew Bible the standard concordance is that by Julius Fürst and Franz Delitzsch, in Latin (Leipzig, 1837-41); but just as good for all practical purposes will be found *The Englishman's Concordance to the Hebrew Old Testament* (London, 1843; 4th ed., 1873), compiled by Tregelles, B. Davidson, and others. For the Septuagint, the best is by Edward Hatch (London, 1892); for the Vulgate, the latest is by V. Coornaert (Bruges, 1892). To the Greek New Testament the best concordance in Latin is by C. H. Bruder (Leipzig, 1842; 5th ed., Göttingen, 1900); in English by W. F. Moulton and A. S. Geden (London and New York, 1897). To Luther's Bible the standard is M. G. Büchler's (Jena, 1740; 23d ed., Berlin, 1899). To the Authorized Version of the English Bible, Alexander Cruden was the first to prepare a concordance which met with wide acceptance (London, 1737), and it has been reprinted so often, complete or in condensation, that Cruden has become a household word. Two others, however, compete for the palm of superiority—Robert Young, *Analytical Concordance to the Bible* (Edinburgh, 1879), often reprinted, and James Strong, *The Exhaustive Concordance* (New York, 1894), which takes account of every word and is surely the most ambitious work of its kind.

Other books than the Bible have been furnished with concordances by the patient and long-continued labors of scholars. To enumerate a few: *Dante*, E. A. Fay (Boston, 1889); *Chaucer*, the Chaucer Society (begun London, 1872); *Shakespeare*, Mrs. Mary Cowden Clarke (London, 1845); or better, John Bartlett (New York, 1894); Milton, *Poetical Works*, G. L. Prendergast (Madras, 1857); C. D. Cleveland (London, 1867); *Pope*, E. Abbott (ib., 1875); *Cowper*, *Poetical Works*, J. Neve (ib., 1887); *Shelley*, F. S. Ellis (ib., 1892); *Dickens*, G. A. Pierce (ib., 1898); *Tennyson*, D. R. Brightwell (ib., 1869).

CONCORDAT (Fr., agreement). A term used to designate a compact dealing with ecclesiastical affairs between the Pope, as head of the Roman Catholic Church, and the temporal ruler of a State. Concordats commonly relate to things which are neither purely spiritual nor purely temporal, but mixed matters, in regard to which the action of the two powers can with

difficulty be dissociated. Concordats may be framed either in the form of a treaty, to which both the contracting powers are consenting parties, or enacted by proclamation issued only by one party, most commonly by the Pope, embodying in the form of a decree the regulations resulting from the terms of agreement previously arrived at. The difference is only in form. It is a settled doctrine of Roman Catholic canonists, and especially of those of the Ultramontane (q.v.) school, that the Pope never absolutely cedes purely spiritual powers. Thus, in the presentation to bishoprics, while the King 'nominated' or 'elected,' the Pope always reserved to himself the power of 'canonical institution.' There have been many famous concordats, of which the following are the most important: (1) *Concordats with Germany*.—The well-known Concordat of Worms in 1122, respecting investitures, is commonly regarded as the first concordat strictly so called. Similar agreements took place on the question of the *Regalia* (q.v.), between the Roman See and the emperors Otho IV., Frederick II., and Rudolph of Hapsburg. A more comprehensive compact on Church matters is that of which the foundation was laid at Constance in 1418, and which was subsequently modified by the 'Frankfort' or 'Princes' Concordat,' by the Concordat of Aschaffenburg, and by that of Vienna, which last, although practically disregarded by Joseph II. and his successor, Leopold II., continued in use till the dissolution of the Holy Roman Empire in 1806. Its place was supplied, under Pius VII. and his immediate successors, by separate concordats with Bavaria, 1817; Prussia, 1821; Baden, Württemberg, and other minor States, 1818; Hanover, 1824; and Saxony, 1827. The last German concordat was that concluded at Vienna, August 18, 1855. This provided for the fullest Papal authority in the Austrian dominions. The Church was to control education and to exercise a censorship over the press. The ecclesiastical courts were accorded special privileges. The Emperor was to nominate bishops, but only with the advice of the existing bishops and archbishops. The Church might acquire new property, but once acquired, it could not be sold or mortgaged without the consent of both Pope and Emperor. This concordat, so favorable to the Papacy, was set aside in 1868 in all the dominions of the Emperor of Austria. (2) *With France*.—The Pragmatic Sanction, ascribed to Saint Louis, but really of later date, has some of the characteristics of a concordat; but the first proper concordat is that of Bologna, concluded by Francis I. with Leo X. in 1515 and 1516, which continued in force, although with more than one conflict of the two powers, till the Revolution. In reëstablishing the Church in France, Napoleon Bonaparte, as First Consul, concluded with Pius VII. the celebrated Concordat of 1801, which he afterwards compelled the Pope, then a captive at Fontainebleau, to modify by a new act in 1814. Both were ignored at the Restoration; but an attempt to produce a substitute in 1817, and again in 1819, led to no result. (3) *With Italy*.—In Italy, an agreement regulating the election of bishops was concluded with Nice and Savoy by Nicholas V. in 1415; and a formal concordat was made with Sardinia by Benedict XIV. in 1740. The ecclesiastical affairs of Naples were anciently regulated by the terms of what

was called the *Monarchia Sicula*; but a formal concordat was made by Pius VII. in 1818. (4) *With Spain*.—Charles I. concluded a concordat for his Spanish kingdom with Adrian VI. and Clement VII.; and a further concordat was made by Clement XII. and Philip V. in 1737. (5) *With Portugal*.—Benedict XIV. made a concordat with Portugal in 1741. Besides these, the Papacy has from time to time made many similar concordats with various small powers, especially with South American States in the nineteenth century. The age of concordats has passed away with the establishment of the preponderance of the State over the Church, and no great power to-day would bind itself as Austria did in 1855.

Consult: Phillimore, *Commentaries on International Law* (London, 1889); Séché, *Les origines du Concordat* (Paris, 1894). The texts of the various concordats will be found in the collections of Münch (Leipzig, 1830); Nussi (Mainz, 1870); Walter (Bonn, 1862); Balve (Munich, 1863); often with extensive commentaries. See AUSTRIA-HUNGARY; CONSTANCE, COUNCIL OF; GERMANY; HOLY ROMAN EMPIRE; INVESTITURE; NAPOLEON I.; PIUS VII.

CONCORDE, kôn'kôrd', PLACE DE LA (Fr., Square of Concord). The largest square in Paris, the starting point of the Champs Elysées, bounded by the Rue de Rivoli, the Tuileries Gardens, and the Seine. It is associated with many historical occurrences. On it, on May 30, 1770, occurred a panic caused by fireworks, resulting in the death or injury of over 3000 persons. On the spot now occupied by the obelisk stood the guillotine by which more than 2800 persons died between January 21, 1793, and May 3, 1795. In 1871 the Versailles troops engaged in a fierce struggle with the Communists on the square. The present name of the place, previously the Place Louis XV., was given in 1799. It was again called Place Louis XV. from 1824 to 1830, when the name now in use was restored. Architecturally the square is one of the finest in the world. It is adorned with an obelisk from Luxor, presented by Mehemet Ali in 1831, with striking fountains, and eight figures representing the principal towns of France, and at night is brilliantly illuminated by twenty large bronze clusters of lamps. It commands a fine view of the Champs Elysées with the Arc de Triomphe, of the Madeleine, and of the Chambre des Députés, approached by the Pont de la Concorde.

CONCORDIA, kôn-kôrd'ê-â. A river port in the Province of Entre Rios, Argentina, situated on the right bank of the Uruguay (Map: Argentina, F 10). It has oil-mills and slaughter-houses, and exports large quantities of salt meat, leather, and Paraguay tea. Population, in 1895, 14,804.

CONCORDIA, kôn-kôrd'ê-â. A city and the county-seat of Cloud County, Kan., 210 miles west by north of Kansas City, on the Republican River, and on the Missouri Pacific, the Union Pacific, and other railroads (Map: Kansas, E 2). Good transportation facilities, abundant water-power, a fertile agricultural country, and valuable deposits of coal and building-stone have aided in developing the city's commercial and industrial interests. There are grain elevators, flouring-mills, iron-works, plow and wagon

works, etc. The city contains Nazareth Academy, Saint Aloysius's School, and library association and high school libraries. Population, in 1890, 3184; in 1900, 3401.

CONCORDIA (Lat., from *con-*, together + *cor*, heart). A Roman divinity, the goddess of harmony. Many temples were built in her honor, the oldest of them by Camillus in B.C. 367, after the passing of the Licinian Laws. It stood on the Forum between the Temple of Saturn and the Mamertine Prison, and was built of white marble with a richly carved cornice. The interior was flanked with rows of columns against the walls, with niches which held masterpieces of Greek sculpture. It contained, besides, paintings and a collection of precious stones. It was twice rebuilt, in B.C. 121 and under Augustus, but only scanty ruins now remain. The temple sometimes served as a meeting-place for the Senate, and Cicero there delivered his last oration against Catiline. The goddess was represented as a matron, holding in her right hand a saucer-like vessel (*patera*), or an olive branch, and in her left the horn of plenty. Her symbols were two hands clasped together, and two serpents entwined about a wand.

CONCRESCENCE (Lat. *concresecientia*, growing together, from *concresecere*, to grow together, from *com-*, together + *cresecere*, to grow; connected with Lat. *creare*, to create). The growing together of young plant organs by reason of mutual contact or pressure when forming. The term has also been applied to the apparent union of neighboring organs, such as the flower parts. In these cases, however, each organ begins its development independently, and those which appear to be united are lifted by the growth, underneath the separate rudiments, of a region of tissue which belongs equally to all. See TERATOLOGY; FLOWER.

CONCRETE (from Lat. *concretus*, p.p. of *concresecere*, to grow together). Opposed to abstract. See ABSTRACTION.

CONCRETE. An artificial stone composed of hydraulic cement (q.v.), sand, and broken stone or gravel, or other hard material in small fragments. The mixture of sand and cement is commonly called the matrix, and the broken stone or other material is similarly called the aggregate. The matrix may be either lime and sand or cement and sand mortar, but is more usually the latter. The aggregate may be pebbles, gravel, broken stone, broken bricks, shells, slag, coke, etc., but the most commonly used aggregates are broken stone and gravel. Broken stone gives a stronger concrete than gravel, other things being equal. The proper proportions of the several constituents composing concrete is considered to be attained when the cement paste exactly fills the voids in the sand, and the matrix exactly fills the voids in the aggregate; less than enough mortar to fill the voids in the aggregate results in a weaker and more porous concrete, and more than enough adds to the cost of the concrete without increasing its strength.

It is evident from this statement that the relative proportions will vary with the character of the sand and aggregate employed. A fair range of proportions for most engineering works is cement, one part; sand, one to three parts; aggregate, four to six parts. There is

considerable diversity of opinion as to the amount of water to be used in making concrete. According to one extreme view, the amount of water should be such that the concrete will quake when tamped; according to the other extreme, the mixture should be made so dry that water will barely flush to the surface when the concrete is tamped. Current practice varies all the way between these two extremes. The manufacture of concrete consists simply in mixing the water, cement, sand, and aggregate of which it is composed. To obtain the best results this mixture should be exceedingly thorough; the ideal mixture is attained when every grain of sand is covered with a film of cement paste and every fragment of aggregate is covered with a coating of mortar. Both hand mixing and machine mixing are employed in practice. In hand mixing the proper proportions of cement and sand are deposited on a timber platform and mixed dry by repeated turnings with a shovel. The proper quantity of water is then added, preferably with a spray, and the mixture then turned and returned with shovels until the water is thoroughly and evenly incorporated with the cement and sand. The aggregate is then thoroughly wetted and is mixed with the mortar by similarly repeated turnings with shovels.

A variety of concrete-mixing machines are employed, some being intermittent and some being continuous in operation, the latter sometimes automatically measuring the proportions of cement, sand, aggregate, and water. Perhaps the most common form of intermittent mixer is a cubical iron box hung on trunnions at diagonally opposite corners; the cement, sand, and aggregate in the proper proportions are placed in the box through a suitable door in one side which can be closed and fastened; the water is admitted through the hollow trunnions, and the box is put in revolution by an engine or other motive power. After from ten to twenty turns the box is brought to rest, its contents of thoroughly mixed concrete dumped out into barrows or cars and a new charge of cement, sand, and aggregate introduced for mixing. A common form of continuous concrete-mixer consists of a trough or cylinder in which a spiral or bladed screw shaft revolves; the raw materials are introduced continuously at one end, and a continuous discharge of mixed concrete takes place at the opposite end. There are numerous other forms of concrete-mixing machines.

The value of concrete as a structural material consists in its property of changing from a plastic condition into a hard, rigid, artificial stone by the setting and hardening of the cement paste. (See CEMENT.) Concrete composed of one part cement, two parts sand, and six parts broken stone has a compressive strength of from ten to twenty tons per square foot at the age of one year. The method of laying the concrete after mixing depends upon the position in which it is placed and upon the form in which it is to be used in the structure. When used in the form of blocks, the blocks are made by placing the plastic mixture in suitable molds in thin layers and tamping each layer thoroughly with wooden or iron rammers before placing the succeeding layers. The mixture remains in the molds until it is hard, when the block is removed and laid in the structure just as a corresponding block of stone would be laid. The more common method of using con-

crete is to place it in the structure in its plastic condition, and let it harden in place. When the work is in the air the mixture is laid and rammed in layers, just as is done in making concrete blocks, but when it is laid under water it has to be deposited in buckets, which open when the bottom is reached and discharge their contents, or it is run through circular chutes, which reach from the surface to the bottom. Sometimes concrete is placed under water by inclosing it in paper bags, which are slid down a chute; the bags become wet and the concrete bursts them open, thus allowing the succeeding bagfuls to unite into a solid mass. Sometimes, also, coarse open-cloth bags are used, the cement oozing through the meshes sufficiently to unite the whole into a single mass. The chief care to be exercised in placing concrete under water is to prevent the cement, sand, and aggregate from becoming separated. Concrete weighs when hard from 130 to 160 pounds per cubic foot, and costs, laid, from \$2 to \$10 per cubic yard.

The uses of concrete are excellently summarized in *A Treatise on Masonry Construction*, by Prof. I. O. Baker, as follows: "Concrete is admirably adapted to a variety of most important uses. For foundations in damp and yielding soils, and for subterranean and submarine masonry, under almost every combination of circumstances likely to be met with in practice, it is superior to brick masonry in strength, hardness, and durability; it is more economical; and in some cases is a safe substitute for the best natural stone, while it is almost always preferable to the poorer varieties. For submarine masonry, concrete possesses the advantage that it can be laid, under certain precautions, without exhausting the water, and without the use of a diving-bell or submarine armor. On account of its continuity and impermeability to water, it is an excellent material to form a substratum in soils infested with springs; for sewers and conduits; for basement and sustaining walls; for columns, piers, and abutments; for the pointing and backing of walls faced with brick, rubble, or ashlar work; for pavements in areas, basements, sidewalks, and cellars; for the walls and floors of cisterns, vaults, etc. Groined and vaulted arches, and even entire bridges (see BRIDGES), dwelling-houses, and factories in single monolithic masses, with suitable ornamentation, have been constructed of this material alone." Consult Baker, *Treatise on Masonry Construction* (New York, 1900). See MORTAR.

CONCRETE TERM. In logic, any name, whether substantive or adjectival, which denotes a thing and connotes a quality. See CONNOTATION; DENOTATION.

CONCRETION (Lat. *concretio*, coalescence, from *concresecere*, to grow together). A term used in medicine to denote a formation of solid, unorganized masses within the body, either by chemical precipitation from the secretions, or by the accidental aggregation of solids introduced into the system from without. If composed of precipitates in the urinary bladder, gall-bladder, or salivary ducts, concretions are called calculi. (See CALCULUS.) They may also be found in former cavities in the lungs, as well as in tubercular joints, in which cases they are composed of lime salts. They may be found in the fingers and toes of gouty patients, appearing in nodules projecting from the sides of the joints, and termed

'crabs' eyes.' These nodules are frequently composed of urate of sodium. Concretions composed of fecal matter are frequently found in the vermiform appendix, in cases of appendicitis; very rarely a fruit-seed is the basis and centre of such a concretion. Concretions have been formed upon pieces of catheter in the urinary bladder, and upon beans in the nostrils. Concretions formed of balls of hair, concretions of Epsom salts swallowed undissolved, and concretions of cholesterolin (q.v.) have been found in the intestines. See BEZOAR.

CONCRETIONARY STRUCTURE. A condition produced in rocks by molecular aggregation about some nucleus, whereby the rock masses assume regularity of outline. This structure is exhibited in both igneous and sedimentary rocks, and may be due to processes acting at the time of their formation (primary concretions), or subsequent to their formation (secondary concretions). It is especially frequent in limestones, clays, and iron ores. Oolite is a limestone composed of rounded grains which resembles fish-roe in appearance and not infrequently attains great thickness. The flints of the English chalk formation are an example of siliceous concretions. Clay-ironstone, hematite, limonite, pyrite, and marcasite often assume nodular or oolitic form, and are widely distributed in geological formations. The structure of these primary concretions is due to the tendency which atoms and molecules possess, when in a state of solution or suspension, of attaching themselves to some foreign body. Particles of silica, such as sand and frustules of diatoms, commonly serve as central points of attachment. Secondary concretions are developed by weathering in sandstones, shales, and limestones; the decomposition and disintegration take effect first on the surface of the rock masses, progressing thence toward the interior. Concretionary structure is rarely developed in igneous rocks, the best example being the beautiful diorite (Napoleonite) of Corsica, in which the feldspar, quartz, and hornblende constituents have grouped themselves into globular aggregations.

CONCUBINAGE (from OE., Fr. *concubine*, from Lat. *concubina*, concubine, from *concumbere*, to lie with, from *com-*, together + *cubare*, to lie). In general, the cohabitation as husband and wife of a man and woman who are not lawfully married to each other. Specifically, a form of polygamy in which the primary matrimonial relation is supplemented by one or more secondary and inferior relations of the same kind. It was used, technically, in the former sense, in the common-law action for dower, in the allegation that the woman claiming dower was not a wife lawfully married to the party in whose land she seeks to be endowed, but his concubine. In the United States, the term has been applied, under the Edmunds acts of 1882 and 1887, to the polygamous relations of the Mormons, at which the acts were aimed. In its general sense, as denoting merely unlawful cohabitation, concubinage, however abhorrent to the moral sense of the community, is not in most jurisdictions obnoxious to the criminal law. (See CRIM. COX.) In its special sense, however, as signifying a plurality of wives, it comes under the penalties of bigamy and polygamy (qq.v.).

The earliest Roman laws were distinguished for the strictness with which they treated marriage.

They not only upheld thoroughly the principle of monogamy, but they fettered marriage itself with many burdensome forms. Hence arose the practice of a free unmarried man entering into a less strict relation with a single woman—a sort of permanent cohabitation. The offspring of such a connection, called 'natural' children, had not the rights of legitimate children, but they were recognized by the father. Augustus, with a view to promote regular marriages and check the growing licentiousness, enacted a comprehensive marriage-law (*Lex Julia*), which discouraged concubinage, restricting it to women of low rank or those who had lost their station. Christianity required the complete sanctity of marriage and taught that concubinage was sinful, and we find the Synod of Toledo legislating against it as far back as A.D. 400. The ancient laws of the Germans recognized, along with regular marriage, an informal connection of the sexes. In the Middle Ages a similar connection became customary, called a 'left-handed,' or morganatic marriage. See MARRIAGE, and consult the authorities there referred to.

CONCURRENCE (ML. *concurrentia*, concurrence, from *concurrere*, to run together, from *com.*, together + *currere*, to run) AND **COLLINEARITY** (from Lat. *com.*, together + *linca*, line). If several lines have a point in common they are said to be concurrent. The common point is called the focus or vertex of the pencil of lines. If several points lie on one straight line they are said to be collinear. The line is called the base of the range of points. That portion of geometry concerned with concurrent lines and collinear points is called the theory of concurrence and collinearity. Some of its fundamental propositions are:

If a transversal intersects the sides of a triangle ABC in the points X, Y, Z, the segments of the sides of the triangle are connected by the relation $(AZ:ZB) \cdot (BX:XC) \cdot (CY:YA) = -1$. Conversely, if the points be so taken that the relation holds, then the three points are collinear. (This relation is known as Menelaus's theorem.)

If the three lines AO, BO, CO drawn from the vertices of the triangle ABC are concurrent in O and meet the opposite sides in X, Y, Z, then $BX \cdot CY \cdot AZ = -CX \cdot AY \cdot BZ$, and conversely (Ceva's theorem).

If three lines perpendicular to the sides of a triangle ABC at X, Y, Z are concurrent, then $BX^2 - XC^2 + CY^2 - YA^2 + AZ^2 - ZB^2 = 0$.

Conversely, if this relation holds, the perpendiculars are concurrent.

If the lines joining the vertices of two triangles are concurrent, their corresponding sides intersect in three collinear points. (This proposition, known as Desargues's theorem, is true for any rectilinear figures.)

The opposite pairs of sides of a hexagon inscribed in a conic intersect in three collinear points (Pascal's theorem).

The lines joining the opposite vertices of a hexagon circumscribed about a conic are concurrent (Brianchon's theorem).

The polars of a range of points with respect to a circle (q.v.) are concurrent, and conversely.

If from any point on a circle perpendiculars are drawn to the sides of an inscribed triangle, their feet are collinear. (The base of this range is called Simson's line.)

From these and other similar theorems, many

properties of elementary geometry follow at once; as, the altitudes of a triangle are concurrent, the medians of a triangle are concurrent, etc. The theorems of Pascal and Brianchon lead to numerous theorems in modern geometry. Consult: Cremona, *Elements of Projective Geometry*, trans. by Leudesdorf (Oxford, 1885); Casey, *Sequel to Euclid* (Dublin, 1888); Beman and Smith, *New Plane and Solid Geometry* (Boston, 1900); McClelland, *Geometry of the Circle* (New York, 1891).

CONCURRENT JURISDICTION. The jurisdiction that exists where two or more courts possess the equal and coördinate right of taking cognizance of a single cause. Thus in the United States, a justice's court and a city court may often take cognizance of the same matter; or a court of common pleas and a superior court may do the same. In criminal cases it is an established rule that when one court has brought an offender before it, the court having concurrent jurisdiction is thereby debarred from taking cognizance of the case. In civil trials it is the privilege of the person appealing to the law—that is, in most cases, the plaintiff—to choose before which of the two coördinate courts he wishes to bring the matter. The phrase concurrent jurisdiction is used in opposition to *private*, or exclusive, jurisdiction, i.e. where only one court has the right of hearing and determining the matter at issue.

In the political system of the United States, with its Federal courts exercising jurisdiction over the same persons as are subject to a local State jurisdiction, the occurrence of cases of concurrent jurisdiction is very common. Where it exists, a decision of a State court may, in a proper case, be taken up to the Supreme Court of the United States for review. See COURT; JURISDICTION.

CONCUSSION FUSE. See FUSE.

CONCUSSION OF THE BRAIN (Lat. *concussio*, shock, from *concutere*, to shake together, from *com.*, together + *quaterere*, to shake). The name given to a group of symptoms which result from injuries to the head, but are not due to fracture or to perceptible laceration of vessels or brain substance. The condition has been widely discussed and extensively studied by many means of experimentation, but authorities still disagree as to whether it is due to laceration of minute blood-vessels, to altered vibratory changes in the molecules of the brain-cells, or to a change in the disposition of the cerebro-spinal fluid. At present, almost all surgeons deny that concussion of itself is fatal, and autopsies show almost invariably some apparent lesion of vessels or brain substance in those fatal cases which have simulated concussion, but which were really instances of contusion or laceration. The symptoms vary in mild and severe cases. In the former, when the patient is 'stunned' by a fall or a blow on the head, there is dizziness, disturbances of vision and noises in the ears, loss of strength, so that the patient falls, the face is pale and covered with a cold perspiration, the respiration is shallow, the pulse feeble and often slower than normal. In graver cases these symptoms become intensified, or the most extreme symptoms may develop instantly. There is complete unconsciousness, the body is cold and relaxed, the pupils widely dilated and unresponsive to light, the

respiration scarcely distinguishable, the pulse weak, irregular, and slow. Vomiting is also frequent. This condition may last for several hours or even for a day or more, after which reaction slowly occurs, and recovery is complete. Frequently the symptoms of contusion or hemorrhage may follow, and the subsequent history becomes that of severe brain injury. Protracted symptoms of concussion are usually regarded as suggestive of a more serious injury. The treatment is expectant; it consists in the application of warmth to the body, stimulation of respiration and pulse if necessary, and in keeping the patient in absolute quiet. A surgical operation is, of course, not indicated in pure concussion, but only in such cases as give symptoms of gross brain lesions. See SHOCK.

CONDAMINE, CHARLES MARIA DE LA. See LA CONDAMINE.

CONDÉ, KŌN'dá', FAMILY OF. One of the great families in France, and a branch of the House of Bourbon. It took its name from the town of Condé. (See CONDÉ-SUR-L'ESCAUT.) The first to bear the title of Prince de Condé was Louis, the youngest son of Charles de Bourbon, Duke of Vendôme. (See below.) The family became extinct in 1830. It gave many famous men to France, of whom the following are the most noted:

LOUIS I. DE BOURBON, Prince de Condé (1530-69), appears in 1549 as gentleman of the royal bedchamber. He distinguished himself at the siege of Metz (1552), and in the battle of Saint Quentin (1557). But the Court was under Guise influence, and no Bourbon could expect advancement. Condé, who had early imbibed Protestant ideas, threw in his lot with the Huguenots on the accession of Francis II. in 1559. He took part in the conspiracy of Amboise, formed by the Huguenots for the overthrow of the Guises. The capture and imprisonment of the chief Huguenot leaders followed, and Condé only escaped execution through the opportune death of the King. The balance of power rested in the hands of Catherine de' Medici (q.v.), who liberated Condé and made him Governor of Picardy. After the massacre of Vassy (1562), Condé and Coligny took up arms against the Guise faction, but they were defeated at Dreux in the same year, and Condé was taken prisoner. He was, however, liberated in the year following by the pacification of Amboise. Owing to fresh persecution, the Huguenots again took up arms in 1567; an unsuccessful attempt to seize the person of the King was followed by the indecisive battle of Saint Denis, in which the Catholic leader, the Constable de Montmorency, was slain, and in 1568 another treaty of peace was made. Condé, however, learning of Court intrigues against his liberty, renewed the conflict. The battle of Jarnac (March 13, 1569) resulted most disastrously for the Huguenots. Condé rashly exposed himself and was wounded and taken prisoner. While his wounds were being dressed he was assassinated by Montesquieu, a Swiss mercenary captain, possibly at the command of the Duke of Anjou, whom Condé had offended. "He was distinguished," says the Duc d'Aumale, "by great ardor and gaiety, the desire and the gift of being pleasant, by a resolute character, a proud soul, and a great and generous heart." Of the four sons who survived him, the eldest, Henri I. (1552-88), joined the Huguenot cause,

but renounced his religion to save his life at the time of the massacre of Saint Bartholomew. He again took up arms for Protestantism in 1585, and was excommunicated by Pope Sixtus V. After several successful encounters with the forces of the League, Condé was wounded at Coutras (October 20, 1587) and died a few months later, not without grave suspicions of foul play on the part of his wife and attendants. The legitimacy of his only son, Henri II. (1588-1646), was a matter of great dispute; but finally he was allowed to succeed to the titles and estates of his father, and, for a time at least, was looked on as the heir presumptive to the French crown. This contingency was removed by Henry IV.'s second marriage and the birth of the Dauphin Louis (1601). After a life at Court, devoted to the aggrandizement of his family, and marked by opposition to the Huguenots, Henri II. de Condé died in 1646. He was the father of the Great Condé.

LOUIS II. DE BOURBON (1621-86) is known in history as 'the Great Condé.' After a thorough education in the Jesuit seminary at Bruges the young prince, who was known as the Duc d'Enghien during the lifetime of his father, was introduced at Court, and the next year, at the age of eighteen, was made Governor of Burgundy. To further his father's political aims, he was forced, in 1641, to marry the niece of Richelieu, much against his inclination. Meanwhile he had entered the military service and distinguished himself in the Netherlands, but his great triumph came in 1643, when, at the battle of Rocroi, he outmaneuvered the Spanish infantry, raised the siege, and inflicted a severe defeat on the enemy. Other successes followed, and Condé was promoted and sent to Alsace, in the summer of 1643, to cooperate with Turenne. After the victory of Freiburg, the capture of Philippsburg, Mainz, and other cities on the Rhine, Condé returned in triumph to Paris for the winter, but in 1645, after the defeat of Turenne by Mercy, he again took the field and by his splendid dash and energy won a series of victories culminating in that of Nördlingen in 1645, where Mercy was killed. Associated with the Duke of Orléans in the Netherlands in 1646, Condé won several brilliant victories. The death of his father in the same year made him head of the Condé family and gave him possession of vast estates and a large fortune, and made him the highest personage in the State after the King and the Duke of Orléans. Though feared by Mazarin, Condé was given the chief command in the Netherlands and made captain-general of the French forces. The victory at Lens in 1648 added to his fame and he was recalled to Paris to suppress the rising of the Fronde (q.v.). After many intrigues, plots, and counter-plots the Court returned to Paris. Condé's haughtiness of manner and dictatorial measures, however, soon alienated the Queen and nobles, and by the advice of Mazarin he was arrested, with other members of his family. The threatened advance of Turenne, the murmurs of the Fronde, and the activity of friends, soon secured Condé's release. The discomfiture and flight of Mazarin again brought Condé to the front, but the failure of the Court to fulfill its promises and the suspicions he entertained that his assassination was contemplated roused him to fresh rebellion in 1651. His former ally, Turenne, was now on the

side of the Court, and after Condé had won the battle of Bléneau (April, 1652) and advanced on Paris, he was met by Turenne at the head of the royal troops. A bloody and indecisive conflict ensued, the net result of which was so to weaken the Frondeurs that most of them consented to a treaty of peace. Condé, however, rejected the proffered terms, and after a vain effort to retrieve his cause and seize Paris, went over to Spain. In the war which followed he acted as commander-in-chief of the Spanish forces in Flanders, but could gain no advantage over Turenne, who opposed him. When the peace of the Pyrenees was made (1659) Condé was pardoned and again entered the service of France. In 1673 he commanded in the Netherlands, and the next year fought a drawn battle at Seneffe with William of Orange. This was the great general's last important battle, though in 1675 he succeeded Turenne, on the latter's death, in command of the army on the Rhine. Disabled by gout, he resigned his post and retired to his estate at Chantilly. There he became a devout Roman Catholic, and occupied himself during his remaining years with literature, religion, and the society of his friends. He was intimate with Molière, Racine, Boileau, Bossuet, and La Bruyère. He died at Fontainebleau on December 11, 1686, and his friend Bossuet pronounced the now famous *Oraison funèbre* over his bier. Though proud, and acting always from motives of selfish ambition, Condé was without doubt one of the greatest men of his time. The only surviving son of the Great Condé, Henri Jules (1643-1709), inherited some of the ability of his father and played a more or less important part in the history of his time, while his grandson, the Duke de Bourbon, known as *Monsieur le Duc*, was a prominent figure at the time of the Regency.

LOUIS JOSEPH DE BOURBON, Prince de Condé (1736-1818), the son of the Duke de Bourbon, was born in Paris, August 9, 1736. He distinguished himself in the Seven Years' War at Minden, Gemmingen, and Johannisberg. At the outbreak of the Revolution he showed himself a strong supporter of the monarchy, and in 1792 took up arms against the Republic, organizing on the Rhine a body of *émigrés*, which cooperated with the Austrians, and was known as 'the army of Condé.' After the peace of Campo Formio (1797), he entered the Russian service, and in 1801 fought in that of England. In that year he took up his abode in England, where he remained until the Restoration. His last years were spent at Chantilly, and he died there May 13, 1818. He was the author (1798) of an *Essai sur la vie du grand Condé*. His son Louis Henri Joseph (1756-1830) was the last of the Condé princes. He was wounded at the siege of Gibraltar in 1782 and later served under his father against France. His eldest son was the hapless Duc d'Enghien, executed in 1804 by order of Napoleon. After the Restoration Condé settled his fortune on the Duc d'Aumale, son of Louis Philippe, but in 1830 seemed to have thought of changing this will. Before doing so, however, he was found strangled, and it was judicially decided that he had committed suicide, though no satisfactory evidence was produced and the verdict was an open one.

Consult: Duc d'Aumale, *Histoire des princes de Condé XVIIe and XVIIIe siècles* (7 vols., Paris,

1863-96); vols. i. and ii. translated into English by R. B. Borlase (London, 1872); Lord Mahon, *Life of Louis, Prince of Condé* (London, 1845); Fitzpatrick, *The Great Condé and the Period of the Fronde* (2d ed., London, 1874); Crétineau-Joly, *Histoire des trois derniers princes de la maison de Condé* (Paris, 1866); Muret, *L'histoire de l'armée de Condé* (Paris, 1844).

CONDELL, kām'dēl, HENRY (? -1627), and HEMING, JOHN (? -1630). English actors, whose names are forever linked with Shakespeare's. They both belonged to Shakespeare's company, and, with Burbage, were joint owners of the Globe Theatre. Like Shakespeare, they amassed fortunes from their profession. The great dramatist, as a token of lifelong friendship, bequeathed to them and Burbage 26s. 8d. to buy rings. And they in turn collected and edited his plays, 'to keep the memory of so worthy a friend and fellow alive' (first folio, 1623).

CONDEMNATION. See EMINENT DOMAIN.

CONDENSED MILK. See MILK.

CONDENSER (from Lat. *condensare*, to thicken, from *com-*, together + *densus*, thick, Gk. *δαρός*, *dasys*, thick). Any device for reducing gas or vapor to a liquid or solid form is termed a condenser, though the name is applied specifically to a variety of apparatus used in the arts besides appliances for condensing gases and vapors, as the part of a cotton-gin which compresses the lint; a machine which takes the wool coming from the carding engine and rolls it into slightly twisted threads or slubbings ready for spinning; the arrangement of steam-pipes used in sugar-mills to evaporate the water in the cane-juice preparatory to concentration. Condensers in steam engineering are apparatus for condensing the exhaust steam from an engine. They are employed on shipboard, invariably in ocean steamers, and very generally in fresh-water craft, but are seldom used on stationary land engines and almost never on locomotive or portable engines. The two forms of steam-condensers are the jet condenser, now seldom used, and the surface condenser. The jet condenser consists essentially of an air-tight chamber into which the exhaust steam flows, and is brought into contact with a spray of water whose action is to turn the steam to water, which falls to the bottom of the chamber and is pumped away by an air-pump. With the jet condenser the condensed steam is necessarily mixed with the water of the spray, which in ocean steamers is always seawater, so that it is always salt and thus objectionable for boiler-feeding purposes. To remedy this objection, the surface condenser was invented, and consists essentially of a vessel containing brass tubes through which the exhaust steam is passed, and around which a current of cold water is kept in circulation, thus keeping separate the condensed steam and the salt condensing water. See STEAM-ENGINE.

CONDENSER. A form of electrical apparatus used to accumulate a charge of electricity, or, in other words, to store up electrical energy. A condenser in its simplest form consists of two conductors which are separated from each other by an insulating medium or dielectric, and is illustrated by the Leyden jar or Franklin plate. The name dates from the time of the fluid theory of electricity, when it was believed that a certain

amount of the electric fluid could be collected or condensed on a conducting surface. The principle of the apparatus is illustrated in the Franklin plate, which consists of a plate of glass with pieces of tin-foil on each side. If a positively charged body or the positive conductor of an electric machine is connected with one of the tin-foil coatings, it will communicate to it by conduction a positive charge of electricity. If now the opposite plate is connected with the ground, the negative electricity is held bound, while the positive is repelled and passes to the ground. Accordingly we have accumulated equal amounts of positive and negative electricity on the tin-foil, and if the two surfaces are connected a bright spark results and the equilibrium is restored. Otherwise, the charge remains on the surface of the conductors until it is dissipated by leakage. The energy which is stored up in the condenser is expended in producing the spark. The amount of electricity that can be accumulated depends upon the capacity of the condenser and the potential of the charge. The Leyden jar consists of a Franklin plate in a cylindrical form, and as it is more compact and has greater capacity, it is more often used. In practice, however, the usual form of condenser consists of sheets of tin-foil separated from each other by paraffined paper, or in the case of standard condensers sheets of mica, with the alternate sheets of tin-foil connected together to give considerable capacity. The apparatus may be arranged so as to afford various amounts of capacity, and is much used in cable-testing and other branches of electrical work. The unit of capacity is the farad (q.v.), but condensers are generally constructed to give capacities in fractions or multiples of a micro-farad ($\frac{1}{1000000}$ farad), which is the unit ordinarily employed. See ELECTRICITY.

