The Builder

AN

ILLUSTRATED WEEKLY MAGAZINE,

FOR THE

ARCHITECT, ENGINEER, ARCHÆOLOGIST, CONSTRUCTOR,

SANITARY REFORMER, AND ART-LOVER.

CONDUCTED BY

GEORGE GODWIN, F.R.S., F.S.A.

"Every man's proper mansion-house, and home, being the theater of his hospitality, the seate of selfe-fruition, the comfortablest part of his own life, the noblest of his sonne's inheritance, a kinde of private princedome, nay, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned."

"Architecture can want no commendation, where there are noble men, or noble mindes."——Sir Henry Wotton.

"Our English word To Build is the Anglo-Saxon Byldan, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling-places."——Diversions of Purley.

"Art shows us man as he can by no other means be made known. Art gives us 'nobler loves and nobler cares,'—furnishing objects by the contemplation of which we are taught and exalted,—and so are ultimately led to seek beauty in its highest form, which is Goodness."

Inauguration of Improvements in London.

THE past week has witnessed an unusual number of those events,—if we date them by the formal completion,—which are so rapidly transforming the architectural and picturesque character of the metropolis. The noble basin which has been in course of execution for some four years past in extension of the Victoria Docks has been opened by the Duke of Connaught; the old burial-ground of the Quakers,—believed to be the first place of interment owned by that religious body,—in Baker's-row, Whitechapel, has been converted into a public garden, and as such was opened by the Prince of Wales; and the freeing to the public for ever of the Putney, Wandsworth, and Hammersmith bridges has also been solemnised by the heir to the throne. Thus, three great elements in the growth of a great capital,—namely, provision for maritime commerce, facilities for internal communication, and room for healthy recreation, have each received at once a development, a stimulus, and a royal acknowledgment of their importance.

While the commercial history of London reaches back to the time of the Roman occupation of England, it was not until the present century that any public dock existed in the neighbourhood of the City, with the exception, of course, of the great natural dock of the river. A century ago the sole accommodation for landing and bonding foreign produce was limited to a single spot, called the "Legal Quay," which extended for about 1,400 ft. seawards from London Bridge. In 1773 Mr. J. Sharp suggested the formation of floating docks,—an accommodation for commerce which had been introduced at Liverpool in 1716. In the year 1800 the West India Docks were commenced; in the year following the London Docks were projected; and in the year 1805 the East India Docks were commenced. Mr. Ralph Walker was engineer for all these undertakings, Mr. William Jessop being associated with him in the West India Docks. In 1824-25, notwithstanding the construction of the above docks, the crowded state of the river, and the urgent need of more dock room, engaged the attention of Parliament, and Acts were passed for Collier Docks, South London Docks, and the St. Katherine Docks, of which the last only were carried out. In the five years from 1830 to 1835 the steam tonnage entering the river nearly quadrupled.

The Victoria Docks, to which a basin without parallel for length in the country, or, it is said, in the world, has now been added, were first proposed in 1842 by Mr. Blyth. This gentleman, after pointing out the site, and the advantages connected with it, did not take any further interest in the matter. But his hint was not destined to be forgotten, for it was given to George Parker Bidder, who at that time was undertaking, with the aid of three or four friends, the construction of a line of railway connecting the Eastern Counties Railway at Stratford with the river Thames. Some idea of the uphill work with which Mr. Bidder had to contend may be formed from the fact that this line, before its completion, was generally known by the name of "Bidder's Folly." It proved, however, so advantageous, that the Eastern Counties Railway took it at cost-price. An extension was then projected to North Woolwich. This was reported against by the Board of Trade; but, owing to the able advocacy of Mr. Anstin, before a committee of the House of Commons, the Bill was obtained.

The marsh land on the north of the Thames, between Bugsby's Reach and Galleon's Reach, and bounded by Woolwich Reach on the south, let at the time of which we are speaking for from 6*l.* to 7*l.* per acre. It was partly pasture and partly arable, and before the introduction of steam-boats for the conveyance of cattle, it was useful for the pasturage of cattle so near the metropolis. The land was not, however, valued at more than 100*l.* per acre; and even after the passing of the Act of Parliament for the Victoria Docks, land was sold by auction at that price. But the landowners determined to oppose the railway, unless the whole of their land were purchased; a policy the short-sighted nature of which it now seems difficult to realise. Thus the Dean and Chapter of Westminster received 8,000*l.* for forty-seven acres of land, which was not worth more than 4,000*l.*, in order to get rid of this threatened opposition. The Victoria Company paid for the 600 acres which they purchased, at the rate of 250*l.* per acre; the difference between this price and the value of 100*l.* per acre, amounting to 90,000*l.*, went into the pockets of the landowners.

Mr. Bidder's calculation was to the effect that, taking the land at 250*l.* per acre, it could be excavated for 1,250*l.* per acre, and puddled for 250*l.* per acre, so that the cost of the water area, in that situation, would be 1,750*l.* per acre. The jetty system, which had been adopted at the London Docks, afforded great facilities for working, loading, and unloading ships. The line of railway placed the docks in direct communication, by means of the Shoreditch and Fenchurch-street Stations, with the City; and by the Great Northern line with the Midland, and the whole of the manufacturing districts.

The cost of the works, on the opening of the docks on April 1, 1858, had amounted to 706,462*l.*, which the purchase of the Steel-yard Estate, that of extra lands, and 29,000*l.* spent in Parliamentary expenses, brought up to 938,164*l.* The water area at this time was about 100 acres. It comprised the entrance dock from the Thames, with two pairs of gates, leading into a tidal basin of 16 acres, separated, by a dumb jetty, from the main dock of 74 acres, but communicating with it by a single pair of gates, and terminating with a cut, or channel, at the eastern extremity. The basin and dock together (exclusive of the eastern cut) were 4,050 ft. in length, and 1,050 ft. in width, at high-water level. In addition to the dumb or terminal jetty, four jetties, each 580 ft. long, projected into the basin, being each 140 ft.

wide, and placed 430 ft. apart, except the most easterly one, which had a space of 550 ft. Thus a quay-room of nearly three miles in length was provided, although the length of the basin was only 1,350 yards. In the new basin a simpler arrangement has been adopted, the length of the dock being a mile and a quarter, and the width 490 ft.

The site selected by Mr. Bidder was found to afford the unusual advantage of furnishing an admirable building material out of the excavation which it was necessary to make. The surface of the marsh was below the level of Trinity high-water mark. Beneath a layer of about 12 in. of subsoil occur 5 ft. or 6 ft. in thickness of blue and yellow clays; then a bed of from 5 ft. to 12 ft. of peat; and then gravel, overlying the London clay. The latter formation was found throughout the length of the first dock, at a nearly uniform depth of 37 ft. below Trinity high-water mark; and on that foundation, at the depth of 37 ft. 6 in., the brickwork of the upper and lower gate platform was laid. The gravel formed the solid silicious portion of the concrete of which the walls were built. In the new dock the quantity of excavation is stated at 4,000,000 cubic yards, and that of the concrete made at 500,000 cubic yards. The new dock,—henceforward to be called the Albert Dock,—is connected with the Victoria Dock, which we have described, by a canal of 1,400 ft. in length, and stretches in nearly a right line across the peninsula of the former marsh to Galleon's Reach.

One or two very instructive failures occurred during the construction of the original works, as to which it is desirable that every architect who has to design important works for the valley of the Thames should possess full information. It would be difficult to imagine a more promising foundation, under ordinary circumstances, than the gravel bed lying on the London clay. Over great part of the area of London this bed is to be found. It supports some of our most important edifices. But it is one thing to build a church or a palace, and quite another thing to design a stable hydraulic work. The gravel, as many of our readers well know, is full of water. In dealing with a depth of nearly 40 ft. of water at high tide, the ordinary conditions of stability are greatly modified. If the foundation of a wall or pier be laid on the gravel, the water can find its way beneath. The lifting power which it exerts at high tide is then such as the weight of the wall would be unable to resist. In the case of the lower-gate platform, according to the calculations of Mr. Bidder, the pressure of the water upwards, if it were allowed to percolate beneath the foundations, would be more than a ton on the superficial foot (say 2,300 lb.), while the weight of the brickwork inside, with 10 ft. of water upon it, would only amount to 1,640 lb. per square foot. Hence the importance of taking out all the gravel, so as to bed the concrete and brickwork solidly on the clay; and the advantage, if not the necessity, of covering the horizontal joints with a close sheet-piling.

On Sunday, the 17th June, 1855, at a time when great progress had been made in the works, the north wall of the lock-chamber began to give way, moving forward bodily into the lock, pushing up the thick puddle towards the centre, bending and breaking the tie-bars behind, and dragging the tie-piles forward, and, in some instances, breaking them off. A few hours later the north side failed in the same way, but the brick side-walls and platforms remained unaffected.

This remarkable subsidence, which was dealt with by the construction of solid concrete walls of 18 ft. in thickness, was due to the hydraulic pressure of the water percolating the gravel. From the commencement of the works in 1853 great pumps had been worked night and day. As this continued for two years, the soil was gradually drained of its contained water for a considerable distance, in all directions. It was found that the water in a well situated in East Ham parish, more than two miles and a quarter from the docks in a direct line, was much lowered while the works were in progress, but recovered its level when they were completed. At the time of the accident, the pumping had been discontinued for some weeks, in order to allow water to collect in the dock to the depth of three feet, with a view of thus testing the clay puddle. It was excluded from the lock chamber by a temporary tank. As the ground behind the walls gradually recovered its charge of water, pressure steadily augmented, and as the clay-puddle afforded no good abutment for the footings of the walls, the consequence was readily to be understood; although it was one which few architects or engineers, unenlightened by any such costly experience, could have been expected to foresee.

The effect of the extension of dock accommodation on the growth of London, and on the increasing value of sites in the neighbourhood, is perhaps not very difficult to calculate. It will be in the nature of an additional impulse given to the activity of the builder, but an impulse acting on the actual lines. It is otherwise with regard to the freedom of the bridges. It may be anticipated that this salutary measure will cause a diversion in the lines in which the activity of the builder is now radiating from the great centres of business. This, indeed, is not a thing of to-day or of to-morrow; but it is nevertheless sure. We recommend those who take an interest in the subject to study what is now taking place in the case of Waterloo Bridge. We beg leave to urge upon the Metropolitan Board of Works not to hide under a bushel the great advantages they have secured to London by the most wise plan of the freeing of the bridges. They owe it to themselves to present us with statistics of the present traffic. As far as can be predicted, the result would be most gratifying. On the first opening of these great thoroughfares, indeed, the increase of traffic disappointed our expectations. These showed that we had not made enough allowance for time. To change habits of business, even for a certain gain, is not a thing to be done in an hour. But now that enough time has elapsed to allow the public to become familiar with the advantages of the new routes,—new in as much as they are free routes,—they appear to be fully availing themselves of the service. The activity of the Waterloo-road, just now presents a very striking contrast to that evinced before the freedom of the bridge. Such, we take it, is sure within a few years to be the case with each of the freed bridges. And as the growth of the delta projecting beyond a line of coast gives proof, century after century, of the force and the direction of the current of the river which forms it, so may we anticipate the improvement and the extension of building along those lines of internal metropolitan communication which are now no longer handicapped by a toll.

ORNAMENTAL IRONWORK AT THE SOUTH KENSINGTON MUSEUM.

SINCE the removal of the great casts of Indian architecture from the South Courts of the South Kensington Museum, the collection of ornamental ironwork which has been exhibited at the Bethnal-green Museum during the last few months has been transferred to the parent museum, where, in a fragmentary form, it for many years found a home. Distributed, through want of adequate exhibiting space, in groups or by solitary specimens in out-of-the-way corridors and galleries, few persons could perceive that which is now, since its re-arrangement, very apparent, namely, that we have here a collection of ornamental wrought-iron work of an almost unique character, the like of which we certainly do not remember to have met with in any other European museum. We are accordingly tempted to offer a few general remarks upon the subject of ironwork.

