CROTCH, WILLIAM (1775-1847). A distinguished English composer, born at Norwich. He was quite as precocious as Mozart. When little more than three years old he could play "God Save the King" almost throughout with chords, and could detect in a moment what note was struck and in what key music was composed. When only twenty-two Crotch was appointed professor of music in Oxford University, and the degree of doctor of music was conferred upon him. In 1822 he obtained the principalship of the Royal Academy of Music. He composed much for the organ and piano, as well as many vocal pieces. Among the last, the oratorio *Palestine*; an ode, "Mona on Snowdon Calls;" a glee, "Nymph, with thee;" and a motet, "Methinks I hear the full celestial choir," are still popular. His most important book was *Elements of Musical Composition and Thorough-Bass* (1812). He died at Taunton, England.

CROTCHET CASTLE. A novel by Thomas Love Peacock (1831). The story is only a thread serving to connect a series of amusing satires on the learned foibles of the day. The scene is laid at Crotchet Castle, the country home of Ebenezer MacCrotchet, where a company of oddities are gathered. The strongest character is Doctor Folliot, a combative clergyman, full of antipathies and classical quotations.

CROTON (Neo-Lat., from Gk. κροτών, κρότων, *krotōn*, tick, shrub bearing the castor-berry, which was thought to resemble a tick). A genus of plants of the natural order Euphorbiaceæ. The species are numerous, mostly tropical or sub-tropical trees or shrubs, a few herbaceous. Some of them possess in a very high degree the acrid properties so characteristic of the order to which they belong. Among these, the most important is the purging croton (*Croton tiglium*), a small tree, a native of India and the more easterly tropical parts of Asia. The leaves are extremely acrid; the wood in a fresh state is a drastic, and in a dried state, a more mild purgative; and the seeds (*croton seeds* or *tilly seeds*) are an extremely powerful drastic purgative, formerly much employed in Europe, but latterly dis-used on account of violence and uncertainty of action, although still valuable as yielding croton oil (q.v.). They are oval, or oval-oblong, about the size of field-beans. The oil is obtained mostly by expression, and partly by treating the cake with alcohol. Other species possess similar properties. Very different properties are found in the species which yield cascarrilla (q.v.) and eopalehe (q.v.) barks, to which a great resemblance exists in the barks of a number of species, natives chiefly of South America. Other species are still more aromatic, and some delightfully fragrant, containing in great abundance a thickish, balsamic sap. The sap of *Croton gratissimus* is much employed as a perfume and cosmetic at the Cape of Good Hope; that of *Croton originifolius* is used in the West Indies as a substitute for balsam of copaiva; that of *Croton flavens*, also West Indian, furnishes *cau de Mantes* by distillation; and the balsamic sap of some South American species is dried and used as incense. *Croton lacciferus*, which grows abundantly in Ceylon, is an important lac-tree. There are quite a number of species in the United States, chiefly in the Southwest, but they have little economic value. The plants extensively cultivated by florists in hot-houses as crotons belong to the genus *Codiaeum*. They have very curious and often highly colored leaves.

CROTONA, or **CROTON** (Lat., from Gk. Κρότων, *Krotōn*). A Greek colony in south Italy, on the east coast of Bruttium, founded probably about B.C., 700, by Achæans. Situated near a good harbor and in a fertile territory, Crotona rapidly became wealthy, and was famous for its Olympian victors, especially the great athlete Milo, who is said to have led the army in the war with Sybaris. About B.C. 530 the city became the home of Pythagoras (q.v.), and the Pythagorean brotherhood the rulers of the city. But soon after the destruction of Sybaris (B.C. 510) a reaction set in and the Pythagoreans were expelled. The power of Crotona sank rapidly during the fifth and fourth centuries B.C. It was captured by Dionysius the Elder of Syra-

cuse, and later by Agathocles, and in the war between Pyrrhus and the Romans was plundered and nearly destroyed. It recovered somewhat, but suffered severely in the Second Punic War, and, though made the seat of a Roman colony in B.C. 194, was never after a place of importance. The modern name is Cotrone.

CROTON AQUEDUCT. See **AQUEDUCT** for descriptions of both the old and the new Croton Aqueduct.

CROTON BUG. See **COCKROACH**.

CROTON EL'EUTE'RIA. See **CASCARILLA**.

CROTON OIL. The fixed oil obtained by expressing the seeds of the *Croton tiglium*, cultivated in India and the Philippine Islands. It is a viscid liquid varying in color from a pale yellow to a reddish brown or deep sherry. It is insoluble in water and but sparingly soluble in alcohol, ether, carbon disulphide, and many other organic solvents. It has an acrid taste and an unpleasant fatty odor. It contains *tiglinic acid*, $C_{11}H_{20}O_2$, *crotonol*, $C_{15}H_{24}O_4$, and the glycerides of several fatty acids. Croton oil is a powerful irritant. When rubbed upon the skin it produces rubefaction and pustular eruption. It is now rarely used in medicine, being prescribed for the purpose of stimulating the skin in alopecia, and internally to relieve very obstinate constipation.

CROTON RIVER. A river of New York, rising in Dutchess County. It flows southwest through Putnam and Westchester counties, and empties into the Hudson River (q.v.) just above Sing Sing, and 30 miles above New York City. The Croton River is about 60 miles in length, drains an area of 340 square miles, and in its basin are fifteen storage lakes and ponds which furnish the chief part of the water-supply of New York City.

CROTUS RU'BIA'NUS. The assumed name of JOHANNES JÄGER (c.1480-c.1540). A German humanist, born at Dornheim, Thuringia. Next to Ulrich von Hutten, he was the most important contributor to the famous *Epistolæ Obscurorum Virorum* (q.v.).

CROUCH, **FREDERICK NICHOLLS** (1808-96). An Anglo-American musician, born in London. He came of a musical family, and was himself remarkably precocious. He studied at the Royal Academy of Music and with Boehm, and when only nine years old was a cellist in the Royal Coburg theatre. Subsequently he was in the orchestras of Queen Adelaide and at Drury Lane theatre, after which he became a teacher and singer in Plymouth. In 1849 he came to the United States, acting in various capacities as musical director, teacher, and chorister. During the Civil War he served in the Confederate Army, and upon its close, having lost all his books and manuscripts, became a gardener at Buckingham Court-house. Through the kindness of his old army comrades he was enabled to re-establish himself as a teacher. He died in Portland, Maine. His compositions were almost exclusively songs, and comprise "Kathleen Mavourneen;" "The Soldier's Grave;" "The Emigrant's Lament;" "Twenty Years Ago;" and "Friendship," all of which became extremely popular.

CROUP (Scotch *croupe*, *crope*, to croak, make a harsh noise). Since the discovery of the

cause of diphtheria, it has been found that there are two forms of disease formerly known as croup: (1) false croup, and (2) membranous croup, which is diphtheria of the larynx. False croup is caused in feeble or ill-fed children, or in those who have a catarrhal tendency, by exposure to cold and wet, digestive disturbances, or, in some cases, the grippe (q.v.). The child has a running from the nose and a cough; he awakens coughing hoarsely, with noisy and labored breathing or gasping, with every appearance of suffocation, the face becoming red or purplish, and tears starting from the eyes. The attack lasts from a half hour to five or six hours, and then relief comes in a loose cough, abatement of the fever, and free perspiration. The attack may be repeated on succeeding nights. No membrane is coughed up. The treatment consists of inhalation of warm, moist air from a tea-kettle placed under a sheet thrown over the child's bed; frequent draughts of warm milk; and a dose of a half-teaspoonful of syrup of ipecac, repeated every fifteen minutes till vomiting occurs once. Other drugs should be prescribed by a physician.

Membranous croup is caused by the bacillus of diphtheria (q.v.), or by streptococcus, and is very dangerously contagious as well as largely fatal. The symptoms are much the same as in false croup, except that the child is generally drowsy for a few hours before the difficulty in breathing and the cough begin, and after a time becomes exceedingly restless, the lips and face become blue, pieces of membrane are coughed up, coma and possibly convulsions follow, and death occurs unless relief is obtained. Relief from suffocation may be obtained by the use of the tracheotomy tube. This is a metal or hard rubber tube inserted into the windpipe below the larynx by a surgeon, through an incision in the neck; or by the use of the intubation tube invented by Dr. Joseph O'Dwyer, of New York, which is passed down the throat and between the vocal cords, and fastened in place. These procedures do not, however, check the disease. See DIPHTHERIA.

CROW (AS. *crowe*, OHG. *chruwa*, *chruja*, Ger. *krähe*, crow, from AS. *cravan*, OHG. *chrujan*, Ger. *krähen*, to crow; probably onomatopoeic in origin). A bird of the genus *Corvus*, the type of the family Corvidæ. The crows are a widely distributed group of birds, found in nearly all parts of the world, but especially in the Northern Hemisphere. The largest species of the genus is the raven; the rook and the jackdaw of England also belong to it. Crows are always more or less black, frequently wholly so, but differ from each other not only in color, but especially in size and in the amount of space at the base of the bill, which is bare of feathers. All are smaller than the raven, but are mostly more than fifteen inches in length. They are omnivorous, eating almost anything edible, and some species live largely on fish. All are intelligent to a high degree, and many stories are current regarding their avoiding danger and communicating with each other. They are easily domesticated. Most of the species are more or less gregarious, at least at certain seasons of the year, and frequently resort in incredible numbers to certain favorite places of woodland to roost at night.

Three species of crow occur in the United States, besides the two ravens. The common crow (*Corvus Americanus*) is generally distributed over North America, but is most abundant in the East, and is apparently wanting from certain parts of the Rocky Mountain region, where ravens are common. Although it formerly had a bad reputation as a corn thief, and is known to be guilty not only of stealing corn, but even of stealing eggs and killing birds (including poultry), yet it is now recognized as a really beneficial bird and a true friend of the farmer, because of the vast number of injurious insects which it destroys. It was primitively confined mainly to the Eastern coast-belt, but has steadily progressed westward with the advance of civilization, as the raven has correspondingly disappeared.

The fish-crow (*Corvus ossifragus*) frequents the coast and the Southern rivers of the United States. (See FISH-CROW.) The 'jabbering' crow (*Corvus Jamaicensis*) of the Blue Mountains of Jamaica is remarkable for the resemblance of its voice to human speech, which some of the other species of this genus may be taught to imitate. The small, glossy crow of India and Ceylon (*Corvus splendens*) frequents the towns, feeding on offal, and boldly entering rooms through open windows to snatch some morsel from the dinner-table; these birds, called hooded crows in English India, are a nuisance by their boldness and thievish ways about camps and villages.

CROW (translation of the Hidatsa name of the tribe *absaroka*, hawk). A warlike and predatory tribe of Sioman stock, formerly roaming over the upper Yellowstone region of Wyoming and Montana and now gathered upon a reservation in the latter State to the number of about 1950. They were formerly almost constantly at war with all their neighbors, particularly the Sioux, but have uniformly remained at peace with the whites, frequently furnishing a contingent of scouts against the hostile tribes.

CROWBERRY, or **CRABERRY** (so called from its black color) (*Empetrum nigrum*). A small procumbent shrub, of the natural order Empetraceæ, a native of the northern parts of the world, abundant in the moors and highlands of all high latitudes. The order consists of a few heath-like shrubs. The berries of the crowberry are nearly black, surround the branches in crowded clusters, and each contains six to nine bony seeds and a watery, acidulous juice, which is sometimes thought to be refreshing; but they are generally little esteemed. A fermented or vinous liquor is prepared from them in some northern countries. They are a favorite food of game. A variety, *rubrum*, said to be a native of the vicinity of Cape Horn, differs little from the northern plant, except in having red berries.

CROW-BLACKBIRD. See GRACKLE.

CROWD (AS. *croda*, *geerod*, throng; of unknown origin), or **MOU**. In the popular sense, an aggregation of individuals, regardless of their character or the purposes which brought them together. The psychological signification of a crowd is different. The aggregation becomes a crowd only "when the sentiments and ideas of all the persons in the gathering take one and the same direction, and their conscious personality

vanishes." A half-dozen individuals gathered together may become a crowd more easily than hundreds assembled accidentally.

The most distinctive characteristic of a crowd is that the individuals composing it do not think and act as each one would think and act independently. Back of the avowed causes of our acts are unconscious motives or forces that defy investigation, and these are the mainsprings of crowd activity. They are the common characteristics of the race, and it is in these points that people are more alike than in the acquired characteristics which result from education. It is owing to the fact that these forces which are requisite for crowd or mob activity are the primitive ones, that crowds are incapable of rising above very mediocre intellectual attainments. This also explains why the crowd descends in the scale of civilization below the average individuals composing it. If this were not true, it would be impossible to explain the conduct of otherwise respectable people at lynchings and the degrading forms of torture imposed by them.

The causes which determine the appearance of the characteristics of the crowd are: (1) a sentiment of invincible power; (2) suggestion; and (3) contagion. Through the mere force of numbers, and also through the irresponsibility of the individual of the crowd, a feeling of invincible power takes possession of him. Nothing is permitted to stand between him and the realization of his aims. On this account the soldier in battle, acting under a common impulse, is braver and stronger than he would be otherwise. By means of suggestion, contagion in the crowd is produced; the individuals are more or less in a hypnotic state; and the individual will and personality disappear in a common purpose or aim.

Crowds are not premeditative; they are impulsive and mobile. Aroused one minute to acts of generosity and heroism, they may descend the next to acts of extreme violence and torture. They are credulous, believing things wholly incomprehensible to those outside of crowd influence.

Much difference of opinion prevails concerning the rôle which mob action is to play in the civilization of the future. Gustave Le Bon, *The Crowd* (Eng. trans. London, 1900), asserts that "while all our ancient beliefs are tottering and disappearing, while the old pillars of society are giving way one by one, the power of the crowd is the only thing that nothing menaces, and of which the prestige is on the increase. The age we are about to enter will in truth be the era of crowds." Professor Baldwin, *Social and Ethical Interpretations* (New York, 1897), differs widely from this point of view, claiming that "the attempt to build a fruitful conception of society upon the actions of the crowd under the influence of these imitative suggestions, seems to be crude and unphilosophical in the extreme." See SOCIOLOGY; SOCIAL PSYCHOLOGY.

CROWD, CROUTH, or CRWTH (from Welsh *crwth*, Gael. *cruit*, OFr. *crot*, violin; ultimately identical with Welsh *crwth*, bulge, on account of the rounded shape of the instrument). A musical bow instrument, of Welsh or Irish origin, and probably the oldest European instrument of that class. It is mentioned as a *chrotta* by Venantius Fortunatus in 609, and from then

till the beginning of the nineteenth century, when it was still in use, seems to have preserved its form. Originally its body was square and was prolonged by two parallel arms, connected at the end by a cross-bar. From this bar a narrow finger-board extended to the middle of the sound-box. The strings, originally three, later six in number, were stretched from the top of the parallel arms to the bottom of the sound-box and were supported by a bridge placed between two sound-holes. For illustration, see MUSICAL INSTRUMENTS.

CROWDE'RO. A fiddler and leader of a rabble met by Hudibras in Butler's *Hudibras*.

CROW-DUCK, or SEA-CROW. A eoot.

CROWE, krō, CAPTAIN. In Smollett's *Sir Launcelet Greaves*, the captain of a merchant vessel, who becomes Sir Launcelet's squire on his journeys as a knight errant.

CROWE, CATHERINE (c.1800-76). An English author. She was born at Borough Green, Kent, and lived chiefly in Edinburgh. Her principal work, entitled *The Night Side of Nature* (1848), has perhaps never been surpassed for weirdness of conception. In her novels, among which may be cited *Adventures of Susan Hopley* (1841) and *Lilly Dawson* (1847), she showed much skill and ingenuity in the development of the plot.

CROWE, EYRE (1824—). An English painter, born in London. He was a pupil of Paul Delaroché in Paris, traveled in the United States as amanuensis to Thackeray in 1852-53, and was elected an associate of the Royal Academy in 1876. He was also appointed an inspector of the science and art department of the South Kensington Museum. His pictures include "Goldsmith's Mourners" (1863), "Friends" (1871), "The Rehearsal" (1876), "Forfeits" (1880), "The Brigs of Ayr" (1894), "The Gipsy's Rest" (1897), and "James II. at the Battle of La Hogue" (1898). He published *With Thackeray in America* (1893).

CROWE, JOSEPH ARCHER (1825-96). An English journalist. He was born in London and began his journalistic career as foreign editor of the *Daily News*. During the Crimean War he was the correspondent of the *Illustrated London News*, and he acted in the same capacity for the *Times* during the Indian Mutiny. While in India he was also director of the Art School at Bombay from 1857 to 1859. In the following year he became Consul-General at Leipzig, and in 1870 he was again correspondent of the *Times* during the Franco-German War. He thereafter became Consul-General at Düsseldorf (1878); secretary and protocolist to the Danubian Conference, London (1883); and British Plenipotentiary to the Samoan Conference, Berlin (1889). He collaborated as co-editor with G. B. Cavalcaselle (q.v.).

CROWELL, krō'el, EDWARD PAYSON (1830—). An American scholar and educator, born at Essex, Mass. He graduated at Amherst College in 1853, at Andover Theological Seminary in 1858, and in 1859 was licensed to preach by the Congregational Church. From 1858 to 1864 he was instructor in German and professor of Latin at Amherst. In 1864 he was appointed to the chair of Latin languages and literature, and in 1880-94 was dean. He was also elected a Representative in the State Legislature of

Massachusetts in 1879. He was a charter member of the American Philological Association, and received the degree of D.D. from Williams College in 1882. His publications include, in addition to contributions to periodical literature, numerous scholarly editions of Latin classics, such as those of (1871) the *De Senectute* and *De Amicitia*; (1873) the *De Officiis*; (1874) the *Andria* and *Adelphæ*; and (1879) the *De Oratore*. He also translated and edited Bendor's *Grundriss der römischen Litteraturgeschichte* (1876) under the title, *a Brief History of Roman Literature* (1880); jointly with H. B. Richardson, prepared a useful volume of *Selections from Latin Poets*, with notes (1882); and wrote *A Clue to the Prose Writings of the Silver Age* (1897).

CROWFIELD, krō'fild, CHRISTOPHER. A name which Mrs. Harriet Beecher Stowe sometimes used as a pseudonym.

CROWFOOT. See RANUNCULUS.

CROWFOOT FAMILY. See RANUNCULACEÆ.

CROW-GARLIC. See ALLIUM.

CROWLEY, krō'li. A town and county-seat of Aeadia Parish, La., 166 miles west of New Orleans, on the Southern Pacific Railroad. Its principal industries are the cultivation of rice and rice-milling. Oil in paying quantities has been discovered in the vicinity. Settled about 1887, Crowley was incorporated two years later, and has enjoyed a rapid growth. The government is administered by a mayor, elected every two years, and a council chosen on a general ticket. The town owns and operates its water-works and electric-light plant. Population, in 1890, 420; in 1900, 4214.

CROW-PHEASANT, fēz'ant. See COUCAL.

CROWN (MDutch *krone*, *krone*, Jecl. *krūna*, Ger. *Krone*, OHG. *corōne*, *corōna*, OF. *corone*, Fr. *couronne*, from Lat. *corona*, crown, Gk. *κορώνη*, *korōnē*, curved end of a bow; connected with Gael. *crúinn*, Welsh *crwn*, round, Lat. *curvus*, curved). The crown, as we understand it to-day, resembles in some degree the fillets, wreaths, and garlands which were worn among the Greeks as an emblem of office (in the case of the archons), as a distinction for the victors in the public games, or for citizens who had rendered exceptional service to their country. The Romans used them chiefly as rewards for valor. The most highly prized was the *corona obsidionalis*, made of grass or wild flowers, bestowed by a beleaguered garrison on the general who rescued them. Next came the *corona civica*, of oak-leaves and acorns, as a reward to any soldier who had saved the life of a Roman citizen in battle; a place next to the senators was reserved for the wearer at public spectacles, and the whole assembly rose at his entrance. The *corona muralis*, a golden ring surmounted with turrets or battlements, was bestowed on the man who first scaled the wall of a besieged city; and the *corona triumphalis*, of three kinds, upon a general who obtained a triumph. There were other crowns not honorary, but emblematical, and regulated not by law as were the former ones, but by custom. Of these the most important were the *corona sacerdotalis*, worn by priests and others engaged in sacrifice; *corona funebri*, or *sepulchralis*, with which the dead were crowned;

corona convivalis, worn on festive occasions by banqueters; *corona nuptialis*, or bridal wreath; and *corona natalitia*, a chaplet suspended over the door of a house in which a child was born.

As the emblem of sovereignty in modern Europe the crown was borrowed rather from the diadem (q.v.) than from the above-mentioned crowns. The Roman emperors are represented as wearing either the diadem, the laurel crown (a simple emblem of glory), or the radiating crown, probably of Eastern origin, which symbolized among the Romans the deification of the emperors. From the time of Constantine the Great (306-337) the diadem was the established emblem of imperial power; but it was supplanted under Justinian (527-65) by the crown called *stemma*, a slight elaboration upon the golden fillet; and this in turn was replaced by still more elaborate crowns, until the crown with arches became the accepted form. The ordinary type of the imperial crown of the Middle Ages, as assumed in imitation of the Greek emperors by Charles the Bald (840-77), is found in an illuminated MS. at Munich representing the Emperor Henry II. (1002-24) crowned by Christ. The crown actually used at the coronation of many subsequent emperors, and now preserved in the imperial treasury in Vienna, is a round cap surrounded by eight small shields with semicircular tops alternately adorned with precious stones and with pictures. It is surmounted by a small cross resting on an arch inscribed "Chonradus Dei gratia Romanorum imperator augustus" (Conrad II., 1024-39). The present Austrian imperial crown is of the style adopted by the Emperor Maximilian II. in 1570; it is cleft in the centre so as partly to resemble a mitre; the golden circlet is jeweled and adorned with fleurs-de-lis and surmounted by a cap, above which rises a single arch surmounted by a cross. The new German imperial crown resembles the old crown of Charlemagne and consists of eight shields ornamented with precious stones; the larger shields show a cross made of precious stones, the smaller the imperial eagle set with diamonds; above it rise four arches surmounted by a cross. The royal crown of Great Britain is a circle of gold enriched with precious stones and pearls, and heightened by four crosses patée and four fleurs-de-lis alternately; from these rise four arches which close under a mound ensigned with a cross patée. See TIARA; CORONET.

So entirely was the crown regarded as the symbol of sovereignty that the word came to be used as synonymous with the monarchy, the State, and matters under the control of the executive authority; thus we speak of Crown lawyers, Crown lands, etc., the term having no connection with the sovereign personally.

CROWN, ORATION ON THE. See DE CORONA.

CROWN DEBTS. In English law, all debts due to the Crown, which are on record, or evidenced by a bond or other specialty, and also those due from accountants to the Crown on account of moneys received for the use and benefit of the Crown. Formerly the lands of the debtor were subject to a lien for the amount due, even in the hands of an innocent purchaser for value without notice of the lien, if they were conveyed after the debt became due. At present the lien is not binding on a *bona fide* purchaser

or mortgagee for value, unless a writ of execution has been issued and registered before the execution of the mortgage or conveyance.

Simple contract debts have no such lien; but the Crown has in all cases preference over private creditors in the distribution of the estates of bankrupts and deceased persons. See ADMINISTRATION: DEBT; PREROGATIVE; EXCHEQUER. Consult Prideaux, *Law of Judgments and Crown Debts, as They Affect Real Property* (4th ed., London, 1854).

CROWN DIAMONDS, THE. The English version of Auber's *Les diamants de la couronne* (1844).

CROWNE, JOHN (c.1640-c.1703). An English dramatist. He began his literary career with *Pandion and Amphigenia* (1665), interesting as one of the very few English heroic romances in imitation of Scudéry. His contemporary reputation as dramatist was gained by *The Destruction of Jerusalem*, in two parts (produced in 1677). His comedy *Sir Courtly Nice* (produced in 1685) held the stage through the eighteenth century. His numerous other plays have only slight interest. Consult *Dramatic Works* (4 vols., Edinburgh, 1873).

CROWN-GALL. A very destructive disease that attacks nearly all kinds of fruit-trees, grapes, almonds, walnuts, blackberries, raspberries, poplars, and chestnuts, frequently killing them. The point of attack is at the crown of the roots where the roots and stem join, the galls formed on young trees being half an inch or more in diameter. Usually occurring at the crown, the galls are sometimes found upon the slender roots of nursery trees. When young they have the color of the young roots, but later they are considerably darker. They increase with the age of the tree, becoming as large as a man's fist or even larger. When small they are soft masses of irregular fibres, and when older they exhibit concentric rings in cross-section. On account of the deep wounds made by the fungus and the attack made upon the vitality of its host the tree is frequently killed, and whole orchards are reported in which every tree has succumbed to this cause. The disease is widely distributed, being known in Europe, in many parts of the United States, and recently reported from New Zealand. The cause is a low fungus or myxomycete to which the name *Dendrophagus globosus* has been given. It is closely related to the cause of the club-root of cabbage and allied plants. Annual inspection of the trees, cutting off all galls and coating the cut surfaces with a paste made of copper sulphate and lime, is the most efficient protection known.

CROWN GLASS (so called because of its crown-like shape when being blown). A soda-lime glass chiefly used for the manufacture of window-panes. In England it is usually made from 12 parts silica, 13 parts soda, 13 parts lime, and 2 parts iron and alumina oxides, while elsewhere it frequently contains more silica and less soda. See GLASS.

CROWN and **HALF-CROWN** (so called from the crown which generally appears on the reverse). English silver coins since 1551. Before that date they were made of gold. The crown, which is the five-shilling piece, is worth approximately \$1.20 in United States currency.

CROWN IMPERIAL. See FRITILLARY.

CROWN INSHIELD, ARENT SCHUYLER (1843—). A United States naval officer, born in New York. He graduated at the United States Naval Academy in 1863, was a participant in both of the attacks on Fort Fisher (December, 1864, and January, 1865), and in 1868 attained the rank of lieutenant-commander. His further promotions were to be commander in 1880, captain in 1894, and rear-admiral in 1897. He became chief of the Bureau of Navigation of the Navy Department in 1897, and during the Spanish-American War was a member of the Board of Naval Strategy. He immediately preceded Capt. H. D. Sigsbee in the command of the battleship *Maine*.

CROWNINSHIELD, FREDERIC (1845—). An American painter and writer, born in Boston, November 27, 1845. He graduated at Harvard College (1866), after which he married and went abroad, where he remained eleven years. He studied under Rowbotham in London, Couture in Italy, and Cabanel in Paris. He returned to America, and from 1879 to 1885 was an instructor in the Museum of Fine Arts in Boston. He published a volume of verse entitled *Pictoris Carmina*, in 1900, and has written a handbook on the processes of mural painting.

CROWN LANDS. The English sovereign was at one time not only the nominal owner, as lord paramount, of all the lands in England, but was also in his royal capacity one of the greatest landowners in the kingdom. He was, by virtue of his office, the lord of many manors, and in him were vested the wastes, forests, and common lands throughout the realm. The ancient demesne lands of the Crown are now contracted within narrow limits, having been almost entirely granted away to subjects. King William III. so impoverished the Crown in this manner that an act was passed, 1 Anne, c. 7, § 5, the effect of which and of subsequent statutes is that all grants or leases from the Crown of royal manors, or other possessions connected with land, for a period exceeding thirty-one years, are void. At a much earlier period (1455, c. 41), a Scottish statute had rendered the consent of Parliament necessary to the alienation of the property of the Crown; but neither it nor the subsequent statutes which were passed with a similar object succeeded in checking the practice. Since the beginning of the reign of George III., the English sovereign surrenders during his life the hereditary revenues derived from the Crown lands in exchange for a fixed civil list granted by Parliament. The superintendence of such property as still belongs to the Crown is now vested in commissioners appointed for that purpose, called the commissioners of woods, forests, and land revenues. These restrictions do not apply to estates purchased by the sovereigns out of the privy purse, or coming to the sovereign, his heirs, or successors, by descent or otherwise, from persons not being kings or queens of the realm; for, although there is no marked line drawn between the proprietary rights which the King has as King and those which he has in his private capacity, and there are no lands which belong to the nation or State as a personified body, yet a distinction is made between the lands of ancient demesne and those coming by modern title, by which the alienation of the former is restricted and that of the latter left free. Consult: Cox, *Institu-*

tions of the English Government (London, 1863); Stephen, *New Commentaries on the Laws of England* (13th ed., London, 1899). See FEUDALISM.

CROWN POINT. A town and the county-seat of Lake County, Ind., 40 miles southeast of Chicago, Ill., on the Chicago and Erie, and the Pittsburg, Cincinnati, Chicago and Saint Louis railroads (Map: Indiana, B 1). It has grain-elevators, machine-shops, wagon-works, broom-factories, and a shirt-factory. Population, in 1890, 1907; in 1900, 2336.

CROWN POINT. A town in Essex County, N. Y., on the west shore of Lake Champlain, and on the Delaware and Hudson Railroad, 110 miles north by east of Albany (Map: New York, G 2). It contains the Hammond Library. The town has manufactures of building material, lumber, and staves; and in the vicinity are deposits of iron ore, which, however, are not worked at present. Population, in 1890, 3135; in 1900, 2112. Crown Point was originally an English trading-station. About 1731 the French built upon the site Fort Saint Frederick, which, in spite of hostile English expeditions directed against it in 1755 and 1756, they held until 1759, when the garrison joined that of Ticonderoga (q.v.) and retreated down the lake. General Amherst then took possession, and, during the winter of 1759-60, began work on fortifications, the ruins of which still remain, and which, though never completed, ultimately cost fully \$10,000,000. On May 11, 1775, Seth Warner, at the head of a company of 'Green Mountain Boys,' captured the fort, then garrisoned by only twelve men. In 1777, on the approach of General Burgoyne, it was temporarily abandoned by the Americans.

CROWN SOLICITOR. The solicitor to the treasury, who, in State prosecutions in England, acts as solicitor for the Crown in preparing the prosecution. In Ireland there are Crown solicitors attached to each circuit, whose duties correspond in some degree to those of the procurator-fiscal and Crown agent in Scotland. In England, there are no analogous officers, and prosecutions are conducted by solicitors appointed by the parish, or by private parties.

CROW'QUILL, ALFRED. See FORRESTER, ALFRED HENRY.

CROW'S-NEST. A perch for the lookout man of a vessel. It is placed on the foremast at as great a height above the deck as is found desirable; protection from the weather is afforded by a platform surrounded by canvas.

CROWTHER, SAMUEL ADJAI (1810-91). The first native bishop of Africa, born in the Yoruba country. He was captured in a slave raid when but a lad, and was several times sold. He was finally shipped on a Portuguese slaver, from which he was rescued by a British man-of-war, and was placed in the mission school at Bathurst. He was the first student enrolled in the Fourah Bay College, where he subsequently served as an assistant instructor. Ordained in 1843, he became a missionary at Akessa. In 1864 he was consecrated bishop of the Niger country. Crowther accompanied both of the British Niger expeditions, a journal of which he published. His other works include a dictionary of the Yoruba language and a translation of the Bible into the Yoruba.

CROY'DON (OEEngl. *Croidenc*, from Fr. *creta*, lt. *creta*, OHG. *krīda*, Ger. *Kreide*, chalk, from

Lat. *creta*, chalk, AS. OHG. *dān*, hill, Engl. *dunc*, from Ir. *dun*, Gael. *dānon*, Welsh *din*, hill, fort; connected with AS. *tūn*, Engl. *town*, OHG. *zūn*, Ger. *Zaun*, hedge). A Parliamentary and municipal borough and market-town of Surrey, England, on the London and Brighton Railway, 10½ miles south of London Bridge (Map: England, F 5). It lies on the edge of the chalk and plastic clay, near the Banstead Downs, at the source of the Wandle. It is an important railway centre. Among its public buildings are the former palace of the archbishops of Canterbury, now used as a girls' school, the restored parish church of Saint John, Whitgift's Hospital, a handsome Elizabethan structure with which is connected a grammar school, and the municipal buildings containing the law courts and central public library.

Owing to its proximity to London, a healthful climate, and the absence of factories, Croydon is a favorite residence place of London business men. This accounts for its great progress in municipal improvements and ownership of public utilities, libraries, water-supply, artisans' dwellings and lodging-houses, parks and recreation grounds, hospitals, baths, electric lighting, and street railways. Its death-rate is a little over 14 per 1000, the smallest in England for a city of its size. It sends one member to Parliament. Population, in 1851, 10,000; in 1871, 55,000; in 1891, 102,000; in 1901, 133,900. Consult Steinman, *History of Croydon* (London, 1836).

CROZAT, KRŌ'zā', JOSEPH ANTOINE, Marquis de Tugny (1696-1740). A French collector of books and objects of art. His various acquisitions included 19,000 original drawings, 2000 engravings, 400 paintings, 1382 intaglios and cameos, and a library of 20,000 volumes. He published two series of engravings of the drawings and paintings in his own collection and in those of the King, the Duke of Orleans, and other collectors. The greater part of these ultimately came into the possession of the Russian Crown. Mariette published a *Description sommaire des dessins des grands maîtres du cabinet de feu Monsieur Crozat* (Paris, 1741).

CROZET (KRŌ'zā') ISLANDS (in honor of a member of the French expedition which discovered the islands). A volcanic group in the Indian Ocean, between Kerguelen and Prince Edward islands (Map: World, O 26). The larger islands are Possession, East, Apostle, and Hog. The total area, including islets and reefs, is about 200 square miles. They have no permanent population, but are occasionally visited by whalers and war-vessels. They were discovered in 1772, and are claimed by Great Britain. Consult Roth, *Crozet's Voyage to Tasmania* (London, 1891).

CROZIER, KRŌ'zhēr, JOHN BEATTIE (1849—). An English writer on philosophy and history. He was born of Scotch parents, at Galt, Ontario, and was educated at the Galt Grammar School and at the University of Toronto. Graduating M.D. in 1872, he at once settled as physician in London. His *Religion of the Future* (1880) was followed by *Civilization and Progress* (1885). To aid him in carrying out his studies, he received in 1894 a civil-list pension of £50, which was doubled four years later. In 1897 appeared the first volume of *The History of Intellectual Development on the Lines of Modern Evolution*. Dr. Crozier has also published *My Inner Life, Being a Chapter in Per-*

sonal Evolution and Autobiography (1898); and *Lord Randolph Churchill: A Study of English Democracy* (1887). In 1899 he received from the University of Toronto the degree of LL.D.

CROZIER, WILLIAM (1855—). A United States artillery officer and inventor of ordnance. He was born in Carrollton, Ohio, and on his graduation from West Point in 1876 was assigned to the Fourth Artillery, in which he served three years, taking part in campaigns against the Sioux and Bannock Indians while at Western posts. From 1879 to 1884 he was instructor of mathematics at West Point, and in 1881 won by competitive examination an assignment to the ordnance department. In 1898 he was major and inspector-general of volunteers. With General Bullington he invented the Bullington-Crozier disappearing gun-carriage (see illustration and description under *ORDNANCE*), which ranks high among modern military inventions, and which has been installed in all the important coast-defense works of the United States. He is also the inventor of a wire-wrapped rifle and a ten-inch gun. In 1899 he was appointed by President McKinley one of the American delegates to The Hague Peace Conference. In the Peking relief expedition in 1900 he served under General Chaffee as chief ordnance officer, and in June, 1902, was appointed chief of ordnance, with rank of brigadier-general. Many of the notes and pamphlets on the construction of ordnance published by the War Department are from his pen. He is of international reputation regarding all matters connected with his department of military science.

CRUCIAN, *krōō'shan* (Dutch *karuts*, Ger. *Karusche*, older *Karas*, *Karutze*, *Karutsch*, from Fr. *carassin*, It. *coracino*, crucian, from Lat. *coracinus*, Gk. *κορακίνος*, *Korakinos*, fish like a perch, from *κόραξ*, *Korax*, raven; so called on account of its color). A species of carp (*Carassius vulgaris*) differing from the common German carp (*Cyprinus*) in the larger scales, in the absence of barbules at the mouth, and in the pharyngeal teeth. It may attain a large size, and inhabits lakes, ponds, and slowly flowing rivers in northern Europe and Asia.

CRUCIBLE (ML. *crucibulum*, *crusibulum*, melting-pot, from OF. *cruche*, Port. *crugo*, crock, from OHG. *chruug*, Ger. *Krug*, AS. *crōg*, jar, or Ir. *crogan*, Gael. *crog*, Welsh *crochan*, pitcher; confused by popular etymology with Lat. *crux*, cross). A vessel for heating and fusing metals, glass, and other materials requiring a great degree of heat for their melting. Crucibles are made in all sizes, from that of a lady's thimble to one which will hold 400 pounds of molten zinc. The essentials in their construction are that they be made to endure extreme heat without fusing, and sudden changes of temperature without breaking. A great variety of materials are used for making crucibles, as clay, plumbago, graphite, lime, aluminum, and platinum. Most crucibles are more or less acted on by litharge, but a chalk lining makes them less so. The most common form is the *Hessian crucible*, made of equal parts of fire-clay and coarse sand. It will stand extreme heat, but not very sudden changes in temperature. This is the cheapest variety, and is adequate for all ordinary processes of experimenting and refining. They come in nests, in sizes varying from two to eight inches in di-

ameter. *Cornish crucibles* are clay crucibles of a coarse grain and mottled grayish-white color. They endure sudden changes of temperature, but cannot be heated to whiteness. They are much used for copper-assaying. *Plumbago* or *coke crucibles* are of great value in the fusion of certain metals. *Graphite crucibles* meet all temperature conditions, but are slowly acted on by metallic oxides or gases. *Lime crucibles* are absolutely infusible. *Aluminum crucibles* possess the advantage of not being readily acted on by the materials fused, even sodium having no effect on them. They are also little affected by changes of temperature. The celebrated *Berlin crucibles* are made of a composition of several non-fusing materials, which contains 8 parts of fire-clay, 4 parts of black lead, 5 parts of powdered coke, and 3 parts of old crucibles.

CRUCIFERÆ (Neo-Lat. nom. pl., from Lat. *cruc*, cross + *ferre*, to carry, bear). An important order of dicotyledonous plants, the mustard family, including about 200 genera and 1600 known species. The flowers have a calyx of four sepals, which fall off after flowering; and a corolla of four petals, which are placed in the form of a cross—whence the name *Crucifera*—and alternate with the sepals. There are six stamens—four long ones in opposite pairs, and two short ones between the pairs of long ones. The ovary is superior, and there are two stigmas. The fruit is either long and podlike, 'siliqua,' or a short and roundish pouch, 'silicle,' one-celled, or usually spuriously two-celled, by the parietal placentæ (see *PLACENTA*) meeting in the middle, and forming a kind of dissepiment (q.v.); and contains either one seed or many in a single row. The grouping of the divisions and genera is extremely difficult, and many systems of classification have been proposed. One classification is founded on the character of the cotyledons and the manner in which the radicle is folded upon them (cotyledons accumbent, incumbent, or conduplicate). A still more recent classification is that of Prantl, whose main divisions are based upon the character of the hairs commonly borne upon the leaves, whether simple, branched, or glandular. The division into tribes is based upon the character of the stigmas. The general character of the order is antiscorbutic and stimulant, with more or less acidity. It contains many plants extensively cultivated for the food of man and of domestic animals, or valuable in medicine, as kale, cabbage, cauliflower, broccoli, colewort, turnip, rape, radish, cress, horseradish, scurvy-grass, mustard, sea-kale, gold-of-pleasure, etc. The dyestuff called woad is produced by a plant of this order. The order includes also a number of garden flowers highly esteemed for their beauty and fragrance, as wallflower, stock, rocket, etc. Sulphur compounds are common in many, as may be recognized from the odor given off when cooking. The pungence and acidity of the *Crucifera* seem to depend on a volatile oil, or on different volatile oils of a very similar character, present in various degrees in different species, or in the same species under different circumstances, and in different parts of the same plant. This diversity is very well illustrated in the common turnip, in the different qualities of the root as to sweetness and acidity in different soils or seasons, and in the difference between the flesh and the rind. The seeds of the

Cruciferae contain a fixed oil, which is extracted from some (rape, colza, in Europe; *Camelina sativa* and *Erysimum perfoliatum* in Japan), to be used as a lamp-oil and in the arts, and the oil cake of which is valuable for feeding cattle. The plants of this order belong mostly to the temperate parts of the Northern Hemisphere, and particularly abound in Europe. Comparatively few are found within the tropics. As now understood, the principal divisions and genera of the Cruciferae are: Thelypodieae, represented by *Thelypodium*; Sinapeae, with *Lepidium*, *Iberis*, *Cochlearia*, *Alliaria*, *Sisymbrium*, *Sinapis*, *Brassica*, *Nasturtium*, and *Cardamine* as the chief genera; Schizopetaleae, represented by *Schizopetalon*; and Hesperideae, which embraces *Capsella*, *Draba*, *Arabis*, *Erysimum*, *Alyssum*, *Hesperis*, *Matthiola*, and *Conringia*.

CRUCIFIX (Lat. *cruci fixus*, fastened to the cross, from *crux*, cross + *figere*, to fasten). A cross with the effigy of Christ affixed to it. It must be distinguished, as an instrument of devotion and liturgical use, from the pictorial or other representations of the scene of the Crucifixion (q.v.). The cross (q.v.), at first used for devotional and symbolic purposes in its simplest form, came first to be decorated with the symbolic sacrificial lamb (see CHRIST IN ART), with the addition sometimes of the medallion bust of Christ, as in the Vatican cross. Perhaps the earliest crucifixes were small devotional objects which contained portions of the supposed true cross, such as that of Mount Athos, or were pictorial crosses, like that of Queen Theodolinda at Monza (sixth century). During the Carolingian Age the crucifix came into somewhat more general use in the West, but, having been opposed in the East shortly after its introduction by the image-hating Iconoclasts (eighth century), it obtained a foothold there not as a plastic image, but in the form of a pictured Crucifixion. The manner in which the figure of Christ was represented on the crucifix is the same as that in pictures of the Crucifixion. During the Romanesque and Gothic periods there was an increasing number of large crucifixes, in some of which the figure was almost or wholly life-size. These were mainly of four classes—the stationary *altar crucifix*, that stood in the centre of the altar or at the entrance to the choir, sometimes with accompanying statues of the Virgin and Saint John (e.g. at Wechselburg, Saxony, thirteenth century); the *road crucifix*, at cross-roads, or to mark certain spots for devotion; the *station crucifix*, which often crowns a hall at the end of a line of devotional stations (q.v.) known as the Way of the Cross; the *processional crucifix*, usually smaller and of metal, carried in religious processions. All such crucifixes became very numerous from the thirteenth to the sixteenth century, and were sometimes carved by the greatest sculptors, as in the case of Brunelleschi's crucifix in Santa Maria Novella, and Donatello's, also in Florence.

A curious compromise between a picture of the Crucifixion and a crucifix is a class of representations in which the figure of Christ is painted on a panel cut in the shape of a cross. A very early instance is in the Cathedral of Spoleto. Others by the Berlinghieri, Margheritone, and other early painters (thirteenth century) exist at Lucca, Pisa, and Florence. The plastic crucifix was more popular in northern Europe than in

Italy before the fifteenth century, and was often executed in wood, while for smaller examples ivory and metals were most used. The realistic schools of North Italy, however, during the fifteenth and sixteenth centuries, gloried in realistic crucifixes of painted wood and terra-cotta, especially the artists of Modena. The most impressive are the large station crucifixes, such as that of the Sacro Monte at Varallo. Consult: Carus, "The Crucifix," in *The Open Court*, vol. xiii. (Chicago, 1899); Stockbauer, *Kunstgeschichte des Kreuzes* (Schaffhausen, 1820).

CRUCIFIXION, THE. The title of many paintings, among the most famous of which are: Lucas Cranach's, in the Stadtkirche at Weimar, Germany; Albert Dürer's, in the Dresden Museum; Mantegna's, in the Louvre; Van Dyck's, in Saint Michael's, Ghent; Rubens's, in the Antwerp Museum; Perugino's, a fresco, at the chapter-house of Santa Maria Maddalena dei Pazzi, in Florence; Tintoretto's, in the Senola di San Rocco, Venice; Fra Angelico's in the monastery (now the museum) of San Marco, Florence. Twenty saints in life-size surround the cross, and below are portraits of seventeen Dominicans.

CRUDEN, KRŪD'ən, ALEXANDER (1701-70). An English scholar, maker of a well-known Bible concordance. He was born at Aberdeen and educated at Marischal College in that city, with a view to the Church, but having exhibited decided symptoms of insanity, he was for some time placed in confinement. On his release he left Aberdeen, and after spending several years as a tutor in and about London, settled in London in 1732 as a bookseller. In 1735 he received the title of 'bookseller to the Queen.' In 1736 he began, and the next year published, his *Complete Concordance of the Holy Scriptures of the Old and New Testaments*. Soon afterwards he relapsed into insanity and his friends were obliged to remove him to a private asylum, where he appears to have been harshly treated. On his recovery he published an account of his sufferings (1738). He then acted as a corrector for the press. Cruden now believed himself divinely commissioned to reform the manners of the world, and styled himself Alexander the Corrector. He went about the country exhorting the people to keep holy the Sabbath day, etc. He also petitioned the King for the honor of knighthood, and Parliament to constitute him by act 'the corrector of the people,' hoping by such honors to influence the people more effectually. The second edition of his concordance appeared in 1761 and the third in 1769; since then it has been repeatedly reprinted in full, with his definitions, which make it a Bible dictionary, or in abridgment, and has been made the basis of other concordances. Perhaps the best edition of the complete work is by Alexander Chalmers (London, 1812; 10th ed. 1824), with his life. Cruden died at Islington, London, November 1, 1770. See CONCORDANCE.

CRUDOR, Sir. A knight in Spenser's *Faerie Queene*, who before he will marry Briana demands of her enough hair from ladies' curls and knights' beards to 'purfle' him a cloak. This she obtains from passers-by until Sir Calidore vanquishes him, and people are again free to pass the castle unshorn.

CRUELTY (OF. *cruaulte*, *cruelte*, Fr. *cruauté*, from Lat. *crudelitas*, cruelty, from *crudelis*, cruel, *crudus*, raw). The intentional infliction of unnecessary pain. As a legal term it is used chiefly in connection with divorce, with the treatment of children, and the treatment of animals.

As a ground for *divorce*, cruelty is not limited to physical violence, although formerly it was thought to be thus limited. It is now held to include any unjustifiable conduct on the part of either husband or wife which so grievously wounds the feelings or destroys the peace of mind of the other as seriously to impair bodily health or endanger life, or which utterly destroys the legitimate ends and objects of matrimony. See *DIVORCE*.

While the common law does not permit a child to sue a parent in *tort* for injuries inflicted by cruel chastisement, it does provide for the criminal punishment of parents guilty of such cruelty, and courts of equity have not hesitated to take children away from a parent who abuses their persons or corrupts their morals. Cruel treatment of animals by their owners is not a criminal offense at common law unless it is of such an aggravated kind as to amount to a nuisance. See *CRUELTY TO ANIMALS*; *CRUELTY TO CHILDREN*; *HUSBAND AND WIFE*; *PARENT AND CHILD*.

CRUELTY TO ANIMALS, PREVENTION OF. The earlier laws on this subject were not so much the outcome of humane principles as for the protection of animals considered as property. At the common law cruel treatment of animals by their owner was a criminal offense only when it was so aggravated as to be a nuisance. But the general tendency of the nineteenth century toward the organization of philanthropy was not slow to operate in this direction. England was the first country to organize (in 1824) a society for the purpose. Legislative enactments followed, and the statute of 1849 provides a penalty not exceeding £5 (in addition to a further sum recoverable as damages by the owner) for any person who 'shall cruelly beat, ill-treat, overdrive, abuse, or torture' a variety of domestic animals. The movement spread to Germany, France, and the United States. The first American society was chartered by the Legislature of New York in 1866, chiefly through the efforts of Henry Bergh (q.v.), who was its president for twenty-two years. Cruelty to domestic animals is now punishable in most of the United States by fines ranging from \$5 to \$100, or imprisonment from thirty to sixty days, or both. The Ohio law, as amended in 1898, specifies cruelty by beating, mutilating, lack of good food and water, carrying in an inhuman manner, overwork, and crowded transportation. The New Hampshire law of 1897 gives the officer making an arrest the right to seize the animal, notifying the owner, and to kill it if disabled, or to hold it as security for proper damages.

The Pennsylvania Society for the Prevention of Cruelty to Animals (founded 1867, incorporated 1868) is generally accepted as a model. It endeavors to prevent cruelty by moral suasion and well-considered advice, rather than by coercion. It tries to educate where cruelty is due to ignorance, and thus attempts to secure the use of proper harness and bits for horses, and the abolition of the check-rein. A similar movement in England against the check-rein, excessive

curbing, and the docking of horses' tails received great impetus from the hearty support of King Edward VII., then Prince of Wales. The Pennsylvania society was the first to provide (1874) an ambulance for the removal of disabled animals and a derrick with chain pulley and sling for hoisting animals out of holes. In several States the weight of a load which may be drawn up-hill is carefully regulated by the work of such societies; and homes are very generally established for stray dogs and cats, where the animals are painlessly put to death in case of need. Similar societies now exist in nearly every European country, in Algeria and South Africa, in Australia, and in Mexico, Brazil, and the Argentine Republic. See *VIVISECTION*; *CRUELTY TO CHILDREN, PREVENTION OF*.

CRUELTY TO CHILDREN, PREVENTION OF. Owing to the long survival of the Roman idea of parental power (see *CRUELTY*), and the comparatively late growth of a tendency toward socialistic legislation, it was not until very recent times that organized effort in this direction became common. Curiously enough, the movement in the direction of organization, in the United States at least, did not take definite shape until eight years after that for the prevention of cruelty to animals. The New York Society for the Prevention of Cruelty to Children was organized in January, 1875, and within five years ten other societies followed, from Boston to San Francisco. As the movement grew, some societies originally intended for the protection of animals added the care of children to their purpose. In other cases 'humane societies' were organized to cover both purposes. The total number of societies in the United States in 1900 for the protection of children, or children and animals, was 161. They were brought into close relations by the Humane Association (q.v.), which has included societies for the protection of children since 1887. As in the case of animals, their work is two-fold—the promotion of better legislation in their field and the diligent enforcement of existing laws. They also investigate cases of alleged cruelty or neglect, and present to the courts such facts as they learn. The New York society exceptionally includes the investigation of cases of destitution. By the work of the agents whom it stations in all the magistrates' courts it has come to have a powerful advisory influence on the commitment of destitute, neglected, and wayward children in New York City, thus affecting the lives, on an average, of about 15,000 children. These societies in general are private corporations, supported by subscriptions, although in New York, Philadelphia, and a few other places, some aid has been given from public funds. In the State of Indiana since 1889 boards of children's guardians have been organized by law, which not only investigate cases of cruelty and neglect and secure the punishment of the offenders, but also undertake subsequent oversight of the children. The Colorado Humane Society was made by the Legislature of 1901 a 'State bureau of child and animal protection,' with an appropriation of \$3000 per annum for two years; this, however, remains under private control, though three State officers are made *ex officio* members of its board of directors. Consult Folks, *The Care of Destitute, Neglected, and Delinquent Children* (New York, 1902). See *DEPENDENT CHILDREN*.

CRÜGER, krü'gēr, JOHANNES (1598-1662). A German choral composer and musical author. He was born at Grossbresen, Province of Brandenburg, and was educated at the Jesuit College in Olmütz, under Hamburger at Ratisbon, and at the University of Wittenberg. He was cantor of the Nikolaikirche, Berlin, from 1622 until his death. As a composer of Lutheran chorals, he has never been excelled, and many of his melodies, such as *Nun danket alle Gott*; *Jesus, meine Zuversicht*; *Schmücke dich, o liebe Seele*, have survived to the present day. His sacred compositions were published under the title *Præcis Pietatis Melica, oder Kirchen-Melodien über Luthers und Anderer Gesänge*, for four voices and two instruments (30th ed. 1703).

CRUGER, krü'gēr, JULIA GRINNELL STORROW (c.1850—). An American author, known by the pen-name 'Julien Gordon,' whose published works include the novels *A Diplomat's Diary* (1890); *A Puritan Pagan* (1891); *A Successful Man* (1892); *Poppa* (1894); and *Eat Not Thy Heart* (1897).

CRUIKSHANK, krük'shänk, GEORGE (1792-1878). An English caricaturist. He was born in London, September 27, 1792, the younger son of Isaac Cruikshank, himself a caricaturist. His early wish to follow the sea was opposed by his mother, who desired that his father should instruct him in art; but his father refused, and George failed to secure entrance into the Royal Academy schools. The idea of adopting art as a profession was for the time abandoned. Subsequently, at the death of his father, having his mother to maintain as well as himself, he turned to drawing. His apprentice work as caricaturist appeared in the monthly periodicals called, respectively, *The Scourge* and *The Meteor*; and about the same period he made the sketches referring to the trial of Queen Caroline. Indeed, a great deal of his work, which at that time reflected the political situations of the day, may be looked upon now as being fairly historical in its bearing. As early as 1823 he began the illustrations for Grimm's *Fairy Tales*. In 1835 he published the first number of the famous *Comic Almanac*, which flourished under various managements until 1853. In 1847 he made a series of wood-cuts on "The Bottle," and his "Sunday in London," "The Gin Trap," and "The Gin Juggernaut," published at this time, had a wide circulation. It is said that the unfortunate life of a personal friend influenced him to exercise his gifts in a crusade against intemperance. A strong moral was enforced in these drawings. His best-known illustrations were those made for Dickens's *Oliver Twist* and the *Sketches by Boz*, those for the Waverley novels, and for the *Memoirs of Grimaldi*. In 1833 he designed and etched fifteen plates for illustration of *Don Quixote*. In later years he essayed to paint, and, though he had little skill in manipulating pigments, his efforts in that direction show his keen insight into human nature and his unique genius in portraying the grotesquely humorous. His "Cinderella," painted in 1854, is in the South Kensington Museum. In 1862 he painted for the National Temperance League "The Worship of Bacchus," which is now in the National Gallery. Rossetti wrote, in reference to this picture, that "the man who in his old age occupies himself for nearly three years in painting this

homily upon canvas, to the most negative results in point of art, deserves respect." George Cruikshank died in London, February 1, 1878, and was buried in St. Paul's Cathedral. Consult: Stephens, *A Memoir of George Cruikshank* (London, 1891); Bates, *George Cruikshank* (London, 1878); Jerrold, *Life of George Cruikshank* (London, 1883).

CRUIKSHANK, ISAAC (c.1756-c.1811). An English caricaturist and water-color painter. His father was an artist, and young Cruikshank, early left an orphan, followed his profession as an illustrator, water-color painter, and political caricaturist. He settled in London, and married Miss Mary Macnaughten; excepting this, very little is known of his career. Two of his water-colors, "A Child Lost" and "A Child Found," are in the South Kensington Museum. His political drawings were as well known as those of Gillray. His other designs include, "The Rage; or, 'Shepherds, I Have Lost my Waist,'" a skit on the exaggerated fashions of the times. His oldest son, ISAAC ROBERT (1789-1856), born in London, was a miniature painter and caricaturist. He satirized the political and social customs of the time, but after 1825 seems to have taken more to illustrating. His most popular work was done for *Life in London* (1821), in collaboration with his brother George, the text being supplied by Pierce Egan. It was dramatized and achieved a notable success. Another work of Cruikshank's was seventy-one illustrations for Charles Molloy Westmacott's *English Spy* (1825); and illustrations for Crithannah's *Original Fables* (1834); Colburn's *Kalendar of Amusements* (1840); and *The Orphan*, a translation of Eugène Sue's *Mathilde*. While neither a gifted nor as imaginative as his celebrated brother George, Robert Cruikshank was a good draughtsman and a clever artist.

CRUIKSHANK, WILLIAM CUMBERLAND (1745-1800). A Scottish anatomist, author of a number of medical works, the most valuable of which is one on *Insensible Perspiration*, showing that carbonic acid is constantly given off by the skin. His work further includes *The Anatomy of the Absorbing Vessels of the Human Body* (1786).

CRUISER (from *cruise*, from Dutch *kruisen*, to cruise, to cross, from *kruis*, O.H.G. *cruci*, Ger. *Kreuz*, AS. *crūc*, Engl. *cross*, from Lat. *crux*, cross). A war-vessel built for cruising. The principal features of a cruiser are: (1) seaworthiness; (2) ability to keep at sea for long periods (this requires large capacity for coal and stores, and habitability); (3) speed; (4) offensive and defensive powers. Cruisers are of many kinds, but they may be divided into three general classes—*armored cruisers*, *protected cruisers*, and *unprotected cruisers*. The dividing line between the classes is not very distinct, as some cruisers partake of the character of two classes. *Armored cruisers* carry armor for the protection of the ship, or battery, which is applied vertically, or nearly so. *Protected cruisers* have no vertical armor, but the vitals are protected by a thick steel deck, which is nearly horizontal, placed about the level of the surface of the water, but having the edges of the deck near the ship's sides inclined downward, so as to meet the side several feet below water. This part of the deck (the slope) is thicker than the middle part,

called the *flat*. *Unprotected cruisers* have no protective deck. Some of them have a watertight deck in the same region, but of insufficient thickness to admit of styling it a *protective* deck. Cruisers are frequently divided into first-class cruisers, second-class cruisers, etc. These distinctions are purely arbitrary, and differ in the various navies. In the United States Navy small cruisers are called gunboats. This is a term properly applicable to craft so small as to approximate to large boats. In the British Navy the terms 'gunboat' and 'gun-vessel' are used almost as loosely. In addition to the regular cruisers, a most important addition to the naval force in time of war is found in fast merchant steamers, which are frequently armed as *auxiliary cruisers*, and used as ocean scouts, or fleet scouts; in the former case, they are bound on distant missions; in the latter, they accompany the fleet.

CRUITHNIGH, kruth'nī, or **CRUITHNIANS**, kruth'nī-anz. The name given by the Irish to invading tribes of Picts, from whom the kings of Ulster were supposed to have descended. The appellation was subsequently applied to some of the inhabitants of the counties of Antrim and Down. They were also called Dalaradians, and their country Dalaradia (q.v.). The name Cruithnigh is sometimes derived from the custom of painting and tattooing practiced by the people. The Irish called the Picts of Britain Cruithnigh, and it is probable that the Irish Cruithnigh were related to those of Britain, as a Pietish colony came from Scotland and settled in Dalaradia a century before the Christian Era.

CRUIVE, kriv, or **ZAIRE**, zâr (probably from Gael. *crò*, sheep-cote, hovel). A contrivance erected upon rivers in Scotland for the purpose of catching salmon. These weirs are of great antiquity, and consist of a kind of hedge formed by stakes driven into the ground, the interstices being filled with brush, and the mode of capturing salmon being similar to those employed with bag and stake nets. See **NET**.

CRUMMELL, ALEXANDER (1818-98). A negro clergyman of the Protestant Episcopal Church. He was born in New York, was educated at the Oneida Institute, N. Y., and graduated from Cambridge University, England. He held a professorship in the Liberian College, at Liberia, West Africa, and then returned to the United States, and was rector for twenty-two years of St. Luke's Church, Washington, D. C. He was one of the first of the negro clergymen to enter the Episcopal Church. His works comprise: *The Future of Africa* (1862); *The Greatness of Christ, and Other Sermons* (1882); and *Africa and America* (1891).

CRUMMLES, krum'lz, VINCENT. The head of a theatrical family, in Dickens's *Nicholas Nickleby*, consisting of himself, his wife, two sons, the 'Infant Phenomenon,' and a performing pony. A big-bodied, big-hearted man, who is very kind to Nicholas and Smike.

CRUNCH'ER, JERRY. In Dickens's *Tale of Two Cities*, a general utility man in Tellson's banking house by day, and a 'resurrection man' at night. His wife's constant prayers he calls 'flopping.'

CRUQUIUS, krook'kī-ūs. The Latinized name of a renowned Flemish scholar of the sixteenth

century, Jacques de Crusque. He was professor at Bruges, and his studies in Horace have had a most important influence on our knowledge of that poet. In his commentary on Horace, Cruquius gives readings from the four valuable 'Blandinian' manuscripts, since destroyed, one of which is very ancient; and also quotes the marginal notes of an early commentator, whose name is lost, but who is now cited as 'Commentator Cruquianus.'

CRUSADE (Fr. *croisade*, It. *crociata*, from ML. *cruciata*, crusade, from *cruciare*, to mark with the cross, from Lat. *crux*, cross). A war undertaken for a religious purpose; specifically one of the wars waged by the Christians for the recovery of the Holy Land. Toward the close of the eleventh century, when the Byzantine Empire was in great danger of being conquered by the Seljukian Turks, the Emperor Alexis Comnenus appealed to Pope Urban II. for help. At the Council of Clermont, in November, 1095, the latter made his memorable speech, in which he exhorted his hearers to bear aid to the Eastern Empire, and to reconquer Jerusalem. His fiery eloquence evoked an enthusiastic response; for he appealed to all the motives which were then influential—to the spirit of religious enthusiasm; to the love of fighting and adventure; and to the desire, in many, of bettering their fortunes. After the conclusion of Urban's speech, many pressed forward to take the Crusader's vow and the cross, which was the symbol of this vow and gave its name to the movement. The agitation spread rapidly to all the countries of western Europe and embraced all ranks of society. The nobles made deliberate preparations for an expedition which was expected to last three years; but the common people, among whom Peter the Hermit (q.v.) and others had been busily preaching the Crusade, were too impatient, and many of them too poor, to wait. In the spring of 1096 thousands of men, women, and children started in different bands under the leadership of Walter the Penniless, Peter, and others. They marched from Cologne and the Rhineland, across Germany, through Hungary, along the Danube, and southward to Constantinople. These bands were very disorderly; their course was marked by persecution of the Jews, robbery, and plunder, and many of them were slaughtered by the infuriated inhabitants of the countries through which they passed. Those who reached Constantinople were received graciously by the Emperor. Their disorderly conduct, however, soon caused him to transport them to Asia Minor, where almost all were slain by the Turks. The march of these disorderly bands is generally styled the *Peasants' Crusade*.

THE FIRST CRUSADE, 1096-99. In the summer and fall of 1096 the real armies, led by the nobles, began their march. Among the leaders were Godfrey of Bouillon, Bohemond, Prince of Tarentum, Robert of Normandy, Robert of Flanders, and Raymond, Count of Toulouse, who was the latest of all to start. They proceeded by different routes to Constantinople, where they were delayed by the Emperor, who was alarmed by their numbers and lack of discipline, but wished to make use of their strength. An agreement was finally made, by which almost all of the leaders were induced to become his vassals, but in the campaign which followed neither party

kept its promises, and the long negotiations resulted only in a mutual feeling of antagonism, which proved disastrous to the Christian cause. All of the Crusaders met at the siege of Nicæa, in May, 1097, when the army may have numbered 100,000, besides the women and non-combatants. Six millions were said to have taken the cross, but undoubtedly the number was greatly exaggerated; many, besides, who had taken the vow had turned back or were dead. Nicæa was taken, the Sultan of Iconium was defeated at Dorykleum, and in a few months the Crusaders accomplished the arduous march to Antioch, which was captured after a siege lasting from October 21, 1097, to June 2, 1098. In the meantime, Baldwin, brother of Godfrey, had taken possession of Edessa for himself, and Bohemond established himself as Prince of Antioch. The leaders became so intent on making conquests for their own profit that the advance to Jerusalem was delayed for months. Finally, on June 7, 1099, the remnants of the army, about 20,000 in number, reached Jerusalem. After a siege of five weeks, the city was captured by reckless daring, on July 15. The Crusaders vented their wrath in an indiscriminate massacre, in which neither youth nor age was spared, and men and women were slaughtered in the holy places. The leaders wrote home exultingly, "In Solomon's Porch and in his temple our men rode in the blood of the Saracens up to the knees of their horses." Godfrey was elected 'Baron and Defender of the Holy Sepulchre,' and after the battle of Ascalon, in which the Egyptian army was defeated with great slaughter, almost all of the Crusaders returned home, leaving Godfrey with a small band of followers to defend Jerusalem. Bohemond held Antioch with his Norman followers. Baldwin was in the distant Edessa. A large part of Asia Minor was restored to the Greek Emperor. The news of the victories gained by the Crusaders set into motion three great armies from France, Germany, and Italy (1101-02), but, owing to their own excesses and folly, they fell an easy prey to the Mussulmans in Asia Minor.

THE SECOND CRUSADE, 1147-49. In 1144 Edessa was captured by the Mohammedans. The news of its loss aroused great alarm in the West, and a new Crusade was initiated, in which special privileges were offered to all participants. Bernard of Clairvaux was the great preacher of this movement. Conrad III. of Germany and Louis VII. of France took the cross and led great armies to the relief of the Holy Land. Conrad and Frederick Barbarossa starting from Ratisbon, in April, 1147. The march was very disorderly, and when the Crusaders entered the Byzantine Empire they came to blows with the Greeks. After much trouble, the Bosphorus was crossed and the army advanced into Asia Minor, led by Greek guides. The guides proved treacherous, the troops were harassed by the Turks, and finally, threatened with famine and death, they retreated, closely pursued by the enemy, scarcely one in ten getting back to Nicæa. Louis had better fortune: his army was more orderly, and he was well received by the Greek Emperor, although, when the French King crossed to Asia Minor, the Emperor refused to furnish guides until Louis and his barons had taken the oath of homage. Near Nicæa they met the German fugitives, with whom they joined forces and

marched along the coast. Conrad soon turned back and spent the winter in Constantinople, but Louis went on, and, after meeting with a terrible defeat, in which the Greeks aided the Turks, he and his knights went by ships to Antioch, while the common people were left behind to be slaughtered. From Antioch, Louis proceeded to Jerusalem, where he was joined by Conrad. Together they planned the renewal of hostilities on a grand scale, but their schemes miscarried, and the kings went home in disgust.

THE THIRD CRUSADE, 1189-91. The capture of Jerusalem by Saladin, in 1187, caused Frederick Barbarossa, Philip Augustus of France, and Richard the Lion-Hearted of England to take the cross. Frederick was drowned soon after he reached Syria. Richard and Philip captured Acre after a long siege; but the two kings quarreled so bitterly that Philip went home soon after the capture. Richard, thwarted at every turn by Saladin (q.v.), was compelled to make a truce without accomplishing anything more.

THE FOURTH CRUSADE, 1201-04. Innocent III. (q.v.) made every effort to bring about a new Crusade. A great number of Latin nobles and knights were induced to take the cross, and the enthusiasm of the people was unbounded. Among the leaders in this Crusade were Baldwin of Flanders, Boniface of Montferat, and Geoffroy de Villehardouin, Louis of Blois, and Simon de Montfort. Arrangements were made with Venice that the republic should supply the vessels and provisions for the journey; but, when the Crusaders reached Venice, they could not raise the amount agreed upon for payment. After a long delay, they made a new bargain with Venice by undertaking to capture for her the city of Zara, in Dalmatia. The common soldiers were kept in ignorance of the infamous plan until it was too late for effectual protest. Zara was sacked, and the army spent the winter there. In the meantime, a new plot was hatched by which, under pretense of reinstating the rightful Byzantine Emperor, Isaac Angelus, the Crusade was diverted to Constantinople. Isaac Angelus was restored to his throne, but, as he was not able to fulfill the conditions to which he had been compelled to agree, the Crusaders turned against him. Constantinople was captured a second time and sacked (1204). Much of the city was burned, precious works of art were destroyed, and enormous quantities of booty were secured. The Crusaders and the Venetians divided their conquests, and the Latin Empire (q.v.) was established. The last three Crusades effected little permanent good for the Christian cause. *The Fifth Crusade* took place in 1228-29. The German Emperor, Frederick II. (q.v.), who had taken the vow, went to the Holy Land and, by a treaty with the Mohammedan powers, secured Jerusalem. In 1244 the Holy City fell into the hands of the Kharezmians. *The Sixth Crusade* (1248-54) was led by Louis IX. of France (Saint Louis). He invaded Egypt, and, although at first successful, was soon defeated, captured, and compelled to pay an enormous ransom. He then went to the Holy Land, rebuilt some fortresses, but accomplished little of importance. In 1270 he started on the *Seventh Crusade*, but was induced to turn aside to Tunis, where he died. Edward Plantagenet associated himself with Louis IX. in that Crusade. He abandoned the Holy Land in 1272, and this

year is generally considered to mark the end of the Crusades.

In addition to the seven principal Crusades, there were countless other expeditions. In some of these large armies took part, as in the Crusade of 1101, of which mention has been made; the German Crusade of 1197; the Children's Crusade (q.v.) in 1212; and the Crusade of John of Brienne and Andrew II. of Hungary in 1217-21, which achieved the conquest of Damietta, in Egypt, in 1219. The last is often called the Fifth Crusade, and in fact the first four Crusades are the only ones to which the same numbers are assigned by unanimous consent. In addition, almost every year, from 1100 to 1270, small bands of Crusaders went to the Holy Land, and after 1270 many attempts were made to reconquer Jerusalem. There were also Crusades in the West against the Moors in Spain, and against the heathen Prussians. (See article TEUTONIC KNIGHTS.) Besides these Crusades against pagans, many Crusades were preached against the Albigenses (q.v.), the Hohenstaufen (q.v.), and other opponents of the popes, the name being used for all kinds of expeditions in which the Church was interested.

THE RESULTS OF THE CRUSADES. The Crusades were of very great importance in the history of Europe in that they accelerated many movements which without them would probably have advanced much more gradually. They contributed to the growth of the great Italian seaports, by establishing closer commercial communications between Europe and the East; they enriched the Church and increased its powers, and they helped to develop the strength of the French monarchy in killing off large numbers of the turbulent nobility, and removing others to a more grateful field of activity in Asia and Africa. For Europe at large the most important results were these: (1) They checked the advance of the Mohammedans for a considerable period of time; for, by carrying the war into the enemy's country, they prevented his advance into Europe. It is true that too much stress may be laid on this fact, for the Crusades undoubtedly weakened the Byzantine Empire and made it an easier prey for the Turks in the fifteenth century; but in the twelfth and thirteenth centuries the Crusading States in the East served as outposts to guard against the invasion of Europe. (2) The Crusades enriched Europe greatly by promoting the growth of commerce. In order to transfer the Crusading armies and to supply their various needs, great fleets had to be built. These brought back to the West the products of the Orient. In Asia and Africa, the Crusaders acquired new tastes and desires, which had to be gratified by a more extensive commerce—witness the remarkable growth in the use of sugars and spices in the twelfth century. Money, which previously had been hoarded, was put into circulation, to equip the crusading hosts. All of these causes led to a remarkable growth in wealth and prosperity, which benefited especially the inhabitants of the cities in western Europe. This is regarded by many as the most important result of the Crusades. (3) The Crusades caused a broadening of the intellectual horizon and originated a tendency toward skepticism. "On its Oriental *Studienreisen*, young Europe studied industriously and with great results." The constant contact for two centuries with the more

advanced Byzantine and Arabic culture taught the Crusaders many lessons in civilization. The admiration which they learned to feel for heretics and Mohammedans dispelled many of their prejudices. Some Crusaders became Mohammedans, others became free-thinkers. There was a rapid spread of heresies. "The roots of the Renaissance are to be found in the civilization of the Crusades." There have been three periods of great advance in the history of Europe: the Crusades, the Reformation, and the French Revolution; and of these three the Crusades were not the least important and influential.

BIBLIOGRAPHY. The literature of the Crusades is very extensive, and only a few of the principal titles can be given. The most important collection of sources is the *Recueil des historiens des croisades*, of which fourteen folio volumes have been published (Paris, 1841, et seq.). Consult also: Bongars, *Gesta Dei per Francos* (Hanover, 1611), and the publications of the *Société de l'Orient* (Paris, 1878-84). Of general histories the best are: Wilken, *Geschichte der Kreuzzüge* (7 vols., Leipzig, 1807-32); Michaud, *L'histoire des croisades* (Paris, 1825-29, many editions), and also an English translation by Robson, *History of the Crusades* (London, 1881); Kugler, *Geschichte der Kreuzzüge* (Berlin, 1891); Arber and Kingsford, *The Crusades* (New York, 1895); Prutz, *Kulturgeschichte der Kreuzzüge* (Berlin, 1883); von Sybel, *Geschichte des ersten Kreuzzuges* (Leipzig, 1900); Röhrich, *Geschichte des Königreichs Jerusalem* (Berlin, 1898). See ANTIQOII, PRINCIPALITY OF; DAN-DOLO; LATIN KINGDOM OF JERUSALEM.

CRUSADE, CHILDREN'S. See CHILDREN'S CRUSADE.

CRUSCA, krōō'skā, ACCADEMIA DELLA. See ACADEMY.

CRUSENSTOLPE, krōō'zen-stōl'pe, MAGNUS JAKOB (1795-1865). A Swedish publicist and author, born in Jönköping. He became editor of *Ställningar och förhållanden* in 1838, and for publishing therein certain expressions against the Government was imprisoned from 1838 to 1841. He is best known for his historical fiction, such as *Morianen* (The Moor, 1840-44) and *Carl Johan och Svenskarne* (Carl Johan and the Swedes, 1845-46).

CRUSHING MACHINERY. See GRINDING AND CRUSHING MACHINERY.

CRUSIUS, krōō'zē-ōōs, OTTO (1857—). A German classical philologist, professor in the University of Heidelberg. He was born at Hanover, December 20, 1857. He is the author of *Zur griechischen Religionsgeschichte* (1886) and *Untersuchungen zu den Mimiamben des Herondas* (1892), etc.; and the editor of *Philologus*; *Herondas* (1901); *Fabeln des Babrius* (1897); *Griechische Lyriker* (1897 et seq.), etc.

CRUSOE, krōō'sō, ROBINSON. See ROBINSON CRUSOE.

CRUSTACEA (Neo-Lat. nom. pl., from Lat. *crusta*, crust). A class of gill-bearing aquatic arthropods, differing from other Branchiata in having five pairs of appendages on the head, the first two of which are antennæ, and in having all of the limbs except the first pair of antennæ biramous.

STRUCTURE. The Crustacea derive their name from the hard armor which in most of them

covers the whole body, forming a complex exoskeleton, calcareous and intermediate between shell and bone in the higher forms, while in the lower and smaller kinds it consists principally of chitin, and corresponds more nearly in its nature with the integuments of insects. It is secreted by the epidermis on its outer side, and serves not merely for protection, but also for the attachment of the muscles. Its color is dependent upon the absence, or presence and amount, of pigment, which is also a product of the epidermis, and is formed during the growth of the skeleton. These pigment-cells are often very ornamental, especially under the microscope, as their shape is beautifully and very irregularly stellate. Usually, however, the pigment is so abundant as to make the body-wall opaque and the individual pigment-cells are no longer visible. The mineral matter of the skeleton is chiefly carbonate of lime. The smallest crustaceans have little or none in the skeleton, but in all of the larger forms it is present in greater or less abundance. In the so-called 'stone-crabs' so much is present that the skeleton is really as hard as a rock. In all cases, however, where the skeleton covers a joint it is thin and free from mineral matter, thus permitting perfect freedom of movement. The bristles and hairs often found on the outside of the skeleton are of the same essential structure as it, and have a central core of epidermis. In barnacles (q.v.), ostracods, water-fleas (q.v.), and a few other crustaceans, there is, in addition to the external skeleton, and formed as an outgrowth of it, a true shell, whose only function is protection. This shell may consist of several pieces, as in barnacles, or be strictly bivalve, as in water-fleas, and it may be wholly chitinous or very firmly calcified. Sometimes it is capable of inclosing the entire animal, but often it only seems to protect certain parts. It is usually hinged along the dorsal side of the animal, where it is attached to the skeleton, and is supplied with muscles for closing it.

The crustacean body is composed of segments, some very distinct, while others coalesce or are consolidated, of which the thorax of a crab affords an excellent example. The first five rings are regarded as forming the head, the next eight the thorax, when that part of the body is separable from what follows.

Epidermis and Molting.—The crustaceous covering has beneath it a true skin, and, like the epidermis, is cast off from time to time and supplied anew, as the growth of the animal requires more room for the internal parts. In this molting or casting of the shell, the animal divests itself of its covering not in separate parts, but in one piece, including the coverings of the limbs and even of the antennæ, although the membranes which connect the hard plates are split and torn. A period of apparent sickness precedes and agitation accompanies the process; and the thick muscular parts of the limbs of crabs and lobsters become soft and flaccid, so as to be more easily extricated from their hard covering. The loss of a limb, which sometimes takes place in this process, and is otherwise a frequent occurrence, is easily repaired, for a new one grows in its stead; but it is a curious circumstance that in order to this reproduction the limb must be broken off at a particular joint, the second from the body, thus leaving only a short stump; and when a limb is broken else-

where, the animal itself exercises the remarkable power of throwing it off by this joint.

Locomotive and Other Organs.—The principal organ of locomotion in many Crustacea, as in the lobster, shrimp, etc., is the abdomen, terminating in fan-like appendages; by bending the abdomen suddenly down under the body, the animal darts backward in the water. The limbs, which are connected with the thoracic rings, are, in some, organs of swimming; those of others are used for walking at the bottom of the water or on dry ground. Some have 'swimming-feet' or pleopods attached to the abdomen, often very different from the thoracic legs. The legs of some are fitted for burrowing. The first pair of legs is not infrequently transformed into a pair of powerful pincers or 'claws,' the last joint but one being prolonged so as to oppose the last joint, which becomes attached as to the side of it; and these are used for seizing and tearing food. The first pair of appendages are organs of touch called antennules; following these are the antennæ, also sense-organs; then come a pair of powerful jaws, the mandibles; and back of these are two pairs of accessory jaws, the maxillæ. The thoracic feet, which follow in regular order, are sometimes modified to function as jaws, and are then called maxillipeds. In some forms the mouth-parts are greatly modified to form sucking instead of masticating organs. The digestive organs are very simple; there is a short but capacious gullet, a large stomach, and a straight and simple intestinal tube. A well-developed digestive gland called the liver is often present. The pyloric region of the stomach is sometimes furnished with a remarkable apparatus of hard tubercles or sharp teeth for grinding or tearing food. Many of the Crustacea feed on animal food, and are very voracious; many, however, feed on vegetable food. The nervous system of crustaceans agrees generally with that of other arthropods, and exhibits many gradations of concentration. The eyes are either simple (ocelli), aggregate (consisting of several ocelli under a common cornea), or compound; and the compound eyes are often elevated on stalks. Besides eyes some crustaceans have ciliated pits or cavities that seem to be sense-organs, perhaps for smell or taste. Others have otcysts or positional organs, but it is doubtful whether any have the sense of hearing. In some Schizopoda there are also 'accessory eyes' on the basal points of certain thoracic feet and in the middle line of the abdomen. The gills are variously placed, on the sides of the body, or on the thoracic limbs, on the abdominal legs, etc. The heart is always in the middle line of the body on the dorsal side, is of variable form, and distributes the blood by a number of trunks through the system; but the blood returns to venous sinuses, from which, and not from the heart, it is sent into the gills, and it is not until after its aëration in the gills that it comes to the heart again.

REPRODUCTION AND ECOLOGY. The sexes are distinct in most Crustacea, and all are oviparous. The eggs are almost invariably hatched in water, even those of terrestrial forms, and a sort of incubation often takes place, as the eggs are carried about under the abdomen or thorax of the female, attached to the pleopods or other appendages. Except in a few cases the development takes place by metamorphosis, through a very remarkable series of larval stages. All the

lower Crustacea hatch as minute, oval, unsegmented creatures with three pairs of appendages, and this larva is called a nauplius. Although the higher Crustacea hatch as a more highly organized form called 'zoea,' and later pass through an intermediate larval form, the 'megalops,' all pass through a nauplius stage in the egg. See BARNACLE for illustration of 'nauplius;' and see CRAB for illustrations of 'zoea' and 'megalops.'

More than 10,000 species of living Crustacea are known, of which the greater number are marine; some inhabit fresh waters, running or stagnant; comparatively few are terrestrial. Many exhibit a high degree of intelligence. The Crustacea constitute, in an economic sense, perhaps the most important group of invertebrates. The myriads of the smaller forms that drift about the ocean and the great lakes furnish the greater part of the fare of the important food-fishes, and are thus indirectly of value to mankind. In the economy of the ocean itself Crustacea are also of great importance, for they act as the natural scavengers of the sea.

CLASSIFICATION AND PHYLOGENY. Classification of the Crustacea is based upon the number and manner of consolidation of the segments of the body, and upon the number and character of the appendages. There are three large groups: (1) Trilobita, (2) Entomostraca, and (3) Malacostraca (qq.v.), which may be considered to constitute subclasses. The principal characters of these subclasses and their component orders, together with some notes of the geological history of the groups, are here briefly given.

I. TRILOBITA. This is an extinct group of Crustacea that lived during Paleozoic time only. No near relatives are known, though they exhibit some affinities with the Phyllopoda. The body consists of three regions—head, thorax, and abdomen—and it is further divided by a raised median dorsal ridge into three longitudinal lobes from which character the group derives its name. The thorax has a variable number (2 to 19) of segments that are so articulated as to enable the animal to coil itself more or less closely after the manner of an armadillo. The trilobites constitute a very primitive group of Crustacea, and, as their remains are found in the oldest sedimentary rocks, they were among the earliest inhabitants of the earth. They are of great importance to the geologist, as the various species are very characteristic of the particular layers of rock in which they occur, and for this reason they will be more fully described in an article under their own name.

II. ENTOMOSTRACA. The members of this subclass present a great variety of form and habit of life, but they are alike in the variability of the degree of segmentation of the body. They are with few exceptions small, and all are aquatic. They are divided into four orders. (1) In the order *Phyllopoda* the segmentation is distinct, the anterior portion of the body is covered by a cephalic shield, and the thoracic appendages are leaf-like, this latter character giving the group its name. In some phyllopods, as *Apus*, and the brine-shrimps (*Branchipus* and *Artemia*), the body is elongated, well segmented, partly covered by a single dorsal shield and divided into three regions. In other genera, as *Daphnia* and *Estheria*, the body is not well segmented and is enclosed in a bivalve shell articulated by a hinge at the dorsal median line. The phyllopods are

doubtfully represented in the Cambrian rocks. One genus, *Estheria*, has enjoyed a remarkably long life-period, since it has existed from Devonian to recent times. During the Devonian and Carboniferous periods the Phyllopoda abounded in the brackish waters of the coastal swamps; in the rocks of the Tertiary era the members of this order are less common. A single doubtful representative of the suborder Cladocera, the genus *Lynceites*, has been found in the Carboniferous rocks. (2) *Ostracoda*.—In this order the animals are all small, mostly microscopic, and with the body inclosed in a hinged bivalve shell that can be tightly shut by a specially developed adductor muscle. These animals occur by myriads in the modern ocean, seas, and lakes, mostly swimming near the surface of the water, and they seem to have lived in equal abundance in the seas of past time, for their fossil shells are common in all the aqueous rocks from those of Cambrian to those of recent time. Their greatest expansion was in the Ordovician and Silurian, and again in the Carboniferous and Cretaceous periods. Examples are *Beyrichia*, *Lepeditia*, and *Cypris*. (3) *Copepoda*.—These are all recent forms, with elongated well-segmented bodies in all except the degenerate parasitic members of the order. The limbs of the free-swimming species are biramous; those of the parasites are greatly reduced in size or entirely wanting. Examples: The water-flea (*Cyclops*), the fish-lice (*Lernæa*), and carp-lice (*Argulus*). (4) *Cirripedia*.—In this order, the barnacles, we see perhaps the most aberrant of all crustaceans. Because of the usual sessile habit of life, the body of the animal has suffered so great modification that only the study of the developmental stages shows that the peculiar forms of the adult barnacles are acquired after passing through a series of larval stages exactly parallel to those of other Entomostraca. The body of the adult is attached by the head. It is inclosed in a leathery integument that develops articulated calcareous plates and is raised upon a peduncle as in the goose-barnacle (*Lepas*); or it may be contained in a calcareous box made of a series of stony plates firmly joined to each other and to the foreign object that serves as a support, as in the acorn-shell (*Balanus*). The earliest members of the order, *Turritepas* and *Plumulites*, appeared in Cambrian and Ordovician time, and were ancestors of *Lepas*, while the oldest relative of *Balanus*, namely *Palæocrensia*, occurs in the lower Devonian rocks, and the genus *Balanus* itself has been found in the Mesozoic and Tertiary deposits. The Cirripedia afford the largest examples of Entomostraca in some of the goose-barnacles that attain a length of eight or nine inches, and they furnish also the most degenerate forms in those Rhizocephala that live as parasites in the bodies of crabs. See BARNACLE; COPEPODA; OSTRACODA; PHYLLOPODA; ENTOMOSTRACA; and Plate of BARNACLES.

III. MALACOSTRACA (crabs, lobsters, etc.). The most commonly known, the largest, and the most highly organized Crustacea belong to this division. The body consists of a constant number of segments (20 or 21), distributed between the head (5), the thorax (8), and the abdomen (7). In most of the orders the head and thorax are fused to form a cephalothorax of 13 segments, and each segment bears a pair of appendages, all

of which are usually well differentiated to perform special functions. The compound eyes are stalked in all orders except the Cumacea and Arthrostraca. (1) The order *Phyllocarida* was much more fully represented in Paleozoic times than it is now by such genera as *Ceratiocaris*, *Echinocaris*, *Pephracaris*, etc., in which the cephalothorax was covered by a hinged bivalve shell provided with an adductor muscle like that in the bivalve phyllopods and the ostracods. The order enjoyed a long life-period, as it first appeared in the upper Cambrian, and it lasted to the end of the Paleozoic. Through the Mesozoic and Tertiary eras the order could not have been very abundant, as no fossil remains referable to it have been found in the rocks of those ages, and the modern genera, three in number, show considerable modifications from their early ancestors. This group presents synthetic types which may have given rise on the one hand to the Phyllopoda, and on the other to the higher Crustacea represented by the Schizopoda and Decapoda. (See PHYLLOCARIDA.) (2) *Schizopoda*.—The animals of this order, the opossum-shrimps (*Mysis*), resemble in their general form the shrimps and prawns among the decapods. They are, however, more loosely built and the thoracic limbs, of which there are eight pairs, are biramous (whence the name), and all alike. These characters mark the group as of primitive rank. Its relation, as one of lower phylogenetic rank, to the Decapoda, is shown by the fact that certain decapods, such as the prawns, pass in their ontogeny, that is, in their development from egg to adult, through a 'mysis stage,' in which schizopod characteristics are strongly marked. The fossil genera *Archæocaris*, *Cran-gopsis*, and *Pygocephalus* from the Carboniferous, and possibly also *Paleocaris* and *Gampsonyx*, the latter from the Permian, are the earliest ancestors of the Schizopoda. These all present very primitive characters and are separated from the modern descendants by the interval of Mesozoic and Tertiary time, from which we have no traces of the group.

(3) *Decapoda*.—The character upon which the order (shrimps, lobsters, and crabs) is based is the prominence of the five posterior pairs of thoracic limbs developed as walking feet; the three anterior pairs being adapted as maxillipedes or accessory mouth-parts. The first pair of walking feet is usually provided with strong chela or nipping claws. The cephalothorax is covered by a single firm carapace, which in many crabs is so shaped as to afford a most efficient protective covering for the entire animal, including the legs. The frontal portion of this carapace is produced into an anterior rostrum that is often of considerable length, and the lateral portions are extended downward to cover the gills, which are borne on the bases of the thoracic limbs. The order is divided into two suborders: the *Macrura*, with long-tailed bodies, as the shrimp, prawn (*Palaemon*), and lobster (*Homarus*); and the *Brachyura*, or crabs, with the abdomen reduced and closely applied to the under surface of the cephalothorax. A number of species allied to the hermit-crab (*Pagurus*), often distinguished under the subordinal designation *Anomura*, are either *Macrura* or *Brachyura* which, through adaptation to their peculiar habits of life, in occupying the discarded shells of gastropods, have lost the regularity of their

thoracic and abdominal segments. The compound eyes of all decapods are raised on stalks, which in many crabs are developed to extraordinary lengths. Some of the largest among Crustacea are found among the decapods. As a rule the quick-swimming decapods (prawns) may be recognized by the lateral compression of the body, while the bottom crawlers have a more or less flattened form. The crabs are the most highly specialized forms of all Crustacea, and they exhibit many interesting and peculiar adaptations to habit of life. (See CRAB; LOBSTER; PRAWN; etc.) The early ancestry of the decapods is not well known for those periods previous to Mesozoic time. Some doubtful Paleozoic forms that seem to be transitional between the schizopods and decapods are *Palaepalaemon*, from the Devonian of Ohio, and *Anthrapalaemon*, from the coal-measures of Illinois, but during this era the order was greatly subordinated to other crustaceans like the trilobites and ostracods, and to the merostomates, represented by *Eurypterus*. In the Mesozoic of Europe the group attained a great development, and this continued through the early Tertiary period. Fossil decapod remains are peculiarly sparse in the American deposits of these periods. The Jurassic lithographic slates of Bavaria have afforded large numbers of finely preserved specimens of fossil decapods of many genera and species. Some of these, as *Eryon*, have modern representatives, as *Willemoesia*, still living in the abyssal depths of the ocean. Other genera, among them the prawn (*Palaemon*), began in the Jurassic and Cretaceous periods and have survived without changes of greater than specific rank throughout the succeeding ages, and are now abundant in the Mediterranean Sea and the Atlantic and Indian oceans. The *Macrura* declined toward the end of Cretaceous time and gave way to the *Brachyura*, which attained great expansion during the Eocene or early Tertiary period. In fact, the crabs were the dominant types of invertebrate life in many parts of the Tertiary seas of Europe, and their fossil remains are now found in abundance in the rocks that are relics of those seas. The Eocene deposits of the London Clay of England, those of Bavaria and Hungary, and especially those of Vicenza, in northeastern Italy, have afforded the finest specimens, nearly all of which belong to modern families.

(4) *Stomatopoda*.—This is a small order comprising nine marine genera, of which the best known is the mantis-shrimp (*Squilla*). They have the body loosely built, elongated and flattened, with an incomplete carapace that leaves the three posterior thoracic segments uncovered,

EXPLANATION OF PLATE OF CRUSTACEA. FOSSIL.

1. *Dromiopis*, a round crab from the Upper Cretaceous of Denmark. 2. *Leperditia*, an ostracod; Silurian; island of Gotland. 3. *Eger*, a prawn; Jurassic lithographic limestones; Bavaria. 4. *Xanthopsis*, a cyclometopon crab; Eocene; Bavaria. 5. *Tarrilepas*, a primitive cirriped, allied to the zoose-barnacle; Silurian; Dudley, England. 6. *Senla pennata*, a stomatopod; Upper Jura of Bavaria; A, outline of the fossil; B, dorsal view of head; C, ventral view of entire body, showing thoracic and abdominal appendages. 7. *Ceratiocaris*, a phyllocarid; Ordovician; Llanarkshire, England; showing the bivalve shell, some of the head appendages, and the segmented long abdomen with terminal spines. 8. *Palaemonia*, a barnacle, allied to the acorn-shell, included in a fossil coral of Lower Devonian age; New York State. 9. *Pephracaris*, a phyllocarid with spinose carapace; Chemung; New York State. 10. *Eryon*, a macrura; lithographic limestones of Bavaria; A, ventral aspect; B, dorsal aspect.

and with a dis-proportionately large abdomen. The five anterior pairs of thoracic limbs function as maxillipedes, the second pair being much the largest and provided with a spiny terminal segment that folds back upon the penultimate segment, like a knife-blade into its handle, to form a very efficient clasping organ. A powerful burrowing organ, developed by the union of the sixth pair of abdominal appendages with the terminal plate or telson, enables the animal to bury itself in the sandy bottoms near shore. Fossil forms of this group are rare. The earliest, *Necroscylla*, from the coal-measures of England, resembles *Squilla*. Another allied genus, *Scudda*, is found in fine preservation in the lithographic slates of the Bavarian Jurassic, and *Squilla* is found in the same horizon and in succeeding horizons of the Cretaceous and Tertiary.

(5) *Cumacea*.—Another small order of prawn-like Crustacea, in which the compound eyes are sessile and sometimes fused together, or are entirely absent. The carapace is further reduced than in the Stomatopoda, for it leaves the five posterior pairs of thoracic segments uncovered. Only two pairs of thoracic limbs function as maxillipedes, and six pairs are legs, of which two or three anterior pairs are biramous. This group is related to the Schizopoda and Isopoda; no fossil representatives of it are known.

(6) *Arthrostraca*.—In this large order the fusion of the segments is still further reduced, only one or two of the anterior being united with the head to form a rudimentary cephalothorax. These fused segments bear maxillipedes, while the remaining free segments bear legs that end in claws or are built for swimming. The two suborders are quite different in outward appearances. The *Amphipoda* have the body laterally compressed and the legs adapted for swimming and jumping, as in the sand-fleas (*Gammarus* and *Orchestia*). The *Isopoda* have the body dorsoventrally flattened, the legs adapted for crawling, and the abdominal segments are fused to form a single terminal plate. The amphipods (see AMPHIPODA) are wholly aquatic, in both marine and fresh water, and are often also found living in the damp hotsam and jetsam of the beach between low and high tides. The isopods, while generally aquatic, afford some fine examples of adaptation to terrestrial conditions in the wood-louse (*Oniscus*) and pill-bug (*Armadillidium*), which are commonly found under the bark of dead trees and in other like situations. Paleontologically the amphipods are of little importance. The earliest indisputable ancestor is *Acanthotelson*, of the Carboniferous, and the genus *Gammarus* itself is found in the Tertiary rocks. The isopods are better known in a fossil state, and the ancestors seem to have been as a rule of larger size than the recent forms. *Arthropleura* of the Carboniferous attained a length of about twenty inches. *Præareturus*, also a large form, from the Old Red Sandstone of the English Devonian, is the earliest isopod known. *Archæoniscus*, *Cyclosphæroma*, and *Eosphæroma* are other genera from the Mesozoic and Tertiary rocks that are closely allied to modern forms.

GEOLOGICAL DISTRIBUTION. The accompanying table indicates in a rough way the larger classification of the Crustacea and the distribution and expansion of the various subdivisions in past geologic times. It shows that certain types, es-

pecially the more primitive, played more important rôles in the early ages than they do at present, and that they have been superseded by the more specialized types. The letters at the heads of the vertical columns indicate the geological systems as follows: C, Cambrian; O, Ordovi-

vol. v. (Leipzig, 1866-94). For description of the fossil forms, consult the various manuals of paleontology, such as those by Zittel, Zittel-Eastman, Bernard, Nicholson, and Etheridge. A good synopsis of the class, dwelling more especially on the fossil forms, is to be found in Zittel-Eastman, *Text-Book of Paleontology* (New York and London, 1900), where are given very useful bibliographic lists of works on both recent and fossil forms.

CRUST OF THE EARTH. It was formerly believed by scientists that the interior of our globe is in a state of fusion due to excessive heat, and they accordingly gave the name 'crust of the earth' to the external solid portion of the earth with which we are familiar. Modern investigation has tended to show that the interior of the earth may not be liquid, as this term is ordinarily understood, and the term 'crust of the earth,' suggesting as it does the liquidity of the earth's interior, has fallen somewhat into disfavor among scientists. The term lithosphere, meaning 'rock sphere,' has been proposed as a substitute, but in popular usage it has not displaced the earlier term. The crust of the earth is composed of igneous and sedimentary rocks. The rocks occurring deepest below the surface, chiefly of the Archaean age, are igneous. Resting on them, and forming the surface rocks for much of the globe, are sedimentary rocks, which have everywhere the same general geological succession, although varying widely in minor stratigraphy and structure. The basal igneous rocks also appear at the surface over considerable areas, and other igneous rocks are associated with the sediments.

The rocks of the earth's crust are fractured and folded, the folding involving an actual plastic deformation or 'flowage' of the rock mass. It is probable that fractures are confined to the outer portion of the earth's crust, while at a considerable depth, perhaps 10,000 meters, the pressure is so great that fractures cannot be developed, and the rock is deformed by flowage. For convenience in discussing its structure, Van Hise has accordingly proposed a division of the earth's crust into (1) a deep-seated zone of flowage, where rocks are deformed by flowage, and where fractures cannot exist; (2) an upper zone of fracture, where the rocks are deformed by fracture alone; and (3) an intermediate zone of fracture and flowage. By surface erosion rocks which have been deformed in the zone of flowage may ultimately reach the surface of the earth, and hence it is that we have side by side the effects of deformation in all zones. Consult Van Hise, "Principles of North American Pre-Cambrian Geology," in *Sixteenth Annual Report U. S. Geological Survey*, pt. i. (Washington, 1896). See CLEAVAGE; ARCHAIC SYSTEM; FAULT.

CRUVEILHIER, kru'vâ'yâ', JEAN (1791-1874). A famous French anatomist. He was educated in the University of Paris, became professor of pathological anatomy at Montpellier and later in Paris. He published an excellent *Anatomie pathologique du corps humain* (1828-42), and several other works.

CRUVELLI, SOPHIE, Countess Vigier (1826-). A German singer. Her real name was Crüwell. She studied under Bordogni in Paris, made her début in Venice in 1847, and sang with increasing success in other Italian theatres, and

afterwards in London and Paris. Endowed with a soprano voice of great strength and purity, she was one of the most popular vocalists of her time. On marrying Count Vigier, in 1856, she left the stage, and thereafter lived at Nice.

CRUYS, krois, or **KRUYS**, CORNELIS (1657-1727). A Dutch rear-admiral of Norwegian extraction. He entered the service of Peter the Great in 1698, and rose to be a vice-admiral and vice-president of the Russian Admiralty Board. He served Peter faithfully in the wars with Sweden and Turkey, but was hampered by the jealousy of the native Russian officers, and in 1714, after an unsuccessful encounter with some Swedish vessels, he was arrested and tried by court-martial. Sentenced to death, he was reprieved by order of the Czar, and exiled to Kazan, but later in the year was recalled and restored to his office. As chief assistant to Count Apraxin (q.v.), Cruys did much to build up the Russian Navy. He promoted the building of dockyards, canals, and the drawing up of charts. At the time of his death in 1727, he owned a large estate at Kexholm, and the island of Birken in Finland. In memory of his work, the Russian men-of-war still fly a white flag with a blue cross (kruis). Consult: "The Russian Fleet under Peter the Great," *English Navy Records Society* (London, 1899); Browning, *Peter the Great* (London, 1898).

CRUZ, krōos, JOSÉ MARÍA DE LA (1801-75). A Chilean general. He was born at Concepción, and became a member of the Republican cadet class when ten years old. In 1838 he became chief of staff in the Peruvian campaign; was twice appointed Minister of War, and in 1842 was elected Governor of Valparaíso. In 1851, defeated as the candidate of the Liberals for the Presidency, he organized a revolution which terminated in the disastrous defeat of Loncomilla (December 8, 1851), and was followed by his retirement from public life.

CRUZ, krōoth, SAN JUAN DE LA (1542-91). A Spanish mystic, born at Fontiveros. His real name was Juan de Yepis y Alvarez, but upon entering the Order of the Carmelites (1563) he assumed that of de la Cruz (of the Cross). Saint Theresa was then engaged in the reformation of the Order of Carmel, and de la Cruz became her ardent disciple. His efforts brought him into constant trouble, and he was practically in exile at the time of his death. He was canonized in 1726. The many writings of Juan de la Cruz in prose and verse contain some passages of great beauty, and others of untranslatable vagueness. His best poem is *Noche oscura del alma*. His works, published first at Barcelona in 1580, were translated into French by P. Maillard in 1694, and have frequently been reprinted.

CRUZ Y GOYENECHÉ, krōos á gō'yâ-nâ'chá, LUIS DE LA (1768-1828). A Chilean general. He was born at Concepción, where he held several municipal offices. His exploration of the Andes in 1806 resulted in the discovery of several important mountain passes, which are described in a report published in the *Angelic Collection* at Buenos Ayres in 1835. Four years after his famous Andean expedition, he became a member of the revolutionary junta of Concepción, but was captured during the ensuing campaign, and imprisoned until 1817. He was afterwards for a time acting President of Chile, and upon

the outbreak of the Peruvian campaign joined San Martín's army (1820), advancing to the rank of grand marshal. Shortly before his death he was appointed Minister of Marine.

CRYING BIRD. See COURLAN; LIMPKIN.

CRYOLITE (Gk. *κρύος*, *kryos*, frost + *λίθος*, *lithos*, stone). A sodium and aluminum fluoride that crystallizes in the monoclinic system. It is found chiefly in west Greenland, near Arksuk, where it occurs as a large bed in a granite vein, and in El Paso County, Col. Cryolite is an important ore of aluminium (q.v.), and is used in the manufacture of alum, sodium hydrate (for making soap) sodium carbonate, and other salts. It is also employed in the making of an opaque white glass, sometimes called hot-cast porcelain, which is said to be prepared by fusing together 100 parts of silica, 35 parts of cryolite, and 15 parts of zinc oxide.

CRYOPH'ORUS (Neo-Lat., from Gk. *κρύος*, *kryos*, frost + *φέρειν*, *pherein*, to bear). An instrument consisting of a glass tube with a bulb at both ends, from which the air has been exhausted. A little water is present in one of the bulbs, and when the second bulb, containing only water-vapor, is placed in a freezing-mixture,

CRYOPHORUS.

the vapor condenses, thus producing a diminution of pressure, which causes more vapor to rise from the water in the first bulb. The result of this evaporation from the first bulb is the abstraction of much heat, and eventually the remaining water freezes.

CRYPT. *kript* (Lat. *crypta*, Gk. *κρύπτη*, *kryptē*, crypt, vault, from *κρύπτειν*, *kryptein*, to hide). A term usually employed to designate a chamber under a church, wholly or partly subterranean; but it was anciently used to mean a subterranean chapel in the catacombs. As a part of a church, it developed out of the confession (q.v.), of which it was the logical enlargement. Like the confession, its prime object was to provide a place under the high altar for the safe custody of the relics of saints; a confession became a crypt when it was large enough for an altar, with room to worship the relics. The circular passage of the larger confessions thus became a chamber occupying at least the space from the high altar in the transept to the end of the apse; like the apse—whose outline it followed—it usually had a semicircular ending. It was reached from the church by a single or a double staircase, usually in the neighborhood of the high altar in the nave or side aisles. Although some crypts existed as early as the sixth century, it was not until the Carolingian period (ninth century) that such chambers attained to any size; but from that time until the thirteenth century, they formed a very important part of church architecture, especially of the Romanesque style. They usually do not occupy more space than that which lies beneath the transept, choir, and apse of the upper church, but sometimes they extend under the entire body of the church, including nave and aisles, as in Saint

Eutrope at Saintes, the Cathedral of Otranto, and San Nicolò, Bari. In such cases it is not always easy to distinguish them from the lower section of a double or two-storied church, such as those of Saint Francis at Assisi (q.v.), the Sainte Chapelle, Paris, Le Puy-en-Velay, and Schwartz-Rheudorf. Some of the early large crypts were connected with the concentric churches of the Holy Sepulchre type, such as Saint Bénigne at Dijon, Ottmarsheim, Saint Michael's at Fulda, where the crypt has the same periphery as the church (ninth to thirteenth century). Where, as is usual, the crypt in a basilical or cruciform church extends only beneath the choir end, the pavement here is often raised above that of the body of the church, so as to give greater height to the crypt. This adds picturesqueness to the interior. Sometimes the change of level is so great that the centre of the crypt opens widely upon the nave by one long central stairway, and two side staircases ascend to the choir. In such cases the crypt is apt to be a very monumental structure. Such are the crypts of San Zeno, at Verona; of San Miniato, at Florence; of the Cathedral of Arezzo; of the Abbey Church of Saint Denis, of the Cathedral of Strassburg (the largest in Germany), and many others. The double choirs—one at each end—that were common in German churches from the time of the old Cathedral of Cologne (814-73), and the Abbey Church of Saint Gall, usually had a crypt under each choir, as existing in the Cathedral of Bamberg. In England the finest crypt is that of Canterbury; next to it, that of Glasgow Cathedral. Of course, all crypts were of necessity vaulted, in order to support the weight above. A few are tunnel-vaulted, as the example at Steinbach-Michaelstadt; but the immense majority are covered with groin-vaults, supported by a forest of columns. In Italian churches, especially in Apulia and the Roman Province, the usual division is into seven aisles by six rows of columns. Farther north, heavy piers are often substituted for the slender columns, especially when the church above is vaulted. These supports were usually placed closer together than those above. Crypts are not only interesting in themselves, and from their great variety of plan and arrangement, but because, on account of their protected subterranean situation, they have suffered less from vandalism and are often the only remaining part of a mediæval church. With the age of cathedrals and churches of the Mendicant Orders, in the twelfth and thirteenth centuries, crypts were no longer used, because the cardinal idea of this era was to provide immense interiors on a single level for large congregations, instead of interiors divided by a raised choir into two sections.

CRYPTO-CALVINISTS. A name given to Melancthon and those who agreed with him in wishing to unite the Lutherans and Calvinists, and especially in his supposed leaning toward the Calvinistic view of the Lord's Supper as shown in the difference between the original and the altered Augsburg Confession. The former said: "The body and blood of Christ are truly present in the Lord's Supper in the form of bread and wine, and are there distributed and received by the communicants; therefore the opposite doctrine is rejected." In the latter, the last clause is omitted. Luther did not approve the alteration, but tolerated Melancthon's change of doctrine. Many, however, called him

a Crypto-Calvinist. The truth seems to have been that he did not consider that either opinion was a sufficient bar to communion with Christ, and therefore thought that both of them ought to be allowed. The controversy was becoming violent before his death, but afterwards it broke out with great virulence, and continued with alternate success on each side for fifty years; during which time frequent attempts were made to suppress the Calvinistic opinions by imprisoning their leading advocates, and, at last, in 1611, by the execution of Chancellor Nicolas Crell. The term has also been applied to the Missouri Lutherans because of their acceptance of the doctrine of unconditional election.

CRYPTOGAMS (from Gk. *κρυπτός*, *kryptos*, hidden + *γάμος*, *gamos*, marriage). A general term that includes all plants below the spermatophytes (seed-plants); that is, the pteridophytes (ferns and their allies), bryophytes (mosses and their allies), and thallophytes (algæ and fungi). The name means 'hidden sex reproduction,' and, in contrast with it, the spermatophytes are often called 'phanerogams,' which means 'evident sex reproduction.' The names are not appropriate, since the sex reproduction of cryptogams is 'very evident,' and that of phanerogams is very much 'hidden.' The mistake arose from regarding stamens and pistils as sex organs. The term cryptogam, however, remains one of great convenience; but the term phanerogam is being replaced by the much more significant term spermatophyte (seed-plant). The old distinction between cryptogams and phanerogams, that the former reproduce by spores and the latter by seeds, is a false one. Both groups produce spores, but the cryptogams do not produce seeds. Since the pteridophytes are distinct from the bryophytes and thallophytes in developing a vascular system, they are very frequently called 'vascular cryptogams.' For full account, see articles under the different group-names.

CRYPTOGRAPHY (Gk. *κρυπτός*, *kryptos*, secret + *γράφειν*, *graphéin*, to write). The art of writing messages and documents in cipher, intended to be read only by those possessing the key. The use of secret methods of correspondence on important matters of state is of considerable antiquity. Plutarch and Gellius tell of a method employed by Spartan ephors in communicating with their generals abroad, which has received the name of *scytale*, from the staff used in deciphering it. A narrow strip of parchment was first wound spirally upon the staff, its edges just meeting, and the message was then written along the line of jointure. When it was unwound, the broken letters could afterwards be read only by rolling the parchment upon a duplicate staff in possession of the general to whom it was sent. This is but one of a large number of mechanical devices for reading secret dispatches, such as papers pierced with holes, to be laid over the document, revealing only such words or letters as compose the secret message.

Cryptography, in its stricter sense of the use of a cipher alphabet formed either by changing the value of the different letters, or by substituting for them groups of letters, numbers, or arbitrary symbols, if not of Semitic origin, was at least already known to, and used by, the sacred writers, in its simplest form of using the alphabet in its inverted order. By the Jews this form is known

by the name of *Atbos*, a word formed from *A*, the first letter of the Hebrew alphabet; *T*, the last letter; *B*, the second; and *S*, the last but one. An instance of its use occurs in Jeremiah xiv., where the prophet, wishing to veil his meaning from all but the initiated, writes *Shehach* instead of *Babel*, using the second and twelfth letters from the end of the alphabet, instead of from the beginning. Julius Cæsar's 'quarta elementorum littera,' in which *D* takes the place of *A*, and *E* of *B*, is only a variant of this simplest form of cipher, and Suetonius states that a like method was employed by Augustus. In mediæval and modern times, many scholars have turned their attention to cryptography, among them John Trithemius, Abbot of Sponheim, in his *Polygraphia* (1500); Anastasius Kircher, and his pupil, Kaspar Schott, whose work, *De Magia Universalis* (Würzburg, 1676), contains a cryptographic table that lies at the foundation of the modern cipher telegraph systems. It consists simply of the alphabet repeated twenty-four times in horizontal rows, each successive row dropping off one or more letters from the beginning, and adding it at the end. Thus, in the second row, *B* stands under *A*, *C* under *B*, etc. In the third *C* represents *A*, in the fourth *D* = *A*, etc. Thus correspondents have a choice of twenty-four alphabets, it being necessary only to agree between themselves upon the first or key letter. For diplomatic purposes, this form is much too simple, since any one could decipher dispatches made in this way, by the simple mechanical task of making at most twenty-four versions. Accordingly, various methods of complicating the cipher have been tried, one simple and effective way being that which is known in France as the method of Saint-Cyr. It consists in using alternately two or more of these twenty-four alphabets, the order in which they are to be used being determined by a key-word previously agreed upon. Thus, if the key-word is *Army*, four alphabets are to be used, namely those in the rows beginning respectively with *A*, *R*, *M*, and *Y*. Various other elaborations have been sometimes employed, such as arbitrarily changing the sequence of the letters of the alphabet, inserting at regular intervals letters or symbols that have no meaning, "nulls and insignificants," Bacon called them, or using groups of letters to represent separate letters. Of the last-named variety is the famous biliteral cipher of Bacon himself, consisting of various combinations of *A* and *B*, arranged in groups of five. Thus, *aabab*, *ababa*, *babba* = fly. Used in this way, such a cipher would be but little more difficult to detect than any ordinary set of single symbols. But Bacon went a step further; for the *a*'s and the *b*'s of his groups he substituted two fonts of type, differing so slightly as to present little distinction to the untrained eye. These, called respectively the *a* font and the *b* font, can be used for setting up any ordinary page of printed matter, when by the proper admixture of the two fonts, each successive group of five letters on the page may be made to stand for a single letter in Bacon's biliteral system. The fact that Bacon took a deep interest in cryptograms is probably the origin of Ignatius Donnelly's theory that the Shakespearean plays contain a cipher that if interpreted would prove that Bacon wrote them. And recently a still bolder attempt has been made by a certain Mrs. Gallup to apply the biliteral

cipher to the early Shakespeare folios, in which, as is generally known, more than one variety of type was used. The general principle involved in Bacon's method, that of representing the whole alphabet with groups and combinations of two symbols only, lies at the basis of many modern methods of signaling—the dot and dash of the Morse telegraphic code, the right and left waving of flags in military or naval signaling, etc.

In spite of the best that modern ingenuity can do to complicate cryptography, the art of deciphering cryptograms has well-nigh kept pace with it. Indeed, it is hardly too much to say that a code based upon any regular mathematical principle may be solved by ingenuity and patience. If the language of the document is known in advance, the relative frequency with which the letters of the alphabet normally occur in that language forms an important initial clue. Thus *e* is the letter of most frequent occurrence not only in our own language, but in French and German as well. In English the next in order of frequency are *t, a, o, n, i, r, s, h, d, l, c, w, u, m*, etc. Single letters must be either *a, i, o*. Words of two letters most likely to occur are *of, to, in, it, is, be, he, by, or*, etc. Double letters are most apt to be *ee, oo, ff, ll, or ss*. If there is doubt whether the cipher is in Latin, English, French, or German, the lack of double letters at the end of words suggests that it is Latin; if but few words end with double letters, it is probably French; if they are very numerous, it is German. A highly inflected language, like Latin, or even the Romance languages, with their complicated conjugations, must be easier to solve than English is, on account of the regular recurrence of the same combinations of letters in the inflectional terminations. Those who make a science of interpreting cipher documents receive no small assistance from a knowledge of the frequency with which certain symmetrical combinations of letters occur in the vocabulary of a language. Thus, the combination which may be represented for convenience by the formula *abab* is comparatively rare in English: one may cite *papa, dodo*; in French, *tête, bébé*. The form *abeba* is found in *level*; Fr., *rêver*. In German, the formula *abba* gives only *Anna, Ebbe, Egge, Esse, Otto*; in French, the formula *abcdabc* gives only two words, *cherche* and *quelque*.

Besides the writers on cryptography already mentioned, readers interested in the subject may be referred to John Baptist Porta, *De Furtivis Literarum Notis* (1563); Blaise de Vigenère, *Traité des chiffres* (1587); Thicknesse, *A Treatise on the Art of Deciphering and of Writing in Cipher* (1772); and among more modern writers, J. L. Kluber, *Kryptographik* (Tübingen, 1809); Romani, *La cryptographie dévoilée* (1875); and Fleissner, *Handbuch der Kryptographik* (Vienna, 1881).

CRYPTU'RI (Neo-Lat. nom. pl., from Gk. κρυπτός, *kryptos*, hidden + οὐρά, *oura*, tail). An order of birds, the tinamous, occupying a singular position and placed by Stejneger near the Apteryx and certain extinct forms. They differ from all other Carinate (q.v.) in the character of the palate, which is like that of the ostrich. The order contains only a single family, which includes perhaps fifty species, all found only in South America. See TINAMOU.

CRYSTAL. See CRYSTALLOGRAPHY.

CRYSTAL CLASS and CRYSTAL SYSTEM. See CRYSTALLOGRAPHY.

CRYSTALLIN. See GLOBULIN.

CRYSTALLINE LENS (Fr. *cristallin*, Lat. *crystallinus*, Gk. κρυσταλλινός, *krystallinos*, from κρυσταλλος, *krystallos*, crystal, from κρυσταναι, *krystancin*, to freeze, from κρύος, *kryos*, frost). A biconvex, transparent, solid body, situated immediately behind the pupil of the eye, and imbedded in the vitreous humor. Through it the rays of light from any object must pass to reach the retina. The crystalline lens is more convex on its posterior than on the anterior surface, and its shape and consistency vary at different periods of life. In early youth it is nearly spherical and soft; as age advances it becomes flattened and firm. In the adult human being it measures three-eighths of an inch transversely, and one-sixth of an inch in antero-posterior diameter. The lens is retained in position by a capsule of equal transparency, composed of tissue exactly similar to the elastic layer of the cornea. The lens has no vascular connection with its capsule, but is nourished by means of a very delicate layer of nucleated cells on its surface, which absorb nourishment from the capsule.

An increase in the refracting power of the eye for the purpose of near vision is called 'accommodation.' The mechanism of accommodation is as follows: The ciliary muscle contracts, drawing forward the choroid and ciliary processes and relaxing the zonula. The lens, which had been flattened by the tension of the zonula, assumes, through its own elasticity, a more spherical shape. The posterior surface of the lens alters but little in shape, being fixed rather firmly in place; but the anterior surface becomes more convex, and thus its refracting power is increased. The eye can see objects accurately at every distance between the 'far point' (the most distant point of distinct vision for that eye) and the 'near point.' The 'near point' is situated at that place at which the eye can begin to see clearly the fine print on a page held close to the eye and then moved slowly from it. Between the 'near point' and the eye vision is indistinct, because the ciliary muscle cannot, by any effort, produce the amount of convexity of the lens requisite for so short a distance. The term 'amplitude of accommodation' denotes the amount of accommodative effort it makes in order to adapt itself from its 'far point' to its 'near point.'

CRYSTALLINE ROCKS. A term used to include the igneous rocks (q.v.) and the metamorphic rocks (q.v.), both of which classes have a more crystalline texture than that of the sedimentary rocks.

CRYSTALLINE SCHISTS. See METAMORPHIC ROCKS.

CRYSTALLOGENY, kris'tal-lōj'ê-nī. See CRYSTALLOGRAPHY.

CRYSTALLOG'RAPHY (from Gk. κρυσταλλος, *krystallos*, crystal + γράφειν, *graphein*, to write). The science which treats of crystals. A crystal is a portion of inorganic matter which has a definite molecular structure, and an outward form bounded by plane surfaces called crystal faces. These faces are formed during the growth of the crystal, and have directions dependent upon the structure of the molecule of

the substance. Hence, only elementary chemical substances and definite chemical compounds form crystals. The molecular structure by which crystal shapes are conditioned is not supposed, however, to be that of the chemical molecule, but a molecular grouping of a larger order involving a number of such chemical molecules. Crystals are formed either where a molten mass solidifies by cooling, or when the amount of a substance dissolved exceeds in quantity the amount which the solvent can retain in solution under the conditions obtaining. Hence, when a solution is evaporated until supersaturated, crystals of the dissolved substance are thrown down. Solutions show, however, considerable inertness, and it is often necessary to introduce some solid substance—best of all, a crystal of the substance—into the solution, in order to start the process of crystallization. Exceptionally, crystals form directly from vapors, as in the cases of iodine and chloride of ammonia.

A substance which never forms crystals is said to be amorphous. A substance which possesses the regular molecular structure characteristic of crystals without the development of crystal faces is said to be crystalline. This condition often exists because crystals are crowded by their neighbors. The clearest proof that the regular structure is present, even when the faces are not developed, is furnished by an examination of the physical properties of the substance, for in a crystalline substance these have different values (or coefficients) for the different directions, and these values are in accord with the symmetry of the crystal faces when they are allowed to develop. For example, a sphere cut from a crystal of quartz does not, when heated, remain spherical, as would a piece of amorphous glass, but becomes distorted into a spheroid. This is due to the fact that the coefficient of expansion of the quartz is different in different directions, but is distributed with a symmetry in accord with, though somewhat different from, that of the crystal's shape.

CRYSTAL FACES AND ANGLES. On every single, or individual, crystal the dihedral or interfacial angles formed by the faces are never reëntrant. Moreover, the faces of a crystal are usually of several kinds or classes, and those which are alike, or of the same kind, are said to comprise a crystal 'form.' Faces belonging in the same form, unless perfectly smooth, have similar natural markings. The angles between faces of the same kind are identical in value. The instrument used in measuring crystal angles is called a goniometer (q.v.). Not only are the angles between the similar faces of a crystal constant in value, but in crystals of the same substance, no matter where found or how produced, they are of constant value, provided only the substance is pure and the measurements are made at the same temperature. Crystal angles are, therefore, individual and characteristic for each substance, and substances may be identified by measurement of their angles. Although the angles are characteristic and definite in size in crystals of the same substance, the size and relative developments of the faces themselves may vary between the widest limits, since these depend upon the accidents of growth (the feeding of crystal substances to the enlarging crystal), and not upon the crystal's characteristic structure—the cause is external, not internal. Crystal

faces are, therefore, described in terms of their direction only, not of their absolute position in space. The groups of faces or forms which occur upon crystals of a single substance are found to have the same kind of symmetry, though as between crystals of different substances the symmetry may be quite different. Nearly all crystals have a centre of symmetry and one or more planes and axes of symmetry.

CRYSTAL CLASSES. No less than thirty-two crystal classes are called for by the mathematical theory which is based on the study of the properties of crystals. The edifice of crystal knowledge is one of the best founded in theory of any in the realm of physical science. Believing the origin of crystal structure and shape to lie in the grouping of the molecules, crystallographers set themselves the task of determining how many arrangements of points in space were possible if certain assumptions were made in accordance with properties known to be common to all crystals. It was found that thirty-two, and only that number, were possible, and, as regarded their symmetry, twenty-three corresponded exactly to the twenty-three kinds of crystal symmetry then known. It is the best possible proof of the general correctness of the theory that in the next eight years representatives were discovered among crystals of six of the nine remaining classes of crystal structure, and none were found not in correspondence with the classification. The thirty-two classes, known or possible, of crystal symmetry fall into six larger groups called 'crystal systems,' though some authors prefer to subdivide one of the systems, making the number seven. Crystal faces being described and named in terms of their directions, i.e. the relative intercepts which they make upon a system of coördinate axes, crystal systems are determined by the kinds of coördinate axes which are suited to the symmetry and which will allow of the simplest calculations. The six systems are known as (1) triclinic, which includes two classes; (2) monoclinic, which includes three classes; (3) orthorhombic, which includes three classes; (4) tetragonal, with seven classes; (5) hexagonal, with two divisions—the trigonal, seven classes; and hexagonal, five classes; and (6) isometric, which has five classes.

MODIFICATIONS. If the faces on a crystal could make any angle with the coördinate axes—any relative intercept whatsoever—the description of forms and faces would be attended with the greatest difficulty. Fortunately, however, there is found to be a law of crystals known as the *law of rational indicies*, which greatly limits the number of possible faces. This law, while empirical, finds a ready explanation in the accepted theory of regular molecular structure. Chemical replacement processes bring about change in the composition in a substance without giving opportunity of readjustment of crystal forms. Thus, substances are found to occur in forms characteristic of other substances. These false forms are known as 'pseudomorphs.' Many chemical compounds have been observed in more than one kind of crystals. Such bodies are said to be dimorphous, trimorphous, or polymorphous. It is a law, however, that for each chemical compound there is a definite kind of crystal determined by its substance, and when two or more varieties of crystal are found, it indicates that two kinds of substances exist, which chemists

have not distinguished (isomerism). Similarity in chemical composition of substances is apt to be attended with similarity of crystal form, a relationship described as isomorphism (q.v.). Two or more crystal individuals of the same kind when grown together and partially parallel are known as twin crystals.

TWIN CRYSTALS.

A, E, Isometric system; B, Trigonal system; C, Tetragonal system; D, F, Orthorhombic system.

DIVISIONS OF CRYSTALLOGRAPHY. Crystallography is treated under the separate divisions of morphological crystallography, which concerns itself with external forms of crystals; crystallogeny or chemical crystallography, which has to do with the genesis or growth of crystals; and physical crystallography, which is concerned with the physical properties of crystals. Included in this latter division of the subject is optical crystallography, the application of which to mineralogical investigation laid the foundation for the modern science of petrology (q.v.) or petrography.

Consult: Dana, *Text-book of Mineralogy*, parts i-iii (New York, 1898); Groth, *Physikalische Krystallographie* (Leipzig, 1895); Moses and Parsons, *Elements of Mineralogy, Crystallography, and Blowpipe Analysis* (New York, 1897). See MINERALOGY.

CRYSTALLOIDS (Gk. κρυσταλλοειδής, *krystatloeidēs*, like crystal, from κρυστάλλος, *krystatlos*, crystal + εἶδος, *eidos*, form). Crystals of reserve proteids in plants. They occur in small proteid granules (see ALEURONE), in the endosperm (the food-bearing tissue surrounding the embryo), and in the embryo of various seeds. Similar crystals are found free in the outer cells of potato-tubers and in certain seaweeds. Crystalloids are angular in form, but their faces and angles are inconstant. They are insoluble in water, but absorb it and swell, as ordinary mineral crystals do not. They are insoluble in weak solutions but dissolve in strong solutions of common salt. The proteid material composing crystalloids belongs to the group of globulins. See also COLLOIDS.

CRYSTALLOMANCY (from Gk. κρυστάλλος, *krystatlos*, crystal + μαντεία, *mantēia*, divination). At one time a popular practice of divination accomplished by means of transparent bodies. A transparent jewel was employed, but a beryl was deemed most effective. The operator first muttered over it certain formulas of prayer and then gave it into the hands of a youth or

virgin—none others were pure enough to discern its revelations—who read in it the information required. The desired facts were conveyed by means of written characters on the crystal, but sometimes the spirits invoked were supposed to appear in the crystal to answer the questions asked. This method of divination is still practiced by magicians. For a graphic description of its employment, consult Shorthouse, *John Inglesant* (London, 1881).

CRYSTAL PALACE (so called because made of glass). An edifice erected in Hyde Park, London, for the World's Fair held in 1851. Designed by Sir Joseph Paxton, it was built of glass and iron, with floors of wood. Its length was 1608 feet and its area 21 acres. It cost £1,450,000. Every department of art and science was represented, and the visitors numbered over 6,000,000. Its materials were removed in 1854, and the structure rebuilt at Sydenham, eight miles from London. There the park and grounds cover nearly 200 acres, and a permanent fair is held. In 1853 a similar but smaller 'crystal palace' was erected between Fortieth and Forty-second streets on Sixth Avenue, New York. It was used for exhibitions and grand concerts, but was destroyed by fire in 1858. The locality is now Bryant Park.

CSABA, chō'bō, or **BÉKÉS-CSABA**, bā'-kāsh-chō'bō, a town of Hungary, in the County of Békés, situated in a fertile district about five miles from the White Kőrös, with which it is connected by canal, and 122 miles east-southeast of Budapest (Map: Hungary, G 3). Its industries are principally agricultural, and cattle-raising, wine production, and wheat and hemp growing. The women are noted for their skill in making linen and hemp fabrics. Csaba has the largest Protestant community of any town in Hungary, excepting Budapest. Population, in 1890, 32,244, of whom less than a fourth were Hungarians, and the rest Slavs; in 1900, 37,547.

CSÁNYI, chū'nyē, LÁSZLÓ (LADISLAV) (1790-1849). An Hungarian statesman. He was born at Csány (County of Zala), and served in the campaigns of 1809-15. He early manifested an interest in local politics, and became intimate with Francis Deák. In 1848 he was appointed commissioner plenipotentiary to various divisions of the Revolutionary army, and subsequently received from Kossuth a portfolio in the Ministry. After the surrender of the Hungarian army at Világos he refused to avail himself of the opportunity for flight; but as he had previously been one of the most active organizers of the revolution, so he now became a martyr to his convictions, and after a voluntary surrender to the Russians at Sarkad, he was delivered by them to the Austrians, and executed on October 10, 1849.

CSÁRDÁS, chār'dāsh (Hung., from *csárda*, tavern). The national dance of Hungary. It consists of two movements, the first a slow *lassu* in *lied* form and in four-fourth or two-fourth time. It is mostly in the minor mode. The second movement, *friss* or *frischka*, is an exceedingly lively dance also in four-fourth or two-fourth time. It is in the major mode and consists of eight and sixteen bar phrases, which are repeated. Toward the end the time is greatly accelerated and the rhythm becomes

CRYSTAL FORMS

1-5. TRICLINIC SYSTEM.
 6-10. MONOCLINIC SYSTEM.
 11-15. ORTHORHOMBIC SYSTEM.

16-20. TETRAGONAL SYSTEM.
 21-25. TRIGONAL SYSTEM.
 26-30. HEXAGONAL SYSTEM.

31-35. ISOMETRIC SYSTEM.

more and more complex, so that the whole piece has a wild, tumultuous, and abrupt character. In both parts of the *csárdás* the accent comes on the weak beat. The alternation from the *lassu* to the *friss* is made according to the will of the dancer, who motions to the players whenever he wants the change made. The figures of the *csárdás* vary greatly in different districts. The usual form opens with a stately promenade, which changes into a rapid whirling motion; the dancers then separate and carry on a sort of pantomime, the girl sometimes approaching, then retreating from her partner, who follows and finally seizes her. Again they whirl wildly around, then separate and go through much the same performance. The dance may be performed by any number of couples, but as no two couples are ever dancing identically the same figures at the same time, the whole gives a varied and complex appearance. See MAGYAR MUSIC.

CSENGERY, chên'gê-rî, ANTON (1822-80). An Hungarian statesman and publicist. He was born at Grosswardein and early devoted himself to journalism. After editing the *Pesti Hirlap* for three years he was in 1848 appointed ministerial councillor, and followed the Hungarian Ministry to Debreczin. In 1849 he returned to Budapest and devoted himself to literary pursuits. In 1857 he founded the review entitled *Budapesti Szemle*, which he conducted for twelve years. He was an active promoter of agricultural and trade societies, and was one of the chief founders and afterwards the director of the Hungarian Institute of Land Credits. In 1861 he was elected to the Diet, where he became, as the most intimate friend of Deák, a powerful leader of the Deák party. In addition to his excellent translation of Macaulay's *History of England* (latest ed. 1874), he was the author of several important and brilliantly written works in Hungarian, among which may be mentioned: *Historical Studies and Character Sketches* (2 vols., 1870); *History and Historians* (1874); *Memorial Address on Francis Deák* (1877). His collected works were published in Budapest in 1884.

CSIKY, chê'kê, GERGELY (1842-91). An Hungarian dramatist. He was born at Pankota (Arad), and after studying Catholic theology at Budapest and Vienna became professor at the Priests' Seminary in Temesvar. After an activity here of several years, he became a convert to Protestantism in 1878. Csiky is considered one of the greatest of modern Hungarian dramatists; he was equally effective in tragedy and comedy. He also wrote several successful novels and translated into Hungarian the works of Sophocles, Euripides, and Plautus, as well as standard works of French and English dramatists. Among his numerous plays, most of which have been highly successful, may be mentioned: The comedies *Jóslat* (The Oracle), *Mukányi*, and *Kaviar*; the tragedies *Janus*, *Spartacus*, *Nora*, and *Theodora*; and the popular drama *The Proletarians*.

CSOKONAI, ehô'kô-nô-ê, VITÉZ MIHÁLY (1773-1805). An Hungarian poet, born at Debreczin. He was appointed professor of poetry in the college at Debreczin in 1794, but resigned the post in 1795, in order to study law, and, with the exception of a brief connection with the gymnasium of Csurgó, he lived thenceforth in private, devoting himself wholly to literature. His

acquirements, particularly in linguistics, were notable. In poetry he was to some extent influenced by Földi, but remained essentially independent. He was preëminently a lyricist, in both the narrower domain of the folk-song and the larger realm of artistic poetry. His diction is simple and often naïve. Some pronounced defects of taste have met with the censure of the critics, but a distinguished place among modern Hungarian poets has been conceded to him. A collective edition of his works was published by Toldy in 1846. Two specimen poems rendered into German may be found in Schwicker, *Geschichte der ungarischen Litteratur* (Leipzig, 1889).

CSOMA DE KÖRÖS, chô'mô de kô'rôsh, SÁNDOR (1784-1842). An Hungarian traveler and Tibetan scholar. He was born April 4, 1784, at Körös, in Transylvania, and was educated first at the college of Nagy-Enyed, and subsequently at Göttingen, where he devoted himself especially to the study of Oriental languages. It was the dream of his life to discover the original home of his race, the Magyars, in Asia. In 1820 he set out on his pilgrimage for that purpose. He went first to Teheran, then to Little Bokhara, and finally settled for four years (1827-30) at the Buddhist monastery of Kanam on the confines of Tibet and India, where he studied Tibetan. He found to his disappointment that the Tibetan language had little bearing on the Magyar problem, but it led him to Calcutta to study Sanskrit, as the literature of Tibet is largely translated from the Sanskrit. At Calcutta, where he became the object of general attention on the part of British scholars, he devoted himself to cataloguing the Tibetan books, upward of 1000 volumes, in the library of the Asiatic Society of Bengal. He prepared, likewise, a Tibetan grammar and dictionary (1834), which is still a standard work, and he wrote a number of articles on Tibetan literature in the *Asiatic Researches*. Once more he set out on his old-time search to find the early home of the Magyars, and bent his way toward the western confines of China, but while on this journey he died at Darjiling, north-eastern India, April 11, 1842.

CSONGRÁD, chôn'grád. A market-town of Hungary, in the county of the same name, situated on a point of land at the confluence of the Theiss and the Körös, 70 miles southeast of Budapest (Map: Hungary, G 3). The inhabitants are chiefly engaged in the rearing of cattle, fishing, and the cultivation of the vine. Population, in 1890, 20,802; in 1900, 22,619.

CTENACODON, tê-nâk'ô-dôn. One of the rare primitive fossil mammals found in the Upper Jurassic rocks of Wyoming. It is known only by its lower jaw, which has a length of about one-half inch and indicates an animal of the size of a mouse. The teeth are of the multituberculate type, and consist of a prominent chisel-shaped incisor, four longitudinally compressed premolars, which are distinctly cutting teeth with serrated edges and grooved sides, and of which the fourth is much the largest, and two small molars with tubercles surrounding the central cavities on their crowns. This type of dentition indicates relationship to the Monotremata (*Ornithorhynchus* and *Echidna*), which, together with the fossil *Ctenacodon* and its allies,

Plagiaulax and Polymastodon from the Eocene, and other Mesozoic and Tertiary genera, are included as a subclass, Prototheria: a group showing affinities to the marsupials among the metatherian mammals. Consult: Cope, "The Tertiary Marsupialia," in *American Naturalist* (Philadelphia, 1884); Marsh, "American Jurassic Mammals," in *American Journal of Science*, vol. xxxiii., ser. 31 (New Haven, 1887); Osborn, "On the Structure and Classification of the Mesozoic Mammalia," in *Journal of the Academy of Natural Science*, Philadelphia, ser. 2, vol. ix. (1888); id., "Supplementary Note on the Above," in *Proceedings of the Academy of Natural Science* (Philadelphia, 1888).

CTENOID (ténoid) **FISHES** (Gk. κτενοειδής, *ktenoieidēs*, comb-like, from *kteis*, *kteis*, comb + *eidōs*, *eidōs*, form). One of the four orders into which Agassiz classified fishes, the others being *cycloid*, *placoid*, and *ganoid*. The name refers to the scales, which bear teeth or sharp projections on the posterior or free margin. These teeth may be in one or more rows. This classification has been abandoned, since evidently unrelated forms may show this character. Such ctenoid scales characterize the more recent fishes, as perch and flounder.

CTENOPHORA, tē-nōf'ō-rā (Neo-Lat. nom. pl., from Gk. *kteis*, *kteis*, comb + *phérein*, *pherein*, to bear, carry). A class of coelenterates, composed of jellyfish, characterized by the absence of nettle-cells and the near approach to bilateral symmetry. The ctenophores are distinguished by the presence of eight external rows of minute plates, made from fused cilia, beginning near the aboral pole and running down toward the mouth, which have given the name 'comb-jellies' to this group. The body is almost transparent, and is oval, more or less elongated, rarely band-shaped, as in the girdle-of-Venus (q.v.). The gastrovascular system of canals is rather complicated and differs from that of other coelenterates by opening at the aboral pole, with two small outlets; between these is a remarkable and complicated sense-organ, which serves as an eye and a positional organ. The body is often prolonged on each side of the mouth as a flap or fold, by the movements of which the animals swim. The eight rows of so-called swimming plates are probably quite as much respiratory as locomotive. On each side of the body is a long tentacle, with branches on one side, capable of being greatly extended or completely retracted into a protecting sheath. In a few forms these tentacles are wanting. More than 100 species of ctenophores are known, all marine. The largest ones are only three or four inches in length, but the girdle-of-Venus is sometimes five feet broad. They are usually colorless, but are sometimes yellowish or brownish, and the movement of the swimming plates sometimes makes them strikingly iridescent. Many species are notably phosphorescent. Consult: L. Agassiz, *Contributions to the Natural History of the United States*, vol. iii., pt. 2 (Boston, 1860); A. Agassiz, papers in *Memoirs of the Museum of Comparative Zoology* (Cambridge, Mass., 1875 et seq.). See COELENTERATA.

CTESIAS, tēs'ī-as (Lat., from Gk. Κτησίας, *Ktēsias*). A Greek physician and historian of the fifth century B.C. He was a native of Cnidus. In B.C. 415 he was captured by the Persians, and

on account of his knowledge of medicine was kept at the Persian Court some seventeen years. In 398 he returned to his home, where he wrote a comprehensive work on Persia (Περσικά, *Persika*) in twenty-three books, based on the knowledge he had gained by his residence and researches at the Persian capital. Of this only fragments remain, and an abridgment in Photius; the latter has likewise preserved an abridgment of another work by Ctesias on India; we also hear of a geographical treatise. The fragments are edited by C. Müller in an appendix to Dindorf, *Herodotus* (Paris, 1844). Consult: Blum, *Herodotus und Ctesias* (Heidelberg, 1836); Wachsmuth, *Einführung in das Studium der alten Geschichte* (Leipzig, 1895).

CTESIBIUS, tē-sib'ī-ūs (Lat., from Gk. Κτησίβιος, *Ktēsibios*). A Greek who was famous for his inventions in mechanics. He lived about B.C. 250. He was born at Alexandria. We owe to him and his pupil, Hero of Alexandria, the force-pump, the water organ, and also the discovery of the elastic force of air, and its application as a motive power. His work on hydraulic machines is lost.

CTESIPHON, tēs'ī-fōn (Lat., from Gk. Κτησιφών, *Ktēsiphōn*), now TAK-I-KESRA. A city on the eastern bank of the Tigris, the common winter residence of the Parthian kings, and finally the capital of the Parthian kingdom. It fell into the hands of the Arabs in A.D. 637, and was later abandoned, its ruins being used to furnish material for the neighboring Bagdad. Its site is today marked by scanty remains, including, however, the façade and arched hall of the Parthian palace. On the opposite bank are the ruins of Seleucia, and the two cities are together called by the Arabs El-Modein.

CTESIPHON. An Athenian orator of the fourth century B.C. He proposed the presentation of a golden crown to Demosthenes for his sacrifices in his country's cause; for this he was prosecuted by Æschines, but was defended successfully by Demosthenes in his oration *On the Crown* (B.C. 330).

CUAUTLA DE MORELOS, kwā'ōō'tlá dá mó-rā'lōs, or **CUAUTLA MORELOS**. A city in the State of Morelos, Mexico, situated on the river Cuautla (Map: Mexico, K 8). It is the centre of a fertile sugar-growing district, and has several sugar-mills. Cuautla de Morelos was at one time the residence of the Governor of the State, and is famous for its heroic resistance under José María Morelos y Pavón in 1812 against the attacks of a superior army of Royalists. Population, about 14,000.