COND'ER, JOSIAH (1789-1855). An English author. He set up as a bookseller in London in 1811, and became proprietor and editor of the *Eclectic Review* in 1814 and editor of the *Patriot* newspaper in 1832. He published many works on religious, political, and miscellaneous subjects. The most popular of these was his *Modern Traveler* (1825-29), a series of 30 volumes descriptive of the various countries of the globe, of remarkable accuracy, though the author never traveled outside of his native country.

CONDÉ-SUR-L'ESCAUT, kōn'dá' sur lá'skó' (Fr., Condé on the Scheldt, from Gall. *condat*, confluence + Fr. *sur*, on + *Escaut*, Scheldt). A town in the Department of Nord, France, at the confluence of the Haine and the Scheldt and on the Condé-Mons Canal, eight miles northeast of Valenciennes. It dates from the Roman period and gave its name to the noble family of Condé. It has an interesting castle, a church, an arsenal, and strong fortifications constructed by Vauban. It manufactures starch, chicory, leather, and soap. Population, in 1901, 4130; commune, 4960.

CONDÉ-SUR-NOIREAU, nwä'ró'. A town in the Department of Calvados, France, on the Noireau River, 33 miles south-southwest of Caen by rail (Map: France, F 3). Among its notable features are the two venerable churches of Saint Sauveur and Saint Mark, and a bronze statue of Dumont d'Urville, the famous navigator, a native of the town. It is an ancient town and a busy industrial centre, with cotton-spinning factories, manufactures of cutlery and

leather, and an important trade in cattle, honey, and other agricultural products. Population, in 1901, 6591.

CONDILLAC, kōn'dé'yák', ETIENNE BONNOT DE (1715-80). A French philosopher. He was born at Grenoble, and in 1768 became a member of the French Academy of Sciences. He never attended the meetings of the Academy after his reception as a member, and passed his life mostly in great retirement. He died at his estate near Beaugency. In 1746 he published his *Essai sur l'origine des connaissances humaines*, a work which represented the views of Locke (q.v.). In his later works he carried out the sensational side of Locke's philosophy with great consistency. He believed that "the ego of each man is only the bundle of the sensations he experiences and of those which memory recalls." He illustrated his view by describing an imagined growth in the consciousness of a marble statue as it received one by one various sense faculties. In addition to his first essay, he wrote: *Traité des systèmes* (1749); *Recherche sur l'origine des idées que nous avons de la beauté* (1749); *Traité des sensations* (1754); and *La logique* (1781), besides thirteen volumes of textbooks he had prepared when tutor to the Duke of Parma, grandson of Louis XV. Consult: Dewaule, *Condillac et la psychologie anglaise contemporaine* (Paris, 1892); Lewes, *History of Philosophy* (London, 1880); Réthoré, *Condillac ou l'empirisme et le rationalisme* (Paris, 1864); Robert, *Les théories logiques de Condillac* (Paris, 1869).

CONDIMENTS (Lat. *condimentum*, from *condire*, to season, from *com-*, together + *-dere*, Skt. *dhā*, to put). Seasoning agents, or substances employed at table for the purpose of imparting a flavor or seasoning to the ordinary solid or liquid food. The greater part of condiments are necessary to sustain the proper functions of the alimentary system, and, besides gratifying the appetite, minister, more or less, to the wants of the structure. The principal condiments are saline substances, such as common salt; acidulous bodies, such as acetic acid or vinegar; oily condiments, such as butter and olive-oil; saccharine substances, such as sugar and honey; and aromatic and pungent condiments, such as mustard, ginger, pepper, and pickles.

CONDITION (OF. *condicio*, Fr. *condition*, from Lat. *condicio*, agreement, from *condicere*, to agree, from *com-*, together + *dicere*, to say). The popular name in American college parlance for a deficiency on the part of a student in examinations (q.v.). It derives its force from the fact that the student is permitted to go on with his class only on *condition* that the deficiency be made good within a given time, failing which his name is dropped from the college rolls.

CONDITION. In natural science and metaphysics, that in default of which a phenomenon does not occur. (See CAUSALITY.) In logic it denotes any qualification of the universal validity of a statement. See LOGIC.

CONDITION and **CONDITIONAL**. As a legal term, condition signifies a provision in a contract, conveyance, grant, or will, that an estate or interest in property, or a personal obligation, shall depend upon the happening of an uncertain event. The term is also applied to the

event itself. If the condition is set forth in words it is called an *express* condition; if it is inferable from the circumstances of the particular case it is called an *implied* condition. In English law conditions are also classified as conditions *precedent* and conditions *subsequent*. An example of the former is the grant of an estate to A upon condition that he marry B; or the contract to charter a ship upon condition that it is in the port of Amsterdam. Here the event named must happen before the estate vests in A, or the contract obligation on the part of the hirer of the ship arises. An example of a condition subsequent is the grant of an estate to A upon condition that he continues to reside in a particular place; or the purchase of a piano upon condition that it shall 'stand up to correct pitch' for a year. Here the estate in A, or the obligation of the purchaser to keep and pay for the piano is annulled upon the non-performance of the condition. Impossible, illegal, or repugnant conditions are void. Accordingly, says Blackstone, "if they be conditions subsequent, the estate shall become absolute in the tenant, for he hath by the grant the estate vested in him, which shall not be defeated by a void condition. But if the condition be precedent, he shall take nothing by the grant, for he hath no estate until the condition is performed."

A provision in a contract which is intended to operate as a condition in favor of one party may contain a binding promise of the other party. For example, A agrees to sell and deliver to B at a named time, place, and price a certain quantity of merchantable corn; and A tenders unmerchantable corn at the agreed time, place, and price. B has the right not only to reject the corn, because the condition precedent to deliver merchantable corn has not been performed by A, but also to recover from A damages for breach of contract to deliver the agreed corn. Such a provision in a contract may be called a promissory condition. Of this class are the mutual promises of the seller to deliver the goods and of the buyer to pay for them—engagements which are sometimes called 'concurrent conditions.' Promissory conditions have been confused with warranties (see WARRANTY) by many judges and writers, but the English Sale of Goods Act of 1893 makes a sharp distinction between the terms, and has done much to clear up the confusion in this branch of the law. See SALE.

Another and distinct class of provisions in contracts may be styled *casual* or *contingent* conditions, because they are intended to prevent any obligation attaching to either party until their performance. An example of this class is afforded by an agreement for the sale of described goods to arrive by a specified ship. Here, if the ship does not arrive, or, if arriving, it has not the described goods on board, neither party is bound.

The word *conditional* frequently appears in standard legal phrases, some of the more important of which are the following: *Conditional acceptance* (of a bill of exchange) is an acceptance in which payment by the acceptor is dependent upon the fulfillment of a condition therein named. *Conditional advance note*, that is, a note given by the master of a ship to a seaman, payable after the ship sails upon condition that the seaman goes with the ship. *Conditional allotment*, *conditional application*, that is, the

allotment of shares in a company, or the application for shares, made upon a specified condition. In the former case the applicant is not bound to take the shares unless he has assented to the condition, nor in the latter case unless the condition is performed. Consult: Blackstone, *Commentaries on the Laws of England*; Benjamin, *Treatise on the Law of Sale of Personal Property* (7th ed., Boston, 1899); Burdick, *Law of Sale of Personal Property* (2d ed., Boston, 1901); consult also the *Cyclopadia of the Laws of England*, vol. iii. (London, 1897).

CONDITIONAL FEE. At common law, an estate granted to a man and the heirs of his body. This limitation to a particular line of heirs, to the exclusion of collateral lines, was interpreted by the courts merely as a condition diverting the estate in the event that no issue was born answering the description of the grant, and the fee thus came to be known as a conditional fee. The condition being performed by the birth of issue, such estates became absolute and might then be alienated to strangers and the expectations of the issue defeated. As conditional fees were a device of the great landowners to preserve their estates intact for their lineal descendants, they procured the enactment of a statute by Parliament forbidding such alienation and preserving the interests of the issue as well as of persons to whom the property was to go on failure of issue. This was the famous statute of Westminster II. (1285), known as the statute *De Donis Conditionalibus* ('concerning conditional gifts'), which had the effect of converting such estates into fees tail and of preventing the evils at which it was aimed until, by the ingenuity of the lawyers and judges, other means were devised for barring entails and alienating such estates. See CONDITION; COMMON RECOVERY; FEE TAIL; FEE SIMPLE; FINE. Consult the authorities referred to under FEE SIMPLE and FEE TAIL.

CONDITIONAL IMMORTALITY. The doctrine advanced by certain theologians that the immortality of the soul is conditional only upon faith in Christ, and that immortality is not inherent in the race. See ANNIHILATIONISM.

CONDITIONAL LIMITATION. A fee simple estate limited or qualified (a) so as to come to an end on the happening of a collateral event, or (b) so as to shift from one owner to another on such an event. The expression conditional limitation is used in both these senses by different law-writers of great authority, and it is therefore impossible to affix to it a precise definition. The first use of the phrase identifies it with the limited or qualified fee simple, as a gift of land to A and his heirs so long as they shall continue to live on the premises, or so long as Saint Paul's Church shall stand, or until the happening of any other event. Under the early common law the donor of such an estate had an interest left—notwithstanding the estate conveyed was a fee simple—known as a 'possibility of reverter,' and, upon the happening of the event specified in the deed, the property would revert or return to the donor or his heirs. This contingent interest remaining in the donor of a qualified fee has been referred to the feudal relation of lord and tenant, which might subsist between the grantor and grantee of a fee, and it has been supposed that the statute *Quia Emptores* (1290),

which did away with this feudal relation, thereby destroyed also the grantor's possibility of reverter, and converted every qualified fee into an absolute fee. But it has been held, nevertheless, in two States (New York and Massachusetts) of the United States, that qualified fees of this type are still good, and that they will revert to the grantor and his heirs on the happening of the event on which they were conditioned, and these decisions are likely to be followed in the United States. But neither at the common law nor today has the grantor of such a fee any interest which he is capable of alienating to any other person prior to the return of the estate to him.

The second meaning of the expression conditional limitation makes it a convenient phrase for the commoner terms executory devise and shifting use. While at the common law a gift of a fee simple—even though qualified as above described—was supposed to exhaust the whole power of alienation, if not the entire interest, of the donor, leaving him no capacity to give the property over, on the happening of a future contingency, to another; yet, as a result of the Statute of Uses (passed in 1527) and the Statute of Wills (enacted in 1532) it became possible to make a fee which should, upon a specified future event, shift to another. Thus, if land be devised by will to X and his heirs on condition that they shall forever maintain their citizenship in New York, with the further proviso that in the event of a failure to comply with the condition within the lives of the donor's children the property should go over to a charity, the last-mentioned gift might take effect as an executory devise, or conditional limitation on the prior gift. Such limitations on fees are now very common, and may, under modern statutes, usually be effected by a simple deed of grant, without invoking the aid of the Statute of Uses. See DEVISE; ESTATE; FEE SIMPLE; FEUDAL SYSTEM; SUBINFEUDATION; USE; WILL; and the authorities referred to under those titles.

CONDOM, kōn'dōn'. A town in the Department of Gers, France, on the river Baise, here crossed by two bridges, 25 miles north-northwest of Auch (Map: France, G 8). The town, founded in 721, is irregularly built, but has handsome suburbs. It has a fine Gothic cathedral (1506-21), adjoined by the remains of an old cloister, an exchange, and hospitals. There is a very considerable trade in grain, flour, wine, and especially in Armagnac brandy, and manufactures of cotton, cotton yarn, etc. Bossuet was at one time Bishop of Condom. Population, in 1901, 6578.

CONDONATION (Lat. *condonatio*, from *condonare*, to pardon, from *com-*, together + *donare*, to give, from *donum*, Skt. *dānu*, gift, from Lat. *dare*, Gk. *δίδοναι*, *didonai*, OChurch Slav. *dati*, Lith. *duiti*, Skt. *dā*, to give). In law, forgiveness of an act by a husband or wife, which entitles the forgiving party to a divorce. Condonation may be either expressed or implied. If the parties have cohabited after a knowledge of the offense complained of, this is an implied condonation of the offense, and bars complaint unless the offense shall have been subsequently repeated. An act once condoned is, in the eyes of the law, as though it had never been committed, unless the guilty party repeats the offense, in which event the old offense becomes a valid

ground of complaint. In other words, condonation is always conditional upon the discontinuance of the condoned misconduct. See DIVORCE.

CONDOR (Sp., from Peruv. *cuntur*, condor). The great vulture (*Sarcoramphus gryphus*) of the Andes, and the largest of known flying birds, unless the albatross may sometimes exceed it. Its dimensions, however, have often been far overstated, the truth being that it varies in length from 44 to 55 inches, and in expanse of wing from 8½ to 10½ feet. The wings are long and extremely powerful; the tail short, and wedge-shaped; the general color black, which is brightest in old males, which have much white in the wing. The young are brownish. Around the lower part of the neck of both sexes there is a broad white ruff of downy feathers, above which the skin is bare and exhibits many folds. The head of the male is crowned with a large, reddish, cartilaginous comb, and the neck is furnished with a dilatable wattle. The beak is thick and strong, straight at the base, but the upper mandible strongly curved at the extremity. The condor feeds mostly on carrion. Its voracity is enormous. Tschudi mentions one in confinement at Valparaiso which ate eighteen pounds of meat in a single day, and seemed next day to have as good an appetite as usual. Condors often gorge themselves so that they cannot fly, and, if attacked, must disgorge in order to escape. They inhabit regions 10,000 or 15,000 feet above the level of the sea, where they are usually seen in small groups, and where they breed, making no nest, but laying their eggs on the bare rocks. To these haunts they return, after their descent into the plains for food. The height to which the condor soars in the air exceeds that of any other bird, and is often far above the clouds.

Closely related to the condor, but distinguished by differences in the cartilaginous comb, bare neck, and shape of the bill, are the king vulture, or king of vultures (*Gyparchus papa*), of the warm parts of America, and the Californian vulture (*Pseudogryphus Californianus*). The king vulture is about the size of a goose, and derives its name from its driving away other vultures from prey at its pleasure. Its plumage is finely colored, reddish above, white beneath, with bluish-gray ruff, and black quills and tail. The Californian vulture is often longer and of greater expanse of wing than the condor, but is not so heavy a bird. It is duller colored, and has less white on the wings. Its range was restricted to the Pacific coast region, from Oregon southward; it was nowhere really common, and it has now become extinct, except possibly in Lower California. Like other American vultures, it has no voice, the only sound that it utters being a hoarse hiss or sort of weak snorting. All these large American vultures belong to the family Cathartidae, which includes the turkey-buzzards, and is less falconine than the Old World vultures. See VULTURE and Plate of VULTURES; and EXTINCT ANIMALS.

The first satisfactory account of the condors was given by Hnhholdt. Consult: Darwin, *A Naturalist's Voyage* (London, 1860); Stejneger, *Riverside Natural History*, vol. iv. (Boston, 1885); Lucas, *Annual Report of United States National Museum*, 1889 (Washington, 1891).

CONDORCANQUI, kōn'dōr-kān'kwé. José GABRIEL. See TUPAC AMARU II.

CONDORCET, kôn'dôr'sâ', MARIE JEAN ANTOINE NICOLAS CARITAT, Marquis de (1743-94). A French mathematician and philosopher. He was born at Ribemont, was educated by the Jesuits, won distinction for mathematics in his youth, and became an active member of the Academy of Sciences in 1769. Genial, susceptible, and enthusiastic, he became allied with the advanced thinkers and shared in the economic and religious propaganda of Turgot, D'Alembert, and Voltaire. He took an active part in the *Encyclopédie*, and, on the strength of his graceful *Éloges des académiciens morts avant 1699* (1773), he was made the perpetual secretary of the Academy of Sciences in 1777. He became a member of the French Academy in 1782. His *Éléments du calcul des probabilités* (1785), revised and enlarged in a posthumous edition (1804), was his most important contribution to mathematics. From this time politics claimed him in increasing measure. He wrote a life of Turgot (1786), and of Voltaire (1787), and was chosen member of the National Assembly from Paris, becoming secretary of that body, and in February, 1792, its president. He composed several of its most important addresses, and elaborated a scheme of public instruction. Though finding Louis XVI. guilty, he refused to vote for his execution. He was active in framing the Constitution submitted to the Convention in February, 1793, but his opposition to the Terrorists led them to proclaim him an outlaw. Friends found him a refuge with a Mme. Vernet, who said "the Convention could declare him outside the law, but not outside humanity." Tracked hither at last, he escaped, was captured at Clamart, and died in prison at Bourg-la-Reine, March 29, 1794, from apoplexy, exhaustion, or poison. While with Mme. Vernet he wrote the *Esquisse d'un tableau historique des progrès de l'esprit humain*, a declaration of human perfectibility through emancipation from priests and rulers, narrow in its sensationalist philosophy and fanatic in its anti-spiritualism, but interesting for its militant optimism. Condorcet's Works (Paris, 1847-49) contain a Life by Arago. Consult Morley, *Critical Miscellanies* (London, 1893).

CONDOTTIERI, kôn'dô-tyä'rê (It., plur. of *condottiere*, captain, leader). The name given in Italy in the Middle Ages to the leaders of companies of military adventurers who offered their services to any party in any contest for pay and often practiced warfare on their own account, for the sake of plunder. The name is frequently applied also to the members of their companies. These mercenaries were called into being by the endless feuds of the Italian States during the Middle Ages. Among the most celebrated of their leaders were Sir John Hawkwood (c.1320-94), the commander of the famous White Company, who, after taking an important part in the wars between England and France, crossed into Italy and became Captain-General of Florence; Carmagnola (c.1390-1432), who fought in the pay of Milan and Venice; and Francesco Sforza (1401-66), who in 1450 made himself Duke of Milan, to the exclusion of the lawful heirs of the Visconti. Venice began to employ condottieri in 1143; but their time of greatest activity was in the fourteenth and fifteenth centuries. Machiavelli paints them in the most unfavorable light, and states that sometimes battles were fought by two condottieri in which no one

was killed except by accident. Consult Ricotti, *Storia delle compagnie di ventura* (Turin, 1845).

CONDUCTING TISSUE. In botany, the lines, strands, or groups of conducting cells used for transferring water and foods from one part of the plant to another. See CONDUCTION.

CONDUCTION (Lat. *conductio*, union, from *conducere*, to lead together, from *com-*, together + *ducere*, to lead, connected with Goth. *tiuhan*, AS. *tēon*, OHG. *ziohan*, Ger. *ziehen*, to draw). In botany, a term applied to the transfer of water, foods, and other materials from one part of the plant body to another. In the smaller plants a sufficient amount of water can be supplied to cover evaporation and other needs, and the foods can be transferred, by relatively slow processes of diffusion and osmosis (q.v.). In the larger plants, however, the amount of water and foods to be moved, and the relatively great distances to be traversed, have brought about the development of a system of tissues, arranged in elongated strands or in layers, specially adapted to facilitate transfer, and known as the conducting system. These are for water chiefly the xylem, or wood bundles, and for foods chiefly the phloëm, or bast bundles, or perhaps the latex vessels. The xylem and phloëm bundles are usually associated, running side by side in the stems, the xylem either toward the centre, or with a phloëm bundle also on the central side of it, or surrounded by the phloëm. In the roots the primary xylem bundles are between the phloëm bundles, but by secondary thickening with age the same position as in stems is reached. So frequent is this association that the two bundles are usually described as regions of one fibrovascular bundle (q.v.). These bundles form a connected system of strands, continuous, through the stem, from youngest root to youngest leaf. In the leaves the bundles run in the larger ribs, and constitute the smaller veins, becoming more and more slender. The final branches join with others to form a fine network, or end blindly among the green tissues, the xylem bundles being the last to disappear.

THE XYLEM AND WATER-CONDUCTION. The essential elements of the xylem are the tracheæ or tracheids, with which parenchyma cells and wood fibres are usually associated. The tracheids are cells whose walls have become unequally thickened as they mature; their protoplasm finally disappears, leaving only the empty cell-wall. The tracheæ are similar, except that a large number of the end walls, where the elements of a row abut, have been resorbed, so that the cell-chambers, empty as they finally become, communicate freely. The tracheæ, where best developed, are thus long tubes, half a millimeter (1-50 inch) or less in diameter, and 1 to 3 meters (3 to 10 feet) long. The remaining elements of the xylem are of less importance for conduction. (See ANATOMY.) Through the xylem bundles the water absorbed by the roots travels to the leaves and other surfaces, from which it is evaporated. The water first enters the root-hairs or the adjoining surface cells of the root (see ABSORPTION and ROOT); thence it traverses the cortex and enters the tracheary tissue, and travels along it to its destination. Proofs that the xylem bundles are the path of the transpiration stream are found by girdling and by the use of colored solutions. When the xylem bundles are severed the leaves wilt promptly, while all the other tissues of the

stem may be cut without such a result. A solution of indigo-carmin or eosin stains only the xylem strands when the cut end of a leafy shoot is plunged into it. It has further been shown that the water travels chiefly in the cavities of the tracheæ, though doubtless a portion traverses the walls themselves, and all must pass through many partition walls in its course. The movement is not at all like that of water in pipes or blood in vessels. The force concerned in the movement of water is not certainly known. In the smaller plants, root-pressure (q.v.) may cooperate, or under some circumstances may be sufficient; but it is not adequate to account for the rise in tall trees. Capillarity is to be excluded, since the conditions under which surface tension operates to raise water in small tubes are not present. Evaporation and the suction set up thereby play an important part; and probably the most important factor is the osmotic action in the living cells of the leaf. But no satisfactory explanation of the observed facts has as yet been found.

THE PHLOËM AND FOOD-CONDUCTION. The essential elements of the phloëm are sieve-cells and companion-cells (parenchyma); often bast fibres accompany them. Sieve-cells, like tracheæ, lose their living contents as they mature. The end walls, and often certain areas of the lateral walls, where they abut upon a like cell, become resorbed in spots and perforate. The perforate area is known as a sieve-plate. Through the perforations the contents may pass freely. It has been shown that when the perforations in a membrane amount to less than 1 per cent. of the area, there may pass through it 60 per cent. of the gases and solutes which could do so were the whole area open, provided they are being freely removed from the other side. In life the contents of the sieve is a slime, in which are abundant the various foods, both proteid and carbohydrate. In addition to this evidence as to their function, girdling experiments have shown that when the phloëm bundles are severed the growth of parts beyond is hindered or stopped. Other tissues of the bundles participate in the transfer, but no decisive division of labor can be made out, beyond the fact that the sieve-cells are most efficient.

LATEX-VESSELS. The latex-vessels are irregularly branched tubes (the branches sometimes connected into a network), containing a milky or colored sap called latex (q.v.). They are found in only ten of the large families of plants, both monocotyledons and dicotyledons, in which they are believed to serve for the conduction of foods. The reasons for this are as follows: (1) The latex always contains, among a great variety of substances, foods whose amount varies much from time to time, and these variations seem to be correlated with variations in growth and development. (2) The latex-vessels are developed early among the growing tissues where foods are needed. They have abundant branches in the leaves and special relations to the cells where food is made.

The mode by which the foods are transported in sieve-cells and latex-vessels is not known. The contents are under pressure from the turgor (q.v.) of adjacent living cells. Bending and the consequent mechanical compression would facilitate mixing of the contents. But diffusion movements are probably the main agency.

CONDUCTION OF HEAT. See HEAT.

CONDUCTOR (Lat., leader, from *conducere*, to lead together). In music, the person who directs the chorus or orchestra, or both combined, and who is responsible for the interpretation of the works performed by the artists under his direction. A good conductor must be a thorough musician. He must have had careful training in all branches of musical composition, must be familiar with the compass and peculiarities of the voice and all orchestral instruments; must be a good score-reader, and a man of broad musical culture, familiar with the styles of various epochs and masters. In addition, he must be gifted with poetic temperament, an unusually fine ear, a forceful, magnetic personality that commands instant obedience, and great coolness and presence of mind. That he be also a fine performer on some instrument is not essential; two of the world's greatest conductors, Wagner and Berlioz, were wretched performers. The principal work of the conductor is not done in public during performances, but during rehearsals. His preparation really begins at home. He must make himself thoroughly familiar with the score of the work he is to conduct. This is best done at the pianoforte. He must have a clear idea of the form of the work, of the melos (q.v.), of the different phrases. Before he conducts the first rehearsal, he has decided on the interpretation of the work, and knows exactly what he wishes each performer to do.

The first rehearsal of a new work (especially if performed from manuscript) is largely taken up with correcting mistakes in the parts. Here the conductor's ear must be on the alert. During rehearsal the conductor can convey his instructions to the singers and instrumentalists by means of the spoken word, audible beating of the rhythm, and by singing or playing to them. In choral works the chorus is rehearsed separately with the piano. The soloists also rehearse privately, with the conductor at the piano, before rehearsals with full orchestra begin. In studying instrumental works, like symphonies, a careful conductor often rehearses the strings and wind instruments separately. After the performers have become thoroughly familiar with the conductor's intentions, they are ready to be guided during the public performance by his baton, and by signals given with the hand or eyes. By that time the conductor practically knows the score by heart. It lies before him more for occasional reference than actual reading. People in general know very little about the real responsibility and importance of the conductor. Berlioz does not exaggerate when he says that a poor singer or instrumentalist can ruin only his or her part, but a poor conductor can ruin the whole performance.

While the essential functions of the conductor have been pretty much the same at all times, the manner of conducting has varied greatly. The custom of beating time with a baton can be traced to the remotest antiquity, when oarsmen were directed by such means. When the baton was introduced for beating time in music is not known. An ancient manuscript is preserved in Paris, showing Heinrich von Meissen, a minnesinger, who died in 1318, directing a group of vocal and instrumental performers by means of a baton. We know nothing of the mode of conducting between that time and 1600. The earliest

operatic performances were conducted from the harpsichord. In the recitative, the leader struck the few chords upon the instrument, and in the concerted pieces he led. This he did by nodding the head, stamping the foot, and using one arm or even both arms. When the opera reached France and Germany, this mode of conducting was naturally employed in these countries also. In Italy this method maintained itself up to the first half of the nineteenth century. In Germany we find before 1700 that at performances of sacred works in churches the organist was assisted by a time-beater. This time-beater was not a conductor: he only indicated the time. But shortly after the beginning of the eighteenth century the Italian operatic method was adopted for the church, and the organist was the sole director, as is still the custom in churches to-day. The earlier symphonic works were also conducted from the harpsichord. When the number of wind instruments increased, it was found that the tones of the harpsichord could not be heard by all players, and the time-beater again made his appearance. In this manner Haydn and Mozart conducted their symphonies, they sitting at the harpsichord while some one else beat time. Beethoven conducted with the baton, and the first violin or concert-master assisted.

Interpretative conducting may be said to have begun with Stamitz (1719-61) and his pupil Cannabich (1731-98), whom Mozart called the best conductor he ever heard. Cannabich developed the *crescendo* and *diminuendo* of the orchestra, one of the great means of expression. Gossec (1738-1829) must also be mentioned among the early conductors who developed orchestral techniques. But these men were exceptions at their time. Interpretative conductors as a class did not exist before the beginning of the nineteenth century. Among these the greatest were Spohr, Weber, and Mendelssohn in Germany, and Habeneck, a German by birth and training, in France. With Wagner and Berlioz begins the school of modern conducting, which is the culmination and natural development of the work begun by the four eminent conductors just mentioned. Nearly all the great modern conductors are German. France boasts three great names—Pandeloup, Colonne, and Lamoureux. But among the Germans there are Liszt, Bülow, Richter, Seidl, Mottl, R. Strauss, Weingärtner, Nikisch, Paur, Lohse, Levi, Zumpe, Suher, Thomas. Among the best treatises on conducting are: Wagner, *Ueber das Dirigiren* (vol. viii. of his collected works, Leipzig, 1888); Berlioz, *Treatise on Modern Instrumentation*, translated by Bennett (London, 1882); Henderson, *The Orchestra and Orchestral Music* (New York, 1899).

CONDUCTOR and INSULATOR OF ELECTRICITY. The property of electrical conductivity is possessed in some degree by all known substances. There is, however, an enormous difference between the conductivity of those that are used as conductors and those that are used as insulators, the former having many million times the conductivity of the latter. The substances at the lower end of the scale are therefore of sufficiently low conductivity to serve for covering and supporting wires made of the good conductors, without permitting any serious escape of an electric current when the wires are charged.

In transmitting electricity from point to point, through telegraph or electric-light lines, for example, those substances possessing the greatest conductivity, such as copper and iron, are selected to form a path for the current, and these are surrounded with materials which have the least conductivity or offer the highest resistance, such as air, rubber, and glass, in order to confine the current and compel it to travel to the end of the line. When a conductor is so surrounded or so placed on non-conducting supports that it prevents the electricity communicated to it from passing into the ground or escaping, it is said to be insulated.

As the difference between conductors and insulators is merely one of degree, there is, even under the best conditions, a loss in the transmission of electricity over a line of wire proportionate to the amount of leakage through the insulation and the resistance to travel offered by the wire itself, since the slight effort required of the current to force its way ahead through the wire causes some of it to escape through the insulation in the same way that water forced through a long pipe will escape in small quantities at weak points. It is, indeed, extremely necessary to prevent conductors buried in the earth from having any connection with water or dampness, and, if the insulation of the conductor is defective in a damp spot, a certain proportion of the current will leave the conductor and travel through the earth. Chemically pure water is a non-conductor, but as found in the earth, water is an excellent conductor on account of the materials it holds in solution.

The electrical conductivity, and its reverse, the resistance of materials, are, therefore, subjects of great importance to electricians; and the selection of materials of high conductivity or low resistance for wires, and materials of high resistance for insulators, receives careful attention. The best conductors are gold, copper, silver, aluminum, brass, iron, and all other metals. The best insulators, or the worst conductors, are dry air, glass, mica, porcelain, paraffin, rubber, silk, gutta-percha, and almost all the hydrocarbons. The intermediate substances are many liquids and damp substances, carbons, minerals, and compound substances. The conductivity of all substances is greatly affected by changes of temperature. An increase of temperature increases the resistance of all the metals, while it has the opposite effect in other substances. Glass loses its insulating properties at a red heat, and so do wax, sulphur, amber, and shellac when fused.

Glass, if not the most perfect insulator, far exceeds others in hardness and durability, and is much employed as insulation for light electrical apparatus. Hard rubber or vulcanite enters into the construction of much electrical apparatus on account of its high resistance. Paraffined paper is also employed for condensers (q.v.), while for the armatures of dynamos and motors mica is used. See ELECTRICITY.

CONE (Lat. *conus*, Gk. *κῶνος*, *kōnos*, cone, Skt. *śāna*, whetstone, from *śā*, to sharpen). A solid formed by a plane cutting all of the elements of a conical surface. A conical surface is generated by a line called the generatrix passing through a fixed point and tracing a fixed curve called the directrix. If the line is unlimited it generates two conical surfaces, on opposite sides of the point (vertex), called the nappes of

the cone. A cone whose base is a circle is called a circular cone. If the vertex is on a perpendicular to the base of a circular cone, through its centre, the cone is called a right circular cone. A right circular cone may be generated by rotating a right-angled triangle about one of its perpendicular sides. The line from the vertex to the centre of the base is called the axis. If the axis makes with the base an angle other than 90° , the cone is called oblique. If a plane cuts a cone between the vertex and the base, the cone is said to be truncated; if the cutting plane is parallel to the base, the lower part is called a frustum of the cone, the section made by the cutting plane being called the upper base. Three curves, called conic sections (q.v.), may be formed by planes cutting a right circular cone at various angles to the base.

CONE, IN BOTANY. See CONIFERÆ.

CONE, ORELLO (1835—). An American theologian and author. He was educated at Saint Paul's College, Missouri; was professor at Saint Lawrence University from 1866 to 1890, and again became associated with that university in 1900. He was also for a term of four years president of Buchtel College, Ohio. He was appointed editor of the *International Handbooks of the New Testament*, and published the following works: *Gospel Criticism and Historical Christianity* (1891); *The Gospel and Its Earliest Interpretations* (1893); *Paul, the Man, the Missionary, and the Teacher* (1893); *Rich and Poor in the New Testament* (1902).

CONE, SPENCER HOUGHTON (1785-1855). An American clergyman, born at Princeton, N. J. He studied for two years (1797-99) at Princeton; was at first an instructor in private schools in Burlington, N. J., and Philadelphia, Pa.; and later became an actor, and played in Philadelphia and other cities with success for seven years (1805-12). He accepted a clerical position on the *Baltimore American* in 1812. In 1814, upon his removal to Washington, D. C., to enter upon a Government office, he became a minister of the Baptist Church. In 1815 and 1816 he was chaplain to the House of Representatives, and in 1823 was called to the Oliver Street Baptist Church, New York City. In 1841 he took charge of the Broome Street Church, where he remained during his life. From 1832 to 1841 he was president of the Baptist Triennial Convention for the United States. On the formation of the American Bible Union he was chosen president, and remained such until his death, and from 1837 until 1850 he was president of the American and Foreign Bible Society. He was a pulpit orator of much ability, and one of the foremost clergymen in his denomination.

CONEFISH (so called from its shape). A small, somewhat globular sea-fish (*Monocentris japonicus*) of the family Beryceidæ, dwelling on the coasts of China, Japan, and the Philippines, and called by the Japanese 'matskasa,' or pine-cone fish. See Colored Plate of PHILIPPINE FISHES.

CONEGLIANO, kō'nā-lyā'nō. A city in the Province of Treviso, Northern Italy, situated 35 miles north of Venice (Map: Italy, G 2). It is commanded by a huge castle, and has a cathedral containing a fine altar-piece by Cima (1492), a native of Conegliano. In the Loggia Municipale are monuments to Dante, Victor Emmanuel, Gari-

baldi, and the victims of the War of Liberation. The town is noted for its wine. In 1808 Marshal Monecy was named Duke of Conegliano by Napoleon. Population (commune), in 1881, 8938; in 1901, 9796.

CONENOSE, or KISSING BUG. A bug of the predatory family Reduviidæ; specifically *Conorhinus sanguisuga*, called 'giant bedbug' in the southern United States, where it is a pest in houses. It is three-quarters of an inch long, black with red patches, or spots, on the sides of the thorax, at the base and apex of the wing-covers, and bands on the sides of the abdomen. The young much resemble large bedbugs (to which they are allied), and all ages are fierce biters and blood-suckers, preying upon insects and flying into houses at night and attacking sleeping persons and animals. The kissing bug seems to breed in the nests of mice, and is prevalent from the central Mississippi Valley to the tropics. The name 'assassin bug' has been given to the whole family by Comstock, because of their cannibalism and rapacity; and to certain species, especially *Melanolestes picipes* and *Reduvius personatus*, which were especially abundant in the Eastern States during the summer of 1898, was due the 'kissing-bug' excitement, busily fostered by the newspapers. Of the two 'kissing bugs' above mentioned, the latter, according to Howard, is a cosmopolitan form which, in the Northern States, is found in basements and cellars of dirty houses, and preys upon bedbugs and cockroaches. When immature it covers itself with dust and presents a very odd appearance. The 'thread-legged' bugs of the family Emesidæ, which rob spiders of their prey, are near relatives.

CONEPATE, kō'nē-pāt (Nahuatl *ncpatla*, subterranean dwelling). The name in Mexico of the large white-backed skunk (*Concpatus mapurito*), called in South America 'mapurito.' See SKUNK.

CONE-SHELL. The popular name of a genus (*Conus*) and family (Coniidae) of gastropod mollusks, of the order Streptoneura; having a shell of remarkably regular conical form; the spire on the base of the cone, and sometimes rising from it to a sharp point, sometimes almost flat; the aperture narrow and straight, without protuberance or fold, extending from the base of the cone to its apex. The head of the animal has a proboscis capable of much extension; the mantle is scanty and narrow, forming an elongated siphon in front; the shell is covered with an epidermis. These mollusks are carnivorous; they inhabit

A CONE WALKING TOWARD THE LEFT.