The oblivious history of Vulcan and the Cyclops, the legendary gods of the forge, encircle the birth of the art with poetical imagery. More than a millennium before Christ it is said that the Greeks discovered iron. Homer writes of a furnace urged by twenty pairs of bellows, into which the ore was cast for the shield of Achilles; and Ecclesiasticus, some 700 years later, presents us with a graphic picture of "the smith sitting by the anvil and considering the ironwork. The noise of the hammer and the anvil is ever in his ears, and his eyes look still upon the pattern of the thing that he maketh." Glaucus of Chios, an art-workman of the second century, is stated by Pausanias to have been the inventor of iron soldering. The use of iron on a large scale was known in the fourth century to the Indians at Delhi, as the iron pillar, more than half of which is hidden many feet in the ground, testifies. Interesting as are these incidents hallowing the age of ironwork, they do not advance an investigation into methods of fashioning iron. Examples of workmanship which can be handled and examined more immediately serve such a purpose.

Broadly speaking, iron may be classified under three heads, viz.,—cast iron, malleable iron, and steel. The presence, or comparative absence, of carbon determines the peculiar qualities of the classes of iron. Thus, malleable iron is freer from carbon than is steel; steel than cast iron; and cast iron contains therefore the largest proportion. Malleable iron, which is comparatively soft, ductile, weldable, tenacious, and not fusible at ordinary temperatures, is used for those arts of the forge, the hammer, and the anvil, which group themselves under "wrought iron." Steel is more like malleable iron than cast iron. It possesses all the properties of ductility and tenacity to be found in iron, and, moreover, is highly elastic, capable of being hardened by tempering, and fusible in furnaces. Steel is used for arms of all kinds, blades, guns, armour, and armour-plating, as well as for articles like axles, cranks, and so forth. Through the exertions of men such as Bessemer, Whitworth, Siemens, and Krupp, it is being adopted for use in works of far larger importance than even that of the famous blade "Mimung," or of the Toledo and Ferrara swords. Cast iron, as its name shows, is used for casting or moulding. It is brittle, and easily fusible. The vast variety of uses to which iron, under its three guises, is put, from nails to tubular bridges, and from needles to railways, occupies so great and interesting an area for observation at the present time, that it will be well to point out that the iron works now under discussion are of an ornamental character, occupying but a small space of the extensive historic field of the uses of iron.

The smiths who designed at their anvils like artists in their *ateliers* scarcely exist any longer. In some obscure German town one may, perhaps, meet with such an artificer; but, to all intents, the hand-wrought ornamental, beaten, rivoted, and welded iron is a thing of the past, and will remain so until knowledge of this art is revived, and demand for its practice re-created. A principal reason of the virtual demise of wrought-iron work is traceable to the employment of coal in lieu of wood and charcoal in melting out the metal from the ore. Charcoal furnaces yielded a malleable metal, whereas coal-fed blast furnaces yield pig-iron,—a coarse form of cast-iron. One may, without difficulty, realise the immense change which has come over ironworks since the utilisation of coal for fuel, and the introduction of blast furnaces for smelting.

In Lancashire, Staffordshire, Yorkshire, and Gloucestershire, traces of ancient iron furnaces have been found. Famous ironworks existed in Sussex from very early times. A great bed of iron ore ran from Hastings in a north-westerly direction for some five-and-twenty miles. Roman relics have been found in cinder-beds of disused furnaces. Cæsar mentions iron in the "maritime regions" of Britain. In the thirteenth century we find Sussex supplying iron for the tomb of Henry III. at Westminster; and somewhat later,—

> "Master Haggett and his man John,
> They did cast the first cannon."

The splendid woodlands of Sussex supplied the fuel for the furnaces. So marked, however, was the thinning of the forests for the purposes of fuel supply, that both Henry VIII. and Elizabeth set in operation wood-protective laws. 140 furnaces are recorded as being in use in the seventeenth century, each of which consumed every twenty-four hours from two to four loads of charcoal. Nevertheless, the woodlands of Sussex now bear but few traces of the busy iron trade of a century and a half ago. The sheets of water which are picturesque features in the Weald frequently owe their origin to the ironfounders having dammed the streams into reservoirs, which supplied the water to move the wheels of the hammers and other machinery in the furnaces. The iron trade of Sussex declined in the eighteenth century. Occasionally are still to be purchased delicately-wrought shovels or tongs, snuffers, andirons, and rushlight-holders of the sixteenth and seventeenth centuries; but these and a few monumental slabs in village churches, or finely-wrought decorative screens to be most exceptionally seen, as at St. Paul's Cathedral, are the principal memorials of the south-eastern English iron foundries.

From the peaceful pastures and parklands of Cæsar's maritime regions one may turn for contrast to the grim, Black Country of the midland and northern counties, with its coal-smoke clouds and roar of thousands of deep, broad-throated blast-furnaces, and see there the modern methods of producing millions of tons of

iron per annum. Blast-furnaces, puddling-furnaces, steam-hammers, and rolling-machines, behemoths of foundries and forges, are here in full operation in the production of those sinews of strength which are imparted to modern construction. Sometimes an important piece of ornamental ironwork, for an international exhibition, emanates almost abnormally from one or another of the great Cyclopian centres. The arts of welding, soldering, riveting, tenoning, mortising, and swaging, the uses of the hammer, the chisel, graver, file, and "organarium," a quaint machine for shaping small pieces of iron, as handed down by the writings of Theophilus, Monk and Priest, of the twelfth century, are now but little remembered. This is not surprising when one finds that in the late thirteenth and early fourteenth centuries the blacksmith's art was apparently dying out in France. The late M. Viollet-le-Duc, in his valuable "Dictionary of Arts," makes his ideal thirteenth-century forger grumble at the patrons of art, "who will not give a price for anything that does not glitter. Each day the art of the forge declines." "What forger," exclaims the ideal Hugo, "is there at this day to forge a *penture* equal to those on the doors of Notre Dame?" Expatiating upon the careful soldering of the thin-beaten petals of some finely-wrought flower,—the work of his father,—and upon the deterioration to quality of work, caused by adopting a "subterfuge" like rivets, Hugo complains of the migration of his fellow-craftsmen to English and German towns, for "in these places ironworks are so esteemed." It may be for some reason of this kind that the collection under notice abounds in a great number of German specimens of ironwork.

The value of this collection may be regarded from two points of view. First, in respect of treatment or manners of manipulating iron for ornamental purposes; and second, as to the kinds of articles and objects produced in iron. Works about the fourteenth and fifteenth centuries of Gothic design are formed with sharply-cut rods of iron, chamfered and bevelled, tenoned and mortised invisibly together. Of such there are here a minutely-executed three-faced shrine, and near it a small turret-clock. Of the same period are the decorative hinges which stretch across the width of a cathedral door, covering the greater portion of it with scrolls and conventional fruits and flowers. This kind of work is, as a rule, bolted or nailed down to its background. Chests and coffers are ornamented with plaques and strips of pierced and punched thin sheet-iron. In later times the thin sheet-iron was twisted and shaped into acanthus and other leafy forms, and then deftly applied to conceal the rivets in frame-work. The sequence of soldering, welding, and riveting may also be traced. For pediments of windows and headings to gateways, light iron, fantastically twisted and of a flatteued rod treatment, was used extensively in Germany and Italy in the sixteenth and seventeenth centuries. We find in the collection an admirable example of this kind of work. Long, continuous spirals sprout from the extremities of attenuated grotesque figures. The main stems of the spirale interweave one another, and at different junctures, growing on the stem, are odd bird-like creatures with long, pointed beaks. In imitating plumage neither the French, Italian, German, nor English blacksmith has shown himself a worthy competitor of the sixteenth century Japanese smith, Myochin Mune Larn, whose osprey stands in an adjacent court,—a wonderful compound of laminated iron feathers fitted together with the utmost cunning, and counterfeiting of Nature herself. Placed in one of the glass cases at the side of the court, and with other shields of less importance, is a beaten and chiselled sixteenth-century shield in which a high order of workmanship is shown. In a central medallion is a well-drawn and modelled Medusa's head, with its snake-locks curling about and forming a good distribution of lines over the background. Around the medallion is a crisply-cut laurel-wreath, beyond which comes a narrow band, containing the inscription, "GIORGIUS · SIGMAN · AURIFEX · AUGUSTE · HOC OPUS · PERFECIT · ANNO · DOMINI · MDLII · MENSE · AUGUST · DIE · XXVII." Then comes a broad, encircling space, ornamented with seven wreaths and floating ribands. Within the wreathe are words such as TRIUMPHALIS, OVALIS, MURALIS, NAVALIS, CIVICA, &c. There is another bordering of laurel-leaves, and then an outer frieze of bold relief, typifying the triumph of Rome. In that portion of the frieze which is above the Medusa's head sits Rome the eternal, and on her right and left spreads a series of gods and goddesses,—Jove and his satellites, Mars and emblems of his victories, Ceres or Cybele, and Pax. The background to these foremost figures is rich with arms, bucklers, trophies of flowers and abundance, galleys, heads of battering rams, dolphins, helmets, and other martial insignia. The shield is some 2 ft. in diameter, and was purchased for 270*l*. It is one of the chief objects of this class belonging to the Museum. Near the north end of the court stretch the well-known wrought-iron screens made in 1695 by a Nottingham smith,—Huntington Shaw,—for the king's palace at Hampton Court. These screens are masterpieces of elaborately-foliated scroll-work. The style of design is *rococo*. Masks and embroidered cloths, or *lambrequins*, garlands, floral devices, cyphers, festoons, are the ornamental details applied to the square rod framework of the three principal panels of the screen, which are separated from each other by architectural pilasters of open iron-work surmounted with crowns. Similar work on grills and window frames, of which there are here many good examples, abounds in the Engadine and South Germany. The towns of Nuremburg and Augsburg were famous for their blacksmiths, and so, indeed, has London been. Examples of her blacksmiths' art of the Queen Anne and succeeding Georgian periods are notable as showing the craftsman's nice appreciation of the character of iron in respect of its ductility, its strength, and its lightness.

Amongst the varieties of objects for which iron has been used, one finds in the collection, besides grills and gates, already mentioned, railings, balustrades, and other kindred architectural accessories, articles like nut-crackers, a press for sealing documents, seals, keys, locks, coffers, tripods of dainty twisting hands and rods, stands for braziers, fireirons, and dogs; door-handles and knockers, gondola-prows, and, of present manufacture, handles for walking-sticks, trinkets, buckles, bracelets, necklets, and brooches of blackened cast-iron. These latter, of Berlin manufacture, serve to show for what delicate purposes the art of casting may be employed.

The days of lanterns enclosed in shrines of sharply-forged iron, like those jutting from the angles of the Strozzi and Ricardi Palaces in Florence, are past; and so, too, are those of the flame-tongued dragon gargoyles, Brobdingnagian keys, and other trade-signs; panels of beaten iron with royal arms, initials, crowns, and dates; specimens of nearly all these works are included in the collection.

From the point of view of concentrating attention upon one branch of metal-working, it would have been better had a few specimens of brass and bronze work been excluded from the collection of which they now are a part. The educational value of a collection of ornamental ironwork is considerable. Its points of instruction may be emphasised by simplicity in selection and arrangement of the specimens. At present the grouping is not according to any particular order of date, country, or method of production. Full explanatory labels to supply information about sorts of workmanship are necessary to help the public in drawing comparisons between methods, and in gleaning facts concerning the development, decline, and metamorphoses in the art of ironwork. Without some such directions who is to perceive the particular uses of square bars, chamfered and bevelled rods, round, spiral, and grooved rods, of pierced and punched thin plate-work, of *repoussé* and chased work?