CUBA, kū'bā, *Sp. pron.* kōō'bā (West Indian *Cubanacan*). An island republic of the West Indies, the largest of the Greater Antilles, situated mainly between latitudes 20° and 23° N., and longitudes 74° and 85° W., and lying south of the Florida peninsula, from which it is separated by Florida Straits, about 125 miles wide, and east of the Yucatan peninsula, from which it is separated by the Yucatan Channel, of nearly an equal width (Map: West Indies, G 3, and special map). The island of Cuba lies nearly east and west; it is long and narrow, having its greatest breadth of about 100 miles at the southeast, and a width of less than thirty miles in its narrowest part, near Havana. The total length of Cuba is about 780

miles, and it has an area of 35,994 square miles, including its small islands and the Isle of Pines.

TOPOGRAPHY. The coast of Cuba is exceedingly broken, being indented by numerous gulfs or bays. The chief of these on the south coast, commencing at the west, are the following: Corrientes, Cortez, Matanaua, Cuzones, and Guacanabo. There are many fine harbors, with narrow, tortuous entrances opening within into broad expanses—as at Havana. The north coast is in great part bordered by coral islands or reefs, which stretch from Nuevitas to Cardenas, and render approach to this part of the coast extremely difficult and dangerous. On the south is the large Isle of Pines (Isle de Pinos), with many small islets associated with it, and, further eastward, a group of many islets, known as the Jardines de la Reina.

The western part of Cuba is traversed by a mountain range, Sierra de los Organos, 2500 feet high. The celebrated tobacco region, Vuelta Abajo, is on its south slope. The middle part of the island has an undulating surface, broken only here and there by hills, such as the group near Trinidad, on the south coast. The land rises eastward, and the eastern province, Santiago, consists in the main of an elevated plateau, 1000 to 2000 feet high, deeply scored by streams. Along the south coast of this province, stretching from Cape Cruz eastward, is the Sierra Maestra, much the highest land of the island, its highest peak, Turquino, being 8320 feet in height. Much of the coast west of Cape Cruz is low and marshy. The great Zapota swamp borders this coast. The rivers are numerous, but short, and in general unfitted for navigation; the river Cauto, in the southeastern part, is about 150 miles in length, and is navigable for a distance of 50 miles to Cauto Embarradero.

CLIMATE. The climate of Cuba on the coast is extremely equable, but less so inland. The average temperatures for January vary from 72° F. at the north, to 75° F. at the south, and the July temperatures average about 82° F.; the coast temperatures seldom exceed 90° F. in summer, nor go below 65° F. in winter. In the mountain regions, however, the temperature goes lower than 50°. The rainfall is excessive in the north-eastern section, reaching over 100 inches in some places; at Havana it is over 50 inches; the southern coast region has, however, much less rainfall. The chief rainy season is in summer, but rain falls throughout the year. The prevailing winds are the Trades, from the northeast. Cuba lies within the path of the West Indian hurricanes, which are liable to occur during August, September, and October. The unhealthy conditions formerly prevalent were largely due to the absence of sanitary precautions. Yellow fever, the local scourge, was an annual epidemic. Since 1901, however, the energetic administration by the military authorities of the sanitary measures recommended by a commission of American scientists has resulted in yellow fever being confined to a few isolated cases. See HAVANA; YELLOW FEVER.

FLORA. The vegetation of Cuba is tropical in its species and luxuriance, although, strangely enough, trees usually found only in colder climates are also found even in the Cuban lowlands. Thus, the pine grows side by side with the mahogany tree. Palms are plentiful. The majuga, with its fibrous bark and beautiful hard-wood

trunk, and the granadillo, the baria, Cuban ebony, lignum vitæ, Cuban cedar, Cuban mahogany, the acana, jiqui, cottonwood, logwood, rosewood, and the odd jagüey, are all indigenous. Among the economic fruit and vegetable products may be mentioned the banana, cocoanut, pineapple, orange, lemon, lime, fig, date, tamarind, mango, guava, zabote, pomegranate, anona, melon, bean, cassava, and sweet potato.

FAUNA. The fauna of Cuba includes rabbits, the hutia (q.v.), and bats; the domestic hog, dog, and cat (which have run wild and become very numerous); over 200 species of birds, including scavenger buzzards and vultures, grouse, quail, snipe, and wild turkeys; alligators, chameleons, iguanas, small lizards, and tree-toads. Few species of snakes are found, although some, like the majá, grow to large size (16 to 18 feet). The land-crabs, which move over the country in countless numbers, and grow in size up to eight inches in diameter, are very annoying, as are also the flying cockroaches. Scorpions, centipedes, and tarantulas are plentiful. Insects are numerous in species and limitless in numbers; among these are ants, beautiful fireflies, and what has been described as the 'worst pest on the island,' the nigua or jigger. Nearly 650 species of fish have been found in Cuban waters, among which are large sharks, the giant aguja (weighing sometimes 500 pounds), the snoring ronco, gallego, garfish, and the parego or red snapper. The porpoise and manatee are also found in numbers in the coast waters.

GEOLOGY. Cuba was largely formed in late Tertiary times. The rocks composing it are mainly recent stratified deposits. There are irregular areas of granite, serpentine, and eruptive rocks near the middle of the island, surrounded by Tertiary beds extending over most of the island to the coast. The Sierra de los Organos is composed mainly of Triassic sandstones, and the Sierra Maestra of Cretaceous and Tertiary beds.

MINERAL RESOURCES. The mineral deposits of Cuba are confined chiefly to the eastern province of Santiago de Cuba, and are exploited almost exclusively by American companies. The chief mineral, iron, was first worked on a large scale in 1884, and the output has since then grown at a steady rate, increasing from 23,977 tons in 1884 to 452,559 tons in 1897. The total production of iron ore for that period amounted to 3,443,444 tons, of which the United States took 3,401,077 tons. The ore is of a good quality and especially adapted for the manufacturing of Bessemer steel. In the last war with Spain, the mining industry, like all economic activities of the island, suffered greatly, in some of the mines work being completely suspended. Another mineral product of importance is manganese, which is also found in the Province of Santiago de Cuba and exported to the United States. Copper was mined in Cuba as early as the sixteenth century in the Sierra del Cobre, Santiago de Cuba; and prior to the discovery of copper in the United States the latter imported most of the copper for its domestic use from Cuba. With the increased cost of production, owing to the exhaustion of the surface deposits, and the discovery of copper in the United States, copper-mining ceased on the island. Gold, silver, and lead are found in small deposits. In general, the mining industries of the island are little developed.

AGRICULTURE. Owing to its climate and soil, Cuba is exceptionally well adapted for agriculture, but long years of political oppression and unfavorable labor conditions, combined somewhat with the indisposition for work inherent in the natives, have retarded the agricultural development of the island. Prior to the late war the number of farms was estimated at over 90,000, valued at nearly \$200,000,000. But the war, with the reconcentrado policy, caused a great destruction of farms and live stock. Thus the census of 1899 gives the number of farms at 60,711, with a total area of 8,542,000 acres, of which, however, only a little over one-tenth was under cultivation. The land is cut up into exceedingly small tracts. The holdings of less than eight acres ($\frac{1}{4}$ caballeria) constitute about 63 per cent. of the total number; those of between eight and sixteen acres comprise about 19 per cent.; while those above thirty-two acres constitute only 7 per cent. Out of the 50,000 farms of less than sixteen acres, about 24,000 are occupied by white renters, 10,300 by colored renters; 9600 are occupied by white owners, 2800 by colored. The participation of colored inhabitants in agricultural pursuits is confined largely to the smaller farms.

Sugar.—Sugar was one of the earliest products of the island. Cane is supposed to have been introduced in 1523, but its cultivation for three centuries was insignificant. The annual output prior to the opening of the nineteenth century averaged about 28,000 tons, which was increased by the end of the first half of the century to about 250,000. During the latter half of the nineteenth century also the tendency was upward, although the industry was greatly handicapped by frequent internal disturbances and by the low price of sugar, brought about largely by the competition of beet-sugar. In 1853 the output of the island was 322,000 tons; in 1870 it had increased to 726,000. Twenty years later the amount had fallen to 632,368 tons; but in 1894 there were produced 1,054,214 tons, or nearly 50 per cent. of the world's output of cane-sugar. Even in 1895, the first year of the Cuban war, the output exceeded 1,000,000 tons; but in the following year it fell to 225,221, with a further decrease in 1897 of 13,221 tons. Since the Spanish-American War the figures have grown to 335,668 tons in 1899, 300,073 tons in 1900, and 600,000 in 1901. The cultivation of sugar differs from most branches of agriculture in that it requires a large outlay of capital for its operation. The successful *colonia*, or sugar plantation, generally contains several thousands of acres, several miles of private railway for the transportation of the cane to the mills, numerous buildings, and costly plants of machinery for the manufacture of the sugar. Besides this, buildings for the housing of a thousand or more employees have to be provided. The cane, which requires replanting but once in seven years, is chiefly grown on elevated land, no fertilizer being required.

Tobacco.—Next to sugar, tobacco is the most important agricultural product of the island. The cultivation of that plant in Cuba dates from about 1580, when it was introduced into the district of Vuelta Abajo, in the Province of Pinar del Rio, which has since been famous for the quality of its tobacco. The output of the province is nearly 50 per cent. of the entire crop of

the island. The plant is also extensively cultivated in the provinces of Havana and Santa Clara. At the outbreak of the late war, the normal annual output was over 62,000,000 pounds, but in 1896-97 the amount had dwindled to about 41,000,000 pounds; in 1897-98 to 9,680,000 pounds; in 1898-99, however, it rose to 24,400,000 pounds. The condition of the tobacco industry is, on the whole, more hopeful than that of sugar, because it suffers less from competition and because the raw tobacco, although the tariff is high on the finished product, such as cigars, is admitted to the market of the United States with only a slight import duty.

Other Agricultural Products.—Corn, or maize, is grown all over the island and is used extensively for the feeding of domestic animals. Rice is also cultivated, but the harvest goes entirely to satisfy the domestic demand. Wheat, barley, and oats, chiefly for economic reasons, are little cultivated, and it is doubtful whether the output of wheat will ever meet the home demand. Sweet potatoes are raised almost everywhere and form a very important food article. The natural conditions are exceedingly favorable for the cultivation of fruit. The banana is grown in enormous quantities, and besides being extensively exported to the United States, figures very prominently in the diet of the poorer native classes. Oranges of an excellent quality also abound, and their cultivation will undoubtedly be extended owing to the recent destructive frosts in Florida. Coffee, once an important product, is now (1902) in a state of decline and the output is barely sufficient for home consumption. Pineapples, coconuts, limes, lemons, and numerous other southern fruits grow in abundance, but thus far very little has been done by the natives toward their systematic cultivation, the fruit interests being in the main in the hands of foreign (chiefly American) companies.

The forests of Cuba are supposed to occupy about 50 per cent. of the total area of the island. Besides the valuable mahogany and cedar woods which find their way to foreign markets, there are about thirty species of the palm, of which the royal palm is probably the most useful tree on the island, every part of it from the leaves and fibre to the roots being utilized by the natives. Of the forest area the State owns 1,250,000 acres.

The natural conditions for the raising of live stock are very favorable, and at one time this branch of agriculture was in a high state of development. During the decades preceding the late war, however, the heavy import duties on live stock, whose effects were aggravated by periods of rebellion, kept the supply far short of the natural demand, and most of the animals necessary for agricultural purposes and slaughtering had to be imported. In 1894 the live stock of the island numbered 584,725 horses, 2,485,766 cattle, 570,194 hogs, and 78,494 sheep, with a total value of over \$101,000,000. The effect of the late war on the live stock of the island may be seen from the census figures of 1899, which give the number of horses at 88,000; cattle, 376,650; hogs, 358,868; and sheep, 9982.

MANUFACTURES. The manufacturing industries of Cuba are confined to the production of sugar, and of cigars and cigarettes—both industries closely connected with agriculture. In fact, the first is so intimately connected with the

plantations that it is rather to be regarded as an adjunct of agriculture than a separate industry. In the case of tobacco products the line of demarcation is more distinct, and, while some of the large manufacturing companies have their own plantations, most of them prefer to buy the raw material of the planters. The centre of the cigar manufacturing is Havana, and most of the large firms are in the hands of foreigners. This industry has of late begun to show some signs of decline owing to the heavy import duties imposed by foreign countries, and the general tendency is to export Cuban tobacco in its raw state.

LABOR CONDITIONS. One of the prominent retarding factors in the agricultural and industrial development of Cuba is the scarcity of labor. The liberation of slaves had a detrimental effect on the economic development of Cuba as well as the West Indies in general. With the supply of black labor cut off, the Chinese coolies became the chief factor in the Cuban labor market, but, owing to real or alleged inhuman treatment, the Chinese Government prohibited further emigration to the island. Since then Spain and the Canary Islands have been drawn upon to some extent, but the supply falls short of the demand. The war still further depleted the ranks of labor, and according to the census of 1899 only 299,197 persons were engaged in agriculture, fishing, and mining; 93,034 in manufacturing and mechanical pursuits. To the sugar planter the problem of securing competent laborers is serious. In the tobacco industry the labor question does not offer such difficulties, owing to the fact that the work requires great skill, and white labor can be utilized to a large extent. In the mining industry the problem is also simplified, largely because of more favorable climatic conditions in the mountain districts.

TRANSPORTATION. Owing to the oblong shape of the island and the comparative evenness of the surface, the transportation problem presents few natural difficulties. The existing facilities, however, are utterly inadequate. The roads are mostly uncarred for, and during the rainy season become almost impassable. Even the *Camino Central*, the chief highway of the island running from Havana to Santiago de Cuba, is for the most part in a very poor condition. The railway lines, while exceeding in mileage the length of the island, are concentrated chiefly in the western and central parts. They are mostly narrow-gauge lines with light rails and poor roadbeds. The centre of the railway system is Havana, from which lines lead to Matanzas, Pinar del Rio, Cardenas, Cienfuegos, Santa Clara, Camajuani, and a number of minor places. East of the Province of Santa Clara there are only a few short lines, of which the most important are the one connecting Puerto Principe with its port, Nuevitas, and the few short lines leading from Santiago de Cuba into the mining region of the province. The total length of the seventeen public railways is over 1200 miles, while the 107 private roads (mostly belonging to sugar plantations) have a total length of 865 miles. The Central Railway connects Santa Clara with Santiago de Cuba, and thus gives uninterrupted railway communication from one end of the island to the other.

COMMERCE. The commerce of Cuba, under the Spanish régime, notwithstanding the restrictions placed upon it, was, relatively speaking, exten-

sive. By a system of heavy protection, which had grown out of the monopoly idea of the seventeenth century, most of the commerce was diverted into Spanish channels, although only few of the demands of the island could be supplied by Spain from its domestic products. But the adoption of a reciprocal treaty between the United States and Spain gave an impetus to commercial relations between the former power and Cuba. The exports of merchandise from the United States to Cuba rose from \$12,224,888 in 1891 to \$24,157,698 in 1893, while the imports of Cuban products into the United States increased during the same period from \$61,744,395 to \$78,706,506. With the expiration of this treaty in 1894 and the beginning of the Cuban war in the following year, the commerce of the island began to decline, and the exports and imports in 1899 amounted to \$65,000,000 and \$45,300,000 respectively, as against \$64,000,000 and \$93,000,000 in 1892. Thus the exports had remained practically the same, while the imports had fallen off over 50 per cent. The figures for 1900 showed but a slight increase over the preceding year. The principal imports into Cuba in 1900 were as follows: provisions and liquors (45 per cent.); textiles (15 per cent.); metals, manufactures, and machinery (about 9 per cent.); and live stock (about 6 per cent.). The exports for the same years consisted of sugar and its products, over 36 per cent.; tobacco and its products, 53 per cent.; the rest being made up of iron ore, fruits, wood, etc. Comparing the mean annual value of imports by countries for 1894-95 (\$67,335,800) with that for the period of 1899-1900 (\$64,965,800), we find that Spain's share fell off from about 44 to less than 16 per cent.; that of the United States increased from about 33 to over 45 per cent., while that of Great Britain practically remained the same, over 15 per cent. The export trade of Cuba for 1900 was distributed as follows: United States and possessions, 68 per cent.; United Kingdom and possessions, 12 per cent.; Spain, 2 per cent.; and Germany, 11 per cent. The United States buys almost the whole of Cuba's sugar and a large portion of her tobacco and mineral products, and sends to the island in return live stock and animal products, flour, and metal manufactures, including railway supplies. Havana was visited in 1900 by 3276 vessels of 2,078,126 tons.

BANKS. Probably no other business reflects so closely the general economic condition of a country as banking. It is therefore not at all surprising to find the banking business of Cuba in a deplorable state. Of all the banks founded in Cuba in the course of the last three decades of the past century, only two survived the Spanish-American War, viz. the Spanish Bank of the Island of Cuba and the Bank of Commerce. The former, though owned by private stockholders, was a semi-official institution under the Spanish régime, being subject to certain official regulations, and its governor appointed by the Spanish Government. It acted as fiscal agent of the Government, collecting the internal revenue, and floating the paper currency. The Bank of Commerce owes its uninterrupted, though by no means entirely prosperous, existence to its valuable railway and other properties which have helped indirectly to swell its banking business, and have yielded a revenue out-

side of that derived from its purely banking operations.

FINANCE. The history of the currency of Cuba does not differ much from the lamentable record made by nearly all of the Spanish-American countries as well as Spain. It is the story of desperate, but in the end of vain, attempts to make the fiat of Government pass for commodities of intrinsic worth in the monetary transactions of the people. For a time, such attempts succeeded, but in the end the Government was compelled to refuse its own worthless currency. This is particularly true of the paper currency of the Spanish Government, which was worth at the time of American occupation but seven cents on the dollar. Even before that event, when the Spanish Government accepted 10 per cent. of customs dues in that currency, the price rose only to 15 cents, varying between that value and 12 cents. The last issue of Spanish paper currency took place during the late war, when \$20,000,000 of paper money was put in circulation through the Spanish Bank of the Island of Cuba upon the security of \$6,330,000 (silver) deposited with the bank. In spite of having been made legal tender, the paper went at a discount from the start, and as soon as the Government had shown by its illegal withdrawal of the silver fund from the bank that it did not mean to depart from its old-time methods, the paper was repudiated throughout the island, until, as stated above, the action of the Government in accepting the paper in payment of 10 per cent. of customs dues raised it from 12 to 15 per cent. of its par value.

The standard of money in Spanish Cuba was Spanish gold, the centen or alfonsino—a 25-peseta piece—being the principal coin. In addition to that there was a large amount of silver currency. The principal silver coins in circulation were: the peso (dollar), medio peso (half-dollar), peseta (quarter-dollar), real (bit), medio real (half-dime). Since silver was not exchangeable for gold at its face value, it tended, as is always the case (see GRESHAM'S LAW), to drive the gold out of circulation. To counteract that tendency the Government by a royal decree artificially inflated the value of the gold centen to \$5.30, the real value being only about \$4.80. In 1893 the French louis, a 20-franc piece (real value \$3.86) was similarly and for the same reason inflated to \$4.24.

On taking over the island, the Government of the United States found itself in a predicament. The only rational course lay in reducing the coin to its face value and putting an end to all inflation and artificial substitutes for currency of intrinsic worth. On the other hand, the people had become accustomed to existing conditions: prices had adjusted themselves to the level of the inflated currency and all contracts had been concluded on that basis. Nevertheless, by order of the President of the United States, which took effect January 1, 1899, the United States gold dollar was declared the standard in which "all customs, taxes, public and postal dues in the island of Cuba shall be paid," and "foreign gold coins such as the Spanish alfonsinos (centen) and the French louis" are accepted at their real value, i. e. at \$4.82 and \$3.86 respectively. At the same time, since retail prices and wages have been usually fixed on the island on the basis of silver money, and in order to prevent a sudden

rise of wages to the detriment of the planters who could not expect a corresponding rise in prices of their products in the foreign markets, the Spanish silver money was also declared legal tender. The old inconveniences of a fluctuating currency were done away with by giving the coins a fixed rate in exchange for gold as follows: peso, 60 cents; medio peso, 30; peseta, 12; real, 6; medio real, 3 cents. A fixed value was also given to the bronze and copper coins, which were made legal tender for sums not exceeding one dollar. As the legal value given the silver coins by the Presidential order is somewhat below the value at which it is accepted in Spain, it becomes profitable to ship that coin to the latter country. The ultimate result of this operation will be the gradual disappearance of Spanish silver from the island without sudden distressing effects upon its industry and commerce.

During the last thirty years of Spanish sovereignty in Cuba the budget of the island remained almost stationary, at from 26,000,000 to 30,000,000 pesos. Although the entire revenue was derived from the people of the island, only about 15 per cent. of the expenditures was incurred for local needs, while about 85 per cent. went to defray 'sovereignty expenses,' that is, the expenses of the general government. The following tables serve to illustrate the budgets under the Spanish and American régimes:

AVERAGE ANNUAL BUDGET FOR THE PERIOD JULY, 1890,
TO JUNE, 1895

REVENUE	
Customs	\$11,599,270 (U. S. Standard)
Internal Revenue	5,882,205
Lotteries	2,919,945
Other Sources	2,058,305
Total.....	\$22,459,725
EXPENDITURE	
Government	\$3,634,439
Justice and Instruction.....	902,449
Finance.....	664,911
Public Works.....	880,685
Total Civil Administration ..	\$6,082,484
Army and Navy.....	6,493,281
Service of the Debt	10,334,421
Total.....	\$22,910,186
Deficit	450,461

REVENUE AND EXPENDITURES OF CUBA FOR THE FISCAL
YEAR 1900-1901

REVENUE	
Customs	\$15,945,666.42
Postal	367,950.28
Internal	658,535.92
Miscellaneous	182,736.96
Total	\$17,154,889.58
EXPENDITURE	
State and Government	\$1,756,689.53
Justice	871,152.52
Public Instruction	734,335.78
Finance	2,363,863.61
Agriculture, Industry, and Commerce.....	223,588.56
Public Works.....	1,735,231.38
Municipalities	8,226,748.39
Military Department.....	1,732,885.94
Total.....	\$17,644,494.81

The chief sources of revenue under Spanish rule were (1) taxes and excise duties, yielding less than one-fourth of the total; (2) import and export duties, which furnished about 55 per cent. of the entire revenue; (3) stamp taxes, 6 per cent. of the revenue; (4) lotteries, over 7 per cent.; (5) State property—rent and sale of public lands and rent from docks—producing about 1½ per cent. of the total revenue; (6)

miscellaneous, over 5 per cent. Thus the great bulk of taxation fell upon the consumer, while the expenditures took little account of the needs of the people. As the above table shows, the army absorbed almost 30 per cent. of the entire expenditure; nearly 50 per cent. went to pay the debt incurred by the Spanish Government, while only about one-fourth of the total went for civil administration, of which the greater part was absorbed by salaries of Spanish officers.

It will be observed that under the new régime the customs duties furnish over 90 per cent. of the entire revenue of the island. On the other hand, on the side of expenditures a radical change may be noted. The expenses of the military department have come down from nearly one-half of the total expenditure to less than 10 per cent. The service of the debt naturally disappeared from the budget because it was not the business of the United States to pay the debts incurred by the Spanish Government, and the Cuban Convention, by repudiating that debt, by one stroke of the pen relieved the people of the island of a great burden. A detailed comparison of expenditures under the two régimes is impossible owing to the different method of classification: however, a comparison of the four leading items common to both budgets shows the following changes:

The expense for State and Government decreased from \$3,634,439 to \$1,756,689.53, or 52 per cent., although the latter sum includes the cost of the census. The expense for justice and instruction, on the other hand, increased from \$902,449 to \$1,605,488.30, or 78 per cent. The finance department shows also an increased expenditure of 255 per cent., and that of public works increased from \$880,685 to \$1,735,231.38, or 99 per cent. An unusually large item, \$8,226,748, almost one-half of the total budget, is formed by the supplementary grants to municipalities. These subsidies were occasioned by the poverty-stricken condition of the people, who were unable to raise the necessary local revenue, and the money was advanced largely to defray expenditures affecting the most vital interests of the people, such as instruction, sanitation, hospitals and asylums, public buildings, etc.

As stated, the tariff has not been reduced materially, owing to the impossibility of providing other equally productive sources of revenue. At the same time, some reductions were made, especially in the case of imported food-stuffs, agricultural machinery, locomotives and rails, and the duties were made equal for all countries, the United States not excepted. This change has done away with some of the worst features of Spanish tariff, the chief purpose of which was to stifle Cuban industries and to favor the Spanish producer and merchant at the expense of the Cuban consumer even when the former could not furnish the goods demanded. As an illustration the following may be taken from the official report of the Hon. Robert P. Porter, Special Commissioner for the United States to Cuba and Porto Rico: "The Spanish exporter was able, by a discriminating duty of more than 100 per cent. against other countries, to import from Minnesota to Barcelona American flour and reship it to Cuba at a price just below the price of the American article shipped direct to Cuba, upon which a duty nearly three times

as great as that exacted from Spain had to be paid."

GOVERNMENT. The Constitution of Cuba was adopted by the Constitutional Convention, on February 21, 1901. It provides for a republican form of government, and, in its main provisions, differs but slightly from the Constitution of the United States. The President, who must be either a native Cuban or a naturalized citizen with at least ten years' service in the Cuban army during the wars for independence, is elected directly by an absolute majority for a term of four years and is disqualified for more than two consecutive terms. He has the right of appointment and removal in regard to the members of his Cabinet.

The legislative power is vested in the Congress, which consists of a Senate and a House of Representatives. The former is composed of four Senators from each province, elected by an electoral board composed of the provincial councilmen and electors, the latter being twice the number of the former and chosen by popular vote. Provision is made for the retirement of one-half of the Senators every four years. The House of Representatives consists of one member for every 25,000 inhabitants, or for a fraction of more than 12,500. They are elected directly for four years, one-half retiring every two years. Congress meets annually and is endowed with extensive powers, controlling besides the financial affairs and foreign relations of the Republic also the preparation of electoral laws for the provinces and municipalities. The approval of two-thirds of the members of both legislative bodies is necessary for a change in the Constitution.

For administrative purposes the Republic is divided into six provinces. The provincial Governors and Assemblies are elected directly for a period of three years. The provinces are independent in their internal administration, but the President has the right of interference in case of abuses of power on the part of the Governor or the Assembly. The municipalities are administered by mayors and assemblies elected directly by popular vote. The judges of the Supreme Court are appointed by the President with the approval of the Senate. The voting franchise is accorded to every male Cuban over twenty-one years of age, and not mentally incapacitated or convicted of crime, to all Spanish residents who have been on the island since April 11, 1899, and to all foreigners who have resided in Cuba since January 1, 1899. For foreigners who have arrived on the island after January 1, 1899, a five years' residence is required for naturalization.

EDUCATION. Primary education, according to the provisions of the Constitution, is free and compulsory, and the expenses are to be paid by the Central Government in case of inability on the part of a province or a municipality to maintain its primary schools. Secondary and advanced education is under the control of the State. During the Spanish régime education was controlled to a large extent by the Church, and the provisions for primary education were very inadequate. According to the census of 1899, the proportion of illiteracy among the voting population was: Cubans, 59 per cent.; and Spanish, 12 per cent. Prior to the Spanish War the total enrollment was slightly more than 36,000. With the American occupation the school system was entirely reorganized, and the facilities for teach-

ing as well as the enrollment increased with an extraordinary rapidity, so that by the middle of 1900 the number of schools was 3550 and the enrollment over 143,000. Cuba has a university at Havana. The population is Roman Catholic. The island forms one archiepiscopal diocese.

POPULATION. The population of Cuba at each census beginning with 1774 was as follows: 1774, 172,620; 1792, 272,301; 1817, 553,628; 1827, 704,487; 1841, 1,007,624; 1861, 1,396,530; 1887, 1,631,687; 1899, 1,572,797. The rate of increase varied from 34 per cent. for the period 1792-1817, to 5 per cent. for the period 1861-71. The decrease of population on account of the war must have amounted to about 270,000. The density of population ranges from 153 per square mile in the Province of Havana to 8 in the Province of Puerto Principe. Besides being the most densely populated province of the island, Havana has also the largest urban population, amounting to 77.4 per cent., against 47.1 per cent. for the entire island. According to race, the population is divided as follows: whites, 67.9 per cent. (57.8 per cent. natives); negroes, mixed elements, and Chinese, 32.1 per cent. The males constitute 54.1 per cent. among the white and 47.0 per cent. among the colored population. According to occupation the population was distributed as follows: 48.1 per cent. in agriculture, fisheries, and mining; 22.8 per cent. in domestic and personal service; 14.9 per cent. in manufacturing and mechanical pursuits; 12.8 per cent. in trade and transportation; and 1.4 per cent. in professional service.

Havana is the capital of Cuba. Following is the list of the provinces of the island:

PROVINCES	Area, square miles	Population in 1899	Population persquare mile
Havana.....	2,265	424,804	187
Pinar del Río.....	5,145	173,064	34
Mataanzas.....	3,506	202,444	58
Santa Clara.....	7,524	356,536	47
Puerto Principe.....	7,429	88,234	12
Santiago de Cuba.....	10,125	327,715	32
Total.....	35,994	1,572,797	44

HISTORY. The 'Pearl,' or 'Queen of the Antilles,' the 'Ever-Faithful Isle,' as the Spaniards used to term Cuba (from the attitude of the Cubans at the time of the Napoleonic overthrow of the Spanish Bourbons), was discovered by Columbus during his first voyage, on October 28, 1492. He landed, it is supposed, on the north coast, near Nuevitas, by the river Máximo, and believed it to be a part of the mainland, until assured by the natives that it was an island; but in 1494, on his second trip, he reiterated his previous belief and called the land Juana, after Juan, the son of Ferdinand and Isabella. Subsequently he changed the name to Fernandina, in honor of Ferdinand, and still later to Santiago, the name of the patron saint of Spain, and finally to Ave Maria, in recognition of the kind offices of the Virgin Mary; but the aboriginal name of Cuba clung to the island, and was never supplanted. A peaceable race of Indians, calling themselves Ciboneyes, were its inhabitants, living under nine independent *caciques*, and holding to a belief in a supreme being and the immortality of the soul. In 1502 Columbus visited Cuba a third time, and in 1511 his son,

Diego Columbus, fitted out a colonizing expedition of 300 men, under Diego Velásquez, who made their first settlement at Baracoa, and in 1514 founded Santiago and Trinidad, and also a place on the southern coast called San Cristóbal de la Habana, a name soon transferred to another settlement, on the northern coast, and in 1519 to the present locality. The natives, reduced to slavery by these adventurers, and employed in the cultivation of sugar-cane and other crops, were so cruelly treated, that by 1553 their race was almost extinct, notwithstanding the appeals of Las Casas, the Roman Catholic apostle to the Indians, to the home Government in their behalf. This humane missionary having observed in Santo Domingo that the negroes seemed to possess a capacity for endurance superior to that of the Indians, in order to save the latter, went so far as to suggest that negroes should be imported to take their places in the mines and cane-fields. The colonists were not slow to act upon this suggestion, and thus negro slavery gained a foothold in the Western world. The Indians of Cuba, however, did not escape the extermination which Las Casas was so anxious to avert, while the negroes were subjected to cruelties that checked their natural increase and made it necessary to recruit their numbers by constant importations. In 1537 Diego Columbus relinquished to the Crown his right to appoint a governor for the island, and Hernando de Soto was appointed, under the title of Captain-General. Havana was destroyed by the French in 1538, and again in 1554, and for a century and a half the people of the island were in almost continual fear of invasion by the French, Dutch, or English, or the pirates infesting the adjacent waters. Many laws were also made in Spain that were exceedingly disastrous to the prosperity of the island—e.g. a law prohibiting all foreigners, even Spaniards not native Castilians, from trading with or settling in the island. This led to smuggling, which was carried on largely, especially after the English captured Jamaica in 1655. Whatever importance and prosperity Cuba has attained seems to date from the Treaty of Paris, 1763, which ended the Seven Years' War during which the English had captured Havana. The island was restored to Spain, and for the rest of the century it enjoyed unusual prosperity. Las Casas, appointed Captain-General in 1790, was especially indefatigable in his efforts for the public good, removing many restrictions from commerce and promoting many useful public works. During the nineteenth century the island was ruled by a succession of Captains-General possessing almost absolute power, some of whom deserve praise for efforts to discharge their duties faithfully, while others can only be classed as oppressors, and whatever progress was made during their administrations was in spite of all obstacles mismanagement could invent—e.g. the royal decree of the *Omnimodas*, issued in 1825, which empowered Captains-General to rule at all times as if the island were in a state of siege. The United States made repeated efforts to purchase the island. In 1848 President Polk authorized the American Minister at Madrid to offer \$100,000,000, and in 1858 a proposal was made in the Senate to authorize an offer of \$30,000,000, but this was finally withdrawn. In 1854 what is known as the 'Ostend Manifesto' (q.v.), drawn up in the interest of the slave-

holding South by Buchanan, Mason, and Soulé, United States Ministers to Great Britain, France, and Spain, respectively, claimed the right of this country to annex Cuba if Spain refused to sell. Various attempts were made to secure the independence of the island and the abolition of slavery. The insurrections of 1849-51, under Lopez (q.v.), and of 1854 failed to accomplish anything, and were suppressed by the most cruel measures. The rebellion of 1868-78, however, induced the Spanish Government to promise the representation of Cuba in the Cortes by her own deputies, and a liberal party was formed to secure the fulfillment of this pledge, to encourage white immigration, and to promote free trade. In 1880 the Spanish Cortes passed an act for the abolition of slavery. The general discontent remained, however, and in 1895 led to a new and formidable revolt, to suppress which Spain sent General Martínez Campos. The insurgents, under Generals Gomez, Maceo, and Garcia, succeeded in keeping the field in spite of every effort to exterminate them; and became so bold as in February, 1896, to approach so near to Havana that the sound of their firing was heard within the capital. In the same month General Campos was recalled by the home Government, and General Weyler, a soldier reputed to be savage in his measures, succeeded him. The revolutionists were able to maintain the semblance of a government, and their conduct, as well as that of Spain, aroused for them much sympathy throughout the United States. Before the close of 1897 General Weyler was recalled and superseded by General Blanco. In the United States the criticism of Spanish methods suddenly developed into widespread and outspoken hostility to Spain upon the mysterious destruction of the American war-ship *Maine* in the harbor of Havana on February 15, 1898. Diplomatic relations became strained, and in April, 1898, owing to the apparent success of the insurrection, and justified by that, President McKinley called the attention of Congress to the situation in such words that Congress, on April 19, declared that the people of Cuba were "and of right ought to be free and independent." War followed, and by the treaty of December 10, 1898, Spain relinquished all right and sovereignty over Cuba, and the United States took temporary possession of the island and assumed all the international obligations arising from such occupation. For three years thereafter the affairs of the island were administered exclusively by the War Department of the United States, and extensive public improvements were effected. In December, 1901, after the people had adopted a constitution, a President of the Republic was elected, in the person of Estrada Palma. On May 20, 1902, the United States formally withdrew from the island, and Governor-General Wood was replaced by President Palma. See SPAIN; UNITED STATES; SPANISH-AMERICAN WAR.

CUBAN FEVER. See CALENTURA.

CUBAN LITERATURE. "In Cuba everybody versifies," says the eminent critic Menéndez y Pelayo. It is certainly true that in her compositions in verse Cuba has made her most important contribution to literature in the Spanish tongue. The earliest poem known to have been written on the island is the *Espejo de paciencia* (1608) of Silvestre de Balboa, a native of the Canaries, but neither the seventeenth nor the first half of the eighteenth century produced any Cuban poet of great merit. Mention may, however, be made of the names of José Surí y Aguila (1696-1762), who wrote some religious *loas*; Mariano José de Alva and Lorenzo Martínez de Avileira, authors of *glosas* and *coplas*; an unknown poetess of Havana, who indited a little poem on the English invasion of 1762; and the cleric Diego de Campos, who commemorated the same event in his *décimas*. To another cleric of the eighteenth century, Fray José Rodríguez (*Capacho*), who likewise wrote *décimas* on various subjects, has been attributed the earliest dramatic work composed in Cuba, *El príncipe jardinero y fingido floridano*, but the bibliophile Barrera ascribes the play to one Santiago de Pita. The University of Havana was established in 1721, and at an early date in the century the first printing-press was set up. In 1790 the first newspaper, *El papel periódico*, made its appearance, and had among its most active collaborators such men of force as the teacher of philosophy José Agustín Caballero, the physician Tomás Rómay, and, above all, the poet Manuel de Zequeira. Quite a number of epigrams are due to the pen of Manuel del Socorro Rodríguez, a journalist who founded several papers elsewhere in Spanish America. The epic was attempted with little success by Count Colombini in his *Glorias de la Habana*. All thus far produced was rather verse than poetry; the first real poets of Cuba are Manuel de Zequeira (1760-1846) and Manuel Justo de Rubalcava (1769-1805). Zequeira, perhaps the most attractive Cuban poet anterior to Heredia, echoed in the colonies the note of patriotic fervor called forth in Spain by the stirring events of 1808; in the heroic strains of his *Batalla naval de Cortés*, of his *Dos de Mayo*, and his *Primer sitio de Zaragoza*, he is as much a Spaniard as Quintana and Gallego in their heroic odes (cf. his *Poesías*, New York, 1829). Rubalcava, who was bucolic in temperament, translated the *Eclogues* of Vergil, and composed some original idyls and descriptive poems (cf. the *Poesías de M. J. Rubalcava*, Santiago de Cuba, 1848).

But towering above the countless poetasters of the time, the greatest of all the poets that Cuba has yet produced was José María de Heredia (1803-39). A patriotic poet, who was exiled from Cuba because of his opposition to Spanish

government. Heredia is held in high esteem not only for his political poems like the *Himno del desterrado*, but also for his descriptive poems like the *Niágara*, the *Tcoacalli de Cholula*, and the *Tempestad*, pervaded by a melancholy sentiment, and full of most noble imagery. Among Heredia's works are many translations and imitations of the poems of English, French, and Italian writers, such as Young, Campbell, the pseudo-Ossian, Lamartine, Delavigne, Millevoye, Arnaut, Foscolo, and Pindemonte (cf. the edition of Heredia's poems and his translations and imitations of foreign dramas, published at New York, 1875; his prose *Lcciones de historia universal*, Toluca, 1831, and other prose works; and consult: Villemain, *Essai sur le génie de Pindare et sur la poésie lyrique*, Paris, 1859; J. Kennedy, *Modern Poets and Poetry of Spain*, London, 1852). Among the lesser lights must be counted Domingo del Monté, a Venezuelan, who, residing in Cuba, there composed pleasing romances, played the part of a generous patron of other poets, and strove energetically to have purity of idiom maintained in the Cuban use of the Castilian speech; Ignacio Valdés Machuca, who imitated Meléndez Valdés in his *Ocios poéticos* (1819), and also translated and imitated Jean-Jacques Rousseau; Manuel González del Valle, a teacher of philosophy, and the author of a *Diccionario de las Musas* (1827), etc. A protégé of del Monté's was the romantic spirit José Jacinto Milanés (1814-63), a man of superior powers, whose lyrics are now gently sentimental, and again madly socialistic. Milanés is also deemed one of the best playwrights that the island has had so far. His pieces include *El Conde Alarcos*, *El poeta en la corte*, *Por el río ante ó por el río*, and *A buena hambre no hay pan duro*. Pictures of manners in dialogue form are to be seen in his *Mirón cubano* (cf. the first ed. of his *Obras*, Havana, 1846; second ed., New York, 1865). Another true poet was Gabriel de la Concepción Valdés, best known by his pseudonym Plácido (1809-44). He was a mulatto and a foundling, and had but slight training, yet few Cuban lyrics will live longer than his romance entitled *Nicoteneal*, and his sonnets, *La muerte de Gessler*, *Falalidad*, and *Plegaria* (cf. the eds. of his verse, New York, 1856; and Havana, 1886). Of undisputed excellence is the work of the poetess Gertrudis Gómez de Avellaneda (1814-73). She was eminently successful as a lyric poet and as a dramatist, less so as a novelist (cf. an edition of her works, Madrid, 1869).

Among the countless writers of verse that have arisen in Cuba later than Avellaneda, three are of particular merit: Joaquín Lorenzo Luaces (1826-67), the author of war songs (the *Caida de Misolonghi*, etc.), of odes (see especially the *Oración de Matías* of biblical inspiration and the ode *A Cyrus Field*, on the laying of the Atlantic cable), and of one or another drama (cf. the *Poesías de J. L. Luaces*, Havana, 1857, and the *Noches literarias en casa de N. Azsárate*, Havana, 1866); Juan Clemente Zenea (1832-71), whose elegiac verse is full of a tender melancholy (cf. the complete edition of his *Poesías*, New York, 1872); and Rafael María de Mendive (1821-86), noted for his translation of the *Irish Melodies* of Thomas Moore, whose influence is also easily discernible in his original Cuban verse (cf. the *Poesías* of Mendive, Havana, 1883; and

the *Melodius irlandesas*, New York, 1875). To the list of the nineteenth-century poets there may further be added the names of Ramón Velez y Herrera (born 1808), Miguel Teúrbie de Tolón (1820-58), Francisco Orgáz (1815-73), Ramón de Palma y Romay (1812-60), Ramón Zambrana (1817-66), José Fornaris (1827-90), José Güell y Renté, etc.

As compared with her poets, it is clear that the prose writers of Cuba are distinctly inferior in importance. In the eighteenth century, she has the historians Arrati and Urtutia; in the nineteenth, Valdéz, José Arrango y Castillo, etc. Among her legal writers have figured Conde, Ayala, Armas, Bermúdez, Cintra, etc., and among her moralists and writers on philosophical matters, Barea, Veranes, José Agustín Caballero, Félix Varela, José de la Luz Caballero, etc. In the fine arts Vermay and Perouani have earned some recognition, and in music Villate has gained notice by his operatic compositions. A really good critical account of Cuban prose and poetry has yet to be written; more light on the subject may be expected from the publication of the *Biblioteca selecta hispano-cubana de prosistas* and the *Antología de poesía cubana*, which a commission of litterateurs has presented to the Spanish Academy. On Cuban lyric poets an excellent essay has been written by M. Menéndez y Pelayo and now appears as the preface to the second volume of the *Antología de poetas hispano-americanos* (Madrid, 1893), which contains very good selections from the works of the most important Cuban poets. Consult also: the *Parnaso cubano*, *Colección de poesías selectas de autores cubanos desde Zequeira*, etc. (Havana, 1881); the *Cuba poética*, *colección escogida de las composiciones en verso de los poetas cubanos desde Zequeira*, prepared by Fornaris and Luaces (2d ed., Havana, 1861); Hills, *Bardos cubanos*, *antología de las mejores poesías líricas de Heredia*, 'Plácido' Avellaneda, Milanés, Mendive, Luaces, y Zenea, with biographical notices of each of the poets and a comprehensive bibliography of their works and of Cuban poetry in general (Boston, 1901); Bachiller y Morales, *Apuntes para la historia de las letras y de la instrucción pública en la isla de Cuba* (Havana, 1860); Mitjans, *Estudio sobre el movimiento científico y literario de Cuba* (Havana, 1890); Merchán, *Estudios críticos* (Bogotá, 1886); Caleagno, *Diccionario biográfico cubano* (New York, 1878); González del Valle, *La poesía lírica en Cuba* (new ed., Barcelona, 1900).

CUBE (Lat. *cubus*, Gr. *κύβος*, *kybos*, cube), or REGULAR HEXAHEDRON. A regular solid with six square faces, each of which is parallel to the one opposite to it. It is a form of frequent occurrence in nature, especially among crystals. The cube or third power of a number is the product formed by taking the number three times as a factor, e.g. the cube of 4, or $4^3 = 4 \cdot 4 \cdot 4 = 64$. This use of the term arises from the circumstance that the solid contents of a cube may be expressed by the third power of the number which expresses the length of one of its edges. Thus, if the edge of a cube is 4 inches, its volume is $4 \cdot 4 \cdot 4 = 1$ cubic inch, or 64 cubic inches. The cube root of a number is one of the three equal factors of the number: e.g. the cube root of 8 is 2, since $2 \cdot 2 \cdot 2 = 8$. The number of which the root is sought is called the power, and

if it is a power of a commensurable (q.v.) number, it is called a perfect power. Roots of perfect powers are often readily obtained by factoring; e.g. to find the cube root of 216: $216 = 6 \cdot 6 \cdot 6$, therefore 6 is the cube root of 216. If the root is incommensurable, the binomial formula, logarithms, or the equation (q.v.) is available. Every number which satisfies the

equation $x^3 = 1$, or $x^3 - 1 = 0$ is a cube root of 1. But $x^3 - 1 = 0$ is the same as $(x - 1)(x^2 + x + 1) = 0$, and equating each factor to 0 and solving, $x = 1, -\frac{1}{2} + \frac{1}{2}\sqrt{-3}, -\frac{1}{2} - \frac{1}{2}\sqrt{-3}$, the three cube roots of unity. (See COMPLEX NUMBER.) The three cube roots of 8 are

$$2, 2(-\frac{1}{2} + \frac{1}{2}\sqrt{-3}), 2(-\frac{1}{2} - \frac{1}{2}\sqrt{-3}).$$

Thus any number has three cube roots, one real and two imaginary. In extensive calculations, tables of roots and of logarithms are employed.

Duplication of the cube or the Delian problem, according to tradition, originated with the oracle of Delos, which declared to the Athenians that a pestilence prevailing among them would cease if they doubled the altar of Apollo—i.e. replaced his cubical altar by another of twice its contents. The problem reduces to the solution of the continued proportion $a : x = x : y = y : 2a$, or to the solution of $x^3 = 2a^3$. This was effected geometrically by Hippocrates, Plato, Menæchmus, Archytas, and others, but not by elementary geometry. This is one of the three great problems whose appearance has been of wonderful significance in the development of mathematics. Consult: Gow, *History of Greek Mathematics* (Cambridge, 1884); Klein, *Vorträge über ausgewählte Fragen der Elementargeometrie* (Leipzig, 1895); *Famous Problems of Elementary Geometry*, trans. by Beman and Smith (Boston, 1897).

CUBEBES, or **CUBEB PEPPER** (Fr. *cubébe*, from Ar. *kabāba*). The dried unripe berries of *Piper officinalis*, a species of climbing shrub of the natural order Piperaceæ, very closely allied to the true peppers. *Piper officinalis* is a native of Penang, Java, New Guinea, etc., and is said to be extensively cultivated in some parts of Java. Its spikes are solitary, opposite to the leaves, and usually produce about fifty berries, which are globular, and, when dried, have much resemblance to black pepper, except in their lighter color and the stalk with which they are furnished. *Piper canina*, a native of the Sunda and Molucca islands, is supposed also to yield part of the cubebes of commerce, and the berries of *Piper ribesiodes* possess similar properties. Cubebes are less pungent and more pleasantly aromatic than black pepper; they are used in the East as a condiment, but in

Europe chiefly for medicinal purposes. They act as a stimulant, and are sometimes found useful in cases of indigestion; also in chronic catarrh and in many affections of the mucous membrane, particularly those of the urino-genital system. The chief constituents of cubebes are a volatile oil, resin, cubebic acid, cubebin, and wax. Cubebes are administered in many ways. For illustration, see Plate of CYPRESS, ETC.

CUBE ROOT. See CUBE; INVOLUTION.

CUBIC EQUATION. A rational integral equation of the third degree is called a cubic equation. It is called binary, ternary, or quaternary according as it is homogeneous of the third degree in two, three, or four unknowns. The general form of a cubic equation of one unknown is $ax^3 + bx^2 + cx + d = 0$. It is shown in algebra that this equation can be reduced to one of the form $x^3 + px + q = 0$. Every cubic equation of this form has three roots, of which one is real and the others real or imaginary. The roots will all be real when p is negative, and

$\frac{p^3}{27} > \frac{q^2}{4}$. This is known as the irreducible case in solving the equation. Only one root is real when p is positive, or when it is negative and $\frac{p^3}{27} < \frac{q^2}{4}$. If p is negative and $\frac{p^3}{27} = \frac{q^2}{4}$, two of the roots are equal. The cubic equation may be solved by the following formula, due to Tartaglia and Ferro, Italian mathematicians of the sixteenth century, but known as Cardan's formula:

$$x = \sqrt[3]{-\frac{q}{2} + \sqrt{\left(\frac{q^2}{4} - \frac{p^3}{27}\right)}} + \sqrt[3]{-\frac{q}{2} - \sqrt{\left(\frac{q^2}{4} - \frac{p^3}{27}\right)}}$$

Besides Ferro, Tartaglia, and Cardan, Vieta, Euler, and others contributed to the early theory of cubic equations. In case the roots of a cubic equation are all real their values are more readily calculated by means of trigonometric formulas—e.g. assume $x = n \cos a$, and the equation $x^3 + px + q = 0$ may be expressed by $\cos^3 a$

$+ \frac{q}{n^2} \cos a + \frac{q}{n^3} = 0$. But from trigonometry $\cos^3 a - \frac{3}{4} \cos a - \frac{\cos 3a}{4} = 0$; therefore, equating corresponding coefficients of $\cos a$, and solving the equations, $n = \sqrt[3]{-\frac{4p}{3}}$ and $\cos 3a = -4q$

$\left(-\frac{3}{4p}\right)^{\frac{2}{3}}$. Hence x may now be computed from

$$x = n \cdot \cos a; n \cdot \cos\left(\frac{2\pi}{3} + a\right); n \cdot \cos\left(\frac{2\pi}{3} - a\right)$$

For history and methods, consult Matthiessen, *Grundzüge der antiken und modernen Algebra der literalen Gleichungen* (Leipzig, 1896). See also **CARDAN**, **JEROME**.

CUBICULUM (Lat., bedroom, from *cubare*, to lie down). A term used to designate a small room or cell in a Roman house, containing a bed or couch, and opening off the court; also a recess or alcove, a box at the theatre or circus; and lastly, a final resting-place or burial-recess for one or more bodies in the early Christian catacombs.

CUBIT (Lat. *cubitus*, elbow). A measure employed by the ancients, equal to the length of the arm from the elbow to the tip of the middle finger. The cubit of the Romans was about 17 $\frac{3}{4}$ inches, and that of the Hebrews 22 inches, but its length is now generally stated at 18 English inches.

CUBITT, Sir WILLIAM (1785-1861). An English civil engineer, born at Dilham, Norfolk. In 1800-04 he was apprenticed to a cabinet-maker at Stalham, and at Swanton was associated with a manufacturer of agricultural machines and devised self-regulating sails for wind-mills. In 1818 he began the manufacture of his invention known as the treadmill, which was quickly introduced into the principal jails of Great Britain. From 1826 he was connected as engineer with important works in the improvement of canals and rivers, and the construction of bridges and railways. He conducted the improvement of the Severn and the building of the Southeastern Railway. The water-works of Berlin were also executed by him. In 1850-51 he was president of the Institution of Civil Engineers.

CUCKOO. кукуу (Fr. *coucou*, Lat. *cuco*, Gk. *κόκκυξ*, *kokkyx*, cuckoo, Skt. *kōkila*, cuckoo). A name given to many birds of the picarian family Cuculidae, which contains about 175 species, mostly confined to the warmer regions of the globe, although some of them are summer visitors to cool climates. Only 35 of the known species live in the New World. The beak is slightly compressed and somewhat arched; the tail long, rounded, and usually of ten feathers; the wings rather long; the tarsi short, with two toes directed forward and two backward, the outer hind toe capable of being brought half round to the front. The feet are thus adapted for grasping and moving about upon branches rather than for climbing.

Cuckoos of the Old World.—The name cuckoo is derived from the note of the male of the common European cuckoo (*Cuculus canorus*), which, although monotonous, is always heard with pleasure, being associated with all that is delightful in returning spring. A similar name is given to the bird in many languages. This common cuckoo is very widely diffused, as it is also found in India, Africa, and, in summer, even in Lapland and Kamchatka. It appears in Great Britain in April, and all except the young birds are believed to migrate southward again before the middle of August. The adult cuckoo is about a foot in length; ashy-gray, barred beneath with black; the wings are black, and the tail is black, marked with white. It frequents both cultivated districts and moors. There is no pairing or continued attachment of the male and female; and the female, after having laid an egg on the ground, takes it in her mouth and deposits it, by means of her beak, in the nest of some other smaller bird, leaving the egg to be hatched and the young one to be fed by the proper owners of the nest. This egg is very small for so large a bird, not larger than a skylark's; and the number laid is uncertain. The young one, soon after hatching, acquires size and strength enough to eject from the nest any eggs or young birds—the true offspring of its foster-parents—which may remain in it, and it seems restless and uneasy till this is accom-

plished. It works itself under them, and then jerks them out by a motion of its rump. Other species of cuckoo, closely allied to the European cuckoo, inhabit Africa, Asia, and Australia, and have essentially the same habits, one, about the Mediterranean, victimizing pies alone, its eggs having a remarkable resemblance to those of the magpie. Equally parasitic are many Old-World tropical species of various other genera; yet some of them (see CUCKAL) do not shirk parental responsibility, but incubate and rear their own offspring. This extraordinary practice of bird parasitism, in respect to its facts and probable origin and development, is thoroughly discussed by A. Newton, *Dictionary of Birds*, article "Cuckoo" (London, 1896).

The American cuckoos represent three different subfamilies—the anis, the road-runners, and the tree-cuckoos. The last compose the group Coccyzinae, and are characteristic of and confined to America. The best-known species are the black-billed cuckoo (*Coccyzus erythrophthalmus*) and the yellow-billed (*Coccyzus americanus*). Both species occur commonly in summer throughout the United States and eastern Canada, but pass the winter in Central and South America. The black-billed cuckoo does not occur west of the Rocky Mountains. The two species are of about the same size, a foot long, and are olive-brown above, white beneath, but are easily distinguished by the color of the bill and the amount of white on the tail.

YELLOW-BILLED CUCKOO.

Unlike the Old-World cuckoos, they are not parasites, but build their own nests and incubate their own eggs. The nests are flimsy structures of twigs, the eggs large and pale blue. Incubation begins when the first egg is laid, so that no two of the eggs or young are in just the same stage of development. The American cuckoos are insectivorous and are very useful birds. Their note or call is a series of accelerated 'chucks,' not exactly harsh, but far from musical. In the Middle, Western, and Southern States the yellow-bill is known as 'rain-crow,' because its note is supposed to predict rain—an idea prevalent in regard to these birds in other parts of the world. Consult Beal, *Food of Cuckoos* (Department of Agriculture, Washington, 1898). See Plate of Cuckoos: and Colored Plate of EGGS OF SONG-BIRDS.

CUCKOO AND THE NIGHTINGALE, THE. A poem attributed in the sixteenth century to Chaucer, but probably not composed by him. The subject is the discussion between a nightingale and a cuckoo on the comparative blessings of love.

CUCKOO-BEE. A naked, somewhat wasp-like bee of the family Nomadidae, all the many species of which are parasitic in the nests of other bees, after the manner of the European

CUCKOOS

1. AMERICAN YELLOW-BILLED CUCKOO (*Coccyzus Americanus*).
 2. BLUEHEADED KOEL (*Eudynamis cyanocephala*).
 3. COMMON EUROPEAN PARASITIC CUCKOO (*Cuculus canorus*).

4. ANI, or RAIN CROW (*Crotophaga ani*).
 5. CRESTED CUCKOO (*Lepidogrammus Cummingi*).
 6. CHANNEL-BILL (*Scythrops Novæ-Hollandiæ*).
 7. CHAPARRAL COCK (*Geococcyx Californianus*).

cuckoo. Each genus makes its home with some particular form or forms of wild bee; thus, our common *Nomada imbricata* is found in nests of *Andrena* and *Haliectus*; *Stelis* lives on *Osmia*, etc. These inquilines have no means of collecting or carrying pollen, and so have been forced to seek the hospitality of forms able to do so. The investigations of J. H. Emerton show that this forced association arouses no quarreling, but that there is frequently enough food for the larva of both the proper owner of the cell and of the guest, whose egg is laid in the same pollen-mass. The cuckoo-bee flies about with its host, and enters and leaves the home without hindrance. See BEE; CUCKOO-FLY.

CUCKOO-FLY. One of a family (*Chrysididæ*) of diminutive, beautiful, metallic-green wasps, in which the abdomen has only three, four, or five visible segments, and can be turned under the thorax and closely applied to it. This 'fly' seeks out the nest of a solitary wasp or bee, and, when the rightful owner is absent collecting food, the cuckoo-fly deposits an egg in each cell. These eggs are walled in by the bee, together with her own eggs. The cuckoo-fly larvæ hatch, eat the food stored up in the cell by the bee, and perchance even the rightful larvæ. The adult fly, when seen by the wasp, is fought desperately, and during such encounters it rolls itself up in a defensive ball. In Europe, where the Germans call them *Goldwespen*, one of the cuckoo-flies is parasitic on the currant-worm.

CUCKOO-SPIT. See FROG-SPITTLE.

CUCU'JIDÆ (Neo-Lat. nom. pl., from *Cucujus*, of South American origin). A large family, chiefly tropical, of oblong, flattened beetles, most of which live under bark. See CORX-INSECTS.

CUCUMBER (OF. *cocombre*, Fr. *concombre*, from ML. *cucumer*, from Lat. *cucumis*, cucumber), *Cucumis sativus*. A common garden vegetable, native of Asia, and cultivated from the earliest times. The plant is vine-like, and somewhat similar in appearance to the muskmelon. The oblong fruit (4 to 30 inches long) is eaten in the green state as a salad, and is extensively used for pickling. The smaller sorts of pickling cucumbers are sometimes called gherkins. The many varieties of cucumber in cultivation differ greatly in size and shape of the fruit. Cucumbers are very sensitive to frost. They are grown during the warm months in nearly all parts of the United States. The seeds are planted in hills 4 by 6 feet apart. The soil should be a fertile, warm loam, and the hills made rich with a few shovelfuls of well-rotted manure. The long English varieties extensively used for forcing in Europe are less used in America, the white-spine varieties being used more extensively for this purpose. To this genus belong other species valued for their edible fruit. *Cucumis anguria* is known as the West Indian gherkin. The snake cucumber (*Cucumis melo*, variety *flexuosus*) grows to a great length, and is similar in quality to the common cucumber. *Cucumis serotimus* is cultivated in Turkey; *Cucumis macrocarpos* in Brazil; the comonom (*Cucumis cononum*) is much cultivated in Japan. The dudaim (*Cucumis dudaim*) is very generally cultivated in gardens in the East, for the fragrance of its fruit. The musk cucumber is *Cucumis moschata*.

CUCUMBER-BEETLE. Of several beetles whose grubs attack cucumbers, the most important ones are described under MELON INSECTS (q.v.). An especial flea-beetle found about cucumber-vines is *Haltica cucumeris*, which is about the size of a small grain of wheat, black, with clay-colored antennæ and legs. The larvæ mine the seed-leaves of the young plants, and both old and young feed upon the mature vine-leaves and also upon other garden vegetables.

CUCUMBER DISEASES. The cucumber is subject to the attack of a number of fungi, only the more important of which can be mentioned. In the seed-bed it is liable to the attack of *Pythium debaryanum*, the disease being called 'damping off' (q.v.). In the field one of the worst pests is *Plasmopara*, or *Peronospora cubensis*, producing mildew. It attacks the foliage, causing the leaves to turn yellow, to wilt, and die, the whole vine being involved. Spraying with some fungicide (q.v.), as Bordeaux mixture or potassium sulphide, will prevent this disease if applied early and often. Care must be taken to spray the mixture upon the under sides of the leaves. In addition to cucumbers, this mildew occurs on muskmelons, squashes, and pumpkins. Another fungus, *Cladosporium cucumerinum*, attacks the fruit of the cucumber and melons, producing upon the young fruits small, sunken areas that later become black, rotten places. Often a sort of gummy exudation is associated with this disease. The treatment given above is recommended for this disease. In the greenhouse the most serious trouble to cucumber-forcing is the powdery mildew (*Erysiphe cichoracearum*). It may be known by the white, flour-like splashes on the leaves. The leaves become yellow, then brown, and dry up, killing the plant. The disease spreads with great rapidity, but may be kept under control as in the above cases. A disease known as the wilt disease is often of great destruction to cucumbers, melons, etc. It is caused by a kind of bacteria to which the name *Bacillus tracheiphilus* has been given. The organisms fill the water-ducts of the plant, causing it suddenly to collapse. The leaf-blades shrivel and dry up, and later the petioles and stem become flaccid and the whole plant perishes. If a stem be cut across, a sticky, milk-white substance exudes. The disease is readily produced by inoculation, and is largely spread through the agency of insects. A somewhat similar disease is caused by a species of *Fusarium*, a fungus.

CUCUMBER-INSECTS. See MELON-INSECTS.

CUCUMBER-TREE. An American forest-tree, growing in nearly all the Eastern States. The fruit, which looks like a cucumber, when macerated in spirit, makes a bitter tonic drink. The timber is light and useful for boat-building. See MAGNOLIA.

CUCURBITACEÆ (Neo-Lat. nom. pl., from Lat. *cucurbita*, gourd). An order of dicotyledonous plants (the gourd family), consisting chiefly of herbaceous plants, natives of the warmer parts of the world, having succulent stems which climb by means of lateral tendrils, the morphology of which has been a subject of much contention. The flowers are monocious or dioecious, and often sympetalous. The calyx and corolla are five-parted and more or less co-

hesive. The stamens exhibit a number of peculiarities, in some cases having bilocular anthers; in others various modifications are shown, the anthers adhering in some and even becoming united into a column with two ring-shaped pollen-chambers in the genus *Cyclanthera*. The fruit, called a pepo, is peculiar; is more or less succulent, has a fleshy rind, and the seed-bearing placentæ either surround a central cavity or send prolongations into it. The seeds are flat, and more or less imbedded in the pulp, which may be dry or juicy. The cotyledons are large and leaf-like. This order contains nearly 90 genera, with about 650 species, many of which produce edible fruits and are cultivated in temperate regions. To this order belong the cucumber, melon, gourd, pumpkin, squash, vegetable marrow, etc. (qq.v.). In some, important medicinal properties abound, as in bryony, colocynth, momordica, etc. (qq.v.). *Telfairia pedata*, a tropical African species, is cultivated for its seeds, which are used for food, and from which oil is expressed. The chief genera are *Fevillea*, *Telfairia*, *Melothria*, *Luffa*, *Byronia*, *Cucumis*, *Lagenaria*, *Cucurbita*, *Echinocystis*, *Sicyos*, *Seschium*, and *Cyclanthera*.

CÚCUTA, koo'koo-tá. See SAN JOSÉ DE CÚCUTA.

CUDBEAR. See ARCHIL.

CUDDALORE, kũd'dá-lór', or **KUDALUR**, kũd'á-lóor'. The chief town in the southern division of Arcot, Madras, British India, on the estuary of the Southern Pennar, 15 miles south of Pondicherry and 100 south of Madras by rail (Map: India, D 6). The river, obstructed by a bar, admits only vessels of moderate size; but there is good anchorage a mile and a half off shore. There are a number of sugar-refineries, oil-presses, and paper-mills, and an extensive export trade in cotton and grain. Cuddalore was the scene of exciting struggles between the French and the English from 1758 to 1795, when it was finally acquired by the latter. Population, in 1891, 47,400; in 1901, 51,900.

CUDDAPAH, kũd'dá-pá'. See KADAPA.

CUD'DY. In Spenser's *Shepherd's Calendar*, the shepherd to whom Colin Clout directs his arguments.

CUDILLERO, koo'dé-lyá'ró. A maritime town in the Province of Oviedo, Spain, 20 miles northwest of the city of Oviedo. The harbor, protected by a jetty, has a lighthouse which marks its eastern point. It admits, however, only small craft. The port is engaged largely in fishing, and there are fish-curing establishments and manufactures of linen and chocolate; stock-raising and agriculture also are carried on, and in the vicinity are mines of manganese. Population, in 1900 (commune), 10,160.

CUDRAKA, shoo'drá-ká. The reputed author of the Sanskrit drama *Mricchakatika* (q.v.). See ŚUDRAKA.

CUD'WORTH, RALPH (1617-88). An English theologian and philosopher. He was born at Aller, in Somersetshire, and admitted pensioner of Emmanuel College, Cambridge, in 1632, where he took his degree of M.A. and became an eminent tutor. In 1645 he was appointed master of Clare Hall and regius professor of Hebrew; in 1654 he was chosen master of Christ's College; in 1662 appointed to the rec-

tory of Ashwell; and in 1678 installed prebendary of Gloucester. He died at Christ's College. Cudworth's chief work, entitled *The True Intellectual System of the Universe* (1678), advocates a Platonizing doctrine of philosophy, especially emphasizing the necessity of a teleological view, against the contention of the mechanists of the day, and defending the doctrine of innate ideas. From such views the remarkable group of which he was a leader obtained the name of the Cambridge Platonists (q.v.). A *Treatise Concerning Eternal and Immutable Morality*, which was first published by Dr. Chandler, Bishop of Durham, in 1731, champions the innate character of our moral ideas, which are held to cognize the objective reality of good and evil with the same immediateness and certainty which attends our geometrical knowledge. Consult: Martineau, *Types of Ethical Theory*, vol. ii. (Oxford, 1898); Lowrey, *The Philosophy of Ralph Cudworth* (New York, 1885); and Birch, *Life*, in the edition of Cudworth's works (Oxford and London, 1829).

CUENCA, kwán'ká. The capital of the Province of Azuay, Ecuador, situated on the Rio Matadero, 8640 feet above the level of the sea, 85 miles south-southwest of Quito (Map: Ecuador, B 4). It has straight streets, and contains, among the chief buildings, the cathedral, the high school (formerly a Jesuit college), the prison, and the Government building. It is the centre of a fertile grain, cotton, sugar, and cochineal producing region, and rich metal deposits are worked in the neighborhood. The most important manufactures are pottery, hats, and woolens, and a considerable trade in preserved fruits, cheese, and grain is carried on. Population, about 25,000. Cuenca was founded in 1557, on the site of the old native village Tumbamba, and in 1786 was created an episcopal see. There are numerous interesting Aztec remains in the vicinity. The mountain of Tarqui on the south was chosen in 1742 for determining the meridian line of La Condamine, Bonguer, and Godin. At the base of the mountain occurred the battle of Tarqui in 1828 between the Colombian and Peruvian forces.

CUENCA. A city of Spain, the capital of the province of the same name and the seat of a bishopric, about midway between Valencia and Madrid (Map: Spain, D 2). It is picturesquely situated, at an elevation of about 3000 feet, on the river Júcar, at the confluence of the Huescar, and is poorly built, with narrow, crooked streets. The walls are in ruins, and the city, once celebrated for industry and art, but faintly suggests its former prosperity. A fine bridge spans the Júcar, and there are a college and several notable churches, the most pretentious of which is the Gothic Cathedral, with the Chapel of the Albornoces. The city has some manufacturing interests, and a trade in lumber and wine. Population, in 1901, 10,505.

Cuenca first appears in the history of the ninth century, under Saracen power. In 1177, after a long siege, it fell into Christian hands, though earlier in the century it had been captured, but retaken. It was granted the dignity of a municipality in 1257. The city was taken by the English in 1706 after bombardment, and in 1808 and 1810 was sacked and burned by the French—disasters which contributed materially

CUCUMBER ALLIES

1. LUFFA OR DISHRAG GOURD (*Luffa ægyptiaca*).
2. BOTTLE OR CALABASH GOURD (*Lagenaria vulgaris*).
3. SNAKE GOURD (*Trichosanthes Angulina*).
4. FLOWERS OF MUSK-MELON (*Cucumis melo*).
5. SUMMER SQUASH (*Cucurbita*); *a*, Crookneck; *b*, Custard or Patty-pan; *c*, Vegetable Marrow.

6. *a*, WATERMELON (*Citrullus vulgaris*); *b*, MUSK-MELON (*Cucumis melo*).
7. CUCUMBER (*Cucumis sativus*).
8. *a*, PUMPKIN (*Cucurbita pepo*); *b*, WINTER OR HUBBARD SQUASH (*Cucurbita maxima*).

to its decline. In 1874 Cuenca fell into the power of the Carlists, who ravaged the city, infuriated by its stubborn resistance.

CUERNAVACA, kwār'ná-vá'ká. The capital of the State of Morelos, Mexico, magnificently situated in the valley of the Cuernavaca, 47 miles south of Mexico City, and 5000 feet above sea-level (Map: Mexico, J 8). It contains a church built by Cortés, an agricultural academy, a fine Government building, a theatre (with a capacity for 2000 spectators), a hospital, and a literary institute. The city is the centre of a fertile district, and has extensive sugar-refineries and distilleries. Near by are the ruins of an Aztec temple, 400 feet high, composed of five terraces. Cuernavaca, at the advent of the Spaniards, was an old Indian village, and became, after its capture, the favorite residence of Cortés, his palace being still extant. In 1863 Maximilian made it his residence. It bears many marks of his royal favor, especially in its public gardens. Population, in 1895, 8747.

CUERO, kwār'ró. A town and the county-seat of De Witt County, Tex., 104 miles east by south of San Antonio; on the San Antonio and Aransas Pass and the Southern Pacific railroads (Map: Texas, F 5). It is located in a rich agricultural belt, producing chiefly corn and cotton, and has cotton gins and compresses, a cotton-mill, cottonseed-oil mills, machine-shops, a tannery, broom-factories, etc. Population, in 1890, 2442; in 1900, 3422.

CUERVO, kwār'vó, JOSÉ RUFINO (1844—). A Spanish-American author, born at Bogotá, Colombia. He has made his home in Paris. He became an authority on the Spanish language, on which subject he published: *Apuntaciones críticas sobre la lengua Bogotana* (1872), and a critical edition of the *Gramática Castellana* of Andrés Bello (1890).

CUESTAS, kwá'stás, JUAN LISBOA (1837—). A South American politician and a President of Uruguay, born at Paysandú. In 1879 he became collector of customs, in 1880 Secretary of the Treasury, in 1886 Secretary of State, and in 1891 Senator for Paysandú. He was appointed president of the Senate in 1897; in 1898, after the assassination of President Borda, was placed in charge of the provisional Government; and in 1899 was elected President of the Republic.

CUEVA, kwá'vá, HENRIQUEZ ARIAS DE SAAVEDRA, BALTAZAR DE LA (1626-86). A Spanish statesman. He was born in Madrid, and was a son of the Duke of Albuquerque. He was educated at the University of Salamanca, and successively became Councilor of State, Councilor of the Indies, Ambassador to Germany, and Viceroy of Peru, Tierra Firme, and Chile, in which capacity he introduced many beneficent reforms and greatly improved the condition of the Indians.

CUEVA, JUAN DE LA (1550-1607). A Spanish poet, born in Seville. Of the life of this poet very little is known. He left a quantity of works, in the form of plays, poems, letters, epigrams, romances, and histories. The plays are of the most value, as in them he departed from the classic model, and attempted a more romantic and less artificial type.

CUEVAS DE VERA, kwá'vás dá vā'rá. A town of Spain, in the Province of Almería, 42 miles northeast of Almería (Map: Spain, D 4). It is situated in a plain on the right bank of the Almanzor, near its entrance into the Mediterranean, and is generally well built, with broad and regular streets. It has two spacious plazas, and among the principal edifices are an old Moorish castle and the parish Church of the Incarnation, a handsome Doric structure, dating from 1758. A large number of persons are employed in the silver-mines of the vicinity; agriculture and stock-raising are also important industries. There are some manufactures, principally of pottery. Population, in 1890, 20,341; in 1900, 20,603.

CUFA, koo'fá. A ruined city of Mesopotamia, in the Turkish Vilayet of Bagdad. It was founded by the Arab conquerors of Persia soon after the decisive battle of Cadesia in 636, and speedily became the political and intellectual capital of the early Caliphate. At the height of its prosperity it numbered from 150,000 to 200,000 inhabitants, for the most part of the pure Arab stock of Yemen. The schools of Cufa exercised the very greatest influence on the development of Arabian literature and theology, and its grammarians were the originators of the so-called Cufan script, which occurs frequently in Arabic manuscripts. Internal dissensions and the removal of the capital to Damascus brought about the decline of the city.

CUFFE, WILLIAM ULICK O'CONNOR. See DESART, FOURTH EARL OF.

CUF'FEE, PAUL (1759-1818). An American sea-captain, half Indian, half negro, born near New Bedford, Mass. He was a member of the Society of Friends, and used his wealth, acquired at sea, in the effort to encourage the colonization of his people in Sierra Leone. He carried out thirty-eight colonists on his own ship in 1815, and died while waiting for permission from England to make further settlements in the colony.

CUF'FEY. A name formerly given to negroes in the West Indies, and common among the maroons of Jamaica.

CU'FIC WRITING. See KUFIC WRITING.

CUI, kó'è', CÉSAR ANTONOVITCH (1835—). A Russian composer and military engineer, born at Vilna. He studied at the gymnasium, where his father, a survivor of Napoleon's army of invasion, taught French. After studying music with Moniuszko (q.v.) for some six months at Vilna, he entered the School of Engineering and the Engineering Academy at Saint Petersburg, becoming subsequently professor of fortification in several military academies. Among his pupils have been several grand dukes, the famous Skobelev, and Nicholas II. During the Russo-Turkish War he was sent to examine the fortifications on the Danube. His report, *Four Notes of an Engineering Officer from the Theatre of Military Operations in European Turkey*, was translated into several languages, and attracted considerable attention. Among his text-books the best-known are: *A Short Manual of Field Fortification* (7th ed. 1894), and *A Short Historical Sketch of Permanent Fortification* (1889). His musical studies he continued with Balakireff (q.v.), making his debut with a Scherzo in F major for orchestra (1859).

His opera *The Prisoner of Caucasus* (1857-58) and the comic opera *The Mandarin's Son* were performed privately, and exhibited no departures from established tradition. In 1864 he became musical critic of the *Saint Petersburg Gazette*. He championed the theories of the Young Russian school, attacking the conservative attitude of the critics, rejudging established reputations, subjecting everything to a keen and searching analysis. He received the nickname 'Musical Nihilist,' and his opera *William Ratcliff* (1869), based on Heine's drama, and embodying the new theories of 'melodic recitative,' met with severe criticism. *Angelo* (1876), based on Victor Hugo's drama, carried the theories even further, and met with a similar fate. In 1883 he rewrote *The Prisoner of Caucasus*, adding a new act, and the work had considerable success. *Le Flibustier* (1894), words by Richepin, was successful at the Paris Opéra Comique, and *The Saracen* was favorably received in 1899. His numerous songs, both to Russian and to French words, are veritable gems, while his pieces for solo instruments and for chorus enjoy great vogue. He was never fond of orchestration, and is far behind his Russian colleagues in that line, but the sincerity and passion of his works are unique. Few can equal him in delineating love in all its varied aspects. As a critic, in Russian periodicals and the French *Revue et Gazette Musicale*. Cui enjoys an enviable reputation. His *La Musique en Russie* (Paris, 1880) is the only sketch of Russian music written with authority, even though it is at times marred by the author's æsthetic views. *The Russian Lied* (1896) is a detailed study of all important Russian song-writers, with careful reference to both music and text. Consult: Countess de Mercy-Argenteau, *César Cui* (Paris, 1888); Pongin, *Essai historique sur la musique en Russie* (Turin, 1897).

CUIRASS, kwê-râs' or kwê'- (Fr. *cuirasse*, from ML. *coratium*, breastplate, from Lat. *coriacus*, leathern, from *corium*, leather). Originally a jerkin, or garment of leather for soldiers, so thick and strong as to be pistol-proof, and even musket-proof. The name was afterwards applied to a portion of armor made of metal, consisting of a backplate and a breastplate hooked or buckled together, with a piece joined to the back called a *culet* or *garde de reins*. For illustration, see ARMOR.

CUIRASSIER, kwê-râs-sêr' (Fr., from *cuirasse*, cuirass). In modern armies, the name given to certain soldiers of heavy cavalry. They are survivals of the troopers of the sixteenth and seventeenth centuries, who wore helmet and cuirass. There are four regiments of cuirassiers in the Russian Army, and twelve regiments each in the German and French armies. (For illustration, see Plate of ARMOR.) The Russian cuirass is of iron, coated with copper, and weighs 30 pounds; the German is of white metal with a brass plate, and the French of steel with a brass plate, their respective weights being 13½ and 16 pounds. There are no cuirassiers in the British Army, although the Life Guards and Royal Horse Guards wear dress cuirasses of steel, costing £3 6s. each, which are discarded on active service. In the time of Queen Mary there were heavy horsemen known as cuirassiers, who wore

body armor over buff coats. They carried swords and pistols, and their reins were strengthened with iron chains. The bodyguard of Napoleon III., Les Cent-Gardes, wore aluminum cuirasses. No cuirass is bullet-proof against a direct shot. See CAVALRY, where an historical sketch of mounted troops is given.

CUISSART, kwê-sârt' (OF., from *cuisse*, thigh, from Lat. *coxa*, hip). A variety of ancient armor worn by troopers. Cuissarts consisted of small strips of iron plate laid horizontally over each other round the thigh and riveted together.

CUITLAHUATZIN, kwê-t-lâ-wüt-sên', or **CITLAHUATZIN** (1470-1520). An Aztec prince, younger brother of Montezuma II. When the latter was seized by the Spaniards, Cuitlahuatzin was also for some time in their hands, but was ultimately released. As the acknowledged leader of the Aztecs after the capture of Montezuma, he led the famous attacks upon the army of Cortés. He also directed the operations of the Aztecs during the retreat of the Spaniards to the coast. He was afterwards elected to succeed Montezuma, but died of a pestilence after his installation, and was succeeded by Guatemotzin.

CUJA'CIUS, properly **JACQUES DE CUJAS**, zhâk de ku'zbâ', or **CUJAUS**, ku'zhô' (1522-90). A French jurist of the sixteenth century. After studying law, he was appointed teacher of the law at Cahors (1554), and in the following year, on the recommendation of the Chancellor L'Hôpital, gained the chair of law in the University of Bourges, after which he taught successively at Valence, again at Bourges, at Valence, at Paris, and at Bourges, at which last place he resided from 1577 till his death, October 4, 1590. He was one of the most eminent jurists of his day, and his learning was founded on the most diligent study of original manuscripts of the Roman laws. His treatment of these authorities and of the feudal system was classical and reconstructive, free from scholastic subtleties. He had in his library 500 manuscripts on Roman law, and by his emendations contributed greatly to remove the obscurities of jurisprudence. A complete collection of his works was edited by Fabrot (10 vols.), at Paris (1658), and reprinted at Venice (1758-83), and at Prato (1834-43). Uhl has edited separately Cujacius's *Animadversiones et Observationes*. Consult: Spangenberg, *Cujacius und seine Zeitgenossen* (Leipzig, 1882); Berriat Saint Prix, *Histoire du droit romain; Histoire de Cujas* (1821).

CULÁMAN, koo-lâ'mân. See MANOBO.

CULASI, koo-lî'sê. A town of Panay, Philippines, in the Province of Antique, situated on the western coast, about 52 miles north of San José de Buenavista. Rice, cacao, fruits, and pepper are cultivated. Population, in 1898, 10,553.

CUL'DEES (OIr. *ceilec*, servant of God, from *ceile*, servant + *Dē*, gen. sg. of *Dia*, God). Anchorite monks who came into Scotland from Ireland in the eighth and ninth centuries, and established themselves in many places, but who in the thirteenth century had been absorbed by the regular Orders, particularly that of Saint Augustine. Their monasteries, which, on the Co-

humban model, were really villages, on Saint Serf's Island, Loch Leven, at Saint Andrews, Monymusk, Abernethy, and at Monifeith, near Dundee, are matters of record. Their abbots were often laymen. The mystery about their origin and fate gave rise to the idea that they were particularly holy, and that they retained the primitive Christian faith. So claimed Hector Boece in his Latin history of Scotland (Paris, 1516), as many, especially ardent Presbyterians, have done since. But the facts were established by W. Reeves, *The Culdees of the British Isles* (Dublin, 1864), and F. Kene, *Celtic Scotland* (3 vols., Edinburgh, 1876-80).

CULENBORG. See KULENBURG.

CULEX (Lat., gnat). A short pastoral and mock-heroic poem of 414 hexameter lines, attributed to Vergil. A sleeping goatherd is awakened by the sting of a gnat, and kills the insect, but finds that it has saved his life by rousing him in time to escape from an approaching serpent. The gnat's shade appears to him in the night, and reproaches him for its death; whereupon the goatherd builds a tomb for it and celebrates the usual funeral rites.

CULIACAN, kōō'lyá-kán'. The capital of the State of Sinaloa, Mexico, on the Culiacan River, 50 miles from the Pacific coast (Map: Mexico, E 5). It is situated in a broad valley, and contains several plazas, those of Rosales and La Constitucion being notable, an ancient cathedral, a seminary, and a mint. It is an episcopal see. The city has some manufactures, principally of textiles, and a large tobacco warehouse. Culiacan was founded in 1599, with the name San Miguel. Population, in 1895, 14,205.

CULICIDÆ, kú-lis'i-dē (Neo-Lat. nom. pl., from Lat. *culex*, gnat). A family of tipuloid Diptera, the mosquitoes, having long and slender wings, the veins and body bearing flattened scales. See MOSQUITO.

CULILAWAN BARK. The bark of a moCCA-tree, *Cinnamomum culilawan*, used like cinnamon (q.v.).

CULIN, STEWART (1858—). An American anthropologist, born in Philadelphia, a descendant of Johan van Culin, one of the earliest Swedish settlers on the Delaware. He was educated at a Friends' school, and afterwards at Nazareth Hall. Leaving this school at the age of seventeen, he engaged in business, but soon developed a deep interest in scientific matters, and, through contact with Dr. Daniel G. Brinton, was led to take up original work in anthropology. In 1883 he was elected secretary of the Numismatic and Antiquarian Society of Philadelphia, and began a study of the Chinese in America, resulting in a series of papers on Chinese games. In 1889 he became secretary of the Archaeological Association of the University of Pennsylvania, and a curator in the Museum of Archaeology; and in 1892 he was appointed director of the museum. In this capacity he represented the University of Pennsylvania at the Columbian Historical Exposition in Madrid, where he was at the same time secretary of the United States Commission. In 1888 he organized the Oriental Club in Philadelphia, of which he became secretary; in 1890 he was elected a fellow in the American Association for the Advancement of Science. He was president of the American Folklore Society in 1897, and was elected to the vice-presidency of

anthropology in the American Association in 1901. In addition to many minor publications, he is author of: *Chess and Playing Cards* (1896); *Korean Games* (1896); and an elaborate memoir on "Games of the American Aborigines," incorporated in the *Twenty-third Report of the Bureau of American Ethnology*.

CULLEN, PAUL (1803-78). An Irish prelate. He was educated in Rome, where he became rector of the Irish College, and in 1848 of the Propaganda College. During the Revolution of that year he saved the college property by appealing to the American Minister. He became Archbishop of Armagh and Primate of Ireland in 1849, and Archbishop of Dublin in 1852. He was a man of great executive ability, piety, and zeal in the restoration and erection of churches, reformatories, and hospitals. He assisted O'Connell, opposed the Fenians, forbade the clergy to take active part in politics, and advocated at the Vatican Council the definition of Papal infallibility. He was the main supporter of the Catholic University at Dublin, and in 1866 was made a cardinal, being the first Irishman to receive that dignity since the Reformation.

CULLEN, WILLIAM (1710-90). A Scotch physician, one of the most celebrated professors of medicine in the universities of Edinburgh and Glasgow. He was born at Hamilton, Scotland, his father being factor to the Duke of Hamilton. He acquired his medical education between 1727 and 1736, under great difficulties, but fortunately secured the aid of John Paisley, a surgeon apothecary, and Monro the Elder. In 1736 he began to practice his profession in his native town, and was rapidly successful. One of his pupils was William Hunter (q.v.). In 1740 he received the degree of M.D. from Glasgow University. In 1744 he removed to Glasgow; in 1746 he began to lecture on the theory and practice of physic, on botany and the materia medica, and finally on chemistry, in Glasgow University. In botany Cullen seems to have lectured in Latin, but in the other departments he adopted the English language as the vehicle of expression, an innovation of great importance, which permitted him to adopt a more familiar style of lecturing than had hitherto been in use. One of his original hearers records that "in the physic class Dr. Cullen never read lectures, but only used notes; in the chemistry he sometimes read, but very seldom." In 1757 he became full professor of chemistry, while continuing to teach clinical medicine in the Royal Infirmary, a duty up to this period performed by Dr. Rutherford only, the professor of medicine and botany. In 1760 he undertook also the lectures on materia medica. In 1766 Cullen was placed in the chair of institutes of medicine, vacant by the death of Dr. Whytt; and Black, the greatest chemical discoverer of the time, took Cullen's place as professor of chemistry. In 1773 Cullen was transferred to the chair of the practice of physic.

His most important works are the *First Lines of the Practice of Physic* (1777), in which he sets forth his system of nosology founded on his theories of nerve influence, and which was translated into many languages; *Synopsis Nosologia Methodica* (1785); *Institutions of Medicine* (1787); *A Treatise of the Materia Medica* (1789). His writings have been collected in two volumes by Dr. John Thomson (Edinburgh,

1827), by whom also a life was commenced, the first volume of which was published in 1832. This biography was continued by his son, and finally completed in a second volume by Dr. Craige in 1859.

CULLERA, *kōō-lyā'rá*. A fortified town of Spain, in the Province of Valencia, on the Júcar River, near its entrance into the Mediterranean, 23 miles south-southeast of Valencia (Map: Spain, E 3). Its streets are irregular but level, and among the noteworthy features are a ruined castle and the chapel of the Virgen de Cullera. Fishing, agriculture, and stock-raising are the principal industries. The city is the centre of a considerable trade in grain, rice, oranges, wine, etc. Cullera was of great military importance under the Moors, by whom it was strongly fortified, and successfully withstood attacks of the Christian armies in 1234 and 1235, though later it was taken by James I. of Aragon. Population, in 1900, 11,957.

CULLODEN, or DRUMMOSSIE MOOR. A Scottish battlefield in Inverness-shire, near the Moray Firth. The place was formerly a desolate tableland, but is now well cultivated. Here on April 16 (new style, 27), 1746, the Duke of Cumberland, with 12,000 royal troops, overwhelmed an army of 5000 Highlanders, under Prince Charles Edward, the Young Pretender, and extinguished the hopes of the House of Stuart of regaining the English crown. A monumental cairn marks the spot where the battle was fiercest, and where many of the slain lie buried. At Culloden House, a mile to the north, the family seat of Duncan Forbes, the valuable historical collection of *Culloden Papers*, covering the years 1625-1748, was discovered in 1812. They were published in London in 1815. Consult William Augustus, Duke of Cumberland, *Authentic Account of the Battle of Culloden* (London, 1746).

CUL'LOM, SHELBY MOORE (1829—). An American politician, born in Wayne County, Ky. He was admitted to the bar in 1855, and began the practice of the law at Springfield, Ill. Here he soon became prominent in politics, was several times elected to the Illinois Legislature, and was Speaker of the House in 1861 and again in 1873. He was a member of Congress for three terms after 1865, and was Governor of Illinois from 1876 to 1883. He then entered the United States Senate as a Republican, and was reelected in 1889, 1895, and 1901. He was the author of the Interstate Commerce Law, and for many years was chairman of the Senate Committee on Interstate Commerce. In 1898 he was appointed one of the commissioners to establish the Government of Hawaii.

CULLUM, GEORGE WASHINGTON (1809-92). An American soldier and writer. He was born in New York, graduated in 1833 at West Point, and was instructor of engineering there from 1848 to 1855. He was made chief engineer of the Department of the Missouri in 1861, superintended engineering works on the Western rivers, and was chief engineer at the siege of Corinth. He was superintendent of the Military Academy from 1864 to 1866, and was brevetted major-general in 1865. He retired from active service in 1874. He published: *Systems of Military Bridges* (1863); *Biographical Register of the Officers and Graduates of the United States Military*

Academy (1868; 3-vol. ed. 1890); *Campaigns and Engineers of the War of 1812-15* (1879). On his death he left part of his fortune to be used for the erection of the Memorial Hall at West Point, and for the continuance of his *Biographical Register*.

CULM. See KULM.

CULM (ME. *culme*, *colm*, soot, smoke, or perhaps connected with Welsh *culm*, knot, the coal being found in knots in some places in Wales, OIr. *colmmene*, nerve, Bret. *koulm*, knot). A term used in the United States for the waste coal thrown out in anthracite mining. Owing to its fine size, much difficulty was experienced for some time in using it. At the present day it is either pressed into bricks or burned on special types of grate, often with forced draught. The name has a similar application in parts of Wales, but in some parts of England it is used in a general sense for anthracite. See ANTHRACITE.

CULMANN, *kōō'män*, KARL (1821-81). A German engineer, born at Bergzabern, Bavaria. He studied at the Artillery School of Metz and the Technical School of Karlsruhe, and from 1841 to 1849 was active as an engineer in bridge construction. In 1855 he was appointed professor of engineering in the Polytechnic School of Zurich, of which he was director from 1872 to 1875. He was the originator of the method of graphical statics, by which the strength of structures is investigated through diagrams made to scale. In exposition of this he published *Graphische Statik* (1864-66). Among his further works is *Untersuchungen über die Schweizer Wildbäche von 1858 bis 1863* (1864), translated into Italian and French.

CULMBACH, *kōōlm'bäk*, HANS VON. See KULMBACH, HANS VON.

CULMINATION (from ML. *culminare*, to culminate, from Lat. *culmen*, OLat. *columnen*, height, from *collis*, hill, *celsum*, high). An astronomical term, signifying the passage of a star across the meridian. The star is then at the highest point (*culmen*) of its course; hence the name. The sun culminates at midday, or 12 o'clock, apparent solar time—which seldom agrees exactly with mean time as shown by a watch or clock. The full moon culminates at midnight. The time of culmination of a fixed star is always exactly midway between the times of its rising and setting; in the case of the sun, moon, and planets, it is only approximately so.

CUL'PA. At Roman law, *culpa* sometimes means fault in general, but in the narrower and usual sense it designates carelessness or negligence. When damage has been done without right and willfully (*dolo*), the doer is always responsible. When damage is occasioned by a careless act or by failure to act as a careful person would act, the person chargeable with carelessness is not usually responsible unless he be under some special obligation to exercise care (*diligentia*). Such an obligation regularly exists only in contractual and quasi-contractual relations; and here the question what degree of carelessness creates liability depends upon the degree of care which the law requires. The standard, in most cases, is the care commonly exercised in similar matters by a good householder (*diligentia boni patris familie*). Exceptionally, in some cases, a person who is habitually some-

what careless is held to that degree of care only which he is accustomed to exercise in his own affairs (*diligentia quam in suis*). This is true when the advantage of the contractual relation is wholly on the other side, as in the deposit for safe-keeping without remuneration, and also when the other party is chargeable with negligence if he enters into relations with a careless person, as in partnership. By reason, however, of the fiduciary character of these relations, the careless depositary or partner who has failed to exercise even that degree of care which he is wont to exercise in his own affairs is regarded as guilty of willful wrong (*dolus*). In contractual relations very gross carelessness (*culpa lata*) is also treated as willful wrong. Whether this is true outside of contractual relations—whether very gross carelessness begets an action on tort—is disputed. Regularly, of course, at Roman law as at English law, action on tort lies only when willful intent can be shown or presumed. Exceptionally, however, and by statutory rule (*lex Aquilia*), the person who has damaged another's property by a careless act is liable although no contractual relation exists between the parties.

At modern civil law most of the Roman rules still obtain. Modern legislators, however, have generally discarded the exceptional standard of the *diligentia quam in suis*; and the French civil code (art. 1383) and some of the codes based on the French, e.g. the Spanish civil code (art. 1089), lay down the broad rule that every person of sound mind who has reached the age of discretion is responsible for damage occasioned by his negligence, whether of act or of omission; but these provisions have not been interpreted as creating a general duty to act in the interest of strangers. For the English and American applications of the civil law doctrine, see BAILMENT; NEGLIGENCE. Consult the authorities referred to under CIVIL LAW.

CULPEPER, JOHN. An early English emigrant to the Carolinas, leader of the 'Culpeper Insurrection.' In 1678 he led a successful insurrection in the northern or Albemarle Colony of Carolina against the representatives of the proprietaries, who had interfered arbitrarily in elections and had imposed excessive taxes. He and his followers succeeded in gaining control of the Government, but when he went to London to arrange a compromise with the home authorities he was promptly arrested on a charge of treason. He was finally acquitted, however, on the ground that there had really been no authorized Government in the colony at that time to rebel against. In 1680 Culpeper laid out on paper the plan of the city of Charleston.

CULPEPER, or COLPEPER, THOMAS (?-1749). A grantee (1673) and Colonial Governor of Virginia. He was appointed Governor for life in 1675, but did not come to the Colony until 1680. In 1683, having administered the office chiefly for his own gain, being shrewd and unscrupulous to the last degree, he returned to England in spite of his orders, was tried and convicted of corruption, and was deprived of his commission. His daughter Catherine brought his great possessions in dower to Baron Fairfax and his descendants.

CULPER. A local name in Africa for a fish resembling a perch, but of uncertain position,

ichthyologically, which inhabits the Zambezi Valley. It burrows in the mud, and thus survives droughts, and is exhumed both by animals and the native negroes for food, but is not thought palatable by the white colonists.

CULPRIT FAY, THE. The title of a poem by Joseph Rodman Drake (1816). Its subject is the love of a fairy for a mortal maiden, and his expiation of the offense.

CULTIVATION. See TILLAGE.

CULTIVATOR (Fr. *cultivateur*, from ML. *cultivare*, to cultivate, from Lat. *cultura*, cultivation, from *colere*, to till). An agricultural implement extensively manufactured and used in the United States. The common name for it in Great Britain is grubber. Certain forms are called scarifiers. It is used for a number of purposes, such as preparing soil for planting, loosening soil between rows of plants, destroying weeds, etc. There are many forms, but usually the essential feature is a triangular or rectangular iron frame in which are fixed tines or teeth, somewhat like those of a harrow, but curved, and so placed as to enter the ground obliquely when the implement moves forward. Handles like those of a plow are provided for control of the implement and the centre beam of the iron framework projects in front for the attachment of wheels and draught-elevises. In some forms the implement is mounted on wheels and provided with a seat for the operator and various levers for the control of the implement. These are called *rider* cultivators, while the simpler forms are known as *walker* cultivators. The two forms are sometimes combined. See also IMPLEMENTS, AGRICULTURAL; TILLAGE.

CULTURE (Lat. *cultura*, cultivation). Specifically, in anthropology, the aggregate result of human development (physical and pschical) either in general or up to and at any particular stage. The chief phases of culture are coördinated with the principal stages of development, themselves usually expounded in terms of social organization, i.e. savagery, barbarism, civilization, and enlightenment. The interchange of culture is one of the most effective factors in human progress. See MAN, SCIENCE OF; AGRICULTURE.

CULTURKAMPF, kool-toor'kämpf. See KULTURKAMPF.

CULTUS COD. A marine fish (*Ophiodon elongatus*) of the family Chiridae, abundant from Lower California to Alaska, and one of the most important food-fishes of the Pacific Coast, where it is also known as ling, buffalo-cod, and blue-cod. *Cultus*, in the Chinook jargon, means 'common,' or 'ordinary,' and was applied to distinguish this species from the true cod of that coast. It is cod-like in form, dark-brown above, variously spotted, and bluish-green below, the flesh being also bluish; and reaches a length of 5 feet and a weight of 30 to 40 pounds, but much smaller specimens are usually brought to market. It lives about rocky places, sometimes in considerable depths, and spawns in summer; and it feeds upon fishes and crustacea and is excessively voracious, often being taken by seizing a fish upon the angler's hook. Its flesh is regarded as of superior quality.

CULVERIN (Fr. *coulcuvrine*, ML. *colubrina*, culverine, from Lat. *coluber*, serpent). An early form of cannon. See **ARTILLERY**.

CULVER'S PHYSIC, CULVER'S ROOT. See **LEPTANDRA**.

CULVERT (probably from Fr. *couloure*, drain, from *couler*, to flow, from Lat. *colare*, to filter, from *colum*, sieve; influenced in termination by analogy with *covert*). An artificial channel for carrying a small stream underneath a canal or the embankment of a roadway or railway. For very small streams vitrified clay pipe or cast-iron pipe is used for culverts. For streams of larger size box culverts are employed, consisting of two parallel masonry walls covered over with stone flagging and having a paved bottom. Where stone is scarce box culverts are sometimes built of timber, and sometimes, instead of stone flagging, a roof of iron beams imbedded in a concrete slab is employed. Large culverts are usually built with parallel masonry side-walls, supporting a stone or brick roof-arch. A culvert, besides the passageway for the water, has wing walls at one or both ends to hold the embankment in place and protect it from the rush of the flowing water in times of freshet. A full technical description of culvert construction is given in Baker, *Treatise on Masonry Construction* (New York, 1900).

CUMA'CEA. See **CRUSTACEA**.

CUMÆ (Lat., from Gk. *Κύμη, Κύμη*). An ancient city on the coast of Campania, founded conjointly by colonists from Chaleis and Cymæ in Eubœa. According to Strabo, it was the earliest of all Greek settlements in either Italy or Sicily, and it is probable that it was founded before the middle of the eighth century B.C., about the same time as the first colonies in Sicily. It soon attained to wealth and power, built several harbors or port towns of its own, including Dicæarchia (Pozzoli) and Neapolis (Naples), and carried on an extensive trade with the interior. From the Chalcidian alphabet of Cumæ the Etruscan and Italian alphabets seem to have been derived. Its prosperity led to wars with the Etruscans and other Italian tribes, and in B.C. 524 a great land army was routed by the Cumæans, while in B.C. 474, when Cumæ was allied with Hiero of Syracuse, the sea-power of the Etruscans was broken in a naval battle near the city. The victory seems to have left Cumæ dependent upon Syracuse, for its power now rapidly waned, and in B.C. 421 it was captured by the Samnites and became an Oscan community. In B.C. 334, along with Capua, it passed under the control of the Romans, and from this period steadily adhered to the fortunes of Rome. In the Second Punic War Hannibal tried to capture it, but was repulsed by Sempronius Gracchus. Toward the close of the Republic it became the municipal capital of the district in which the Roman nobles had their villas and seacoast residences. It continued to exist as a 'quiet' place down to the close of the Roman Empire, but reassumed a momentary importance during the wars of Belisarius and Narses. Its strong fortress, garrisoned by the Goths, was the last place in Italy that held out against the Byzantine Army. The town was finally destroyed, as an abode of pirates, by the Neapolitans in A.D. 1205. Of the ancient fortifications considerable remains may still be

traced, and both on the Acropolis and in the lower city there are fragments of architecture and scanty ruins. Underneath the Acropolis are a number of grottoes and subterranean passages of unknown origin and purpose. One of these caverns was the seat of the oracle of the Cumæan Sibyl (q.v.). Consult Beloch, *Campanien im Alterthum* (Breslau, 1890).

CUMÆAN SIBYL. The most famous of the ancient sibyls. She lived at Cumæ in the crypts under the Temple of Apollo, and has been represented pictorially by several of the great masters. The most noted examples are paintings by Michelangelo in the Sistine Chapel, and by Raphael in the Church of Santa Maria della Pace, in Rome.

CUMANÁ, koo-má-ná'. A town in the State of Bermudez, Venezuela, situated on the Manzanares River, near its mouth, on the Gulf of Cariaco (Map: Venezuela, E 1). It has a college and is the seat of a United States consular agent. The town is an important commercial centre, its trade being promoted by an excellent roadstead and harbor, which are dominated by the fort of San Antonio on a hill overlooking the town. It exports cacao, sugar, cocoanuts, tobacco, pearls, and hides. Population, about 12,000; the suburbs of San Francisco, Guayquerias, and Serritos have an aggregate population which equals that of the mother town. Cumaná, possibly the oldest city in America, was founded in 1520 under the name of Nueva Toledo, and became in the following year capital of the newly erected Province of Nueva Andalucía. It has suffered considerably from earthquakes, notably in 1766 and 1853.

CUMARIN, or COUMARIN (from *cumarou*, the Gallicized form of the native name of the Tonka bean),

The anhydride of cumarin (ortho-oxy-cinnamic) acid. It is a colorless, crystalline substance melting at 67° C. and boiling at 201° C. It has an exceedingly agreeable odor. It is found in various plants, including the Tonka bean (the seeds of the *Dipteryx odorata* and *oppositifolia* Willd.); the woodruff (*Asperula odorata* L.); the melilot (*Melilotus officinalis* Desv.); a number of grasses, such as the sweet-scented vernal grass (*Anthoxanthum odoratum* L.); the fennel or faham leaves (*Angreum fragrans*), much prized among Asiatics for their vanilla-like scent; the Indian sarsaparilla (the root of *Hemidesmus Indicus*), etc. Cumarin is soluble in hot water and in alcohol and ether. It may be obtained from Tonka beans by extracting with alcohol. It has also been prepared synthetically by heating salicylic aldehyde with sodium acetate and acetic anhydride. Tonka beans are largely used to impart the odor of cumarin to snuff. Cumarin is also employed in perfumery and in preparing the beverage well known in Germany as *Maitrank* (May drink), which is made by adding a small quantity of pure cumarin to wine.

CUMBERLAND. A peninsula of Baffin Land, forming the western coast of Davis Strait (Map: Canada, S 3). It cuts off the gulf known as Cumberland Sound.

CUMBERLAND (AS. *Cumbria*). The extreme northwest county of England (Map: England, D 2). It has 75 miles of coast, and an area of 1516 square miles. Two-thirds of the county is cultivated, the rest is covered by mountain and lake. The highest peaks of the Cumbrian Mountains (q.v.) are in this county. The chief rivers are the Eden and Derwent. Mineral wealth abounds, chiefly coal, iron, and lead. Dairy farming and domestic manufactures are carried on. The chief towns are Carlisle, the capital, Cockermouth, Whitehaven, and Wigton. Population, in 1891, 266,550; in 1901, 267,900. Consult: Ferguson, *History of Cumberland* (London, 1890); Wilson (editor), *The Victoria History of Cumberland* (Westminster, 1901).

CUMBERLAND. A city and county-seat of Allegany County, Md., 152 miles northwest of Washington, D. C., and 150 miles southeast of Pittsburg, Pa., on the Chesapeake and Ohio Canal and on the Pennsylvania, the Baltimore and Ohio, and other railroads (Map: Maryland, B 2). It is in a remarkably picturesque locality on the Potomac River, some 600 or 700 feet above tide, on the outer edge of the Cumberland Canal coal region, and ships vast quantities of semibituminous coal. There are also extensive rolling-mills for the manufacture of railroad materials, iron-foundries, steel-works, railroad shops, tanneries, brick-works, flour-mills, glass-works, and cement-works. Cumberland was laid out in 1785 on the site of Fort Cumberland, which was erected in the winter of 1754-55 at the outbreak of the French and Indian War. The town was incorporated in 1815, becoming a city in 1850. The government is administered by a mayor, elected every two years, and a city council, some of the members of which are elected by wards and some at large. The several administrative boards are nominated by the executive subject to the approval of the council. Ownership and operation of the water-works and electric-light works are municipal functions. Population, in 1890, 12,729; in 1900, 17,128. Consult Lowdermilk, *History of Cumberland* (Washington, 1878).

CUMBERLAND. A town in Providence County, R. I., six miles north of Providence, on the Blackstone River, and on the New York, New Haven and Hartford Railroad. It has extensive manufactures of horseshoes, cotton, etc. Cumberland was incorporated in 1747. The government is administered by annual town meetings. Population, in 1890, 8090; in 1900, 8925.

CUMBERLAND, THE. A Federal war-vessel under the command of Lieut. George U. Morris, sunk by the Confederate ram *Merrimac* in Hampton Roads, March 8, 1862. She went down firing and with colors flying, and carried with her a hundred of her crew.

CUMBERLAND, DUKE OF. See WILLIAM AUGUSTUS, Duke of Cumberland, and ERNST AUGUST, King of Hanover.

CUMBERLAND, RICHARD (1632-1718). An English moralist. He was born in London, educated at Saint Paul's School and at Cambridge, appointed in 1658 to the rectory of Brampton, Northamptonshire, and in 1667 to the living of All Hallows, Stamford. In 1691 he was made Bishop of Peterborough. His work, *De Legibus Naturæ Disquisitio Philosophica* (1672), translated into English by Jean Maxwell in 1727, was

one of the first protests against the egoism of Hobbes's ethics. He maintained therein that "the common good of all is the chief end and ultimate standard of morality, and is thus one of the forerunners of the well-known English Utilitarians. Consult: Spaulding, *Richard Cumberland als Begründer der Englischen Ethik* (Leipzig, 1894); and Albee, "The Ethical System of Richard Cumberland," in the *Philosophical Review* (Boston, 1895).

CUMBERLAND, RICHARD (1732-1811). An English dramatic writer and essayist, born in Cambridge. He was the great-grandson of the Bishop of Peterborough, and was the grandson, on his mother's side, of Dr. Richard Bentley. He graduated at Trinity College, Cambridge, in 1750, and two years afterwards was elected fellow. Having been appointed private secretary of the Earl of Halifax, he gave up his intention of entering the Church, and became Ulster secretary during Halifax's term as Lord Lieutenant of Ireland. Later he obtained a sinecure in the Board of Trade, and retired to Tunbridge Wells, where he devoted himself to literature, and wrote farces, tragedies, comedies, pamphlets, essays, novels, and translations from the Greek poets. Many of his comedies were well received, but have not survived. They include *The Brothers* (1769) and *West Indian* (1770), his best play. Goldsmith describes Cumberland with gentle satire in *The Retaliation*, as "The Terence of England, the mender of hearts." His *Memoirs* appeared in 1807, but are considered untrustworthy.

CUMBERLAND AND TEVIOTDALE, tē'vī-ot-dāl. DUKE OF. English titles borne by the first cousin of Queen Victoria, George V. of Hanover (q.v.), and perpetuated by his eldest son, Prince Ernest Augustus, born September 21, 1845.

CUMBERLAND GAP. A pass through the Cumberland Mountains on the State line between Kentucky and Tennessee at the southwestern end of Virginia (Map: Kentucky, H 4). It is a notch about 500 feet deep and in some places so narrow as merely to allow room for a roadway. The road between Virginia and Kentucky laid out by Daniel Boone in 1769 passed through Cumberland Gap, and over this road journeyed most of the early emigrants to Kentucky. During the Civil War the Gap was of great strategic importance, constituting as it did a kind of passageway between central Kentucky and eastern and central Tennessee. It was occupied by the Confederate General Zollicoffer, on November 13, 1861, but on June 17, 1862, the Confederates withdrew on the approach of a superior Federal force under Gen. G. W. Morgan, who took possession on the following day and immediately began to strengthen the fortifications. Various minor skirmishes occurred in the vicinity, in the most important of which, that of August 7, the Confederates lost 125 men in killed and wounded, the Federals 68 in killed, wounded, and missing. On the night of September 17 Morgan secretly evacuated the place, destroyed the fortifications and the war material, and by a skillful retreat saved his command from capture at the hands of the superior Confederate forces in the vicinity. On October 22d General Bragg occupied the Gap. On September 8, 1863, the place again passed into the hands of the Federals un-

der General Shackelford, the Confederate General Frazer surrendering, without resistance, 2000 men and 14 pieces of artillery; and here on April 28, 1865, 900 Confederates surrendered and were paroled.

CUMBERLAND MOUNTAINS. A part of the westernmost division of the Appalachian system extending from northeastern Alabama across Tennessee, thence along the boundary of Virginia and Kentucky to near the southern border of West Virginia (Map: Virginia, A 5). Toward the north the range of elevations is continued by the Alleghany Mountains through West Virginia into Pennsylvania. The Cumberland Mountains comprise several parallel ridges, which together form a plateau some 50 miles in width with an elevation ranging from less than 1000 to more than 2000 feet. Their eastern edge is usually defined by a strong escarpment, while on the west the slope is abrupt in Tennessee but less so in Kentucky. The range is composed of Paleozoic strata, including sandstones, limestones, and slates, which inclose valuable deposits of coal and iron. They are usually well timbered with ash, hickory, chestnut, and other hard woods, but the soil is not sufficiently fertile to support a large agricultural population. The slopes of the Cumberland Mountains are drained mostly into the Ohio River by the Cumberland and the Tennessee, the latter river crossing the southern portion of the range after flowing along the greater part of its eastern edge.

CUMBERLAND PRESBYTERIAN CHURCH. See PRESBYTERIANISM.

CUMBERLAND RIVER. A river of Kentucky and Tennessee, rising in the Cumberland Mountains. It flows southwest and west through southern Kentucky and enters Tennessee in longitude 85° 30' W. (Map: Kentucky, C 4). It runs in a semicircle through the northern part of Tennessee and then turning northward reenters Kentucky, running through the southwestern part of the State parallel with the Tennessee River. It joins the Ohio River at Smithland. The total length of the river is over 600 miles. It is navigable for steamboats to Nashville, and for smaller craft for 100 miles above that town.

CUMBERLAND ROAD, THE. A road 800 miles long, which extended from Fort Cumberland, Md., to Vandalia, Ill., and which had an important part in opening up the West and Southwest to settlement from the East. It was begun about 1806, was constructed in sections, and was finished about 1840. It was to have been built by the Federal Government out of funds derived from sales of public lands in the States to be traversed; but additional appropriations soon became necessary, and, largely owing to the influence of Henry Clay, the National Government advanced the sum of \$6,821,246 for this purpose between 1806 and 1838. For many years the road was under Federal control, and was called the 'Great National Pike,' but by 1856 the Government had turned over to the various States through which it passed the portions included within each. For many years it was perhaps the chief avenue for Western emigration, and thousands of prospective settlers passed over it from the various Eastern States. Consult: Hulbert, *The Cumberland Road* (Cleveland, 1903); Sparks, *The Expansion of the American People* (Chicago, 1901); and an

article "The Old National Pike," in vol. lix. of *Harper's Monthly Magazine* (New York, 1879).

CUMBERLAND UNIVERSITY. An educational institution under the supervision of the Cumberland Presbyterian Church, established in 1844 at Lebanon, Tenn. Connected with the university is the theological seminary of the Church, established in 1852. The university also maintains a law department and preparatory department. Its student enrollment in 1901 was approximately 200.

CUM'BRIA (Lat., the land of the Cymry, or Welsh). An ancient British principality, including Cumberland in England, and most of Scotland as far north as the Clyde. In Scotland, however, the boundaries were indefinite, and depended upon the strength of the ruler. Cumbria had a mixed population of Britons, Goidels, and Piets, who, on account of common danger from the Saxons, united and took the name of Cymry. During the sixth century Cumbria ceased to be governed by one ruler, and was united only in times of war. The country, however, was hilly and easily defended. Edmund conquered Cumbria in 946, with the help of the King of South Wales, and gave it to Malcolm of Scotland. William II, of England annexed Cumbria early in his reign. In 1107 David I, of Scotland became Prince of Cumbria, holding it from the English Crown.

CUMBRIAN MOUNTAINS. A group of mountains, 37 by 35 miles in length and breadth, in the northwest of England, occupying part of Cumberland, Westmoreland, and Lancashire. This tract, embracing the English lake district, is of great picturesqueness and beauty, and much frequented by tourists. There are 25 mountain-tops upward of 1500 feet high, including Sea Fell Pike (3210 feet), Sea Fell (3162), Helvellyn (3118), and Skiddaw (3054). The deep valleys between the mountains contain 14 lakes, 1 to 10 miles long. The largest of the lakes are Windermere, Ullswater, Coniston Water, Bassenthwaite Water, and Derwentwater. Many eminent persons have resided among the lakes, the beauty of which has inspired some of the finest writings of Wordsworth, Coleridge, Southey, Professor Wilson ('Christopher North'), De Quincey, Arnold, and Harriet Martineau.

CUM'MING, ALFRED (c.1802-73). An American official. In 1857 he was appointed by President Buchanan Governor of the Territory of Utah, whither he was sent with a protective force of 2500, under the command of Gen. A. S. Johnston, later famous in the Confederate service. He issued, on November 27, a proclamation which declared the Territory to be in a state of rebellion, a copy of which was forwarded to Salt Lake City. Brigham Young, the Mormon president, retaliated by announcing that the region was under martial law, and forbidding the expedition to enter. A compromise was subsequently effected, and Governor Cumming assumed office on April 12, 1858. The troops were retained at Camp Floyd until February 29, 1860. In 1861 Cumming was succeeded by Stephen S. Harding.

CUMMING, JOHN (1807-81). A Scotch preacher and author, born in Aberdeenshire. He was educated at King's College, Aberdeen, and in 1833 was ordained to the Scotch Church, Crown Court, Covent Garden, London, where he

officialied till 1879. He was very popular as a preacher and lecturer, but is remembered chiefly for his controversies with the Roman Catholic dignitaries, and for his interpretation of the apocalyptic writings. The most important of his voluminous publications are: *Apocalyptic Sketches* (1849); *The Great Tribulation* (1859); *Destiny of the Nations* (1864); and *The Seventh Vial* (1870).

CUMMINGS, Amos J. (1841-1902). An American editor and politician, born at Conkling, Broome County, N. Y. A journeyman printer at fifteen, he set type in nearly every State of the Union. He was with William Walker, in the last 'invasion' of Nicaragua (1857), and during the Civil War served as sergeant-major of the Twenty-sixth New Jersey Infantry, and received the Congressional medal of honor for gallantry. Subsequently he became editor of the New York *Weekly Tribune*, and in 1869 joined the staff of the *Sun*, of whose weekly and evening editions he was afterwards editor. From 1887 he was a Democratic member of Congress from New York, and in 1892 and 1896 was a delegate to the Democratic national conventions. During his Congressional career he held many important positions on committees. He was the author of a series of letters written from Florida and California to the *Sun*, over the signature 'Ziska.'

CUMMINGS, JOSEPH (1817-90). An American educator, born in Falmouth, Maine. He was president of Wesleyan University, Middle town, Conn., from 1857 to 1875, and was professor of mental philosophy and political economy there from 1875 to 1877, and was president of Northwestern University from 1881 until his death.

CUMMINGS, THOMAS SEIR (1804-94). An American painter and author, born in England. He came to New York early in life, and studied there with Henry Inman. He painted miniatures in water-color, and many of his sitters were well-known contemporaries of the artist. In 1826 he helped to found the National Academy of Design, and was its treasurer for forty years. He also wrote an account of its history, entitled, *Historic Annals of the National Academy from its Foundation to 1865*. His later life was spent in Connecticut, and Hackensack, N. J., where he died.

CUMMINS, GEORGE DAVID (1822-76). An American clergyman. He was born in Delaware, graduated at Dickinson College, and entered the Methodist ministry. In 1845 he took orders in the Episcopal Church, and was rector of several Episcopal churches in Virginia, Washington, and Chicago. He was chosen Assistant Bishop of Kentucky in 1866, but in 1872 resigned this office, withdrew from the denomination, and founded the Reformed Episcopal Church, of which in 1873 he was made bishop. Consult the *Memoir* by his wife (New York, 1878).

CUMMINS, MARIA SUSANNA (1827-66). An American novelist, born at Salem, Mass. After receiving a good education she began writing for contemporary magazines. In 1854 she scored an immense success with her story *The Lamplighter*—more than 100,000 copies in all being sold; a surprising sale for ante-bellum fiction. Her later books are negligible, and her reputa-

tion has not been maintained, although *The Lamplighter* is still read.

CUM'NOR HALL. (1) An old manor house, near Oxford, of which only a few ruins remain—the place where Amy Robsart was imprisoned, as mentioned in Scott's *Kenilworth*.—(2) A ballad of that name by W. J. Meikle, supposed to have suggested to Scott the idea of *Kenilworth*.

CUMULATIVE SENTENCE. See SENTENCE.

CUMULATIVE VOTING. A method of voting at elections for office and in representative assemblies, intended to obviate the inconveniences of the majority system by giving proportional weight to the minority vote. As commonly practiced, each voter is permitted to cast as many votes as there are candidates for a given office, and he may distribute his votes or give them all to one candidate, as he may choose. It has been advocated for many years, both in England and the United States, as an important measure of electoral reform, but has made headway slowly. The system has been employed to some extent in Illinois and Michigan, and in Parliamentary elections in England. Its constitutionality was established by a decision of the Supreme Court of Michigan in 1891. See ELECTION; ELECTORAL REFORM.

CUMULUS. See CLOUD; CLOUDINESS.

CUNA, kōō'ná. A tribe, apparently of distinct stock, occupying the Isthmus of Panama, in Colombia, from the Chagres River to the Atrato. They are also known as Darien or San Blas Indians. They are of small stature, but athletic and of light complexion, many of them even approaching the blonde type. They formerly lived in villages of communal houses, cultivated corn and cotton, and worked gold obtained from the streams and mountains. The women were clothed, but the men usually went naked. They used poisoned arrows. They have never been entirely subdued, and still retain their love for freedom and wild life.

CUNARD', Sir SAMUEL (1787-1865). An English shipowner, born in Nova Scotia. He was the founder (1839) of the Cunard Line of ocean steamers plying between England and America. He was a member of the Royal Geographical Society, and was made a baronet in 1859.

CUNAX'A (Lat., from Gk. Κούναξα, *Kounaxa*). A place in Mesopotamia, on the eastern bank of the Euphrates, probably about 60 miles north of Babylon. It was the scene of the battle fought (B.C. 401) between Cyrus the Younger (assisted by a body of Greeks, the Ten Thousand) and his brother, Artaxerxes Mnemon, in which Cyrus was killed.

CUNDINAMARCA, kōōn'dē-ná-mār'ká. The central department of the Republic of Colombia, bounded by Boyacá on the north, Venezuela on the east, Cauca on the south, and Tolima on the west (Map: Colombia, C 3). Its area is estimated at over 79,000 square miles. The western portion belongs to the region of the Eastern Cordilleras, while the remainder forms a part of the Orinoco basin. Numerous rivers flow across it, the largest of which are the Guahibos and the Guayabero. All its streams are tributary to the Orinoco. The soil, with the exception of the

mountain regions, is very fertile, but only a small portion is cultivated. The chief crops are corn, wheat, coffee, tobacco, cacao, and sugar. The chief exports are cinchona and tobacco. Bogotá, the capital of the State of Cundinamarca, is also the capital of Colombia. Cundinamarca derives its name from an old American goddess, and before the conquest of the land by the Spaniards was one of the chief regions of native civilization, as is proved by numerous remains found in the State. The population in 1884, exclusive of aborigines, was 537,658.

CUNDURANGO, kûn'dû-rân'gô (Quichua, eagle-vine). A vine growing in northern South America. It contains a strong bitter principle, and was at one time claimed to be valuable in the cure of cancer, as a remedy for which it was sold in the United States at enormous prices. Subsequently it was found to be worthless for the cure of that disease, although it is still claimed to be valuable as a blood-purifier. It is not recognized in the American pharmacopœias, although it is still given in the German.

CUNEGONDE, kû'ne-gônd'. The mistress of Candide, in Voltaire's novel of that name.

CUNEIFORM, kû-nê'î-fôrm (from Lat. *cuneus*, wedge + *forma*, shape) **INSCRIPTIONS**. Cuneiform writing, one of the oldest systems of the alphabet which is known, originated in Mesopotamia, and spread, through the influence of Babylonia, even to Armenia and to Egypt. The earliest texts in cuneiform writing are at least six thousand years old, and the latest inscriptions are dated in the reign of Antiochus Soter, in the third century B.C. The script receives its name from the peculiar wedge-shaped characters of which it is composed. These consist of combinations of the five elements:

which become in many cases exceedingly complex. The difficulty of deciphering the characters is complicated by the fact that many of them are polyphonic, so that one cuneiform group may represent several entirely different combinations of sounds. In addition to their polyphonic character, all the varieties of cuneiform writing, with the exception of the Old Persian, are syllabic instead of alphabetic. That is, each character represents not a letter, but an entire syllable, or even a word. Furthermore, there are many ideograms in the script, conventionalized characters which do not denote the sounds for which they would naturally be supposed to stand, or which have no real phonetic value whatever. In the same way English possesses certain ideograms, such as lb., which is read pound; viz., pronounced namely; \$, which is dollar in speech; ♂ (the head and horns of the bull) as the astronomical sign for Taurus; and the like. It would seem that originally the cuneiform letters, like the Egyptian, Chinese, and Mexican alphabets, were pictorial, as, for instance, the older form of the character for sun (which may have been regarded as a complete

circle of time), , which later became

. On the other hand, it is doubtful whether the entire body of the extremely complex charac-

ters which make up the bulk of the cuneiform texts can be resolved into such simple elements. The form of the signs was undoubtedly influenced by the material on which the texts were inscribed. As the Germanic runes, which were carved on wood, are angular in shape and avoid curves, or as the Singhalese, which was written on palm-leaves, has almost no straight lines, which would split the leaf, but is composed of curves, so the cuneiform received its characteristic shape from the substance on which it was written. On the soft clay tablets, which were the ordinary writing material of Mesopotamia, the straight line was the easiest stroke, while the triangularly prismatic stylus by its heavy initial touch to the clay formed the peculiar arrow-shaped head of the wedge. These clay bricks, after the writing was finished, were carefully baked or dried in the sun. A chisel was of course employed for the longer inscriptions which were carved in the rock. The cuneiform text, unlike most other Semitic alphabets, as the Hebrew, Syriac, and Arabic, runs from left to right.

HISTORY OF DECIPHERMENT. The history of the decipherment of these alphabets is an interesting one. Although allusion is plainly made to cuneiform texts by Herodotus, Diodorus, Strabo, Plutarch, Arrian, and the epistles ascribed to Themistocles, all remembrance of them seems later to have been lost. Early European travelers to the East, however, were attracted by the mysterious signs, as early as Josafat Barbaro at the end of the fifteenth century, and especially Pietro della Valla in 1621, who seems to have been the first one to suspect that the inscriptions were something more than simple decorations of the rocks. His views, however, made no lasting impression, and the wildest theories were offered in explanation of the meaning of the signs. They were supposed to be talismans, or hieratic and astrological formulas, or it was thought that they might contain the original language of Eden. They were regarded as Greek by one investigator, while another found them pure Arabic. Gradually, however, the theories became more sober and accurate. The investigation centred from the very first about the most striking of all cuneiform inscriptions, the great trilingual text on the side of Behistun. On this steep mountain, which rises abruptly some seventeen hundred feet above the plain, there is carved at a height of three hundred feet an account of the reign of Darius I. in three languages which we now know to be Old Persian, Babylonian, and New Susian. Beginning with the discovery that

the Persian sign  denoted the end of a

word, and basing investigations on historical data furnished by Herodotus and other classical authors, and on hints as to word-order and style which were gained from Pahlavi (q.v.) inscriptions, successive investigations gradually deciphered the Old Persian cuneiform writing. It was then a comparatively easy task to solve the Babylonian and New Susian versions, which reproduce almost word for word the Old Persian text. From such a beginning the key has been found, not only to Assyro-Babylonian and New Susian, but to the Mitanni inscriptions and the tablets of Van and Cappadocia.

SUMERIAN CUNEIFORM INSCRIPTIONS. There are five chief forms of cuneiform alphabets—Sumerian or Accadian, Assyro-Babylonian, New Susian, Old Persian, and Armenian. Of these by far the oldest is the Sumerian, also called the hieratic, which was employed by the pre-Semitic inhabitants of Mesopotamia. This alphabet is ideographic in character, that is, the signs express not syllables, but concepts, and are, consequently, frequently pictorial in origin, as in the

case of  , heaven, god, which later became  , or  , dagger, later .

The numerical system, as in all the cuneiform alphabets, consists of simple wedges,  , for units, and angles,  , for tens. After sixty,

which, like the first digit, is represented by the simple vertical wedge, the system becomes sexagesimal.

ASSYRO-BABYLONIAN. The second alphabet, which is at once the most important and the most complicated of all, is the Assyro-Babylonian. This is the system, moreover, which had by far the longest use and the widest extent. Not only was it the medium of communication for the kingdoms of Assyria and Babylon, which for centuries controlled Mesopotamia, but it was employed by the kings in their messages to Egypt, as is shown by the rich discovery in 1887 of three hundred and twenty bricks inscribed with these characters at Tel-el-Amarna, which lies on the east bank of the Nile about one hundred and eighty miles south of Memphis. The writing is syllabic in character, and with the homophones, or different signs for the same sound, polyphones, or signs with various values, and ideograms, or pictorial representations, numbers some five hundred characters. The reading of these signs has been rendered possible by the discovery at Babylon of the so-called syllabaries. This class of tablets contains in the centre the phonogram, which is explained syllabically on one side and ideographically on the other. The reading of the Assyro-Babylonian inscriptions is further simplified by determinatives, which are found also in all the other cuneiform systems except Old Persian, as well as in Egyptian hieroglyphics. By these signs, which precede the word they determine, the noun is shown to denote a country, deity, or the like. Thus, in the Sumerian alphabet, one vertical wedge is the determinative for a man, three longitudinal wedges for a country, while in Assyro-Babylonian the sign for god, above noted, is the determinative for the name of a deity, and two vertical wedges indicate the dual number. The substances on which these inscriptions were cut were numerous. Not only clay bricks, as in the Tel-el-Amarna tablets, but also seals, stone obelisks, statues of bulls and lions, and the walls of the palaces were favorite places for texts to be inscribed. The writing is often exceedingly minute, some tablets having six lines to the inch, so that the complex characters must be read with the help of a magnifying glass. It is probable that the letters were cut with such assistance, as lenses of considerable power have been found among the ruins of the Mesopotamian cities. In

writing on sculpture the details of the carving were often entirely neglected, so that the lines of text are frequently carried over representations of portraiture or drapery. The clay tablets are of various sizes, some being as large as nine by six inches, while others are little more than an inch square. The character of the writing naturally varies, and there is of course a slight but constant change, so that the later Assyro-Babylonian cuneiform letters are distinctly different from the earlier. It would not be easy to overestimate the importance of the solution of the literature of Babylonia and Assyria. Not only in its contribution to our knowledge of the East, which had been almost a sealed book, is it of value. Almost more momentous still is the light which it has cast on the creation and deluge legends of Genesis, and its resultant value for Old Testament students.

NEW SUSIAN. The third variety of the cuneiform inscriptions, while ultimately derived from the Assyro-Babylonian system, is very much simpler. The name which should be assigned to it is somewhat doubtful. It has been called by no less than ten names—Median, Proto-Median, Medo-Scythian, Scythian, Elamitic, New Elamitic, Susian, Amardian, Anzanian, and New Susian. It is also termed the 'language of the second form,' in allusion to the fact that the only monument of it which has yet been discovered is the second of the Persian Aehgmians. The name which seems preferable and is adopted by the majority of scholars at present is New Susian. This system contains ninety-six syllabic signs, which at times, however, show a distinct approach to alphabetic values. Like the other cuneiform alphabets, the New Susian possesses ideograms and determinatives, having sixteen of the former and five of the latter. It is noteworthy that each ideogram, excepting for *zun-kuk*, king, which already has one determinative, is

followed by the determinative  , *id.* The

readings of the New Susian characters are in general fairly clear, although there is uncertainty about many words. The Old and Middle Susian inscriptions are still little known. Their study, should it prove successful, may help to solve some of the difficulties which still beset our knowledge of New Susian.

ARMENIAN. The cuneiform inscriptions which are found in Armenia, chiefly in the neighborhood of Van, and number over fifty, are written in a language which is related to the modern Georgian dialects. The inscriptions, which are probably to be dated from the ninth to the eighth century B.C., were first noted by Saint-Martin in 1823, and studied by Schulz, who was murdered by the Kurds in 1829, before his researches were completed. Despite the erroneous view held by one of the early investigators that the language of these texts was Armenian, while another more naturally tried to read them as Assyrian, researches into them were at last successful. The alphabet of the Armenian cuneiform inscriptions is an obvious modification of the Assyro-Babylonian characters. It is relatively extremely simple, since polyphones are discarded, and the number of signs is but one hundred and fifty-eight, including fifty-one ideo-

grams and seven determinatives. The type of this script, like the New Susian, forms a kind of transition between the Assyro-Babylonian and the Old Persian, since it has partly given up the syllabic system and often approximates the alphabetic form. Some of the determinatives, as those for god and man, and the numerical system, are borrowed from the Assyro-Babylonian system of writing.

OLD PERSIAN. The most simple of all the cuneiform systems, and the one which, as stated above, gave the key to all the others, is the Old Persian. This is employed from the sixth to the fourth century B.C. in the tablets of the Achæmæniens, Darius the Great, Xerxes, Artaxerxes I., II., and III., and Cyrus the Younger, together with a few seals of private persons. By far the most important text is that of Darius at Behistun, which is about four hundred and thirteen lines long. Other inscriptions, some of them of great value, are found at Persepolis, Susa, Naqsi-Rustam, Elvand, Kirman, Hamadan, and Murghab. In addition, there are shorter tablets at Van, where the most important Armenian inscriptions exist, and at Suez. The trilingual inscription of Behistun was known to Diodorus Siculus (q.v.) in the first century B.C., who says that the deeds of Semiramis were carved there 'in Syrian letters.' The Old Persian cuneiform characters are almost entirely alphabetic, each sign standing either for a vowel or for a consonant plus a vowel. Traces of the earlier syllabic system may perhaps exist in the case of characters which, like some of those found in the Armenian inscriptions, have different forms ac-

ording to the following vowel, as  , ja, but  , ji. The alphabet possesses thirty-

six letters, in addition to which there are four ideograms, for king, land, earth, and Ormazd. Polyphones and homophones are altogether lacking, and the only possible trace of a determinative is in the oblique wedge, already mentioned as the first character of any cuneiform alphabet to be deciphered, which marks the end of a word. While it is obvious that the Old Persian alphabet is derived from the later Assyro-Babylonian signs, just as the Achæmæniens were strongly influenced in their literary style by their non-Iranian predecessors, it is nevertheless not an easy task to trace the direct lineage of the letters of the single Iranian cuneiform alphabet to their Semitic originals.

There still remain a number of Old Persian inscriptions which have never been published or even copied or photographed. It is not impossible that future investigations will add new Armenian tablets, or even New Susian texts, while it is practically certain that continued excavations will bring to light large masses of Sumerian and Assyro-Babylonian cuneiform inscriptions. The difference in the various alphabets of this system may be illustrated by reproducing the name of Darius in Old Persian, *Dārayavaush*; New Susian, *Tariyavaush*; and Babylonian, *Dāriyavush*:

OLD PERSIAN.

NEW SUSIAN.

BABYLONIAN.

CUNENE. See KUNENE.

CUNEO, *kōō'nā-ō* (dialectically called *Coni*). The capital of the province of the same name in North Italy, situated 55 miles south of Turin on a hill at the confluence of the Stura and the Gesso (Map: Italy, B 3). The town has a twelfth-century Franciscan church, a cathedral, and a city hall with a high tower. It markets grain, silk, and hemp in Lombardy, Switzerland, and Germany, and manufactures paper and fabrics of silk and wool. On account of its strategic importance as the key to the upper plains of Piedmont, and to the road that leads to Nice and Provence, Cuneo has often been besieged since it came into possession of the House of Savoy in 1382. Population (commune), in 1881, 24,853; in 1901, 27,065. Consult Bertano, *Storia di Cuneo* (Cuneo, 1898).

CUNHA, *kōō'n'yá*, TRISTÃO DA (1460-c.1540). A Portuguese navigator. He was at the head of an expedition to Africa and the Indies in company with Affonso d'Albuquerque. Afterwards he fought in Madagascar, and he was distinguished for his conduct in the East. In 1514 he was made special ambassador to present to Pope Leo X. the new possessions of Portugal. Upon

his return he was made one of the special council of the Crown. Da Cunha was the discoverer of three volcanic islands in the Atlantic, one of which bears his name.

CUNIBERT, SAINT (c.590-663). One of the earliest bishops of Cologne. He was consecrated in 623; was present at the synods of Rheims (625) and of Clichy (626), and soon took a place beside Pepin as one of the most influential men in the kingdom of the Franks. He educated Sigebert III. and other Merovingian princes; was prominent in the revision of the Salic and Ripuarian laws, and in drawing up the Alemannian and Bavarian codes, and spread the power of the Church over Saxony, Westphalia, Frisia, and part of France. He died after forty years in the bishopric.

CUNIMUND (c.510-566). The last King of the Gepidae. He was killed in 566 in a battle with the Lombards, to whose King, Alboin (q.v.), his daughter Rosamund was married.

CUNNER. A small, brown labroid fish, common in summer about all the eastern shores of the United States, where it affords amusement to hosts of amateur anglers who fish for it from wharves and anchored boats. It is closely allied to the tautog, but less valuable, and is variously known as burgall, chogset, blue perch, sea-perch, niffer, etc., and to ichthyologists as *Otenolabrus adspersus*.

CUNNINGHAM, Sir ALEXANDER (1814-93). An English soldier, archæologist, and author, born at Westminster. He studied at Addiscombe, went to India in 1833 as second lieutenant of Bengal engineers, and in 1836 was appointed an aide-de-camp to Lord Auckland. From 1836 to 1846 he was employed in military and engineering service, in 1846-49 was field-engineer in the Sikh wars, and in 1856, with rank of lieutenant-colonel, was appointed chief engineer of Burma. In 1858 he was appointed to a similar post in the Northwestern Provinces, and, as a major-general, retired in 1861. He was from that time until 1865, and again in 1870-85, archæological surveyor to the Indian Government. In that capacity he made extensive explorations, excavations, and drawings, gathered the most valuable collection of Indian coins yet made, and conducted important researches in the history of Buddhism as revealed by its architecture. His publications include: *Essay on the Arian Order of Architecture* (1848); *The Ancient Geography of India* (pt. i., 1871); *Corpus Inscriptionum Indicarum*, vol. i. (1877); *The Coins of Ancient India* (1891); and *The Coins of Mediæval India* (1894).

CUNNINGHAM, ALLAN (1784-1842). A Scottish poet and miscellaneous writer. He was born in the parish of Keir, Dumfriesshire. His father was for a time a neighbor of Burns, and Allan, as a boy, was present at the poet's funeral. At the age of eleven Cunningham was taken from school and apprenticed to his brother, who was a stone-mason; but his spare time was given to song and the collection of traditions. In 1810 he contributed largely to R. H. Cromek's *Remains of Nithsdale and Galloway Song*. The ballads in this collection, though purporting to be ancient popular songs, were Cunningham's own compositions. Removing to London just before this publication, Cunningham became one

of the best-known writers for the *London Magazine*. He subsequently obtained a situation in Chantrey's studio as foreman, or confidential manager, and this office he held till the sculptor's death. Among Cunningham's many works are *Songs, Chiefly in the Rural Dialect of Scotland* (1813); *Songs of Scotland, Ancient and Modern* (1825); several romances, and a drama; *Traditional Tales of the English and Scottish Peasantry* (1822); *Lives of the Most Eminent British Painters, Sculptors, etc.* (1829-33); and an admirable life of Burns. Cunningham is the author of a fine sea song, "A Wet Sheet and a Flowing Sea." He died in London. Consult Hogg, *Life*, with selections from works (London, 1875).

CUNNINGHAM, JOHN (1819-92). A Scottish divine. He was born at Paisley and was educated at the universities of Glasgow and Edinburgh. He was pastor at Crieff for forty-one years (1845-86). In 1886 he became Moderator of the General Assembly of the Church of Scotland, and in the same year was appointed professor of divinity at Saint Mary's College, Saint Andrews. His *Church History of Scotland*, first published in 1859, is the best work on this subject. His further publications include: *A New Theory of Knowing and Known, with Some Speculations on the Borderland of Psychology and Physiology* (1874); *The Quakers from Their Origin to the Present Time: An International History* (1868).

CUNNINGHAM, JOHN F. (1842—). An American Catholic divine. He was born in the parish of Irremore, County Kerry, Ireland, and was educated at Saint Benedict's College, Atchison, Kan., and at Saint Francis Seminary, Milwaukee, Wis. He took an important part in the development of the Catholic Church influence in Kansas, having been the first resident pastor of that Church to be appointed at Fort Scott (1865-68). In 1868 he was transferred to Lawrence.

CUNNINGHAM, PETER (1816-69). A British author, born in London, the son of the writer Allan Cunningham. He is best known by his *Hand-Book of London* (1849), a valuable work full of information. He also edited a number of the English classics; wrote a *Life of Drummond of Hawthornden* (1833); a *Life of Inigo Jones* (1848); and *The Story of Nell Gwynne* (1852); and was a contributor to numerous English periodicals.

CUNNINGHAM, RICHARD (1793-1835). A Scotch botanist, a brother of Allan Cunningham, the poet. He was born at Wimbleton. From 1808 to 1814 he worked on the *Hortus Kewensis* at Kensington; from 1814 to 1832 he acted as assistant to the King's gardener at Kew, and in the latter year was made Colonial Botanist and superintendent of the gardens at Sydney, Australia. After spending nearly a year in New Zealand, he returned to Australia in 1834, and in the following year, while out with an exploring party on the banks of the Darling River, he was murdered by the natives. He wrote *Two Years in New South Wales* (London, 1827).

CUNNINGHAM, WILLIAM (1805-61). An English theologian. He was born at Hamilton, Lanarkshire, and was educated at Edinburgh University. In 1834 he was appointed pastor of Trinity Church, Edinburgh, and after a visit to the United States for purposes of theological investigation became professor of theology in

the New College in 1843. He was widely known as a controversialist of exceptional ability, and used his abilities largely in the defense of Calvinism. Among his principal works are the following: *Historical Theology* (1862); *The Reformers and the Theology of the Reformations* (1862); and *Discussions on Church Principles* (1863).

CUNOBELINE, kŭ'nō-bē-lin. The legendary father of Caractacus, and King of the Silures.

CUOCO, kŭō-ō'kō, VINCENZO (1770-1823). An Italian historian, born at Cività-Campomorano (Province of Naples). He practiced law for a time at Naples, but was banished for participation in the revolutionary movement of 1799, and until his return in 1806 lived chiefly at Milan, where he edited the *Giornale Italiano* and published his *Saggio storico sulla rivoluzione di Napoli* (1800), a vivid and interesting narrative. From 1806 to 1816 he was director of the Treasury and a member of the Court of Cassation at Naples. Consult d'Ayala, *Vita di Vincenzo Cuoco* (Naples, 1861).