The siphon is protruded and held upright; and the eyes are seen on the tentacular eye-stalks springing from the head.

shores and banks of sandy mud, chiefly within the tropics, a few only occurring in the Mediterranean. The shells of many species are very

beautiful, and much prized by collectors. Cone-shells first appear in Cretaceous rocks, and become more abundant in later formations.

The young cone-shells are elongated and have high spires, which in the adults are more or less completely shortened through envelopment by the outer whorls. These elongated spires are also characteristic of the adult stages of the early ancestors of the cones, of Cretaceous and Tertiary time, especially of the genus *Conorbis*, of the Eocene. The genus *Conus* has some doubtful representatives in the Cretaceous, about 150 species in the Tertiary, in the rocks of which age it is common and beautifully preserved, and it is at present approaching the maximum of its evolution. See Colored Plates of MARINE GASTROPODS.

CONES' SI BARK. See WRIGITIA.

CON'ESTO'GA (Iroquois). Formerly an important tribe of the Iroquoian stock, occupying the country on the Lower Susquehanna and about the head of Chesapeake Bay in Pennsylvania and Maryland, and claiming dominion over several smaller tribes on both sides of the bay. The name is said to mean 'people of the forked roof-poles.' The French called them *Andastes*, while to the Virginia tribes and the Southern colonists they were known as *Susquehannas*. They lived in palisaded villages, and when first known were a powerful people, bidding defiance to the invading Iroquois, by whom, however, they were at last overcome about 1675. A part fled south through Virginia and took refuge in North Carolina, under the name of *Meherrin* (q.v.). Others were deported to the Iroquois country, whence they were afterwards allowed to return, and settled at *Conestoga*, near Lancaster, Pa. Here they rapidly wasted away, until 1763, when the few that remained were massacred by a mob during the excitement provoked by the Indian wars.

CO'NEY (OF. *canin*, Lat. *cuniculus*, Gk. *κύνικλος*, *koniklos*, or *κύνικλος*, *kyniklos*, rabbit; of Iberian origin). The old English name for the rabbit, used in the Bible as the translation of the Hebrew word *shaphen*, the local name for the Syrian hyrax, or daman (see *HYRAX*), and since applied to other mammals which superficially resemble either *Lepus* or *Hyrax*. The *Pika* (q.v.) is known to hunters and miners in the western United States as the 'coney,' though it looks more like a guinea-pig than a rabbit. In Jamaica the hutia (q.v.) is generally called the 'Indian coney.'

CONEY ISLAND. An island, included in the Borough of Brooklyn, New York City, and the most popular seaside resort in the vicinity of the metropolis; situated on the southern shore of Long Island, 9 miles southeast of the Battery (Map: Greater New York, G 12). Coney Island is nearly five miles long, and from a few hundred feet to three-fourths of a mile wide, and is separated from the mainland by a narrow tidal inlet. For a long period it was considered comparatively worthless; but as soon as its fine beach became recognized as a safe place for bathing, and regular communication by boat and railroad was established, the sporadic bath-houses and cheap hotels were replaced by more permanent structures, and its growth has been extraordinary. It is now reached by several lines of steamboats, and by numerous electric and steam railroads. There are several sharply differentiated districts. West Brighton is the centre for the mass of visitors

and for the cheaper amusements, and is more generally known as 'Coney Island.' To the east is Brighton, the site of a popular race-track. Sea Gate, at the extreme west, and Manhattan Beach, east of Brighton, are more select resorts.

CONFARREATION (Lat. *confarreatio*, from *confarreato*, to marry by an offering of spelt, from *com-*, together + *farreus*, made of spelt, from *far*, spelt; connected with OCh. Slav. *bŕrŭ*, AS. *bere*, Engl. *barley*). A form of celebrating marriage, of peculiar solemnity and of great antiquity, among the Romans. It was a customary form, originally restricted by law to the patricians, among whom it originated. It retained its superior sanctity and validity long after it had been extended to the plebeians, and after simpler and less conventional forms of marriage had come to be recognized. Its specialty consisted in the employment of certain words in the presence of witnesses, and in the performance of a religious ceremony in which *panis farreus* (bread made of spelt) was used. Many of the high offices of State, especially such as were of a priestly character, were open only to those who were born of parents thus married. See *MARRIAGE*.

CONFECTIONERY (from ML. *confectionarius*, confectioner, from Lat. *confectio*, preparation, from *conficere*, to make up, from *com-*, together + *facere*, to make). Preparations of sugar, or of material of which sugar is the principal ingredient, used as sweetmeats.

Where confectionery is pure its use may involve little danger to health. Unfortunately, a certain proportion of the cheaper kinds are adulterated and colored with poisonous ingredients. The common adulterants used are terra alba, kaolin, and other mineral substances intended to give weight and volume to the mass. Most organic coloring materials are harmless, but mineral colors should never be used.

Until the beginning of the nineteenth century the art of making sweetmeats was practiced chiefly by physicians and apothecaries, who used sugar and honey to conceal the taste of their medicines. Medicated candies are still largely made by drug manufacturers. During the earlier half of the nineteenth century the art of candy-making was largely an English specialty. In 1851 an international exhibition was held in London, and the unique collection of candies there exhibited attracted to this industry the attention of other nations, especially Germany and France. The latter soon excelled all other countries in the art of making chocolate bonbons, and still maintains its supremacy. In the United States, as early as 1816, there were twenty candy factories in the city of Philadelphia, and probably as many more in New York. Previous to 1845 each candy dealer made his own goods by hand, the assortment being limited to stick and molasses candy and sugar plums, and a few imported fancy candies. In 1845 the first machinery, in the form of a revolving steam-pan, was introduced by Sebastian Chauveau, of Philadelphia, and the following year a lozenge-making machine was invented by Oliver Chase, of Boston, and put into operation in his candy factory. Since that time new forms of machinery have constantly been added to such an extent that the manufacture of candy forms a separate and important industry.

The following table, taken from a chapter on the confectionery trade, by A. F. Hayward, in the work entitled *One Hundred Years of American Commerce* (New York, 1895), shows the growth of the confectionery industry in the United States as represented by the large factories. In addition, an enormous amount of candy is made every year by small establishments from which statistics are not obtainable.

day the convention of Alabama made the proposition more specific by inviting the other Southern States to send delegates to a convention to be held at Montgomery, Ala., on February 4, in order that they might consult "as to the most effectual mode of securing concerted and harmonious action in whatever measures may be deemed most desirable for the common peace and security." Similar action was taken by the con-

STATISTICS OF THE CONFECTIONERY INDUSTRY IN THE UNITED STATES

YEAR	No. of factories	Hands employed	Capital invested	Wages paid	Value of material used	Value of product	Exports
1850.....	383	1,733	\$1,035,551	\$458,904	\$1,691,824	\$3,040,671
1860.....	541	2,340	1,568,748	668,423	2,991,186	5,361,100
1870.....	941	5,825	4,995,293	2,091,826	8,703,560	15,922,643
1880.....	1,450	9,801	8,486,874	3,242,852	17,125,775	25,637,033	\$73,253
1890.....	2,921	27,212	23,326,790	11,633,448	31,116,629	55,997,101	179,276

In 1884 the National Confectioners' Association of the United States was organized. It includes all the leading manufacturers of the country; and one of its purposes, as defined by its constitution, is "to advance the standard of confectionery in all practicable ways and absolutely to prevent harmful adulterations." The association has secured the necessary legislation in the different States whereby the manufacture or sale of any candy containing harmful ingredients or poisonous colors is punishable by law.

CONFEDERACY, THE. A comedy by Vanbrugh (1705), said to have been adapted from Dancourt's *Bourgeois à la mode*.

CONFEDERACY, UNITED DAUGHTERS OF THE. A woman's patriotic society organized in Nashville, Tenn., in 1894, for the preservation of the memory of Southern devotion and suffering during the Civil War. The society admits to membership the direct female relatives and lineal female descendants of those who served honorably in the Confederate service, or who in some other direct way aided the Confederacy. The organization is subdivided into local chapters, of which there are over 550 in the Southern States and elsewhere. These are governed by State divisions, which in turn are controlled by a general organization. Annual reunions are held, usually in November, and the total membership is nearly 30,000.

CONFEDERATE STATES OF AMERICA. The name adopted by the federation of those eleven commonwealths of the United States of America which seceded from the Union in 1861, and were arrayed against the national Government during the Civil War (q.v.). None of the theories of 'State sovereignty' was inconsistent with membership in a properly federated union, and even the extreme advocates of those views recognized the advantages of the essential features of the existing system of national government. Thus, the convention of South Carolina, at the time of the adoption of its ordinance of secession, December 20, 1860, expressed a strong desire for the early formation of a new confederation by the States at that time contemplating secession. Three weeks later the convention of Mississippi, at a time, as Davis wrote, "when the last hope of preserving the Union of the Constitution was extinguished," indorsed this proposal, as did also the convention of Florida on January 10th. On the following

vention of Georgia, on January 19, and by that of Louisiana, on January 25, with the result that at Montgomery on the appointed day there gathered delegates from these six States, who organized as a Provisional Congress of the Confederacy. By this body for one year, and thereafter by the more representative bicameral body which succeeded it, were directed the affairs of the new confederation, these bodies undertaking quite as complete an exercise of the more essential functions of a national government as had hitherto been undertaken by the old national Congress. Technical objections were dispelled by the exigencies of the situation, and the Congress was recognized as actually possessing, and as entitled to exercise, the powers of general government throughout the States then and thereafter represented in its membership. The authority and influence thus acquired was enhanced by the presence in its sessions not only of many men who had rendered efficient service in a similar capacity at Washington, but also of men who were at the time recognized as leaders of Southern thought and action, such as Wigfall of Texas, ex-President Tyler, Roger A. Pryor, and James M. Mason, of Virginia; Rhett and Barnwell, of South Carolina; Campbell, of Mississippi; Toombs, Cobb, and Stephens, of Georgia; and McRae and Curry, of Alabama. In the first instance, the Congress, as originally organized, was particularly a constituent body, and among its first acts was the adoption, on February 8, in behalf of the six States represented, of a temporary constitution of government, to have force for "one year from the inauguration of the President, or until a permanent constitution or confederation between the said States shall be put in operation, whichever shall first occur." The convention, however, went further and assumed to act as the legislative body of this new government, on the following day enacting that all laws of the United States in force in the Confederate States on November 1, 1860, and not inconsistent with the constitution of the Confederacy, should be continued in force until repealed or altered by the Confederate Congress. To the same end, provision was made for the continuance in office, at least for a time, of all administrative officials, and in order to hasten the detailed organization of the new national government, the more important Congressional committees, upon war, finance, and foreign affairs, were forthwith ap-

pointed. The Provisional Congress furthermore assumed the function of naming the chief executive officers, and on February 9th chose as Provisional President of the Confederacy, Jefferson Davis (q.v.), of Mississippi, and as Provisional Vice-President, Alexander H. Stephens (q.v.), of Georgia. Mr. Davis had already been appointed to the chief command of the Mississippi troops, and although seeming strongly to prefer the military service, he relinquished his plans and undertook promptly the duties of the civil office which had come to him thus unsolicited, and in which he was to become recognized as the leader of the Confederacy. His first important act as President, the choice of a cabinet, was controlled rather unduly by political and geographical considerations. Each of the States represented, except that which secured the Presidency, was allotted a cabinet officer, as was also Texas, which at that time was practically, although not formally, in the control of the secessionists. The result was a group of high officials among whom only two were recognized as men of especial ability—the noted Robert Toombs (q.v.), of Georgia, who became Secretary of State, and Judah P. Benjamin (q.v.), of Louisiana, a man of considerable repute as a barrister, who became Attorney-General. The executive departments were promptly organized, although the activity of some, particularly that of the Navy, soon became limited, and the administration of public affairs proceeded thenceforth along lines familiar to Americans, and without unusual incident except such as naturally arose from the instability of the Government, from the gradual overshadowing of the civil branches of Government by the military, and from its final collapse.

The formal inauguration of Mr. Davis as President occurred on February 18, when, in the course of his inaugural address, he said: "We have entered upon the career of independence, and it must be inflexibly pursued. Through many years of controversy with our late associates of the Northern States we have vainly endeavored to secure tranquillity and obtain respect for the rights to which we were entitled. As a necessity, not a choice, we have resorted to the remedy of separation, and henceforth our energies must be directed to the conduct of our own affairs, and the perpetuity of the Confederacy which we have formed. . . . With a constitution differing only from that of our fathers in so far as it is explanatory of their well-known intent, freed from sectional conflicts, which have interfered with the pursuit of the general welfare, it is not unreasonable to expect that States from which we have recently parted may seek to unite their fortunes to ours under the government which we have instituted. For this your constitution makes adequate provision; but beyond this, if I mistake not the judgment and will of the people, a reunion with the States from which we have separated is neither practicable nor desirable." The constitution of which President Davis thus spoke was intended only for temporary use, and the convention accordingly, on March 11, 1861, adopted and submitted to the various States for ratification, the permanent Constitution of the Confederate States. In large measure this instrument was identical with the Constitution of the United States, although between the two there were

natural divergences of theory, as well as some differences of detail. Thus, the President was made ineligible for reelection, and his term was fixed at six years; a qualified membership in Congress of Cabinet officers was made possible; special prohibitive duties were forbidden, ordinary appropriations were made dependent upon a two-thirds vote in each House; and the President was empowered to veto specific portions of an appropriation bill, while approving other portions. Where opportunity offered, the phrases of the new constitution were so turned as to express the views of the Southern leaders as to sovereignty and as to the proper position of commonwealths in any union or federation. Thus it was specifically stated that each State was "acting in its sovereign and independent character"; that legislative powers were 'delegated' thereby, rather than 'granted,' and that citizens of one State might 'sojourn' in another State with their slaves without losing any right of property therein. The new constitution was, as the New York *Herald* then said, "the Constitution of the United States with various modifications and some very important and most desirable improvements."

The Provisional Congress also made provision for the formation of a permanent army of the Confederacy, proceeded early to establish various sources of public revenue, and promptly attempted to secure from foreign governments both material assistance and formal recognition. The character and work of the army thus organized formed possibly the most distinctive feature in the work of the Confederacy. (See CIVIL WAR.) The development of a system of public finance was hampered by the prevalent opposition to internal taxes, while the small quantities of dutiable goods imported made the customs duties an inappreciable element in the public revenue. To meet this exigency, special war taxes were levied, repeated issues of treasury notes were made, and very large amounts of bonds were authorized by the new government. Produce loans also were resorted to, and subsidies or loans to the central government were made by some of the States, so that the first year was passed with a semblance of financial stability. With the increase of the bond issues, and especially with the abnormal expansion of the currency, prices were forced upward, credit became unsettled, and financial demoralization became pronounced toward the close of the war, when the price of a gold dollar was sixty times its price at the beginning of the war, when boots sold at \$200 a pair, and when the price of coffee had increased nearly two hundred times, and the price of cereals nearly ninety times. In seeking to enlist the aid of foreign governments, the steps taken by the Confederacy early gave occasion for critical relations between England and the United States (see TRENT AFFAIR), and led also to serious diplomatic complications in the later years (see ALABAMA CLAIMS), although the efforts of this character were to a considerable degree successful and at times reached such a point as to foreshadow foreign intervention, or at least recognition to an extent that would have made the success of the Confederacy, if not imminent, certainly far less improbable.

The early months of the Confederacy were marked, in addition to the rapid steps of organi-

zation and of preparation for conflict, by an effort at peaceable adjustment. In response to a call of the Virginia Legislature, a peace convention met at Washington in February, 1861, and delegates from seven slave-holding States, including Tyler and Rives of Virginia, Caruthers of Tennessee, and Clay of Kentucky, took part in its futile proceedings. During the following month there were active at Washington three formally appointed commissioners of the Confederate Congress—Messrs. Crawford of Georgia, Forsyth of Alabama, and Roman of Louisiana—who endeavored, largely through the mediation of Justice Campbell of the Supreme Court, to secure recognition and to arrange some reasonable basis of at least a temporary settlement, pending more formal negotiations. This effort also proved abortive through a misunderstanding, involving charges of breach of faith, as to the relief of Fort Sumter. With the withdrawal of these commissioners from Washington and the disappearance of any possibility of voluntary recognition by the Northern Government, the position of the Confederacy was more clearly defined. Its strength, moreover, was increased by the secession of Virginia on April 17, of North Carolina on May 20, and of Tennessee on June 8, so that there were eleven States in the new union when its Congress met for its third session on July 20, at the new capital of the Confederacy, Richmond, Va. Upon the 6th of November were held the first general elections under the permanent constitution, resulting in the choice by a unanimous electoral vote of Davis as President, and Stephens as Vice-President. The fourth and last session of the Provisional Congress closed on February 18, 1862, when the new Senate and House assembled, including in their membership such men as Clay and Yancey of Alabama, Hunter of Virginia, and Wigfall of Texas. Upon the 22d Davis was formally inaugurated as President for a term of six years, but the remaining years of his service were distinguished not so much by his administrative services as by the conflict between the civil and military elements, and by such controversies as that over the suspension of the writ of habeas corpus, the whole situation gradually becoming more and more abnormal, and being to some extent typified by the studied omission to provide for the creation of a supreme court. The course of the President in his official career provoked at the time much severe criticism, and later occasioned a variety of comment. Of his election one recent writer says that "the choice was the best that could have been made," while another equally competent critic describes the situation as follows: "The strongest and most self-assertive spirit of the senatorial clique, having been chosen President, at once began to quarrel with his associates, and to drive them from his counsels; there was no popular strength in the Provisional Congress to resist him; and even before the inauguration of the permanent government, the Confederacy had become a military despotism of the executive." Such a tendency was increased by the custom of holding secret sessions of Congress and by the practice of Cabinet officers exercising their right to sit in Congress, as well as by the gradual lowering of the political morale and independence of that body. This unfortunate condition of affairs was further complicated

by personal controversies among officials, both civil and military, in the highest stations, so that the later months of the administration of the Confederacy were such as to indicate the approach either of internal crisis or of complete dissolution, and such as to make the collapse of the Government, on the fall of its capital, a natural and inevitable event. The first Congress under the permanent constitution had held four sessions, and the second Congress had held two sessions, the final adjournment of the body having been taken on March 18, 1865. The Cabinet officials who served the Confederacy were as follows: Secretary of State, Robert Toombs, of Georgia, February 21, 1861; R. M. T. Hunter, of Virginia, July 30, 1861; Judah P. Benjamin, of Louisiana, February 7, 1862. Secretary of the Treasury, Charles G. Memminger, of South Carolina, February 21, 1861; George A. Trenholm, of South Carolina, June 13, 1864. Secretary of War, L. P. Walker, of Alabama, February 21, 1861; Judah P. Benjamin, of Louisiana, November 10, 1861; G. W. Randolph, of Virginia, March 17, 1862; James A. Seddon, of Virginia, March 22, 1862; John C. Breckenridge, of Kentucky, February 15, 1865. Secretary of the Navy, Stephen R. Mallory, of Florida, March 4, 1861. Attorney-general, Judah P. Benjamin, of Louisiana, February 21, 1861; Thomas H. Watts, of Alabama, September 10, 1861; George Davis of North Carolina, November 10, 1863. Postmaster-General, John H. Reagan, of Texas, March 6, 1861.

While the political organization of the Southern Confederacy was thus almost identical with that prevailing at the North, the outbreak of the war served to accentuate in important respects the marked difference between the two sections, particularly in those features which were of especial importance in time of war. Not only did the population of the Union States exceed that of the seceding States in the proportion of five to two, but the discrepancy was even greater in material resources. In general wealth, in foreign commerce, in internal improvements, and in manufactures, especially of fabrics and of *materiel* of war, the North was vastly superior to the South. Thus, the value of the improved lands of the seceding States was estimated at less than two billion dollars, while the value of those in the Union States was nearly five billion dollars. In the South were 150 fabric factories, with a product valued at eight million dollars, while in the North there were 900 such factories, with a product valued at one hundred and fifteen million dollars. In the South some two thousand persons were employed in the manufacture of clothing, while in the North one hundred thousand persons were so engaged. During the year 1860 the imports of the South were valued at \$31,000,000, and those of the North at \$331,000,000. It was thus apparent that the South was "dependent on Europe and on the North for everything but bread and meat." The South, indeed, seemed fairly supplied with foodstuffs, but the mismanagement seems to have been such that at the end of 1864 there was a "general distress for food," and "an actual prospect," as a leading Southerner stated it, "of starving the Confederacy into submission." In addition to these serious obstacles to success, the South was seriously embarrassed by the lack of powder-mills and of suitable iron-works. Only one plant, the Tredegar Iron-

Works at Richmond, was capable of turning out the larger types of field guns, and it was not until the close of the war that operations were well under way for equipping the South with suitable ammunition and arms plants. Moreover, such minor supplies as leather were very limited and at times quite unavailable, and throughout all branches of activity were apparent the very unusual difficulties under which the Confederacy was obliged to carry on its work of administration and of warfare. The conditions prevailing at the end of such a struggle, and the results of the termination of such a conflict appeared more tangibly in the following years of Reconstruction, when the energies of the defeated were directed toward the economic reorganization of the South as well as to its political reorganization. See also SLAVERY and RECONSTRUCTION, and the articles on the various States mentioned.

BIBLIOGRAPHY. Important works by Southerners are: J. Davis, *Rise and Fall of the Confederate Government* (2 vols., New York, 1881); A. H. Stephens, *Constitutional View of the War Between the States* (2 vols., Philadelphia, 1870); and the several works of E. A. Pollard, especially his *Lost Cause* (New York, 1867). There is a short bibliography in A. B. Hart, *Guide to American History*, sec. 209 (Boston, 1899), and a paper, "Materials for the History of the Government of the Southern Confederacy," in the *American Historical Society Papers* (New York, 1890). A recent and valuable work on financial and industrial matters, by J. C. Schwab, is *The Confederate States of America* (New York, 1901). Consult also Callahan, *Diplomatic History of the Southern Confederacy* (Baltimore, 1901).

CONFEDERATE VETERANS, UNITED. A patriotic society organized in New Orleans, La., in 1889. The objects of the society are to unite in a general federation all associations of Confederate veterans now in existence or hereafter to be formed; to gather authentic data for an impartial history of the war between the States; to preserve relics and mementos; to cherish the ties of friendship formed during the war; to aid veterans and their widows and orphans; and to keep alive the memory of the dead. Membership is extended to all surviving soldiers or sailors of the Confederate service. The local organizations, which are called camps, are nearly 1500 in number, and are organized in three departments, as follows: The Army of Northern Virginia Department; the Army of Tennessee Department; and the Trans-Mississippi Department. The badge or recognition button, worn in the lapel of the coat, is a square miniature Confederate flag. Membership is estimated to be upward of 65,000. The *Confederate Veteran*, Nashville, Tenn., is the official organ of the association.

CONFEDERATE VETERANS, UNITED SONS OF. A patriotic society organized in Richmond, Va., in 1896. The objects of the society are to gather authentic data for a history of the Civil War, written from a Southern standpoint; to collect historic relics; and to establish an accurate record, so far as may be, of the services of every Confederate veteran. Membership is accorded to the male descendants of Confederate veterans with an honorable military record. The society is organized into camps, dis-

tributed throughout the Southern States, and comprising three departments, as follows: Army of Northern Virginia Department; Army of Tennessee Department; Trans-Mississippi Department. Annual reunions are held, at which the representatives of local camps meet, forming the general society of the organization. The total membership is estimated to be about 10,000. In 1902 this society purchased Beauvoir, the home of Jefferson Davis, and it will be used as a home for Confederate veterans.

CONFEDERATION (Lat. *confederatio*, from *confederare*, to unite in a league, from *com-*, together + *federare*, to make a league, from *fadus*, league; connected with Lat. *fides*, faith, from *fidere*, to believe, Gk. *πειθειν*, *peithein*, to persuade, Got. *bidjan*, O.H.G. *bittan*, Ger. *bitten*, to request, AS. *biddan*, Engl. *bid*). An alliance of nations, States, or princes; according to Woolsey (*Introduction to International Law*, sec. 104), a union more or less complete of two or more States which before were independent. The New England Confederation (1643-84) is the earliest example of confederation in America. In 1777 the Continental Congress adopted the Articles of Confederation, in which are set forth the principles of government which were a few years later embodied in the Constitution of the United States, with such additions as were necessary "in order to form a more perfect union." Most of the Latin-American republics have come into being on a basis of confederation. In 1815 the German Confederation was formed, to replace the Holy Roman Empire, which confederation had been dissolved in 1806. The North German Confederation (1866-70) preceded the establishment of the German Empire, by whose original Constitution all the States of Germany "form an eternal union for the protection of the realm and the care of the welfare of the German people." The Swiss Confederation, comprising at present twenty-two autonomous cantons, had its origin in 1291 in the union of the cantons of Uri, Schwyz, and Lower Unterwalden.

CONFEDERATION, ARTICLES OF. See UNITED STATES.

CONFEDERATION, GERMAN. See GERMANY.

CONFEDERATION OF THE RHINE. A league of German princes formed in 1806 under the protection of Napoleon. The first to seek the French alliance were the Electors of Bavaria and Württemberg, who, in recompense for their services, were elevated to the dignity of kings by the Peace of Presburg, December 26, 1805. At Paris on July 12, 1806, sixteen German princes formally signed an act of confederation, dissolving their connection with the German Empire, and allying themselves with France. These princes were the kings of Bavaria and Württemberg, the Arch-Chancellor Dalberg, the Elector of Baden, the Duke of Cleves and Berg (Joachim Murat), the Landgrave of Hesse-Darmstadt, the princes of Nassau-Usingen, Nassau-Weilburg, Hohenzollern-Hechingen, Hohenzollern-Sigmaringen, Salm-Salm and Salm-Kyrburg, the Duke of Arenberg, the princes of Isenburg-Birstein and Liechtenstein, and the Count of Leyen. The princes justified their conduct by enumerating the vices of the constitution of the German Empire, promised to aid Napoleon in his wars with an army of 63,000 men, and called upon the other princes of

Germany to imitate their example. The Arch-Chancellor Dalberg was made Prince Primate of the Confederation, with his seat at Frankfort. During the years 1806-08 other German sovereigns enrolled themselves as members of the Confederation, and at the close of 1808 it embraced a territory of 122,236 square miles, contained a population of 14,608,877 souls, and kept up an army of 119,180 men. The disasters which overtook the French army in the Russian campaign acted like a solvent on the Confederation, and it vanished in 1813 in the sudden outburst of German patriotism. Consult: Rambaud, *La domination française en Allemagne, 1804-11* (Paris, 1876); Seeley, *Life of Stein* (3 vols., Cambridge, 1878); and the general histories of Ranke, Pertz, Oncken, and Treitschke. See GERMANY.

CONFERENCE (ML. *conferentia*, from Lat. *conferre*, to carry together, from *com-*, together + *ferre*, to bear). The assemblage of persons gathered for the purposes of consulting upon any course. In legislation there are often conference committees appointed when the two houses of a legislature disagree on any measure. The two houses may meet in joint session for certain specified purposes, but never in conference. There have been many international conferences, such as those of Geneva in 1864, of London in 1864, 1867, and 1871, and that of The Hague, 1899. An ecclesiastical conference was held at Hampton Court Palace, at the instance of James I., in 1604. It was composed of prelates of the Church of England and dissenting ministers, the object being to establish a scheme of 'comprehension' or common creed. This conference led to the translation of the Bible known to English readers as the Authorized Version. Another conference was held in 1661, the Savoy House Conference, when some alterations were made in the Prayer Book. Similar conferences were once frequent in the Roman Catholic Church; and in other churches there are pastoral and other conferences. The annual meeting of the Wesleyan Church of England is called the Annual Conference; and the title is used for annual or other stated sessions in the Methodist Episcopal, the Evangelical, and some Baptist denominations. Under the name of 'Evangelical Church Conference,' delegates from the Reformed churches in the German States and Austria meet for the consideration of questions affecting church matters.

CONFERVA (Lat., a kind of water-plant, from *confervere*, heat, from *com-*, together + *fervere*, to be hot). A general term sometimes applied to certain simple filamentous green algae. Also the name of a genus of the Chlorophyceæ (q.v.).

CONFES'SIO AMAN'TIS (Lat., the lover's confession). A long poem of over 30,000 lines by John Gower (1393). It is a conversation between Genius, the representative of Venus, and a lover, in which a series of tales, illustrating the effects of the various vices, is introduced.

CONFESSION (Lat. *confessio*, from *confiteri*, to confess, from *com-*, together + *fateri*, to acknowledge; connected with *fari*, Gr. *φῆναι*, *phēnai*, to speak). In law, a purely voluntary declaration made by one who has committed a misdemeanor or a crime, to some other person, of the agency or participation which he had in the offense. Also, the admission of a prisoner that he is guilty of the offense with which he is

charged. If made before a magistrate or in the course of judicial proceedings before a court, such confessions are 'judicial'; if made anywhere else, they are 'extra-judicial.' An entirely voluntary confession is admissible in evidence; but not so if procured through inducements, threats, promises, or hope of escape or favor. A confession in answer to questions by a magistrate or by any other person is admissible. A prisoner's confession when the *corpus delicti* (q.v.) is not otherwise proved is not sufficient to warrant conviction. Whether an alleged confession is admissible, as having been made voluntarily, for example, is a question for the court; what weight as evidence it is entitled to is a question for the jury. See ADMISSION; also CRIMINAL LAW, and consult the authorities referred to there.

CONFESSION. In Roman Catholic theology, a declaration of sins to a priest in order to obtain absolution. The practice of confession is believed by Roman Catholics to be of divine institution, being founded on the power of binding and loosing from sin conferred on the Apostles by Christ (Matt. xvi. 19, xviii. 18, and John xx. 22, 23). The power of binding or loosing, being in the view of its advocates judicial and discretionary, presupposes a confession of sins in order to its being judicially exercised. Catholics do not allege any formal scriptural precept for it, but they contend that the above passages contain an implied precept. Though the Apostle James recommends that Christians should confess their 'faults one to another,' yet open and public confession appears to have been first required in cases where persons guilty of gross apostasy desired to be again received into the Church. Motives of piety, and a wish to avoid the scandal of open confession, led gradually to the preference of private confession. Open or public confession, which was part of the discipline of public penance, ceased when that discipline went into disuse. Private confession has been retained, and though its defenders hold it to have been at all times in use, a general law was enacted by the fourth council of the Lateran in 1215 (can. xxi., *omnis utriusque sexus*) requiring that every Christian who has attained the years of discretion should confess to a priest approved for the purpose, at least once in the year. Confession is one of the three 'acts of the penitent'—contrition, confession, and satisfaction—which the Council of Trent declares to be parts of the sacrament of penance. The sinner is required to confess each and every mortal sin, in thought, word, and deed, which, after diligent examination of his conscience, has occurred to his memory. To conceal one vitiates the confession. He is exhorted, but not required, also to confess venial sins (q.v.), especially if they be habitual. Confession, in order to be fruitful, must be accompanied by contrition and a purpose of amendment. It commonly embraces the sins committed since the last confession; but may include a longer period, and even the entire life. In the latter case, the confession is called general. It is called 'auricular,' as being made to the private 'ear' of the priest, and is ordinarily spoken; but in cases of necessity may be made in writing, by signs, or even by an interpreter. Priests cannot validly receive confessions in any place without the 'approbation' of the

bishop of the place, which may be given either absolutely or with restrictions. Confession is prescribed in the ritual of the Greek, the Russo-Greek, the Coptic, the Syrian, and the other Oriental churches. In most of these churches the practice is obligatory, but in some it has gone into disuse. The Lutheran Church professes (according to the eleventh article of the Augsburg Confession) "that private confession must be retained in the Church; but that full and particular statement of *all* sins is not necessary, because, according to Psa. xix. 12, it is impossible." In the Apology of the Augsburg Confession, it is said to be 'impious' to abolish the practice of private confession to the priest; but in practice the Lutheran Church has widely departed from these rules. The Reformed Church in Germany has always been more inclined to general confession, and the United Church also substitutes for private confession certain devotional exercises previous to communion. The Church of England employs a general form of confession and absolution in its morning and evening services, but retains private confession in the rubric for visitation of the sick (the last not retained by the Protestant Episcopal Church in the United States). See ABSOLUTION; PENANCE; CONTRITION.

The *sigillum confessionis* ('seal of confession'), in the Roman Catholic and in the German Protestant Church, means the obligation of a confessor or priest not to divulge the secrets of the confessional. This custom of secrecy is traceable in the fourth and fifth centuries, but was made binding by Innocent III. (1198-1216), and its violation by a priest makes him subject to the severest penalties that can be inflicted by the Church. See PRIVILEGED COMMUNICATION.

CONFESSION (the tomb of a confessor or martyr). In church architecture, the recess, ambulatory, or chapel beneath the central altar, containing the relics of the saints, and corresponding to the subterranean tombs of the martyrs in the catacombs over which churches were erected. Such confessions gradually grew in size between the fourth and seventh centuries, until they developed into the crypt (q.v.).

CONFESSIOAL (ML. *confessionalis*, relating to confession, from Lat. *confessio*, confession). The seat, recess, or booth in which the priest sits to hear confession in a Roman Catholic church. These booths are distributed throughout the interiors of churches, in the nave and aisles, and are slight closed structures made of wood. The confessional commonly has a door in front, through which the priest enters, and an opening on one or both sides, like a small window, with a grating of wire or zinc, for the penitents to speak through as they kneel.

CONFESSION AND AVOIDANCE. Pleadings are said to be in confession and avoidance, in common-law practice, when they expressly or by a reasonable implication admit the allegations of the pleading to which they are interposed, and show some justification or excuse which will deprive them of the legal effect of supporting the plaintiff's claim of a right to recover. The admission must be sufficiently comprehensive to give color to the matter adversely alleged—that is, must show it to be *prima facie*, or apparently, true. Any pleading after the declaration may be by way of confes-

sion and avoidance of the last pleading of the opposite party. Thus, if the defendant should plead a release by plaintiff, the latter might in his replication admit that he gave a release, but allege that it was obtained from him by coercion or fraud. This might be denied by the opposite party, and then the cause would be at issue. See PLEADING.

CONFESSION D'UN ENFANT DU SIÈCLE, kŏn'fe-syŏn' du nän'fän' du syŏk'l, LA (Fr., the confession of a child of the century). A work of fiction by Alfred de Musset (1836), founded upon the author's love affair with George Sand.

CONFESSION OF JUDGMENT. A method of allowing judgment to be entered against a person upon his acknowledgment in proper form that a claim is, or is about to become, due and owing to another, and consenting that the latter may enter judgment for the amount named. A judgment thus obtained is equally valid and binding as though it had been secured by legal process. While the weight of advantage is with the person obtaining the judgment, in the saving of the time and expense of litigation, this device may also be of advantage to the debtor in saving him the annoyance and costs of suit involved in the ordinary process. It is commonly resorted to in cases where the debtor desires to prefer a certain creditor and give him the priority over other creditors and the additional security which a judgment affords.

It differs from *cognovit* (q.v.) in the fact that it may be made without the institution of an action, and in the further fact that it is generally limited to debts, in the usual sense of that term, and is not available for the liquidation of claims founded on torts. However, as intimated above, a confession of judgment may be equally valid for a claim not yet accrued, as for future advances.

In a few of the States of the United States it is customary to give a promissory note at the time of its inception the form and character of a confession of judgment, whereby the holder of the note is authorized at maturity, or at a specified time thereafter, to enter up judgment thereupon without further process. This extension of the principle is not, however, generally favored. See JUDGMENT; WARRANT OF ATTORNEY.

CONFESSIONS, LES, lâ kŏn'fe-syŏn' (Fr., the confessions). A remarkable autobiography of great frankness and dramatic strength, by Jean Jacques Rousseau, composed between 1766 and 1770. The work, in twelve books, was published in 1781 and 1788, after the author's death, contrary to his intention of suppressing it during the lifetime of the persons referred to in it. The confessions present the author in an unfavorable light, showing much that is base and weak in the acts admitted by him; but the work is distinguished by great narrative skill and a feeling for natural beauty.