The art of casting iron is becoming better understood, and although cast-iron ornament has not the quality or *cachet* of hammered work, there is no reason why designers for cast work should not, by mastering the capabilities of sand and other moulds, adopt certain distinctive features so as to raise cast iron from its present position of being merely a bad and coarse rendering of decorative wrought iron.

At the same time, it might be satisfactory to see signs of a more general revival of the arts of hammering and fashioning iron on the anvil. Modern wrought-iron work is generally deprived of its freshness in appearance. Details are often beaten from a single matrix, which engenders a monotony. Formal geometric precision is a quality now frequently preferred to that vivacity of irregularity, which charms a minority of people, who see in it the character and craft of the workman.

RECENT EXCAVATIONS IN ASIA MINOR.

THE library of the Institute of British Architects has recently received, through the liberality of Professor Donaldson, an interesting foreign addition,—the first numbers of a work of great architectural and archæological interest, on the series of explorations and excavations carried out in Asia Minor, at Miletus, and in the towns of the Gulf of Latmos, and which, apart from the interest they possess in themselves, continue the unpublished inquiries of Mr. Pullan (of the Institute of British Architects), commenced, it will be remembered, some eight or nine years since, at Priene. The work now published by M. Olivier Rayet, a former member of the French École d'Athènes, and M. Albert Thomas, long an occupant of the Villa Medici, at Rome, is devoted to a detailed account of the excavations made by them in 1872 and 1873, at the mouth of the historic river Mæander, not far from Ephesus.* The whole expenses of the excavation the Barons G. de Rothschild and E. de Rothschild have generously taken upon themselves, the work being published under the auspices of the French Government. It may be easily understood what artistic relics were brought to light in the course of the excavations. Those again, through the liberality of the Barons de Rothschild, now repose in the museum of the Louvre, where they form, among the many treasures of that priceless collection, some of the most interesting and instructive among the remains of antique art. The work which M. Rayet and M. Thomas are now publishing is more than a mere detailed catalogue of these Greek treasures and the history of their discovery; it is a learned and valuable commentary on the interesting period of art to which they belong. The theatre of the city of Miletus, the Agora of Heraclea (of Latmos), has been explored and excavated by MM. Rayet and Thomas; but perhaps the most interesting of their researches have been devoted to the superb temple of the Didymean Apollo, a curious relic of Greek architecture. The parts in which these are described remain to be published.

The first part of their work MM. Rayet & Thomas published nearly three years ago (in 1877). It is only very recently that they have been able to prepare for the press the second and third parts; but the delay in a work executed with such care as this is excusable, the more so when it arises from the lengthy residence on the scene of their explorations of the two industrious authors.

It is at the mouth of the muddy but poetical and winding stream of the Mæander, in the bay which the alluvial deposits of the river have since Classic days filled up with reed-grown marshes, that lies the field of operations of MM. Rayet and Thomas. Winding down from its mountainous source in the south of the antique province of Phrygia, the Mæander (the *Maiandros* of the modern Greeks, as it was of their ancestors, *Buyuk-Mendie* of the Turks) passes, before reaching the Ægean Sea, many a ruined city of which learned notes and figured coins give one a glimpse of the past splendour. Whirling through its soft bed, the river rolls down, as it has done for centuries past, volumes of mud, and these deposits at the mouth have at length filled up the once existing Bay of Latmos. In their first chapter MM. Rayet and Thomas describe at length, and with many archæological details, the true "mæanderings" of the river which has given its name to that familiar figure of speech. The scene as described is picturesque as the muddy river reaches the plain, now so desolate, alone broken by the broad sheets and pools of water and clusters of reeds, the rose-laurels, and the flocks of waterfowl. Even the Roman Campagna, remarks the author, in its wildest portions, does not cause so impressive a feeling of desolation as this plain, occupied in summer by a few nomad Turcomans, with their dark, camel-hair tents, and their half-starved cattle. From the hay, so treacherous with its reefs, the view is more imposing. "To the left the chain of the Mycale, bathed in that milky and transparent light alone known to those who have seen Greece, seems to plunge into the water its steep, light-gray iridescent slopes, on which the shadows of the deep ravines draw their dark lines. To the right the chalky cliffs of the Milesian coast die

* "Milet et le Golfe Latmique: Tralles, Magnesie, Priène, Milet, Didymes, Heraclée, etc.; Fouilles et Explorations archéologiques," etc. Par Olivier Rayet et Albert Thomas. Paris; Baudry. 4to. Part I.

away to the point of the Posidion, lost in the distance. Behind these cliffs Mount Grion shows its dark-green slopes, balancing, as in a picture, the colour of Mount Mycale. In the centre of the scene the towering triangle of Mount Latmos, rearing its crest like the pediment of a temple, stands out on the pale blue of the sky; its northern slopes leaving between them and Mount Mycale a gaping opening, through which the eye can penetrate to the distant tops of the Mesogide, lost in the dim vapours of the horizon. In the foreground, finally, a pointed hill, rising like an island placed at the entrance of a vast gulf, and which a narrow channel would separate to the right from the continent."

Such is the aspect of the coast as it presented itself in the eighth century before the Christian era to the first Greek colonists whose vessels warily approached the coast. In those distant days the sea formed a wide bay from the slopes of Mounts Thorax and Mycale to those of Latmos and Grion, and it was on the waters of this bay—now dry land—that their vessel was borne by the west wind to the point where the emigrant founded, opposite the antique native town of Tralles, Magnesia of the Mæander, Priene, Miletus, Heraklea, of Latmos and Myonte. It is the ruins of these cities that MM. Rayet and Thomas have explored, and the history of which is learnedly told in their work. The bay became in time commercially and politically important, and numerous are the historical incidents with which its name is connected; but from this very period the action of the Mæander can be traced; little by little the land encroached on the sea, the ports lost their importance, and the population shifted its centre further outwards. With the gradual extension of the plain, Miletus, at the extreme point, was menaced with a similar fate to its companions; one by one the cities were depopulated, Heraklea succumbing among the last. From that day, about the fourth century of the Christian era, the slopes of Mount Latmos became a desert, and remained such till the moment when their very solitude caused them to be chosen by the Byzantine monks as a place for retreat and penitence. The filling up of the port of Miletus, remarks M. Rayet, must have taken place about the same time, and closed the long-delayed decay of the city once so excellently situated, so prosperous at the outset of its history, and against which fortune seemed ever to have been adverse.*

The district of Aïdin, which bears this name from a conquering emir of the thirteenth century, and its capital the antique Tralles, form the subject of the second chapter of MM. Rayet and Thomas's work. The well-populated district is beautiful and fertile. No part of Asia Minor, the authors assure us, unites in such a measure material wealth and picturesque beauty. The capital, Aïdin-Guzel-Hissare, the beautiful fortress of the Emir Aïdin, M. Rayet picturesquely describes in all its Oriental beauty of antiquity from the outside, so sadly different from the inside, with its squalor, its filth, and its crowd of busy Spanish Jews; the *Tcharchi*, or bazaar, filled with its trashy German Brummagem, and Swiss or Belgian cottons; alone relieved by the traditional shops of the *samardjis*, or saddlers, and the carpet-sellers.†

This portion of M. Rayet's work contrasts in its simple graphic narrative with the archæological research of the rest of his volumes; the mention of the English "Ottoman Railway Company," which crowds with inland merchandise the goods station of the "beautiful fortress," carrying to a height this contrast.

M. Rayet's archæological tastes are soon exercised in describing the ruins which occupy the plateau that rises above the Frank quarter of the city of Aïdin: these ruins, of which Smith, Sherard, Chandler, Leak, and the other travellers in Asia Minor all speak, are now known to be those of the city of Tralles. Great as is the interest connected with this city, little idea can be gathered from these remains of its past splendour. The destruction of the town is complete; the architectural remains are scarcely recognisable,—a fact which arises in great part from the nature of the building materials used. Stone is rare in Lydia, but clay abounds. The pottery of Tralles was famous. The Lydian brick, 1½ ft. long, and 1 ft. broad, was much esteemed in the past, and at the epoch of the empire the factories of Italy even adopted its dimensions and name, as we see by reference to Vitruvius.

At Sardis and at Tralles even the more important edifices were built of brick,—at Sardis, the palace of Crœsus; at Tralles another palace built for the kings of Pergamus. It is more than probable, suggests M. Rayet, that the greater part of the public and private edifices of both cities were built of the same material, a fact which, in the case of Tralles, is abundantly proved; as for those portions which still exist they are formed interiorly of a very hard concrete composed of stones and mortar, and exteriorly of a casing of bricks, a species of construction usually attributed to the Romans, as largely used by them, though of which the Greeks were undoubtedly the inventors: it is what they termed the *emplekton*. M. Rayet describes how highly valued in Asia Minor are these ancient bricks so superior to those made in the present day; and he amusingly refers to the workmen he employed for his exploration filling sacks upon sacks of the "tonvlais" for their own use.

A lengthy description is given of the theatre at Tralles, the form of which is still recognisable. But the interest of this building, remarks M. Rayet, does not lie so much in its now shapeless ruins; it is in an anecdote related by Vitruvius, and which shows us strikingly the artistic revolution which, under the successors of Alexander, introduced into the decoration of the theatres that long and questionable taste which Roman architecture was later on to urge to excess. In the past days the "back scene," the *logeion*, remained merely an accessory, but Vitruvius's account transports us to the time when this accessory became the principal feature, when the religious signification retired before the superior interest of the scenic representation. It is then that on the "back scene" it became the custom to paint an architectural view, which, as remarks M. Rayet, could not fail in course of time to fall into the hands of artists more desirous to obtain decorative effect than truth, and degenerate into the wildest extravagance (Vitruv. de Arch., VII., v., 5, 6, 7).

The temple of Asclepius, cited by Vitruvius as a Classic model, together with the other monuments of Tralles (in addition to a number of paragraphs devoted to the architect Pythios, and the use of the Ionic order) occupies the rest of M. Rayet's second chapter; the third, fourth, and fifth chapters dealing with the history of the city, its golden days in the third and second centuries before Christ, when most of its monuments were erected, and during which period it probably numbered among its citizens two sculptors, Apollonios and Tauriscos, famous artists in the past, more familiar to the world at large in connexion with the so-called Farnese Bull of the Naples Museum, and to the vicissitudes of which several paragraphs are devoted. The following chapter, which concludes the first number of the work, continues the ulterior history of Tralles, eventually incorporated in the great Roman empire. Tralles from that time ceases to possess a history; what is only curious to study, remarks the author, is the share it takes in the intellectual movement of the Roman world. Those of its citizens gifted with more than ordinary accomplishments leave their home to seek elsewhere fame and riches. Rome especially attracts them, and there it is that will be found the greater number of its most illustrious children in letters, in art, in science.

The list of the Trallian artists of the imperial period is less long than that of the writers; it only presents two names,—the sculptor, Aphrodisius, who worked at the decoration of the palace of the Cæsars at the Palatine, and the architect, Anthemius, the collaborator of Isidorus of Miletus in the erection of Saint Sophia. He alone, observes M. Rayet, would be sufficient to throw a greater glory on his country than all its famous writers united.

Such is a short sketch of the contents of the first number, a very imperfect summary, it can be understood, of the 116 quarto pages of printed matter, the columns of which are supported by a stout base of closely-packed notes bristling with well-selected Greek and Latin quotations, and references to the English, French, and German writers on, and travellers in, that interesting land of historic and artistic wonders, Asia Minor.