CUP (AS. *cuppe*, Icel. *koppur*, OHG. *choph*, cup, from Lat. *cupa*, cask, OChurch Slav. *kupa*, cup, Gk. *κύπη*, *kypē*, hollow, Skt. *kupa*, well). **DIVINATION BY**. A mode of foretelling events practiced by the ancient Egyptians, and still prevailing in some of the rural districts of England and Scotland. One of the Eastern methods consisted in throwing small pieces of gold or silver leaf into a cup of water, in which also were placed precious stones, with certain characters engraved upon them. The infernal powers were then invoked, and returned answer, either in an intelligible voice, or by signs, on the surface of the water, or by a representation in the cup of the person inquired about. By the modern method, a person's fortune is foretold by the disposition of the sediment in his tea-cup after pouring out the last of the liquid.

CUPANIA. See ⁶AKEE.

CUPAR, kŭō'pēr, or **CUPAR-FIFE**. A royal and municipal burgh, the county town of Fifeshire, Scotland, on the Eden, 32½ miles north of Edinburgh (Map: Scotland, E 3). It has several schools and a public library. The chief manufactures are linens, brick, and earthenware. A fortress of the Macduffs, thanes of Fife, once stood on a mound called the Castle Hill, at the east end of the town. Population (royal, Parliamentary, and municipal burgh), in 1901, 4511.

CU'PEL AND CU'PELLA'TION. See AS-SAYING.

CUPID (Lat. *cupido*, desire, from *cupere*, to desire). In classic mythology, the god of love; in Greek *Ἔρως*, *Erōs*, and also called in Latin *Amor*, love. Eros was worshiped at Thespie and Leutrea in Bœotia, and Parion on the Hellespont, as a very ancient god of productivity, and he also appears in the poets from the time of Hesiod as a personification of the power of love, which unites the gods and produces all things. In this aspect he is called offspring of Chaos, or of Heaven and Earth, or any such symbolical genealogy is assigned to him as pleased the fancy of a poet or philosopher. The prevailing conception, however, is that Eros is the son and inseparable companion of Aphrodite, though there is considerable confusion as to his father. In the earlier Greek art, Eros is a winged youth,

holding a flower or very commonly a lyre, and sometimes a whip, as symbol of his power. The bow and arrows, which were the common attributes in Hellenistic and Roman times, seem to have been introduced in the fourth century B.C., when Praxiteles and Lysippus represented the god in famous statues. Eros stretching the bow, probably influenced by Lysippus, shows the passage to the type which afterwards became universal, the chubby mischievous boy. The later Alexandrian and Roman literature, with its frequent mention of the love-gods, finds a reflection in the contemporary art. The artists of the time are exceeding fond of genre scenes, in which the actors are Cupids, who appear hunting, chariot-driving, making wine, selling their wares, or even playing like children.

CUPID, THE LETTER OF. A poem by Oeeleve, which was attributed to Chaucer in the edition of 1532, though bearing a date (1402) two years after the latter's death.

CUPID AND PSYCHE, sī'kē. (1) One of the tales narrated in the *Golden Ass* of Apuleius. Psyche, a princess, incurs the wrath of Venus, who sends Cupid to punish her; but he falls in love with his prospective victim and visits her, cloaked in invisibility. He commands her not to attempt to see him. Curiosity leads her to disobey, and the lovers are separated. The pity of Jupiter, however, finally unites them for eternity. The episode has been frequently translated and imitated. (2) A graceful antique marble in the Capitoline Museum at Rome, a copy of a Greek original. Cupid, undraped, embraces Psyche, who is draped from the hips. The statue was found on the Aventine.

CUPID'S REVENGE. The title of an inferior comedy by Beaumont and Fletcher, showing strong resemblance to Sidney's *Arcadia*.

CU'POLA (It., dome, from Lat. *cupula*, *cupule*, little cup, *cupola*, dim. of Lat. *cupa*, cask). A spherical vault or ceiling used to cover a building, so called from its resemblance to a cup. Cupolas are hemispherical, or of any other curve, and may be made of any material, stone, brick, wood, metal, or glass. The term *cupola* is distinguished from *dome* (q.v.), because it applies only to the inner surface of the covering, while the term *dome* covers the entire curved structure. In popular but incorrect usage, a *cupola* is a small termination on a roof, often a sort of lantern on the top of a dome (e.g. that of Saint Peter's), for an egress or look-out. In late Byzantine, in Mohammedan, and in Russian domes especially, the inner shell or *cupola* differed essentially in shape from the outer shell, a low inner face being often surmounted by a high pointed or bulbous roofing for effect. This was also the case at Saint Mark's, Venice. The Mes-jid-i-Shah mosque at Ispahan and the Um-es-Sultan mausoleum at Cairo are Eastern examples. In later architecture this is illustrated in the dome of the Invalides in Paris and Saint Paul's, London.

CUPPING. The application of cups, from which the air has been exhausted, to the skin, with the object of causing congestion or excessive fullness of the cutaneous blood-vessels; and if it should be thought desirable to withdraw some blood, the skin may be cut or scarified, and the exhausted cups applied over the incisions, to favor its flow. The two procedures are respect-

ively called 'dry' and 'wet cupping.' Cups are made of glass, with round mouths, from two inches to one inch wide. The cup is held near the skin and the flame of an alcohol lamp is thrust into it till part of the air is driven out by expansion. The flame is then withdrawn and the cup is quickly inverted on the skin, to which it adheres on account of the partial vacuum formed on cooling. The 'French cup' is provided with a rubber bulb connected with its interior. The bulb is grasped as the cup is applied, driving out the air, and when the cup is in position the bulb is allowed to expand and fill, thus exhausting part of the air in the cup. Wet cupping should be done under antiseptic precautions.

CUPRES'SUS. See **CYPRESS.**

CUPRITE (from Lat. *cuprum*, copper). A red cuprous oxide that crystallizes in the isometric system and has an adamantine or submetallic lustre. It occurs in Thuringia and Tuscany, in Cornwall and elsewhere in England; also abundantly in Chile, Peru, and Bolivia; and in the United States with various copper ores in the Lake Superior region, Missouri, and Arizona. It is found occasionally as a furnace product.

CUPULE (Neo-Lat. *cupula*, dim. of Lat. *cupa*, cask). A word with at least two distinct applications among plants. Among seed-plants it refers to a peculiar involucre of coalesced bracts, such as the acorn 'cup,' and the husk of beechnuts, hazelnuts, etc. Among liverworts (as *Marchantia*) it refers to a cup-like structure that appears on the plant body and contains the peculiar reproductive bodies called 'gemmæ.' See **HEPATICÆ.**

CUPULIFERÆ (Neo-Lat. nom. pl., from *cupula*, cupule, little cup, eupola + Lat. *ferre*, to bear). The oak family. This order of Bentham and Hooker is divided by other botanists into several, the principal species being placed in *Fagaceæ* by Engler and the remainder included in *Betulaceæ*. This is one of the most important orders of dicotyledonous plants when their uses are considered. To it belong the oak, chestnut, and beech (q.v.), which are among our most valued deciduous forest trees. The order is composed of monoëcious trees and shrubs with alternate simple, straight-veined leaves, deciduous stipules; fertile flowers borne singly or clustered, sterile ones in catkins. The fruit is a nut inclosed in a cupule of coalesced bracts. In the oaks the nuts are borne singly in the cupule and more or less inclosed by it. With the beeches two three-angled nuts are formed within the cupule, which opens by four valves. The chestnuts have three nuts within a spiny bur, which opens by two or four valves when ripe. As limited by Engler, there are but four or five genera and about 350 species in this order, the principal genera being *Quercus*, *Castanea*, and *Fagus*. The first two are found indigenous only in extra-tropical regions of the Northern Hemisphere, while *Fagus* occurs in the same region and is represented by the sub-genus *Nothofagus* in South America, New Zealand, and Australia.

CURA, *koo'rá*, or **CIUDAD DE CURA**. A city of Venezuela, formerly capital of the State of Miranda, situated near Lake Valencia, 1600 feet above sea-level (Map: Venezuela, D 2). Owing to its position near the llanos of the Guárico, it has considerable trade as the centre of a cotton-growing, agricultural, and stock-raising region.

Cura, founded in 1730, suffered considerably in the War of Independence. In 1900 it was visited by a destructive earthquake. Population, in 1889, 12,198.

CURAÇAO, *koo'rá-sü'ó* or *koo'rá-só'*. One of the Dutch West India islands lying in the southern part of the Caribbean Sea (Map: West Indies, N 8). It is situated about 41 miles north of Venezuela, in latitude 12° N. and longitude 69° W., and covers an area of 210 square miles. Its surface is generally flat, with the exception of the southwestern part, where some of the elevations reach about 1200 feet. The lowlands are mostly of coral formation, and the coasts are bordered with a number of lagoons. Streams are few, and the rainfall light. Sugar, tobacco, corn, and fruits are raised, but a considerable part of the island is uncultivable on account of the lack of water. The principal minerals worked are salt and phosphate. The commerce of Curaçao is chiefly with the adjacent islands and the United States, which sends the larger part of the imports. No figures for the exports of the island are obtainable, as there are no export duties in Curaçao, but the imports for 1899 were valued at over \$770,000. The island of Curaçao, together with the adjacent Dutch islands of Buen Ayre, Oruba, a part of Saint Martin, Saint Eustache, and Saba, form a separate colony officially called Curaçao, administered by a governor, assisted by a council of four members and a colonial council of eight members. The smaller islands are administered by subordinate officials. The members of both councils, as well as the minor officials, are nominated by the sovereign. The population of Curaçao in 1899 was 30,119 and that of the colony, 51,693. The capital of the colony of Curaçao is Willemstad, on Curaçao, a well-built town with a good harbor. Curaçao was occupied by the Spanish in 1527 and fell into the hands of the Dutch in 1634. After a period of eight years under English rule the island was returned to the Dutch in 1815. There is a United States Consul on the island. Consult Dissel, *Curaçao* (Leyden, 1857).

CURAÇAO, *koo'rá-só'* (so called from the peel of the Curaçao orange). A well-known and palatable liqueur, made from orange-peel by digesting in sweetened spirits, with certain spices, as cinnamon, mace, or cloves. See **LIQUEURS.**

CURANA (*koo-rá'ná*) **WOOD.** See **PROTIUM.**

CURARI, *koo-rá'rè* (South American), **CURARE**, **OURARI**, **URARI**, **WOORALI**, or **WOORARA**. A celebrated poison used by some tribes of South American Indians for poisoning their arrows. It is by means of this poison that the small arrows shot from the blow-pipe become so deadly. The nature and source of this poison remained long unknown, the Indians being very unwilling to reveal the secret, which seems, however, to have been at last obtained from them by Sir Robert Schonburgk, and it is now regarded as pretty certain that the principal ingredient is the juice of the *Strychnos toxifera*, a tree or shrub of the same genus with that which yields *nux vomica*. (See **STRYCHNOS.**) It has a climbing stem, thickly covered with long, spreading, reddish hairs; rough, ovate, pointed leaves; and large, round fruit. The poison, when introduced

into the blood, acts on the end plates of the muscles, peripheral end organs of the motor nerves, causing complete paralysis without affecting consciousness, sensation, circulation, or respiration except indirectly. Convulsions are due to the asphyxia which results from paralysis of the muscles concerned in respiration. Death finally occurs from this respiratory paralysis. Curari is supposed to be the most powerful sedative known. Artificial respiration is the most efficacious means of preventing its effects. It has been proposed to employ it in the cure of lockjaw and hydrophobia, but it merely stops the convulsions and is itself very dangerous on account of the liability to paralysis of the respiratory muscles. Like snake-poison, it is comparatively inert when taken into the stomach.

CURASSOW (from *Curacao*, an island in the Caribbean Sea), or properly CURAÇAO BIRD. A large gallinaceous bird of the genus *Crax*, of the family Cracidae, having a strong bill surrounded at the base with a skin—sometimes brightly colored—in which the nostrils are pierced, and the head adorned with a crest of feathers curled forward, which can be raised and depressed at pleasure. They are natives of the forests of the warm parts of America. They congregate in flocks, and although they live much among the branches of trees, their habits greatly resemble those of domestic poultry. They make large, clumsy nests in trees and lay white eggs. They are very unsuspecting of danger, until taught by severe experience, and are easily domesticated. The best-known species, the Curacao bird (*Crax alector*), is about the size of a turkey; its plumage is almost entirely black. It is abundant in the forests of Guiana. Its flesh is very good eating. It is kept in poultry-yards in South America, and was introduced into Holland at the close of the last century, where it seemed completely acclimated, but the stock has never become widespread. For this point consult Dixon, *The Dovecote and the Aviary* (London, 1853); for general facts see Selater's illustrated papers in the *Transactions of the Zoölogical Society of London*, vol. ix. (London, 1877). Compare CHACHALACA, GUAN, and HOCCO; and see PLATE OF GROUSE, ETC.

CURATE (ML. *curatus*, from Lat. *cura*, cure, care). One who has the cure of souls. In this sense it is used in the phrase of the English Prayer-book, 'all bishops and curates,' and similarly in France the word *curé* denotes the parish priest. In modern popular usage, however, in England, and to some extent in America, the word is applied to assistant clergymen. A few incumbents in England hold what are known as perpetual curacies and are practically the same as vicarages.

CURATE OF LOS PALACIOS, lós pá-lá-thê-ós (Sp. *Cura de Los Palacios*). The pseudonym of Andres Bernaldez, the Spanish historian.

CURB (from OF. *courber*, *corber*, *curber*, Fr. *courber*, It. *curvare*, from Lat. *curvare*, to bend, from *curvus*, curved, OChurch Slav. *krivŭ*, Lith. *kreivas*, crooked). A strain of the straight ligament in the rear of the hock of horses. Swelling appears on the inner and back part of the joint, generally causing lameness, which is most apparent in trotting, and, in slight cases, usually wears off after the animal has been out for ten minutes. It may be

most readily detected by standing at one side and looking across the joint. Fomentations must first be used to allay the irritation and inflammation; when heat and tenderness disappear, cold applications will be advisable; and if, after ten days, the enlargement still continues, a blister may be necessary. All work should be suspended.

CURBINA, kūr-bē'ná. See DRUM, OR DRUM-FISH.

CURCI, kūr'ehê, CARLO MARIA (1809-90). An Italian priest and author, born in Naples. He became in 1850 the founder of the *Civiltà Cattolica*, a journal which stood for the rehabilitation of the temporal power of the Pope. But Curci later retracted these opinions and in 1877 published the reasons for his opposition to the policy of Pius IX. This forced him to leave the Society of Jesus, but afterwards Leo XIII. induced him to recant to some extent, and he continued more favorable to the policy of the Vatican until the publication of his books, *La nuova Italia* (1880); *Il Vaticano regio* (1883); and *Lo scandalo del Vaticano regio* (1884). These works were immediately placed upon the Index. Toward the end of his life Curci retracted again, and died in the communion of the Church.

CURCULIONIDÆ (Neo-Lat. nòm. pl., from Lat. *curculio*, *gurgulio*, weevil). A large family of rhynchophorous beetles; snout-beetles. See WEEVIL; PLUM CURCULIO.

CUR'CUMA (It., Fr. *curcuma*, from Ar. *kurkum*, saffron). A genus of plants of the natural order Zingiberaceæ (or Scitamineæ according to some botanists), having the tube of the corolla gradually enlarged upward, and the limb two-lipped, each lip three-parted. The species are stemless plants, with tuberous roots, natives of the East Indies. The dried roots of *Curcuma zedoaria* are the zedoary (q.v.) of the shops; the roots of *Curcuma longa* yield turmeric (q.v.); and *Curcuma angustifolia* yields a kind of arrowroot (q.v.). The same species often yields both arrowroot and turmeric, the former being obtained from the young roots, the latter from the old. *Curcuma amada* is called mango ginger. Its root when fresh has the smell of a mango, and in its qualities resembles ginger. It is a native of Bengal.

CURD. See CHEESE.

CURÉ DE MEUDON, kūr'á' de mē'dón', LE (Fr., the curate of Meudon). The name frequently given to Rabelais, whose last charge was at Meudon.

CURE FOR A CUCKOLD. The title of a play by Webster and Rowley (1661), also attributed to Middleton and Rowley.

CURES, kūr'tez (from Sabine *curis*, *quiris*, spear). A town of the Sabines. It was situated about twenty-five miles from Rome, near the Tiber, and was the birthplace of Titus Tatius. (See ROMULUS.) The term *Quirites*, as applied to the Roman people, is supposed to have come from Cures. The town was destroyed by the Lombards near the close of the sixth century. It stood not far from the modern Corresi. See QUIRITES.

CURETES, kūr-rē'tez (Lat., from Gk. *Κουρήτες*, *Kourētes*, connected by Hesychius with Gk. *κουρά*, *koura*, a cutting of the hair, in allusion

to their mode of wearing their hair). Cretan demigods who protected the infant Zeus from his father Cronus, when the latter swallowed his other children, by drowning his cries with the clanking of their brazen weapons. They are sometimes identified with the Corybantes.

CURETON, kūr'ton, WILLIAM (1808-64). An English Syriac scholar. He was born at Westbury, became Canon of Westminster and rector of Saint Margaret's, London, in 1849. He died in London, June 17, 1864. His fame rests upon his Syriac studies: *Corpus Ignatianum* (1849); *Four Gospels in Syriac* (1858); *Ancient Syriac Documents Relative to the Earliest Establishment of Christianity in Edessa and the Neighboring Countries* (1864).

CURETU, koo-rá'too. A tribe of Tapuyan stock occupying the country between the Yapura and Uaupés Rivers, on the Brazil-Colombia border. They are a peaceable people, living in circular thatched houses and cultivating corn and manioc. The men paint their bodies and wear woolen girdles, but the women go entirely naked.

CURFEW (OF. *courfeu*, *corfeu*, from *cucrefeu*, *cocrefeu*, *covrefeu*, *covrefeu*, cover-fire, from *cocrir*, Fr. *couvrir*, to cover + *feu*, fire). In the Middle Ages, the ringing of a bell at night as a signal for the cessation of all outdoor life. The custom existed as a general police regulation, providing that after 8 o'clock all fires must be covered, and people keep within their houses. Polydore Vergil attributes to William the Conqueror the introduction of the curfew-bell into England, but the custom prevailed throughout Europe long before his time. There was so much opposition to the ordinance in England that Henry I., in 1103, abolished it. The curfew is mentioned in English laws for more than a century afterwards, but Blackstone says it refers to the time of night, and not to the ordinance. In parts of the United States and England the curfew-bell is still rung; in some towns of the former it is a police regulation to warn children off the streets.

CURIA (Lat., court). In Roman history, the name of a division of a tribe in the constitution of Romulus. The tribes being three and the divisions ten, there were thirty curia. This division was a division of the *populus* to the exclusion of the *plebs*; and the assembly of the *populus* was called the *comitia curiata*. (See *COMITIA*.) *Curia* is also the name given to the Senate-house in ancient Rome.

CURIA MURIA (koo'ri-á moo'ri-á) ISLANDS. See KURIA MURIA ISLANDS.

CURIA RE'GIS (Lat.), or KING'S COURT. The ancient supreme court of England, known also as the *Aula Regia*, or Royal Hall (of Justice). It was instituted by William the Conqueror as the instrument of his judicial authority as supreme head of the State, and, exercising, as it did, a general and practically unlimited jurisdiction, it rapidly drew to itself all the important litigation of the kingdom. There had been no analogous tribunal under the Saxon kings, the popular county courts being in all ordinary cases supreme within their respective counties (shires), and a centralized administration of justice being foreign to the sentiments and traditions of the English people.

Among the Normans, however, it was the duke or king, and not the people, from whom the stream of justice flowed, and the followers of the Conqueror could hardly be expected to subject their causes—their land-titles, their exactions, their controversies over tithes and preferments—to the judgment of the popular tribunals. It was in the County Court of the County of Kent, however, that a great case, involving the title to twenty-five manors, between the Archbishop of Canterbury and Odo, the Bishop of Bayeux and Earl of Kent, the half-brother of the King, was tried and adjudged in the tenth year of the Conqueror, and cases of this kind were not uncommon in the earlier years of William's reign.

But the older tribunals could not long compete with the immediate jurisdiction of the King, at first administered by him in person, and then by the chief justiciar, an officer of almost royal authority and importance. All important causes, public and private, whether civil, criminal, or ecclesiastical, might be brought before the King's court in the first instance, and judgments of the county courts and other local tribunals were subject to be appealed and brought before it for review. Its disinterestedness contributed as much as its authority to invest it with the function of the principal court in the kingdom for the adjudication of private controversies, and the position of the justiciar, as the chief executive and military officer, as well as the highest judicial officer in the kingdom, added to the weight of its judgments.

The *Curia Regis* early became a peripatetic or circuit court, attending the King, or, in his absence from the realm, the justiciar, in his frequent progresses through the kingdom, and this, in the course of time, became a great abuse, amounting in many cases to a denial of justice. To remedy this, it was provided in Magna Charta (Sec. 17) that common pleas—that is, causes between private parties—should not follow the court, but be heard in a fixed place. The establishment, thereupon, of a distinct Court of Common Pleas, in the reign of Henry III., to sit permanently at Westminster, was the beginning of the dissolution of the *Curia Regis*. A separate division of the court, known as the King's Court of the Exchequer, had previously been created for determining questions relating to the royal exchequer. When in the same reign a Chancellor of the Exchequer was appointed as the permanent head of this department, it also became a separate and distinct tribunal. Finally, in the fifty-second year of Henry III., a third court, thenceforth known as the Court of King's Bench, was created and took over the remaining jurisdiction of the *Curia Regis*. Thus, the latter, though never formally abolished, lost its importance and became obsolete, after two hundred years of greatness. The last justiciar of the King's Court, Robert de Brus, became the first Chief Justice of the King's Bench in 1268, and with him the line of great justiciars became extinct. From that time to the reform of the judicial system of Great Britain in 1873-75, England lacked a single supreme court, but the model of the *Curia Regis* of the Norman kings was followed in the creation of the Supreme Court of Judicature, by which justice is administered in England to-day. See COURT; SUPREME COURT.

Consult: Thorpe, *The Ancient Laws and Institutes of England* (London, 1840); Stubbs,

Constitutional History of England (Oxford, 1883); Stephens, *History of the Criminal Law* (London, 1883); *Essays in Anglo-Saxon Law* (Boston, 1876); Dugdale, *Origines Juridicales; or, Historical Memorials of the English Laws*, etc. (London, 1666); Underwick, *The King's Peace, a Historical Sketch of English Law Courts* (London, 1895); Pollock and Maitland, *History of English Law* (2d ed., London and Boston, 1889); Digby, *An Introduction to the History of the Law of Real Property* (5th ed., Oxford, 1899).

CURIATII, kūr'ā'shī-ī. The tribal name of three Alban brothers, the opponents of the three Horatii (q.v.) in the famous contest by which Alba became subject to Rome. They were successively slain by the surviving Horatius after his two brothers had been killed. The story is finely told in Corneille's tragedy *Horace*.

CURICANCHA, kūr'rē-kān'chā (Quichua, court of gold). A temple of the sun, said to have been founded by Manco Capac, in Cuzco, Peru, and to have been first used as a palace by the early Incas. The church and convent of Santo Domingo were built upon its site, soon after its demolition during the Spanish Conquest. Only irregular portions of its walls now remain, surrounded by the structure of the more modern edifice.

CURICÓ, kūr'rē-kō'. The capital of the Province of Curicó, Chile (Map: Chile, C 10), situated, at an elevation of 800 feet above sea-level, 108 miles south of Santiago. It is connected with Santiago by railroad, and has considerable trade with Argentina through the Planchón Pass. Curicó was settled in 1743, though not on its present site. Population, in 1899, 17,638.

CUR'IO (clipped from *curiosity*). A term still popularly used, though somewhat obsolete, to describe any kind of object of curiosity, especially such as would belong to cabinet (q.v.) collections, on account of antiquity, rarity, unusual association, or intrinsic interest, in such domains as pottery, porcelain, enamels, metal-work, ivories, wood-carvings, arms, clocks, fans, watches, snuff-boxes, musical instruments, and the like. The kind of indiscriminate, unscientific collection that could be called by this name is going out of fashion, and the term with it.

CURIOSITIES OF LITERATURE. A work in six volumes by Isaac D'Israeli, which appeared without indication of its authorship, at intervals from 1791 to 1824.

CURIOS IMPERTINENT, THE. A tale in Cervantes's *Don Quixote*, in which the 'Curious Impertinent' tries the fidelity of his trusted wife through the agency of a friend, and is deceived by both. The story is used by Crowe in *The Married Beau, or the Curious Impertinent*.

CURISCHES HAFF, kūr'rīsh-es häf. See KURISCHES HAFF.

CURITIBA, kūr'rē-tā'bā. The capital of the State of Paraná, Brazil (Map: Brazil, H 9), situated on Iguazú River, in a fertile plain, 3200 feet above sea-level. It is well built, and has a high school and a street railway. Railroads run to the interior and to the coast, and the town exports corn, beef, fruit, tobacco, and Paraguay tea. There are gold-mines in the vicinity. Curitiba was settled in 1654, and since 1831 has been

the capital of the State. Population, about 10,000.

CURLEW (OF. *corlicu*, It. *chiurlo*; probably onomatopoeitic in origin). A shore-bird of the genus *Numenius*, and snipe family, characterized especially by its long, slender, downward-curving bill, and its liking for upland plains rather than

BILL OF ESKIMO CURLEW.

marshy places. In America are the Hudsonian or Jack curlew (*Numenius Hudsonicus*), the Eskimo curlew, or doe-bird (*Numenius borealis*), and the long-billed curlew (*Numenius longirostris*). The first two are found in summer in far Arctic regions and in winter as far south as Patagonia, so that during some part of the year they occur in most portions of the Western Hemisphere. The long-billed, whose beak is sometimes eight inches long, belongs in the eastern and central United States, especially at the South, and on the Northwestern prairies. Its nest, like that of other curlews, is on the ground, and slightly constructed, and the eggs are clay-colored, with various brown markings.

The common curlew of Great Britain (*Numenius arquatus*), the 'whaup' of the Scotch, has an almost world-wide distribution in the Old World, migrating even to New Zealand. It frequents the grassy moors of England and Scotland in summer, and its whistle is one of the characteristics of those upland scenes. Its flesh and eggs are both eaten. Other Old World species are the whimbrel (*Numenius phaeopus*) and the Otahiti curlew (*Numenius Taitensis*), of the Pacific islands, often called the bristle-bellied curlew, because the feathers of the belly are tipped with glistening bristles. Consult: Coues, *Birds of the Northwest* (Washington, 1874); and Selous, *Bird Watching* (London, 1901). See Plate of BEACH-BIRDS.

CURLING (so called from the twisting motion of the curling-stones). This has the unique distinction of being the only ancient game about which there is no ambiguity as to its place of origin; it is purely a Scottish game, and wherever Scotchmen have gone, there the game flourishes. Associated with the parent body to-day, 'The Royal Curling Club of Scotland,' are clubs in England, Ireland, Canada, Newfoundland, New Zealand, Nova Scotia, the United States, Russia, and Switzerland.

There are two curling games—the rink play and 'playing for points.' The rink game is played on any piece of ice, upon which may be platted out a rink 42 yards long (occasionally 32 yards) and 10 yards wide. There are four players on each side, each using two stones of circular shape, not heavier than 44 pounds, and not of greater circumference than 36 inches, though in Canada, where iron has to be used instead of stone, they weigh from 60 to 70 pounds. Each player in turn takes his position on the crampet or iron foothold at one end of the rink, and propels his stone as near to the tee, 38 yards

off, as he can. The next man of the opposite side then projects one of his stones still nearer, if possible, and so the game proceeds until each has cast his two stones, after which the end, or 'head,' is counted. A stone is of no use unless it reaches the mark called the 'hog score,' and of no value if it passes out of the parish, which is a seven-foot ring drawn round the tee. All the stones that stay within the parish are counted, and that side wins which has the greatest number of stones nearest the tee.

It is permitted during the game for one side to aim at its opponents' stones, and to knock them out of the circle if possible. The sweeping of the ice, an important feature of the game, is under the direction of one player of each side called the 'skip.' The player's party may sweep the ice from the hog score next to the player to the tee; but when snow is falling the ice may be swept from tee to tee. In the 'point' game there are no sides; each player has two stones to throw, and other stones are placed round the tee for him to make his points by placing his ball, or displacing the other balls from the positions in which they have been placed. Originally, the stones were simply rounded stones, taken from the channel of a river; but about the middle of the eighteenth century they

were improved by chiseling, and later handles were introduced. Now each stone has usually two sides: one so curved that it runs as on a pivot and highly polished for use on dull ice, and the other less polished, but with a larger concave or hollow, to give it a better catch or hold on keen, clean ice. A set of matches is called a 'bonspiel.' There are international bonspiels between the United States and Canada, and interstate matches yearly at Montreal, Winnipeg, Ottawa, Hamilton, Toronto, Saint Paul, Minneapolis, Duluth, Chicago, Buffalo, and Hoboken, N. J. Numerous trophies are contested for, among which are the International Trophy, the Quebec Challenge Cup, the Grand Challenge Cup of Manitoba, the Caledonian Tankard, the Vice-regal Tankard, the Merrian Trophy, and the Gordon-Mitchell and Smith medals. Consult: Ramsay, *An Account of the Game of Curling* (the earliest history of the game, Edinburgh, 1811); Taylor, *Curling, the Ancient Game* (Edinburgh, 1877); Kerr, *History of Curling* (Edinburgh, 1890).

CURLL, EDMUND (1675-1747). An English bookseller. From 1706 at the sign of the Peacock, outside Temple Bar, and from 1735 at that of the Pope's Head, Rose Street, Covent Garden, he dispensed literature and—its concomitant in those days—patent medicine. He seems continually to have been involved in quarrels, and many of his publications were of the character of vindications and explanations. His most memorable contentions were with Pope, who devoted to him some of the least complimentary lines of the *Dunciad*. Numerous standard works displayed his imprint, and many volumes were edited by him.

CURRACH, COURACH, kūr'rá or kur'rák, or **COR'ACLE** (Gael., Ir. *curach*, Welsh *corve*, boat). The name given in the British Islands to a canoe or boat, made of a slender frame of wood, covered with skins. Skiffs of this sort, as well as canoes hollowed out of the trunks of oaks, were in use among the Britons in the earliest times of which we have record. Julius Cæsar, who built some of them after the British model, tells us that the keel and gunwales were of light wood, and the sides of wicker, covered with hides. Similar descriptions of the Currach are given by Pliny, Lucan, Solinus, Festus Avienus, Sidonius Apollinaris, and others. The first occurrence of the name seems to be in Gildas, who wrote in the sixth century; he speaks of the currach as in use among the Scots and the Piets. A long voyage in the North Sea, made in a currach during the same century, by one of the companions of Saint Columba, is commemorated by Adamnan, who died in 704. In 878 three Irish missionaries sailed in a currach from Ireland to Cornwall; the voyage occupied seven days, and the size of the currach is indicated by the remark that it was one of two skins and a half. An old life of Saint Patrick speaks of a currach "of one skin, with neither helm nor oar." The currach of a larger size had a mast and sail. The currach still continues to be used on the Severn, and on many parts of the Irish coast, especially on the shores of Clare and Donegal. The last one known to have been used in Scotland is in the museum at Elgin. It was employed on the Spey, toward the end of the nineteenth century.

CURRAGH OF KILDARE, THE. A famous race-track and the seat of a military school in County Kildare, Ireland. The plain is about six miles long.

CUR'AN, CHARLES COURTNEY (1861—). An American painter, born at Frankfort, Ky. He studied in New York at the Art Students' League, and in Paris under Duet, Lefebvre, and Benjamin-Constant. In 1888 he won the third Hallgarten prize, and in 1890 honorable mention at the Paris Salon. He became a member of the Society of American Artists and of the National Academy in 1888. There are pictures by him in the Chicago Art Institute and at Vassar College. His work is skillful, refined, and soft in color. Several of his pictures are highly imaginative, especially "The Dream."

CURRAN, JOHN PHILPOT (1750-1817). An Irish judge and orator. He was born at Newmarket, Cork County, July 24, 1750, and educated at Trinity College, Dublin, where he was more dissipated than studious. In 1773 he went to London and studied law assiduously at the

Middle Temple. He was called to the Irish bar in 1775, and soon won success by his ability and social qualities. He was an expert cross-examiner and possessed a thorough acquaintance with every intricacy of the cunning native mind. In 1782 he became member for Kilbeggan in the Irish Parliament and supported a liberal policy. His sarcasm led him into several fortunately harmless duels. In 1788 he favored the formation of an Irish volunteer army corps, and eloquently protested against the English policy which led to the rebellion of 1798. His fearless defense of the leaders at the State trials, and Robert Emmet's affection for his daughter, the heroine of Moore's pathetic poem, led to Curran's examination before the Privy Council, but he was found guiltless of complicity. He bitterly opposed the Union, as the 'annihilation of Ireland'; and its consummation, crowding on domestic trouble, seriously impaired his health. After the death of Pitt, Fox appointed him Master of the Rolls with a seat in the Privy Council. He held the office from 1806-13, and retired on a pension. As a distinguished man among the brilliant men of the period, he spent the last three years of his life in London, where he died, October 14, 1817. His memory is preserved by excellent examples of sparkling wit and repartee found in various memoirs. Consult: Phillips, *Recollections of Curran and His Contemporaries* (London, 1850); Curran, *Life of Curran* (London, 1819; New York, 1855); Stephens, *Memoir* (London, 1817); O'Regan, *Memoir* (London, 1817); and *Curran's Speeches*, with a *Life*, edited by Davis (Dublin, 1855).

CURRANT (Fr. *corinthe*, It. *corintho*, currant, from Lat. *Corinthus*, Gk. *Κόρινθος*, *Korinthos*, Corinth; so called as being originally exported from that city). A name used to designate some fruits of the genus *Vitis*, as well as both the plant and fruit of the genus *Ribes*. Originally this term seems to have been applied to the small raisins which are now a common commercial article much used in cookery. In general the term currant is applied to both the plant and fruit of those species of the genus *Ribes* that have no thorns and bear their fruits in bunches or clusters like grapes. *Ribes rubrum* may be taken as a type. This group is found chiefly in the northern half of the north temperate zone. In Europe it is wild, and occurs in England and on the Continent as far north as Kamechatka, although it is not found in the Mediterranean countries. In America it is found in Canada, and both eastern and western United States. Having a northern origin, it has proved a most valuable plant in the Northwest, where few cultivated fruits thrive without protection. The currant is found in almost every fruit garden throughout the northern United States and Canada, and is cultivated to a considerable extent commercially.

Ribes rubrum, from which our red and white varieties are derived, is the most important member of this group, both in America and Europe. (For illustration, see Plate of CYPRESS.) It grows best on a strong, moist loam, with a northern exposure or partial shade. For this reason it is often planted in orchards and on the north side of buildings. It is generally propagated by hardwood cuttings, six to ten inches long, taken in the early fall. The plants are set about four feet apart in rows six feet apart. Frequent and shall-

ow cultivation is given, and good results are often secured by mulching. Not much pruning is required. The old wood should be thinned out each year, none over three years old being allowed to remain. Red varieties are the ones chiefly grown for market. The white sorts are sweeter, but not so popular. Both white and red varieties are extensively used in the preparation of jellies and jams, and for wine-making. Black currants (*Ribes nigrum*) are little grown in the United States, but are extensively cultivated in Canada and in Europe, especially in Scotland. A kind of liquor (*liqueur de cassis*) is made in large quantities from them in France. The raw fruit has an unpleasant odor and flavor, which becomes agreeable only by scalding. It possesses medicinal properties and is used as a tonic and in throat troubles.

Ribes Americanum, the Western representative of the black currant, possesses all its good qualities and is more ornamental. Another American species very generally met with in ornamental plantations, under the name of flowering currant, or golden currant, is *Ribes aureum*. It has been lately placed upon the market as a fruit plant under the name of Crandall currant; its fruit is of good quality, but it is a small bearer. The red-flowered currant (*Ribes sanguineum*), now so common as an ornamental bush in shrubberies, and trained on walls, producing in April a profusion of deep-red flowers in large drooping racemes, is a native of northwestern America, and was introduced into Great Britain in 1826. Its bluish-black, mucilaginous, insipid berries are not poisonous, as is popularly believed. Another currant, with beautiful red berries, larger than the largest English red currant, occurs on the Himalayas, at an elevation of 13,000 feet. The name native currant, or Australian currant, is given in Australia to the berries of different shrubs, particularly the white berries of *Leucopogon Richei*, of the natural order Epacridaceæ. Other fruits bearing the same name are produced by species of *Coprosma* (natural order Cinchonaceæ), but they are very inferior.

Currant Discases.—Two diseases of the currant are well known in the United States, and they both occur in Europe and elsewhere. The anthracnose, caused by *Gleosporium ribis*, attacks the leaves, causing small black spots on the upper side, and later white areas on the under surface; the leaves turn yellow and fall from the bushes. The leaf-spot, due to *Septoria ribis*, occurs as whitish spots with black centres, which spread over the leaf, causing it to fall prematurely, the whole bush being bare by late summer. These diseases can be prevented by the proper use of any standard fungicide (q.v.).

CURRANT-INSECTS. Currants are most injured by the caterpillar-like larvæ, called 'currant-worms,' of two sawflies (q.v.). One, of foreign origin, is *Nematus ribesii*, and the other, a native, is *Pristiphora grossulariæ*. Both are fully described and treated of by Professor Riley in his *Ninth Report on the Insects of Missouri*, and hellebore is recommended as a remedy. These defoliate the plant. Its stem and roots are attacked by scale-insects and by two borers of note. One is the caterpillar of a small wasp-like ageriid moth or clearwing (*Egeria tipuliformis*): the other is a small, black, sparsely spotted, long-horned beetle (*Pscnocercus supernotatus*). It lays its eggs on the currant-stems

early in June, where there are soon hatched tiny grubs that begin to bore into the stem until they reach and feed upon the pith. When full grown (before the close of the season) they are half an inch long, have brown heads, and whitish, pubescent bodies. When about to change to a chrysalis, this larva gnaws a tunnel to, but not quite through, the outer bark, and then pupates in this chamber, and sleeps through the winter. As soon as it is revived by the spring it makes its final change, and the beetle gnaws its way out. The way to destroy these beetles is to prune and burn all dead twigs on the bushes early in spring. Compare GOOSEBERRY.

CURRENT WINE. A wine made of the juice of red or white currants, to which is added water and a little spirits before it is set aside to ferment. Fermentation requires several weeks, and the wine is not fit for use for at least some months afterwards. Black currant wine is made in the same way from black currants.

CURRENCY (ML. *currentia*, current of a stream, from Lat. *currere*, to run). The circulating medium in which debts are paid and the business of the country transacted. This would seem to be also the definition of the term money, and, indeed, among economic writers there is no hard and fast line to distinguish the use of the respective terms currency and money. In general, however, the term currency applies more specifically to those attributes of money which are included under the designation medium of exchange, as distinguished from those which attach to its function as a standard of value.

While, with few exceptions, the money of civilized States rests upon a metallic basis of gold and silver, the circulating medium is often exceedingly complex. Of this the statement of money in circulation in the United States furnishes an excellent illustration:

MONEY IN CIRCULATION IN THE UNITED STATES SEPTEMBER 1, 1901

Gold coin.....	\$630,037,710
Gold certificates.....	259,342,649
Standard silver dollars.....	68,021,039
Silver certificates.....	433,550,842
Subsidiary silver.....	80,788,228
Treasury notes of 1890.....	44,300,417
United States notes.....	333,975,624
Currency Certificates Act of June 8, 1872.....	347,773,315
National Bank notes.....	347,773,315
Total.....	\$2,197,789,824

The aggregate of these various forms of money constitutes the currency of the nation; but among them we can recognize one only—namely, gold coin—as possessing all the attributes of money. It is in the relation of these other forms to the standard money that the questions touching the currency arise. While a fuller discussion of these questions must be reserved for other articles, a brief survey can be had in examining the list here given. In it we recognize three types—token currency, Government paper currency, and bank currency.

The subsidiary silver and minor coinage of the United States (the latter not given in the table) represent in the fullest sense token currency. The metallic value of the coins is in contemplation of the law less than their nominal value; their legal-tender quality is limited, as is also their amount, while the Government undertakes the obligation to redeem them in stan-

dard money. The silver dollars approach token currency in the lack of correspondence between their metallic and nominal values and in the limitation of their quantity, but they depart from its principles in possessing full legal tender and in not being directly redeemable in gold.

Two forms of paper currency appear in the circulation of the United States—the certificates and the legal-tender notes. The certificates, whether of gold, silver, or currency, represent in another form a definite quantity of money deposited in the United States Treasury. They are not themselves endowed with the legal-tender qualities of the money they represent, though receivable by the Government as money. The United States notes convertible into gold on demand are secured not by an exactly equivalent holding of gold by the Treasury, but by a 'reserve' of \$150,000,000, which is deemed sufficient to meet all ordinary demands for redemption. Experience has taught that all such obligations due on demand will not be presented simultaneously. The Treasury notes of 1890, popularly known as 'Sherman notes,' were issued in payment for silver bullion bought between 1890 and 1893. They are full legal tender and are redeemable in gold like the United States notes. They are gradually being retired in exchange for silver certificates based on silver dollars coined from the bullion purchased by the notes when first issued.

Banking currency is represented in our circulation by the national-bank notes. These are receivable at par by all national banks and by the Government in payment of all dues except customs duties, and are payable for all debts owing by the United States except interest on the public debt and in redemption of United States or Treasury notes, for they rest, not on the credit of the issuing banks, but on Government bonds, and their redemption is guaranteed by the Government. Viewed in this light they appear as a form of Government paper currency.

The word currency is often used to include such credit instruments as checks and drafts, and is usually then designated 'deposit currency.' Consult: Farrer, *Studies in the Currency* (London, 1898); *Sound Currency Red Book*, published by Reform Club (New York, 1896); Horace White, *Money and Banking* (New York, 1902). See BANKS; COINAGE; GREENBACKS; TREASURY NOTES; MONEY.

CURRENT, ELECTRIC. See ELECTRICITY.

CURRENT-METER. A device for measuring the velocity of sub-surface currents, usually for the purpose of ascertaining the discharge of a stream or channel. (See HYDROGRAPHY.) Current-meters are made in several patterns, but they are all of the same general form. A horizontal metal frame or body carries at one end a vane-like tail, and at the other end a bladed wheel free to rotate, the whole being attached at its centre of gravity to a vertical metal shaft so as to have a free, rocking motion between certain limits in the vertical plane. When sunk in flowing water by attaching a suspending wire or cord to the top of the shaft and an anchor weight to the bottom, so as to hold the shaft vertical and the meter-frame horizontal, the current acting on the vane-like tail, like the wind on a weatherecock, swings the instrument into coincidence with the direction of the cur-

rent, with the bladed wheel pointing against the current. The current, striking the blades of the wheel, causes the wheel to rotate at a speed varying with the velocity of the current, and a record of the speed of rotation is kept by means of an electrical circuit which is completed and broken by the wheel one or more times each revolution. The recording apparatus is kept on shore or in a boat, while the meter is suspended by suitable appliances at any point of the stream at which it is desired to measure the velocity of the current. With one exception, which is noticed further on, the chief difference between the different patterns of current-meter now in use exists in the rotating wheel. In the earliest form of meter, invented by Gen. Theodore G. Ellis, the wheel has helicoidal blades, but in later forms conical cup-shaped vanes are employed. The invention of the electrical recording attachment as applied to current-meters is credited to D. Ferrand Henry, of Detroit, Mich. The Price current-meter shown in the

PRICE CURRENT-METER.

illustration has an electrical recording device, and the wheels shown at A are of such shape that they feel the influence of a very slight current. The weight which serves to keep the apparatus submerged is shown at B. The most recent pattern of current-meter is the so-called direction current-meter invented by E. S. Ritchie and E. E. Haskell, the latter of the United States Coast and Geodetic Survey. With this meter the observer is able to determine simultaneously on recording dials the direction and velocity of any current. This meter consists of a fish-like body, or chamber, mounted on horizontal bearings carried by a ring which encircles the body. To the top of this ring is attached an eye for the suspension-cable connection, and to the bottom is attached a similar eye from which the anchor weight is hung. The rear end of the body is prolonged in the shape of a tail-vane, cruciform in section, and the forward end terminates in a hollow shaft on to the end of which the wheel-hub is journaled. The wheel is of the screw-propeller type and conical in form, and its rotation is recorded by indica-

tors operated by an electrical circuit. The body of the meter is a compass, whose needle is free to assume the magnetic meridian, and by means of an electric circuit the angle between the direction in which the compass-needle points and the direction in which the axis of the instrument points is recorded on a dial. This meter is sufficiently delicate to record a variation in velocity of current as small as 0.2 foot per second.

CURRENT RIVER. A stream less than 250 miles in length, rising among the foothills on the eastern slope of the Ozark Mountains, in Texas County, southern Missouri. It flows southeast, then south, crossing into Arkansas, where it joins the Black River in Randolph County (Map: Arkansas, E I).

CURRENTS. See OCEAN CURRENTS; TIDES.

CURRICULUM (Lat. *curriculum*, a running, a course, from *currere*, to run). The term applied to a course of study, or collectively to that of any type of educational institutions, as the college curriculum, the high-school curriculum, the common-school curriculum, etc. The historical basis of the modern educational curriculum is found in the Seven Liberal Arts of the Middle Ages, the development of which from Greek philosophical speculation and educational practices is traced under the title of ARTS, SEVEN LIBERAL. As long as the idea of the symbolical perfection of this organization of studies and of human knowledge prevailed, there was no modification of the form of the curriculum, though the content of these terms was modified from time to time. All lower education was included in the subject of the *trivium*—i.e. grammar, rhetoric, and dialectic—which represented so many approaches to the Latin language. This was based, it is true, on the work of the 'singing' school, which furnished to the child the school arts (reading and writing), with a modicum of arithmetic. The curriculum of higher education included the subjects of the *quadrivium*—i.e. arithmetic, geometry (mathematics) and geography), astronomy (natural sciences), and music (aesthetic, etc.). The elaboration of the curriculum under the influences of the early universities and of the Renaissance consisted chiefly in the addition of the subjects of medicine and law, both common and civil, and in the change in the content of the subjects of the quadrivium. These changes can be followed in the successive Papal rules and university regulations which prescribed the books that should be read in the several subjects. From the time of the Renaissance to the close of the eighteenth century, there was no modification in the organization of the educational curriculum and little in the content. From that time, however, the changes have been numerous and radical, and the old idea of the historical and logical perfection of the traditional curriculum has largely disappeared. In the United States, where conditions permitted these changes with less opposition than in the more conservative societies, very extensive changes have occurred, and an almost chaotic condition has ensued. These changes have consisted primarily in the addition of new subjects to each of the stages of the curriculum, due to the great development of knowledge, especially scientific, during the nineteenth century. The curriculum of the elementary school has expanded in content

from the three fundamental school arts until it now embraces from twelve to fifteen subjects in half that many spheres of intellectual interests, and in time, from three or four years to eight and nine; the secondary curriculum has undergone no expansion in time, perhaps a diminution, owing to the encroachment of both the lower and the higher curricula, but has added so great a number of subjects that it deals in a preliminary way with almost all those included within the curriculum of college and university. This multiplication of subjects, with no corresponding increase in time and with but little improvement in methods of teaching, has made the problem of the curriculum of the secondary school peculiarly difficult, and that part of our educational system is most in need of reform.

The problem of the curriculum in each of its stages is twofold: that of content, and that of organization. This twofold problem is now and long has been the chief topic of educational discussions in the United States. It cannot be said that any solution has been offered, but a statement of the case will be found in the article **PEDAGOGY**. (See also **ELECTIVE STUDIES**.) The matter has received extended study by American educators, and has formed the subject of two important reports by committees appointed by the National Educational Association. The first of these, issued in 1892, is known as the *Report of the Committee of Ten*, and relates chiefly to secondary education; the second, known as the *Report of the Committee of Fifteen*, relates chiefly to the elementary school and was issued in 1895. Consult, also: *Reports of the National Educational Association* (Washington, 1865, et seq.); files of the *Educational Review* (New York, 1891, et seq.).

CUR'RIE, JAMES (1756-1805). A Scottish physician. He was born at Kirkpatrick Fleming, Dumfriesshire; held a mercantile position at Cabin Point, Va., from 1771 to 1776; and graduated at Glasgow University in 1780. He settled in Liverpool, where he obtained a considerable practice as a physician, and published *Reports on the Effects of Water in Fever and Febrile Diseases* (1797). He is best known, perhaps, for his (the first) edition of *Burns* (1800; 7th ed. 1813), prefaced by a *Life* which was long the basis for studies of the poet.

CUR'RY, JABEZ LAMAR MONROE (1825-1903). An American lawyer, educator, and clergyman. He was born in Lincoln County, Ga., but removed to Alabama in 1838, where he was admitted to the bar in 1845. He served in the Alabama Legislature from 1847 to 1855, and in Congress from 1857 to 1861, and then became a member of the Confederate Congress. After the war he became a Baptist minister, was president of Howard College, Ala., from 1866 to 1868, and was professor of law at Richmond College from 1868 to 1881. From 1881 to 1885 he was general agent of the Peabody Educational Fund, from 1885 to 1888 was United States Minister to Spain, and subsequently was chairman of the educational committee of the John F. Slater Fund. His publications include: *Constitutional Government in Spain*; *William Ewart Gladstone* (1891); *The Southern States of the American Union* (1894); *Establishment and Disestablishment in the United States*; and *History of the Peabody Educational Fund*.

CURRY POWDER, and CURRY PASTE (Kannarese *kari, kadi*, Malayalam *kari, curry*). A compound condiment added to cooked dishes of meat and rice to render them piquant and appetizing. So generally is curry powder employed in East Indian cookery that it has been called the 'salt of the Orient.' Substances that commonly form the basis of these powders are turmeric, fenugreek, and sago. To these ginger, black and Cayenne pepper, coriander, caraway, and many other spices are added in varying quantities or omitted, according to the locality. Such curry powders as contain the pulverized leaves of *Murraya Koenigia*, an East Indian tree of the natural order Rutaceæ, are used not only as aromatic stomachic stimulants, but as remedies for dyspepsia, diarrhœa, and even dysentery. The basis of many curry pastes is tamarind (q.v.).

CURSCHMANN, kōōrsh'mān, HEINRICH (1846—). A German physician, born at Gies-sen. He studied at the university there, became a lecturer at the University of Berlin in 1875, and in 1876 was appointed head physician of the hospital connected with the city barracks of Berlin. In 1879 he obtained the post of director of the general hospital at Hamburg, and in 1888 was called to the chair of special pathology and therapy in the University of Leipzig. He became recognized as a prominent authority on hospital administration, and from 1886 to 1892 was an associate editor of the *Fortschritte der Medizin*. His publications include: *Entwicklung der Krankenpflege und des klinischen Unterrichts* (1889); *Klinische Abbildungen* (1894).

CURSE OF KEHAMA, kō-hā'mā, THE. A poem by Robert Southey (1810), relating to the adventures of an Indian rajah who is cursed with supernatural powers.

CURSE OF SCOTLAND, THE. In cards, a term applied to the nine of diamonds. Its origin is unknown. Among the many explanations offered are the following: (1) The nine of diamonds is the 'pope' in the game of Pope Joan, and hence the symbol of Antichrist to the Reformers. (2) It is the chief card in comette, which game ruined many families in Scotland. (3) It goes back to the nine lozenges on the Dalrymple arms, the Earl of Stair having been responsible for the massacre of Glencoe.

CURSIVE WRITING. See **PALEOGRAPHY**.

CUR'SOR MUN'DI (Lat., courier of the world, but intended to mean the course of the world, *cursus mundi*). A poem dating from the beginning of the fourteenth century, professing to be a history of the world from its creation to its destruction. It was based on the paraphrase of Genesis by Cadmon. It is among the works printed by the Early English Text Society.

CURTAIN. A term used in fortification. See **BASTION**; **FORTIFICATION**.

CURTAIN, THE. An old theatre in London at Shoreditch, called also the Greene Curtain, mentioned in 1577 and probably established about that year. The name was probably given from its green curtain, used for the first time in this theatre. After the time of Charles I. it was turned into an arena for the prize-fight.

CURTAL FRIAR. A term used by Sir Walter Scott in *Ivanhoe*, to denote an irregular clerk or 'hedge-priest,' and applied by him to Friar Tuck of Copmanhurst. The phrase seems to denote a monk with his gown or frock shortened (curtailed) for convenience of moving about. Consult: *Ivanhoe*, chap. xxxii., and "Robin Hood and the Curtall Friar," in Child's *Ballads*, v. 273.

CURTANA (Neo-Lat., from Lat. *curtus*, short). (1) The name given to the sword of Ogier the Dane. (2) The sword of Roland, the point of which had been broken off in trying it. (3) A pointless sword, also known as 'the sword of Edward the Confessor,' carried before English kings at coronation and symbolizing mercy.

CURTESY (OF. *curteisie*, *cortoisie*, Fr. *courtoisie*, courtesy, from OF. *curteis*, *cortois*, Fr. *courtois*, courteous, from ML. *cortis*, court, from Lat. *cors*, *cohors*, place inclosed: connected with Gk. *χόρτος*, *chorotos*, garden, OIr. *gort*, sedge, Goth. *gards*, Icel. *garpr*, house, OHG. *gart*, circle, Ger. *Garten*, AS. *gard*, Engl. *yard*). In law, the life interest which the surviving husband has in the real or heritable estate of the wife. It is remarkable that, both in England and Scotland, this customary right should be regarded as a national peculiarity—that in England it should be called the curtesy of England, and in Scotland the curtesy of Scotland—whereas it is well known to be peculiar to neither of them. Traces of it are to be found in a constitution of the Emperor Constantine (code 6. 60. 1): and there can be no doubt that it had found a place, with all the peculiarities which now belong to it, in the *coutume* of Normandy, whence there is every reason to think that it was transferred to England (Barnage, vol. ii., p. 60; Stephen's *Commentary*, vol. i., p. 264; Fraser's *Domestic Relations*, vol. i., p. 635). The four circumstances which are requisite to make a tenancy by curtesy in England are lawful marriage, actual seizin of the wife, birth of living issue, and the wife's death. It is not necessary, however, that the child survive; it is enough that it was once in existence, although it may have died immediately after its birth. Not only must the estate of the wife be one of inheritance, i.e. a fee simple or a fee tail, in order that the husband shall be entitled to curtesy therein, but the child born must have been one capable of inheriting the estate in question. Thus if the estate were entailed on male issue, and a daughter were born, the husband's inchoate estate of curtesy would not become vested, or 'initiate,' as the phrase was. Accordingly it is said that curtesy is due to the surviving husband rather as the father of an heir than as the widower of an heiress. As soon as the estate becomes vested in the husband by the birth of appropriate issue, he may alienate his life interest in it, subject of course to the wife's rights therein during her life. If she die first the estate, notwithstanding the conveyance, is defeated. Originally curtesy attached, as dower still does in the United States, to all estates of inheritance of which the wife was seized at any time during the marriage. But it is now limited, both in this country and in England, to such lands as she is seized of at her death: and she may, by alienating the land during her lifetime or by last will and testament, defeat her husband's claims as tenant by the curtesy. See

Blackstone, *Commentaries on the Laws of England*; Pollock and Maitland, *History of English Law* (Boston, 1899).

CURTILAGE (OF. *cortillage*, *curtillage*, *curtilage*, *courtillage*, from *cortuil*, *cortil*, *curtil*, courtyard, from Lat. *cors*, *cohors*, inclosed place). The inclosed space of ground and buildings immediately surrounding or lying near a dwelling and used for its convenient occupation. The term is of feudal origin and originally meant a castle and outbuildings inclosed in a stone wall for defense. There is no exact limit to the area which may be included under the term, and it is a matter of proof in each case as to what is set apart for the use of any particular dwelling. The law has always given the curtilage greater protection than outside property, and this idea prevails to-day, as in most jurisdictions breaking and entering curtilage is burglary, and setting fire to any building in it constitutes arson. See REAL PROPERTY, and consult the authorities there referred to.

CURTIN, ANDREW GREGG (1817-94). An American politician, famous as the 'war Governor' of Pennsylvania. He was born in Bellefonte, Pa., studied law in Dickinson College, was admitted to the bar in 1839, and soon became prominent, as a Republican, in State politics. He was appointed Secretary of State for Pennsylvania in 1854, and from 1860 to 1866 served as Governor of the State. From 1869 to 1872 he was Minister to Russia, and after his return abandoned the Republican Party and served as a Democratic member of Congress from 1881 to 1887. During the Civil War he was always prompt in his response to President Lincoln's calls for troops, and by his minute care for the persons and families of the Pennsylvania soldiers, won their esteem and became widely known as 'the soldier's friend.'

CURTIN, JEREMIAH (1840—). An American linguist and translator, born in Milwaukee, Wis. He prepared for Harvard and by his own efforts graduated there in 1863, as an excellent linguist. In the following year he went to Russia, where he remained until 1870 as secretary of legation for the United States at Saint Petersburg. While serving in this capacity he made a careful study of the languages of the Slavic group, and it was the knowledge thus acquired which has enabled him to make his translations of works by Sienkiewicz, Zagoskin, and Alexis Tolstoy. From 1883 to 1891 he was connected with the Bureau of Ethnology of the Smithsonian Institution, and since that time has made independent researches in matters pertaining to the North American Indians. Besides his translations, Curtin has written books dealing with folk-lore and mythology, and is said to be more or less familiar with more than sixty languages.

CURTIS, BENJAMIN ROBBINS (1809-74). An American jurist, born in Watertown, Mass. He graduated at Harvard in 1829, was admitted to the Massachusetts bar in 1832, and soon became one of the foremost lawyers of the State. In 1851 he was appointed by President Fillmore to the United States Supreme Court, and in 1857 he dissented, in a powerful argument, from the opinion of the majority in the Dred Scott decision (q.v.). In the same year he resigned and resumed his practice in Boston. During the

celebrated impeachment trial of 1868 he was one of President Johnson's counsel. He published several valuable collections of law reports, including *Reports of Cases in the Circuit Courts of the United States* (2 vols., 1854); *Decisions of the Supreme Court of the United States* (22 vols.); and *Digest of the Opinions of the Supreme Court of the United States to 1854*. Consult *Memoirs and Writings of Benjamin R. Curtis* (Boston, 1880), the first volume of which is a memoir by his brother, George Ticknor Curtis. (q.v.).

CURTIS, GEORGE TICKNOR (1812-94). A distinguished American jurist and writer on the constitutional history of the United States. He was born in Watertown, Mass.; graduated at Harvard in 1832; was admitted to the bar in 1836, and began the practice of the law in Worcester, Mass. In the following year he removed to Boston, where he continued with short intermissions to practice law until 1862, from which time until his death he practiced in New York City and before the United States Supreme Court in Washington, D. C. While in Boston he acted for many years as United States Commissioner, and in this capacity, though his sympathies were strongly against the institution of slavery and the rendition of the fugitive slaves, he ordered the return of Thomas Sims (q.v.) to his master in accordance with the Fugitive Slave Law in 1852, and for so acting was denounced by the Abolitionists throughout the country. Among the well-known cases in which he appeared as counsel are the Dred Scott case, the legal-tender cases, the Colt revolver suits, and the sewing-machine cases. He was popular as a public speaker and delivered many able addresses dealing for the most part with legal or political subjects. He will best be remembered as a writer, and especially as the author of the valuable *Constitutional History of the United States from their Declaration of Independence to the Close of their Civil War* (1896), a part of which was first published in 1854 as *The History of the Origin, Formation, and Adoption of the Constitution of the United States*; and of the *Life of Daniel Webster* (1870), and the *Life of James Buchanan* (1883). He also published, besides numerous magazine articles: *Digest of the English and American Admiralty Decisions* (1839); *Rights and Duties of Merchant Seamen* (1841); *American Conveyancer* (1846); *Law of Patents* (1849); *Equity Precedents* (1850); *Commentaries on the Jurisprudence, Practice, and Peculiar Jurisdiction of the Courts of the United States* (1854-58); *Memoir of Benjamin R. Curtis* (1880); *Creation or Evolution: A Philosophical Inquiry* (1887); and a novel entitled, *John Chambers: A Tale of the Civil War in America* (1889).

CURTIS, GEORGE WILLIAM (1824-92). An American critic, essayist, and publicist, born in Providence, R. I., February 24, 1824. After a few years at school he began life as a clerk, in New York, joined the Brook Farm Community at West Roxbury, Mass., in 1842, went thence, after eighteen months, to Concord, Mass., and afterwards spent some years in Italy, Germany, and the Orient. Returning to America in 1850, he became well known through his books of travel and his editorship of *Putnam's Monthly*. In *Harper's Monthly* he published a series of

papers called *The Editor's Easy Chair*, from 1853 onward, which increased his reputation. He was popular also as an anti-slavery orator and lecturer, was long the chief editor of *Harper's Weekly*, took an active part as Republican (till 1884) in politics, and after 1871 in the agitation for civil-service reform. He declined offers of diplomatic service abroad. Shortly before his death, which occurred at West Brighton, S. I., August 31, 1892, he became chancellor of the University of New York. He was the master of an attractive style, and his books of travel and light essays paved the way for the more important services rendered by his polished lectures and orations and by his single-hearted, patriotic labors in behalf of a pure civil service. His strictly literary reputation seems hardly so well assured as it did a few years since, but the man and orator are still remembered with pleasure and gratitude. His youthful years spent at Brook Farm are charmingly set forth in his letters exchanged with John S. Dwight, which have been published in a volume (1898). His most important publications are: *Nile Notes of a Howadji* (1851); *The Howadji in Syria* (1852); *Lotus Eating* (1852); *The Potiphar Papers* (1853), a satire on New York social life; *Prue and I* (1856), generally thought the best of his early books; *Trumps: A Novel* (1861); *Eulogy on Wendell Phillips* (1881); three series of essays from the "Easy Chair" (1892, 1893, 1894, etc.). He edited the *Correspondence of Motley* in 1889 (2 vols.). Charles Eliot Norton edited his *Orations and Addresses* in 1893-94 (3 vols.). Edward Cary wrote his biography for the "American Men of Letters Series" (Boston, 1894).

CURTIS, SAMUEL RYAN (1807-66). An American soldier. He was born near Champlain, N. Y., but when very young removed to Ohio. In 1831 he graduated at West Point, and in the following year resigned from the service to become a civil engineer. He afterwards studied law, was admitted to the bar, and practiced from 1843 to 1845. In the Mexican War he served as a colonel of volunteers, and from 1847 to 1848 was Governor of Saltillo. He was then successively an engineer and a lawyer in the West, and for two terms and a part of the third was a member of Congress from Iowa. He became a brigadier-general of volunteers in 1861, commanded the southwestern district of Missouri from December, 1861, to February, 1862, and the Army of the Southwest from February to August, 1862, and on March 7-8, 1862, defeated the Confederate general Van Dorn, in the battle of Pea Ridge (q.v.). Soon afterwards he was raised to the rank of major-general, and subsequently commanded the departments of Missouri (1862-63), of Kansas (1864-65), and of the Northwest (1865); and in 1865, as United States Commissioner, negotiated treaties with several Indian tribes.

CURTIS, WILLIAM (1746-99). An English botanist, born at Alton, Hampshire. He studied botany, pharmacuties, and entomology, established botanic gardens at Lambeth Marsh and at Brompton, and published a number of valuable works on subjects of natural history. His writings include: *Flora Londinensis* (1777-87; the same work, edited by Graves and Hooker, was republished in 5 volumes in 1817-28); *British Grasses* (1790 and several later editions); and

Lectures on Botany (3 vols., 1805; 2d ed., 1807). In 1781 he established, and for many years thereafter edited, the *Botanical Magazine*.

CURTIS, WILLIAM ELEROY (1850—). An American journalist. He was born in Akron, Ohio, and graduated at Western Reserve University in 1871. From 1872 to 1887 he was on the staff of the *Chicago Inter-Ocean*, and by his great enterprise—notably in securing interviews with the James brothers during their contest with Pinkerton's detectives, and in investigating the Ku-Klux Klans of the South—gained a national reputation. In 1887 he became the Washington correspondent of the *Chicago Record*. He was a commissioner of the United States to the Central and South American republics in 1885, was the executive officer of the International American Conference of 1889-90, and was director of the Bureau of American Republics from 1890 to 1893. He has traveled extensively and is the author of several books, the most important of which are: *The Life of Zachariah Chandler* (1879); *Capitals of South America* (1886); *The Land of the Nihilist* (1887); *The United States and Foreign Powers* (1892; 2d ed. 1899), a concise and generally accurate summary of the foreign relations of the United States; *The Yankees of the East* (1896), an account of the manners and customs of the Japanese; *Between the Andes and the Ocean* (1900); and *The True Thomas Jefferson* (1901).

CURTISS, SAMUEL IVES (1844—). An American Congregational clergyman, born at Union, Conn. He was educated at Amherst College, at Union Theological Seminary, and at the universities of Leipzig and Berlin. From 1874 to 1878 he was pastor of the American Chapel at Leipzig, Germany, and upon his return to America was appointed professor of biblical literature at the Chicago Theological Seminary. He was president of the City Missionary Society of Chicago from 1888 to 1898. In addition to several translations of important works from the German, his writings include: *A Plea for a More Thorough Study of the Semitic Languages in America* (1879); *Moses and Ingersoll* (1881); *Franz Delitzsch; Ezekiel and His Times* (in *The Bible as Literature*, 1876).

CURTIUS, KŌŕ'tsĕ-ŏs, ERNST (1814-96). A distinguished German archaeologist and historian, born at Lübeck. He studied philology at the universities of Bonn, Göttingen, and Berlin, traveled in Greece and Italy, and in 1844 was appointed a professor at Berlin and preceptor of the Crown Prince Frederick William, afterwards Frederick III. From 1856 to 1863 he was professor of classical archaeology and philology at Göttingen, whence he returned to Berlin as professor of ancient history. Since 1853 Curtius was a member of the Royal Academy of Sciences, and from 1871 to 1893 he was continuously secretary of the philologico-historical section of that institution. Under imperial commission in 1874 he negotiated with the Greek Government in regard to the German excavations at Olympia, begun by him in the following year. With Schöne he edited the *Archäologische Zeitung*, in which he published many important contributions. He must be reckoned among the great scholars of modern Germany, a thinker of imperious influence alike in his academic instruction and in his published works. These latter in-

clude: *Peloponnesos* (2 vols., 1851-52), a study of the Greek peninsula with special reference to its mythology, history, and monuments of art; *Griechische Geschichte* (3 vols., 1857-67; 6th ed. 1889), in which he endeavored to present in popular form the results of expert research; *Attische Studien* (1863-64); and three volumes of collected lectures and addresses, entitled *Altertum und Gegenwart*. Consult: Broicher, *Erinnerungen an Ernst Curtius* (Berlin, 1896); also, for a brief but most appreciative study of his personality, Grimm, "Ernst Curtius: Ein Brief an seine Freunde," in the *Deutsche Rundschau*, vol. lxxxviii. (Berlin, 1896).

CURTIUS, GEORG (1820-85). An eminent German comparative philologist. He was the brother of Ernst Curtius, and was born at Lübeck. He studied at the universities of Bonn and Berlin; in 1849 became professor extraordinarius, and in 1851 full professor of philology in Prague. In 1854 he was called to Kiel and in 1862 to Leipzig, where he remained. Curtius was the teacher of many of the most eminent comparative philologists of the present day. His most important works are his *Griechische Schulgrammatik* (1852; many editions since); *Grundzüge der griechischen Etymologie* (5th ed. 1879); *Das Verbum der griechischen Sprache* (2d ed. 1877-80). In his *Studien zur griechischen und lateinischen Grammatik* (1868-78), he published not only his own studies, but those of his pupils and others. In 1878, with Lange, Lipsius, and Ribbeck, he founded the *Leipziger Studien zur klassischen Philologie*.

CURTIUS, Kŭr'shĭ-ŭs, METTUS. In Roman legend, the leader of the Sabines who occupied the Capitoline Hill, in the battle with the Romans of the Palatine, during the reign of Romulus. To escape death he plunged with his horse into a morass, from which he extricated himself with difficulty, and the morass was thenceforth called *Lacus Curtius*.

CURTIUS, QUINTUS (QUINTUS CURTIUS RUFUS). A Roman historian. He was the author of the work *De Rebus Gestis Aleandri Magni*, in ten books, of which the first two have been lost, and the text of the remainder has come down to us in a damaged condition. Great differences of opinion have existed with regard to the time in which Curtius wrote. Some critics have supposed that Curtius lived in the reign of Augustus; others that he wrote in the second century, or under Constantine or Theodosius; but the most probable opinion is that he flourished in the time of Claudius. The value of the work is as dubious as its authorship. Curtius had a very inaccurate knowledge of geography, chronology, military tactics, astronomy, and historic criticism; hence his work is far from being reliable as a whole. The style, though declamatory, is in general pure and elegant. The first edition of Curtius's history was published at Venice about 1471. Modern editions are by Vogel (Leipzig, 1884), and Dossou (Paris, 1887). It is translated into English by Crosby (New York and London, 1858).

CURTIUS, Kŏŕ'tsĕ-ŏs, THEODOR (1857—). A German chemist. He studied at several German universities, and after the publication of a series of original researches, became professor of chemistry at Kiel in 1889; in 1897 he went to

Bonn, but on the death of Victor Meyer, in the same year, accepted the professorship of chemistry at Heidelberg. Curtius discovered new series of important compounds of nitrogen, including hydrazine and many of its derivatives, and the diazo-derivatives of the fatty series of organic compounds.

CURULE CHAIR (translation of Lat. *sella curulis*, from *sella*, seat, from *sedere*, to sit, and *curulis*, curule, from *currus*, chariot, from *currere*, to run). The chair of state, equivalent to a throne, among the early Romans. No one except consuls, praetors, and a few others high in authority was permitted to occupy it. The chair was usually ornamented with gold and other precious work.

CURVATURE. See CURVE.

CURVATURE OF FIELD OF A LENS.

See LIGHT for general discussion of the properties of lenses.

CURVATURE OF THE EARTH'S SURFACE. See CURVE.

CURVE (OF. *courbe*, *corbe*, Fr. *courbe*, Sp., Port., It. *curva*, from Lat. *curvus*, curved, OChurch Slav. *krivŭ*, bent, Lith. *kreivas*, crooked). In common language, a line that constantly departs from a fixed direction. In analytic geometry, however, the word curve is commonly used to designate the locus of a point moving according to any definite law, and hence to include the straight line. If the statement of the law according to which the point moves can be translated into an equation or equations between the coördinates (q.v.) of the moving point, these equations may be used to represent the curve—e.g. the circle is the locus of a point moving in a plane at a constant finite distance from a fixed point in that plane, and its equation is $x^2 + y^2 = r^2$. (See COÖRDINATES.) If the curve possesses the property of continuity (q.v.) it is precisely definable at every point, although it may contain singularities. The form of a curve corresponds to the nature of its equation; hence a curve may be designated as algebraic or transcendental according as its equation consists of algebraic or transcendental functions of the coördinates; for example, the conic sections are algebraic curves, and the cycloid, the logarithmic spiral, and the catenary are transcendental curves. Algebraic curves are fundamentally grouped into orders and classes, according to Newton's classification. The order of a plane curve is determined by the number of points, real or imaginary, in which it intersects any line in its plane. Curves which cut such lines in two points are called curves of the second order; those which cut the lines in three points curves of the third order, and so on—e.g. the conic sections are all curves of the second order, and cubic curves are of the third order. The straight line is the only line of the first order. Similarly the order of an algebraic curve in space depends upon the number of points in which it cuts any plane. The class of an algebraic plane curve is determined by the number of tangents, real or imaginary, which can be drawn to it from any point in its plane. If two tangents are possible it is a curve of the second class, if three are possible, a curve of the third class, and so on—e.g. the conic sections are curves of the second class; the cissoid (q.v.) is of the third class. Similarly the class of a

space curve is given by the number of tangent planes which can be drawn containing any fixed line. The class of a plane curve depends directly upon its order when no singularities exist. If n is the order and c the class, $c = n(n-1)$. Thus a conic with no singular points is of the second class, since $c = 2(2-1) = 2$; the cubic is of the sixth class, since $c = 3(3-1) = 6$. But singularities tend to diminish the class. Plücker gave six equations connecting the order, class, number of double points, number of double tangents, number of stationary points, and number of stationary tangents from which, if any three of these numbers are given, the other three may be obtained. The one directly connecting the order and class is $c = n^2 - n - 2d - 3p$, in which c is the class, n the order, d the number of double points, and p the number of stationary points. Thus, a cubic with one double point is a curve of the fourth class, since $c = 9 - 3 - 2 = 4$. By the aid of covariants (see FORMS), the class of a curve can be determined directly.

SINGULARITIES. (1) An algebraic curve whose equation is $y = f(x)$ is convex or concave downward, according as $\frac{d^2y}{dx^2}$ is positive or negative.

(2) A point of inflection is one at which the tangent to the curve takes a limiting position—that is, the point of contact of a stationary tangent, at which $\frac{d^2y}{dx^2} = 0$ or ∞ . See CURVE OF SINES.

(3) A multiple point is one at which more than one tangent exists—that is, a point for which $\frac{dy}{dx}$ has more than one value. Two values determine a double point, three values a triple point, and so on. A multiple point is also called a node or ernode. Multiple points of the third order are divided into classes according to the relative number of cusps and ernodes involved.

(4) When two branches of a curve have a common tangent at a point, but do not pass through the point, they are said to form a cusp, called also a spinode or stationary point. See CYSOID; COXCHON.

(5) An isolated point whose coördinates satisfy the equation of the curve is called a conjugate point or acnode. An acnode is a multiple point at which the tangents are imaginary. A node or conjugate point corresponds to a double tangent, and a cusp to a stationary tangent.

CURVATURE. The curvature of a plane curve at any point is its tendency to depart from a tangent to the curve at that point. In the circle this deviation is constant, as the curve is perfectly symmetrical round its centre. The curvature of a circle varies, however, inversely as the radius—that is, it diminishes at the same rate as the radius increases. The reciprocal of the radius is therefore taken as the measure of the curvature of a circle. A straight line may be considered a circle of infinite radius and as having no curvature, since $\frac{1}{\infty} = 0$. The constancy

of curvature in the circle suggests an absolute measure of curvature at any point in any other curve, for whatever be the curvature at that point a circle can be found of the same curvature. The radius of this circle is called the radius of curvature for that point; and the

circle itself the osculating circle. By means of this radius we may compare the curvatures at different points of the same curve or of different curves. In simple cases, as in the conic sections, the measure or radius of curvature may be determined geometrically, but it is usually necessary to employ the calculus. The expression for the radius of curvature at any point (x, y) of a curve is

$$\rho = \frac{\left[1 + \left(\frac{dy}{dx} \right)^2 \right]^{\frac{3}{2}}}{d^2y/dx^2}$$

If the curve, instead of lying in a plane, twists in space, it is sometimes called a *gauche curve* or a curve of double curvature, and its curvature at any point may be measured by the radius of its osculating sphere at that point. The centre of the osculating circle or sphere is called the centre of curvature. The curvature of surfaces is determined similarly to that of curves. Thus the measure of the curvature of the earth, commonly taken as the deviation of the line of apparent level from the line of true level—that is, from a line everywhere parallel to the surface of still water—is approximately eight inches per mile.

RELATIONS. The following are some of the more important relations which exist among certain groups of curves:

(1) The evolute (q.v.) of a curve is the locus (q.v.) of its centre of curvature. Regarding the evolute as the principal curve, the original curve is called its involute. The normals to any curve are tangents to its evolute.

(2) Two curves or surfaces are said to have contact when they touch at two or more consecutive points. A contact (q.v.) of the n th order exists between two curves $y_1 = \phi(x), y_2 = \psi(x)$ at the point whose abscissa is a when $\phi(a) = \psi(a), \phi'(a) = \psi'(a), \phi^{(n)}(a) = \psi^{(n)}(a)$. If n is even, the curves cross at the point. No curve which has contact of a lower order can pass between the given curves. Curves which have contact of the first order have a common tangent, and those having contact of the second order have a common radius of curvature at the point of contact.

(3) The envelope of a curve is the locus of the ultimate intersections of the individual curves of the same species, obtained by constantly varying a parameter of the curve. That is, the envelope touches all of the intersecting curves thus obtained; e.g. if p is a variable parameter and $f = 0$ is the equation of the curve, then the result obtained by eliminating p between $f = 0$ and $\frac{df}{dp} = 0$ is the equation of the envelope.

Every curve may be an envelope, and some are evidently so by definition—e.g. evolutes and caustics (qq.v.).

(4) The process of replacing each radius vector of a curve by its reciprocal is called inversion. The origin is called the centre of inversion and the resulting curve the inverse of the given one. See CIRCLE, *Inversion*.

(5) The locus of the feet of the perpendiculars from the origin upon the tangents to a curve is called a pedal curve. The pedal of a pedal is called the second pedal, and so on. Reversing the order, the curves are envelopes and are called negative pedals. The pedal and reciprocal polar are inverse curves. (See CIRCLE.) In general, to find the inverse of a curve whose

equation is given in rectangular coördinates, substitute for $x, y, \frac{k^2x}{x^2 + y^2}, \frac{k^2y}{x^2 + y^2}$ respectively.

(6) A roulette is defined as the locus of a point rigidly connected with a curve which rolls upon a fixed line or curve. See CYCLOID.

CENTRES. A point such that every radius vector (see COÖRDINATES) drawn from it to a point on the curve is matched by another vector of the same length in the opposite direction is called the centre of a curve. See also CIRCLE and the paragraph on *Curvature* above.

When a plane figure moves in any manner in its own plane, the instantaneous centre of rotation is the intersection of two lines drawn through two points perpendicular to the directions in which the points are moving.

The number of kinds of curves that might be drawn is infinite. A large number are known by specific names, and are objects of great interest on account of their beauty, their remarkable properties, or their relation to physical problems. Among those discussed under separate titles are the conic sections, cissoid, conchoid, lemniscate, cycloid, trochoid, witch, cardioid, cartesianes, Cassinian ovals, caustic curve, tractrix, curve of pursuit, catenary, curves of circular functions (e.g. curves of sines), logarithmic curves, and spirals.

Though the history of curves is inseparable from that of geometry, it may roughly be divided into four periods: (1) The synthetical geometry of the Greeks, in which the conic sections (q.v.) play an important rôle; (2) the birth of analytic geometry, in which the synthetic geometry of Guldin, Desargues, Kepler, and Roberval merged into the coördinate geometry of Descartes and Fermat; (3) the period 1650 to 1800, characterized by the application of the calculus to geometry and including the names of Newton, Leibnitz, the Bernoullis, Clairaut, Maclaurin, Euler, and Lagrange; (4) the nineteenth century, the renaissance of pure geometry, characterized by the descriptive geometry of Monge, the modern synthetic geometry of Poncelet, Steiner, von Staudt, Cremona, and Plücker. Descartes's contributions were confined to plane curves, but led to the discovery of many general properties. The scientific foundations of the theory of plane curves may be ascribed to Euler (1748) and Cramer (1750). Euler distinguished algebraic from transcendental curves, and Cramer founded the theory of singularities. Clairaut (1731) attacked the problem of double curvature; Monge introduced the use of differential equations. Möbius (1852) summed up the classification of the cubic curve, Zeuthen (1874) did the same for the quartics, and Bobillier (1827) first used trilinear coördinates (q.v.). In 1828 Plücker published the first volume of his *Analytisch-geometrische Entwicklungen*, which introduced abridged notation and marked a new era in analytic geometry. To him is due (1833) the general treatment of foci, a complete classification of cubics (1835), and his celebrated 'six equations' (1842). Hesse (1844) gave a complete theory of inflections, and introduced the so-called Hessian curve as the first instance of a covariant of a ternary form. To Chasles (q.v.) is due the method of characteristics developed by Halphen (1875) and Schubert (1879), and the general theory of correspondence (1864),

completed by Cayley (1866) and Brill (1873). Cayley's influence was also very great. He advanced the work of Plücker, investigated bitangents and osculating conics, extended the properties of covariants and invariants, as well as Salmon's theory of reciprocal surfaces and the theory of double curvature. Mention should also be made of the labors of Jean-Claude Bouquet (1819-85) and Charles-Auguste-Albert Briot (1817-82), two of Cauchy's most eminent pupils, whose labors in the field of geometry and theory of functions are well known. Their *Leçons de géométrie analytique* (Paris, 1847) has been translated into English (Chicago, 1896) and forms an excellent introduction to the subject. Besides the works of those mentioned in connection with the development of curves, consult, for the theory: Salmon, *Treatise on the Higher Plane Curves* (Dublin, 1852); Clebsch, *Vorlesungen über Geometrie* (Leipzig, vol. i., 1875-76; vol. ii., 1891); and for history, Merriman and Woodward, *Higher Mathematics*, chap. xi. (New York, 1896); Brocard, *Notes de bibliographie des courbes géométriques* (Bar-le-Duc, 1897-99).

CURVE OF PURSUIT. The problem of the curve of pursuit first attracted attention in the following form: To find the path of a dog which takes the shortest course to reach his master. This problem, though stated in various forms, resolves itself mathematically into finding the curve traced by a point *A* whose movement is always directed toward a point *B* moving on a known curve. The curve seems to have been studied first by Pierre Bouguer (1732). The result is, in general, an algebraic curve; in particular cases logarithmic. For a solution of the problem, consult Salmon, *Treatise on the Higher Plane Curves* (Dublin, 1852).

CURVE OF SINES. A curve whose ordinates are equal or proportional to the sines of a variable angle and whose abscissas are equal to the corresponding arcs of the unit circle. This curve is also called an harmonic curve, it being the curve in which a musical string vibrates when sounded.

CURVE OF SINES.

In the figure, OA represents the length of an arc whose sine is y_1 , OB the length of an arc whose sine is y_2 , and so on. The ordinate y_3 is the sine of 90° , and is the maximum ordinate of the curve. D, which corresponds to an angle of 180° , is a point of inflection, the radius of curvature being infinite. Similarly

the curves of the other trigonometric functions may be represented graphically.

CURVES, ANTICLINAL AND SYNCLINAL. See ANTICLINE and SYNCLINE.

CUR'WEN, JOHN (1816-80). An English music reformer and writer. He was born at Heckmondwike, in Yorkshire, and was early influenced by the community music, in those days characteristic of every Yorkshire village. The influence of Handel, and his oratorios, more than any other single factor, had caused choral and philharmonic societies to spring up throughout the northern counties of England. In order to develop these and the numerous local band organizations, Curwen, then a dissenting minister, resigned his pastorate, and becoming interested in the 'tonic sol-fa' system, invented by Miss S. A. Glover, spent his entire time in propagating it. In 1853 he had begun to found associations for spreading the theory, and in 1862 established the Tonic Sol-Fa College. He was successful enough to start a publishing house in London, where he published the *Tonic Sol-Fa Reporter*. Nearly all of his many publications are for the system of his choice. He died at Heaton Mersey, near Manchester.

CURZOLA, *kor'zò-lá* (Slav. *Korčula*, ancient *Corepra Nigra*, so called from the sombre color of its pine forests). An island of the Adriatic, situated off the coast of the Austrian Crownland of Dalmatia, in latitude 43° N. and longitude 17° E. (Map: Austria, E 5). It is almost 25 miles long, has an area of about 100 square miles, and is hilly, the greatest altitude being 1880 feet. It is well wooded and produces grain, wine, and olives. The inhabitants are engaged chiefly in ship-building, seafaring, and fisheries. It has a number of good harbors. Population, in 1900, 18,749. The principal towns are Curzola, the capital, with a population of 6487, and Blatta, with 7326 inhabitants.

CUR'ZON, GEORGE NATHANIEL, Baron Curzon of Kedleston (1859—). An English statesman, born at Kedleston. He studied at Balliol College, Oxford, became assistant private secretary to the Marquis of Salisbury in 1885, and from 1886 to 1898 sat as a Conservative for the Southport division of Southwest Lancashire. In 1891-92 he was Under-Secretary of State for India, and in 1895-98 Under-Secretary of State for Foreign Affairs. He was appointed, in 1898, Viceroy and Governor-General of India. His administration has proved most acceptable to both the Indian natives and the English Government. His policy aims at the promotion of education, the increased efficiency of the military, and opposition to Russian advance in the East. He has published *Russia in Central Asia* (1889); *Persia and the Persian Question* (1892); and *Problems of the Far East* (1894).

CU'SA, NIKOLAS OF or **NIKOLAUS CUSANUS** (1401-64). A Roman Catholic philosopher and theologian. He was born at Kues, on the Moselle, in the Diocese of Treves; educated at Deventer by the Brethren of the Common Life, and at the University of Padua; became Archdeacon of Liège and attended the Council of Basel (1431-49), where he opposed the Papal claims; but, altering his views, he entered the Papal service and was made a cardinal in 1448; Bishop of Brixen in the Tyrol, and Papal legate for Germany in 1450.

He died at Todi, Italy, August 11, 1464. As a philosopher he was the first to break with the ruling scholasticism. He taught that God passes over into the world, but does not become the world. As a mathematician and natural philosopher he first taught the revolution of the earth about the sun and the plurality of worlds; as critic he declared the so-called 'Donation of Constantine' to be a forgery. His most important writings have been translated into German by F. A. Scharpff (Freiburg, 1862), who also published the first part of a biography (Mainz, 1842), and subsequently *Der Cardinal und Bischof Nikolaus von Cusa* (Tübingen, 1871). Consult, also: Falkenburg, *Grundzüge der Philosophie des Nikolaus von Cusa* (Breslau, 1880); Schanz, *Cardinal Nikolaus von Cusa als Mathematiker* (Rottweil, 1872); id., *Die astronomischen Anschauungen des Nikolaus von Cusa und seine Zeit* (Rottweil, 1873).

CU'SACK, MARY FRANCES (1820-99). An Irish nun, known as the NUN of KENMARE. She was born near Dublin, Ireland, and spent her youth in England, where she joined an Episcopalian sisterhood. She later became a convert to Catholicism and upon her return to Ireland took a deep interest in the Franciscan sisterhoods known as 'Poor Clares,' organized for the purpose of providing poor and friendless girls with a useful education, thus enabling them to become self-supporting. From 1861 to 1884 she conducted the celebrated Convent of Poor Clares, established by her at Kenmare. In the latter year Pope Leo XIII. gave his personal sanction to the founding of the somewhat similar Order known as 'Sisters of Peace,' whose sphere of activity however, was more extensive. After the establishment of a house in Nottingham, England, in 1884, a branch of the Order was successfully founded at Jersey City, N. J. (1885). The movement has had considerable sympathy and support among Irish Catholics both in Europe and in the United States, which country the founder visited in 1886. Among her published works are the following: *A Student's Manual of Irish History* (1870); *Woman's Work in Modern Society* (1874); *The Book of the Blessed Ones*; and lives of Saint Patrick, Saint Bridget, Saint Columba, and Patrick O'Connell. Consult *The Nun of Kenmare: An Autobiography* (Boston, 1888).

CUSACK-SMITH, Sir BERRY (1859—). An English legislator. He was born at Dublin, and was educated at the Middle Temple. After acting for one year as Consul at Samoa and deputy-commissioner for the Western Pacific, he was in 1891 sent as Consul-General to Valparaiso, whence he was again transferred in 1892 to the Tokelau Islands. As special judicial commissioner to Samoa he acted conjointly with the consuls of Germany and the United States as receiver and custodian of the revenues of the islands and as president of the municipality of Apia. He returned to England in 1897, where he was shortly afterwards knighted by Queen Victoria. From June, 1900, to December, 1901, he was chargé d'affaires at Santiago.

CUS'CUS. The native name in the Papuan Archipelago of certain phalangers much esteemed as food. See PHALANGER, and Plate of PHALANGERS AND DASYURES.

CUSCUS. See NETIVER, and Plate.

CUS'CUTA. See DODDER.

CUSH (Heb. *Kūsh*). The eldest son of Ham, according to the genealogical scheme given in the tenth chapter of Genesis. In the Bible, he seems to be regarded as the eponymous ancestor of the Cushites, or people of the land of Cush, a country mentioned in a number of passages of the Old Testament. The Babylonian Nimrod is also said (Gen. x. 8) to have been a son of Cush. The 'Land of Cush' is rendered 'Ethiopia' in the Septuagint, in the Vulgate, and in most modern versions of the Bible, and until comparatively recent times the country has been generally identified with the ancient Ethiopia (i.e. Nubia), called by the Egyptians *Kōsh*, though some scholars have supposed that it also included a portion of Arabia. Some modern critics believe that, in Gen. x., Cush (v. 6) the brother of Mizraim (Egypt) and Cush (v. 8) the father of the Babylonian Nimrod are two different persons, and that the name of the second Cush represents *Kashshu*, an old name for Babylonia. They further maintain that the Arabian Cushites (Gen. x. 7) were also of a different stock, and that thus, under the same name, three different peoples are confused in the biblical account. Other scholars, however, adhering to the older view, believe that the dark Ethiopian race once extended across Arabia into, or even beyond, Babylonia.

CUSHAT, kush'at (AS. *cūscote*, ring-dove, from *cucu*, quick + *scotan*, to shoot; so called from the bird's swift flight), or CUSHIE-DOO (Scotch). A dove.

CUSHING, kush'ing, CALEN (1800-79). An American statesman, the first American Minister Plenipotentiary to China. He was born at Salisbury, Mass., and was educated at Harvard, where he graduated when seventeen years old. He practiced law at Newburyport, and was elected to the State Legislature in 1825 and to the State Senate in 1826. From 1829 to 1831 he traveled in Europe. He was elected to Congress in 1835, and served four terms as a Whig, but afterwards joined the Democratic Party. President Tyler nominated him as Secretary of the Treasury, but the Senate rejected the nomination. Tyler then appointed him Minister to China, where new ports were to be opened according to the Treaty of Nanking. Here he made good use of his erudition and talents. When he arrived, February 24, 1844, at Canton in the frigate *Brandywine*, he had already made the general outline of the treaty, which greatly abridged the subsequent negotiations. The Peking Government honored the United States by sending as High Treaty Commissioner Ki-Ying, a member of the Imperial family, who, on July 3, 1844, signed the convention, which contained sixteen provisions not included either in the English Treaty of Nanking or in the treaty supplementary thereto. Among these was the right of Christian missionaries to follow the openings of commerce and to build dwelling-houses, churches, and hospitals and to have cemeteries, while Chinese scholars acting as teachers or assistants were to be protected from injury. The purchase of books was legalized, and American citizens were forbidden to engage in the opium trade, or to use the flag of the United States to cover a violation of the laws of China. In short, this treaty, because of its

fullness of detail and clear exhibition of the rights conceded by the Chinese Government to foreigners dwelling within its borders, was the leading authority in settling disputes until 1860, when foreigners were admitted to Peking.

After his return to the United States Cushing advocated the Mexican War, and furnished the necessary funds to equip a regiment of which he was made colonel. He subsequently rose to be brigadier-general. In 1852 he became associate justice of the Supreme Court of Massachusetts, and in 1853 entered the Cabinet of President Pierce as Attorney-General, serving through the entire administration. He favored the Union cause during the Civil War. When the arbitration of the 'Alabama Claims' was to be settled at Geneva in 1871, President Grant chose Mr. Cushing as one of the three men who were to be counsel for the United States. In 1873 he was nominated Chief Justice of the United States, but the nomination was withdrawn. From 1874 to 1877 he was Minister of the United States at the Court of Spain. Mr. Cushing was a man of unusual erudition and of rare ability, imposing in person and forcible in argument. He was the author of *The Practical Principles of Political Economy* (1826); *The Growth and Territorial Progress of the United States* (1839); *Reminiscences of Spain* (1833); *Historical Review of the Late Revolution in France* (1833); *The Treaty of Washington* (1873).

CUSHING, FRANK HAMILTON (1857-1900). An American ethnologist. He was born at Northeast, Pa., spent his boyhood on a farm in New York State, and at the age of sixteen began excavations on the sites of Indian camps. He studied for a time at Cornell University in 1875, and in 1876 had charge of a part of the National Museum collection at the Centennial Exposition at Philadelphia. He went to New Mexico in 1879 as assistant ethnologist of the United States Bureau of Ethnology, and remained for three years among the Zuñi Indians. He was adopted into the tribe, made a thorough study of the habits, folk-lore, language, and history of the Pueblo Indians of New Mexico and Arizona, and became the recognized authority in this branch of American ethnology. In 1896 he conducted the Pepper-Hearst Expedition to the Gulf coast of Florida, and published a *Report on the Ancient Key Dwellers of Florida*. Among his publications are: *Zuñi Fetiches* (1881); *The Relationship Between Zuñi Sociology and Mythic Systems* (1882); *The Nation of the Willows* (1882); *Adventures in Zuñi* (1883); and *Studies of Ancient Pueblo Ceramic Art, as Illustrative of Zuñi Culture Growth* (1884). A volume entitled *Zuñi Folk-Tales* was published posthumously in 1902.

CUSHING, HARRY ALONZO (1870—). An American educator, born at Lynn, Mass. He graduated at Amherst College in 1891, studied at Columbia University, and was appointed a lecturer in history and constitutional law at Columbia. In 1895 he became connected with the faculty of political science at that institution. He was also admitted to the bar, and practiced law in New York City. His publications include, besides an edition of *The Writings of Samuel Adams, a History of the Transition from Provincial to Commonwealth Government in Massachusetts* (1896).

CUSHING, LUTHER STEARNS (1803-56). An American lawyer and law reporter, best known as the author of a *Manual of Parliamentary Practice*, or *Cushing's Manual* (1845). He was a native of Massachusetts and was judge of the Court of Common Pleas in Boston and reporter for the Supreme Court of the State, in connection with which he published eight volumes of reports.

CUSHING, THOMAS (1725-88). An American statesman, born in Boston. He was a graduate of Harvard, and president of the General Court, or legislative body of Massachusetts, as well as a member of the Massachusetts Provincial Congress and the First and Second Continental Congresses. In England he had the groundless reputation before the outbreak of the war of being the great leader of the American revolutionary movement, and Dr. Johnson, in some of his pamphlets, accused him of aiming at an American crown. At home, however, he made himself unpopular by opposing the Declaration of Independence. In 1788 he was a member of the convention which ratified the Federal Constitution for Massachusetts.

CUSHING, WILLIAM (1732-1810). An American jurist, born at Scituate, Mass. He was appointed Chief Justice of the State Superior Court in 1777; became an associate justice of the United States Supreme Court in 1789, and in 1796 declined the Chief-Justiceship, for which he had been nominated by Washington. He was a founder of the American Academy of Arts and Sciences.

CUSHING, WILLIAM BARKER (1842-74). An American naval officer, born in Delafield, Wis. He studied at the United States Naval Academy from 1857 to 1861, and at the outbreak of the Civil War entered the United States Navy as a volunteer. In 1862 he was promoted to be lieutenant. He soon became conspicuous for his fearless and successful performance of perilous tasks assigned to him, the most notable of which was the destruction by torpedo of the Confederate ram *Albatross*, on the night of October 27, 1864, at her moorings in Plymouth Harbor, N. C. This exploit won him the thanks of Congress and the rank of lieutenant-commander. Later he served in the Pacific and Asiatic squadrons and was commissioned commander in 1872.

CUSHION DANCE. Originally an old country dance in triple time, which was introduced into court at the time of Elizabeth. The dance was very simple; a performer took a cushion and after dancing for a few minutes stopped and sang, "This dance it will no further go;" the musician then sang, "I pray you, good sir, why say you so?" The dancer answered, "Because Joan Sanderson will not come to," and upon the musician's replying, "She must come to, whether she will or no," the dancer threw the cushion before one of the spectators. The one so selected had to kneel on the cushion and allow the dancer to kiss her, after which she repeated the dance.

CUSHMAN, kush'man, CHARLOTTE SAUNDERS (1816-76). A celebrated American actress, best remembered perhaps for her acting of Meg Merrilies in Scott's *Guy Rannering*. She was born in Boston, July 23, 1816, of Puritan descent, and was the eldest of five children left poor with their mother by the early death of their father.

She had, however, a fine contralto voice, which she cultivated, and in 1835 she made her appearance as an opera singer in the *Marriage of Figaro*. Her prospects were bright, when shortly afterwards in New Orleans her voice suddenly failed. She was greatly disheartened, but at the request of a tragedian (Mr. Barton), she undertook her first dramatic part, Lady Macbeth, which became one of her greatest rôles. Long afterwards Lawrence Barrett said of her: "To the last she was the greatest Lady Macbeth of her age." She played for a time in Albany and elsewhere, and then began at the Park Theatre, New York, an engagement which lasted for several years. She took a great variety of parts, both comedy and tragedy, among them Bianca, Helen McGregor, Queen Gertrude, Goneril, Nancy Sikes, her wonderful Meg Merrilies, and later, Queen Katharine, Cardinal Wolsey, Ophelia, Lady Teazle, and many others. In 1844, after a period of successful management in Philadelphia and a tour with Maeready, whom she had supported before, she went to England. She met with great success; while there she and her sister Susan made their first appearance in *Romeo and Juliet*, which had, for that period, an exceptionally long run in London. She returned to America in 1849, but revisited Europe several times. In 1856 she went to Rome, where she had a home for some years. She was honored in the most cultivated society of Europe and America, not only as a great artist, but as a good woman. During the Civil War she showed her patriotic spirit by giving performances for the benefit of the Sanitary Commission, contributing in this way over \$8000. In her later years she was known as a reader, with singular interpretative powers. Her last appearance on the New York stage, November 7, 1874, was a memorable occasion. She played Lady Macbeth. When the curtain fell, a body of eminent citizens, with William Cullen Bryant as spokesman, came upon the stage and presented the actress with a laurel crown, inscribed *C. C.—Palmar qui meruit ferat*. Charlotte Cushman never married. She died in Boston, February 18, 1876. In 1880 her grave in Mount Auburn was marked by an obelisk which in form is a copy of Cleopatra's Needle as it stood in Heliopolis. Consult: Stebbins, *Charlotte Cushman: Her Letters and Memories of Her Life* (Boston, 1878); Clement, *Charlotte Cushman* (Boston, 1882); and Cook, *Hours with the Players* (London, 1881).

CUSHMAN, ROBERT (c.1580-1625). One of the founders of the colony at Plymouth, Mass. He was born in Kent, and arranged the emigration of the Pilgrims to Holland, later following them to Leyden. He accompanied Deacon Carver upon his fruitless mission to London (1617); assisted Brewster in obtaining a patent from the King (1619); and, together with Carver, chartered the *Mayflower*. He emigrated to New England with his son Thomas in 1621, and leaving him there in the care of Governor Bradford, returned to Europe three weeks later to act as the agent of the colonists in London. The celebrated sermon on "Sin and the Danger of Self-Love," delivered by him before his departure, is memorable as being the first published discourse delivered at Plymouth, and is the oldest sermon extant delivered in America. It was printed in London in 1622, and in Boston in 1724 and 1780. The strip of territory on Cape Ann secured by

him and Edward Winslow in 1623 afterwards became the site of the first successful settlement established within the boundaries of the Massachusetts Bay Colony. Sixty facsimile copies of his famous sermon were published in 1870.

CUSINS, kûz'inz, Sir WILLIAM GEORGE (1835-93). An English composer, born in London. He sang in the Royal Chapel at the age of ten. Soon afterwards he was sent to study under Fétis in Brussels, and upon his return obtained the King's scholarship at the Royal Academy of Music. At the age of sixteen he was appointed organist to the Queen's Private Chapel, and in 1867 he succeeded Sterndale Bennett as conductor of the Philharmonic Society, which position he retained until 1883. In 1875 he became examining professor at Queen's College, and in 1876 joint examining professor of scholarships at the National Training School of Music. In recognition of his services in behalf of art, he was knighted in 1892. The few but highly meritorious compositions which he wrote include: *Royal Wedding Serenata* (1863); *Gideon*, an oratorio (Gloucester Festival, 1871); *Masonic Prayers Set to Music*; *Responses to the Commandments* (sung in Queen Victoria's Private Chapel); pianoforte concerto in A minor (performed by Arabella Goddard with success in Rome, Liverpool, New York, and London); *Te Deum*, a cantata; several songs, and a violin concerto.

CU'SIS. The imaginary land of the single-footed race in Mandeville's *Travels*.

CUSK. A fish of the cod family (*Brosmius brosmic*), frequenting rocky ledges in the North Atlantic, especially off the shores of Scandinavia and Newfoundland. It has much the same habits and characteristics as the eod, and is more extensively used in northern Europe than in America, where it has never found favor in market.

CUSP (from Lat. *cuspis*, point, spear). In architecture, the point formed by the meeting of two small arches, or foils, in foil arches (q.v.) or tracery. Cusps often end in rich bosses of flowers and leaves. It is a specialty of the Gothic style, though not unknown, in its simplest form, to Romanesque.

CUSSET, kus'sâ'. The capital of a canton in the Department of Allier, France, at the confluence of the Sichon and Jolan, tributaries of the Allier, two miles northeast of Vichy. It is an ancient town, dating from a convent founded in 886, which was created an abbey in the thirteenth century. It has interesting fifteenth and sixteenth century houses, and the Grosse Tour is a relic of the mediæval fortifications, now replaced by boulevards, which surrounded the town. It is noted for its mineral springs, and has linen, paper, and basket manufactures. Population, in 1901, 6598.

CUST, ROBERT NEEDHAM (1821—). An English Orientalist. He was born at Cockayne, Hatley, Bedfordshire; educated at Eton, and, entering the East Indian service, took honors in the College of Fort William, Calcutta, for skill in four Oriental languages. For many years he served with the military in various parts of India; took part in several battles, and was present at the taking of Lahore in 1846. He also took an active part in the Punjab War of 1848-

49, and in the pacification of the country after the Sepoy Mutiny. After his return from the East, he filled various local offices; became a member of several societies, and is a constant contributor to certain religious publications. Among his works are: *Modern Languages of the East Indies* (1878); *Modern Languages of Africa* (1883); *Modern Languages of Oceania* (1887); *Modern Languages of the Caucasian Group* (1887); *Modern Languages of the Turki Branch of the Ural-Altaic Family* (1889); *Linguistic and Oriental Essays* (5), six series (1880-99).

CUSTARD-APPLE. The name commonly given in the West Indies and other tropical countries to the fruits of certain species of *Anona*, a genus of trees of the natural order Anonaceae. Some of the fruits of this genus are among the most delicious produced in tropical countries, as the cherimoyer (q.v.), and even the common custard-apple (*Anona reticulata*) of the East and West Indies. The custard-apple is a large, dark-brown, roundish fruit, sometimes from its size and appearance called bullock's-heart in the West Indies; the tree is of considerable size. The custard-apple is represented in the northern United States by the common papaw (*Asimina triloba*). There are two or three which are natives of western Africa. To the genus *Anona* also belong the sweet-sop, the sour-sop, the pinana or pinha, all of them tropical American fruits, and the alligator-apple of the West Indies (*Anona palustris*), a fruit which in its present unimproved state is probably not worth cultivation.

CUSTER, GEORGE ARMSTRONG (1839-76). An American soldier, born in New Rumley, Harrison County, Ohio. He graduated at West Point in 1861, was assigned as a second lieutenant to the Fifth United States Cavalry, and arrived at the front on the day of the first battle of Bull Run. He served successively as an aide on the staffs of Generals Phil Kearny, William F. Smith, and McClellan, was promoted to be a captain of volunteers, and served throughout the Peninsular campaign of 1862. In June, 1863 he was made a brigadier-general of volunteers, and was placed in command of a brigade of Michigan volunteer cavalry, which, under his leadership, became one of the most efficient and best-trained bodies of cavalry in the Federal Army. At the head of these troops he distinguished himself at the battle of Gettysburg. His brigade was then attached to Sheridan's cavalry corps, with which he served in the campaigns in Virginia in the spring and summer of 1864, and the subsequent operations in the Shenandoah Valley. Placed in command of the Third Division of Sheridan's corps, he won a victory at Woodstock and distinguished himself at the second battle of Winchester (Cedar Creek). He was brevetted major-general of volunteers on October 19, 1864, for his services, defeated General Early at Waynesboro, and took part in the battles of Five Forks, Dinwiddie Courthouse, and other engagements of Grant's last campaign. After several months' service in Texas during the winter of 1865-66, he applied for leave of absence, in order to accept the offer which had been made him to take command of the cavalry which Juarez was organizing to drive the Emperor Maximilian out of Mexico. His request being denied, he accepted the position of lieutenant-colonel of the Sev-

enth Cavalry. In 1867-68 he gained his first experience as an Indian fighter in Gen. W. S. Hancock's campaign against the Cheyennes, bringing the campaign to a successful conclusion by a decisive defeat of the Indians at Washita, I. T., in November, 1868. From 1871 to 1873 he was stationed with his regiment in Kentucky. In the spring of the latter year he was ordered to Dakota Territory to operate against the Sioux, who, under Sitting Bull and Crazy Horse, had formed a confederacy with other tribes in Dakota and Montana, and had succeeded in organizing one of the most formidable Indian revolts the United States Government had ever had to contend with. During the next three years Custer and his command saw considerable active service in the Black Hills country and along the valley of the Yellowstone. In the spring of 1876 General Sheridan planned a campaign against the Indians which he hoped would be decisive. Three expeditions were set under way, with the expectation that they would meet and act in conjunction against Sitting Bull and his force of about 6000 Indians, who were supposed to be encamped somewhere near the juncture of the Rosebud and the Yellowstone. General Crook, with 2500 troops, was to advance from the east; General Terry, with a force of about the same size, from the south; and General Gibbon, with a smaller force, was to follow the Yellowstone from the west. Custer and his regiment of 600 strong formed part of General Terry's force. On June 17 Crook, feeling his way along the Yellowstone, came upon Crazy Horse and some hundred of his braves on the Rosebud, and engaged them in a sharp but indecisive struggle. Terry and Gibbon had meanwhile effected a junction on the Yellowstone, at the mouth of the Big Horn, without encountering Indians in any number. After their engagement with Crook on the Rosebud, Crazy Horse and Sitting Bull led their forces in a southwesterly direction, until they were directly south of Terry and Gibbon, where they set up their tepees on the west bank of the Little Big Horn. This new move of the Indians was discovered by scouts sent out by Terry, who immediately determined to march upon them. He sent Custer and his cavalry ahead to prevent them from turning to the eastward, and prepared to follow by boat up the Big Horn with all his own troops and Gibbon's, with the understanding that he would meet Custer at the junction of the Big and Little Big Horn on June 26. But Custer, riding night and day, reached the place a day ahead of time. His scouts discovered the Indian encampment on the morning of June 25. Mistaken as to the number of his antagonists, Custer, with his accustomed impetuosity, determined to attack them at once, without waiting for Terry. He divided his troops into three divisions. He kept with himself five companies, with which he planned to attack that part of the village that lay directly before him, dividing the remaining six companies between Major Reno and Captain Benteen, the latter being sent two miles to the southward, while Reno advanced midway between Benteen and Custer. Thus fatally divided, the Seventh Cavalry advanced to the attack of an enemy outnumbering them ten to one. Benteen's advance took him far south of the village. Reno's rather spiritless attack led him against the south end of the village,

where he was repulsed and driven back across the river to the shelter of a protecting bluff. Custer and his five companies dashed almost at the centre of the Indians, were driven back and surrounded, but fought on desperately until every man of them was killed. Not a single man survived to give any account of the tragedy, but their bodies were found the next day when Terry's troops relieved the reunited forces of Benteen and Reno, who had been holding their position on the bluffs with difficulty. Custer was one of the bravest, most daring, and dashing soldiers America has produced, but he undoubtedly allowed his impetuosity to get the better of his judgment. He was the author of *My Life on the Plains* (1874). Consult Whittaker, *Life of General George A. Custer* (New York, 1876). General Custer's wife, ELIZABETH BACON CUSTER, is well known as an author. She accompanied him in many of his campaigns on the frontier, and published: *Boots and Saddles, or Life with General Custer in Dakota* (1885); *Tenting on the Plains* (1887); and *Following the Guidon* (1891).

CUSTINE, *ku'stên'*, ADAM PHILIPPE, Count de (1740-93). A French general, born at Metz. He served with distinction in the Seven Years' War. As colonel of the infantry regiment 'Sain-tonge,' and quartermaster-general of the French Army in America, he took part in the Revolutionary War, and was present at the surrender of Yorktown. In 1792 he became commander of the Army of the Lower Rhine, and conducted the brilliant campaigns against Speyer, Worms, and Mainz. In consequence of his failure, however, in the campaign of 1793, to relieve the latter city, which was recaptured by the Allies, he fell under a strong suspicion of entertaining secret negotiations with the enemy, and was shortly afterwards accused of treason and executed.

CUSTINE, ASTOLPHE LOUIS LÉONARD, Marquis de (1790-1857). A French author, grandson of the preceding, born at Niederwiller, Lorraine. His writings include a play and several romances, but he is mostly celebrated for his descriptions of travels in his *Mémoires et voyages* (1820). The most amusing of his books on travels, *La Russie en 1839* (1843), is very well known.

CUSTIS, GEORGE WASHINGTON PARKE (1781-1857). An American author, the adopted son of George Washington. He was born at Mount Airy, Md., a grandson of Martha Washington, his father being her son by her first husband. Custis studied at Princeton and Saint John's colleges, married Mary Lee Fitzhugh, and in 1802 went to reside on an estate of 1000 acres at Arlington, near Washington. His daughter married Robert E. Lee, the Confederate general. The grand estate was confiscated by the Government and is now the Arlington National Cemetery. Besides orations and plays, he left *Recollections of Washington* (1860).

CUSTOM (OF. *costume*, Fr. *coutume*, It. *costuma*, ML. *custuma*, *costuma*, from Lat. *consuetudo*, habit, from *consuescere*, to grow accustomed, from *consuere*, to be accustomed, from *con-*, together + *suere*, to be accustomed; probably from *suus*, Gk. *ἑός*, *heos*, *ἄς*, *hos*, Skt. *sra*, Av. *hva*, one's own). One of the three great departments of social psychology (q.v.), co-ordinate with language and myth (qq.v.). It

may be defined as "any norm of voluntary action which has been developed in a national or tribal community" (Wundt). Like animal instinct (q.v.), it is the outgrowth of individual habits. But instinct is practically invariable; it expresses the habits of past generations in the form of mechanized, not of consciously motivated, actions, whereas custom, however rigorous its prescriptions, may always be disobeyed or modified; the customary action has not lost its conscious antecedents. Hence we may say that "instinct is habitual conduct that has become mechanical; custom, habitual conduct that has become generic."

The origin of custom appears to have been twofold. In the great majority of cases in which we are able to trace a custom back toward its first beginnings, we come upon religious or ceremonial ideas. In certain other cases custom seems to have originated in ancient rules of law, the meaning of which has been forgotten, while the usage which they enjoin still persists; although, when we consider that every action of importance in a primitive society, whatever its special significance, has a religious aspect, we shall probably not be wrong in referring these legal customs also to an ultimately religious source. As an illustration of legal custom we may cite the Greek and Roman marriage ceremony, in which it was an established tradition that the mothers of the contracting families should bring the bride and groom together—a clear indication of that law of mother-right which the civilized societies of the ancient world had long outgrown. But the mother-right is itself permeated through and through with primitive mythological conceptions: so that we are, in this case, thrown back with practical certainty upon a religious origin of the custom. As an instance of the transformation by custom of the purpose of a religious ceremonial, we may take the funeral feast. In primitive times the 'funeral baked meats' were furnished forth as a sacrificial feast: the mourner seeks in part to obtain the favor of the gods for his dead and in part to offer worship to the dead man himself. Later the feast becomes a meal shared in all piety with the dead; the survivors symbolize their brotherhood with the departed by partaking of the meat which is to sustain him on his pilgrimage to the other world. Nowadays the cake and wine may be offered quite perfunctorily; or may bring so much of comfort to the mourners as springs from the conviction that they have dealt handsomely with the dead; or may serve as an excuse for ill-timed carousals. In any event it has completely lost its primary significance, and has persisted only by virtue of that *vis inertiae* which makes custom at large so valuable a mine of information to the anthropologist and social psychologist.

Consult: Wundt, *Ethics* (London, 1897); id., *Völkerpsychologie* (Leipzig, 1900); Tylor, *Primitive Culture* (New York, 1891); id., *Early History of Mankind* (London, 1878); id., *Anthropology* (New York, 1881). See ANTHROPOLOGY. For the legal aspect of custom, see the following article.

CUSTOM. In a legal sense, a custom is a usage which has obtained the force of law, and which will, accordingly, be enforced by the courts. As is explained in the article on CUSTOMARY LAW, the greater part of the legal

rules enforced by society are the expression of customs, and custom continues to be an important, though diminishing, source of law in civilized as well as in primitive society. Indeed, it is only in the progressive communities, where the constantly accelerating progress multiplies social needs faster than they can be supplied by the slow processes of custom, and where the political consciousness has kept pace with this progress, that conscious legal development by legislation and judicial action tends more and more to supplant the unconscious development of customary law. In the non-progressive societies, which vastly outnumber the progressive, custom is still the principal, if not the only, source of law.

English and American law writers distinguish between *general* and *particular* customs, the former being of general observance and constituting the body of the common law, and the latter being restricted to the inhabitants of a particular district or the members of a certain calling. As an example of the former may be cited the right of the public to use the seashore, between high and low water mark, for landing and other lawful purposes; and, as an example of the latter, the right of persons engaged in the business of towing, on some parts of the river Thames, to go upon the banks of the river for that purpose, though the land is the private property of abutting proprietors. There is, in truth, and from the point of view of jurisprudence, no distinction between the two classes of customs, both depending alike upon immemorial usage, and both, when established, having equally the force of law. In practice, however, the common-law system has made a distinction between them for the purpose of establishing them, the courts taking 'judicial notice' (q.v.) of general customs as a part of the common law which it is their business to interpret and declare, but requiring proof of the existence of local or other particular customs. But the line between the two classes is not very accurately drawn, the custom of the county of Kent, known as 'gavelkind' (q.v.), whereby lands descend to all of the sons equally instead of to the eldest only, and the still more curious custom of 'borough English' (q.v.), under which lands descend to the youngest son in preference to his elder brothers, and which is confined to no particular area, but affects isolated estates or manors in various parts of England, being recognized as parts of the common law, notwithstanding their limited occurrence. Doubtless these exceptional cases are to be explained by the great antiquity of the customs in question and their early recognition by the courts. Of a similar character is the *lex mercatoria*, or custom of merchants, which, though applying only to a limited class in the community, has also become incorporated in the common-law system, and is noticed by the courts without special proof of its terms.

In order that a particular or local usage, alleged to be a custom, shall have the force of law, (1) the practice "must have been used so long that the memory of man runneth not to the contrary"—i.e. as the phrase is understood in England, from the accession of Richard I. (1189); (2) it must have been continued without interruption; (3) it must have been peaceable and acquiesced in, not subject to contention and dispute; (4) it must be definite and certain; (5) it must be reasonable. The ques-

tion of the reasonableness of a custom is often one of great difficulty. It has been decided that any usage relating to land which is destructive of the land itself, or which deprives the owner of the beneficial use of it, is unreasonable. Thus, a custom for all persons to play games or walk for recreation on private property which has not been dedicated by the owner to public use has been held to be unreasonable and void; whereas a custom for all the inhabitants of a village to do the same acts has been decided to be reasonable and protected by law. But a custom for all the inhabitants of a village to pasture cattle on private land is, in its turn, unreasonable. As usually stated, the rule is that a right in the nature of an easement may arise by custom, but not a right in the nature of a profit.

It is doubtful whether local or particular customs can arise generally in the United States. It has usually been assumed that the common-law rules above set forth are in force in this country, and a few States have so held. It has, on the other hand, been decided in New Jersey and Virginia that no rights in another's land can arise by custom, and the decisions have been put upon the ground that there is in the United States no possibility of a usage having the requisite antiquity (i.e. of dating from the reign of Richard I.) to give it the standing of a custom enforceable at law.

The common law makes a further technical distinction between local or particular *custom* and *usage*, the former being of compulsory legal effect, and the latter consisting of current practices, to which parties may or may not conform, and in accordance with which they are supposed to have regulated their conduct or agreements. Thus, in matters of contract, a usage affecting the trade or calling with which the contract has to do may be dealt with as an understood but unexpressed term of the agreement; and in matters of tort, as an allegation of negligence, the usage of the community (as, e.g. the so-called 'rule of the road') may be called into play to determine the presence or absence of negligence. See COMMON LAW; CONTRACT; EASEMENT; LAW; PROFIT. Consult: Blackstone, *Commentaries on the Laws of England*; Holland, *Elements of Jurisprudence* (9th ed., London, 1900); Holmes, *The Common Law* (Boston, 1881); Pollock and Maitland, *History of the English Law* (2d ed., Boston, 1899); Gale, *Treatise on the Law of Easements* (7th ed., London, 1899); Jones, *Treatise on the Construction or Interpretation of Commercial and Trade Contracts* (New York, 1886).

CUSTOMARY FREEHOLD. In English law, a variety of copyhold tenure, sometimes called privileged copyhold, which differs from the common form of that tenure in that it is not expressed to be "at the will of the lord." It is not a true freehold, however, the freehold title being actually vested in the lord of the manor. See COPYHOLD, and the authorities there referred to.

CUSTOMARY LAW. The body of customs recognized as binding in any social group or community, and enforced by its authority. As, in the evolution of humanity, social habits or customs precede the definite organization of social groups, such an organization, when it arises, finds a body of customary observances

ready to be transformed, and in process of being transformed, into positive law. This body of customs constitutes the entire legal system of primitive society, and the development and recognition of new customs and the modification of old customs are its principal, if not its only, means of expansion and change. Indeed, the primitive codes—as the Mosaic law of the Jews, the laws attributed to Lycurgus among the Greeks, the Twelve Tables of Rome, and the more recent barbaric codes (*leges barbarorum*) of the early Middle Ages—represent little more than a statement, in precise and definite form, of the body of custom which had already gained the force of law in the community. It is only when a community has reached the stage of political consciousness that it undertakes deliberately, by legislation or judicial methods, to effect changes in its laws; and even then custom, though relatively diminishing in importance, continues to be an important source of new law.

Customary law, then, is the foundation and basis of all existing legal systems. Of many, if not most, of those systems it constitutes by far the greater portion of the body of rules of which they are composed, and in all of them it forms an important increment of their growth. Even where the political and legal consciousness of a community has reached the stage of sweeping legal reform—as in the Eastern Empire under Justinian and in France under Napoleon Bonaparte—the resultant code of laws, however comprehensive, must be based upon, and must consist mainly of, the rules of the customary law which it is intended to supersede, and its most radical departures from that law are most swiftly corrected by the judicial organs of the community. Undoubtedly the most complete and widespread transformation which the customary law of mankind has ever undergone was the general reception throughout Europe of the civil-law system of Rome. (For the history of this process, see CIVIL LAW.) Only the common-law system of England, upon which that of the United States is based, was able to withstand that influence; and this is still, for the most part, consciously and avowedly a body of customary law. (See CODE; COMMON LAW.) Under the influence of the spirit of nationality, which has so powerfully affected the nations of Europe during the last quarter of the nineteenth century, there has recently developed a strong sentiment in favor of the revival of the local customary law, as against the more general law of foreign origin. This is particularly noticeable in the recent revision of the German codes.

CUSTOM HOUSE. The office in a port of entry (seaport or lake port) where masters of ships are bound to enter and clear their vessels according to the statutes governing the subject, and where importers of merchandise must pay customs duties. In the United States the custom house of each port is under the direction of a

Collector of the Port, appointed by the President with the advice and consent of the Senate. He is responsible for its proper conduct, subject only to the direction of the Secretary of the Treasury, and it is his duty to carry out the United States statutes and tariff laws governing and restricting the importation of foreign goods. See CUSTOMS DUTIES.

CUSTOM OF THE COUNTRY, THE. The title of a play by Fletcher and Massinger (about 1628), in part taken from Cervantes. A play by Mrs. Centlivre, with the same title, was produced in 1715.

CUSTOMS DUTIES. Taxes levied upon merchandise which passes a frontier; generally upon goods imported. Such taxes are of very early origin, and in the long conflict between the English King and the Commons over the right of taxation it was claimed that these taxes were ancient customs over which Parliament had no jurisdiction. Hence the name which has since clung to this class of taxes. It appears that in their origin such taxes were largely in the nature of payments for privileges of trading at certain places and for use of the facilities of ports and markets, but that they soon passed beyond the stage of fees into that of imposts. The name customs duties was applied indifferently to the taxes levied at ports of entry or at ports of passage or upon goods brought into a city from surrounding parts of the same country. Such internal customs have almost disappeared in modern countries, though remnants of them are found in the 'octroi' of Paris and other Continental cities. Transit taxes, such as those levied upon the navigation of the Rhine, have also disappeared. Such restrictions upon the freedom of commercial intercourse would no more be tolerated in modern times than the tributes once paid to the Barbary pirates.

Taxes upon exports have become infrequent. They are no longer an element of consequence in the fiscal system of modern States, though a few remnants of them can be found. In South America such taxes are more common. Chile derives considerable revenue from its nitrate exports, and Brazil from its coffee exports. Quite striking, as a return to older forms of taxation supposed to be laid aside, was the imposition in 1901 of a tax of one shilling per ton upon all coal exported from Great Britain.

Customs duties are, therefore, generally synonymous with duties upon imports. Such duties may have no other object than to raise revenue. The most conspicuous case of such a purely fiscal tax is when the imported article is taxed to exactly the same extent as the home product, such a tax aiming to equalize the conditions of competition for the foreign and the home producer. Another distinctly fiscal tax is one imposed upon an article not produced in the home country, as the English duty upon tea. Taxes which weigh more heavily upon the foreign article than the home product, or which are levied upon imports where the same article is not taxed at home, may be purely fiscal in intent or may be designed as a protection for home industries. It is not the magnitude of the taxation which decides this point, but the effect upon the economic order. It is well understood that any taxation whatever influences consumption and production, but this influence may be deliberately planned or in-

cidental. It is the deliberate planning which characterizes a protective tariff. Whether such a course is to be justified is not to be discussed here. (See FREE TRADE; and TARIFF.) It is enough for our purpose to note that the injection into tariff legislation of ulterior economic motives complicates the machinery of customs duties in a high degree. Such a course does not eliminate the fiscal features of a tariff, as there are few States which can afford to handle their customs taxation in such a way as entirely to subordinate fiscal interests to economic policy.

The contrast between a purely revenue tariff and a protective tariff is illustrated most strikingly by comparing the United States and Great Britain. In the latter the general principle is freedom from taxation, duties being laid upon a few articles only, twenty-seven in all. In the United States, the general principle is taxation, and all articles not specifically taxed at rates named, or expressly exempt from taxation, are subject to a duty of 10 per cent. if unmanufactured and of 20 per cent. if manufactured in whole or in part. The complicated structure of the American tariff is shown in the following analysis of the tariff act of 1897, showing the several schedules and the classes of duties imposed by the several paragraphs under each which fix the rates:

convenience of administration has produced a general sentiment in favor of specific duties, but nations which pursue an avowedly protectionist policy cannot yield to this sentiment as largely as those whose tariff is for revenue only. Specific duties can best be applied when the product is comparatively uniform in quality and value. In Great Britain, Germany, and Austria, only specific duties prevail, and the tariffs in France and Italy show very few ad valorem rates.

With these countries the United States stands in marked contrast. Here ad valorem rates are abundant, but the provisions of the act are so complex that a separation of rates into two classes only is not practicable, and it has become necessary, as is shown in our statement above given, to add a mixed class. This includes several cases (1) when two articles are named in the same paragraph, one receiving an ad valorem and the other a specific tax; (2) where one article receives both forms of tax; (3) where an article is classed according to value and then receives a specific tax for each class. Other combinations also occur, as where an article is classed according to value and receives a different ad valorem rate in each class, or again when classed according to specific characteristics and taxed at different ad valorem rates, but these combinations are classed as ad valorem rates. Specific rates

SCHEDULES	Paragraphs fixing rates			
	Total	Specific	Ad valorem	Mixed
A. Chemicals, Oils, and Paints.....	86	67	14	5

Totals.....	444	246	106	92
Free List.....	242			

Customs duties are specific and ad valorem, the former being reckoned by the quantity of the goods imported (weight, measure, or number), and the latter by the value. Theoretically, the ad valorem duties are the preferable, as they adjust the amount of the burden to the value of the article. But they offer great practical difficulties in ascertaining the value of the goods. As the statements of the importers, even when made under oath, are not accepted as final evidence as to the value of the goods, a complex machinery for the ascertainment of values is a necessary adjunct to all ad valorem taxes. Hence the preference for specific duties, which can be imposed readily according to the physical characteristics of the objects imported. Such specific duties fall unequally upon objects of high value and low value in the same class. Thus, if all textiles were taxed 15 cents a square yard, such a tax would be prohibitive on print cloths, but insignificant upon silks. It is the plaint of the protectionist that specific duties protect only the lower grades of goods from foreign competition. The only method of mitigating this is to make a minute division into classes. The greater

predominate in the schedules A, C, F, G, and H, but in the others ad valorem and mixed rates prevail.

CLASSES	Duty collected, 1901	Average ad valorem rate, %
1. Sugar and Molasses.....	\$63,022,429	73.44
2. Cotton and manufactures of.....	21,826,690	54.87
3. Wool and manufactures of.....	21,575,005	70.21
4. Tobacco and manufactures.....	16,655,744	110.63
5. Silk and manufactures of.....	14,245,993	53.07
6. Fibres, vegetable, and manufactures of.....	12,908,017	37.27
7. Liquors, Malt, Distilled, and Wines.....	9,121,236	70.01
8. Tea.....	8,259,354	82.54
9. Iron and Steel and manufactures.....	6,988,479	38.15
10. Chemicals, Drugs, and Dyes.....	5,603,647	26.96
Total of all imports.....	\$180,206,294 232,641,500 49.64

But if rates be many, they are not all equally significant. As indicated above, rates are fixed in 444 paragraphs of the tariff law, but many impose several rates, so that neither the number

of objects taxed nor the rates of taxation correspond to the number of paragraphs. The statistics of imports deal with individual articles or closely allied groups. From the figures for 1901 it appears that 78.3 per cent. of the entire customs revenue of the United States was derived from ten articles or groups. The figures are given in the preceding table, which also embraces the average ad valorem rate of taxation, found by comparing the amount of duty collected with the value of the goods imported.

The same concentration of revenue produced upon a few articles of importation is generally observed in other countries. Thus in England in 1901, tobacco and snuff, tea, and spirits produced 90.1 per cent. of the customs revenue, while in the German Empire in 1901, breadstuffs, petroleum, and coffee produced 55.8 per cent. of the customs revenue. The important rôle of the customs duties in the fiscal arrangements of modern States is shown in the following statement:

sure, impact, movement, resistance, weight, touch; hardness, roughness, wetness, and their opposites; warmth, heat, cold; pain, tickling, goose-flesh, pricking, tingling, creeping. When, however, the organ is explored, point for point, by mechanical, thermal, and electrical stimuli, it proves to be capable of four sensation qualities, and of four only: pressure, warmth, cold, pain. The so-called sensations of contact, weight, resistance, touch, smoothness, etc., are really perceptions, made up of sensations from the skin and from the underlying tissues. Pricking, tingling, etc., are in all probability circulatory sensations, aroused by change of blood-flow or blood-supply; their organs and mode of excitation are imperfectly known. We shall return to heat and tickling below; we now take up the cutaneous qualities in order.

(1) *Pressure*.—If a small point of cork or soft wood be set down firmly upon the skin surface, e.g. on the back of the hand, one of

COUNTRY	Year	Denomination	Total Revenue	Customs Revenue	Per cent. of Total

CUSTOMS OF WAR. See WAR; HONORS OF WAR; SALUTES; LAWS AND USAGES OF WAR.

CUSTOS ROTULORUM (Lat., keeper of the rolls, or records). An office of great antiquity and dignity in England. It is usually held by the first civil officer of the county, as the Lord Lieutenant, though the actual custody of the records of the sessions of the peace and of the commission of the peace, constituting by eminence 'the rolls' of the county, is vested by statute in the clerk of the peace. Formerly the office was filled by appointment of the Lord Chancellor, but it has for over three hundred years been conferred by the Crown. The Keeper of the Rolls is always one of the commission of the peace, though the title of the office points to ministerial rather than to judicial functions.

CUSTOZZA, kōō-stōd'zā. A village in the Province of Verona, North Italy, situated 16 miles southwest of Verona (Map: Italy, E2). On July 25, 1848, and on June 24, 1866, the Italians were defeated here by the Austrians. (See ITALY, *History*.) In 1879 a monument was erected to the fallen. Population, in 1881, 624.

CÜSTRIN, ku-strēn'. See KÜSTRIN.

CUTANEOUS SENSATIONS (Fr. *cutané*, Port., It. *cutaneo*, from Lat. *cutis*, skin). The sensations aroused by stimulation of skin and mucous membrane. The term 'cutaneous' is applied to all these sensations, although one of them, the sensation of pain, is derived not from the cutis proper, but from the epidermis. (See SKIN.) The skin has been credited, in one or another psychological system, with a large number of sensations: sensations of contact, pres-

sure, two things will happen: either it will arouse a dull, vague, diffuse pressure sensation, or it will arouse a sharp, distinct pressure, the kind of sensation that one might suppose to come from the inward pressure of a little hard seed lodged in the cutis (Goldscheider). If the point be now applied lightly, we get either no sensation at all, or (at the place where the seed-pressure was before produced) a light, fine, rather ticklish pressure sensation. The seed-pressure and the ticklish pressure come from the organs of the pressure sense, the 'pressure spots,' as they are called. The dull pressure with intensive stimulation is set up by the indirect affection of several pressure spots; the stimulus makes an indentation in the skin, and the dragging down of the tissue squeezes the pressure organs that lie about the point of application. The absence of sensation with light contact means that the experimenter has applied the stimulus at a point of the skin which has no pressure organ. We see, then, from this simple experiment, that the skin is not uniformly sensitive to pressure; it may rather be compared to a mosaic of tiny blocks, some of which are sensitive, while the rest are insensitive, to mechanical stimulation.

A careful exploration of the cutaneous surface, undertaken with the object of mapping the pressure spots, has led to two definite results. (a) If the portion of the skin explored is hairy, the pressure spot lies always to windward of a hair-shaft, immediately above a hair-bulb. It follows that the nerve-skein which enfolds the bulb is the terminal organ of pressure, and that the hairs are as truly sense-apparatus in man as they are, e.g. in the cats. (b) If the region is hairless, pressure spots, arranged in lines and groups, can still be identified. The organs in this case are the corpuscles of Meissner.

(2) *Warmth and Cold*.—If the blunt point of an ordinary lead-pencil be drawn slowly over the back of the hand, it will give rise, from time

to time, to little flashes of cold; over the rest of its course, it will arouse nothing but pressure sensations. If the point be warmed, and drawn in the same way over the closed eyelid, it will give rise, from time to time, to little dots of warm sensation; at other points, it excites nothing but pressure. There is, then, a mosaic of temperature organs as there is a mosaic of pressure organs. Moreover, if a small square or circle of skin is accurately marked, and explored twice over, once with a cooled and once with a warmed point of metal, it will be found that the cold and warm spots do not coincide. A 'cold spot' never gives a warm sensation; a 'warm spot' never responds to stimulation by a cold sensation. While, therefore, we are justified, physically, in speaking of 'degrees' of temperature, and in arranging 'warms' and 'colds' upon a single thermometric scale, we must recognize the fact that, psychologically regarded, warmth and cold are distinct things; there are two temperature senses, each with its own distribution and its peculiar terminal organs. The organs of cold are more numerous than those of warmth. They are to be found, probably, in the end-bulbs of Krause, while the organs of warmth are the cylinders of Ruffini (von Frey). All these cutaneous organs are of extremely simple structure, consisting of little more than a skein or tangle of nerve-fibrils, twined about a cluster of connective-tissue cells. All alike are readily fatigued; and all show differences of responsiveness of 'attunement,' some answering a given stimulus with an intensive, others with a weak sensation.

(3) *Pain*.—If a small area of skin, say, upon the back of the hand, be shaved, moistened, stretched taut, and explored, point for point, by a fine horse-hair or needle, sensations of pain—more closely distributed than any of the three preceding sensations—will be obtained. The pain sensations are the most delicate, the smallest, so to speak, of all the skin sensations. The pain quality is unmistakable; even a novice will have no difficulty, after the first few trials, in distinguishing it from the ticklish quality of fine pressures. Moreover, if a pressure spot be very accurately localized, and the needle-point thrust into its centre, no sensation of pain will be aroused. The temperature spots are similarly analgesic. Hence there can be no doubt that pain is a new, fourth sense, endowed with organs of its own.

These organs are, in all probability, the free nerve-endings in the epidermis. The epidermis lies, like a layer of stiff leather, upon the elastic cutis. When, then, the skin is lightly touched, the resulting vibration passes *through* the epidermis to the underlying cutis; the epidermis, with its organs, is not stimulated at all. When, however, the skin is bruised, so that the epidermis is actually broken or crushed; or when the epidermis is itself explored, under experimental conditions that render it accessible to stimulation; then the pain quality is evoked. The mechanical character of cutis and epidermis thus enables us to explain the apparently paradoxical fact that the pain organs are placed more superficially than the organs of pressure, and yet that, under ordinary circumstances, it takes less stimulation to call out pressure than to excite pain.

(4) *Heat*.—We have seen that warm spots

give only sensations of warmth, and cold spots only sensations of cold. It is remarkable that, while the cold spots do not as a rule respond to warm stimuli—as, indeed, we should not expect them to do—they respond, by a distinct cold sensation, to heated stimuli of some 45° C. or over (von Frey's 'paradoxical cold'). No explanation can at present be offered. Stranger still is the experience that, if a piece of metal, heated to this temperature, be laid upon a portion of the skin that is furnished with both cold and warm spots, the result of the combined excitations is not warmth, or cold, or pain, but an altogether new quality, the quality of heat. A good place for experimentation is the median line of the forehead, close up to the hair. Raise the temperature of the metal from 40° upward, by 1° steps. For the first few trials you get nothing but a mild warmth, from the warm spots. But as soon as you pass the critical temperature (the heat that, if the metal were a point, would evoke from a cold spot the paradoxical cold sensation), you get a distinct sense of heat. Again, no explanation can be given. It is noteworthy, however, that heat affords a good instance of the difference between a psychological and a psychophysical sensation. (See ELEMENTS, CONSCIOUS.) To introspection, heat is a sensation, entirely unanalyzable; but when we take account of its bodily conditions, it appears as a fusion, a mixture of the stimulus qualities warm and cold.

(5) *Tickling*.—The psychophysics of this sensation complex is still obscure. Tickling may be set up, at certain parts of the cutaneous surface, by light intermittent pressure, or even by a single light touch. The resulting pressure sensations are (a) in some way diffused, so that the area of sensation presently becomes much larger than the area of original stimulation. Concomitant sensations of pressure (see COMMON SENSATION) may also be aroused in remote regions of the skin. It is possible (b) that the smooth muscle-fibres at the roots of the hairs, the muscles that cause the hair to 'stand on end' and whose contraction produces goose-flesh, may contain sensory nerve-endings which functionate in the tickling complex. (c) The occasional thrills of warmth which are characteristic of tickling are due, apparently, not to mechanical stimulation of the warm spots, but to a change of blood-supply in the vessels of the cutis. Weak pressure or blowing upon the skin is known to increase the arterial blood-pressure. (d) The movements of withdrawal have been ascribed to the unpleasantness of the intermittent stimulation; a flickering light, a beating tone, an interrupted pressure, are all disagreeable. While this statement may contain a part of the truth, it seems probable that the movements are referable, in part at least, to reflex connections between the sensory and motor nerves, akin to the connections which, on the purely sensory side, subserve concomitant sensation. Moreover, laughter is the direct motor response to tickling, and unpleasantness does not arise unless the stimulation be long continued. (e) For theories of the connection of laughter with tickling, see LAUGHTER.

We have spoken, so far, only of the 'external' skin. The 'internal skin' of the body, or mucous membrane, is sensitive to pressure and pain over most, if not all, of its extent. It is, however,

very weakly if at all sensitive to temperature from the pharynx downward.

(London, 1897-98); for tickling, Kuelpe, *Outlines of Psychology* (London, 1895). See PAIN.

CUTCH or **KACHH** (Skt. *kaccha*, shore). A protected principality under the Presidency of Bombay, British India, occupying the peninsula south of Sindh, between the marshy tracts of the Rann of Cutch and the Gulf of Cutch. It covers an area of 6500 square miles (Map: India, A 4). Its soil is mostly sterile. The climate and meteorological conditions are extremely unfavorable for vegetation. The Rann is a morass nearly 7000 miles in area. It is flooded during the monsoon by salt water, but by December 1st it is comparatively dry. Cutch has a feudal system of government, the ruling power being confined to the dynasty of Jharija Rajput, of which there are about 200 members. The chief town is Bhuj and the principal seaport Mandvi. The population, in 1891, was 558,415; in 1901, 487,374. About one-third of the inhabitants are Mohammedans, the rest Hindus of various castes.

CUTCH, or **KACHH GUNDAVA**, gūn-dā'vā. A region in Baluchistan, east of Khelat. The Hala range of mountains extends along the western frontier (Map: Central Asia, E 4). The soil is rich, producing grain and cotton. The climate is damp and unhealthful.

CUTCH, GULF OF. An inlet on the northern border of the Arabian Sea, lying between Cutch and the peninsula of Kathiawar, British India (Map: India, A 4). It is about 30 miles wide and 100 miles long, and connects at its upper end with the Little Rann (or Rann) of Cutch, and through this with the great western Rann, the remarkable salt marshes lying to the east and north of Cutch.