CONFESSIONS OF AN ENGLISH OPIUM-EATER. A work by Thomas De Quincey (1821). It describes the effects of opium-eating, and is an example of impassioned prose which has few, if any, equals in English.

CONFESSIONS OF A YOUNG MAN. See MOORE, GEORGE.

CONFESSIONS OF SAINT AUGUSTINE, THE. A work by Saint Augustine in thirteen books, of which the first ten are autobiographical. The remaining three are exegetical, treating the first portion of Genesis.

CONFIDENTIAL COMMUNICATION. See PRIVILEGED COMMUNICATION.

CONFIRMATION (Lat. *confirmatio*, from *confirmare*, to strengthen, from *com-*, together + *firmare*, to make firm, from *firmus*, firm). In the ancient Church, the rite so named was administered immediately after baptism, which is still the custom in the Greek and African churches. In the Roman Catholic Church, for the last 300 or 400 years, the bishops have interposed a delay of seven years after infant baptism; in the Lutheran Church, the rite is usually delayed for from thirteen to sixteen years; and in the English Church, from fourteen to eighteen years. The ceremony consists in the imposition of hands, accompanied by an invocation of the Holy Ghost as the Comforter and Strengthener. But both in the Lutheran and English churches, the ceremony is made the occasion of requiring, from those who have been baptized in infancy, a renewal in their own persons of the baptismal vow made for them by their godfathers and godmothers, who are thereby released from their responsibility. None can partake of the Lord's Supper, in these churches, unless they have been confirmed. In the Roman Catholic Church, confirmation is held to be one of the seven sacraments, and in its administration, unction and the sign of the cross are used; in addition to the imposition of hands, the person confirmed receives a light blow on the cheek, to remind him that he must in future suffer affronts for the name of Christ. In the English Thirty-nine Articles, confirmation is declared not to be one of the sacraments, and the above ceremonies have been discontinued since the Reformation. See SACRAMENT.

CONFIRMATION. In old English law, a conveyance of an estate or right in lands to one who has the possession or some estate therein, the object being to confirm or render sure and indefeasible an estate which, but for such confirmation, is defective and voidable. It may be illustrated by the case of a disseizin, where the disseizee, or rightful owner, confirms the estate of the disseizor, who is in adverse possession of the land, vesting an absolute and indefeasible title in the latter. A confirmation was effected by deed and was nearly equivalent to a release (q.v.), by which it has been superseded. The confirmation is now, as a separate mode of conveyance, obsolete, though the term is still sometimes employed to describe the release of an outstanding claim to land to the party in possession. See CONVEYANCE.

CONFISCATION (Lat. *confiscatio*, from *confiscare*, to confiscate, from *com-*, together + *fiscus*, basket, treasury). The forfeiture of lands or goods to the Crown or State. At Rome *bona confiscata* were goods forfeited to the Emperor's treasury. Though sometimes employed in English and American law as synonymous with *forfeiture* for crime, confiscation is, at common law, a term of much more limited signification, and should probably be confined to the cases of the seizure by the Crown of waifs (*bona waviata*), or goods scattered by a thief in his flight, and of goods found in the possession of a felon and dis-

claimed by him. See ESCHEAT; FORFEITURE; EMINENT DOMAIN.

Under certain statutes, however, the State exercises the right to confiscate goods for violation of law, as in case of false entries of goods under customs and other revenue laws, and for violations of excise and internal revenue laws of the United States. The seizure and sale of real property by the State for non-payment of taxes is a similar proceeding.

Both international law and municipal law recognize the right of the sovereign authorities to confiscate the goods of an alien enemy found within the State, but the right is in fact seldom exercised in modern times.

CONFLICT OF LAWS. An opposition or contrariety between the laws of different jurisdictions affecting the rights of the same individual. In the decision of legal controversies every court regularly applies its own law (*lex fori*), i.e. the law prevailing within its jurisdiction; but exceptionally, and not infrequently, justice requires, and the domestic law itself authorizes, the application of foreign law. The cases in which the question arises whether domestic or foreign law should be applied are figuratively termed cases of conflict; and 'conflict of laws' is the title under which it is customary to set forth the rules by which such conflicts are adjusted. Because this branch of the law has been of international growth, and because the rules applied in the different nations are in the main similar, it is sometimes described as 'international private law.' Apart from other objections, this term is too narrow; for the rules in question apply not merely to conflicts between the laws of different nations, but also to conflicts between different cantonal or provincial laws within the same State, and to conflicts between the laws of different States within the same empire or federation. To a New York court, the law of New Jersey is as foreign as that of England or of France, and the same rules govern its application. This branch of modern law was developed on the Continent of Europe in the Middle Ages; and because in the later Middle Ages all purely local rules, whether of written or unwritten law, were termed statutes (*statuta*), it was first known as the doctrine of 'collision of statutes.' It took form as a body of judicial usages, but its development was largely controlled by the writings of leading jurists. Until the sixteenth century the authoritative writers were Italians (Bartolus and Baldus); from the sixteenth to the eighteenth century, they were French (Dumoulin, D'Argentré, Bouhier, and Boullenois), or Dutch (Burgundus, Rodenburg, P. and J. Voet, and Huber); in the nineteenth century the most important treatises were those of the American, Story, and the German, Savigny.

BY WHAT LAW SPECIAL RELATIONS ARE GOVERNED. Since Savigny, the effort of writers and of courts has been to determine by what local law each class of legal relations is properly governed. A substantial consensus exists on many of the chief points. (1) Domestic relations are regularly governed by the law of the husband's and father's domicile (*lex domicilii*). (2) Succession, whether testamentary or *ab intestato*, is governed by the law of the decedent's domicile. On the Continent of Europe this is generally

true of the entire estate, including realty; in England and in the United States the law of the domicile governs the distribution of the personality only. On the Continent the law of the domicile also governs the liquidation and division of a bankrupt's estate; in England this is true as regards the personality only. Everywhere the property relations of husband and wife (at least as regards personality) are governed by the law of the matrimonial domicile. (3) Real property (except on the Continent in the above cases) is governed by the law of the jurisdiction in which it lies (*lex rei sitæ*). (4) Movable things, except in the cases mentioned above (No. 2), are also governed by the law of the site, i.e. rights vested by the law of the site are respected everywhere and are not affected by the removal of the thing to another jurisdiction. (5) Contractual obligations are governed, so far as the relations between the creditor and the debtor are concerned, partly by the law of the place where the contract was concluded (*lex loci contractus celebrati*), and partly by the law of the place where the obligation is to be performed (*lex loci solutionis*). As regards transfers or assignments of the creditor's claim, however, the law governing transfers of personal property may prevail over the proper law of the contract; and claims (choses in action) regarded as assets of an estate will regularly be governed by the law of the creditor's domicile in the cases mentioned in No. 2.

Back of all these matters lie questions of capacity, (a) to take and hold property, real or personal, and (b) to act with legal result. The question of capacity to take and hold property rarely arises to-day except as regards corporations. This capacity is primarily determined by the law of the State in which the corporation was created; but it may be diminished or denied by the law of the place in which the property is situated. Questions of capacity to act are similarly determined as regards corporations, i.e. capacity must be accorded by the law of the State in which the corporation was created and also by the law of the State in which the corporation attempts to act. As regards natural persons, capacity to transmit property by will or to marry is generally determined by the law of the domicile; capacity to transfer personal property or to contract debt by the law of the place of the act (*lex loci actus*). In the United States, however, capacity to marry is governed by the law of the place of marriage. The sufficiency of the forms observed in legal acts is usually determined by the *lex loci actus*.

As regards wrongful acts, no action of tort can be maintained unless the act was wrongful (tortious) by the law of the place where it was done; and it is commonly held that it must also be tortious according to the law of the place where suit is brought (*lex fori*).

CITIZENSHIP GENERALLY IMMATERIAL. It should be noted that some European countries (Italy, Belgium, and Germany) substitute for the law of the domicile, in nearly all cases, the law of the State of which the person is (or in the case of a deceased person, was) a citizen or subject (*lex hæcænticæ, lex civitatis*); but the dominant theory makes allegiance immaterial in matters of private law.

EXCEPTIONS TO PREVIOUS GENERAL RULES. To all the above rules there is a series of exceptions.

Foreign law cannot be applied unless the domestic law permits its application. If the domestic legislator has expressly declared that a certain law is to govern all cases coming before the domestic courts, or if the purpose of the law would be thwarted by admitting exceptions, foreign law cannot be applied. Nor will foreign law be applied when its application would contravene the settled policy of the domestic law.

Finally, foreign law is applied only as regards questions of right, not as regards remedies—a rule which, properly construed, means that rights are to be enforced according to the methods prescribed by the domestic law.

PROOF OF FOREIGN LAW. Foreign law is said to be a question of fact. According to the sounder theory, this does not mean that it is a question for the jury; it means that the court is not bound to know foreign law, and may demand evidence concerning it.

FOREIGN JUDGMENTS. A foreign judgment is recognized as conclusive on the facts and on the law when it is a final judgment on the merits of the case by a competent court, i.e. by a court having jurisdiction. Whether the foreign court had jurisdiction is, however, a question which the domestic court will investigate, and will decide on principles of general jurisprudence, i.e. according to its own view of those principles.

Consult: Story, *Commentaries on the Conflict of Laws* (8th ed., edited by Bigelow, Boston 1883); Wharton, *Treatise on the Conflict of Laws: or, Private International Law, Including a Comparative View of Anglo-American, Roman, German, and French Jurisprudence* (2d ed., Philadelphia, 1881); Westlake, *Treatise on Private International Law* (3d ed., London, 1890); Dicey, *A Digest of the Law of England with Reference to the Conflict of Laws*, American notes by J. B. Moore (Boston, 1896). Two valuable German treatises—those of Savigny and Bar—have been translated into English, the former by Guthrie, under the title *Private International Law* (2d ed., Edinburgh, 1880), the latter by Gillespie, under the title *International Law, Private and Criminal* (Boston, 1883).

CONFORMITY (Fr. *conformité*, from Lat. *conformis*, like, from *com-*, together + *forma*, shape). In geology, the succession of two series of sedimentary or igneous strata in regular order. Such strata are said to be 'conformable,' and bear evidence of having been laid down continuously and without disturbance. The term 'conformability' is frequently used as a synonym of conformity. See UNCONFORMITY; GEOLOGY.

CONFRONTÉ, kôn-frôn'tá; Fr. pron. kôn'-frôn'tá' (Fr., confronted). In heraldry, a term which signifies facing or fronting one another. It is the same as combatant. See HERALDRY.

CONFUCIUS, kôn-fü'shî-ûs (Latinized form of Chinese *Kung-fü-tze*, the Master Kung) (c.551-478 B.C.). The most famous of all the sages of China. He was born in the State of Lu in the province which is now called Shan-tung. His lineage is traced by native tradition to Hang Ti, one of the early mythical rulers of China, although Confucius himself was the son of a soldier, Kung Shuh-Liang Heh, who was in command of the District of Chow. When a very old man, Heh wedded Chang Tsai in 552, and about a year later had as a son the future sage. When Confucius was but three years old, he lost his

father, but the boy was most carefully educated by his mother, and trained according to the highest ideals of China. At an early age he gave evidence of his exceptional abilities and his regard for ancient customs, while his thirst for learning was insatiable. When only seventeen years old he was manager for a wealthy landowner of Lu, and two years later he married. As in the case of other great teachers, however, notably Buddha, and later, Rama Krishna of India, Confucius seems to have been little adapted for family life. He had one son, who was born in 531, and, it would seem, two daughters. After four years he parted from his wife, but doubtless with unbroken friendship on both sides. The real life work of Confucius began when he was twenty-two, and from that time till his death, a period of fifty-one years, he led the life of a teacher, migrating frequently from place to place. His conduct on the death of his mother, which occurred in 527, is significant as showing the bent of his mind. With a filial devotion very rare at that epoch, he erected a large mound over her as she lay in the same grave with his father, and for twenty-seven months remained in entire seclusion. This time was probably not wasted. Doubtless his meditations during this period of mourning had considerable influence on his subsequent teachings. The effect of his rigorous observance of the ancient ceremonial custom of mourning for parents had an effect on all who knew him, and heightened their respect for his words. By the time Confucius had reached the age of thirty, he had formulated to his own satisfaction the tenets of his philosophy. In 517 he gained his first pupils of importance, and he was enabled to visit Lo-yang, the capital of the district, where he had an interview with Lao Tsz', the founder of Taoism. On his return to Lu in the following year, he found the city in a state of anarchy, and on the expulsion of the governor, who was his friend, Confucius retired with the ex-official to the neighboring State of Tsi. Here, however, he could not find a congenial home, and he returned to Lu, where he remained for the next fifteen years, carefully keeping himself aloof from all factional strife, and never slackening his devotion to his mission. At last his moral worth received its reward, and at the age of fifty-two Confucius was appointed Governor of Chung-tu, and this honor was followed by others higher still. Through the machinations of the Governor of Tsi, however, the influence of Confucius in Lu was so weakened that he left the country after four years. For thirteen years he wandered from place to place, and did not return to Lu until 485, seven years before his death. These last years were spent in well-earned retirement; but they were full of sorrow, marked by the deaths of his son and his two best-loved disciples, Yen Hui and Tsz' Lu. In 478 the teacher himself died, saddened by the fear lest he had failed to accomplish his mission. Herein he was wrong. The news of his death spread throughout the land, and called attention anew to his purity of life and teaching, so that the name of Confucius has ever since been the highest and most honored in the land to which he gave his life-long devotion. By the irony of fate he was deified after his death, and, like Buddha, Confucius, who had little belief in the supernatural, became a divinity.

Confucius was, as he himself said, not a re-

former, but a conservator. This is strikingly evident in his services to the literature of China. Although he is sometimes called a prolific author, he was in reality but a careful though voluminous editor, and he may, if this is clearly understood, be termed the founder of Chinese literature. Thus he established the canon of four of the 'five classics,' the *Shih Ching*, or Book of Poems, the *Li Ching*, or Book of Rites, the *I Ching*, or Book of Changes (originally a cosmological work), and the *Shu Ching*, or Book of Historical Documents, for which Confucius is said to have composed a preface, although merely a list of books which the *Shu Ching* once contained now remains. His one independent work, apart from his apothegms which were recorded by his disciples, is the *Chün Tsin*, or Spring and Autumn. This is an extremely dry annalistic history, very meagre in content and information, and altogether untrustworthy as a source of Chinese history, and records the events in the Province of Lu from B.C. 721 to 480.

Confucius was in no real sense of the word a religious teacher. His doctrines were entirely ethical and political. His attitude toward the supernatural may be summed up in his own words: "Respect the gods! but have as little as possible to do with them," and it is recorded that he spoke but seldom of four subjects—marvels, feats of strength, rebellions, and spiritual beings. In harmony with this attitude, he expresses no opinion concerning the immortality of the soul. He inculcates ever the duty, which he himself had observed so faithfully, of honor to parents and of obedience to temporal power. In this way the individual becomes absorbed in the family and the family in the State, which was regarded by Confucius as the highest concept on earth. For a State to be prosperous, mercy and all other virtues are necessary, and these qualities are to be manifested by the entire body of citizens. His teachings are, consequently, wholly worldly in character, and the dry maxims in which he expressed his views are permeated by a utilitarian philosophy which is devoid of any touch of idealism. His attitude toward women is the one generally current in the Orient. Metaphysical speculation, like religious investigation, is absent from his system, which sums up its principles in the five cardinal virtues—humanity, uprightness, decorum, wisdom, and truth. Confucius may perhaps be said to be China incarnate in his lack of originality; but with his devotion to the practical and his moral principles as patriot, sage, and teacher, he ranks among the foremost men that the world has ever seen. The most valuable account of Confucius is contained in the *Lun Yü*, or Philosophical Dialogues, which record his conversations, while the *Ta Hsüeh*, or Great Learning, and the *Chung Yung*, or Doctrine of the Mean, are important sources for the study of his system of philosophy.

As illustrations of the maxims of Confucius, the following characteristic ones may be cited: Learning without thought is labor lost; thought without learning is death of the mind. Riches and honor are what men desire; yet, except in accordance with right, they should not be enjoyed; poverty and degradation are what men dread; yet, except in accordance with right, they should not be avoided. What the superior man seeks is in himself; what the small man seeks is

in others. The foundation of all good is the virtue of individual men. Confucius also enunciated the Golden Rule, although in negative terms, as follows: "What ye would not that others should do unto you, do ye not unto them." Despite the negative form of this maxim, it is to all intents and purposes closely parallel to the Golden Rule as given by Christ.

Consult: Plath, *Confucius und seiner Schüler Leben und Lehren* (Munich, 1867-74); von der Gabelentz, *Confucius und seine Lehre* (Leipzig, 1888); Haug, *Confucius der Weise Chinas* (Berlin, 1880); Dvorak, *Chinas Religionen*, Band i., *Confucius und seine Lehre* (Münster, 1895); Legge, *Life and Teachings of Confucius* (London, 1887); Douglass, *Confucianism and Taoism* (London, 1879). For the original sources, Legge's translations of the *Lun Yü*, *Ta Hsüeh*, and *Chung Yung* in the first volume of his *Chinese Classics* (Hong Kong and London, 1861) should be consulted as of the first importance. The same scholar's translations of the *Texts of Confucianism* (comprising the *Shu Ching*, *Hsiao Ching*, *I Ching*, *Li Ching*, and portions of the *Shih Ching*), vols. iii., xvi., xxvii., xxviii. of the *Sacred Books of the East* (Oxford, 1879-85) are also of value.

CONFUSION (Lat. *confusio*, a mixing together, from *confundere*, to mingle or mix together, from *com-*, together + *fundere*, to pour, pour out) or GOODS. The intermingling of the goods of two or more several owners so as to be indistinguishable. This may occur voluntarily, or by agreement of all the parties concerned—as in the common case of the deposit of grain in a common storage elevator; or accidentally, as when, in case of fire or shipwreck or innocent mistake, goods are inextricably mingled together; or the confusion may be malicious and willful, as when one person takes gold belonging to another and throws it into the melting-pot with his own. In the first two cases the law adjusts the rights of the parties by making them tenants in common of the mixture, in the proportion of their respective contributions thereto, and, where the portions confused are of unequal value, in the proportion of their respective values. In the case of a willful confusion, however, the common law originally adopted the stringent rule of giving the entire mass to the innocent party, and this principle would still be applied in some common-law jurisdictions. The present tendency, however, in England as well as in the United States, is to adopt the milder rule of the Roman or civil law, either making the parties tenants in common of the mixture, as in the other cases referred to, or permitting the innocent party to recover the value of his share at the time of the confusion. Compare ACCESSION. Consult Schouler, *Treatise on the Law of Personal Property* (Boston, 1896).

CONGAREE (kōn'gá-rē') **RIVER**. A river of South Carolina, formed by the junction of the Broad and the Saluda rivers, near Columbia. (Map: South Carolina, D 3). It flows southeast, and, joining the Wateree, forms the Santee. It is 60 miles long and navigable to Grandby, two miles below Columbia. At this city it furnishes considerable water-power.

CONGÉ D'ÉLIRE, kōn'zhá' dá'lér' (Norman-French, Fr., permission to elect). The name

given in England to the King's warrant or permission to a dean and chapter of a cathedral to proceed to the election of a bishop to a vacant see. Since the passing of the statute 25 Hen. VIII, c. 20, with the exception of short periods in the reigns of Edward VI. and Mary, the congé d'élire has always been accompanied by a letter missive from the King, mentioning the person to be elected by name, so that in reality it is an appointment by the Crown. If the dean and chapter delay the election beyond twelve days, the appointment is effected by letter patent from the Crown; if they elect another than the person named, they incur the penalties of a *premunire*, i.e. loss of civil rights, forfeiture of their goods, and imprisonment during the royal pleasure. The same penalties are imposed upon any bishop or archbishop who neglects to assist in the consecration and investment of a bishop so elected, within twenty days after the royal announcement of his election. Consult Stephen, *Commentaries*, vol. iii. (London, 1886).

CONGENITAL DISEASE (Lat. *congenitus*, born with, from *con-*, together + *gignere*, to beget). A term used to denote any disease with which an infant enters the world. Congenital diseases may be acquired from the mother during pregnancy or during the act of delivery. In the former class belong syphilis, and, according to some authorities, smallpox. The latter class is to be separated into two subdivisions: (1) diseases obtained by infection from the parturient canal of the mother, as syphilis, gonorrhoea, septic peritonitis, purulent ophthalmia, and pyæmia; (2) conditions due to accidents occurring during delivery of the infant, such as asphyxia, atelectasis (unexpanded lungs), and cephalhematoma (tumor of the scalp containing bloody fluid). Infants may also develop an acute fatty degeneration as well as tumors of various kinds before birth.

CONGER, kōn'gēr (Lat., from Gk. γόγγρος, *gongros*, conger), or **CONGER EEL**. A marine eel (*Leptocephalus conger*) of the family Leptocephalidae, having the form of the typical eels, but no scales. The head is pointed and the mouth deeply cleft. The teeth in the outer series of either jaw are placed closely together so as to form a cutting edge. The dorsal fin commences much nearer the head than in the fresh-water eel and is confluent with the anal around the tail. The conger grows to a length of 8 feet and a weight of 25 or 30 pounds, and is almost cosmopolitan. "Congers feed chiefly by night and prey upon crustaceans, cuttles, and various kinds of fish. . . . Their favorite resorts are either hollows or crevices in the rocks or sandy bottoms, in which they can bury themselves; and in such situations they are sometimes left by the ebbing tide. The flesh of these eels is of a highly gelatinous nature, and is said to be largely employed in soups." American fishermen usually eel them sea-eels. Several Oriental species are known; and the name is sometimes applied to other similar fishes, as those of the genus *Synaphobranchus*. The conger passes through a metamorphosis, "the young being loosely organized, transparent, and band-shaped, with a very small head. The body grows smaller with age owing to the compacting of the tissues." This larval form was mistakenly described as a differ-

ent genus, *Leptocephalus*. This name, being the older, has displaced the long-used generic term, *Conger*. See EEL; and Plate of EELS, CONGERS, and MORAYS.

CONGER, EDWIN HURD (1843—). An American politician and diplomat, born in Knox County, Ill. He graduated in 1862 at Lombard University (Galesburg, Ill.), and at the Albany Law School in 1866, and in the latter year was admitted to the bar of Illinois. He served in the Federal Army during the Civil War, was brevetted major, and in 1868 set up as a stockman and banker in Iowa. From 1885 to 1891 he was a member of Congress, and at the close of the latter year was appointed Envoy Extraordinary and Minister Plenipotentiary to Brazil. In 1898 he was transferred to the embassy in China, a post of obviously greater importance. He was the only representative of a foreign power who, during the siege of Peking from June 28 to August 14, 1900, was able to send a communication to his Government. Subsequent to the siege, he was prominent in the peace negotiations between the Chinese commissioners and the foreign envoys.

CONGESTION (Lat. *congestio*, accumulation, from *congerere*, to carry together, from *com-*, together + *gerere*, to carry). An abnormal increase of blood in the vessels, due to increased pressure in the arteries or obstruction to the emptying of the veins. Emotion or exercise, by causing the heart to beat more rapidly; alcohol, or other drugs, by expanding the arteries as well as stimulating the heart; local irritation by cold, a blow, or a burn, may cause congestion of the active variety, with the production of a rosy color. A tight garter, a stooping posture, or the swelling of a finger from injury may cause passive congestion by obstructing the veins, in which case the color of the congested part is bluish or purple. In certain diseases in which the blood deteriorates, such as smallpox, typhoid fever, and septic conditions, the blood gravitates to the most dependent parts of the body, and 'hypostatic congestion' of the lungs, liver, and skin results mechanically. Congestion occurs during many diseases.

CONGLETON, kōp'g'l-ton. A market-town of Cheshire, England, on the Dane, about 26 miles south of Manchester (Map: England, D 3). Its chief industries consist of manufactures of silks and towels. Population, in 1891, 10,744; in 1901, 10,706. Congleton appears in *Domesday*, and received a charter from Henry de Lacey in the thirteenth century.

CONGLETON, HENRY BROOKE PARNELL. See PARNELL, HENRY BROOKE.

CONGLOMERATE (from Lat. *conglomeratus*, p. p. of *conglomerare*, to roll together, from *com-*, together + *glomerare*, to roll into a ball, from *glomus*, ball). A sedimentary rock (commonly called 'puddingstone') composed of pebbles cemented together by finer grained rock material. Conglomerates form along shores, and the pebbly beaches which are now forming will, when consolidated, produce conglomerates. Since conglomerates can form only in shallow water (where the force of the waves is sufficient to move pebbles), their occurrence within the strata of the earth's crust indicates an encroachment of the sea upon the land. Such an encroachment occurs during and after a subsidence

of the land beneath the sea, when deposits of sediment are laid down. Conglomerates, therefore, generally lie at the base of geological formations and serve to separate these formations from one another. Their occurrence also indicates a lost page of the record which the sedimentary rocks have furnished of the earth's history.

CONGO, kōn'g'ô, or **KONGO** (from the African tribe of *Mosicongo*). The largest, and, excepting the Nile, the longest river of Africa, and in length, volume, and drainage area, one of the great rivers of the earth. It drains most of Central Africa west of longitude 32° E., from latitude 8° N. to 12° S. It has its source in the mountain region in latitude 9° S. and longitude 32° E., at a point a little southeast of Lake Tanganyika (Map: Africa, F 5). The headstream is the Zambesi River, which flows southwest and enters Lake Bangweolo (altitude, about 3800 feet). The outlet of this lake, known as the Luapula River, flows southwestward, then northward, and enters Lake Moero (altitude 2900 feet). The outlet of this latter lake, still called the Luapula, flows northwestward and, in latitude 7° S., longitude 27° E., joins the Lualaba River, which flows north from its source in Katanga, in latitude 12° S., longitude 26° E., to form the Congo by its junction with the Luapula. About 60 miles north of the confluence of the Luapula and the Lualaba the Congo is joined by the Lukuga, the outlet of Lake Tanganyika (altitude, 2700 feet). Below this point several minor tributary streams are received by the Congo, mainly from the eastern side, until, at the equator, in longitude 24° 30' E., at a point about 80 miles below Stanley Falls, the Congo is joined by the Lomami, which has a parallel course on the west. Eastward of this point the Congo begins its great bend toward the west. About 60 miles below the entrance of the Lomami, the Aruwimi enters the Congo from the east, and still farther down-stream there join at intervals from the north the rivers Itimbi, Mongala, Ubangi (which drains the borders of Sudan, and is a very powerful stream), Sanga, Likuala, and Mossaka, besides smaller streams; and from the south the Lulonga, Ruki, and Kasai. Below these, throughout the lower 500 miles of the river's course, only small tributaries are received. About 300 miles from the mouth of the Congo is Stanley Pool, an enlargement of the river. The mouth is in latitude 6° S., longitude 12° E. The basin of the Congo consists of plateaus ranging in altitude from 1000 to 3000 feet. It is in the descent from the plateau near the west coast that the impediments to navigation occur. The basin is densely forested with a great variety of broad-leaved trees, and an almost impenetrable undergrowth. The river is navigable for ocean steamers from its mouth to a point about 110 miles up-stream, where navigation is interrupted by falls and rapids; and also by steamboats from Stanley Pool to Stanley Falls, for a distance of nearly 1000 miles farther. The length of the navigable waters of the Congo system is estimated at about 9000 miles. Over 100 steamers were engaged in traffic on the upper Congo waters at the end of the nineteenth century. The completion of the Matadi Railroad has placed the middle course of the river in communication with its estuary. The Congo has a length of about 2500 miles, and

drains an area of more than 1,400,000 square miles.

CONGO FREE STATE. An independent State under the sovereignty of King Leopold II. of Belgium, situated approximately between longitudes 12° and 30° E. and between latitudes 14° S. and 6° N. (Map: Africa, G 5). It is bounded on the north by French Congo and the Egyptian Sudan, on the east by British East Africa, German East Africa, and Northern Rhodesia, on the south by Northern Rhodesia and Portuguese West Africa, and on the west by Portuguese West Africa, the Atlantic, and French Congo. The boundaries of the State, with the Congo and Ubangi rivers on the west, and Lakes Tanganyika, Moero, Albert Edward Nyanza, and Albert Nyanza on the east, are all well defined, and the area is estimated at from 850,000 to 900,000 square miles.

The surface of Congo is a depressed plateau-basin, tilted seaward, which was seemingly occupied at a recent date by the sea. It is unbroken by mountains except in the western part near the Atlantic, but rises on its borders to elevations of 6000 feet and more. More than half of the area is covered with forests, while the remainder is composed of savannas and arable land. The chief river is the Congo (q.v.), which, together with its tributaries, drains the larger part of the country. The climate is exceedingly hot and moist, and very unhealthy for Europeans. The normal temperature ranges from 60° to 90°, and not infrequently an exceedingly hot day is followed by a chilly night. The climate in the interior is not so injurious to Europeans as that of the coast region.

The flora of Congo is very rich and varied, the forests being full of rubber-trees, and other trees yielding gums and resins. Among the cultivated plants are the coffee, cotton, yam, papaw, pineapple, cassava, corn, rice, peanut, sweet potato, banana, bean, tobacco, sorghum, and Kafir corn. The fauna includes the elephant, hippopotamus, buffalo, antelope, chimpanzee, and crocodile. Elephants and hippopotami are especially numerous, and furnish large quantities of ivory. The mineral resources of Congo are said to be very rich. Iron occurs at many localities, while copper is confined to a smaller area, but is found in very rich deposits, especially between the Kasai and the Atlantic, and also in the southern regions. Much of the surface is composed of a loose, porous, weathered rock, known as 'laterite,' which has been derived from the underlying gneisses and sandstones.

The natural agricultural possibilities of the State are very great, but the unhealthy climate, which practically forbids white immigration, largely prevents systematic agricultural development. The agricultural land is divided among the natives, the Europeans, and the State, the last partly renting its land and partly cultivating it through agents. So far the chief products are rubber, palm-nuts, and palm-oil, but coffee, cacao, tobacco, corn, bananas, and beans are also grown to a considerable extent, and recent experiments have proved that many of the European grains and vegetables can be raised successfully. There are no statistics concerning the live stock. Coffee and tobacco grow wild.

The transportation facilities of the State are mainly provided by the Congo and its several

navigable tributaries. The Congo is interrupted in its lower part, from Matadi to Leopoldville, a distance of about 200 miles, by a series of rapids—a great obstacle to direct communication between the interior of the country and the Atlantic. To obviate this difficulty, a railway line about 260 miles in length was constructed between Matadi and Leopoldville (Stanley Pool), and opened for traffic in 1898. Above the rapids the river is navigable for 1000 miles to Stanley Falls. A Belgian company has obtained a concession for the construction of about 900 miles of railway to connect the Congo at Stanleyville and Nyangwe with the lakes of Albert Nyanza and Tanganyika. The Government runs thirty-five steamers on the upper and lower Congo. The total number of miles of waterway by river and lake in the Free State is estimated at 9500. There is steam communication regularly each fortnight with Antwerp, and also frequent communication with other European ports. The construction of telegraph lines was begun in 1892, and by the end of 1900 there were about 500 miles.

There are as yet no European manufacturing plants in the Free State. In some districts the natives work in wood, ivory, and metals with no small skill.

The commerce has grown with remarkable rapidity. The general export trade, which amounted to only \$3,000,000 in 1896, rose to nearly \$10,000,000 in 1900, while the imports increased during the same period from about \$3,100,000 to over \$6,100,000. Of these exports for 1900, about 90 per cent. were special, as were also 80 per cent. of the imports for the same year. Of the total special commerce, about 83 per cent. is with Belgium; the remainder is with Great Britain, Germany, Holland, and Angola. Nearly 90 per cent. of the special exports consist of rubber, the remainder being made up of ivory, palm-nuts, palm-oil, timber, coffee, and tobacco. The chief special imports are tissues and clothing, food substances, beverages, machinery, and other metal manufactures. There is an import duty of 10 per cent. ad valorem on arms, ammunition, and salt, and of 6 per cent. on all other articles, with the exception of machinery and agricultural implements which were admitted duty free from 1892 to 1896, and since then have been liable to a duty of 3 per cent. There is an export duty on rubber and several other articles. The trade is chiefly with Belgium, Great Britain, Germany, and Holland. The principal ports are Boma and Banana, which have an annual shipping of over 900,000 tons, over one-half being Belgian. The coasting trade is small.

The central Government of the State is located at Brussels, and is constituted by the King of Belgium and a Secretary of State, the latter being at the head of the departments of Foreign Affairs, Finance, and the Interior. The King's power is not limited by a constitution, but is somewhat circumscribed by the General Act of Berlin of 1885 relative to the organization of the Congo Free State. The direct administration is in the hands of a Governor-General at Boma, assisted by a Vice-Governor-General. According to the agreement of 1890, between Belgium and the Congo Free State, the former obtained the right of annexing the latter after a period of ten years. In 1901 the question of annexation

came up before Parliament, and it was decided to continue the present form of government, reserving the right of annexation to the King alone. The departments of the local government are: Justice, defense, public force, finance, agriculture and industry, transport, marine, and public works, and superintendence of State lands. For administrative purposes, the State is divided into fourteen districts, administered by commissaries. Civil law is in force wherever the State's authority reaches. Courts of First Instance have been established, and there is a Court of Appeal at Boma, with a right of further appeal in more important cases to a superior council at Brussels. There is also a commission to protect the natives from ill treatment. The army, consisting of natives under Euporean officers and sergeants, numbers nearly 13,000 men. The chief sources of revenue are import and export duties, State domains, Government transportation lines, and portfolio taxes. The budget balances at present at about \$6,000,000, the expenditure slightly exceeding the revenue. The principal expenditures are for administration, the public domains, and the marine and transport service. The legal money is the same as that of Belgium. The total indebtedness of the State amounts to over \$32,000,000, including the 25,000,000 francs advanced by Belgium in 1890, and the loan of 50,000,000 francs, at 4 per cent., issued in 1901 for the construction of railways and other public works. The Belgian act of 1901 relinquished the repayment by the Free State of Belgium's advances and the interest thereon, and these obligations are to revive only in case Belgium decides not to annex the country.

The population has been variously estimated at from fourteen million to twice that figure. The inhabitants are mostly of the Bantu race. The Azandés, a superior native people, are found in the northeastern part, and there are many bands of pygmies along the Congo. In 1901 the European population was 2204, about half of whom were Belgians. Among the numerous 'stations' in the Free State are: Boma, the capital, situated on the Congo, about 50 miles from its mouth, and the centre of a large trade; the port of Banana, with an excellent harbor; Matadi, a promising railway point at the foot of the Congo Rapids; Ndolo, an important river port; Leopoldville, apparently destined to become the capital of the State; Stanley Pool, Equatorville, Basoko, and Stanley Falls. The religion of the natives is generally of a very low order, consisting largely of a repulsive fetishism, including cannibalism in many districts. Missionary work, though without financial support from the State, is being actively and successfully carried on at 76 missions. The instruction is educational as well as religious. The State, mainly for military purposes, has provided three agricultural and technical colonies capable of receiving 1500 boys.

ETHNOLOGY. The natives of the Congo Free State are Negroid in race, largely mixed with Hamites of Caucasian blood. The Negroid element, far from homogeneous in physical characteristics, presents a great variety of types, due to intermixture with the true negroes as well as the pygmies north of them. The natives are handsomer than the negro, shorter in stature, less dolichocephalic and prognathic, the nose is more prominent and narrower, and the forehead

less convex. Steel-gray eyes prevail in some tribes. In speech there exists over the Congo Basin the most astonishing unity. With the exception of the northern border, where true negro dialects have intruded, the languages all belong to the Bantuan family (from *aba*, or *ba*, plurality, and *ntu*, person, comes *ba-ntu*, men, people). They are agglutinative, and use the prefix almost exclusively for modifying the meaning of the fundamental term. These languages have scarcely been studied sufficiently for a minute classification. The Congolese, both men and women, are clever in handicraft. They are not mechanical, however, and it is doubtful whether one of them ever invented a machine. Evidences of a Stone Age among them are meagre. Nature having furnished iron ore easily worked in open fires, the Iron Age has had a long history among them. The women are excellent weavers; the men are excessively fond of ornament. Their art sense is most primitive. Their knowledge of nature is confined to practical acquaintance with things of use.