Commendation can be given to the plates that accompany this part as careful, instructive, artistic works, which will interest especially the architect in their masterly treatment of detail. Two maps, two photogravures, views of the present state of the ruins, together with a number of plans, sections, and restorations, form the "atlas" to the first number of MM. Rayet and Thomas's work, which does all concerned in its production the utmost credit, not least among them M. Baudry, the prolific publisher.

* The advance of the land on the sea has been calculated to be at the rate of more than five to six hundred yards in each century.

† M. Rayet devotes an interesting passage to the decay of the beautiful carpet-weaver's art in the East. The very colours used are now of Western origin.

HYDROGRAPHIC SURVEY OF ENGLAND.

COMPLETION OF THE ORDNANCE SURVEY.

A GENERAL assent hailed the application to Government, made the other night verbally in the House of Commons, to hasten the completion of the large Ordnance Survey of England. The subject is one of more than professional interest. For the projection of public works,—of drainage, irrigation, harbourage, or land or water inland communication, the importance of the 6-in. survey is of the first order. This is well known to all engineers, surveyors, and practical men. It was, however, rather with reference to the purchase and sale of landed property that the subject attracted attention in the House of Commons. As to that, the argument is as strong as it is with reference to the construction of works. It might have been thought that no opposition could have been raised to a recommendation the carrying out of which would allow of so material a saving in private, corporate, and public expenditure. That saving would probably be underrated if,—on the consideration that where a private survey has to be made for each special object, the large Ordnance Survey, once made, is available for all and for ever,—we calculate that the country gains thirty-three times the actual cost of the survey.

But no proposal, however sound, seems to command universal assent. In one of the morning papers a writer, under the signature "Observer," recommends the very opposite course. He says that some time since it was promised that the Ordnance Survey should be completed in 1879, and that so long as it is in the hands of professional men it will never be finished. This is a view of the status and the character of the Royal Engineer very similar to that to which we lately directed attention as applied to the architect by a writer in the *British Quarterly Review*. It is not necessary for us to take up the defence of an honourable service. But we call attention to the great want of knowledge of what survey means, no less than to that of what architecture means, displayed by writers who seem to think that the best preparation for doing any kind of scientific or artistic work is—to be wholly uneducated in either art or science. Incredible as it may seem, there is a class of men who do, in point of fact, ride that ridiculous hobby.

The great point to which we would wish to call attention, as regards the completion of the Ordnance Survey, is, that the hydrography of the country should be included in the details collected. This has long since been urged by the late Sir Henry James, and by other engineers, both military and civil. The contrast between our want of information as to the water supply and waterways of England, and that which is readily accessible as to those of France and Italy, is most striking. We hardly know where to put our hand on statements of the outflow of a dozen English rivers. While giving all the information as to length of channel, and area of water-shed, which can be gleaned from the Ordnance Survey, the last work of the late lamented Mr. Austed was almost wholly silent on this question of outflow. And that silence was due to the fact that the information has never been collected. As to the rivers of France and of Italy, their several mean, minimum, and maximum flows are stated with precision among the elements of hydrographic survey.

The uneasiness which has been felt in so many parts of the country as to the water supply and drainage has culminated in the case of the metropolis. Of that we have spoken elsewhere. We only now refer to it as part of the existing state of things, and at once a very characteristic and a very unsatisfactory part. It is now an old story for the readers of the *Builder* to be told that the first requisite for dealing with any physical process is a knowledge of the facts. In all inquiries the great difficulty is the collection of facts. In physical inquiry, 99 per cent. of the whole difficulty is often in that primary collection. If we attempt to legislate as to any point connected with the travel of a drop of

rain from the summit of Snowdon, Skiddew, or any other mountein or hill to the sea, without accurate knowledge of the facts of the case, whether as to the sub-aërial or subterranean contour and physical character of the country, we are working in the dark, and willingly working in the dark. We are laying up trouble for the future,—trouble both of a financial and of a sanitary kind. A good deal has of late come to light which proves that we have very seriously underrated the magnitude of the water-supply question, and that we are, perhaps, looking in entirely the wrong direction for the supply of the wents of a not very distent future.

FROM THE BANKS OF THE SEINE.

DUAING the recent Congress of Architects held at the École des Beaux-Arts, the punctuel attendants at the two o'clock meetings passed more than one profitable half-honr in the courtyard of the studious esteblishment of the Rue Bonaparte. The pupils of the school can scarcely complein of a want of instructive matter for observation, for, apart from the large glazed court crowded with casts from all the more famous works of the sculptors of antiquity, there is here, as we believe we have mentioned once before, a full-sized model of a corner of the Parthenon, and the two columns of the Græcostasis at Rome, besides another court of Mediæval and later casts. The open courtyard coutains a number of original treasures of more than passing interest, ranging from architectural details of the Dark Ages, down to the Renaissance, typically represented by the façade of the princely Château de Gaillon. But amidst these relics of the past, the litter of a number of freshly-opened packing-cases and scattered straw, under a large tent, attracted, during the week of the Congress, no small attention. Inquiry proved this to he connected with the "Envois de Rome," the annual arrival of the works from the pupils of the French Academy at the Villa Medici. These "Envois," consisting of casts, statues, pictures, engravings, medals, aud architectural drawings, sent home by the various laureates of the "Prix de Rome" in their respective branches, are annually exhibited at the École in Jnne. On Satnrday last (the 26th nlt.), the exhibition was opened. To say that the show as a whole, from a French poiut of view, is satisfactory, is the utmost that can be said. Among the paintings are two or three original pictures,—in two instances very donhtful and somewhat wild attempts at originality, the figures heing almost colossal; a certain number of obligatory copies of old masters, a fragment from Michelangelo's noble decoration of the Sistine Chapel; a copy of Bellini's glowing Virgin of the Frari, in Venice, together with several careful Academy chalk studies of tbe nude. Among the sculptors, much the same spirit is observahle. Mercié and Carpeaux, as popnlar sculptors, are recalled. It is among the architectural exhibits that the most praiseworthy work is to he found; here it is impossible to find fault with the care, the patient indnstry, the erudition, and the reverential artistic appreciation tbat are shown in many of the drawings. M. Blondel seuds home, on his third year's stay at the Villa Medici, a series of ten large studies of the Temple of Concord,—a drawing of its actnal state,—sections, elevations, and plans of the various parts; a nnmber of studies of the portions still standing, justifying the restored view of the Temple which forms one of the series. M. Blondel's exhibits, in themselves of the highest interest, are the more so when it is remembered that it was during the French excavations of 1817 that the existence of the Temple of Concord was first made known to the archæological world. In the same order of research stands M. Paulin's restoration of the hnge baths of Diocletian,—a careful groundplan of the site, marking, amidst the confusion of the more modern additions of Michelangelo's Church of Sta. Maria degli Angeli, tbe Ospizio Margharita, the old Convent of St. Bernardo, the old cloister, the Palazzetto Massimi, the portions remaining of the classic *thermæ*. At the moment wben the Palazzo Ducale at Venice, thongh being gradually released of its scaffolding, is still not entirely free, the superb drawing of the elevation of the Palace (on the side facing the Piazetta), by M. Nenot, will he looked npon with interest by all who are familiar with tbe gorgeous design of Calendario. Each particularity is marked; most conspicnous to the observant eye, among their nnmerous whiter companions, are the two red marhle columns of the graceful loggia, from between which were reed in the days of the Republic the sentence of death. A grond-plan of the palece completes the Venetian studies of M. Nenot, who hes still two years more to pass in the South. Happy students! Of all the artists sent to Italy, it is the architects who now profit most by their sojourn among the exuherant and inspiring creations which lie scattered over the Peninsula; the changes in style from those of Classic antiqnity to the letest traces of the Renaissance have left each their mark on the architecture of Italy, the mesterpieces of which have not, like those of the sister-art of painting, been torn away and forcibly transplanted to our northern climates. At the risk of offending the painters, one cannot help acknowledging tbat the architects, English and foreign, at all events when they are young, appear more thorough students abroad than their compeions the peinters and sculptors. M. Nenot sends three other drawings of the so-called Temple of Nerva, or Mars the Avenger (*Mars Ultor*), believed to mark the site of the Forum Trensitorium. The studies consist of drawings done to a scale of quarter the size of the original, a capital and hase of a column, the architrave and portion of the roofing, ell heantiful drawings of originals familiar to the profession for the purity of their style. Two drawings of the Pitti Palace at Florence complete M. Nenot's industrious second year's work. M. Laloux sends, as the result of bis first year's residence in Rome, a series of studies of that mysterious so-called "Temple of the Sun," which has puzzled many a worthy archæologist. If M. Laloux does not throw any light on to the history of these gigantic fragments which so pictnresquely adorn the quiet Colonna gardens, his drawings possess a peculiar charm; portions of the architrave, tbe angle of the pediment, nnd the frieze, together with details a quarter the size of the original, give one a very complete iden of the interest connected with these heautiful and mysterious fragments of Classic architecture.

While we nre still under the roof of the École des Beaux Arts, it may not he ont of place to mention the talk in the artistic world that the old École, large as it is, is about to be enlarged. It would appear that its accommodation illsatisfies its requirements. Certainly there is a little crowding in tbe old conveut of the Petits Augustins, which Alexandre Lenoir transformed at the time of the Revolution into a museum of French antiqnities; and although the qniet of the apartment, with its historic memories, still occupied by his son, tbe respected Secretary of the École, is likely to he disturbed, M. Albert Lenoir, will, we feel sure, be one of the first to aid in the extension of the generous art-educational system of which he is one of the administrators. The École, nnfortunately, is more than a school; its overcrowded halls, rooms, and cellars contain an immense nnmber of casts of great value.* The school possesses, in addition, a collection of tbe drawings and restorations of ancient monnments sent from Rome, like those above mentioned. This interesting collection, sufficient in itself to form an architectural museum of greal value, is now, for want of space, hidden from the puhlic in unknown garrets and lnmber-rooms. As for the copies of the old masters sent home from Italy, from Spain, and elsewhere, a large number already crowd tbe great hall, and various illlighted vestibules and corridors; while hundreds, cut off their stretchers, are rolled up and packed away. With the wants of the school increasing every day (time was when there were barely five hundred pnpils—there are now nearly triple that nnmher), it is evident that the old hnildings which served admirably their pnrpose half a centnry ago, are utterly insufficient for the present day. The Chamber of Deputies will shortly he asked to vote a quarter of a million sterling for the enlargement of the school, a request which doubtless will meet with no serious opposition.

The *Salon* has now closed its doors, after having been visited by a considerahly larger number of persons during the six weeks it remained open than the exhibition of last year; many thonsands more official catalognes having heen sold, in spite of the innnmerable other catalogues in French and English, illustrated, honnd, interleaved, and whatnot. In addition, there are several pnhlications at present appearing, in which ere reproduced by photogravnre, at a very small rate, all the pictnres of any note. Notwithstanding that it has been universally admitted that never was there such a had exhibition, never have more certain means been taken of immortalising its weakness.

Coming curiously enough at the time when a correspondent in these columns has re-suggested thet some memoriel should he set up to mark the site of the Great Exhibition of 1851 in Hyde Park, a recent decision of the Paris Municipal Council points out almost exactly in what such a memorial should consist. In anticipation of the great *fête* of the 14th inst. (which, from all appearances, will be one of the events of the century in the nnanimity of the public rejoicings, in which every private individuel is already making preparations to join), the Municipality determined some days since on marking, on the pavement of the Place de la Bastille, the site of the famous prison. The work has already commenced, and in a short time will he traced indelihly, by inlaid stonework, the ground-plan of the old fortress. In the courtyard of the Louvre the same method was adopted some years since to mark the site of the old castle, all trace of which in the subsequent alterations bad disappeared. Something of this simple end inexpensive nature might be done with the site of the Great Exhibition of 1851.