CUTHBERT, kŭth'bĕrt. A town and the county-seat of Randolph County, Ga., about 120 miles southwest of Macon; on the Central of Georgia and the Georgia, Florida and Alabama railroads (Map: Georgia, B 4). It contains colleges for young men and women. Cuthbert is the commercial centre of a fertile agricultural and fruit-growing section. Population, in 1890, 2328; in 1900, 2641.

CUTHBERT, SAINT (c.635-687). Bishop of Lindisfarne and one of the most popular saints in England in the Middle Ages. He was born about 635, probably of Lowland Scotch parents. In 651, moved by a vision of angels carrying to heaven the soul of Saint Aidan, he entered the monastery of Melrose. Ten years later he was put at the head of this monastery, and did noble missionary work in the surrounding country. He left it in 676 for an austere hermit life, from which he was withdrawn in 684 to accept the bishopric of Hexham, which he exchanged for that of Lindisfarne, holding the latter only two years and returning to his solitary hut on Farne Island. Here he died, March 20, 687.

The influence of Saint Cuthbert upon his contemporaries was great, but his fame became even greater after his death. His body remained at Lindisfarne till 875, when the monks, bearing

it on their shoulders, fled from the fury of the Danes. After many wanderings through the south of Scotland and the north of England, they found a resting-place at Chester-le-Street in 883. In 995 the remains were transferred to Ripon, and then to Durham, where, inclosed in a costly shrine, and believed to work frequent miracles, they remained until the Reformation, when the shrine was defaced and the body buried under the pavement of the cathedral. The tomb was opened May 17, 1826, when a coffin ascertained to have been made in 1541 was found to inclose two others. The innermost case contained the skeleton of Saint Cuthbert, still entire, wrapped in five robes of embroidered silk, and also the head of King Oswald, killed in battle (642), which it was known had originally been buried with the saint. His life was twice written by the Venerable Bede, and still earlier by a monk of Lindisfarne. Besides these lives, all of which have been printed more than once, and what is told of him in Bede's *Historia Ecclesiastica Gentis Anglorum*, there are three modern lives, by Raine (Durham, 1828), Eyre (London, 1849; 3d ed. 1887), and Fryer (London, 1880).

CUTHBERT OF CANTERBURY (?-758). An English prelate. He was born in the Kingdom of Mercia, became Bishop of Hereford in 736, and Archbishop of Canterbury in 740. He died on October 26, 758. An instructive letter was addressed to him by Saint Boniface, in reply to one from him relating the doings of a council which determined upon closer relations between the English Church and that of Rome, in which Boniface shows that he too had adopted Roman usages. This letter has been printed more than once, and will be found in the appendix to Hussey's edition of Bede, *Historia Ecclesiastica* (Oxford, 1846).

CUTICLE. See SKIN.

CUTICLE (Lat. *cuticula*, dim. of *cutis*, skin). In plants, a hyaline film covering the surface of plants, and derived from the outer walls of the epidermal cells. The film consists of 'cutin,' which is a transparent, elastic substance, only slightly permeable to water. The process of formation of the cuticle is called 'cutinization' or 'cuticularization.' The term cuticle is sometimes loosely used instead of epidermis, and is not to be confused with the same term as used by zoölogists. See ANATOMY OF PLANTS.

CUTIN (in plants). See CUTICLE.

CUTINIZATION (in plants). See CUTICLE.

CUTLASS (Fr. *coutelas*, from OF. *couteel*, *cuttel*, Fr. *couteau*, knife, from Lat. *cutellus*, dim. of *culter*, knife). A short curved sword formerly used in men-of-war as a side arm for the men. The blade was usually about 27 inches long, an inch wide, and had a bowl-shaped guard on the hilt. See SWORN.

CUTLASS-FISH. A remarkable fish (*Trichiurus lepturus*), alone representing in this country a family (Trichiuridae, the hair-tails) of pelagic fishes allied to the sailfishes and better known elsewhere. Its body is long, band-like, tapering into a hair-like tail, scaleless, and covered with a glistening white skin, so that its resemblance to a sword or to a silver scabbard justifies the European 'scabbard-fish,' or the names 'swordfish,' prevalent along the Gulf

coast, and 'silver-fish,' heard in Florida. Its length may reach two or three feet, and it swims mostly at the surface, often leaping above it (whence another local name, 'skipjack') in pursuit of its prey: and it is sought by anglers both for sport and food. In Jamaica, indeed, it

CUTLASS FISH; MOUTH OPEN AND SHUT.

forms the object of a commercial fishery; and another species is the highly esteemed frostfish (q.v.) of New Zealand.

CUTLER, ELDRIDGE JEFFERSON (1831-70). An American scholar and poet, born at Hollister, Mass. He was professor of modern languages at Harvard from 1865 until his death. His works include *War Poems* (1867) and *Stella* (1868). In addition to his creative work, he wrote much valuable criticism.

CUTLER, MANASSEH (1742-1823). An American clergyman and botanist. He was born in Killingly, Conn., graduated at Yale in 1765, and in 1767 was admitted to the bar. He then studied theology, was licensed to preach in 1770, and from 1771 until his death was pastor of Hamlet Parish, Ipswich, now the town of Hamilton, Mass. During the latter part of the Revolutionary War he served as chaplain of a Massachusetts regiment. He subsequently studied medicine and botany, and was the first to make a systematic study of the plants of New England, 350 species of which he classified in accordance with the Linnæan system. As the representative of a number of old Revolutionary soldiers, he contracted with Congress for 1,500,000 acres of the public lands northwest of the Ohio, and in 1788 materially assisted the party of Connecticut farmers who, under the lead of Rufus Putnam (q.v.), founded Marietta, Ohio (q.v.). He is generally credited, moreover, with having made the first draft of the famous Ordinance of 1787. He himself went to Marietta in 1788, but soon returned to Massachusetts, and from 1801 to 1805 was a member of Congress. He was a frequent contributor on scientific subjects to the *Proceedings* of the American Academy, and wrote the chapter on trees and plants in Belknap's *History of New Hampshire*. Consult William P. and Julia P. Cutler, *The Life Journals, and Correspondence of Manasseh Cutler* (Cincinnati, 1888).

CUTLER, TIMOTHY (1683-1765). An American clergyman. He was born at Charlestown, Mass.; graduated at Harvard in 1701, became president of Yale College in 1719, but was forced to resign (1722) on account of his prelatial tendencies. He went to England and was ordained a minister of the Church of England by the Bishop of Norwich (1723), and received the degree of D.D. from both Oxford and Cambridge; he returned to Boston, became rector of Christ Church (1723), and died there, August, 1765.

CUTLERY (from *cutler*, AF. *coteller*, OF. *cotellier*, Fr. *coutelier*, from ML. *cuttellarius*, knife-maker, from Lat. *cuttellus*, little knife).

A term broadly applied to cutting instruments in general, but as more commonly employed its use is limited to such cutting utensils as pocket, pen, and table knives, razors, shears, and scissors. Shells and sharp-edged stones formed the rudest and most ancient cutting instruments. These were followed by bronze weapons and instruments which were used by the Romans as late as the beginning of the Christian Era. In the remains of Pompeii, however, knives, shears, and lancets were found made of iron or steel as well as bronze. During the Middle Ages, when the chivalry of the period sought the best equipment, certain cities of Spain and Italy acquired a high reputation for the manufacture of cutting instruments, especially of swords. The knives used by the Anglo-Saxons resembled in appearance the modern razor-blade. Forks were used only for serving, as the custom of eating with forks, which was introduced from Italy, was not known in England until the time of James I. Knives were not placed on the table until about the close of the fifteenth century, and each person carried a knife with him for use whenever the exigencies of dining required other instruments than his fingers. As early as the reign of Richard I. Sheffield had gained a reputation for the excellence of its *whittles*, and in 1417 the cutlers of London obtained a charter from Henry V. In the seventeenth century, when England had acquired a reputation throughout Europe for the quality of its cutlery, Birmingham was regarded as the centre of the industry; but during the nineteenth century Sheffield regained its old preëminence.

The manufacture of table cutlery in the United States began in 1832, when a factory was built at Saccarappa, Maine. With the improvement of the quality and lowering of the price of American steel, the industry has steadily developed. The annual product now amounts in value to between \$3,000,000 and \$4,000,000, of which less than 5 per cent. is exported. America excels in the production of 'medium' goods—that is, goods of tasteful design and good quality at a moderate price; but in the manufacture of other branches of cutlery it has not been so successful. Although it is claimed that an equally good quality is produced at home, still the United States imports from England large quantities of the finest grades. In the very cheap grades, such as vegetable and other kitchen knives which retail in this country for a few cents apiece, America cannot compete with Germany. The first pocket knives were made in a Connecticut factory in 1842, and many English workmen, attracted by high prices and steady employment, came over from Sheffield to work in the Connecticut shops. Some of these afterwards migrated to Walden, N. Y., where they built a coöperative factory, and since that time over fifty factories, many of them coöperative, have been established, a number of which have failed, while others have sold out, or have been reorganized as corporations. The piece system of paying the operative still prevails to a large extent in cutlery shops. All the early cutlery was hand-forged, and this practice is still general in England and in the United States for the manufacture of some of the best pocket and pen knives. In the latter country to-day, however, large quantities of pocket and pen knives and apparently all table knives and most carving and

butcher knives are machine-forged. Machinery is used for driving the various grinding-stones, emery and buffing wheels for finishing blades and handles. In some instances, also, the blades are placed in holders and manipulated by automatic machinery for the rough grinding. The evil effects from the grinding dust are now obviated, as far as possible, by wet grinding and by exhaust fans and ducts for removing the dust. The hand and machine processes for making different kinds and grades of cutlery vary greatly in detail. But a fair general idea of the industry may be gained by first describing the actual operations of an American pocket and pen knife factory where hand-forged goods are made, and then indicating in a more general way some points of difference in the manufacture of other kinds of cutlery.

POCKET AND PEN KNIVES. Each knife, roughly speaking, consists of two parts, the blade and the handle, but each of these, from the manufacturer's standpoint, is composed of a number of parts. The blade consists of the blade proper or cutting edge and its supporting back, and of the tang, or the portion which joins the blade to the handle. The handle, in turn, includes (1) the horn, ivory, or other material which is grasped by the hand, and which portion alone is technically called the handle; (2) the scale, which is the brass or iron lining of the handle; and (3) the spring, which, besides its primary purpose of controlling the blade in opening and shutting, also closes the back of the lining.

The edge-tool steel from which pocket and pen knife blades are made is called rod steel; it is flat, of proper widths for the different sizes of blades, and of thickness one gauge greater than the finished blade. In the best goods the blades are forged and shaped by hand. In the case of cheap knives, the blades are pressed into rough shape by mauls, then further shaped or forged by trip-hammers in much the same manner as that explained below in describing table-knives. Comparatively little machinery is used on the blades in either case, except that the grindstones and finishing wheels are driven by mechanical power. The processes here described relate to high-grade goods.

Mooring is the name given to the rough shaping of the blade at the first heat, and the formation of the tang is called *tangling*. After these two processes are completed the metal is heated for the third time, the blade again worked by hammer, and the nail-mark cut, which finishes the third or *smithing* process. All the forging is done by means of special hammers on special anvils, both imported from England. *Choothing* is filing the little nick just between the cutting edge and the tang. This removes a weak spot in the metal and serves as a guide in filing the blade flatwise. The blade is now shaped in the rough, but before it leaves the forge it must be hardened and tempered. *Hardening* is effected by bringing it to a red heat and dipping it in water up to the choil. The tang is left soft, so it may be readily filed, drilled, stamped with maker's name, and fitted in the handle. *Tempering* (q.v.) is often accomplished by bringing the blades to a purple heat on a thin copper plate, resting on the fire of the forge. The blades are set on their backs, thus keeping their edges furthest from the heat. The final work of the forger or smith is to straighten crooked blades,

if any, by means of light hammer-blows on the concave side of the blade.

Grinding is next in order. The grinder places the tang in a holder, which he grasps with one hand, while with the other hand, protected by a leather patch, he presses the blade against the rapidly revolving power-driven stone. *Racing-irons*, consisting of small rods of Norway iron, are occasionally held against the face of the stone to restore the rough surface and preserve its cylindrical shape. *Material* is the name given to all the separate parts except the blade. The *material-maker* presses out, or cuts out with dies, the steel springs and the brass or iron linings, and fastens the tips or bolsters to the outside of the lining, in case the material forming the handle proper does not cover the tip ends of the lining. *Cutler's work*, curiously enough, includes assembling, or putting together, the various parts of the knife, including drilling, filing, fitting, polishing, and buffing the handles. The material for handles embraces ivory, pearl, silver and gold, tortoise-shell, buffalo and stag horn, celluloid, rubber, California redwood, cocoa wood, and ebony. *Polishing* the handles is accomplished by power-driven built-up wood wheels, covered first with leather, then with a mixture of glue and emery. *Buffing* is effected on wheels in which the leather, emery, and glue give place to cotton cloth, fastened on edge around a wheel or spindle. *Blade-finishing* is done on emery wheels, much like the polishing-wheels already described, except that the glue and emery are placed on very hard leather, instead of on wood. *Glazing*, on these wheels, removes the dirt and gives a glazed finish. *Crocus finish* is a superior glaze, or polish, requiring special wheels.

Sharpening is done by hand, on flat stones. The edges of the blades are held at an angle of 45° with the stone, a point that might well be borne in mind by all who attempt to sharpen old knives. The common practice of holding the knives flat on the stone gives a thin, easily broken edge. Finally, the handles are again buffed and the whole knife wiped, packed, and boxed. The ordinary knife of fair quality has now gone through about 100 operations, while the finest goods receive 200 to 300. It may be added that the processes involved in machine-forged pocket and pen knives resemble those described for table-knives in the next paragraph.

TABLE CUTLERY, including ordinary and carving knives, and also forks, is chiefly made by machinery in America, and largely or wholly by hand in England. Knife-blades and tangs are roughly shaped by rolling or by trip or drop hammers, and are brought to a uniform shape and size by means of dies. The blades are hardened in oil, which is sometimes burned or blazed off. They are sometimes heated in a sand-bath to secure the desired color and temper. The holes in the tang are punched and the blades are ground on large power-driven stones, five to seven feet in diameter. Where machinery is used at every possible point the blades are rough-ground by placing six or more in a brass frame, which is so manipulated as to give them both a side to side and vertical motion on the stone. The finish, however, is done by hand, on wheels similar in general character to those explained in describing pocket knives. The highest grades of steel table-knives receive more hand work, but

the cheaper ones have even less, and the handle, and in some cases the whole knife, are cast instead of wrought. The same is likewise true of forks. Wooden handles are generally in two pieces, united to the tang, but ivory, bone, horn, and various other materials are in one piece, with the tang inserted. The curved tines of forks are shaped by means of presses, or dies, and the tines are rough-cut in the same general manner. In some instances more or less forging, either by hand or machine, is employed. Silver-plated (see ELECTRO-PLATING) table knives and forks are plated on steel, or on some softer malleable metal.

SCISSORS and SHEARS differ principally as to length, the dividing line in the trade being six inches, and the shorter instruments being classed as scissors. Some of the cheapest scissors are cast, but the best ones are hand-forged. English shears are of steel, but some of the best American shears, which are now largely exported, have their inner sides only of steel, 'laid on' to shear blades of malleable iron, often cast in outside foundries.

RAZORS, at least those of good quality, are practically all hand-forged from razor-steel, in much the same general way as pocket knives, but with greater care. *Safety razors* of various types are provided with guards designed to make cutting the flesh impossible. The earliest safety razor is said to have been made by Michael Hunter, of Sheffield, England, about 1875. It was merely an ordinary razor with a guard. The later safety razors have detachable blades and adjustable guards. The cutting edge is generally shorter than in the ordinary razor, in some cases not much over an inch in length. Consult Landrin, *Die Kunst des Messerschmiedes* . . . (Weimar, 1836); Page, *La coutellerie depuis l'origine jusqu'à nos jours* (4 vols., Châtellerault, 1896-98).

CUTLIPS. A curious sucker (*Lagochila lacera*) of the streams of the central Mississippi Valley, distinguished at sight by its mouth, where the reduced lower lip is divided into two distinct, elongated lobes; the lower lip, further, is "entirely separated from the upper at the angles by a deep fissure," cloaked by the skin of the cheek. It is olive or brown above, silvery on the sides and belly, and the lower fins are faintly orange. Many names have been given this singular fish, such as hare-lip, or split-mouth, or rabbit-mouth, sucker, and May sucker.

CUTPURSE, MOLL. The sobriquet of Mary Frith, a notorious character born in London about 1584, a thief and prostitute and famous in almost every form of crime. She dressed in male attire and is said to furnish the first recorded instance of the use of tobacco by a woman.

CUTTACK, küt-tük', or KATAK (Skt. *Kataka*). The capital of the district of the same name in Bengal, British India, situated on the southern bank of the Mahanadi, at the apex of its delta, 220 miles southwest of Calcutta (Map: India, E 4). It contains the ruins of an old fort, and it is famous for its fine filigree work in gold and silver. Population, in 1891, 47,186; in 1901, 51,364.

CUTTER. The name given to a portion of the equipment of boats on board of a man-of-war. They are double-banked and are fitted either for

rowing or sailing. In sailing ships, a nest of cutters of varying sizes used to be stowed amidships, one within the other, the launch being the bottom boat of all. At present, the boats are either swung at the davits or in cradles resting on frames amidships, clear of the blast of the guns. A large ship may carry as many as four pulling cutters, in addition to one or more steam launches, and various other boats. (See BOAT.) The name cutter is also applied to a small vessel with a single mast, a mainsail, a forestaysail, and a jib set to the bowsprit end. Cutter yachts are sloop-rigged vessels, and the name is now generally applied to sloops of considerable draught and comparatively small beam.

A *revenue cutter* is a light, armed Government vessel, commissioned for the prevention of smuggling and the enforcement of the customs regulations. (See REVENUE CUTTER SERVICE, UNITED STATES.) A small, light sleigh with a single seat for one or two persons, usually drawn by one horse, is also called a cutter.

CUTTER, GEORGE WASHINGTON (1801-65). An American poet. He was born in Massachusetts, and, after studying law, settled in Kentucky. He fought with distinction in the Mexican War, and later entered the political arena, where he soon became known as a brilliant public speaker. His most celebrated poems are "The Song of Steam," "The Song of the Lightning," and "E Pluribus Unum." His works were published under the respective titles: *Bucna Vista and Other Poems* (1848); *Song of Steam and Other Poems* (1857); and *Poems, National and Patriotic* (1857).

CUTTHROAT TROUT. The Rocky Mountain or black-spotted trout (*Salmo mykiss*). See TROUT.

CUTTING. A detached portion of a plant inserted in soil or water for the purpose of propagation. This process, one of the oldest forms of artificial reproduction, is also one of the most important. Plants in general lend themselves readily to the process, thus enabling the propagator to secure hundreds of offspring from a single individual. Cuttings are superior to seeds, because, with the exception of bud variations, plants so propagated come true to kind, i.e. varieties of cultivated plants which do not come true to sort by seeds can be perpetuated by cuttings. In its sphere, propagation by cuttings is as important to commercial horticulture as the art of budding or grafting. While a great majority of the cultivated plants are capable of being increased by one form of cutting or another, it is not economical so to increase them, and other means are resorted to. Cuttings are made from such a variety of parts of plants—sometimes even from root, stem and leaf of the same plant—that a corresponding number of styles of cuttings have been developed. In general, cuttings are made from hard wood or soft wood or herbaceous plants, and are classified accordingly: under each general head there are a number of subdivisions, depending upon the plant employed or the manner of making the cutting, as:

Hard-wood cuttings	{	(1) Simple stem,
		(2) Single eye,
		(3) Hoel,
		(4) Mallet, etc.
Soft-wood (herbaceous) cuttings	{	(1) Stem-cuttings—slips,
		(2) Leaf-cuttings,
		(3) Root, rootstalk or rhizome,
		(4) Tubers, etc.

Some conception of the importance of this means of increasing plants can be gathered from the fact that, except for the production of new varieties, all commercial varieties of grapes, currants, and gooseberries are increased in this way, while among flowering and ornamental bedding plants, millions are annually produced by one or another of these methods in the United States alone. Sugar-cane and pineapples are extensively perpetuated by this process.

The parts used in making cuttings are numerous, but the methods resorted to are as varied as interesting. Some plants root readily from cuttings placed in the open ground; others require special treatment before they will 'strike' root, while still others require most careful nursing in the greenhouse and even under a bell-jar to induce them to take root. Special devices, carrying a variety of soils, and capable of maintaining a given degree of heat and moisture, have been constructed, in order to facilitate the work of propagating plants by this means. Consult: Bailey, *The Nursery Book* (New York, 1896); article on "Cuttings," in *Cyclopedia of American Horticulture* (New York, 1900).

CUTTLE, Captain. A rough-looking, good-hearted, retired merchant-captain in Dicken's novel *Dombey and Son*. He had a hook in place of a right hand, with which he did everything, from frying sausages to wiping his forehead when excited. He was an intimate friend of Sol Gills and his nephew Walter, and took care of Florence Dombey when she was driven to leave her father's house. His favorite expression, "When found, make a note of," was adopted as the motto of *Notes and Queries*.

CUTTLEFISH (*cuttle*, AS. *cudde*; connected by popular etymology with *cuttle*, knife (on account of the knife-like cuttle-bone) + *fish*). A

least, to octopods. (See OCTOPODS.) The European cuttlefish (*Sepia*) furnishes cuttlefish-bone and sepia, which are of commercial importance. The former is the calcareous 'pen' or brace which lies along the 'back' of the creature beneath the skin; and the sepia is the substance in its 'ink-bag,' by throwing out which it beclouds the water and eludes pursuit.

FORMS OF 'PENS' OF CUTTLEFISH.

1. Common North Atlantic Squid (*Loligo Pealei*). 2. *Histioteuthis Collinsi*. 3. *Sthenoteuthis ptaropus*; anterior end of pen, whose posterior end is spatulate. 4. *Chiroteuthis lacertosa*; ventral view. 5. *Moroteuthis robusta*; side-view. 6. The same; ventral view. 7. *Desmotenuthis hyperborea*. 8. *Lestoteuthis Fabricii*. 9. *Ommastrephes illecebrosus*.

Fossil cuttlefish-bones of *Sepia*, scarcely different from the modern species, are found in various Tertiary deposits. In the Triassic, Jurassic, and Cretaceous rocks are other forms of sepoid shells that are not calcified, but are thin, elongated, and horny, often containing fossilized ink-bags and hardened ink, which may still be prepared and used for drawing. *Sepia* and its allies are supposed to have evolved from Belemnite-like forms through such intermediate stages as the genus *Belosepia* of the Tertiary. See CEPHALOPODA; SQUID; and Colored Plate of OCTOPODA AND DECAPODA in article DECAPODS.

CUTTS, EDWARD LEWES. An English clergyman. He graduated at Queen's College, Cambridge, was ordained in 1848 to the ministry of the Established Church, and between 1848 and 1859 was curate successively of Ide Hill (Kent), Coggeshall (Essex), and Kelvedon (Essex). From 1859 to 1865 he was curate of Billericay (Essex), and in 1871 was appointed vicar of the Church of the Holy Trinity, Haverstock-hill, London, S.W. In 1865-71 he was secretary of the Additional Curates Society.

CUTTYHUNK. The most southerly island in Buzzard's Bay, Mass., on which the first settlement of white men in any part of New England was made. Sailing from Falmouth, England, March 25, 1602, Bartholomew Gosnold, in the ship *Concord*, with "32 persons, whereof 8 were mariners and sailors, 12 proposing upon the discovery to return with the ship for

FOSSIL CUTTLEFISH (BELEMNITES).

1. A belemnite (*Pachyteuthis acutus*) from the Lower Lias, England. 2. A belemnite (*Belemnoteuthis antiqua*) from the Oxford Clay, England, partly restored: *b*, arms; *oc*, eyes; *m*, mouth; *d*, ink-bag; *Ph*, phragmacone; *R*, guard. 3. Restoration of a belemnite's shell: *Po*, proboscitracum; *Ph*, phragmacone; *R*, guard. See BELEMNITE.

popular name of certain cephalopods, originally applied to a calamary (*Sepia officinalis*), but now generally restricted, in the United States at

England, the rest to remain there for population," made land off the coast of Maine on May 14. Coasting southwesterly he discovered and named Cape Cod, and, coming "amongst many fair islands, all lying within a league or two, one of another, and the outermost not above 5 or 7 leagues from the main," landed on Cuttyhunk on the 25th of May. This they called Elizabeth's Isle, after the Queen, and here they built a fort. On account of disagreements, the settlement was abandoned on June 18, and the colonists returned to England. Cuttyhunk, whose name is contracted from the Indian *Toocutohhunkounoh*, which may mean 'place of departure,' later became the home of many pilots, when New Bedford had 400 whaling ships. The winter population is 50, and in summer, in the club-houses and hotels, several hundred. The United States Life-Saving Station was established in 1889, and the house of the Massachusetts Humane Society in 1847. Consult *New England Magazine* (Boston, 1897).

CUTTY STOOL (Scotch *cuttie*, short, hussy, dim. of *cut* + *stool*). A seat once used in the Scottish Church for the exposure of offenders against chastity. The sinner was required to sit on the stool before the whole congregation during the entire service, and, at its close, to stand up while severely reprimanded by the minister.

CUTWORM. The terrestrial caterpillar of certain noctuid moths, mainly of the genus *Agrotis*, which winter and pupate in the ground and are ready to attack early vegetation. Cutworms are night mowers, and eat the plants off at the level of the ground, destroying far more than they can eat. They attack wheat, Indian corn, oats, and all the cereals, as well as garden vegetables. By day they hide under the surface of the soil, where each patch of withering vegetation marks their hiding-places. In vegetable beds these spots should be dug over, and the up-turned worms killed; holes made with a hoe or rake handle furnish favorite hiding-places by day, and thus serve as traps to catch many a worm. Some kinds of cutworms ascend trees by night and eat off tender leaves and buds, descending and hiding in the early morning. A widely distributed example is *Agrotis saucia*, a pest of orchards in both Europe and America.

CUVIER, *ku'vyá'*, FRÉDÉRIC (1773-1838). A French naturalist, born at Montbéliard. He was professor of zoölogy in the Jardin des Plantes, Paris, and keeper of the collection in comparative anatomy at that institution. His published works include: *Sur les dents des mammifères comme caractères zoölogiques* (1825); and *Histoire naturelle des mammifères* (jointly with Geoffroy de Saint-Hilaire, 1819-29). He was a brother of the celebrated Baron Georges Léopold de Cuvier.

CUVIER, GEORGES LÉOPOLD CHRÉTIEN FRÉDÉRIC DAGOBERT, BARON DE (1769-1832). A French naturalist, founder of the science of comparative anatomy, born at Montbéliard, then in the Duchy of Württemberg, to which place his father, formerly an officer in a Swiss mercenary regiment, had retired on a pension. He was educated at home in the strictest tenets of the French Protestant or Calvinistic faith, and at the age of fourteen entered the academy at Stuttgart, where he remained four years. His father intended him for the ministry, but he showed such a love for natural history that he was allowed to spend his time

in pursuing such studies in that branch of science as the academy afforded, and supplemented them with reading almost every scientific book in the library. In 1788, he became tutor in the family of the Comte d'Héricy, a Protestant nobleman living near Caen, on the coast of Normandy. Here, during the stormy years of the Reign of Terror, he remained, quietly utilizing the rather unusual facilities the neighborhood offered for the study of marine animal life and fossil remains, thus laying the foundations of his future eminence. A chance acquaintance with the Abbé Tessier, a writer on agricultural subjects, who was struck with young Cuvier's remarkable knowledge of zoölogy, secured for him an introduction to Geoffroy Saint-Hilaire, who at once recognized in Cuvier a man of genius, and urged him to move to Paris. Here, in 1795, he became, through the influence of Lacépède, Lamarck, and others, assistant to Mertrud, the professor of comparative anatomy at the Musée d'Histoire Naturelle. He immediately took a high position among the scientists in Paris, and was chosen one of the original members of the Institute upon its organization in 1795. In 1796 he was chosen professor of natural history at the central school of the Panthéon, and in 1800 he succeeded Daubenton in a similar position at the Collège de France. In 1802 he succeeded Mertrud at the Jardin des Plantes. In 1798 appeared his first separate work, *Tableau élémentaire de l'histoire naturelle des animaux*, in which he introduced tentatively his classification of animals upon which so much of his fame rests. Between 1800 and 1805 were published the five volumes of his *Leçons d'anatomie*, which brought together the hitherto disconnected knowledge of comparative anatomy, and gave him the right to be considered the founder of that branch of science. In 1800 he published his first work on paleontology, *Mémoires sur les espèces d'éléphants vivants et fossiles*. At the opening of the nineteenth century, therefore, Cuvier may be said to have already attracted the attention of the scientific world to the three branches with which his name will always be connected.

Cuvier began his career as an administrator in 1802, when he was appointed an inspector of education under the Consulate, and helped establish *lycées* at Marseilles, Bordeaux, and Nice. From 1808 to 1813, as a member of the council of the Imperial University under Napoleon, he spent considerable time in Italy, Holland, and Germany, organizing the academies in the districts recently annexed to the Empire. In 1814 Napoleon made him a Councilor of State, a position which he continued to hold under Louis XVIII. In 1819 he became president of the Committee of the Interior, and chancellor of the University of Paris. He was made a member of the Academy in 1818, and a grand officer of the Legion of Honor in 1826. In 1822 he was appointed grand master of the faculties of Protestant theology, in which position he had supervision of all the civil, political, and religious affairs of Protestant institutions and organizations. In 1831 Louis Philippe made him a peer of France, and in 1832, shortly before his death, was considering him for the office of Minister of the Interior.

With all his administrative duties, Cuvier still found time and opportunity to pursue his scientific investigations. His life work falls natu-

rally into three divisions; paleontology, systematic zoölogy, and comparative anatomy. In each of these departments, he achieved remarkable success, and left a lasting impression, in spite of mistakes due largely to personal peculiarities derived from his Calvinistic training, such as his refusal to accept the theory of descent. His investigations in paleontology marked a great advance over the existing knowledge of the subject. By means of his knowledge of comparative anatomy, and his theory of the correlation of growth, Cuvier 'reconstructed' a large number of extinct animals, proving that every geological epoch is represented by distinct animal forms, having a similarity well defined to animals in preceding or succeeding epochs. Nevertheless, he held to the Linnean doctrine of the constancy of species, and looked upon the similarity of animal forms in successive epochs as a recurrence of types rather than a steady development of the same type. In comparative anatomy his work in special fields was as remarkable as it was valuable. His investigations of the comparative anatomy of fishes, and of the osteology of mammals, may be mentioned as two of his most valuable contributions to zoölogy. In systematic zoölogy his work was of great originality and importance, for to him is due the reclassification of the animal kingdom on a natural basis, in place of the artificial and arbitrary classification of Linnæus. Cuvier's system was based on the constancy and morphological resemblance of types, rather than on outward similarities of structure, as in the Linnean system. It remained the standard arrangement of animals until set aside by modern investigators, who studied the relationship of animals in the light of their ontogeny and phylogeny. Cuvier's great work, *Le règne animal* (1816), became at once the standard reference book in natural history; several editions were issued, and the work was translated into English and other languages, and profoundly influenced zoölogical studies everywhere.

Among his published works not noted above may be mentioned: *Les reptiles douteux* (1807); *Recherches sur les ossements fossiles des quadrupèdes* (1812); *Mémoire pour servir à l'histoire et à l'anatomie des mollusques* (1816); *Description géologique des environs de Paris* (1822); *Histoire naturelle des poissons* (1828); *Discours sur les révolutions de la surface du globe et sur les changements qu'elles ont produits dans le règne animal* (1851). Consult: Lee, *Memoirs of Baron Cuvier* (New York, 1833; French translation, Paris, 1833); Flourens, *Histoire des travaux de Georges Cuvier* (Paris, 1845); Duerotay de Blainville, *Cuvier et Geoffroy Saint-Hilaire* (Paris, 1890).

CUVILLIER-FLEURY, ku've'yá'flé're'. ALFRED AUGUSTE (1802-87). A French author, born in Paris. His love of letters brought him to the attention of the Duc d'Orléans and he was made by him tutor to his son, the Duc d'Aumale (1827). These duties ended, he became a political writer on the *Journal des Débats*. In 1866 he was made a member of the Academy. Among his works are: *Voyages et voyageurs* (1837-54); *Etudes historiques et littéraires* (1854); *Nouvelles études historiques et littéraires* (1855); *Dernières études historiques et littéraires* (1859); *Historiens, poètes et romanciers* (1863); *Etudes et portraits* (1865-68); *Post-*

humes et revenants (1878). The Duc d'Aumale wrote an interesting biography of his tutor, published in *Le Livre du Centenaire des Débats*.

CUXHA'VEN, Ger. pron. koo'ks'hü-fen. A German seaport and watering-place on the North Sea, at the mouth of the Elbe, about 57 miles west-northwest of Hamburg, to which it belongs (Map: Germany, C 2). Great harbor works have been erected here in recent years. Cuxhaven is the station of the Hamburg pilots. The coast defenses consist of a series of strong detached forts. There is a handsome old castle dating from the fourteenth century. Population, in 1900, 6906. See HAMBURG.

CUYABÁ, kw'yá-bá'. An episcopal city of Brazil, the capital of the State of Matto Grosso, situated on the Cuyabá River (Map: Brazil, F 7). It has broad, well-paved streets and contains barracks, an arsenal, and a military hospital. The town was formerly famous for gold and diamond mines, and is now an important commercial centre. Cuyabá was founded in 1820 by miners, and since 1840 has been the capital of the State. Population, in 1890, 17,815.

CUYLER, kí'ter, THEODORE LEDYARD (1822—). An American Presbyterian clergyman. He was born at Aurora, N. Y., January 10, 1822; graduated at Princeton in 1841 and at Princeton Theological Seminary in 1846. After holding a charge in New Jersey, he became pastor of the Market Street Reformed Dutch Church, New York, in 1853, and pastor of the Lafayette Avenue Presbyterian Church, Brooklyn, from 1860 to 1890. In the latter year he resigned the active charge and was presented with a purse of \$30,000. He then entered upon a ministry at large and preached frequently and in many places. His eightieth birthday was publicly celebrated in Brooklyn. He has written many religious works, and a large number of articles in religious newspapers.

CUYP, koip, ALBERT (1620-91). A Dutch painter, born at Dort, in October, 1620. His father, Jakob Gerrits Cuyp, a portrait painter of mediocre ability, was his first master. The son painted animals, still life, and even portraits, but his best work was his landscapes. These were at first executed in the manner of Van Goyen, but later on he was much influenced by Rembrandt. He was a close student of nature, and his paintings are characterized by rich color and a skillful handling of life. Most of his works are preserved in England, especially in the Royal collection. Among the best of them are "Evening," in the National Gallery, London; "Banks of a Lake," in Grosvenor House; and two famous views of the "Meuse Near Dort," one in Bridgewater Gallery and the other at Dorchester House. Consult Buxton, *German, Flemish, and Dutch Painters* (London, 1881).

CUYPERS, koip'ers, PETER (1827—). A Dutch architect, born at Roermond. He studied at the Academy of Antwerp, and became a prominent Dutch representative of the Gothic style. The Royal Museum at Amsterdam is by him. He also restored several churches of the Middle Ages, among them the Mainz Cathedral, and built a number of important church edifices, including those of Saint Jacob at the Hague, Saint Barbara at Breda, Saint Catharine at Eindhoven, the Sacred Heart at Amsterdam, and Saint Boniface at Leeuwarden.

CUZA, koo'zá. See ALEXANDER JOHN I.

CUZCO, kōos'kō, *Castilian Sp. pron. kōōth'kō* (Quichua, navel, as being the centre of the ancient Inca Empire). An episcopal city, the capital of the department of the same name, Peru, situated on the eastern end of that section of the Andes known as the Knot of Cuzco, 11,000 feet above sea-level, and 528 miles southeast of Lima (Map: Peru, C 6). It is regularly built in part, and contains several handsome buildings, prominent among which is the Cathedral of Santo Domingo, in the Corinthian style. There are also hospitals, a university founded in 1692, a national college, and a museum. The city is the centre of a fertile agricultural district, and has considerable trade and manufactures of cotton and woolen goods, refined sugar, leather, and embroidery. Population, about 30,000. Cuzco, the capital of the Incas, is said to have been founded in the eleventh century. It retains evidences of its former splendor, although the ancient city was destroyed by Pizarro in 1535. These remains include the palace of the Incas, a fortress built of massive and irregular stone blocks, the temple of the Sun, and the temple of the virgins of the Sun.

CUZCO. One of the largest departments of Peru, bounded by Loreto on the north, Bolivia on the east, Puno and Arequipa on the south, and Apurimac, Ayacucho, and Junin on the west (Map: Peru, C 6). Area estimated at over 156,000 square miles. The southern and western parts are mountainous, and the eastern and northern are low and covered with thick forests. The department is to a large extent unexplored, and only a small portion in the south is inhabited. It is watered by the Urabamba and the headstreams of many tributaries of the Amazon. The population is chiefly engaged in agriculture and cattle-raising. Population, officially estimated in 1896 at 438,646. Capital, Cuzco (q.v.).

CYAM'ELIDE. See CYANIC ACID; WÖHLER.

CYANE, sī'á-nē (Lat., from Gk. Κρανῆ, *Kranē*). In Greek legend, the wife of Æolus, the god of the winds. Also a nymph, playmate of Persephone. She was transformed into the spring Cyane near Syracuse at the time when Hades carried off Persephone from this neighborhood.

CYANIC ACID (from Gk. κύανος, *kyanos*, dark-blue). An unstable compound of carbon, hydrogen, oxygen, and nitrogen, obtained by heating cyanuric acid (q.v.) in a current of carbon dioxide. Under ordinary conditions it is a volatile liquid having a strong pungent odor, but is readily transformed into a white, porcelain-like mass of the same percentage composition as cyanic acid, though probably of much higher molecular weight. This *polymeric* modification of cyanic acid is known as *cyanetide*. (See WÖHLER.) Among the salts of cyanic acid may be mentioned the cyanate of potassium and the cyanate of ammonium. Potassium cyanate may be readily obtained by cautiously heating a mixture of potassium ferrocyanide and potassium bichromate; when pure it forms a white crystalline powder readily soluble in water, in which, however, it gradually undergoes decomposition. Ammonium cyanate may be obtained from the cyanate of potassium by double decomposition. The transformation of ammonium cyanate into

urea, observed by Wöhler in 1828, constituted the first synthesis of an organic compound and formed an event of the greatest importance in the history of chemistry.

The careful study to which many derivatives of cyanic acid have been subjected has led to the view that cyanic acid may possess two different constitutional formulas, viz. $N \equiv C - O - H$ and $O = C = N - H$. All efforts to produce two different compounds corresponding to those formulas having failed, chemists have proposed to explain this comparatively rare phenomenon on the following hypotheses: (1) Cyanic acid, like most other organic compounds, has a definite structure—say $N \equiv C - O - H$; but while, during some of its transformations, that structure remains unaltered, other transformations involve an intra-molecular change resulting in the formation of derivatives of the compound $O = C = N - H$ ('iso-cyanic acid'), which is, for some unknown reason, less stable than the compound $N \equiv C - O - H$ and incapable of existing in the free state. (2) According to another hypothesis, every single molecule of the acid is constantly changing its structure, its hydrogen atom rapidly oscillating between the nitrogen and the oxygen; so that while at a given instant the structure of the molecule might be represented by the formula $N \equiv C - O - H$, we would find its structure to be $O = C = N - H$ if we could stop the motion of the hydrogen atom at the very next instant. The substance is thus imagined to be composed, at any instant, of two different kinds of molecules; and as under certain conditions each kind may be capable of transformations which the other kind could not undergo, two series of derivatives should be expected, according to the nature of the transformations necessary to produce those derivatives and to the conditions under which the transformations take place.

CY'ANIDES. See HYDROCYANIC ACID.

CY'ANITE (from Gk. κύανος, *kyanos*, dark-blue), KYANITE, DISTHENE, or SÁPARE. An aluminum silicate that crystallizes in the triclinic system. Although sometimes gray or green, it usually has a blue color and a vitreous to pearly lustre. The handsomest specimens are found in the Saint Gothard region in Switzerland; in the United States, Chesterfield, Mass., and Bakersfield, N. C., are well-known localities. Fine specimens have been cut as gems, but as a rule the material is too soft for wear.

CYANOGEN (Gk. κύανος, *kyanos*, dark-blue + γένος, *genōs*, producing, from γίγνεσθαι, *gignesthai*, Lat. *gignere*, Skt. *jan*, to be born). An important compound of carbon and nitrogen obtained by heating dry cyanide of mercury in hard glass tubes. It is a poisonous gas, having a peculiar odor and dissolving quite readily in water and in alcohol. If ignited in air it burns with a purple flame, its carbon combining with the oxygen of the air to form carbon dioxide, while its nitrogen is set free. When dry, cyanogen is an exceedingly stable substance and may be heated as high as 800° C. without being decomposed; in aqueous solution, however, it gradually undergoes a series of chemical changes resulting in the formation of ammonia, hydrocyanic acid, urea, oxalic acid, and other compounds. The molecular formula of cyanogen is C_2N_2 , its molecule being composed of two 'cyan-

ogen groups' (CN, or, as it is often written, Cy), which enter into the composition of a large number of other substances known. Some of these interesting substances having a blue color, the name cyanogen has been applied to the gas from which they are derived; but that gas itself is perfectly colorless. During the preparation of cyanogen from the cyanide of mercury, an amorphous brown substance forms, which has the same percentage composition as cyanogen, but probably a much higher molecular weight; this compound is called *paracyanogen* and is denoted by the symbol (CN)_x. Paracyanogen may be readily transformed into cyanogen gas by heating.

The derivatives of cyanogen form a large group of compounds, including hydrocyanic acid and its salts, the ferro-cyanides and ferri-cyanides, cyanic and cyanuric acids and their derivatives, etc. The most important of these compounds are described in special articles.

CYANOIDEA (Neo-Lat. nom. pl., from Gk. *κύανος*, *kyanos*, dark-blue + *είδος*, *eidos*, form). A suborder of the Carnivora (q.v.), composed of the family Canidae (dogs, wolves, jackals, etc.), regarded as forming the most central group of the Carnivora, from which the bears, weasels, and raccoons (Aretaidea) depart on the one hand, and the cats, civets, and hyenas (Ailuroida) depart on the other. Consult Huxley, *Anatomy of Vertebrated Animals* (New York, 1878), and the books mentioned under MAMMALLA, Dog, Fox, etc.

CYANOMETER (Gk. *κύανος*, *kyanos*, dark-blue + *μέτρον*, *metron*, measure). An instrument for determining the color of the sky, invented by Saussure—a disk divided into sections, the several sections being tinted and gradually increasing in intensity from white to deep blue. When used to compare with the color of the sky, some of its sections will appear deeper and some lighter in tint. The section where there is no perceptible difference gives the measure or degree of the blueness of the sky.

CYANOPHYCEÆ (Neo-Lat. nom. pl., from Gk. *κύανος*, *kyanos*, dark-blue + *φύκος*, *phykos*, seaweed). The lowest of the four great groups of alga. They are called blue-green alga from the prevailing color of the cell contents, which are tinted by a diffused blue pigment named phycocyan. The cell-structure is very simple, agreeing in this respect with the Bacteria (q.v.). For details of cell-structure and classification, see ALGÆ.

Many of the Cyanophyceæ are one-celled, or consist of indefinite aggregations of cells situated in a common gelatinous matrix. Other forms are filamentous, and some are elaborately branched. A well-known unbranched form is *Oscillatoria*, interesting because of the movements of the tip of the filament, which swings in a circle. *Nostoc* forms large gelatinous balls filled with convoluted chains of cells. Certain cells in some filamentous forms lose their protoplasmic contents, becoming the so-called heterocysts, whose functions are not well understood; but they are responsible in many cases for the branching of the filaments, because the heterocysts become firmly fastened to the sheaths that inclose the vegetative cells. The growth of the latter causes such pressure between the fixed points, determined by the heterocysts, that the

sheath is ruptured and the filament grows out at one side. Such branching is termed 'false branching.' Branches or portions of filaments that break off and start new plants are called homogonia.

The Cyanophyceæ are especially fond of warm shallow water, although many grow in damp situations on land, such as spray-wet rocks, damp timber, and earth. They live among the reeking vegetation of salt marshes, and flourish in open sewers and drains. The fouling of shallow reservoirs in warm weather, when they give off the well-known 'pig-pen odor,' is generally due to growth of Cyanophyceæ. The only remedy is to deepen the water.

One of the most remarkable displays of Cyanophyceæ is in warm springs, well illustrated in Yellowstone National Park, where the growths are brilliantly colored. Here certain species grow luxuriantly in water at a temperature of 75° C. and above, conditions which no other forms of alga can endure.

Another conspicuous display of blue-green alga is the water-bloom or scum that frequently covers the surface of ponds and small lakes. Most of the water-blooms are due to

CYANOPHYCEÆ.

1, *a* and *b*, *Oscillatoria*; 2, *Chroococcus* (*a*), and its division (*b*); 3, *Stigonema*, showing false branching and heterocysts.

Cyanophyceæ, and the largest of all has given name to the Red Sea, whose tint is due to the presence of a flocculent sediment made up of bundles of short filaments of *Trichodesmium*. This peculiar condition of the ocean is not confined to the Red Sea, but has been reported off the coast of Brazil and South Carolina, and in the Indian and Pacific oceans.

The best monograph on the Cyanophyceæ is Bornet and Flahault, *Nostocacées Heterocystées* (Paris, 1886-88).

CYANO'PHYLL (Gk. *κύανος*, *kyanos*, dark-blue + *φύλλον*, *phyllon*, leaf). A collective name for the blue coloring substance of leaves and flowers. See COLOR.

CYANO'SIS (from Gk. *κύανος*, *kyanos*, dark-blue). Lividity of the skin, caused by interruption of the circulation or of the respiration. It may be temporary, as in a convulsion, when the face or lips are blue, or in croup (q.v.), where

the Medes some twenty-eight years. Media at last threw off the Scythian yoke, and Cyaxares once more successfully engaged the Assyrians and conquered Nineveh and the surrounding provinces with the exception of Babylon. The reign of Cyaxares lasted forty years, including the Scythian domination, and his name is often mentioned in the Old Persian inscriptions as the one to whom the rebel princes of Media, who revolted against Darius, traced back their lineage in claiming the throne. See MEDIA.

CYAXARES II. According to Xenophon (Cyp. i. 5.2), a grandson of Cyaxares I. (q.v.) and son of Astyages, and maternal uncle of Cyrus the Great. On the authority of Herodotus, however, it is generally believed that Astyages had no son, and it has been suggested that Cyaxares II. may have been the brother of Astyages and son of Cyaxares I. His identity with Ahasuerus of the Bible has likewise, but with uncertainty, been suggested. In this way it has been thought that Cyaxares II. may perhaps be the same as Darius the Mede in the Book of Daniel, or even be identical with Gobryas. But the whole matter is complicated and uncertain. See DARIUS THE MEDE.

CYBELE, sîh'ê-lê (Gk. Κυβέλη, *Kybelê*, *Pêa*, *Rhea*), or RHEA CYBELE, or the GREAT MOTHER OF THE GODS. A divinity whose worship spread far and wide through the ancient world, though its early seats seem to have been Crete and Asia Minor. According to the myth which belonged to the worship of Zeus on Mount Ida, Rhea was the wife of Cronus and mother of Zeus, Poseidon, and Hades, i.e. of the ruling race of gods. In Asia Minor we find widespread worship of a nature goddess, regarded as the mother and source of all life, and honored with orgiastic rites upon the mountains and among the wild woods and caves. The wild beasts attended upon her, especially the lion, by whom her throne was watched and her car drawn. Her priests were called Corybantes. The Asiatic worship of Cybele had its origin apparently and certainly its chief centre at Pessinus in Phrygia, whence it passed into Lydia. United with the similar but less orgiastic Cretan cult of Rhea, it was early adopted by the Greeks of the mainland, and connected with local cults of a similar goddess. In Rome the worship of Cybele was introduced from Pessinus in B.C. 204, in consequence of the Sibylline prophecy, and the annual Megalensian games were established in her honor. From the first century B.C. this cult of the great Eastern goddess in various forms and under many names was spread among the people by wandering bands of begging priests and priestesses, professing to work wonders, predict the future, and by initiation into their mysteries to bring relief from sin. The priests of Cybele in Asia Minor were eunuchs, in imitation of the mutilation of Attis (q.v.), the original servant of the goddess. In works of art she is usually represented as seated on a throne, adorned with a mural crown, from which a veil is suspended. At either side of the throne are lions, or perhaps a lion lies on her lap or under her feet. Sometimes she is seen riding in a chariot drawn by lions.

CYCADACEÆ (Neo-Lat. nom. pl., from Neo-Lat. *cycas*, Gk. κύκας, *kykas*, African cocopalms). One of the four living groups of gymnosperms. In the present flora nine genera of

cycads are recognized, which contain about eighty species. They are exclusively tropical, and are about equally distributed between the eastern and western tropics. The stems are either columnar shafts, crowned with a rosette of huge fern-like foliage leaves, having the general habit of tree-ferns and palms; or they are like great tubers, completely invested by an armor of thick leaf-bases and scale leaves, and crowned with fern-like leaves as in the other case. The group is of especial interest on account of its fern-like characters, and there seems to be general consent that it is a group which has been derived from the ferns. Although fern-like in appearance and in many structures, the cycads produce seeds and must be associated with seed-plants, and since the seeds are exposed, they are gymnosperms.

A discovery recently made emphasizes strikingly their fern-like character. In fertilization the male cells bear many cilia and are free-swimming, while in all other known seed-plants they have no power of motion. This retention of the old ciliated sperm habit by undoubted seed-plants is a very interesting transition condition. The group is also of interest in showing that the pollen-tube, which is connected in other seed-plants with the transfer of the male cells to the egg, may not have been originally developed for this purpose. In the cycads the tube is developed by the pollen-grain, but it branches freely through the ovule and acts as an absorbing system, the male cells never entering it. It was probably later in the evolution of plants that this absorbing system came to be used as a means of transferring the male cells. Another characteristic feature of the group is that the seed-coat, instead of being entirely hard, as in the conifers, is plum-like, since it develops in two layers, the inner hard and bony, the outer pulpy, making the ripe fruit resemble a plum.

The structure of the stem in many cases is not essentially different from that of the ordinary conifer-stems, but in certain genera it presents unusual and suggestive features. In these cases the primary cambium, by means of which the ordinary increase in diameter is effected, is short-lived, and a series of secondary cambiums is organized in the cortex. The vascular bundles thus formed in the cortex are frequently of the concentric type, which is characteristic of the ferns and not of the seed-plants.

Although the strobili of the cycads have the general structure of those of conifers, in some cases the spore-leaves do not resemble those of the other seed-plants. For example, in the genus *Cycas* there is no distinct stamen in the ordinary sense, but a leaf-like body whose under surface is thickly covered with groups of sporangia, as in ordinary ferns.

The geographic distribution of cycads is as follows: In the Oriental tropics the genera are: *Cycas*, containing about sixteen species and ranging throughout tropical Asia, the East Indies, and the Australasian region; *Macrozamia*, with fourteen species, and the monotypic *Bowenia*, both strictly Australasian; *Enecephalartos*, with twelve species, and the monotypic *Stangeria*, both restricted to Africa. In the Occidental tropics the largest genus is *Zamia*, with about thirty species, ranging throughout tropical and subtropical America; *Ceratozamia*, with six species, and *Dioon*, with one species, are American;

CYCADS AND CYPRESS

1. CYPRESS TREE near Monterey, Cal.

2. CYCAS REVOLUTA, In New York Botanical Garden.

while the monotypic *Microcyas* belongs to Cuba. In general it is true that *Cycas* and *Zamia* are the typical cycads of the two hemispheres, while the other genera represent relatively isolated forms which bear the stamp of local conditions.

FOSSIL FORMS. The Cycadaceæ are a group of very great antiquity, the genus *Cycas* itself appearing to be the oldest of all the genera of the family, for it is known from the Carboniferous limestone. This singular type has, since that early time, persisted in modern vegetation, where it stands without any near relatives. The remains of Cycadaceæ attain their greatest development in the Mesozoic formations, especially in the Jurassic rocks (Purbeck and Wealden) of England and France, and in the Lower Cretaceous of the Black Hills of North America, in which latter formation the silicified short cylindrical stems with their closely crowded, spirally disposed leaf-bases are quite characteristic fossils. Also the leaves and fructification of the Cycadaceæ are of frequent occurrence in the Mesozoic beds of the Northern Hemisphere, showing that these plants flourished there in that era. In the Tertiary they are rare in Europe, though still occurring in southern Europe. Later their last survivors withdrew mostly to the Southern Hemisphere. With the fossil Cycadaceæ are usually mentioned the *Medullosæ*, remains of stems from the Carboniferous and Permian rocks, which show many points of resemblance to the Cycadaceæ, while departing from them in some important features. Consult: Von Sölm-Laubach, *Fossil Botany* (Oxford, 1891); Ward, "Description of the Species of Cycadeoidea or Fossil Cycadean Trunks from the Lower Cretaceous Rim of the Black Hills," *Proceedings of the United States National Museum*, vol. xxi. (Washington, 1899); id., "Description of a New Genus and Twenty New Species of Fossil Cycadean Trunks from the Jurassic of Wyoming," in *Proceedings of the Washington Academy of Science*, vol. i. (Washington, 1900).

CYCLADES, *sik'la-dēz* (Lat., from Gk. *Κυκλάδες*, *Kyklades*, from *κύκλος*, *kyklos*, circle). A portion of the archipelago lying southeast of Greece, in the Aegean Sea, comprising, according to the old geographers, the islands of Ceos (*Zea*, *Kea*), Cythnus (*Thermia*), Seriphus (*Serpho*), Siphnus (*Siphanto*), Gyaros, Syros (*Syra*), Paros, Antiparos, Andros, Tenos, Myconus, Delos, Rhenea, and Naxos (Map: Greece, F 4). This group, arranged in three series, was supposed to form a circle with the sacred island of Delos at its centre, and this belief accounts for the name of the group. The modern nomarchy of the Cyclades includes also the islands of Melos, Cimolus, Polyandrus, Sienus, Ios (*Nio*), Amorgos, Santorini (*Thera*), Anaphi, and a number of smaller islands, some of which were formerly grouped with the Sporades (q.v.). The total area is 923 square miles. The islands are mountainous, reaching an altitude of over 3000 feet in some instances. Some are of volcanic formation. They are generally scantily watered and sparsely wooded. They produce southern fruits, and large quantities of marble and other valuable building-stones are obtained from them. The population of the nomarchy (province) was 134,747 in 1896. The chief town is Hermopolis (q.v.), on *Syra*.

CYCLAMEN, *sik'la-mēn* (Neo Lat., from Gk. *κυκλάμιος*, *kyklamios*, from *κύκλος*, *kyklos*, circle; referring to its corolla). A genus of plants of the natural order Primulaceæ, having a wheel-shaped corolla; with a long reflexed limb, and flower-stalks twisted spirally downward after flowering. The species are herbaceous perennials, not numerous, and chiefly Alpine in the south of Europe. They have turnip-like, partly subterranean stems, which are very acrid, but nevertheless are greedily eaten by swine, and the plants are accordingly often designated sow-bread. They are drastic and emmenagogue. Several of the species are frequent in our flower-gardens, on account of the beauty and fragrance of their flowers. The most common species are *Cyclamen Europæum* and *Cyclamen latifolium*, the latter being the source from which are obtained many of the forms cultivated as Persian cyclamens. The corolla of *Cyclamen latifolium* is strongly reflexed, giving the flower a curious appearance. For illustration, see Plate of GREENHOUSE PLANTS.

CYCLE (Lat. *cyclos*, from Gk. *κύκλος*, *kyklos*, circle; connected with Skt. *cakra*, AS. *hucól*, Engl. *wheel*). A term used in chronology to denote an interval of time in which certain phenomena always recur in the same order. Cycles have chiefly arisen from the incommensurability of the periods of revolution of the earth and other celestial bodies. Our unit of time is the day of 24 hours, being the period of revolution of the earth round its axis. But neither the year—the period of the earth round the sun—nor the month—the period of the moon round the earth—can be measured by days, or even by hours, so as not to leave fractions. Cycles have been invented in such a way that after a certain number of revolutions of the body whose period is to be compared with that of the earth on her axis, the body shall at last occupy the same place in the heavens and calendar as it did when the cycle commenced. Of the numerous cycles or periods of this kind that have been invented, the more important are noticed under their specific names. See INDUCTION; METONIC CYCLE; PERIOD; GOLDEN NUMBER; etc.

CYC'LICAL FORMS (from *cyclic*, Lat. *cyclicus*, Gk. *κύκλικος*, *kyklikos*, circular, from *κύκλος*, *kyklos*, circle). In music, forms that consist of a cycle or series of movements, such as the suite, concerto, sonata, or symphony. The origin of cyclical forms is to be found in the form of the old overture, which consisted of three parts, the first and third being slow, while the middle part was lively. Gradually these three parts were extended and detached. In the older compositions the movements were alternately slow and fast. But soon it became customary to begin and end with a fast movement. In the modern symphony the customary arrangement is: (1) Fast; (2) slow; (3) fast; (4) fast. But Beethoven's "Sonata," opus 109, and Tchaikowsky's "Symphonic Pathétique," are two famous examples of cyclical compositions closing with a slow movement. Originally all the movements of a cyclical composition were written in the same key. The development of the sonata (q.v.) wrought a change in this direction, so that different keys (though always related to the fundamental) were assigned to the different movements. The first and last movements, however,

are always in the same key, which is considered the fundamental key of the whole work. If the first movement is in minor, the last is generally in the parallel major.

CYCLIC ANAPÆST. See VERSIFICATION.

CYCLIC CHORUS (Gk. κυκλικὸς χορὸς, *kyklikos choros*). The chorus of fifty men or boys which danced in a circle around the altar of Dionysus, during the dithyramb. See CHORUS.

CYCLIC DACTYL. See VERSIFICATION.

CYCLIC POETS (Gk. κυκλικὸὶ ποιηταὶ, *kyklikoi poietai*). The name was given by the later Greek grammarians to a class of minor epic poets, who wrote on subjects dealing with events preceding, as well as during and following, the Trojan War, and also on the Theban Myths, each poet limiting himself to a certain cycle (*κύκλος*) of events. The following titles are known to us: *Theogony, Titanomachy, Cypria, Little Iliad, Destruction of Troy, The Return, Telegony, Oedipodea, Thebais, Epigoni, and Ethiopis*. The scanty fragments with testimonia are best published by Kinkel, *Epicorum Græcorum Fragmenta* (Leipzig, 1877); also as an appendix to Welcker's *Der epische Cyclos* (Bonn, 1835-49). Horace, *Ars Poetica*, 136, uses *cyclicus scriptor* in a derogatory sense, but there is no evidence that this was a common connotation.

CYCLING (from *cycle*). The use or act of riding the cycle, either bicycle or tricycle. Although now a common utility of every-day business life, as well as a means of recreation, it had its origin at the beginning of the latter half of the nineteenth century in what was then an improved velocipede, and was only used for sport or recreation. (See BICYCLE.) The progress of cycling as a means of recreation has been very rapid, its greatest general popularity occurring between 1890 and 1900. At the beginning of the twentieth century it apparently has taken its real position as a permanent means of enjoyment and recreation, and an added means of locomotion for either business or pleasure. Apart from the many physical advantages derived from the practice of cycling as an exercise, it has been of inestimable benefit to the community at large, in that it has given to all a capacity of locomotion, which formerly none but those of ample means and leisure could enjoy; and, as a natural consequence, has developed a general interest in the many 'good roads' movements through the United States and England. Many long-distance tours have been accomplished by its means, notably that of Thomas Stevens, who, between April, 1884, and December, 1886, rode round the world; and Lenz, who (1892-94) rode a wheel carrying all his necessaries, as well as a camera, across America, Samoa, Japan, through China, Burma, India, Beloochistan, Persia, and Armenia. *Road racing* has always been a popular sport, and in the early nineties had attained such proportions that nearly every city and town throughout England and America had its annual road-racing fixtures. This phase of the sport is not now so general, but the annual road races of Chicago and those of the metropolitan district of New York are still events of considerable importance in the cycling world.

Track racing is entirely artificial, and confined usually to professional riders racing under unnatural conditions. Long-distance and relay races, such as have been held at Tattersall's, Chi-

ago, and Madison Square Garden, New York, while financially profitable to their projectors, have been very severely condemned as of no real value to the sport, and frequently injurious to the riders themselves. Several cycling associations exist for the benefit of tourists, notably the League of American Wheelmen, which supplies maps, and enables machines to be passed into Canada and back into the United States without any other expense or hindrance than the depositing of the L. A. W. membership tickets; and under some circumstances even this is not necessary. Similar advantages are obtained for tourists in Europe by the Cyclists' Touring Club of England, founded in 1873 with headquarters in London S.W. With this latter organization is allied the Touring Club of France, and the Deutsches Radfahrerbund. The military organizations of all the European countries include corps of specially equipped and drilled cyclists, whose principal duties are the transmission of orders and the securing of information; for which purposes their speed, their noiselessness, and the comparatively good roads which prevail have made them conspicuously useful. See ARMY ORGANIZATION; TACTICS, MILITARY.

CYCLOID (Gk. κύκλωειδης, *kykloideîs*, circle-like, from κύκλος, *kyklos*, circle + εἶδος, *eîdos*, form). A plane curve, the locus of a point on the circumference of a circle which rolls along a straight line. If, in Fig. 1, circle O rolls on the line A_1A_2 , the point P traces the arc of the cycloid A_1PA_2 . If the generating point is taken

FIG. 1.

at Q, within the circle, the resulting curve is B_1QB_2 , called a prolate cycloid. If the generating point is taken at R, in the plane of the circle, the resulting curve is C_1RC_2 , a curtate cycloid or

FIG. 2.

trochoid. If the generating circle rolls on a fixed circle, instead of a straight line, curves like those in Fig. 2 are produced (see CARDIOID). The curve formed by rolling the generating circle

around the outside of the fixed circumference is called an epicycloid. On the other hand, that produced by rolling the generating circle on the inside of the fixed circle is called a hypocycloid. These curves belong to a general class called 'ronlettes.' The construction for the cycloid was known to Bouvelles (1503), but its name is due to Galilei (q.v.), who in a letter to Torricelli (1639) recommends it for bridge arches. The term trochoid is due to Roberval (q.v.), and the term roulette (1659) to Pascal (q.v.). Roberval also effected (1634) the quadrature of the cycloid, showing that it equals three times the area of the generating circle, and he determined the volume obtained by revolution about its axis. Descartes constructed its tangents, and Pascal (1658) determined the length of its arc, and the centre of gravity of its surface and of the corresponding solid of revolution. The length of one branch of the cycloid is four times the diameter of the generating circle, and its area is three times that of the same circle. If A_1 (Fig. 1) be taken as the origin of coördinates, and a be the radius of the generating circle,

the equation of the cycloid is $x = a \text{ vers}^{-1} \left(\frac{y}{a} \right) - \sqrt{2ay - y^2}$. It is simpler, however, to use the expressions for x and y separately; viz. $x = a (\theta - \sin \theta)$, $y = a (1 - \cos \theta)$. The equations of the hypocycloid are $x = \frac{(a-b) \cos \theta + b \cos \frac{(a-b)\theta}{b}}$, $y = (a-b) \sin \theta - b \sin \frac{(a-b)\theta}{b}$, where a and b

are the radii of the fixed and rolling circles. If the radius of the fixed circle is four times that of the rolling circle, the equation of the hypocycloid is $x^2 + y^2 = a^2$, a being the radius of the fixed circle, as in Fig. 2. Because of the elegance of its properties and because of its numerous applications in mechanics, the cycloid is the most important of the transcendental curves. One of its most interesting properties is that the time of descent from rest of a particle from any point on its inverted arc to the lowest point is the same; that is, the cycloid is an isochronous curve. Thus, on an ideally hard and smooth surface whose sections are cycloids, the particle, having reached the lowest point, will, through the momentum received in its fall, ascend the opposite branch to a height equal to that through which it fell, losing velocity at the same rate as it acquired it. The cycloid is also the curve of quickest descent; i. e. an object acted upon by the force of gravity, and setting out from any point of the cycloid, will reach any other point of this curve in shorter time than by following any other path. The cycloid is therefore referred to as the *brachistochrone* (Gr. βράχιστος, *brachistos*, shortest, and χρόνος, *chronos*, time). The problem of finding the brachistochrone was proposed by Jean (Johann) Bernoulli in 1696, and formed the first important step in the calculus of variations. It was solved by Bernoulli himself, by Leibnitz, Newton, L'Hôpital, and Jacques (Jakob) Bernoulli. For the interesting history of the cycloid, consult any of the best histories of mathematics, and also: Chasles, *Aperçu historique sur l'origine et le développement des méthodes en géométrie* (Paris, 1875); de Groningue, *Histoire de la cycloïde* (Hamburg, 1701); Tannery, "La cycloïde dans l'antiquité," in *Bulletin des sciences mathématiques* (Paris, 1883).

CY'CLOID FISHES. One of the four orders of fishes proposed by Agassiz, based on the character of the scales. Cycloid scales have the posterior or free margin smooth and not spinous. Cycloid-like ctenoid (q.v.) scales are not covered with enamel, and belong to many of the present as well as many fossil fishes. The chub and its allies are examples.

CYCLOM'ETER (Gk. κύκλος, *kyklos*, circle + μέτρον, *metron*, measure). An instrument for recording the revolutions of any rotating object, as of a carriage-wheel, bicycle-wheel, or certain parts of machinery. A similar instrument for measuring distances traversed is an odometer. This instrument, invented by Hudson, is extensively used by surveyors in collecting data for maps. It is commonly attached to the wheel of a wagon, or to a light vehicle drawn by hand. The term cyclometry is often applied to the method of measuring circumferences or areas of circles (q.v.), but more generally it refers to the theory of circular functions. See FUNCTIONS.

CY'CLONE. See STORM.

CY'CLOPÆ'DIA. See ENCYCLOPÆDIA.

CY'CLOPEAN ARCHITECTURE, or MASONRY. The name frequently used for an ancient wall of large, irregular stones, rudely hewn or quite unwrought. The term originated in Greece, where structures of this kind were fabled to have been the work of the Cyclopes. The ancients also attributed them to the Pelasgians (q.v.), whence such walls are sometimes called Pelasgian. The walls of Tiryns (q.v.), near Nauplia, are an example of the ruder style of Cyclopean masonry. They are of irregular unshapen stones, from 6 to 10 feet long, from 3 to 4 feet wide, and from 2 to 3 feet deep; the interstices are filled up by small stones, and clay mortar was employed to bind them, though it has now been washed away to a great extent. The walls of Mycenæ are in part of the same rude construction as at Tiryns, but near the Lion Gate they are faced with huge rectangular blocks, fitted in rudely horizontal courses, and the same style of masonry (but more carefully executed) is employed in the great beehive tombs. A portion of the wall of Mycenæ—probably of later date—is built of polygonal stones, carefully fitted so as to leave no interstices. Walls of the same general character are found in Asia Minor and Italy, where they surround many of the old Etruscan towns, though here the walls are more commonly in the rude ashlar masonry found at Mycenæ. While in Greece these walls belong for the most part to the Mycenaean period, and are probably to be attributed to the Achaean domination, it is not likely that this style of fortification was peculiar to any one race, as similar masonry has been found in China, and also in Peru, and on a smaller scale in the British Isles. Polygonal masonry, composed of carefully hewn and fitted blocks, is common in Greek works of later times, and the early walls of Troy, as well as the tombs already mentioned, show that the Mycenaean civilization was capable of building walls of hewn and fitted stones, as good as, or better than, those erected in the classical times. The Cyclopean architecture is discussed in histories of architecture (q.v.), or in works dealing with the Mycenaean Age (see ARCHÆOLOGY), or Etruria (q.v.). For a description of the remains

of Cyclopean architecture in Greece and Italy, consult: Middleton, *Grecian Remains in Italy* (London, 1812), a rare work; Dodwell, *Views and Descriptions of Cyclopean or Pelasgic Remains in Greece and Italy* (London, 1834); and, for a more general discussion, Petit-Radel, *Recherches sur les monuments cyclopiens* (Paris, 1841).

CYCLOPES, sī-klŏ'pēz (Lat., from Gk. κύκλω-πες, *kyklōpes*, round-eyed, from κύκλος, *kyklos*, circle + ὤψ, *ōps*, eye). In Greek mythology, a race of one-eyed monsters, described as follows: (1) Homeric Cyclopes, a wild, lawless, gigantic race of shepherds, inhabiting an island in the western sea. The most famous of these Cyclopes is the son of Poseidon, Polyphemus (q.v.). Homer describes him as one-eyed, and later poets attributed this characteristic to his companions. (2) The Hesiodic Cyclopes, Brontes, Stereopes, and Arges (that is, Thunder, Lightning, and Thunderbolt), each having one eye in the middle of his forehead. These were the sons of Uranus and Gæa. Hurlled into Tartarus by their father, but delivered by their mother, they helped Cronus to usurp the government of heaven. Cronus, however, in his turn, threw them back into Tartarus, from which they were again released by Zeus, whose servants they now became. Finally, they were slain by Apollo, because they forged the thunderbolt with which Zeus killed Asclepius. The Alexandrian and Roman poets represented them as the companions and assistants of Hephestus at his forge, which was situated in a volcano, as at Lipari or Etna. In this capacity they were frequently represented on works of art. (3) The Cyclopes, a people who had come from Thrace or Lycia to Argolis, and built the mighty walls of Tiryns, Mycenæ, and Argos for King Proteus. See CYCLOPEAN ARCHITECTURE.

CYC'CLOPS. A play by Euripides, following the Homeric account of the adventures of Odysseus with the Cyclopes, and remarkable as the only preserved specimen of a satyric drama. It has been translated by Shelley, who omitted a few passages.

CYC'CLORA'MA (Gk. κύκλος, *kyklos*, circle + δράμα, *horama*, sight). A painting placed on the walls of a cylindrical room representing a landscape, battlefield, or other subject, with true perspective. The spectator stands in the centre, and the effect is extremely realistic.

CYCLO'SIS (Neo-Lat., from Gk. κύκλωσις, *kyklōsis*, a surrounding, from κύκλος, *kyklos*, circle). The rotation of the protoplasm within a plant-cell. Only the outermost portions remain quiet. The various inclusions of the protoplasm, such as chloroplasts, nucleus, etc., are swept along with it. The mass descends on one side of the cell and ascends on the other. A line of no movement necessarily exists between the portions moving in opposite directions. See PROTOPLASM.

CYCLOS'TOMI (Neo-Lat. nom. pl., from Gk. κύκλος, *kyklos*, circle + στόμα, *stoma*, mouth). A class of eel-like marine animals, the lampreys and hags, regarded as the lowest existing vertebrates (excluding Amphioxus). They have eel-like bodies of very primitive construction. "The spinal column is represented merely by a thick, persistent notochord, inclosed in a sheath, with, in the lampreys, small cartilaginous processes

representing neural and hæmal arches. The skull is cartilaginous, and is peculiarly modified. Behind it in the lamprey is a remarkable basket-like apparatus, composed of cartilaginous processes. This branchial basket, as it is termed, supports the gill-sacs. The gill-sacs, of which there are either six or seven pairs, are the organs of respiration and represent the gills of the true fishes." They are, however, very differently arranged, opening externally in some forms by several gill-slits, and in others by only one, and communicating internally with the pharynx in diverse ways. Other organs do not differ so widely from those of the true fishes, the most remarkable fact being that there is only one nasal sac and nostril, instead of a pair. The round mouth, without jaws, suggests that of leeches. The Cyclostomi, which by some ichthyologists are regarded as an order (Marsipobranchii) of fishes, are bottom-keeping, voracious, slinky creatures, occasionally truly parasitic, and are traceable back to Paleozoic times.

FOSSIL FORMS. Minute teeth (conodonts), found in Paleozoic rocks, have been by some authors considered to be teeth of cyclostomid fishes, but they are more probably the teeth of carnivorous annelids like the modern Nereidæ. In the Caithness flagstones of the Old Red Sandstone of Devonian age, near Thurso in Scotland, are found numbers of a small, eel-like fossil, which has, with much probability of correctness, been referred to the cyclostomes. These small fossils, known as Palæospondylus, vary in length from one to two inches, and consist of an oblong skull, made of bony plates, armed anteriorly with small calcified cirri, and provided posteriorly with two long prolongations that parallel the vertebral column. From between these prolongations projects the long vertebral column, made up of distinct calcified elements, with neural spines in the abdominal region, and both neural and hæmal spines in the caudal region. A long, diphycecal tail-fin with very slender rays, of which those of the neural series are bifurcated, must have formed a powerful swimming organ for this small fish. This fossil, if it be a true cyclostome, differs from all others of the group in having a calcified skeleton. Consult: Dean, "The Devonian Lamprey, Palæospondylus Gunni, Traquair, with Notes on the Systematic Arrangement of the Fish-like Vertebrates," *Memoirs of the New York Academy of Sciences*, vol. ii., part i. (New York, 1899). This work includes a complete bibliography of fossil cyclostomes. See CONODONT; HAG-FISH; LAMPREY; and plate of LAMPREYS AND DOGFISH.

CY'CLO-SYM'METRY. See SYMMETRY.

CYCLUS (Lat., circle). A curious fossil crustacean found in the coal-measures of North America and Europe. It is of a circular, convex form, with usually a low median ridge on its dorsum, and its surface is either smooth, radially striated, or nodular. A pair of small sessile compound eyes, like those of the horseshoe crab, have been found near the anterior lateral margin of some American examples. These fossils are perhaps the larval stages of other crustaceans, like Belimurus, Euproops, Prestwichia, or Eurypterus, of which adult specimens are often found in the same beds with Cyclus. Consult: Woodward, "On the Genus Cyclus," *Geological Magazine*, vol. viii. (1870), and ser. 4, vol. i.

(London, 1894). See EURYPTERUS; PRESTWICHIA; XIPHIOSURA.

CYDIP'PE (Gk. Κυδίππη). The Athenian maiden craftily won by Acontius. For the details of the story, see ACONTIUS.

CYDNUS (Lat., from Gk. Κύδνος, *Kydnos*). A river of Cilicia, passing the city of Tarsus and emptying into the Mediterranean. It was on this river that Cleopatra made her voyage to meet Antony.

CYDONIA. See QUINCE.

CYGNÆ'US, FREDRIK (1807-81). A Finnish poet and literary historian. He was born at Tawastehus, and was educated at the University of Åbo, where he lectured from 1839 to 1843, in which year he began an extensive tour through Europe. In 1854 he was called to the chair of æsthetics and modern literature at the University of Helsingfors. He bequeathed his entire fortune and his valuable art collection to the State. His poetic works were published by him under the title *Skuldestycken* (6 vols., 1851-70).

CYGNÆUS, UNO (1810-88). A Finnish educator, born at Tawastehus. From 1837 to 1839 he was a pastor and instructor at Wiborg, from 1839 to 1846 spiritual director of the colony at Sitka, Alaska, and in 1861 was appointed chief inspector of the Finnish public-school system, which he thoroughly reorganized. In 1863 he established the first normal school in Finland, and until 1869 was its director. He was the first to make manual work (*slöjd*, *sloyd*) a part of regular public-school instruction. He published *Förslag rörande folkskoleväsendet* (1861).

CYGNUS (Lat., from Gk. Κύκνος, *Kyknos*, the swan). A constellation in the Northern Hemisphere, between Lyra and Cassiopeia. Several stars in this constellation have received the particular attention of astronomers. See STARS.

CYLINDER (OF. *cilindre*, Fr. *cylindre*, from Lat. *cylindrus*, from Gk. κύλινδρος, *kylindros*, roller, from κύλινδριν, *kylindrin*, κώλιν, *kylin*, to roll). A surface generated by a line (the generatrix) which moves parallel to a fixed line and touches a given curve (the directrix) is called a cylindrical surface. The space inclosed by a cylindrical surface is called a cylindrical space. The portion of a cylindrical space limited by two parallel planes cutting all the elements of the cylindrical surface is called a cylinder. If the directrix is a circle, the cylinder is called a circular cylinder; if the directrix is an ellipse, the cylinder is called an elliptic cylinder, and so on. If the elements (positions of the generatrix) are perpendicular to the plane of the directrix, the cylinder is called a right cylinder, otherwise it is called oblique. If a rectangle be revolved about one of its sides, a cylinder of revolution, or a right circular cylinder, is formed. The plane figures which form the ends of a cylinder are called

A CYLINDER OF REVOLUTION.

its bases, and these are always congruent. The perpendicular distance between the bases

is called the altitude. The lateral area of any cylinder, expressed in surface units, is the product of the number of linear units in the perimeter of a section perpendicular to the elements (right section) and the number of linear units in an element.* The number of units of volume of a cylinder is equal to the product of the number of square units of the base and the number of linear units in the altitude of the cylinder.

A RIGHT CIRCULAR CYLINDER. AN OBLIQUE CYLINDER.
B₁, B₂, lower and upper bases; E, an element; R, a right section, a, the altitude.

A cylindrical surface may be considered as a conical surface (see CONE) with the vertex at infinity. Hence, plane sections of the cylindrical space of a right circular cylinder lead to the so-called conic sections, in particular, to the ellipse. If $V \equiv$ volume, $C \equiv$ curved surface, $B \equiv$ base, $A \equiv$ total area of surfaces, $a \equiv$ altitude, $r \equiv$ radius of the base (or of the inscribed sphere) and $R \equiv$ the radius of the circumscribed sphere of a right circular cylinder, then $V = \pi r^2 a$, $C = 2\pi r a$, $A = 2\pi r^2 + 2\pi r a = 2\pi r (r + a)$, $R = \sqrt{\frac{a^2}{4} + r^2} = \frac{1}{2} \sqrt{a^2 + 4r^2}$. The volume of a sector of a cylinder of arc k° is $\frac{k}{360} \pi r^2 a$; if the arc is given in radian measure, as n radians, the volume is $\frac{1}{2} n r^2 a$. If a plane parallel to the axis cuts off a segment, the corresponding arc cut from the base being k° , the volume of the cylindrical segment is $V = \frac{r^2 a}{2} \left(\frac{k}{180} \pi - \sin k^\circ \right)$, or if $k^\circ = n$ radians, $V = \frac{r^2 a}{2} (n - \sin n)$.

CYLINDER-SNAKE. One of a family (Ilysiidæ) of small burrowing snakes allied to the Typhlopidae and shield-snakes, and retaining vestiges of pelvis and hind limbs, the latter showing in claw-like spurs protruding between the scales on each side of the vent. The form is cylindrical, the scales small, polished, and hardly larger on the belly than elsewhere, and the colors bright. The few species are scattered over the Malay Islands and Indo-China, where the common 'red snake' (*Cylindrophis rufus*) reaches a length of two and one-half feet, and occur in Ceylon and South America. A beautiful species (*Ilysia scytale*) in tropical South America is one of those called 'coral-snake,' and is coral-red with black rings. On account of its beauty, perfectly harmless nature, and 'for cooling purposes,' this snake is said to be sometimes worn as a necklace by the native ladies.

CYLLENE, sil-lē'nē (Lat., from Gk. Κυλλήνη, *Kyllēnē*). A mountain in northwest Arcadia,

the fabled birthplace of Hermes. Its modern name is Ziria. Height, 7790 feet.

CYLON (c.660-c.610 B.C.). An Athenian noble, who sought to make himself tyrant of Athens. He was victor at Olympia (B.C. 640), was son-in-law of Theages of Megara, and, probably in 630 (616 or 612), with the protection of the Delphic Oracle, and with outside help from Megara and a disaffected party in Athens, he seized the Acropolis of Athens. He was blockaded there by Megacles, an Alcmæonid, archon for the year, and surrendered on being promised his life, but was killed with his followers. The immediate result was war with Megara; the more lasting effect was the blood-guiltiness of the Alcmæonidæ, under cover of which they were so often attacked.

CYMA (Lat. *cyma*, hollow sphere, from Gk. κύμα, *kyma*, swelling, from κύω, *kýein*, to swell). In architecture, a molding, consisting of a hollow and round conjoined, each one about a quarter round. When hollowed in the upper part, it is termed *cyma recta*; when hollowed in the lower part, it is called *cyma reversa*. It is bounded usually by a fillet, and corresponds practically to the modern ogee molding.

CYMATIUM, sí-má'shí-üm. See ENTABLATURE.

CYMBALS (OF. *cimbale*, Fr. *cymbale*, Lat. *cymbalum*, Gk. κύμβαλον, *kymbalon*, from κύμβος, *kymbos*, cup, Skt. *kumbha*, pot, Ger. *Humpfe*, drinking-cup). Instruments of percussion in the form of round plates, with leather holders. When struck one against the other, they produce a loud, harsh sound of no fixed pitch. The best cymbals are those made in Turkey and China. Attempts to discover and imitate the composition of the metal have all failed. The notes in music for this instrument are written on the same line or space, in rhythmical succession. Although originally military instruments, cymbals are now much used in the orchestra.

CYMBELINE, sí-m'bé-lín or -lín, or CUNOBELINUS. A king of the Britons, who lived in the earlier part of the first century of our era. His capital was Colchester. In A.D. 40 Cymbeline banished his son Adminius, who made his submission to Caligula. The Emperor considered Britain a part of the Roman Empire, but no attempt was made to subdue the island till after the death of Cymbeline. In 43 Aulus Plautius was sent to Britain by Claudius, but was opposed by Togodumnus and Caractacus, the sons of Cymbeline. We have no other authentic information of Cymbeline except what may be derived from the few coins extant. The story of Cymbeline which Shakespeare used in the drama is found in Holinshed's *Chronicle* and is in large measure mythical. Consult Boswell-Stone, *Shakespeare's Holinshed* (London, 1896).

CYME, sím (Gk. κύμα, *kyma*, swelling). A flat-topped flower-cluster, in which the pedicels arise at different levels upon an elongated axis, and the innermost flowers bloom first. See INFLORESCENCE.

CYMRU or **KYMRU**, kím'rí. See WALES, paragraph *History*.

CYNANCHE, sí-nán'kè (Gk. κυνάγχη, *kynanchē*, dog-quinsy, from κύων, *kýōn*, dog + ἀγγχειν, *anchēin*, to press tight). An obsolete medical term applied to the severer forms of sore throat.

CYNANCHUM, sí-nán'küm. Several drugs, including the knotty, acrid emetic roots of *Cynanchum vincetoxicum*, a once reputed counterpoison; the nausea-producing leaves of *Cynanchum oleaeifolium*, an adulterant of Alexandria senna; and *Cynanchum monspeliacum*, formerly considered as the source of Montpellier scammony. See ASCLEPIADACEÆ.

CYNEWULF, kí'n'e-wulf, or **CYNWULF**, kí'n'wulf (AS., king-wolf) (c.750-c.825). A writer of some of the best Old English or Anglo-Saxon verse: *Juliana*, the story of the martyrdom of Saint Juliana; *Elene*, a legend of the discovery of the true cross by the Empress Helena; *Christ*, celebrating the coming of Christ, His ascension, and the day of judgment; the *Fates of the Apostles*; *Andreas*, or the *Legend of Saint Andrew*, and probably several other extant Old English poems. There is, however, no good reason for assigning to him (as is sometimes done) the riddles in the Exeter Book. About the poet nothing is positively known beyond what he himself has chosen to tell in his verse. In the first four poems cited above, he wove his name in runes. In the epilogue to *Elene*, he gave a brief sketch of himself, in which he speaks of his sinful youth, his conversion, his old age, and his reflection on poetic themes during the watches of the night. Cook has shown that Cynewulf's life must have been bounded very nearly by the years 750 and 825. It is further agreed, very generally, that the poet was an Anglian by birth; but it is uncertain whether his home was in Mercia, East Anglia, or Northumbria. Consult: Grein, *Bibliothek der angelsächsischen Poesie*, revised by Wülker (Göttingen, 1883-98); the editions of *Christ* by Gollancz (London, 1892); and by Cook (Boston, 1900); and Root, "The Legend of Saint Andrew," in *Yale Studies in English* (New York, 1899).

CYNICS (Lat. *cynicus*, Gk. κυνικός, *kynikos*, dog-like, cynic, from κύων, *kýōn*, dog). The name applied to a school of philosophers founded by Antisthenes, a pupil of Socrates. The main tenet of the extreme Cynics was that civilization is a curse, and true happiness can be obtained only by gratifying the most primary physical appetites which man has in common with the brutes. The general attitude of the Cynics, as distinguished from that of the Stoics, lay in the fact that while the Stoics regarded everything in the external material world with indifference, the Cynics viewed it with contempt. They were not an important philosophical school numerically, but attracted attention largely by their eccentricities and insolence. On account of their contempt for refinement, their name came subsequently to be applied to any one who takes a mean view of human life. The word cynic is probably derived from the Cynosarges gymnasium where Antisthenes taught. See ANTISTHENES; DIOGENES; MENIPPUS.

CYNODON, sí'nò-dòn (Neo-Lat., from Gk. κυνόδων, *kynodōn*, or κυνόδους, *kynodous*, dog-tooth, from κύων, *kýōn*, dog + ὀδός, *odous*, tooth). A genus of grasses, having digitate or racemose spikes, with spikelets on one side, glumes nearly equal, boat-shaped, and containing one floret, which has two awnless paleæ, the fruit coated with the hardened paleæ. The most important species is *Cynodon dactylon*, a grass very widely diffused, which is the principal fod-

der-grass and best pasture-grass of India, where it is the principal covering of many thousands of square miles, and is known by the names of Dhob, Doorba, etc. It is also common in the south of Europe. It is introduced throughout the warmer parts of the world. Its creeping roots have medicinal virtues, and are sometimes used as a substitute for sarsaparilla. See BERMUDA GRASS.

CYNOGNATHUS, sī-nōg'nā-thūs (Neo-Lat., from Gk. κύων, *kyōn*, dog + γνάθος, *gnathos*, jaw). A large theriodont reptile found fossil in the Karoo formation, of Permo-Jurassic age, of South Africa. The skull, which has a length of 16 inches, is, in respect to its form and dentition, remarkably like that of the carnivorous mammals, and recalls that of a wolf. The vertebrae, which are 29 in number, are amphicelous, and the ribs have double articulations. It is perhaps one of the reptiles which have given rise to some of the early mammals. See THERIODONTIA.

CYNOSARGES (Lat. from Gk. κυνίσσαργες, *kyinosarges*, from κύων, *kyōn*, dog + ἀργός, *argos*, white). A place on the outskirts of ancient Athens, near the present site of the American and British schools of archaeology on Mount Lycabettus. It contained a number of temples and a gymnasium consecrated to Heracles, at which strangers with but one Athenian parent were obliged to exercise, recalling the semi-mortal parentage of Heracles. The philosopher Antisthenes is said to have taught here, and thence his school probably derived the name 'Cynic.'

CYNOSCEPHALÆ, sīn'ōs-sēf'ā-lē (Lat., from Gk. Κυνός κεφαλαί, *Kynos kephalai*, dogs' heads). The name of two hills in eastern Thessaly, ancient Greece, noted for two important conflicts. In the first the Thebans under Pelopidas defeated Jason, tyrant of Pheræ, B.C. 364; in the second the Romans, commanded by T. Quinctius Flaminus, defeated Philip V. of Macedon, B.C. 197.

CYNOSURE, sīn'ō-shōōr or sīn'ō-shōōr (Lat. *Cynosura*, Gk. Κυνόσουρα, *Kynosoura*, constellation of Ursa Minor, from κύων, *kyōn*, gen. sing. of κύων, *kyōn*, dog + οὐρά, *oura*, tail). The constellation of which the pole star is the principal star. Milton's lines in "L'Allegro"—

Where perhaps some beauty lies,
The cynosure of neighboring eyes—

have made the word popular; the metaphor is grounded on *Ursa Minor* being the constellation toward which the others look, as it were, and round which they wheel.

CYNOSURUS. See DOG'S-TAIL GRASS.

CYNTHIA (Lat., from Gr. Κυνθία, *Kynthia*). A surname of the moon-goddess Diana, from her birthplace, Mount Cynthus, on the island of Delos; and hence a poetic term for the moon. Queen Elizabeth is referred to under this name in Spenser's *Colin Clout's Come Home Again*, in Fletcher's *Purple Island* and in Raleigh's poem "Cynthia."

CYNTHIA MOTH. See AILANTHUS MOTH.

CYNTHIANA, sīn'thī-ā'nā. A city and county-seat of Harrison County, Ky., 33 miles north by east of Lexington; on the South Licking River and on the Louisville and Nashville Railroad (Map: Kentucky, G 2). It is the cen-

tre of a fertile agricultural region and is widely known for its manufactures of whisky. The government is administered under a charter of 1893, which provides for a mayor, elected every four years, and a municipal council. The city owns and operates the water-works. Population, in 1890, 3016; in 1900, 3257. On June 11, 1864, Gen. John Morgan, with 1800 men, captured Cynthiana, and, later in the day, defeated 500 Union cavalry under General Hobson; but on the 12th he was in turn defeated by General Burbridge with a force of about 5400, the Union army losing, in killed, wounded, and missing, 414 men, the Confederates about one-third of their number.

CYNTHIA'S REVELS. A conical satire by Ben Jonson, first acted in 1600.

CYNTHIUS (Lat., from Gk. Κύνθιος, *Kynthios*). A surname of the sun god, Apollo, from his birthplace, Mount Cynthus, in Delos.

CYPERACEÆ, sip'ē-rās'sē-ē or sī'pē- (Neo-Lat. nom. pl., from Lat. *cyperos*, *cyperum*, Gk. κύπερος, *kypeiros*, sedge), sometimes popularly called sedges. An order of monocotyledonous plants, akin to grasses, but having generally a triangular, solid stem, which is without joints, or almost so, and often leafless. The species are mostly perennial, growing from sympodial rhizomes. The leaves are sometimes sheathing, when they are 3-ranked, but their sheaths are always entire, not split, as in the grasses. The flowers, which are hermaphrodite in some and unisexual in others, consist of a scale-like glume within which lie the organs of fructification, the pistils alone being frequently inclosed in a separate urn-shaped covering; the place of the perianth is sometimes supplied by a few bristles. The stamens are one to three in number, the anthers erect; the ovary is one-seeded, the style single, trifid or bifid; the fruit a small crustaceous or bony nut or achene, not adhering to the pericarp. Plants of this order, which contains fully 60 genera and 2500 known species, occur in all zones; some of the genera, as *Carex*, abound in the colder, some, as *Cyperus* (q.v.), in the warmer parts of the world. Many of them are plants of very humble growth, some, as bulrushes, papyrus, etc., comparatively large, but none rival in size the gigantic grasses, e.g. bamboos. Most of them grow in marshy and moist places, but a few in sunny, dry places. Their stems and leaves are somewhat deficient in succulence, and in most of them also very rough, so that they are eaten by domesticated cattle only when in a very young state, and then rather from necessity than from choice. They are regarded by farmers as mere weeds. Much of the so-called 'marsh hay' is composed of various species of this order. Pax divides the order into two groups, Scirpoideæ, with *Scirpus*, *Cyperus*, *Eriophorum*, *Eleocharis*, and *Fimbristylis* as the principal genera; and Caricoideæ, the chief genera of which are *Carex*, *Schömus*, and *Rhynchospora*. Aside from the references given above, the members of this order are of little economic importance. See **CYPERUS**; **SCIRPUS**; **BULRUSH**; **COTTON-GRASS**; **PAPYRUS**.

CYPERUS (Neo-Lat., from Lat. *cyperos*, *cyperum*, Gk. κύπερος, *kypeiros*, sedge). A genus of plants of the natural order Cyperaceæ which contains a great number of species, chiefly tropical, and gradually decreasing in number toward

the colder parts of the globe. Many of the species have tubers or corms, which in some are mucilaginous and nutritious; others contain a bitter principle, and possess medicinal qualities. Of the latter class is *Cyperus longus*, or sweet cyperus, one of the species which is common in ditches and wet meadows in some parts of Europe, the rhizome of which has an odor of violets, and is astringent, tonic, and stomachic. It has been employed in medicine from very ancient times, but is now more used in perfumery. Some of the Indian species are also used medicinally and in perfumery in their native country, as well as species of kindred genera. Of those with esculent tubers, the most important is *Cyperus esculentus*. (See CHUCA.) A number of species are frequently grown as house plants, common among which are the umbrella plant or umbrella palm, *Cyperus alternifolius*, and *Cyperus papyrus*, formerly called *Papyrus antiquorum*, the Egyptian paper-plant. See PAPHYRUS.

CYPHEL. See HOUSE-LEEK.

CY-PRÈS, sè' prâ' (OF., as near). The principle of English and American law whereby a testamentary gift which cannot take effect in the precise manner intended by the testator is given an effect as nearly as possible like that which was intended. The doctrine has been applied in two classes of cases.

In the Creation of Fee-tail Estates.—It is an established rule of real property law that a gift of land by way of remainder to the issue of an unborn person is void if it follow a gift of a life estate in the same property by the same instrument to such unborn person himself. But if the gifts be made by will, the remainder to the issue may be saved by construing the life estate of such unborn person as a fee tail, in which case it is capable of descending to the issue as tenant in tail. See FEE TAIL; ESTATE.

In Charitable Gifts.—Where the object of a charitable gift fails, as by the dying out of the entire class of persons intended as beneficiaries of the charity, or where a charitable gift might be void in consequence of the indefiniteness of the charity or the operation of the rule against perpetuities, the court of chancery may direct the application of the property to another or to a specific charity. Thus, in the first case, a testamentary gift for the emancipation of slaves in the United States might, after the abolition of slavery, be devoted under the cy-près doctrine to the education of emancipated slaves; and, in the second case, a charitable gift for the benefit of the American Zionist Society—there being no such society in existence and there being a possibility that it may not come into existence within the period fixed by the rule against perpetuities—may be applied to the purposes which the testator had in mind, through the agency of any other society having similar aims and competent to make a beneficial disposition thereof.

It is in cases of charitable gifts that the cy-près doctrine finds most of its applications in the United States. It has been repudiated in several of the States, but in most of them it exists, and in New York, where it has for many years been in abeyance, it has recently been revived by statute. It is generally considered a salutary doctrine, as tending to preserve to charity a gift clearly intended for benevolent pur-

poses, and as effectuating the general intention of the testator, even though the particular intention entertained by him cannot be carried into effect. See CHARITABLE TRUSTS; PERPETUITIES; TRUST; INTERPRETATION; WILLS; and the authorities there referred to under those titles.

CYPRESS (Fr. *cyprès*, Lat. *cupressus*, Gk. *κυπάρισσος*, *kyparissos*; connected by some with Heb. *gopher*, a sort of tree, Assyr. *giparu*, reed, canebrake). Evergreen trees and shrubs of the genus *Cupressus*, and of the natural order Conifera. They have small, generally appressed and imbricate leaves and globular cones of a few thickened scales. There are about a dozen species, natives of Europe, Asia, and the western part of North America. One of the best known is the common cypress of the south of Europe (*Cupressus sempervirens*), and introduced into England and parts of the United States, a tree which attains a height of 80 feet, and is famous alike for the great age it reaches and for the durability of its wood. The wood is red or yellowish, hard, compact, and durable. It is not subject to attacks of insects and was once in great demand for cabinet work. It is believed to be the cedar wood of Scriptures and possibly the gopher wood also. Museum specimens of the wood are known to be several thousand years old, and the old doors of Saint Peter's at Rome lasted for more than 1100 years until replaced by doors of bronze. Medicinal virtues were once attributed to the wood, but its present use is for cabinet work and musical instruments. Perhaps the finest tree of this genus is *Cupressus macrocarpa*, the Monterey cypress of California. It is a beautifully symmetrical tree, attaining a height of 150 feet and a circumference of trunk of eight to ten feet. It grows rapidly, even on poor soils, and thrives best near the sea. It is not very hardy; freezing temperatures are fatal to it. A small tree (*Cupressus Macnabiana*) of California is much hardier. *Cupressus funebris*, of China, has wide-spreading and often pendulous branches; it attains a height of 60 feet, and has been extensively planted as an ornament in regions adapted to it. *Cupressus lusitanica* is common ornamentally in the south of Europe, where it is known as cedar of Goa. *Cupressus torulosa* is a valuable species found in the north of India. *Cupressus obtusa* or *Retinospora obtusa*, a Japanese species, is hardy, attains a height of 100 feet, has a hard, close-grained, durable wood, which is considered of great value in Japan, where the tree is abundant in the forests. It is hardy in the latitude of New York, and some of its varieties are of great beauty. Other species occur in Japan, Mexico, and the United States. By some botanists the species of *Chamaecyparis* are united with *Cupressus*. Among the best known are the white cedar (*Cupressus thyoides*) of the eastern United States, the yellow cedar (*Cupressus nootkanensis*), and Port Orford cedar (*Cupressus Lawsoniana*), all of the Pacific Coast region. The bald or southern cypress (*Taxodium distichum*) is a tall tree with deciduous leaves which occurs abundantly in the swamps from Maryland to Missouri and south to the Gulf of Mexico. The timber of this tree is valuable for many purposes. It works easily and is commonly used for shingles. In water it is very durable. When growing in wet places curious, conical, hollow upward growths, called knees, rise from the roots. Their function

CYPRESS, ETC.

1. MONTEREY CYPRESS (*Cupressus macrocarpon*).
2. BROOM (*Cytissus scoparius*).
3. CUBEBS (*Piper cubeba*).

4. AN ORNAMENTAL CROTON (*Croton Cooperi*).
5. RED CURRANTS (*Ribes rubrum*).
6. NUT GRASS (*Cyperus rotundus*).

is not positively known. The tree will grow in dry places, and is frequently planted as an ornament as well as for its timber. For illustration of a California cypress-tree, see *PLATE OF CYCADS AND CYPRESS*. For fossil forms of cypress, see *CONIFERÆ*.

CYPRESS SWAMPS. Swamps of the southeastern United States in which the bald cypress (*Taxodium distichum*) is one of the dominant trees. See *SWAMPS*.

CYPRESS-VINE. See *IPOMŒA*.

CYPRIA (Lat., from Gk. *Κύπρια*, *Κύπρια*, from *Κύπρος*, *Κύπρος*, Cyprus). The title of a poem once ascribed to Homer, but declared by Herodotus not to be his, and later attributed to Stasinus or Hegesias. It relates the causes leading to the Trojan War, and so is a sort of preface to the *Iliad*.

CYPRIAN. A name sometimes given to a courtesan as being a follower of Venus, the Cyprus-born goddess of love.

CYPRIANUS, or CYPRIAN, THASCIUS CECILIUS (? -258). The great leader of the early African Church. He was born in North Africa, probably not in Carthage, though at the time he first comes into notice he was living there in the luxurious style of a man of large wealth. His training had been in the law, and he had attained prominence as a teacher of rhetoric. Up to 246 he had been a pagan. Then he applied for admission to the Christian Church as a catechumen, and after instruction was baptized. Such a man was a great gain to the Church. He early gave evidence of his piety and desire to throw in his lot with the Christians by voluntarily parting with his property and giving the proceeds to the poor. In 247 he was made a presbyter, and in 248 Bishop of Carthage. He owed his rapid elevation to his high character, his noteworthy gifts of administration, and to the promise he gave of being a devoted leader. These hopes he did not belie. No sooner had he become accustomed to the duties of his high office than the peace which the Church had enjoyed for many years was broken by the sudden exhibition of zeal for the old faith on the part of the Emperor Decius. By the imperial decree of 249 Christianity became a forbidden religion; its profession meant confiscation, torture, exile, even death, and bishops had a price set upon their heads. Not from cowardice, but from the conviction that it was better for him to continue to guide his flock, which he thought he could do just as well out of Carthage as in it, in January, 250, he went into retirement; not exactly concealment, because it must have been easy for the authorities to find him if they wished. Thus he lived fourteen months, and then as calmly returned to Carthage. His time had been well spent, and the fruits of it appear in his preserved correspondence and treatises. But when once more in the city he saw for himself the desolation the persecution had caused. Many had denied the faith, or pretended to do so, many had abandoned their homes, many had died. The more pressing question related to the treatment to be accorded the 'lapsed,' whom he treated sternly and commanded to repent and show contrition; then he would receive them. (See *LAPSED*.) He had indeed dealt with the matter while in retirement, but now he must take a more decided stand. In March, 251, he

held his first council at Carthage, and there he met the internal foes, who had greatly increased during his retirement, and was compelled to yield some points. The relation between the Bishop of Rome and the Bishop of Carthage is the most interesting point. Cyprian treats Stephen, the bishop of the former, as an equal, and they differ upon the important matter of the reception into the Church upon their renunciation of heresy of those who had been baptized by heretics. Stephen—and this was the Roman and ultimately the general position—did not re-baptize such, while Cyprian did. The controversy between these bishops was sharp and even acrimonious. Stephen called Cyprian a pseudo-Christian; Cyprian called Stephen a schismatic.

The episcopate of Cyprian was indeed a troubled one; heretics, schismatics, feeble, timid Christians, scheming, ambitious leaders, and, to add to the turmoil, the horrors of pestilence—all these must have greatly worried the Bishop. But he did much to strengthen the episcopate as an institution, and make Church councils part of the regular machinery of the Church. These two services entitle him to everlasting remembrance. He held seven councils, the last in 256. But the end which he had long anticipated was very near. In August, 257, persecution once more broke out, this time under Valerian, the successor of Decius, and Cyprian was apprehended. He was treated with the utmost tenderness, for manifestly the officers were discharging a very disagreeable duty. He was brought before the proconsul (August 30, 257), required to sacrifice to the gods, and on his refusal banished to Curubis, a free town near the sea (modern Xurbo), 50 miles southeast of Carthage. There he lived, attended by many friends and active in his episcopal duties, for eleven months, when he was recalled to Carthage and lived for a while in his own home. On September 13, 258, he was again arrested, brought before the consul, sternly questioned, and sentenced to death. "Our pleasure is that Thascius Cyprianus be executed by the sword;" to which Cyprian only said, "Thanks be to God." On September 14 the sentence was carried out.

The writings of Cyprian are most interesting and handle a great variety of topics. The eighty-two letters are the most important, but the treatises on the "Unity of the Church," the "Dress of Virgins," the "Lapsed," the "Lord's Prayer," the "Vanity of Idols," "Against the Jews," and others are very instructive. The best edition of his writings is by G. Hartel (3 vols., Vienna, 1868-71); there is an English translation in *The Ante-Nicene Fathers*, vol. v. (Buffalo, 1886-96). Consult A. Harnack, *Drei wenig beachtete Cyprianische Schriften und die Acta Pauli* (Leipzig, 1899); and for his life consult E. W. Benson (London and New York, 1897).

CYPRINE, *sīp'rīn* or *-rīn* (Lat. *cyprinus*, *cuprinus*, from *cuprum*, copper). A name given to a pale sky-blue or greenish-blue variety of vesuvianite. Its color is said to be caused by a small amount of copper, whence its name.

CYPRINIDÆ (Neo-Lat. nom. pl., from Lat. *cyprinus*, Gk. *κυπρίνος*, *kyprinos*, carp). A family of soft-rayed fishes inhabiting the fresh waters of North America, eastern Asia, and Africa. The head is naked, and the body, with a

few exceptions, is covered with cycloid scales. The mouth bears no teeth, but the pharyngeal bones bear from one to three series of teeth, with a maximum of seven teeth in the main series. There are about 200 genera and 1000 species. They are usually very numerous in individuals. With exceptions like the goldfish, they are not highly colored. The males often differ from the females during the spawning season, not only in additional colors, but in the growth of tubercles on the head, fins, and other parts of the body. The family includes such familiar fish as the chub, dace, carp, tench, bleak, bream, barbel, minnow, goldfish, roach, loach, etc. Most of the North American species are small, under 12 inches in length. The Old World forms and some of the Pacific Coast species grow to a much larger proportion, and are often important as food. All important kinds are described elsewhere under their English names. See *CARP*.

CYPRINODON'TIDÆ (Neo-Lat., from Gk. *κυπρίνος*, *kyprinos*, carp + *ὀδός*, *odous*, tooth). A large family of soft-rayed fishes closely related to the Cyprinidæ (q.v.), with which they were formerly placed. The body is elongate, compressed behind and usually depressed at the head, and both are covered with rather large cycloid scales. The mouth is small, extremely protractile, and provided with small teeth; the lower jaw usually projects, and the pharyngeal bones are not armed, as in the Cyprinidæ. The sexes are usually unlike, and some of the species are viviparous. In these the anal fin of the male is modified into an intromittent organ. The species are numerous, but none attains a large size, and some are extremely small. They inhabit the fresh-water streams, brackish waters and bays of America, southern Europe, Africa, and Asia. The family includes the top-minnows, mummichog, killifish, etc., and the interesting anableps, or four-eyed fish. Many of the species are extremely resistant and have become adapted to very diverse habitats. See *MINKOW*; and *PLATE OF KILLIFISHES AND TOP-MINNOWS*.

CYPRIOTES, sîp'ri-ōts (from Lat. *Cyprius*, Cyprian, from *Cyprus*, Gk. *Κύπρος*, *Kypros*, Cyprus; Turk. *Kıbrıs*). Natives or inhabitants of Cyprus (q.v.). Since there appears to have existed at least as early as B.C. 4000 an indigenous civilization in the island of Cyprus, the creative and stimulative influences of which are discoverable all over the eastern Mediterranean, the relationship of its ancient inhabitants is a question of great importance. The idea that they were simply Semitic Phœnicians is being abandoned, since the civilization of the latter may very well have been derived from Cyprus, and not *vice versa*. Some of the latest authorities, like Ohnefalsch-Richter and Sergi, regard the autochthonous civilization of Cyprus as belonging, with the prehistoric Egyptian, to the Afro-Mediterranean or 'Afro-European' culture-centre, and its originators physically to the North African white race. Asiatic influence as such is later.

The literature about the Cypriotes and their culture is listed up to date in Cobham, *Bibliography of Cyprus* (London, 1900). The ethnological questions involved have been discussed by Ohnefalsch-Richter, in his article in the *Verhandlungen der Berliner Gesellschaft für Anthro-*

pologie for 1899, and by Sergi in his *Mediterranean Race* (London, 1901).

CYP'RIPE'DIUM. See *LADY'S-SLIPPER*.

CYPRUS (Lat., from Gk. *Κίπρος*, *Kypros*). One of the largest and most important islands in the Mediterranean, in the northeast of that sea, nearly equidistant from Asia Minor on the north and Syria on the east, 46 miles from the former, and about 50 miles from the latter (Map: Turkey in Asia, E 5). It is 145 miles long and 60 miles wide. Area, 3584 square miles. Cyprus formerly belonged to the Ottoman Empire, but since 1878 has been under British control. A great part of the island is occupied by two mountain ranges in a general direction of west to east. The loftiest, which fills the whole southern portion of the island, is called Olympus, a name applied by the ancients to one particular peak. The highest summit is that of Mount Troodos, about 6500 feet. The range terminates in the isolated peak of Oros Stavro, or Hill of the Holy Cross, a conspicuous object from Larnaka, and evidently the peak called Olympus by Strabo, although it is but 2300 feet high. The northern range is an unbroken ridge for 100 miles, inferior in elevation to the other, its highest summits not exceeding 3200 feet. Between these ranges is a broad plain extending across the island from the Bay of Famagosta to that of Morphu on the west, about 60 miles long and from 10 to 20 miles wide. This plain is called Messaria, and is watered by two streams. It is open, but little cultivated. It is bare of timber, and only the loftiest and central summits of the Olympian range retain their covering of pine woods. The climate varies in different localities; in the central plain and about Larnaka the heat is excessive, but is tempered by cool sea-breezes until about the middle of September, between which time and the end of October is the hottest period. The winter is short and cold, but snow is seldom seen except upon high mountain peaks. Fevers are prevalent during the warm months.

In ancient times Cyprus supplied the Greek monarchs of Egypt with timber for their fleets. It was also celebrated for its mineral wealth, especially for copper, a metal which takes its name (*cuprum*) from the name of the island. No copper-mines are now worked. There was also considerable silver produced, and Pliny says the precious stones were found there. Salt, for which the island was noted in olden times, is still produced in large quantities in the neighborhood of Larnaka and Limasol. Gypsum and terra-umbra are the chief minerals found. The principal vegetable productions are cotton, wines, and fruits; some tobacco is grown. Cultivation is easy and the soil in many places is exceedingly productive, particularly at the foot of Mount Olympus, and along the level land of the northern shore.

Drainage and the planting of trees has greatly benefited the least healthful regions. Agriculture and manufactures, formerly in a backward state, have made considerable progress since the island came under British rule; according to current estimates about two-thirds of the arable land is under cultivation. The success of the crops depends on irrigation, which is chiefly effected by means of wells. The rivers are short and variable in volume, depending for their water

on the rains and the melted snow from the mountains. During the hot season they present only dried-up watercourses. The formation of the coast-line is unfavorable to commercial development, as there are practically no good harbors. The chief places of trade, Larnaka and Limasol, have only roadsteads; and Salamis, which was the chief port of antiquity, and Famagosta, which held that position under the Venetians, are only artificial harbors on an open sandy coast. The English early selected Famagosta as the most favorable place to construct a good harbor. The towns in Cyprus worthy of notice are: Lefkosia, commonly called Nicosia, which since the time of the Lusignan kings has been the capital of the island, and which has a population of over 12,500; Famagosta, on the eastern coast near the ruins of Salamis, important under the Venetians, but now having only a few hundred inhabitants; Lanarka, on the southeast coast on the site of the ancient Citium, now the chief place of trade, with 7000 or 8000 inhabitants; Limasol, on the southern coast, some distance west of the site of Amathus, the chief point for the export of wines; and Baffo, or Papho, on the site of the ancient Paphos, in the southwest. In 1871 Nicosia was brought into telegraphic communication with the rest of the world by means of a submarine cable to Latakia on the Syrian coast, and this line was subsequently extended to Larnaka; there is also communication by cable with Alexandria in Egypt. There are several hundred miles of telegraph lines and good roads. The commerce of Cyprus is comparatively unimportant, the average annual value of 1895-99 reaching but \$2,735,000, the imports generally exceeding the exports. Among the chief exports are raisins, cocoons, wines, wheat and barley, wool, carobs and flour; the chief imports are cotton and woolen manufactures, tobacco, groceries, rice, alcohol, iron, leather, petroleum, timber, sugar, soap, and cotton manufactures. The sponge-fisheries yield products valued at between \$100,000 and \$150,000 per annum.

By treaty between the British Government and the Ottoman Empire, June 4, 1878, Asiatic Turkey was placed under British protection, and permission was given to England to occupy Cyprus. Sir Garnet Wolseley was appointed Governor, and was installed as administrator, July 23. The head of the administration is the High Commissioner, who is assisted by an executive council consisting of three office-holders, and a legislative council of eighteen members, one-third of whom are office-holders; the rest are elected on a property qualification, three by the Mohammedan and nine by the non-Mohammedan population. The municipalities are administered by elected councils. Education is to some extent controlled by the Government, and is chiefly of an elementary character. The total number of schools in 1899 was 408, of which 339 were in receipt of some aid from the Government, while the rest were maintained by endowments or private contributions. The total enrollment in all the schools was a little over 19,000, of which number 4300 were Moslems. Justice is administered by a supreme court, assize, district magistrate, and village courts, all of them with the exception of the first having natives for judges. For administrative purposes Cyprus is divided into the six districts of Nicosia, Larnaka, Lina-

sol, Famagosta, Papho, and Kyrenia. The chief sources of revenue are tithes, which are paid in kind, taxes on property, salt monopoly, and customs. The revenue shows an increase from £167,777 (\$838,885) in 1895-96, to £200,638 (\$1,003,190) in 1899-1900, while the annual grant from Great Britain shows a decrease from \$230,000 in 1896-97 to \$65,000 in 1899-1900. The currency consists of English, Turkish, French, and native coins. The weights and measures are Turkish.

The population, in 1891, was 209,286, of whom three-fourths were Greeks, 47,928 being Mohammedans; in 1901 it was 237,022, including 51,309 Mohammedans.

The early civilization of the island is known only from the excavations of recent years, which have thrown little light on the ethnic affinities of the primitive inhabitants. (See CYPRIOTES.) There are but scanty traces of the Stone Age, but the Bronze Age, both in the earlier period when pure copper is used and in the later period after the introduction of tin, is characterized by a well-developed and clearly marked civilization, presenting close analogies to that represented in the lower strata at Troy. The people seem to have been pastoral, and to have avoided the mountains and forests. They early learned to work the rich copper-mines of the island, and seem to have been somewhat in advance of their neighbors in Syria and on the islands of the Ægean. From its situation, Cyprus was exposed to foreign influences, and seems to have served as intermediary between Egypt and Syria and the Mycenaean civilization of the West. The Mycenaean civilization seems to have reached the island about B.C. 1600 and to have continued for about 800 years. Whether it was introduced by Greek colonists is uncertain, but these colonists certainly came to the island before the Dorians had occupied Peloponnesus, and before the introduction of the later Greek alphabet; for they spoke a dialect closely akin to that of the Arcadians, and used a clumsy syllabic mode of writing, which seems akin to that of southern Asia Minor and possibly of Crete. The Greek and Phœnician settlements belong to the Iron Age; the latter are found chiefly along the southern coast, where they remained predominant in Citium, Amathus, and Marion even in later times. The Greeks at first settled along the northern shores and at the eastern and western extremities of the great plain which crosses the island at Amathus, Salamis, Soli, and later predominated in Paphos, Citium, and Lapathus. Whether the worship of Aphrodite, which flourished greatly in Cyprus, developed from that of a nude nature-goddess of the original inhabitants or from that of the Phœnician Astarte is uncertain, but it reached the greatest splendor and sensuality among the Greeks, who regarded Cyprus as the favored spot where the goddess was born from the sea-foam. The island was invaded by Thothmes III. of Egypt, and in the eighth century before Christ was tributary to the Assyrians. In the sixth century it was conquered by Amasis of Egypt, and on the conquest of that kingdom by Cambyses, passed under Persian rule. The Greeks of Cyprus joined in the Ionic revolt, but were conquered, and Cypriote vessels were in the fleet of Xerxes. The attempt of Cimon to join Cyprus to the Athenian League was unsuccessful, and

the island remained tributary until Evagoras (q.v.) became King of Salamis (B.C. 410-374), made himself master of much of the island, and nearly succeeded in casting off the Persian yoke. After the battle of Issus, when Alexander advanced into Phœnicia, all the cities of Cyprus declared in his favor, and sent ships to assist him in the siege of Tyre. Under the Persian rule the cities had been allowed a large measure of self-government under the control of kings, who seem to have claimed descent from heroic ancestors. After the death of Alexander, the possession of this island, so important for its seemingly inexhaustible forests (it is now quite bare of trees), became an object of contention among his successors, being especially sought by Antigonus and Ptolemy. It finally passed into the hands of the latter and was for a long time a valued dependency of Egypt. In B.C. 58-57 the tribune Clodius proposed and Cato effected its annexation by Rome. Under Augustus it was made a proconsular province, and from this time is scarcely mentioned in ancient history. Cyprus is noticed in Acts iv. 36, where it is mentioned as the native place of Barnabas; and in Acts xi. 19-20 it appears prominently in connection with the earliest spreading of Christianity. During the reign of Trajan (A.D. 116) it was the scene of a rising of the Jews, who are said to have killed 24,000 of the other inhabitants. After the division of the Roman Empire, Cyprus passed under the Byzantine emperors. In 646 the Arabs became masters and destroyed the city of Salamis. Two years later the Greeks recovered sway; but in 802 it was again conquered by Harun-el-Rashid, who was soon compelled to relinquish it to the Byzantine rulers. In 1184 Isaac Comnenus made Cyprus an independent sovereignty. In 1191 Richard of England ejected Comnenus, and in 1193 put Guy de Lusignan in possession as compensation for the loss of Jerusalem, of which Guy had been appointed king. For three centuries, under this dynasty, the feudal system flourished in Cyprus, the cities of Nicosia and Famagosta were adorned with churches, splendid even in their ruins, and the island seems to have been rich and prosperous. Through the Venetian Catarina Cornaro, the wife of James II., the Republic of Venice came into full possession of the island in 1489 and held the rule for about eighty years. In 1570 the Turks invaded Cyprus, quickly subdued the country districts, took the capital (Nicosia) after a siege, and murdered 20,000 of its inhabitants. Famagosta held out for a year and then made a capitulation, which was immediately violated by the Moslem general, who slowly tortured to death the governor of the city. From that period Cyprus continued a part of the Turkish Empire. In 1878 it was placed under English control by a treaty, which recognized the sovereignty of the Sultan, and assured him an annual income of £92,746. In 1882 a new constitution was promulgated, and under English rule the prosperity of the island has greatly increased. The antiquities of the island have been the subject of much unscientific and inaccurate exploration, conducted chiefly for the purpose of obtaining booty. Of these earlier excavations the most productive were those of L. P. di Cesnola, whose collections are for the most part in the Metropolitan Museum in New York. Later excavations in the modern scientific

method have been conducted by the Cyprus Exploration Fund, the British Museum, Ohnefalsch-Richter, and others.

CYRANO DE BERGERAC, sé'rá'nó' de bār'zh-rák'. See BERGERAC.

CYRENAICA (Lat., from Gk. Κυρηναία, *Kyrēnaia*). The name of the district whose capital was Cyrene (q.v.). It comprised the tableland on the north coast of Africa from the Great Syrtis to the promontory of Ardanis (Rās el-Mellah), though its boundaries fluctuated according to the degree of subjection in which the neighboring tribes were held. This plateau of Cyrenaica was, and still is, one of the loveliest and most agreeable regions of the world. The climate is delicious, mountains on the south sheltering the land from the scorching blasts of the Sahara, and cool sea-winds fanning it on the north. From the central plateau, whose breadth is about 80 miles, the land slopes down in verdant terraces to the Mediterranean. These terraces are cut and watered by mountain streams, forming luxuriant ravines. The productions of Cyrenaica mentioned by ancient writers are wheat, oil, wine, honey, fruits of all kinds, cucumbers, truffles, cabbage; flowers yielding the richest perfumes; and a rare plant called *silphium*. The country was also celebrated for its breed of horses, but was much exposed to the ravages of locusts.

The chief cities of Cyrenaica were Cyrene, Taucheira (afterwards called Arsinoë), Hesperides (afterwards called Berenice), Barca, and Apollonia. To each of these five cities (whence in the time of the Ptolemies Cyrenaica was named Pentapolis and Pentapolitana Regia) a certain amount of territory was attached. This favored their individual independence; and the consequence was that the dynasty of Battus, who led the first Greek colony to Cyrene (q.v.), exercised very little influence over Cyrenaica in general. After the death of Alexander the Great, Cyrenaica became part of the Egyptian kingdom of Ptolemy Lagi, and in the second century B.C. a separate kingdom under a branch of the Ptolemaic family. In B.C. 96 it was bequeathed to the Romans by Apion, the last king,

and shortly after was united with Crete as a Roman province. It continued to prosper for some time, but with the increasing weakness of the Eastern Empire, to which it belonged, was more and more exposed to the encroachments of the desert tribes, and in A.D. 647 was overrun by the Arabs. Ancient Cyrenaica nearly corresponds to modern Barca (q.v.).

CYRENAIC SCHOOL. A school of philosophy established by the followers of Socrates upon his death. Aristippus of Cyrene, its founder, taught that pleasure was the highest good, thus developing one side of the Socratic teaching to the exclusion of all others. Virtue for this school meant the course of life that secured the greatest enjoyment. For this, wisdom is necessary, since the pursuit of pleasure, prompted by instincts and impulses as they arise, often defeats itself. The wise man is the man who knows how he can obtain the maximum of enjoyment and who acts upon this knowledge. This doctrine received various modifications according to the view its adherents took as to the way in which the hedonistic end is attainable. Thus Theodorus insisted that in the form not of the pleasure of the moment, but of enduring joy or 'cheerful frame of mind,' can true satisfaction be obtained; Hegesias urged that an excess of pleasure over pain is unattainable, hence the true end of human endeavor is to minimize the discomforts of life, and he carried this doctrine to its logical outcome, that death is preferable to life; hence he was called the 'recommender of death.' This is perhaps the earliest appearance of pessimism (q.v.) in Occidental philosophy. On the other hand, Amieeris maintained that in the search for pleasure the friendly, social, filial, patriotic man is most highly successful, and thus went far toward carrying egoistic hedonism beyond its most obvious limitations. The Cyrenaic school was the precursor of the Epicurean (q.v.). Consult Watson, *Hedonistic Theories from Aristippus to Spencer* (Glasgow, 1895), and the authorities referred to in the article on ETHICS. See ETHICS; HEDONISM; UTILITARIANISM.

CYRENE, *si-rē'nē* (Lat., from Gk. *Κυρήνη*, *Kyrēnē*). In ancient geography, the capital of Cyrenaica, in northern Africa, situated about 10 miles distant from the coast and 1800 feet above the level of the sea. It is said to have been founded in B.C. 631, by Battus and a body of Dorian colonists from the island of Thera. It carried on an extensive commerce with Egypt and Greece, and was the birthplace of many distinguished men—the philosophers Aristippus and Carneades, the poet Callimachus, the astronomer Eratosthenes, the rhetorician and Bishop Synesius.

CYRIACUS, or **CIRIACO DE' PIZZICOLLI** (1391-c.1449). One of the most diligent antiquarians of the Renaissance in Italy. He was born at Ancona. Possessed from boyhood by the spirit of exploration, he early entered upon the life of a merchant, which enabled him to gratify his passion for travel. Led by his admiration for Dante to Vergil, and thence to Homer, he turned to the study of the classics, and devoted his travels to the enthusiastic study and description of the remains of the past. Unlike most of the Italian scholars of his time, he did not confine himself to the monuments of Italy. He visited

Syria, Egypt, the islands of the Aegean, and finally Athens and the mainland of Greece, everywhere purchasing manuscripts, coins, and works of art, copying inscriptions, sketching and describing roads, walls, buildings, and any other evidences of the life of ancient Greece. His notes and drawings were collected in three large folio volumes, but after his death, which occurred about 1449, they became scattered, and now are known only by fragments or partial copies. Though Cyriacus never became a learned man, and often made ludicrous mistakes, his breadth of interest and untiring zeal led him to copy much that others neglected, and to him we owe our knowledge of many inscriptions and monuments which have since disappeared. Consult: Voigt, *Wiederherstellung des klassischen Altertums*, vol. i. (Berlin, 1893), where the earlier literature is cited; also Jahn, "Cyriacus von Ancona und Albrecht Dürer," in *Aus der Altertumswissenschaft* (Bonn, 1868).

CYRIL, *si-ril* (Lat. *Cyryllus*, Gk. *Κύριλλος*, *Kyryllos*), **SAINT** (?-444). A bishop of Alexandria, one of the most energetic but least amiable of the Church Fathers. He was born in Alexandria, but the date of his birth is not known. He was educated in the desert, 65 miles south of Alexandria, by the cenobitic monks of Nitria, with whom he lived for five years, and who probably inspired him with that fiery, intolerant, and impetuous zeal which characterized him through life. Subsequently he went to Alexandria, where he became a presbyter, and on the death of his uncle, Theophilus, A.D. 412, obtained the episcopal see. The Alexandrian Jews, who were numerous and riotous, were the first to feel the effects of his inflexible character. Some Christian blood having been shed by them in a city tumult, Cyril put himself at the head of a rabble of zealots, attacked the Jewish quarter of Alexandria, destroyed the houses, and banished the inhabitants. Orestes, the Prefect of Egypt, having drawn up an accusation against Cyril, was attacked in the streets by 500 monks, who had come up from the deserts of Nitria, at the call of their old companion, ready to defend him against his foes. One of these monks having fallen in the skirmish, his corpse was carried in procession to the high church of Alexandria, where Cyril delivered a sanguinary discourse, gave the dead monk the name of Thaumasius ('the excellent'), and pronounced him a martyr and a saint. The violent death of Hypatia (q.v.), the famous woman philosopher of Alexandria, at the hands of a mob, has often been laid to the charge of Cyril, but perhaps all that can be justly alleged against him on this count is that he was in great measure responsible for the riotous conditions which led up to this deplorable event. But the most important historic event in his career was his controversy with Nestorius (q.v.), whose doctrines were condemned by the Council of Ephesus, presided over by Cyril (431). All the sternest features of his disposition appeared in this contest. In the midst of disquietudes, which he himself had largely occasioned, he died June 9, A.D. 444. In the Greek Church his day in the calendar of saints is June 9, in the Latin Church January 28. Cyril's numerous writings consist of commentaries, treatises, homilies, epistles, etc. The best edition was published by Jean Aubert (Paris, 1638, reprinted in Migne, *Patrol. Græca*,

lxviii.-lxxvii.). Certain of his works have been published in critical editions by English scholars, among them his commentaries on Luke (1859), John (1872), Minor Prophets (1868), and *Five Tomes Against Nestorius* (1881). For his biography, consult Kopallik (Mayence, 1881). Charles Kingsley's brilliant romance *Hypatia* gives a view of Cyril tinged with the author's prejudices against monasticism.

CYRIL, SAINT (c.315-86). A bishop of Jerusalem and an eminent Church Father. He was born in Jerusalem about A.D. 315, and ordained a deacon in 334, a presbyter in 345, and, on the death of Maximus, in 351 was elected bishop of his native city. His metropolitan was the Arian bishop Acacius of Caesarea, with whom he was soon engaged in hot conflict concerning originally the rights of his office, but ultimately their differences of doctrine. Acacius accused Cyril before a council at Caesarea in 358, whose competency Cyril did not acknowledge, of selling the treasures of his church in a time of famine to feed the poor, and this Arianizing assembly undertook to depose him. He appealed to a larger synod, which was held at Seleucia (359), and was by it restored to his office; but once more, through the persevering hostility of Acacius, he was deposed by a council assembled in Constantinople in 360. On the death of the Emperor Constantius (361) he was again restored to his episcopate. Soon after his old enemy Acacius died, but Cyril was immediately involved in new difficulties, and after considerable strife was banished, by order of the Emperor Valens, in 367; nor did he return till the Emperor's death in 378. He died March 18, 386.

Cyril's writings are extremely valuable, not because of their vigor, profundity, or beauty, but on account of their theology. They consist of twenty-three treatises, eighteen of which are addressed to catechumens and five to the newly baptized. The former are for the most part *doctrinal*, and present to us in a more complete and systematic manner than the writings of any other father the creed of the Church; the latter are *ritual*, and give us a minute account of baptism, chrism, and the Lord's Supper. Their style is simple and unattractive. Cyril's works were published by A. A. Toutée, the Benedictine monk (Paris, 1720; Venice, 1761); they were reprinted in Migne, *Patrol. Græca*, xxxiii., and by G. C. Reischl and J. Rupp (2 vols., Munich, 1848-60; Eng. trans. by E. H. Gifford in *The Nicene and Post-Nicene Fathers*, 2d series, vol. vii., New York, 1894). Consult Delacroix, *Saint Cyrille de Jérusalem, sa vie et ses œuvres* (Paris, 1865).

CYRIL and METHODIUS. The apostles of the Slavs in the ninth century. They were brothers, and sprang from a respectable family living in the half-Slavic, half-Greek town of Thessalonica. Having been ordained priest, Cyril (whose name was properly Constantine) became secretary to the Patriarch of Constantinople, and later prominently connected with the anti-Jewish polemics. The latter interest it was which induced him to go forth, during the reign of the Byzantine Emperor Michael III., to evangelize the Khasars, dwelling by the Caspian Sea under a Jewish king who allowed Jews, Mohammedans, and Christians to live peacefully together. His labors were very successful, the Khan himself being among the

converts. At this time Methodius, his elder brother, was abbot of a famous monastery in Constantinople. The Duke of Moravia, Rostislav, having established an independent Slavic kingdom and driven out the German priests, applied to Constantinople for Christian teaching. The patriarch sent him Cyril and Methodius (864). Cyril invented the Slavic alphabet, and the brothers, assisted by a number of their pupils, completed their translation of the Holy Scriptures, which is in use to the present day among all Greek Catholic Christians (Russians, Bulgarians, and Serbs). Feeling the necessity of linking the Moravian Church to the power of Rome, the brothers, after three and one-half years of work, went to Rome. There they were cordially received and were ordained. The younger of the two brothers died February 14, 869, as monk in a monastery at Constantinople, where he had taken the name of Cyril. Methodius continued the work among the Slavs, but in Pannonia, not in Moravia. In 870 the Pope made him a bishop and in 873 archbishop. Supported by the Pope, he long kept up a constant fight with the German emissaries. He died at Wehlerad, April 6, 885. Consult: Ginzler, *Geschichte der Slavenapostel Cyril und Methodius* (2d ed., Vienna, 1861); Dümmler and Miklosich, *Die Legende vom heiligen Cyrillus* (Vienna, 1870); Goetz, *Geschichte der Slavenapostel Constantinus (Cyrillus) und Methodius* (Gotha, 1897); also *Vita Sancti Methodii*, ed. by Miklosich (Vienna, 1870). The *Apologia Moralis* ascribed to Cyril was published by Carter (Vienna, 1630).

CYRIL/LA (named in honor of Domenico Cirillo or Cyrillo, an Italian physician). An evergreen tree or shrub, of which there is but one species, leatherwood (*Cyrilla racemiflora*), found from the southern United States to Brazil. In the United States it occurs from North Carolina to Texas, and is hardy as far north as Philadelphia. It has bright green leaves, and white flowers in racemes. The species is variable, and under cultivation some of the varieties are very ornamental.

CYRIL/LIC ALPHABET. A method of writing invented by Cyril, apostle of the Slavs (see CYRIL; METHODIUS) between 855 and 863. It is based upon the Greek *uncials* of the eighth or ninth century, with the addition of some signs to represent sounds not found in Greek. It originally consisted of thirty-eight characters, to which ten more were added later. With some modifications, introduced chiefly by Peter the Great, it is the alphabet now used in Russia, Bulgaria, and Servia. Consult Taylor, *The Alphabet*, vol. ii. (London, 1899).

CYRIL LUCAR. See LUCARIS, CYRIL.

CYR/OPÆ/DIA (Lat., from Gk. Κύρου παιδεία, *Kyrou paidéia*, education of Cyrus), THE. The longest work of Xenophon, purporting to give a history of the early life and training of Cyrus the Great, but in reality an historical romance. Its elaborate scheme of government and education are Spartan rather than Persian, and the whole work is to be regarded as the exposition of an ideal government. The story of Abradatas and Panthea is the earliest specimen of the love romance.

CYRTOCERAS, sēr-tōs'ē-ras (Neo-Lat., from Gk. κυρτός, *kyrtos*, curved + κέρας, *keras*, horn).

A genus of curved tetrabranchiate cephalopods, of which fossil species are found in rocks of Devonian age. They have large laterally compressed or triangular curved shells, with sub-triangular or T-shaped openings. The camerae or chambers are very short, so that the septa are close together, and the siphuncle is large, ventral, or sub-ventral, and restricted at each septum so that in a longitudinal section of the shell it gives the appearance of a string of elongated beads. The genus *Cyrtoceras* formerly included a great variety of curved shells, most of which have been proved by Hyatt to belong to other genera and even other families from that which includes the type species. Consult: Hyatt, "The Genera of Fossil Cephalopods," *Proceedings Boston Society of Natural History*, vol. xxii. (Boston, 1884); von Zittel and Eastman, *Textbook of Palaeontology*, vol. i. (London and New York, 1900). See also CEPHALOPODA; ORTHOCERAS; NAUTILUS; NAUTILOIDEA. For illustration see Plate of CEPHALOPODA.

CYRUS. River in Transcaucasia. See KUR.

CYRUS THE GREAT, or **CYRUS THE ELDER** (c. 600-529 B.C.). The founder of the Persian Empire and conqueror of Babylon, whom Isaiah called the *anointed* of the Lord and his *shepherd* (Isa. xlv. 28; xlv. 1). The name of this monarch appears in Old Persian as *Kūruš*, in the Babylonian inscriptions as *Kūruš*, in Hebrew as *Kōreš*, and in Greek as *Kēpos*, whence Latin *Cyrus*. According to Herodotus, the name signifies *sun*; but there is some possibility, judging from the Neo-Elamitic, that its signification may have been *shepherd*, with which the Isaiah passage might be compared. The lineage of this great King we have on his own authority on a famous cuneiform cylinder discovered some years ago. (Consult *Journal Asiatic Society*, London, 1880). This was written in the Babylonian language, and is now among the treasures of the British Museum. In this Cyrus traces his royal claim through his father, Cambyses, and his grandfather, Cyrus, back to Teispes; the latter was the son of Achaemenes (q.v.), founder of the Achaemenian line. The ancestral home was Anshan, or Anzan, which is believed to have been a city or district of Elam (q.v.). However that may be, there can be no doubt that Cyrus was a Persian, and he is rightly so called in the Old Testament.

According to the cuneiform records of Nabonidus (*Nabū-nā'id*), Cyrus was a vassal of Astyages (*Ištaregu*), who is spoken of as King of the Medes, or again of the Scythians. There is good ground for believing that Cyrus was directly connected with this ruler by the ties of blood. Herodotus (i. 107ff) expressly states that Cyrus was the grandson of Astyages, whose daughter Mandane had been married to Cambyses, a Persian noble. The Greek historian has a number of interesting and highly colored legends to narrate regarding the fear of Astyages for the infant as his future vanquisher, with popular stories also regarding the fortunes of the youthful prince and his rapid elevation to power. Whatever value is to be placed on these picturesque accounts, there is no question that Cyrus's triumphant career began with his overthrow of Astyages and his final mastery of Media before the year B.C. 550. The conquest of the Median Empire opened the way for

further success, and Cyrus turned his victorious arms against Crœsus of Lydia, whom he vanquished B.C. 546. Asia Minor was thus brought practically under this ambitious ruler's sway.

The time had now arrived to strike a mighty blow against Babylon. Nabonidus, the King of that ancient capital, seems to have estranged himself from his subjects, and to have lost the favor of the priestly class. By preference he lived at Temä, or Tevā, and when the condition of affairs within Babylon itself became such as to call him back it was too late. The account of the fall of the city we can gather by combining the testimony of the cuneiform records with the biblical narrative and Herodotus. Internal factions seem to have been numerous; the Jews, who were in captivity in the city, apparently played a part. Babylon is stated to have fallen *without fighting* before the victorious hosts of Cyrus, and Nabonidus was utterly overthrown. Belshazzar of the Old Testament may have been Bel-sar-usur, the son of Nabonidus, who, according to the inscriptions, offered resistance to the advance of Cyrus's forces. The fall of the city itself occurred at the moment of the great Tamuz festival, July, 539, and it was actually accomplished by Cyrus's satrap Gobryas (Gubaru or Ugbaru of the inscriptions), who was in command of the advance army. Cyrus himself made his triumphal entry into the city in October, 539, and became King of Babylon. The famous cylinder above referred to records the inauguration of his rule. We know in general that his policy toward the conquered people was a most liberal one, and even though it may have fallen somewhat short, perhaps, of the enthusiastic hopes of a prophetic Isaiah, its ultimate influence and effects are undoubted as having contributed toward the restoration of the Jews from captivity. See BABYLON.

The ambition of Cyrus, growing with advancing years, led finally, it seems, to his own destruction. The vision which Herodotus tells us Astyages beheld in a dream of the figure of the youthful Cyrus adorned with wings that overshadowed all Asia seemed now on the eve of fulfillment. The great conqueror's dominions actually extended almost from the Hellespont to the Indus. But disaster was at hand. Cyrus engaged in an invading expedition against the Scythian hordes of the north (Herod. i. 204; Ammianus Marcellinus, 20, 6, 7, 40). In a battle against the Queen, Tomyris, Cyrus is said to have been slain. Ctesias (*Pers.* 6-8), however, states that Cyrus fell in battle against the Derbica, a tribe bordering on India. The year of his death was B.C. 530-529, and his age is given as seventy-one years. His body is said to have received a final resting-place at Pasargade. A tomb, now empty, still stands there surmounting a series of rising stone steps. Near by is a huge monolith slab that once bore his name; but this is broken and tumbled down, a monument, like the empty and lonely mausoleum, silently recording the fall of greatness.

In estimating the character of Cyrus, after we have considered all the accounts of him, we may judge him to have been not only a man of great personal power, but an ideal king. The Persians called him father (Herod. iii. 89, 160); the Jews looked upon him as their liberator; the Greeks admired his qualities as a ruler and legislator (*Æschylus, Pers.* 764-68); and Xenophon chose

him as the hero of his famous historic romance, the *Cyropædia*. Taken for all in all, his claim to be entitled Cyrus the Great, as history has crowned him, remains unchallenged with time. The best short account of Cyrus, with abundant references, is that of Justi, in Geiger and Kuhn, *Grundriss der iranischen Philologie* (Strassburg, 1897). Consult also Duncker, *History of Antiquity*, Eng. trans. (London, 1881). Passing mention may be made of Horner, *Daniel, Darius the Median, Cyrus the Great* (Pittsburg, 1901).

CYRUS THE YOUNGER (? -401 B.C.).

The second of the sons of Darius Nothus, or Ochnus, and Parysatis, familiarly known through Xenophon's *Anabasis*. When his elder brother, Artaxerxes Mnemon (q.v.), succeeded to the throne (B.C. 404), Cyrus conspired to deprive him of his crown and his life. The plot, however, being discovered, he was at first sentenced to death, but afterwards pardoned, through his mother's intervention, and was even restored to his dignity of satrap of Asia Minor. Here he employed himself in making arrangements for war against his brother, although he concealed his purposes to the very last. In the spring of B.C. 401 he left Sardis at the head of 100,000 Asiatics and 13,000 Greek mercenaries, under pretense of chastising the robbers of Persidia. Artaxerxes, being warned of Cyrus's perfidy, made preparations to oppose him, and the two armies encountered each other in the Plains of Cunaxa, between 60 and 70 miles from Babylon. Cyrus was defeated and slain, although the Greeks fought with the greatest courage, and even routed that portion of Artaxerxes's troops immediately opposed to them. The fortunes of the Greeks, on their retreat through the highlands of Kurdistan and Armenia in severe winter weather, are recorded by Xenophon in his *Anabasis* (q.v.). That historian represents Cyrus the Younger as endowed with every amiable quality.