In social organization and customs the tribes of the Congo present the greatest varieties. In some of them the tribal bond seems loose, and cannibalism prevails to a dreadful extent. On the larger rivers and under more favorable skies, where there is an infusion of Hamitic blood and the benefit of Hamitic tuition, large empires have arisen, the form of whose government is purely despotic. Under such organization, polygamy and slavery are the legitimate types of family life. To the Bantu mind, the spirit world lies very near the material world. In faith he is an animist of the lowest type—i.e. a hecastotheist: everything is vital, a vague somebody. Moreover, there are more spirits than bodies, and they wander about night and day, benevolent and malevolent. In cult there is no definite organization for social worship, except where the Caucasian race has taught it. Religion is personal, its minister is the sorcerer or wizard, who knows how to call forth this spirit and that, to appease the powers that do harm even with human sacrifices, and to compel the services of the benevolent ones. See Colored Plate of AFRICAN RACES.

HISTORY. The Congo Free State was established as a neutral independent sovereignty in 1884. In 1876 King Leopold II. of Belgium had organized, with the cooperation of the leading African explorers and the support of several European governments, the International African Association (q.v.), for the promotion of African exploration and colonization. In the following year Henry M. Stanley called attention to the Congo country, and was sent there by the Association, the expense being defrayed by Leopold. By treaties with native chiefs, rights were acquired to a great area along the Congo, and posts were established. After 1879 the work was under the auspices of the Comité d'Etudes du Haut Congo, which developed into the International Association of the Congo. This organization sought to combine the numerous small territories acquired into one sovereign State, and asked for recognition from the civilized governments. On April 22, 1884, the United States Government, having decided that the cessions by the native chiefs were lawful, recognized the International Association of the Congo as a sovereign independent State, under the title of

the Congo Free State, and this example was followed by Austria-Hungary, France, Germany, England, Italy, the Netherlands, Portugal, Russia, Spain, and Sweden. The international conference on African affairs which met at Berlin, 1884-85, determined the status of the Congo Free State, which occupies a peculiar position among States because of the conditions surrounding it and the auspices under which it was founded. By the act of the Conference, signed February 26, 1885, the Congo Free State was declared neutral and open to the trade of all nations, the Powers reserving for twenty years the right to decide as to the taxation of imports; the navigation of the Congo and its affluents was to be free, under the supervision of an international commission; religious freedom and equality of treatment of all settlers were guaranteed; and war was declared upon the slave trade. The United States refrained from ratifying this act, on the ground that it would thereby be committed, contrary to its policy, to certain international engagements. The new State was placed under the personal sovereignty of Leopold II., who, by will, four years later, bequeathed it to Belgium. Soon, however, other interests had been acquired in Africa by the Powers, and they correspondingly lost interest in the Congo enterprise, which became less international and more Belgian. On July 31, 1890, the territories of the Congo Free State were declared inalienable, a convention between Belgium and the Congo Free State having already reserved to Belgium the right to annex the Congo State after ten years.

In accordance with the tariff reservation in the act of 1885, the international conference at Brussels in 1890 authorized the Congo Free State to levy duties on certain imports, in order to provide the needed revenue. By the Treaty of 1891 the United States established relations with the Congo Free State, providing for commercial intercourse and a consular system, and for the arbitration of any dispute under the treaty. Several separate treaties with the European States having colonial possessions in Africa adjoining the Congo Free State have defined its boundaries. The Belgian Chambers have liberally supported the King in the development of the Congo, and the ultimate transfer of the sovereignty to Belgium was acquiesced in by the European Powers because Belgium, like the Congo Free State itself, is under an international guarantee of neutrality. There is a difference of opinion in regard to the success of the work done by Belgium on the Congo. The slave trade has been restricted, if not wholly suppressed, but the officials have not been wholly successful in dealing with savage tribes in the interior, and it is doubtful to what extent the authority of the Government may be regarded as established. Critics assert that Leopold has regarded the Congo State more as a commercial enterprise to be exploited for profit than as a country to be redeemed for civilization, and that his capital has been insufficient for the expenses of so vast an undertaking. The latter is undoubtedly true. There seems to be no doubt, on the other hand, that intertribal wars and cannibalism, as well as abuses arising from the liquor traffic, have been largely reduced in the territories subject to Leopold.

CONGO PEA. See PIGEON PEA.

CONGO SNAKE. A small, eel-like amphibian (*Amphiuma means*) with very small two-toed legs, and eyes covered with skin. It is found in the rice-fields of the Southern States, where it is much feared by the common folk. It is wholly harmless, and burrows in mud in search of fishes, snails, and insect-larvæ. It lays under logs, etc., a mass of eggs, which have a firm, transparent skin, and are connected by cords into a string; these seem to be guarded and kept moist by the mother. (*Bulletin United States National Museum*, No. 31, p. 220.) The *Amphiuma* is remarkable as being the only salamander possessing a voice; when angry or excited it gives a clear whistle. See AMPHIUMA.

CONGREGATION (Lat. *congregatio*, from *eongregare*, to flock together, from *com-*, together + *gregare*, to flock, from *grex*, herd). An assembly; generally a religious assembly; in its most ordinary sense, an assembly of Christians met in one place for worship. (See CHURCH.) In the Roman Catholic Church it often designates a sort of board of cardinals, prelates, and divines, to which is intrusted the management of some important branch of the affairs of the Church. For example, the *Congregation of the Index* examines books and decides on their fitness for general perusal. (See INDEX.) The *Congregatio de Propaganda Fide* consults as to the advancement of the Roman Catholic religion throughout the world. (See PROPAGANDA.) The *Congregation of Relics* inquires into the genuineness of supposed relics. The *Congregation of the Holy Office* takes cognizance of heresies, etc. (See INQUISITION.) The *Congregation of Rites* regulates the festivals and offices of new saints.

CONGREGATIONALISM. A term used in two significations at present. It designates a peculiar system of church organization and government, and as such is rightly claimed by a great family of religious bodies, of which that popularly called 'Congregational' is only one. In this usage, the word appropriately describes the polity of the Baptists, the River and the Plymouth Brethren, the Christians, the Disciples of Christ, the Unitarians, and the Hebrew synagogues. It properly describes the organization of considerable groups of Adventists, American Lutherans, and less numerous religious communions, as well as of those churches specifically called by the Congregational name. But the term 'Congregational' is employed no less appropriately in a second signification, to denote

a particular group of churches in Great Britain, the United States, Canada, and Australia, which are 'Congregational' in their government and 'Evangelical' in their type of Protestant doctrine, and stand in recognized relations of denominational fellowship one with another within the bounds of the respective countries of their location, and to some extent in international fraternal union. In this sense it is proper to speak of the Congregational denomination of the United States, or of England and Wales.

The Congregational polity, in its modern history, had its origin in the Reformation age, and was due to the belief that the Bible contains an authoritative revelation of the will of God concerning church organization, no less than a God-given revelation of religious truth. In working out the details of the Congregational system, its early expounders conceived that they were simply reproducing the divinely appointed model of the Apostolic churches. Few modern Congregationalists hold, however, that the minutiae of church government are matters of revelation, or that any one form of church organization was divinely appointed for all times, countries, and stages of civilization: though Congregationalists generally believe that their polity embodies the broad scriptural principles of fraternal equality, individual responsibility, and full-rounded independent Christian manhood. They deem it, also, peculiarly consonant with the democratic tendencies and high individual intelligence of modern civil society. As indicated in the name, Congregationalism believes the basic element in the visible organized Church to be the local congregation of Christian disciples. It holds that congregation competent to designate its own officers, admit members to communion, discipline the erring, state its faith in language of its own choosing, and order its worship as seems best suited to its needs. Each local congregation, modern Congregationalism regards as a democracy, where affairs of concern are decided by the votes of the membership, normally under the moderatorsip of the pastor—if there be a pastor in office. Like all democratic bodies, however, a Congregational church makes large use of committees, which report results rather than processes for the consideration of the body as a whole, and act as the executive arms of the congregation.

Congregationalism holds to the autonomy of the local church. It rejects the judicial system of Presbyterianism, or the supervision of any form of episcopacy, as an undue interference with the rights of the local body. But Congregationalism in America, and increasingly in Great Britain, rejects pure independency. Though one church or body of Christians has no judicial authority over another, each owes fraternal counsel to its neighbors, and no act of large importance in any single congregation should be done without seeking the advice of the representatives of sister churches. Illustrated in various ways in different countries, mutual responsibility and helpfulness are distinguishing features of the Congregational polity.

The Local Church.—The local church is held by Congregationalists to be a company of professed disciples of Christ, who have some intelligent acquaintance with Christian truth, and personal experience of the saving work of Christ. Hence admission to church-membership is based

on evidence of intelligent determination to lead a Christian life. Such a company of Christians is knit together into a church by the covenant which they make with God and one with another, to live as those who have God for their Father and Christ for their Saviour, and to join in the worship, seek the welfare, and submit to the discipline of the particular local body of believers of which they are members. In early Congregationalism, and in American practice to the present day, this covenant, which each local congregation may express in whatever way seems best to it, was written; in Great Britain written covenants are now rare. In addition to a written covenant, it is usual for American Congregational churches of the present day to have a brief confession of faith, assent to which is required of would-be members. Such local confessions, though not unknown, are unusual in Great Britain. Examination of candidates for membership as to their knowledge of Christian truth has prevailed since the beginnings of Congregationalism; but the local confession of faith, though occasionally exemplified in New England during the seventeenth and eighteenth centuries, attained general use in America during the doctrinal discussions of the opening years of the nineteenth century. Each local church is free to express its faith in its own language, and such confessions, like the examination of candidates for church-membership, have steadily tended toward greater catholicity and simplicity. While Congregationalism recognizes no creed-statement as binding on a local church save that which the church may itself adopt, Congregationalists have never hesitated, in their representative gatherings, to adopt confessions of faith. These have the value of a testimony to the common faith of the churches, and have never been regarded as creed-tests. Thus, the exiled London Congregationalists put forth a confession in 1596; the Cambridge Synod, representing the churches of New England, approved the doctrinal parts of the Westminster Confession in 1648. Ten years later, a meeting representative of the Congregational churches of England put forth a modified form of the Westminster Confession, known, from the place of their assembly, in the Savoy, in London, as the 'Savoy Declaration'; and meetings of the delegates of the Massachusetts churches in 1680, and of those of Connecticut in 1708, set their approval, save for slight changes, on this work of the Savoy Synod. The 'Congregational Union of England and Wales' put forth a statement of 'Principles of Religion' in 1833; the 'National Council of the Congregational Churches of the United States' adopted the 'Burial Hill [Plymouth, Mass.] Declaration' in 1865; and in 1883 a commission appointed by the 'National Council' three years before reported a creed that has had wide acceptance among American Congregationalists, and has been adopted as their statement of faith by many local churches.

Doctrinal Position.—The doctrinal position of early Congregationalism was that of general Puritan or Presbyterian Calvinism. It was not on doctrinal grounds that the founders of New England left their homes. They were wholly one theologically with the Puritan Party of the English Civil War, with which they and the English Congregationalists were alike associated. His-

torically considered, American and English Congregational theological development has been along Calvinistic lines; but, as in other Protestant bodies, the peculiar problems of seventeenth-century debate have ceased to arouse interest. Calvinistic and Arminian interpretations of the way of salvation, as far as there is present significance in either interpretation, are regarded as alike acceptable. The doctrinal position of modern Congregationalism is that common Protestantism which is known as 'Evangelical.' Its ministry and churches, as a whole, however, while holding broadly to the system of Christian doctrine characteristic of historic Protestantism, have been more disposed in recent years than many Protestant bodies to welcome the new interpretations of Christian truth, and of its sources, which current theological discussions in Europe and America have presented.

Officers and Support.—Early Congregationalism, following what was believed to be the Scripture model, held that a completely organized local church should have five classes of officers—a 'pastor' and a 'teacher,' both of whom should preach and administer the sacraments; a 'ruling elder,' who should aid in church discipline; 'deacons,' to care for the poor and assist at the Lord's Table; and 'widows,' to aid in nursing among the sick. But little of this elaborateness of organization survived the end of the seventeenth century, and by that time the officers of a Congregational church had become reduced almost universally to a pastor and several deacons. The development of the nineteenth century added to these officers in practically every church a clerk, a treasurer, and a Sunday-school superintendent; and, in churches of size, a 'prudential committee,' to serve with the other officers as advisory to the pastor. In early Congregationalism, the pastor, teacher, and ruling elder were salaried officers. Since the cessation of teachers and ruling elders, the pastor has been the only paid officer of an ordinary Congregational church. In the earliest Congregationalism everywhere, and in English Congregational practice always, the expenses of the church were met by some form of voluntary payment, by gifts, subscription, or more often in modern times by the rental of sittings in the place of worship. Modern American Congregationalism employs these voluntary methods exclusively. But during most of the Colonial history of New England the intimacy of relationship between Church and State was such that Church expenses were assessed upon the taxable property of all inhabitants not specially exempt, and such assessments were collectible like any other taxes. This continued the practice in Connecticut till 1818, and in Massachusetts till 1834. When there was but one church in a township, its pecuniary affairs were settled in the meeting of the legal voters of that township. Where two or more churches existed in the township, it was subdivided territorially into districts for voting and tax-raising, known as 'societies,' 'parishes,' or 'precincts.' The New England feeling that there should be no taxation without the consent of those taxed led, during the last third of the seventeenth century, to the assumption by the legal voters, by whom the minister's salary was assessed and paid, of a right to concur in or reject the choice of a minister by the membership of the church, and established a dual system of

entrance to the local pastorate, the election of the church requiring the confirmation of the 'society.' In the general usage of New England, and to some extent in other parts of the United States, this system has survived the loss of the right of public taxation for ecclesiastical purposes, and prevails at the present time. The ownership of the buildings used by the church and the determination and payment of the salary to its minister, remain under the control of a voluntary local legal business corporation, admission to which is secured by election, by renting sittings in the church edifice, or in a variety of ways; and this corporation, still known as the 'society' or 'parish,' has a concurrent authority in the choice of a minister. English practice has known nothing of this institution; and outside of New England the temporalities of the church have been largely placed in the hands of trustees chosen by the membership of the church, or the church itself has held title to its property and administered its pecuniary affairs. Even in New England the 'society' is falling into disuse in many places, the church itself securing the incorporation permitted by statute and assuming all the rights previously shared with the 'society.'

Worship.—Early Congregationalism, in its sharp reaction from the imposition of a written liturgy, characteristic of the days of Elizabeth and the Stuarts, went to the extreme of rejecting all written liturgy as unscriptural. Modern Congregationalism entertains no such hostility, and a considerable degree of modification of the public services of Congregationalism, by responsive reading, united repetition of the Lord's Prayer and the Apostles' Creed, and development of the musical aids to worship, has taken place in recent years. In accordance with its fundamental principle of local autonomy, Congregationalism recognizes the full right of each local church to order its worship as it sees best. But, whatever minor modifications have taken place, Congregational worship remains essentially non-liturgical. It makes the sermon central, and includes, as it has always done, the elements of preaching, free prayer, the reading of the Word of God, and singing. Till about the middle of the eighteenth century in America, and in the early Congregational practice of Great Britain, only metrical translation of portions of Scripture were deemed appropriate to be sung in public worship, and the aid of musical instruments was rejected till about the same period; but since then full freedom in the use of hymns and musical aids has prevailed.

Fellowship Between the Churches.—While each congregation is autonomous, Congregationalism believes that it is the duty of each local church to consult neighboring churches in matters of importance. This feature of Congregational practice has attained a larger development in America than in England, and is chiefly manifested by the 'advisory councils,' which American Congregationalism has employed since the time of the first settlers on New England soil. Though given a place in the theoretic exposition of early English Congregationalism, the 'advisory council' of America has no exact counterpart in modern British usage. Such ecclesiastical acts as the formation of a church, the settlement or dismissal of a pastor, and the consideration of cases of discipline from which quarrel and divi-

sion have resulted, are judged by American Congregationalism to demand the advice of neighboring churches. At the request of a church, or of a party in a divided church, the representatives of neighboring churches meet in an 'advisory council'—a temporary body assembled to consider the particular case. Its composition depends solely on the invitation, and may be drawn from a distance, though usage regards a council the majority of the membership of which is not from the vicinity as seriously irregular. Its authority is not judicial, but its advice is seldom disregarded. On completing its work, an 'advisory council' is dissolved, and the minutes are left with the church with which it met. No member of the council is taken from the church which calls it. The council does not report to any other organization than the church which asks its advice.

Early Congregationalism in England and America recognized the desirability of gatherings representing the communion as a whole in occasional important exigencies. Thus, the ministers and delegates of the New England churches gathered at Cambridge, Mass., in 1637, when the supposed heresies aroused by Mrs. Anne Hutchinson were considered, and again in 1646-48, when English religious politics induced them to formulate their system of church government in the 'Cambridge Platform.' The favor which English Congregationalists experienced from Cromwell induced an assembly at the Savoy Palace, London, in 1658, which set forth Congregational faith and practice. Besides these general gatherings, meetings of representatives of colonies and districts were held as necessity required. Massachusetts called such assemblies to consider the proper recipients of baptism in 1662, and to find remedies for the declining state of religion in 1679-80. Connecticut summoned such a gathering in the height of the excitement of the 'Great Awakening' in 1741. Less formal and distinctly ecclesiastical, but nevertheless a factor of weight in the religious life of the province, was the annual convention of ministers of Massachusetts which met from early Colonial days, at the time of the May election.

Permanent Organizations.—Local stated meetings of ministers for discussion of matters of ecclesiastical interest existed in England under the Commonwealth, and were introduced into Massachusetts in 1690. By 1705 there were five such associations in the province, by which candidates for the ministerial office were examined and licensed; and in 1708 the system was extended to Connecticut, where, besides these local gatherings, an association representative of the whole Colony was formed that has assembled annually from 1709 to the present time. Similar State bodies were organized in Vermont in 1795, in Massachusetts in 1803, in New Hampshire in 1809, and have since extended everywhere where Congregationalism has gone in America, while minor local meetings, often coextensive with county lines in their constituency, are universal in American Congregational practice. During the early part of the nineteenth century, however, the feeling was strongly manifest that these stated meetings, which were at first of ministers only, should be made really representative bodies by the admission of delegates of churches. This has been widely accomplished. In each State, and in most subdivisions of States, where Con-

gregationalism is organized, there is now a body meeting for discussion at least once a year, and composed of the pastors and the elected delegates of the churches. The pressing questions of the decade previous to the Civil War led to the gathering at Albany, in 1852, of the first convention representative of American Congregationalism as a whole that had assembled since 1648; and at Boston, in 1865, a similar representative council was held. In 1871 the "National Council of the Congregational Churches of the United States" was formed. This body has since met regularly every third year, and can hold special sessions at any time at the request of any five State organizations of churches. Its membership is elected by the local and State bodies into which the churches are grouped, and the number of delegates chosen is proportionate to the number of local churches and of the communicants in the bodies by which they are appointed. The decisions of the National Council, like those of the smaller bodies into which the Congregational churches of the United States are grouped, are not mandatory or judicial; but the free discussion of matters of common concern, their investigation by competent committees, and the recommendation of courses of action by vote, have much weight with the churches. The churches of Canada are not constituents of this 'National Council,' but are organized in the 'Congregational Unions' of 'Ontario and Quebec' and of 'Nova Scotia and New Brunswick.'

In the United States, Congregational churches are normally united by permanent representative bodies of three kinds, the larger in a true sense superior to the smaller: (1) The local association or conference; (2) the State association; (3) the National Council. The usage of Great Britain is much less developed. Independency is more nearly the condition of English than of American Congregationalism. As has been pointed out, English Congregationalism does not have the 'advisory council.' But an approximation to the American system of mutual responsibility and helpfulness exists in the county and district associations, in which English Congregational churches have long been grouped. Some of these bodies may have come down from the days of the Commonwealth; but their modern development began in Hampshire in 1781, whence they rapidly extended over England. By these 'associations' or unions the good standing of Congregational churches and ministers is certified, church advancement is superintended, and denominational fellowship variously expressed. Besides their cooperation in these local associations, the Congregational churches of Great Britain are federated in two larger bodies, the Congregational Union of Scotland, organized in 1813, and the Congregational Union of England and Wales, formed in 1832. The semi-annual meetings of the last-named assembly are the most influential events in modern English Congregational life.

The sense of mutual fellowship characteristic of modern Congregationalism has its further illustration in the formation of an 'International Congregational Council,' representative, by appointed delegates, of the churches of all lands into which Congregationalism has penetrated. Its first meeting was held at London in 1891,

and its second at Boston in 1899. Provision has been made for its continuance.

Missionary Agencies.—The benevolences of Congregationalism have called into being a large number of denominational agencies. In the United States organized home missions began with the formation of the Missionary Society of Connecticut, in 1798, and the Massachusetts Missionary Society in 1799. Similar local societies have been formed in the States where Congregationalism is strongly represented, and they serve as auxiliaries to the national Congregational Home Missionary Society, founded in 1826, to which a large share, not merely of the westward extension of Congregationalism, but of the maintenance of the feebler churches in the older States, is due. A second society by which Congregational effort is carried forward within the territory of the United States, from Porto Rico to Alaska, is the American Missionary Association, organized in 1846 by anti-slavery sympathizers, which now maintains an extensive educational and evangelistic work, chiefly among the negroes of the South, but also among the mountain whites, the Indians of the West, the Eskimos of Alaska, and the Chinese of the Pacific Coast. The Congregational Education Society, founded in 1815, has for its work the strengthening of schools and colleges in the newer portions of the land, and the assistance of worthy and needy candidates for the ministry. The work of the Congregational Church Building Society and of the Congregational Sunday-School and Publishing Society is sufficiently indicated by their titles. Congregational foreign missionary effort reaching forth from the United States is under the direction of the American Board of Commissioners for Foreign Missions, founded in 1810, and now carrying on work in India, Turkey, China, Japan, Micronesia, Africa, Austria, Spain, and Mexico. In Great Britain the work of home missions is under the charge of the Congregational Church Aid and Home Missionary Society, and that of foreign evangelization of the London Missionary Society, founded in 1795. Canadian Congregationalism has its own Foreign Missionary Society.

Theological Seminaries.—Congregationalism has always believed in an educated ministry. In order to secure a proper training for their ministers, the early New England Congregationalists established Harvard and Yale, and the course of instruction in both of those institutions of learning was long regulated by the design of equipping men for the ministry. But by the first quarter of the eighteenth century the ordinary course of collegiate instruction was increasingly felt to be inadequate for the needs of ministerial training, and the result was the foundation at Harvard, in 1721, of the Hollis professorship of divinity, and the beginnings of a similar professorship of divinity at Yale in 1746—a professorship that was not fully established there until 1755. Even more influential in the ministerial training of the eighteenth century than the instruction of these professors, was the custom, which grew into increasing prominence as the century went on, of taking a few months of training supplemental to the college course, under the guidance of some eminent pastor, before applying for ministerial licensure. Such household theological seminaries were pre-

sided over by many of the prominent pastors of New England; and among such instructors Jonathan Edwards, of Northampton, Mass.; Joseph Bellamy, of Bethlehem, Conn.; Charles Backus, of Somers, Conn.; and Nathaniel Emmons, of Franklin, Mass., were conspicuous.

The immediate cause of the establishment of theological seminaries, in the modern sense of the term, in America, was the passage of Harvard College to the control of the party soon to be known as Unitarian, in 1805. Deprived thus of control of their chief seat of ministerial training, the conservative Congregationalists of eastern Massachusetts began at once to plan for separate schools of theological instruction. Two independent designs for the establishment of a theological seminary—the one begun by representatives of the older type of New England Calvinism, and the other by men of the Edwardean sympathies—were happily combined, after much effort, in 1808, and resulted, in September of that year, in the establishment of Andover Theological Seminary, at Andover, Mass. Conspicuous in the teaching force of this institution, from its foundation to his resignation in 1846, was Leonard Woods, its first professor of theology; while Moses Stuart, from 1810 to 1848, was eminent for his services in the study of the Old Testament and in introducing the theology of Germany to the knowledge of American students. Even more conspicuous as a theological leader at Andover was Edwards A. Park, who taught in the institution from 1836 to 1881, and, from 1847 to the year last mentioned, occupied its chair of theology. Andover Seminary under its first instructors occupied a theological position which represented a union on broad and generous lines of the various shades of conservative New England opinion, in opposition to the Unitarian movement of its day. Under Professor Park the Edwardean theology was even more emphasized and developed. For twenty years past Andover has been distinguished by a cordial welcome to the newer phases of theological discussion, especially as developed in Germany.

A second theological seminary was that established at Hampden, Maine, in October, 1816, but which was removed to Bangor, Maine, in 1819, where it has since continued, and from which place it takes its name. Its most eminent theological instructor in the past was perhaps Enoch Pond, whose connection with it extended from 1832 to 1870.

In 1822 the corporation of Yale College—now Yale University—carried into execution a plan which had been entertained by them for a considerable time, by establishing a department of theology in the college, which has since been known as Yale Divinity School, and is a coordinate department of Yale University. Its first professor of theology, from its foundation to his death in 1858, was Nathaniel W. Taylor, whose type of doctrine, though belonging essentially to the historic Edwardean school, yet modified the characteristic teachings of that school in some particulars to such an extent as to receive the name 'New Haven theology,' and subjected its author to much criticism from the stricter representatives of the Edwardean party. Other conspicuous teachers of the Yale Divinity School have been Eleazar T. Pritch, from its foundation to 1852; Samuel Harris, professor of

systematic theology from 1871 to 1895; Timothy Dwight, professor of New Testament Greek from 1858 to 1886, and president of Yale University from 1888 to 1900; and George Park Fisher, its professor of Church history from 1861 to 1901.

The differences of opinion awakened by the theology of Nathaniel W. Taylor, already alluded to, led to the foundation of a school at East Windsor, Conn., in 1834, then called the Theological Institute of Connecticut, but much better known as Hartford Theological Seminary since its removal to Hartford in 1865. Its founder and first professor of theology was Benet Tyler, who occupied its most conspicuous chair till 1857. Its chief leader among its later instructors has been Chester D. Hartman, its present president, who has been connected with it since 1878, and under whom its curriculum and its equipment have been greatly developed.

Almost contemporary with the founding of the Hartford Seminary was the establishment of a theological department in connection with Oberlin College, opened under the title of Oberlin Theological Seminary, in 1835. Its most distinguished instructors have been Charles C. Finney, the eminent revivalist, whose services to it continued from 1835 to 1875; and, since his death, James H. Fairchild, who was connected with Oberlin College, as an instructor in various departments, from 1838 to his decease in 1902, and held the office of president from 1866 to 1889. Oberlin is at present distinguished by the hearty reception there given to the theology of the Ritschlian school.

The growing needs of the Middle West led to the organization, in 1854, and to the complete establishment in 1858, of Chicago Theological Seminary, an institution prevalently conservative in its broader evangelical type of theology, of which it has long been a leader in a region which looks to Chicago as its centre. Conspicuous in its teaching force have been Samuel C. Bartlett, its professor of biblical literature from 1858 to 1877, when he became president of Dartmouth College; Franklin W. Fisk, its professor of sacred rhetoric from 1859 to his death in 1901; and George N. Boardman, its professor of theology from 1871 to 1893.

The youngest of the Congregational theological schools is that known as Pacific Theological Seminary, which was established at Oakland, Cal., in 1869, and is now located at Berkeley, in the same State.

The Congregational College of Canada was founded in 1830 as a 'Congregational Academy,' at Toronto, and was removed to Montreal in 1864, where it is now located as a theological school in affiliation with McGill University.

It will thus be seen that of the American Congregational theological seminaries, Yale and Oberlin are departments of a university or a college; two others, Montreal and Pacific, are affiliated or in close geographical connection with universities; and four, Bangor, Hartford, Andover, and Chicago, are independent foundations. While some of them originated in doctrinal discussion, and they still represent in several instances somewhat dissimilar points of view, the general tendency of modern Congregational development has been to an increasing similarity in doctrinal position and in methods of instruction, so that good fellowship instead of

schism exists among all these theological seminaries at the present time.

In Great Britain, as in America, theological education has long commanded the attention of Congregationalists. Soon after the passage of the Toleration Act by the English Parliament, Congregational and Presbyterian Dissenters about London established a 'fund' to aid feeble churches and to educate candidates for the pastoral office (July 1, 1690). The union of representatives of the two parties proved but temporary, and in 1695 the 'fund' was divided, and a 'Congregational Fund Board' organized. This board still exists. By its influence, and that of eminent Congregationalists like Philip Doddridge, many 'academies' and 'colleges' were organized in the eighteenth century. These had, at first, the twofold object of training an educated ministry and of providing a general education for lay students who were debarred from university privileges by their 'dissent' from the Establishment. To some extent these two aims are still sought by the Congregational 'colleges' of Great Britain; but with the removal of disabilities from the pathway of Nonconformists who are seeking a general education these 'colleges' are laying increasing and in some instances exclusive emphasis on ministerial training. They correspond to the 'theological seminaries' of the United States.

The Congregational 'colleges' of Great Britain at the present time, are the following: (1) *New College*, London, tracing its origin to 1696, and now affiliated with the University of London. (2) *Western College*, Bristol, founded as the Western Academy, in 1752. (3) *Yorkshire United Independent College*, Bradford, dating from 1756. (4) *Cheshunt College*, Cheshunt, founded by the Countess of Huntingdon at Targarth in 1768, and now affiliated with the University of London. (5) *Hackney College*, founded by Rev. Matthew Wilks and Rev. George Collison at Hackney in 1803, and now at Hampstead. It is affiliated with the University of London. (6) *Lancashire Independent College*, Manchester, founded at Blackburn in 1816. (7) *Mansfield College*, Oxford, founded as Spring Hill College at Birmingham in 1838, and greatly strengthened by its significant reestablishment at Oxford in 1886. (8) *The Congregational Institute*, Nottingham, opened in 1861. (9) *The Congregational Memorial College*, Brecon, combining a number of institutions, the oldest of which dates from 1755, and giving special attention to Welsh students. (10) *Bala-Bangor Independent College*, Bangor, dating from 1843 and largely Welsh in its constituency. (11) *The Theological Hall of the Congregational Churches in Scotland*, Edinburgh, tracing its origin to the Congregational Academy founded at Glasgow in 1811. Congregational students are also supported by separate funds in the *Presbyterian College* at Carmarthen. In 1901-02 the students in the various institutions numbered 361.

History.—Modern Congregationalism had its rise in the discussions consequent upon the English Reformation. Its earliest advocates may properly be described as forming the radical wing of English Puritan Protestantism. But, besides the characteristics which they shared with the Puritan party, they showed several non-Puritan peculiarities. They denied the existence of a National Church; they denied that church-mem-

bership belonged to all baptized inhabitants of the kingdom; they held each church competent to regulate its own affairs. These peculiarities are so similar to those of the Continental Anabaptists, that some influence from Anabaptist sources in Congregational beginnings seems probable; but the dissimilarities existing between Anabaptists and Congregationalism are so considerable that this influence must have been indirect and unconscious. The founders of Congregationalism thought they were simply reproducing the system of the New Testament. Though a church essentially Congregational in organization existed in London as early as 1567, Congregationalism first came to significance in the work and especially in the writings of an erratic but earnestly reformatory young graduate of Cambridge, Robert Browne. Convinced that reforms such as he desired were unattainable within the Establishment, Browne organized a Congregational church at Norwich in 1580 or 1581. Compelled to seek refuge in Holland, Browne put forth several tracts in 1582, in which he urged the duty of immediate separation from the Church of England—a characteristic that gave the name 'Separatists' to these early Congregationalists. He also set forth Congregational principles with great distinctness. By 1587 Congregational preaching by Henry Barrowe, a London lawyer, and John Greenwood, like Barrowe a Cambridge graduate, had gathered a following in London and brought upon its teachers and disciples the hostility of the Government. The organization of a Congregational church in London, in 1592, was followed by the martyrdom, by hanging, of Barrowe, Greenwood, and John Penry, in 1593, and the exile of the greater portion of its membership, who found a home in Amsterdam with Francis Johnson as their 'pastor' and Henry Ainsworth as their 'teacher.'

Meanwhile a movement to secure earnest Puritan preaching was begun, about 1590, in the country region of their residence some 150 miles north of London, by Richard Clyfton, rector of Babworth, and William Brewster, a layman of Scrooby. Ecclesiastical opposition deepened the movement into Separation, and it was stimulated by the coming of Rev. John Robinson, in 1604, and Rev. John Smyth, apparently the following year. Churches were formed on the Congregational model at Scrooby and Gainsborough, probably in 1606, though the year is uncertain. Governmental opposition compelled both to seek refuge in Holland, and that of Scrooby, with Robinson as its 'pastor' and Brewster as its 'ruling elder,' found a home at Leyden in 1609. Thence a minority of its membership emigrated to New England in 1620, founding Plymouth, now in Massachusetts, in December of that year. Here the Separatist colony passed through severe struggles successfully under the leadership of Brewster, and with William Bradford, Edward Winslow, and Myles Standish as its foremost men in civil affairs.

This 'Pilgrim' emigration, as it was called, was Separatist, and Plymouth Colony numbered only about three hundred in population by the close of its first decade. It would have amounted to little had it not been unexpectedly and greatly reinforced. The policy of Charles I. impelled English Puritans to seek new homes across the ocean, and the result was the estab-

lishment of a Puritan colony at Salem in 1628. Acquaintance with the Plymouth Separatists brought recognition of the large similarity of their views, and when a church was formed at Salem, in 1629, it was organized on the Congregational model. The example thus set was followed in the formation of the succeeding Massachusetts churches. The flood tide of Puritan immigration ran strong till the political situation altered in England in 1640; and it brought to New England such men as John Winthrop in 1630, Rev. John Eliot in 1631, Rev. John Cotton in 1633, and Rev. Richard Mather in 1635, giving to Massachusetts a strong and numerous Congregational population. Slightly divergent views regarding the extent of the franchise, combined with an ardent desire to secure a fertile territory, and more personal motives, led emigrants from Massachusetts under Rev. Thomas Hooker and John Haynes, to settle in Connecticut in 1634-36; and in 1638 another company, under Rev. John Davenport and Theophilus Eaton, founded New Haven. In 1643 the four Congregational colonies united in a confederacy for mutual protection.

The settlement of New England was followed by a time of planting and developing institutions. The right to vote was restricted in Massachusetts to church members from 1631 to 1664, and in New Haven from 1639 to 1665. No such limitation ever obtained in Plymouth or Connecticut colonies. Schools received the early attention of the settlers, and the founding of Harvard in 1636, followed by the establishment of Yale in 1701, bore witness to the desire for a learned ministry always characteristic of Congregationalism, and were evidences of that interest in education which marks the denomination to the present day. Congregational polity was expounded in treatises by Cotton, Hooker, and Mather, and authoritatively defined by the Cambridge Synod in 1648. Missionary labors among the Indians, begun in 1646 by John Eliot in Newton, Mass., and by Thomas Mayhew on Martha's Vineyard, were considerably successful, resulting, by 1674, in six churches, and bringing about 4000 savages in some measure at least under the influence of the Gospel, though these results were robbed of permanence by the dying of the Indian race. The chief intellectual monument of this missionary activity is Eliot's Indian version of the Bible of 1663. The most important internal discussion of seventeenth-century New England Congregationalism was that regarding the 'Half-Way Covenant'—the question being whether persons who had themselves been baptized in infancy because of their parents' church-membership, could in turn bring their own children to baptism when they themselves were subjects of no conscious regenerative change. The decision of a meeting of Massachusetts and Connecticut ministers at Boston in 1657, and of a convention of the Massachusetts churches in 1662, was that such baptized, but not consciously regenerate, parents could bring their children to baptism and transmit the church status they themselves possessed, but could not come to the Lord's Table or vote in church affairs. Hence the nickname 'half-way.' Though never universally adopted, the Half-Way Covenant was practiced by most New England churches till about the opening decade of the nineteenth century.