* We remember seeing, many years ago, in one of the lower rooms of the British Museum, the magnificent collection of architectural casts gathered by Sir Thomas Lawrence. Where are these now?

INDUSTRIAL CO-OPERATION.

THE question of industriel co-operation, or participation by the workman in the profits of the employer, is one of very considerable importance, which appears to have received more attentiou on the Continent than it has in England, where, certainly, it has been tried, hut with somewhat doubtful success. A work was pnblished about a year or so ago at Leipsig, written by Herr Victor Böhmert, who took a great deal of trouble to ascertain what had been done in various places towards a practical trial of the experiment; and the subject is one of so much interest that a brief *resumé* of his facts can scarcely fail to be acceptahle to the readers of the *Builder*. Herr Böhmert made inqniries in every European country, and gives particnlars of some 120 cases in which the system has been attempted, deriving his examples as follows:—Germany, 54; Switzerland, 25; France, 17; England, 10; Belgium, 3; United States, 3; Anstria and Italy, 3; Scandinavia and Russia, 3. It is not pretended that these instances are exhaustive of the subject; hut they are, at all events, sufficient to show what bas been done in this direction.

France seems to have taken the initiative in these matters, and the first experiment was made tbere by M. Leclaire, a painter in a large way of hnsiness, who started with nothing in 1826, hut succeeded so well, that in 1842 be was enahled to carry ont his favourite scheme of allowing his workmen to participate in profits. M. Leclaire died in 1872,* a wealthy man, while his *employés* had received over 30 per cent. beyond their salaries, partly in money presents, and partly in deposits in the savings-hank fund. The total sum returned as having heen disbursed in this way hetween 1842 and 1876 is said to have been no less than 1,760,000 francs, and from the fund thus accumulated, forty-five superannuated members enjoy an income of 1,000 francs per annum, while temporary help is also given of 500 francs per annum. By the halance-sheet of 1879, tbe accounts showed that 13,000 francs had been distributed amongst 1,032 participants, and 65,000 francs were to the good in the *caisse de secours*.

Since Leclaire's time, other efforts have been set on foot with success, snch as those of Chaix & Cie., the railway printers; Bord & Cie., the pianoforte-makers; Larochе Joubert & Cie., paper-manufacturers; and Henze, of the tanyards at Coulommes. These and others have all adopted the principle of participation in profits. Another form of the experiment is that of the employer establishing a fund in which each workman shall share according to the valne of his place, either after a certain time of service or of age,—a kind of life insurance, in fact. This system was set on foot in 1850, by M. de Courcy, superintendent of the General Insurance Company, and it has heen adopted by other firms, such as the Bon Marché shops, Hannapfen & Cie., wine merchants, of Bordeaux;

* Some particulars of the career of this benevolent man appeared in our volume for last year, p. 1419, and before.

tha Orleans Railway Company; Godchaux, the printere, &c. Again, there are certain well-known houses which give periodical bounses upon profits, such as Christofle, the goldemith; Fourdinois, the upholsterer; Pleyel & Wolff, the piano-makers; and there are many others who have followed theee examples. In eome ehape or other, then, the effort to interweave the interests of the *employé* with those of the employer have taken very good root in France.

Switzerland, in proportion to its limited extent and the sparseneee of ite population, can show more examplee of participation than any other country, although, as the couditions of labour vary throughout the nineteen cantons and six demi-cantone of the Swise Republic, there has been great diversity in the forms in which the experiments took place. The most ancient, etill met with in some districts, is to be found in the agricultural population, in which the farm-labourer or vine-worker frequently sharee some part of the land with the owner. In commercial and manufacturing pnrsuits, participation meets with less difficulties than in most places, owing to the prevalent equality of civil righte and social conditione. The master often livee or works under the eame roof as the journeyman, and is, therefore, more impelled to interest himself in the well-being of that journeymsu. The Canton of Zurich wae the first to take up the question in 1868, and its example was speedily followed by those of Ceneva, Basle, and St. Gall. One of the largeet and most important firms in Switzerland that have adopted the participation eystem ie that of Geilinger Brothers, cotton-spinners, at Winterthur, though here there is no hard-and-fast line in dealing with the question, the participation of each workman being settled by reference to the foremen and the position which the artisan holds in the establishment. The workmen, however, have experienced steady progreseive benefits therefrom, having received in 1867 an increase of 5 per cent. to their wagee; from 1868 to 1871, but 2 per cent. (owing to depressed times); in 1872 it was 10 per cent.; and in exceptionally favourable years, such as 1873 and 1874, from 12 to 20 per cent. The system was tried in 1869 by the woollen manufacturing houses of Fleckerstein and Schulthess at Wädenewerl and Feldbach (Zurich). In this case the participation wae given through a savings-bank, to the deposits in which bonuses were added. Two large linen-manufacturers at Schaffhansen followed suit, the distribution of profits in 1870 reaching 5,000 francs, while in the next year it went up to the very large sum of 34,000 francs. A certain number of houses in Switzerland have a system of participation, carried out in an improvised manner by preminme and preeents, dependent partly on length of service and partly on the production; and in this category may be mentioned several spinning and weaving establishments at Lorze (Zug) and at Ziegelbruch (Glarus), Rutschi & Co.'s silk-mille at Zurich, Dupasquier's watch establishment at Cortaillod (Neufchatel), and the curryiug and ekin-dreeeing firm of Henri Baymond at Morges (Vaud), &c. M. Spöri, of Barentschweil (Zurich), left by his will 50,000 francs to be divided amongst his workmeu; and Henri Kunz, of Zurich, bequeathed no less than 18,000 francs, part of which was divided amongst the workpeople, and part went to the eick-fund and savings-bank. Very many employers make a regular practice of helping their artisane, either in building housee for them, or making donations of coals, wood, groceries, clothee, furniture, or anything elee that the household happens to want. In some establishmente cows are kept, and the milk sold to the people at such low prices as to be almost nominal. There is no donbt but that the old patriarchal eystem of community of interest is still very prevalent in Switzerland, the effects of which are plainly visible in the rarity of Swiss appearances in the etormy arena of labour quarrels. The feeling has unhappily disappeared in Great Britain, and we very much question whether the adoption of any such system by a large employer would not be viewed at the present day with a conciderable amount of snspicion by the intended recipients. A Swiss firm, which has, of all others, gone most deeply into tha experiment of participation, is that of Billon & Isaac, of Geneva, musical-box makers, which employs abont 90 or 100 workmen. Since 1871 these masters have given up to their industrials 50 per cent. of the net profite in one form or another; and M. Billon has likewise contributed much to the literatnre of the questiou, having writtea a pamphlet in which the whole of their system ie miuutely described. Both MM. Billon and Isaac are fully convinced of ite equity and good policy, and consider that, if carried properly ont, it would do more than anything else to eradicate strikes.

In other Continental countries the participation system has been tried eo far but slightly. Some of the Austrian railway companiee give bonuses to such of their *employés* as appear to be deserving of encouragement; but only one firm, that of Dr. Marchet, a papermaker at Schlöglmühl, in Lower Austria, has made any regular division of profits amongst the men, taking for a baeis the duration of employ, the value of the yearly wagee, and the amount of production. In Italy the experiment hae been tried satisfactorily at the woollen-mille of Signor Rossi, at Schio, although the money is not given in hard cash, but ie spent on various objects of domestic requirement. In Belgium the zinc-mining establiehment of Vieille-Montagne has adopted the system, together with a few houses at Antwerp and Verviers. In Denmark, the Baron Zytphen-Adeler, an extensive proprietor in the north-west of Seeland, has successfully tried it on a large scale amongst hie agricultural labonrers; but only one other manufacturing firm, that of Burmeister & Wain, engineers and shipbuilders at Copenhagen, has followed his example. In Sweden, however, and particularly in Gothenburg, participation has taken root at the eteam saw-mills of Strömman & Larson, the well-known philaathropists, who are ever foremost in applying any scheme which seems likely to benefit their people, and it is said that it has exercised the happiest result in diminishing drunkenness,—the plague of Scandinavia, and of Sweden in particular.

THE PARIS LIBERAL ARTS CLUB.

EVER ready to seize any opportunity that may present itself for tha development of taste and skill, the Parieians have not failed to support the initiators of what promisee to become one of the most pleaeant and useful instittntione of the gay capital. It has often been demonstrated that in the struggle of life new men do not enjoy a fair chance of obtaining a hearing. This is more especially the case with respect to dramatic authors. The coet of putting a play on the stage is so great that managers dare not make the venture unless the author ie well known; particularly ae it is, after all, most difficult to judge a play before it is acted. Painters, engravers, sculptors, are all hampered by the diffionlty of bringing their works before tha public even when they possess undoubted talent. These considerations have led to the creatiou of the Cercle des Arts Libéranx, which, in the ahort space of six months, has already proved an unparalleled euccess. The initiator of thie scheme, M. Devriès, had eoon grouped a hundred meu distinguished in the world of arts and letters as founders of the club. Then the premises, formerly known as Frascati's, in the Rue Vivienne, were secured and traneformed into a moet luxurious clubhouse, at a cost of 24,000*l*. On the 21st of Decemher last, after this large sum had been expended, the doore were thrown open, and a magnificent inaugural entertainment given. Aea curione detail, and to afford some idea of the lavish character of the hospitality, we may mention that no fewer than 1,900 bottlee of champagne were opened on this occasion, and we are further assured that the wine was of a good quality. To nee the stock French phrase, "All Paris had been invited, and all Parie was there." The result of this munificenca is that 1,700 members have already been enrolled in the club, and it now fully pays its own expenses,—a fact which, apart from the private interest of the persone concerned, may be considered a public benefit, for the inetitution may undonbtedly facilitate the development of the liberal arte.

Whatever tha club undertakes is certain to receive the fullest notice at the hande of the French press, and will be reflected more or lees in the journale of Europe. At the present moment it hae opened ite ealoons to an exhibition of painting, and, to encourage the artiete who exhibit, has organised a lottery conaisting of 15,000 tickete of one franc each, to be sold exclusively to members. The coet of thie lottery, the cost of the exhibition, the cloth to cover the walle on which the pictures are hung, the printing of catalogues, tickete, &c., all is defrayed by the club. The whole of the money obtained hy tha lottery goee to tha artists who exhibit. There will be one prize of 5,000 francs, five prizes of 1,000 franee, and ten prizes of 500 francs. None of this money is, however, to be taken out of the club; but the winnere are to select pictures from the exhibition to the value of the same they have won. Thus the artiste are certain that eome of the picturee will be sold, and this, too, without any favouritism, as it is the winnere and not the committee who select the prize-picturee. Apart from the certain minimum sale of 600*l*. worth of picturee, the exhibitors get as much publicity as if their worke were hung in the *Salon*. Indeed, the Parie *Salon* seems on the eve of losing its old character. Varione disputes have brought about the resiguation of half the members of the jury, and the constitution of a new jury for next year promisee to be a matter of no small difficulty. The enormous number of picturee admitted, the carelessness of the selection, all tend to create tha impression that the great French annual exhibition is degenerating to a picture bazaar; on the other hand, the privata exhibitione, ench ae that organised by this club, ara gaining more and more ascendancy, and many of the best painters prefer them to the crowd and confneion of the *salon*. Thus, at the exhibition now held by the Liberal Arte Club, we noticed some admirable paintinge by tha following well-known artiste:—Louise Abbema, Berne-Bellecour, Clairin, Detaille (portrait of a piper of the 42nd Highlanders), eome flowers by Mdme. Eecalier, and portraits by Fantin-Latour, Henner, Lehmann, and Bastien Lepage. Among the younger artists, whose renown the club will help to create, we remarked a good picture by the eon of the great Meissonier, and some admirable engraving by Paul Manron, whose works are familiar to the readers of the French illustrated papere.