CYST (from Gk. *κύστις*, *kystis*, bladder). A tumor containing one or more cavities, the contents of which are of a fluid or semi-fluid consistence. The cyst-wall is formed of connective and fibrous tissue, rarely of muscular fibres, and the inner surface of the cavity is lined with epithelium. Cysts are classified according to their mode of development. Some are found in glands and are due to an excess of the normal cell-secretion; others are caused by obstruction of the ducts through which the secretion naturally escapes. One class, known as dermoid cysts, are due to faulty embryonic development, and these at times contain hair, nails, or teeth. Occasionally solid tumors undergo cystic degeneration. Hydatid cysts are of parasitic origin, and occur most frequently in the liver. Besides these there are numerous other varieties depending upon the tissues in which they grow. Cysts vary in size from minute retention cysts on the face to the enormous tumors of the ovary, one of which is reported as weighing 116 pounds. Surgical interference is frequently required. See OVARIES; HYDATIDS.

CYSTIDÆA. See CYSTOIDEA.

CYS'TIN (from Gk. *κύστις*, *kystis*, bladder), $C_5H_7NO_2S_2$. An organic acid (amido-sulpholactic acid), allied to lactic acid and having the constitutional formula $HOOC(NH_2)(CH_2)_2C.S.S.C(CH_3)(NH_2)COOH$. It is the principal constituent of the urinary calculus known as

cystic calculus, from which it may be obtained by dissolving in ammonia and allowing the solution to evaporate, the cystin separating out in the form of characteristic colorless crystals, which are insoluble in water, alcohol, or ether.

CYSTITIS (Neo-Lat., from Gk. *κύστις*, *kystis*, bladder). Inflammation of the urinary bladder. Among the causes of cystitis may be mentioned injuries, exposure to cold, injection of irritating medicaments in treating the urethra, insertion of a dirty catheter when drawing off the urine, retention of fermenting urine, extension of inflammation from other adjacent tissues, or the presence of a calculus (q.v.). The inflammation is accompanied by chills, fever, some nausea, pain in the bladder, and a continual desire to urinate. The urine is generally cloudy, from mucus and pus, or bloody. In treating cystitis, heat should be applied to the abdomen, or the patient should take a hot sitz-bath; he should take large quantities of alkaline drinks, and rest in bed. In many cases it is necessary to wash out the bladder, and a variety of drugs are used, according to the exact nature of the symptoms.

CYS'TOCARP (Gk. *κύστις*, *kystis*, bladder + *καρπός*, *karpós*, fruit). A complex form of fructification developed in the red algæ as a result of the sexual act. See RHODOPHYCEÆ; ALGÆ.

CYSTOIDEA (Neo-Lat. nom. pl., from Gk. *κύστις*, *kystis*, bladder + *εἶδος*, *eidos*, form). A class of extinct echinoderms of the subphylum *Pelmatozoa* (q.v.), allied to the erinoids and blastoids, but differing from these chiefly in the irregular arrangement of the plates of the calyx and the imperfect development of their arms. In general appearance the Cystoidea resemble the erinoids, with the remains of which they are often found associated in the Ordovician and Silurian strata. The cystoid body was included in a case or 'calyx' of variable form, spherical, cylindrical, hemispherical, or discoid, which is made up of polygonal calcareous plates without regular arrangement. The calyx-plates seem to have been, in many early genera, loosely united to each other, so that they became easily dissociated after death of the animal. This explains the rarity of perfect individuals in the Ordovician rocks, where the fragments are often exceedingly abundant. Another characteristic is the presence of pores that perforate the plates and that are arranged in rhombic series. These pores are supposed to have been connected with the respiratory apparatus. The number of plates in the calyx is very variable, from 10 or 12 to over 100, and as a rule those forms with the largest number of plates show the greatest irregularity in their arrangement. In some of the forms, with less number of plates, these are arranged in regular transverse rows, and the calyx then approaches more nearly the aspect of the simpler forms of erinoids.

The arms are absent in many genera of cystoids, and when present are seldom found attached to the calyx. They are never pinnulated like those of the erinoids, though they are composed in a similar manner, and are often supplied with grooves. In those cystoids without free arms there is generally found on the ventral surface of the calyx a system of ambulacral furrows that radiate irregularly from the mouth-

opening. These furrows, representing the arms, are bordered by rows of small plates that often bear pinnules of delicate construction, as seen in *Callocystites*, *Glyptosphaerites*, and *Agelaerinus*. The more primitive cystoids have neither arms nor ambulacral furrows. The openings of the calyx are four in number. The mouth is central or subcentral on the upper or ventral surface; the anal opening is eccentric, and is generally closed by a pyramid of small, triangular plates; a third opening, often present near the anal opening and generally closed by triangular plates, is considered to be the genital orifice; and a fourth small, slit-like aperture, present in only a few genera, is of problematic nature. The calyx of the cystoid is usually elevated on a stem which often resembles that of the crinoid in being composed of a single series of plates pierced by a central canal. In some genera (as *Dendrocystites*) the stem is made up of plates arranged in transverse rows, and the central cavity is then much enlarged and continuous with the general cavity of the calyx. In *Echinospaerites* the stem is reduced to a tubercle on the dorsal surface, and the animal seems to have been a free living form. The discoid genera *Agelaerinus* and its allies are sessile, and are attached either by a pedestal or by cementation of the dorsal surface of the calyx to foreign objects, generally the shells of mollusks.

Classification of the Cystoidea is a matter of difficulty, not alone because of the general imperfection of the material, but also on account of the great diversity of structure seen within the class, which contains a number of synthetic or ancestral types that seem to have given rise to all the other more specialized groups of the Echinodermata. Through assumption of a more regular arrangement of the plates and the development of the arms, with consequent rearrangement of the ventral surface, as in *Cryptocrinus*, *Poroerinus*, and *Caryoerinus*, they gave rise to the Crinoidea. Reduction of the plates and enlargement of the ambulacral grooves, with the assumption of the pentamerous gemmiform shape, as in *Asteroblastus*, leads to the Blastoidea. *Agelaerinus* is suggestive of the star-fish (*Asteroidea*) and brittle stars (*Ophiuroidea*), and finally the Echinoidea and Holothuroidea may be imagined to have been derived from the more spherical forms of armless cystoids, the echinoids presenting a series of progressive evolution, the holothurians a regressive series.

RANGE. The Cystoidea is the oldest known class of echinoderms; their isolated plates, rarely united to give a clue to the form of the animal, known under the names of *Eocystites*, *Protocystites*, etc., from the Cambrian rocks, are the earliest representatives. The class enjoyed two periods of expansion. First, in the early Ordovician time they flourished in hosts in some regions, their remains forming the larger part of certain limestones, such as the lower Chazy limestones of Lake Champlain. Other limestones, of Beekmantown and Trenton age, in the Saint Lawrence and Champlain valleys, and beds of equivalent age in the Baltic provinces of Europe, contain abundant cystoid remains. The second expansion of the class occurred during the Silurian time, when these creatures lived in abundance in some portions of the seas of northern and middle Europe and eastern North America. In all about 250 species are known,

and of this number only about 15 have been found in rocks above the Silurian system. The group entirely disappeared with the close of Paleozoic time.

(Prague and Paris, 1887); Bather, "The Cystidea," in Lankester's *Treatise on Zoology*, part iii., chap. ix. (London, 1900); von Zittel and Eastman, *Textbook of Paleontology*, vol. i. (London and New York, 1900). See CRINOIDEA; ECHINODERMATA; and articles on the other classes of echinoderms.

CYSTOLITHS (Gk. *κυστίς*, *kystis*, bladder + *λίθος*, *lithos*, stone). Masses of cellulose and calcium carbonate (the chief constituent of limestones), found in the cells of plants belonging to the families Urticaceae and Acanthaceae. They are most common in the epidermis of both leaves and stems, but are found also in the cortex and pith. A single cystolith occupies a cell, nearly filling it, though the cell is enlarged. Cystoliths are irregularly warty or nodulated like a compact bunch of grapes. Each is attached to the wall of the cell in which it lies by a short stalk of cellulose. In reality the cystolith is an outgrowth from the cell-wall, at first peg-shaped, later club-shaped, and finally warty. Its foundation substance is cellulose (the same as that of the wall), which is impregnated with a large quantity of calcium carbonate in the form of very fine granules, thus forming a stony mass. The stalk often contains silica. The carbonate is to be regarded as a waste product from the chemical processes occurring in the plant, and is of no further direct use. It can readily be dissolved out by weak acids, the process of solution being accompanied by effervescence and the evolution of carbonic-acid gas (carbon dioxide). Good examples of cystoliths are to be found in the leaves of nettles (*Urtica*) and of the fig (*Ficus*).

CYTASE (from Gk. *κύτος*, *kytos*, cavity, cell). An enzyme that attacks the cell-walls of plants and alters the chemical composition of some of the components so that the walls swell up in water, become translucent, and finally dissolve. The process is one of digestion. It is not yet known whether what is called cytase is a single enzyme or several, no sufficient study having been possible. Cytase has been found in the hyphae of various fungi which live as parasites in plants, destroying their tissues. It has also been identified in the seeds of many grasses, in which it is secreted chiefly by the 'gluten layer' (a layer of cells outside the starch-bearing ones), and in the seeds of certain Leguminosae, palms, etc. In many seeds the reserve food is stored as cellulose in the form of thickened walls, making the food-bearing tissue, the endosperm (q.v.), of bony hardness—e.g. vegetable ivory, the seed of a palm (*Phytolophus Indica*). In this seed certainly, and probably in all such

seeds, cytase is produced at germination to digest the reserve cellulose and render it available as food for the growing embryo. Since the substances which take part in the formation of cell-walls are numerous and diverse, and their composition is still uncertain, no adequate knowledge has been obtained as to the products of their digestion by cytase. From the cellulose constituents one or more sugars are produced, possibly by hydrolysis, through dextrins. Cytase acts only on cellulose walls, being unable to attack lignified or cutinized walls. It acts most energetically in a weakly acid medium, but is destroyed by temperatures of 60 to 65° C. It may be obtained (mixed with diastase) from malt by the method described under **DIASTASE** (q.v.). See also **ENZYMES**; and **DIGESTION**.

CYTHE'RA. See **CERIGO**.

CYTH'ERE'A. See **VENUS**.

CYTHE'RIS. A well-known Roman courtesan, the mistress of Marcus Antonius and later of Gallus, the elegiac poet. She is referred to under the name of Lycoris in Vergil's tenth Eclogue.

CYTISUS (Lat., shrubby kind of clover). A genus of plants of the natural order Leguminosae, of which some of the species, having long twiggly branches, are popularly called broom, others are called laburnum, while others still are generally known by the name cytisus. The species are numerous—small trees or shrubs, with leaves of three leaflets, and yellow, white, or purple flowers, natives chiefly of the warmer temperate parts of the Old World. Many of them are very beautiful, and some are among the esteemed ornaments of our shrubberies, others of our greenhouses. Several species of *Cytisus* have been recommended as forage plants, stock readily browsing upon their green twigs. *Cytisus scoparius*, the Scotch broom, is a form so valued, while *Cytisus proliferus alba*, the tagasaste of the Canary Islands, is highly commended. Trials of it in California have not substantiated the rather extravagant claims made for it.

CYTOL'OGY (Gk. κύτος, *kytos*, cell + λογία, *logia*, account, from λέγειν, *legein*, to say). A branch of the sciences of botany and zoology. As histology is largely concerned with tissues, so cytology deals principally with cells, the elements which make up the tissues. Although it is only recently that botanists have begun to make a specialty of this subject, the work has been prosecuted with great vigor and the subject is beginning to assume some definiteness. The chief problems at present are the structure and activities of protoplasm, the life history of plastids, the structure and function of the nucleus, the reduction of chromosomes, the origin and development of the achromatic figure, the centrosome, the cell-wall, the development of the sex cells, fertilization and the formation of the embryo, and, most difficult of all, the problem of heredity.

BOTANICAL CYTOLOGY. As yet little is known regarding the structure of protoplasm in plants, but the investigations which have been made favor the assumption that its structure is identical with that in animals. Much more attention has been paid to the nucleus. Even the small nuclei of many of the algae and fungi have been

studied, and the details of their structure and mode of division quite accurately determined. No organ of the cell has been so assiduously investigated as the chromosome, but nevertheless most of its important problems remain to be solved. The fact that the number of chromosomes is constant for a given species, and the phenomena of fertilization indicate that the chromosome is a permanent organ of the cell, but its life history from one cell generation to another has not yet been traced, the identity of the several chromosomes being lost in the resting nucleus. In the flowering plants the splitting of the chromosomes during nuclear division is generally conceded to be longitudinal in all cells except spore-producing cells in which the reduction of the chromosomes is taking place, and even here most botanists believe that the splitting is longitudinal, although a transverse splitting, i.e. a reducing division in the sense of the Weismann school, has been reported by investigators of undoubted ability. Both observations and theories are still very conflicting. The origin and development of the achromatic figure have received large attention, especially during the past five or six years. It was formerly supposed that the achromatic figure always rose under the influence of the centrosomes, but recent observations have made it very doubtful whether a centrosome exists at all in the angiosperms, and it is almost equally doubtful whether such an organ exists in the gymnosperms and pteridophytes, unless the 'blepharoplast,' a centrosome-like body which develops the cilia of the male cell, be interpreted as a genuine centrosome. In the other groups, except the mosses, which have received scant attention, an undoubted centrosome has been demonstrated.

The development of the sex cells, from the earliest appearance of the archesporium up to the time of fertilization, has been repeatedly studied in various plants, but the work has been morphological rather than cytological, little attention having been paid to the details of cell contents except in case of mother cells. In the study of cells more immediately concerned in fertilization, the cells of the sporogenous tissue have been slighted. Some of the most important cytological work deals with the problems of fertilization. The question of sexuality in the Ascomycetes has received a definite answer in the case of several forms by the demonstration of an actual process of fertilization. The fusion of the sex nuclei in ferns has been described with more or less completeness. In the gymnosperms, where the sex cells are extremely large, the process of fertilization has been more satisfactorily investigated, and it has been found that both the nucleus and the cytoplasm of the male cell enter the egg, but that the nucleus slips out from its cytoplasmic mantle before it reaches the nucleus of the egg. The male nucleus with its nuclear membrane still intact is then received bodily into the much larger egg nucleus. The chromatin of the two nuclei in the form of two distinct spires has been observed, and it has been suggested that the chromatins of the two nuclei may remain distinct during the later stages of fertilization, and even during the cell divisions which follow. In the angiosperms, while the union of the sex nuclei has been repeatedly observed, the behavior of the chromatin is practically unknown. Two male cells are dis-

charged from the pollen-tube into the embryo-sac; the nucleus of one of these cells unites with the nucleus of the egg and the first cell of the sporophyte is formed. It has recently been found that the second male cell often unites with the definite nucleus of the embryo-sac formed by the fusion of the two polar nuclei, so that there is a 'double fertilization.' Double fertilization has been observed in monocotyledons and dicotyledons, but whether it is the usual method of fertilization is not entirely settled. While it is becoming conceded that the problems of heredity must be ultimately problems of the cell, nearly all the work of botanists along this line must be classed as morphological. See CELL (in plants); EMBRYOLOGY; SEX.

CY'TOPLASM. See CELL (in plants).

CYZICUS (Lat., from Gk. *Κύζικος*, *Kyzikos*). A colony of Miletus in the Propontis, founded probably about B.C. 676, on the south shore of the island of Arctomessus, which has now become a peninsula, though in ancient times it was connected with the mainland by bridges. Its situation and two good harbors made it early a prosperous town, while its strong position enabled it to maintain its freedom. It was favored by the Romans, and after sustaining a long siege by Mithridates it was made a free city, a privilege which it lost under Tiberius. The site is still covered with extensive ruins. It lies to the southeast of the island of Marmora, and about 70 miles southwest of Constantinople.

CZACKI, chäts'kê. **TADEUSZ**, Count (1765-1813). A Polish writer. He was born at Poryck, Volhynia. At twenty he obtained an office in the Superior Court of Justice at Warsaw, and in 1788 was appointed to the Treasury Commission of the Diet. His interest in the economic welfare of his country impelled him to travel through Poland and to produce a map of its river system. The development of navigation on the Dniester engaged his particular attention. When his property was confiscated at the second partition of Poland he became a professor at Cracow; but Paul I., to whose coronation he went as deputy from Volhynia, restored what he had lost. After this Czacki's whole life was devoted to the education of his countrymen. His plans for disseminating instruction in the Polish provinces of Russia, the people of which were extremely ignorant, met with the approval of Alexander I., and in 1803 he was made inspector of the schools in the governments of Volhynia, Podolia, and Kiev. He gave, out of his various resources, about 500,000 thalers to various schools. The Gymnasium of Kremenetz, which he founded, was the main object of his care. For a generation this institution was the spiritual centre of Poland, furnishing the champions of national self-consciousness against the deadening influence of French pseudo-classicism. Accused of stirring up political discontent among his countrymen, Czacki went to Saint Petersburg in 1807, and so ably defended himself that Alexander I. appointed him deputy of Prince Czartoryski, who was curator of public instruction in the Polish section of Russia. Czacki died at Dubno, and his collections passed into the hands of Czartoryski. His works were published in three volumes (Posen, 1843). They are in the main historical and archaeological. His most valuable work is a treatise

On Lithuanian and Polish Laws (2 vols., Warsaw, 1800).

CZAJKOWSKI, chî-kôv'ske, **MICHAŁ** (1808-86). A Polish novelist. He was born near Berdichev in the Ukraine, where, in 1831, he participated in the insurrection against Russia, and was compelled to flee to Paris. In 1840 a number of Polish émigrés sent him on a secret mission to Turkey, and in 1851 he embraced Mohammedanism. As Mohammed Sadik he commanded a body of troops called the Cossacks of the Sultan. He fought with distinction against the Russians in 1853-54. Amnestied by Russia in 1873, he removed to Kiev. In consequence of an accusation of treason subsequently made against him, he committed suicide. Czajkowski obtained wide celebrity through his stories of Cossack life, several of which have become extremely popular and have been translated into German, French, and English.

CZAR, zär (Russ. *tsarî*, Bohem. *tsar*, Ochurch Slav. *tsčsarî*, *tsšsarî*, through OHG. *keisar*, from Lat. *Cæsar*). The alternative title of the Russian Emperor; also written **TSAR**. During the Middle Ages the Emperor of the East and the Mongol Khans appear under the title of Czars in Russian contemporary literature, while the rulers of the various Russian provinces are called grand dukes till the sixteenth century. In 1547, however, Ivan the Terrible caused himself to be solemnly crowned Czar of Moscow. From this time the Russian monarchs called themselves by this title until the conquest of Little Russia and Smolensk caused them to assume that of Czar of All the Russias. The word now became practically the equivalent of Emperor; yet Peter I., in 1724, thought fit to assume this latter title in addition, and as the Russian language had no term corresponding to it, the Latin word *Imperator* was introduced, while the Empress was termed *Imperatritsa*. At first several European powers refused to sanction the assumption of imperial dignity by the Russian Czar, but ultimately consented to do so. The wife of the Czar was named *Czaritsa* (Czarina); the sons, *Czarevitch*; the daughters, *Czarevna*; but after the death of Alexis, Peter I.'s son, these titles were abolished, and the imperial princes were called grand dukes and the imperial princesses grand duchesses. In 1799 the Emperor Paul I. introduced the title of *Czarevitch* (not *Czarevitch*) for his second son, the Grand Duke Constantine. The heir apparent and his wife are still called *Czarevitch* and *Czarevna*. Among the Russian people themselves, the Emperor is more frequently called *Gosudar*, i.e. lord, than Czar. See **RUSSIA**.

CZARNIECKI, or **CZARNECKI**, chärnyč'skê, **STEFAN** (1599-1665). A Polish general. He was distinguished by his bravery and brilliant generalship in the war against Charles X. of Sweden (1655-60), upon the conclusion of which he was hailed as the liberator of his country, which, simultaneously with the great onslaught of the Scandinavians, had been assailed by the Russians and Transylvanians. He also won laurels in the war against the Cossacks (1660-61), successively defeating them in two great battles. He had attained the highest rank in the Polish army when, attended by only a few horsemen, he undertook an expedition to the Crimea, in order to secure an alliance with the Tatars. In conse-

quence of the fatigue and exposure of this journey he died at a village in Volhynia. He has been styled the Polish Du Guesclin.

CZARTORYSKI, châr'tô-ris'kê, ADAM JERZY (George), Prince (1770-1861). A Polish patriot, born at Warsaw, January 14, 1770. He was the son of Prince Adam Casimir Czartoryski, the head of an ancient Polish house. After studying in Edinburgh and London, he returned to his native country and took part against Russia in the war following the second partition of Poland, in 1793. On the defeat of the Poles, Czartoryski was taken to Saint Petersburg as a hostage, and here he exhibited so much ability and prudence as to gain the friendship of the Grand Duke Alexander, and the confidence of Emperor Paul, who made him ambassador to Sardinia. When Alexander ascended the throne (1801) he appointed Czartoryski assistant to the Minister of Foreign Affairs; and he took an active part in official life until after the peace of Tilsit (1807). As curator of the University of Vilna he exerted all his influence to keep alive a spirit of nationality among the Poles, and when some of the students were arrested on a charge of sedition and sent to Siberia, Czartoryski resigned his office. His successor reported to the Emperor that the amalgamation of Russia and Lithuania had been delayed a century by Czartoryski's activity as head of the university. When the Revolution of 1830 broke out, he threw in his lot with his countrymen. He was elected president of the provisional Government, and in this capacity summoned a national diet, which met in January, 1831, and declared the Polish throne vacant, and elected Czartoryski head of the National Government. He immediately devoted half of his large estates to the public service, and adopted energetic measures to meet the Russian invasion. The Poles were soon crushed by superior numbers, and Czartoryski—specially excluded from the general amnesty, and his estates in Poland confiscated—escaped to Paris, where he afterwards resided, the friend of his poor expatriated countrymen, and the centre of their hopes of a revived nationality. In 1848 he liberated all the serfs on his Galician estates, and during the Crimean War he ineffectually endeavored to induce the Allies to identify the cause of Poland with that of Turkey. He refused an amnesty offered to him by Alexander II., and died in Paris, July 16, 1861. Consult his *Mémoires et correspondance avec l'empereur Alexandre Ier* (Paris, 1887; English translation, Sielgerd (London, 1888); Morfill, *Story of Poland*, in "Stories of the Nations" series (London, 1893). See POLAND.

CZASLAU, ehäs'lou, Bohem. pron. ehäs'läv. A town of Bohemia, about 40 miles east-southeast of Prague (Map: Austria, D 2). The Church of Saint Peter and Saint Paul was the place of burial of the blind Hussite leader Ziska, a fine statue of whom adorns one of the public squares. The town's manufactures include beet-sugar, alcohol, and beer. Between Czaslau and the neighboring village of Chotusitz the Prussians under Frederick the Great gained a decisive victory over the Austrians under Charles of Lorraine, May 17, 1742. Population, in 1890, 8145; in 1900, 9105, mostly Czechs.

CZECH (chêk) or **BOHEMIAN LANGUAGE**. The Czech language, like the Polish,

Kashubian, and Sorbian, belongs to the north-western group of the Slavic languages (q.v.). The number of persons speaking Czech, exclusive of the Slovaks, is about 6,000,000. Of these 3,650,000 are found in Bohemia, 1,550,000 in Moravia, 130,000 in Austrian Silesia, 300,000 in other Austro-Hungarian provinces, 30,000 in Russia, 100,000 in Germany, and 250,000 in America. The Czechs occupy the quadrangle bounded by the Bohemian Forest, the Erzgebirge, the Sudetic Mountains, and the Little Carpathians. They are thus surrounded on three sides by Germans, and only on the eastern side do the Czechs come in contact with Slavs: in Silesia with the Poles, and in southeastern Moravia and Hungary with the Slovaks, their nearest kindred, with whom the Czechs are usually grouped into the Czecho-Slovakian division. Within the quadrangle the Czechs are interspersed with Germans, against whom they have maintained a continuous struggle. (See CZECH LITERATURE.) Literary Czech is most nearly related to the dialect of the Prague district, but taken as a whole the Czech language presents a great variety of well-defined dialects.

The first mention of the existence of Czech dialects is found in Jan Blahoslav's *Grammar* (1571), published by Jirček in 1857. The Slavic alphabets used in the earliest times were superseded by the Roman characters on the establishment of Roman Catholicism instead of the earlier Greek Orthodox faith. The Latin alphabet was insufficient to reproduce all the native sounds, and diacritical letters were introduced. Thus, *č* = Engl. *ch*, *ž* = Engl. *zh* (as in pleasure), *š* = *sh*, while the acute accent is used to denote long vowels. Among the phonetic characteristics of the language may be noted: (1) Disappearance of the old Slavic sounds *ū*, *ī*, and their transition into *e*: Old Church Slavic *sūnū*, sleep, *dnī*, day, *livū*, lion, *liva* (id., gen. sing.) = Czech *sen*, den, lev, lva. (2) Substitution of open sounds *u*, *ú* and *a*, *ě*, *e* for the old Slavic nasal vowels *a* and *e*: *muka*, torture, *nesu*, I carry = Old Church Slavic *maka*, *nesa*; *patro*, five, *deset*, older *desēt*, ten = Old Church Slavic *petro*, *desētī*. (3) The so-called transvocalization, whereby *a* becomes *ě* (*e*), *á*, *ie* (*é*, *í*): *zeme*, land, for *zemīa*, *dušĕ*, soul, for **dušĭa*, while *u*, *ú* = *ju*, *jú*, become *i*, *í*: *duši* for **dušu* (acc. sing., cp. Russian *dushu*), *duši* for *dušŭ* (abl. sing., cp. Russian *dushoyu*), *lid* for **lud*, people (Russian *lyud*). (4) The obliteration of distinction between *y* (= Engl. *ī*) and *i* (Engl. *ē*) in pronunciation: *býk*, bull, *mýš*, mouse, *sýr*, cheese, are pronounced as if spelled *bik*, *mish*, *sir*: *byl*, I was, and *bil*, I beat, are pronounced precisely alike. (5) Syllabic or vocalic *r*, *l*, *m*, *n*: *zrno*, grain, *srdec*, heart, *vlna*, wave, wool, *slny*, strong, correspond to Russian *zerno*, *serdtsē*, *volna*, *silniy*; *Rožmberk Liemburk*, represent German Rosenberg, Luxemburg. This peculiarity is common also to the Slovakian and Serbo-Horvatan (Serbo-Croat). (6) Long and short vowels: Short, *a*, *e*, *i*, *o*, *u*, *y*; long, *á*, *é*, *í*, *ó*, *ú*, *ý*. (7) The primary accent is expiratory or stressed, and is always on the first syllable of the word, as in Slovakian, Serbo-Lusatian, and South Kashubian. This accent has been proved to be an historical development of the primitive Slavic free accent. See SLAVIC LANGUAGES.

The quantitative system of versification based on the Latin has been almost entirely superseded of late by the tonic system—more proper

to the spirit of the Slavic languages. Among the inflectional peculiarities of the language the following are most noteworthy: In declension of nouns—loss of dual; confusion of various stems; confusion of case-endings; change of quality and quantity of the root-vowels. In conjugation it comes very close to the primitive Slavic, retaining both the infinitive and the supine. All past tenses are periphrastic, and the forms of the future are either periphrastic—in verbs of incomplete or imperfective action—or are represented by the present in verbs of completed or perfective action.

From the point of view of euphony, the Czech language stands lower than the Russian or Polish, although superior to the latter in some particulars, as in the comparative rarity of sibilants and the absence of nasal vowels.

SLOVAKIAN. Along with the Czech language must be mentioned the Slovakian language, spoken by 2,500,000 persons in northwest Hungary and in America. Its literature is only a century old, and its independent development was entirely due to the great wave of national reawakening that swept over Europe at the end of the eighteenth and the beginning of the nineteenth century. The movement, communicated to the Czech language, spread to the kindred Slovakian. In spite of the serious opposition on the part of such prominent Bohemians as Havlíček, Šafařík (q.v.), and Kollar (q.v.), himself a Slovak, a Slovakian literature was established. The pioneer of the movement was Antonín Bernolák (1762-1813), whose *Dissertatio Philologica-Critica de Literis Sclavorum, Grammatica Slavica* (Prosburg, 1790), and *Lexicon Sclavicum Bohemico-Latino-Germanico-Hungaricum* (6 vols., Buda, 1825-27) supplied the foundation for Slovak literature. The other great names are: the poet Jan Holý (1785-1849), Ljudevit Štur (1815-56), Josef Hurban, and Michael Hodž, who brought the language to its high standard of literary perfection. Among the more recent writers the following deserve especial mention: the famous Martin Hattala, one of the foremost of Slavic linguists; Svezozár Hurban Vajanský, son of Josef Hurban; the lyric poet Orsag Hvézdoslav, and the novelist Kukučín, a powerful portrayer of popular life and manners. The language in the works of these writers, though closely kindred to the Czech, exhibits many well-defined peculiarities which justify its classification as a separate branch. There are numerous works that are not found in the Czech language, and many features bring it nearer to the Russian, Polish, and Servian than to the Czech. Ethnographically considered, the Slovaks are yielding before the march of the stronger and politically dominant Hungarian nationality; but Slovak literature has received too strong a start to allow of any doubt as to its future development.

BIBLIOGRAPHY. Grammars of the Czech language: Dobrovský, *Lehrgebäude der böhmischen Sprache* (Prague, 1819); Hattala, *Srovnávací mluvnice jazyka českého a slovenského* (ib., 1857); Gubauer, *Hláskosloví jazyka českého* (ib., 1876); id., *Mluvnice česká pro školy střední* (ib., 1890), excellent; id., *Historická mluvnice jazyka českého* (ib., 1894, 1896-98)—in all four volumes are promised by the author of this epoch-making work; Vymazal, *Böhmische Grammatik für deutsche Mittelschulen und Lehrer-*

bildungs-Anstalten (Brünn, 1881)—although somewhat behind latest philological researches, a most practical and simple handbook; Masařík, *Löhmische Schulgrammatik* (5th ed., Prague, 1890).

Dictionaries of the Czech language: Jungmann, *Slovník česko-německý* (5 vols., Prague, 1835-39); Čelakovský, *Additions to Jungmann's Dictionary* (Prague, 1851); Kott, *Böhmisch-deutsches Wörterbuch*, especially Grammatico-Phraseological (7 vols., Prague, 1878-93); Sumavský, *Böhmisch-deutsches Wörterbuch* (3d ed., Prague, 1874); Rank, *Taschenwörterbuch der böhmisch-deutschen Sprache* (6th ed., Prague, 1895).

CZECH or BOHEMIAN LITERATURE.

Among the Slavic literatures the Czech is inferior to the Russian or the Polish (q.v.), although chronologically it precedes them both.

First Period (to 1410).—The earliest literature of the Czech language came into existence with the introduction of Christianity in Bohemia, in 865, by Cyril and Methodius, the apostles of the Slavs. The earliest extant monument is the Kyrie Elcison *Hospodine pomiluj ny* (Lord, have mercy upon us). Greek Christianity and the Cyrillic alphabet (see KIRILLITSA), however, gave way to Latin Catholicism and Roman script. The famous Grüneberg manuscript (eighth or ninth century), the *Judgment of Libusha*, and the Königinhof manuscript (thirteenth or fourteenth century), discovered by Hanka in 1817, are the only remains in the native tongue which belong to this period, and their authenticity is somewhat doubtful. The influence of the Teutonic knights was growing rapidly among the natives, and the result was that until about the fourteenth century vernacular literature was entirely superseded by Latin. At the end of the thirteenth century a Czech translation of the Latin *Alexandreis* of Gualterus de Insulis (Philip Gaultier de Châtillon) was made, and to the early years of the following century belong Czech versions of two episodes from the Arthurian legend—*Tristan*, according to Eilhart of Oberge and Gottfried of Strassburg, and *Tauridias and Floribella*, after Pleier. Original works in Czech are the famous *Rhymed Chronicle of Bohemia*, by Dalimil, of 1314, and the romantic story *Tkadleček* (The Weaver), written in strikingly beautiful prose about the end of the fourteenth century. Other works that contributed to the development of the literature were translations of the travels of Marco Polo and Sir John Mandeville. The original writers of the period are: Thomas Štítný (1325-1410), one of the first alumni of the University of Prague, which was founded in 1348; Andrew of Duba, and the poet Flaška. Štítný exercised a great influence over religion and literature in Bohemia, and, properly speaking, paved the way for the later Hussite movement. Andrew of Duba is the reputed author of *The Book of the Old Lord Rosenberg* and *The Exposition of the Law of the Bohemian Land*. Smil Flaška, Lord of Pardubitz, composed didactic and satirical poems—*Father's Advice to His Son*; *Contest Between Water and Wine*; *Dispute Between Body and Soul*; *New Council*; and *The Groom and the Scholar*. They abound in local allusions, and are a rich mine of information for the culture history of the country.

Second Period (1410-1620).—The Golden Age of Czech literature.

The reformer Jan Huss, who, by the religious movement which he inaugurated, contributed so powerfully toward the assertion of nationality by the Czechs, gave an immense impulse to the development of Czech literature, and 1410—the year of his open breach with Rome—is commonly considered the beginning of a new era. Though a master of the Latin tongue, Huss preferred Czech for works which were designed for the people as a whole, and the language received at his hands a perfection which it had never before attained. Since his time the Czech has undergone comparatively little change from a linguistic point of view. Huss adopted as the basis the speech in actual use around Prague. He contributed, moreover, to the development of the language by grammatical works like his *Czech Orthography* (published in 1857 by Šembera). After the death of Huss the Moravian Brethren assiduously cultivated the spirit of nationalism, and directed their energies to developing their native idiom. Among these champions of the people, the following names are the most noteworthy: Petr Chelčický (1390-1460), a pupil of Huss, was the theoretical expounder of his master's doctrines. In his works, such as *The Net of Faith* and *Book of Expositions of Sunday Lessons*, various religious and political questions are treated in a surprisingly liberal manner. Other writers of distinction of this period are Victorin Cornelius Všehrad (1460-1520), the author of *Nine Books of Laws . . . in Bohemia*, and Ctibor Cimburg (1437-94), who wrote the famous *Toračov Book*—only two out of a long line of famous jurists, who devoted their time and labors to the scientific exposition and systematization of Bohemian law. Their works are written in masterly style, and contributed much to the progress of the Czech juridical language. These two, with several others, constituted the Hussite minority among the humanists who made their appearance in Bohemia with the Renaissance. The other, more numerous faction of the humanists, was, strange as it may seem, solidly opposed to the doctrines of Huss. Among these were Bohuslav of Lobkovic (1462-1510) and Rehoř Hrubý of Jelení (1450-1514). Lobkovic collected the most remarkable library of his time, wherein he was greatly helped by the introduction of printing in Bohemia in 1468, when the *Trojan Chronicle*, the first book to be printed in the Czech language, appeared at Pilsen. Lobkovic and his contemporaries laid all subsequent Bohemian literature under deep obligations. They translated Greek and Latin classics, as Cicero, Seneca, Isocrates; wrote Latin poems; compiled lexicographical works, like the *Lexicon Symphonum*, of the Czech, Greek, Latin, and German languages, by Siegmund Hrubý (1497-1554), son of Rehoř Hrubý. Grammatical studies of the Czech language were embodied in Jan Blahoslav's (1523-71) *Czech Grammar* (1571). It contains disquisitions on the subject of how to translate idiomatically various words, phrases, constructions, etc. Literary and scientific activity was at its height, and men of science, like Tycho de Brahe and Kepler, made Bohemia their home. The Bohemian historians of this period combined with their patriotic zeal a scientific preparation and seriousness of purpose which made their work especially valuable and reliable. They found their prototype

in the anonymous *Old Bohemian Annals*, embracing the period of 1378-1527. Adam Veleslavin (1545-99), whose *Historical Calendar* is his best-known work, represents the highest type among these historians. Vaclav Hájek (?—1553) is the author of a *Chronicle* more interesting than accurate. Jan Blahoslav, who has been mentioned above, wrote an excellent history of the Moravian Brethren, of whom he was a bishop. He is also famous for his supervision of the Czech translation of the Bible from the original tongues, which is for the Czech what the King James Version of the Bible is for the English. Blahoslav did not live to see his work printed; it was published in six volumes in 1579-93, at the expense of Jan of Žerotin, a Moravian patron of letters, and is known as the *Kralitz Bible*. The unusual vigor displayed in the domain of prose and the widening of the intellectual horizon were naturally communicated to the field of poetry. Prince Hynek Poděbrad (1452-92) wrote his *May Dream* and other poems which won favor. Nicholas Dačický (1555-1626) composed a satirical poem, *Prostopravda*, and many works of an historical character. Among the religious poets Jan (1500-72), a Moravian bishop, deserves special mention. The greatest poet of the latter part of this period, which is known as the 'Golden Age,' was Simon Lomnický (1552- after 1622). His works include didactic and satirical poems and sacred dramas. Chief among them are the satire *Cupid's Arrow*, for which the King, Rudolph II., ennobled him and granted him an annuity; and the didactic *Short Precept for a Young Householder*, which is full of valuable allusions to the manners and customs of the time.

Third Period (1620-1774).—In the battle at the White Mountain in 1620, the Bohemians lost their political independence, and Ferdinand I. of Austria, seven years later, made Catholicism the State religion of Bohemia. The works of the Protestant writers that had made the 'Golden Age' so brilliant were now seized everywhere and destroyed. Nevertheless, it was during the opening years of this period that Czech literature reached its highest stage of purity and finish in the works of Karl Žerotin and Jan Komenský. Karl Žerotin (1564-1636), great as are his polemical and historical writings, acquired a lasting fame through his enormous correspondence, in which he stands in the very first rank with the few famous letter-writers of the world. Jan Amos Komenský (see COMENIUS) (1592-1670), who became one of the greatest authorities on questions of pedagogy, spent his life in exile, like Karl Žerotin. His *Magna Didactica*; *Janua Linguarum Reserata Aurca*; and *Informatorium*, form his permanent contributions to the domain of pedagogy, philosophy, and religious controversy, and they advanced materially the stylistic standard of Czech literature. His purely literary work, *Labyrinth of the World and Paradise of the Heart*, is more important as a product of pure literature. All the other writers of this period are of little importance. The systematic efforts of the Hapsburgs to crush the Czechs were successful. Higher society became Germanized, the Czech language was heard only in out-of-the-way hamlets, and Czech books became a great rarity. The works of the Jesuit writers of the period, who employed the Czech language for religious propaganda among the

masses—Sturm, Berlička, Steyer, and Koniaš—are full of barbarisms, monstrous forms and words. In 1774 Maria Theresa enforced by a decree the use of German in the intermediate schools as the language of instruction.

Fourth Period—Renaissance (1774 to the present day).—The forcible suppression of the native tongue in the common schools of Bohemia produced results entirely opposite to those which were expected, and met a vigorous protest. Count Kinsky published in German a plea for the Czech language under the title *Erinnerung über einen hochwichtigen Gegenstand* (1774), which was followed in 1775 by Balbin's *Dissertatio Apologetica Linguae Sloenicae*, published by Pelzel. Pelzel himself (1734-1801) was one of a number of young scholars who devoted themselves to the study of their native tongue and the history of their country. Thus appeared Fr. Thoms's *Böhmische Sprachlehre* (1782) and K. I. Thám's *Kurzgefasste böhmische Sprachlehre* (1785), which laid the foundations for the study of the language. Pelzel's own contributions were: *Typus Declinationum Linguae Bohemicae Novo Methodo Dispositarum* (1793); *Grundsätze der böhmischen Grammatik* (1795); and especially his historical works, of which the *New Bohemian Chronicle* was chief. These latter works awakened interest in their own history among the Czechs. A chair of Czech language was established at Prague in 1793 (Pelzel). The greatest name of this period of Czech literature is that of Josef Dobrovský (1753-1829) (q.v.), the 'patriarch of Slavic philology.' In his works on grammar and literary history he gathered enormous lexical materials, and the historical and comparative method brought him to the discovery of the richness of the ancient classical language, to which his main interests were devoted. It is true that he made a *Collection of Czech Proverbs* in 1804, but all his works were written in German. Such men as Prochazka, Rulík, Puchmayer, Jan Nejedlý, V. Nejedlý, Huňkowsky, and others wrote pamphlets for the instruction of the people, compiled dictionaries and grammars, translated the classics of European literature, published periodicals, composed plays for the theatre, and even poetry in the sentimental style of the idyls of Gessner. These attempts met with very serious obstacles, owing to the imperfect state of the language, which was practically the old language of the classical period, and which naturally lacked terms for new ideas and concepts that had come into vogue during the third period. The language was brought to its final state of perfection in the works of Jungmann (q.v.) (1773-1847), the most illustrious name of the early renaissance. His translation of *Paradise Lost* (1811), an almost incredible *tour de force*, widened the horizon of poetical speech; his *Czech Dictionary* contained the vocabulary of the language; while his *History of Czech Literature* presented a complete survey of all the literary remains. He was particularly happy in coining new words, and whenever this expedient was found insufficient he borrowed from other Slavic languages, especially Russian and Polish. The four other names that are most closely linked with that of Jungmann as leaders of the renaissance of Bohemia are Kollar, Šafařík, Palacký, and Hanka. Kollar (q.v.) (1793-1852), poet and scholar, is famous for his *Daughter of Slava* (1824), one of the poetic masterpieces of the

Czech language, and his numerous prose works, among which that *On the Literary Reciprocity Between the Families and Dialects of the Slavic Nation* (1831) advocated literary Pan Slavism (q.v.). Šafařík (1795-1861) was one of the greatest philologists the Slavic countries have produced. Among his works, his *Slavic Antiquities* (1837) and editions of many literary monuments have all been of importance. Palacký (1798-1876) is an historian, whose *History of Bohemia* (5 vols., 1836-67) is an ideal combination of critical judgment, profound erudition, and striking style. Along with them may be mentioned Hanka (1791-1861), who discovered the manuscripts of Grüneberg and Königshof, and published a number of other important remains of Czech antiquities. The greatest poet of the period is František Ladislav Čelakovský (1799-1852), whose *Echoes* of Russian and Czech songs, and the long poem *The Rose of a Hundred Leaves*, together with the poetic works of Kollar, were most responsible for the reawakening of the poetic spirit of the nation. Other names of importance are those of the lyric poets Jablonský and Vinařícký, the epic writers Woel, Marek, Holý, and Erben, and dramatists like Kliepera and Tyl. Poetry seems to have absorbed all the best energies of the nation at that time, and the novel, which holds the chief place of honor in the literature of all other nations, did not reach any high level of development. Most works of fiction dealt with themes from Bohemian history. The most noted novelists are Chochołušek, Tyl, and especially Božena Němcová (1820-62), whose themes are simple country life. The masterpiece of the latter, *Babička* (Grandmother), has been translated into English.

The reorganization of the Austrian Empire on a constitutional basis in 1860-61, which allowed the people of Bohemia scope in the development of political life, and the furtherance of national aspirations, marks the beginning of the modern period in Czech literature. The foundation of a new national theatre at Prague and the establishment of a Czech university by the side of the old university (1882) gave a great stimulus to literary activity. Little by little the narrow 'national' current gave way to cosmopolitanism, with Mácha as the leading representative of Byronism. The recognized head of the young generation is Vítěslav Hálek (1835-74). The greatest living poet is Vrehlieký (born 1853), whose *A Year in the South; Pilgrimages to Eldorado*; and the historical dramas *Brothers and Drahomira*, as well as translations from European classics, are specially noteworthy. Equal in popularity is the poet and novelist Svatopluk Čech, whose best-known work is *Arabesky*. Zeyer, Heyduk, Arbes, Vlček, and the ladies Eliška Krásnohorská (born 1847) and Karolína Světlá (born 1830) are the most popular novelists of the present day. Great activity has also been exhibited in the departments of science, philology, and literary history, the most important names being those of Jireček, Šembera, Gebauer, and Patera.

Vienna, 1874); K. Tieftrunk, *Historic literary české* (3d ed. Prague, 1885); Fr. Bayer, *Stručné dějiny literatury české* (Olmütz, 1879); Bačkovský, *Zevrubné dějiny českého písmenictví doby nové* (Prague, 1888). German: Pypin and Spasovich, *Geschichte der slavischen Litteraturen*, bd. 2, abt. 2 (Leipzig, 1884). English: Francis, Count Lütow, *A History of Bohemian Literature* (New York and London, 1899).

CZEGLÉD, tsé'glád. A market-town of Hungary, about 46 miles southeast of Budapest (Map: Hungary, F 3). The inhabitants are chiefly employed in agricultural pursuits, the surrounding country being particularly adapted to the raising of grain and fruit. Considerable red wine is produced. Population, in 1890, 27,549; in 1900, 29,905.

CZEKANOWSKI, ché'ká-nóv'ské, ALEXANDER (1832-76). A Russian explorer. He was born in Volhynia, and studied at Kiev and Dorpat. Banished to Siberia in 1863 because of his participation in the Polish insurrection of that year, he was five years later permitted to settle at Irkutsk. Here, as the agent of the Imperial Geographical Society, he began a series of geological investigations extending along the Lower Tunguska, the Olenek, and the Lena, the results of which were published chiefly in Petermann's *Mitteilungen* (1874 et seq.). Amnestied by the Government, he returned to Saint Petersburg, where, during an attack of melancholy, he committed suicide.

CZELAKOWSKY, ché'lá-kóv'ské. See CELAKOVSKY.

CZENSTOCHOWA, chén'stó-kó'vá. A town of Russian Poland in the Government of Piotrkow, situated near the left bank of the Warthe, on the Warsaw-Vienna Railway. It consists of the old and the new town, and is of considerable industrial importance. There are a number of large cotton-mills, iron-foundries, paper-mills, breweries, flour-mills, etc. Population, in 1897, 45,130. Czenstochowa owes its fame to the adjacent monastery of the Order of Saint Paul the Hermit, situated on the Warthe and visited annually by over 200,000 pilgrims. The chief attraction is the picture of the Virgin, made of dark wood and known among the Catholics of Poland and Russia as the Black Virgin. It is supposed to be of Byzantine origin and to have been brought to the monastery at the end of the fourteenth century. The monastery was formerly fortified, and in 1655 withstood a siege of thirty-eight days by the Swedish troops.

CZERMAK, chér'mák, JAROSLAW (1831-78). A Bohemian painter, brother of Johann Nepomuk Czermak, the physiologist. He was born in Prague, and studied in that city under Christian Ruben, in Antwerp under Gallait, in Brussels, and finally in Paris under Robert Fleury. His early paintings treated chiefly subjects from the history of Bohemia, but later he devoted himself more and more to genre scenes. After a journey in 1858 through Hungary, Croatia, Bosnia, Dalmatia, and Montenegro, when he made abundant studies in national types and costumes, the life of the southern Slavs became his favorite field. Among his most noteworthy pictures are: "Murder of Wallenstein's Companions at Eger," "Slavonian Emigrants," "Norman Fishermen in a Boat Reading the Bible" (1850): "The

Court Poet of Rudolf II. Begging on the Bridge of Prague" (1854); "Hungarian Swineherd" (1854); "Montenegrin Woman and Child" (1861); "Rape of a Herzegovinian Woman by Bashi-Bazouks" (1867); "Return of Montenegrins to Their Devastated Village" (1877).

CZERMAK, JOHANN NEPOMUK (1828-73). A German physician, born in Prague. He studied at the universities of Vienna, Breslau, and Würzburg, and was appointed a lecturer on physiology and microscopic anatomy at the University of Prague. Subsequently he held a professorship of zoölogy and comparative anatomy at Graz (1855-56), and of physiology at Cracow (1856-58), Pest (1858-60), Jena (1865-69), and Leipzig (1869-73). At Leipzig he erected at his own expense a laboratory and an auditorium specially arranged for demonstrations in experimental physiology. He is best known for having made notable improvements in the laryngoscope and for having been the first systematically to employ that instrument. His publications include *Der Kehlkopfspiegel und seine Verwertung für Physiologie und Medizin* (1860; 2d ed. 1863). Consult the biography by Springer in the *Gesammelte Schriften* (2 vols., Leipzig, 1879).

CZERNOWITZ, chér'nó-vits (Ruman, *Cernăuți*). The capital of the Austrian Crownland of Bukowina, situated on a hill near the right bank of the Pruth, about 164 miles east-southeast of Lemberg, not far from the Rumanian and Russian frontiers (Map: Austria, J 2). Most of the public buildings are quite modern. Among the more noteworthy ones may be mentioned the Archiepiscopal Palace, a handsome Byzantine structure, the Greek Oriental Cathedral, copied from the Church of Saint Isaac in Saint Petersburg, the Armenian Church, and the sumptuous Jewish synagogue in Moorish style. Czernowitz is the seat of a Greek Oriental archbishop. Its educational institutions include a university founded in 1875, with a library of 60,000 volumes, a gymnasium, industrial and trade schools. It has manufactures of machinery and oil. There are also saw-mills and breweries. Population, in 1890, 54,171, of whom 27,000 were Germans, 10,000 Ruthenians, 8000 Rumanians, 8000 Poles, the above figures including more than 17,000 Jews counted with the Germans and Poles according to the language used by them; in 1900, 69,619. Up to 1774, when it was occupied by the Austrians, who made it the capital of Bukowina, Czernowitz was an unimportant village.

CZERNY, KARL (1791-1857). An Austrian pianist and composer, born in Vienna. He was at first instructed by his father, Wenzel Czerny (1752-1832), then studied under Beethoven, with whom he was a great favorite, and under Clementi. At the early age of fifteen he was in great demand as a teacher and also rapidly won high reputation as a virtuoso. Among his pupils were Liszt, Thalberg, Jaell, and Kullak. He left over 1000 compositions, of which his instructive works for the pianoforte are of permanent value. They are "Die Schule der Geläufigkeit," op. 299; "Tägliche Studien," op. 337; "Die Schule des Virtuosen," op. 365; "Die Schule der Fingerfertigkeit," op. 740; and others.

CZERNY, VINCENZ (1842-). An Austrian surgeon, born at Trautenau, Bohemia. He stud-

ied at Vienna, and until 1871 acted as Billroth's assistant. In the latter year he was made professor of surgery at Freiburg-im-Breisgau, and in 1877 at Heidelberg. He introduced important improvements in operative surgery and published the following works: *Ueber die Beziehungen der Chirurgie zu den Naturwissenschaften* (1872); and *Beiträge zur operativen Chirurgie* (1878).

CZERNY (chěr'ně) **GEORGE** (i.e. Black George) (1766-1817). The leader of the Servians in their struggle for independence, generally known as KARA (Turk. *kara*, black) GEORGE. He was born December 21, 1766, in the neighborhood of Belgrade. In 1787 he was involved in a rising against Turkish rule, but later settled down as a cattle-dealer. In August, 1801, a band of Janizaries broke into his dwelling and plundered it, and in retaliation he collected a band of malcontents, and entered upon a course of guerrilla warfare. Gradually his followers increased; in 1804 he captured the fortress of Shabatz, and subsequently invested Belgrade. In the beginning of 1806 he routed the Turks at the rivers Drina and Morava, and captured Belgrade in December, 1806. The cause of Servia was aided by the war which at this time broke out between Russia and Turkey. After the Treaty of Slobosic (July 8, 1808), Czerny George was elected Governor by the people, and recognized as Prince of Servia by the Sultan. The French invasion of Russia in 1812 compelled the latter country to let Servia shift for itself. Hostilities recommenced; the Turks were successful, and Czerny had to flee to Russia. He afterwards went to Austria, where he lived for some time. Meanwhile the freedom of Servia was secured through the leadership of Milosh Obrenovitch, and in July, 1817, when Kara George returned, intending, as some suppose, to rally his partisans round him for the furtherance of his ambitious schemes, he was murdered at the instigation of Prince Milosh. This was the beginning of a feud between the factions which lasted throughout the greater part of the nineteenth century. Kara George's second son, Alexander Karageorgevitch, was Prince of Servia from 1842 to 1858, but was finally expelled and died in exile in 1885. Consult: Ranke, *Die serbische Revolution* (Hamburg, 1829) translated by Mrs. Keri in Bohn's Library under the title of *A History of Servia and the Servian Revolution* (London, 1853); Denton, *Servia and the Servians* (London, 1862).

CZERNYSCHESKY, chěr'ni-shěv'skâ. See TCHERNYSHEVSKI.

CZERSKI, chěr'skâ, JOHANNES (1813-93). A German divine, one of the founders of German Catholicism. He was born at Warlubien, West Prussia, and was educated at the Priests' Seminary at Posen. Sentenced to penitential confine-

ment for contracting a secret marriage in 1844, he resigned his vicariate in Silesia, and founded an independent community of Catholics, known as the 'Christlich-Apostolisch-Katholische Gemeinde.' Although he maintained his own views, he participated in the struggles of the German Catholics, and upon their downfall devoted himself to quiet religious activity. His most important work is the *Nachlass des sterbenden Papsttums* (12th ed., 1870). He defended his defection from the Orthodox Church of Rome in the work entitled *Rechtfertigung meines Abfalles von der römischen Hofkirche* (1845).

CZOLGOSZ, chōl'gōsh, LEON (1873-1901). A Polish-American anarchist, the assassin of William McKinley, twenty-fourth President of the United States. He was born at Detroit, Mich., and was by trade an iron-worker. He was tried before the criminal term of the State Supreme Court at Buffalo, N. Y., on September 23-24, 1901, and convicted of murder in the first degree. No witnesses were summoned for the defense, but ex-Judge Lewis, of counsel for the prisoner, made a brief address to the jury. The assassin was killed by electricity in the State prison at Auburn, N. Y., on October 29, 1901. See MCKINLEY, WILLIAM.

CZÖRNIG, chěr'nik, KARL, Baron von Czernhausen (1804-89). An Austrian statistician, born at Czernhausen, Bohemia. He studied at Prague and Vienna, and in 1841 became director of the bureau of administrative statistics at Vienna. In 1859 he was appointed chief of the section of railway affairs in the Ministry of Commerce. In 1863-65 he was president of the central statistical commission, organized by himself. He published an ethnographic chart of the Empire (with text), 1855, and other works.

CZUCZOR, tsōō'tsōr, GERELY (1800-66). An Hungarian poet and linguist. He was born at Andód (comitat of Neutra), became a member of the Benedictine Order, and from 1825 to 1835 was a professor successively in the gymnasia at Raab and Komorn. In 1835 he was appointed second secretary and archivist of the Hungarian Academy, by which he was commissioned in 1844 to prepare the great lexicon of the Hungarian language (6 vols., 1861-74). Four volumes were edited by him, the remaining two by János Fogarassy (q.v.). His disregard of the historical and comparative method in philology often impaired the scientific value of his work as a lexicographer, particularly in connection with etymologies. He was imprisoned in 1849 for the publication of his *Riado*, a poem calling Hungarians to action on behalf of their liberties, but obtained his release under the amnesty of 1850. His poems appeared collected in 3 vols. at Pest in 1850.

D

D The fourth letter and third consonant in the Græco-Roman alphabets. Its form is derived by a rounding of the sign Δ found in the West Greek inscriptions rather than from the familiar form of delta (Δ) seen in most Greek scripts. (See ALPHABET; LETTERS.) The Greek name of the letter, *delta*, is a modification of the Semitic word *daleth* (originally *dalt*), which means a door. The Greek capital, Δ , still retains the shape of the opening of a tent, the kind of door most familiar to a nomadic people.

Sound.—In sound the English *d* is a dental or rather alveolar (lingual) voiced explosive, made by a contact of the tip of the tongue and the roof of the mouth near the upper front teeth. In French the contact is rather dental than alveolar. The North German *d* is between the English and the French. There is also in English a slightly more cerebral *d* as in *drown*, made by bending up the tip of the tongue and touching the roof of the mouth farther back than in the so-called dental sound. This is due to its position before the lingual *r*.

Source.—English *d* comes: (1) from Indo-Ger. *dh* (Gk., Lat. *f*, *d* (with *r*), *b*); as *deer*, Gk. $\Theta\acute{\eta}\rho$, Lat. *fera*; *udder*, Skt. *udhar*, Lat. *uber*; (2) from Indo-Ger. *t* when not immediately preceded by the accent; *hund-red*. Skt. *gatam*, Gk. $\xi\acute{\alpha}\rho\acute{\alpha}\nu$, Lat. *centum*; (3) from Germanic *p*, with *t*; *gold*, Goth. *gulþ*; (4) *d* arises as a special development from the affinity of *n* for *d* (as a transfer-sound), in such words as Eng. *gonder*, Lat. *gener*, Eng. *thunder* (OE. *þunor*), *riband* (ME. *riban*). The *d* sometimes disappears as in *cruel* (Lat. *crudelis*). The letter *d* is often assimilated as *affirm*, *accept*, *gossip* (OE. *godsibb*); and in certain linguistic developments it interchanges phonetically with *t*, for example, *t*, Lat. *Ulysses*, from Gk. Ὀδυσσεύς , or with *r* in Lat. *arbiter* from *ad betere*, and *b*, *bellum* from *duellum*. According to Grimm's Law, original *d* becomes *t* in English, *z* in German. Thus Indo-Ger. **dekm*, Eng. *ten*, Ger. *zehn*. *Di* followed by a vowel becomes *j*, as in *journal* from *diurnal*.

As Symbol.—(1) As a numeral, **D** = 500; $\overline{\text{D}}$ = 5000. This use of **D** to denote 500 arose from a confusion with D , the original symbol for that number. (2) In Roman names, **D** = Decimus, Divus, Dominus, and Deus. (3) In academic degrees, **D** stands for Doctor. (4) In music, **D** is the second note of the natural

scale, and is a whole tone above C. It is written in the first added space below the treble clef or on the fourth line; in the bass clef it is on the third line or in the second added space above. (See MUSICAL NOTATION.) (5) In chemistry **D** = didymium. (6) In reckoning English money (£ s. d.), *d* = pence, penny (Lat. *denarius*). (7) In mathematics **D** = derivation, *d* = differentiation, Δ = differencing, and δ = variation.

DAB (probably from *dab*, gentle blow). A fish (*Limanda limanda*) closely related to the plaice and flounder (qq.v.) and sometimes included with them in the same genus. It is common on the sandy shores of northern Europe. It can easily be distinguished from the common flounder by the distinct arch in the lateral line at the anterior end. It attains a length of 12 inches and is much esteemed as food. A nearly related species, the rusty dab (*Limanda ferruginea*), possessing smaller scales, is rather abundant on the eastern coast of North America. There are other less common species of dab.

DAB, DABB, or DHABB (Ar. *dabb*, lizard). A lizard of northeastern Africa, as the common spiny-tailed agamoid *Uromastix acanthinurus*. Two or more species, about a foot in length, are common in Algeria, Tunis, and Egypt; and in Algeria are called 'lézards des palmiers,' perhaps because they eat dates, besides grass, berries, and various flowers. This genus has no voice, and their color, which is very changeable, depends upon the weather, being dull on cool days and much brighter when it is warm. The term is also given to the dried flesh of lizards, especially of the skink (*Scincus officinalis*), preserved for use in medicine among the Arabs.

DAB/BAT (Ar. *dabbat*, reptile). The third sign of the coming of the judgment, the Apocalyptic beast of the Mohammedan religion.

DABCHICK (variant of *dob-chick*, a diving bird, from *dap*, to drop bait into water. AS. *doppa*, a water-bird, from *dypettan*, to dive, from *dypnan*, to dip). A small grebe, as (1) in the United States, the pied-billed grebe (*Podilymbus podiceps*); (2) in England, the little grebe (*Podiceps minor*). See GREBE.

DABNEY, dāb'nī. ROBERT LEWIS (1820—). An American Presbyterian clergyman. He was born in Louisa County, Va., and studied at Hampden Sidney College, at the University of Virginia, and at the Union Theological Seminary

in that State. From 1853 to 1883 he was professor of Church history in the Union Seminary, Virginia, but resigned temporarily during the Civil War, when he first served as chaplain of the Eighteenth Virginia Regiment and later became major and chief of staff to General Thomas J. Jackson. In 1870 he was Moderator of the Presbyterian General Assembly of the South, and in 1883 was appointed professor of moral philosophy in the University of Texas at Austin. In addition to numerous contributions to periodical literature, he published the following: *Life of Gen. T. J. (Stonewall) Jackson* (1867); *Sacred Rhetoric* (Richmond, 1867; 3d ed. 1881); *Defense of Virginia and the South* (1868); *Sensualistic Philosophy of the Nineteenth Century Examined* (1875; 2d ed. 1888); *Theology Dogmatic and Polemic* (1879; 3d ed., 1885).

DABOIA (East Indian). The formerly accepted generic name, which has passed into English, of the very deadly Russell's viper (*Daboia Russellii*). See VIPER, and Colored Plate of VENOMOUS SERPENTS, with article SNAKE.

DABROWSKI, dá-brów'ské, JAN HENRYK. See DOMBROWSKI.

DA CAPO, dá ká'pó (It., from the beginning). A term in music, frequently placed at the end of a phrase or movement, indicating that the performer must return to the beginning of the movement, or to some other part of it usually marked with the sign \S , and finish where the word *fine* is placed. Scarlatti is generally credited with being the first to introduce the use of the *da capo* in his opera of *Teodora* (1693), though it appears that a *da capo* occurs in Teneaglia's opera *Clearco*, as early as 1661. See ARIA. The words are generally abbreviated *D. C.*, sometimes *D. C. al fine*.

DACCA, dák'ká, or **DHAKA**. The capital of the division and the district of the same name in Bengal, British India (Map: India, F 4). It is situated on the left bank of the Burhi Ganga, which connects the Brahmaputra with the Ganges, about 150 miles northeast of Calcutta. The surrounding country is low and overflowed during the rainy season. Many of the old temples and other public buildings are in ruins and give to the city an appearance of decay. Since 1870, however, it has recovered some of its ancient prosperity, and there are now a number of modern public buildings and educational institutions, including a college, modern water-works owned by the municipality, and gas. Prior to the nineteenth century Dacca was a flourishing city of great commercial importance, famous for its muslins, which in the phraseology of the East were characterized as 'flowing water,' 'woven air,' and 'evening dew.' In those days Dacca was filled with magnificent temples and palaces, and its population was estimated at 200,000. The change in the river system of that part of India proved very detrimental to the commerce of the city by depriving it of its facilities for inland navigation, while the invasion of British manufactures almost completely ruined the native textile industry. With the construction of the Dacca-Maimansingh Railway line the trade of Dacca has revived and there is again a demand for the native textile products. Besides textiles Dacca also produces fine silver and gold plate, filigree work, and steel ornaments. There is a considerable trade in ele-

phants. During the seventeenth century Dacca was the capital of Bengal. Population, in 1891, 82,321; in 1901, 90,700.

DACE, DARE, or DART (OF. *dars*, dace, dart, ML. *dardus*; ultimately connected with Engl. *dart*, OIG. *dart*, javelin). A fresh-water fish (*Leuciscus leuciscus*) of the family Cyprinidae, belonging to the same genus as the chub (q.v.), and common in the streams of western Europe. The body is robust and covered with rather large scales; the mouth is rather large. The upper parts are dusky blue, becoming paler on the sides and passing into white on the belly; the cheek and gill-covers silvery white. The dace is gregarious and swims in shoals. They furnish the angler fair sport both with fly and bait, but the flesh is not highly esteemed. The genus includes many other species both in Europe and the United States. In the United States the name is applied to species of various genera of the family, especially *Semnotilus*, of which the best known is the 'horned' dace, or creek-chub (*Semnotilus atromaculatus*), which commonly frequents brooks from the Hudson Valley to that of the Missouri. It grows to a length of ten inches, is bluish above and creamy below, has a vague dusky band on the side, and its dorsal fin always bears a conspicuous black spot at the base in front, bordered with red in the males. It is one of the favorite objects of boys' fishing, and it is a good fish for the aquarium. Several other species of *Semnotilus* occur east of the Rocky Mountains and are called 'chubs,' 'fall-fishes,' etc. See Plate of DACE AND MINNOWS.

DACE'LO (transposed from Lat. *alcedo*, also *alcyon*, Gk. ἀλκυών, *alcyōn*, kingfisher, halcyon). A book name for a genus (*Dacelo*) of Australasian kingfishers, representative of a subfamily (Daceloninae) of kingfishers (q.v.), characterized by their large size, harsh voices, and their adaptations to a forest life and a diet of reptiles and insects. The best known is the laughing kingfisher (*Dacelo gigas*), also called laughing jackass and king-hunter, which is the largest of kingfishers, and widely distributed throughout Australia. "It is an uncouth-looking bird," says Wheelwright, "nearly the size of a crow, of a rich chestnut brown and dirty white color; the wings slightly checkered with light blue after the manner of the British jay; the tail-feathers long, rather pointed and barred with brown. It has the foot of a kingfisher; a very formidable, long, pointed beak, and a large mouth; it has also a kind of crest, which it erects when angry or frightened; and this gives it a very ferocious appearance. It is a common bird in all the forests of Australia throughout the year; breeds in a hole in a tree, and the eggs are white. . . . Its principal food appears to be small reptiles, grubs, and caterpillars. . . . The laughing jackass is the bushman's clock, and, being by no means shy, of a companionable nature, a constant attendant about the bush-tent, and a destroyer of snakes, is regarded, like the robin at home, as a sacred bird in the Australian forests." See illustration of KINGFISHERS.

DACHSHUND, dák'shūnt. A breed of small, long-bodied dogs, formerly employed in central Europe in hunting badgers, but now kept wholly as pets. See HOUND.

DACIA, dā'shī-ā. The land of the Daci or Getæ. Its geographical limits were very indefinite until its conquest by the Romans. After that period it comprised modern Transylvania, with adjacent parts of Hungary, Rumania, and Bukovina. The Getæ came originally from Thrace, and were divided into various tribes. Their course northward can only be imperfectly traced, but we know that shortly before the time of Alexander the Great (B.C. 335) they had migrated across the Danube. It is not known when or for what reason the Getæ changed their name to Daci. They seem to have been the most valiant of the Thracian barbarians. Curio, the first Roman general who ever penetrated as far north as the Danube, did not venture to assail them. Julius Cæsar, however, is said to have contemplated their subjugation. In B.C. 10 Augustus sent an army up the valley of the Maros. From this time there was almost continual fighting between the Romans and the Daci, on the whole to the advantage of the latter, who actually compelled their civilized enemies, in the reign of Domitian, to pay tribute. In A.D. 101 the Emperor Trajan crossed the Theiss, and marched into Transylvania, where he fought a great battle near Torda. The Wallach peasant calls the battlefield, to the present day, *Prat de Trajan* (*Pratum Traiani*, Field of Trajan). The Daci, who were commanded by their famous chief Decebalus, were defeated. A second expedition of the Emperor resulted in the destruction of their capital, the death of Decebalus, and the loss of their freedom (A.D. 106). Roman colonists were sent into the country, a bridge was built over the Danube—the ruins of which are still extant—and three great roads were constructed. The chief towns were Apulum and Sarmizegetusa. In A.D. 270-75 the Romans abandoned the country to the Goths, and the colonists were transferred to Mesia.

DACIER, dā'syá', ANDRÉ (1651-1722). A French philologist. He was born of Protestant parents at Castres, in Upper Languedoc, studied at Saumur, and in 1672 came to Paris, where he was employed to bring out, for the use of the Dauphin, an edition of the Latin writer *Festus*, which he published in 1681. In 1683 he married Anne Lefèvre, also a Protestant, and two years later both entered the Roman Catholic Church. Dacier subsequently became royal librarian, member of the Académie des Inscriptions, and perpetual secretary of the 'Académie.' He died September 18, 1722. Dacier's principal works, besides his *Festus*, are *Œuvres d'Horace en Latin et en Français* (Paris, 1681-89), an edition of Valerius Flaccus, and numerous translations into French of Greek authors, such as Plutarch and Epictetus, all of which, in spite of his erudition, are of mediocre quality, while the expositions and criticisms are shallow.

ANNE DACIER (1654-1720). The wife of the preceding. She was born at Saumur, and after the death of her learned father, who had developed her talent, came to Paris, where she acquired such a reputation by her edition of Callimachus (1674) that the Duke of Montausier commissioned her to edit several of the ancient authors for the use of the Dauphin. Similarity of tastes and employment led to a marriage between her

and André Dacier. Her domestic duties did not, however, weaken her literary ardor. Besides editing a number of the classics, she translated the comedies of Terence; the *Amphitryon*, *Epidicus*, and *Rudens* of Plautus, accompanied by an able dissertation on the origin, progress, and mutations of dramatic poetry; Anacreon, Sappho, and the *Plutus* and *Clouds* of Aristophanes. Her admiration of Homer was unbounded, and involved her in two learned controversies. Madame Dacier is generally acknowledged to have possessed a more acute and vigorous mind than her husband. She died August 17, 1720.

DA'CITE. A volcanic rock of generally porphyritic texture, characterized by the occurrence of lime-soda feldspar, and generally also by quartz and by mica, hornblende, or pyroxene. These minerals are imbedded in a ground mass or matrix of rock glasses or of a finer-grained aggregate of crystals. The color of the rock is generally gray, but under prolonged weathering it may become brownish. The newer or younger dacites are, therefore, in contrast with the older, much less brown in color. The average chemical composition of dacite is: silica, 68 per cent.; alumina, 17 per cent.; ferric oxide, 2 per cent.; ferrous oxide, 1.5 per cent.; magnesia, 1.5 per cent.; lime, 3 per cent.; soda, 4 per cent.; potash, 3 per cent. Dacite differs from andesite (q.v.) principally in its higher percentage of silica, due to the presence of quartz and a greater abundance of the light-colored mineral constituents. The name dacite has been given because of the great development of this type of rock in Dacia, an ancient Roman province comprising part of modern Hungary and vicinity. Many recent as well as more ancient volcanic lavas are dacite. Dacite graduates into trachyte, rhyolite, and diorite (qq.v.).

DACOITS' (Hind. *dakait*, *dākāyat*, robber, *dākā*, attack by robbers, from *dākūā*, to shout). The name given to bands of men in India who live by robbery. They resemble the thugs (q.v.) in that a slight religious element seems to enter into their conduct, but plunder, and not murder, is their guiding motive. On the whole, they are a national type of banditti, closely resembling the brigands of Sicily or Greece. Driven out by the British Government from Hindustan, they are still fairly active in Burma. Technically, dacoity in British-Indian law means the conspiring of five or more men to engage in any act of theft.

DACOSTA, dā-kō'stā, GABRIEL. See ACOSTA, GABRIEL.

DA COSTA, ISAAC (1798-1860). A Dutch poet and Protestant theologian, born in Amsterdam. He studied at Leyden, in 1818 received the degree of LL.D., and that of Ph.D. in 1821. Though by parentage he was a Portuguese Jew, he embraced Christianity in 1822, and became a professor and director of the Free Scotch Church Seminary. He was an effective public lecturer. The friend of Bilderdijk, the latter's poetic mantle fell upon him, and he was thenceforth esteemed the greatest of Holland's poets. The more noteworthy of his volumes of verse are: *Prometheus* (1820); *Poems* (1821-22); *Festive Songs* (1828); *Haar* (1840); and *The Battle of Nieuwpoort* (1859). Da Costa translated Byron's *Cain*, and, as a theologian, produced a *Gospel Harmony* and *Israel and the Gentiles*,

AMERICAN DACE AND MINNOWS

1. SQUAWFISH (*Pytocheilus Oregonensis*).
2. CREEK CHUB (*Semotilus atromaculatus*).
3. UTAH CHUB (*Leuciscus lineatus*).

4. GOLDEN SHINER (*Abramis chrysoleucas*).
5. SPOT-TAILED MINNOW (*Notropis Hudsonius*).
6. HORNED DACE (*Notropis cornutus*).
7. SILVER-FIN (*Notropis Whipplei*).

both translated. He died at Leyden, April 28, 1860.

DACRÈS, dāk'kērz, JAMES RICHARD (1788-1853). An English naval officer, born at Lowestoft. He entered the navy in 1796, accompanied the expedition sent against Ferrol, and in 1806 was placed in command of the sloop *Bacchante*. After distinguished service, he was in 1811 transferred to the *Guerrrière*. Upon the loss of that vessel in the famous contest with the *Constitution*, he was taken aboard the latter, and subsequently paroled at Boston. By the court-martial assembled in 1812 at Halifax, he was honorably acquitted of all blame for the surrender of his vessel. In 1815, while commanding the *Tiber*, he captured the *Leo*, an American privateer. He became a rear-admiral in 1838, and in 1845 commander at the Cape of Good Hope.

DACRES, Sir SYDNEY COLPOYS (1805-84). An English admiral. He was captain of the flagship of the Channel fleet under Sir Charles Napier from 1847 to 1849, and as commander of the *Sans Parcil* took a prominent part in the bombardment of Sebastopol. As rear-admiral, to which position he was appointed in 1859, he later commanded the first ironclad squadron. He was second in command on the North American station during the controversy over the Trent affair (1861). In 1868 he was appointed senior lord of the admiralty, and in 1872 commander of Greenwich Hospital.

DACRYDIUM (Neo-Lat., from Gk. δακρυδιον, *dakrydion*, dim. of δάκρυ, *dakry*, tear; referring to the drops of gum exuded by the tree). A genus of lofty trees of the natural order Taxaceæ, which has the male and the female flowers on separate individuals. The species are chiefly natives of Australia and New Zealand. *Dacrydium Franklinii* is called Huon pine, although rather a yew than a pine. Its timber is harder than any Baltic pine, and is excellent for spars for naval purposes. The tree attains a height of a hundred feet, and a diameter of six feet. The wood is light, tough, and very durable. It is said to be one of the best Australian woods for carving. *Dacrydium cupressinum* and *Dacrydium Kirkii* are two species occurring in New Zealand, where they are large trees of considerable economic value. The drupes of both species are edible. The young twigs of *Dacrydium cupressinum* are sometimes used for making a kind of beer. Closely related are the species of *Podocarpus*, of which there are a score or more species in Asia and through the islands of Australia. *Podocarpus totara* is the most valuable timber-tree of New Zealand, where it attains a height of 60 to 100 feet and a diameter of 6 to 8 feet. The bark is extensively used for roofing houses. *Podocarpus spicata* and *Podocarpus excelsa* are other species of value.

DACTYL (Lat. *dactylus*, Gk. δάκτυλος, *daktylos*, finger). The name of a measure or 'foot' in Greek and Latin versification. It consists of one long and two short syllables, as in the word *omnibus*, and was so called from its resemblance to the finger, which consists of three joints—one long and two short. The same name is applied to a trisyllabic measure in English verse, consisting of one accented syllable and two unaccented syllables, as in *destiny*. (See VERSIFICATION.)

VOL. V.—47.

Dactylic verses consist of dactyls and equivalent feet. See HEXAMETER.

DACTYLIS. See ORCHARD GRASS.

DACTYLOLOGY (from Gk. δάκτυλος, *daktylos*, finger + -λογία, *-logia*, reasoning, from λέγειν, *legcin*, to say). The art of communicating thought by the fingers. See DEAF MUTE.

DACTYLOMAN'CY. See SUPERSTITION.

DACTYLS, DACTYLI, DAK'TYLOI. In Greek legend, a supernatural folk who dwelt on Mount Ida in Phrygia. They were the discoverers of copper and iron, and were deeply versed in the metal-working arts. The legends later transferred them to the Cretan Mount Ida, and identified them with the Corybantes. They were originally three in number—Kelmis, the Smelter; Dammameneus, the Hammer; and Aemon, the Anvil; then were increased to five, ten, fifty-two, and at last one hundred.

DADAYAG, dā'dā-yāg'. A head-hunting Malayan people in the mountains of Cagayan Province, Luzon. Their speech is separate. See PHILIPPINES.

DADDY-LONG-LEGS. (1) In the United States, the long-legged, spider-like creatures of the arachnid family Phalangida. (See HAN-YESTMAN.) (2) In England, the flies of the family Tipulidæ, which includes the crane-flies—big, long-legged insects, resembling exaggerated mosquitoes, that swarm in late summer in grassy and bushy places. The eggs are not known. The larvæ of some live in damp earth, decaying wood, etc., and of others in the water, feeding on vegetable material, diatoms, etc. One curious wingless genus (*Chionea*) contains the 'snow-insect' occasionally seen in swarms on the surface of snowbanks. Some of the earth-inhabiting forms injure the roots of grain and other grasses. More than a thousand species have been described.

DA'DO (It., a die). In architecture, the term applied to the cubic block which forms the body of a pedestal. It is also applied to the plane face and the series of moldings which, in the interiors of buildings, form, as it were, a continuous pedestal. The ordinary modern interior dado is formed of wood, and, running round the bottom of the walls of a room, serves to protect the plaster or paper from injury. It is generally about three feet in height, and surmounted by a narrow cornice. It is also called a wainscot, though this name is more properly applied to a paneled dado.

DADOXYLON (Neo-Lat., from Gk. δάξ, *das*, torch + ξύλον, *xylon*, wood). Fossil wood of Paleozoic age, found in the Devonian rocks of Europe and America, and having a microscopic structure like that of Cordaites wood and Araucaria wood. See CONIFERÆ; CORDAITES.

DÆDALUS (Lat., from Gk. Δαίδαλος, *Daidalos*, literally 'the cunning worker'). The mythical sculptor, placed by Greek legend at the beginning of native art, to whom were attributed many early wooden statues, apparently of the type of the early nude male figures, such as the "Apollo of Oreomenos." The early forms of the legend seem to have made him a native of Crete, and there seems to have been an early school of Cretan artists, the Dædalidæ, who claimed him as their ancestor. Under Athenian influ-

ences, however, the more common forms of the myth arose. Dædalus was a descendant of the Athenian royal race, the Erechthidæ, and having killed his pupil Talos, fled to Crete, where he was received by King Minos, for whom he built the Labyrinth for the Minotaur, and for Pasiphaë (q.v.), the wooden cow. To escape the wrath of Minos, he fitted wings to his son, Icarus, and himself, and fled across the sea. Icarus flew too near the sun, the wax which fastened the wings melted, and he was drowned in the Icarian Sea. Dædalus escaped to Italy, where he built the Temple of Apollo at Cumæ, and then crossed to Sicily, where local legend attributed to him many architectural works. It seems useless to seek any historical basis for the story of Dædalus, though it is very probable that Crete exercised an important influence on early Greek art. Consult: Kuhnert, *Dædalus* (Leipzig, 1886); Potier, in Daremberg and Saglio, *Dictionnaire des antiquités* (Paris, 1873); and Robert, "Die Daidaliden," in *Archäologische Märchen* (Berlin, 1886).

DÆDALUS OF SICYON, sish'i-on. A Greek sculptor, who lived in the first half of the fourth century B.C., probably the son and, according to Pausanias, also a pupil of Patrocles of Sicyon. His earliest work mentioned was a "Trophy," erected at Olympia by the Eleians to commemorate a victory over the Lacedæmonians. His other productions include the "Cowering Venus," probably the prototype of the familiar copies in the Louvre and Vatican Museums, the figures of "Two Boys Using the Strigil," and the portrait statues of several of the victors in the Olympian games.

DÆDICU'RUS. See GLYPTODON.

DÆMON'ELIX (Neo-Lat., from Gk. *δαίμων*, *daimōn*, demon + *ἑλίξ*, *helix*, spiral). A problematic fossil found in great numbers in the sandstones of the Loup Fork Tertiary of northwestern Nebraska and adjacent portions of Wyoming, and known to the ranchmen of the vicinity by the name of 'Devil's cork-screws.' The fossil ranges through a thickness of about 250 feet of sandstones and varies in form from delicate fibrous structures in the lowermost beds, through cylindrical, spherical, cake-like, and irregularly twisted forms in successively higher horizons, till in the uppermost beds it assumes the form of a vertical left- or right-handed spiral spring, 2 to 10 feet high, with or without a central axis, and usually with a more or less curved fusiform or cylindrical 'trunk,' 3 to 20 feet long, that rises obliquely from the base of the spiral. The fibrous forms penetrate the sandstone and are also found traversing the surfaces of skulls and bones of fossil mammals entombed in the same beds. The spiral screws are wonderfully regular in their proportions, both as to the angle of pitch of the spiral and as to the increase in diameter of the same from bottom to top. The whole mass of the fossil consists of an aggregation of twisted plant-fibres, which on examination with a microscope prove to have a simple cellular structure like that of parenchyma tissue. This cellular structure has been found in all parts of the fossil, and clearly indicates its vegetable nature. The beds in which the Dæmonelix is found are of lacustrine origin, and it is possible that the fossil is of algal affinity. Prof. E. H. Barbour, the discoverer of Dæmonelix, has

described it fully in a paper on the "Nature, Structure, and Phylogeny of Dæmonelix," in the *Bulletin of the Geological Society of America*, vol. viii. (Rochester, 1897).

DAENDELS, dän'dêls, HERMAN WILLEM (1762-1818). A Dutch general. He was born at Hattem, in Gelderland, where he practiced law and took part in the revolutionary disturbances that broke out in 1787. Compelled to seek refuge in France, he rendered important service to Dumouriez in 1793, in the latter's campaign against Holland, was made brigadier-general, and, after the proclamation of the Batavian Republic, entered its service as lieutenant-general. In 1799 he commanded a division of the Republican army, which compelled the Anglo-Russian forces to surrender. Hostile intrigues induced him to leave the service in 1803, but at the outbreak of the war in 1806 he was reinstated in his former rank by the King of Holland, and served against the Prussians. He now occupied East Friesland, and became successively Governor of Münster, commander-in-chief of the Dutch cavalry, marshal of Holland, and Governor-General of the Dutch East India possessions. This last office he held from 1808 to 1811, and discharged his duties with great ability and prudence. He participated in the Russian campaign of 1812-13, and distinguished himself by his stalwart defense of Modlin. On the overthrow of Napoleon, his services were secured by the new King of Holland, William I., who intrusted him with the organization of government in those colonies on the west coast of Africa which had been restored to the Dutch. In this capacity he labored with energy and success until his death. The work he published (1814) on his administration of Java was an important contribution to our knowledge of that island.

DAET, dâ-ät'. A town of Luzon, Philippines, in the Province of North Camarines. It is situated near the coast, 50 miles northwest of Nueva Cáceres. Population, in 1898, 10,650.

DAFFODIL. See NARCISSEUS.

DAGAMI, dâ-gâ'mê. A town of Leyte, Philippines, 20 miles from Tacloban. It is situated in a plain, near the eastern coast of the island. Population, in 1898, 25,000.

DAGE, dâ'ge, EDUARD (1805-83). A German painter, born in Berlin. He received his artistic training at the Academy of Berlin and under Wachs. From 1861 until his retirement in 1875 he was acting director of the Royal Academy at Berlin. He executed some religious works, including frescoes in the chapel of the Schloss in Berlin. But he was more successful with genre and ideal subjects, such as "The Discovery of Painting" (1832; National Gallery, Berlin) and "The Compassionate Monk" (1836).

DAGGER (Icel. *daggardr*, dagger, from Ir. *daigear*, Welsh *dagr*, dagger, from Bret. *dag*, OGael. *daga*, knife). A short sword, or two-edged, sharp-pointed knife. It is one of the oldest forms of the *arme blanche*, and has its modern representative in the infantry sword-bayonet. (See BAYONET.) In the Middle Ages soldiers often fought with sword or rapier and dagger, the latter being held in the left hand. (See FENCING.) The dagger proper has ceased to be part of the modern military equipment,

except by some of the native or tribal troops of the British and Russian empires.

The dirk, practically a dagger, is still carried by the Highlanders of the British Army, but only as an ornamental part of their national dress. The American bowie-knife (q.v.) is in effect a dagger.

DAGGER-MOTH. A moth of the noctuid genus *Acronyeta*, so named because of dagger-shaped marks on the wings.

DAGGERWING. One of the small, slender-tailed North American butterflies of the nymphalid genus *Timetes*.

DAGHESTAN, *dä'ge-stän'* (Pers., place of mountains, from Turk. *dagh*, *tagh*, mountain + Pers. *stän*, OPers. *stāna*, place, from *stā*, Skt. *sthā*, to stand). A province of Transcaucasia, Russia, bounded by the Caspian Province of Terek on the north, the Caspian Sea on the east, Baku on the south, and the Caucasus mountain chain on the west (Map: Russia, G 6). Area, 11,332 square miles. A large portion of the territory belongs to the region of the Caucasus Mountains. The coast land is mostly level. Numerous short mountain streams cross Daghestan and fall into the Caspian Sea. There are a number of hot springs. The climate is moderate. In the lower portions of the territory some grain and fruit are raised. The mountains are well wooded. Sulphur is practically the only mineral worked. Cattle-raising receives much attention. The commerce is insignificant, and the transportation facilities inadequate. The population, in 1897, was 586,636, consisting mostly of Lesghians, Avars, and other Caucasian tribes. The Turkish Tatar element is, however, not unimportant. The Russians number about 10,000, and the Jews are about equally numerous. The natives are chiefly Mohammedans, and the educational facilities are very meagre.

The seat of the provincial government is Temir-Khan-Shura, and the chief commercial centres are Derbent and Petrovsk (q.v.), both on the coast. Until 1812 Daghestan formed a province of Persia, although the inhabitants enjoyed partial independence under native khans, and manifested their opposition to Persian rule by periodic revolts. It then passed into the nominal possession of Russia, whose authority was not established until after a fierce struggle of many years. Daghestan still continued to be ruled by native khans until 1868. The last outbreak of the natives against Russian rule occurred during the Russo-Turkish War in 1877.

DAGNAN-BOUVERET, *dä'nyän' bōō'v'rá'*, PASCAL ADOLPHE JEAN (1852—). A French painter, born in Paris, January 7, 1852. He studied under Gérôme, and won his first important success with his Salon picture of 1870, "A Wedding at the Photographer's." In 1882 appeared "The Nuptial Benediction," and in 1884 "The Horse Pond," which is in the Luxembourg. "The Consecrated Bread" (1886) admirably displays his management of light in interiors, and the subject of the picture is painted with a sentiment that is poetic, yet quiet and serene. His work shows poetic feeling and patient labor. Bouveret was made Chevalier of the Legion of Honor in 1885, and received the first medal at the Salon of 1899 for his "Breton Women at the Pardon." Consult: Mrs. Arthur Bell, *Rep-*

resentative Painters of the Nineteenth Century (New York, 1899); Stranahan, *A History of French Painting* (New York, 1899); *Modern French Masters*, Van Dyke, ed. (New York, 1896).

DAGÖ, *dä'gö*, or **DAGDEN**, *däg'den*. An island in the Baltic Sea, belonging to the Russian Government of Esthonia. It lies north of the island of Osel, is quadrilateral in shape, and covers an area of 370 square miles (Map: Russia, B 3). The surface is mostly low land, partly covered with marshes. Fishing and farming are the main industries. Population, in 1897, about 14,000, composed of Esthonians, Swedes, and Germans. Dagö belonged to Denmark until 1645, when it was acquired by Sweden, and was annexed to Russia in 1721.

DA'GO. A name originally given by sailors to Spaniards, Portuguese, and Italians in general. It is asserted to be a corruption of the Spanish name Diego, equivalent to the English name 'James,' or 'Jack.' By others it is a title given exclusively to those born of Spanish parents. By others, again, it is thought to be purely a corruption or nickname derived from *hidalgo*, which came to be applied to any for-eigner from Latin Europe. Whatever the derivation of the word may have been, it is applied chiefly to the lower class of Italian immigrants in America.

DAG'OBERT, *Fr. pron. dä'gö'bär'*, I. (? - 638). King of the Franks, son of Cloaire II. He ruled in Austrasia from 622 to 632, and in Neustria and Burgundy from 628 to 638. In 632 he gave Austrasia to his son Sigibert.

DAGOBERT, **CHANSON DU ROI** (Fr., song of King Dagobert). A French song, in which the characters are King Dagobert and Saint Eloi, his counselor. It became very popular as a political song; the couplets being altered to fit different political conditions. A notable version which sprang up in 1814, aimed at Napoleon, was suppressed by police regulations.

DA'GON. A god of the Philistines, and perhaps also of the Phœnicians. The references to this god in the Old Testament are too few and our knowledge of Philistine religion too scanty to enable us to identify the god. There was a temple dedicated to him at Gaza (Jud. xvi. 23) and another at Ashdod (I. Sam. v. 2, etc.). From the description in the latter passage it would seem that Dagon had a head and hands, but the shape of his lower extremities is in doubt. Kimchi says that he was half man, half fish, but this may be due to the etymological explanation of *Dagon* from Hebrew *dag*, fish. *Dagon*, however, can also be compared with *dagan*, corn, and the god would thus become an agricultural god, which is much more probable. It has been supposed by some that the man-fish figures on Assyrian monuments represent Dagon, but there is no warrant for this hypothesis. The figure in question is the Assyro-Babylonian god Ea, a water deity whose seat of worship was originally at Eridu, on the Persian Gulf. There is, however, a god Dagon who is associated with Anu, the god of heaven. It is not impossible that Dagon is a foreign deity introduced into Assyria and whose original character is there lost sight of. I. Sam. v. 5 mentions that the priests and worshippers never stepped on the threshold of the temple of Ashdod. Consult:

Menant, "Le mythe de Dagon," in the *Revue de l'histoire des religions*, vol. xi. (Paris, 1886).

DAG'ONET, SIR. King Arthur's fool, in the "Round Table" legends. The Elizabethan dramatists frequently allude to him as a type of the court jester.

DAGUERRE, dā'gār', LOUIS JACQUES MANDÉ (1789-1851). A French painter and physicist, born at Corneilles, Seine-et-Oise. He first became a scene painter under Degoti, and was so successful in this art that he began to paint extensive panoramas, and finally evolved the diorama, which attracted much attention. About 1829 he began to interest himself in the discoveries which became famous under his name. He entered into a correspondence with Nicéphore Niépce, who had been studying in the same direction since 1814. Together they invented the art of photography on metal, the well-known daguerreotype process, the improvement of which was to result in modern photography. Before the completion of their experiments Niépce died. In 1839 the discovery was made known, and immediately its value was appreciated. Daguerre was given a pension of 6000 francs and made a member of the Legion of Honor. While he was still laboring to bring his work nearer perfection he died suddenly at Petit-Brie-sur-Marne, near Paris. He wrote the following volumes descriptive of his inventions: *Historique et description des procédés du daguerreotype et diorama* (1880) and *Nouveau moyen de préparer la couche sensible des plaques destinées à recevoir les images photographiques* (1844). Consult Ernouf, *Les inventeurs du gaz et de la photographie* (Paris, 1885). See **DAGUERREOTYPE PROCESS**; **PHOTOGRAPHY**.

DAGUERREOTYPE (dā-gēr'ō-tīp) **PROCESS** (Fr. *daguerreotype*, from *Daguerre* + Gk. *τύπος*, *typos*, impression). The original photographic process, as introduced by its inventor, Daguerre, in 1839. The pictures are positive or direct, though they appear as negative when viewed at certain angles, and are the result of the successive action of the vapors of iodine, bromine, and mercury upon a highly polished surface of chemically pure silver. The manipulations involved in conducting the process are: (1) cleaning and polishing the plate; (2) rendering the plate sensitive; (3) exposing it in the camera; (4) developing the latent image; (5) fixing the picture.

A copper plate of moderate thickness is first coated with silver by electro-plating and polished as highly as possible; it is then exposed first to the vapor of iodine, and then to the vapor of bromine for a length of time, ascertained in practice by watching the succession of prismatic colors which begin to appear with the first contact of the vapor. The plate is then exposed in a camera, and the development of the latent image, which is the next operation, is effected by subjecting the plate to the action of the vapor of mercury, which attaches itself to the various parts of the picture in proportion as it has been acted on by the light. Those portions of iodide and bromide of silver unaffected by light are next removed by immersing the plate in a solution of hyposulphite of soda; and the picture is subsequently fixed and intensified by pouring over its surface a solution of hyposulphite of soda and chloride of gold, and applying heat;

by which means it is coated with a thin film of metallic gold, and thereby rendered so permanent that it requires a chemical solvent for its removal. It may be mentioned in conclusion that though Daguerre published in 1839 the first practicable process for taking pictures by the agency of light, his experiments would seem to have been suggested by the researches of Niépce, who, about 1820, obtained impressions on silver plates rendered sensitive by being coated with asphaltum saturated with oil of lavender. See **PHOTOGRAPHY**.

D'AGUESSEAU, dā'gēs'sō'. See **AGUESSEAU**.

DAGUPÁN, dā'gōō-pān'. A town of Luzon, Philippines, in the Province of Pangasinán, situated eight miles from Lingayen, near the Gulf of Lingayen (Map: Luzon, C 2). It is the terminal of the Manila-Dagupán Railway. The surrounding region, generally level, is very fertile. Population, in 1898, 16,000.

DAHABEAH, dā'hā-bē'ā (Ar. *dahabiya*, from *dhababa*, to go). The name given to barges on the river Nile, much used by tourists, to whom they are hired by the week. They resemble in their conveniences and comforts the houseboats so popular on English rivers.

DAHL, dāl, JOHANN KRISTEN CLAUSEN (1788-1857). A Norwegian landscape painter, born at Bergen, February 24, 1788. His parents wished him to enter the Church, but he was determined to study art, and in 1811 entered the Academy at Copenhagen. In 1818 he entered the Academy at Dresden, and in 1821, after his return from Italy, he was made professor there. He was a pioneer in Norwegian landscape. Though very rugged in style, he painted with a hard and dry effect. In spite of this, he stood in the front rank of his contemporaries, especially between the years 1820 and 1830. He died at Dresden, October 14, 1857. Among his most prominent works are: "Danish Coast by Moonlight" (1828); "Storm at Sea" (1823); "Great Norwegian Landscape" (1850); and "Winter Landscape." Consult Aubert, *Maleren Professor Dahl 1788-1857* (Kristiania, 1892-94).

DAHL, VLADIMIR IVANOVITCH (1801-72). A Russian author, born in Lugansk (Government of Ekaterinoslav). He was educated at Dorpat, and in 1828-31 accompanied the Russian army in a medical capacity in the Turkish and Polish campaigns. Subsequently he was a Government official at Orenburg. His studies in Russian ethnography and philology are valuable, in particular his *Dictionary of Existing Russian Dialects* (4 vols., 1861-68; 2d ed. 1882). His works in belles-lettres were collected at Saint Petersburg in 1860-61 (8 vols.).

DAHLAK, dā-lāk', or **DAHALAK**, dā'hā-lāk'. An archipelago (a dependency of Italy) just off Massawa, Abyssinia, consisting of a number of islands of coral, rock, and sand (Map: Africa, H 3). Three only have a permanent population. The entire area is about 420 square miles, the larger portion of which is taken up by the main island, Dahlak-el-Kebir, 32 miles long and 18 wide. The chief occupation is fishing for pearls and sponges. Domestic animals are raised to some extent. The permanent population is about 1500, mostly Abyssinians.

DAHLBERG, dāl'bērg, ERIK, Count (1625-1703). A Swedish military engineer, born in

DAHLIA ETC.

1. DOGBANE (*Apocynum androsæmifolium*).
 2. CACTUS DAHLIA (*Dahlia juarezii*).
 3. SHOW DAHLIA (*Dahlia* sp.).
 4. SINGLE DAHLIA (*Dahlia* sp.).
 5. ENGLISH DAISY (*Bellis perennis*).

6. MALE FERN (*Aspidium Filix-mas*). Tip of frond showing a portion of the sori.
 7. DURIAN LEAVES (*Durio zibethinus*).
 7a. DURIAN FRUIT, much reduced.
 8. DAMMAR (*Agathis Dammara*).
 8a. CONE OF DAMMAR.

Stockholm. Under Charles XI. he became director of fortifications. He rebuilt most of the works then existing with such skill as to be called the 'Vanban of Sweden.' He was appointed a royal counselor, a field-marshal, and in 1696 Governor of Livonia. Consult Schlözer, *Schwedische Biographien* (vol. i, Altona, 1760).

DAHLGREN, däl'grën, FREDRIK AUGUST (1816-95). A Swedish poet, born at Nordmark, August 20, 1816. He is the author of many popular dialect songs and ballads (3 vols., 1876) and of some successful dramas, of which *Vermålandingarne* (1846) is most noteworthy. He was also a facile translator for the theatre and wrote a history of the Swedish stage.

DAHLGREN, däl'grën, JOHN ADOLF (1809-70). An American naval officer, prominent on the Federal side during the Civil War. He was born in Philadelphia of Swedish parentage; entered the United States Navy as a midshipman in 1826; cruised for a time on the *Macedonian* and the *Ontario*; and from 1834 to 1838 was engaged in the United States Coast Survey work, for which his aptitude and training in mathematical studies had well fitted him. In 1837 he was promoted to the rank of lieutenant, but in the same year was forced by failing eyesight to leave the active service, and did not resume his duties until 1842. After a cruise of two years in the Mediterranean on board the *Cumberland*, he was assigned to the Ordnance Department, which absorbed the greater part of his energies from this time on, and of which he was twice chief—in 1862-63 and in 1868-70. In his many years of service he greatly increased the efficiency of the department and became especially well known through his invention (1850) of the Dahlgren gun, which proved of the utmost value to the Government during the Civil War. In April, 1861, on the defection of Franklin Buchanan (q.v.), he succeeded that officer as commandant of the Washington Navy Yard, a position which he held until the fall of 1862, when he became chief of the Bureau of Ordnance. In February, 1863, he was raised to the rank of rear-admiral, and in July replaced Admiral Dupont as commander-in-chief of the South Atlantic blockading squadron, the greater part of which was engaged in the siege of Charleston, S. C. Soon after taking command, he, in coöperation with General Gilmore, the commander of the Federal troops near Charleston, succeeded in capturing Morris Island, silencing Fort Sumter, and completing the closing of the port. Finally, in February, 1865, Charleston was evacuated by the Confederates, and Dahlgren occupied Charleston Harbor, while General Schimmelpfennig took possession of the city. Soon afterwards he resigned as commander of the South Atlantic squadron, and from 1866 to 1868 commanded the South Pacific squadron. After finishing his second term as chief of the Bureau of Ordnance, he was placed in command, at his own request, of the United States Navy Yard in Washington, where several months later he died. In addition to many reports and magazine articles, he published: *Thirty-two-Pound Practice for Ranges* (1850); *Systems of Boat Armament in the United States Navy* (1852); *Naval Percussion Locks and Primers* (1852); *Ordnance Memoranda* (1853); *Shell and Shell Guns* (1856); and an uncompleted volume entitled *Notes on Maritime and*

International Law was published posthumously in 1877. Consult Madeleine V. Dahlgren (his widow), *Memoir of John A. Dahlgren* (Boston, 1882).

DAHLGREN, däl'grën, KARL FREDRIK (1791-1844). A Swedish humorist and poet whose ballads and songs are widely sung. He was born near Norrköping, June 20, 1791. Descriptions of natural scenes and the burlesque idyll are his fortes. Like Hood, whom in many ways he resembled, he published for some years an annual, *The Muscs' Almanac*, as a receptacle for his stories and comic sketches. His sole novel, *Nahum Fredrik Bergströms krönika* (1831), is excellent. He died at Stockholm, May 2, 1844.

DAHLGREN, däl'grën, MADELEINE VINTON (1835—). An American author, wife of Admiral J. A. Dahlgren, born in Gallipolis, Ohio. Under the name of "Corinne," and later that of "Cornelia," she wrote many sketches and poems. She was one of the founders of the Literary Society of Washington, and at one time its vice-president. A list of her works includes the following: *Idealities* (1859); *South Sea Sketches* (1881); *Etiquette of Social Life in Washington* (1881); *South Mountain Magic* (1882); and *Lights and Shadows of a Life* (1886). She also rendered from the Spanish Donoso Cortes's *Catholicism, Liberalism, and Socialism*, and from the French the *Pius IX.* of Montalémbert and the *Executive Power* of De Chambrun (1874), with a preface by James A. Garfield.

DAHLGREN GUN. The type of gun designed by Admiral Dahlgren after a series of experiments to determine the pressures at different parts of the bore. They were introduced into the Navy in 1852 and were in general use during the Civil War. See BALLISTICS; GUNS, NAVAL; ORDNANCE.

DAHLIA, däl'yä or däl'yä (Neo-Lat.). A genus of large perennial herbaceous plants of the natural order Compositæ, natives of Mexico. Most of the varieties in cultivation are derived from the species *Dahlia variabilis* and *Dahlia Juarezii*, the latter being the parent of the cactus forms. Dahlias were first brought to Madrid by Spanish botanists in 1789. The name was given in honor of Dahl, a Swedish botanist. The dahlia varies greatly under cultivation. Some 3000 varieties have been catalogued. Most of these have been the showy and fancy kinds with spherical, symmetrical flowers differing mainly in color. The cactus or decorative types are more chrysanthemum-like in form. Their introduction within recent years has done much to increase the popularity of the dahlia. The dahlia possesses a wide range of colors and lacks practically only sky-blue and kindred shades. It is propagated by division of the root, cuttings, and seed. The first method is that of the amateur, the second that of the commercial grower, and the last is used in the production of new varieties. In gardens the roots are planted 18 to 36 inches apart in any good soil and require ordinary cultivation. In the fall the roots are dug and stored in the cellar like potatoes.

A beetle injurious to dahlias (*Diabrotica 12-punctata*) is illustrated under CORN-INSECTS.

DAHLMANN, däl'mán, FRIEDRICH CHRISTOPH (1785-1860). A German historian and statesman, born May 13, 1785, at Wismar. His earlier studies in Copenhagen and Halle were devoted to archaeology and philology, but his attention was subsequently directed to political science and history. In 1812 he was made a professor in the University of Kiel, and in 1815 became secretary of the permanent committee of the Schleswig-Holstein clergy and nobility, in which capacity he opposed the Danish policy concerning those duchies. He published several historical works, and in 1829 was appointed professor of political science in Göttingen, where he published his valuable work, *Quellenkunde der deutschen Geschichte* (1st ed. 1830; reëdited by Weitz, 1875, and subsequent editions). Dismissed from the university in 1837, with six of his colleagues, by King Ernest Augustus, on account of their protest against the abrogation of the Hanoverian Constitution, he went to Leipzig and afterwards to Jena, where he wrote his admirable *Geschichte von Dänemark* (Hamburg, 1840-43). In 1842 he became professor of history and political science at Bonn, and later on took a prominent part in the political affairs of Germany. At the outbreak of the Revolution, in 1848, he was appointed deputy of Prussia in the Germanic Diet, and was the principal member of the committee appointed to draft a new German constitution. He exerted his influence in the Frankfort Parliament in favor of an hereditary German empire, the dignity to inhere in the King of Prussia, but his views were not accepted, either by King Frederick William IV. or the majority of the Parliament. After a less conspicuous parliamentary activity at Erfurt and Berlin, Dahlmann returned to his academic duties, to which he devoted himself till his death, December 5, 1860. Besides the works mentioned above, he was the author of important histories of the English and French revolutions, of a work in two volumes on early Germanic history, and the editor of the *Ditmarsh Chronicle*. Consult: Springer, *F. C. Dahlmann* (Leipzig, 1870-72); Nasse, *F. C. Dahlmann*, an inaugural lecture (Kiel, 1885).

DAHLONEGA, däl'lo-nē'gá (from American Indian *Tauhunecca*, yellow gold). A town and the county-seat of Lumpkin County, Ga., 78 miles northeast of Atlanta (Map: Georgia, B 1). It is situated among the foothills of the southern portion of the Blue Ridge Mountains in a gold-mining region, and has gold-mills, concentrators, and an extensive chlorination plant. Until the Civil War, a United States branch mint was situated here. Dahlonega is the seat of the North Georgia Agricultural College, a department of the State University. The Cherokee Indians called the place Dah-lo-ne-ga, meaning yellow money. Settled in 1831, it was incorporated in the following year, and at the present time is governed by a mayor, elected biennially, and a city council. Population, in 1890, 896; in 1900, 1255.

DAHLSTJERNA, däl'shēr-ná, GUNNO EURELIUS (1661-1709). A Swedish poet, born at Öhr, September 7, 1661. He was an intense patriot, and beguiled the tedium of surveying expeditions in Sweden, Livonia, and Pomerania, by composing songs that are at times the best of his epoch, and again nearly the worst in their pathetic puerility. He had the misfortune to

choose bad models, the Silesian poets of the school of Lohenstein and the Italians of the school of Marini. But their florid pomposity could not always smother his true poetic fire, and his "Elegy on the Death of Charles XI." (1697) (*Kungaskald*) is sometimes sublime, while his "Goth's Battle Song" (1701) is an admirable popular ballad, an exulting defiance of the Russians, whose triumph at Poltava Dahlstjerna could not survive. He was a man of varied gifts, distinguished as a cartographer, and as the author of a number of scientific papers. He died in Pomerania, September 7, 1709.

DAHN, dän, FELIX (1834—). An historian, jurist, and novelist. He was born in Hamburg, February 9, 1834. His parents were celebrated actors, his early training classic. He studied history and law in Munich and Berlin, became privat-docent in Munich in 1857 and professor of law there in 1862. He has since occupied the same position in Würzburg (1863), Königsberg (1872), and Breslau since 1888. To history he has contributed *Die Könige der Germanen* (1861-97) and *Urgeschichte der germanischen und romanischen Völker* (1878 et seq.); to jurisprudence, *Die Vernunft im Recht* (1879); to poetry, collections of *Poems, Ballads, and Songs* (1857, 1873, 1875, 1878, 1892). He has also written many dramas, of which *Markgraf Rüdiger von Bechelaren* (1875) is typical. Dahn is most widely known, and deservedly, for his historical novels, which deal mainly with the primitive Germanic peoples, from the Vikings of Norway to the Goths of Italy, and from prehistoric times to the Crusades. Of these there are more than twenty, the chief of which are *Odhins Trost* (1880) and the longest and best of all, *Ein Kampf um Rom* (1876). This latter work has an epic breadth and an artistic unity that makes it one of the most striking historical novels of recent times. It is an epitome of the history of the German invasion of Italy, involving immense learning, borne so lightly by the author that it never oppresses the reader. The period is that of Justinian and Theodora, of the Gothic kings Theodoric, Totila, Vitiges, and Teja. Through the four volumes the interest never flags, and the dread of impending fate increases to the tragic close. Dahn's shorter stories of the migration, *Felicitas* (1883), *Bissula* (1884), *Fredigundis* (1885), *Attila* (1888), and *Stilicho* (1900), are also worthy of mention; but facility of composition has been Dahn's snare.

DAHOMÉY, dá-hō'mí or dá'hó'má'. Formerly a negro kingdom of West Africa, now a French colony, comprising with its dependencies all the French possessions in the region bounded by the military territories of French Sudan on the north (near latitude 14° N.), the British colonies of Nigeria and Lagos on the east, the Gulf of Guinea on the south, and the German colony of Togo on the west (Map: Africa, E 4). The total area is estimated at nearly 60,000 square miles, the territories of Kwala and Say having been added in 1899. There are 70 miles of coast. The surface is low and sandy along the Gulf, which is bordered by lagoons. The country is very hilly in the northern and more extended part, which includes the Mahé highlands. In the interior there are savannas, and large districts having a rather luxuriant flora; and

finally, the extreme north is characterized by bare tracts of desert, forming part of what is called Upper Dahomey. The only river of importance is the navigable Weme, which traverses the eastern part of the country. Mono, however, borders on the west, and the Niger on the north-east.

The climate is unhealthful in the low coast lands, being both hot and moist, but is favorable in the interior. The rainy season is in summer. A large part of Dahomey is covered with thick forests abounding in rubber-plants, and also palms which yield large quantities of oil and kernels for export. The soil is remarkably fertile, and along the coast manioc, maize, and potatoes are grown by the industrious natives, who also weave, and make pottery. Trade, which in former days was little more than an exchange of trinkets for gold and other equally precious articles, has now assumed an entirely modern aspect and importance. The commerce is mostly concentrated in the Gulf towns, especially in Porto Novo, the main port of the colony. The exports, consisting almost entirely of palm-oil and palm-kernels, amounted to nearly 13,000,000 francs in 1900. The imports for 1900 exceeded 15,200,000 francs, and were made up chiefly of liquors, cotton, and tobacco. About one-fourth of the trade is with France. In 1900 vessels with a total tonnage of 394,000 tons entered and cleared the ports. The port Kotonu is connected with the Niger and the Senegal by telegraph. There is regular steamship communication with Europe.

Dahomey was an absolute monarchy previous to the French occupation. There was a standing army estimated at over 15,000, consisting partly of female warriors or amazons, who were distinguished for superior physique and high skill in the use of weapons. At present the colony is locally administered by a French Governor, assisted by a council over which he presides. The council is made up of higher officials, and also two prominent residents, one of whom is native and one white. (See FRENCH WEST AFRICA.) The local budget for 1901 balanced at \$574,000. The colony is self-supporting. The population is estimated at nearly 1,000,000, composed of full-blooded Guinea Negroes, or Nigritions of the coast (Deniker). The Dahomans are tall, very long-headed (index 75.1), but not so black as the tribes of Senegal. In their own tongue, a dialect of the Ewe language, common on this part of the Slave Coast, they are called Fon or Fawin. Their religion is purely fetish, and the sacrifice of human beings, a widespread custom in former times, is still supposed to be practiced. In spite of a low standard of morality and warlike attributes and usages, the Dahomans are polite in their intercourse. The activity of missionaries has thus far been attended with little success, except in the case of the dervishes, who are indefatigable in their efforts to spread the gospel of Islam. The capital of the colony has been removed, since the French occupation, from Abomey to Porto Novo (q.v.). Other towns are Grand Popo, Agoué, Say (on the Niger), Whydah, and Allada, an important trading point.

The kingdom of Dahomey arose in the seventeenth century around the city of Abomey as a nucleus. By successive conquests the kings extended their rule to the highlands of the Mahé

on the north and to the Slave Coast on the south (1772). There they came into contact with the Europeans and succeeded in obtaining control of a large part of the slave trade, which was then carried on actively by the English, the French, and Portuguese. With the cessation of the slave traffic, the prosperity of the country came to an end. France secured a firm footing on the coast in the second half of the nineteenth century. Between 1878 and 1885 it obtained possession of Kotonu, Porto Novo, and Grand Popo, and after a bloody contest in 1890 forced King Behanzin to acknowledge its title to the coast region. War broke out again in 1892, and resulted in the taking of Abomey, the deposition of Behanzin (since retained as prisoner at Fort-de-France, Martinique), and the establishment of a virtual French protectorate. Since then the French have been actively engaged in extending their authority over the region to the north, so as to bring Dahomey into touch with their possessions in the Sudan. In 1897 and 1898 they concluded treaties with the Germans and the English, and the sphere of influence claimed by each was determined.

Consult: Skertchley, *Dahomey As It Is* (London, 1874); Careb, *Les territoires africains et les conventions anglaises* (Paris, 1901); Toutée, *Du Dahomé au Sahara* (Paris, 1899); Keane, in *Stanford's Africa* (London, 1895); Verdier, *Trente-cinq années de lutte aux colonies, côte occidentale d'Afrique* (Paris, 1897); Aublet, *La guerre au Dahomé* (Paris, 1894).

DAIBUTSU, di'boo'tsoo (Japanese, great Buddha). A famous Japanese image of Buddha at Kamakura, near Yokohama. It dates from 1252 and is a unique production of Japanese art, wrought of bronze and silver, with eyes of gold, and measures 50 feet in height and 97 feet in circumference. More ancient, even, dating from 749, and of more gigantic proportions, but of inferior artistic merit, is the Daibutsu at Nara, in the main island of Japan.

D'AIGUEBELLE, dag'bél'. See AIGUEBELLE.

DAILLÉ, dá'yá', or **DALLÉUS**, däl-lé'ús, JEAN (1594-1670). A French Reformed theologian, born at Châtellerault. He was tutor to the grandsons of Philippe de Mornay and traveled with them through Italy, Germany, Holland, and England in 1621-25. He became preacher at Saumur in 1625, and at Charenton in 1626, and was president of the last national synod of the Reformed Church held in France in 1659. He was one of the most learned and influential theologians of the Reformed Church in France, and wrote a considerable number of controversial works, among which the *Traité de l'emploi des Saints Pères* (1623) is of permanent value.

DAILY COURANT, THE. A journal called the first English daily newspaper, which first appeared March 11, 1702.

DAIMIÉL, di-myál'. A town in Spain, in the Province of Ciudad Real, 20 miles east-northeast of the city of that name, with which it is connected by rail (Map: Spain, D 3). It lies on the Azuer River, in the fertile Campo de Calatrava; it has several squares, and its principal streets, though unpaved, are wide and comparatively clean. Its chief buildings are the churches of San Pedro and Santa Maria—the former a Doric and the latter a Gothic structure

—a town hall, and a hospital. One of the most important towns in the La Mancha district, Daimiel has manufactures of woolens, linens, bricks, liquors, soap, hats, etc. Population, in 1900, 11,825.

DAIMIO, dī'mě-ō (Japan., great name). A term applied in Japan to a territorial feudal lord, in contrast with the *kuge* or landless noble of the Imperial Court. From the decay of the Mikado's power in the twelfth century, this class, numbering nearly 300, flourished until the abolition of feudalism in 1868, when they were amalgamated with the *kuge*, the two forming the Kuzoku, or flowery nobility. According to their former rank, wealth, power, historical or personal importance, the individual daimios have become princes, marquises, comits, barons, etc. Consult: Diekson, *Sketch of the History and Government of Japan* (London, 1869); and Griffis, *The Mikado's Empire* (New York, 1900).

DAINTY, LADY. A feminine type of fashion and frivolity in Cibber's *The Double Gallant*.

DAIRCELL. An Irish saint of the seventh century; the illegitimate son of a farmer at Luachair, near Castle Ireland, Kerry. He was born in the wilderness and would have been killed at birth by his mother, had not a dove descended from heaven to protect him, or "gather him to her in her wings;" whence his name *Dair-ecll*, meaning 'a gathering.'

DAIROLLES, dā'rōl', ADRIENNE. An actress of French origin, who, in England, in 1885, attracted notice as an amateur. The following year she supported Mrs. Langtry in a play called *Les Brebis de Pauvreté*. Later she appeared at the Drury Lane, Globe, and Adelphi theatres. In September, 1891, she was Noémie Nioche, in Henry James's play *The American*, produced at the Opéra Comique in London. In 1893 she appeared in New York at the Star Theatre. The following year she played at the Lyceum, and in the production of *The Fatal Card* at Palmer's Theatre, taking the part of Mercedes.

DAIRYING (ME. *deycry*, from *deyc*, dairy-maid, leel, *deigja*; probably connected with OSwed. *daggja*, to suckle, Skt. *duh*, to milk). That branch of agriculture which has to do with the production and utilization of milk. It embraces the feeding and management of milch cows, the supplying of cream and milk, and the making of butter and cheese, etc. The term *dairy husbandry* is applied to a system of farming under which cows are kept and bred, and the principal crops grown with special reference to the dairy herd. *Dairy* was formerly used to designate the place or house where the milk was kept, cheese was made, etc. Like almost all other occupations, dairying has become in recent years divided into several distinct and special lines. These differ as to the form of the product and the manner of disposing of it. In one case milk or cream may be produced for delivery to consumers direct from the dairy, or the same product may be delivered to a creamery to be manufactured into butter and cheese, or the product of the herd may be converted into butter and cheese at home.

In no branch of agriculture has greater progress been made in recent years than in dairying, and it is now regarded as among the most progressive and highly developed forms of farming

in the United States. While formerly believed to be confined by natural conditions to a limited area, known as the 'dairy belt,' it has been shown that the industry can be profitably and successfully carried on over a wide range of country, and that, generally speaking, good butter and cheese can be made by proper management in almost all parts of North America. Dairying was formerly confined to the spring and summer months, when pasturage could be had for the cows, and it was planned to have the cows calve as far as possible in the spring; they were generally allowed to go dry during the fall and early winter, and were neither well fed nor well housed through the winter. Winter dairying was practically unknown, as it was not supposed to be feasible or profitable. Under the system at present followed, dairying is not confined to any season, and the cows are fed succulent fodder during the winter in the form of corn silage, and roots, in addition to hay and liberal grain rations, composed largely of bran, cornmeal, and the by-products of factories where gneose and similar products are made. Great stress is laid upon the value of succulent foods as supplements to dry feed in winter, and in all countries where dairying has attained a high degree of development succulent feeds have occupied a prominent place in the ration given throughout the year. Corn silage is extensively relied upon for this purpose in the United States, being the cheapest food which can be supplied over a wide extent of the country. There may now be said to be two general systems of summer-feeding cows, the pasturage system, and the 'soiling' system, in which latter the green crops are cut for the animals. Pasturage is still extensively practiced where practicable, and it is quite customary to feed some grain to good cows on pasture. A large number of cows in the eastern part of the United States are now 'kept up' during summer, such green feed as comes into condition in succession throughout the season being raised for them. This method is thought to be more economical in sections where land commands a high price. A much larger number of cows can be kept on a given area by this 'soiling' system, and the animals are found to keep healthy and do well under it. Perhaps the most remarkable advance in dairying has been in the keeping of better cows, and in giving more attention to their feeding, comfort, and general management. The introduction of the creamery and cheese-factory systems (q.v.) has caused a great revolution in dairy practice, to a large extent transferring the manufacture of butter and cheese from the farm to the factory. The invention of the Babcock test, which has made practicable the payment for milk by test and placed it within the power of dairymen to test their individual cows, has been a very potent factor in improving the grade of cows which are kept, and has probably done more than any other single thing to advance American dairying. Milk of guaranteed fat-content is now sold in most of the large cities, and cream is supplied of various degrees of richness, according to the purposes for which it is intended. The sanitary conditions of milk production have been greatly improved as a result of bacteriological and other studies which have been made, and pasteurized milk and cream are now extensively used.

Dairying has been very greatly advanced by

the invention and introduction of various kinds of dairy machinery, such as creaming apparatus, notably the separator; hand and power churns, butter-workers, cheese vats and presses, etc. The cream separator, aside from its increased efficiency and reduction of labor, has almost eliminated the disturbing factor of climate from a large part of dairy management, and has altogether worked a revolution in this industry. See **BUTTER**.

The numerous by-products of the dairy are now very generally utilized in a variety of ways. The skim milk and buttermilk are, where practicable, fed to animals; considerable quantities are sold in towns and cities for household consumption, and milk-sugar is made from skim milk and whey. The casein of skim milk is also dried and prepared as a bakers' supply and substitute for eggs, as the basis of an enamel paint, as a substitute for glue in paper-sizing, and is also solidified and used for making buttons, combs, and many similar articles.

The value of the principal dairy products of the United States (milk, butter, and cheese) was estimated by the Federal Department of Agriculture for the year 1899 to be over \$450,000,000. "If to this be added the value of the skim milk, buttermilk, and whey, at their proper feeding value, and the value of the calves dropped yearly, the aggregate value of the product of the dairy cows exceeds \$500,000,000."

The leading dairy States are Iowa, New York, Pennsylvania, Illinois, Wisconsin, Ohio, Minnesota, Kansas, Michigan, and Indiana. In the Middle and Eastern States the milk is used quite largely to supply the numerous large towns and cities. In the Central West and Northwest butter is the principal dairy product. Dairying is also quite extensively practiced in Canada, where both butter and cheese of good quality are made. Canadian cheese, especially, enjoys an excellent reputation.

Since 1872 oleomargarine (q.v.), known in Great Britain as margarine and butterine, has been used in the United States, and has become a formidable competitor of the true dairy product. Its use in adulterating both butter and cheese led to the passage in several States of laws restricting its use and sale. The manufacture of oleomargarine cheese, or 'filled' cheese, as it is called, has greatly injured the good name of American cheese.

For further discussion of topics relating to dairying, see: **CATTLE**—*Dairy Cattle*; **BUTTER-MAKING**; **CHEESE-MAKING**; **MILK PRODUCTION**; **CHEESE-FACTORY**; **CREAMERY**.

DA'IS (Fr., canopy). This term was used with considerable latitude by mediæval writers. Its most usual significations are the following: (1) A canopy over an altar, shrine, font, throne, stall, chair, statue, or the like. The term was applied to the canopy without regard to the materials of which it was composed, which might be cloth, wood, stone, metal, or other substance. (2) The chief seat at the high table in a hall, with the canopy which covered it, from which probably the word in all its significations was introduced, its French meaning being a canopy. (3) The high table itself. (4) The raised portion of the floor, or *estrade*, on which the high table stood, and by which the upper was divided from the lower portion of the hall. (5) A cloth of state for covering a throne or table. In old

writings the word occasionally takes the form of *dois*, and more rarely that of *dez* or *detz*.

DAISY (AS. *dages cūge*, day's eye, referring to the form of the flower). A plant of the genus *Bellis*, of the natural order Compositæ. The common daisy (*Bellis perennis*), plentiful throughout Europe, flowers almost all the year in pastures, meadows, and grassy places. For illustration, see Plate of **DAILLIAS**, etc. What are called double varieties, with flowers of various and often brilliant colors, are very commonly cultivated in gardens. A variety has the flower (head of flower) surrounded by smaller ones, the short stems of which grow from the summit of the scape or leafless stem. The daisy (*gowan* of the Scotch) has long been a favorite with poets and lovers of nature, characteristic as it is of many of the fairest summer scenes, its blossoms gemming the pastures, and recommended also by its frequent appearance during the severer seasons of the year. Its flowers close at night. It is sparingly introduced in America. A species of *Bellis* is, however, found in the United States (*Bellis integrifolia*), but it is confined to Kentucky, Tennessee, Arkansas, and the Southwestern States. The flower commonly called daisy, or oxeye daisy, in the United States is a species of chrysanthemum (*Chrysanthemum leucanthemum*). A number of other plants are called daisies in the United States, among them *Rudbeckia hirta*, also called yellow daisy and black-eyed susan, *Erigeron annuus*, *Erigeron strigosus*, and other species are called daisies or daisy fleabane, and a number of species of wild aster are likewise known as daisies.

DAISY, SOLOMON. In Dickens's *Barnaby Rudge*, the rusty little parish clerk of Chigwell, and one of the 'quadrilateral,' or village club, which met at the 'Maypole.'

DAISY MILLER. A well-known novel by Henry James (1878), so called from the name of its heroine, an American girl who disregarded European rules of conduct. This character sketch was much criticised as not being a true representation of the American type; but its veracity is now admitted.

DAITYA, dit'yā (Skt., sons of *Diti*, a popular formation from *Aditi*, the boundless goddess). The Titans of Hindu mythology, hostile to the gods and disturbers of religious observances.

DAKAR, dā-kār'. A seaport in the French colony of Sénégal, Africa, situated about 1½ miles north of Gorée and on the extreme point of Cape Verde (Map: Africa, C 3). It has an excellent harbor and is connected by railway with Saint Louis, 163 miles distant. The climate is unhealthful. There are a number of large factories, and the commerce of the town has increased since the completion of the railway to Saint Louis. Population, in 1896, 12,000.

DA'KER HEN (dialectic Engl. and Scotch *daker*, to loiter; cf. OFlem. *duckeren*, to move to and fro). An English local name for a corn-crake. See **CRAKE**.

DAKO'TA. See **NORTH DAKOTA**; **SOUTH DAKOTA**.

DAKOTA (or JAMES) RIVER. A navigable stream rising in Wells County, N. D., about seventy miles northeast of Bismarck (Map: South Dakota, G 4). It flows southerly through a fertile country, and joins the Missouri

River nine miles east of Yankton, S. D. It is about 400 miles long in its general direction. It falls nearly 600 feet, but the fall is so uniform that the stream is incapable of much development as to water-power. Only small tributaries flow into it.

DAKOTA INDIANS. See **STOUX**.

DAKOTA STAGE. A subdivision of the Cretaceous system in America, the rocks of which were first described as occurring in Dakota. It comprises conglomerates, sandstones, and clays, with layers of lignite, and is found along the western edge of the great plains from Texas to Canada. In the Black Hills the series of rocks is from 250 feet to 400 feet thick. The coal deposits of Bear Creek, Wyo., are probably of this age. See **CRETACEOUS SYSTEM**.

DAKSHA, dāk'shā. A deity in Hindu mythology, represented as having a goat's head, and regarded as a son of Brahma (q.v.). His name means the *dexterous* or *clever* god, and in the oldest of the Vedas he is accounted especially as a progenitor of the race of the gods. His daughter Umā, according to later mythology, was married to Siva (q.v.). Owing to an affront received in connection with a great sacrificial feast, Siva slew Daksha and cut off his head. The scene is portrayed in Hindu sculpture. Siva later restored his father-in-law to life, and replaced his head, which had accidentally been destroyed, by the head of a goat, which the god still wears.

DALAGUETE, dāl'gā'tā. A town of Cebú, Philippines, 49 miles from Cebú. It is situated on the coast, near the mouth of the river of the same name. Dalaguete was founded in 1711. Population, in 1898, 21,323.

DALAI-LAMA, dā-lā'è lā'mā. See **LAMAISM**.

DAL'ARA'DIA. The ancient name applied to a district in Ireland, including the southern half of the present county of Antrim and the eastern part of the county of Down. The name is not to be confounded with Dalriada (q. v.), as Dalaradia, or 'Dal Araidh,' takes its name from 'Fiacha Ariad,' a king of Ulster of the Irian race, while Dalriada belonged to the race of Heremon. A Pictish colony from Scotland settled in Dalaradia a century before the beginning of the Christian Era.

DALAYRAC, dā'lā'rāk', NICOLAS (1753-1809). A French dramatic composer, born at Muret. His parents intended him to become a lawyer, and bitterly opposed his studying music; but in 1774 he was sent to Paris to enter the Guards of the Count d'Artois, and in that city he was able to pursue his musical studies. He was a pupil of Langle, and after writing a number of violin quartets, in 1781 produced his first opera, *Le petit souper*. Its success encouraged him, and he immediately began to write other works, producing in all about fifty operas. In 1798 he was made a member of the Stockholm Academy, and a little later a Chevalier of the Legion of Honor. His best operas were *Nina* (1786), *Azémia* (1787), *Camille* (1791), and *Romeo et Juliette* (1793), all of which show a vivid dramatic instinct and a charm of melody which made them immediately popular throughout France. He died in Paris, and his bust is now in the foyer of the Opéra Comique.

DALBERG, däl'bĕrk. The name of an ancient German family, the members of which possessed under the Holy Roman Empire the dignity of 'First Knight of the Empire.' The most distinguished member of the family was KARL THEODOR, Baron von Dalberg (1744-1817), Archbishop of Mainz, and famous as a patron of arts and letters. He assisted in the negotiations between Napoleon and Pius VII. at Paris in 1804, and was much esteemed both personally and as a scholar and ecclesiastical prince by such men as Wieland, Schiller, and Goethe. He was made Prince Primate of the Confederation of the Rhine (1806), and Grand Duke of Frankfort (1810), but was constrained by public opinion to retire into private life on the fall of Napoleon (1814). His writings are no longer of value. For his *Life*, consult: Krämer (Leipzig, 1821); and Beaulieu-Marconnay, *Karl von Dalberg und seine Zeit* (Weimar, 1879).

DALBERGIA, däl-bĕr'jā (Neo-Lat., named in honor of the Swedish botanist *Dalberg*). A genus of trees and climbing shrubs of the natural order Leguminosæ, having a stalked membranous pod, which is flat, tapers to both ends, and contains one to three flat seeds. The leaves are pinnate, with a terminal leaflet. All the species are natives of warm climates. Some of them are valuable timber-trees, particularly the sissou of Bengal (*Dalbergia sissou*), much prized, and more extensively used in the north of India than any other timber-tree except the sal (q. v.). The sissou extends through India to Afghanistan, growing at elevations up to 5000 feet. The trees become 60 feet high; the wood is elastic, seasons well, does not warp, and has a greater transverse strength than teak or sal. *Dalbergia latifolia* furnishes the East Indian rosewood, or Malabar blackwood, which attains a diameter of six feet. The wood is heavy, dark, and very strong, and is extensively used in cabinet-work, for ship-knees, gun-carriages, and agricultural implements. *Dalbergia nigra* and *Dalbergia miscolobium* of Brazil furnish valuable woods for export. *Dalbergia monetaria*, or *Ecastophyllum monetaria*, a related tree, a native of Surinam, yields a resin very similar to dragon's blood.

D'ALBERT, däl'bār', EUGEN FRANCIS CHARLES. See **ALBERT**.

DALE, DAVID (1739-1806). A Scottish manufacturer, born at Stewarton, Ayrshire. He secured the use of Arkwright's spinning patent, founded the New Lanark mills, and subsequently other important establishments, and became widely known for his many benevolences. Robert Owen married his daughter and succeeded him in the Lanark mills. Dale was the founder and chief pastor of a Scotch Church of Congregational principles, the members of which were called 'Dalites,' or 'Old Independents.'

DALE, JAMES WILKINSON (1812-81). An American Presbyterian divine. He was educated at the University of Pennsylvania, and at Andover and Princeton theological seminaries, and was pastor from 1845 to 1876, with his last charge at Wayne, Pa. He died at Media, Pa. He wrote the elaborate works on baptism: *Classical* (1867), *Judaic* (1869), *Johannic* (1871), and *Christic and Patristic Baptism* (1784). For his biography, consult James Roberts (Philadelphia, 1886).

DALE, RICHARD (1756-1826). An American naval officer. At the opening of the Revolutionary War, he entered the English service, but afterwards joined the American Navy, served under John Barry in the brig *Leaington*, and later as first lieutenant under Paul Jones, and gained distinction in the engagement between the *Bon Homme Richard* and the *Scraps*. He was several times taken prisoner. After the declaration of peace with England he was appointed captain, and in 1801 had command of the squadron sent against Tripoli. (See BARBARY POWERS, WARS WITH.) He resigned in 1802 and spent the rest of his life in retirement.

DALE, ROBERT WILLIAM (1829-95). An English Congregational minister and author. He was born in London, graduated at the University of London in 1853, and in the same year was ordained to the ministry. He was chairman of the Congregational Union in 1868 and 1869; edited *The Congregationalist* for seven years; and in 1877 visited the United States to give the Lyman Beecher lectures on preaching at the Yale Divinity School. He was the first Englishman to give this course. His pastorate was for many years in Birmingham, where, besides being a strong leader in the affairs of his own Church, he was influential in politics. Among his publications are: *The Jewish Temple and the Christian Church* (1863); *The Atouement* (1875); *Impressions of America* (1878); and *The Fellowship of Christ* (1891).

DALE, Sir THOMAS (? -1619). A colonial Governor of Virginia. He served for some time as an English officer in the Netherlands, and in 1606 was knighted by King James. In 1611 he was sent to Virginia, by the London Company, with supplies, and, in the absence of Lord de la Warr (q.v.), the Governor-General, assumed control of the Government. He was nominally relieved in August of this year, by Sir Thomas Gates, but nevertheless remained the leading spirit of the colony, holding the position of High-Marshal, and from 1614 to 1616 was again in full control. He returned to England in 1616; was put in command of a fleet sent out by the East India Company against the Dutch in 1618; defeated a Dutch fleet off the site of the present Batavia in November of this year; and in 1619 died at Masulipatam, India. His administration in Virginia was remarkable for its pitiless severity. Finding the colonists dejected, listless, and disinclined to work, he placed them under martial law, and inaugurated a code known as 'Dale's Code,' whose rigor has become proverbial. The years 1611-1616 were long known among the colonists as 'the five years of slavery.' Dale founded a new settlement at Henrico, overcame the Appomattox Indians, and by apportioning some of the lands among private individuals, took the first step toward abolishing the pernicious communal system. His administration of affairs was approved by the London Company, and Sir Edwin Sandys (q.v.), one of the most influential members, said in 1619 that "Dale . . . with great and constant severity reclaimed almost miraculously those idle and disordered people, and reduced them to labor and an honest fashion of life." Much information concerning Dale and his administration is given in Brown, *The Genesis of the United States* (Boston, 1890), and *The First Republic in America* (Boston, 1898). A

copy of 'Dale's Laws' may be found in Force, *Tracts and Other Papers Relating to the Colonies in America*, vol. iii. (Washington, 1836-46). Consult also Prince, "The First Criminal Code of Virginia," in the *Report of the American Historical Society* for 1899 (Washington, 1900).

DALECARLIA, dä'le-kär'li-ä, or **DALARNE**, dä'lär-ne. An old province of Sweden, now forming the Län of Kopparberg or Falun. The Dalecarlians are celebrated for the part they took under Gustavus Vasa in freeing their country from the yoke of Christian II. of Denmark.

D'ALEMBERT, dä'län'bär' (1717-83). The assumed name of Jean le Rond, a French mathematician, philosopher, and encyclopaedist. He was the natural son of Chevalier Destouches and Madame de Tencin, and was left as an infant on the steps of the Chapel of Saint Jean le Rond, from which he received his name. He was tenderly reared by a glazier's wife, his father contributing secretly to his support, and was educated by Jansenists at the Collège Mazarin, where he showed a brilliant promise in mathematics, physics, and astronomy, to which he reverted after essaying law and medicine. At twenty-two he published a scholarly *Mémoire sur le calcul intégral*, at twenty-four another, *Sur la réfraction des corps solides*. His *Traité de dynamique* (1743) marks an epoch in mechanical philosophy. This work is based on the theory known as D'Alembert's principle, discovered by him at the age of twenty-six, and expressed in the proposition: The impressed forces are equivalent to the effective force. His *Réflexions sur la cause générale des vents* (1744) contains the first conception of the calculus of partial differences. In 1749 he published the first analytical solution of the precession of the equinoxes. He was made a member of the Academy of Sciences in 1741, and in 1754 of the French Academy, whose perpetual secretary he became in 1772. As such he wrote a series of *Eloges* of members deceased between 1770 and 1772. In 1751 he undertook, with Diderot, the editing of the great French *Encyclopédie*, and, though he withdrew from the editorship in 1758, because of Government interference with the publication, he continued to contribute articles in science and philosophy. Very noteworthy is his preliminary discourse, or general introduction, to the work, in which he traces in broad outlines the evolution of human society, civilization, science, and art. An article of his on Geneva involved him in a celebrated dispute with Rousseau on the merits of Calvinism and the stage as teachers of morals. Meantime his scientific work had attracted the attention of Frederick II., who repeatedly offered him the presidency of the Berlin Academy. Catharine II. of Russia offered him (1762) 100,000 francs a year as tutor to her son. This he also declined. David Hume left him a legacy of £200, and on the recommendation of Pope Benedict XIV. he was admitted to membership in the Institute of Bologna (1755). But he continued to live simply, being by nature a plain, independent, bluff, benevolent, though sometimes rude man. He was a total abstainer from alcohol. His last years are closely associated with the name of Mlle. de l'Espinasse (q.v.), whom he learned to admire at the literary salon of Mme. du Deffand (q.v.). She nursed him during a serious illness in 1765, and they were never

after separated, though not a breath of scandal attached to their connection till her death (1776), a shock from which he never recovered. D'Alembert is fully as important for his personality as for his works. He gave learning an official status in French society and did a great service to letters, both by his example and by his *Essai sur les gens de lettres* (1753), in fostering the independence of his class from subserviency to social prominence and political power. This essay exposed thoroughly and finally the evils of patronage. His religious opinions, once the subject of eager controversy, are revealed as a tolerant theism in his correspondence with Voltaire, published in Bossange's partial edition of D'Alembert's *Works* (1821). Condorcet's *Eloge* of him before the French Academy (1784) gives a sympathetic yet judicious account of D'Alembert's life and writings. Consult Bertrand, *D'Alembert* (Paris, 1889).

DALGARNO, GEORGE (1626-87). A Scottish writer, who interested himself in the subject of a universal language and in the methods of teaching the deaf and dumb. He was born at Aberdeen, studied at Marischal College, and afterwards kept a school in Oxford for thirty years. His *Ars Signorum, Vulgo Character Universalis et Lingua Philosophica* (1661) is an ingenious attempt to represent and classify ideas by specific arbitrary characters irrespective of words. His *Didascalocophus, or the Deaf and Dumb Man's Tutor* (1680), has for its design "to bring the way of teaching the deaf man to read and write as near as possible to that of teaching young ones to speak and understand their mother-tongue."

DALGARNO, LORD. A villainous favorite of Prince Charles, in Scott's *Fortunes of Nigel*; the enemy of Nigel and the betrayer of Lady Hermione. He is finally murdered while attempting to flee the country.

DAL'GETTY, CAPTAIN DUGALD. A mercenary soldier and ex-divinity student in Scott's *Legend of Montrose*; a brave and reliable fellow, whose prototype is a certain Munro who served among the Scotch and English auxiliaries in Swinemünde, in 1630.

DALHOUSIE, dāl-hōō'zī or dāl-hou'zī. A popular summer resort and port of entry, the capital of Restigouche County, New Brunswick, Canada (Map: New Brunswick, C 1). It is situated at the mouth of the Restigouche estuary on Chaleurs Bay, and has a large and well-protected harbor. A considerable trade in preserved lobsters and salmon, and in lumber, is carried on. Angling, boating, bathing, and beautiful hill scenery are among its varied attractions. Estimated population, in 1901, 3000.

DALHOUSIE, JAMES ANDREW BROWN RAMSAY, tenth Earl and first Marquis of (1812-60). A Governor-General of India. The third son of the ninth Earl, he was born at Dalhousie Castle, Midlothian, April 22, 1812. He was educated at Harrow, and graduated at Christ Church, Oxford. In 1837 he was elected Conservative member of Parliament for Haddingtonshire, and at the death of his father in 1838 became Earl of Dalhousie and took his seat in the House of Lords. In 1843 he was appointed Vice-President of the Board of Trade, and in 1845 succeeded Gladstone as President. His administration at the time of the so-called 'Railway Mania,' marked

his ability, and at the change of Ministry in 1846 Lord John Russell paid him a rare compliment in asking him to remain in office to complete his work. In 1847 he became the youngest Governor-General ever sent to India. His administration, through additions of territory, development of resources by railways, canals, and other public improvements, forms an important era in Indian history, although, on account of his reduction of the army of occupation, the Indian Mutiny was subsequently laid to his charge. He was the recipient of many honors, and in 1849 was created Marquis of Dalhousie. In 1856 he returned to England as an invalid, and died after a lingering illness, December 19, 1860. Consult: Arnold, *History of the Marquis of Dalhousie's Administration of British India* (London, 1862-65); the Duke of Argyll, *India Under Dalhousie and Canning* (London, 1865); and Trotter, *Life of Dalhousie*, in the "Statesmen Series" (London, 1889).