Though the majority of the Puritan party in England remained Presbyterian during the seventeenth century and controlled the Westminster Assembly, English Congregationalism had five sturdy champions in that convention; and in the army, as well as among the people as a whole, it grew in favor as the struggle against the King continued. Under the sympathetic rule of Cromwell it reached its widest extension in seventeenth-century England. After the Restoration it suffered the disabilities imposed on Dissenters in general, until partially relieved by the Toleration Act of 1689. Yet, in spite of the labors of such men as Isaac Watts and Philip Doddridge, and the founding of 'academies' for ministerial as well as general training, the course of English Congregationalism in the eighteenth century, like the religious life of England as a whole, was one of spiritual decline, until awakened by the new spiritual impulse that came forth from the great Wesleyan revival. Quickened thus, the Congregational churches of England grew in numbers throughout the latter half of the eighteenth century, awakened to fresh zeal for missionary service at home, and a new interest in missions abroad, and became increasingly conscious of their denominational unity and desirous that that unity should find expression.

In America, the latter half of the seventeenth and the three opening decades of the eighteenth century saw a steady decline of the spiritual enthusiasm in which the churches of New England had been planted. New England life grew provincial in every respect. From this state of relative decadence the churches of New England were powerfully aroused by a series of 'revivals' beginning at Northampton, Mass., under the ministry of Jonathan Edwards in 1734 and extending throughout New England in 1740-42, in connection with a visit of Rev. George Whitefield. The movement, known as the 'Great Awakening,' stirred the spiritual life of the churches profoundly, but was so accompanied by physical demonstrations and other evidences of excitement as to lead to much division of judgment as to its merits. Partly owing to this division, and partly in consequence of the distraction accompanying the struggle for the political possession of Canada and for American independence, the 'Great Awakening' was followed by a period of comparative religious inactivity, lasting till about 1790.

The second half of the eighteenth century, however, witnessed the rise of a native modification of the historic Calvinistic theology—the 'New England Theology'—under the leadership of Jonathan Edwards, father and son, of Samuel Hopkins, Joseph Bellamy, and Timothy Dwight. This theology won its way gradually, and by 1800 was dominant in Connecticut and Vermont, and largely represented in the rest of New England. Parallel to this Edwardean development, though with much smaller following, there ran a 'Liberal' movement, represented especially in eastern Massachusetts, and corresponding to similar modifications of doctrine among the Dissenters, especially those of Presbyterian lineage, in England. This 'Liberal' theology, already manifest in the preaching of Jonathan Mayhew and Charles Chauncy before the American Revolution, was little discussed during the excitement of that struggle; but when doctrinal

debate again attracted attention and was stimulated by a great series of 'revivals,' beginning about 1790, it was found that a considerable number of Congregational churches had drifted out of sympathy with historic Christianity. Under the lead of men of ability like William Ellery Channing, the 'Liberal' movement strengthened, while the cleavage between it and more conservative Congregationalism grew to separation. The year 1815, when 'Unitarian' became the popular designation of the new 'Liberal' denomination, may be assigned as the approximate date of the schism; though Harvard College had come under the recognized dominance of the 'Liberal' party in 1805. The Unitarian division was almost strictly local, but wholly or partially involved about one-tenth of the Congregational churches then existing in the United States. The loss of Harvard College as an agency for ministerial training led the conservative majority of the churches to seek new methods of ministerial education. As a result, theological seminaries were opened at different places and times. See section *Theological Seminaries*.

Congregationalism entered Canada by way of Nova Scotia in 1753. There was a feeble church in Newfoundland as early as 1645, which died and was not revived, and Congregationalism did not reappear there until 1775.

The beginning of the nineteenth century was marked by a rapid broadening and deepening of the activities of American Congregationalism. The rise of home and foreign missions has already been indicated in speaking of the benevolent agencies of Congregationalism. With the settlement of the West, Congregationalism ceased to be confined to New England and the adjacent sections of New York. Its spread was at first slow, because of a distrust engendered by the Unitarian schism, as to its adaptability to meet frontier conditions, and a lack of denominational consciousness which led to ready affiliation with Presbyterianism. But through the efforts of men like Rev. Dr. Leonard Bacon, of New Haven, denominational consciousness was awakened; and, from the fourth decade of the nineteenth century, the planting of distinctly Congregational churches and colleges in the West has gone rapidly forward. This westward extension was greatly aided by the Albany Convention of 1852. After the Civil War, Congregationalism entered the South, but has never had a relatively large following in that section of the United States.

Congregationalism during the nineteenth century has witnessed a gradual theological development. The Edwardean school was ably carried on in somewhat divergent directions by Nathaniel W. Taylor at Yale, and by Edwards A. Park at Andover. By the middle of the century the influence of Horace Bushnell was becoming felt in a direction away from the Edwardeanism then dominant. And the last two decades have seen increasing welcome given to what is popularly termed the 'New Theology.' This tendency has met with strenuous opposition; but the division of feeling has at no time been sufficient really to threaten the denomination with schism. Nineteenth-century American Congregationalism has had its conspicuous preachers in abundance, of whom Lyman Beecher and his son, Henry Ward Beecher, Charles G. Finney, and Richard Salter Storrs may be mentioned as illustrations. It has been ready to adopt new methods of Chris-

tian work—its most successful recent contribution being the 'Young People's Society of Christian Endeavor,' founded by Rev. Francis E. Clark in 1881. Its spirit is warmly missionary, and it desires to cooperate broadly with all who are trying to advance the Redeemer's Kingdom.

English Congregationalism during the last century has been marked by much the same traits; but its existence in the face of an ecclesiastical establishment has led it to emphasize the characteristic principle of independence more proportionately than American Congregationalism. Its struggle has been largely one for equality of privilege in education and exemption from disabilities. Its most important recent educational foundation is Mansfield College, Oxford, of which Rev. Dr. A. M. Fairbairn has been principal since its opening in 1886. The same tendencies to express denominational unity in organizations for mutual helpfulness have been manifest in England as in America, though in less marked degree. Their illustration in county associations and in larger unions has already been mentioned.

Statistics.—The total number of Congregational churches in America in 1645 appears to have been 53. About 120 English Congregational churches were represented in the Savoy Convention of 1658. In 1760 Rev. Dr. Ezra Stiles enumerated the churches of this order in New England, to which region they were then almost exclusively confined, as 530. By 1816 American Congregationalism numbered about 1020 churches and not far from 100,000 communicants. The most recent statistics available (1901, in the *Year Book* of 1902) give the churches of the United States as 5753, their ministers as 5717, their members as 645,994, and their Sunday-school enrollment as 658,405. Their benevolent contributions were \$2,233,722, and their home expenditures \$7,580,655. The seven Con-

279. Canada and Newfoundland reported 137 churches and preaching stations, with 9119 members. Congregationalism in Australia and New Zealand counts 349 churches and preaching stations, with 14,176 members.

The foreign missionary activities of the United States and Canada in 1901-02 were represented by 556 missionaries, assisted by 3559 native laborers, carrying on missions in 102 foreign stations, with 525 churches organized, and an enrollment of 55,694 communicants, of whom 5623 had been added during the previous year. Statistics for the London Missionary Society, through which the outreaching work of the English Congregational churches is maintained, show that during 1900-01 it employed 438 missionaries, assisted by 5811 native laborers, in 97 stations, and ministering to 56,059 communicants, of whom about 7000 were received during the year then closing.

BIBLIOGRAPHY. The student who wishes to investigate the history of Congregationalism thoroughly will look for guidance to the bibliography of 7250 titles of publications relating to Congregationalism issued between 1546 and 1879, which was given by Rev. Dr. H. M. Dexter as an appendix to his *Congregationalism of the Last Three Hundred Years* (New York, 1880). So closely is Congregationalism interwoven with the origins of New England that any good history of New England gives much regarding its spread and workings. General sketches of American Congregationalism are those of Rev. Dr. A. E. Dunning, *Congregationalists in America* (New York, 1894); and Prof. Williston Walker, *A History of the Congregational Churches in the United States* (New York, 1894). The characteristics of Congregational religious life are treated by Rev. Dr. George Leon Walker, *Some Aspects of the Religious Life of New England* (Boston, 1897). The reader specially interested in the beginnings of Congregationalism will be aided by the work of Rev. Dr. Dexter, above cited; also, John A. Goodwin, *The Pilgrim Republic* (Boston, 1888); Rev. Dr. John Brown, *The Pilgrim Fathers of New England* (London and New York, 1895); Prof. Edward Arber, *The Story of the Pilgrim Fathers* (London, 1897); Rev. Dr. Fred. J. Powicke, *Henry Barrow, Separatist* (London, 1900). The doctrinal peculiarities of American Congregationalism have been compactly sketched by Prof. George N. Boardman, *A History of New England Theology* (New York, 1899).

No adequate brief history of English Congregationalism has been written, but the five volumes of Rev. Dr. John Waddington, *Congregational History* (London, 1869-78, new ed., 1880), treat the story at much length to the date last mentioned. Contemporary English Congregationalism is well discussed by Rev. Dr. A. H. Bradford, *The Pilgrim in Old England* (New York, 1893). The story of Scotch Congregationalism is well and briefly told by Rev. James Ross, *A History of Congregational Independency in Scotland* (Glasgow, 1900).

The main documents relating to the polity and beliefs of Congregationalism are collected by Prof. Williston Walker, *The Creeds and Platforms of Congregationalism* (New York, 1893). Brief manuals of its usages are those of Rev. Dr. H. M. Dexter, *A Handbook of Congregationalism* (Boston, 1880); and of a Committee

gregational seminaries in the United States reported an attendance in 1901-02 of 379 theological students. The churches and preaching stations of Great Britain numbered 4873, their ministers 3121, and their church members 436,-

of the 'National Council,' entitled *The Council Manual for a Congregational Church* (Boston, 1896). A good sketch of the chief representative body of American Congregationalism and of the occasional conventions that preceded it, is that of Rev. E. Lyman Hood, Ph.D., *The National Council of the Congregational Churches of the United States* (Boston, 1901). English and American Congregational statistics are given in the *Year-Books* annually published on either side of the Atlantic.

CONGREGATIONAL METHODIST CHURCH, THE. A body formed in May, 1852, in Monroe County, Ga., by ministers and laymen who had withdrawn from the Methodist Episcopal Church and wished to establish a church with Methodistic doctrines, but giving the people a voice in their own government. In 1852 the first district conference was held and a Book of Discipline adopted; in 1855 the first general convention was held. Since 1881 many churches have joined the Congregational body, but in 1901 the Congregational Methodists reported 350 churches and 21,000 members. In government it is not strictly Congregational, since it has semi-annual district conferences, annual State conferences, and quadrennial general conferences, and it is admissible to carry an appeal from one to another. It admits both white and colored persons, the latter being separately organized.

CONGRESS (Lat. *congressus*, conference, from *congrēdi*, to meet together, from *com-*, together + *aradi*, to step). In international affairs, an assembly either of sovereign princes or of delegates of sovereign States for the purpose of considering matters of common interest. In the United States, where the term has now a specific meaning as applied to the National Legislature (see UNITED STATES), it had a similar origin, the first Congress being that of the delegates from the various British colonies, who met on October 7, 1765, for the purpose of considering their grievances. Previous to signing a treaty of peace, a meeting of plenipotentiaries usually takes place, to which the name of a congress is sometimes applied, though the term seems more properly to be reserved for those more important meetings at which extensive schemes of future policy are determined. The period of secular diplomatic congresses opened with the Congress of Münster and Osnabrück, which closed the Thirty Years' War by the Peace of Westphalia in 1648 (q.v.). Since then, omitting those diplomatic bodies whose object was simply to arrange terms of peace at the close of a war, the most important European congresses have been those of Vienna (1814-15), Paris (1856), Berlin (1878), and the International Peace Conference at The Hague (1899). An international 'Pan-American' congress, to discuss industrial and commercial questions, was held at Washington, from October, 1888, to April, 1890. In the winter of 1901-02 a similar congress assembled at Mexico and discussed at great length the question of international arbitration. See VIENNA, PARIS, BERLIN, CONGRESS OF.

CONGRESS, UNITED STATES. The legislative branch of the Federal Government of the United States. It was instituted by the Constitution, which prescribes its membership and defines its

powers. It has no general legislative power, such as is enjoyed by the British Parliament, and, in a lesser degree, by the legislatures of the several American States; but it has only such functions and authority as the Constitution, expressly or by necessary implication, has conferred upon it. Acting in conjunction with the President and the Federal judiciary, it exercises the sovereign power of the people of the United States, in so far as that power has been committed to the Central Government.

Congress is composed of two 'houses,' or chambers—a Senate and a House of Representatives. It is not, however, as is generally assumed to be the case, modeled upon the British Parliament, with its House of Lords and House of Commons, nor is its bicameral form due to any general agreement on the part of the framers of the Constitution that that type of legislature was theoretically preferable to a legislature of a simpler type. The Continental Congress, under whose direction the War of the Rebellion was waged, had after the adoption of the Articles of Confederation, as before, only a single chamber. But this was not of a popular character, and it is not the House of Representatives, but the Senate, which represents it in the present Congress. These first American congresses represented not the people of the Colonies and States, but the Colonies and States themselves, and it was to preserve the weight and dignity of the States among themselves and especially of the smaller and less populous States as against the larger and more influential ones, that the Senate was instituted as a counterweight to the popular branch of the National Legislature.

The Senate is composed of two Senators from each State, and its membership has accordingly varied from twenty-two in the first Congress (when eleven States constituted the Union) to ninety at the present time (1902). The Constitution prescribes that Senators shall be chosen by the legislatures of the several States for a term of six years, and constitutes them a permanent and continuing body by providing a method of classification, whereunder the term of one class shall continuously overlap that of another, the terms of one-third of the members expiring every two years. Senators must be thirty years of age and residents of the State for which they shall be chosen. The presiding officer of the Senate is the Vice-President of the United States, but he has no part in its deliberations and no vote unless the Senators are equally divided. The rule of the Congress of the Confederation which preceded the Constitution, that the voting should be by States, each State represented having one vote, was not retained in the creation of the Senate, it being provided by the Constitution that each Senator shall have an individual vote. Senators receive a compensation fixed by Congress, of \$5000 a year, with a small allowance for stationery and mileage.

The House of Representatives is not a permanent or continuing body, but its entire membership is renewed simultaneously every second year. Its members are chosen by popular vote, and it is provided that they shall be apportioned among the several States included in the Union according to their respective numbers. The Constitution, as adopted, provided that for the purpose of apportionment the popu-

lation of a State should be determined by adding to the whole number of free persons three-fifths of the whole number of slaves. The basis of apportionment fixed by the Constitution for the first enumeration was one Representative for every 30,000 inhabitants, with the proviso that each State should have at least one Representative. The first House numbered 65, and successive enumerations and apportionments have varied the number of Representatives as follows: in 1793, 105; 1803, 141; 1813, 181; 1823, 213; 1833, 240; 1843, 223; 1853, 233; 1863 (during the Civil War), 243; 1873, 293; 1883, 325; 1891, 357; 1901, 386. The basis of apportionment under the twelfth census (1900) is one Representative to every 194,182 inhabitants. This furnishes the following representation for the several States:

Alabama.....	9	Nebraska.....	6
Arkansas.....	7	Nevada.....	1
California.....	8	New Hampshire.....	2
Colorado.....	3	New Jersey.....	10
Connecticut.....	5	New York.....	37
Delaware.....	1	North Carolina.....	12
Florida.....	3	North Dakota.....	2
Georgia.....	11	Ohio.....	21
Idaho.....	1	Oregon.....	2
Illinois.....	25	Pennsylvania.....	32
Indiana.....	13	Rhode Island.....	2
Iowa.....	11	South Carolina.....	7
Kansas.....	8	South Dakota.....	2
Kentucky.....	11	Tennessee.....	10
Louisiana.....	7	Texas.....	16

Maryland.....	6	Vermont.....	2
Massachusetts.....	14	Virginia.....	10
Michigan.....	12	Washington.....	3
Minnesota.....	9	West Virginia.....	5
Mississippi.....	8	Wisconsin.....	11
Missouri.....	16	Wyoming.....	1
Montana.....	1		

It is further provided by the Constitution that Representatives shall be at least twenty-five years of age and residents of the States in which they are chosen. They receive an annual salary, determined by Congress, the amount of which at present is \$5000. The House of Representatives chooses its own presiding officer, called the Speaker, from among its members. In the process of time this has become an office of great power and importance, ranking, perhaps, next after that of the President in influence and authority. This aggrandizement of the Speaker of the House of Representatives has resulted from the control over legislation, which, as the leader of the dominant political party in the House and under the committee system which has come to prevail in Congress, he has gradually acquired. He does not, upon becoming Speaker, lose his right to vote or otherwise to participate in the proceedings of the House.

Under the Constitution the two Houses of Congress have in most respects an equal voice in legislation, the only important exception being the requirement that all revenue bills shall originate in the popular branch of the legislature. Each House is made the sole judge of its the elections, returns, and qualifications of its own members, though the times, places, and manner of holding elections for Senators and Representatives are left to the legislatures of the several States.

The ample legislative powers of Congress, which are enumerated in Sec. 8 of Art. I, and Sec. 3 of Art. IV, of the Constitution (q.v.), are limited by the veto power of the President. Every bill intended to have the force of law

must be submitted to him, after passing the two Houses separately, and, if vetoed by him, will fail to take effect, unless passed a second time and by a two-thirds vote of each House. If any bill shall not be returned by the President within ten days after it shall have been presented to him, it shall become a law in like manner as if he had signed it, unless its return be prevented by the adjournment of Congress. The Constitution provides for an annual meeting of Congress on the first Monday in December unless a different date is duly appointed by law. The President is empowered by the Constitution to call an extra session of Congress or of either House.

In addition to their legislative powers, each of the two Houses of Congress is endowed by the Constitution with important functions in the government. The House of Representatives has the sole power of impeachment, and the Senate the exclusive authority to try impeachments. In addition to this, the Senate exercises, in conjunction with the President, important executive powers in the ratification of treaties and in the confirmation of his appointments to all important offices of the Government, including the members of his Cabinet, the judges of the Supreme and other Federal courts, and even officers of the army and navy.

In the century of national life which has just closed, the balance of governmental power has insensibly shifted from the Executive to the Congress, and in Congress from the Senate to the House of Representatives. The free exercise by the Senate of its power of refusing assent to the President's nominations to office, and the extreme development of the party system in national politics, have operated in a great measure to deprive the executive of the actual power of making appointments to office; while the popular character of the House, the absolute control exercised over its business by the Speaker and other leaders of the dominant political party, and the consequent unanimity and weight of its action, have given it a marked predominance in legislation. It is both more active and more influential than the Senate, notwithstanding the fact that its great size and the enormous volume of its business have deprived it of the character of a popular deliberative assembly.

Many acute observers see in these facts a curious reproduction in our history of recent British experience in the great art of self-government. They argue that the place of Parliament in the British system is being taken by Congress in ours, while the House of Representatives seems destined to assume the supremacy over the other organs of government which has been attained by the House of Commons in England. It is a well-known fact that the Cabinet in Great Britain, which is the virtual executive, is in fact a self-constituted committee, made up of party leaders, of the House of Commons; and it is generally assumed that our executive is placed by the Constitution in an impregnable position of independence. But the leaders of the House of Representatives have, to a considerable degree, assumed the same control over the legislation which is exercised in England by the Cabinet, and it is plausibly argued that it will require no great extension of Congressional power to reduce the constitutional executive in this country to the same position of nominal authority but real

impotence as that which it holds in the British system. It is accordingly asserted that the oligarchy of party leaders who determine the membership of the standing committees of the House and control their action are already the masters of the several executive departments, determining their very organization and policy through the power over appropriations which the present organization of the House lodges in the hands of its leaders; that the business of the Government is carried on more and more through conferences, as yet informal, between the President and this Congressional cabinet, while the great heads of departments tend to become advisers of the real masters of the situation, the Congressional leaders, rather than of their nominal chief, the President. It is not denied that a strong and popular executive may stay the rising tide of Congressional supremacy for a time, but it is claimed that the appeal to the people, by which he accomplishes this, is itself a confession of the real weakness of his position. To such observers, it seems highly probable that within the lifetime of many now living the vital differences still remaining between the British and American systems will have disappeared, and that the Government of the United States will have become to all intents and purposes a government of the parliamentary or congressional type, and that this will be accomplished without formal amendment of the Constitution, by the insidious and persistent process of Congressional usurpation.

Reference has been made to the great power wielded by certain committees of the House. It remains to be noticed that the large increase in the number of Representatives and the growth in volume and complexity of the matters with which they have to deal have necessitated the reference of all bills to standing committees. These conditions have made it impossible for the House to give any real consideration even to the most important measures of legislation, and it follows that the real processes of legislation—the discussion, the sifting, the shaping of bills—is done wholly in the committee-rooms. The committees, therefore, being deliberately made up with reference to the carrying out of party policy, have acquired virtual control over the legislation of the House, their action on bills submitted to them being usually final and conclusive.

The 'committee system,' as it is called, was adopted by the House of Representatives at an early period of its history. At present there are forty-eight standing committees, which are appointed by the Speaker for each Congress, and which hold office during the life of the Congress. These committees vary in size, and are made up of members of all parties, the dominant party having an effective majority in each. The principal committees of the House are those on Rules, Appropriations, Ways and Means, Foreign Affairs, Judiciary, Commerce, Elections, Military Affairs, and Naval Affairs. The Senate, because of its smaller membership, and its tradition of dignity and deliberation, has to a large extent retained the character of a deliberative assembly, and much of the work of legislation is still actually performed by it. It has also adopted the committee system; but its committees perform the more legitimate function of sifting and shaping the bills for their

more convenient consideration by the Senate. They are appointed by vote of the Senate, and, like those of the House, hold office during the life of the Congress for which they are chosen. The most important of the Senate committees is that on Foreign Affairs, though those on Appropriations, Ways and Means, the Judiciary, and on Military and Naval Affairs, also play an important rôle in shaping legislation. For a history of the United States Congress, see the article UNITED STATES.

The leading authorities on the position of Congress in the American scheme of government are: Woodrow Wilson, *Congressional Government* (Boston, 1885), and Bryce, *The American Commonwealth* (London, 1893). See, also, the authorities referred to in the article CONSTITUTION OF THE UNITED STATES.

CONGRESSIONAL CEMETERY, A handsome cemetery near Washington containing monuments to such members of Congress as have died during their term of office. See WASHINGTON.

CONGRESSIONAL LIBRARY, See LIBRARY OF CONGRESS.

CONGRESSIONAL RECORD, The journal of the United States Congress. Up to 1799 the Senate sat with closed doors, and no reports of its proceedings were published. Since that time, an official record of the proceedings of each House is required to be published. The so-called 'executive sessions' of the Senate are secret. The journal now known as the *Congressional Record* was called from 1789 to 1824 the *Annals of Congress*; from 1825 to 1837 the *Register of Debates*; from 1834 to 1874 the *Congressional Globe*. Since 1875 its present name has been used. The *Record*, however, is not an accurate transcript of the actual proceedings. Members are allowed to revise their remarks before they appear in type; and they also frequently receive from the House 'leave to print' speeches which they have never delivered, but which appear in the *Record* as though a part of the proceedings of the session.

CONGRESSMAN AT LARGE. A member of the United States House of Representatives elected by the voters of the entire State, and not, as is customary, by those of Congressional districts. Such Congressmen are elected under the apportionment acts of Congress, and the election of a Congressman at large is merely a device adopted to give each State the proper number of representatives under the acts until the State should be redistributed. Some States have had two such members, and several one. According to a Congressional act of 1901, the ratio of Congressional representation is one Representative for every 194,182 of the population.

CONGREVE, kōn'grēv, RICHARD (1819-99). An English philosophical writer and essayist, born at Leamington. He studied under Arnold at Rugby, and afterwards at Wadham College, Oxford, of which he became successively scholar, fellow, and tutor but resigned after having become definitely a disciple of Comte. In 1855 he published a good edition of Aristotle's *Politics* (1855). Among his other publications are: *The Roman Empire of the West* (1855); *The Catechism of Positive Religion*, translated from Comte (1858); *Elizabeth of England* (1862); and *Essays Politi-*

cal, Social, and Religious (1874). He was early one of the foremost exponents of English Positivism.

CONGREVE, WILLIAM (1670-1729). A brilliant English dramatist. He was born at Bardsey, Yorkshire, and educated at Kilkenny, and at Trinity College, Dublin. He returned to England, and was entered at the Middle Temple, but did not take kindly to law. His first publication was a novel, entitled *Incognita*, really a dramatic intrigue put into narrative. His first play, *The Old Bachelor*, was produced at Drury Lane in January, 1693, and its success was remarkable. In November he brought out *The Double-Dealer*, which was a comparative failure; but his comedy, *Love for Love*, performed in 1695, was a great success, and brought to its author money and fame. *The Mourning Bride*, a blank-verse tragedy, was acted in 1697. Its success exceeded even that of his comedies, but it has long since been forgotten. Three years after, he produced a comedy, entitled *The Way of the World*, which failed completely, and disgusted him with the theatre. In other respects Congreve was a fortunate man. He held various offices, which together yielded him an income of £1200. Congreve affected to despise his theatrical triumphs, and cultivated the manners of the fine gentleman—an eccentricity which laid him open to rebuke when he was visited by Voltaire. In his later days he was afflicted with gout and blindness. He died in London, 1729, and was buried in Westminster Abbey. As a comic dramatist Congreve has been variously estimated. He was gross, but his age was gross. His plots are intricate, but they were so intended. His world is composed of wives, gallants, and husbands—and the husbands are hoodwinked. The characters have no heart, no generosity, but they play their parts brilliantly. Indeed, the wit of Congreve's dialogue is unsurpassed in our later drama. Famous essays on Congreve and the art he represents are: Hazlitt, *Lectures on English Poets and English Comic Writers* (London, 1846); Lamb, "On the Artificial Comedy of the Last Century," in *Essays of Elia* (London, 1875); Leigh Hunt, critical notice, prefixed to *The Dramatic Works of Wycherley, Congreve, etc.*, which he edited; Macaulay, review of Hunt, entitled *Comic Dramatists or Leigh Hunt* (London, 1848); and Swinburne, article on Congreve in *Encyclopædia Britannica*. Consult: Congreve's *Comedies*, ed. Ewald (London, 1887); id., ed. Street (London, 1895); and Gosse, *Life of Congreve* (London, 1888).

CONGREVE, Sir WILLIAM (1772-1828). An English engineer, the inventor of the Congreve rocket. (See ARTILLERY.) He was educated at the Royal Academy, Woolwich, received a commission in the artillery, and became controller of the Royal Laboratory at Woolwich. He was also a member of Parliament for Gatton, and later for Plymouth, and wrote various works on technological subjects, including: *Description of the Hydro-Pneumatic Lock* (1814) and *A Treatise on the General Principles, Powers, and Facility of Application of the Congreve Rocket System* (1827). He received many honors for his invention, became prominent in scientific circles, and was a favorite with George IV.

CONGRUENCE (Lat. *congruentia*, from *congruere*, to agree). In geometry, plane figures

which can be superposed so as to coincide throughout are said to be congruent. This is the Euclidean definition of equality, and indicates both quality of area and similarity of form. The symbol \cong for congruence signifies these two properties. In general it is not necessary actually to superpose the figures. If the equality of certain parts is known, the equality of the other parts can be established—e.g. if two sides and the included angle of one triangle are equal to the corresponding parts of another, the triangles are congruent, since the remaining parts are also equal and similarly placed. Congruence is related to axial and central symmetry (q.v.), and constitutes an important theory of geometry. Congruency, in modern geometry, signifies a system of elements satisfying a twofold condition. Of all possible lines, those particular lines which satisfy a given condition are together called a complex, and those which satisfy two conditions are called a congruency—e.g. all lines which intersect a given circle form a complex, and all which intersect two given circles form a congruency. The order of a congruency is the number of its rays co-planar with a given plane; the class of a congruency is the number of its lines concurrent in a given point.

In the theory of numbers, two integers are said to be congruent with respect to a third, called the modulus, when their difference is exactly divisible by the modulus. Thus, 12 and 7, 27 and 12, are congruent with respect to 5 as a modulus, since (12-7) and (27-12) are divisible by 5. This relation is expressed thus: $12 \equiv 7 \pmod{5}$, $27 \equiv 12 \pmod{5}$, and, in general, $a \equiv b \pmod{c}$. When two integers are congruent with respect to a third, either is called the residual of the other with respect to this modulus. A few fundamental theorems of congruences are: (1) If $a_1 \equiv a'_1$, $a_2 \equiv a'_2$, . . . $a_n \equiv a'_n$ (to the same modulus), then $a_1 + a_2 + \dots + a_n \equiv a'_1 + a'_2 + \dots + a'_n$. (2) If $a \equiv a'$, then $na \equiv na'$. (3) If $a \equiv a'$, $b \equiv b'$, then $ab \equiv a'b'$. (4) If $a \equiv a'$, then $a^n \equiv a'^n$. (5) If $a_1 \equiv a'_1$, $a_2 \equiv a'_2$, . . . , then $G(a_1, a_2, \dots) \equiv G(a'_1, a'_2, \dots)$, G designating any rational integral function of a_1, a_2, \dots .

In algebra, the congruence of functions is considered in addition to the congruence of numbers. When the elements considered are of the form $ax + b$ the congruence is called linear. When the elements are of the form $ax^2 + bx + c$, the congruence is called quadratic, and so on. To solve a congruence is to find the values of the unknown quantity which satisfy the congruence. Thus, to solve the quadratic congruence $x^2 \equiv 39 \pmod{49}$ is to find the number whose square gives a remainder 39 when divided by 49. These numbers are 23, 26.

As to geometry, consult: Henrici, *Geometry of Congruent Figures* (London, 1888); Beman and Smith, *New Plane and Solid Geometry* (Boston, 1900); Plücker, *Neue Geometrie des Raumes gegründet auf die Betrachtung der geraden Linie als Raumelement*, edited by Clebsch (Leipzig, 1868); and as to algebra, Salmon, *Modern Higher Algebra* (Dublin, 1876), and Pund, *Algebra mit Einschluss der elementaren Zahlentheorie* (Leipzig, 1899).

CONI, kō'nè. See CUNEO.

CONIBO, kō-nē'bò. The most important tribe of Panoan stock (q.v.), ranging along the mid-

de Ucalayi River, northeastern Peru. For a long time they repelled the missionaries, but are now completely Christianized. In their daily life, however, they cling to their old customs, although they learn Spanish readily and prove valuable house servants. They live chiefly by boating, fishing, and gathering sarsaparilla. They paint their faces in red and blue, and wear silver rings in their lips and noses.

CONIC SECTIONS. Curves which may be formed by various sections of a cone (q.v.). In the figure, which represents the two nappes of a

right circular cone, AB, a section perpendicular to the axis, is a circle; CD, a section oblique to the axis, cutting all the elements of the conical surface on one side of the vertex, is an ellipse; EF, a section parallel to the element CI, is a parabola; and GH, IJ, a section cutting both nappes, gives the two branches of an hyperbola. These curves

were discovered by Menæchmus in the fourth century B.C., and were known for a long time as Menæchmian triads. The Greeks extensively cultivated the theory of the conic sections. Since the invention of coördinate geometry (see ANALYTIC GEOMETRY), new interest has attached to these curves, and the properties of conics form the basis of instruction in analytic geometry. See CIRCLE; ELLIPSE; PARABOLA; HYPERBOLA; CURVES; MATHEMATICS.

CONID'IA (Neo-Lat. nom. pl. from Gk. *κόνις*, *konis*, dust). Aërial spores of fungi, usually formed in chains or clusters upon the swollen end of a filament (the *conidiophore*), and never borne in spore-cases (*sporangia*). See FUNGI.

CONIDIOPHORE (Neo-Lat. *conidium* + Gk. *-φόρος*, *-phoros*, from *φέρειν*, *pherein*, to bear). A fungal filament which bears conidia, one kind of asexual spores. See FUNGI.

CONIF'ERÆ (Lat. nom. pl. of *conifer*, cone-bearing, from *conus*, cone, Gk. *κόνος*, *kónos* + *φέρω*, to bear). The greatest of the four living groups of gymnosperms. The species are all trees or shrubs, and are characteristic of the north and south temperate regions, being almost entirely absent from the tropics. Prominent representatives of the group are the pines, spruces, hemlocks, firs, larches, cedars, cypresses, redwoods, junipers, arbor-vitæ, and yews. The habit of the trees is characteristic, a central shaft extending continuously to the very top, while the lateral branches spread horizontally, with diminishing length toward the top of the tree, resulting in a conical outline. Another peculiar feature is the 'needle leaf,' which seems to be poorly adapted for foliage. It is very slender and firm, being well organized to endure cold. In some of the conifers, however, as in species of *Podocar-*

pus, the leaves are quite broad and flat; while in others, as in the arbor-vitæ, they consist of closely appressed and overlapping disk-like bodies. As the leaves have no regular period of falling, the trees are always clothed with them, and are commonly called evergreens. There are a few exceptions to this evergreen habit, however, as in the case of the common larch or tamarack, which sheds its leaves every season. The branches of conifers are apt to occur in two forms, as may be seen in the pines. There are the elongated axes, which bear only scales, known as the long shoots; and also short, spur-like, dwarf branches, which bear the clusters of needle leaves. This disposition of the foliage leaves is by no means common to all conifers, or even to all ages of the pines. In many conifers, as in spruces and in seedling pines, the needles occur on the long shoots. The structure which gives name to the group is the cone-like strobilus which bears the seeds, and which sometimes becomes very large. This, when mature, consists of heavy overlapping scales, at the base of which, upon the upper side, the seeds are found. The strobili which are made up of the stamens are never so prominent or permanent, and hence are not usually noticed. The pollination of conifers is effected by the wind, and hence the pollen is very light and powdery, and is produced in enormous quantities. In the pines the pollen-grains are assisted in this wind transportation by the development of a pair of wings, which are outgrowths from the outer coat of the spore. Sometimes strong winds carry the pollen far from the forests which produce it, and the fall of this yellow powder in places in which the phenomenon is rare gives rise to accounts of 'showers of sulphur.'

STRUCTURE. The tissues of the stems of conifers are very characteristic. The woody bundles are arranged to form a hollow cylinder, as in the dicotyledons, and hence are able to increase in diameter during each growing season. It is only the primitive bundles, however, which are made up of true vessels. All of the secondary bundles, which form the whole mass of wood, consist of tracheids, i.e. thick-walled cells resembling true vessels, but not fitted together end to end so as to form more or less continuous vessels. These tracheids are also distinguished, as in all gymnosperms, by bearing upon their walls bordered pits, i.e. thin spots which appear to be bounded by two concentric circles. They are also packed together very closely and with remarkable regularity, so that the wood is very uniform and fine-grained, and hence easily split.

CLASSIFICATION. There are two great families of conifers, the Pinaceæ and the Taxaceæ. The former has true cones, by whose scales the ovules are concealed, and whose seeds ripen dry. In general, the cones ripen dry and hard, but sometimes, as in junipers, they become pulpy, the whole cone forming the so-called 'berry.' This family (Pinaceæ) is much the larger one, and contains four well-marked tribes. Chief among these are the Abietæ, containing the pines, spruces, hemlocks, firs, larches, etc., the genus *Pinus* with its seventy species being by far the largest genus of conifers. The Cupressæ contain the various cypresses and cedars; the Taxodiæ contain the bald cypresses, redwoods, and their allies; while the Araucariæ include the Araucarian or Norfolk pines of the Southern Hemisphere. The other family, the Taxaceæ, has

exposed ovules, and the seed either ripens fleshy or has a fleshy investment. It includes two tribes—the Podocarpeæ, genera of the Southern Hemisphere (the genus *Podocarpus*, with forty species, being the second largest of the conifers), and the Taxeæ, including the yews (*Taxus*) and their allies.

Some of the conifers, as the pines and junipers, are very widely distributed, while others, like the gigantic redwoods (*Sequoia*) of California and the bald cypress (*Taxodium*) are now very much restricted. The greatest displays of much restricted ('endemic') genera occur in the China-Japan region, and in the Australasian region.

Fossil Forms. Fossil remains of Coniferæ, consisting of branches, leaves, cones, and seeds, are found in great abundance in the most recent of the Mesozoic and in the Tertiary formations, and have been referred to genera still living on account of their resemblance to them. But only when such determination is based on well-preserved cones may it, as a rule, be considered satisfactory. Leaves and leaf-bearing branches furnish only in exceptional cases a basis for the determination of the genera, as there are recent genera from different families in which the leafing branches cannot be distinguished at all by their outward appearances.