When the present exhibition ie over, the olub will organiee a display of all that relates to the decorative arts, such as wood-carving, chasing, carving on glass, painting on porcelain, &c., and every effort will be made to produce as many unknown men as possible. Aleo, during the few monthe of the club's existence, there have been three theatrical and musical evenings. As theee were the first efforts, the representatione were good, but the plays were not new. Ultimately the managere of the Paris and provincial theatree will be able to eee on the stage of the club plays which they have not the courage to preeent to the public. As the press will aleo ba preeent, the authors and the new actors will obtain the long-sought-for publicity, and, when approved at the club, may soon hope to appear before the general public.

Such, in a few words, are the general action and scope of this inetitution, due, we must repeat, solely to private initiative, and principally to the energy and the bold outlay of money on the part of the promoter, M. Devriès. M. de Bonnier, tha author of "Attila," is tha president; M. J. Collin, member of the Municipal Council and of the Academy, is vice-president; and among the committee are M. Berne-Bellecour, the well-known painter, and M. Jules Claretie, the anthor. Among a list of celebrated authore, artiste, painters, composers, theatre directors, &c., who founded the club, the name of M. Charpentier, architect to the town of Paris, holds an important place, for he designed the façade of the club. This conaists of several eplendid oak doors, enrmounted by ceramic ornamentation, and combined with stone carving, in the best Renaissance style. A fine mosaic covere the floor of the entrance-hall, and facing the door there ie a etained-glass window giving an allegorical representation of the liberal arts. The first rooms are the reading-rooms and billiard-rooms, which, when thrown into one, form a long saloon, where the exhibitione are held. Beyond, a room of equal size, is what will be the gaming and card room on ordinary occasione, but which is capable of heing rapidly converted into the theatre; for at the end there is the stage, with all the mechanism for scenery complete, eo that any play can be put on the stage. In the third range of rooms, we have a bright sunny room, with etained-glass roof, and various other apartments; for the club aleo poseeseee a fencing-room, a bath-room, committee-rooms, a green-room, and dressing-rooms for tha actors. The club promises to be a fountain from which much good and neeful work will flow.

Building in the Temple.—No. 2, Tanfield-court, Temple, will shortly be pulled down to make room for a naw wing to the Inner Temple Library.

ELEPHANTS AND TIGERS.

An elephant ie a piece of architecture in himself. See how solid and steadfast hie mighty frame appeare,—huge, immovable, and stately! His legs, resembling columns, rest erect on their firm hases, round and high, supporting a great entahlature and superetructure; and his vast head, in front, heare a likeneee to a lofty tympanum! But he flaps his pendent ears to distnrh the flies, and he ie no longer a rude, domed temple erected in his native forest, hut a living creature. A huilding compact of stone and marhle is a fine thing. A ship of wood or iron is a great marvel, for it is a structure that moves proudly to its destination on an unstable element. But a great edifice which hreathes and lives is still more a miracle.

The tiger, on the other hand, is anything hut a solemn animal. Although his stalk may he majestic, his movement is more like a ripple surging along his hack as the waving of a hillow approaching the ehore and ahout to hurst in fury, or, in a milder mood, the undulation of the tops of long grass under the action of the wind, than the gait of a creature so ahsolutely destructive, nnrelenting, and hloodthirsty. His pace, although graceful, is stealthy, and his strong fore-paws fall noiselessly on the grounds, as if not to hetray his progress. In his colour also, gorgeous in his variegated coat, he offers a marked contrast to the elephant in his suit of sober grey covering his huge form, as he stands quiet and serene in the confidence of his vast strength; while, on the other hand, the great feline, ever restless and suspicious, advances with cautious steps, as if he sought concealment, although resplendent with the most hrilliant stripes,—black, yellow, orange, and white. Different as they are in aspect, none the less so are they in habits and temper; still, however, when they meet on their common ground, of jungle or forest, soldom is it to contend, except under the influence of man.

Of hoth these creatures the art of their native India has naturally made large use; and the very interesting collection, greatly enhanced and expanded of late, of examples in the different hranches of structural work,—carving, painting, jewelry, and goldemith's work, textile fahrics and ornament, and further illustrated hy models and photographs,—which opened recently to the public in the Exhihition-road, as an adjunct to the South Kensington Museum, among its other rich stores of the decorative art of the East yields some most interesting illustrations of the modes of the adoption and adaptation of these animals hy the native designer.

Tigere appear occasionally in these compositions, hut elephants are far the most frequent, especially in architecture, as their great hodies yield solid forms for masses of support, while their trunks, convoluted in a variety of curves, are as accommodating in affording graceful sweeps and flowing lines, as that most used shape of all in ornament, the serpent. The tusks also come in as serviceable points in these compositions, and the large ears also take their part in making up and completing the required contours. The two animals, however, sometimes appear together. In the first room, on entering the apartments of the collection from the Exhihition-road, may, for instance, he observed some hosses, in which these are combined, and very remarkable examples they are of Indian design in architectural carving.

These hosses, which are repeated, are exceedingly well composed, for their purpose of projection and light and shade, out of an elephant's head, fronting the spectator, with his trunk wound round a tiger. Although the parts of each are small from its scale, each hoss is so cleverly put together and compacted that it is pretty secure from damage, at the same time that it presents a hold and spirited architectural detail, representing the great creature in the act of crushing his antagonist. Other subjects are displayed in profile and in lower relief, on either side, forming a running accompaniment and connexion hetween these hosses, which stand out here and there with appropriate emphasis. On the same walls, and close hy this example, are other relievi, representing the hunting and securing of elephants hy means of their domesticated hrethren. These are all Hindu work,—the former heing from the Amher-nath temple in Bombay, and the latter from the temple at Orissa in Bengal,—and are of the ninth or tenth century.

The most striking presentation, however, of the ornamental and structural use of the elephant, which arrests attention on entering thie first room, is the full-sized plaster-cast from one of the four elephant gateways of the Buddhist tope at Sanchi. A small model of the whole structure of the tope, to which these form the entrances, with its circumvallation gates at four intervals, may he consulted in the same room; it displays the adjustment of these in relation to the principal huilding; and it may he recognised hy this, that the artistic interest of the whole design rests chiefly with these gateways, of which carved representations of elephants form the important feature. They are situated high up on these entrances, and are arranged ingeniously, so as to yield support to the superstructure, turning the angles without ahruptness, and twining their trunks so as to comhine and complete the composition. It has nothing in common with classic art, and yet is highly satisfactory.

One of the points of view, indeed, in which Indian structural details are so interesting, is their difference from those of our European schools. They seem to have crystallised and shot up from fresh points of origin, and are composed of elements we do not possess. Not only are these the natural forms of the country, hut also those suggested hy the exuherant imagination of the people; and especially in their temples do these details partake of the character of the extraordinary, and, to our conception, preposterous Hindu mythology. Heterogeneous in comhination, and irrational in motive, human heads and arms are multiplied until they appear hut excrescences, and the hodies of the figures they are joined to are gifted with the most outrageous proportions and adjuncts; and the features of the forms of other creatures and of the vegetahle kingdom are made use of with the same utter disregard of logical propriety or of matter of fact. Yet it cannot hut he acknowledged, and, indeed, it forces itself upon the senses, that all this rank growth and unrestrained luxuriance co-exists with a certain delightful harmony of general effect, which is, not unfrequently, missed in works approached more according to rule and canon in the teaching of our Western schools.

Reticulated with many piercings, their structures look like coral edifices, unexpected in their forms, and accidental in their effects, yet leaving nothing to he desired, and as if the artist had worked hy infallihle instinct rather than hy fallible reason. And the hest authorities, as Fergueson, the more they study the riches of these results, the more they become enamoured of them, because they seem as if they sprang and grew from the teeming ahundance of nature rather than from the logic and pruned exertions of man. If, indeed, the Indian huilders were like the coral zoophytes, and made heautiful things hecause they could not help it, although it somewhat shifts the direction of our admiration, it does not lessen it. However produced these treasures were, we may address our attention to them, and learn, as we are told to do, from the proceedings of the ant. Assuredly the workers of them were no "sluggards," nor did they spare paine; and, when we examine the wealth of the collection in this new department of the South Kensington Museum, in casts, paintings, drawings, carvings, and photographs of these great performances of Indian architecture and decoration, we may well rejoice in their acquisition for the public instruction and delight; and recognise, in contemplating them, that the title of "Empress" seems but correspondent to the rule over a dominion which can array such an Arahian Nights' entertainment of gorgeous ahundance.

Admirably as this collection has been arranged hy Mr. Richard Thompson, it is only hy careful examination that the real qualities of the details of the examples can he done justice to, or the pleasure extracted from them that they can afford, and each visitor may most likely search out hest, for him or herself, the subjects of most interest. To the great beauty and elegance of some of the columns, however, although unlike, except in that they are columns, to anything to he found in our Western Classic styles, we would call attention, especially to that one of Hindu art of the eleventh century, from Kuth, near Delhi, which is on the north side of the first room, and to the other of the same date on the other side, which is of almost equal excellence.

In seeking illustration of our theme in the gallery upstairs, although we may find many artistic data, we cannot admit among these Tippoo Saih's toy-tiger, who cannot even growl, as he was wont to do,—as the machinery for that is out of order,—and we may readily turn from it to the small images from the Hindu Pantheon, which are arranged here and there through the rooms. Among these we recognise, as one of the most remarkable, the effigy of Ganesa, who is endowed with an elephant's head. On the strength of this, Sir William Jones calls Ganesa the God of Wisdom, and in the South of India he is in especial estimation with the learned, as, without worship of this divinity, it is held that no literary fame is attainable. It is a curious comment on this, therefore, that hy the usual Hindu, the elephant itself is hy no means considered as intellectual; "as stupid as an elephant" being hy no means uncommon as a hitter taunt.

This does not, however, appear to have been the estimate of the Hindu architects of the earlier days, or configurations of this creature would not have been so frequently associated with their huildings. Nor, assuredly, is it the verdict of our own country, as in one of the finest groups of modern art, the composition of Asia, at the Albert Memorial, hy the gifted and lamented J. E. Foley, an elephant is posed in submissive dignity as its central form. We, indeed, look upon this creature as of the highest rank of animal intelligence, and, in our esteem, he disputes the place of pre-eminence, in this respect, with our dear and faithful friend and companion, the dog.

Although the tiger is appropriately the attendant of Bowanee, the goddess of the Thugs, with whom murder is a religion, he does not take part in the mythology of the Hindu Pantheon to the extent that the elephant does, as exemplified in the figure of Ganesa; nevertheless he is in degree considered a sacred animal, simply because he is so dangerous and destructive, and religious ideas of this strange perverted nature interpose to protect him! Sport comes in with its aid in the same direction, and some chiefs even "preserve" tigers, thinking little of an occasional woman or child being carried away by the royal game! Some of the fakirs, or mendicant priests, have succeeded in taming this, their occasional attendant *daimon*, to that degree that a tiger will accompany them obediently and harmlessly through the villages at times of festival. To this point of docility they are said to bring him hy deharring him of all raw animal food, and hy a diet of rice and ghee, or vegetahle hutter.

With the docility of the elephant we are all acquainted, and it has hecome almost a hye-word. Although he can scarcely he called an architect, he may have some claims to heing a huilder. There is an anecdote of him in the latter capacity which may be appropriate to these columns, although we need not be responsible for its authenticity, as, for this, it rests on the high authority of the Rev. J. Wood, the well-known classic in the province of natural history. These are his words in speaking of a particular elephant:—"By profession he was a huilder, and was employed in laying stones, under the supervision of an overseer, who came and inspected his work, and, after ascertaining that the task was properly performed, gave the signal to lay another course. On one occasion the elephant placed his foot against the wall and refused to move from the spot when the overseer came to the part of the wall which his hody concealed. The overseer, however, insisted on the animal's moving aside, and the elephant, seeing that his stratagem had failed, immediately set to work at pulling down the wall which he had just huilt, and which was defective in the spot which he had been attempting to conceal from the inspector's eye!"