DALIN, dāl'én, OLAF VON (1708-63). 'The Father of modern Swedish poetry,' whose literary maturity is known in Sweden as the 'age of Dalin,' a period of transition from the dominance of German to that of French, and especially English literary ideals. He was born in the Province of Halland, August 29, 1708, the son of a clergyman. He studied at Lund, went to Stockholm as tutor, and entered the civil service in 1731. In 1733 he began to issue anonymously a literary weekly, *Svenska Argus*, that soon became widely popular for its piquant wit. Dalin announced his editorship, published *Thoughts About Criticism*; a comedy, *The Jealous Man* (1738); a tragedy, *Brunhild* (1739); and the witty *Story of the Horse* (1739), through which runs a satire on the history of Sweden, following it by another satire on contemporary politics, *April Work of Our Glorious Time*. Dalin's highest poetic flight is *Swedish Freedom* (1742), a didactic allegory. In 1751 he was made tutor of the Crown Prince (later King Gustavus III.), and commissioned by Queen Louise Ulrika, sister of Frederick the Great, to write a *History of Sweden* (4 vols., 1747-62). She also consulted him in establishing the Academy of Arts and Sciences (1753). In this year he was made Privy Councillor, but fell under suspicion of political intrigue and was banished from the Court, to which he returned in 1761, two years before his death at Drottningholm, August 12, 1763. Dalin's collected *Works* (1767) have no lasting qualities, but his personal influence was path-breaking and transforming in the national literature.

DALKEITH, dāl-kēth'. A market-town of Scotland, six miles southeast of Edinburgh (Map: Scotland, E 4). It has a corn-market, a large and commodious market-hall, erected in 1854; manufactures of carpets, besides iron-foundries, tanneries, and coal-works. There are large coal-mines near by. Dalkeith arose around an ancient castle, which was long a stronghold. It was successively held by the Grahams, the Douglasses, the Earls of Morton, and the Earls of Buccleuch. Dalkeith Palace, the chief seat of the Duke of Buccleuch and Queensberry, built about 1700 on the site of the old castle, is a large square structure overhanging the North Esk, amid fine grounds in which the two Esks unite. Population (police burgh), in 1901, 6753.

DALL, CAROLINE HEALY (1822—). An American author and philanthropist, born in Boston. She lectured frequently on theological subjects, and on questions associated with the amelioration of conditions affecting woman, and was a founder of the Social Science Association, the constitution of which she framed. For many years she conducted a class in literature and morals at her home in Washington. With Mrs. Pauline Wright Davis she founded *Una*, a journal devoted to woman's rights, and the pioneer publication of its kind in Boston. The writings of Mrs. Dall are devoted chiefly to a discussion of the rights of woman, and her work entitled *The College, the Market, and the Court, or Woman's Relation to Education, Employment, and Citizenship* (1867), is a widely known contribution to that subject. Another popular work from her pen is entitled, *What We Really Know About Shakespeare* (1885; 2d ed. 1886).

DALL, WILLIAM HEALY (1845—). An American naturalist, born in Boston. He was a special student under Louis Agassiz. In 1865-68 he accompanied the International Telegraph Expedition to Alaska, and from 1871 to 1884 he was on the United States Coast Survey of Alaska. Since 1880 he has been attached to the United States National Museum, and since 1893 he has been professor of invertebrate paleontology at the Wagner Institute of Science, Philadelphia. He is the author of numerous papers on mollusks, brachiopods, and the natural history of Alaska. Important among his works are: *Alaska and Its Resources* (1870); *Reports of the Mollusca of the Blake Expedition* (1880-90); *Mollusca of the Southwestern Coast of the United States* (1890).

DALLAS. A town and the county-seat of Paulding County, Ga., about 35 miles west by north of Atlanta; on the Southern Railway. New Hope Church, four miles from Dallas, was the scene of a sharp conflict (May 25-28, 1864) between the armies of General Sherman and General Johnston. Population, in 1890, 455; in 1900, 644.

DALLAS. A city and the county-seat of Polk County, Ore., 63 miles southwest of Portland; on La Creole Creek and on the Southern Pacific Railroad (Map: Oregon, B 5). It is situated in the fertile Willamette Valley, and has considerable trade, and manufactures flour, woolen goods, lumber, sashes and doors, organs, foundry products, and tanned leather, the industrial interests being promoted by good water-power. Sandstone is quarried in the vicinity. Dallas was settled in 1849, and in 1891 was chartered as a city. Population, in 1890, 848; in 1900, 1271.

DALLAS. A city and the county-seat of Dallas County, Tex., 33 miles east of Fort Worth, on Trinity River, and on the Gulf, Colorado and Santa Fé, the Missouri, Kansas and Texas, the Texas and Pacific, the Houston and Texas Central, and the Texas and New Orleans railroads (Map: Texas, F 3). It is in the great grain belt of the State, and has large manufacturing and commercial interests. The industrial establishments include many factories of cotton-gin machinery, saddlery and harness, cotton and woolen mills, grain-elevators, flour-mills, meat-packing plant, lumber and planing mills, cotton-compresses, cottonseed-oil mills, nurseries, etc.

Dallas is one of the largest distributing centres of farming implements and machinery in the United States. The city contains the Roman Catholic Pro-Cathedral of the Sacred Heart, the Protestant Episcopal Cathedral of Saint Matthew, Saint Paul's Sanitarium, with accommodations for 200 patients, a city hospital, Carnegie Public Library, a court-house, erected at a cost of \$300,000, a Confederate monument, and numerous public and private educational institutions. Dallas has a number of public parks, City Park and Oak Cliff being of notable beauty. The State Fair and Dallas Exposition is an annual event of more than State-wide reputation. The city is governed by a mayor, elected every two years, and a city council, in which rest the appointments of auditor, city engineer, city secretary, secretary of water-works, and city electrician; all other important offices are filled by popular election. The city's annual income amounts to about \$750,000; expenditures to \$575,000, the main items being about \$40,000 each for the departments of police, fire, and water-works, and about \$90,000 for schools. Population, in 1890, 38,067; in 1900, 42,638.

DALLAS, ALEXANDER JAMES (1759-1817). An American politician. He was born in the island of Jamaica, was educated at Edinburgh and at Westminster, and in 1783 removed from Jamaica to Philadelphia. In 1785 he was admitted to the bar, and soon became prominent both as a lawyer and a politician. He was Secretary of the Treasury in President Madison's Cabinet from 1814 to 1816, and it was on his recommendation that in 1816 Congress passed an act to incorporate a new United States bank. From 1815 to 1816 he discharged the duties of the War as well as of the Treasury Department. He published *Reports of Cases Ruled and Adjudged by the Courts of the United States and of Pennsylvania Before and Since the Revolution* (4 vols., 1790-1807); *Address to the Society of Constitutional Republicans* (1805); and *Exposition of the Causes and Character of the War of 1812-15*.

DALLAS, GEORGE MIFFLIN (1792-1864). An American statesman and diplomat. He was born in Philadelphia, the son of Alexander J. Dallas; graduated at Princeton in 1810; and accompanied Mr. Gallatin in his special embassy to Saint Petersburg, as private secretary. On his return he practiced law and successively filled, for his native city, the offices of deputy attorney-general, mayor, and district attorney. From 1831 to 1833 he represented Pennsylvania in the United States Senate, and from 1833 to 1835 was Attorney-General of Pennsylvania. In 1837 he was appointed American Minister at Saint Petersburg, but was recalled at his own request in 1839. From 1845 to 1849 he was Vice-President of the United States, and as such cast the deciding vote for the tariff bill of 1846. From 1856 to 1861 he was Minister to the Court of Saint James, where he was called upon to deal with two matters of importance, the Central American question and the recall of the British Minister at Washington, Sir John Crampton, both of which threatened for a time to cause considerable friction between the British and the American governments.

DALLAS, ROBERT CHARLES (1754-1824). An English miscellaneous writer, and a friend of

Lord Byron. He was born at Kingston, Jamaica, where his father was a physician and owner of a valuable estate. He passed his life in Jamaica, the United States, England, and France. On his return from the East, Byron showed Dallas the MS. of *Childe Harold* (first two cantos), and was encouraged by Dallas to publish it. In gratitude for his many services, Byron gave him the sums received for this poem and the *Corsair*. Dallas's *Recollections of Lord Byron* appeared in 1824. Dallas also wrote novels, tales, and tragedies. He died November 20, 1824, at Sainte-Adresse, Normandy.

DALLES, dälz (Fr., slabs, flagstones). A term applied, in regions which have been under French influence, to rapids where the rocky river-bed wears in smooth slabs, and consequently especially to rapids produced by the narrowing of rivers between basaltic rocks. The best-known dalles are those in the Columbia, the Wisconsin, the Saint Louis, Minn., and the Saint Croix, Minn. The dalles of the Columbia are east of the Cascade Mountains, at Dalles City, Ore., where the fantastic shapes which these rocks assume, together with the swiftly moving waters, form a river scene of rare beauty.

DALLES, THE, or DALLES CITY. The county-seat of Wasco County, Ore., 88 miles east of Portland; on the Columbia River, at the head of navigation, and on the line of the Oregon Railroad and Navigation Company (Map: Oregon, D 4). It is the starting-point for the grandest scenery of the lower Columbia. The city carries on an extensive trade in wool, live stock, grain, and fruit; and its manufacturing establishments include flouring-mills, a wool-scouring plant, and minor industries. A Methodist mission, followed by a trading station and military post, was established here in 1838, and the settlement was incorporated in 1858. The government is administered by a mayor, elected biennially, and a municipal council. Population, in 1890, 3029; in 1900, 3542.

DALLES OF THE WISCONSIN. A famous gorge through which the Wisconsin River flows between Adams and Juneau counties, Wis. It is 7.5 miles long, ending near Kilbourn City, 21 miles above Portage. The average width of the river in the Dalles is 200 feet, but in places it narrows to about 60 feet. The walls of the gorge, about 100 feet high, are Potsdam sandstone, in which the stream has fashioned many fantastic forms. It is a favorite resort for sightseers.

DAL'LING AND BUL'WER, BARON. See BULWER, WILLIAM HENRY LYTTON.

DAL'LINGER, WILLIAM HENRY (1841—). An English scientist, born at Devonport. He entered the Wesleyan ministry in 1861, and for many years preached in Liverpool. But he also gave a great deal of his time to scientific investigation with the microscope, and this work he continued while acting as principal of Wesley College, Sheffield (1880-88), as well as later. In 1880 he was made a fellow of the Royal Society, and from 1883 to 1887 was president of the Royal Microscopical Society. He has also lectured at Cambridge and at Oxford, and has been senior lecturer to the Gilchrist Educational Trust. His published works include the following: *Minute Forms of Life* (1866); *The Origin*

of Life (1878); *The Creator and What We May Know of the Method of Creation* (1887); and a thorough revision of Carpenter's *The Microscope and Its Revelations* (1901).

DAL'ONGARO, däl-on'gä-rö. FRANCESCO (1808-73). An Italian poet, novelist, and patriot, born near Treviso. Abandoning the priesthood, for which he found himself unfitted, he started at Trieste a revolutionary journal, the *Favilla*; served under Garibaldi in 1849; and, after living for some years in exile in Paris and Brussels, returned to Florence to accept a chair of literature. Later he taught at Naples, where he closed a life full of sorrow and misfortune. He left a great variety of writings, including plays once quite popular. He is remembered chiefly, however, for his graceful and spirited poems, many of them in the Venetian dialect, and for having adopted the *stornello*, a particular form of folk-poem, as a medium for patriotic verse, his famous *Stornelli politici*.

DALMANITES, däl'mä-ni'tèz (named in honor of the geologist *Dalman*). A genus of fossil trilobites found in rocks of Ordovician to Devonian age, especially in those of the Silurian, in North America, Europe, Asia, and Australia. The carapace is depressed, with well-marked axis, is ovate in outline, tapering to the tail, and has eleven thoracic segments, with a large, often pointed, pygidium. The head-shield is broad, sometimes with an anterior point, and the genal angles are pointed. The eyes are large and usually well raised above the general surface, and are provided with numerous distinct facets. The glabella has a broad frontal lobe and three lateral lobes. Dalmanites has several related genera—*Acaste*, *Chasmops*, *Pterygometopus*, etc.—which differ in more or less conspicuous features, and which are all members of the family Phacopida, of which the type genus is *Phacops*. About 100 species are known in the genus Dalmanites, and of these the best known are *Dalmanites limulurus* of the North American Niagaran series, its representative *Dalmanites caudatus*, of the English Wenlock, and *Dalmanites socialis*, of the Bohemian Ordovician. See PHACOPS; and for bibliography and illustration see TRILOBITE.

DAL'MANUTHA (Lat., from Gk. Δαλμανουθά, Dalmanoutha). A place mentioned in Mark viii. 10, as the locality ("into the parts of Dalmanutha") whither Jesus retired after feeding the four thousand. It was somewhere near the coast of the Sea of Galilee, but has not yet been identified. In the parallel record in Matthew (xv. 39) the name of the place is Magdala.

DALMATIA, däl-mä'shî-ä. The most southern crownland of Austria, occupying a narrow strip of land along the Adriatic, and bounded by Croatia on the north and by Bosnia, Herzegovina, and Montenegro on the east (Map: Austria, E 5). Its area, including the adjacent islands, is 4940 square miles. The eastern part of Dalmatia belongs to the region of the Dinaric Alps, which form a wall on the side of Bosnia, while parallel to the coast rise the mountain chains of Castella, Mosor, and a few others. The coast is well indented and skirted by many islands. The scenery of the Dalmatian coast is famed for its picturesqueness. The Gulf of Cattaro is one of the finest harbors in Europe. The mountains are generally composed of lime-

stone and barren of vegetation. Dalmatia has no navigable rivers of importance. There are a number of lakes which dry up in the summer, and considerable tracts are covered with swamps and morasses. Dalmatia has almost a subtropical climate. The summer is exceedingly hot and dry, and snow is rare in winter. The average annual temperature varies between 58° and 62°.

Owing to the frequency of political upheavals in Dalmatia, agriculture has been in a backward state. About one-fifth of the total area is in farms, vineyards, and vegetable and fruit gardens. The geographical position of the region makes it well adapted to the cultivation of southern fruits. The vine and the olive grow profusely on the coast, and considerable quantities of wine are exported. The famous maraschino cordial comes from Dalmatia, where it is made from a cherry (*marasca*) peculiar to the country. Fishing is one of the chief occupations of Dalmatia, employing a considerable portion of the population. Cattle-raising and dairying are also carried on to some extent. The chief mineral products are lignite, asphalt, and salt, mined on a small scale. Owing to its extensive coast, Dalmatia is an important centre of the Austrian sea trade, and has a well-organized merchant marine. Ship-building is prominent among the industries. The most important ports are Zara, Ragusa, and Spalato. Cereals are imported; oil, fish, meat, and skins are exported. Dalmatia has only about 80 miles of railway lines.

Local affairs are under the control of the Diet, consisting of 43 members, of whom 10 are elected by citizens paying a direct annual tax of at least 100 florins, 8 by the towns, and 20 by the rural communities, and the remaining 5 consist of the Roman Catholic archbishop, the Greek Orthodox bishop, and three representatives of the chambers of commerce of Zara, Ragusa, and Spalato. To the Lower House of the Austrian Reichsrat Dalmatia sends 11 delegates, of whom two are elected by all the qualified voters. Administratively the crownland is divided into 13 counties. Elementary instruction is given in nearly 400 schools, with an attendance of nearly 40,000. The population in 1900 was 591,597, showing an increase of 12.2 per cent. for the decade. Over 83 per cent. of the people are Roman Catholics and 16 per cent. Greek Orthodox. The Dalmatians, who constitute five-sixths of the population, are tall and short-headed (height, 1.715 m.; index, 87). They are supposed to be fundamentally the modern representatives of the ancient Illyrians, subjected by Augustus and modified afterwards by Mæso-Goths, Avars, and Slavs. They are now classed with the Serbo-Croats. These Dalmatian Slavs, especially those in the interior, often figure under the name of Morlaks. Italian is largely spoken in the towns. Capital, Zara (q.v.).

In ancient times Dalmatia was inhabited by the warlike race of the Dalmatii, who for nearly one hundred and fifty years resisted successfully the encroachments of the Romans, but who were finally subdued in the time of Augustus. After the fall of the Western Empire, Dalmatia, which had formed the southern part of the Province of Illyricum, was occupied by the Goths, from whom it was taken by the Byzantines. Early in the seventh century the Croats and Serbs took possession of the region. About the beginning of the eleventh century King

Ladislas of Hungary incorporated a part of Dalmatia with Croatia, while the other part came into the possession of the Venetian Republic, the Doge of which had in 997 assumed the title of Duke of Dalmatia. In the south the little republic of Ragusa (q.v.) maintained an independent existence. By the Peace of Campo Formio (1797), Dalmatia, with Venice itself, became subject to Austrian rule; and when Austria, in 1805, retroceded it to Napoleon, it was annexed to the Kingdom of Italy. In 1809 it was constituted part of the dominion of the Illyrian Provinces. Since 1814 Dalmatia has formed part of the Austrian Empire. In 1816 it was made a kingdom. Political revolts have been frequent.

Consult: Jackson, *Dalmatia, the Quarnero and Istria, etc.* (London, 1893); *Die österreichisch-ungarische Monarchie in Wort und Bild*, vol. vii. (Vienna, 1892); Yriarte, *La Dalmazia* (Milan, 1878); Royle, *Dalmatia Illustrata* (London, 1900).

DALMATIA, DUKE OF. See SOULT.

DALMATIAN (däl-mā'shan) **DOG.** See COACH-DOG.

DALMAT'IC. In ecclesiastical art and in the usage of the Roman Catholic Church, the distinguishing vestment of a deacon. Its name recalls its origin from the ordinary costume of Dalmatia, which the Emperor Commodus was the first to wear publicly in Rome. Pope Sylvester, in the fourth century, ordered deacons to wear it in the church. It remained, however, for centuries a garb of men of high rank; and Christian kings and emperors have often been invested with it to symbolize the quasi-sacred character of their functions. As an ecclesiastical vestment it was originally white, with broad perpendicular stripes of purple; it now follows the color of the day, with the stripes represented in embroidery. It reaches to the knee and has wide sleeves.

DALNY, däl'nŭ. A Russian seaport in Manchuria, on the peninsula of Liao-tung, a short distance north of Port Arthur (Map: China, F 4). The spacious harbor, ice-free throughout the year, is of sufficient depth for the accommodation of large vessels. The harbor works are on a large scale, and the port is intended to become the centre of Russian trade on the Pacific, especially with Japan and China. Although founded as late as 1899, Dalny has a considerable and rapidly increasing population.

DALOU, dá'lō', JULES (1838-1902). A French sculptor, born in Paris, pupil of Carpeaux and of Duret. For several years he confined his art to objects of industrial art in bronze, before beginning to exhibit works on a larger scale in 1862. His statue of a "Woman Embroidering" (1870) was awarded a prize. Having held some administrative office in the Louvre under the Commune in 1871, he was obliged to take refuge in England, where his works met with great favor. Appointed professor in the South Kensington Museum about 1878, he returned to France after the amnesty of 1879, and speedily won distinction as one of the most gifted representatives of the naturalistic tendency in his branch of art. His style, while kindred to that of Carpeaux, is more refined and free from eccentricity. His masterpiece is the high relief in marble, "Mirabeau Delivering His Famous Address in the States-General, 1789," a composition of great dramatic power, which was placed in the

Chamber of Deputies. Among his other works deserving notice are: "Triumph of the Republic," in the Place de la Nation; the "Monument of Eugène Delacroix," in the Garden of the Luxembourg; and "Bacchus Consoling Ariadne" (1892). He also produced a considerable number of statues and busts of noted men of the time.

DAL'RIA'DA. The ancient name for the northern half of the county of Antrim in Ireland, now known as 'The Route.' The Dalriads are supposed to have descended from Carbry Riada (Riogh-flhada, i.e. of the long wrist), a son of a chief of the Scots in Ireland, who ruled not only in the district of Ireland, named after him, but, according to Beda, crossed to Scotland and settled in the lands of the Picts. In the beginning of the sixth century the Dalriads, led by Fergus, passed over to Argyllshire, where they settled themselves permanently, and formed the kingdom of 'Dalriada in Albany.' The Scottish colonists increased so much in power that they threw off the yoke of Ireland, and, about 637, attempted to subdue that island, but were defeated at Magh Rath, in County Down. The Dalriads nevertheless extended their kingdom in Scotland, and in 843 their king, Kenneth, became King of Albany, and thus united under one sceptre the Dalriads, or Scots, and the Picts. Later the Kingdom of Albany was known as Scotland.

DALRYMPLE, dāl-rīm'p'l, ALEXANDER (1737-1808). A British hydrographer; a younger brother of Sir David Dalrymple, Lord Hailes (q.v.). He was born at New Hailes, near Edinburgh, July 24, 1737. In 1752 he obtained an appointment in the East India Company's service; but he labored under the disadvantage of youth and imperfect education, until Lord Pigot, Governor of the Presidency, gave him lessons in writing. In 1758 he made a voyage of observation among the Eastern islands, and at Suha negotiated a commercial treaty with the Sultan, which he returned to consummate in 1762, but was unsuccessful. In 1765 he returned to Britain, and in 1775 was sent to Madras as a member of council, but was recalled in two years, apparently without good reason, for in 1779 he was appointed hydrographer to the East India Company, and shortly after received a pension. In 1795, when the British Admiralty resolved to establish a similar office, it was conferred on Dalrymple, who held it until his summary dismissal, occasioned by an excess of zeal, on May 28, 1808. Depression at the humiliation occasioned his death, three weeks afterwards, on June 19, 1808, at Marylebone, London. He wrote a vast number of letters, pamphlets, etc., containing plans for the promotion of British commerce in various parts of the world, political dissertations, accounts of geographical expeditions, etc., and his library, containing valuable geographical and scientific works, was acquired by the Admiralty.

DALRYMPLE, Sir DAVID, Lord Hailes (1726-92). A Scotch judge and antiquarian, born in Edinburgh, October 28, 1726. He was the grandson of Sir David Dalrymple, youngest son of Viscount Stair. Educated at Eton, in Edinburgh, and finally in Leyden, he returned to Scotland in 1746, and in 1748 was called to the Scottish bar. In 1766 he was appointed judge of the Court of Session, with the title of Lord

Hailes. Ten years after, he was made Justice Lord. He died November 29, 1792. He was a voluminous writer. His most important works are: *Annals of Scotland, from the Accession of Malcolm III., Surnamed Canmore, to the Accession of Robert I., 1776*; with continuation to the *Accession of the House of Stuart, 1779*; and *An Inquiry into the Secondary Causes which Mr. Gibbon Has Assigned to the Rapid Growth of Christianity, 1786*. He also wrote works on legal antiquities and ancient Church history; edited old Scotch poems, and published biographical sketches of notable Scotchmen. He was the esteemed friend and correspondent of Dr. Johnson. Consult "Memoirs of Lord Hailes," in late editions of the *Inquiry, etc.*

DALRYMPLE, Sir JAMES, first Viscount Stair (1619-95). A Scotch lawyer and statesman. The son of a small proprietor in Ayrshire, he was born at Drummurchie in May, 1619. Educated at Glasgow and Edinburgh Universities, at an early age he entered the army raised in Scotland to repel the religious innovations of Charles I., but returned to civil and literary pursuits, and in 1641 was appointed professor of philosophy at Glasgow. In 1648 he entered as an advocate at the Scotch bar, where he rapidly acquired distinction. In 1649 and in 1650 he was appointed secretary to the commissioners sent to Holland by the Scottish Parliament to treat with Charles II.; and in 1657 was induced to become one of the 'commissioners for the administration of justice' in Scotland under Cromwell's Government. Dalrymple was a Royalist, but resigned his seat in 1663 on his refusal to take the 'declaration' oath, which denied the right of the nation to take up arms against the King. His great talents, however, induced Charles II. to create him a baronet, and in 1671 to appoint him Lord President of the Court of Session. He was invariably the advocate of moderate measures. In 1681 he refused to take the new test oath, and resigned his appointments. The same year he published the *Institutions of the Law of Scotland*, which is still the grand text-book of the Scottish lawyer. After some time spent on his estate in Wigtonshire, Dalrymple went to Holland in 1682 to escape factious persecution. During 1684-87, while residing at Leyden, he published at Edinburgh his *Decisions*; and in 1686, at Leyden, a Latin work entitled *Physiologia Nova Experimentalis*. He accompanied the Prince of Orange on his expedition to England. William reappointed him Lord President of the Court of Session and created him Viscount Stair, Lord Glenluce and Stranraer in 1690. He died in Edinburgh, November 25, 1695. His daughter, Janet, who died in 1669, within a month of her marriage to Dunbar, Laird of Baldoon, is the original of Scott's *Bride of Lammermoor*. Consult: Mackey, *Memoirs of Sir James Dalrymple, First Viscount Stair* (Edinburgh, 1873); and Graham, *Annals and Correspondence of the Viscount and First and Second Earls of Stair* (Edinburgh, 1875).

DALRYMPLE, Sir JAMES (?-c.1714). The second son of Viscount Stair, and the author of *Collections Concerning Scottish History Preceding the Death of David I.* (1705).

DALRYMPLE, Sir JOHN, first Earl of Stair (1648-1707). A Scottish statesman. He was the

eldest son of the first Viscount, and was familiarly known as the Master of Stair. He held office under James II. and William III. While Secretary of State for Scotland he incurred great odium as the instigator of the 'massacre of Glencoe.' In 1703 he was created Earl of Stair.

DALRYMPLE, Sir JOHN, of Cranston (1726-1810). The grandson of Sir James Dalrymple, and author of *Memoirs of Great Britain and Ireland from the Dissolution of the Last Parliament of Charles II. until the Sea Battle Off La Hogue* (3 vols., 1771), which created a sensation at its appearance, owing to the revelations it contained, culled from authoritative State papers.

DALRYMPLE, Sir JOHN, second Earl of Stair (1673-1747). A Scottish general and diplomat. The second son of the first Earl and grandson of Viscount Stair, he was born in Edinburgh, July 20, 1673. When eight years old, he killed his elder brother by the accidental discharge of a pistol. Alienated from parental affection by this unhappy circumstance, he was prudence under the care of a clergyman, who, by prudence and kindness, developed the excellent qualities of the youth. He proceeded to Leyden University, where he won a reputation for scholarship, and, after completing his curriculum at Edinburgh, in 1701, accepted a commission as lieutenant-colonel of the Scottish Regiment of Foot-guards, and gained high distinction in Marlborough's campaigns. In 1711 he retired from the army, and when George I. succeeded to the throne, Dalrymple, who had become Earl of Stair by the death of his father in 1707, was made Lord of the Bed Chamber, Privy Councilor, and Commander-in-Chief of the Forces of Scotland. The following year he went as ambassador to France, and exhibited the highest ability in counteracting the schemes for the reinstatement of the Pretender. But, as he refused to flatter his countryman, Law, then high in favor with the regent Orleans, he was recalled. For twenty-two years he lived in retirement at Newliston, near Edinburgh, and devoted himself chiefly to scientific agriculture, in which he originated distinct advancements. He was the first to plant turnips and cabbages in the open fields. In 1742 he was sent as ambassador to Holland, and in the following year served under George II. at the battle of Dettingen. Later he was made Commander-in-Chief of the forces of Great Britain. He died in Edinburgh, May 9, 1747. His Countess, a beautiful and cultured woman, who survived him twelve years, is the heroine of Scott's novel *My Aunt Margery's Mirror*. Consult Graham, *Annals and Correspondence of the Viscount and First and Second Earls of Stair* (Edinburgh, 1875).

DALSGAARD, dǎls'gård, CHRISTEN (1824—). A Danish genre painter, born at Knabesholm, near Skive, Jutland. He studied at the Royal Academy and under Rørbye, was made professor of drawing at the Academy of Sorø in 1862, and became a member of the Copenhagen Academy in 1872. His impressive delineations of Danish peasant life, showing a keen sense of observation and imbued with deep feeling, have justly caused him to be esteemed one of the typical masters of Denmark. Especially noteworthy among them are: "Christmas Morning on a Farm" (1848), in the Museum at Aarhus;

"Jutland Peasants Going to Communion" (1859); "Seizure for Debt" (1860); "Fisherman and Daughter" (1854); "Mormons Visiting a Joiner's Home" (1856); "Going to Church After Confinement" (1861), the last three in the Gallery at Copenhagen.

DALTON, dǎl'ton. A city and county-seat of Whitfield County, Ga., 100 miles north by west of Atlanta, on the Southern, the Western and Atlantic, and other railroads (Map; Georgia, B 1). It is in a region possessing extensive deposits of iron, limestone, and manganese; exports cotton, grain, and fruits, and has agricultural-implement works, foundries, and machine-shops, cotton-mills, lumber-mills, etc. Settled and incorporated in 1848. Dalton is governed, under a charter of 1874, by a mayor chosen every two years, and a city council elected on a general ticket. During the latter part of 1863 and the spring of 1864, Dalton was the headquarters of the Confederate General Joseph E. Johnston, who commanded the army for the defense of Atlanta. Several minor battles were fought in this vicinity. Population, in 1890, 3040; in 1900, 4315.

DALTON, HERMANN (1833—). A German Protestant theologian. He was born at Offenbach-on-the-Main, August 20, 1833; studied at Marburg, Berlin, and Heidelberg; was pastor of the German Reformed congregation in Saint Petersburg (1858-88), and has since lived in Berlin. He is the author of *Geschichte der reformirten Kirche in Russland* (1865); *Johannes a Lasco* (1881; Eng. tr. 1886); *Verfassungsgeschichte der evangelisch-lutherischen Kirche in Russland* (1887); *Urkundenbuch der evangelisch-reformirten Kirche in Russland* (1888); *Zur Gewissensfreiheit in Russland* (1890); *Die russische Kirche* (1891); *Zur Geschichte der evangelischen Kirche in Russland* (1893-98); and several sketches of travel around the world.

DALTON, JOUN (1766-1844). A celebrated English chemist and natural philosopher, born at Eaglesfield, near Cockermouth, in Cumberland. He received his early education in the school of his native place, and, after 1781, in a boarding-school kept by a relative in Kendal. Here his love of mathematical and physical studies was first developed. He wrote several mathematical essays, and in 1788 commenced a journal of meteorological observations, which he continued throughout his whole life. In 1793 he was appointed teacher of mathematics and the physical sciences in the new college at Manchester, where he chiefly resided during the remainder of his life, though frequently employed, after 1804, in giving lectures on chemistry in several large towns. In the years 1808 to 1810 he published his *New System of Chemical Philosophy* (2 parts, London), to which he added a third part in 1827. In 1817 he was appointed president of the Literary and Philosophical Society at Manchester. He was also a member of the Royal Society, and of the Paris Academy, and in 1833 received a pension of £150, afterwards raised to £300. In the same year Dalton's friends and fellow-townsmen collected £2000, to raise a statue to his honor, which was executed by Chantrey, and placed at the entrance of the Royal Institution in Manchester. Dalton was also honored by the University of Oxford with the degree of D.C.L., and with that of LL.D. by

the University of Edinburgh. His chief physical researches were those on the constitution of mixed gases, on the force of steam, on the elasticity of vapors, and on the expansion of gases by heat. In chemistry he distinguished himself by his progressive development of the atomic theory (see CHEMISTRY), as also by his researches on the absorption of gases by water, on carbonic acid, carburetted hydrogen, etc. His papers are mostly contained in the *Memoirs of the Literary and Philosophical Society of Manchester*, the *Philosophical Transactions*, Nicholson's *Philosophical Journal*, and Thomson's *Annals of Philosophy*. Besides these, we have his *Meteorological Essays and Observations* (London, 1793; 2d ed. 1834). Profound, patient, and intuitive, Dalton had precisely the faculties requisite for a great scientific discoverer. His atomic theory has revolutionized the science of chemistry and has yielded a greater number of valuable results than, perhaps, any other idea ever introduced into physical science. In his habits, Dalton was simple: in his manners, grave and reserved, but kindly, and distinguished by his truthfulness and integrity of character. Consult Roseoe and Harden, *A New View of the Origin of Dalton's Atomic Theory* (New York, 1896).

DALTON, JOHN CALL (1825-89). An American physiologist and physician. He was born in Chelmsford, Mass., and graduated at Harvard in 1844, and at the Harvard Medical School in 1847. He was professor of physiology successively in the University of Buffalo, in the Vermont Medical College, and in the College of Physicians and Surgeons, and in 1883 succeeded Dr. Alonzo Clark as president of the last. During the Civil War he rendered important services as surgeon in the Federal Army. He contributed many articles on medical subjects to scientific journals, and, in addition, published a valuable *Treatise on Human Physiology* (New York, 1859); *A Treatise on Human Physiology for Schools, Families, and Colleges* (1868); *The Experimental Method of Medicine* (1882); *Doctrine of the Circulation* (1884); and *Topographical Anatomy of the Brain* (1885).

D'ALTON, JOHANN SAMUEL EDUARD. See ALTON.

DALTON-IN-FURNESS, dāl'ton-in-fūr'nēs. A market-town in Lancashire, England, on the peninsula of Furness, about 4 miles northeast of Barrow-in-Furness (Map: England, C 2). A canal about three miles long connects it with the Irish Sea. It has extensive iron-works. Population, in 1890, 13,300; in 1901, 13,030.

DALTON'S LAW. See GASES, GENERAL PROPERTIES OF.

DALY, dà'lé', CÉSAR DENIS (1811-94). A French architect and writer on architecture, born at Verdun, Meuse. His principal work as an architect is the restoration of the Cathedral of Saint Cecilia at Albi, for which designs were shown at the Exposition in 1855. But the work upon which his reputation rests is the monumental journal, *Revue générale de l'architecture et des travaux publics* (1840-90). The forty-five volumes contain a theoretical and practical library of architecture. Among his other publications are: *Les motifs historiques d'architecture et de sculpture d'ornement* (1874); *L'Architecture funéraire* (1873); *L'Architecture privée au XIXème siècle* (Paris, 1870-77); *Motifs divers*

de serrurerie (Paris, 1881-82); *Des hautes études d'architecture* (1889).

DALY, CHARLES PATRICK (1816-99). An American jurist, born in New York City. He was admitted to the bar in 1837, and was Chief Justice of the Court of Common Pleas in New York for twenty-seven years, until retired by the age limit in 1868. From its organization in 1864 until his death, Judge Daly was president of the American Geographical and Statistical Society. Besides his *Historical Sketch of the Judicial Tribunals of New York* (1855), and many legal papers of importance, he wrote: *When Was the Drama Introduced into America?* (1864); *First Settlement of Jews in North America* (1875); *What We Know of Maps and Map-Making Before Mercator* (1879); and *History of Physical Geography*.

DALY, JOHN AUGUSTIN (1838-99). An American playwright and theatrical manager. He was born at Plymouth, N. C., and educated at Norfolk, Va., and in the public schools of New York City. He was dramatic critic for the *Sunday Courier* in 1859, and held similar positions on the *Express*, *Citizen*, *Sun*, and *Times* for some years. Meanwhile he was producing adaptations of several plays, and in 1867 his first original success, *Under the Gaslight*, was brought out at the New York Theatre. In 1869 he opened in Twenty-Fourth Street the playhouse known as the Fifth Avenue Theatre, which with such 'stars' as Fanny Davenport, Mrs. Scott Siddons, E. L. Davenport, and Clara Morris, quickly became very popular. After the destruction of this theatre by fire and an interval of a few months in another, he opened, in 1874, Daly's Fifth Avenue Theatre, which he managed till 1877. In 1879 he returned, after a year of study in Europe, and opened the house since known as Daly's Theatre on Broadway, near Thirtieth Street, which he controlled until the time of his sudden death in Paris. Mr. Daly had in his company at various times many of the best-known players in America. For years Miss Ada Rehan was his leading actress. Several times he went with his whole company to California, to England, and to Germany and France. In 1893 he leased a theatre in London. He wrote many adaptations from German and French plays, one of his earliest efforts being from Mosenthal's *Deborah*, in 1862. In the long list of works which he wrote or adapted are: *Divorce*, *Pique*, *Under the Gaslight*, *The Railroad of Love*, *Seven-Twenty-Eight*, *The Great Unknown*, *Love on Crutches*, and *The Last Word* (1890). Mr. Daly was especially noted for excellence in scenic presentation, and his Shakespearean revivals have received warm praise both in this country and in England. In 1894 he was presented with the Lætare Medal of the University of Notre Dame, Ind. He was a great book-lover, and made a remarkable collection of plates on biblical subjects, Thackeray, etc., which was sold at auction in the settlement of his estate. Besides his plays and dramatic adaptations, he was the author of *Woffington: A Tribute to the Actress and the Woman* (1888), and various minor articles.

DALY, JOSEPH FRANCIS (1840—). An American jurist, born at Plymouth, N. C. He studied law in New York City in 1855-62, was admitted to the bar in 1865, and from 1870 to 1890 was

a judge of the Court of Common Pleas of New York, of which he in the latter year became Chief Justice. In 1896-98 he was a justice of the State Supreme Court. During his career on the bench he was conspicuous for wide legal attainments.

DALYELL', or **DALZELL'**, THOMAS (c.1599-1685). A Scotch general, vigorous in the persecution of the Covenanters. He was born at Binns, Linlithgowshire. In 1642 he accompanied Gen. Robert Monro in the expedition to Ireland, and fought in 1651 at Worcester. Especially excluded by Cromwell from the Act of Grace, he took service under the Czar Alexis of Russia, and participated as a general in a number of wars against the Turks and Tatars. In 1666 he was appointed by Charles II. Commander-in-Chief of the forces in Scotland, and was particularly commissioned to repress the Covenanters—a commission executed with brutal vigor. His defeat of the Covenanted troops at Rullion Green was followed by cruelties which made his name a by-word through the countryside. A stubborn Royalist, he did not, says Creighton, "shave his beard since the murder of King Charles I."

DAM, TINKER'S. A guard of dough or clay placed by a tinker around a cavity to confine the melted metal until it 'sets.' It is worthless after use; hence the vernacular expression, 'not worth a tinker's dam.'

DAMA, dā'mā (Lat.). A gazelle (*Gazella dama*) of the Sudan, with short lyrate horns and no dark band on the sides. See **GAZELLE**.

DAMAGES (OF. *damage*, *domage*. Fr. *domage*, from Lat. *damnum*, loss). The pecuniary recompense given by a court of law to one who has suffered an invasion of a legal right through the act of another. The right invaded may be one which the plaintiff enjoys in common with other members of society, as, for example, his right to have his person or property not interfered with; or his right not to be injured through the negligence of others; or it may be a right which he has acquired through entering into a special legal relation with another, as by contract.

But, although the law furnishes a legal remedy for every violation of a legal right, that remedy is not always an action for damages. The entire jurisdiction of the equity tribunals is concerned with remedies of a different order—as injunction, the specific enforcement of contracts, etc.—the remedy of damages being for the most part left to the courts of common law. Furthermore, not even at common law does every invasion of a legal right give rise to an action for damages. The breach of a condition, for example, is remediable only by action on the part of the one injured, thereby restoring both parties to their former condition. Thus if the condition was attached to a sale of land or goods, its breach enables the injured party to rescind the transaction and place himself *in statu quo*, but not to sue for damages, however great the injury to him may have been.

Strictly speaking, the term damages is not applicable to all cases of a recovery of money for infringement of legal rights, but only to such as call for an estimate or admeasurement by the court or jury of the injury suffered and of the proper compensation to be made therefor. Where the 'damages' are liquidated, i.e. where the amount to be recovered is fixed in advance

by agreement of the parties, they are not damages, in the technical sense of the term. Thus an action to recover the amount payable on a bond, or the amount due for goods sold and delivered, or to recover a sum of money paid to the defendant by mistake, is not an action for damages, but an action to recover a debt. But where the amount claimed is not ascertained, as where an injury has been done to a man's character or property, or in the ordinary case of breach of contract, the action will be to recover the damages suffered through the defendant's wrongful act or default. The complaint or declaration of the plaintiff sets forth an estimate of the damages sustained by him, the amount of which will then be conclusively ascertained by the court or jury (usually the latter) upon principles determined by law.

The principles upon which damages are measured by the courts vary according to the nature of the right infringed and sometimes of the act by which it was violated, and are of a most illogical and unsatisfactory character. To a considerable extent they are still influenced by considerations which belong rather to the conditions and feelings of primitive society than to those which now govern the relations of the parties and the administration of justice. In their origin, damages were a pecuniary commutation of the right of private vengeance, and were based not on any principle of restitution, but on that of satisfaction to the injured party. It was a long step toward the orderly administration of justice when the victim of a theft was compelled to rest satisfied with four times the value of the thing taken, instead of scourging the thief and selling him into slavery, as was the law of the Twelve Tables. But the damages so awarded were as clearly vindictive in character as was the harsher penalty of the earlier law, and this vindictive element still survives in the modern law of damages. Thus, it is still the law in England and in many of the United States that a tenant who commits willful waste on the premises shall pay thrice the amount of the damage committed, and that a tenant who refuses to quit after due notice shall thereafter pay his landlord double rent. To the same principle is due the doctrine of aggravation of damages, or 'vindictive,' 'retributory,' or 'exemplary' damages, which permits a recovery in excess of the actual damage suffered in certain cases of breach of promise of marriage, libel, slander, and seduction. There was abundant justification for furnishing this solace to the vindictive feelings of the injured party in an age when it was necessary to buy him off from a more violent vindication of them, but it is submitted that the survival of this barbarous principle into our milder age cannot be justified.

Obviously, the sound principle for the award of damages is that of restitution, rather than of satisfaction—the restoring to the injured party of the property of which he has been deprived, or making to him due compensation for the injury sustained by him—and this principle is generally followed by our law in most actions other than those above referred to. It is expressed in the phrase that damages are limited to the loss which the plaintiff has actually sustained. In practice, however, a more restricted rule is followed, the defendant being liable only for such damages as he did in fact contemplate or which

are the natural and probable consequences of his acts, whether contemplated by him or not. This rule is equally applicable in cases of contract and of tort, and operates to exclude what are called 'remote' or merely 'consequential' damages. That, under a perfect system, the latter would also be included in an award of damages can hardly be doubted, but the judicial distrust of the jury, by whom, both in England and America, the award is usually made, has induced the courts to adopt the narrower rule.

Damages are also an available remedy in some cases of injury, even where no actual loss has been sustained. It is the violation of a legal right, and not the detriment or loss resulting therefrom, which furnishes the ground for an action for damages. Such an action, accordingly, is the appropriate remedy in the case of a trespass upon land, an unauthorized interference with a watercourse, and the like, although no injury or serious inconvenience to the tenant or riparian proprietor results. The damages to which the plaintiff is entitled in such a case are not 'substantial,' but 'nominal.' And, on the other hand, where loss or harm is sustained, but without the violation of a legal right, the damage is irremediable by any legal process. It is *dammum absque injuria*.

For the measure of damages appropriate to the various classes of rights, see the articles in which those rights and the remedies for their infringement are considered. See especially CONTRACT; TORT; INJURY. Consult: Holmes, *The Common Law* (Boston, 1881); *Essays on Anglo-Saxon Law* (Boston, 1876); Lee, *Historical Jurisprudence* (New York, 1900); Arthur G. Sedgwick, *Elements of Damages* (Boston, 1896); Sedgwick, *Treatise on the Measure of Damages* (8th ed., New York, 1891); Sutherland, *Treatise on the Law of Damages* (Chicago, 1893); Mayne, *Treatise on the Law of Damages* (5th ed., London, 1894); Watson, *Treatise on the Law of Damages for Personal Injuries* (Charlottesville, 1901); Harris, *Treatise on Damages by Corporations* (Rochester, 1894).

DAMAN, dá-mán', or **DAMÃO**, dá'mouh. A fortified seaport and district on the west coast of India, belonging to the Portuguese since 1558. The town stands at the mouth of the Damán River about 100 miles north of Bombay (Map: India, B 4). The harbor affords good shelter from the southwest monsoon. The neighborhood is well stocked with suitable timber for the building and repairing of ships, which largely employ the inhabitants. Damán also has important deep-sea fisheries and salt-works. There is a scarcity of fresh water. The district is an administrative dependency of Goa. Area of district, 168 square miles. Population, in 1887, 77,454.

DAMAN, dá'mán (Syrian). An old name for the Syrian hyrax (*Procapra syriaca*), the 'coney' of Scripture (Prov. xxx. 24-28, etc.), also called rock-rabbit. See HYRAX, and compare DASSIE.

DAMANHUR, dá'mán-hoor' (Egypt. *Tema-en-Hor*, city of Horus, Lat. *Hermopolis Minor*). A town of Lower Egypt, capital of the Province of Beherah (Map: Egypt, D 2). It is situated on the Mahmudieh Canal and the railway line leading from Cairo to Alexandria. It has a considerable commerce in cotton and woolen goods. Population, in 1897, 27,236.

DAMAR or **DHAMAR**, dá-mär'. A town of Yemen, Arabia, situated about 63 miles south of Sana, on the route to Mecca (Map: Arabia, with Turkey in Asia, Q 12). It carries on some trade in horses. Population, about 20,000.

DAMARALAND, dá-má'rá-lánd. See GERMAN SOUTHWEST AFRICA.

DAMASCENUS, NICOLAÛS. A Greek historian. He lived in the time of Augustus and Herod the Great, at whose court he spent the greater part of his life. His principal work was a universal history in 144 books, of which only fragments remain. He also wrote an autobiography and a history of the education of the Emperor. Fragments of these works, as of the first seven books of his universal history, are preserved in the collections of Constantinus Porphyrogenitus. Nicolaüs was, in philosophy, an adherent of the Peripatetic School, and wrote a compendium of Aristotelianism. Historical fragments are edited by Müller, *Fragmenta Historicorum Græcorum*, vol. iii. (Paris, 1868-83).

DAMASCIUS (Lat., from Gk. *Δαμάσκιος*, *Damaskios*). A Neoplatonic philosopher of the sixth century A.D. He was born at Damascus, and was the last teacher of Neoplatonism at Athens. When the philosophic schools were closed by imperial edict in 529, he, with Simplicius, Diogenes, Priscian, and others, was forced to go to Persia. Of his writings we possess his book *On the Origins*, edited by Kopp (Frankfort, 1826), a commentary to Aristotle, and an extract from his life of Isidorus of Gaza, preserved by Photius, 181 and 242.

DAMASCUS (Arab. *Dimishk-esh-Shâm*). The capital and largest city of Syria, Asiatic Turkey (Map: Turkey in Asia, G 6). It is situated in a plain at the eastern base of the Anti-Libanus, 53 miles southeast of Beirut. The city with its beautiful surroundings and its abundant supply of water has since the earliest times been regarded by the Arabs as the most beautiful spot in the world, and is supposed to have served as a model for the paradise described in the Koran. The appearance of Damascus from a distance is impressive, but upon a closer inspection it is, like most Oriental cities, disappointing. It is about five miles in circumference and is surrounded by partly ruined walls, pierced by seven gates. The streets, with the exception of the 'Straight Street,' on which Saint Paul is supposed to have lived, are crooked and narrow. The houses are generally built in the Moorish style and not infrequently combine a splendidly decorated interior with a plain and sombre exterior. The walls fronting the street are usually without windows; the courts in the houses of the wealthy residents are adorned with splendid marble fountains, fine trees, and flowers. Damascus derives its water-supply, by an excellent system of canals, conduits, and pipes, from the Barada, the Abana of the Old Testament, which traverses the city from west to east and divides the newer portion of the city on the north from the ancient walled city with its sectarian quarters on the south.

Of the seventy-one large mosques of Damascus that of the Omniads is the most important. It is supposed to have been originally a heathen temple converted into a Christian church at the end of the fourth century. It then contained what was believed to be the head of John

the Baptist, and was named the Church of Saint John. The site of the church was later acquired by the sixth Omniad Caliph, who erected on it a mosque of fabulous splendor, according to the description of the Arabic writers. After the conquest of Damascus by Timur the mosque was despoiled. It covers a site of $143 \times 41\frac{1}{2}$ yards, and has the shape of a basilica divided by columns 23 feet high, ornamented, as also are the walls, with inscriptions from the Koran. The architecture belongs to different periods; only a small portion of the original structure has survived. The dome, 120 feet high, is flanked by three minarets, one 250 feet high. Other noteworthy mosques are the Sināniyeh with its striking green-tiled minaret, and the Tekkiyeh, with its graceful minarets and dome, founded in 1516 on the river bank to the west of the city as a refuge for indigent pilgrims. There are also numerous beautifully ornamented chapels. The Chapel of Abraham in the northern suburb of Burzeh, the leper hospital in the house of Naaman, the house of Ananias, the place of Saint Paul's conversion near the east gate, and the point where he was lowered from the walls are traditionally sanctified localities. The English cemetery on the southeast contains the grave of Buckle the historian, who died here in 1862.

Damascus was once a famous seat of learning, and contained numerous schools in which grammar, theology, and jurisprudence were taught. The higher schools, with a few exceptions, are now closed, and Damascus as a centre of culture has been surpassed by Cairo. Elementary education is provided to some extent by the missionary schools, and a number of higher schools are conducted by the French orders.

The municipal affairs are administered by a council in which Christians as well as Jewish residents are represented. Damascus is the seat of the Wali or Governor of Syria, and of the commander of the Syrian troops. The chief manufactures consist of silver and gold articles, stuffs interwoven with silver and gold threads, and inlaid furniture. The manufacture of the blades for which Damascus was famous has ceased. The commercial importance of the city rests chiefly on the transit trade, which, however, has considerably declined since the construction of the Suez Canal. The bazaars of Damascus are numerous and well kept, but they are generally poorly stocked, and the magnificent *khans* formerly thronged by merchants are now but indifferently attended. The exports consist chiefly of wool, hemp, grain, and animal products, grapes, and dried fruit. Damascus is connected by rail with its port, Beirut, and a railway line extends southward to El Muzerib, in the Hauram. It is visited monthly by caravans from Aleppo. The population is estimated at 154,000, and is very heterogeneous in its composition. About three-quarters is Mohammedan, while the rest consists of Christians belonging to different churches. The Jews number about 8000. The United States is represented by a consular agent.

The foundation of Damascus is attributed by Josephus to Uz, the son of Aram. The city was the seat of a kingdom at the time of the Hebrew monarchy. Subjugated by David, it soon regained its independence and even recovered sufficiently to attack the Kingdom of Israel, weakened by internal strife. In the second half of the eighth century B.C. Damascus

was conquered by Assyria and its people carried away to the land of the conquerors and replaced by colonies from Assyria. After the death of Alexander the Great, Damascus became part of the Kingdom of the Seleucide. Conquered by Pompey in B.C. 64, it became a dependency of Rome, under which it enjoyed local autonomy and regained a part of its former prosperity. It was during this period that Christianity was introduced into Damascus, and the city became the seat of a bishopric. In 635 it was taken by the Mohammedans, under whose rule it was for a time (previous to the founding of Bagdad) the residence of the Caliphs and was greatly adorned and fortified. After an unsuccessful siege by the Crusaders under Baldwin in 1148, Damascus was taken by Nureddin in 1154, and, at the death of the latter, passed into the hands of Saladin, who died there in 1193. The victory of Tamerlane over the Egyptians at Damascus in 1401 placed the city in the hands of the Mongol conqueror, who after exacting a large tribute from its residents slaughtered most of them and pillaged and burned the city. It was soon rebuilt, and in 1516 wrested from Egypt by the Turks under Selim I. Retaken by the Egyptians under Ibrahim Pasha in 1832, Damascus remained under the rule of Egypt until 1841, when, together with Syria, it was restored to Turkey. An uprising of the Moslem population in 1860 resulted in the destruction of the Christian quarter, and the massacre of about 6000 Christians. Consult: Porter, *Five Years in Damascus* (London, 1870); Macintosh, *Damascus and Its People* (London, 1882).

DAMASCUS BLADE. See DAMASKEENING.

DAM'ASK. The name given to certain textile fabrics in which figures are woven. The ornamental forms and the ground are usually of the same texture and color, but are distinguished from each other by being woven in opposite directions, the opposing threads causing the characteristic glittering contrast. The name is supposed to have been derived from the city of Damascus, where these fabrics were early manufactured. From the intricacy of the early process, the art of damask-weaving was long a mystery confined to a few localities; but since the introduction of the Jacquard loom (see LOOM) it is extensively employed in making ornamental satins, and particularly in the manufacture of table-linen. One variety of damask silk is called *brocatelle*. In this weave the principal ornamental figure is of a satin sheen, but a plainer weave is combined with it. The term *brocatelle* is also applied to a heavy and coarse brocaded or figured fabric in which wool or cotton is mixed with the silk, and which is largely employed for tapestry and upholstery. *Lampas* is woven like brocatelle, but the ground and figure are of different colors. *Diaper* is damask with the pattern arranged in geometrical figures, usually squares, with no ground pattern. *Brocades* are the most elaborate damasks, and often gold thread is interwoven with the silk. They are sometimes distinguished from ordinary silk damask by having the pattern raised slightly above the ground. For a more detailed description of silk damasks, consult Cole, *Ornament in European Silk* (London, 1899).

DAM'ASKEEN'ING, or **DAM'ASCEN'ING.** The art of producing upon ordinary steel

certain ornamental appearances resembling those on the famous Damascus blades. Attention was first drawn to this branch of industry by the Crusaders, who brought from Damascus to Europe many articles made of superior steel, such as sword-blades and daggers. These were found to possess not only great elasticity, united with considerable hardness, but their surfaces were covered with beautiful designs, formed by a tissue of dark lines on a light ground, or light lines upon a dark ground, and occasionally by the inlaying of gold on the steel-blue ground. In genuine Damascus blades the designs run through the substance of the blade, and the watering, or regular, almost symmetrical figuring, is not worn off by friction, or even grinding. Imitations of the watering of Damascus steel are produced on common steel by etching with acids; and in this way landscapes, inscriptions, and ornaments and decorations in general, are imprinted on the steel-blue ground. Gold and silver are also inlaid in the higher class of sword-blades and other articles. Gun-barrels are occasionally subjected to the process of damaskeening.

DAMASTES, *dā-mās'tēs* (Lat., from Gk. *Δαμάστης*, *Damastēs*), of SIGEUM, a Greek historian, a contemporary of Herodotus. According to Suidas, he wrote a *History of Greece*, a work on the *Ancestors of Those Who Warred Against Troy*; and a *Catalogue of Nations and Towns*. Strabo charges him with ignorance and credulity. The few extant fragments of his works are collected in Müller's *Fragmenta Historicorum Græcorum* (Paris, 1868-83).

DAM'ASUS. The name of two popes. DAMASUS I. (Pope 366-84). A Spaniard by extraction and the son of a priest, he was born in Rome about 305. In 355 he was made archdeacon. On his consecration to the episcopal office he was opposed by Ursicinus, who was the choice of a considerable faction, but finally acknowledged by all. His reign was far from peaceful. It was spent in subduing the still numerous Arians in the West, in combating the heresy of Apollinaris, which he caused to be condemned at the Council of Constantinople in 381, and in defending the cause of Paulinus against Meletius. He was a great friend of Saint Jerome, and was primarily instrumental in inducing him to undertake his translation of the Bible. His works are in Migne, *Patr. Lat.*, xiii. For his life, consult: Rade, *Damasus, Bischof von Rom* (Freiburg, 1882); Wittig, in *Römische Quartalschrift für christliche Alterthumskunde und für Kirchengeschichte*, 14th suppl. Heft (Freiburg, 1902). DAMASUS II. (Pope, 1047-48). He was a Bavarian by birth, and Bishop of Brixen, in Tyrol, when he was chosen Pope on the nomination of Emperor Henry III. He lived only twenty-three days after his solemn enthronization.

DAMAYANTI, *dā'mā-yān'tē*. The heroine of the Nalopakhyanam, or story of Nalay, in the Indian epic the *Mahabharata*.

DAMBACH, *dām'bäg*. OTTO (1831-99). A German jurist, born at Querfurt. In 1862 he was appointed justice of the General (now Imperial) Post-Office, Berlin. The laws on copyright in its various bearings, as well as the postal laws of the Empire, were devised chiefly by him. In 1873 he was appointed professor

extraordinary of law in the University of Berlin. His numerous writings include the following: *Fünfzig Gutachten über Nachdruck und Nachbildung* (Leipzig, 1891); *Das Telegrafien-Strafrecht* (2d ed., ib., 1897); *Das Gesetz über das Postwesen des Deutschen Reichs erläutert* (6th ed., ib., 1900).

DAMBUL, *dām-bōol'*. A vast rock-temple of the Buddhists in Ceylon, about 40 miles north of Kandy, containing, among a profusion of carvings, figures of Buddha of extraordinary magnitude.

DAME (OF, Fr. *dame*, from Lat. *domina*, lady, fem. of *dominus*, master, Skt. *damana*, conquering, Lat. *domare*, Gk. *δαμάω*, *daman*, Skt. *dam*, to tame; connected with OIG. *zam*, Ger. *zakm*, Icel. *tamr*, AS. *tom*, Engl. *tame*). A title of honor which long distinguished high-born ladies from the wives of citizens and of the commonalty in general. In the age of chivalry, it was customary even for a queen to be so called by her chosen knight (the dame of his heart, of his thoughts, etc.). Hence, too, the Virgin mother was called in France 'Notre Dame' ('our Lady'), as the mother of the whole human race. From *dame*, with the possessive pronoun *ma* prefixed, arose an ordinary title of honor, answering in modern French to the English 'Mrs.' The daughters of the King of France, as soon as they came into the world, were called *Madame*; and this was also the sole title of the wife of the King's eldest brother, who was himself simply known as *Monsieur*. In England the word 'dame,' though not much used, is now applied to married women of all classes. The word 'madam' or 'ma'am' is today the informal manner of address used in England for the Queen. A curious local usage at Eton College applies the title dame as well to men as to women in charge of boarding-houses for the boys.

DAME AUX CAMÉLIAS, *dām ô kâ'mâ'lyâ'*, LA (Fr., the lady of the camellias). A novel by the younger Dumas (1848), dramatized in 1852. It has been translated under the title *Camille*. The heroine is Marguerite Gautier, a courtesan.

DAME BLANCHE, *dām blānsh*, LA. A comic opera produced in Paris in 1825, the music being by Boieldieu and the words by Scribe; played in England, January 2, 1827, under the title of *The White Maid*.

DAMERON, *dā'm'rōn'*. CHARLES EMILE (1848—). A French landscape painter. He was born in Paris, and studied there under Pelouse. His first Salon picture was "The Court of an Inn at Cernay-la-Ville" (1872), and he often afterwards painted scenes in this locality. He was awarded a medal at the Centennial Exhibition, Philadelphia, in 1876, for his landscapes, "The Pyramids" and "The Oaks of Grand Moulin." These pictures are more remarkable from the point of view of composition and drawing than color, for his tones are dark and his shadows heavy.

DAMEROW, *dā'me-rō*. HEINRICH PHILIPP AUGUST (1798-1866). A German physician, born in Stettin. He studied medicine at the University of Berlin, and became professor extraordinary there in 1830. The following years of his life, with the exception of a few years dur-

ing which he held office in the Ministry of Public Instruction, he spent at Halle as director of a sanitarium for mental and nervous diseases. He is remembered for the important improvements that he introduced in the treatment of insanity and the management of asylums. His published works include the following: *Ueber die relative Verbindung der Irrenheil- und Pflegeanstalten* (1840); *Sefolge, eine Wahnsinnstudie* (1853); *Zur Kretinen- und Idiotenfrage* (1858). He was also one of the founders of the *Allgemeine Zeitschrift für Psychiatric*.

DAMES, dā'mēs, WILHELM BARNIM (1843-98). A German paleontologist, born in Stolpe. He studied at the universities of Breslau and Berlin, and became in 1878 professor of paleontology in Berlin and custodian of the department of paleontology at the museum there. Several of Dames's publications, especially those on fossil vertebrates, have been of the greatest importance, nearly all of them having appeared in *Paläontologische Abhandlungen*, issued in Berlin from 1883 to 1886, at which date the place of publication was transferred to Jena. Special features of his work are his descriptions of the echinoderms of the Jurassic and Tertiary; a memoir on the Jurassic bird *Archaeopteryx*; various publications on the ganoids of the Mesozoic, together with other shorter memoirs on the philogenetic relations of both the invertebrate and vertebrate fossils of Germany. Consult Frech, "Nekrolog an W. B. Dames," in the *Paläontologische Abhandlungen* (Jena, 1900).

DAME SCHOOLS. See COMMON SCHOOLS.

DAME'S VIOLET, *Hesperis*. A genus of plants of the natural order Cruciferae, which has four-sided or two-edged pods, and contains about twenty species, annual and biennial herbaceous plants, natives chiefly of the middle and south of Europe. The common dame's violet, or white rocket (*Hesperis matronalis*), cultivated in America to some extent, is found in Great Britain in hilly pastures, but has perhaps escaped from cultivation. It has an erect branched stem, with ovate-lanceolate leaves, and terminated by numerous large lilac flowers, which are scentless by day but very fragrant at night, on which account it is often cultivated in flower-pots by ladies, from which custom the plant appears to have derived its common name. The night-scented rocket (*Hesperis tristis*) is a favorite flower in Germany, numerous double, hardy, attractive forms of which are well known.

DAMGHAN, dām-gān'. A town of Persia, on the southern slope of the Elburz Mountains, 45 miles south of Astrabad. It is on the high road from Khorasan to Teheran, at an altitude of 3770 feet. It was a large city, containing 15,000 houses, in the reign of Shah Abbas, and has a ruined mosque and other remains of that period. It has a large export trade in nuts, especially of 'khaghazi' or thin-shelled almonds. The extensive ruins of Hecatompylos lie to the southwest. Population, estimated from 5000 to 10,000.

DA'MIAN. (1) The love-sick and not too scrupulous youth in Chaucer's *Merchant's Tale*, who seduces the wife of old January. (2) A youthful would-be Templar in Scott's *Ivanhoe*.

DA'MIA'NA. See APHRODISIACS.

DAMIANI, dā'mā-ā'nē, PIETRO (1006-72). A saint and doctor (1828) of the Catholic

Church. He was born in Ravenna in 1006 or 1007, and had a sad boyhood through neglect and cruelty. Feeling the call to the monastic life, he resigned a promising career as teacher and became a hermit at Fonte Avellana, near Perugia, in 1035, became prior in 1043, and did much to keep the monks up to their duties and to cure the abuses which had crept in. He also threw himself energetically into reform outside his monastery. He aimed at ridding the Church of the giant evils of concubinage and simony. To these ends he employed his promotion in 1057 to be Cardinal Bishop of Ostia, and his friendship with successive popes. He also endeavored to effect reforms through the German emperors. His efforts were, however, not always successful, as he could not secure the requisite backing; but he prepared the way for the greater reformer, Gregory VIII. He died at Faenza, February 23, 1072. His works are printed in Migne, *Pat. Lat.*, cxliv., cxlv. His *Liber Gomorrhianus* gives a frightful picture of the corruptions of the time. For his biography, consult J. Kleinermann (Steyl, 1882), Capecelatro (Florence, 1862).

DA'MIANISTS, or ANGELISTS. A sect of the sixth century, followers of Damianus, a Monophysite patriarch of Alexandria, who taught that there was only a single substance in the Godhead.

DA'MIA'NUS (Lat., from Gk. *Δαμιανός*). A celebrated sophist and rhetorician of Ephesus, who lived about A.D. 200. He taught rhetoric at Ephesus, and followed the methods of Adrianus and Ælius Aristides, of whom he had been a pupil. Philostratus, who was his contemporary, gives an account of his life in his *Lives of the Sophists* (*Βίοι Σοφιστῶν*, *Bioi Sophistōn*), but it is not known whether he left any writings.

DAMIEN DE VEUSTER, dā'myān' de vē'stār', JOSEPH (1840-89). A Belgian priest of the Roman Catholic Church, better known as Father Damien, and distinguished as a missionary to the leper settlement on the island of Molokai, Hawaii. He was born at Louvain, studied theology at the university there, entered the Society of the Sacred Hearts of Jesus and Mary in 1863, was appointed to the mission to the Hawaiian Islands, and until 1873 performed the customary duties of a missionary priest. In that year he was sent, at his own request, to the Molokai settlement established by the Hawaiian Government in 1865 for the enforced segregation of lepers and their maintenance at public expense in the villages of Kalaupapa and Kalawao. At his arrival in the island physical conditions among the lepers were thoroughly wretched. He found the water-supply unfit, the food bad, the people ill-washed, ill-clothed, and ill-housed. Forthwith he labored to obtain good water, wholesome food, suitable dwellings, medical assistance, and hospital accommodations. He organized religious worship, established schools, erected a general shop for leper trade, lent his own skilled hand to the building of the church at Kalaupapa, and even personally dug the graves of many of the hundreds of parishioners whom he buried. In the prosecution of his work he gradually gathered about him priests, lay brethren, and nuns as associates. In 1884 he perceived in the insensibility of his skin the sign of the approach of the disease,

and could begin his sermons with the words, 'We lepers.' He finally succumbed to the concentration of the leprosy in his lungs. His simple, heroic life and death attracted wide notice, and, in addition to the benefits secured by him for the immediate objects of his endeavors, led to agitation by Englishmen of the difficult leper problem in India. Many know his name chiefly through the famous *Open Letter to the Reverend Dr. Hyde*, written by Robert Louis Stevenson, first printed in the Sydney (New South Wales) *Presbyterian* of October 26, 1889, and privately published at Sydney as a pamphlet in 1890. Consult: Stoddard, *The Lepers of Molokai* (Notre Dame, 1885), and Father Pamphile, *Life and Letters of Father Damien* (London, 1889).

DAMIENS, dā'myān', ROBERT FRANÇOIS (1715-57). A French fanatic, known for his attempt to assassinate Louis XV. He was born near Arras, in France. Opium and accompanying dementia caused him to crown a life of idleness, mischief, and dishonesty with an attempt to kill the King of France. He himself alleged that it was the conduct of Louis toward the Parlement that drove him to the act; the opponents of the Jesuits sought to implicate them in this crime. On January 5, 1757, as the King was entering his carriage, bound for the Trianon, Damiens stabbed him in the side, but not seriously. All the agencies of slow fire, glowing pincers, and boiling oil were visited upon the poor wretch to make him reveal the names of possible accomplices. He confessed nothing, however. He was torn apart by four strong horses, and his remains were burned and his family was driven from France.

DAMIETTA, dā'mī-ēt'tā (Ar. *Damyāt*, Copt. *Damiati*, Lat. *Tamiathis*). A town of Lower Egypt, situated on the right bank of the eastern branch of the Nile (Map: Egypt, E 1), about eight miles from its mouth. It contains a number of ancient mosques, marble baths, and several bazaars. It is the seat of a governor and a Coptic bishop, and of a number of European consular representatives. The mouth of the river is closed by a bar which prevents the entrance of large vessels. In former years Damietta was a flourishing manufacturing and commercial centre, with a population of about 80,000. With the opening of the Suez Canal and the rise of Alexandria its commerce has declined considerably, and its manufacturing industries, with the exception of the weaving of cotton fabrics, have almost wholly disappeared. The cloth *dimity* is supposed to have received its name from Damietta, where it was first manufactured. The exports consist of rice, southern fruits, and wood. Damietta is connected by rail with Cairo and Alexandria, and contains a population of (1897) 31,515, including a few foreigners. The existing town was erected about 1251, but prior to that a city of the same name (anciently Tamiathis) stood about four miles to the south. It was strongly fortified by the Saracens, and formed on that side the bulwark of Egypt against the Crusaders, who, however, succeeded in capturing it more than once. It was razed and rebuilt further inland, on the site it now occupies, by the Sultan Bibars.

DAMIOTTI, dā'mé-ōt'té, DR. The Paduan charlatan in Scott's *My Aunt Margaret's Mirror*.

He shows the faithlessness of Sir Philip Forester in the enchanted mirror.

DAMIRON, dā'mé'rōn', JEAN PHILIBERT (1794-1862). A French philosophical writer. He studied under Burnouf, Villemain, and Cousin, lectured on philosophy in various Parisian institutions, and became professor in the Normal School and titular professor at the Sorbonne. He was for years a regular contributor to the *Globe*, and afterwards published his articles collected under the title *Essais sur l'histoire de la philosophie en France au XIX. siècle* (1828). His most important works are: *Cours complet de philosophie; Essai sur l'histoire de la philosophie en France au XVII. siècle* (1846), and *Mémoires pour servir à l'histoire de la philosophie du XVIII. siècle* (1858-64).

DAMIS, dā'mé'. The excitable and self-willed son of Orgon in Molière's *Tartuffe*.

DAMJANICS, dōm'yō-nīts, JOHANN (1804-49). An Hungarian revolutionist, born at Pancsova. He entered the Austrian Army, in which he rose to a captaincy; was received into the councils of Kossuth in 1848; and, at the outbreak of hostilities, organized a battalion, as commander of which he distinguished himself. Promoted to be general, he participated in the various operations leading to the Revolutionists' retreat, and after the disaster of Világos surrendered to the Russians, by whom he was turned over to Austria. He was condemned to death, and with twelve other generals was hanged by Haynau at Arad.

DAMMAR, or **DAMMAR PINE** (Hind. *dāmar*, pitch, resin), *Agathis*, formerly called *Dammara*. A genus of trees of the natural order Conifera, distinguished by their broad, lanceolate, leathery leaves, which have numerous nearly parallel veins. The name, originally applied to its resinous product, has been extended to a number of different trees, one of which is the Moluccan dammar (*Agathis orientalis*), which grows on the high mountain ridges of the Molucca Islands. It grows to a great height, attains a diameter of nine feet, and generally has the lower part of the trunk beset with knots as large as a man's hand. The timber is light and of inferior quality, and the tree is chiefly valuable for its resin, which is soft, transparent, hardens in a few days, and is then white, with a crystalline appearance. The resin often flows spontaneously from the tree in such quantity that it hangs in masses like icicles of a handbreadth and a foot long. At another period of the year it is yellow, and less valued. By incision, especially in the protuberances of the stem, it is obtained in large pieces. So long as dammar resin is soft it has a strong smell; upon drying this odor is lost. It contains only a trace of volatile oil, but consists of two distinct resins, one of which is soluble in alcohol, the other not. It is light, brittle, and easily friable, readily soluble in oil of turpentine. It is used in Asia for domestic purposes, and in the arts like other resins: it is an article of commerce, and in Europe is employed in various ways to form varnishes, which dry quickly, have a very bright lustre, are colorless, but readily become viscid again, and are not permanent, so that this resin cannot be made a substitute for copal and amber. It is almost completely soluble in benzole, and in this solvent

makes an excellent colorless varnish for positive photographs on glass. To this genus belongs also *Agathis Australis*, the Kauri pine (q.v.) of New Zealand, which produces the resin known as Kauri resin, or Kauri gum. The tree attains a height of 150 to 200 feet, and a diameter of 15 feet. The timber is straight-grained and very durable. The Kauri resin is dug from under the trees, masses weighing 100 pounds having been found. *Agathis robusta* is a valuable Queensland tree which has been successfully introduced in California. The resin known as black dammar is obtained in the Molucca Islands from the trunk of *Protium obtusifolium*, a tree of the natural order Burseraceæ. It is a semi-fluid, strong-smelling resin, which becomes black when dry; it is used as pitch, also to yield a kind of turpentine, which is obtained by distillation. *Canarium microcarpum* and *Canarium strictum*, trees of the same order, also natives of the farthest East, yield by incision of the trunk a viscid, odorous, yellowish substance, very similar to balsam of copaiva, which is called damar, or dammar, and is used in naval yards, mixed with a little chalk and the bark of reeds, for caulking boats. The resin called white dammar, or piney dammar, in India, often also called copal in India, is the product of *Vateria indica* and related species, large trees of the natural order Dipterocarpaceæ. It is obtained by wounding the tree, and when fresh is clear, fragrant, and acridly bitter; when dried it becomes yellow, brittle, and glass-like. It is used in India as a varnish ('piney varnish') which is hard, tenacious, and much esteemed. It is also made into candles in Malabar, which, in burning, diffuse an agreeable fragrance, and give a clear light with little smoke. *Shorea robusta*, the Sal (q.v.), so much valued in India as a timber-tree, of the same natural order, and some other species of *Shorea*, yield a resin, also known as dammar and as ral and dhoona, which is much used in dockyards in India as pitch. For illustration of *Agathis dammara*, see Plate of DAHLIAS.

DAMMARA. See KAURI PINE.

DAMMARTIN, dâ'mär'tän'. A family of distinguished French architects of the close of the fourteenth century.—ANDRÉ DAMMARTIN was architect of the Chartreuse, near Dijon (1383), in the service of the Duke of Burgundy.—GUY DAMMARTIN was architect of the Duke de Berri. Both were engaged on the Old Louvre and died about 1400.—JEAN DAMMARTIN was employed (1421-32) in the construction of the great cathedrals of Le Mans and Tours.

DAMNATION DE FAUST, dâ'nâ'syôn' de fôst, LA (Fr., the damnation of Faust). The title of a symphony-cantata by Berlioz, produced in Paris in 1846.

DAMOCLES, däm'ô-klêz (Lat., from *Δαμοκλῆς*, *Damoklês*). One of the courtiers and sycophants of the elder Dionysius, the tyrant of Syracuse. It is recorded by Cicero that Damocles, having lauded in the highest terms the grandeur and happiness of royalty, was shown the nature of this happiness by Dionysius in the following manner. He was seated at a table richly spread and surrounded by all the pomp of royalty, but in the midst of his luxurious banquet, on looking upward, he saw a keen-edged sword suspended over his head by a single

hair. The story had become proverbial in the day of Horace, who alludes to it in his *Odes*, iii. 1, 17ff.

DAM'ODAR. A river of India, rising in Ramgarh, a district in the Presidency of Bengal, and after a generally southeastern course of 350 miles, entering the Hugli from the right, below Calcutta (Map: India, E 4). The valley of the Damodar, traversed by the main railway between Calcutta and the northwest (the East Indian Railway), abounds in coal and iron. It is navigable from the mouth of its chief tributary, the Barakhar, which flows into it from the north.

DA'MON AND PHIL'LIDA. A mock pastoral in dramatic form by Cibber (1729), published anonymously.

DAMON (Lat., from Gk. *Δάμων*) AND **PHIN'TIAS** (Lat., from Gk. *Φιντίας*), commonly PYTHIAS. Two Pythagoreans of Syracuse, who have been remembered as models of faithful friendship. Pythias having been condemned to death by Dionysius, the Tyrant of Syracuse, begged to be allowed to go home, for the purpose of arranging his affairs, Damon pledging his own life for the reappearance of his friend. Dionysius consented, and Pythias returned just in time to save Damon from death. Struck by so noble an example of mutual affection, the tyrant pardoned Pythias and desired to be admitted into their fellowship. The story is told by Plutarch, *De Amic.*, and by Valerius Maximus, iv. 7.

DAM'OPHON (Lat., from Gk. *Δαμοφών*). A Greek sculptor of Messene, whose works were found chiefly at Messene, Megalopolis, and Lycosura. It was formerly supposed that he lived in the fourth century B.C., and that his statues were completed soon after the founding of Messene and Megalopolis under the auspices of Epaminondas. The discovery of fragments, including three heads, of the colossal statues at Lycosura, and the architectural evidence as to the date of that sanctuary, have led many scholars in recent years to assign Damophon to the first half of the second century B.C., though some (notably E. A. Gardner) still insist on the earlier date.

DAMOPHYLE, dâ-möf'i-lê, or **DAMOPH'ILA** (Lat., from Gk. *Δαμοφύλη*). A lyric poet of Pamphylia, who lived about B.C. 610. She was a pupil of Sappho, and like her, instructed other damsels. She is said to have written love poems and a hymn on the worship of the Pergæan Artemis, but none of her works is extant.

DAMOXY'ENUS (Lat., from Gk. *Δαμόξενος*). An Athenian poet of the new, and, probably, of the middle comedy. Two of his plays, *The Foster-Brothers* (*Σύντροφοί*) and *The Self-Tormentor* (*Ἐαυτὸν Πενθῶν*), are mentioned by Suidas and by Athenæus, who quotes a long passage from the former and a few lines from the latter work. The extant fragments of his works are published in Meineke's *Fragmenta Comicorum Historicorum*, vol. iv. (1839-57).

DAMPER. A door or valve which, by sliding, rising and falling, turning on a hinge, or otherwise, diminishes the aperture of a chimney or air-flue; this lessens the quantity of air that can pass through a furnace or other fire, and thus 'damps' or checks the combustion. The damper of a pianoforte is that part of the mechanism which, after a key is struck, and the finger

is lifted up from the key, immediately checks or stops the vibration of the string. It consists of a second hammer, which, on the rising of the key, strikes the string and remains upon it, instead of bounding off as the sounding-hammer does. Damper is also the name given in Australia to a simple kind of unleavened bread formed of wheat flour. It is made while traveling in the bush, and baked among the ashes of a fire.

DAMPIER, dām'pēr, WILLIAM (1652-1715). An English freebooter and explorer. He early went to sea with a party of buccaneers, crossed the Isthmus of Panama in 1679 and embarked on the Pacific with a considerable force in canoes and similar small craft, and captured several Spanish vessels, in which he cruised along the coast of Spanish America, waging war on Spanish subjects. In 1684 he engaged in another buccaneering expedition, in which he coasted along the shores of Chile, Peru, and Mexico, sailing thence to the East Indies, touching at Australia, and returning to England in 1691, where in 1697 he published an interesting account of the expedition, entitled *A Voyage Round the World*. He was afterwards (1699) deputed by the Government to conduct a voyage of discovery to the South Seas, during which he explored the west and northwest coasts of Australia, and the coasts of New Guinea, New Britain, and New Ireland, giving his name to the Dampier Archipelago and the Dampier Strait. In 1703-07 he made his third, and in 1708-11 his fourth trip around the world, the last time as pilot of the privateer *Duke*, which returned with specie and merchandise to the value of nearly £200,000. Besides his *Voyage Round the World*, he published: *A Discourse of Winds* (1699); *A Vindication of the Voyage to the South Sea in the Ship Saint George* (1707); and *Voyages to the Bay of Campeachy* (1729).

DAMPIER ARCHIPELAGO, dām'pēr är'ki-pěl'á-gō. A group of small islands northwest of and very near Australia, named after the famous navigator and buccaneer Dampier (Map: Australia, B 3). The principal ones are Barrow, Enderby, Rosemary, and Direction.

DAMPIERRE, dän'pyär', AUGUSTE HENRI MARIE PICOT, Marquis de (1756-93). A French general. He was born in Paris and entered the military service at the age of sixteen. After the battle of Valmy (September 20, 1792) Dampierre was made general of division, and by his skill and efficiency he contributed largely to the victory of Jemappes (November 6). He was subsequently placed in command of the centre at Neerwinden (March 18, 1793), where he stood his ground until the retreat of the left wing of the army. After the defection of Dumouriez to the Austrian ranks he assumed supreme command. He was mortally wounded May 8, 1793, while leading the attack on the intrenchments of Clerfayt, near the city of Condé.

DAMPIER STRAIT. (1) A strait separating the island of Waigiu from the Berau Peninsula of northwest New Guinea (Map: East Indies, H 5). It offers one of the safest channels from the Indian to the Pacific Ocean. (2) A strait separating New Britain from the east coast of New Guinea.

DAMPING OFF. A disease of plants induced by an excess of moisture in the soil and

atmosphere. Young seedlings in hothouses and hotbeds are particularly liable to it. Although the cause is sufficiently obvious, prevention is not always easy; not only because some plants are very sensitive to moisture, but also because the necessity of keeping sashes closed on account of temperature often stands in the way of the ventilation which would otherwise be desirable, and it is when a moist atmosphere stagnates around them, and the temperature is not very low, that plants are most liable to damp off.

The excessive moisture of soil and atmosphere gives the proper conditions for the development of the fungus *Pythium* or *Artotrogus debaryanum*, which is believed to be the immediate cause of the destruction of the plant. It is a soil fungus that lives on decaying vegetation until the conditions are right for attacking seedlings. If examined, the seedlings will be seen to show weak, thin spots near the surface of the soil and on account of this weakening the plant falls over and dies. The disease spreads with great rapidity in the seed-bed, so that in a few days all the plants may be reduced to a rotten mass. This fungus attacks many kinds of plants in the open ground, among which are mustard, cress, spurry, maize, clover, lettuce, egg-plant, peppers, cucumbers, melons, and forest-tree seedlings. Drying or freezing does not destroy the fungus or its spores. The best precautionary measures are to avoid infested soil, sow thinly, ventilate freely, shade little, water sparingly, and burn all diseased plants.

DAMROSCH, däm'rōsh, FRANK (1859—). A prominent American musician, son of Leopold Damrosch. He was born in Breslau. At first a clerk in a music store in Denver, he later drilled the chorus in the German opera in New York, which his father conducted. In 1892 he organized the People's Singing Classes in New York. Of these, now numbering about 1500 members, the more advanced form the People's Choral Union. They are most important factors in popularizing music, and their annual concerts are of a high artistic order. Damrosch also became conductor of the Oratorio Society, Symphony Society, president of the Musical Arts Society, and supervisor of music in the public schools of New York City.

DAMROSCH, LEOPOLD (1832-85). A German-American musician, violinist, composer, and conductor, born in Posen, Prussia. His parents chose the profession of medicine for him, and after graduating at the University of Berlin he returned to Posen to practice; but his passionate love of music, which he had continued to study incidentally, prevailed, and in 1854 he abandoned medicine for the study of counterpoint and composition under Hubert, Ries, and Dehn. In 1855 he started out as a concert violinist in Magdeburg; became acquainted with Liszt, and under his influence began to write for the *Neue Zeitschrift für Musik*. He was director in Posen and in Breslau, and in 1871 came to New York as director of the Arion Society. The credit of firmly establishing choral organizations in New York belongs entirely to Damrosch. He founded the Oratorio Society (1873) and the Symphony Society (1877), and organized several large musical festivals. All these played a most important part in the musical life of New York City. But the most brilliant achievement of his life was the successful establishment, in 1884, of

German opera in New York City, at the Metropolitan Opera House, notwithstanding the obvious difficulties of the undertaking. Among the operas given, *Fidelio*, *Tannhäuser*, *Lohengrin*, and *Die Walküre* were the most important as comparative novelties. He died in New York, and imposing funeral services were held in the Opera House. His works comprise several cantatas, a festival overture, beside violin concertos and songs.

DAMROSCH, WALTER JOHANNES (1862—). An American musician, son of Leopold Damrosch, born in Breslau, Prussia. He came to the United States, and was made conductor of the Harmonic Society of Newark, N. J., in 1881, and organist of Plymouth Church, Brooklyn, in 1884. In 1885 he succeeded his father as conductor of the Oratorio and Symphony societies, and became assistant conductor of German opera at the Metropolitan Opera House, New York. In 1894-99 he directed several operatic ventures, at first German, and subsequently French and Italian. In 1900-01 he conducted the German operas at the Metropolitan Opera House. He produced, in 1896, an opera, *The Scarlet Letter*, founded on the novel by Hawthorne, composed a *Te Deum*, in honor of Dewey's victory in Manila Bay, and shorter pieces and songs. His music is melodious, and the accompaniments to his songs are often striking.

DAMS AND RESERVOIRS. A dam is a barrier built across a stream or across a valley or other depression, to raise the level of water or to retain or store water for the supply of cities, towns, or villages, for irrigation, hydraulic mining, power, or manufacturing purposes. A reservoir is a basin or other receptacle used for receiving, storing, or distributing water. Reservoirs are often, but by no means always, formed by a dam connecting the banks of a stream or the sloping sides of a valley, canyon, or some more basin-like depression. The terms dams and reservoirs are used in speaking of devices to confine substances other than water; as when clay is used to hold back molten metal of any sort, or as in dentistry, where a dam is built by a dentist to keep saliva out of a cavity, or when a receptacle is attached to a stove, lamp, or machine for heating or storing water, oil, or other liquids, prior to or during use. The dams and reservoirs considered below will be only those constructed to retain water.

DAMS.

Where earth cannot be used, the choice of materials until quite recently has been between timber, timber and loose stone, and masonry. Within recent years a few dams of steel or of steel reinforced by masonry have been erected. Of course the greatest care must be taken to provide against dam failures, for which there are the following common causes: (1) By sliding on the base or on some horizontal joint; (2) by overturning; (3) by fracture due to tension; (4) by crushing, in the case of masonry dams; (5) by erosion, in the case of earth, or, though rarely, by breaking up and washing away, from the top downward, in the case of masonry structures. After a good site has been chosen and the utmost care devoted to the construction of the foundations and the supervision of the material and workmanship, the chief factor of safety in dam construction is obtained by placing a sufficient

volume and weight of material in the dam itself to withstand the pressure upon it. This pressure is directly proportioned to the height of water behind the dam and not to the total volume, as is sometimes supposed. In well-designed earth dams the cross-section is so great, for other reasons, as to give a weight far in excess of that which could be removed by the pressure of the retained water. But in masonry dams the cross-section may be proportioned to resist the pressure with mathematical nicety, allowing, of course, the factor of safety common to all good engineering work. In the new type of steel dams questions of volume and weight yield place to the tensile and compressive strength of the material.

A most essential feature in the design of dams of all classes is ample provision for passing waste or flood water. Otherwise the increased pressure against the up-stream face of the dam due to the excessively high water in the reservoir, or else the force of the current in passing over the top of the dam may cause a serious rupture. In overfall dams relief may be obtained, in some cases, by providing flood-gates at one end of the structure, either connected with or detached from the main dam; by having a crest to the whole dam which can be dropped in time of floods (see MOVABLE DAMS, below); or, in connection with one or both of the foregoing precautions, there may be an artificial overflow or waste channel leading from a spillway above or at one side of the dam down to the natural channel of the stream some distance below. Such a spillway and overflow channel are essential to all earth dams. It should also be noted that waste gates, or under sluices, are sometimes provided beneath the crest of masonry dams, particularly in India. These may be placed near the bottom of the reservoir to permit washing out deposits of silt. Where no other means are feasible, waste water may be carried to a point below the dam through a tunnel cut in the solid rock at one side and beyond the structure itself.

EARTH DAMS are formed by depositing the natural soil from the vicinity of the site in thin layers to form the structure and carefully rolling or otherwise rendering compact each layer before another is added. Water is sometimes applied to the earth to help compact it. Soil that will compact readily and be as little porous as possible should be selected, but it is difficult and generally impracticable to make earth dams impervious to water. Since continuous percolation through an earth dam would lead to its ruin, it is customary, where an attempt is not made to secure imperviousness through the whole structure, to place a water-tight barrier either on the upper face of the dam or at its centre. The former is known as a lining and the latter as a heart or core wall. Both a lining and a heart-wall may be used. Heart-walls may be composed of a carefully selected mixture of clay and loam or sand, called puddle; of concrete; or of stone masonry plastered with cement. One of the advantages of the heart-wall is that it can be carried well into the bed and banks of the valley, beneath and beyond the main part of the dam, which is a great safeguard against leaks between the natural ground and the artificial structure. Whether or not the upper face of the dam is lined to prevent leakage, it must be paved with stone, concrete, or brick to prevent damage to the earth slope by the action of the waves at

the water-level, which latter varies with the fullness or depletion of the reservoir. Where a water lining is desired, puddle is generally employed, often with concrete or masonry above it. Asphalt has recently been used to supplement concrete, brick, or stone lining. Occasionally the lower slope of earth dams is paved; in high dams it is frequently built with a level

that there were then ten earth dams 60 feet or over in height, as shown by the accompanying table. Later information shows that the fourth dam in the table, now known as the San Leandro, has a total height of 158 feet from the lowest point of the foundation to its crest, and has no heart-wall; also that it extends 125 feet above the original surface. The Tabraud dam, near Jackson, Cal., completed in December, 1901, has its crest 120 feet above rock foundation, and 110 feet above the natural surface of the ground. It has no heart-wall. See *Engineering News*, July 10, and September 11, 1902, for illustrated descriptions of the Tabraud and San Leandro dams, respectively.

FIG. 1.—CROSS-SECTION OF EARTH DAM, with concrete heart-wall and upper slope paved; Metropolitan Water-Works, Southborough, Mass.

place or *berm* part way up its height. Water is rarely allowed to come within five feet of the top of earth dams or reservoir embankments and it may be kept even lower. The minimum advisable thickness of the base will increase with the height of the dam and the gentleness of the slopes. The angle of repose, or natural slope, of ordinary earth, dumped in banks, gives a base of one and one-half feet to one foot of height, but wet earth has a less angle of repose. It is common, therefore, to give dams of ordinary earth a slope of 2 to 1 on the lower or dry face, and 2½ or 3 to 1 on the wet face, and even these figures may be exceeded. Some earth dams are backed with loose stone or rock, to give greater stability. Occasionally the material composing earth dams is brought into place by means of flowing water, instead of by carts, scrapers, or buckets, running on and dumped

Earth dams or earth embankments for reservoirs are among the oldest of engineering structures, having been built for irrigation thousands of years ago, in Egypt, India, and other Oriental countries.

MASONRY DAMS, particularly of notable size, are of comparative recent origin, their construction having awaited the development of modern engineering. Moreover, while masonry dams of great height date from the sixteenth century (see table), it was only during the last half of the nineteenth century that their design accorded with the great principles of engineering—maximum strength with a minimum of material and cost. The accompanying table, taken from Wegmann, *The Design and Construction of Dams* (New York, 1899), will serve as a basis for tracing the development of the most notable masonry dams of the world during the last three centuries, terminating with the new Croton Dam, under construction in 1901. In 1900, or since the table was compiled, the contract was let

PARTICULARS OF TEN HIGH EARTH DAMS

NAME AND LOCATION	Height, ft.	Length, ft.	Heart-wall

* These two dams, while without heart-walls in the dam proper, have puddle-filled trenches, 26 and 47 feet deep, respectively, from the natural surface to solid rock.

from a cableway (q.v.) *Hydraulic fill dams* is the name applied to this rather novel class of structures. This process was used to build a part of the San Leandro and Temescal dams of the water-works supplying Oakland, Cal., and also in building earth dams at La Mesa and San Joaquin (Lake Christine), Cal., and Tyler, Tex. Earth dams vary in height from a few feet to 100 feet or more, and in length from a few score to thousands of feet, or even to miles, although most of the structures running into miles are more properly called reservoir embankments. A summary of the heights of earth dams in the United States, for water-works purposes alone, compiled from figures included in *The Manual of American Water-Works* for 1889-90, showed

for the Wachusett Dam, which is a worthy rival of the new Croton Dam. Some figures concerning the Wachusett Dam and the Assuan Dam on the Nile (see *Reservoirs*, below) have been added to the table.

Masonry dams are designed as though they were monolithic structures, and for this reason, as well as because of the fact that the pressure against the face of the dam tends to rupture it both vertically and horizontally, the blocks of stone are not laid in regular courses. Portland cement mortar is used to bind the stones in one homogeneous mass, or the dam may be composed of irregularly shaped masses of stone with the intervening spaces filled with concrete, or it may be made of concrete alone. (See CEMENT.)

DAMS AND RESERVOIRS

NEW CROTON DAM IN COURSE OF CONSTRUCTION.

No.	Dam	Location	Date of construction	Depth of water	Height above bed-rock	Thickness in feet		Area of profile in sq. ft.	Maximum pressure in the masonry in tons per sq. ft.	Weight of masonry per cu. ft.	Length in feet		Plan

1. Puente failed April 30, 1802.

2. Habra failed in December, 1881.

3. San Mateo not above 134-foot level (1901).

4. Colorado River (Abstin) failed April 7, 1900.

Overturning is guarded against by giving the structure such a cross-section that the lines of pressure will be thrown within the centre third of the dam. To provide against crushing, a material with high resistance to such action is selected and the structure is so proportioned that

FIG. 2.—CROSS-SECTION OF A MASONRY DAM
(New Croton Dam for New York City Water-Works).

its own weight will not crush the material in its lower part. As a general rule the pressure should never exceed fifteen tons per square foot, and with some materials it may need to be as low as six tons. Obviously the only way to prevent excessive or crushing pressures at the bottom of very high dams is to diminish the thickness as the height increases. The action of ice and of the actual or possible current of overflowing water renders it necessary to make the top of the dam thicker than would be required to resist water pressure alone; otherwise the dam might be tapered to a knife edge at the top. The common type of cross-section for high masonry dams approaches a right-angled triangle, with the perpendicular side up-stream, but it varies from a real triangle in having both sides curved somewhat, particularly so as to give a broader base, and in having the extreme upper part built with nearly parallel sides, while the top is flat, or perhaps more or less rounded. While some of the early dams were quite bold in cross-section, most of them were far otherwise. The French engineers were the first to apply the results of theoretical study of the subject to the design of the cross-section of dams. M. Sazilly discussed the questions involved in a memoir published in *Annales des Ponts et Chaussées* (Paris, 1853). M. DeLoere carried the work on to more rational conclusions, which were made public in 1858, and on which the design of the Furens Dam, near Saint Etienne, France, was constructed (1862-66). A memoir on these studies was published in the journal just named in 1866. Although this dam was only 6 feet higher (170.6 against 164.24 feet) than the Puentes Dam, completed in Spain in 1791, the French dam was 9.91 feet thick at the top and 161.02 at the base, while the Spanish dam was 35.73 feet thick at the top and 144.29 feet at the base. The French dam was curved in plan and the Spanish was polygonal. An Englishman, Prof. W. J. Rankine (q.v.), made the next notable study of the subject. (See his *Miscellaneous Scientific Papers*, London, 1880.) A number of eminent American engineers connected with the new Croton Aqueduct and its adjuncts, for New York City, made studies which resulted in the design of the highest masonry dam yet attempted, which was put under construction in 1892. Very extensive investigations were made in this connection by Mr. Edward Wegmann, who published

an important treatise, entitled *The Design and Construction of Masonry Dams* (New York, 1888), to which new matter was added and a new title given in 1899, so as to cover all classes of dams.

ARCHED or CURVED DAMS have given rise to a great amount of discussion as to the possibility of utilizing the arch principle to resist a part of the thrust of the water on the dam, instead of relying wholly on gravity dams, or those with a section which gives sufficient weight to resist overturning and sliding. The most notable dams designed on this principle are the Bear Valley, Zola, and Sweetwater dams, details of which are given in the table. The first two are declared by Mr. James D. Schuyler, in his work on reservoirs (see below), to be "so slender in profile as to be absolutely unstable were they built straight." The Bear Valley Dam is only 3.17 feet thick at the top, 20 feet thick at the bottom, and is 60 feet in height.

CONCRETE MASONRY DAMS are not essentially different from other masonry structures, except in their composition. (See CEMENT and CONCRETE.) Perhaps the most notable concrete dam in the world is that near San Mateo, Cal., built by the Spring Valley Water-Works Company of San Francisco. This dam, which is of the arched type, had attained a height of 13.4 feet in 1888 or 1889, but is designed to reach ultimately 170 feet, with a top width, when completed, of 25 feet and a width at the base of 176 feet.

ROCK-FILL DAMS are built of large stones, or rock, loosely put in place, but with hand-laid face or slope walls. To make such dams water-tight, or sufficiently so for the objects to be attained, the up-stream or wet slope may be faced with plank, concrete, concrete and asphalt, or steel. It is also possible to use earth to form either the upper or lower section; or riveted steel plates may be built in the centre of the structure. A masonry wall, with earth above and rock fill below, faced on the lower slope with stone laid in mortar, is another variation. The adoption of this form of construction is generally in the interests of economy, in localities where the transportation of cement would be very costly, where earth dams are out of the question, and where stone is abundant and easily thrown into place. The Escondido Dam, built by a Cali-

FIG. 3.—ROCK-FILL DAM WITH STEEL HEART-WALL OR DIAPHRAGM.
Southern California Water Company, San Diego, Cal.

fornia irrigation district of that name, is one of the most notable of the rock-fill structures. It is 76 feet high, 10 feet thick at the top, and 140 feet thick at the base, has top and bottom lengths of 380 feet and 100 feet respectively. The hand-laid dry wall on the upper or wet slope is 15 feet thick at the base and 5 feet at the top. It is covered with redwood plank and the space between the plank and the stone was rammed full of concrete. The joints in the planking were calked with oakum and daubed

with asphalt. The Lower Otay Dam, near San Diego, Cal., completed in 1897, is a rock-fill dam with a steel core. The dam was started in masonry, but being carried to a height of 40 feet above its lowest point, when its top length was only 85 feet, it was decided to change the design. An inverted T-iron (thus, \perp) was bolted to the masonry and steel plates one-third of an inch thick, $17\frac{1}{2}$ feet long, and 5 feet high were riveted first to the T-iron, then to each other until three courses had been placed. The plates were diminished in thickness as they neared the top. The dam is 161 feet high above its lowest point, 130 feet high above the natural earth, and is of rock fill for 121 feet. The steel plates were protected by a coat of hot Alecatraz asphalt, then a layer of burlap, then harder asphalt, and finally one foot of Portland cement concrete, on each side. A part of the rock fill was deposited in place by the force of a very heavy blast and the rest was transported from the quarry by a cableway (q.v.) 948 feet long. Nearly 180,000 cubic yards of stone were used. The stream flow must be passed around and not over rock-fill dams.

STEEL DAMS have recently been built. One of the first of these, known as the Ash Fork, was built about 1897 or 1898, by the Atchison, Topeka and Santa Fé Railway Company to supply

FIG. 4.—CROSS-SECTION OF STEEL DAM,
Ash Fork, Ariz.

its engines and incidentally to furnish water to the village of Ash Fork, Ariz. It forms a reservoir of 36,000,000 gallons capacity. The steel portion of the structure is 184 feet long at the top and its greatest height is 46 feet. It consists of a series of triangular steel frames, against the upper sides of which rest the riveted steel plates, three-eighths of an inch thick. These plates are curved so as to form a series of channels from the top to the bottom of the inclined face of the dam, with flat strips between. Water flows over the top of the steel dam and between two masonry abutments having a combined length of 116 feet.

FIG. 5.—CROSS-SECTION OF TIMBER AND STONE DAM,
Bangor, Me.

TIMBER DAMS include a great variety of structures built of framed timber, logs, and crib-work of either timber or logs filled with stone. They are generally comparatively low, overflow dams. They frequently have a sloping up-stream face

and either a sloping or stepped down-stream face, with an apron below the toe of the latter, to break the force of falling water. Sometimes piles are used in their construction and often earth is filled against their upper side. The once famous timber dam at Holyoke, Mass., built in 1849 for water-power, 1017 feet long and with a maximum height of 30 feet, has been replaced by a masonry structure.

MOVABLE DAMS are those which can be lowered or raised at will, according to the stage of water in the river. They are generally aids to navigation, placed at stretches where there are shallows or rapids, but where permanent structures to raise the water-level might do damage by causing floods at times of high water. They may also be used on any ordinary dam, or on waste weirs. It is more common, however, to call movable devices connected with ordinary dams *flashboards* or *floodgates*. Flashboards are generally comparatively low and are of fragile construction, or have supports designed to give way in time of freshet. There are a great variety of movable dams, but they fall more or less closely into three groups—*needle*, *wicket*, or *shutter*, and *bear-trap*. The latter have some decided points of superiority, being raised and lowered by the force of the water itself, on its being turned under or discharged from chambers beneath or within the dam. *Needle dams* were developed in France about the close of the eighteenth century. They are an outgrowth of the earlier French and English needle dams and consist of horizontal beams, or stop planks, dropped into grooves built in the two abutments of a pass through the dam. These beams could be lifted out at times of high water. Later, to facilitate handling, they were set vertically, or nearly so, resting against a sill below and a beam above. A chain was finally substituted for this beam to make greater lengths of dam feasible. In this way movable dams 40 feet wide were developed on the Yonne, in France. In 1834 M. Poirée increased the width of one of these dams, or passes, to 72 feet by substituting iron bars for the chains. The bars were short and were supported by means of vertical, iron frames, placed at right angles to the length of the dam. To throw down the dam, it was only necessary to remove the needles one by one, detach the horizontal bars, then lower the frames into recesses in the top of the masonry portion of the dam. The needle dams were somewhat modified subsequently and used in various parts of France, in Belgium, in Germany, and in the United States. The first needle dam in this country was built in 1891-97 by the United States Government across the Big Sandy River at Lonisa, Ky. The whole improvement includes a lock 52 feet wide, a navigable pass 130 feet long, and an overflow weir 140 feet long. The sill of the pass is 13 feet and that of the weir is 7 feet below the normal height of water in the pool, and the sill of the pass is one foot below low-water mark of recent years. The steel frames supporting the pass needles are four feet between centres. The horizontal bars connecting the frames and supporting the upper ends of the needles are hinged at one end and hooked at the other. The frames have a sheet-iron floor, forming a foot-bridge, which falls with them, and are connected by a chain. The pass needles are of white pine, 12 inches wide, $8\frac{1}{2}$ inches thick at the bottom, and $4\frac{1}{2}$ inches thick

at the top, and 14 feet 3 inches long, each weighing 263 pounds when wet. The needles are set in place by means of a derrick on a boat, and are lifted out by means of a chain passing through irons fastened to their top, operated by an engine. The frames are raised or lowered from one of the abutments to the pass by means of a chain crab.

WICKET or SHUTTER DAMS have been developed from simple gates or shutters working on a horizontal axis near their tops, which have been used in Holland for centuries. These simple shutters have been elaborated until they are now made of short lengths, which may be revolved on their horizontal axis, then lowered so as to rest flatwise on the sill of the dam. They are operated from a bridge placed above them, which can be lowered much the same as the frames of the needle dams just described. In 1880 two wicket dams were completed on the Great Kanawha River by the United States Government, and others have since been built on that stream. One, completed in 1892, has a pass 248 feet long; besides a weir 316 feet long and a lock 55 feet wide. The pass is closed with 62 Chanoine wooden wickets 3 feet 9 inches long and 14 feet high, with a three-inch space between them, which may be closed by means of a timber, if desired. The first of a series of movable dams in the Ohio River, at Davis Island, near Pittsburg, was built in 1878-85, and also has Chanoine wickets. There is one pass 716 feet long, another 1223 feet long, besides a fixed dam 456 feet wide, several weirs, and a lock 110 feet wide and 600 feet long between the gates. In 1899 a second Chanoine wicket dam was being built across the Ohio River 25 miles below Pittsburg.

DRUM DAMS are modifications of the wicket or shutter dam. One of these, named after its inventor, Capt. H. M. Chittenden, may be described, roughly, as being shaped like one-sixth of a cylinder. When lowered by revolving on a horizontal axis at the centre of the cylinder, it drops into the chamber, leaving one radial side of the cylinder flush with the sill. The sections are raised by the force of the water acting from beneath.

BEAR-TRAP DAMS or GATES, in their simplest form, consist of two leaves extending across the pass or opening to be closed, and so hinged to the sill of the dam on their outer edge that they form a triangle when in use and lie flat on the sill of the dam when open; one leaf, when open, overlaps the others. The space within the triangle is filled with water. On drawing out this water through suitable openings, the dam fills, and on admitting water beneath the leaves, when the dam is open, the leaves are raised slowly into position. Thus the dam is operated by the force of the water. The first dam of this type was built on the Lehigh River, in 1818 or 1819, by Josiah White and Erskine Hazard, managers of the Lehigh Navigation Company, to secure slack water for shipping anthracite coal. Until 1880 or later this type seems to have been used but little outside of Pennsylvania; but in 1886 two bear-trap gates, each 60 feet long, were built by United States engineer officers in the Beattyville Dam, across the Kentucky River. Since 1886 a number of other dams of this type have been built in this country. A study of bear-trap dams was made for the United States Government by Capt. H. M. Chittenden and Major A. O. Pow-

ell, beginning in 1892. (See *Journal Association Engineering Societies*, Philadelphia, for June, 1896; also an article by Captain Chittenden reviewing the whole subject, in *Engineering News*, New York, February 7, 1895.) Various modifications of the bear-trap dam have been made, including a hinge at the apex and another in the upper leaf, so in falling the dam falls over on itself, and there is no overlapping at the apex. The largest bear-trap dam yet built forms a part of the regulating works of the Chicago Drainage Canal (q.v.), where the canal discharges into the Des Plaines River. The pass closed by this dam is 160 feet long and 20 feet high, besides which there are 15 sluice-gates, 30 feet wide and 20 feet high, working vertically between masonry piers. Eight of the gates were walled up, as the full capacity was not deemed necessary for some time. This bear-trap dam is not for navigation, so it is mounted on a masonry structure of some height, permitting the upper gate to slide down the upper face of the masonry. This dam differs from others of the same type not only in being of steel instead of wood, but in having various mechanical devices to supplement its operation. A full illustrated description of this structure is given in *Engineering News* (New York) for March 24 and May 26, 1899. A general review of movable dams, by B. F. Thomas, is given in the *Transactions of the American Society of Civil Engineers* (New York, 1888); also see *Reports Chief of Engineers, United States Army* (Washington, 1860 et seq.), particularly those for 1884 and 1887.

COFFERDAMS (q.v.) are employed to exclude water from foundations and other classes of work while under construction. See FOUNDATIONS.

FAILURES OF DAMS.

The Bradford earth dam, Sheffield, England, failed in March, 1864. This dam, built to supply water and furnish power to the city of Sheffield, was about 90 feet in height, 13 feet wide, and 1250 feet long, with slopes of $2\frac{1}{2}$ to 1. The dam, except for a puddle wall extending from end to end and 60 feet into the ground, was of earth loosely dumped from carts. Cast-iron outlet pipes about 500 feet in length, surrounded by clay puddle, extended through the base of the dam. While the reservoir was being filled for the first time, a leak suddenly appeared, and enlarged so rapidly that in 30 minutes the reservoir had emptied itself. The flood reached Sheffield at midnight, without warning, causing great destruction of property and the loss of 238 lives. In the official inquiry made as to the cause of the failure, it was claimed that in a work of such great magnitude the outlet pipes should not have been placed through the dam itself.

The failure of the Mill River Dam at Williamsburg, Mass., in 1874, was a conspicuous example of improper construction which resulted in complete saturation of the embankment. No engineer had been employed in constructing the work, and no proper means used for consolidating the embankment. One morning, when the water was 4 feet from the top of the dam, masses of earth were observed to slide from the outer slope of the embankment. In 20 minutes the reservoir was emptied of 100,000,000 cubic

feet of water, which drowned 143 persons and destroyed \$1,000,000 worth of property.

The most disastrous reservoir failure of the nineteenth century was the destruction of the South Fork Dam, which caused the famous Johnstown flood on June 1, 1889. That this disaster was due to an insufficient wasteway has been abundantly proved. The South Fork Dam was built on the headwaters of the Conemaugh River, about 3 miles above Johnstown. It was of earth, 70 feet in extreme height. The dam was built as far back as 1852, and, after various changes in ownership, the reservoir, in 1880, came into the possession of the South Fork Hunting and Fishing Club of Pittsburg, Pa. The original specifications for the dam required a waterway 150 feet wide. The waterway existing at the time of the disaster was 130 feet wide at its upper end, but was obstructed by a bridge and by screens to prevent the escape of fish. It extended across a channel 176 feet long, and at its lower end only 69 feet wide. In other words, the waste was only half that originally contemplated, besides which a brick outlet culvert had been abandoned. Unusually heavy rains had been falling for several days, and for 3½ hours before the break occurred the water had been flowing over the entire length of the dam. When the dam was carried away, the reservoir emptied itself in about 45 minutes. Over 2000 lives were lost in this disaster, and between \$3,000,000 and \$4,000,000 worth of property.

The Walnut Grove Dam, in Arizona, failed on February 22, 1890. It was one of the highest rock-fill dams ever built, having been 110 feet in height, about 10 feet thick at the top and 140 feet at the base, with a top length of some 400 feet and a bottom length of 100 feet. Both faces were composed of granite blocks, laid by hand and derrick, these dry-face walls being 20 feet thick at the base and 5 feet thick at the top. It is supposed that a very heavy rainfall and an altogether inadequate spillway caused the destruction of the dam, which was overtopped for a number of hours. Many deaths resulted from the failure.

The failure of the Puentes masonry dam, in Spain, in 1802, was due to defective foundation, the central part of the dam resting upon piles, instead of being carried down to bed rock. In the Habra masonry dam, in Algiers (see table), whose failure caused the drowning of 400 persons, the disaster was probably due to defective masonry work. The failure of the Bonzey masonry dam, near Epinal, France, in 1895, was caused by defective construction between the base and the foundation, although in its dimensions the dam was carried to the extreme of lightness. The failure of the dam on the Colorado River, at Austin, Tex., which occurred in April, 1900, was due to defective foundation, largely on account of the soft limestone rock on which the foundation was laid. The dam was 1090 feet long, 66 feet high above the foundation, and 60 feet above low water. The upstream face of the dam was vertical, and the down-stream face was curved, giving a thickness of 66 feet at the base and 20 feet near the top. On April 7, 1900, after a heavy rainfall of several days, when the water was flowing over the crest of the dam to a depth of 11.07 feet, a portion some 500 feet in length was detached from

the remainder of the dam, broke into two parts, and was carried down-stream. Two sections were left standing upright in the stream a few feet below the original portion. One of these broke up in a few hours, but the other remained intact. When the dam broke, eight people in the power-house were drowned by the sudden rush of water, and during the following night the power-house itself was partially destroyed.

RESERVOIRS.

Reservoirs may be classified broadly into *impounding, settling, storage, and distributing* reservoirs, all of which, except impounding, may be covered or open, the latter being the general form. *Impounding reservoirs* are formed by throwing a dam across some stream and flooding the country above. *Storage reservoirs* are often created in the same way; or they may be formed more or less completely by embankments or excavation, or a combination of the two. Both impounding and storage reservoirs are designed to conserve a supply of water above the normal consumption, for times when either the natural yield is below the average or the consumption is unusually great. Impounding reservoirs are always for storage purposes, whether the capacity be for a few hours' supply or for a much longer period. The larger and more regular the daily yield of the stream or other source of supply, as compared with the consumption, the smaller need be the storage capacity. In some cases storage is required for months, or even for a year. The new Croton Dam will provide a storage of about 32,000,000,000 gallons, or nearly enough to supply the whole of Greater New York (3,438,000 people in 1900) with 100 gallons each for 100 days. The Wachusett Dam, of the Metropolitan Water-Supply District (Boston and vicinity), will retain about 63,000,000,000 gallons of water. It is located at Clinton, Mass., and ranks next to the new Croton Dam in height (see table of dams above for dimensions), but has almost double the storage capacity. The Periyar, or Periar, Dam in India (see table) forms a reservoir larger than either of the last two, having, as it does, a total capacity of about 100,000,000,000 gallons; but the outlet tunnel is at so high a level that only about one-half of this capacity can be utilized. Still greater will be the capacity afforded by the great Assuan Dam, now being built (see table) across the Nile, some 500 miles above Cairo. The storage here will be about 280,000,000,000 gallons, or sufficient to cover 6,400,000 acres of land to a depth of one foot. The Periyar and Assuan dams are for irrigation purposes.

An important sanitary question involved in the construction of impounding and storage reservoirs for public water-supplies is the stripping of the sites, or flooded areas, of all heavy accumulations of organic matter which, either through their decay or through serving as a food-supply to low forms of life, would impart unpleasant tastes and odors to the stored water. It is a common practice to remove stumps and timber and to burn over the site, where practicable, before filling such reservoirs; but outside of New England very little more than this has been done toward stripping the sites of storage reservoirs. The estimate for the Wachusett Reservoir, mentioned above, included \$2,910,000, out of a total cost of \$9,105,000, for stripping the reservoir site. Aside from stripping and clear-

ing the sites, the construction of impounding reservoirs pertains mostly to the dam and its accessories. One additional element of importance in some cases is the excavation at the border of reservoirs to prevent shallow flowage and the growth and decay of vegetable matter which would occur when these slopes are alternately exposed and covered by the varying levels of water in the reservoir.

SETTLING RESERVOIRS, also known as *subsiding* and as *sedimentation* reservoirs, are shallow basins, with long weirs between the several compartments over which the water flows in thin sheets, thus drawing off only the upper and most clarified layer. (See WATER PURIFICATION.) It is desirable to make provision for removing the mud, to which end the paved bottoms may slope to a common point and then connect with a scour-pipe, through which the mud may be flushed with a stream of water from a hose.

DISTRIBUTING RESERVOIRS are generally located within or near the city which they serve. They are often classified as high, low, and middle service, according to their elevation and the areas which they supply. They may afford storage for periods ranging from a day or two up to several weeks; but in the latter case they would perform the duty of a storage reservoir as well. Occasionally distributing reservoirs are formed by a dam across a stream; but as a rule they have masonry walls above or below the natural surface. The construction of embankments or walls does not differ essentially from that of earth and masonry dams, except that when masonry is used the principles of design are more like those involved in the planning of earth retaining walls, subjected, of course, to water pressure on the other side at times; but also liable to be empty. It is common to line the inner slopes of reservoir embankments with stone, brick, concrete, or asphalt. The bottoms are frequently lined like the sides. When concrete is used it is well to lay it in relatively small squares, with a good filling for the joints, to prevent cracking.

COVERED RESERVOIRS may have vaulted roofs of masonry, generally either brick or concrete, or else less expensive and more temporary roofs of timber. Much ingenuity has been exercised to find a cheap and permanent covering, since the work at best adds largely to the cost of the structure. In fact, the cost is so great that covering is rarely attempted in the United States, except for relatively small reservoirs receiving either filtered water or that from underground sources, either of which is liable to injury through the development of organisms giving rise, in their life processes, to bad tastes and odors.

Wegmann, *Design and Construction of Dams* (New York, 1899); Schuyler, *Reservoirs for Irrigation, Water Power and Domestic Supply* (New York, 1901); Frizzell, *Water Power* (New York, 1901); also general treatises on water-works by Fanning, Folwell, Goodell, and Turneure, and Wilson, *Manual of Irrigation Engineering* (New York, 1897).

DAMSEL FLY (so called from the French name *demoiselle*). An insect of the family Agrionidae, order Odonata, closely allied to the dragon-flies. They are, says Howard, the small, graceful species, with extremely slender bodies

and narrow, clear wings, held vertically in repose, which are very commonly found over large bodies of still, fresh water. "All of our North American species [about 75] are small, but in tropical regions they grow to a large size, and some South American forms are among the largest species of the order Odonata. They do not fly high in the air, but frequent low-growing aquatic vegetation. The colors as a rule are rather dull, but the slender bodies of some are brilliantly blue, green, or even red." Many authors unite with these as a subfamily the dark-colored, prominent-eyed flies otherwise regarded as constituting the separate family Calopterygidae. The life history of these flies is substantially that of the dragon-flies (q.v.). See Plate of DRAGON-FLIES.

DAMSEL OF BRIT'TANY. A title given to Eleanor of Brittany, sister of Arthur, Count of Brittany, and niece of King John of England, who confined her in the Castle of Bristol, where she died in 1241.

DAN (Heb., judge). A city on the northern boundary of Israel, called originally Laish (Judges xviii. 29), but renamed Dan by the Danite invaders. Owing to its northerly location (Gen. xiv. 14), it was often used in connection with Beersheba (I. Sam. iii. 20; II. Sam. iii. 10) in the phrase "from Dan to Beersheba," to express the whole land of Israel. The Danites introduced an idolatrous worship (Judges xviii.), but this gave way to the calf-worship introduced by Jeroboam (I. Kings xii. 29). At the solicitation of Asa, King of Judah, Ben Hadad, the Syrian King, invaded Israel, and, among other cities, Dan was destroyed (I. Kings xv. 20; II. Chron. xvi. 4). The ruins of the city are identified with modern Tel-el-Kadi.

DAN. The eponymous ancestor of the tribe of Dan, the son of Jacob and his concubine Bilhah (Gen. xxx. 5, 6). The tribe was one of the smallest and weakest of the Hebrew confederacy. Belonging to the northern group, its territory lay southwest of Ephraim, occupying the valleys of Sorek and Ajalon (Joshua xix. 40-46). Owing, however, to difficulties with the Amorites (Judges i. 34), we find them later migrating to the far north, and conquering the city of Laish, which they rebuilt and called Dan (Joshua xix. 47; Judges xviii.). Samson (q.v.) was of the tribe of Dan (Judges xiii. 2, 24, 25). The earliest reference to the tribe is in the song of Deborah (Judges v.); the passage in which Dan is reproached for seeking protection in ships, instead of coming forward to help its brother tribe Bilhah, is obscure; but it seems certain that at this period already Dan's settlements were to the north and near the seacoast. Dan, though designated as a 'concubine' tribe, which generally indicates secondary rank, plays no unimportant part in the early traditions and legends. This is in part due to the fame and antiquity of the sanctuary at Dan, which as late as the days of Amos is put on a level with Bethel and Beersheba (Amos viii. 14). In this sanctuary the older rites and practices were preserved with great fidelity, and its priests traced their origin to Moses himself (Judges xviii. 30). The name Dan ('judge') may originally have been the title of a deity.

DA'NA. CHARLES ANDERSON (1819-97). An American journalist, born at Hinsdale, N. H.,

August 8, 1819. He studied at Harvard, but, owing to defective eyesight, did not graduate. He joined the Brook Farm Association in 1841, edited in its interest *The Harbinger*, contributed to the *Boston Chronotype*, and, after the failure of Brook Farm, was, with its founder, Ripley (q.v.), connected with the *New York Tribune* (1847-62). Disagreement with Horace Greeley in war politics, proclaimed in a once-famous editorial, "On to Richmond," forced his resignation. He was Assistant Secretary of War in 1863-64. After the war he edited the *Chicago Republican*, which failed. He then returned to New York and became part proprietor and editor-in-chief of the *New York Sun*—a position which he held from 1868 to his death. With George Ripley he planned and edited the *New American Cyclopadia* (1857-63), and its successor, the *American Cyclopadia* (1873-76). He compiled also the well-known *Houschold Book of Poetry* (1857), and collaborated in a *Life of Grant* (1868). Other works are: *The Art of Newspaper Making* (1895); *Lincoln and His Cabinet* (1896); and *Recollections* (1897). At the time of his death at Glen Cove, L. I., on October 17, 1897, Mr. Dana was in many ways the most noted journalist in the country. He had a brilliant intellect and understood every detail of the art of making a good newspaper, but he was generally believed to be so intense in his prejudices that he failed to acquire the authority to which his talents entitled him.

DANA, CHARLES LOOMIS (1852—). An American neurologist. He was born at Woodstock, Vt., and was educated at Dartmouth College and the New York College of Physicians and Surgeons. He served as professor of physiology in the New York Woman's Medical College, of nervous and mental diseases at the New York Postgraduate Medical School, and of nervous diseases in Dartmouth Medical College, and for a time was president of the American Neurological Association. Besides numerous papers, his publications include a *Text-book of Nervous Diseases* (1892).

DANA, EDWARD SALISBURY (1849—). An American mineralogist, born at New Haven, Conn. He graduated at Yale University in 1870, and became tutor there in 1874. He received his doctor's degree at Yale in 1876, and also studied at Heidelberg and Vienna. In 1879 he was made assistant professor of natural philosophy and astronomy, and later professor of physics, at Yale. His publications include numerous papers on mineralogical topics: "Appendix I." and "Appendix II." of Dana's *System of Mineralogy*; a *Text-Book of Mineralogy* (1877); *Minerals and How to Study Them*, and a *Text-book of Mechanics* (1881).

DANA, FRANCIS (1743-1811). An American statesman and jurist. He was born in Charlestown, Mass.; graduated at Harvard in 1762; soon became prominent at the bar, and, as a Whig, in colonial politics; and from 1776 to 1780 was a member of the Executive Council of Massachusetts. He was elected to the Continental Congress in 1776, and from the first took a conspicuous part in the work of that body. In 1778 he was made chairman of a committee appointed to draw up plans for the reorganization of the army, and in the same year was a member of the committee of three to which the

conciliatory proposals of Lord North were referred. He went abroad in September, 1779, as the official secretary of John Adams, recently appointed to negotiate a treaty of peace with Great Britain, and, after spending some time in Paris and Amsterdam, was sent in March, 1781, as United States Minister to the Court of Saint Petersburg. Catharine persistently refused to receive him as an accredited Minister, however, and in 1783 he returned to America. He was again elected to the Continental Congress (1784), and in January, 1785, was appointed Justice of the Supreme Court of Massachusetts. In 1786 he was a delegate to the Annapolis Convention (q.v.), and in the following year was also elected as a delegate to the Constitutional Convention at Philadelphia, but was prevented by illness from attending. In the State Convention of 1788 he cooperated with Theophilus Parsons and John Hancock in securing the ratification of the Federal Constitution by Massachusetts. He was Chief Justice of the Massachusetts Supreme Court from 1791 to 1806, during which period he took no active part in State or national politics.

DANA, JAMES DWIGHT (1813-95). An American geologist and one of the eminent scientists of the last century. He was born in Utica, N. Y. His father was a successful business man of New England birth, and his mother was Harriet Dwight, daughter of Seth Dwight, of Williamsburg, Mass. Dana early became interested in scientific studies. In his school days at Utica he devoted much time to chemical investigations, and he frequently made excursions to distant points for the purpose of collecting minerals. Attracted by the reputation of Professor Silliman, he entered Yale College in 1830, where for three years he pursued the study of classics, mathematics, and natural sciences. In 1833 Dana received an appointment as instructor in the United States Navy, a position that afforded him an opportunity of European travel. Three years afterwards he returned to Yale and was appointed assistant to Professor Silliman. While at New Haven he published his first important scientific work (*The System of Mineralogy*), a book that subsequently passed through several editions and attained a reputation in both Europe and America as a standard of reference. From 1838 to 1842 Dana was a member of the Wilkes Exploring Expedition sent out by the United States Government. While on this expedition, which explored the little known parts of the Pacific Ocean, he had a wide field for scientific discovery and description. The opportunities presented were such as few scientists have received; so extensive was the material collected that, upon his return to the United States, Dana devoted thirteen years of almost constant labor to its study. The results were published by the Government in three voluminous reports: "Zoöphytes," in *United States Exploring Expedition* (Philadelphia, 1846); "Geology," in *United States Exploring Expedition Under C. Wilkes, U. S. N.* (Philadelphia, 1849); and "Crustacea," in *United States Exploring Expedition Under C. Wilkes, U. S. N.* (New York, 1852-54). In the work on "Zoöphytes," 230 species were described by Dana for the first time, while the report on "Crustacea" contained descriptions of no less than 658 new species. The intense zeal with which Dana pursued this task seriously

impaired his health, and although he was able to accomplish much in after-years, his life henceforth was a continual struggle against disability.

The value of Dana's services to science received prompt recognition from Yale College, which appointed him in 1850 to the professorship of natural history, a position he filled from 1855 to 1890. During this period his activities found expression in lectures to college students, in several text-books on geology and mineralogy, and in numerous contributions to scientific journals. His work was characterized by keenness of perception, great powers of analysis, and by vivid imagination. These qualities eminently fitted him for geological investigations, and his discussions of the grander features of the earth, such as the form and origin of continents, mountain-building, and volcanoes, are among the most valuable contributions to scientific literature. From 1846 until his death he served almost continuously as editor of the *American Journal of Science*, in which many of his papers were published. Dana received many marks of honor from American and foreign institutions. He was elected president of the American Association for the Advancement of Science in 1854, and at various times a member of the Royal Society of London, the Institute of France, and the Royal Academy of Berlin, the Royal Academy of Vienna, and of many other learned societies. In 1872 the Geological Society of London conferred upon him the Wollaston Medal "in acknowledgment of his services to mineralogy and geology," and in 1877 he received the Copley Medal "for his biological, geological, and mineralogical investigations, carried on through half a century, and for the valuable works in which his conclusions and discoveries have been published." The more important of his contributions to scientific literature, in book form, are the reports previously mentioned, and the following: *A System of Mineralogy* (1837; 4th ed. 1854); *Manual of Mineralogy* (1848; 4th ed. 1854); *Manual of Geology* (1862; 4th ed. 1865); *Coral and Coral Islands* (1872; 2d ed. 1890); *Text-Book of Geology* (1864; 4th ed. 1882); *The Geological Story Briefly Told* (1875). He died in New Haven, April 13, 1895.

DANA, NAPOLEON JACKSON TECUMSEH (1822—). An American soldier, born in Eastport, Maine. He graduated at West Point and was assigned as second lieutenant of infantry in 1842. During the Mexican War he served in both the northern and the southern campaigns, and in April, 1847, was brevetted captain for gallantry at Cerro Gordo, where he was severely wounded. In 1855 he resigned and thereafter until 1861 was engaged in the banking business in Saint Paul, Minn. On the outbreak of the Civil War he entered the service as colonel of a regiment of Minnesota volunteers, and in February, 1862, was appointed brigadier-general of United States volunteers. He served throughout the Peninsular and Maryland campaigns; was seriously wounded at Antietam; became a major-general of volunteers in November, 1862; was engaged in various operations in the Department of the Gulf, and then commanded successively the District of Vicksburg, the Sixteenth Army Corps, the Districts of West Virginia and Vicksburg, and the Department of the Mississippi. In May, 1865, he resigned from the service, and subsequently took an active interest in railway man-

agement, becoming president of the Montana and Union Railway Company in 1885. He was appointed captain and assistant quartermaster U. S. A., by special act of Congress, and retired from active service in 1894.

DANA, RICHARD (1700-72). An American jurist. He was born in Cambridge, Mass., graduated at Harvard in 1718, and soon became one of the leaders of the Massachusetts bar. He was also prominent, as a Whig, in colonial politics; frequently presided over Boston town-meetings; was chosen to administer the oath to Andrew Oliver binding him not to carry out the provisions of the Stamp Act, and in 1770 was a member of the committee appointed to make a careful investigation of the Boston Massacre.

DANA, RICHARD HENRY (1787-1879). An American poet, essayist, and novelist, born in Cambridge, Mass., November 15, 1787. He entered Harvard College in 1804, but remained there only three years. Adopting law as a profession, he was admitted to the Boston bar in 1811, but after some activity in politics renounced the practice of law for literature. His first literary work of note was an oration delivered on July 4, 1814, before the Washington Benevolent Society in Cambridge. In 1815 he became associated with the *North American Review*, to which he contributed several essays, and of which he was for a time an editor. He then (1821) started a miscellany, *The Idle Man*, to which his friend Bryant contributed, but which came to an end after the sixth number had been issued. His published works are: *Poems* (1827); *Thoughts on the Soul* (1829), a poem delivered before the Porter Rhetorical Society of Andover, Mass.; *Poems and Prose Writings* (1833), the best of which were republished in *The Buccaneer and Other Poems* (London, 1844); and *Poems and Prose Writings* (2 vols., 1850). He did his best work as a critic, and had considerable influence in forming the taste of New England in the early part of the century. His poetry was good for the time, but is read little to-day. "The Buccaneer" is probably his best poem; his prose tales, such as "Paul Felton," display imagination but are poorly constructed.

DANA, RICHARD HENRY (1815-82). An American author, born in Cambridge, Mass., a son of Richard Henry Dana, the poet. He developed in early life a passion for the sea, and was with difficulty restrained from entering the navy. He entered Harvard, but suffered from weak eyes, and, to cure them, undertook a Pacific voyage as a common sailor, a record of which is given in his sea-classic *Two Years Before the Mast* (1840; augmented ed. 1869), a book often republished and translated. On his return Dana reentered Harvard and graduated in 1837. He studied law and attained eminence in practice. On sea usages and laws, he wrote *The Seaman's Friend* (1841), reprinted in England as *The Seaman's Manual*. He contributed to legal journals and to the *North American Review*; wrote *To Cuba and Back* (1859); and edited *Wheaton's International Law* (1866). In 1876 he was appointed Minister to England, but was refused confirmation through a paltry political intrigue and unfounded accusations of plagiarism. He richly deserved the honor because of his patriotism, his high character, and his diplomatic

and legal learning. To prosecute studies on international law he went to Europe in 1878. He died in Rome of pneumonia. Consult Adams, *Richard Henry Dana: A Biography* (1890).

DANA, SAMUEL LUTHER (1795-1868). An American chemist. While chemist of the Merrimack print-works he invented a method of bleaching cotton goods which was widely adopted, and discovered that sodium phosphate is a mordant, a fact of considerable importance in the art of calico-printing.

DANA, WILLIAM PARSONS (1833—). An American artist, born in Boston. He studied art in Paris under Picot and Le Poitevin, and became known as a marine and genre painter. He was made a member of the National Academy in 1863, and in 1878 won a third-class medal at the Paris Exposition for his picture "Gathering Seaweed" (1878). Other of his works are: "Chase of the Frigate Constitution," and "Heartsease."

DANAË, dān'ā-ē (Lat., from Gk. *Δανάη*). The daughter of Acrisius, King of Argos. According to the legend, an oracle declared that her son would kill his grandfather. Acrisius therefore confined Danaë in an underground chamber, or in a tower of bronze. Here she was visited by Zeus in a shower of gold, and bore him Perseus (q.v.). Acrisius put both the mother and child into a chest, and exposed them on the sea. The chest, however, drifted ashore on the island of Seriphos, and Danaë and her child were saved. Danaë remained in the island until Perseus had grown up and become a hero famous for his exploits. She afterwards accompanied him to Argos. On his approach Acrisius fled, but was subsequently slain accidentally by Perseus at Larissa. Rembrandt, Correggio, and Titian have made the picturesque union of Danaë and Zeus the subject of famous paintings, which hang respectively in the Hermitage at Saint Petersburg, the Palazzo Borghese at Rome, and the Museo Nazionale at Naples. A second Titian on the same myth is in the Imperial Gallery, Vienna.

DANÆ'US, or DANEAU, dā'nō'. LAMBERT (c.1530-95). A French Reformed theologian. He was born at Beaugency; studied law at Orléans, Paris, and Bourges; became a Protestant in 1560; was preacher in France (1561-72); fled to Geneva on the outbreak of the Saint Bartholomew massacres (August 24, 1572), and preached in various other places till his death at Castres, November 11, 1595. He was one of the most important Reformed theologians of the sixteenth century, and the author of many learned volumes, the most famous of which is his *Ethica Christiana* (1577; 7th ed. 1640), the first Protestant attempt at a system of morals apart from dogmatics. For his life, consult Paul de Félice (Paris, 1882).

DANAI, dān'ā-ī, or DANAŌI, dān'ā-oi (Lat., from Gk. *Δαναοί, Danaoi*). A term originally applied to the Argives as the descendants of King Danaüs. Because of their warlike character. Homer uses the name to designate the Greeks in general.

DANAIDE, dān'ā-īd (from Lat. *Danaides*, Gk. *Δαναίδες*, the fifty daughters of Danaüs, condemned, with one exception, to pour water eternally into sieves as a punishment for mur-

dering their husbands on their wedding night at their father's bidding). An early form of water-wheel, sometimes called a tub-wheel. It resembled a smaller tub set in a larger one, with a free annular space and with a horizontal space between the two bottoms provided with radial floats, arranged spirally. The whole device revolved on a vertical axis, water flowing through it vertically.

DANAÏS, dān'ā-īs (Neo-Lat., from Gk. *Δανάϊς*, daughter of Danaüs). A genus of large blue- and brown-winged, strongly marked nymphalid butterflies of the tropics, of especial interest to the students of mimicry and protective coloration. According to Bates and Wallace certain South American species are distasteful to the local birds, monkeys, and other butterfly-hunters, and therefore fly about regardless of exposure; and they are 'mimicked' by other butterflies, which are eatable, in order to secure immunity through this gradually acquired resemblance. (See MIMICRY.) An Australian species is the bugong 'moth,' whose grub the aborigines regard as a dainty. (See BUGONG.) The representative of the group in the United States is the familiar milkweed-butterfly, formerly classified as *Danais archippus*. See MILKWEED-BUTTERFLY.

DANAKIL, dā'nā'kil. An Ethiopian people, calling themselves Afar. See also AFRICA, *Ethnology*.

DANAŌ, dā-nā'ō. A town of Cebú, Philippines, situated four miles north of Cebú, on the coast, near the mouth of the Danao River. The town is very old, having existed from the time of the conquest. Population, in 1898, 15,483.

DANAÛS, dān'ā-ūs (Lat., from Gk. *Δαναός*). A mythical personage, according to the common genealogy, the son of Belus and Anchinoë, grandson of Poseidon, brother of Ægyptus, and originally ruler of Libya. Thinking his life in danger from the machinations of his brother, he fled to Argos, accompanied by his fifty daughters, known as the Danaides, where he was chosen king, after the banishment of Gelanor, the last of the Inachidæ. The fifty sons of Ægyptus followed him, and sought the hands of his daughters in marriage. Danaüs consented, but in fear of treachery or in revenge for his exile, gave each of his daughters a dagger, and made them promise to murder their husbands on their wedding night. All did so, except Hypermetra, who saved her husband, Lynceus. The future of the Danaides was variously told. According to one version, Danaüs found no suitors for his daughters, and finally offered them as prizes in a contest. They were thus married to the Argive youth and became the ancestors of the Danai. The story of Lynceus was also variously told; according to one version Hypermetra was forgiven, and Lynceus chosen by Danaüs as his successor. The other version was that Lynceus later slew Danaüs and his guilty daughters. The Danaides in the lower world were condemned to the never-ending task of filling with water a vessel full of holes. The Danaides seem to have been regarded as nymphs of the springs in the plain of Argos, and Danaüs is said to have been the first to dig wells for the inhabitants, who thereupon chose him king. The tomb of Danaüs, in the Agora of Argos, was shown as late as the time of Pausanias.

DANBURY. A city and one of the county-seats of Fairfield County, Conn., 60 miles north-northeast of New York City: on the Berkshire and Highland divisions of the New York, New Haven and Hartford Railroad (Map: Connecticut, B 4). It contains a court-house, the county jail, a public library, parks, a beautiful cemetery, two soldiers' monuments, and one to General Wooster. An annual agricultural fair is held here. The manufacture of hats, dating from 1780, represents a capital of about \$3,000,000. Other products are machinery for making hats and cutting fur, paper and wooden boxes, shirts, silk, and silver-plated ware. The government, under a charter of 1889, is vested in a mayor, biennially elected, and a city council, which confirms the mayor's nominations to the police department and elects all other administrative officials. The water-works are owned and operated by the municipality. Population, in 1890, 16,552; 1900, 16,537.

First settled in 1684, Danbury was organized as a town in 1687, was incorporated as a borough in 1822, and was chartered as a city in 1889. Supplies for the American army were stored here during the Revolution, and in April, 1777, General Tryon entered the town, destroyed the stores, and burned a large number of the buildings. An American force pursued, and, in a skirmish at Ridgefield, General Wooster (q.v.) was mortally wounded. Consult Bailey, *History of Danbury, 1684-1896* (New York, 1896.)

DANBY, FRANCIS (1793-1861). An Irish painter, born near Wexford, November 16, 1793. He entered the Royal Dublin Society's school, and also studied under O'Connor. In 1812 he exhibited his first picture, "Landscape—Evening," in Dublin. In 1813 he visited London, but shortly left there and went to Bristol, where he lived until 1824, supporting himself by giving lessons in drawing. In 1824 he made his reputation by a large marine painting, "Sunset at Sea, After a Storm;" and his "Opening of the Sixth Seal," in 1828, at the Institution, secured his election to the Royal Academy. In the same year he removed to London. The following year he sent two pictures, subjects from the Revelation, to the Academy: but, on account of a quarrel with the authorities, he went to live in Switzerland, where he remained eleven years. He returned to London in 1841, and from that year exhibited annually both at the Academy and at the Institution. "The Evening Gun," exhibited in 1848, is one of his finest works. He died at Exmouth, February 10, 1861. His art showed high imagination, with the effect of solemnity and stillness, but his composition was often theatrical and his execution smooth and thin. His son, JAMES FRANCIS DANBY, was a landscape painter of some repute.

DANBY, THOMAS OSBORNE, Earl of (1631-1712). An English statesman. In 1673 he was appointed Lord High Treasurer, and in 1674 was created first Earl of Danby. On the resignation of Clifford in 1673, he became Lord High Treasurer and Prime Minister of the Kingdom, and retained these positions until 1678, when he was accused of carrying on treasonable negotiations with France, and imprisoned in the Tower, with some interruptions, for five years. The marriage of Mary, daughter of the Duke of York, to William of Orange was due mainly to his per-

sistent efforts, and upon the accession of William III. in 1689 he became President of the Council. He was created Duke of Leeds in 1694, but was impeached for bribery in the following year. The charge, however, was not pressed.

DANCE, GEORGE, JR. (? 1740-1825). An English architect, born in London. He was associated with his brother Nathaniel in the foundation of the Royal Academy, of whose original members he was for several years the last survivor. Newgate Prison was rebuilt in 1770 from his plans, and the front of the Guildhall was also designed by him. In later life he exhibited chalk portraits.

DANCE OF DEATH. See DEATH, DANCE OF.

DANCETTE, dän-sët' (Fr., irregular formation from Lat. *dens*, tooth). One of the lines of partition in heraldry, which differs from indented (q.v.) only in the greater size of the notches. The indentations where the division is *per fess dancette* never exceed three in number.

DANCING (from *dance*, from OF. *dancer*, *danser*, Fr. *danser*, to dance, from OHG. *dansōn*, to drag, from *dinsan*, OS. *thinsan*, to drag; connected with Lat. *tenus*, cord. Gk. *τελευν*, *teinein*, Lith. *tensti*, Skt. *tan*, to stretch). The origin of dancing may be traced to a universal desire of expressing emotion by action. At a later period comes the element of pantomime, the suggestion of an *idea* by means of motions. As far into antiquity as history reaches, every dance, whether belonging to civilized or to savage nations, was accompanied by music, or by rhythmic beats on the drum, shells, rattle, sticks, or by clapping of hands. Frequently the dance was accompanied by chants or songs. Records show in a general way that in the very earliest times people danced and sang at the same time; afterwards some danced while others sang an accompaniment, and finally musical instruments took the place of voice accompaniment. Ultimately music and the dance separated, the former improving and the latter deteriorating.