It is no better with the fossil woods, for it is known that fragments of wood having the structure of living conifers are found in every state of preservation throughout the entire series of geologic formations from the Middle Devonian upward. The great hopes entertained that they would furnish important results have, according to Solms-Laubach, not materialized, owing to the uniformity of structure which characterizes secondary growth in thickness in Coniferæ. Moreover, the Cordaites, which stand between the Cycadaceæ and Coniferæ, have a woody structure distinguishable only in entire sections of the stem. Göppert's example in dealing with the fossil woods has been followed, and they are divided into general groups according to their resemblances to the wood of modern genera, as: Araucaroxyton (*Dadoxylon*), like wood of Norfolk Pine—Araucaria; Pissodendron; Cupressoxyton, like wood of cypress; Pityoxyton, like wood of pine; Cedroxylon, like wood of cedar; Taxoxyton, like wood of yew. Of these, Taxoxyton is known only from the Tertiary; Cupressoxyton occurs only from the Chalk onward; pine and cedar woods only from the Tertiary onward. Araucaroxyton and Pissodendron are the only types of coniferous wood found in the Paleozoic formations. To Araucaroxyton probably belongs the wood of the Carboniferous pines and Dawson's species of *Dadoxylon* and *Ormoxyton*, from the Canadian Middle Devonian. But the wood of Cordaites has also the Araucaroxyton structure. The presence of true Coniferæ with this wood structure is, however, known from the Carboniferous. The stems of *Protaxites Loganii* and *Nematoxylon erassum*, from the Lower Devonian of Canada and New Brunswick, which were described by Dawson as the oldest Conifer remains, are now considered to be remains of algae.

It has been determined that the conifers originated in the Arctic region, from whence they have spread over the globe. The pines (*Pinus*) appeared first in the European early Cretaceous

beds, where their cones are found, and they became very abundant in the Tertiary. The firs are known from the Jurassic of Spitzbergen and Siberia, and the cedars date also from the Jurassic. The Araucarians, to which belong also the Taxodiæ (Bald Cypress) and the Sequoie (Redwood), are thought to be represented by the gigantic *Walehia* of Permian age. The typical American bald cypress (*Taxodium distichum*), which abounds in the swamps of Florida, occurs as the same species in the Miocene of Middle Europe. The Voltzias, so common in the Triassic sandstones of Germany, may also belong to the Taxodiæ.

The cypress appears in the Triassic with a form extremely similar to a genus now found only in Africa—*Widdringtonia*. The cedar of Lebanon, the junipers, and others, make their earliest appearance in the Cretaceous of Greenland, and are found in later formations—Upper Cretaceous and Tertiary—of Middle Europe, an indication of the migration they made with the passing of geologic time. *Salisburias* are to-day represented by a single living type, the famous ginkgo (q.v.), which was first known in the cultivated state in the groves of Chinese temples. Ginkgo is the last descendant of a once great race, with ancestors that reach back as far as the Lower Carboniferous, and flourished, during those periods, from the Triassic onward, in the northern parts of Europe, as Spitzbergen and Siberia, etc.

CONIINE (from Lat. *conium*. Gk. *κόνιον*, *kōncion*, hemlock), $C_8H_{15}N$. The active alkaloid principle of hemlock, the seeds of the spotted hemlock plant (*Conium maculatum*, Linné). Being a volatile substance, coniine may be readily obtained from the seeds by distilling with water which contains a little soda in solution; coniine then passes over with the water in the form of a yellowish oil, but, when purified by redistillation, it is obtained as a colorless, transparent, oily liquid having a penetrating hemlock-like odor, communicating a burning sensation if applied to the tongue, and acting as a very energetic poison. It has a powerful alkaline reaction and precipitates metallic oxides from many salts. Strong sulphuric acid causes its compounds to assume first a purple-red and then an olive-green color, while nitric acid gives a blood-red color that fades into an orange. It is moderately soluble in water, its solutions having the property of turning the plane of polarized light to the right. If pure, it boils at $167^\circ C$.

The chief physiological effect of coniine is a powerful depression of all motor nerves, beginning at their periphery and gradually ascending to the spinal cord. As a result, all motion, voluntary and reflex, is paralyzed, although the muscles are not affected. This leads to enfeeble-

ment of the respiration and finally causes death by asphyxia. The symptoms of coniine poisoning are increasing heaviness in the legs and feebleness in the arms, dimness of vision, dilated pupils, difficulty in swallowing and breathing, and finally, loss of the voice. As coniine has no action on the brain, consciousness is preserved until the end. The following illustration will give an idea of the rapidity of its action: One drop placed in the eye of a rabbit killed it in nine minutes; three drops employed in the same way killed a strong cat in a minute and a half; while five drops, poured into the throat of a small dog, began to act in 30 seconds, and in as many more motion and respiration had ceased. In a case of coniine poisoning, emetics and the stomach-pump should be employed as early as possible; the patient's feet should be kept warm, a stimulant injected subcutaneously, and artificial respiration employed. Coniine is but rarely used as a therapeutic agent in medicine; it is extremely doubtful whether it has any useful effect at all, except perhaps in spasmodic diseases, like whooping-cough, lockjaw, or epilepsy. See HEMLOCK.

Chemically, coniine has been shown to be the dextro-rotary modification of α -propyl-piperidine, its formula being represented by the following graphic scheme:

The artificial preparation of coniine was the first synthesis of an optically active alkaloid. See also the article ALKALOIDS.

CO'NINCK. See KONINCK.

CON'INGSBY, OR THE NEW GENERATION. A novel by Benjamin Disraeli (1844). The plot is slight, and the interest of the novel is found in its political satire.

CON'INGTON, JOHN (1825-69). An English classical scholar, born at Boston, Lincolnshire. He studied at Rugby, under Dr. Arnold, in 1838-43, and at Magdalen College, Oxford, in 1843-46, and in 1846 became a fellow of University College. In 1849 he read law with much unwillingness for six months, at the London Inns of Court, and thereupon returned to the university. He contributed articles to the *Morning Chronicle* of London during 1849-50. In 1854 he was elected to the chair of the Latin language and literature at Oxford, that professorship having just been founded by Corpus Christi. His tenure of the post, continued until his death, was markedly successful, and his 'imposing personality' extended his influence far beyond his large circle of immediate pupils. His interests in connection with Latin studies were comparatively restricted. He cared little for ancient history, antiquities, or for many authors, even such great writers as Lucretius, Cæsar, Livy, and Cicero. But as a minute and careful interpreter of the more strictly literary aspects of Vergil, Horace, and Persius, and as an accurate, fluent, and generally very readable translator of all three, he gained a justly high repute. His translation (1866) of the *Aeneid* in the ballad metre of Scott, though questioned by scholars as a repre-

sentation of the manner of Vergil, is a vital piece of work, and has been much read. The renderings (1863) of the *Carmina* of Horace, and in particular of the *Satura Epistula* and *Ars Poetica* of the same author (1869), won the critical esteem of the learned. His most important work is his edition of Vergil, begun in conjunction with Goldwin Smith, and finished by Prof. Henry Nettleship (*P. Vergili Maronis Opera. The Works of Vergil, with a Commentary*, 3 vols., 1858-70; 4th ed., 1881-4). His edition of Persius, with a remarkably idiomatic prose translation, appeared in 1872. He was also a Greek scholar of fine attainments, and knew by heart the dramas of Æschylus, whose *Agamemnon* and *Choëphori* he edited (the former, with a verse-translation and notes, 1848; the latter, 1857). Consult *The Miscellaneous Writings of John Conington*, edited by J. A. Symonds (London, 1872), which contains a memoir by Prof. H. J. S. Smith.

CONINXLOO, kō'nīŋks-lō'. A family of Flemish painters, of whom the most celebrated was Gilles van Coninxloo (1544-c.1607), called the Younger. He was born at Antwerp and studied under Pieter Coek and Mostaert, but derived his chief preparation in France and Italy, making a specialty of landscape-painting. But two signed pictures by him exist, both in the Liechtenstein Gallery at Vienna. Coninxloo is known, with Bles and Gassel, as one of the few sixteenth-century artists who painted landscape otherwise than as a background for figures.

CO'NIUM. See HEMLOCK.

CONJUGAL RIGHTS. The rights which a husband or wife possesses to the companionship, society, service, and affection of the other. For any unlawful invasion of these rights by a third party, the injured spouse has a claim against the wrong-doer. One who alienates the affection of a wife from her husband is liable to him in damages; and in many of the United States the same liability is incurred by a woman who alienates a husband's affections from his wife. A spouse who violates conjugal rights may thereby afford the other a valid ground for divorce. Such misconduct, however, does not give to the innocent spouse the right to inflict chastisement, or to imprison the offender, or to obtain a decree for restoration of the conjugal relation. Both in England and in the United States the courts have declared that they have no jurisdiction to compel cohabitation where one party to the marital relation withdraws from the society of the other without justifiable cause, nor to decree a restitution of conjugal rights withheld. See COHABITATION; HUSBAND AND WIFE; MARRIAGE; and authorities there referred to.

CONJUGA'TÆ, OR POND SCUMS. See ALGÆ; CHLOROPHYCEÆ.

CONJUGATE (Lat. *conjugatus*, p.p. of *conjurare*, to join together, from *com-*, together + *jugare*, to yoke, from *jugum*, yoke; connected with Gk. *ζυγόν*, *zygon*, OChurch Slav. *igo*, Lith. *jūngus*, Goth. *juk*, Icel. *ok*, AS. *geoc*, Engl. *yoke*, OHG. *joh*, Ger. *Joch*, Skt. *yuga*, yoke). A term signifying united in pairs, and having various uses in mathematics. Conjugate *roots* are numbers, real or imaginary, such as $a + \sqrt{b}$ and $a - \sqrt{b}$, or $a + bi$, $a - bi$, satisfying a given equation. (See COMPLEX NUMBER.) Conjugate angles

are any two angles whose sum is 360° , as 10° and 350° , 400° and -40° , 180° and 180° . Conjugate *points* with respect to a conic are points each of which lies on the polar of the other. (See CIRCLE.) A conjugate *hyperbola* is one which has for its transverse and conjugate diameters the conjugate and transverse diameters of a given hyperbola. The equations of an hyperbola and its conjugate hyperbola are related thus: If $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ be the equation of the given hyper-

bola, then $\frac{x^2}{a^2} - \frac{y^2}{b^2} = -1$ is the equation of its conjugate. Conjugate *lines*, with respect to a conic, are lines each of which passes through the pole of the other. Conjugate *axes* or diameters of a conic are diameters which are conjugate lines with respect to the conic. Conjugate *triangles* with respect to a conic are triangles such that the sides of each are the polars of the vertices of the other and the vertices of each are the poles of the sides of the other. Conjugate *points* in a harmonic range are a pair of points harmonically separating two others. Thus, if A, P, B, Q, are four collinear points such that $AP:PB = AQ:BQ$, P and Q are called harmonic conjugates. Similarly in a harmonic pencil of four rays O (APBQ), OP and OQ are conjugate rays. (See ANIHARMONIC RATIO.) Conjugate *elements* of a determinant (q.v.) are those elements which are symmetrically situated with respect to the principal diagonal. Certain forms of quantities are also called conjugate.

CONJUGATE FOCUS. See LIGHT.

CONJUGATION (Lat. *conjugatio*, combination, from *conjugare*, to yoke together). IN PLANTS. A kind of fertilization, in which there is no distinction between the male and the female cells (*gametes*). It is restricted to certain low forms of algae and fungi (qq.v.). See FERTILIZATION.

CONJUGATION. A term in grammar applied to a connected view or statement of the changes of form that a verb (q.v.) undergoes in its various relations. (See INFLECTION.) The forms usually included under this term are those that serve to mark: (1) Person, or the distinction between the speaker, the spoken-to, and the spoken-of: as (I) *write*, (thou) *writest*, (he) *writes*. (2) Number; as (John) *writes*, (they) *write*. (3) Tense, or time; as (I) *write*, *wrote*, *have written*, *shall write*. (4) Mood, or the manner in which the action is presented. When the action is simply asserted, it is the indicative mood, as (he) *wrote*; when put as a supposition or condition, it is the conditional or subjunctive mood, as *if he wrote*. The imperative mood expresses a command or request, and is generally used only in the second person, as *write*. The infinitive mood expresses the action without limitation of any kind—to *write*; as it makes no affirmation, it is, strictly speaking, not a verb, but a kind of abstract noun. The two participles, the one expressing the action as in progress (*writing*), the other as completed (*written*), may be classed with the infinitive, as not affirming anything. The infinitive and the participles are sometimes called verbals. In opposition to the infinitive and the participles, the other parts of the verb are called finite. (5) Voice, or distinction between active and passive (see VERB);

as (he) *wrote* (the letter), (the letter) *was written* (by him).

In English, and in most modern European languages, the greater part of these distinctions are indicated by separate words; in Sanskrit, Greek, and Latin they were nearly all indicated by prefixes and suffixes, or other modifications of the word itself. The nature and origin of these modifications are considered under the head INFLECTION. All verbs do not take the same changes, even in the same language. Although the suffixes, e.g., may have originally been the same, yet they underwent, in course of time, different kinds of corruption or obliteration, depending upon the nature of the sounds in the root verb. This leads to the verbs of a language being arranged in different classes or conjugations. In Latin, for instance, grammarians recognize four conjugations, and verbs that cannot be brought into any class are called irregular verbs.

In English there are two distinct types of the inflections of verbs: thus, *I love* becomes in the past tense *I loved*, and in the passive voice *I am loved*; while *he shakes* becomes *he shook* and *he was shaken*. Verbs that, like *love*, take *d* (or *ed*—sometimes *t*) in their past tense and past participle form one class or conjugation, and those resembling *shake* in their changes form another. The former class is by far the more numerous; but the latter includes the most commonly used and oldest verbs in the language. The mode of change seen in *shake*, *shook*, *shaken* is believed to be more ancient than the other, and is therefore sometimes called the old conjugation, but more generally the 'strong' conjugation, the other being the new or weak. The terminology regular and irregular is incorrect. The verbs belonging to the old conjugation are all of Saxon origin, and are primitive or root verbs; while derivative verbs belong to the other class. Verbs of the weak conjugation are pretty uniform in taking *d* or *ed*, although after certain sounds the *d* is of necessity pronounced as *t*, and is sometimes replaced by that letter in writing—*dreamt*. For the vowel change in the strong conjugation, see ABLAUT. For further information on the conjugation of English verbs, consult: Lounsbury, *English Language*, rev. ed. (New York, 1894); Emerson, *History of the English Language* (New York, 1894); Skeat, *Principles of English Etymology*, vol. i. (London, 1887); and for language in general, Strong, Logeman, and Wheeler, *Introduction to the Study of the History of Language* (New York, 1891). See GRAMMAR and INFLECTION.

CONJUNCTION (Lat. *conjunctio*, from *conjungere*, to join together, from *com-*, together + *ungere*, to join; connected with Lat. *jugum*, yoke). One of the *parts of speech*, or classes into which grammarians divide words. Conjunctions serve the purpose of connecting sentences, parts of sentences, and single words; as 'Day ends and night begins. William and John learn Latin. Charles and James carried the basket between them.' In the first sentence, *and* connects two separate affirmations into one compound sentence. The same is true in the second—the separate affirmations being, 'William learns Latin,' and 'John learns Latin.' In the third sentence, *and* connects only the two words 'Charles' and 'James,' as it cannot be affirmed of either of them alone that he 'carried the

basket.' In most cases, however, it can be shown that, logically at least, two affirmations are involved, and that the conjunction really connects the affirmations. Conjunctions may also connect paragraphs. It is not easy to distinguish conjunctions from adverbs. In fact, conjunctions were all originally other parts of speech; and the greater part of them are still really adverbs, and owe their conjunctive effect to their significance as adverbs. In *and* and *but*, whatever may have been the original meaning, we now attend only to the conjunctive effect; or is a shortened form of the pronominal adjective *other*; and *nor* is *or* with the negative prefixed. In such a sentence as, 'I believe that you are wrong,' *that* is the demonstrative pronoun, equivalent to—I believe *this*, viz. 'you are wrong.' This is clearly seen in the corresponding words in other languages: Ger. *dass*, Fr. *que*, Lat. *quod* (for the relatives were originally demonstrative pronouns). All the rest might be called adverbial conjunctions, or conjunctive adverbs; as, 'He is industrious; *therefore* he is happy'—that is, 'he is happy for *that*.' This adverb, or adverbial phrase, expressive of the cause of the happiness, by referring us back for its meaning to the former assertion, has the effect of connecting the two assertions in the mind. Again, 'The messenger arrived *while* he was speaking.' Here *while* is equivalent to *at the time at which* (he was speaking). As an adverbial phrase, this simply indicates the time of the act of 'arriving'; but as it also expresses that the speaking was going on at the same time, it thus conjoins the two assertions.

The most important distinction among conjunctions will be seen in the following pair of sentences:

The sun went down, *and* the moon rose.
The moon rose, *as* the sun went down.

The first (compound) sentence contains two simple sentences or assertions, linked together, yet each standing on an independent footing; the two are joined on terms of equality, and are therefore said to be *coördinate*, and the conjunction is called a *coördinating* conjunction. In the second (complex), the last clause, though a grammatical sentence, contains no logical proposition, no assertion made for its own sake, but merely states a fact as a modifying circumstance with regard to the assertion contained in the first clause. The sentence of the second clause is therefore *subordinate* to that of the first, and the conjunction that marks the relation is a *subordinating* conjunction.

CONJUNCTION. In astronomy, one of the aspects (q.v.) of the planets. Two heavenly bodies are in conjunction when they have the same longitude—that is, when the same perpendicular to the ecliptic passes through both. If they have, at the same time, the same latitude—that is, if they are both equally far north or south of the ecliptic—they appear from the earth to be in the same spot of the heavens, and to cover one another. This phenomenon is called an eclipse in the case of the sun and moon, and an occultation in the case of the moon and a star. The sun and moon are in conjunction at the period of new moon. In the case of inferior planets, like Mercury and Venus, which revolve in orbits interior to that of the earth, there is an inferior conjunction when the planet is between the earth and the sun, and a superior

when the sun is between the earth and the planet. In general, a heavenly body is in conjunction with the sun when it is on the same side of the earth and in a line with the sun; and it is in *opposition* to the sun when it is on the opposite side of the earth, the earth being in a line between it and the sun. Planets are invisible when in conjunction with the sun, except in rare cases when an inferior planet passes over the sun's disk, and may be seen as a speck on its surface. The foregoing has reference to *geocentric* conjunctions, or such as are seen from the earth. *Heliocentric* conjunctions are analogous planetary arrangements, such as could be seen by a supposed observer on the sun. In observing a conjunction, eclipse, or occultation, from the earth's surface, it is usual to reduce the observation to what it would be if made from the earth's centre. By this means, the exact times of conjunction are more accurately fixed, and the observations of one astronomer made available to every other, wherever he may be on the earth's surface. *Grand conjunctions*, in astrology, are those where several stars or planets are found together. Chinese history records one in the reign of the Emperor Tehuenhiu (B.C. 2514-2436), which astronomers calculate to have actually taken place.

CONJUNCTION, or **SYNAPHE**. In music, the name given by the Greeks to their old system of tuning the seven-stringed lyre. The new system, which came into use with the eight-stringed lyre, was called *ἀρμονία*, *harmonia*, harmony. See GREEK MUSIC.

CONJUNCTIVI'TIS (Neo-Lat., from *conjunctiva*, connective membrane, from Lat. *conjunctivus*, connective, from *conjungere*, to join together), OPHTHALMIA, or OPHTHALMITIS. An inflammation of the conjunctiva, or the mucous membrane that covers the external surface of the eyeball, and the internal surface of the eyelids. The disease occurs in several distinct varieties, which are separately described below:

ACUTE CATARRHAL CONJUNCTIVITIS. The symptoms of this variety are redness of the surface of the eyes (the redness being superficial, of a bright scarlet color, and usually diffused in patches), sensations of uneasiness, stiffness and dryness, with slight pain, especially when the eye is exposed to the light; an increased discharge, not of tears, except at the beginning of the attack, but of mucus, which at first is thin, but soon becomes opaque, yellow, and thicker; pus (or matter, as it is popularly termed) being seen at the corner of the eye, or between the eyelashes along the edges of the lids, which it glues together during the night. The disease results from exposure to cold, damp, and dust; it may be epidemic in the spring and autumn, probably from bacterial infection; or it may be transmitted by contact with articles used by those having the disease; or finally may follow or occur during measles, smallpox, scarlet fever, influenza, hay fever, or coryza.

CHRONIC CATARRHAL CONJUNCTIVITIS. This is probably the most common disease of the eye and usually occurs in adults, generally involving both eyes. It often lasts a long time, frequently on account of the continuance of the causes which led to its appearance. Among the most important causes are: acute catarrhal conjunctivitis, improper hygienic surroundings, irritation by dust or smoke, insufficient sleep, abuse of alcohol,

and eye-strain. The conjunctiva is red and smooth, the secretion is but slightly increased.

FOLLICULAR CONJUNCTIVITIS. This is an obstinate form of chronic catarrhal conjunctivitis, and may be recognized by the small follicles or granular swellings which form under its influence upon the lower lids. It closely resembles trachoma (see *Granular Conjunctivitis*, below), commonly called 'granular lids,' and some even maintain that they are identical. Those who differ from this opinion assert that the follicles in follicular conjunctivitis disappear after a few weeks' treatment, while in trachoma there are persistent changes in the conjunctiva.

ACUTE PURULENT CONJUNCTIVITIS OF ADULTS, or Gonorrhœal Ophthalmia. This differs from catarrhal conjunctivitis in the severity of its symptoms and in its exciting causes. It is a violent form of inflammation of the conjunctiva; is accompanied with a thick, purulent discharge on the second or third day, and is very apt to occasion loss of vision. It begins with the same symptoms as catarrhal ophthalmia, but in a very exaggerated form. The conjunctiva rapidly becomes intensely red, and soon appears raised from the sclerotic by the effusion of serum between them, projecting around the cornea, which remains buried, as it were, in a pit. Similar effusion takes place beneath the mucous membrane lining the eyelids, causing them to project forward in large, livid, convex masses, which often entirely conceal the globe of the eye. These symptoms are accompanied by severe burning pain, tenderness of the eye, some constitutional symptoms, and slight fever. When the disease is unchecked, it is liable to produce ulceration or sloughing of the cornea, with the escape of the aqueous humor and protrusion of the iris; and, even when these results do not follow, vision is often destroyed by permanent opacity of the cornea.

The disease is unquestionably contagious, and arises from the application of gonorrhœal discharge or matter to the surface of the eye; and hence is most common in persons suffering from the disease from which this variety obtains its specific name. It may be conveyed directly to the eye, or by means of towels or other articles used by such a person. It is, moreover, often occasioned by the disgusting practice, adopted by the poorer classes, of bathing the eyes in human urine, under the idea that by this procedure they strengthen the sight.

PURULENT CONJUNCTIVITIS OF INFANTS, or Ophthalmia Neonatorum. This usually appears about the third day after birth. Its importance is apt to be overlooked until it has made considerable progress. The edges of the lids appear red and glued together, and the eye, when the lids are separated, shows redness and swelling of the conjunctiva. The disease, if not checked, progresses in much the same way as in adults. It is, however, much more amenable to treatment, and with proper care the sense of sight is seldom impaired, provided the disease has not extended to the cornea before medical aid is sought. Ophthalmia neonatorum is the result of gonorrhœal infection of the eyes from the mother during birth. It is practically preventable by the use of Credé's method of cleansing the eyes immediately after birth, and putting one drop of a 2 per cent. solution of silver nitrate into each eye. This is a routine practice in many of the

maternity hospitals, and has done much in these institutions, and among the better classes, to diminish the frequency of the affection.

The treatment of purulent conjunctivitis must be left entirely to a competent physician, whose advice should be sought as soon as there is the slightest suspicion of the nature of the case.

DIPHTHERITIC CONJUNCTIVITIS and Crocopous CONJUNCTIVITIS. These are forms caused by the bacillus of diphtheria.

PHLYCTENULAR CONJUNCTIVITIS, called also *Pustular Conjunctivitis, or Scrofulous Ophthalmia.* This occurs in children, especially of the lower classes, who suffer from the tuberculous or so-called scrofulous diathesis or constitution. The most prominent symptom is extreme intolerance of light, the lids being kept spasmodically closed. When they are forcibly separated, a slight vascularity, usually stopping at the edge of the cornea, is observed, and at or about the line of separation between the cornea and sclerotic small opaque pimples or pustules appear. The treatment consists (1) in improving the general health, and (2) in local applications. This form of disease, being dependent on constitutional causes, is often very obstinate, and is always liable to recur.

GRANULAR CONJUNCTIVITIS, or Trachoma, popularly known as 'granular lids.' This is a contagious affection of the eye, conveyed by means of the secretion. The contagion is most frequently carried by towels, etc., used in common by many persons, and so the disease is found chiefly in crowded and dirty houses, in schools, barracks, etc. It occurs very frequently in Arabia, Egypt, and the lowlands of Europe. In this country the negro race is comparatively seldom affected by it. The disease has been called Egyptian ophthalmia on account of its importation into Europe from Egypt during the wars of Napoleon. The Irish and Jews are especially liable to the affection. It is accompanied by a varying degree of dread of light, itching and burning of the lids, pain, flow of tears, and trouble with sight. The lids are swollen, the upper drooping; there is a variable amount of muco-purulent discharge. The conjunctiva of the lids and fornix, or fold between lids and eyeballs, is red, thickened, and covered with many small papillæ, or velvety elevations, or by granules which are round, translucent, and yellow or grayish. After a time, scar tissue forms and the papillæ and granules disappear. The disease may be acute, but usually begins gradually and lasts for years. It is believed by some that the cases in which the granulations give few or no symptoms, and there are no signs of inflammation, are not contagious. The dangerous complications are ulceration of the cornea alone or accompanying a condition known as *pannus*. In the latter, new tissue containing blood-vessels gradually forms until the upper half of the cornea is covered, occasionally the whole. If this disappears later, sight will be restored; otherwise, the new tissue causes permanent opacity, an accident which may also result from corneal ulceration. Entropion (q.v.), trichiasis (q.v.), or ectropion (q.v.), or symblepharon, a cicatricial adhesion of the conjunctiva of the lid to that of the eyeball, may follow trachoma.

The treatment of trachoma may require either local applications or surgical interference. Prevention is most important. Persons having the

disease should exercise great care that others may not use their towels or other toilet articles, which might serve to convey it; and in public institutions cases should be carefully watched for and isolated.

CONJURY (from *conjure*, OE., Fr. *conjuror*, from Lat. *conjurare*, to swear together, from *com-*, together + *jurare*, to swear, from *ius*, law). Incantation, bewitchment, or magic. Specifically, the casting of spells, or evil enchantment, characteristic of Afro-American folk-lore. See MAGIC; MAN, SCIENCE OF.

CONK'LING, ROSCOE (1829-88). An American politician. He was born at Albany, and after receiving an academic education, at the age of 17 began the study of law in the office of Speneer and Kernan at Utica. His first identification with politics was in 1848, when he won some reputation as a campaign speaker by making a number of speeches in behalf of Taylor and Fillmore. In 1850 he was admitted to the bar, and in the same year became district attorney of Albany County by appointment of Governor Fish. In 1852 he returned to Utica, where in the next few years he established a reputation as a lawyer of ability. Up to 1852, in which year he stumped the State for Gen. Winfield Scott, the Whig candidate for the Presidency, Conkling was identified with the Whig Party, but in the movement that resulted in the organization of the Republican Party he took an active part, and his work, both as a political manager and an orator, contributed largely toward carrying the State for Frémont and Dayton, the Republican nominees, in 1856. In 1858 he was elected Mayor of Utica, and in the same year was chosen a Representative in Congress, serving throughout the period of the Civil War, except in the Thirty-eighth Congress (1863-65), during which interval he acted as a Judge-Advocate of the War Department. He was again a member of Congress in 1865-67. In his career in the House of Representatives, Conkling won national distinction as a debater and orator. He was an enthusiastic supporter of the Lincoln administration in its conduct of the war, but vigorously opposed the passage of the Legal Tender Act in 1862. He was a member of the Committee of Ways and Means, and the Special Committee of Fifteen on Reconstruction, delivering one of the strongest speeches in support of the Fourteenth Amendment. His renown as an orator and prominence in the legislative councils of the Republican Party secured him in 1867, at the age of thirty-eight, an election to the United States Senate to succeed Judge Ira Harris. Conkling's career in the Senate was brilliant, but, like all the rest of his political life, erratic and marked by strong personal likes and dislikes, by which, rather than by the welfare of the nation or of his party, he was frequently controlled. Through the eight years of Grant's administration he stood out as the spokesman of the President and one of the principal leaders of the Republican Party in the Senate. He was active in framing and pushing through Congress the reconstruction legislation, and was instrumental in the passage of the second Civil Rights Act, in 1875, and of the act for the resumption of specie payments, in the same year. In the Republican National Convention at Cincinnati in 1876, Conkling first appeared as a Presidential candidate, receiving 93 votes. He was one of the framers of the bill

creating the Electoral Commission to decide the disputed election of 1876, but, when its judgment was announced, declined to vote for its affirmation. Himself an opponent of civil-service reform, Conkling was entirely out of sympathy with the reform element in the Republican Party. The first break with the administration occurred in April, 1877, when the Secretary of the Treasury, John Sherman, appointed a commission to investigate the affairs of the Custom House. The investigation brought to light extensive irregularities in the service, showing in particular that the Federal office-holders in New York constituted a large army of political workers, and that their positions were secured by and dependent upon their faithful service in behalf of the men holding the principal Government offices in the city. President Hayes decided upon the removal of Chester A. Arthur, the Collector; Gen. George H. Sharpe, the Surveyor, and A. B. Cornell, the Naval Officer of the Port, and in October, 1877, sent nominations of their successors to the Senate. Senator Conkling defended the displaced officials, and, through his influence in the Senate, secured the rejection of the new nominations. He succeeded in blocking all the efforts of President Hayes and Secretary Sherman until January, 1879, when, a new lot of nominations having been made, they were confirmed in spite of Conkling's continued opposition. Early in 1880 Senator Conkling became the leader of the movement for the nomination of General Grant for a third term in the Presidency. How much of his advocacy was due to his regard for Grant, and how much to his hostility to the other leading two candidates, Sherman, with whom he had come into conflict during Hayes's administration, and Blaine, whose bitter political and personal enemy he had been for twenty-four years, can never be known. The convention, by a combination of the Blaine and Sherman interests, nominated James A. Garfield. Conkling and the famous '306' remained faithful to Grant to the last, and were allowed to name the candidate for Vice-President. The result emphasized Conkling's hostility toward Blaine, and eventually led to the former's quarrel with Garfield and consequent retirement from political life. Immediately after Garfield's inauguration, Conkling presented to the President a list of men whom he desired to have appointed to the Federal offices in New York. Garfield's appointment of Blaine as Secretary of State, and of Windom as Secretary of the Treasury, instead of Levi P. Morton, whose appointment Conkling had urged, angered Conkling and made him unwilling to agree to any sort of compromise with Garfield on the New York appointments. Without consulting him, the President nominated for Collector at New York William H. Robertson, an anti-Conkling man. Robertson's nomination was confirmed by the Senate, in spite of the opposition of Conkling, who claimed the right of Senators to control Federal patronage in their States. Conkling and his colleague, Thomas C. Platt, immediately resigned their seats in the Senate, and appealed to the New York Legislature to justify their course by reelecting them. After an exciting canvass, Conkling and Platt were defeated, and Warner Miller and E. G. Lapham were chosen in their stead. The remainder of his life Conkling spent in the practice of law in New York City. In 1882 he was nominated by his friend, President Arthur, to succeed Ward

Hunt as an associate justice of the United States Supreme Court, but he declined. Consult: *Life and Letters*, edited by A. R. Conkling (New York, 1889).

CONN. An irresponsible, gay-spirited fellow, the leading character in Dion Boucicault's play *The Shaughran*.

CONN, HERBERT WILLIAM (1859—). An American zoölogist and bacteriologist, born at Fitchburg, Mass. He took his baccalaureate degree at the Boston University and his doctorate at Johns Hopkins University, and soon afterwards became professor of biology at Wesleyan University in Connecticut. From 1889 to 1897 he was director of the Marine Biological Laboratory at Cold Spring Harbor, L. I. He is considered an authority on the bacteriology of dairy products, in connection with which he has published many papers, usually under the auspices of the Agricultural Station at Storrs, Conn. His works include: *Evolution of To-day* (1886); *The Living World* (1891); *The Study of Germ-Life* (1897); *Classification of Dairy Bacteria* (1899); *The Method of Evolution* (1900).

CONNAUGHT, kōn'nat (Ir. *Connacht*). The northwestern and smallest of the four provinces of Ireland, bounded north and west by the Atlantic, east by Ulster and Leinster, and south by Munster (Map: Ireland, B 3). It contains the counties of Galway, Leitrim, Mayo, Roscommon, and Sligo. Area, 6867 square miles. Population, in 1841, 1,420,900; in 1891, 719,500; in 1901, 649,630.

CONNAUGHT, ARTHUR WILLIAM PATRICK ALBERT, Duke of, Prince of the United Kingdom (1850—). The third son of Queen Victoria. He entered the Military Academy at Woolwich in 1866, and in 1880 became a general of brigade. He was created Duke of Connaught and Strathern and Earl of Sussex in 1874, and took his seat in the House of Lords. In 1879 he married Princess Margaret Louise, grandniece of the German Emperor William I. He served in Egypt in 1882, became a general in 1893, and from 1893 to 1898 was in charge of the permanent camp at Aldershot. In 1896 he and his wife represented Queen Victoria at the coronation of the Czar Nicholas II. He succeeded Lord Roberts as commander-in-chief of the forces in Ireland in January, 1900, and in the following year became commander of the Third Army Corps.

CONNEAUT, kōn'né-ət'. A village on Conneaut Creek, Ashtabula County, Ohio, near the Pennsylvania line, 68 miles northeast of Cleveland, and noted as the landing-place of the first white settlers of northern Ohio in 1796 (Map: Ohio, J 2). It is on the Lake Shore and Michigan Southern; the New York, Chicago and Saint Louis; and the Pittsburg, Lake Erie and Bessemer railroads, and has a good harbor at the mouth of the creek, where there is a lighthouse. It is an important ore and coal port, and has extensive railroad shops and plants for the manufacture of canned goods, self-sealing packages, bricks, lumber, etc. Conneaut also exports large amounts of molding sand and agricultural produce. The electric-light plant is owned and operated by the village, which was incorporated in 1832. It is governed by a mayor, elected every two years, and a council. Population, in 1890, 3241; in 1900, 7133.

CONNECTICUT, kōn-nēt'ī-kūt (Algonquin *Quinnī-tuk-ut*, long river). One of the original thirteen States of the United States; a north Atlantic Coast State and the southwesternmost of the New England States (Map: United States, L 2). It is included between latitudes 40° 59' and 42° 3' N. and longitudes 71° 47' and 73° 43' W., and is bounded on the north by Massachusetts, on the east by Rhode Island, on the south by Long Island Sound, and on the west by New York. It has an extreme length from east to west of nearly 105 miles, and an average length of about 95 miles; an extreme width from north to south of 76 miles, and an average width of 57 miles, with a total area of 4990 square miles, of which 145 square miles are water surface and 4845 square miles, or 3,100,800 acres, are land. Connecticut is one of the smallest States in the Union, only two States being smaller, but it ranks twenty-ninth in population. The boundary lines between Connecticut and the adjoining States are somewhat irregular, since they depend on old grants and surveys which were very unsystematic.

TOPOGRAPHY. The highland region, which commences in Vermont in the Green Mountains and continues across Massachusetts in the Berkshire Hills, descends into Connecticut, at first with considerable height; but southward it gradually loses its mountainous character, and as Long Island Sound is approached it is represented by low hills only. In this hill country, the streams flow in most cases in narrow valleys. East of this region is the broad valley of the Connecticut, with an altitude of less than 100 feet at the north boundary of the State, and less than 500 feet over a breadth of 25 miles. The river leaves this depression at Middletown, the depression continuing southwestward to the coast at New Haven, while the river flows southeastward through a hill country to its mouth at Saybrook. The eastern part of the State is hilly, with altitudes exceeding 1000 feet near the northern boundary, and diminishing in height southward. Here also most of the streams flow in narrow, deep valleys.