The elephant of Asia only is in suhjection at present, although formerly, at least along the northern shores of Africa, he was in ancient times equally in servitude. Hannibal even brought his elephants across the Mediterranean, and over the Alps, in his invasion of Italy: and, after the conquests in Africa hy several of the Roman generals, these animals appeared in their triumphs; and consequently figured on the memorial structures which were erected in record of them. It appears an evident mark of retrocession from the former energy and civilisation of Africa that the suhjugation and domestication of this species of elephant since those times has been neglected, and the art of taming them lost, insomuch that the African examples which were brought

over, several years ago, to this country, and placed in our Zoological Gardens, in their infant state, are the first, apparently, for many centuries which have been trained, and instructed, and brought under the dominion of man. It is in our recollection that considerable doubt was expressed, while they were growing up, by the keepers, whether they would eventually prove of a docile nature, and submit to subjection. Since that, however, it has been amply exhibited that they are equally capable of becoming domesticated as their brethren of India; and at holiday times they now take their part, with similar obedience, in adding to the interest of this finest institution in the world of this nature, by stalking about the gardens with easy indifference as to how many visitors are put on their backs. They are of a somewhat different type from those of India, and appear to bear a nearer resemblance than the Asiatic examples to the old genera of trunked and tusked creatures that were so numerous in former ages of the earth, but which have now passed away from the surface of it, and are only at present to be found in fossil remains, or preserved in the ice of the Arctic regions. Their heads are smaller than that of the elephant of Asia, and their ears are larger, and they are somewhat different in build; although loftier in stature, they do not possess the same sage appearance as the Indian species, which has not only been far more used in art, but will hold his own as being, at least in appearance, the more intellectual variety. He is still highly considered in India, not only for his usefulness in carriage, both of men and goods, the lifting of heavy weights, and, as we have seen, for even his building powers, but also for hunting purposes, and generally in State progresses through the country, and as a dignified appendage to rank and royalty. The "points," accordingly, of an elephant are as much a matter of interest in India as those of the horse in Europe; and the following are those which are especially mentioned in a native statement of them:—"Softness of the skin, red colour of the mouth and tongue, an expanded forehead, large ears, the trunk broad at the root, the eyes kindly, the back level, the chest square, the forelegs columnar, the hind-quarters full, with five nails on each foot, each smooth, elastic, and round," and "with these perfections," the account concludes, "the elephant will impart glory and magnificence to a king."

In relation with art, it is evident that he not only, in his frame, suggests fine forms for its details, but that he is in himself a fine subject for decoration. His great shape and power, which enable him to bear aloft in the most stately fashion, the "howdah" on his back, with all the paraphernalia of majesty, his sombre colour offers a fine neutral tint of surface for the contrasted display of the trappings of Oriental magnificence; and he affords an ample field and scope for the most lavish decoration, of which the imagination of the Eastern artist has taken full advantage. In the elaborate ivory carvings also, of which there are several beautiful examples in the upper rooms of the collection of which we have been speaking, he is exhibited frequently in all the dignity of being the chief feature in the processions of foot and horse armaments on festival occasions. And even in the exquisitely-carved sets of chessmen, arranged in ranks on their chequered arena, which we occasionally see, these creatures bear the castles which might be the refuge, and are the defence, of the potentates of mimic warfare. In every aspect, indeed, in nature and in art, which the elephant assumes, he appears a grand animal of dignified presence. And although the Tiger may be more illustrative of the Indian character in rebellion, as displayed at the time of the Mutiny, yet it may, we hope, be trusted confidently that the Elephant will ever remain a characteristic and consistent type of the power of our Indian Empire, and the sagacity of its rulers.

Sheppard's Improved Slide-Rule for Curing Quantities.—Mr. Stanley, of Great Turnstile, is the sole maker of this rule, which comprises a decimal rule and a duodecimal rule. It appears to have several advantages over the ordinary form, and is a very expeditious rule for multiplying quantities. Moreover, it is simple to use. It gives contents of three dimensions in about half a minute to those who master it, and will thus work out quantities quickly and correctly.

THE THREE BRIDGES.

WANDSWORTH, Putney (or Fulham), and Hammersmith Bridges were on Saturday last thrown open to the public, free of toll, by the Prince of Wales. At the meeting of the Metropolitan Board of Works on the previous day a report was presented from the Works and General Purposes Committee stating the amounts agreed upon for the purchase of the three bridges: Wandsworth Bridge.—Purchase-money of the undertaking, as per arbitrator's award, 52,761*l.*; purchase-money for two strips of land at side of road leading from the bridge to King's-road, Fulham, as per arbitrator's award, 550*l.*, making a total of 53,311*l.* Hammersmith Bridge.—Purchase-money for the undertaking, as per agreement, 112,000*l.* Fulham Bridge.—Purchase-money for the undertaking, as per arbitrator's award, 58,000*l.*; cost of arbitration, 10*l.* 10*s.*, making a total of 58,010*l.* 10*s.* The total cost of the three bridges was thus 223,321*l.* 10*s.*

"A Short Account of the Three Bridges over the River Thames, and within the Fulham District, to be declared Free of Toll on the 26th day of June," by Thos. Edward Jones, clerk to the Fulham Board of Works, has been privately circulated. Mr. Jones has brought together in a small compass a considerable amount of information concerning the three bridges in question, Fulham, Hammersmith, and Wandsworth, especially as to the first named. It is curious to read the expressions in Parliament, April 4, 1671, when the Bill for building a bridge at Putney was introduced. One of the members for the City of London said he knew, and could assert positively, that the erection of a bridge over the Thames at Putney would not only injure the important city he represented, not only jeopardise it, not only destroy it, but actually annihilate it altogether! The Bill was lost by 13,—54 voting for it and 67 against it. The question then rested for fifty years. The ignorance which has ruled the world, and which does rule the world, is astounding. The present bridge, built from a design by Sir Jacob Ackworth, was opened on the 14th of November, 1729, O.S. The tolls during the one year ended March 25th, 1879, realised 4,462*l.* The price paid by the Metropolitan Board of Works to the shareholders was, as stated above, 58,000*l.*

The tolls taken on Hammersmith Bridge in the year ending May 28th, 1880, amounted to 6,647*l.*; the sum paid by the Metropolitan Board for this bridge is 112,000*l.*

The tolls on Wandsworth Bridge in the year 1878 amounted to 1,109*l.* The sum paid by the Board for the purchase of the undertaking is 52,761*l.*, with about 500*l.* additional for land.

All the bridges crossing the Thames within the London district are now toll-free.

SOME POINTS IN CONNEXION WITH ILLUMINATIVE GAS.

ILLUMINATIVE gas has, by this time, been in use long enough, one might think, for the general public to know all about it. Some evidence which we propose to give will show how far this is from the truth. Instead of intimate acquaintance with a long domesticated guest, the general public know very little more about the properties of illuminative carbohydrogen than the two facts of its being illuminative when burned, and a dispenser of heat. Certain ratiocinative samples of the general public may have felt constrained to put themselves the question,—how it comes to pass that a gas-jet burning with smokeless flame, when a sufficiency of atmospheric air is allowed to come into operation, immediately begins to smoke so soon as free access of atmospheric air is denied. Certain, but very few, more investigating minds to be found amongst the general public, advancing a stage further in the quest, may have wanted to know how it can happen that illuminative gas, which, as everybody knows, is invisible, can yield visible, tangible, ponderable soot. Beyond this, ordinary popular speculation does not go,—no, truth to tell, nor technical speculation either, as will be made manifest before concluding the note we have in hand. Starting on the groundwork of first principles,—the only starting-point which can open the path to sound conclusions,—we have first to settle in the mind the composition of illuminative gas; and then,—invoking chemistry,—to ascertain what the product, or products, will be when illuminative gas is burned. Ordinary illuminative gas may be curtly described as a gaseous result of chemical union between carbon and hydrogen. The description, however,—true so far as it goes,—must go much farther to comprehend truths belonging to the subject, and without grasping which no useful conclusion can be arrived at. First, there are several gaseous combinations of carbon with hydrogen, all of which may be present in illuminative gas ordinarily supplied, and more than one always is present. Just, however, as science recognises a normal atmosphere as being a mixture of four measures of nitrogen and one of oxygen, an atmosphere never met with out of the laboratory, an atmosphere wholly devoid of watery vapour and carbonic acid, both always present in naturally-existing atmospheric air, together with scores, even hundreds, of other vaporous things present under special circumstances; so science recognises a normal hydrocarbonaceous illuminative gas. This is no other than olefiant gas, to which compound, the nearer approach illuminative gas of corporate supply makes, by so much the more excellent is it. No such thing as pure olefiant gas, however, is or can be supplied by our companies; more, save under penal obligation, the gas companies have overmuch regard for good dividends to supply pure olefiant gas if they could. The illuminative power of any carbonaceous gas is directly proportionate to the amount of carbon in a given bulk. Olefiant gas holds the maximum of carbon in the minimum of space; but by the simple expedient of passing it through a red hot pipe, it is decomposed into other hydrocarbon gases, variously mixed, according to the temperature of the pipe, but all having the common property of holding the original quantity of carbon united with a lessened ponderable amount of hydrogen. Slight reflection will lead to the conclusion that this involves increase of bulk. The operative chiefs of gas-making establishments are only too well aware of this fact, and frequently they turn their knowledge to practical account. Coal distillation effected in a retort very highly heated gives rise to the same decomposition on olefiant gas as transmission through a red-hot tube. One operative chief of a certain gas factory in a certain seaport town told us confidentially that he made a point of supplying expanded (and to the extent of expansion low illuminative) gas for night street-lamp service. He thought to justify the practice by stating that the attenuated gas supplied was good enough for drunken sailors, and that hardly anybody else was about after shop-closing.

Premising that illuminative gas supplied from factories ought to contain nothing else than carbon and hydrogen, though it practically always does contain other things, we will pass on to the consideration of what products, had those other things been absent, would be yielded,—must be yielded, on combustion. Given an adequate supply of air during combustion, the results would be two; simply carbonic acid and water. There would be no smoke, the development of which always means that a sufficiency of air to effect perfect combustion has not been admitted, neither would there be any carbonic oxide, an invisible gas-like carbonic acid, but only holding half the quantity of carbon. In respect to these two products, the most prominent fact to be noted is the production of water. When coal, coke, or charcoal are burned, water is not a product of combustion; but illuminative gas, oil-lamps, spirit-lamps, candles, all yield water. The fuel use of all these, except gas, is limited; but gas-stoves are frequent enough as instruments of ordinary domestic arrangement. They yield no smoke, and on that ground alone the general public take it for granted that they yield nothing to contaminate the air. Go into almost any business office where a gas-stove, from motives of convenience, has been installed, and you shall, in nine cases out of ten, see a pan of water placed on the stove. Water, of all things! You ask the reason,—"To moisten the atmosphere, which, without this precaution, becomes uncomfortably dry, giving us headaches." Yes, hard-headed business man, you have a headache, and no wonder. A hundred pans of water, notwithstanding, you will keep your headache all the same. The gas-stove combustion contributes water enough of its own and to spare. The explanation of headache is the presence of carbonic acid, which might easily enough, together with the second product of combustion,—water,—have been disposed of by a flue. Whenever a gas-stove is burned without a flue it must always be prejudicial, not to say to comfort, but to health as well. Small

excuse can there ever be for not adopting a flue, which is of far easier application than when ordinary coal or coke stoves are in question. We want no metal, no fixing, no elbow-joints. A sufficient length of vulcanised rubber hose is about the best material for the flue of a gas stove. So long as the hose is so arranged as to be always on the ascent, its disposition is a matter alone for taste and convenience. At any rate, ordinary sheet-iron pipes are very objectionable, and pipes of zinc worse still, both for a reason which will hereafter become apparent. We have known builders so ignorant of chemical first principles that they have been in the habit of lighting up numerous gas flares in the chambers of houses newly built to dry them, and thus fit them for more speedy habitation.