A consideration of savage dances as we find them at present (and it is remarkable how world-wide are the principal forms) will give us a general idea of dancing before the beginnings of civilization. Folk-dancing may be divided into three groups—*social*, *warlike*, and *religious*. Under the first may be included all comic and erotic dances. Under the second we have those dances which were used to inspire the warriors before a battle, to celebrate a victory, or to imitate the motions of animals after a successful hunt. The *religious* class comprises medicine, incantation, and mystery dances. Although this general classification does not by any means exhaust the list of savage dances, it will be found that all others are derivative, or of merely local importance. In all forms of savage dancing exactness is insisted upon. Each dance has its particular step, and among certain tribes mistakes on the part of the performer are often punished by death. This insistence on absolute precision is characteristic of their idea of dancing. It is a serious business, and even in comic dances the performer maintains an air of absolute gravity. It is of interest to note that their dances are most numerous during the summer and winter solstices, and at such times the figures danced are almost always circular. The separate forms of savage dances are too numer-

ous to describe, but of greatest importance are the religious ones. A universal custom is the dancing of women while the men are away at war. It is a sort of prayer, for they continue it day and night, believing that by so doing they protect the warriors from evil spirits and from danger. The medicine dances have two purposes—one to ward off harmful influences; the other, strange as it seems, to keep the patient awake. This latter motive is explained by the belief of savages that when a man is asleep his soul temporarily leaves his body. When he dies the departure of his soul is final; if, then, the sick man falls asleep, his soul may take advantage of the opportunity to go away and not return; and consequently the most heroic measures are employed to keep him awake. In the savage mysteries, as in the Greek, dancing plays an important part; but so great and universal is the secrecy maintained about them that we know practically nothing of the elaborate dances used. One of the most sacred rites is the initiation of a lad to manhood. Sword, snake, and fire dances are especially developed among the American Indians.

ANCIENT DANCES. In Egypt dancing reached a state of considerable excellence, for although Egyptian dances were monotonous and unimaginative, like those of most Oriental peoples, the use of the body and of the hands and arms was carried to great perfection. Their most important dances—those in honor of the dead—were slow and gliding, but they had also many lively forms. The *pirouette* in particular was developed in Egypt about 4000 years ago. As dancing was never, at least in the early and middle empires, practiced by the higher classes, its cultivation was carried on wholly from the religious and spectacular standpoints; and thus the social element, which more than any other has helped the art of dancing, was never given any prominence. See EGYPTIAN MUSIC.

Hebrew dancing was essentially a religious rite. It was an act of praise, and no religious festival or feast was complete without dances. Miriam, leading out the women in a dance, is typical of a form used in Arabia to-day. It should be noticed that each sex danced by itself, and that, in this particular, Hebrew dancing differed from its Egyptian prototype. See HEBREW MUSIC.

When we come to Greece we approach the golden age of the art of dancing. Here for the first time it ranked with poetry and music, and, as Lucian expresses it, dancing and music were 'the married pair.' Heretofore dancing had represented emotions; now it was also made to represent ideas, and pantomime arose. Hands and arms were used still more than legs; but an atmosphere of gaiety and expressiveness foreign to Oriental nations was created. The Greeks were a cheerful religious nation whose sense of dignity did not interfere with their dancing, as it did in the case of the Romans; and as long as their morality remained unshaken the dance retained its purity. It was at first religious, then educational, and finally popular. There were four great classes of sacred dances—the *Emmeleia*, the *Hyporchema*, the *Gymnopaedia*, and the *Endymatia*. From these four types the later forms were derived. The characteristics of the first were its gentle gravity, strength, and nobility. It was danced without the support of

either a chorus or a voice. The second class was danced by both men and women, and was of a dignified, elevated character. The *Gymnopaedia* was a favorite of the Lacedaemonians in the festivals of Apollo. It was danced by youths, and was often a preliminary to the wild Pyrrhic dance. In the last, the *Endymatia*, the performers wore most brilliant clothes, and this first of all the sacred dances lost its sacred character and became merely a popular dance. The military dances came later, and were principally educational. They were divided into two groups: (a) Pyrrhic, and (b) Memphitic. The first was really a military pantomime, and was used especially at festivals in honor of Minerva. It was danced by both men and women, was wild and rapid, and finally degenerated into the rites of Bacchus. The Memphitic was less warlike and wild, but its general character was the same. On the Greek stage there were tragic, comic, and satiric dances. The costumes and scenic arrangements were often elaborate, and the evolutions were accompanied by choral song. The forms were multitudinous, and the performers became so adept in the expression of emotions that the sculptors and painters of Greece selected them as their models. Although the pantomime was introduced first in Greece, it never reached the height of perfection which characterized it among the Romans.

Rome had few native dances. The *Bellicreps* was a war dance said to have been invented by Romulus. The Salian dance was the original of many later forms, and was danced by the priests of Mars. Later the Romans adopted some forms from Etruria, and still others from Greece. One of the most interesting of their dances was the May-day dance, which corresponded to the flower dance of the Greeks. It is really the original of the old English May-day sports, for, as in England, the youths and maidens danced out into the fields, gathering flowers and branches, and returning to the city again to continue their dancing. Upon the deterioration of Greek power, Rome inherited its arts, and among them its dances, which were modified and increased. In the reign of Augustus the dance was introduced into the theatre. It became widely popular, there being at the time about three thousand foreign women dancers in Rome. At this time pantomime had reached its height, fable, history, poetry all being perfectly expressed in mute action. The most cultured persons studied the art; but under Nero and his successors the decline began, and dancing became exaggerated and licentious.

EARLY AND MEDIEVAL DANCES. After the fall of Rome, dancing as an art practically disappeared. Christianity at first encouraged it as an inheritance from the Jews; Saint Basil recommended the practice of the dance on earth because it was the principal occupation of the angels in heaven, and sacred dances were given on feast days, and later every Sunday. In reality they were hardly so much dances as processions, each sex going through the evolutions separately. Gradually, however, they degenerated from their solemn character, and in 692 were expressly forbidden by the Church, though they still lingered in some localities for a considerable length of time. There are curious survivals of these old Church dances, such as *Los Seises* (q.v.), which is still performed annually by the choir boys

in the cathedral at Seville, on Corpus Christi and the Immaculate Conception: the *Gaillia di San Paolino* is a ritual dance performed on June 26, in front of the Cathedral of Nola, near Naples, in honor of San Paolino, who, on his return from Barbary, was met by a procession of the citizens of Nola. Meanwhile the simpler forms of the dance had been preserved by the peasants of Gaul, who kept them alive until they were taken up by the knights and nobles. In Spain the heritage of dances left by the Romans was more or less imperfectly preserved. Even the Arab invasion could not completely destroy the old forms; and there are some dances used at present in Spain, such as the *Turdion* and *Gibiduna*, which date from about the twelfth century. Liveliness is characteristic of early as well as later Spanish dances.

Dancing in Germany and England developed along the lines originated by the barbaric nations which governed their early history. In England the egg dance and the *Carole* were derived from Saxon sources. The Morris dance was introduced in the reign of Edward III. All English dances are lively and varied in motion. In Germany, war, funeral, and harvest dances were among the earliest popular kind, and with the formation of the guilds each trade adopted its characteristic dance. Hans Sachs gives an excellent description of the Schönpart, which was a carnival dance peculiar to the city of Nuremberg. From the thirteenth century on, each class of society had its own dances; but there were two general classes—the 'circular dance' and 'the measure.' The first was a rapid, uneven sort of dance; the second, a slow, gliding movement.

MODERN DANCES. The revival of dancing as an art began in Italy in the fifteenth century. The Renaissance awoke an interest in dancing as well as in the other arts, and ballets were given on an elaborate scale. Catherine de' Medici introduced the fashion into France, and from that time on France has led the world in the refinement of its dances and the gracefulness of its performers. It borrowed dance forms from almost every civilized country, but so adapted and changed them that their value was immeasurably increased. The origin of modern French forms may be traced to the *danses basses* and the *danses hautes* of the sixteenth century. The former were so called because of their slow, even motion; they were practiced by the nobility. The *danses hautes* were lively, jumping dances, and were performed only by the country people and the lower classes. Later the *galliard*, *courante*, and *volta*, which were of a more lively character than the old Court dances, were introduced; and still later the *branle* became popular. It was a dance of exceedingly varied character, each province having its own form, the *passepied* of Bretagne and the *minuet* of Poitou being branles. Richelieu gave many famous ballets during the reign of Louis XIII., while Louis XIV. was himself an enthusiast of the dance, founding in 1661 the Academy of the Dance. In the seventeenth century many of these Court dances were enjoyed for the sake of the music alone, and the idea arose of playing several of them in succession as a merely instrumental entertainment. Out of this custom originated the *suite* (q.v.), which in its turn suggested the *sonata* (q.v.) and the *symphony* (q.v.). The *snites* of Bach, Handel,

and Corelli contain excellent examples of some of these old dances. In Italy these groups of dances were early known as *Sonate da Camera*. As the classic composers used these old dance forms, so modern composers have utilized more recent dances in their compositions. Thus the *esárdás* is found in Liszt's *Hungarian Rhapsodies*; the *seguidilla* in Bizet's *Carmen*; and there is a charming series of Spanish dances in Massenet's *Le Cid*. The list of national dances is large, but the most representative are the *fandango* and *bolero* of Spain; the *tarantella*, the *saltarello*, and the *forlana* of Italy; the *mazurka* and the *polonaise* of Poland; the *reel* and the *Highland fling* of Scotland; and the *jig* in Ireland and Wales. Numerous classes of national dancers have arisen, of which the Bayederes or Nautch girls in India and the Geishas in Japan are well-known examples. In all the Eastern countries the dance is really a sort of pantomime containing a series of gestures, postures, and mimeries.

Of the more popular modern dances, the *quadrille* is probably the oldest. Its recent development dates from 1815; but before that time it was common in Europe for centuries. The *lancers* was invented in 1836; the *polka* was introduced about 1835; and the *waltz*, from Germany, about 1812. The *two-step* is of American origin, and has lately become exceedingly popular. For a discussion of the development of the *ballet*, see that article. There is no authoritative and comprehensive history of dancing, but the best works are: Grove, and collaborators, *Dancing* (London, 1895); Vuillier, *A History of Dancing*, translated from the French (New York, 1897); Giraudet, *Traité de la danse* (Paris 1900), which gives exact descriptions of a great number of dances; Cahusac, *La danse ancienne et moderne* (La Hague, 1754), which, although completely out of date, contains much of historical value; and Emmanuel, *La danse grecque antique, d'après les monuments figurés* (Paris, 1896). See also ALLEMANDE; BOLERO; CACHUCHA; CANARIE; CANCAN; CARMAGNOLE; CHACONNE; COTILLON; CUSHION DANCE; CSÁRBDÁS; EGG DANCE; FANDANGO; FARANDOLE; FIRE DANCES; FLOWER DANCE; GALOP; GAVOTTE; GEISHA; HIGHLAND FLING; HORMOS; HORNPIPE; JIG; JOTA; KIRMESS; LANCERS; MAY DANCE; MAZURKA; MEDICINE DANCES; MINUET; MORRIS DANCE; NAUTCH GIRLS; PASSEPIED; PAVANE; POLKA; POLONAISE; QUADRILLE; REDOWA; REEL; RIGADON; SALMON DANCE; SARABANDE; SCHOTTISCHE; SEGUIDILLA; SICILIANA; COVERLEY, SIR ROGER DE; SNAKE DANCES; SUN DANCES; SKIRT DANCES; STRATHSPEY; SWORD DANCES; TAMBOURIN; TARANTELLA; TARASQUE, LA; TORCH DANCE; WALTZ.

DANCING FAUN. An antique bronze representing a faun dancing and snapping his fingers to mark the time. It was discovered in 1853 in a house in Pompeii, hence known as the House of the Faun.

DANCING GIRLS. A designation applied to various classes of women, especially in India, whose profession is to dance and sing in connection with the temples, and in services upon the idol of some god. They also perform at entertainments of private persons or nobles. A number of subdivisions or classes of these dancers

are recognized in India. Consult Whitworth, *Anglo-Indian Dictionary* (London, 1885). See BAYADERE; NAUTCH.

DANCING MANIA. A form of epidemic disorder allied to hysteria (q.v.), and evidently the result of imitative emotions acting upon susceptible subjects, under the influence of a craving for sympathy or notoriety. There is little doubt that imposture entered to a considerable extent into all the epidemic forms of the dancing mania, which indeed were usually attended by consequences that showed clearly the presence of impure motives; but there is also evidence that in many cases the convulsive movements were really beyond the control of the will, whatever may have been the original character of the motives that prompted them. Epidemics of this sort were common in Germany during the Middle Ages; in Italy, a somewhat similar disease was ascribed to the bite of a spider called the tarantula (see TARANTISM); and similar convulsive affections have been witnessed in Abyssinia, India, and even in comparatively modern times and in the most civilized countries in Europe, under the influence of strong popular excitement, especially connected with religious demonstrations. The true dancing mania of the Middle Ages, however, prevailed chiefly in the crowded cities of Germany.

In July, 1374, there appeared at Aix-la-Chapelle assemblies of men and women, who began to dance on the streets, screaming and foaming like persons possessed. The attacks of this mania were various in form, according to mental, local, or religious conditions. The dancers, losing all control over their movements, continued whirling in wild delirium till they fell in extreme exhaustion, and groaned as in the agonies of death; some dashed out their brains against walls. When dancing, they were insensible to external impressions, but were haunted by visions, such as of being immersed in a sea of blood, which obliged them to leap high, or of seeing the heavens open, and the Saviour enthroned with the Virgin Mary. The frenzy spread over many of the towns of the Low Countries. Troops of dancers, inflamed by intoxicating music, and followed by crowds, who caught the mental infection, went from place to place, taking possession of the religious houses, and pouring out imprecations against the priests. The mania spread to Cologne, Metz, and Strassburg, giving rise to many disorders and impostures and much profligacy. Exorcism had been found an efficacious remedy at the commencement of the outbreak; and in the beginning of the sixteenth century Paracelsus, that great reformer of medicine, applied immersion in cold water with great success. At the beginning of the seventeenth century the Saint Vitus's dance, as the affection was called (see CHOREA), was already on the decline; and it now occurs only in single cases as a sort of nervous affection. For a detailed account of the phenomenon, consult Hecker, *The Dancing Mania of the Middle Ages* (3d ed., London, 1859).

DANCLA, dān'klā', JEAN BAPTISTE CHARLES (1818—). A French violinist and composer. He studied under Baillot, Halévy, and Berton, and gained many prizes for his proficiency. In 1857 he was appointed professor of the violin at the Paris Conservatory and had many eminently

successful pupils. He was famous for his execution and tone as a player, as much as for his many successful compositions, notably his *Études*, and exercises for the violin.

D'ANCONA, dān-kō'nā, ALESSANDRO (1835—). An Italian literary historian, born at Pisa. He was educated in Florence, and in 1860 became professor of literature in the University of Pisa. His works consist of valuable studies in early Italian literature, a field little known until his time. He edited various texts with critical notes and prefaces, including stories, legends, curious traditions, and notably an edition of the *Vita Nuova* (2d ed. 1884). His other writings include: *Opere di Tommaso Campanella, scelte, ordinate ed annotate* (1854); *Suere rappresentazioni del secolo XIV., XV. e XVI.* (1872), and *Origini del teatro in Italia* (1887).

DANCOURT, dān'kōōr' FLORENT CARTON (1661-1725). A French dramatist and actor. He was born at Fontainebleau, November 1, 1661, and was educated by the Jesuits. He practiced law for a time, but after marrying an actress took to the stage and in 1685 appeared as an actor at the Théâtre Français with popular success and royal favor. In that year his first play, *Le notaire obligeant*, won applause. It was followed by many others, of which *Le chevalier à la mode* (1687) is his best, if indeed it be his, which is doubtful. In 1718 he retired from Paris and the stage, and occupied his declining years with a metrical version of the *Psalms*, and a sacred tragedy. He died at Courcelles (Indre et Loire), December 6, 1725. His rather farcical comedies are best when dealing with middle and low life and the peasantry. They are easy and witty in dialogue, realistic in treatment, and not infrequently introduce events and persons of passing notoriety. Dancourt's *Works* were collected in 12 volumes (1760), his select *Works* in five volumes (1810). Consult Lemaître, *La comédie après Molière et le théâtre de Dancourt* (Paris, 1882).

D'ANCRE, dān'kr'. See ANCRE.

DANDELION (Fr. *dent de lion*, tooth of a lion, referring to the teeth on the leaves), *Taraxacum officinale*. A stemless perennial or biennial plant of the natural order Composite, native to Europe and Asia, and now common in all temperate countries. The dandelion is used to a considerable extent both in England and the United States for greens and the blanched leaves for salads. Several improved varieties, mostly of French origin, are in cultivation. The root is employed in medicine and is sometimes ground and used to adulterate coffee. The plant called the fall dandelion is *Leontodon autumnalis*. For illustration, see SALAD PLANTS.

DAN'DIE DIN'MONT. See TERRIER.

DANDIN, dān'dēn. A Sanskrit author who is believed to have flourished in the latter part of the sixth century A.D. He composed a well-known Sanskrit novel or series of stories, entitled *Daśa-kumāra-carita*, or *Adventures of the Ten Princes*, a sort of romance of roguery. He is also the author of a valuable rhetorical treatise entitled *Kāvya-lōka*, or *Mirror of Poetry*, and some scholars, like Pischel, have sought to ascribe the Sanskrit play *Mrecha-katikā* (q.v.) to his pen. Dandin was probably the earliest

of the Sanskrit novelists whose works are extant, preceding Subandhu, the author of the romance *Īśavādattā*, which formed the model for Bana's *Kādambarī*. Dandin's works have been edited several times: *Daśa-kumāra-carita* (Bombay, 1889), and translated into English by Jacob, under the title *Hindoo Tales* (London, 1873), by Bhattacharyya (Calcutta, 1899—incomplete), into French by Fauche (Paris, 1862), and into German by J. J. Meyer (Leipzig, 1902). There is an edition with German translation of the *Kāvya-darśa* by Böhtlingk (Leipzig, 1890).

DANDIN, dān'dān', GEORGES. The hero of Molière's comedy of that name. He is a wealthy bourgeois who marries the daughter of a noble, and is compelled to support his wife's family and to put up with their contemptuous treatment. He expresses his helpless regret for his self-inflicted troubles in the much-quoted phrase, "Vous l'avez voulu, Georges Dandin."

DANDIN, PERRIN. The ridiculous judge in Racine's farce *Les Plaideurs*. The character is introduced also by La Fontaine in the *Fables*.

DANDOLO, dān'dō-lō. A famous Venetian family, already powerful in the seventh century. The most illustrious of its members was ENRICO DANDOLO, born about 1108. Eminent in learning, eloquence, and knowledge of affairs, he ascended from one step to another until, in 1171, he was sent as ambassador to Constantinople, and, in 1192, was elected Doge. In this latter capacity he extended the bounds of the Republic in Istria and Dalmatia, defeated the Pisans, and took part in the Fourth Crusade (q.v.). By this, Venice obtained great possessions in the Ionian Sea and the Archipelago, several harbors and tracts of land on the Hellespont, in Phrygia, the Morea, and Epirus, and also, by purchase, the island of Crete. Dandolo had for his special portion one-half of Constantinople. Soon after the conquest of the Byzantine Empire by the Crusaders, Dandolo died (June 4, 1205) in Constantinople, and was buried in the Church of Saint Sophia. His monument was destroyed by the Turks at the taking of Constantinople, in 1453. —ANDREA DANDOLO, Doge from 1343 to 1354, was the author of a Latin chronicle recording the history of Venice from the Pontificate of Saint Mark to the year 1339 in ten books. The last seven books are printed in Muratori, *Rerum Italicarum Scriptores*, vol. xii., (Milan, 1723-51).

DANDOLO, VINCENZO, Count (1758-1819). An Italian chemist and agriculturist. He was born in Venice, studied at Padua, and became a chemist in his native city. When Venice came under Austrian rule, he went to Milan, where he became a member of the Grand Council of the Cisalpine Republic. He went to Paris in 1799, but soon afterwards returned to the vicinity of Milan and engaged in scientific agriculture. In 1805 Napoleon made him Governor of Dalmatia, where he proved himself an excellent officer. In 1809 he returned to his estate near Varese, where he contributed much to the progress in silk-worm culture. He published *Fondamenti della fisico-chimica applicati alla formazione de' corpi e de' fenomeni della natura* (6th ed. 1796); and *Il buon governo de' bachi da seta* (1816).

DANDRUFF. See HAIR.

DANE, GREAT, or GERMAN BOARHOUND. See HOUND.

DANE, NATHAN (1752-1835). An American legislator and jurist, born in Ipswich, Mass. He graduated at Harvard in 1778; studied law in Salem; began to practice in 1782 at Beverly, and was successively a member of the Massachusetts House of Representatives, the Continental Congress, and the Massachusetts Senate. In addition, he held various commissions to codify or revise laws, and was judge of Common Pleas. While in Congress, he was a member of the committee appointed to draw up an ordinance for the government of the Northwest Territory, and made the original draft of that document, though in a larger sense it seems that Manasseh Cutler (q.v.) probably deserved the credit of authorship. The question of the relative credit due to each man has, however, been much debated. He was a member of the Hartford Convention (q.v.) in 1814. Dane contributed \$15,000 toward founding the Harvard Law School, and the Dane professorship of law was named in his honor. He published *A General Abridgment and Digest of American Law* (1823-29), and an *Appendix* (1830).

DANEBROG, dān'e-brög, ORDER OF. The second in rank of the Danish Orders, instituted by Waldemar II., in 1219. According to tradition, the Order was founded in honor of the banner of Denmark, which graciously fell from heaven for the inspiration of the army. In 1500 the Order was suppressed, but reinstated in 1671, by Christian V. In 1808 Frederick VI. made it an Order of merit for all the Danish people. The Danebrog has four degrees, besides a class composed of those on whom the Cross has been bestowed for certain meritorious services, but who are not members strictly of the Order. These are known as 'Danebrogsmænd.' The decoration of the Order consists of a cross of gold *patée*, enameled with white, and bordered with red, or gold.

DANEGELD, dān'gēld, or **DANEGOLD**, dān'gōld' (AS. *Denc*, Danes + *geld*, *gild*, payment, Goth. *gild*, tax, OHG. *gelt*, Ger. *Geld*, money). A tax of two shillings upon each hide of land, first levied by the Witan under the Saxon King Ethelred the Unready, in 991. It was probably the first money taxation imposed in England, and was used as tribute money for the Danes. The tax was collected four times within the next twenty years. Edward the Confessor abolished the impost, but William the Conqueror, in 1084, demanded from each hide of land, not held by himself in demesne, or by his barons, a sum of six shillings, or three times the old rate. In this manner the hated tax became a permanent source of income. In 1198 the rate was fixed at five shillings on a hundred acres of land. Stephen (1135-54) promised to abolish Danegeld, but it was not repealed till Henry II.'s time (1163). The tax, however, was secured in other ways, under the head of aid.

DANELAGA, dā'ne-lā'gā, or **DANELAW**, dān'lā' AS. *Denc*, Danes + *lagu*, Engl. *law*). The name applied to that part of England which by the treaty of Wedmore or Chippenham, in 878, was ceded to the Danes by Alfred the Great. It included Northumbria, East Anglia, Essex, and the northeastern part of Mercia, the boundary line being constituted by

the rivers Thames, Lea, and Ouse, and by the ancient Roman road of Watling Street. Within this region the laws and customs of the Danes were distinctly recognized and were later enumerated by Canute. The term Danelaw is used in contradistinction to Mercian and West Saxon law, until after the reign of Stephen (1135-54).

DAN'ENHOWER, JOHN WILSON (1849-87). An American Arctic explorer, born in Chicago. He graduated at the United States Naval Academy in 1870, served for a time in the line and on the coast survey, and in 1878 joined the *Jeanette* expedition for polar research, commanded by Lieutenant De Long, U. S. N. The ship was crushed in the ice, June, 1881, in latitude 77°, longitude 157° E. Traveling by sleds, the crew reached Bennett's Island, July 27, whence they embarked in three whaleboats for the Siberian coast. The one containing Lieutenant Danenhower and ten others, in command of Chief Engineer G. W. Melville, arrived at the Lena delta in September. Danenhower reached New York in June, 1882, and was compelled by an affection of the eyes to desist from further explorations. He published *Narrative of the Jeannette* (1882).

DANES ISLAND. A small island off the northwestern coast of Spitzbergen (Map: Arctic Region, G 4). André started from here for the North Pole, July 11, 1897.

DANEWORT. See ELDER.

DAN'FORTH, MOSELEY ISAAC (1800-62). An American engraver, born in Hartford, Conn. He was one of the founders of the New York Drawing Association (1825) and of the National Academy of Design (1826). He lived in London for ten years, during which time he executed some well-known drawings of the Elgin Marbles and many plates, besides engravings of the "Sentry Box," "Don Quixote," and portraits of Washington Irving and others. On his return to America he worked principally upon bank-note engraving.

DANGEAU, dān'zhō, PHILIPPE DE COURCILLON, Marquis de (1638-1720). A French historian. After commanding the King's regiment he became aide-de-camp to Louis XIV., and in this capacity took part in the principal campaigns of the period. In 1667 he was appointed Governor of Touraine. He was a favorite at Versailles, enjoyed the fullest confidence of the King, and was the patron of Boileau, who addressed to him the well-known satire on the nobility. He was frequently sent on diplomatic missions, and it was he who encouraged the marriage between Mary of Este (Modena) and James II. of England. The *Journal* of Dangeau is one of the best historical documents on the reign of Louis XIV.

DANGLE. A fatuous virtuoso, the leading character in Sheridan's *The Critic*, said to have been intended for Thomas Vaughan, an inferior playwright.

D'ANGOUËME, dān'gōō'lām'. See ANGOULÈME.

DANHAUSER, dān'hōu-zēr, JOSEPH (1805-45). An Austrian painter, born in Vienna. He studied at the Vienna Academy under Peter Krafft, and first appeared as an historical painter with scenes from the *Rudolph von Habsburg* (Vienna, 1824) of Johann Ladislaus Pyrker.

At Pyrker's invitation he went to Venice, where he determined to attempt genre subjects, in which he was very successful. He had abundant humor and fancy, and possessed a manner which, if somewhat glassy in its coloring, is nevertheless remarkable for its observant and skillful execution. His works include "The Death of Ottokar" (1832); "The Martyrdom of Saint John" (1835), in the Cathedral of Erlau; "Hagar and Ishmael" (1836), in the Vienna Museum; "The Gourmand" (1838); "The Widow's Mite" (1839), and "Liszt at the Piano" (1840).

DANICAN, dá'nó'kán'. FRANÇOIS ANDRÉ. See PHILIPOR, FRANÇOIS ANDRÉ DANICAN.

DANIČIĆ, dā'né-chích, GJURO (1825-82). A Servian philologist, born in Neusatz. He studied at Pesth and Vienna, and became librarian of the National Library at Belgrade, and afterwards professor of the history of literature in the university there. In 1877, under commission of the Academy of Sciences at Agram, he began the compilation of the Servian-Croatian dictionary, of which he finished but three parts. His works further include a Servian grammar (1863; 8th ed. 1892) and a history of the Servian and Croatian languages (1874).

DAN'IEL (Heb., God is my judge). In the Book of Ezekiel (xiv. 14, 20 and xxviii. 3), a personage introduced with Noah and Job as a proverbial type of wisdom and righteousness. It is this traditional Daniel, of whom nothing certain is known, who is made the hero of the Book of Daniel by the author (or authors), otherwise unknown, who lived and wrote in Jerusalem in the days of Antiochus IV. (B.C. 175-164). The author of the book makes Daniel a Jewish captive carried to Babylon in the third year of Jehoiakim (B.C. 605), who through his supernatural wisdom rose to a prominent position at the Court of Nebuchadnezzar (Dan. i.-ii.), and whose career is made to extend into the reign of Cyrus (Dan. x. 1). Daniel is referred to also in I. Macc. ii. 60, and in the New Testament (Mat. xxiv. 15; Mark xiii. 14); the first passage contains a reference to the story of the lion's den; in the second he is called "Daniel the prophet." See DANIEL, BOOK OF.

DANIEL, BOOK OF. A composition of about the year B.C. 165, written by a Jewish patriot as an exhortation and encouragement to the Jews, who at the time were sorely oppressed and hindered in the free exercise of their religion by Antiochus IV., surnamed Epiphanes. The book, comprising twelve chapters, consists of several distinct parts, and no less than ten detached sections may be distinguished. These sections may be considered as falling into three groups: (1) Introduction, chapters i.-ii., containing two sections; (2) chapters iii.-vi., containing four narratives; (3) chapters vii.-xii., comprising four prophetic visions. The first section relates how Daniel was brought to Babylon by Nebuchadnezzar in the third year of Jehoiakim (B.C. 605). With Daniel are three other youths of noble descent—Hananiah, Mishael, and Azariah. Babylonian names are given to them in place of their Hebrew ones, Daniel being called Belshazzar, while the other three are called Shadrach, Meshach, and Abednego. They are portrayed as being in the royal service, but also as steadfast in their fidelity to their God, declining to par-

take of the food provided for them for fear of polluting themselves. God rewards them for this, and when brought before the King they are found ten times superior to the Babylonian magicians, Daniel excelling every one in the matter of visions and dreams. In the second section proofs are given of Daniel's supernatural wisdom; he saves the lives of the magicians as well as his own by his ability not only to interpret a dream Nebuchadnezzar had had, but also to tell him what the dream was. The King had seen a great image with its head of gold, and other parts of the body of silver, brass, and iron. The gold is interpreted to refer to the Babylonian Empire, the other three metals to the kingdoms that are to follow the Babylonian. The image is destroyed by a stone quarried without human intervention out of a mountain, and this destruction symbolizes the disappearance of all the kingdoms. The third section (chap. iii.) tells of the fiery furnace into which the three friends of Daniel are thrown because of their refusal to worship the golden image which Nebuchadnezzar had set up, and how they came out of the furnace unscathed. In the fourth section (chap. iv.) Nebuchadnezzar issues a proclamation to all peoples of the world, declaring, in consequence of Daniel's success in interpreting another of his dreams, his intention of glorifying the King of Heaven, i.e. Jehovah. The dream itself consists of a vision of the uprooting of a great tree with its numerous branches, under which all birds have shelter and which feeds all mankind. The vision, as interpreted by Daniel, forebodes the downfall of the kingdom, and the King himself is humbled by being bereft for a time of his reason and conducting himself like an animal. The fifth section (chap. v.) recounts a great feast arranged by Belshazzar (q.v.), during which the mysterious writing appears on the wall as a punishment for the King's desecration of the sacred vessels of Jerusalem, which Nebuchadnezzar had brought to Babylon (chap. i. 2). Daniel succeeds in reading and interpreting the handwriting, which predicts the overthrow of Belshazzar, who indeed is slain that very night. The crown passes to Darius the Mede. The sixth section (chap. vi.) introduces King Darius, who, at the instance of his nobles, issued a decree forbidding any one for the space of a month to pray to or ask a petition from any one except Darius. Daniel, as a pious Jew, accustomed to pray thrice daily, disobeys and is thrown into a den of lions. By divine protection Daniel escapes the fate of being torn to pieces. He is taken out of the den and his accusers are thrown into it, and at once are torn to pieces by the lions. The last four sections contain visions of Daniel: (1) Of the four beasts, the last having ten horns, from each of which in turn supremacy is taken away (chap. vii.). (2) of the ram pushing in all directions with its two horns, which are eventually broken through a he-goat with a notable horn between its eyes. In time the kingdom of the he-goat is broken, and in its place four other horns arise, and out of one of these comes forth a little horn which exalts itself even against the host of heaven and against God Himself, destroying His sanctuary and interrupting the daily service for 2300 evenings and mornings (chap. viii.); (3) Gabriel appears to Daniel and explains that the seventy years of desolation prophesied by Jer-

miah (xxv. 11; xxix. 10) will be only seventy weeks, after which time the guilt of the people will be atoned for (chap. ix.). In the last vision, in the third year of Cyrus, an angel reveals to Daniel glimpses of the future. Under veiled names the doings and fate of various kings are described; after the last disappears the Messianic age arrives, heralded by the Archangel Michael.

There is no longer any question among scholars that all the narratives and visions refer to conditions as they existed in Jerusalem in the days of Antiochus IV. A difference of opinion merely exists on the question whether the book is an organic unity or the work of several authors pieced together. The trend of opinion is now in the direction of regarding the book as a unit, in view of the uniformity of style and the references in one part to matters referred to in another. In chapters i.-ii. 4 the author writes in Hebrew; beginning in ii. 4, since he introduces 'Chaldeans,' he continues in Aramaic, the current speech of Babylonia (though not the official language); but in chapter viii., and thence to the end, he returns to Hebrew. The supposition that the Hebrew portions replace the lost original Aramaic is without sufficient foundation. On the basis of the theory currently adopted, the interpretation of the figures and metaphors in the book is not difficult. Nebuchadnezzar, Belshazzar, and Darius are disguises for Antiochus IV. The four metals of which the image is composed represent the Babylonian, Median, Persian, and Macedonian empires, and the four beasts are to be similarly interpreted. The little horn is again Antiochus, while the ten horns represent the successors of Alexander the Great. The ram with two horns represents Medo-Persia and the he-goat the Greeks. The kingdoms in the last vision are the four Persian kings, Alexander, and his successors, the detached references being to leagues and conflict with Egypt during their régimes and to other occurrences. The tyranny of Antiochus IV., whose aim it was to replace Jewish rites by Greek forms of worship, led to the Maccabean uprising which marks the temporary triumph of Jewish patriotism. The struggle in Palestine represents from the broader historical point of view the natural conflict between Greek and Jewish ideas brought about through the meeting of Jew and Greek after the conquests of Alexander.

BIBLIOGRAPHY. See the commentaries of Kamphausen, Bevan, Prince, Hitzig, Ewald (*Prophets of the Old Testament*), Bruston, Keil, and Meinhold. Of these the latest is that of Prince (New York, 1899), and one of the best that of Meinhold (Leipzig, 1889).

DANIEL, dá'nyél', ANTONY (1601-48). A French Jesuit missionary in America, born at Dieppe. He came to Quebec with Samuel de Champlain in 1633, began his labors among the savages of Cape Breton, and in 1634 was transferred to the Huron mission. His station was at Saint Joseph, or Teanastayé, one of the largest of the Huron towns. On July 4, 1648, he had just concluded the service of the mass when the town, from which most of the warriors were for the time being absent, was attacked by a band of the hostile Iroquois. He roused such defense as was possible, administered the sacrament of baptism to those unbelievers who, in the face of this danger, were clamorous to receive it,

and urged all that could to escape. As he came from the church and confronted the enemy, he for a space overawed them by his calmly majestic bearing. A moment later, pierced by a bullet, he fell, and his body was consumed in the burning church. Consult Parkman, *The Jesuits in North America* (Boston, 1867).

DANIEL, ARNAUT. A celebrated French troubadour of the twelfth century, styled by Petrarch 'Il gran maestro d'Amore' (the great master of love). He was born at Riberae, Dordogne, was a juggler at the Court of Richard Cœur de Lion, and is said to have been present at the coronation of Philip Augustus and to have been acquainted with several distinguished troubadours, such as Bertrand de Born. He was the author of a number of amatory poems, which, although technically masterpieces of versification, are frequently characterized by an artificial straining after effects. Dante, although indebted to him for several of his stanzas, places Daniel far beneath Giraud de Borneil, then regarded as the greatest of troubadours. An admirable modern edition of Daniel's works has been published by Canello under the title *La vita e le opere del trovatore Arnaldo Daniel* (Halle, 1883).

DANIEL, dä'né-él, ERNST VON (1843—). An Hungarian politician, born at Ellemér, County of Torontál. He studied law at Budapest, became judge-lateral in 1868, and in 1870 a Liberal member of the Hungarian Parliament. In 1895 he was appointed Minister of Commerce, and in 1896 a member of the Table of Magnates.

DANIEL, GEORGE (1616-57). A Cavalier poet, about whom very little is known. His best verse is represented by *Occasional Poems and Scattered Fancies*, composed in 1645-46. The beautiful MS. copy of his poems was printed (in a limited edition) by Grosart (4 vols., Blackburn, Lancashire, 1878).

DANIEL, HERMANN ADALBERT (1812-71). A German geographer and theologian. He was born at Cöthen, studied theology at Halle in 1830-34, and was from 1834 to 1870 instructor and professor at the Pädagogium there. He was one of the most eminent followers of the geographer Ritter, and by the attractive style of his various geographical writings greatly contributed toward arousing an increased interest in the study of geography in the schools and among the educated generally. Of these works the following deserve especial mention: *Lehrbuch der Geographie für höhere Unterrichtsanstalten* (76th ed. 1895); *Leitfaden für den Unterricht in der Geographie* (201st ed. 1896); *Handbuch der Geographie* (6th ed., 4 vols., 1894-95); all of which were translated into several European languages.

DANIEL, JOHN MONCURE (1825-65). An American editor, born in Virginia. He was privately educated, studied law, and in 1845 became librarian of a small public library in Richmond. In 1847 he joined the staff of the *Richmond Examiner*, and as the result of expressions contained therein was compelled to fight numerous duels. He was a friend of Theodore Parker, whose famous sermon on Webster he published in the *Examiner*, and of Poe, a sketch of whom he wrote for the *Southern Literary Messenger*. In 1853 he was appointed Minister to the Court of Victor Emmanuel. By demanding for some Italians naturalized in the United States and visiting Sardinia rights equal to those of other Ameri-

cans, he nearly brought about a rupture in the diplomatic relations of Italy and the United States, and afterwards, by a breach of social etiquette at Turin, he greatly lessened his influence at the Italian Court. Upon the outbreak of the Civil War he was appointed to the staff of Gen. A. P. Hill. His arm having been shattered, he resumed the *Examiner*; and for attacks upon Jefferson Davis and Elmore, the Treasurer of the Confederacy, was challenged by the latter to a duel, in which he was wounded. Consult his *Writings*, with a memoir by his brother (New York, 1868).

DANIEL, JOHN WARWICK (1842—). A United States Senator, born in Lynchburg, Va. After the Civil War, in which he fought on the Confederate side and rose to the rank of colonel, he studied law and became active in politics. He was for some time a member of the State Legislature, and in 1885-87 served in the United States Senate.

DANIEL, SAMUEL (1562-1619). An English poet, born near Taunton, Somersetshire. He entered Magdalen Hall, Oxford, in 1579, but left without a degree and visited Italy. In 1590 he became tutor to William Herbert at Wilton and wrote masques for the Court of James I. Later he retired to a farm near Beckington, in Wiltshire, where he died in October, 1619. Daniel's principal works are a series of sonnets to Delia (1592), unsurpassed in their time by any except Shakespeare's; the beautiful *Complaint of Rosamond* (1592); a long historical poem in eight books, entitled *The Civil Wars Between the Houses of York and Lancaster* (1595-1609); two tragedies in the style of Seneca; and a prose history of England. Daniel's verse has been praised for its grace and purity by a long succession of critics. His works were collected in 1623. Consult *Complete Works*, edited by Grosart (5 vols., London, 1885-96).

DANIEL DERON'DA. A novel by George Eliot published serially in 1876 and in book form in 1877. It is a study of race feeling and tradition, the title character being a Jew.

DANIELL, JOHN FREDERICK (1790-1845). A distinguished English physicist, born in London. He was elected a fellow of the Royal Society in 1814, and in 1816, in connection with Professor Brande, established the *Quarterly Journal of Science and Art*. From this period he devoted almost all of his time to the subjects of chemistry and meteorology. In 1824 the Horticultural Society awarded him their silver medal for his *Essay on Artificial Climate*. He was appointed professor of chemistry in King's College, London, in 1831, and in 1839 published his *Introduction to Chemical Philosophy*. He is the only person who ever obtained all of the three medals in the gift of the Royal Society. His *Meteorological Essays* contain the first scientific account of the known phenomena of the atmosphere. He made the first precise determinations of atmospheric moisture by the use of the hygrometer of his invention, and invented the *Daniell cell*, an electric battery furnishing a tolerably constant current. Besides the works mentioned he wrote a large number of interesting and valuable papers for the Royal Society.

DANIELL, THOMAS (1749-1840). An English painter and etcher, born at Kingston-on-Thames. He was a pupil of the Royal Academy

and was elected an R.A. in 1799. Accompanied by his nephew William, he went to India in 1784 and remained in the East ten years. The fruit of these travels was the remarkable collection, "Oriental Scenery" (1808, 144 views). Besides these he published "Views in Egypt," "Hindu Excavations at Ellora" (24 plates), and *Picturesque Voyage to China by Way of India* (London, 1810).

DANIELS, WINTHROP MORE (1867—). An American political economist, born at Dayton, Ohio. He graduated in 1888 at Princeton University, studied at Leipzig, and in 1892 was appointed professor of political economy at Princeton. His publications include *Elements of Public Finance* (1894) and a *Revision and Continuation of Alexander Johnston's History of the United States* (1897).

DANILO, dan'ŭ-lŏ, I., or **DANILO PETROVITCH NIEGOSII** (1826-60). A prince of Montenegro. He was educated at Vienna and succeeded his uncle, Peter II., in 1851, dispensing, however, with the customary title of prince-bishop. In 1852 he became involved in a war with Turkey, the Porte claiming jurisdiction in Montenegro, and the boundaries between the two countries were not defined until 1858. Danilo devoted himself steadfastly to the achievement of Montenegrin independence and the furtherance of civilization throughout the land. He introduced financial reforms, organized a military service, and issued a legal code. He was assassinated by a personal enemy, August 12, 1860. His nephew, Prince Nicholas, succeeded him.

DANISH LANGUAGE AND LITERATURE.—LANGUAGE. The history of the Danish language begins properly about the year A.D. 1000, when the different Scandinavian dialects, which until that time had formed one speech, developed into separate languages. (For an account of the earliest Scandinavian monuments, see **RUNES**.) The Danish and Swedish formed together the East Northern group, the Icelandic and Norwegian, with the Faroese, the West Northern. The oldest specifically Danish records are runic inscriptions and a few names in Latin MSS. About 1300 appeared several collections of laws, which show the existence of at least three distinct dialects, there being at that time no standard form for literary use. The leveling of inflections, which is as marked a feature of Danish as of English, had already begun, although many forms were still retained. The vocabulary is still in the main Northern, with very few foreign elements. Between 1350 and 1500 the loss of inflections and of other grammatical distinctions increases rapidly and the language approaches more and more its present form. A striking feature of the vocabulary is the introduction of foreign words, especially those from the French, Latin, and Low German, High German words being sparingly borrowed. The syntax, too, is affected by Latinisms in consequence of the wide use of Latin by Danes. As a result of the publication of the first modern Danish translation of the Bible, that of Christian III. (1550), the vocabulary became fairly fixed, receiving practically its present character. The relation of the Danish Bible to the Danish language is very similar to that of the English Bible to the English lan-

guage. After 1537 Danish became the official language of Norway, the Norwegian language remaining as a collection of dialects spoken chiefly in the country districts. (For the relation of these dialects to Danish, see **NORWEGIAN LANGUAGE**.) In the following century, on the other hand, Denmark suffered a loss by the cession to Sweden of the Province of Skåne, or Schonen, and within a generation the Swedish took the place of the original Danish.

The principal grammatical changes between the Reformation and 1700 are the partial substitution of the natural for the grammatical gender, and the simplification of the inflections. The vocabulary shows a generous borrowing of French and German words. The different dialects are still used for literary expression, and it was not until Holberg (1684-1754) that a standard literary Danish may be said to have existed. During the last half of the eighteenth century German and Danish were used side by side in Denmark, very much as Latin and Danish had been used earlier, and so great was the German influence that the Danish State Calendar was published in that language until the first year of the nineteenth century. During the last thirty years, mainly as a result of the war with Germany, the vocabulary has become more and more pure. Whole classes of German words have been replaced by Danish equivalents, and no new German words have been borrowed.

Danish differs in general from its nearest Scandinavian neighbor, Swedish, by a greater leveling of inflections and by less archaic sounds. The most striking single feature of the spoken language is the glottal 'catch,' called in Danish *Stød* (literally a push or thrust). It occurs after certain consonant sounds and consists of a momentary closure of the glottis. It has been compared in its effect upon foreigners to a hicough. The glottal catch is not found in Dano-Norwegian, and it is lacking in some of the dialects in Denmark, while Jutish occasionally employs the catch where it is not found in the Seeland dialect. The cultivated standard speech is characterized by a marked tendency to slurring, the enunciation being much less distinct than that of Swedish or of the Danish spoken in Norway. There is also much less vocal inflection. In Danish, as in German, the pronunciation of the stage is very different from that of social intercourse.

The principal Danish dialects are the Seeland, including the slightly differing uses of the neighboring smaller islands, and with a distinct type for Copenhagen, the Jutish, including the speech of Schleswig, and the Bornholmsk, which latter is the sole remnant of the East Danish dialects. The Dano-Norwegian will be considered in connection with the Norwegian (q.v.). Mention should be made of the Danish spoken in the United States, which really constitutes a modern dialect. It differs from the home tongue in pronunciation, apparently as a result mainly of English influence, and in vocabulary. Danish-American newspapers contain many English words not recognized in Denmark, and the speech of our Danish citizens is even more mixed, the English influence extending to the syntax as well as to the vocabulary. As the subject has never been scientifically investigated, it is impossible to determine how far the original dialectic peculiarities are preserved.

Danish orthography is in an even more unsettled state than the English. There are several distinct systems of spelling in use in Denmark, and at least two others in Norway. The official system is employed in all school books and Government publications, but is generally disregarded by writers, whose system in turn is scorned by philologists. As in German, both the so-called Gothic and Roman type are in use, and substantives are sometimes uniformly spelled with initial capitals, sometimes not. There is, however, a decided tendency in recent times toward simplification of spelling, and in time uniformity will probably be reached.

BIBLIOGRAPHY. Dictionaries: Molbeek, *Dansk Ordbog* (Copenhagen, 1854-59), the standard dictionary in Danish; Larsen, a *Dictionary of the Dano-Norwegian and English Languages* (3d ed., London, 1897); Rosing, *English-Danish Dictionary* (7th ed. Copenhagen, 1899); Brynildsen, *English-Dano-Norwegian Dictionary* (Christiania, 1900—). This last, when completed, will be the best Danish international dictionary. There are also several dictionaries of foreign words in Danish, and dictionaries giving simply the forms of words. Pronouncing dictionaries are very little used. Grammars: Groth, *Danish and Dano-Norwegian Grammar* (Boston, 1894), especially strong in the treatment of the Dano-Norwegian. There is no good treatment in English of Danish grammar. The best grammars in Danish are Jessen's and Mikkelsen's. The best recent history of the language in Danish is Verner Dahlerup's (Copenhagen, 1896). There is a short survey by Ludvig Wimmer, translated by Lentzner, in *Modern Language Notes* (Baltimore, 1895). The oldest period is treated technically by Noreen in Paul, *Grundriss der Germanischen Philologie*, vol. i. (Strassburg, 1896).

LITERATURE. The first Danish book is a treatise on medicine by Henrik Harpestreng, who died in 1244. The first Danish law dates from 1386, but the first distinctively literary writings in the language are the chivalric ballads, *Kjæmpeviser*, which must have been composed from 1300 to 1500, though they survive only in sixteenth-century form, best edited by Gruntvig (6 vols., unfinished) and by Abrahamson, Nyerup, and Rabbek (5 vols., 1812-14). Of these there are some 500, partly historical, partly mythical, but wholly popular in origin. The first Danish book was printed in 1495, and sequential literary history begins with Christian Pedersen, who translated the Bible (1550) and gave to his people the legends of Charlemagne and Ogier in their final form. Vedel (1542-1616) stimulated national literature by publishing 100 of the *Kjæmpeviser* (1591) and translating Saxo Grammaticus (1575). *Reynard the Fox* had been translated into Danish in 1555. Hvitfeld gave Denmark its first history (1595) and Rauch its first drama (about 1600). Clausen's translation of the Icelandic *Heimskringla* appeared in 1633, and Arrebo's (1587-1637) *Hæwæron*, the first Danish epic, in 1641. Hymn-writing was soon after inaugurated by Kingo (1634-1703) and Brorson (1694-1764). But these beginnings were all overshadowed by the genius of Holberg (q.v.), the first Dane whose work is still an actuality in Danish culture. All branches of learning and art felt his stimulating influence, the university was reopened (1742), the Society of Sciences founded, and the Society

for the Improvement of the Danish Language, then Klopstock, who had settled at Copenhagen, though his direct influence was bad, fostered the founding of the Society of the Fine Arts, and Frederick V. patronized all.

Under these influences, or the spirit that prepared for them, many poets were born (1742-49)—Johannes Ewald, Wessel, Brun, Frimann, Fasting, Pram, Storm—who brought about a lyric and dramatic revival in the last quarter of the century. The first, Ewald (q.v.), aided the revival of interest in Scandinavian mythology; Wessel helped to emancipate the Danish stage from French bondage; the others, Norwegians by birth, gave the language a richer imagery. The only prose writer of importance till near the close of the eighteenth century was the philosopher Treschow (1751-1833); and poetry, after the passing of the group just named, sank into a mechanical insignificance, from which Baggesen (q.v.) and romanticism revived it.

The literary births from 1758 to 1777 are mainly of prose writers—Rahbek (1760-1830), a good novelist, catholic-spirited critic, and editor of older poets; Heiberg the elder (1758-1841), a political and æsthetic critic; Malte-Brun (1775-1826) and Olufsen (1764-1827), geographers; Nyerup (1759-1829), a diligent literary compiler; Engelstoft (1774-1850), an historian; Mynster (1775-1854), a theologian; and the great and genial scientist Oersted (1777-1851), are the most prominent names for two decades, where the only poet of distinction is Baggesen (1764-1826), an erratic exception to prove the rule that an 'age of enlightenment is not an age of song.'

The romantic movement in Denmark centres around Oehlenschläger (q.v.), and dates from 1802. His more important assistants in fostering national individualism in literature were Blicher (q.v.), novelist and poet; Grundvig, scholar, antiquarian, poet, politician; Ingemann (q.v.), the historical novelist; Hauch (q.v.), a dramatist and novelist; Countess Gyllembourg-Ehrensvard (q.v.), the greatest woman writer of Denmark, and mother of J. L. Heiberg (q.v.), critic, poet, dramatist, and, on the whole, the most important figure of the generation. These writers were born between 1779 and 1791. To the second generation of the romanticists, born between 1798 and 1809, belong Hertz (q.v.), the poet; Andersen, of the world-famed *Fairy Tales*; Bagger (1807-46), who died like Keats, with unmatched promise unfulfilled, and Paludan-Müller (1809-76), a dramatic and epic philosophic poet of much power.

Aside from poetry the romantic period was not fruitful. One may note the antiquarians Rask (1787-1832), Rafn (1795-1864, q.v.), and Petersen (1791-1862); the lexicographer Molbeek (1783-1857); the botanist Schouw (1789-1852); and the philosopher Sibbern (1785-1872); succeeded by the brilliantly subtle Kierkegaard (1813-55). The period counts no significant novelist or dramatist who was not primarily a poet, though writing perhaps like Andersen in prose.

The thirty odd years that separate the birth of Paludan-Müller from that of Brandes are singularly unproductive of Danish literary genius. The most prominent names are those of the poet Ploug (1813-94), the novelist Goldschmidt (1819-87), and Herman Ewald (1821—). Politics absorbed popular interest after 1848. Romanticism

seemed bankrupt, but the Danes were slow in attuning themselves to the modern spirit of realism. That they have done so at all, through political distractions, national humiliation and dismemberment, is largely the work of Brandes, supplemented by the example of Björnson and Ibsen. Of the new school the most distinguished are Drachmann (q.v.), Richardt (q.v.), and Christiansen (q.v.). One may record also the names of Bergsøe (1835—, q.v.), Jacobsen (1847-85), Skram (1847—), Edward Brandes (1847—), Bang (1857—), Gjellerup (1857—), and Esmann (1860—), but there seems little promise of greatness in any field of literature in the Denmark of this generation.

DANISH POLITICAL PARTIES. See POLITICAL PARTIES, paragraph on *Denmark*.

DANISH WEST INDIES. See WEST INDIES, DANISH.

DAN'ITES, or DESTROYING ANGELS. In American history, a name given to members of a secret society, connected either officially or unofficially with the Mormon Church, which was organized about 1837 for the purpose, as alleged, of 'dealing as avengers of blood with Gentiles.' Many crimes and atrocities have been attributed to the organization, but little definite information has ever been obtained concerning it, and the Mormons themselves either disavow any connection with it, or flatly deny its existence. Other names by which the society was known are: Daughters of Zion, Big Fan, Daughters of Gideon, and Flying Angels, though these were used much less frequently than the term 'Dan-ites,' or 'Sons of Dan,' which is said to have owed its origin to Gen. xlix. 17 ("Dan shall be a serpent by the way, an adder in the path, that biteth the horse's heels, so that his rider shall fall backward"). During the political campaign of 1858 in Illinois, which has become famous be-

cause of the contest between Lincoln and Douglas for the United States Senatorship, the term 'Dan-ites' was applied as a nickname to the anti-Douglas Democrats, whose greatest vote (5079) was cast in that year for the candidate for State Treasurer. The faction was charged with servile acquiescence in the policies of President Buchanan, who was then under fire for his attitude toward the 'rebellion' in Utah.

DAN'NAT, WILLIAM T. (1853—). An American painter, born in New York City. He studied in Munich and under Munkacsy in Paris, where he afterwards took up his residence and became a teacher at the Ecole des Beaux-Arts. But he owes more to Manet and Degas than to his own master. One of his first pictures, "The Quartette" (1884), now in the Metropolitan Museum, New York City, is a fine example of his earlier work. It shows the technical ability, the daring style, the solid, broad painting, and absence of conventionality characteristic of all his work. Among the many Spanish subjects done at this time are a "Sacerdote in Arragon" (1888), in the Chicago Art Museum, and "A Café Chantant" (Munich, 1892), which was the sensation of the Exhibition. For sheer bravura, this startling, masterly study of artificial light has been equaled by no other American artist, and by few foreigners. His "Lady in Red," a one-color scheme, is in the Luxembourg. The difficulties presented by such a subject as this one are managed with consummate ease. Something in the same manner is his "Lady in White." Among the portraits that have made him at once criticized and praised is that of "Madame E." (Salon of 1895), the three-quarter length of a woman, almost colorless except for the vivid red of her lips. He joined the Society of American Artists in 1881, and became a member of the Société Nationale des Beaux-Arts. He was one of the International Art Jury in 1889, and the same year received the cross of the Legion of Honor. Consult: Muther, *Painting in the Nineteenth Century* (New York, 1896); Hartmann, *History of American Art* (Boston, 1902).

DANNECKER, dän'nek-er, JOHANN HEINRICH VON (1758-1841). A German sculptor, born near Stuttgart, October 15, 1758. His father, a groom of the Duke of Württemberg, was much opposed to his studying art, but through the favor of the Duke the lad was educated in the Karlssehule at Ludwigsburg, where he formed his life-long friendship with Schiller. He afterwards studied sculpture under Le Jeune, and in 1780 he obtained the prize for the best model of "Milo of Croton Destroyed by the Lions." In 1783 he studied in Paris under Pajou, and soon afterwards went to Rome, where he remained until 1790. At Rome he met Goethe, Herder, and Canova. The latter befriended him, and gave him instruction in sculpture. Here he executed his first marble statues, of "Ceres" and "Bacchus." On his return to Germany he was appointed professor of sculpture in the Academy of Stuttgart, and remained in that city until his death, on the 8th of December, 1841. Dannecker was undoubtedly one of the greatest of modern sculptors. His art is midway between that of Canova and Thorwaldsen, and his forte lies in expressing individual characteristics. This gives great value to his busts, among the best of which are those of Schiller at Weimar, of La-

vater in the Public Library of Zurich, and of the Kings Frederick and William of Württemberg. His perceptions of the beautiful and delicate, especially in the female form, are sometimes considered more exquisite and true than those of Canova himself. His earlier works are chiefly pagan in subjects, while his later ones are Christian, and are pervaded by a sensitive idealism. Among the former are his "Sappho," "Psyche," and his best-known work, the "Ariadne," in Frankfort—a figure larger than life, reclining on the back of a panther. His chief work, however, is his statue of "Christ," completed in 1824, after eight years' study. The original statue is in a church in Moscow, but the sculptor executed a replica, which is now at Regensburg. Consult: Clement, *Painters, Sculptors, Architects, and Engravers* (Boston, 1889); Radcliffe, *Schools and Masters of Sculpture* (New York, 1894); Grüneisen and Wagner, *Dannecker's Werke in einer Auswahl* (Hamburg, 1841).

DANNENBERG, dän'nēn-bēr'k. HERMANN (1824—). A German numismatist, born in Berlin. He became president of the Numismatic Society in that city, and is an authority on mediæval coins, on which subject he published the standard work entitled *Die deutschen Münzen der sächsischen und fränkischen Kaiserzeit* (3 vols., 1876-98).

DANNEVIRKE, dän'ne-vēr'ke (Dan., Danes' work). A wall or intrenchment, built by the Danes under King Goetrik in the time of Charles the Great, and enlarged by Queen Thyra in the tenth century. The Dannevirke extended from the Schlei to the Treene, a distance of ten miles, and protected the Danes from the incursions of the Saxons and Wends. In 974 Otho II. vainly endeavored to take the Dannevirke. Later, however, he burned and destroyed a part of it. Waldemar the Great rebuilt a section with brick and stone, in 1080. During the Schleswig-Holstein wars the Dannevirke fell into the hands of the Prussians, April 23, 1848, and was stormed by the Austrians and Prussians in 1864. It has since been leveled.

DAN RIVER. A river rising in the Blue Ridge Mountains (q.v.), in Patrick County, Va., and flowing southeast into North Carolina. After crossing and recrossing the boundary between these States five times, it combines with the Staunton River in southern Virginia to form the Roanoke River (q.v.) (Map: North Carolina, C 1). It is 180 miles long, drains an area of 3700 square miles, and is navigable as far as 60 miles above Danville. It furnishes extensive water-power at several points.

DANTAN, dän'tän'. ANTOINE LAURENT (1798-1878). A French sculptor, born at Saint Cloud. He was a pupil of his father, a wood-carver, and of Bosio. Having won the *grand prix* in 1826, he continued his studies in Rome, and after his return acquired reputation by a considerable number of ideal statues and of eminently characteristic portrait busts of celebrated persons, such as Beethoven, Rossini, and the actress Rachel. Especially noteworthy among his works are: "Young Bather Playing with His Dog" (1835); "Neapolitan Tambourine Girl" (1838); "Allegorical Figure of Asia"; "Colossal Statue of Saint Raphael": the statues of Admiral

Duquesne, at Dieppe, and of the mathematician Laplace at Caen.

DANTAN, JEAN PIERRE (1800-69). A French sculptor, born in Paris. He was a pupil of Bosio, and won the *prix de Rome* in sculpture. He executed busts of Spontini, Bellini, Rossini, and Verdi, a bronze statue of Boieldien (Rouen), and busts of Victor Hugo and Marshal Canrobert. But he is better known for his caricature statuettes of notabilities of the time.

DANTAN, JOSEPH EDOUARD (1848—). A French painter, born in Paris, son of the sculptor Jean Pierre Dantan. He studied in his native city under Pils and Lehman. His remarkable studies in still life, such as the exquisite, soberly painted "Corner of an Atelier" (1880), in the Luxembourg, and "An Interior at Villerville" (1883), are better known than his more conventional religious and historical works, among which are: "The Trinity"; "An Episode in the Destruction of Pompeii" (1869); and "The Vocation of the Apostles Peter and Andrew" (1877). In still another, more pictorial manner, he painted "The Burial of a Child at Villerville," in the Havre Museum.

DANTE ALIGHIERI, Ital. pron. dän'tá ä'lé-gyà'rè (1265-1321). One of the greatest poets of all times, and incomparably the greatest among the Italians. He was born in Florence in the latter part of May, 1265, and his name was originally Durante. The outward circumstances and fortunes of Dante's life are largely involved in uncertainty, and recent critical researches have tended rather to destroy long-accepted beliefs than to add new and reliable details. Rome, Ferrara, Parma, and Verona in turn claimed the origin of his family, which was not necessarily of ancient lineage, although Dante himself seems to have believed that he sprang from Roman stock and to have prided himself upon his noble blood. The first appearance, however, of the Alighieri in history was in 1147, when Cacciaguada, the poet's great-great-grandfather, fell in the Crusades. Alighiero, Dante's father, may or may not have been a jurist, but it is certain that he was an adherent of the Guelph faction. Of his mother nothing is known except that her name was Bella. There is reason to suppose that she died soon after his birth, that his father soon married again, and, dying in 1275, left him with a step-mother, a brother, and two sisters. Of Dante's boyhood and education we know little beyond his own statement that he had 'taught himself the art of bringing words into verse.' It is not surely known that he was ever a pupil of the learned Florentine Brunetto Latini, though he undoubtedly profited from the latter's precepts and example. It is equally questionable whether he ever pursued legal studies at the University of Bologna. We are better informed regarding the social influences under which he grew up in Florence. Among his friends and intimates were the poets Guido Cavalcanti and Cino da Pistoia, who was also a jurist of note; Dino Frescobaldi and Lapo Gianni, both famed for their finished verse; the musician Casella, and the artist Giotto. The most significant event, however, of Dante's early youth, and the one fraught with most enduring consequences, was his meeting with the Beatrice afterwards celebrated in his poems, and believed, upon the authority of Boccaccio, to have been the daughter

of Folco Portinari, who later became the wife of Simone de' Bardi. As related in that unique and earliest of the poet's productions, the *Vita Nuova*, he met her first at a family festival when he himself was but nine years old, and she some months younger. Yet from that moment his love for her seems to have been the dominant influence in his life. There seems to be no good reason for questioning, as some have questioned, whether, after all, Beatrice was a real personality, or whether she was not the creation of a poet's mind, a mere personification of philosophy. It is difficult to read the *Vita Nuova* and still question the truth of what it narrates; from first to last it bears the striking stamp of sincerity. Yet it must be borne in mind that his love for Beatrice was very different from what is ordinarily understood by the term. It was the highest form of spiritual love, freed from the dross of all earthly desires and vulgar jealousy. In Beatrice he saw something more than a woman: from first to last, she was in his eyes an 'angiola gentilissima.'

Beatrice died June 9, 1290, a date that marks an epoch in Dante's life. We know not who was the *donna gentile* to whom a year later he turned for spiritual sympathy, though some have chosen to see in this unknown comforter the Gemma Donati, whom by the persuasion of his friends he was soon after led to marry. Two sons, a daughter Antonia, and perhaps another, Beatrice, were the fruit of this union, which there is no positive reason for believing an unhappy one. Dante maintained an unbroken silence regarding his wife, who continued to live in Florence after his exile, and presumably they never met again.

Of Dante's part in the public affairs of his city a few meagre details are preserved, enough to show that his interest gradually deepened after the death of Beatrice. Too much importance has sometimes been attached to the so-called heroism of his military service. In point of fact, he was simply discharging the duties incumbent upon a citizen of the commune when, in 1289, he took part in an invasion of the territory of Arezzo and was present at the taking of the fortress of Caprona, shortly afterwards. After 1295 his voice was heard with growing frequency in municipal affairs, until the summer of 1300, when he was chosen as one of the six Priors of the city. Though his duties lasted but two months, the time was long enough, as he himself said, to effect his undoing. The Guelphs at this time had become divided into two factions—the *Neri*, led by Corso Donati, and supporters of the Papal power; and the *Bianchi* or moderate Guelphs, who leaned toward the ideas of the Ghibellines. Dante had allied himself with the latter faction, but during his tenure of office party feeling ran so high that the Priors decided upon the extreme measure of banishing the leaders of both factions, and Dante advocated the measure, though Donati, a relative of his wife, was among the banished *Neri*, and Cavalcanti, his friend, among the *Bianchi*. But soon afterwards the *Bianchi* were unwisely allowed to return, and, fearing that their party would get the upper hand in the city, Boniface VIII. sent Charles of Valois to Florence, who quickly restored the *Neri* to power. In 1302 there followed a wholesale banishment of the *Bianchi*, among them Dante, charged with barratry, extortion, corruption, and conspiracy against Boniface, Charles, and the Guelph party.

The exiled *Bianchi* joined forces with the many Ghibellines then living in banishment, and made many attempts to return by force of arms. Just how long Dante remained with his fellow exiles is not known, but sooner or later he wearied of their dissensions, and found an asylum with Bartolommeo della Scala, at Verona. Through the years of wandering that followed, it is idle to attempt to trace him—'a ship without sail or helm,' he calls himself in the *Convivio*. In 1306 we find him at Padua; in 1307 at Casentino, and the following year perhaps at Forlì; 1309 is the date assigned for his alleged visit to Paris, and some would have it that he even pushed on to Oxford, but this cannot be proved. At all events, in 1313 he was in Pisa, where Petrarch saw him as a child. Two years later the Florentines passed a decree allowing the exiles to return, but upon such humiliating conditions that Dante rejected them with scorn. In 1317 he made his permanent home at Ravenna, where he was warmly welcomed by Guido Novello da Polenta, the lord of the city and nephew, it is thought, of Francesca da Rimini. Here he passed his last years, busied with the completion of his great epic, and surrounded by his children and friends, and here he died on the night of September 14, 1321, having been taken ill while on a political mission in behalf of Novello and the city that had given him refuge. He was buried by Novello with great honor, but the latter was expelled from Ravenna before he had time to raise a fitting monument to his friend. Florence, which sought to make tardy atonement by raising a memorial tablet in the Church of Santa Croce, tried in vain to obtain the custody of his remains. For fear of theft, they were hidden, and their resting-place remained a secret down to 1865, since which time they have been jealously guarded by Ravenna.

The chronological order of Dante's writings has been the ground of endless debate. The order which affords the least ground for objections is probably the following: *Vita Nuova*, *De Vulgari Eloquentia*, *Convivio*, *De Monarchia*, the *Rime* and *Epistole*, which cover a long period of years; the *Ecloga*, and the *Commedia*. The *Vita Nuova* probably dates from the early nineties, is written in mingled prose and verse, and contains the story of his love for Beatrice, together with the poems addressed to her and some other ladies. Aside from its lofty sentiment and poetic charm, the *Vita Nuova* possesses a deep interest as being the earliest example of polished Italian prose. The *Convivio*, or Banquet, is also a combination of prose and poetry, in which, as has been quaintly said, the poems are served up as the viands, the commentary as the accompanying bread. Here, also, Beatrice is the central figure, but this time as a sort of personification of divine philosophy. As originally planned, the *Convivio* should have contained fourteen canzoni, with accompanying comment, but in the form in which we have it, it is incomplete. The *Rime* or *Canzoniere* are a collection of poems on many subjects, and obviously covering a long period of years. Among them are four canzoni which relate to a brief attachment felt by Dante for an unknown woman, whom he designates as La Pietra, and whom some would identify with the *donna gentile* of the *Vita Nuova*. The *De Vulgari Eloquentia* is the most interesting of Dante's Latin writings, and may be defined as the first

DANTE
FROM A PORTRAIT BY GIOTTO, IN THE NATIONAL GALLERY, FLORENCE

attempt at a scientific treatise of the Italian language. Dante recognizes the kinship of the Romance languages, but errs rather curiously in declaring Latin an artificial product of later origin. He distinguishes, moreover, fourteen dialects, and condemns them all, including that of Tuscany.

Concerning the poetry, the majesty, the philosophy of Dante's masterpiece, the *Divine Comedy*, whole libraries have been written in praise, in controversy, and in elucidation. The central motive of the epic may be briefly summed up as follows: It depicts a vision, in which the poet is conducted, first by Vergil, the representative of human reason, through hell and purgatory; and then by Beatrice, the representative of revelation, through paradise, and finally by Saint Bernard through the several heavens, where he beholds the triune God. The name *Commedia* was given to the work because, beginning with the horrible, it ends cheerfully, and because in respect to the style it was lowly, being written in the vulgar tongue. The epithet 'Divina' was added by the admiration of after-times. Hell is represented in the poem as a funnel-shaped hollow, formed of gradually contracting circles, the lowest and narrowest of which is at the earth's centre. Purgatory is a mountain rising solitary from the ocean, on that side of the earth that is opposite to us. It is divided into terraces, and its top is the terrestrial paradise, the first abode of man. From this the poet ascends through the seven planetary heavens, the heaven of the fixed stars and the 'primum mobile,' to the empyrean or fixed seat of God. In all parts of the regions thus traversed there arise conversations with noted personages, for the most part those recently deceased, whom Dante had known personally in life. Incidentally, the deepest questions of mediæval philosophy are discussed and solved, and the social and moral conditions of Italy, with the corruption of Church and State, are depicted with noble indignation.

Fifty-two years after the poet's death the Republic of Florence set apart an annual sum for public lectures to explain the *Divine Comedy* to the people, and Boccaccio himself was appointed first lecturer. The example was imitated in several other cities of Italy. The works of these men are among the earliest commentaries on Dante that we possess. Since 1472 there have appeared nearly 500 editions of the *Divine Comedy* in Italian, and the number is being augmented at the rate of at least six a year. Of the notable early editions may be mentioned the following, the earliest of all: Fuligno (1472); the Nidobeatine (Milan, 1477-78); the first Florentine (1481); the first Aldine (1502); the first Cruscan edition (1595); that of Volpi (1727); and of Venturi (1732). Of the countless modern editions, with commentaries, that of Fraticelli (1852) is probably as good as any. The chief English translations are: Boyd's (1785); Cary's (1814); Wright's (1833); Pollock's (1854); Longfellow's (1867); Norton's (1891-92).

DANTÉS, dän'tás', EDMOND. The Count in Dumas's romance *The Count of Monte Cristo*. In the pursuit of vengeance, he adopts the aliases of 'Lord Wilmore' and 'Abbé Busoni.'

DANTIER, dän'tyá', HENRI ALPHONSE (1810—). A French author, born at Noyon. His books include a number of valuable histories, particularly of the Benedictines, such as *Etudes sur les Bénédictins* (1854); *Les monastères Bénédictins d'Italie*; and *Les femmes dans la société chrétienne* (1878). The latter was crowned by the French Academy.

DANTON, dän'tón', GEORGES JACQUES (1759-94). One of the great popular leaders in the French Revolution. He was born October 28, 1759, at Arcis-sur-Aube, of a bourgeois family. Though his parents wished him to become a priest, Danton preferred the law, and, after being educated in his native town and at Troyes, he went to Paris. A born orator, Danton quickly rose in his profession, and as early as 1785 he was known as a successful practitioner before the Parlement of Paris. In 1787 he married, and purchased, at a cost of 80,000 livres, a position as advocate of the Royal Council, and was soon earning an income of 25,000 livres a year. At this time he is described as a forcible and eloquent speaker, a man of liberal tastes, fond of books, and happy in his domestic life. He saw the Revolution approaching, and as early as 1787 said to his patron, M. de Barentin, "Moderate reforms are no longer possible; do you not see the avalanche soon to descend?" It is said

that Mirabeau, perceiving Danton's genius, sought to attach him to himself. In the early revolutionary outbreaks Danton took no prominent part, but early in 1790 he was threatened with arrest for protesting in violent terms against Marat's arrest, and in June of the same year he appears as one of the chief founders of the club of the Cordeliers, or ultra-Jacobins, while in the autumn he was chosen to be commander of the National Guard of his district. The next year he appeared as the advocate of the extremists of Paris, and publicly attacked the anti-revolutionary leaders. His utterances having exposed him to arrest, he fled to England and remained there some six weeks, during which time he had conferences with the chief leaders of the Whig opposition. On returning to Paris he was elected to office in the commune, and probably was largely instrumental in inciting and bringing to a successful issue the insurrection of August 9 and 10, 1792. After the taking of the Tuileries and the suspension of the royal power, Danton became Minister of Justice, and in this capacity entered the Provisional Government and became a member of the Executive.

The strongest personality of them all Danton at once assumed the leadership. He took active measures to free the country of its foreign invaders. His eloquence thrilled the people, and when, on September 2d, he made his wonderful speech before the Assembly, and cried: "*Pour les vaincre, pour les atterrir, que faut-il? De l'audace, encore de l'audace, et toujours de l'audace*" ("to vanquish them, to crush them down, what is necessary? To dare, to dare again, and always to dare"). France responded by placing fourteen armies in the field. In October, 1792, partly by force and partly by diplomacy, the foes had been expelled. In the fearful days of the September massacres, when political prisoners were taken out and butchered by hundreds, Danton would not let the Government leave Paris. Of the atrocities that took place he was not actively guilty, though Marat was, but as a revolutionist he acquiesced in and condoned the deeds of his associates. In September, 1792, he resigned as Minister of Justice, and was elected to the Convention. There he successfully repelled a venomous attack made on him by the Girondists, and, later, on his return from his mission to Dumouriez, answered Marat's insinuations that he had been privy to the treachery of that General. Danton was among those who voted for the death of the King (January, 1793). After being elected president of the Jacobin Club, Danton, in March, 1793, became a member of the Committee of Public Safety, and later its president. This was the period of his greatest services to France, when he organized her defenses and directed her foreign policy. The irreconcilable attitude of the Girondists forced him to take active measures for their suppression (June 2, 1793), for he felt that they were not true revolutionists. In his revolutionary enthusiasm, however, Danton called up a force that was destined to crush him. After the fall of the Girondists, he advocated the formation of a new and more powerful Committee of Public Safety, endowed with unlimited authority and ample resources. He himself ceded his right to a seat on this tribunal, an error of judgment which cost him his life. Danton's aim at this time was undoubtedly the conciliation of the various republican and revolu-

tionary factions in France into a stable and peaceful government; the aim of the committee was to make its own power supreme over all others. Robespierre began to emerge as its leader, supported by Saint Just, Billaud-Varennes, and Couthon. While Danton, with his friend and ally, Camille Desmoulins (q.v.), the inspirer and chief author of the Vieux Cordelier papers, were advocating moderation, the followers of Robespierre were preparing to strike. The first of their opponents to fall were the fanatical Hébertists, in March, 1794; after them came the turn of the Dantonists. Their leader seemed no longer to care for the turmoil of politics, but pursued a policy of inaction and awaited the attack. For a short time Danton retired to his home at Arcis-sur-Aube, having recently married a second wife. His enemies were active, and, after some show of hesitation, Robespierre yielded to Billaud-Varennes (q.v.) and the fate of the Dantonists was sealed. On March 30, 1794, Danton, Camille Desmoulins, and others of the party were seized and imprisoned.

Before the revolutionary tribunal, the strength of Danton's character shone forth. Questioned by the president as to his name and dwelling, he replied: "My name? It is Danton: a name tolerably well known in the Revolution. My dwelling? It will soon be annihilation; but my name will live in the pantheon of history." His trial was a farce, the formal charge being that of conspiring to restore the monarchy. The eloquence of the man was so great that Paris thrilled as he hurled defiance at his accusers, and there was danger of a popular revolt in his favor. The Convention eagerly seized on the infamous suggestion of Saint Just, that disrespect for justice merited summary conviction, and, with fourteen of his supporters, Danton was at once condemned to the guillotine. Almost his last words were inspired by the treachery of Robespierre. "I could have saved him," he said; "I leave it all in a frightful welter; not a man of them has any idea of government. Robespierre will follow me; he is dragged down by me." On April 5, 1794, Danton mounted the scaffold with calm courage. A moment he stood erect, facing the mob, then, turning to the executioner, knelt, and, laying his head on the block, said, "Show the people my head; it is worth seeing." The accusations of venality, of dissolute conduct, of blood-thirsty ferociousness, so often made against Danton, have been long since disproved. "The Mirabeau of the *sansculottes*," says M. Claretie, "was a bourgeois Mirabeau, equally powerful, but neither dissolute nor venal."

BIBLIOGRAPHY. Following the lead of Comte, the French Positivists have sought with considerable success to redeem the reputation of Danton, and to establish his claim to rank as a patriot. The biographies of him that are of any value represent this tendency. His chief biographer has been Dr. Robinet, whose studies are supported by an ample array of documents and *pièces justificatives*. These are: *Danton, mémoire sur la vie privée* (Paris, 1865); *Le procès des Dantonistes—documents avec introduction historique* (Paris, 1879); *Danton émigré, recherches sur la diplomatie de la République, 1793* (Paris, 1887); and *Danton, homme d'état* (Paris, 1889), the most important of the series, published on the revolutionary centenary. All recent writers

have relied largely upon the researches of Robinet. Other important works are: Bougeart, *Danton* (Paris, 1861); Dubost, *Danton et la politique contemporaine* (Paris, 1880), a study of Danton's influence on French republicanism, which the author regards as permanent, and *Danton et les massacres de Septembre* (Paris, 1886); and Beesly, *Life of Danton* (London, 1889). Belloc, *Danton: A Study* (London, 1899), is a well-written book by a strong admirer. Danton's works have been collected and edited by Vermorel, *Œuvres de Danton* (Paris, 1886). An admirable selection of significant extracts from his important speeches will be found, preceded by a useful introduction, in H. Morse-Stephens, *Orators of the French Revolution* (Oxford, 1892). Consult, also: Aulard, *Notes sur l'éloquence de Danton* (Paris, 1882); *Les orateurs de la Législative et de la Convention* (Paris, 1885-86); and *Les grands Français* (Paris, 1887); Gronlund, *Ça ira! or, Danton in the French Revolution* (Boston, 1888), is a tractate from the Socialist point of view.

D'ANTRAIQUES, dän'tràg'. See ANTRAIQUES.

DANTZIC, dän'tsík. See DANZIG.

DAN'UBE (Ger. *Donau*, Hung. *Duna*, Lat. *Danuvius*, OChurch Slav. *Dunavü*, *Dunay*; connected with OHG. *tuonaouca*, foreign). The second of European rivers, inferior only to the Volga. It has its origin in the Brege and Brigach, two mountain streams rising in the eastern part of the Black Forest, in Baden, at an elevation of 2850 feet above sea-level, in latitude 48° 6' N., and in longitude 8° 9' E. (Map: Europe, E 4). The total length of the Danube is about 1800 miles. The area which it drains is estimated at about 300,000 square miles, comprising countries differing widely in climate and productions, including southern Germany, a great part of Austria-Hungary, Bosnia, Servia, Bulgaria, and Rumania. The Danube is joined in its course by sixty navigable rivers, whose waters, with those of many lesser streams, it conveys into the Black Sea. From its source it flows in an easterly and then in a northeasterly direction through Baden, Hohenzollern, Württemberg, and Bavaria. Passing Ulm, near which it receives the Iller, and at which point the river becomes navigable for small steamboats, it receives from the south the Lech and flows past Ingolstadt and Regensburg (Ratisbon), between which two towns it is joined by the Altmühl from the left; then, altering its course to the southeast, it receives the waters of the Isar and the Inn from the south, the latter joining it at Passau. It then traverses Upper and Lower Austria from west to east, passing Linz and Vienna, and about 40 miles beyond the latter city it enters Hungary near the town of Pressburg. Between Passau and Pressburg it receives from the south the Enns, and from the north the March, in a country rich in minerals, well peopled, and highly cultivated. Below Pressburg it divides, inclosing the low-lying islands called the Great and Little Schütt. Between Pressburg and Budapest, in which part of its course it passes the famous fortress of Komorn and the town of Gran (Esztergom), it receives from the north the Waag, the Neutra, the Gran, and the Eipel, and from the south the Raab. A few miles above Budapest it turns directly south and enters the great Hungarian plain, in which it

is continually forcing new channels and silting up old ones, sometimes sweeping away towns, or capriciously removing its channel to a distance of several miles from those formerly upon its banks. Here it receives from the west the Drave. After this the river turns toward the southeast, and, joined by the waters of the Theiss from the north and the Save from the west, sweeps past Belgrade, forming the boundary between Servia and Hungary, and receiving the Morava from the south. From Belgrade to Orsova, where it reaches the borders of Wallachia, the Danube pursues an easterly course.

Leaving Orsova, the Danube passes the famous 'Iron Gate,' where the river formerly rushed over a broad plateau of rock 1460 yards wide. This rapid, which was followed by a series of whirlpools, eddies, and shallow falls, formed an effectual bar to the upward progress of vessels, no craft drawing more than two and one-half feet of water being able to pass it. In 1847-49, however, the obstruction formed by the 'Iron Gate' was to some extent removed by blasting, and since then further improvements have been made in this part of the course, the Austrian Government in 1890 having begun works for making the river constantly navigable at this point. The new passage was formally opened September 27, 1896. For a short distance below this the river flows south between Wallachia and Servia, and then, turning eastward, traverses a vast plain, in which it forms the boundary between Wallachia and Bulgaria. From the Carpathians it receives the Sibil and the Aluta and Veda, and from the Balkan Mountains the Isker, the Osma, and the Yantra. Increased by these rivers and by numerous lesser streams, it progresses through a poorly cultivated and thinly peopled but fertile district, occasionally broadening like a sea, as at Hirsova, and encircling many islands. After being joined by the Sereth and the Pruth from the north, and about 50 miles from the Black Sea, it divides into several branches, forming a great delta with an area of about 4000 square miles. The principal channel-mouth is the Sulina, through which the greater number of ships pass. This has been deepened by means of jetties, so as to admit vessels of 20 feet draught. The other principal mouths are the Kilia and Saint George, which, although useless for navigation, discharge a large proportion of the water. The Danube is the chief natural highway for central European commerce. Communication has been established between it and the Rhine by the construction of the Ludwigs-Kanal, in Bavaria, connecting the Altmühl with the Regnitz, an affluent of the Main. At the Peace of Paris in 1856 the navigation of the Danube was declared free to all nations, and its management was intrusted to two commissions, one representing the European Powers, another named by the States on the banks of the river. At the Berlin Congress of 1878 it was stipulated that no ships of war should navigate the Danube below the 'Iron Gate.' Within the last thirty years the Austrian Government has executed great works for the improvement of the navigation of the river at Vienna, and for the regulation of its flow, so as to avert disastrous inundations. The Danube Steam Navigation Company has done much to increase the commerce.

DANUBIAN PRINCIPALITIES. See MOLDAVIA; WALLACHIA; RUMANIA.

DANVERS. A town, including several villages, in Essex County, Mass., four miles northwest of Salem; on the Boston and Maine Railroad (Map: Massachusetts, F 2). It contains Saint John's Normal College (Roman Catholic); the Danvers Insane Hospital, a State institution; Peabody Institute Public Library of about 17,000 volumes; and Danvers Historical Society. The manufactures include shoes, leather, morocco, brick, motor vehicles, electric lamps, iron, rubber, soap, etc. The government is administered by town meetings. Population, in 1890, 7454; in 1900, 8542.

Until 1752, when it was incorporated as a separate town, Danvers was part of Salem. Here the witchcraft delusion of 1692 first appeared, and ten of the inhabitants within this district were convicted and hanged, many more being arrested and acquitted. Consult: Handson, *History of the Town of Danvers* (Danvers, 1848), and Hurd, *History of Essex County* (Philadelphia, 1888).

DANVILLE, dän'völ'. See ANVILLE.

DANVILLE. A city and county-seat of Vermilion County, Ill., 125 miles south of Chicago; on the Vermilion River, and on the Wabash, the Chicago and Eastern Illinois, and the Cleveland, Cincinnati, Chicago and Saint Louis railroads (Map: Illinois, E 3). It has coal-mining interests, foundries, and manufactures of woollen goods, glass, and bricks. Among the points of interest may be noted the Danville Branch National Soldiers' Home, Carnegie Public Library, Government building, Railroad Y. M. C. A. building, and three fine parks—Lincoln, Douglas, and Ellsworth. Settled about 1830, Danville was incorporated in 1867. It is governed by a mayor, elected biennially, and a city council which selects the city engineer and confirms the executive's appointments to the police and fire departments and public library board. Other administrative officials are chosen by popular election. Population, in 1890, 11,491; in 1900, 16,354.

DANVILLE. A town and the county-seat of Hendricks County, Ind., 20 miles west of Indianapolis; on the Cleveland, Cincinnati, Chicago and Saint Louis Railroad (Map: Indiana, C 3). It contains the Central Normal College, which has a library of 2500 volumes, and manufactures flour, lumber products, etc. Population, in 1890, 1569; in 1900, 1802.

DANVILLE. A city and county-seat of Boyle County, Ky., 84 miles southeast of Louisville; on the Cincinnati Southern Railroad (Map: Kentucky, G 3). It is in a stock-raising and agricultural region, the principal products of which are hemp, corn, wheat, tobacco, and fruit. The city is the seat of the Kentucky Institution for Deaf Mutes, and of several Presbyterian institutions: Centre College, founded in 1819; Danville Theological Seminary, founded in 1853; and Caldwell College for women, founded in 1860. It has a park named in honor of Dr. Ephraim McDowell. It is governed by a mayor, elected every four years, and a unicameral city council. The water-works are owned and operated by the city. Here in 1785, 1786, 1787, and 1792 important conventions were held, the first State Constitution for Kentucky being drawn up

in 1792. Danville was the birthplace and early home of James G. Birney and the home of Joshua F. Bell. The settlement was first incorporated in 1789. Population, in 1890, 3766; in 1900, 4285.

DANVILLE. A borough and county-seat of Moutour County, Pa., on the north branch of the Susquehanna River, 12 miles from its intersection with the West Branch, and on the Pennsylvania, the Laekawanna, and the Philadelphia and Reading railroads (Map: Pennsylvania, E 3). It contains a public library and is the seat of a State hospital for the insane. There are deposits of coal, limestone, and iron ore in the vicinity, and the borough has several extensive blast-furnaces, rolling-mills, stove-works, etc. The government is vested in a burgess, elected every three years, and a borough council. The water-works are owned and operated by the municipality. Population, in 1890, 7998; in 1900, 8042.

DANVILLE. A city in Pittsylvania County, Va., 141 miles southwest of Richmond; on the Dan River and on railroads of the Southern Railway System (Map: Virginia, E 5). Located in the Piedmont section of Virginia, amid picturesque mountain scenery, Danville rises from the river, which furnishes splendid water-power, to an altitude of from four to six hundred feet above tide. Its streets are well shaded, and the climate is mild and healthful. The surrounding region is adapted to the cultivation of tobacco, grain, fruits, and other produce. The city is the seat of Roanoke Female College (Baptist), established in 1859; Randolph Macon Institute (Methodist) for Young Ladies, founded 1883; and Danville Military Institute, organized in 1890. Danville has an extensive tobacco trade, and many tobacco warehouses and factories, a cheroot factory, cotton-mills, furniture factory, fertilizer factory, knitting-mills, and pants and overall factory. The government is administered, under the charter of 1890, by a mayor, chosen for two years, and a city council which controls the appointments to the important administrative offices; the sergeant, attorney, treasurer, and the clerk of the court being elected by the people. The water-works and electric-light and gas plants are all owned and operated by the city. Danville was incorporated as a town in 1792. It was for a short time the seat of government of the Southern Confederacy during its last days. Population, in 1890, 10,305; in 1900, 16,520.

DANZIG, dän'tsik, in English commonly written DANZIC (Pol. *Gdansk*, Lat. *Gedanum*). An important seaport, manufacturing centre, and fortress, chief town of the Province of West Prussia, on the left bank of the western branch of the Vistula, about three miles from its mouth in the Baltic, and about 300 miles northeast of Berlin (Map: Prussia, II 1). Danzig is surrounded by a moat and ramparts strengthened by twenty bastions and is further fortified by several detached forts on the west and a chain of works extending north along the Vistula to the fort at its mouth at the suburb of Neufahrwasser. In addition, the garrison possesses the means of laying the surrounding country under water on three sides. The city is traversed by the Mottlau and Radaune, tributaries of the Vistula. The former, which flows through the

city in two branches, divides the older sections of the Altstadt, Rechtstadt, and Vorstadt from the newer Niederstadt and Langgarten. The Radaune, which enters the town through an artificial channel, separates the Altstadt from the Rechtstadt. Between the two branches of the Mottlau is the Speicherinsel, an island on which enormous granaries have been erected for the accommodation of the vast stores of grain exported from Danzig. The rivers and canals are crossed by about fifty bridges. The Lange Brücke, a quay extending along the bank of the Mottlau, opposite the island, is one of the picturesque sights of the town. The city is generally very mediæval in aspect, successive old styles of its buildings having been well preserved, including in the residences the countless gable façades and a peculiar feature known as *Beischläge*—elevated, open-air landings. Many of the streets of Danzig are narrow and crooked, but the principal streets, Langgasse and Lange Markt, intersecting it from east to west, abound in fine specimens of antique architecture, and have a most picturesque appearance. Among the most noteworthy buildings are the Church of Saint Mary, a fine structure, commenced in 1343, but not finished until 1503, and containing, besides a fine high altar by Michael and other interesting objects of art, a celebrated picture of the "Last Judgment," generally attributed to Memling; the Church of Saint Catharine; Trinity Church; the fine old Rathaus, dating from the fourteenth century; the Artushof—or Junkerhof—the former merchants' guild, now used as an exchange; and the old Franciscan monastery containing the municipal museum.

Danzig is the seat of the provincial government and of a provincial court. The city's affairs are administered by a municipal council of 60 and an executive board of 21 members. It has exhibited an enterprising spirit in the matter of municipal undertakings. It has excellently organized fire and street-cleaning departments. Two large aqueducts supply it with water, and a modern system of sewers connected with sewage farms on the Baltic gives the town a satisfactory drainage. It has, however, a rather high death rate, exceeding 24 per thousand. The municipality maintains gas-works, an electric-light plant, slaughter-houses, and a market-hall. Danzig is well provided with educational institutions, which include two gymnasias, of which only one is maintained by the city, two high schools, a navigation school, military school, industrial trade and music schools, and a municipal library and theatre. Its charitable institutions include two municipal hospitals, as well as numerous other institutions.

Danzig has advantageous connections by rail, river, and sea. It maintains a large trade in lumber and grain, serving as a clearing place for the agricultural products of eastern Prussia and the whole of the Vistula region, which embraces a considerable part of Russian Poland. The value of the sea trade alone, which constitutes less than one-half of the total trade of the city, exceeds \$50,000,000 a year, the imports having almost doubled in value in the decade of 1888-98. They include coal, iron, petroleum, machinery, spices, and other agricultural products of tropical countries; whereas the exports, as already stated, consist almost entirely of lumber, grain, and a few other agricultural prod-

ucts. The growth of Danzig's sea trade has been interfered with by the competition of Stettin and of the Russian ports on the Baltic, and it is losing its relative importance as a port. The manufactures of Danzig are developing rapidly. There are large ship-building yards, breweries, distilleries, and factories for the production of firearms, machinery, and other iron-ware, paper, glass, soap and candles, flour, etc. Danzig is the seat of a United States consular agency. Population, in 1890, 120,000; in 1900, 141,000. The environs are very attractive.

Danzig is mentioned in 997, when Christianity was first preached there. Its possession was contended for by the Danes, Swedes, Pomeranians, and Teutonic knights, of whom the last became masters of the town in 1310. Under their rule Danzig prospered exceedingly; about 1358 it joined the Hanseatic League. In 1466 the town declared itself a free city, under the protection of Poland. The wars of the seventeenth century destroyed its prosperity, and though it was left a free city on the first partition of Poland, in 1772, its trade ceased almost entirely. In 1793 it became Prussian. Taken by the French Marshal Lefebvre (who received the title of Duke of Danzig) in 1807, it was retaken by the Allies in 1814, and restored to Prussia. Consult: Prutz, *Danzig, das nordische Venedig* (Leipzig, 1868); Wistulanus, *Geschichte der Stadt Danzig* (Danzig, 1891); Puttner, *Danzig* (ib., 1899).

DANZIG, DUKE OF. See LEFEBVRE, FRANÇOIS JOSEPH.

DAPHNE, *dāf'nē* (Lat., from Gk. *Δάφνη*, laurel). The personification of the laurel, Apollo's sacred plant. According to the legend, Daphne was a nymph, beloved and pursued by Apollo. On crying to her mother, Earth, for help, she was transformed into a laurel, which Apollo chose as his favorite plant.

DAPHNE. A magnificent grove and sanctuary of Apollo, near Antioch, on the Orontes (q.v.). Like the city, it was founded by Seleucus Nicator, who localized here the story of the transformation of the nymph. The Temple of Apollo, containing a statue of the god by Bryaxis, was placed in the midst of a grove of cypress and bay trees, and surrounded by baths, porticos, and gardens. The place had the privilege of asylum, and was also the scene of the 'Olympian games' held at Antioch. The extreme beauty of the surroundings made it a favorite place of resort for the luxurious, and it has been described as a scene of continual vice. With the growth of Christianity the worship of Apollo gradually fell into neglect, and shortly after the attempt by the Emperor Julian (q.v.) to revive its splendors the temple was burned and the site gradually abandoned. The probable site of Daphne is now called Bēt el-Mā, and still shows luxuriant vegetation, though the ancient remains are scanty.

DAPHNE. A genus of plants of the natural order Thymelæaceæ, containing 30 or 40 species of European or Asiatic shrubs or small trees, some of which have deciduous and some evergreen leaves; and all more or less acid in all their parts, which makes some of them even caustic. The berries are poisonous, but the flowers of some are deliciously fragrant. To this genus belongs the *Daphne mezereum*, well known both

for the fragrance of its flowers and for its medicinal uses, naturalized in some places in England and escaped in Canada and the United States. The garou bush (*Daphne gnidium*), a native of the south of Europe, less hardy than the mezereon, has the same medicinal properties. The spurge-laurel (*Daphne laureola*), a native of Great Britain, is an evergreen shrub three to four feet high, with obovate-lanceolate leaves, which grow in tufts at the end of the branches, and give it a remarkable appearance. It grows well under the shade of trees. *Daphne odora*, a species introduced from Japan, has lemon-scented leaves. Of species in cultivation, *Daphne mezereon* is the only one hardy as far north as New York. The evergreen species are as a rule less hardy, though *Daphne encorum* is fairly resistant. (For illustration, see Plate of MOUNTAIN PLANTS.) From the bark of some species of Daphne and of the most nearly allied genera paper is made in different parts of the East, particularly 'Nepal paper,' from that of *Daphne cannabina*. Slips of the inner bark are boiled in a lye of wood ashes for half an hour, till quite soft; are then reduced to a homogeneous pulp by beating with a wooden mallet in a mortar, churned with water into a thin paste, and poured through a coarse sieve upon a cloth stretched on a frame. The paper is subsequently polished by friction, with a shell or a piece of hard wood, and is remarkable for its toughness, smoothness, and durability. Most of the paper used in Tibet is made from the bark of different species of Daphne and allied genera, particularly of *Edgeworthia Gardneri*, a beautiful shrub, with globes of waxy, cow-slip-colored, deliciously fragrant flowers, growing on the Himalaya, at an elevation of 6000 to 7000 feet. The bark of *Lasiosiphon Madagascariensis* is made into paper and ropes in Madagascar.

DAPHNE. The first, strictly speaking, of the Italian operas, produced in 1596, under the auspices of the Society of the Alterati. The score was by Caccini and Peri, and the libretto by Ottavio Rinuccini. When translated by Opitz to the new music of Heinrich Schütz, it became the first German opera as well (1627).

DAPHNEPHORIA, dāf'nē-fō'ri-ā. See GREEK FESTIVALS.

DAPHNIN, dāf'nin (from *Daphne*). $C_{15}H_{18}O + H_2O$. A glucoside found in the *Daphne mezereon* and readily decomposed into sugar and a substance called *daphnetin*, which, like the asculetin obtained from the glucoside *asculin*, has the composition represented by the molecular formula $C_8H_8O_4$. *Daphnetin* has also been prepared artificially.

DAPHNIS, dāf'nīs (Lat., from Gk. *Δάφνις*). A favorite character in the bucolic poetry of the ancients. The first certain appearance of the story in literature is in the early part of the third century B.C., in Timæus and Theocritus. In its earliest form it seems a Sicilian folk-tale. The herdsman Daphnis, son of Hermes and a nymph, was beloved by a nymph, who made him promise never to love a mortal. Under the influence of wine he was seduced by a Sicilian princess; thereupon the nymph punished him with blindness or petrification. The bucolic poets altered the details of this very common folk-tale to suit themselves, and Daphnis became merely a conventional figure. Late writers in-

deed made him the inventor of the Sicilian herdsman's song, which was regarded as the original bucolic poetry. Consult Prescott, "A Study of the Daphnis Myth," in *Harvard Studies in Classical Philology*, vol. x. (Boston, 1899).

DAPHNIS. A modest shepherd in Beaumont and Fletcher's *The Faithful Shepherdess*.

DAPHNIS AND CHLOE, klō'ē (Gk. *Δάφνις καὶ Χλόη*, *Daphnis kai Chloē*). The title of an exquisite Greek pastoral love story by the pseudolongus, dating from the later period of the Roman Empire. It is the source of Tasso's *Aminta*, Bernardin de Saint-Pierre's *Paul et Virginie*, and Ramsay's *Gentle Shepherd*. Almost all these authors knew the story as rendered into French by Amyot (1559). See Loxgus.

DA PONTE, dá pōn'tá, LORENZO (1749-1838). An Italian librettist, born at Ceneda, near Venice, and for many years a resident of New York City. Exiled from Venice for writing a satirical poem, he went to Vienna, where he became one of the secretaries of Joseph II. There he wrote for the stage, among other works, the librettos for Mozart's *Don Giovanni* and *Le Nozze di Figaro*. After the Emperor's death he went to London, where he was secretary and poet of the Italian opera. In 1805 he emigrated to New York, where he taught Italian, and in 1828 was appointed professor of that language in Columbia College. He described his adventurous life in *Memorie* (1823-27), and also wrote sonnets, and translations of English works into Italian.

DAPONTES, dá-pōn'tēs, CONSTANTINOS (? - 1789). A Greek monk and poet. He was attached to the court of the Hospodar of Moldavia, Maurocordatos, and frequently came into conflict with the Mohammedan authorities. He is regarded as the most distinguished of the modern poets of the Greek Church, and several of his works, such as the *Garden of Mercy*, are still read. He died in a monastery on Mount Athos. One of his works has been translated into French by E. Legrand under the title, *Ephemérides Daces, ou chronique de la guerre de quatre ans, 1736-39* (1880).

DAPPLE. In Cervantes's *Don Quixote*, the ass ridden by Sancho Panza.

DAQĪQĪ, dā-kē'kē. The name of a Persian poet, one of the predecessors of Firdausi. See FIRDAUSI; PERSIAN LITERATURE.

DARAB, dā-rāb', or **DARABGHERD**, -gērd' (Pers., city of Darius, from *Dārā*, OPers. *Dārayavansh*, Gk. *Δαρείος*, *Dareios*, Darius + *gird*, OPers. *vardana*, city; connected with Lat. *urbs*, city). A town of Persia in the Province of Farsistan, situated on a small river, about 130 miles southeast of Shiraz (Map: Persia, E 6). It has some tanneries and exports southern fruits, especially dates. In its vicinity is situated a caravansary hewn in rock, and also a relief commemorating the victory of Shahpur over Valerian. The population is estimated at from 4000 to 12,000.

DARBHANGA, dārb-hān'gā. The capital of a district of the same name in the Patna division, Bengal, India (Map: India, E 3). It is situated on the Little Bagmati River, and is an important railway junction, 78 miles north-east of Patna. Its chief building is the maharajah's palace, situated in beautiful gardens, with noteworthy zoölogical sections. It has a large market-place, important bazaars, a hospital, and

a good water-supply from extensive tanks. A considerable trade is carried on in the agricultural and mineral products of the region. Population, in 1891, 73,600; in 1901, 66,000.

D'ARBLAY, dār'blá', FRANCES BURNEY (1752-1840). An English novelist. She was a daughter of Charles Burney, a musician, and was born at King's Lynn, June 13, 1752. Eight years later the Burneys removed to London. At the famous musical assemblies given by her father, Miss Burney saw, from the outside, fashionable life, and this she depicted with spirit and humor in her first novel, *Evelina* (1778). No novel since *Clarissa Harlowe* attracted more notice. It was read by Burke, Reynolds, and Johnson, and lavishly praised. This brilliant success was followed by *Cecilia* (1782), which, though not so fresh as *Evelina*, and a little heavy, had a large sale. In 1786 Miss Burney was appointed second keeper of the robes to Queen Charlotte. Disliking the service, she resigned her position five years later. While visiting her sister at Mickleham, she became acquainted with a French refugee, General d'Arblay, whom she married in 1793. The rest of her life was passed partly in England and partly in France. She published two other novels, *Camilla* (1796) and *The Wanderer* (1814), neither of which is readable. A play of hers, *Edwy and Elvina*, was performed in 1795, and was unsuccessful, though Mrs. Siddons and Kemble took the leading parts. She also published memoirs of her father (1832), written in an affected style resembling her last novels. She died January 6, 1840. In 1842-46 appeared her interesting *Letters and Diaries*, a section of which seems to have been used by Thackeray for his Waterloo scene in *Vanity Fair*. Miss Burney's first two novels mark the beginning of the novel of domestic life, and prepared the way for Maria Edgeworth and Jane Austen. Consult Macaulay, *Essays*.

DARBOUX, dār'bōō', JEAN GASTON (1842—). A French mathematician, born at Nîmes. He studied at the Ecole Normale, was appointed senior professor of geometry in the faculty of sciences there, and in 1887 became dean of that faculty. His *Mémoire sur les solutions singulières des équations aux dérivées partielles* was in 1876 awarded the mathematical grand prize by the Academy of Sciences. His works include *Sur les théorèmes d'Ivory relatifs aux surfaces homofocales du second degré* (1872); *Mémoire sur l'équilibre astatique* (1877); and *Leçons sur la théorie générale des surfaces et les applications géométriques du calcul infinitésimal* (1887).

DARBOY, dār'bwá', GEORGES (1813-71). An ill-fated French prelate, Archbishop of Paris. He was educated at the Seminary of Langres and became professor there in 1840, having been ordained priest in 1836. Preceded by his reputation as translator of Dionysius the Areopagite, he went to Paris in 1845, became almoner of the Collège Henri IV. in the following year and titular vicar of Paris in 1855. He was in high favor at the Court of Napoleon III., was made Bishop of Nancy in 1859, Archbishop of Paris in 1863, and afterwards grand almoner to the Emperor, and Senator. A strenuous upholder of episcopal independence, he stoutly opposed the declaration of the dogma of Papal infallibility at the Vatican Council. When it was declared, he silently submitted, yet in his diocese continued

to disregard Papal interference. Decidedly at variance with the Jesuits, he incurred the displeasure of Pius IX., who persistently declined to confer upon him a cardinal's hat. During the siege of Paris in 1870-71 he was indefatigable in his care for the sick and wounded soldiers and in works of benevolence, and could not be induced to leave his post or to seek safety in flight during the brief and terrible triumph of the Commune. He was seized as a hostage by the Communists, and while the combat raged in the streets of Paris after the entry of the Versailles troops, he was shot in the court of La Roquette Prison, several of his priests and many others sharing his fate. Among his writings are worthy of mention: *Saint Thomas Becket, sa vie et ses lettres* (1860); *Les femmes de la Bible* (8th ed. 1876); *Les saintes femmes* (4th ed. 1877). For his biography, consult Foulon (Paris, 1889).

DARBY, JOHN NELSON. See PLYMOUTH BRETHREN.

DARBY AND JO'AN. The hero and heroine of an eighteenth-century ballad which first appeared in the *Gentleman's Magazine*, March, 1735, under the title *The Joys of Love Never Forget: A Song*. Its author was Henry Woodfall, a London printer. In his youth Woodfall had been apprenticed to the printer John Darby, of Bartholomew Close; and he took Darby and his wife as the subject of this popular song.

DARCEL, dār'sél', ALFRED (1818—). A French archaeologist, born in Rouen. In 1871 he was made director of the Musée Cluny. His works include many articles in the *Gazette des Beaux-Arts* on Mediæval and Renaissance art and architecture. Among his publications are: *Notice des faïences italiennes* (1869); *Les manufactures nationales de tapisserie* (1884); *Catalogue de l'exposition rétrospective de l'art français au Trocadéro* (1889).

DARCEY, dār'sá', JEAN (1725-1801). A French chemist, director of the porcelain works at Sèvres. He was one of the first to manufacture porcelain in France. He devoted himself chiefly to applied chemistry and made valuable contributions to that science. In 1774 he was appointed professor of chemistry in the Collège de France, and in 1795 he became a member of the Institute.

DARCET, JEAN PIERRE JOSEPH (1777-1844). A French industrial chemist, son of Jean Darcet. He introduced important improvements in the manufacture of soap, soda, alum, sulphuric acid, etc., and contributed a number of important papers to the *Annales de chimie et de physique*.

DARDANELLES, dār'dá-nél'z' (named after the Greek city *Dardanus*, on the eastern side; the ancient Hellespont). A narrow channel separating southeast Europe from southwest Asia, and uniting the Sea of Marmora with the Ægean Sea (Map: Turkey in Europe, F 4). It extends from northeast to southwest, between latitudes 40° and 40° 30' N., and longitudes 26° 10' and 26° 40' E., having a length of about 42.3 miles and a breadth varying from 1 to 4 miles. The average depth of the channel is 180 feet. From the Sea of Marmora a strong current runs through the strait to the Grecian Archipelago, except in the presence of a strong southwest wind, but there is an undercurrent in the opposite direction.

The European shores are steep and sterile, while the Asiatic shores are sloping and fertile. To prevent an attack on Constantinople by water from the Ægean, the Dardanelles is strongly fortified on both sides with many guns of large calibre. A treaty concluded between the five great Powers and Turkey in 1841 arranged that no ship of war belonging to any nation save Turkey should pass the Dardanelles without the express consent of Turkey, and all merchant ships were required to show their papers to the Ottoman authorities. These provisions were confirmed at London in 1871 and at Berlin in 1878, but in 1891, by an agreement with the Porte, Russia secured for her 'volunteer fleet' the right of passage through the Dardanelles. The Dardanelles is celebrated in ancient history on account of Xerxes and Alexander having crossed it, the former in B.C. 480, to enter Europe, and the latter in B.C. 334 to enter Asia. The point at which Xerxes crossed was in the neighborhood of Abydos, on the Asiatic shore, opposite to Sestos, where the strait is 6500 feet wide. Alexander crossed at nearly the same place; and here also, in the ancient legend, young Leander nightly swam across to visit Hero—a feat performed in modern times by Lord Byron.

DAR'DANI. In Greek legend, a people living on the Hellespont, adjoining the territory of Ilium. Under the leadership of Æneas they were allies of the Trojans, and were so closely identified with them that their name was often used, particularly by Roman poets, as equivalent to Trojan.

DARDA'NIUS. The servant of Brutus, in Shakespeare's *Julius Cæsar*; he appears only in act v., scene 5, and refuses to let his master run upon his sword.

DAR'DANUS (Lat., from Gk. Δάρδανος). The mythical ruler of the Dardanians (see DAR-DANI), son of Zeus and Electra, the daughter of Atlas. In some legends he is closely connected with Samothrace, and is celebrated as introducing the Samothracian mysteries and the worship of Cybele into Asia Minor. In Roman story he was said to have come to Phrygia from Italy, so that Æneas really returned to the home of his ancestors.

DARDS (Skt. *Darada*, Gk. Δάρδαί, *Dardai*, Δάρδαροι, *Daradrai*, or Δέρδαί, *Derdai*). The natives of what is known as Dardistan, a region of Asia between Kafiristan and Baltistan, to the northwest of Kashmir. The Dards (Dardi, Dardu) belong by language to the Aryan stock. Physically they are of the short-statured dolichocephalic (or mesocephalic) variety of the white race, rather dark-skinned and black-haired, but presenting also a number of taller and lighter individuals. Among the chief divisions of the Dards are the Chins and the Yeshkuns. The religion of the Dards is now Islamism, which only recently has superseded Buddhism among them. Surrounded by Asiatics, these Aryans seem to have preserved some of the primitive social characteristics of their remote ancestors, and in spite of Mongoloid intermixture they have never been completely Orientalized. Since Leitner's *Languages and Races of Dardistan* (1867-73), the more recent literature of the subject includes Biddulph's *Tribes of the Hindoo Koosh* (1880); De Ujfalvy's *Aus dem westlichen*

Himalaya (1884); and Leitner's *Hunza and Nagar Handbook* (1893).

DARE, VIRGINIA (1587- ?). The first child born in America of English parents. She was born at Roanoke, Va. (now North Carolina), and was the granddaughter of John White, who was sent out by Sir Walter Raleigh as Governor of the colony, which, during the founder's absence in England, disappeared without leaving a trace.

DAREDEVIL. A cowardly blasphemer, the hero of Otway's *The Atheist*, who forgets his boastings when in the face of death.

DAR-EL-BEIDA, dār'el-bā'dā, or CASABLANCA (Ar., white house). A seaport on the western coast of Morocco, North Africa (Map: Africa, D 1). It is surrounded by walls and has a deep but unprotected roadstead. It has an extensive foreign trade. Its population is estimated at 25,000, including about 19,000 Arabs and only about 400 Christians.

DARES, dā'rēz (Lat., from Gk. Δάρης). A Trojan priest mentioned in the *Iliad* 5, 9. To him was attributed an account of the destruction of Troy, extant only in a Latin version, but it is very doubtful whether the Latin work ever had a Greek original; if so, it cannot have been older than the Hellenistic period. The Latin version pretends to be the work of Cornelius Nepos, but in reality belongs to the fifth century A.D.; it is quoted by Isidorus. In the Middle Ages the work was much read in its present form, and together with the work of Dictys (q.v.) of Crete was the basis of a famous romance written by Guido delle Colonne (q.v.) in the thirteenth century. The best edition is by Meister (Leipzig, 1873). On the various late versions, consult: Dunger, *Die Sage vom trojanischen Kriege in den Bearbeitungen des Mittelalters* (Dresden, 1869); Körting, *Dictys und Dares* (Halle, 1874).

DAR-ES-SALAAM, dār'ēs-sā-lām'. The capital of German East Africa (q.v.), situated on the coast a few miles south of Zanzibar (Map: Congo Free State, G 4). It is a progressive town, with a good harbor, a number of churches and schools and public buildings. It is the seat of the central government of the colony and of the principal commercial houses. There is telegraph connection with Zanzibar, Tanga, Kilwa, and other important centres in the colony. Its population is about 21,000, including about 360 Europeans and 480 Arabs.

DARESTE DE LA CHAVANNE, dā'rēst' de lā shā'vān', ANTOINE ELISABETH CLÉOPHAS (1820-82). A French historian, born in Paris. He occupied the chair of history successively at the Collège de Rennes, the Collège Stanislas in Paris, the University of Grenoble, and that of Lyons, with which he remained associated in that capacity for more than twenty years. His partiality to the Catholic interests, however, eventually compelled his resignation, in 1878. His principal publication is the *Histoire de France* (2d ed., 7 vols. and suppl., 1879), a work distinguished by remarkable accuracy and profound scholarship.

DAR FERTIT, dār fēr-tēt'. A region in the Egyptian Sudan (q.v.), situated south of Darfur, in the upper part of the basin of the Bahr-el-Ghazal (Map: Congo, D 1). It is a country rich

in ivory and rubber, but very thinly inhabited. It was one of the largest slave-hunting centres in North Africa, and numerous depots or *dens* existed formerly for the collecting of slaves from the surrounding country. The population is extremely heterogeneous, consisting of a number of negro tribes.

DARFUR, dār'fūr (Ar., House of the Fur, a negro tribe of the province). A region with undefined boundaries in East Central Africa, under British control. It lies between Wadai, Kordofan, the Libyan Desert, and the Bahr-el-Ghazal region, covering an area of about 150,000 square miles (Map: Africa, G 3). It is traversed through the centre in a direction from northeast to southwest by the volcanic mountain range Marrab, whose extinguished craters rise above 5000 feet. On the east and west it is generally flat and sandy. Among the mountain chains there are numerous fertile valleys yielding wheat, cotton, sesame, tobacco, etc. During the rainy season, which lasts from June to September, the lower portions of the country are frequently covered with water, which produces a rich vegetation. Cattle-raising is carried on by the natives on a large scale. The manufacturing industries are insignificant and are chiefly confined to weaving and the manufacturing of small metal products. In some parts of the country copper and iron ores are found. The population of Darfur is estimated at 4,000,000, but some authorities put it at not more than 1,500,000. It consists of Arabs and Furs, all professing Islam. Capital, El Fasher. Prior to the revolt of the Mahdi, Darfur was a great centre of the caravan trade. Darfur was annexed to Egypt in 1874-75, but reasserted its independence after the Mahdi's revolt in 1883. In 1890-91 the greater part was acknowledged by Germany and Italy to be within the British sphere of influence. With the overthrow of the Dervishes in 1898 it became a part of the Egyptian Sudan.

D'ARGENS, dār'zhän'. See ARGENS.

DARGOMYZHSKY, dār'gō-mizh'skē. ALEXANDER SERGEYEVICH (1813-69). A famous Russian composer, founder, with Glinka, of the Russian National School of Music. He was the son of a wealthy nobleman in the Government of Tula. Speechless to his sixth year, he early exhibited fondness for music, and was taught the piano at six and violin at eight; his teachers, later, were Schöberlechner, a pupil of Hummel, in piano, and Zeibich in musical theory and singing. At Saint Petersburg in 1833 he met Glinka, who lent Dargomyzhsky his copy of Dehn's lectures on musical theory, which "he studied through in five months." Orchestration and composition he learned practically by assisting Glinka in the production of his *Life of the Czar* and by organizing various aquatic serenades on the Neva River, with private orchestras. He had by this time acquired a reputation as a song-writer, pianist, and quartet-violinist, and he decided to embrace music as a career. Later, in 1843, he gave up his governmental clerkship. He selected Hugo's *Lucrezia Borgia* for an opera, but, on the advice of Zhukovsky (q.v.), abandoned it in favor of *Esmeralda*, based on the *Hunchback of Notre Dame*. In 1839 the finished opera was translated into Russian, and was produced only in 1847, at Moscow, with a poor cast. In 1840 he began a cantata, *The Triumph of Bac-*

chus, but owing to the delays of *Esmeralda* he stopped work on it, and only finished it in 1848, as an opera-ballet, first produced in 1868. In 1844-45 he traveled, meeting Halévy and also Fétis, who made him known to western Europe. The delays of his opera 'deadened his inspiration,' but his personal success in 1853, at a charitable concert, encouraged him, and in 1855 the opera *Rusalka* (The Mermaid) was ready. Its production at Saint Petersburg (1856) left much to be desired, and the public received it coldly; the Halévy-Meyerbeer style of *Esmeralda* gave way to powerful dramatic recitatives, pronounced characterization, especially in comic scenes, and a strong national element. Only ten years later, the opera, when revived, achieved an unheard-of success. During this decade Dargomyzhsky became more and more retired. He spent his time giving vocal instruction to gifted amateurs, and, in a measure, trained a new generation of singers. He wrote three orchestral works: *Kazachok* (Cossack dance); *Finnish Fantaisie*, and *Baba-Yaga*, and while in Brussels (1864-65) won high praise with the *Kazachok* and the overture to *Rusalka*. His songs (he wrote about 100 in all) of this period are among the greatest of the world's *Lieder*. Among all composers he was perhaps the greatest master of recitative, and now he "wanted the sound to exactly express the word." Among the members of the Young Russian School he found the moral support he so sadly needed, and in 1868 he undertook to embody his new theories by setting to music Pushkin's dramatic sketch *The Stone Guest*, a variant of the Don Juan story. Even during his final illness he worked unceasingly and so successfully that after his death only ten and one-half lines had to be completed by Cui. The orchestration was finished by Rimsky-Korsakov. The work was produced in 1872, but had little success. It contains no ballet, choruses, set numbers, or ensembles. The text, without a change in one syllable, was set to 'melodic recitative,' ever-varying, fluent, expressive, like that of the fourth act of the *Huguenots*, or of *Otello*. The opera is unique in the history of dramatic music. Both his special vocal training and his theoretical views militated against Wagner's theories; his personages are always the protagonists musically, while the orchestra furnished the background, atmosphere, or dynamic part. Consult: Cui, *La musique en Russie* (Paris, 1880); Pougin, *Essai historique sur la musique en Russie* (Turin, 1897); Fétis, *Biographie universelle des musiciens* (Paris, 1862).

DAR'IC (Gk. δαρεικός, *dareikos*; supposed by the Greeks to be derived from Δαρειός, *Dareios*, OPers. *Dāraya-ra*[h]uš, Darius, but probably really from Babylonian *dariku*, weight, measure). A gold coin of ancient Persia, used in Greece as well as Asia. It was about the same weight as the Attic silver didrachma, and passed current as worth 20 drachmas. On the obverse is the figure of the Persian King kneeling, holding in one hand a spear, and in the other a bow, and on the reverse an irregular oblong stamp. It contained about 130 grains of gold, or as much as \$5.60, but its value in Attic silver was about \$7.20.

DARIEL. A transverse pass in the main chain of the Caucasus Mountains, at an altitude of 4122 feet. It is traversed by the main road

from Vladikavkaz to Tiflis, and is the *Porto Caucasica* of Strabo and the *Dariallan* of Oriental authors.

DA'RIEN. A city and port of entry, and the county-seat of McIntosh County, Ga., 60 miles south by west of Savannah, on the Altamaha River 12 miles from the ocean, and on the Darien and Western Railroad (Map: Georgia, E 4). It exports large quantities of pine lumber, cross-ties, rice, fish, and garden produce. Settled in 1736. Darien was incorporated as a town in 1816, and was chartered as a city in 1818. The government is administered by a board of five persons selected by the grand jury and confirmed by the Governor of the State, one of these five being chosen as chairman of the council and ex-officio mayor. Population, in 1890, 1491; in 1900, 1739.

DARIEN'. An open-mouthed gulf of the Caribbean Sea on the western part of the north coast of South America, separating the two Colombian departments of Panama and Bolívar (Map: Colombia, B 2). Its southern extension, called Gulf of Urabá, affords good anchorage. The rainy coastland is hilly and thickly overgrown. The chief affluent is the Atrato (q.v.). The name Darien was also applied to the Isthmus of Panama (q.v.) and to a province in the Republic of New Granada, corresponding to the present State of Panama in Colombia. One of the earliest Spanish settlements on the mainland was in Darien, the region being then also called by the Spaniards *Castilla de Oro* ('the Golden Castile') and forming the best-known part of their *Tierra Firme*. In 1513 Balboa, Governor of the Darien settlement, crossed the Isthmus with 290 men, and on September 25 first caught sight of the Pacific.

DARIEN SCHEME. A scheme projected by William Paterson (q.v.) in 1695, for the purpose of forming a settlement on the Isthmus of Darien for controlling the trade between the Eastern and Western Hemispheres. It was one of the most disastrous commercial speculations in history. Nine hundred thousand pounds were quickly subscribed, a large part of it by Scottish merchants, and in 1698 1200 colonists, recruited in Scotland, proceeded to the Isthmus to lay the foundations for their prospective commercial centre 'New Caledonia.' Their number was rapidly reduced, however, by starvation and disease, and in June, 1699, the survivors returned. Soon afterwards the Scotch sent out another company, of 1300, but this likewise was soon forced to return, and a third company, which arrived in February, 1700, was almost immediately driven away by the Spaniards. For a brief account of the enterprise, consult H. H. Bancroft, *History of Central America*, vol. ii. (San Francisco, 1883).

DA RIMINI, dà rē'mē-nē, FRANCESCA (?-1389). A woman of extraordinary beauty, daughter of Guido Minora, a nobleman of Ravenna. She was married to Gianciotto Malatesta of Rimini, a dwarf, who, detecting her in criminal relations with his brother, Paolo, killed them both. The story has formed a favorite theme for poets. It forms the basis of one of the most famous episodes of Dante's *Divina Commedia* (*Inf.*, v., 73-142); Leigh Hunt wrote a poem, the *Story of Rimini* (1819); Silvio Pellico and D'Annunzio have each found in the tale the subject of a

tragedy, and so also has the English poet Stephen Phillips (q.v.) in his *Paolo and Francesca*.

DARI'US. The name of several Persian kings, and, like the Egyptian Pharaoh, *titular* and not *personal*. According to Herodotus (6. 98). *Δαρείος* signifies one who restrains; but the old Persian form, *Dāraya-va(h)uš* shows that it signifies upholding what is good. The most famous of the name is called DARIUS I., or DARIUS HYSTASPIS, from his father's name. (See HYSTASPES.) He was born B.C. 558, and was a Persian and of the Achæmenian line. On the death of Cambyses (B.C. 522), he leagued himself with six other nobles to murder Smerdis the Magian, who had usurped the throne. The conspirators were successful in their plot, and Darius was chosen King. An account of these occurrences is given in the great Behistun inscription, which serves to supplement or correct the narrative of Herodotus. His position at first was very insecure, but his caution, skill, and energy enabled him to govern his vast dominions for thirty-six years. To strengthen himself, he married the daughter of Otanes, who had been the head of the conspiracy, and likewise took three wives from the royal household—viz. two daughters of Cyrus's son, Smerdis. He then divided his empire into twenty satrapies, and determined the exact amount of the taxation to be borne by each. In some of the remoter provinces great confusion seems to have prevailed after the death of Smerdis the Magian; and a proof of how little Darius could effect at first is afforded by the conduct of Orætes, the Governor of Sardis, who for some time was quite defiant of his authority. The inscriptions of Darius contain the account of no fewer than nine or ten rebellions against his sway. Babylon also revolted, and Darius besieged the city unsuccessfully for two years. At last, however, it was taken by an extraordinary stratagem of his general, Zopyrus (516). It is more likely, however, that the account of the conquest of Babylon, as given by Herodotus (3. 150), belongs to the first siege of the city. In the year B.C. 514 Darius is thought to have begun the great rock inscription of Behistun, which records the events of his reign. In 513 B.C. with an army of 700,000, crossed the Bosphorus by a bridge of boats, marched to the mouth of the Danube, crossed the river, and advanced against the Scythians. The expedition proved a failure. Darius retreated, but detached from his main force an army of 80,000 men, under Megabyzus, to conquer Thrace, while he himself returned to Asia, whence he extended his authority in the east as far as the Indus. About 501 B.C. the Ionian cities rose in revolt against Persian dominion. They were unsuccessful, the final victory of the Persians being achieved in the naval battle at Lade and the taking of Miletus (494). The assistance given by the Athenians and Eretrians to the Ionians, and the part which they had taken in the burning of Sardis, determined Darius, who was also influenced thereto by the banished Hippias, to attempt the subjugation of the whole of Greece. In 492 he sent Mardonius with an army into Thrace and Macedonia, and at the same time dispatched a fleet against the islands. The former was routed by the Brygi in Thrace, the latter was shattered and dispersed by a storm when rounding the promontory of Mount

Athos. In 490 he renewed his attempt. His fleet committed great ravages in the Cyclades, but his army was entirely defeated at Marathon by the Athenians, under Miltiades, the tyrant of the Chersonese. In the midst of his preparations for a third expedition, Darius died B.C. 486, and was succeeded by his son Xerxes. His tomb is still to be seen at Nakshi-Rustam. Darius was an able ruler, and he organized and wisely administered the kingdom which Cyrus had founded. His liberality to the Jews in connection with the rebuilding of the Temple at Jerusalem is referred to in the Bible. For the inscriptions of Darius, consult: Rawlinson, *Journal of the Royal Asiatic Society of Great Britain*, vol. x. (London, 1847); Spiegel, *Altpersische Keilinschriften* (Leipzig, 1882); Weissbach and Bang, *Altpers. Keil.* (Leipzig, 1893); Tolman, *Old Persian Inscriptions* (New York, 1893); Justi, in *Grundriss der iranischen Philologie* (Strassburg, 1897). See ACHÆMENES; CAMBYSES; CYRUS; PERSIA.

DARIUS II., called, before his accession to the throne, *Ochus*, and after his succession *Nothus*, the Bastard. He was one of the seventeen bastard sons of Artaxerxes I., Longimanus. When Sogdianus, another of the bastards, had murdered the rightful King, Xerxes II., and assumed for himself the regal power, Ochus declared war against him, slew him, and secured the diadem for himself (B.C. 424-23). He now called himself Darius. His reign was ignoble. He showed himself to be completely under the control of his eunuchs and his cruel step-sister and spouse, Parysatis. Rebellions were constantly breaking out among his satraps, all of which, however, were crushed except that of Amyrtæus, Satrap of Egypt, who made himself independent in 414. It was during the life of Darius, and chiefly through the craft of Tissaphernes, Satrap of Asia Minor, and of his successor, Cyrus the Younger, son of the King, that the Persians exercised so great an influence over the affairs of Greece in the last years of the Peloponnesian War. Darius died B.C. 405-04.

DARIUS III., called before his accession *Codomanus*; a monarch noted for his mild disposition, handsome person, and courageous spirit. He was great-grandson of Darius II., and was raised to the throne through the help of Bagoas, after the murder of Arsēs (B.C. 336). But in spite of his superior qualities he could offer no solid opposition to the advance of the Macedonians. At the battle of Issus, in 333, his mother, wife, and three children fell into the hands of Alexander; the victory of Gaugamela, near Arbela (q.v.), in 331, opened to the latter the way to Susa and Persia proper. Darius now fled to Ecbatana, in Media; and, on the approach of his opponent, fled from there to the northern provinces, where he was seized by Bessus, Satrap of Bactria. Alexander, in a fit of generosity, hurried to deliver Darius. Bessus then prepared for flight; but Darius, refusing to follow, was stabbed by the barbarian and left. The scouts of Alexander's cavalry found Darius dying, and administered to his last necessities. Thanking the Grecian King for his magnanimity, and commending his family to his care, he expired (330). Alexander sent the dead body to Sisymbria, mother of Darius, to be interred in the tomb of the Persian kings. With him the Achæmenian line and the Persian

Empire, that had so long dominated Asia, came to a close. Consult Justi, *Grundriss der iranischen Philologie* (Strassburg, 1897).

DARIUS THE MEDE. The son of Ahasuerus, and conqueror of Babylon, according to the biblical narrative of the Prophet Daniel (Dan. v. 31; vi. 28; ix. 1; xi. 1). His age is given as sixty-two years at the time of the taking of the city. There is great difficulty in identifying this ruler, whom Daniel speaks of as "Darius the son of Ahasuerus, of the seed of the Medes, which was made King over the realm of the Chaldeans" (Dan. ix. 1). Some scholars have suggested an identity with Cyaxares II. (q.v.), or more likely with Gobryas, Governor of Gutium, who actually took the city of Babylon as chief in command for Cyrus. (See CYRUS THE GREAT.) But much uncertainty on the whole subject prevails. Some suggestions may be gained from Horner, *Daniel, Darius the Median, Cyrus the Great* (Pittsburg, 1901).

DARJILING. *där-jël'ing*, or **DÖR-JILING** (Tib. *Dar-ryas-glin*, land of the diamond thunderbolt—i.e. of the Lama's sceptre). A popular sanitary station of Bengal, British India, capital of a district of the same name, in the Sikkim Himalayas (Map: India, E 3). It is situated 7200 feet above the sea, on the side of a great hollow or basin, in which flows the Runjit, a branch of the Tista. It commands a magnificent view of the Himalayas to the north and west, and is on the Darjiling and Himalayan Railway, a road remarkable for its elevation. Notwithstanding frequent heavy rains and a great annual rainfall, the climate is very salubrious. Mean annual temperature, 54° F. Darjiling has good bazaars, a fine sanitarium, beautiful botanical gardens, two Anglican churches, an excellent water-supply, and is, especially during October, the fashionable Indian health resort. Tea-growing is the principal industry of the district. Fifty thousand acres are devoted to its cultivation, and as much as 8,000,000 pounds has been produced annually. Darjiling is about 36 miles from the Plain of Bengal and 308 miles north of Calcutta. It was obtained by the British Government from the Rajah of Sikkim in 1835, in order to be made a sanitary station. Population, including the adjacent cantonment, 14,100.

DARK AGES. A name formerly applied either to the whole or the earlier part of the Middle Ages (q.v.).

DARK AND BLOODY GROUND, THE. A name given to the State of Kentucky as the scene of frequent Indian warfare in the days of the early settlers. The phrase has also been said to be a translation of the Indian word Kentucky.

DARK CONTINENT, THE. Africa, the least known of the earth's great divisions. The term is also explained as referring to the color of the inhabitants.

DARK DAY. Any day in which the sunlight appears to be remarkably dim or altogether absent. In New England the term is specifically applied to May 19, 1780, also known as Black Friday; but many similar dark days are also on record in other parts of the world. Other notable dark days in the United States were those of October 21, 1716, and October 19, 1762. Stygian darkness often prevails during erup-

tions of ashes from volcanoes. In recent years the months of August and September, 1881, were remarkable in the eastern part of the United States for a long series of days in which artificial light was oftentimes necessary at mid-day and business was generally very much interrupted. In this case the darkness is known to have been the result of a combination of ordinary cloudiness with the smoke from forest and prairie fire, and it is presumable that the same conditions must have obtained during the historical dark days of the previous century. The *United States Monthly Weather Review*, for September, 1881, page 27, says: "The foggy or smoky condition of the atmosphere became quite general from the first to the tenth of this month over that portion of the United States between the meridians of 67° and 87° W. and the parallels of 40° and 45° N. It reached an unusual culmination in density in the eastern portion of the Middle Atlantic States and throughout New England, where it interrupted the prosecution of business and compelled the use of artificial light. The destructive violence of prairie and forest fires throughout northern Michigan and portions of Canada has perhaps never been exceeded, and the intensity of the accompanying smoke was simply dreadful. On September 6 southwesterly winds prevailed from Tennessee northward to Lake Superior, and thence eastward to the Canadian maritime provinces, and smoke was reported as far south as Knoxville, westward to Milwaukee, northward to Rockliffe, Canada, and eastward to New Brunswick. To show the progress eastward of this condition in the atmosphere it is necessary to trace the movement of low-pressure areas over Canada and northern New England, and watch the accompanying change in wind directions." The darkness of the dark day of May, 1780, covered very much the same area, with southwest winds and occasional light rains, and was undoubtedly of the same nature, although in both cases it was attributed by the superstitious to supernatural causes. On the plains of Tibet, according to Marco Polo and other travelers, dark days are sometimes caused by clouds of dust so fine and light that it is carried to a great distance by the wind. Similar days of darkness have been caused by clouds of mingled vapor, smoke, and dust emanating from volcanic eruptions, although such clouds do not usually extend to the great distances reached by clouds of smoke from forest fires. Cases of such volcanic clouds occurred in connection with the eruption of Mont Pelée and La Soufrière in the West Indies in May, 1902.

DARKE, WILLIAM (1736-1801). An American soldier, born in Philadelphia. He served under Braddock; rose to the rank of colonel in the American Army during the Revolutionary War; and in 1791 commanded the left wing of Saint Clair's army, which, on November 4, was defeated by the Miami Indians.

DARK HORSE. A term familiarly used in the vocabulary of American politics, and applied to a comparatively unknown man brought forth in a nominating convention at the supreme moment as a candidate for office in the place of a prominent rival candidate of his own party whose nomination would incur the risk of a divided vote. James K. Polk and Franklin Pierce

were typical 'dark horses' of the Democratic Party; Rutherford B. Hayes and James A. Garfield of the Republican.

DARK LADY, THE. In Shakespeare's *Sonnets*, the woman thought, by those who maintain that William Herbert is the dedicatee, to be Mary Fitton, one of Elizabeth's maids of honor. It is certain that Herbert and she created a scandal. Another suggestion, with fewer supporters, is Penelope Devereux, Lady Rich, the "Stella" of Sidney's sonnets.

DARLASTON. A town in Staffordshire, England, four miles southeast of Wolverhampton (Map: England, D 4). It has extensive mines of iron and coal, and manufactures of hardware. Population, in 1901, 15,400.

DARLEY, FELIX OCTAVIUS CARR (1822-88). An American painter and engraver, born in Philadelphia. He illustrated the works of Irving, Cooper, Longfellow, Hawthorne, and Shakespeare, and made 500 drawings for Lossing's *History of the United States*. Among his best-known illustrations are those for the *Legend of Sleepy Hollow*, *Rip Van Winkle*, and Dickens's *Great Expectations*. In 1868 he published, after a visit to Europe, *Sketches Abroad with Pen and Pencil*. His water-color paintings of incidents in American history are full of spirit.

DARLEY, GEORGE (1795-1846). An English poet. He was born in Dublin in 1795; was graduated from Trinity College, Dublin, in 1820, and went to London, where he wrote critical papers for the magazines, and eventually joined the staff of the *Athenæum*, becoming famous for his caustic reviews. He died November 23, 1846. Under the inspiration of the Elizabethans, Darley produced several lyrical dramas containing passages of great beauty—*Sylvia, or the May Queen* (1827), and the inferior *Thomas à Becket* (1840) and *Ethelstan* (1841). As early as 1822 he had published *The Errors of Ecstasie*, a melodious poem in blank verse, followed by *Lilian of the Vale* (1826), a thrilling tale. He also wrote several treatises on mathematics, which were praised by Carlyle. For specimens of his verse consult Stedman, *Victorian Anthology* (New York, 1895).

DARLING. A mountain range of western Australia, extending north and south for about 250 miles, parallel with the coast and from 20 to 70 miles distant (Map: Australia, B 5). It ends near Point D'Entrecasteaux. Its highest summit reaches 3700 feet.

DARLING RIVER (named in honor of Sir Ralph Darling, Governor of New South Wales, 1825-31), or **BARCOON RIVER.** An Australian stream, the most important tributary of the Murray (Map: New South Wales, C 2). It rises in southeastern Queensland, flows through New South Wales, and joins the Murray on the Victoria border. The area of its basin is about 200,000 square miles. During the dry season its course is marked by a succession of pools or small lakes; but during the winter, when it is subject to sudden floods, it is navigable by light-draught steamers for over 600 miles to Bourke, the terminus of the Great Western Railway, from Sydney. Most of the region of the Darling is but a desert in the dry season.

DARLING, GRACE HORSLEY (1815-42). An English heroine. She was born in Bamborough,

Northumberland, the daughter of William Darling, lighthouse-keeper on Longstone, one of the Farne Islands. On the morning of September 7, 1838, the steamer *Porfarskire* was wrecked near the lighthouse, and all but nine of the sixty-three passengers perished. In spite of the danger of such an undertaking, the father and daughter made two trips to where the survivors lay, and rescued all of them. News of the exploit was received with great enthusiasm by the English people, and by popular subscription the sum of £750 was raised for the heroine. Consult *Grace Darling: Her True Story, from Unpublished Papers in the Possession of the Family* (1880).

DARLINGTON. A Parliamentary and municipal borough and market town in Durham County, England, on the Skerne, near its junction with the Tees, 18 miles south of Durham City (Map: England, E 2). The town is laid out in wide and regular streets, and has a spacious market-place. The parish church of Saint Cuthbert, a handsome Early English edifice, was founded about 1160 by Bishop Pudsey. Darlington sends one member to Parliament. It received its charter of incorporation in 1867. It has owned its gas and water supply since 1854, and it maintains public baths and markets. Its principal manufactures are iron and worsteds, and there are extensive locomotive works belonging to the Northeastern Railway. The first passenger railway operated by steam was opened in 1825 between Darlington and Stockton. Population, in 1891, 38,000; in 1901, 44,500. At Oxen-le-field, three miles from Darlington, are curious cavities of unknown origin, called Hell Kettles. From Anglo-Saxon times till 1867 Darlington was under the authority of the Bishop of Durham. Consult Longstaffe, *History and Antiquities of Darlington* (London, 1854).

DARLINGTON. A town and the county-seat of Darlington County, S. C., 82 miles east by north of Columbia, at the junction of two divisions of the Atlantic Coast Line Railroad (Map: South Carolina, E 2). It carries on a considerable trade in cotton, tobacco, and grain, the principal products of the surrounding agricultural region. There are cotton-mills, tobacco-factories, fertilizer-works, etc. Population, in 1890, 2389; in 1900, 3028.

DARLINGTON, WILLIAM (1782-1863). An American botanist, born at Birmingham, Pa. In 1806 he went to India, and on returning published an account of his voyage. In 1814 he was chosen to Congress, and in 1819 was reelected. At Westchester, Pa., he founded an atheneum, an academy, and a society of natural history. Among his publications are: *Mutual Influence of Habits and Disease; Agricultural Chemistry; Agricultural Botany* (1847); and *Memorial of John Bartram* (1849).

DAR'MESTETER, AGNES MARY FRANCES. See ROBINSON, AGNES MARY FRANCES.

DARMESTETER, därm'ste-târ'. JAMES (1849-94). A French Orientalist, whose eminence was achieved especially in the field of Iranian scholarship. He was born, of Jewish parentage, at Château-Salins, in Lorraine. He was educated at the Lycée Bonaparte, Paris, from which he graduated with the highest honors in 1867, when he began to devote himself to Oriental philology, chiefly under the guidance of the gift-

ed Michel Bréal. In 1877 he was appointed assistant professor of Zend at the Ecole des Hautes Etudes, and in 1885 was advanced to the professorship of Iranian languages and literature at the Collège de France. In 1886 he visited India, to make special philological researches in connection with the sacred books of the Parsis, and was afterwards honored by an appointment as fellow of Bombay University. For years he had acted as secretary of the Société Asiatique de Paris, and he was likewise busily engaged as an editor of a leading political and literary periodical, *La Revue de Paris*, at the time of his death. His writings in the field of Avestan philology and Zoroastrianism are of prime importance, even if his theories, which are often very radical, cannot always be accepted. Among his works may be mentioned: *Haurvatât et Ameretat, Essai sur la mythologie de l'Avesta* (1875); *Ormuzd et Ahriman, leurs origines et leur histoire* (1877); *Etudes iraniennes* (1883); *The Zend-Avesta* (translated 1880, 1883); *Essais orientaux* (1883); *Chants populaires des Afghans* (1888-90); *Les prophètes d'Israël* (1892); and his most important work, *Le Zend-Avesta; Traduction nouvelle* (3 vols., 1892-93). A number of his literary essays have been translated into English by Helen Jastrow (Boston, 1895), and by his wife (New York, 1897).