In former geologic times the area of Connecticut is believed to have formed a part of the southern slope of a great mountain mass, whose summits are perhaps indicated by the present White, Green, and Adirondack mountains. Long-continued erosion of streams and perhaps of ice reduced this region to a plain, with low relief and shallow stream valleys. A comparatively recent tilting of the land has slightly depressed the coast and elevated the interior. This has revived the cutting power of the streams, which are now actively eroding their valleys, most of them in hard rocks, in which slow progress is made. The Connecticut Valley is, however, largely of relatively softer rocks, which have been eroded away with greater rapidity. In recent geologic times the area of the State was covered by the Laurentian glacier, which did much erosion and deposition, scouring out lake basins, and thus forming the multitude of little lakes and ponds which diversify the surface, and modifying the streams' courses, producing rapids and falls, now utilized for water-power.

Among the highest points in Connecticut are Bear Mountain, 2355 feet; Gridley Mountain, 2200 feet; Riga Mountain, all in Salisbury; Bradford Mountain, in Canaan, 1927; Dutton Mountain, 1620 feet, and Mount Ball, 1760, in

Norfolk; Above All Mountain, 1456, in Warren; Ivy Mountain, in Goshen, 1640 feet; and Ellsworth Hill, 1580 feet, in Sharon. The coast of Connecticut is very broken and irregular, and consists of a succession of rocky points and gravel or sandy beaches. It possesses a number of good harbors, and the larger rivers have estuary-like mouths. The coast waters are shallow, but usually deep enough to permit the near approach to land of vessels. Numerous small rocky islands skirt the shores; the largest island on this coast being Fisher's Island, off the mouth of the Thames, which, while geographically belonging to the Connecticut coast, politically belongs to New York.

The hydrography of Connecticut is simple in general outline, the streams as a whole following the slope of land from the north toward the south. Since this slope is but a continuation from the higher land to the north, the main streams rise north of the Connecticut boundary and the waters flow in a generally southerly direction across the State and empty into Long Island Sound. There are three main river systems: the Housatonic-Naugatuck in the west; the Connecticut in the middle; and the Thames in the east. The streams tributary to these main rivers are numerous, and some of them of considerable size. In the southern part of the State there are many small streams which have a southerly direction and flow straight to the Sound. The three main rivers receive the drainage of a comparatively small portion of this coast area. The small streams are in few cases more than 25 miles in length in a direct course, except the Quinnipiac, which enters New Haven Harbor, and which has its source well within the Connecticut depression. The Connecticut water-courses have in general deeply cut their path through the highlands, so that on the main streams the fall is less than might be expected from the neighboring elevations. The smaller streams, however, and the larger ones in their upper courses, furnish an enormous water-power.

CLIMATE AND SOIL. In Connecticut the average annual temperature decreases from about 50° F. on the southern coast to about 48° in the northeastern part and 46° in the northwest. In midwinter the average temperatures decrease from about 30° along the southern coast to 24° in the northern part. In all portions of the State the temperature usually descends below zero at times during the winter, and may even fall as low as -10° or -15° F. In mid-summer the average temperature is about 72° along the southern coast, but increases to 74° in the middle interior, and decreases again to about 70° in the northwest. During the summer extreme temperatures ranging from 90° to 100° F. may be expected in all parts of the State.

The prevailing winds in Connecticut are from the westward. In the winter the prevailing wind throughout most of the State is from the northwest, and in mid-summer from the southwest throughout the State. The general or prevailing southwest winds during the summer months considerably lessen the land temperatures on the southern coast and to some distance inland, while the prevailing northwest winds during the winter carry the inland cold air to the coast. The relative humidity varies from 70 to 80 per

cent., and is greater in winter and less in the spring than at other times of year. Throughout most of the State the average rainfall during the year is from 45 to 50 inches. The precipitation is quite evenly distributed over the entire year; on the average a little more than 5 inches falls during each of the spring and summer months and a little over 4 inches during each of the fall and winter months. The snowfall varies very much from year to year, but on an average for a series of years about 40 inches fall on the southern coast, and there is a rather regular increase toward the northern part of the State to 50 inches in the northeast corner and to 60 inches in the northwest corner.

The valley land of Connecticut is usually a rich alluvial deposit, which has left the hill land rather thin in soil and barren, but nevertheless still of great value for fruit, grass, and pasture. The northern part of the Connecticut River Valley, as far south as Middletown, has a rich, deep, loamy soil, often with a clay subsoil. In the southern part of the State, however, and along the coast, the soil is sandy. In the southwest there is a dark argillaceous soil, and in the northeast a light gray loam.

For flora and fauna, see paragraphs under UNITED STATES.

GEOLOGY. The great valley which extends northward from New Haven to the Massachusetts boundary is occupied by a belt 5 to 18 miles in width, of Triassic sandstone, broken through in places by trap-rocks. East and west of this valley crystalline rocks, including granite, gneiss, schist, slate, and limestone, predominate. In the northwestern part of the State these rocks are of metamorphic origin and represent the altered product of Ordovician strata, while the granite and gneiss in the eastern and southern parts probably belong to the Archaean. The whole State lies within the region of glacial drift, and a heavy mantle of sands, gravels, and boulder clay rests upon the rock formations.

MINERAL RESOURCES. Tungsten ore is mined near Long Hill, in Trumbull township, but there are no other metallic mines in operation at present, although copper, lead, and iron ores are known to occur. The granite outcrops on Long Island Sound yield a good quality of building-stone, and feldspar is produced at Branchville and South Glastonbury. Portland is noted for its quarries of brownstone (sandstone), large quantities of which have been consumed for building purposes in the large cities on the Atlantic Coast. Marble, limestone, and clay are also produced at various localities. For a long series of years Connecticut has produced granite, limestone, and sandstone in quantities varying in aggregate value from a half-million to a million dollars per annum. Connecticut contains the oldest iron-mines in the United States, the Salisbury Mine having been opened in 1732. The Connecticut mines and furnaces furnished valuable supplies of cannon-balls, shells, etc., for the Continental forces during the War of the Revolution.

FISHERIES. The State ranks third among the New England States in the value of its fisheries. Their importance has changed but little in recent years, the product remaining about constant at \$1,500,000, while the number of men engaged—2470 in 1897—has decreased as a result of improved methods. There has been a decided de-

AREA AND POPULATION OF CONNECTICUT BY COUNTIES.

crease in the menhaden and cod fisheries, so that at present the industry is almost wholly confined to oyster-fishing, the product of which was valued at \$1,250,000 in 1897. Next in importance are the lobster fisheries, with an aggregate value of \$83,700.

AGRICULTURE. With the exception of the river valleys, Connecticut soil is not favorable to agriculture. The surface is broken and stony, and generally lacks fertility. With the development of the fertile and easily cultivated plains of the West, Connecticut, in common with the other New England States, found market prices reduced below the point of profit, and its farmers were forced to give up the occupation or improve their methods of farming. Since 1850 there has been a continual decrease in the production of almost every staple crop. In 1899 the acreage of corn (47,900) was twice that of all other cereals, and it was the only cereal which did not lose in acreage during the decade. But proximity to the best markets of the country has been of great advantage to Connecticut, and this, together with improved methods of tilling the soil, particularly the extensive application of fertilizers, has saved the agricultural interests from complete ruin. Hay is by far the most extensive crop, the acreage (480,000 in 1900) being more than three times that of the total for all other crops. Tobacco ranks next to hay in importance. The cultivation of this plant was begun in 1640, if not earlier, and it is confined mostly to the valleys of the Housatonic and Connecticut rivers. The tobacco, which is of superior quality and of mild flavor, is used chiefly for wrappers for cigars made from the stronger-flavored Havana tobacco. The acreage for 1899 (10,120) was the largest for any year recorded, and though constituting but 2 per cent. of the area for all crops, returned 13.9 per cent. of the gross income. The average value of the product per acre was \$303, exceeding the corresponding figure for any other tobacco-growing State. Vegetables rank next to tobacco in value of product. The influence of the large city population of the State on agriculture has been to increase the interest in dairying and vegetable and fruit raising, for which purposes the land is well adapted. The dairy cows number about 127,000, and the dairy product for 1899 exceeded in value \$7,000,000. The production of milk increased over 30 per cent. during the decade, but this gain was somewhat offset by a decrease in the manufacture of butter and cheese. There has been a decided increase during the last decade in the number of peach orchards, but apple-trees still constitute about three-fifths of the total number of orchard trees. With the exception of dairy cows, horses are the only kind of farm stock showing an actual increase during the last half-century; swine, sheep, and meat cattle have greatly decreased. Of the total land surface of the State, 74.6 per cent. is included in its farms, and of this but 46 per cent. is improved. While the farm area has remained about constant for a number of decades, the percentage of improved land has greatly decreased, particularly during the last decade. This curious fact is explained by the increase in dairying, etc., as stated above. The average size of the farms is 86 acres. Eighty-seven per cent. of the farms are operated by their owners, and among those rented the cash-rent method predominates. The

following comparative table for the years 1890 and 1900 includes the more important varieties of crops and domestic animals:

Year	Corn	Potatoes (both kinds)	Hay and forage	Tobacco	Misc. Vege- tables
1900	(acres)	(acres)	(acres)	(acres)	(acres)
1890	47,914	27,150	478,555	10,120	11,143
	40,445	23,099	511,728	6,331

Year	Dairy cows	Meat cattle	Horses	Sheep	Swine
1900	126,434	90,624	52,576	23,021	46,447
1890	127,892	75,769	43,764	37,652	62,087

MANUFACTURES. Connecticut is notably a manufacturing State, 19.5 per cent. of the total population being engaged in that industry. Though one of the smallest States of the Union, it ranks eleventh (1900) in the importance of its manufactures. Influential among the factors which have developed these interests have been the favorable geographical location and the excellence of the land and water communication of the State, the water-power afforded by its streams, and especially the inventive talents and industrious habits of its people. The proverbially ingenious Yankee is indigenous in Connecticut, and from an early day has excelled in the invention and manufacture of 'Yankee notions.' The names of Colt, Whitney, Goodyear, and Howe, among others, suggest the State's prominence in the past, while to-day more industries are protected by patents in Connecticut than in any other State; and in proportion to population the State also leads in the number of patents received.

By the Twelfth Census the State surpassed any other State in 11 important industries, producing 75 per cent. in value of the total ammunition output of the country; 56 per cent. of the brass manufactures; 63 per cent. of the clocks; 47 per cent. of the hardware; 76 per cent. of the plated and Britannia ware; 64 per cent. of the needles and pins. The development of manufactures has been steady, and the absolute gain was the greatest from 1890 to 1900, both in the number of establishments and the value of the product. In the seventeen most important industries a tendency toward centralization is evident, inasmuch as the number of establishments has increased less than 5 per cent. during the last decade, while the total product has increased over 45 per cent. In certain industries, however, quite the contrary drift is noticeable. The textile and the brass-manufacturing industries lead in importance, but the two fared differently from 1890 to 1900, the product of the former more than doubling, that of the latter increasing but slightly. The influence of the development of cotton-mills in the South is probably reflected here, the increase in the textile manufactures being in the dyeing, finishing, and silk products—branches which have not yet developed in the South. The cotton-mills of the State are clustered on the streams that flow into the Thames at Norwich. The following table shows the num-

ber of establishments, the number of wage-earners, and the gross value of the products for 1890 and 1900:

port of New York, most of the foreign trade of the State passing through that city. Although there are no exports to foreign countries direct

TRANSPORTATION AND COMMERCE. The railroad system of Connecticut reached an early development, and has been but little extended in recent years. In 1900 the total mileage was 1025, the greater part of which was owned or leased by the New York, New Haven and Hartford Company. There were 53,352,000 passengers carried during the year; the freight carried amounted to 17,393,000 tons. While railroad-building has remained for some time almost stationary, street railways, on the other hand, especially cross-country lines, show a noteworthy growth. These had in 1900 reached a total length of 500 miles, having authorized capital stock amounting to \$21,467,000. Transportation within the State is also much helped by the improvement of country roads, in which enterprise the State aids the communities.

The ports of entry are Hartford, Fairfield, New Haven, Stonington, and New London. There is a brisk coastwise trade, particularly with the

from Connecticut, there were foreign imports in 1900 amounting to about \$1,800,000, two-thirds of which entered by the port of Hartford.

GOVERNMENT. The present Constitution was approved by the people of the State in 1818. Twenty-nine amendments have since been adopted. An amendment originates in the House of Representatives, is approved by a two-thirds vote of each House at the following session, and in turn by a majority vote of the electors present at the town meetings held for its consideration. Applicants for franchise must be twenty-one years of age, must be able to read, and must have lived one year in the State and six months in the town.

Legislature.—General elections for State officers and the General Assembly are biennial, in even years, on the first Tuesday after the first Monday in November. The General Assembly consists of 24 Senators, elected from districts of contiguous territory, no town being divided or part

of a county attached to any other county, and 252 Representatives, elected from the towns, each town being permitted one or two members, according as its population is below or above 5000. But towns which had two Representatives prior to the amendment of 1874 still retain that number without regard to population. Senators and Representatives are elected for a two years' term, and receive for the regular session \$300 each and mileage. Only mileage is allowed for extra sessions. The Assembly convenes on the first Wednesday after the first Monday in January of each odd year.

Executive.—The Governor, Lieutenant-Governor, Secretary, Treasurer, and Comptroller are each elected for two years, and have their salaries fixed by law. The Governor's veto may be overcome by a majority vote of each House. The Lieutenant-Governor presides in the Senate.

Judiciary.—The judiciary consists of a supreme court of errors, with a chief justice and four associate judges; a superior court of six judges (all the foregoing are nominated by the Governor and appointed by the Assembly for eight years); courts of common pleas for Hartford, New Haven, New London, Fairfield, and Litchfield counties, each with one judge, except in New Haven County, where there are judges respectively for the civil and criminal sides; a district court in Waterbury; various city and borough courts, and justices of the peace.

Local Government.—The counties elect sheriffs who serve for a term of four years. The towns annually elect selectmen and other local officers.

State Laws.—Real estate acquired by a married woman's services, or conveyed to her for a consideration, may be held for her own use. The husband is trustee of a wife's personal estate, which upon his death falls to her or her devisees, legatees, or heirs, as though she had never been married; and married women may convey by devise the same as single persons, except that a husband (if he have not abandoned her) must unite in conveying by deed. Divorce may be had for fraudulent contract, adultery, desertion, and neglect of duty for three years, habitual intemperance, cruelty, for imprisonment for life, and for certain crimes; previous residence required, three years; either party may remarry. The sale of liquor is regulated by each town in accordance with local-option laws. The registration of voters is required in this State. Women may vote in an election for school officers. The legal rate of interest is 6 per cent. Judgments outlaw in seventeen years; notes and open accounts in six years.

Militia.—There is a total organized militia of 2774 men—infantry 2589, artillery 128—organized into one brigade and four regiments. There are 207,600 men of military age, of whom 106,500 are liable to military duty.

Finances.—The receipts for the civil-list funds during the fiscal year ending September 30, 1900, aggregated \$2,876,856 and expenditures, \$2,528,514. The largest items of expense were the common schools (\$454,652) and humane institutions (\$365,684). The largest sources of income were tax on railroads, \$975,143; tax on savings banks, \$418,780; tax on mutual life insurance companies, \$291,066; and inheritance tax, \$165,930. The total State debt, less the civil list funds, was \$2,108,873. The total indebtedness of all towns, cities, boroughs, and counties of the State was \$27,624,827, much of which was incurred in the

support of schools and in the construction of roads.

BANKS. On October 31, 1900, there were 103 national banks within the State, 84 of which were in active operation. The capital stock aggregated \$20,546,000; circulation outstanding, \$10,390,000. On September 5, 1900, the deposits amounted to \$44,304,000 and the reserve, \$12,933,000. On October 1, 1900, there were eight State banks, with resources amounting to \$10,279,000; capital, \$2,340,000; deposits, \$6,937,279; and 14 trust companies doing a banking business, whose total resources aggregated \$11,408,583; capital, \$1,775,000; and deposits, \$8,484,690. There were also 89 savings banks, with 410,342 depositors and \$183,781,000 deposited.

POPULATION. Population, in 1637, 800; in 1688, 17,000; in 1755, 133,000—3500 slaves; in 1787, 202,000; in 1800, 251,002; in 1840, 309,978; in 1860, 460,147; in 1890, 746,258; in 1900, 908,420. It will be seen that the absolute increase during the last decade exceeds that of any previous decade. Almost two-thirds of this increase was among native whites of foreign-born parents. This class, together with the foreign-born (238,210), constitutes almost three-fifths of the total population. Of the latter class, almost half came from Ireland, the next most important nationalities being Germans, English, and Canadians. For several decades the large emigration of the male population to the West resulted in an excess of females within the State; but the 1900 census shows that the sexes are almost equal in number.

Being of a manufacturing State, the population shows a strong tendency to congregate in the cities. In 1900, 53 per cent. of the population was in cities of over 8000 population. According to the census of 1900, New Haven had 108,027 inhabitants; Hartford, 79,850; Bridgeport, 70,996; Waterbury, 45,859; and New Britain, 25,998. Hartford is the capital. The State has five representatives in the Lower House of Congress.

EDUCATION. Connecticut has always been one of the leading States in educational matters. From the earliest colonial period primary education was provided for at the public expense, and the establishment of Yale University in 1701 afforded opportunities for higher instruction. For more than a decade before 1901 the school term exceeded 180 days, although the average for the whole country is only 134 days. Almost five-sixths of the school population attend the public schools, and in 1900, 94 per cent. of all children between the ages of four and sixteen were registered in some school. The expense of education per registered student was \$17.58. For the twenty-five-year period 1875-99 the school expenditure was drawn from the following sources: permanent funds, 7.8 per cent.; State taxation, 14 per cent.; local taxation, 67.7 per cent.; and other sources, 10.5 per cent. There were 4079 public-school teachers, of which but 9 per cent. were males. There are 77 public high schools and three normal schools. School districts not having high schools must pay the tuition for such students as may wish to attend the high school of some other school district. The administration is vested in a board of education, or town committee, or board of school visitors, while the general educational supervision of the State is in the hands of a State Board of Education.

There is no State university. The chief higher educational institutions are Yale University, non-sectarian, though historically affiliated with the Congregationalists; Wesleyan University (Methodist Episcopal), at Middletown, for both sexes; Trinity College (Protestant Episcopal), at Hartford. Schools of science, law, art, and medicine form departments of Yale University. The Congregationalists have divinity schools at New Haven and Hartford; the Protestant Episcopalians, one at Middletown; and the Baptists, a literary institute at Soufield. There are an agricultural college at Mansfield and training schools for nurses at Hartford and New Haven.

CHARITABLE AND PENAL INSTITUTIONS. The State has a large number of charitable and penal institutions. The humane institutions alone cost in 1900 \$365,000, and the correctional institutions and soldiers' homes, over \$300,000, the combined amounts being much greater than the amount which the State government annually expends upon the public schools. There are a State prison at Wethersfield; an industrial school for girls at Middletown; a school for boys at Meriden; a hospital for the insane at Middletown; a school for imbeciles at Lakeville; a retreat for the insane at Hartford; and Fitch's home for soldiers at Noroton. Besides these, there are 10 private sanatoriums for nervous and mental diseases; 2 institutions for the deaf; 1 institution for the blind; 21 hospitals, 8 county temporary homes, 16 homes for the aged, and 16 children's homes. In general, Connecticut has assumed an enlightened and progressive policy in the administration of her charitable and correctional affairs. There is a State Board of Charities, consisting of five members, appointed by the Governor for a term of four years. Its powers are largely advisory, being authorized to visit and inspect all institutions, public or private. It embodies some of the functions of a prison commission and of a lunacy commission, and may correct any abuses, providing that this is done in such a manner as not to conflict with any personal, corporate, or statutory rights. The members of the board receive no remuneration; their actual expenses are paid. The policy has been adopted of placing in private families children committed to the reformatory schools, as well as orphans. The State has no reformatory for cases of 'first offense' committed between the ages of sixteen and thirty.

RELIGION. Connecticut was in its early days a refuge for the English Nonconformists, and soon became a Puritanical stronghold. For a long time the Congregational Church had almost the entire field to itself. The Unitarian movement made less progress in Connecticut than in other New England States. With the emigration to Western States of large numbers of the descendants of the original Colonial stock and the incoming of large numbers of foreigners—especially Irish and French-Canadian—a still greater religious change has taken place, and the Catholic Church now numbers more than half of the church-membership of the State.

HISTORY. In 1614 Adrian Block, a native of Holland, discovered and explored the Connecticut River, but it was not till 1633 that the Dutch of New Amsterdam began a trading post at Suckiaug (Hartford). Two years earlier the soil from Narragansett Bay to the Pacific Ocean was granted by the Earl of Warwick to Lord Say and

Sele, and others, but the transfer apparently had no legal basis. In 1633 traders from Plymouth visited the site of Windsor, Wethersfield in 1634, and Windsor and Hartford in the following year, were settled by emigrants from Massachusetts Bay. In 1635 the Say and Sele patentees sent over John Winthrop, Jr., to act as Governor. He built a fort at Saybrook, preventing the Dutch from getting control of the Connecticut, and gave the settlers in the upper valley a conditional permission to remain. Desire for a more democratic government caused a new exodus from Massachusetts, and in 1636 Hartford, Windsor, and Wethersfield received their chief bodies of immigrants. In 1638-39 the three towns united in an independent commonwealth and adopted a thoroughly democratic constitution. The Massachusetts system of town government, transplanted to Connecticut, attained its fullest development in the three upper settlements, with which Springfield (Agawam) remained nominally associated till 1641. War with the Pequots, the most powerful of the Indian tribes, in 1637, led to their extermination, and the progress of colonization was never again hindered by the enmity of the natives. In 1638 New Haven was founded by a Puritan colony under the Rev. John Davenport, and from 1638 to 1640 Milford, Guilford, and Stamford on the mainland and Southold on Long Island were settled. Together with Branford these towns were united, between 1643 and 1651, into one 'jurisdiction,' known subsequently as the New Haven Colony, as opposed to the upper settlements, which constituted the Connecticut Colony. The laws of the Old Testament were made the rule for all courts. A somewhat similar code of laws in Connecticut gave rise in after years to the nickname 'blue laws' (q.v.), although Connecticut, unlike New Haven, did not restrict the franchise and the holding of office to church members. In 1644 Connecticut bought the colony of Saybrook from Say and Sele, and gradually (1644-62), by purchase and colonization, acquired the greater part of the present State and a considerable portion of Long Island. In 1657 John Winthrop, Jr., was chosen Governor of Connecticut, and by his skill in diplomacy procured, in 1662, a charter from Charles II. granting absolute autonomy to that Colony. By this charter New Haven was incorporated with Connecticut, in spite of the most vehement opposition on the part of the former. New Haven, nevertheless, was forced to submit (1664). In October, 1687, Sir Edmund Andros came to Hartford and demanded the charter from the General Assembly, but it was carried away and secreted till 1689. (See CHARTER OAK.) From 1687 to 1689, however, the Colony was subject to the despotic rule of Andros. In 1708 the Congregational Church system was established by the adoption of the Saybrook platform, and this was supplemented by the Act of 1742. Though other denominations were tolerated, Church and State for a long time remained closely connected, and secular and religious affairs were under the control of the same authorities. In 1754 Connecticut bought from the Indians a large tract of land in the Wyoming Valley in Pennsylvania and proceeded to settle it, but was compelled in 1782 to surrender it to Pennsylvania. In 1786 the Colony relinquished its charter rights to the territory west of its present

limits and received in return the Western Reserve (q.v.). Emigration to the western lands, as well as to Vermont and New York, was active.

The passage of the Stamp Act was vigorously denounced by the General Assembly; in May, 1776 the Colony was declared released from its allegiance to England, and in October Connecticut was constituted an independent State. It contributed more than 30,000 men to the Revolutionary Army, and its Governor, Jonathan Trumbull, was one of Washington's most trusted advisers. In 1777 the British burned Danbury, and in 1779 pillaged New Haven. Forts Griswold and Trumbull, at New London, were taken on September 6, 1781, by Benedict Arnold, and the town was destroyed. In the framing of the Federal Constitution Connecticut took a prominent part, and to its delegates was due the adoption of that feature of the Constitution which provides for State representation in the Upper House of Congress and proportionate representation in the Lower. Connecticut was always a stronghold of federalism; it strongly opposed the War of 1812, and its Capitol was the meeting-place of the celebrated Hartford Convention (q.v.). In 1818 a new constitution was framed, Church and State were separated, and the franchise was widely extended. The General Assembly was divided into a Senate and a House of Representatives. The conservative and theoretic character of the government became greatly modified as the State developed from an agricultural region into a commercial and industrial centre. The shrewdness of the Connecticut trader and the preëminent ingenuity of the Connecticut mechanic raised the State to a high degree of prosperity. During the Civil War Connecticut gave to the Union cause nearly 60,000 troops and the services of her great War Governor, Buckingham. Progress was rapid after the war. In the matter of public instruction the State took one of the foremost places in the Union, if not the foremost, devoting the entire proceeds from the sale of its public lands to the support of the free schools. In the readjustment, however, of the balance of political power in conformity with changed political conditions, no like spirit of progress was shown, and in 1901 the necessity of electoral reform was discussed at length in the press of the State. Representation in the Lower House being based on the old township divisions and not on population, it happened that great cities like New Haven and Bridgeport were dominated by rural communities with one-tenth their population. In many cases, a state of things prevailed not far removed from conditions in England before the Reform Bill of 1832. The agitation resulted in the calling of a constitutional convention, which met in January, 1902, and drew up a scheme of redistribution which was submitted to the people on June 16. The measure provided for one representative from every town with a population of less than 2000, two representatives for towns between 20,000 and 50,000, three for towns between 50,000 and 100,000, and four for all cities over 100,000, with one additional for every 50,000 inhabitants above that number. The effect of the measure would have been to deprive some towns of one representative each and to assign these to the large towns. The plan, however, satisfied neither the conservatives nor the advocates of reform, and was voted down. In national elections, Con-

necticut has been in general Federalist, Whig, and Republican; but it cast its vote for Monroe in 1820, for Van Buren in 1836, for Pierce in 1852, for Tilden in 1876, and for Cleveland in 1884, 1888, and 1892. In State elections it is doubtful.

Consult: Dwight, *History of Connecticut* (New York, 1841); Holister, *The History of Connecticut* (New Haven, 1855); Trumbull, *The Colonial Records of Connecticut* (Hartford, 1850-59); Levermore, *The Republic of New Haven* (Baltimore, 1886); Johnston, *Connecticut* (Boston, 1887), which contains a bibliography.

CONNECTICUT LAKES. A chain of four lakes in Coos County, N. H. (Map: New Hampshire, J 1). The 'First' or Connecticut Lake is five miles long, four miles wide, and 1619 feet above the sea. Four miles northeast is the 'Second' Lake, two and three-quarter miles long,

one mile wide, and 1882 feet above the sea. The 'Third' Lake, about seven miles farther north and one-half mile from the Canadian boundary, is 2038 feet above the sea. 'Fourth' Lake, a mere pond, the last of the chain and the source of the Connecticut River (q.v.), is northwest of the 'Third' Lake, near the Canadian boundary line, and about 2550 feet above the sea.

CONNECTICUT RIVER. A river of the United States, rising in the beautiful Connecticut Lakes (q.v.), in northern New Hampshire, 2551 feet above the sea (Map: Connecticut, F 4). It flows southwest and south, forming the boundary between New Hampshire and Vermont, and enters Massachusetts near South Vernon, Vt. From this point it continues nearly due south across the State and enters Connecticut, where at Middletown it turns toward the southeast, and, completing its course across the State, empties into Long Island Sound. The Connecticut River, the longest in New England, is 375 miles long and drains an area estimated at 11,269 square miles; in the lower part of its course it is over 1000 feet wide. Its mean discharge at Hartford is about 19,000 cubic feet per second. It is navigable to Hartford, 49.5 miles, for large steamers, and by means of the Windsor locks small boats may ascend to Holyoke; the tide ascends to a point a few miles above Hartford. The river falls rapidly at places and furnishes extensive water-power. The principal falls and their heights are: Holyoke, 59 feet; Turner's 41 feet; Bellows Falls, 54.5 feet; Olcott, 36 feet; and the Fifteen-Mile Falls. The principal tributaries from the west are the Nulhegan, Passumpsic, Wells, White, Black, West, Deerfield, Westfield, Farmington, and Little River, and those from the east are the Upper Ammonoosac, Lower Ammonoosac, Ashuelot, Millers, Chicopee, Scantic, and Salmon rivers. The chief towns on its course are Wells River, Bellows Falls, Walpole, Brattleboro, Greenfield, Northampton, Holyoke, Chicopee, Springfield, Hartford, and Middletown.

CONNECTIVE TISSUE. The most widely distributed tissue of the body. It originates in the middle or mesoblastic layer of the embryo, and the differentiation which occurs and which distinguishes the different forms of connective tissue takes place mainly in the intercellular substance. Thus the intercellular substance may be soft and gelatinous, as in mucous connective tissue, or dense and firm, as in fascia and tendon, or hard, as in bone. The cells of connective tissue begin as small round mesoblastic cells. Either directly from these cells or under their influence, there is formed between the cells an intercellular substance, which, as stated, varies in character, and during the formation of which various changes take place in the cells themselves.

The principal types of connective tissue are as follows: (1) White fibrous connective tissue. (2) Yellow elastic connective tissue. (3) Developmental forms of connective tissue, (a) mucous and (b) embryonal. (4) Cartilage. (5) Bone and dentine. (6) Adipose tissue or fat. (7) Neuroglia, the connective tissue of the nervous system. Of these forms of connective tissue, fat, cartilage, bone, and neuroglia (see NERVOUS SYSTEM) represent the more highly specialized types and will be found described in articles under

their respective names. The remaining represent those forms of connective tissue to which the term usually refers. *White Fibrous Connective Tissue.*—This constitutes the subcutaneous connective tissue and intermuscular septa, where it is known as areolar tissue; it also forms the ligaments, tendons, and the framework of all the organs. Its cellular elements consist of fixed connective-tissue cells and the so-called wandering cells. The fixed cells are mainly irregular or fusiform in shape, with very little cell-body. Much less numerous are the so-called plasma cells of Waldeyer and the granule cells. Some connective-tissue cells, such as many of those found in the choroid coat of the eye, are densely pigmented. The wandering connective-tissue cells are probably identical with the white blood-corpuscles. (See BLOOD.) In the intercellular substance two kinds of fibres are found, white fibres and yellow elastic fibres. The former occur in broad wavy bundles composed of minute fibrils; the elastic fibres are narrow, glistening, apparently homogeneous bands which branch and anastomose. There is much variation in the relative number of cells and fibres, the softer tissues being more cellular, the more dense tissues, such as tendon, being almost entirely composed of fibres. *Yellow Elastic Tissue.*—This may occur almost pure in some parts of the body, as in the *ligamentum nuchæ*. (See NECK.) In such tissue, instead of the fine delicate fibres described above, the fibres are large and coarse. *The Developmental Forms of Connective Tissue.*—The mucous tissue constitutes the Wharton's jelly of the umbilical cord, the embryonal connective tissue found in fetal life. In mucous tissue the cells are stellate, with long branching processes which anastomose with those of other cells. The intercellular substance is gelatinous, with only a few fibres.

CONNELLY, WILLIAM ELSEY (1855—). An American author, born in Johnson County, Ky. He became the director of the Kansas State Historical Society and is the author of numerous publications on the early history of Kansas, Indian traditions and folk-lore, and kindred topics. Among these are: *Wyandot Folk-Lore* (1899); *Kansas Territorial Governors* (1900); *John Brown, the Story of the Last of the Puritans* (1900). He was greatly assisted in his researches by his knowledge of the Indian languages, as exemplified in his publication of a vocabulary of the Wyandot tongue.

CONNELLSVILLE. A borough in Fayette County, Pa., 60 miles southeast of Pittsburg; on the Youghiogheny River and on the Baltimore and Ohio and the Pennsylvania railroads (Map: Pennsylvania, B 3). It is the centre of the Connelville coke region, the most important seat of coke production in the United States. According to the census of 1900, the Connelville coke industry represented a capital investment of nearly \$15,000,000, giving employment to over 7000 persons, and produced more than one-half of the total coke output of the United States, and over three-fourths of that of Pennsylvania. The borough contains also machine-shops, tin-plate and automobile works, steam-pump factory, etc. It has a park, fine municipal and public library buildings, and is the seat of a State hospital. Settled in 1770, Connelville was erected into a township and named (in honor of Zachariah Connell, the founder) in 1793, and was incorpo-

rated as a borough in 1806. It is governed by a mayor, who holds office for three years, and a common council. Population, in 1890, 5629; in 1900, 7160.

CONNEMARA, kōn'nē-mā'rā (Ir. *Connac-ne-mara*, sea-side of the descendants of Connae, the second of the three sons of Maeve, the English Mab, reputed Queen of Connaught in the first century A.D.). A district, 30 miles long by 15 to 20 broad, in the west of Galway, Ireland, between the bays of Kilkieran and Ballinakill. The name is often applied to the whole western part of County Galway (Map: Ireland, B 3). It affords good angling and cycling, and is an interesting field for geologists and botanists. Building-stone and a green variety of marble, well adapted for decorative work, are extensively quarried.

CON'NER, DAVID (1792-1856). A United States naval officer, born in Pennsylvania. He entered the United States Navy as a midshipman in 1809, and during the war of 1812 served as lieutenant on the *Hornet* in her engagements with the *Peacock* and the *Penguin*. He became commodore of the West India and home squadron in 1843, and, at the outbreak of the Mexican War blockaded the Gulf ports. In his flagship, the *Raritan*, he led the attack on Vera Cruz in 1847 (see *VERA CRUZ, CAPTURE OF*) and landed General Scott's army of invasion. Commodore Conner was the first United States naval officer to use steamships in warfare. He was commandant of the Philadelphia Navy-yard at the time of his death.

CON'NERSVILLE. A city and county-seat of Fayette County, Ind., 60 miles east by south of Indianapolis; on the White Water River and on the Cincinnati, Hamilton and Indianapolis, and other railroads (Map: Indiana, D 3). It manufactures blowers, carriages, buggy springs and bodies, axles, wheels, mirrors, furniture, triple signs, overalls, flour, etc. The city has a public library and owns and operates its water-works. Connersville was incorporated in 1813, and is now governed under a charter of 1869, as revised, which provides for a mayor elected every two years, and a city council. Population, in 1890, 4548; in 1900, 6836.

CONNOISSEUR, kōn'nīs-sēr' or -sōōr' (Fr., one who knows). A person who, without being an artist, is supposed to possess a discriminating knowledge of the merits of works of art. Such persons are called by the Italians *cognoscenti*. See *DILETTANTE*.

CONNOISSEUR, THE. A weekly publication conducted by George Colman the Elder and Bonnel Thornton, from the early part of 1754 to 1756. In it the first published work of William Cowper appeared, entitled *Keeping a Secret*.

CON'NOR, SELDEN (1839—). An American soldier. He was born in Fairfield, Maine, and in 1859 graduated at Tufts College. At the beginning of the Civil War, he enlisted in the First Vermont Volunteers, but later joined the Nineteenth Maine Volunteers, of which he became colonel, and was severely wounded in the battle of the Wilderness. In 1864 he was commissioned brigadier-general of volunteers, but in 1866 was mustered out of service. He was Governor of Maine in 1876-78. Subsequently he was United States pension agent (1882-86), in 1890 became president of the Society of the Army of the Po-

tomac, in 1896-99 was senior vice-commander-in-chief of the Order of the Loyal Legion, and in 1897 was again appointed pension agent.

CONNOTATION (from Lat. *connotare*, to connote, from *com-*, together + *notare*, to note, from *nota*, mark, from *noscere*, to know; connected with Gk. *γινώσκειν*, *gignōskein*, Skt. *jñā*, Engl. *know*) OF A TERM. In logic, the quality or totality of qualities an object must possess in order to be appropriately designated by a given term. Thus, the connotation of the term 'animal' consists of all those qualities (organized physical constitution, sensitiveness, etc.) which any object must possess if it is properly to be called an animal. Synonyms of connotation are intension, comprehension, depth. (See *DENOTATION*.) A *connotative term* is one which has a connotation, and is said to *connote* the qualities by virtue of which objects have a right to be designated by the term, and to *denote* the objects possessing these qualities.