DARMSTADT, därm'stât (Ger., city of the Darm, the river near which the city lies). The capital of the Grand Duchy of Hesse, Germany, and residence of the Grand Duke, about midway between the Rhine and the Main, at the north-western extremity of the Odenwald, and 17 miles south of Frankfort-am-Main (Map: Germany, C 4). It consists of an old and new town, the streets of the former being narrow and crooked, but those of the latter broad and handsome, exhibiting many imposing specimens of architecture. Its principal square, the Luiseplatz, adorned with a lofty column, surmounted by a bronze statue of Grand Duke Louis I., who founded the new town, contains the post-office, the Government building, and the old palace. The Grand Ducal Palace, surrounded by pleasant gardens, was begun in the fifteenth century, but practically rebuilt in the early part of the eighteenth. It contains a valuable library of some 500,000 volumes, an archaeological collection, and a picture gallery with some good examples of the early German and the Netherlandish masters. The chef-d'œuvre is the so-called Meyer Madonna, by Holbein the Younger. Prominent among numerous churches are the Stadtkirche, with the handsome monument of Landgrave George I., and the Roman Catholic church built after the Pantheon at Rome, with a lofty dome supported by twenty-eight columns. Other notable features include the new palace, the palace of Prince Henry, the old and new town halls, theatre, and the Herrgarten, a fine public garden and park. Darmstadt is the seat of government for the grand duchy and for the province, and of the provincial court of appeal. The town's affairs are administered by a municipal council of 42, and an executive board of 3 members. It owns its water-supply, and operates gas-works and an electric-light plant. Its educational institutions include two gymnasia, a high school, technical school, the Municipal Victoria School, and several elementary schools. Among its charitable institutions are

a municipal hospital and the Alice and provincial hospitals.

Darmstadt is a manufacturing town of growing importance. The chief articles of industry are machinery, carpets, hats, tobacco, chemicals, scientific instruments, playing-cards, and beer. Darmstadt is an important railway centre. An electric street railway accommodates internal traffic. The famous chemist Justus von Liebig was a native of the town, and the composer Flotow died here. To the east of the town is the Palace of Rosenhöhe, with the grand-ducal mausoleum, containing the tombs of the Grand Duke Louis IV. and his wife, Princess Alice of England. Population, in 1890, 56,000; in 1900, 64,000.

Darmstadt appears as Darmundstadt in the eleventh century. It acquired municipal rights in 1330, and became in 1567 the capital of Hesse-Darmstadt. It was burned by the French in 1688 and 1693, but attained great prosperity toward the end of the eighteenth century.

DAR'NEL (Fr. dial. *darnelle*; probably from OF. *darne*, stupid, Dan. *daare*, fool; so called from its supposed stupefying power), *Lolium temulentum*. A grass of the same genus with the valuable rye-grass (q.v.), an annual, common in grain-fields in England and in many parts of Continental Europe, and introduced in some parts of the United States. This grass has from ancient times been reputed to have a narcotic, poisonous seed, to which many bad effects were ascribed. Lindley, in his *Medical and Economical Botany*, published in 1849, ascribes narcotic and acrid qualities to darnel-seed, and speaks of fatal consequences as produced by it when mixed with flour, saying that it "is the only authentic instance of unwholesome qualities in the order of the grasses." Recent investigations have shown the presence of a fungus in the grain of this grass and to it the poisonous qualities are attributed. The fungus seems to be almost always present in the seed of this species and rare in the other species of the genus.

DAR'NELL, HENRY FAULKNER (1831—). An English Protestant Episcopal clergyman, born in London. For some time he was principal of Hellmuth Ladies' College at London, Ontario, and of Dufferin College in the same city. Afterwards he became rector of the Episcopal church at Avon, N. Y. His publications include: *Philip Hazlebrook* (1887); *The Craze of Christian Englehart* (1890); and *Songs of the Season* (1895).

DARNÉTAL, dār'nā'tāl'. The capital of a canton in the Department of Seine-Inférieure, France, at the confluence of the Aubette and Rohee, 2½ miles east of Rouen. Its noteworthy buildings are a Gothic church, a fine early sixteenth-century belfry, and the town hall. The town commands a good view of Rouen. It has important manufactures of woollens. Population, in 1901, 6826.

DARNING-NEEDLE. A dragon-fly or damselfly: supposed by ignorant folk to be attempting to pierce and 'sew up' one's ears or do other mischief as it darts about one's head; hence the term is frequently extended to 'devil's darning-needle.' See DRAGON-FLY.

DARN'LEY, HENRY STEWART, OF STUART, Lord (1545-67). The second husband of Mary.

Queen of Scots. The second but eldest surviving son of the Earl of Lennox by Lady Margaret Douglas, niece of Henry VIII., he was born December 7, 1545, at Temple Newsam, Yorkshire, where he received a private education. He was handsome, and of accomplished manners, but destitute of moral and intellectual power. He married Mary on July 29, 1565, but soon disgusted her by intemperance, profligacy, and insolence. As an accessory to the assassination of Rizzio, he intensified Mary's hatred by holding her while the deed was committed in her presence. While recovering from an illness, he met his death in an isolated house which was blown up by the Earl of Bothwell, February 9, 1567. See MARY STUART.

D'ARREST, dār-rĕst', HEINRICH LUDWIG (1822-75). A German astronomer. He was born in Berlin, and studied astronomy there under Encke. He was subsequently connected with the observatories of Berlin and Leipzig, and became in 1852 professor in the Leipzig University. In 1857 he became professor of astronomy in Copenhagen, where he died. His important publications include: *Siderum Nebulosorum Observationes Havnienses* (1867), and numerous astronomical papers in scientific journals. His original observations include discoveries of several comets, and of the planet Freia (1862).

DARTER (so called from the quick motion). One of a group of small fresh-water fishes of the perch family, peculiar to the United States. None is more than 10 inches in length, and the least is only 1½ inches long—the smallest spiny rayed fish known. All are powerful swimmers, and have been spoken of by Forbes as concentrated rather than dwarfed fishes. "They have developed," he says, "an activity and hardihood, a vigor of life, and a glow of high color almost unknown among brook-fishes elsewhere." They have been the subject of special study by Dr. D. S. Jordan, who tells us that most of them prefer clear running water, where they lie on the bottom concealed under stones, darting, when frightened or hungry, with great velocity for a short distance, then stopping as suddenly. All are carnivorous, and feed chiefly on the larvae of flies. These beautiful and very interesting little fishes exist in great variety throughout the central and southern United States, and are universally known to country boys as 'Johnny darters,' a name particularly given to a typical species (*Boleosoma nigrum*). A few others of the larger ones have received other names locally, as the sand-darter (*Ammocrypta pellucida*), indicating the preference of its genus for sandy bottoms. (See Plate of DARTERS AND SUNFISH.) Excellent popular accounts will be found in *The American Naturalist* for 1876 and 1880; and a full history of the group in Jordan and Evermann's *Fishes of North America*, pages 1016 to 1105 (Washington, 1896).

DARTER, OR SNAKE-BIRD. A name given to certain steganopod birds, nearly allied to cormorants, but having a bill longer than the head, perfectly straight, slender, and sharp-pointed; and also remarkable for the great length of the neck, which has obtained for them the name 'snake-birds.' They generally live in pairs near bodies of fresh water. If alarmed while sitting on a branch over a stream or by the edge of a lake, they drop off quietly into the water, sink

DARTERS AND SUNFISH

1. SAND DARTER (*Ammocrypta pellucida*).
2. BLACK-BANDED SUNFISH (*Mesogonistus chætodon*).
3. COMMON SUNFISH OR PUMPKIN-SEED (*Eupomotis gibbosus*).

4. YELLOW-BELLIED SUNFISH (*Lepomis aurtus*).
5. BLUE OR COPPER-NOSED SUNFISH (*Lepomis patildus*).
6. JOHNNY DARTER (*Boleosoma nigrum*).

gently beneath the surface and disappear; or they may fly upward and circle about like a hawk. They make rude nests upon trees and lay chalky blue eggs. They eat great quantities of fish, which they kill by a quick, snake-like darting forward of the closed beak, impaling the prey, which is then flung into the air, caught in the

BEAK OF THE DARTER.

mouth and swallowed entire. Four species are known, constituting the family Anhingide. One species occurs in Africa, one in southern Asia, one in Australia, and one in tropical and subtropical America. The last (*Anhinga anhinga*) is sometimes called the water-turkey, and wanders in summer as far north as southern Illinois. It is a handsome bird, about three feet long, glossy black, the back marked with numerous silvery white spots or streaks. See Plate of FISHING BIRDS; and Colored Plate of EGGS OF WATER AND GAME BIRDS.

DARTFORD (AS. *Darentford*). A town in Kent, England, 14 miles east-southeast of London Bridge, on the Darent, about three miles from its junction with the Thames (Map: England, G 5). It lies in a narrow valley between two steep hills. It has large corn-mills, cotton and silk printing-works, large powder and paper mills; also manufactures of oil, iron, machinery, and chemicals. The first paper-mill in England was built here by Spielman, jeweler to Queen Elizabeth in 1590. The City of London Lunatic Asylum is situated here, and there are interesting ruins of a nunnery, founded 1355 by Edward III. Wat Tyler's insurrection, in the reign of Richard II, broke out at Dartford in 1381. Population, in 1891, 12,000; in 1901, 18,600.

DARTLE, ROSA. The companion of Mrs. Steerforth, in Dickens's *David Copperfield*. She is wildly jealous of Steerforth himself, although he was the cause of the disfiguring scar upon her face.

DARTMOOR (named from the river Dart, which rises in the region). A granitic tableland in the southwest of Devonshire, England, remarkable for its wild, rugged scenery and cyclopean relics of aboriginal inhabitants (Map: England, C 6). Dartmoor proper (or the ancient forest of that name) and the outlying common lands are about 20 miles square. This moorland region, encircled by a natural rampart, and moated by deep valleys, has a considerable elevation above the surrounding country, and culminates in Yes Tor, 2040 feet above the sea-level. Copper is found, and at Wheal, Duchy, and Birch Tor are productive tin-mines. The largest kaolin-works in England are at Lee Moor, which is also the seat of a meteorological observatory. The soil is composed chiefly of peat, which in the bottoms has accumulated in some places to the depth of 25 feet, and it rests on a subsoil of fine sand. Many of the well-watered dells and ravines are fertile, while the whole moor affords pasturage for cattle, sheep, and horses. The antiquities include the Gray Wethers, a fine specimen below

Sittaford Tor, of what is now styled a Druidical temple, the vestiges of a large aboriginal village at Grimspound, the cromlech at Drewsteignton, logans, stone avenues, dolmens, barrows, cairns, rock-pillars, and ancient trackways.

During the long war with Napoleon, a prison, now used for convicts, was erected in western Dartmoor for French captives. Prince Town sprang up close by, and soon became a thriving place. During the war with the United States (1812-15), many captured Americans were confined at Dartmoor. See DARTMOOR MASSACRE.

The castle, manor, and forest of Dartmoor were granted by Henry III. to his brother Richard, Earl of Cornwall, and since 1337 Dartmoor has been, in part, permanently annexed to the Duchy of Cornwall. Dartmoor figures conspicuously in poetry and romance. Consult Rowe, *A Perambulation of the Ancient and Royal Forest of Dartmoor*, etc. (Plymouth and London, 3d ed., 1896).

DARTMOOR MASSACRE, THE. The killing (April 6, 1815) by a company of English soldiers of some American prisoners, who, together with 6000 others, had been confined in the Dartmoor (England) prison for several months after the close of the War of 1812 between England and the United States. To quell what they regarded as a mutiny and to thwart an apparent effort at escape, the prison guard, probably under orders from Capt. T. G. Shortland, their commanding officer, fired upon the prisoners, killing seven and wounding about sixty—thirty of them dangerously. The Americans at the time regarded this as an act of wanton murder, but it was pronounced justifiable by a joint commission, which, however, acquitted the prisoners of the charge of organizing a mutiny or of planning an escape. The British Government soon afterwards promoted Shortland, but made liberal provision for the families of those who had been killed or permanently disabled. Consult: Andrews, *The Prisoners' Memoirs; or, Dartmoor Prison* (New York, 1852); and Cobb, *A Green Hand's First Cruise, Together with Five Months in Dartmoor* (Boston, 1841).

DARTMOOR PRISON. See DARTMOOR, and DARTMOOR MASSACRE.

DART-MOTH. A noctuid moth of the genus *Agrotis*, whose caterpillars are cutworms, some-

A DART-MOTH (*Agrotis saucia*).

a, Adult moth; b, deposit of eggs; c, caterpillar (a cutworm); d, head of caterpillar.

times called 'climbing cutworms.' A species very widespread in both Europe and America is *Agrotis saucia*, whose wings expand an inch and

a quarter. The fore wings are grayish brown variegated with black; the hind wings whitish, deepening into brownish toward the margin. The caterpillar is nearly 2 inches long when mature, and is of a dull flesh-color mottled with brown and black. When ready to pupate it descends and forms a smooth cavity in the ground for that purpose. These caterpillars feed on the leaves of fruit-bearing trees and shrubs.

DARTMOUTH, därt'müth. A town of Halifax County, Nova Scotia, Canada, situated on a small river emptying into Chebucto Bay, opposite the city of Halifax, of which it is practically a suburb connected by ferries (Map: Nova Scotia, F 5). It contains handsome residences, the provincial asylum for lunatics, several foundries, rope-walks, a sugar-refinery, and tanneries. Dartmouth, founded in 1749, was destroyed by Indians in 1751. Fort Clarence, below the town, commands the narrow and dangerous eastern passage, which was considered impassable for large vessels until 1862, when the Confederate steamer *Tallahassee* escaped through it. Population, in 1891, 6252; in 1901, 4806.

DARTMOUTH. A municipal borough and seaport of Devonshire, England, built in terraces on a steep slope 300 to 400 feet high on the River Dart, at a short distance from the sea (Map: England, C 6). The streets are narrow and many of the houses very old, with overhanging stories, projecting gables, and wood-carvings. Saint Saviour's Church, of the fourteenth century, has a richly sculptured stone pulpit, a highly ornamented, painted, and gilt interior, and a beautifully carved rood-loft. A battery and the remains of a castle built during the reign of Henry VII. stand at the entrance to the harbor, which affords secure anchorage for vessels. In the river above the town is anchored the cadet training-ship *Britannia*. The commerce and shipping trade of Dartmouth is of considerable importance. Its fisheries are quite extensive and the town is a coaling station for the south coast. It has a resident United States consular agent. Population, in 1891, 6000; in 1901, 6600. Sir Humphrey Gilbert, the Newfoundland explorer, was born near the town. At Dartmouth, in 1190, the Crusaders, under Richard Cœur de Lion, embarked for the Holy Land. Its earliest known charter dates from the fourteenth century. The French burned the town in the time of Richard II., but were repulsed in another attack on it in 1404. In the Civil War of the seventeenth century, it was captured by the Royalists under Prince Maurice, and retaken by the Parliamentarians under Fairfax.

DARTMOUTH COLLEGE. A leading American college situated at Hanover, N. H. Dartmouth originated in Moor's Indian Charity School, organized about 1750 at Lebanon, Conn., by the Rev. Eleazer Wheelock, and receiving its name and first endowment from Joshua Moor or More, in 1755. Support for the school came from gifts made chiefly by the General Courts of Massachusetts Bay and New Hampshire, and by persons in England interested in the project of educating the Indians. This interest was fostered by Sampson Oocoom, an Indian preacher and pupil of Dr. Wheelock, who toured England and Scotland in 1766-67, raising funds for the school. The proceeds, some £10,000, were intrusted to a board of trustees, of whom the Earl

of Dartmouth was chairman. Encouraged by this success, plans were made for the enlargement of the school, so that both whites and Indians might be taught, and for placing it upon a legal and permanent basis. Largely through the influence of John Wentworth, Governor of New Hampshire, large tracts of land were given by that province on the present site of the college, and in 1769 George III. granted a royal charter to 'Dartmouth College'—named in honor of its patron, the Earl. At the same time, Moor's School was made a separate institution, though under the control of the same trustees as those of the college. This school was maintained until 1849, and still retains a legal if fictional existence under the title 'The President of Moor's Charity School.' Dr. Wheelock was made the first president of the college and retained office until 1779, when he was succeeded by his son John. In 1816, a religious controversy having arisen, the Legislature of New Hampshire passed acts intended to deprive the trustees of authority and to take to itself the control of the institution. These acts were sustained by the State court, but were, in 1819, upon argument by Daniel Webster (q.v.), invalidated by the Supreme Court of the United States, which declared the original charter to constitute an inviolable private trust. (See DARTMOUTH COLLEGE CASE.) Dartmouth comprises the college; the Medical School, founded in 1798; the Thayer School of Civil Engineering, founded 1867; and the Amos Tuck School of Administration and Finance, founded in 1900. The Chandler School of Arts and Sciences, founded in 1851, was merged into the college in 1893 as the Chandler Scientific Course. In 1866 the New Hampshire College of Agriculture and Mechanic Arts was established by the State in connection with Dartmouth, but was separated from the college in 1893, and moved to Durham, N. H. The course of the Medical School is four years, and that of the Thayer and Amos Tuck Schools, two years; but the first year in any of the graduate schools may, under certain restrictions, be credited also as the last year in the undergraduate school.

Degrees are conferred in arts, letters, science, civil engineering, and medicine. The college buildings, numbering some twenty-five, include laboratories, an observatory, a medical building, dormitories, a large dining-hall, and commons. There is, besides, the Mary Hitchcock Memorial Hospital, having lecture and clinic facilities at the disposal of the Medical School. The library represents the accumulations of a century and a quarter, and consists of some 90,000 volumes and 20,000 pamphlets. The student enrollment in 1902 was 768, of whom 72 were in the Medical School, 36 in the Thayer School, and 27 in the Amos Tuck School. The presidents of the college have been: Eleazer Wheelock, 1769-79; John Wheelock, 1779-1815; Francis Brown, 1815-20; Daniel Dana, 1820-21; Bennett Tyler, 1821-28; Nathan Lord, 1828-63; Asa Dodge Smith, 1863-77; Samuel Coleord Bartlett, 1877-92; William Jewett Tucker, 1893—.

DARTMOUTH COLLEGE CASE. One of the most important cases in constitutional law ever decided by the United States Supreme Court. The charter of Dartmouth College was granted by the British Crown in 1769, incorporating twelve persons by the name of the Trus-

tees of Dartmouth College, and giving them full power to govern the college and to fill all vacancies in their body. In 1816 the Legislature of New Hampshire passed an act amending the original charter, providing for the appointment of eleven new trustees by the Governor of the State, and for a board of overseers to inspect and control the conduct of the trustees. The old trustees refused to accept the amended charter, and brought suit against the officers of the new board who had obtained possession of the college property. The Supreme Court of New Hampshire upheld the constitutionality of the statute, and the case was then taken on writ of error to the Supreme Court of the United States. For the plaintiffs the main argument was made by Daniel Webster (q.v.), and for the defendants by William Wirt (q.v.), Attorney-General of the United States. In its decision, handed down in 1819, and in which all but one of the justices concurred, the court held, through Chief Justice Marshall, that the acts of the New Hampshire Legislature in question were unconstitutional and void. The college was declared to be a private and not a public corporation; the charter of such a corporation was declared to be a contract between the Crown (to whose obligations the State of New Hampshire had succeeded) and the corporators and their successors, and the State statute which attempted to change the charter without the consent of the corporation was held to be within the prohibition of the Federal Constitution, that "no State shall . . . pass any . . . law impairing the obligation of contracts." The consequences of this decision have been very far-reaching, both in securing the inviolability of private trusts, and in limiting State sovereignty and extending, through the Federal courts, the authority of the Federal Constitution. The principles of the decision have been applied frequently both by Federal and State courts. The case is reported in 1 *New Hampshire Reports*, 111., and 4 *Wheaton (United States) Reports*, 518. For favorable comments on the decision, consult: Kent, *Commentaries on American Law*, vol. i. (Boston, 1884), Lect. xix.; Story, *Commentaries on the Constitution of the United States*, vol. ii. (Boston, 1891); Pomeroy, *Introduction to the Constitutional Law of the United States* (9th ed., Boston, 1886); Maine, *Popular Government* (London, 1885). For a searching criticism of the case, consult Shirley, *The Dartmouth College Causes* (Saint Louis, 1879).

DARU, dá'ru', PIERRE ANTOINE NOËL BRUNO (1767-1829). A French historian, poet, and statesman, born at Montpellier, January 12, 1767. He entered the army in 1783, was imprisoned (1792-93) on a charge of treason to the Republic for eighteen months, during which he produced a highly esteemed translation of Horace. Under the Empire he served with distinction as soldier and diplomat, and during the Restoration was made intendant-général by Louis XVIII. in 1814. At the second Restoration he retired for a time (1815-19) to private life and study, but was made member of the Chamber of Peers in 1819 and became a distinguished defender of constitutional liberty. He died on his estate, near Meulan, September 5, 1829. His *Histoire de la république de Venise*, and *Histoire des ducs de Bretagne* (1826), are impartial, erudite, and accurate. His occasional verses are

unimportant. Sainte-Beuve devotes three articles to him in the *Causeries* (vol. ix.). A *Life* by Viennet is prefixed to the fourth edition of *Histoire de la république de Venise* (Paris, 1853).

D'ARUSMONT, dá'rus'món', FRANCES. See WRIGHT, FANNY.

DAR'WEN. A town of Lancashire, England, situated amid moorland hills, 3½ miles south of Blackburn and 18 miles northwest of Manchester (Map: England, D3). It owes its importance to a trade with India and China in calicoes, for which it employs a large number of spindles and looms. The 'India Mill,' one of the finest in the country, covers an area of 31,000 square feet. The town also contains paper-staining works, paper-manufactories, calico-printing establishments, works for the manufacture of fire-bricks, tiles, and sanitary tubes, iron and brass founding, bleaching, machine and reed making. Coal-mines and stone-quarries also find employment for a considerable number of the inhabitants. It has numerous places of worship, large and commodious schools for elementary education, and a coöperative public hall. The municipality is enterprising and owns gas, water, electric-lighting supply, tramways, slaughter-houses, markets, public baths, free library, technical school, cemetery, artisans' dwellings, and lodging-house, and a modern system of sewage disposal for fertilizing purposes. The place was known as Over Darwen from the reign of Henry II., and with several hamlets was incorporated in 1878 as the municipal borough of Darwen. Population, in 1851, 11,702; in 1891, 34,192; in 1901, 38,200. Consult Shaw, *History of Darwen* (London, 1891).

DARWIN, CHARLES ROBERT (1809-82). The greatest English naturalist of the nineteenth century. He was born at Shrewsbury, February 12, 1809, the son of Dr. Robert W. Darwin, F.R.S., and grandson of Erasmus Darwin (q.v.). His mother was a daughter of Josiah Wedgwood, the famous manufacturer of pottery. After attending a public school at Shrewsbury for some years, he studied at Edinburgh University for two sessions, and then at Christ College, Cambridge, where he took his degree of B.A. in 1831. His father had originally intended him for the Church, but hereditary tendencies toward natural history led him in another direction. Shortly after graduation he seized an opportunity to go around the world as naturalist in H. M. S. *Beagle*, commanded by Captain Fitzroy, R.N. This expedition, which continued from December 27, 1831, to October 2, 1836, and spent much time in making surveys of southern South America, afforded Darwin a great opportunity for making original observations and for contemplation. It was, indeed, his studies on the fauna of the Galapagos Islands that planted the germ of his evolutionary studies. The account of his voyage, finally (1860) entitled *Voyage of a Naturalist on H. M. S. Beagle*, which has passed through many editions, is a classic work, and shows a degree of intelligence in the author that promised great things for his future. This voyage had a marked effect on Darwin's health, leaving him with a tendency toward nausea which during life permitted of only a limited amount of work each day. In the seclusion of his country place at Down, the great thinker was

able, by steady application, despite his disability, to produce his great works.

The scientific outcome of his voyage was a series of important books. In 1839 was published his first *Journal of Researches*; and in 1840-43 the *Zoology of the Voyage of H. M. S. Beagle*, published by the Government and edited by Darwin; in 1842 *The Structure and Distribution of Coral Reefs*, in which was proposed the theory of the origin of coral reefs that is most generally held to-day; in 1844, *Geological Observations on Volcanic Islands*; and in 1846, his *Geological Observations on South America*. Darwin's valuable *Monograph of the Cirripedia* (1851-55) was the immediate outcome of his voyage, and remains to-day the standard systematic work on this group.

It had long been known to a number of scientific friends that Darwin was working on a theory of evolution when, in 1858, he received from A. R. Wallace, then in the East Indies, the manuscript of a paper containing precisely the same explanation of adaptation that Darwin had hit upon. Darwin was naturally much embarrassed, but seemed willing to throw aside the work of years and give precedence to his friend's paper. On the advice of friends, however, his paper and Wallace's were read at the same meeting of the Linnean Society of London, and were published in their *Transactions* for 1858. In 1859 Darwin's book, *The Origin of Species by Means of Natural Selection, or the Preservation of Favored Races in the Struggle of Life*, appeared. It at once created the greatest interest, and, largely through the extraordinarily able championship of Huxley, its ideas soon gained widespread acceptance. Although Darwin's theory of natural selection is primarily only an explanation of adaptation, yet adaptation is of such fundamental importance that its explanation paved the way for the acceptance of the general theory of evolution; for Darwin contributed a mechanical or natural explanation of what had before required a supernatural explanation. Development by natural law took the place of the special-creation hypothesis. Darwin's mechanical theory is that of the struggle for existence, the annihilation of the unfit, and the consequent "survival of the fittest." It rests upon the evident fact that every species of animal produces more young than will develop to maturity and breed; for if all the young produced by any species bred the world would soon become filled with that species to the exclusion of every other. The vast number of individuals that are killed off are, on the whole, below the average of those that survive. The latter have been preserved on account of a certain, perhaps slightly, greater fitness to their environment, which may protect them from their enemies or give them greater power in gaining food or reproducing their kind. Their slight advantage will be inherited, and so the next generation will start from a fitter plane, and by a continuance of the selective process in successive generations, perfect adaptation will result. The theory of natural selection has been subjected to the most rigorous criticism, but it still remains a useful explanation of certain phenomena. See NATURAL SELECTION; EVOLUTION.

The importance of the change wrought by Darwin's book cannot be overestimated. First, it revolutionized the method of work and the

aims of natural history. The aims of zoölogical investigation were thenceforth the retracing of zoölogical *history*, determining the stages through which plants and animals have passed in their development. Before Darwin's time systematic work was the mere enumeration of species; since, it has been the study of relationships. Before Darwin, embryology was the description of the earlier stages of development; since, it has been the reading of the phylogeny in ontogeny. Before Darwin, comparative anatomy was the comparison of types; since then it has become the study of the effect of function and environment in molding the bodily form.

But the influence of Darwinism was by no means confined to natural history. Darwin himself early extended his general theory to man, especially in *The Descent of Man and Selection in Relation to Sex* (1871). Thus extended, Darwin's theory came into opposition to the Bible, literally and narrowly interpreted, and so it aroused a vast storm of opposition from Church officials. In fullness of time not only ecclesiastics but philosophers of every sort have come to base their teachings and doctrines on evolution. Darwin taught that the mind of man in its lowest stages was essentially an animal mind, and the upward progress of man is viewed as effected by natural causes, chief among which is the action of natural selection. He does not inquire into the exact way in which the mental and bodily are connected. He simply assumes that, just as the bodily organism is capable of varying in an indefinite number of ways, so may the mental faculties vary indefinitely in correspondence with certain physical changes. In this way he seeks to account for all the higher mental powers, as the use of language and reason, the sentiment of beauty, and conscience. Finally, Darwin seeks to give a practical and ethical turn to his doctrine, since he defines the general good—the proper object of man's action—as "the rearing of the greatest number of individuals in full health and vigor, and with all their faculties perfect under the conditions to which they are subject." It is well to observe that if Darwinism confined itself to a strict following of the great investigator, it might involve less of philosophic and metaphysical theory than has become popularly associated with it, for much of which Darwin is not to be held responsible. For further exposition of Darwin's views, see EVOLUTION AND NATURAL SELECTION, and the discussion of special phases of his doctrine and investigations under other titles there indicated.

Darwin's later life was devoted to the demonstration of his theory by a series of studies, the results of which appeared chiefly in the following books: *Fertilization of Orchids* (1862); *Variation of Animals and Plants Under Domestication* (1868); *Expression of the Emotions in Man and Animals* (1872); *Insectivorous Plants* (1875); *Climbing Plants* (1875); *The Effects of Cross and Self Fertilization in the Vegetable Kingdom* (1876); *Different Forms of Flowers in Plants of the Same Species* (1877); *The Power of Movement in Plants* (1880); and *On the Formation of Mould by the Action of Earthworms* (1881).

Personally Darwin was characterized by a kind disposition, gentle manners, and brilliant conversational qualities. His warm-heartedness,

CHARLES DARWIN
FROM A PHOTOGRAPH

Ch. Darwin

added to his genius, made for him strong friends, many of whom were of great assistance to him in gaining an acceptance of his theories. His methods of study were interesting. He was a voluminous gatherer of notes on topics which interested him; in experimentation he was quick in his movements and accurate. As in the case of many other leaders of science, his brain was fertile in hypotheses, which were readily rejected when experiment had shown them to be faulty. Although his correspondence was voluminous, he attended to it all with scrupulous care, replying courteously even to a request from a young man who was preparing a lyceum lecture for an abbreviated statement of his views, as the writer had no time to read his books.

He died April 19, 1882, full of years and honors. He was awarded the Prussian Order *Pour le Mérite* (1871), and was made a member of the French Academy in 1878.

Consult *Life and Letters of Charles Darwin*, including an autobiographical chapter, edited by his son, Francis Darwin (3 vols., London, 1887; reprinted in 2 vols., New York, 1893).

DARWIN, ERASMUS (1731-1802). An English physician and naturalist, the grandfather of Charles Darwin. He was born at Elton. He was a keen and philosophic observer of nature, and embodied much of his observations and thoughts in didactic verse, which form several long poems, whose style is stilted and fancifully elaborate. The principal of these is *The Botanic Garden* (1789), of which the second part, entitled "The Loves of the Plants," became famous, and was translated into French and Italian. It contained many suggestions as to 'protective mimicry' and other features afterwards a part of the elaborated doctrine of the evolution of plants. In 1794-96 was published his *Zoönomia*, in prose, which was primarily a medical work, but contained many more general reflections, and received wide notice. Its ideas were so novel and revolutionary that, according to Samuel Butler, Paley's *Natural Theology* was aimed at it and extinguished for a time its influence. Charles Darwin wrote of it, in his *Origin of Species*: "It is curious how largely my grandfather anticipated the views and erroneous grounds of opinion of Lamarck;" and modern students see also that he anticipated much that Charles Darwin himself advanced to acceptance. Erasmus Darwin's views on evolution include the belief that all animals have originated from a single living 'filament'; that changes are produced by differences of climate; that all animals undergo constant changes, and that many of their acquirements are transmitted to their posterity; that the contests of the males for the possession of the females lead to such results as were afterwards stated under the name of 'sexual selection'; that many structures have been acquired as a means of security in a struggle for existence; and that a vast length of time has elapsed since these modifications began. The debt which Charles Darwin, Lamarck, and other exponents of the doctrines of organic evolution, owe to Erasmus Darwin has been carefully considered by Packard in his biography of *Lamarck* (New York, 1901), and by Krause in *The Scientific Works of Erasmus Darwin* (1879); also by Butler, *Evolution, Old and New* (London, 1879). A meagre biography by Anna Seward was published in London in

1804. Dr. Darwin's last work was *Phytologia, or the Philosophy of Agriculture and Gardening* (1799), in which he expresses a belief that plants have sensation and volition. He died at Derby. See EVOLUTION.

DARWIN, FRANCIS (1848—). An English botanist, a son of Charles Robert Darwin, born at Down, in Kent. He received his education at Trinity College, Cambridge, studied medicine at Saint George's Hospital in London, assisted Charles Darwin at Down, and in 1888 was made reader in botany at the University of Cambridge. Besides a number of interesting papers on special botanical topics, he published the following works: *Life and Letters of Charles Darwin* (1887); *Charles Darwin* (1892); *Practical Physiology of Plants*, jointly with Acton (1894); *Elements of Botany* (1895). Charles Darwin's *Practical Physiology of Plants* was prepared with the son's aid.

DARWIN, GEORGE HOWARD (1845—). An English geologist, son of Charles Robert Darwin. He was born at Down, Kent, and after graduating at Trinity College (1868), where he was later a fellow (1868-78), he was admitted to the bar. He did not practice, however, but devoted his entire attention to mathematical science, and particularly to experimental investigation on the pressure of loose sands, on changes in the level of the earth's surface, and minor earthquakes. His publications include papers on *The Harmonic Analysis of Tidal Observations* (1883); *The Effects of Tidal Friction on the Earth and Moon*; *Periodical Orbits* (1896); and *Tides and Kindred Phenomena* (1898). In 1882 he assisted Sir William Thomson in the preparation of a new edition of Thomson and Tait's *Natural Philosophy*. He was appointed Plumian professor of astronomy and experimental philosophy at Cambridge in 1883. Mr. Darwin was chosen a member of the Royal Society, and in 1885 became a member of the council of the Meteorological Office.

DARWIN, MOUNT. A mountain of Tierra del Fuego, South America, above 6000 feet in altitude (Map: Chile, D 14). It is named after Charles Darwin.

DARWINISM. See DARWIN, CHARLES; EVOLUTION; and NATURAL SELECTION.

DASE, dä'zē, JOHANN MARTIN ZACHARIAS (1824-61). A mathematical prodigy, born in Hamburg. When a boy he gave public exhibitions as an expert calculator. One of his feats was the rapid multiplication of a series of fifty figures or more by another series of equal length; and he is said to have been equally expert in extracting the cubic root of numbers containing from 80 to 100 figures—a task he frequently performed in less than an hour. He wrote *Tafeln der natürlichen Logarithmen der Zahlen* (Vienna, 1850), and *Factoren-Tafeln für alle Zahlen der siebensten Million, oder genauer von 6,000,001 bis 7,002,000 mit den darin vorkommenden Primzahlen* (1862-65).

DASENT, dä'sent, SIR GEORGE WEBBE (1820-96). An English scholar and author, born at Saint Vincent, West Indies. He was educated at Oxford, was appointed civil-service commissioner in 1870, and in the following year assumed the editorship of *Fraser's Magazine*. He was also associated for some time with the Lon-

don *Times*, and edited the valuable lexicographical work entitled *Icelandic-English Dictionary* (1874). In addition to a translation of *The Younger Edda* (1842), he wrote the following: *The Norsemen in Ireland* (1855); *The Story of Burnt Njal* (1861); and *Selection of Norse Tales* (1862). His fascinating narrative entitled *Annals of an Eventful Life* passed through five editions (latest ed., 3 vols., 1870).

DASH, dāsh, LA COMTESSE (Fr., Countess Dash). The *nom-de-plume* of Gabrielle Anne de Cisterne de Courtiras, Marquise de Saint-Mars, a French novelist.

DASHKOFF, dāsh'kōf, EKATERINA ROMANOVNA, Princess (1743-1810). A prominent figure in Russian political and literary circles during the latter half of the eighteenth century. She was the daughter of Count Vorontsoff, and was born March 28, 1743. At the age of fifteen she was married to Prince Dashkoff, an officer of the Imperial Guard. As lady-in-waiting and intimate friend of the Grand Duchess Catharine, the Princess appears to have taken an extraordinarily active part in the conspiracy of 1762, which resulted in placing her mistress on the throne as Catharine II. (q.v.). Prince Dashkoff died in 1761, and his widow gave herself up to her children, to literature, and to politics. A coldness between herself and the Empress now ended in a quarrel and in her retirement from the Court. After an extended tour through Germany, England, France, and Italy, during which she met almost all the great literary men of the day, the Princess returned to Russia in 1782, and was at once restored to Imperial favor. She was appointed director of the Russian Academy of Science, and in 1783 became first president of the Russian Academy, which was established through her efforts. On the death of Catharine II., in 1796, she was deprived of her offices, and ordered by Paul I. to retire to her estates at Novgorod. Later on she was allowed to reside in Moscow, where she died on January 16, 1810. In literature the Princess is remembered as the writer of several comedies, and as being mainly instrumental in inducing the Russian Academy to draw up a dictionary of the Russian language. The work was completed under her direction, and was in part written by her. Her memoirs have been edited by Mrs. W. Bradford (London, 1840).

DASHT, dāsht, or **DESHT**, dēsht. A river of Baluchistan, Asia, running through the southwestern portion of the country and falling into the Arabian Sea near the Persian border (Map: Persia, H 7). Its northern branch, the Nibing, forms a part of the boundary between Baluchistan and Persia. The combined rivers are 175 miles long.

DASHWOOD, ELINOR and MARIANNE. In Jane Austen's *Sense and Sensibility*, two sisters typifying the two opposite qualities.

DASS, dās, PETER (1647-1708). The father of modern Norwegian poetry. He was born at Nord-Herø, the son of an immigrant Scotch merchant and a Norse woman of good breeding. He attained in the Church a position of dignity, responsibility, and some danger, on the north coast of Norway, where with brief intermissions he lived peacefully and wrote unremittingly verses and a garrulous *Autobiography*. His work

circulated in manuscript, but little was printed in his lifetime, and the first collection of his *Works* was by Eriksen (Christiania, 1874-77). *The Northland's Trumpet*, his most famous poem, was not printed till 1739. This rhyming description of land and people, quaint, witty, fanciful, and in an unforgettable lilting measure, is known by heart throughout northern Norway. Note-worthy, too, are the *Valley Song* (1696), and *Spiritual Pastime* (1711), a collection of religious verse.

DAS'SIE, or **DASSY** (South African). A familiar diminutive in Cape Colony of the local Dutch name *Klip-das* for the South African hyrax (*Procavia Capensis*), also called rock-rabbit by English colonists. See **HYRAX**.

DASTRE, dās'tr', FRANK ALBERT (1844—). A French physiologist, born in Paris. He studied at the Ecole Normale Supérieure, of which he became fellow, and was appointed professor of natural history at the Lycée Louis-le-Grand. In 1887 he was called to the chair of physiology at the Sorbonne. He translated S. Weir Mitchell's *Injuries of Nerves, and Their Consequences* (1872), as *Des lésions des nerfs, et de leur conséquence* (1873), and wrote *Rôle physiologique du sucre de lait* (1882); *Recherches expérimentales sur le système vaso-moteur* (with Morat, 1884), and other scientific works.

DASYPÆDES, dās'i-pē'dēz. See subtitle *Plumage*, in the article **BIRDS**.

DASYURE, dās'i-ūr (from Gk. *δαρύς*, *dasys*, shaggy + *οὐρά*, *oura*, tail). A marsupial of the family Dasyuridae, which includes various highly generalized carnivorous and insectivorous forms of Australasia allied to the opossums, and closely representative of Tertiary forms found fossil in South America and elsewhere. Their hind and fore limbs are approximately equal,

DENTITION OF DASYURES.

a, Tasmanian wolf (*Thylacinus*); *b*, Tasmanian devil (*Sarcophilus*).

and the toes (of which the second and third of the hind feet are entirely free) are well developed and clawed; their tails are long, hairy, curling, and not prehensile; their dentition is

carnassial, the canines often being large tusks, and there are eight large incisors in the upper jaw; and a cæcum is lacking. Many of the dasyures are strong, fierce, cat-like beasts of prey, scattered over Australia, New Guinea, and especially prevalent in Tasmania, where, as also in southeastern Australia, they have become rare owing to the war made upon them by the colonists. All are mainly terrestrial and live in burrows.

Prominent among these beasts is the thylacine, or Tasmanian zebra-wolf or pouched dog (*Thylacinus cynocephalus*). It is very wolf-like in appearance, but somewhat smaller than the common wolf, with shorter hair, a long terete, comparatively smooth tail, and more rounded ears. Its color is grayish-brown, with the hinder part of the back and root of the tail barred with blackish stripes diminishing to points on the flanks. It dwells in rocky dens, seeks its prey at night, and until reduced in numbers was a destructive pest to the flocks of sheep.

Another is the ferocious Tasmanian devil (*Sarcophilus ursinus*), which is a heavy, powerful, long-furred, almost black animal resembling a bear, but only about the size of a badger, and having a long, thick tail. It also is decidedly nocturnal, sleeping by day in some dark lair or burrow, and attacking sheep and lesser prey by night, nothing being safe from its strength and ferocity; but this pest is now nearly exterminated.

On the continent of Australia several very cat-like or civet-like dasyures occur, of which the handsomest is the spotted 'native cat,' nearly as large as a house cat; but some of this genus (*Dasyurus*) are much smaller. To the genera Phascologale and its allies belong a variety of small insect-eating dasyures greatly resembling rats and mice in their appearance, and living mainly on insects, birds' eggs, etc.; and another now very rare form (*Antechinomys laniger*) has much the form and appearance of a jerboa. Finally there must be mentioned the banded ant-eater (*Myrmecobius fasciatus*), "which derives its special interest from the circumstance that it comes closer to some of the extinct marsupials of the Secondary rocks of Europe than does any other living type." This animal is about the size of a squirrel, but has a viverrine form and long, somewhat bushy, tail. In many of the dasyures the pouch is rudimentary, but here the female has no pouch, "the young, when first born, being merely concealed by the long hair of the belly as they cling to the teats (four in number)." Its teeth are all small and adapted to eating the insects that constitute its fare—mainly ants and termites, which are gathered by the long and protrusile tongue. Hence it is found chiefly in the sandy plains of southern and western Australia, where it dwells in the hollows of ant-hills and similar retreats. Its general hue is white beneath, and on the upper part dark chestnut-red marked by broad transverse bars of white. See MARSUPIALIA; and Plate of PHALANGERS.

DATE. See CALENDAR; CHRONOLOGY.

DATE, and **DATE-PALM** (OF. *date*, *datil*, *datille*, Fr. *datte*, from Lat. *dactylus*, Gk. *δάκτυλος*, *daktulos*, finger, date; so called from the shape). The common date of commerce is the fruit of the date-palm (*Phoenix dactylifera*). Besides this

there are several other species which bear fruits of more or less value, but none rank in importance with *Phoenix dactylifera*. This plant is a native of the southwest of Asia and the northern half of Africa, finding its most congenial home and most extensive cultivation in Arabia. The plant is also cultivated in China, in France, Italy, and, very sparingly as yet, in the United States. California, however, promises to become a commercial date-producing section.

The date is borne on one of the tree-palms, although many of the representatives of the genus *Phoenix* are low-growing plants. The date-palm is a tree ranging from 40 to 100 feet in height, bearing a dense head of pinnated leaves several feet in length. The plant is dioecious, the staminate flowers being borne on one plant, while the pistillate ones are borne by another individual. This peculiarity is well understood by the natives, who cut off the staminate flower clusters and place them in the pistillate trees to insure fertilization. Since each tree reproduces its sex in the sprouts or suckers from its base, date orchards or plantations are made up of the young plants taken from the roots of bearing trees, with only a sufficient number of staminate plants to insure fertilization. The date enjoys a hot, bright, sunny situation, thrives on soils too alkaline for other vegetation, but must have water within reach of its roots. The bearing age is reached in about eight years, and as the plants are long-lived and frequently bear as much as 300 to 500 pounds of fruit in a season when at full bearing, they become enormously profitable; in fact, the date is the chief source of wealth for Arabia, and is used as the staple food by caravans crossing the great desert. The fruit possesses a high food value, being chiefly composed of sugar, together with pectin, gum, and proteids. The fruits are eaten both fresh and dried. The seeds when roasted form a substitute for coffee, and when ground yield a valuable oil, as well as a pomace used as a cattle food. Beside these products the tree itself yields in its leaves materials for baskets and wickerwork; the trunk yields a fibre from which twine and rope can be made; an edible bud known as 'palm cabbage' is produced at the crown of the tree, and the wood is used for fencing and for the construction of light shelter. Besides these economic uses, the date-palm has long figured conspicuously in religious services among Jews and Christians, as well as among pagans. The *palm-tree* of the Scripture is *Phoenix dactylifera*, and Christ's triumphal entry into Jerusalem is to this day celebrated on Palm Sunday. It has other symbolic meanings; to the Hebrews and Hellenes it stood as the symbol of beauty and of victory. See Plate of MONOCOTYLEDONS.

DATE LINE. See INTERNATIONAL DATE LINE.

DATE-PLUM. See PERSIMMON.

DATE-SHELL, or **DATEFISH** (so named from its shape). (1) A shell of a small bivalve mollusk or datefish of the genus *Lithodomus* (or *Lithophagus*), closely allied to the horse-mussel (*Modiolus*), which burrows deeply into calcareous rocks, the shells of larger mollusks, etc. One species (*Lithodomus lithophagus*) abounds in the Mediterranean, and is of interest mainly because of its perforations of certain columns of

the ancient Temple of Serapis at Pozzuoli (ancient Puteoli), a few miles west of Naples, Italy. These columns are of African marble, and several centuries ago were carried by the sinking of the ground below the level of the sea, which overflowed the site of the ruins and submerged the pillars to the height of 13 feet, exposing them to attack by these mollusks, which burrowed into them in large numbers. Subsequently they were slowly elevated (probably about the end of the fifteenth century) and have since been above the water. The method of boring rocks is not thoroughly understood, but is thought to be mainly by abrasive movements of the foot. (2) In California, an edible bivalve mollusk (*Zirphæa crispata*) related to the piddock (q.v.).

DATI, dā'tē, CARLO ROBERTO (1619-75). An Italian philologist and writer, born in Florence. His many curious and interesting books include: *Discorso dell' obbligo di ben parlare la propria lingua* (1657); *Lettera a Filatele* (1663); *Vite de' pittori antichi*, dedicated to Louis XIV. (1669); and *Due novelle* (1863).

DATIA, dāt'ē-ā. The capital of the principality of the same name in Central India (Map: India, C 3). It stands on a rocky height surrounded by a stone wall. The chief of the Datia State dwells here. West of the town rises a palace of immense size and remarkable beauty; and there are interesting Jain temples, four miles distant. Population, in 1891, 27,566; in 1901, 24,071.

DA'TIS (Lat., from Gk. Δάτις, from Pers. *Dātrēh*, good according to the law, from *dat*, OPers. *dāta*, law + *rēh*, Av. *rohu*, good). A Persian general of the fifth century B.C. In conjunction with Artaphernes, he commanded the army of Darius which was defeated at Marathon by Miltiades (B.C. 490). Afterwards he was put to death by the Spartans.

DATIVE. See DECLENSION.

DAT'OLITE, or **DATH'OLITE** (Gk. *δατέλιθον*, *datēlisthai*, to divide + *λίθος*, *lithos*, stone; referring to its granular structure). A boron and calcium orthosilicate that crystallizes in the monoclinic system. It is usually found in the form of glassy, greenish crystals, but sometimes has a yellow or reddish tinge. Datolite usually occurs in veins and cavities in basic eruptive rocks, often with calcite, prehnite, and the zeolites. It is found in Scotland, Norway, Sweden, and various places on the Continent. In the United States it occurs at Bergen Hill and Paterson, N. J.; in Connecticut and Massachusetts, and in the Lake Superior region. The crystals take a high polish and have been cut as opaque gems or ornamental stones.

DATU'RA. See STRAMONIUM.

DATU'RINE. See ATROPINE.

DAUB, doup, KARL (1765-1836). A German speculative theologian. He was born at Cassel and educated at Marburg, where he was tutor for a time; became professor of philosophy at Hanau in 1794, and soon afterwards of theology at Heidelberg, where he remained until his death. His writings, based on the philosophies, successively, of Kant, Fichte, Schelling, and Hegel, were once important for their argumentative method, but are no longer much read. The principal ones are: *Lehrbuch der Katechetik* (1801); *Theologemena* (1806); *Einleitung in das Studium der*

Dogmatik (1810); and *Die dogmatische Theologie jetziger Zeit oder die Selbstsucht in der Wissenschaft des Glaubens* (1833).

DAUBAN, dō'bān', JULES JOSEPH (1822—). A French painter. He was born in Paris, and studied there under Auguste Delbay. He became director of the School of Fine Arts at Angers in 1849, and was made a member of the Legion of Honor in 1868. Among his works are "Trappists Receiving a Stranger" (1864), in the Luxembourg; "Trappists Exchanging the Kiss of Peace" (1865), in the Angers Museum; and "Fra Angelico da Fiesole" (1873). He produced several decorative paintings in the theatre and hospital at Angers, and in the Church of Saint Louis-en-l'Isle, Paris. Despite a certain coldness of color, his compositions are dignified and impressive.

DAUBENTON, dō'bān'tōn', LOUIS JEAN MARIE (1716-99). A French naturalist, born at Montbar, May 29, 1716. In 1742 he became associated in Paris with Buffon in the preparation of the latter's great *Histoire naturelle*, for which he furnished the anatomical descriptions relating to mammals. In 1745 Daubenton became curator and demonstrator of the cabinet of natural history of the Académie des Sciences, and in 1778 professor in the Collège de France. He wrote voluminously, and has been especially influential in the science of herpetology. He died in Paris, December 31, 1799.

DAUBER, dab'ēr, or MUD-DAUBER. See MUD-WASP.

D'AUBIGNÉ, dō'bē'nyā'. See MERLE D'AUBIGNÉ.

D'AUBIGNÉ, THÉODORE AGRIPPA (1550-1630). A Protestant historian, poet, and soldier, born near Pons in Saintonge, France, February 8, 1550. He was educated at Geneva. Latin, Greek, and Hebrew were familiar to him from his earliest youth, and at seven years of age he is said to have made a translation of Plato's *Crito*. His father had inspired him with an enthusiasm for the Huguenot cause, and he was present at the siege of Orléans in 1563, when the elder d'Aubigné was slain. The son played a prominent part in the religious wars preceding the accession of Henry of Navarre. Though opposed to that prince's conversion, he consented to serve him, and was made vice-admiral of Guienne and Brittany. D'Aubigné was famous for his rough wit and frank speech, and he did not hesitate to use the most outspoken sarcasm against the King and other members of the royal family. The assassination of Henry IV., in 1610, caused D'Aubigné to retire to his estates, and later he took up his residence at Geneva. There he employed himself in literary work and in furthering the cause of Protestantism, in every way possible. His last years were embittered by the conduct of his son Constant, who betrayed the trust reposed in him by the Huguenots. This son was the father of the Duchesse de Noailles and of Madame de Maintenon. D'Aubigné died April 29, 1630, leaving as his literary legacy a number of works, of which the following deserve mention: *Histoire universelle 1550-1601*; *Confession catholique du Sieur de Sancy*; and *Aventures du baron de Fancoste: histoire secrète écrite par lui-même*. These, with others of less importance, will be found in *Œuvres complètes de Th. d'Aubigné*, edited by MM. Reaume and de Caussade, which

also contains *Sa vie et ses enfants*, the best biography; consult, also Réaume, *Etude historique et littéraire sur A. d'Aubigné* (Paris, 1883).

DAUBIGNY, dô'bényé', CHARLES FRANÇOIS (1817-78). A French landscape painter, born in Paris on February 15, 1817. His father was a teacher of drawing and a painter who occasionally exhibited at the Salon. Charles François was brought up by an old nurse at Valmandois, near He-Adam, where he remained until his tenth year. In this, his childhood home, to which he frequently returned, and where he finally settled, he imbibed his great love for nature. On his return to Paris he helped support the family by painting articles like fans, snuff-boxes, and even business signs. In his seventeenth year he went to Italy with a friend and fellow artist, traveling on foot. He remained there for a year, but was not much influenced by his sojourn. In 1840 he entered the studio of Delaroche, with a view to competing for the Prix de Rome, but having been disqualified, he was thrown upon his own resources. He turned to nature, and was thenceforth a landscape painter. With the exception of the years 1842-46, he exhibited every year in the Salon. He received a second-class medal in 1848, a first-class in 1852, and in 1857 he was made Chevalier of the Legion of Honor. Gratified with his success in painting river scenery, he built a house at Auvers on the Oise, near his childhood home. He constructed a curious boat, the *Botin*, at the same time a house and a studio, in which, accompanied by his son Karl, he navigated at will, sketching river scenery. In 1876 he visited Normandy, bringing back with him many sketches of the sea and the shores of the channel. During the latter part of his life he suffered much from rheumatism contracted on his river trips. He died in Paris on February 20, 1878.

Daubigny was the youngest of the five great landscape painters of the Barbizon School. The rest were perhaps greater discoverers than he. They painted nature with figures as a subordinate incident of the scene, and only adding to the artistic sentiment they wished to express. Daubigny painted the country, that is to say, nature as affected by man, although men do not usually appear in his scenes. There are certain kinds of landscapes which he may be said to have discovered, and which are indissolubly linked with his name. He is the great painter of river scenery of central France, on the Seine, the Marne, and the Oise; of orchards, full of white blossoms or laden with ripe fruit, and of the fields; of the sea and of the shores of the Channel. His favorite light was at dusk, in the cool of the evening, or the pale light of the moon. A delicate shade of vaporous air pervades his paintings; his values are just, and the colors are properly juxtaposed. His paintings do not always present distinctness of outline, for drawing was not his strong point, but the handling is massive and powerful. In his early period he paid more attention to detail, but he increasingly adopted greater breadth of treatment, and his last works may almost be called impressionist.

Among his chief works are the "Valley of Optevoz," which took the gold medal in 1853. In the Louvre are his "Springtime," in which one can fairly smell the apple-blossoms and see the green grass grow, the "Lock of the Optevoz,"

and the "Vintage." Other important works are the "Beach at Villerville" (1859); "Mourise" (1861); "The Sheepfold" (1866); and the "Apple Orchard" (1876), an autumnal scene in which the prevailing tone is a dark, rich green, with apples ripe for the pickers. The chief public galleries of America are well supplied with his works, as are also some of the private collections. Daubigny unfortunately sold to art dealers a large number of works which are little more than sketches. These are frequently met with in picture collections, but no adequate conception of his work can be formed from them. Besides being a great painter, Daubigny was an etcher of repute, especially in the period after his return from Italy.

Consult: Strahan, *History of French Art* (New York, 1900); Hustin, "Daubigny," in *Les Artistes célèbres*; Tryon, "Daubigny," in Van Dyke's *Modern French Masters* (New York, 1896); Henriet, *Daubigny et son œuvre* (Paris, 1878).

DAUBIGNY, KARL PIERRE (1846-86). A French landscape painter, born in Paris, son and pupil of Charles François Daubigny. His pictures, the subjects of which were mostly chosen from the valleys of the Seine and Oise, and the coasts of Brittany and Normandy, bear the impress of his own strong individuality. Among them may be mentioned: "Return from Fishing at Trouville," "The Thames Near Chelsea," "Road from Paris to Fontainebleau," "The Farm of Saint Siméon Near Honfleur," and "Moonrise at Sunset" (1866), his last, and also one of his best, efforts.

DAUBRÉE, dô'bré', GABRIEL AUGUSTE (1814-96). A French geologist and mineralogist. He was born at Metz, and was educated at the Ecole Polytechnique in Paris. In 1838 he was made professor at Strassburg, and in 1861 became a member of the Academy of Sciences in Paris. In Paris he also held a professorship at the Museum of Natural History and at the School of Mines, of which latter he became director in 1872. Besides a very large number of original papers, Daubrée's published works include: *Etudes synthétiques de géologie expérimentale* (1879); *Les météorites et la constitution du globe terrestre* (1886); *Les eaux souterraines* (3 vols., 1877). His original researches resulted in valuable contributions to our knowledge of the mode of formation of various mineral substances and of crystalline rocks.

DAUCUS. See CARROT.

DAUDET, dô'dá', ALPHONSE (1840-97). The most graceful of modern French humorists, the most sympathetic satirist and the most charming, if not the deftest, story-teller of his generation in France. He was a native of Provence, and inherited its warm imagination. He has given us one of the classics of child autobiography in his *Le petit chosé*. His father, a well-to-do manufacturer, suffered a reverse of fortune, and young Daudet, who was already nursing literary dreams, was obliged to accept a post as usher, ill-paid and ill-paid, in a school at Alais. After a year of this mental slavery, he escaped in desperation and joined his equally penniless brother Ernest (q.v.) in Paris (November, 1857). He tried to eke out a livelihood by journalism, contributing prose and verse to the *Figaro* of sound morale and polished workmanship. "His literary conscience," says

his brother, "awoke in him at the same instant as his literary talent," and it never slumbered, even when, as occasionally happened, the talent nodded. "It is style that perfumes a book," he said, and his own had a studied and unique fragrance from the first. Zola describes him at this time as "living on the *Romanée of the Rose*, a love allegory, on the outskirts of the city with other poets, a whole band of joyous Bohemians," whom he was to picture in *Jack*. Yet he lived with them and left them without losing the bloom of his youth, the freshness of his mind, or the straightforwardness of his character. His work attracted notice, and in 1861 Empress Eugénie, fascinated by his poem on *Les Prunes*, induced the Duc de Morny, the Minister of State, to give Daudet a sinecure secretaryship, which he held till Morny's death (1865) and turned to good account in *Le nabab*.

Holding this Government post, he traveled on nominal commissions to Algeria, Corsica, and Sardinia, gaining health and supplementing an always deficient sense of color while he gathered material for Arabian and Corsican stories, used in his *Lettres de mon moulin* and *Contes du lundi*, as well as for his greatest novels, *Numa Roumestan* and *Le nabab*, and for the scenery of the first exploits of his immortal *Tartarin*. He now first learned to know Gambetta, Mistral, and others, from whom he caught the secrets of Provençal character; he attempted the drama, and felt in 1865 sufficient confidence in his literary future to resign his Government position. In 1867 he finished *Le petit ébosc* and married an almost ideal helpmeet—a woman of letters, whose northern French common sense supplemented and directed his southern ardor, compelling him, as it were, to realize the possibilities of his genius. Her influence was obvious in his next book, *Lettres de mon moulin* (1869), which contains some exquisite bits of story-telling in lighter vein. Then came the war with Germany to give his mind a sterner temper. In that terrible year (1870-71) it was that his genius came to full ripeness, which manifested itself first in *Tartarin de Tarascon* (1872). This, with its sequels, *Tartarin sur les Alpes* (1886) and *Port-Tarascon* (1890), is a masterpiece of subtle caricature of the effervescent imagination of Provence, that creates its own environment and yet charms in spite of its own self-deception. A second volume of short stories, *Contes du lundi* (1873), fulfilled his promise of the *Lettres de mon moulin* and added a stronger note in such stories as *La dernière classe*, *Le siège de Berlin*, *Le jeu au billard*, and *Le bac*. Less admirable in tone are the *Lettres à un absent* (1871), now canceled in Daudet's works, and *Robert Helmont* (1874), sketches of wartime, interesting because they contain preliminary studies for *Jack* and *Le nabab*. In 1874 Daudet entered on the high road to fortune as well as fame with his first 'Parisian drama,' the novel *Fromont jeune et Rister aîné*, translated under the name of its feminine incarnation of evil, *Sidonie*. Here, as later, he showed himself an idealistic student of reality, choosing as his scene what he could view from his study window and gathering notes in street and shop and parlor, masses of which are among his literary remains. He had now found a new power and discovered the joy of sustained creative effort. Each novel now marks progress—*Jack* (1876);

Le nabab (1877); *Les rois en exil* (1879); and *Numa Roumestan* (1881). Then comes a change in method with *L'Évangéliste* (1883), no longer a drama, but 'an observation,' a psychic study, a cauterization of cant and hypocrisy, not a novel of action. *Sapho* (1884), too, is more a demonstration than a narration, though some regard it, as did Daudet himself, as the crown of his achievement. It was the last novel written before nervous disease laid hold on him. It is a work of great power, but its realism verges on the pathologic, and its story of facile love, that saps the strength of heart and mind, is disagreeable reading. The novels of Daudet's decline are *L'immortel* (1888), a satire on the French Academy, as inexplicable as it was cruel, with an imputation as improbable as it was unjust; *Rose et Ninette* (1891), a story of divorce; *La petite paroisse* (1895), a study of jealousy. His reminiscences are embodied in *Trente ans de Paris* (1888) and *Souvenirs d'un homme de lettres* (1889). The posthumous *Soutien de famille*, a bitterly sarcastic picture of French political life (1898), and a volume of stories, trivial or saturnine, *La Fédor*, also published after Daudet's death, complete the list.

Since 1885 Daudet had been an intense nervous sufferer, with alternating periods of great activity and dead calm. Death came suddenly at table in the family circle. Daudet had exquisite subtlety rather than forceful virility. He charms by variety and suppleness, and by shifting of scenes and keys. He is more impressionist than logician. He seldom shows more than one side, even of a complex character, and is better with women than men. But though he lacked interpretative insight, he had an acutely sensitive imagination, and was able to give of the society in which he lived the broadest, most varied, and, in the main, most faithful image, while he leaves on his readers the impression of a noble and sympathetic character. There are several translations of Daudet's chief novels and a uniform edition of them (Boston, 1900), with critical introductions. Consult: Léon Daudet, *Alphonse Daudet*, and Ernest Daudet, *Mon frère et moi* (Eng. trans. of them both, Boston, 1898); Brunetière, *Le roman naturaliste* (Paris, 1896); Doumic, *Portraits d'écrivains* (id., 1892).

DAUDET, ERNEST (1837—). A French novelist and historian, born at Nîmes, May 31, 1837. He is a brother of Alphonse Daudet, of whom he wrote an interesting biographical sketch, *Mon frère et moi* (1882), translated as an appendix to *Alphonse Daudet*, by Léon Daudet (Boston, 1898). His noteworthy novels are: *La Vénus de Gordes*; *Fleur de pêché*; *Marthe*; and *La Princesse de Lerici* (1900). He has written also an *Histoire de l'émigration* (1886-90) during the French Revolution, and an *Histoire des conspirations royalistes du midi* (1881) in the same period.

DAUGHTERS OF THE AMERICAN REVOLUTION, SOCIETY OF. A woman's patriotic society, organized in Washington, D. C., October 11, 1890. It has for its objects the perpetuation of the memory of those who achieved American independence, the collection of relics of early American days, and the erection of monuments on historic sites. Membership is restricted to those women of whose access-

tors—at least one aided in establishing American independence. The society has admitted to membership about 40,000 women, organized into some 700 local chapters. These chapters are found in all of the States and Territories excepting Idaho and Mississippi, Nevada, Arizona, and New Mexico, and there are also chapters in Canada, the Hawaiian Islands, and in Europe. Delegates from all the chapters meet in annual congress in Washington in the week of Washington's Birthday. The society has collected many historical relics, which have been deposited in the United States National Museum in Washington, and it has also a valuable historical and genealogical library at its headquarters in Washington. During the Spanish-American War it aided the Government by securing nurses of proper character and qualifications. The society has accumulated a fund of \$125,000, for the purpose of erecting a Continental Memorial Hall in Washington, and in 1902 purchased a site for that purpose. The National Society was incorporated by act of Congress in 1896, and, in accordance with that act, reports annually to Congress. The society publishes *The American Monthly Magazine*, the first number of which was issued July, 1892; and also a series of lineage books, containing the record of the ancestry of each member of the organization.

DAUGHTERS OF THE CONFEDERACY, UNITED. See CONFEDERACY, UNITED DAUGHTERS OF THE.

DAUGHTERS OF THE KING. An organization for women in the Episcopal Church, analogous to the Brotherhood of Saint Andrew. It was organized in New York City in 1885, and its pledge requires that each member shall make an earnest effort each week to bring at least one woman within the hearing of the gospel of Jesus Christ. It holds an annual convention, has headquarters in New York City, and an organ, *The Royal Cross*, and has enrolled upward of 12,000 persons. Members are admitted with a solemn service before the altar, invested with the cross, and pledged by a vow to prayer and service. Consult Bacon and Northrop, *Young People's Societies* (New York, 1900).

DAUGHTERS OF THE REVOLUTION, SOCIETY OF. A woman's hereditary patriotic society organized in New York City in 1891. As originally composed, the society consisted largely of those who had withdrawn from the Society of the Daughters of the American Revolution (q.v.), because that society then admitted to membership women of collateral descent. The patriotic objects of the two societies are similar, but the requirements for admission to the Daughters of the Revolution are the more stringent. They require a member to be the lineal descendant of an ancestor who actively assisted in the establishment of American independence, and who became thereby liable to conviction for treason against the Government of Great Britain. The General Society, which meets annually, is composed of national officers and delegates from the following organized State societies: Colorado, Connecticut, Delaware, Indiana, Iowa, Kentucky, Maryland, Massachusetts, Minnesota, New Hampshire, New Jersey, New York, North Carolina, Ohio, Pennsylvania, Texas, Utah, Washington, West Virginia, and Wisconsin. The total membership is 4000.

DAULATABAD, dou'la-tā-bād' (Ar., city of prosperity; Hind. *Deogiri*, Skt. *Dēvāgiri*, mountain of the gods, from the cliff which commands the town). A strongly fortified town of India, within the Nizam's dominions, near their north-western frontier, in latitude 19° 57' N., and longitude 75° 18' E. The town is noted for its commanding rock-fortress, which, with a height of about 500 feet, is scarped into a perpendicular for the lowest third of its altitude. This stronghold is all the more formidable from its being completely isolated, being 3000 yards distant from any other eminence. The town has greatly decayed, and has a population of less than one thousand. The famous cave temples of Ellora are within seven miles of Daulatabad.

DAUMER, dou'mër, GEORG FRIEDRICH (1800-75). A German poet and philosophical writer, known also by his pen-name, Eusebius Emmeran. He was born at Nuremberg, studied at the Universities of Erlangen and Leipzig, and, from 1822 to 1830, was a professor in the Nuremberg Gymnasium. He solemnly urged that human sacrifice had attended Hebraic and even primitive Christian rites, and passed in a few years from violent rationalism to ultra-Romanism. His writings, which mirror his peculiarities, include *Die Urgeschichte des Menschengeistes* (1827); *Die Geheimnisse des christlichen Altertums* (2 vols., 1847); *Aphorismen über Tod und Unsterblichkeit* (1865); and *Das Wunder* (1874). For somewhat more than a year he was guardian and instructor of the famous foundling Kaspar Hauser (q.v.), in regard to whom he published *Mittheilungen über Kaspar Hauser* (1832); *Enthüllungen über Kaspar Hauser* (1859); and *Kaspar Hauser, sein Wesen, seine Unschuld* (1873).

DAUMET, dô'má', PIERRE JÉRÔME HONORÉ (1826—). A French architect, born in Paris. He studied at the Ecole des Beaux-Arts, and obtained the Prix de Rome in 1855. Afterwards he accompanied an archaeological mission to Greece under the directorship of M. Henzey. Upon his return he was employed by the city of Paris in the rebuilding of the Palais de Justice. After the death of Viollet le Duc, he was made architect-in-chief for this important work, and completed it. In 1885 he became a member of the Institute and inspector-general of civil buildings. M. Daumet's name became connected with all the architectural societies of interest in France, and he was elected an honorary member of the Royal Society of British Architects. His most notable work is the restoration of the Château de Chantilly for the Duke d'Annamale (1876-81).

DAUMIER, dô'myá', HONORÉ (1808-79). A celebrated French caricaturist, born in Marseilles. Fashion, fiddle-tattle, scandal, politics, blemishes of figure, and oddities of character in turn inspired his genius for mockery. Few among his illustrious contemporaries escaped his pencil. His most celebrated work is the series of "Robert Macaire," published in the *Charivari*, after which followed "Les actualités," "Les divorcés," "Les femmes socialistes," "Les philanthropes du jour," "Les Grecs," "Les gens de justice," "Les bons bourgeois," "Les pastorales," and "Les papas." The Revolution of 1848 suggested two of his most remarkable series—"Idylles parlementaires" and "Les représentants représentés."

He became blind in 1877, and died in 1879 at Valmondois (Seine-et-Oise) in a house given him by Corot, the landscape painter. Consult: Muther. *The History of Modern Painting* (London, 1896); Alexandre, *Honoré Daumier, l'homme et son œuvre* (Paris, 1890).

DAUN, *doun*, LEOPOLD JOSEPH MARIA, Count von (1705-66). An Austrian field-marshal and commander-in-chief of the Austrian forces during the Seven Years' War. He was born September 24, 1705, in Vienna, and entered early upon his military career as an officer in the regiment of his father. In the Turkish campaigns of 1737-39, and in the War of the Austrian Succession, he found opportunities for distinction and rose rapidly in rank, being made a field-marshal and privy councillor after the Peace of Aix-la-Chapelle. He was the first director of the military academy at Wiener-Neustadt, and introduced many reforms in the organization of the Austrian Army. In 1757 he succeeded to the chief command. He took the field against Frederick the Great in Bohemia, and, after a hard-fought battle at Kolin, forced the King to retire from that country. He and Prince Charles of Lorraine were thoroughly beaten by the King of Prussia at Leuthen on December 5 of the same year. On October 14, 1758, he gained another victory over Frederick at Hochkirch, and, but for the late arrival of the Prince of Baden-Durlach with reinforcements, he would probably have annihilated the Prussian army. Again, on November 25, 1759, at Maxen, he compelled the Prussian General Fink to surrender, with 11,000 men. He won no other important victories, and was defeated by Frederick at Torgau (1760), where he was wounded for the third time upon the field of battle. He was brave and a skillful strategist, but too deliberate in his movements and no match for his alert antagonist. He won victories without following them up, while Frederick, though losing battles, nearly always derived signal advantages from his campaigns. The Peace of Hubertsburg in 1763 closed Daun's active military career. He died in Vienna, February 5, 1766. Consult *Leben und Thaten des Grafen Leopold von Daun* (Frankfurt and Leipzig, 1759-60). See SEVEN YEARS' WAR.

DAUNOU, *dō'nōō'*, PIERRE CLAUDE FRANÇOIS (1761-1840). A French publicist and statesman. He was born at Boulogne-sur-Mer, and entered the Congregation of the Oratory in 1777. In 1792 he became a member of the National Convention for Pas-de-Calais, where he had previously held the position of grand vicar under the bishop of the department. He opposed the execution of Louis XVI., but voted for his deportation until a settlement might be effected; and he also refused to give his support to the law proscribing the Girondists. For these views he was imprisoned, and escaped death only by the downfall of Robespierre. Throughout this critical period he was distinguished for his moderate policy. He belonged to the Council of the Five Hundred and was the first president of that body. In 1801 he became librarian at the Panthéon, and secured for that library the valuable collection of Pius VI., and in 1807 he was appointed the archivist of the Empire. He was editor of the *Journal des Savants* from 1816 until shortly before his death. His works include: *Histoire littéraire de la France*, upon which he was employed for

twenty years, and *Essai historique sur la puissance temporelle des papes* (1810).

DAUPHIN, *da'fīn*; *Fr. pron. dō'fān'* (OF. *dauphin*, *doffin*, *Fr. dauphin*, *Port. dalfin*, from *Lat. delphinus*, dolphin, on account of the three dolphins on their family crest). Formerly the title of the eldest son of the French King. It was originally the appellation of the lords of the province of Dauphiné. The last of these, Humbert II., dying childless (1349), bequeathed his possessions to Charles of Valois, grandson of Philippe VI. of France, on condition that the heir apparent to the throne of France should bear the title of Dauphin of Vienno, and govern the province. Louis XI. conferred on the Dauphin almost sovereign rights; but after his time these were gradually abridged, until Dauphiné was placed under the same laws as the rest of the kingdom, and the title became merely honorary. After the revolution of 1830, it was abolished altogether. Consult Tricaud, *Histoire des dauphins français* (Paris, 1713).

DAUPHINÉ, *dō'fē'nā'*. Formerly a frontier province in the southeast of France, comprising the present departments of Drôme, Isère, and Hautes-Alpes. After the fall of the Roman Empire Dauphiné formed the southernmost part of the Kingdom of Burgundy. It then passed under the dominion of the Franks, and after the dismemberment of the Carolingian monarchy it became a portion of the new Burgundian Kingdom of Arles. It then passed into the possession of the German Emperor in 1032, and remained united with Germany till the middle of the fourteenth century, when it was presented to France by the last of the lords of Dauphiné. Governed for a century as a separate State, by the heir to the French throne, it was finally incorporated with France. During the Civil Wars Dauphiné was the stronghold of Protestantism and the scene of many bloody conflicts, in which the Huguenots gained the upper hand. The old rulers of the land bore the title of Dauphin (q.v.), and the name was afterwards transferred to the district. Consult Chariot, *Histoire générale du Dauphiné* (Valence, 1883).

DAUPHINE, *dō'fēn'*, SIR EUGENE. The none too scrupulous hero of Ben Jonson's *Epicæne*, who marries his uncle to a man disguised as a woman, and thereby secures the inheritance.

DAURAT, *dō'rā'*, or **DORAT**, JEAN, Latin name AURATUS (c.1500-88). A French poet, born and educated at Limoges. He was appointed preceptor of the pages at the Court of Francis I., who took a deep interest in him; became director of the College at Coqueret, and in 1560 was appointed professor of Greek in the Royal College in Paris. He was called the 'modern Pindar,' and ranked among the 'Pleïades,' or seven great poets of the age. He also held the position of 'poet royal' to Charles IX. His numerous odes and epigrams do not, however, justify the high estimation in which he was held in the sixteenth century. They are written in Latin and in 1586 were published under the title, *Pœmatica, hoc est Poematum Epigrammatum, Anagrammatum*.

DAUTZENBERG, *dou'tsen-bērck*, JOHANN MICHAEL (1808-69). A Flemish poet, born at Heerlen, Netherlands. He is known chiefly through his *Folksleesboek* (with Duyse, 1854), his valuable writings on prosody, and his intro-

duction of foreign metres into Dutch poetry, a task in which he succeeded despite the numerous difficulties presented. His valuable poetic works, which include a translation of the *Odes* of Horace, were published at Brussels in 1850, under the title of *Gedichten*. Those written after 1850 were collected by Frans de Cort in the volume entitled *Verspreide en nagelaten gedichten* (2d ed. 1875). Dautzenberg exercised a most favorable influence upon the development of Flemish poetry, and at the same time advocated a closer union with the other branches of Teutonic literature, and more particularly with the German.

DAUW, *dā*. A local name in South Africa for Burchell's zebra, also called by the Dutch there 'bonte quagga,' and by the Bechuanas 'peetis.' See ZEBRA.

DAVALOS, *dā-vā'lōs*, GIL RAMIREZ (c.1505-61). A Spanish soldier, born at Baeza, in Castile. He accompanied Antonio de Mendoza to Peru, and after the revolt of Girón succeeded his brother, Egidio Ramirez Davalos, as Governor of Quijos. He founded Cuenca (1557) and several other towns, which are now abandoned.

DAVENANT, *dāv'e-nant*, Sir WILLIAM (1606-1668). An English poet and playwright. He was born at Oxford, where his father kept the Crown Inn. When only ten years old, the precocious boy composed, on the occasion of Shakespeare's death, an ode to the memory of the great dramatist; and afterwards was accustomed to claim that he was, in fact, Shakespeare's son. In 1682 he began to write for the stage, and ten years after, on the death of Ben Jonson, he was appointed poet laureate. The next year he became manager of the Cockpit, a theatre in Drury Lane; but, entering into the intrigues of the Civil War, he was apprehended. He finally escaped, however, to France, and, returning, distinguished himself so much in the cause of the Royalists that he was knighted by Charles after the battle of Gloucester. Davenant a second time got into difficulties, and was confined in the Tower for two years, when he was released, as is said, on the intercession of Milton. There he continued his epic poem *Gondibert*, begun in France. Once more set free, he set about establishing a theatre. Obtaining at first permission to give dramatic performances at private houses, he reopened the Cockpit in 1658. After the Restoration he was favored by royal patronage, and continued to write and superintend the performance of plays until his death. Davenant was one of the most popular playwrights of his time. Though none of his plays rank high as literature, they seem to have been suitable to the stage. He made some curious adaptations of Shakespeare's plays; for example, of *Measure for Measure*, and, aided by Dryden, of *The Tempest*. He introduced opera on the English stage, and women to play the female rôles. The date of these innovations is 1656. His epic has some interest in that it was written in a stanza afterwards employed by Gray in his famous *Elegy*. Consult Davenant's plays, with memoir, edited by Laing and Maidment (5 vols., Edinburgh, 1872-74).

DAVENPORT. A city and county-seat of Scott County, Ia., on the west bank of the Mississippi River, 330 miles above St. Louis, Mo., and opposite Rock Island, Ill., with which it is

connected by two bridges: an iron railway and carriage bridge, built at a cost of \$1,200,000, and an iron railway bridge, which cost \$800,000 (Map: Iowa, G 3). It is 183 miles west by south of Chicago, and is on the Chicago, Rock Island and Pacific; the Chicago, Milwaukee and Saint Paul; the Chicago, Burlington and Quincy; the Burlington, Cedar Rapids and Northern; and other railroads. River packets from Saint Louis to Saint Paul afford additional transportation facilities. Davenport is situated on the slope of a steep bluff, and commands an extensive view. On Rock Island, which is crossed by the great bridge, are the United States Arsenal and military headquarters, and other Government buildings. The city has a public library, Academy of Natural Sciences, Saint Luke's, Mercy, and other hospitals, numerous public and parochial schools, two opera houses, and many other notable buildings; and is the seat of the Academy of the Immaculate Conception, Saint Ambrose College, Saint Katherine's Hall, and the State Orphan Home. It is an episcopal see of the Protestant Episcopal Church and of the Roman Catholic Church. The city is in a rich agricultural and coal-mining region; it ships large amounts of farm produce, and has extensive manufactures of carriages, farming tools, machinery, lumber, flour, woolen goods, cordage, glucose and its products, pottery, cigars, beer, soap, etc. Founded in 1835 by a company headed by Col. George Davenport, Davenport was incorporated as a town in 1838, and as a city in 1851. The Chicago and Rock Island Railroad was completed in 1854. The government is conducted by a mayor, elected every two years, and a city council, composed of the executive and aldermen, chosen by wards and on a general ticket. The city officials are appointed as follows: By the mayor, all police officers; by the mayor and council, city electrician, library trustees, chief of fire department, and city scavenger; by the council, street commissioner, city engineer, attorney, and sexton; all others are elected by the people. The annual income of the city amounts to about \$540,000; expenditure to \$500,000; the principal items of expense being: Police department, \$24,000; fire department, \$30,000; schools, \$125,000. Population, in 1890, 26,872; in 1900, 35,254.

DAVENPORT, CHARLES BENEDICT (1866-). An American zoölogist, born at Stamford, Conn., June 1, 1866. He graduated at the Brooklyn Polytechnic Institute in 1886, and at Harvard in 1889, taking the degree of Ph.D. at the latter place in 1892. In 1888 he began to teach at Harvard, where he was instructor in zoölogy until 1900. In 1898 he became director of the Marine Biological Laboratory at Cold Spring Harbor, L. I., and in 1900 assistant professor of zoölogy at the University of Chicago. He has written *Observations on Budding in Paludicella and Some Other Bryozoa* (1891); *On Urnatella Gracilis* (1893); *Experimental Morphology* (1897-99); *Statistical Methods, with Special References to Biological Variation* (1899); *Introduction to Zoölogy* (with Gertrude Crotty Davenport, 1900).

DAVENPORT, EDWARD LOOMIS (1816-77). An American actor. He was born in Boston, Mass., and made his first appearance in Providence, R. I., playing a minor part in *Sir Giles*

Overreach, with the elder Booth as Sir Giles. Davenport made rapid progress, and was soon recognized as a leading artist in tragedy, comedy, and melodrama. He supported Mrs. Mowatt (Ritchie) in a wide range of characters, and accompanied her, about 1847, to England, where he also played with Macready and other stars. There, too, in 1849, he married Miss Fanny Vining, an actress, whom he later introduced to the American stage. She died in 1891. Returning in 1854, he traveled over the United States, playing in the principal cities, chiefly in Shakespearian characters and those drawn from Dickens's novels. At different times he was manager of the Howard Athenæum, in Boston, and other theatres. Among his latest conspicuous representations were such widely divergent characters as Brutus in *Julius Cæsar* and Bill Sikes in *Oliver Twist*. His renderings of the part of Sir Giles and of Hamlet were also especially admired. Davenport was highly esteemed for his genial and open-hearted manners. He died at his summer home in Canton, Pa. Consult Edwards, in Matthews and Hutton, *Actors and Actresses of Great Britain and the United States*, vol. iv. (New York, 1886).

DAVENPORT, FANNY LILY GIPSY (1850-98). A well-known American actress, the daughter of Edward Loomis Davenport. She was born in London, England, but was brought to America when a child, and was educated in the Boston public schools. When seven years old she appeared at the Howard Athenæum, in Boston, as the child of *Metamora*, but her real début was at Niblo's Garden in February, 1862, as King of Spain in *Faint Heart Never Won Fair Lady*. This was followed by a season in soubrette parts in the South. While playing at the Arch Street Theatre, Philadelphia, under the management of Mrs. John Drew, she attracted the attention of Augustin Daly, who promptly gave her a place in his Fifth Avenue Theatre in 1869. Afterwards she visited the principal towns and cities of the United States as a star in a wide variety of rôles in both comedy and tragedy. Among her greatest successes were those won in Sardou's *Fedora* (1883), *La Tosca* (1888), and *Cleopatra* (1890). In 1897 she produced *The Soldier of France*, a play with Jeanne d'Arc as the heroine. It was a failure, and the chagrin of that is thought to have hastened her final illness. She appeared on the stage for the last time at the Grand Opera House, Chicago, March 25, 1898. Her death occurred at Duxbury, Mass. She was the wife of Mr. Willet Melbourne MacDowell, her second husband, whom she married in 1889. Consult Benton, in McKay and Wingate, *Famous American Actors of To-day* (New York, 1896).

DAVENPORT, JOHN (1597-1670). An eminent Puritan clergyman, one of the founders of the New Haven Colony in Connecticut. He was born in Coventry, England; studied at Oxford University from 1613 to 1615; acted for about a year as chaplain at Hilton Castle, near Durham; and from 1616 to 1633 was a preacher in London, "where," says Cotton Mather, "his notable accomplishments for a minister and his courageous residence with and visiting of his flock, in a dreadful plague-time (1625), caused much notice to be quickly taken of him." In 1625 he passed the examinations at Oxford for the degrees of B.D. and M.A. He came into conflict

with the ecclesiastical officers, especially with Archbishop Laud on account of his non-conforming tendencies, and in 1633 withdrew from the Established Church and removed to Amsterdam, Holland, whence he returned, however, in 1636, after engaging in a controversy with the Dutch classis on the subject of indiscriminate or promiscuous baptism of infants. In 1637, eluding the authorities, he embarked for Massachusetts, whose charter he had assisted in obtaining in 1629, and in June arrived at Boston, where he remained for nine months, during which time he took a prominent part in the famous Ecclesiastical Synod at Cambridge. He cooperated with Theophilus Eaton (q.v.) in founding the colony of New Haven in April, 1638, and here, as minister and as one of the 'seven pillars' of the civil government, he exercised a powerful influence over both civil and ecclesiastical affairs. In 1661 he concealed the regicides Goffe and Whalley (qq.v.) for more than a month in his own house. He strongly opposed the union of the New Haven and Connecticut colonies, which was effected in 1665, and three years later accepted a call to succeed John Wilson, the original pastor, as pastor of the First Church in Boston, his election to the position causing the secession of part of the congregation, who opposed his views on the 'half-way covenant,' and who, after withdrawing, organized the famous Old South Church. He was one of the editors of the works of the celebrated Dr. John Preston, the leader for some time of the Puritan party in England, and published a number of volumes dealing for the most part with theological subjects, and including: *Discourse About Civil Government in a New Plantation, Whose Design is Religion* (1663); *The Knowledge of Christ Indispensably Required of All Men that Would Be Saved* (1653); *The Power of Congregational Churches Asserted and Vindicated* (1672); *The Saints' Anchor-Hold* (1661); and (with William Hooke) *A Catechisme Containing the Chief Heads of Christian Religion* (1659). Consult: "A Sketch of the Life and Writings of John Davenport," by Dexter, in the *Papers of the New Haven Colony Historical Society*, vol. ii. (New Haven, 1877); and a chapter in Mather, *Magnalia* (London, 1702).

DAVENPORT BROTHERS, THE. The name of two Americans professing to be spiritualistic mediums who flourished between 1845 and 1865. They performed a number of remarkable feats which gained them many followers, but were finally exposed as impostors. See SPIRITUALISM.

DAVID (Heb., beloved). A king of Israel, the youngest son of Jesse, a Judean, dwelling in Bethlehem. His family was one of the principal ones in the town. The number of Jesse's sons is given by later tradition as seven (1. Chron. ii. 13-15), but as eight in Sam. xvii. 12. The chronology of David's reign is very doubtful, but it is certain that the traditional date, B.C. 1055-15, is too early and must be reduced by thirty-five to forty years. The duration of his reign is fixed at forty years (1. Kings ii. 11); but this number, being a round one, is open to suspicion, so that all that can be stated is that his career falls between the last quarter of the eleventh and the first quarter of the tenth century B.C. The biblical account of David is found in (1) 1. Sam. xvi.-1. Kings ii. and (2) in 1. Chron. ii., iii., and

x.-xxix. Of these two sources the first alone can lay claim to historical value. The second, in so far as it is not based on the other (see CHRONICLES), must be used with great caution, and its statements are as a general thing to be discarded as unhistorical or untrustworthy; while the picture that it gives of the King, differing considerably from that found in the books of Samuel, is an idealized David, such as he had become by the third century B.C. in the mind of a pious Jew. Coming to the narrative in Samuel and Kings, great difficulties confront the critic, due largely to the composite character of the historical documents and in part to the corrupt state of the text. The existence of 'doublets,' i.e. two accounts of the same event, in the story of David is believed sufficient to show that in the Book of Samuel different documents have been pieced together. Thus we have two accounts of David's introduction to Saul (I. Sam. xvi. 19-23 and xvii. 1-xviii. 5); of the slaying of Goliath (I. Sam. xvii. 1-xviii. 5 and II. Sam. xxi. 19); of Saul's throwing a spear at David (I. Sam. xviii. 10-11 and xix. 9-10); and more of the same sort. All these doublets, however, are limited to the First Book of Samuel, and from the ninth chapter of the Second Book of Samuel to the end of the twentieth chapter we have a continuous narrative, which is brought to a close in the first two chapters of I. Kings. Chapters xxi. to xxiv. of the Second Book of Samuel again represent an addition of a composite character like the first eight chapters of the First Book of Samuel, and in addition to these we have a number of editorial additions and interpolations, of which the two principal ones are II. Sam. viii. 1-15 and I. Kings ii. 1-12. Of these authorities, the most authentic, according to the critical view, is the long, continuous narrative of the Second Book of Samuel. But even the author of this, while he had trustworthy documents at his disposal, was not a contemporary of David. The date of the other sections is made to vary from a period as old as II. Sam. ix.-xx. down to the days of Josiah (B.C. 639-608). But in even the oldest there is already manifest a tendency to idealize David, which, weak at first, becomes more pronounced as the popular hero recedes into the background of history and becomes a favorite subject for romance, legend, poetical embellishment, and eventually the type of the ideal king and religious poet. In consequence, it is not easy to pick out the genuinely historical incidents in David's career and piece them together into a continuous narrative. Thus the story of David's encounter with the giant Goliath is believed to be a piece of romance (I. Sam. xvii.-xviii.) and the genuine account of Goliath's death to be found in II. Sam. xxi. 19, where we learn that Elhanan was the slayer. Similarly, the stories of David and Jonathan's friendship are romantic, though based on historical facts. On the other hand, there is no reason to question that he acquired musical skill, which, together with his personal charm and the indications that he gave of becoming valorous in war, attracted Saul to him and led to his entering into close relations with the 'melancholy' King. He becomes Saul's armor-bearer, and among the personal services that he renders is to be reckoned his soothing the King by achievements in minstrelsy. His success in the wars against the Philistines increases his

popularity with King and people, and he becomes the son-in-law of the King by marrying Michal.

Soon after, however, a momentous change ensues. Saul, subject to fits of brooding, becomes jealous of David's popularity and entertains suspicion of the latter's fidelity. The story of his actually hurling a javelin at David may be a romantic touch, but it is certain that Saul's jealousy eventually led to David's banishment from the Court. David now becomes a freebooter and gathers a retinue of brave but reckless warriors about him. With them he leads the life of a Bedouin chief, attacking defenseless landowners and hiring his services in attacks upon Amalekites, Philistines, and others. The exact course of his wanderings during this period can no longer be followed. After first trying his fortunes at Nob, he is obliged to seek refuge from Saul at Adullam. We find him next in the wild and desert country south of Judea, and he passes at times as far east as the Dead Sea, but after taking up his abode for a time at Engedi, Saul's pursuit drives him to Gath, where he offers his services to Achish, King of the Philistines, in an expedition against Amalekites, Gezrites, and other desert tribes. In reward for his services he obtains the town of Ziklag as a possession. Achish prepares an attack upon the Israelites and calls upon David to join him. The latter consents, but yielding to the protests of his chief men, who feared treachery on David's part, Achish compels David to depart. Upon reaching Ziklag he finds that the Amalekites had raided the town during his absence. In his pursuit he surprises the Amalekites and routs them. At this moment the tidings reach David of the death of Saul and his three eldest sons at Gilboa in an encounter with the Philistines. The opportunity had now come for David's return to his native country. He secures the favor of the inhabitants of Hebron and the surrounding district and is anointed King in Hebron, while still retaining Ziklag. He makes an attempt at first to obtain control of the northern section, which passes into the hands of Ishbaal, Saul's youngest son, who, however, was entirely in the hands of Abner, the powerful general. Ishbaal foolishly alienates Abner's interest by reproaching him for taking one of Saul's concubines to himself, an act which may have indicated Abner's intention to seize the throne for himself. Abner enters into secret communication with David, but during a visit to him is murdered by Joab, the general of David. Soon afterwards Ishbaal is murdered, and David, being recognized as the natural leader of all Israel, is solemnly anointed King of the whole people at Hebron by an assembly of the elders of the tribes. He is said to have been thirty-seven years old at this time. Seven years, according to the biblical account, had passed since the death of Saul. The accounts of David's reign are quite fragmentary except for occurrences in his immediate family. We learn of successive wars against Moabites, Ammonites, Edomites, and Philistines, and while the accounts of his exploits are portrayed perhaps in too vivid colors, there is no doubt that he succeeded in firmly establishing the independence of Israel and in laying the foundations for future extensions. Among other things, he captures Jebus, which becomes known henceforth under its old name, Jerusalem, makes it the capital of the country, and symbolizes this by removing the

sacred ark to that place. After securing peace from his enemies, David had to quell opposition which arose in his own household. His eldest son Ammon outraged his half-sister Tamar, and in revenge Absalom caused Ammon to be murdered. Subsequently Absalom organized a rebellion against his father, which obliged the King to leave Jerusalem for a time. The uprising is quelled, but not until Absalom has fallen as a victim. Amasa, David's nephew, who had taken part in the rebellion, but had been pardoned by David and promised the chief command in place of Joab, also falls a sacrifice to the latter's jealousy. Once more, as the King stands on the verge of the grave, serious trouble threatens regarding the question of succession. The Court was divided between two candidates—Adonijah, the surviving eldest son, and Solomon, the son of David by Bathsheba. Through the influence of the prophet Nathan, the King decides in favor of Solomon. David dies at an advanced age and is buried in his capital. These family troubles are looked upon by the Jewish writers as a punishment for David's adulterous act with Bathsheba and his subsequent connivance at the murder of Bathsheba's husband, Uriah. There is no doubt that this act, which took place during the war with the Ammonites, is the most serious charge to be brought against him, and there is no reason to question its authenticity, since it is fully in keeping with the conditions that prevailed at the time. In forming an estimate of David, those conditions must be taken into consideration, and no true picture can be obtained of him unless we are willing to recognize his human limitations. That he was a great warrior admits of no doubt. Indeed, he was essentially a soldier, courageous and of boundless energy. He possessed the faculty, moreover, to an extraordinary degree, of gathering men to himself, and as a natural-born leader he overcomes obstacles that would have crushed others. But he also shows traits of cruelty in the treatment of his enemies, connives at treachery, and is willing to make use of underhand measures to accomplish his ends. His moral sense is not strong, and it is probably due to this defect that he shows such lamentable weakness in dealing with his family affairs. But, with all his faults, he remains one of the most notable figures in Hebrew history, and it is not surprising that the attachment to him should have led to the idealization of him by popular tradition, abetted by later writers. Whether he composed poetry is doubtful, though many critics believe that the dirge on the death of Saul and Jonathan (II. Sam. i. 17-27; cf. Psalm xviii.) is his production. In any case, the Psalms, of which seventy-three are by Jewish tradition ascribed to him, do not belong to his age, but reflect in all but a few cases the religious thought and aspirations of post-exilic Judaism. Consult: The Hebrew histories of Ewald, Stade, Wellhausen, Renan, Guthe, Piepenbring, Kittel, Kent, etc.; also Budde, *Die Bücher Richter und Samuel, ihre Quellen und ihr Aufbau* (Giessen, 1890); for David as a tactician, Manel Dieulafoy, *Le Roi David* (Paris, 1897). See PSALMS.

DAVID. (1) A celebrated statue by Michelangelo, representing the youthful Israelitish shepherd, sling in hand. It stands in the Accademia in Florence. The colossal statue was carved by the sculptor when a youth from a great block of marble, which had been cast aside as worthless.

It once stood before the Palazzo Vecchio. (2) A smaller statue, a masterpiece of Donatello, showing David standing over the prostrate Goliath. It is in the National Museum in Florence.

DAVID I. (1084-1153). King of Scotland from 1124 to 1153. He was the youngest son of Malcolm Canmore by his wife Saint Margaret (q.v.). During the fierce struggle for the possession of the Scottish crown, which followed the death of his father in 1093, the youthful David found refuge in England, together with his sister Eadgyth, or Matilda, who, in 1100, married Henry I., King of England. The residence of David at the English Court would appear to have been prolonged for several years, and the assertion of William of Malmesbury may well be credited that "it freed him from the rust of Scottish barbarity." In 1107 his elder brother, Alexander, succeeded to the throne, and David became Prince of Cumbria (q.v.). Together with this great principality he seems to have held lands in Lothian; and by his marriage, in 1113, with Matilda, widow of the Earl of Northampton, he acquired possession of that earldom too. In 1124 he succeeded his brother as King. In 1127 he took an oath, with the other great barons of England, to maintain the rights of his niece, Matilda, as heiress to the English crown, should her father, Henry I., die without male issue. The event thus contemplated came to pass in 1135, and when Stephen mounted the English throne David took up arms in behalf of Matilda. Peace was restored by the grant of the earldom of Huntingdon and the promise of the earldom of Northumberland to David's son, Henry, then in his twentieth year; but the war was soon resumed, and in 1138 the King of the Scots, deserted by Bruce and others of his Anglo-Norman vassals, was signally defeated in the battle of 'the Standard,' near Northallerton. In the next year a second peace was concluded between the two kings, when the promised earldom of Northumberland was bestowed on Prince Henry. In 1140 the Scottish King marched into England for the third time to assert the rights of Matilda. He was again defeated, and only regained his own country with difficulty.

The rest of his reign was devoted to the introduction of English civilization into Scotland, a task which had been begun by his parents and continued by his brothers, King Edgard and King Alexander. He secured the peace and safety of the country by building castles; and by erecting burghs he promoted trade, shipping and manufactures. He showed his favor for learning by endowing many bishoprics and monasteries. David died at Carlisle on May 24, 1153. His son Henry had died in the previous June, and he was succeeded by his grandson, Malcolm. The remains of David's legislation, including the interesting code of the *Leges Burgorum*, have been carefully collected in the first volume of *The Acts of the Parliament of Scotland* (Edinburgh, 1844). Consult Robertson, *Scotland Under Her Early Kings* (Edinburgh, 1862).

DAVID II. See under BRUCE, ROBERT.

DAVID, dâ'vêd', ARMAND (1826—). A French missionary and naturalist, born at Espelette, Basses-Pyrénées. In 1848 he entered the congregation of the Lazarists, and in 1862 went as a missionary to China. Here he made valuable collections of animals, plants, and min-

erals, which he presented to the Museum of Paris. From 1869 to 1871, on behalf of the museum, he made scientific explorations in China and Tibet, discovering many new genera and species of flora and fauna. Subsequently he accomplished a third journey, of which he wrote in the *Journal de mon troisième voyage d'exploration dans l'empire chinois* (2 vols., with maps, 1875). The results of his previous travels are to be found in the *Nouvelles Archives du Muséum d'Histoire Naturelle* (1866, 1868-70). His *Les oiseaux de la Chine* (with 24 plates, 1877) is an important work.

DA'VID, CHRISTIAN (1690-1751). A Moravian missionary, born at Senfleben, December 31, 1690. Brought up a Roman Catholic, he embraced Lutheran views and then Moravian (1717), and founded the Moravian colony of Herrnhut (1722), and was elected the first of the twelve elders. Henceforth he was a missionary in Europe, and even went to Greenland, where he founded the first mission (1747). See **MORAVIANS**.

DAVID, dä'vét, EDWARD. A Flemish buccancer of the latter part of the seventeenth century. He early became one of the 'Brethren of the Coast,' as the West Indian pirates styled themselves, achieved prominence in that organization, and in 1683 sailed as leader of an expedition of three ships for the Pacific. Reinforced by French filibusters with two vessels and a fire-ship, he devastated the coasts of Chile and Peru. A fleet of three galleons and two fire-ships was sent against him by the Viceroy of Peru, but after an indecisive battle he succeeded in making his escape. Subsequently he returned to the coast of Peru, pillaging towns, slaughtering, and exacting ransoms in true piratical fashion. He then transferred his depredations to Central America and Mexico. In 1688, under a general amnesty granted by King James II., he betook himself to England, where he lived for many years in undisturbed possession of his plunder.

DAVID, dá'ved', FÉLICIEN CÉSAR (1810-76). A distinguished French composer. He was born at Cadenet, Vaucluse. At first a chorister and later chapel-master in the cathedral at Aix, he entered at twenty the Paris Conservatory, where he studied with Benoist (organ), Fétis (composition), and Reber (harmony). His uncle cut off his paltry monthly allowance of 50 francs, and David had to give lessons. He joined the Saint-Simonists, but their commune broke up at Ménil-Montant in 1833; with a number of fellow-dreamers he went to the East—Turkey, Egypt, and Syria. After two years of hardship and suffering he returned to France, rich in novel experiences. The fruit of his journeys, *Mémoires orientales*, received scant notice, and David retired for more serious study and composition, but his first symphony (1838) had a like fate. In 1844 his 'symphonic ode,' *Le désert*, was performed at the Conservatory amid tumults of applause, which continued day after day at the successive performances of the work. His next productions, the oratorio *Moïse au Sinaï* (1846), the symphonic ode *Christophe Colomb* (1847), and the mystery *L'Eden* (1848), had little success. But he was now a recognized master; even his earliest compositions found a hearing, and the doors of every theatre were open for his new works, chiefly operas. *La perle du*

Brésil (1851) was received with acclamation, and a national prize of 20,000 francs was awarded (in 1867) to his *Herculanum*, produced at the Grand Opéra in 1859. *Lalla Roukh* (1862) was equally successful, but *Le Saphir* (1865) found less favor. *La captive* was withdrawn by the composer before it was performed. In 1862 he was appointed an officer of the Legion of Honor, and in 1869 elected to succeed Berlioz at the Institute and as a librarian of the Conservatoire de Musique in Paris. His compositions include also chamber music, songs, and pieces for solo instruments. David, the 'musical Orientalist,' occupies a singular position in the history of music: he inaugurated a new movement. During his long years of wandering in the East he absorbed the quaint and weird Oriental melodies, and to express these in the most gorgeous orchestral colors that a rich fancy could think of was his task. It was the easier as Berlioz (q.v.) had already worked out orchestral effects that glowed and blazed, and it remained only to give them an Oriental setting, which David did in *Le désert* and subsequent works. His followers were numerous, and among them the most famous—Bizet (*Djamitch; Les pêcheurs des perles*), Massenet (*Roi de Lahore*), and Délibes (*Lakmé*)—were the most directly influenced. He died at Saint Germain-en-Laye. Consult Azevedo, *Félicien David* (Paris, 1863).

DAVID, FERDINAND (1810-73). A German violinist, born in Hamburg. For two years he was a pupil of Spohr, in Cassel, studying at the same time with Hauptmann. In 1825, when only fifteen years old, he made his first appearance as a violinist at the Gewandhaus in Leipzig. During 1827 and 1828 he played in the orchestra of the Königsstädtisches Theatre, Berlin. At this time he met Mendelssohn, with whom he formed a warm friendship. He left Berlin to become first violin of the private quartet of Baron von Liphardt, of Dorpat, whose daughter he married. During his sojourn in Russia, which continued until 1835, he appeared with great success in Saint Petersburg, Moscow, Riga, and other large cities. In 1836 he was, through Mendelssohn's influence, appointed concertmeister of the famous Gewandhaus Orchestra in Leipzig, a position which he filled ably until his death, near Kloster, Switzerland. In Leipzig he was active as a virtuoso, teacher, editor, and composer. As a virtuoso he had the solid foundations of Spohr's method, combined with the freer development of technique and feeling demanded by more modern taste. His leadership of the violins has left its traditions impressed upon the Gewandhaus Orchestra. Of his success as a teacher it is only necessary to say that Joachim and Wilhelmj were among his pupils. As an editor, he has left *Die hohe Schule des Violinspiels*, a collection of standard works of old masters of the instrument which, together with his own *Method for Violin*, has had much to do with determining the lines along which modern violin-playing has developed. Though he was not a composer of the first rank, his violin concertos are highly esteemed, and his *Bunte Reihe* is a charming series of short pieces for violin with pianoforte accompaniment. When, in 1843, the Leipzig Conservatory of Music was established, David became instructor of violin there. While Mendelssohn was writing his violin concerto he was in constant communication with David, who was the first to play the work,

and to him Mendelssohn presented the MS., which now belongs to David's family.

DAVID, dā'vét, GHEERADT (1450-1523). A Flemish painter, born at Oudewater. Although his name was known to early Flemish writers, it was forgotten in later times until it was discovered by Mr. Weale that a triptych in the Museum of Rouen was painted by him in 1509. He lived chiefly in Bruges, where we find him as a member of the Painters' Guild in 1484, and where most of his works were executed. In 1515 he entered the Painters' Guild of Antwerp. He died at Bruges on August 13, 1523. He was probably a pupil of Memling, to whom his pictures were formerly attributed, and he is the last of the school of the Van Eycks. Among his authenticated works are the "Baptism of Christ," in the Academy of Bruges; the "Virgin and Child, with Saints," an altar-piece in the Rouen Museum; "The Descent from the Cross," a triptych in the Church of Saint Basil in Bruges; and "Christ on the Cross," in the Berlin Museum. His works are noted for their landscapes, which serve as a background, and for their composition. Excellent in this regard are two paintings in the Museum of Bruges representing the "Judgment of Cambyses," painted for the magistracy of that town in 1488. Consult: Crowe and Cavalcaselle, *Early Flemish Painters* (London, 1872); Conway, *Early Flemish Artists* (New York, 1887).

DAVID, dā'véd', JACQUES LOUIS (1748-1825). A French historical painter. He was born in Paris, August 31, 1748. When Boucher was prostituting his art to gratify the depraved tastes of the French populace, David became his pupil; but Boucher, recognizing the broad and noble tendency of David's mind, wisely and honorably transferred him to the influence of Vien. After many struggles, David took the Prix de Rome with his picture, "Antiochus and Stratonice." Arriving at Rome, he found the thoughts of all directed toward antiquity. German minds—that of Winckelmann, for example, and that of Lessing—were also creating enthusiasm for Greek ideals of beauty. This view of art, widely different from that prevailing in France, impressed David, who was copying the classical masterpieces of the Vatican. Its influence upon him was first manifested after his return to Paris, in his picture, the "Plague of Saint Roche," painted in 1780.

More than any other painter of his time, David, with his classical tendencies, represented the spirit of the age—the reaction against the frivolous immorality of monarchical France, and the return to the stern virtues of antiquity. His "Oath of the Horatii" (1784) and "Brutus Condemning His Sons to Death" (1789) were hailed with universal applause. He became the great painter of the Revolution, and presented to the Convention, of which he was a leading spirit, the "Deathbed of Lepelletier," the first martyr of liberty. When Marat was assassinated, he was called by the Assembly to memorialize his death, and he responded with a painting in which the murdered man is portrayed with considerable naturalistic strength. Those of his works which represent what he himself lived and experienced are painted in this manner. The same is true of his portraits of the Revolutionary epoch, like those of Madame Récamier (Louvre), of Barrère,

and especially of the young Bonaparte. His chief masterpiece of the Napoleonic period was the colossal picture of the "Coronation of Napoleon I." (finished 1807, and now at Versailles). This is a stately composition, noble in color, and with a tender, quivering light, justifying Muther's encomium of being the best historical painting of the past century. His portraits of this period, as, for example, those of the Emperor, the Pope, and Murat, are all of the highest naturalistic merit. Upon the restoration of the Bourbons, he was exiled to Brussels, where he died on the 29th of December, 1825. During his exile he painted the graceful portrait of the daughter of Joseph Bonaparte, and his "Three Fates," in the Praet collection, Brussels—three hideous old women, painted with keen realism and great pictorial strength, in a manner almost worthy of Frans Hals. All of these works show a realistic talent of the first order, with high powers as a draughtsman and a colorist.

But this is not the only side, or even the best-known side, of David's art. He was at heart an antiquarian, and most of his large canvases represent antique subjects. While these paintings show great excellence of drawing, they are cold in composition and coloring, exaggerated and theatrical in action. Besides those mentioned above, the "Death of Socrates," "Belisarius Asking Alms" (1784), at Lille, "Leonidas at Thermopylæ" (1814), the "Rape of the Sabinæ" (1799), are among the chief of this class of his paintings. These were the works which had the greatest influence upon his pupils. Throughout the Revolution and under the Empire, he was the supreme dictator of art in France, and his influence upon its development was very great. While he resented it from the littleness and trivialities of the followers of Watteau, he established a despotism of classicism which had to be broken before there could be real progress. Nevertheless, he was in a way the regenerator of modern French art, and the accuracy of his drawing exercised a salutary influence upon its development.

Consult: Stranahan, *History of French Painting* (New York, 1899); Muther, *History of Modern Art*, vol. ii. (London, 1896); Delecluze, *J. L. David* (Paris, 1855); Coupin, *Essai sur J. L. David* (Paris, 1827); Normand, "David," in *Les artistes célèbres*.

DAVID, dā'vét, JOHANNES BAPTISTA (1801-66). A Flemish philologist, born at Liege. For more than thirty years he held the chair of Belgian history and Flemish literature at the Catholic University of Louvain. He was one of the greatest Flemish scholars of the century and a very prolific writer. His principal work is the famous *Vaderlandsche historie* (10 vols., 1842-64; 4th ed. 1885 et seq.), a complete history of Belgium. The most important of his linguistic works is entitled: *Eerste beginselen der nederduitsche sprakkunst* (10th ed. 1858).

DAVID, dā'véd', LAURENT OLIVIER (1842—). A Canadian journalist, born at Sault au Recollet, Quebec Province, was educated at the College of Sainte Thérèse, and was called to the bar in 1864. From 1870 to 1884 he was editor of *L'Opinion Publique*; and he has also been at different times connected with *Le Bien Public* and *La Tribune*. He has sat in the Quebec Legislature for Montreal East, and from 1887 to

DAVID
THE CORONATION OF JOSEPHINE, FROM THE PAINTING IN THE LOUVRE, PARIS

1888 was president of the Saint-Jean Baptiste Society of Montreal. His publications include *Biographies et portraits* (1876); *Les héros de Chateauguy* (1883); *Les patriotes de 1837-38* (1884); *Mes contemporains* (1894); *Les deux Papineau* (1896); and *Le clergé canadien: Sa mission et son œuvre* (1896). The last-named work reproves certain Roman Catholics for intervention in political affairs, and was condemned by the Congregation of the Index.

DAVID, PIERRE JEAN (1789-1856). A French sculptor. He was born at Angers, March 12, 1789, and was called David d'Angers to distinguish him from David the painter. He went to Paris to study sculpture. Through the liberality of David the painter, who gave him gratuitous instruction, he was finally enabled to take a prize and to pursue his studies in Rome. He was also a pupil of the sculptor Rolland, and at Rome he frequented the ateliers of Canova and Thorwaldsen. But, notwithstanding this classical training, he copied nature with freedom and fidelity, and belongs to the early naturalists of this century, although not entirely free from classic conventions. He was eminent as a portraitist in sculpture, always producing a work of real art. The ease with which he handled relief is more manifest in his results than in foreshortening, where form is truthfully defined, and yet remains suggestive. The work of David d'Angers is best studied in his own town, and at Père-la-Chaise. He executed many colossal works and numerous busts, but his fame also rests upon his medallions, of which those of Bonaparte and Mme. David are best known. Of his large works, there are the fine groups of the pediment of the Panthéon in Paris, the commission for which was given him by the new Government after the July revolution, during which David had fought in the ranks. In 1848 he was a member of the Constituent Assembly. After the coup d'état by Napoleon III., he was sent into exile, but, after some time spent in Greece, he returned to France. He died January 5, 1856. Among the statues executed by David are "Madame de Staël"; "Talma," for the Théâtre Français; "Cuvier," "Corneille" (Rouen), and "Lafayette" (Washington). Fénélon's monument at Cambrai is also his work, as are busts of Goethe, Schelling, and Dannecker. His two chief works, besides the pediment of the Panthéon, are the tomb of General Gobert (Père-la-Chaise), a very realistic production; and his "Philopœmen" (Louvre) in classic garb. David was a Chevalier of the Legion of Honor, a professor in the Academy of Painters, and a member of the Institute. Consult: Brownell, *History of French Art* (New York, 1892); Gonse, *La sculpture française depuis le XII. siècle* (Paris, 1895); Jouin, *David d'Angers* (Paris, 1878).

DAVID, or DEWI, SAINT (? -601). The patron saint of Wales. He was, according to tradition (probably worthless), the grandson of Ceredig, King of Cardiganshire. He was educated by monks and later went through Wales on a preaching tour. He also founded monasteries, especially that one at Menevia, now called Saint David's, in Pembrokeshire, and there he became abbot, which office was equivalent to bishop and its holder was so designated. As bishop, he presided at the synods of Brei and 'Victory.' He died in 601, and was canonized

in 1120; his festival is held on March 1. He was celebrated for his eloquence and success in conversion. Several works have been ascribed to him, but these are no longer extant. His life was written by Ricemarch, Bishop of Saint David's, who died about the year 1099, reprinted in W. J. Rees, *Lives of the Cambro-British Saints of the Fifth and Immediately Succeeding Centuries*, with an English translation (London, 1853). Consult Rice Rees, *An Essay on the Welsh Saints* (London, 1836).

DAVID AP GWILYM, dā'vəd äp gw'ŵlīm (c.1300-70). The greatest of mediæval Welsh poets. He was born either in Cardiganshire or Glamorganshire. He was a man of considerable education, and his knowledge of Latin and Italian literatures has given rise to the belief that he was educated in Italy. His tendency to satirize his neighbors, as well as his numerous love affairs, brought him into frequent difficulties. He has been compared to Shakespeare, Burns, Ovid, and Petrarch, and addressed to Morvydd, who may be called his Laura, more than 147 poems. Morvydd was the daughter of Madog Iawgain, and her marriage to a wealthy suitor was soon followed by her elopement with the poet. They are said to have escaped to France, but a lawsuit was brought against David by the outraged husband, to whom damages were adjudged in a large sum. Unable to pay it, the poet might have languished in prison had not the people of Glamorgan generously remitted the obligation. In gratitude for this the poet dedicated two of his principal poems to Glamorgan. Two hundred and sixty-two of his poems were edited by Owen Jones (Myfyr) and William Owen-Pughe (London, 1789), and more have been lately discovered in the Mostyn Library and British Museum. An admirable English version of the poems was published by Arthur James Johns (1834). See WELSH LITERATURE.

DAVID CITY. The county-seat of Butler County, Neb., 60 miles west of Omaha; on the Union Pacific, the Burlington and Missouri River, and the Fremont, Elkhorn and Missouri Valley railroads (Map; Nebraska, G 2). It is the centre of an agricultural region. Population, in 1890, 2028; in 1900, 1845.

DAVID COP'PERFIELD. A novel by Dickens, published serially, beginning May, 1849. It was the author's favorite book, and is said to be partly autobiographical. It narrates the life of the hero from his birth to his marriage with the gentle Agnes—the early remarriage of his mother, her death, his miserable school days, his apprenticeship, his running off to the home of an eccentric aunt, Miss Betsy Trotwood, his growth to manhood and happiness in his new surroundings, his first marriage with his 'child-wife,' Dora Spenslow, her death, and his final union with the patient daughter of Mr. Wickfield.

DAVIDEIS. dā-vid'ē-īs. A sacred poem on the troubles of David, the chief work of Cowley, published in 1656, and founded on the life of the second King of Israel.

DAVID GAR'RICK. A comedy by Robertson, which appeared in 1864, and is a translation from the French play *Sullivan*. It purports to represent amatory incidents in the life of the famous eighteenth-century English actor, and

was first produced at the Haymarket with the elder Sothorn in the principal rôle.

DAVIDGE, WILLIAM PLEATER (1814-88). An English comedian, who came to the United States in 1850 and became identified with the American stage. He was born April 17, 1814, in London, and appeared as a youthful amateur at Drury Lane in *The Miller's Maid*. Afterwards he acted in various English cities, especially in Manchester. His first appearance in America was in August, 1850, as Sir Peter Teazle at the old Broadway Theatre, New York; later he supported many well-known actors in the metropolis and elsewhere, among them Edwin Forrest and Fanny Davenport. Some of his notable parts were Caliban; Eccles, in *Caste*; Dick Deadeye, which he created, in *Pinafore*; Old Hardy, in *The Belle's Stratagem*; and Hardecastle, in *She Stoops to Conquer*. His last engagement was with the Madison Square Company, beginning in 1885. He died at Cheyenne, Wyo., August 7, 1888. He was the author of a volume of autobiographical reminiscences, called *Footlight Flashes* (New York, 1866); *The Drama Defended* (New York, 1859); and other works.

His son, **WILLIAM DAVIDGE** (1847-1899), also an actor, was born at Manchester, England, and brought to the United States when a child of three years. During his career he played with William H. Crane (1870-71), Kate Claxton (1877-78), and later for several seasons with Roland Reed. He died in Chicago.

DAVID HAR'UM. A very popular story by Edward Noyes Westcott, which, after rejection by a number of publishers, attained a remarkable success. The character of the shrewd, horse-trading David Harum is distinctively an American type, and was drawn from an original who was a resident of the town of Homer, N. Y. An identification of the characters and scenes has been published by Arthur T. Vance, under the title *The Real David Harum* (New York, 1901).

DA'VIDISTS. The name of two distinct Christian sects: (1) Followers of David of Dinant, a teacher in the University of Paris, whose philosophical work was condemned by the Synod of Paris in 1210, and who, in consequence of the ban laid upon him in 1215 by the Pope, had to flee from France. The place and date of his death are unknown. His fundamental idea was that the Deity alone had any real existence, being the *materia prima* of all things. (2) Davidists, or David Georgians, followers of David George, or Joris, a native of Delft, Holland. In 1530 he was whipped, had his tongue bored, and was imprisoned for obstructing a Roman Catholic procession. He founded a sect of his own, and in 1542 published his *Book of Wonders*, detailing the visions which he professed to have received. After his death his body was dug up and burned by order of the Senate of Basel, where he had passed the latter part of his life as a merchant under an assumed name, John of Bruges. The sect, under the leadership of Henry Nicholas, became known in Holland and England as the 'Familists.' They interpreted the whole of Scripture allegorically, and maintained that as Moses had taught hope and Christ had taught faith, it was their mission to teach love, the service of which was the highest and best of the dispensations. The result was an extreme Antinomianism in practice, which attracted the

notice of the authorities in both countries. Early in the seventeenth century the sect was suppressed or absorbed by others. See JORIS, DAVID.

DAVIDOFF, dä'vê-dôf, KARL (1838-89). A Russian violoncellist, born at Goldingen, Courland. He was educated at the Moscow University, and studied the violoncello under fl. Schmitt in Moscow and Schubert in Saint Petersburg, and harmony with Hauptmann, in Leipzig. He first appeared at the Gewandhaus, Leipzig, in 1859, and was made first violoncellist in the Gewandhaus orchestra, and professor in the Leipzig Conservatory. In 1862 he was appointed solo violoncellist to the Emperor of Russia, and professor in the Conservatory of Saint Petersburg, and was director of the latter from 1876 to 1887. As a virtuoso he was equalled by few, and won great fame on his concert tours through Europe. Besides four concertos, and a number of minor pieces for his instrument, he composed some works for orchestra, pianoforte pieces, and songs.

DAVIDS, THOMAS WILLIAM RHYS (1843—). An English Orientalist. He was born at Colchester, was educated at the University of Breslau, entered the civil service in Ceylon, and filled various judicial appointments in that island. He was called to the bar of the Middle Temple in 1877, and was made professor of Pāli and Buddhist Literature at University College, London, 1882. He has devoted himself especially to the study of Buddhism. His works include: *Buddhism: A Sketch of the Life and Teachings of Gautama, the Buddha* (1877); a translation from the Jātakas, or Buddhist Birth stories; *Buddhism, Its History and Literature* (1896, composed from American lectures). He has also edited many Pāli texts, and is (1902) editor of the Pāli Text Society.

DAVID'S DEER. See ELAPHURE.

DAVIDS ISLAND. An island lying in Long Island Sound, a quarter of a mile north of the city line of Greater New York. It is owned and occupied by the United States Government for military purposes. Its extent is about 100 acres.

DA'VIDSON, ANDREW BRUCE (1840-1902). A Scottish biblical scholar. He was born in Aberdeenshire, and, after receiving an academic education, was ordained in 1863, in which year he was appointed professor of biblical exegesis in the New College, Edinburgh. He is considered an authority on Old Testament exegesis. His publications include a *Commentary on Job* (vol. i., 1862); *An Introductory Hebrew Grammar* (4th ed. 1881); *The Epistle to the Hebrews* (in Clark's Handbooks for Bible Classes, 1882); and *Job and Ezekiel* (in the Cambridge Bible for Schools, 1884).

DAVIDSON, CHARLES (1852—). An American scholar. He was born in Streetsboro, Ohio, and was educated at Iowa College and at Yale University. His publications include: *The Phonology of the Stressed Vowels of Beowulf* (in "Publications of the Modern Language Association," vol. vi., No. 283); *The Difference Between the Scribes of Beowulf* (in "Modern Language Notes," vol. v., No. 2); *English in the Secondary Schools* ("School and College," vol. i., No. 10); and *Studies in the English Mystery Plays*.

DAVIDSON, GEORGE (1825—). An American astronomer. He was born in Nottingham, England, but went to the United States in 1832 and was educated there. He has done notable work on the Government Coast and Geodetic Survey (1845-95), but it is in astronomical research that he gained his greatest distinction. He has traveled on every continent to make observations, particularly of transits of Venus. At present he is professor of geography at the University of California.

DAVIDSON, JAMES WOOD (1829—). An American author, born in Newberry District, S. C. He became professor of Greek in South Carolina College, then principal of the High School at Columbia, and, during the Civil War, adjutant of infantry in Jackson's corps of Lee's army. He was literary editor of the *New York Evening Post* (1873), and American correspondent of the *London Standard* from 1873 to 1878. His published works include *The Living Writers of the South* (1869); *The Correspondent* (1886); *The Poetry of the Future* (1888); and *The Florida of To-day* (1889).

DAVIDSON, JOHN (1857—). An English poet. He was born at Barrhead, near Glasgow, Scotland, April 11, 1857; at the age of thirteen became assistant in the chemical laboratory of a sugar-house at Greenock; attended for a short time Edinburgh University; taught in several Scotch schools; and went to London in 1890, intending to take up a literary career. He had already published three plays—*Bruce* (1886); *Smith: A Tragic Farce* (1888); and *Scaramonsh in Xaros* (1889)—which, though poorly constructed, contain many striking scenes. His later plays have met with considerable success on the stage. In 1901 he began the issue of a series of verse-pamphlets called *Testaments*, of which have appeared "A Vivisector," "A Man Forbid," and "An Empire-Builders." Reactionary from the start, he now utterly repudiates the past in art, literature, morals, and religion. His philosophy (partly derived from Schopenhauer) is thoroughly pessimistic. In man he sees matter striving through brutal effort toward self-knowledge. Hence his defense of vivisection. He is best known by his ballads, individual in subject and style. His thought and manner are well represented by *Making of a Poet*, *Houndsditch*, and the ballads of "Heaven" and "Hell," in *Ballads and Songs* (1894). Other volumes are *Fleet Street Eclogue* (1st ser., 1893; 2d ser., 1895); *New Ballads* (1896); *The Last Ballad and Other Poems* (1898). For critical analysis of his work, consult Archer, *Poets of the Younger Generation* (London and New York, 1902).

DAVIDSON, JOHN WYNN (1824-81). An American soldier. He was born in Fairfax County, Va., graduated at West Point, and was assigned as second lieutenant of dragoons in 1845, and during the Mexican War was with the Army of the West at San Pasqual, the passage of the San Gabriel River, and at Mesa. In 1848 he was promoted to be first lieutenant of the First Dragoons, and from that time until the outbreak of the Civil War was on scouting, garrison, and frontier duty. From 1861 to 1862 he served in the defenses of Washington, D. C., and in the latter year, with rank of major of cavalry, fought in the Army of the Potomac during the Peninsular Campaign, becoming brigadier-gen-

eral of volunteers in 1862. He was brevetted colonel for gallant and meritorious services at the battle of Golding's Farm (Va.), and in 1865 major-general in both the regular and volunteer services for gallantry during the war, and was in command successively of the Saint Louis Division of the Missouri, of the Army of Southeast Missouri, and again of the Saint Louis Division. In 1863 he commanded a cavalry division at Brownsville (Ark.) and Ashley's Mills (Ark.), and in the capture of Bayou Metre (Ark.). He was appointed in 1864 chief of cavalry of the division west of the Mississippi, and in 1866 became lieutenant-colonel of the Tenth United States Cavalry. From 1873 to 1881 he was in command of various posts in the Indian Territory, Texas, and Montana, and in 1879 became colonel of the Second Cavalry.

DAVIDSON, LUCRETIA MARIA (1808-25). An American poet, remarkable for her precocity in rhyming. The first of her writings preserved were done when she was nine years old. At sixteen she attended Mrs. Emma Willard's school at Troy, but her health failed and she died the next year. Many of her pieces were lost or destroyed, but nearly 300 were collected and published by S. F. B. Morse under the title *Amir Khan and Other Poems* (1829). Her sister, MARGARET MILLER DAVIDSON (1823-38), was also a precocious writer, and at the age of ten composed a drama called the *Tragedy of Aethia*. Washington Irving was her patron and supervised the publication of the two sisters' works (1850).

DAVIDSON, SAMUEL (1806-98). An Irish biblical critic. He was born at Kellswater and was educated at the Royal College of Belfast. He entered the Presbyterian ministry, and in 1835 was given the chair of biblical criticism in the Royal College of Belfast. Soon afterwards he became a Congregationalist. In 1842 he was offered the chair of biblical literature and Oriental languages in the Lancashire Independent College at Manchester and was one of the Old Testament Revision committee. His principal works are *Sacred Hermeneutics* (1843); *Text of the Old Testament Considered, with a Treatise on Sacred Interpretation* (1856), written for Horne's *Introduction*. The publication of this discussion resulted in his resignation of his chair at the Manchester College. His other publications include *The Canon of the Bible* (1877); *The Doctrine of Last Things Contained in the New Testament* (1882).

DAVIDSON, THOMAS (1817-85). An English geologist and paleontologist, born in Edinburgh. He studied on the Continent and at Edinburgh University, made extensive geological tours, and at the suggestion of Leopold von Buch, the German geologist, undertook the study of the Brachiopoda. In 1851-70 he published, under the direction of the Palaeontographical Society, his important monograph on *British Brachiopoda* (3 vols.), containing 250 plates drawn by himself. To this work he added (1873-1885) three supplementary volumes. His *Memoir on Recent Brachiopoda* was posthumously published by the Linnean Society. In 1852 he was elected fellow of the Geological Society of London, and in 1857 fellow of the Royal Society. His splendid collection of recent and fossil brachiopods, together with his books, he presented to the National Museum at South Kensington.

DAVIDSON, THOMAS (1840-1900). A Scotch-American philosopher, born near Tetterangus, Scotland. He graduated in 1860 at the University of Aberdeen, removed in 1866 to Canada, and in 1867 to the United States, and in 1875 settled at Cambridge, Mass., where he was active as scholar, author, and lecturer. A close student of Thomas Aquinas, he was invited by the Pope to assist the corps of Italian professors in the preparation of a new edition of the works of that philosopher. His *Philosophical System of Antonio Rosmini-Serbati* (1882) was the first introduction of the latter to English readers. For many years he conducted at Keene, in the Adirondacks, a 'summer school for culture sciences,' and from 1898 a class of Russian Jews in New York City. His personality was large and commanding. His published works include further: a translation of the fragments of Parmenides (1869) and one of Bleek's *Origin of Language* (1869); *A Short Account of the Niobe Group* (1874); *The Parthenon Frieze and Other Essays* (1882); *The Place of Art in Education* (1886); *Aristotle and Educational Ideals* and *A History of Education* (1900).

DAVIDSON, WILLIAM (1746-81). An American soldier. He was born in Lancaster County, Pa., was taken when a child to North Carolina, and became a major in one of the first regiments raised in that State for the Revolutionary War. He was in the engagements at Brandywine, Germantown, and Mounmouth, and advanced to the rank of a brigadier-general of North Carolina militia. In the attempt to check the advance of Cornwallis over the Catawba River at Cowan's Ford, February 1, 1781, he was killed. Davidson College, N. C., was named in his honor.

DAVIDSON COLLEGE. A town in Mecklenburg County, N. C., 22 miles north of Charlotte; on the Southern Railway (Map: North Carolina, B 2). It has cotton-mills, a cottonseed-oil mill, planing-mills, and a flouring-mill. The town is the seat of Davidson College (q.v.) and of the North Carolina Medical College, established about 1890, connected with which is Altheon Hospital. Population, in 1890, 481; in 1900, 904.

DAVIDSON COLLEGE. An institution of higher education established in 1837 at Davidson College, N. C. The college was founded by members of the Presbyterian Church, and is at present governed by a board of trustees appointed by the Presbyterians of North Carolina, South Carolina, Georgia, and Florida (Presbyterian Church South). No theological department, however, is maintained and the degrees conferred are the academic ones in art and science. The student attendance approximates 200; the endowment of the college is \$125,000, the income about \$20,000, and the total value of the college property \$325,000. The library contains 15,000 volumes.

DAVID THE PHILOSOPHER (Arm. *David 'Imasdaser*), or **DAVID THE ARMENIAN**. An Armenian scholar of the fifth century A.D. He studied in Greece, and wrote learned translations of, and commentaries on, the works of Aristotle. Consult: Neumann, *Mémoire sur la vie et les ouvrages de David* (Paris, 1829).

DA'VIE, WILLIAM RICHARDSON (1756-1820). An American soldier, born in Egremont, England. He came to the United States in 1763,

graduated at Princeton in 1776, studied law at Salisbury, N. C., and in 1779 received the commission of a lieutenant of dragoons. His troop was subsequently assigned to Count Pulaski's legion, in which he rose to the rank of major. He resumed the study of law at Salisbury, and in 1779 was admitted to the bar of North Carolina. Under the authorization of that State in 1780 he raised at his own expense a troop of dragoons and two mounted infantry companies, with which to assist in the defense of the southwestern districts against British attacks from South Carolina. In 1780 he was promoted to the command of the State cavalry, with the rank of colonel. At the entry of Lord Cornwallis into Charlotte, N. C., he distinguished himself by his spirited resistance to the repeated charges of Tarleton's famous legion. He was appointed in 1781 to the post of commissary-general of the American Army in the South. After the Revolution he became a successful lawyer, was a delegate to the Constitutional Convention of 1787, and for a number of years represented the borough of Halifax in the Lower House of the State Legislature. He drew up the act, passed in 1789, for the establishment of the University of North Carolina; in 1794 was commissioned major-general of militia; in 1798 was elected Governor of North Carolina; and in 1799 resigned that post to accept appointment to the embassy which concluded with the French Government the convention of September 30, 1800. Consult the biography by Hubbard, in vol. xxv. (Boston, 1848) of *The Library of American Biography*, edited by Jared Sparks.

DA'VIES, BEN (1858—). An English tenor, born in Swansea, Wales. He studied under Randegger at the Royal Academy of Music (1880-83), where he won numerous prizes. Upon leaving the Academy he joined the Carl Rosa Opera Troupe, appearing in *Faust*, *The Bohemian Girl*, etc.; but he is best known as a concert and oratorio singer. He visited the United States in 1893, and again in 1894.

DAVIES, CHARLES (1798-1876). An American mathematician, born in Washington, Conn. He early removed to Saint Lawrence County, N. Y., and in 1815 graduated at West Point. In 1848 he took the chair of mathematics and natural philosophy in the University of New York, and in 1857 the chair of higher mathematics in Columbia College. His works include: *Surveying* (1832); *Trigonometry* (1840); *Logic of Mathematics* (1850); and *Dictionary and Cyclopædia of Mathematical Science* (1855). He edited, in English, Bourdon's *Algebra* (1834), and Legendre's *Geometry* (1828).

DAVIES, HENRY EUGENE, JR. (1836-94). An American soldier, born in New York. He was educated at Harvard, Williams, and Columbia, and was admitted to the bar in 1857. At the outbreak of the Civil War he entered the United States Volunteers as captain, and became brigadier-general in September, 1863. He served with distinction in the Cavalry Corps, Army of the Potomac, became one of Sheridan's most trusted lieutenants, and by 1865 had risen to the rank of major-general of volunteers. He resigned in 1866, and afterwards became a prominent New York lawyer and held several public offices. He was the author of *General Sheridan* (1895), in the Great Commander Series.

DAVIES, JOHN, OF HEREFORD (c.1565-1618). An English poet, not to be confounded with Sir John Davies (q.v.). At Oxford and elsewhere he was famous as a writing-master. He wrote many curious philosophical poems, epigrams, satires, and sonnets. Among these are: *Microcosmos* (1603); *Triumph of Death* (1605), descriptive of the plague; *Wit's Pilgrimage* (c.1610), containing sonnets, etc.; *The Scourge of Folly* (c.1611), containing epigrams, etc., one of which is addressed to Shakespeare under the name 'our English Terence'; and *The Muse's Sacrifice, or Divine Meditations* (1612). Consult *Complete Works*, edited by Grosart (2 vols., Blackburn, 1873).

DAVIES, Sir JOHN (1569-1626). An English poet and statesman. He was born at Tisbury, Wiltshire, educated at Oxford, studied law in the Middle Temple, and was called to the bar in 1595. In 1603 he was sent by James I. as Solicitor-General to Ireland. Three years later he became Attorney-General, and was raised to the degree of sergeant-at-law. Elected to the Irish Parliament in 1613, he was chosen Speaker of the Lower House. The next year he took his seat in the English Parliament as member for Newcastle-under-Lyme. He died just after being nominated Chief Justice. Davies was a faithful public servant, and a man of great talent and learning. His two works connected with his Irish career are *A Discovery of the True Causes why Ireland was Never Subdued, etc.* (1612) and *Reports of Cases Adjudged in the King's Courts in Ireland* (1615), and several masterly State papers. As a poet he belonged to a group of late Elizabethans who, in reaction from the earlier love poetry, turned to moral themes. In 1596 he published *Orchestra, or a Poem of Dancing*, in which he fancifully maintains that all motion is music; to him the heavens move in "spondees, solemn, grave, and low." Still more fanciful are his acrostics, called *Hymns to Astræa* (1599). The poem by which he is best known is *Nosce Teipsum* (1599), in which is discussed the nature of the soul and immortality. It is written in the four-line stanza, afterwards employed by Davenant, Dryden, and Gray. Consult *Complete Works*, with memoir edited by Grosart (3 vols., Blackburn, 1869-76).

DAVIES, LOUIS HENRY (1845-). A Canadian statesman. He was born at Charlottetown, Prince Edward's Island, was educated at Prince of Wales College, Charlottetown, and in 1866 was called to the bar. In 1876 he became Premier and Attorney-General of Prince Edward Island, and in 1882 was returned as a Liberal to the Dominion Parliament, in which he has since continued to hold his seat. He was appointed as one of the British counsel before the International Fisheries Commission at Halifax in 1877.

DAVIES, SAMUEL (1724-61). An American clergyman and educator. He was born near Summit Ridge, Newcastle County, Del.; was educated at the seminary of the Rev. Samuel Blair, Fogg's Manor, Chester County, Pa., and in 1746 was licensed to preach by the Newcastle Presbytery. In 1747 he was sent as an evangelist to Hanover County, Va., where by 1748 he was conducting worship in seven churches near Hanover. He later argued against Peyton Randolph, the Royal Attorney-General, before the General

Court at Williamsburg, in defense of the proposition that the Act of Toleration extended to the Colony of Virginia. In this view he found himself supported by the King. In 1753, with Gilbert Tennent, he visited England to obtain funds for the College of New Jersey (now Princeton University). His sermon, "Religion and Patriotism," preached to Captain Overton's company of volunteers in Hanover County, 1755, refers to the martial spirit aroused by the French and Indian War, and he adds in a footnote: "As a remarkable instance of this, I may point out to the public that heroic youth, Colonel Washington, whom I cannot but hope Providence has hitherto preserved in so signal a manner for some important service to his country." In 1759 he succeeded Jonathan Edwards as president of the College of New Jersey. His collected sermons appeared in London in 1767. The New York edition of 1851 (3 vols.) contains a memoir by Albert Barnes.

DAVIES, THOMAS (c.1712-85). A Scotch bookseller and author. He studied at the University of Edinburgh, made an unsuccessful attempt at acting, and, having been roundly ridiculed by Churchill in *The Rosciad*, set up a bookshop in Covent Garden. It was here that, in 1763, he introduced Boswell to Dr. Johnson, who was his very good friend, and to whom he dedicated his edition of the works of Massinger. He wrote a *Life of Garrick* (1780), which soon passed through four editions, and brought him considerable money and repute.

DAVIESS, dā'vīs, JOSEPH HAMILTON (1774-1811). An American lawyer. He was born in Bedford County, Va.; was taken to Kentucky by his parents when a child, was educated there, and soon became well known in the West for his eccentricities as well as for his skill as a lawyer. He was United States district attorney for Kentucky, and as such attempted to bring Aaron Burr (q.v.) to trial for treason (1806), but was unsuccessful, and gained only personal unpopularity. Having entered the army, he fought as major under Gen. W. H. Harrison at Tippecanoe, where he was killed while leading a brilliant cavalry charge against the savages. Daviess married a sister of John Marshall.

DÁVILA, dā'vê-lá, or DE ÁVILA, ALONZO (c.1540-66). A Spanish soldier, born in the City of Mexico. In 1566 he was accused of complicity in a plot to overturn the Government and place Martín Cortés on the throne of New Spain. He was subsequently condemned and executed at Mexico. That he had any share in the plot, if such there were, is now considered extremely doubtful.

DAVILA, ENRICO CATERINO (1576-1631). An Italian historian, born at Sacco, near Padua. His father was the constable of Cyprus, and after the Turkish victories was obliged to take refuge in France, where Enrico was brought up as page to Henry III. Afterwards he fought in the French Army, distinguished himself at Honfleur (1594) and Amiens (1597), and was killed while in the service of Venice (1631). His history gives an authentic account of the years from 1559 to 1598, although he was always a partisan of Catherine de' Medici. The title is *Historia delle guerre civili di Francia nella quale si contengono le operazioni di quattro re Francesco II., Carlo IX., Henrico III., et Henrico*

IV., *cognominato Grande* (1630); the work has gone through two hundred editions; the best is that published in Paris (1644). It has been translated into nearly all the modern languages, and into Latin by Cornazzano (1745).

DÁVILA, GIL GONZALES (1570-1658). A Spanish historiographer, born at Avila. He held a minor ecclesiastical office at Salamanca, and was appointed royal chronicler of Castile and the Indies. His *Teatro eclesiástico de la primitiva iglesia de las Indias Occidentales* (1640-55) holds a high place as a general Church history of New Spain.

DÁVILA Y PADILLA, dá'vê-lá ê pâ-pê'lyá, AGUSTIN (1562-1604). A Mexican historian. He was born in the City of Mexico, where he entered the Dominican Order in 1579. He was friar of the Convent Puebla de los Angeles in Thascala, and lecturer on philosophy and theology at the colleges of Puebla and Mexico. He was one of the chief officers of the highest chapter

in his province, and in 1596 was sent as ambassador of the Order to Rome and Madrid, where two years later he became Court preacher. As a prominent officer of the Inquisition he caused to be burned several hundred copies of a Spanish translation of the Bible which had been supplied with annotations by Protestants. He was one of the most zealous members of his Order, and also one of the most learned and eloquent, for which reason the title 'Chronicler of the Indies' was bestowed upon him. His principal work, written by order of the Government, was published under the respective titles: *Historia de la fundación de la provincia de Santiago de Méjico, de la orden de predicadores* (1596; 2d ed. 1625) and *Varia Historia de la Nueva España y Florida* (2d ed. 1634).

DAVIN, dá'văn', FÉLIX. The nom-de-plume signed to the introduction of the *Etudes psychologiques* by Honoré de Balzac.

DA VINCI, dá-vên'chê, LEONARDO. See VINCI, LEONARDO DA.