Hitherto normal illuminative gas has alone been taken into account, but the gas actually supplied us by the gas companies is a very different matter. This latter, in addition to the components normally belonging to it, always holds adventitious bodies—contaminations. Thus sulphur is always present, not so frequently in the state of hydrosulphuric acid (which can be separated at the works, and mostly is separated), but as a constituent of carbon-bisulphide, the problem of abstracting which still awaits solution. Besides sulphur, ammonia is frequently present, carbonic acid and carbonic oxide generally. Sulphur is the element we have most to dread. The first result of the burning of sulphur is sulphurous acid, unpleasant in smell (that of a burning match), and a powerful bleaching agent. Unfortunately, sulphurous acid is not permanent. With a rapidity more or less dependent on circumstances, it absorbs oxygen from air and becomes sulphuric acid,—oil of vitriol. No assurance is needed to impress the fact that oil of vitriol is rapidly destructive to almost everything it touches. Especially destructive is it to bookbindings, hangings, paper, brass, iron. And pictures—what must be the effect of continually administered small doses of vitriol to them? The reader's own intelligence shall furnish a reply. We beg him to remember that given the constituents of illuminative gas as we have put them, the results of its combustion must be as we have indicated. They are neither to be evaded nor avoided! they are integral, inevitable. Ventilation is the only resource to fall back upon; but even ventilation, if perfect, would not wholly countervail the evil.

TYNEMOUTH AND NORTH SHIELDS.

ONE of the districts in the North of England which has united steady modern growth to ancient repute is that at the mouth of the Tyne, and no part more sustains that statement than does that of the joint towns of Tynemouth and North Shields. The former of the two has antiquity, and though North Shields as an important town is of modern date, yet it had existence before it acquired the distinction or the municipal government of a town, though as a humble fishing village. It may be well worth while to glance at the position of the parish of Tynemouth at the time when Parliamentary honour was conferred upon it of distinct representation and of a municipal corporation, and to see what it now is. In 1834 Tynemouth boasted its one good street, which during the bathing season was "a place of fashionable resort," and the walks in the vicinity presented, according to one of the chroniclers of the day, "many pleasing and romantic views." The principal object of interest was the castle of Tynemouth, which, though "shorn of its just proportions by the heavy and dilapidating hand of time, still presents remains of great architectural beauty." There were mineral springs and beautiful residences near, but the trade of the place was small and scant, though the growth of North Shields had swollen the population of the parish greatly. North Shields had a large trade in coal; it had also roperies, tanneries, potteries, chain-cable manufactories, and shipbuilding was also carried on, but the ancient and once chief trade of Shields,—that arising from the saltpans which gave names to so many places near,—was then decaying, and was "confined to only two establishments." The old church of Tynemouth was then the one place of worship for episcopacy, except the chapel-of-ease shortly before built in the market-place; but there were churches or chapels for the Roman Catholics, the Wesleyans, Primitive Methodists, Independents, "United Secessionists," the Society of Friends, and the Hebrews, so that Dissent in its many phases appeared to prevail in Shields. The Tynemouth General Cemetery in Rosella-place had been recently opened; the early gas-works,—commenced so soon as 1820,—were in operation with the still earlier waterworks; whilst in almshouses, dispensaries, schools, and institutions, there was an ample testimony to the public spirit of the little town. Though the borough was just being municipally created, the lord of the manor held "courts leet and baron at Easter and Michaelmas." The harbour is described as a mile and a half in length, and "in spring tides it has sufficient water for vessels of 500 tons burden." Under the then new Parliamentary franchise there were 700 electors; and whilst North Shields had a population of 6,744, the entire parish of Tynemouth contained 24,778 inhabitants. A list of the traders shows that three old banks,—Chapman & Co., the North of England Joint Stock, and Sir M. W. Ridley & Co.,—furnished financial facilities; there were five "coal-owners," including the "Right Hon. Lord Ravensworth & Co.,"—one of Stephenson's "Grand Allies,"—seven shipbuilders are enumerated; but except for one "magnesia manufacturer," the chemical trade only figures in its retail aspect. The railway system had not been introduced; there were five or six coaches, an omnibus, and some gigs, which did the bulk of the conveyance of passengers. A number of carriers served the town; there were three sailing vessels conveying regularly to London; and three steam-packets, in addition to those crossing the river and running up to Newcastle. This, then, was the state of North Shields and Tynemouth at the time when the "House of Correction" was at Tynemouth; when the "Tradesmen and Mechanics' Library" was in Stephenson-street; and of the waterworks "George Rippon" is described as the "proprietor."

Electorally and in the population there is a very great change in the borough of Tynemouth now. In the 4,303 acres, the population of the Parliamentary borough was stated as 38,941 in 1871, the inhabited houses being 5,385, and the number of the electors being, in 1877, not less than, 5,384. Those of the populace who were assessed to the income-tax were assessed at the large amount of 475,000*l.*, exclusive of the incomes derived from public bodies. As of yore, North Shields and Tynemouth form a great shipping port. In a year 500 vessels leave for foreign ports, with a tonnage of 250,000. To North Shields 469 vessels belong,—about one-half being steamers,—the total tonnage being 142,191 tons, and it is thus one of the largest of the shipowning ports of the kingdom. Not less than 437 "boats" are registered under the Sea Fisheries Act as belonging to North Shields, and it is supposed that these furnish employment for nearly 900 men and boys. It is not a ship-building port of note, from eight to ten small vessels being its yearly contribution to the total built in the kingdom; but from the figures above given, it is evident that North Shields takes high rank amongst the shipping ports of the kingdom. It still exports large quantities of coal,—from 30,000 tons to 50,000 tons monthly,—and it occasionally sends slight quantities to London and to southern ports; but the great bulk of the trade in this branch of coal-shipments is on "coally Tyne" from the higher ports on the river. The southern side of the lower reaches of the Tyne may be said to be especially the manufacturing side; but at North Shields there is also a very extensive commerce now carried on; and some of the manufactures indicated as on a small scale in the past of the town have grown with its growth.

Not the least interesting of the changes has been that of the river Tyne, which, within the last two score years, has been transformed from what it was into one of the chief commercial rivers of the world. Magnificent piers at the mouth of the river have been extended for thousands of feet into the sea; most important and costly works of dredging have been carried on; and a portion of the deepened and improved river has been converted into docks with facilities such as place it high amongst the ports of the world, and have given it a premier position in certain classes of trade. In a sentence, this result may be told in the fact that, whereas in 1850 the depth of water on the bar of the Tyne was only 6 ft., it is now upwards of 20 ft. deep at low water. As to dredging, it may be said that in 1857 the Lords of the Admiralty suggested that the Tyne Commissioners should be compelled to remove 400,000 tons annually, but over twelve times that amount have been removed in a year since. In one year,—in 1866,—not less than 5,273,585 tons of material were dredged. These works, added to the gigantic works of river improvement, have brought about that change in the state of the Tyne that we have indicated, and have also caused a large increase in the revenue of the Commission, and brought up the trade of the Tyne until now only the Mersey exceeds it in the export trades amongst the rivers of the world. Very naturally a share of the benefits reaped from this expanded trade has been derived by North Shields, and Tynemouth, as one of the residential places of the North, has shared in the benefits. As a pleasure resort, the latter boasts the possession of "one of the prettiest ruins in the North of England" in its priory of Early English style, with portions of a prior structure shown here and there, of Norman architecture. Recently,—two years ago,—it added to its attractions a magnificent aquarium, with summer and winter garden. The latter is 216 ft. long by 50 ft., the height to the centre of the arched roof being 50 ft. The aquarium occupies a lower story, and the basement floor is a refreshment-room and promenade entered from the beach. Detached from the main building is a skating-rink, 200 ft. by 125 ft., and from the proportions the whole buildings form, it may be readily believed that the total cost was above 80,000*l.* It is evident, therefore, that Tynemouth is placing itself in a position to attract visitors to itself as a sea-side resort. Of it and of its sister town it may be said that, as in the past, they have grown, and as the trade of the trading portions has grown, so in the future it may be hoped that, with that good regard to sanitary well-being and local government which has distinguished them, there may be continued prosperity, extension, and improvement.

ART TEXT-BOOKS: "GOTHIC AND RENAISSANCE ARCHITECTURE."

THE book thus entitled* is one of the series of text-books of art-education which are being brought out under the editorship of Mr. Poynter, R.A. It is not, as we learn from the preface, especially intended for architectural students, but rather for the requirements of those who are preparing for the professional pursuit of other arts, or who make the study of art part of a liberal education. The author has aimed, therefore, at giving the broad facts of the history of architecture, the principles which underlie it, and illustrations of its most typical examples.

A difficulty in treating Gothic architecture in this manner, in a brief and concentrated style, arises from the fact of the very close relation of early Gothic with Roman architecture, and the gradual and almost insensible manner in which the one passes into the other. In the early days of Gothic criticism, when it was imagined that the Crusaders saw pointed arches in the East, and came home and imitated them, the demarcation of the subject was simple enough; but no one who comprehends the history of architecture during the period between the decline of the Roman and the rise of the Mediæval world will now undertake to say in any positive manner where and when Gothic architecture precisely begins; the whole thing was a process of gradual development.

This continuous development is almost necessarily placed on one side in the present book, which is the continuation of a companion volume dealing with Classic and Early Christian architecture. This last-named volume, though naturally placed first on the series, is not yet published, but will follow, and it is only by comparison of the two that the development of Gothic architecture from Roman materials can be made out so as to be intelligible to the student. But in any case it seems a pity to have broken the subject in the middle, thereby confirming to some extent the popular idea that Gothic was a new birth of the Middle Ages. Renaissance architecture, which is included in this volume, has, on the other hand, no connexion whatever with Gothic, and may be rightly described as a kind of new birth in the art. It might have been possible to make the development of the subject more logical and intelligible to the reader (who is pre-supposed

* Architecture: Gothic and Renaissance. By T. Roger Smith, F.R.I.B.A. London: Sampson Low, Marston, & Co. 1880.

to be a person little informed on the subject, and seeking a statement of the outlines), by partially dropping the chronological arrangement and treating Classic and Renaissance architecture in one volume, and early Christian and Gothic in another. The skipping over of fifteen centuries between Classic and Renaissance would, in fact, have been nearly the correct representation of the position; for the Renaissance in architecture at all events, really was an ignoring of all the intervening centuries and their work,—a going back to where the Romans left off, and making a fresh beginning from that point. By such an arrangement of the subject, therefore, both Gothic and Renaissance, would have been brought before the reader in connexion with the origin of their respective development. As it is, the one volume does not explain itself without the other, and the second half of the present has little connexion, artistically or critically, with the first half. If it were thought there were insuperable objections to this, it might have been possible to divide the subject differently, and give Renaissance an extra booklet to itself, rather than group it with Gothic. Renaissance architecture, no doubt, immediately succeeded Gothic, but in this, as in so many successive series of events in this world, *post hoc* is not by any means *propter hoc*.

In pursuance of the intention of rendering the subject generally intelligible in its outlines, the method has been adopted of giving a general sketch of the characteristics of Gothic architecture first; then tracing its development in England (as the phase of its history best adapted for illustrating it to English readers), and subsequently following some of its specialties of form and development in other countries. This seems a logical and intelligible method. A glossary of terms is prefixed to the volume, but in regard to this there has been some little oversight. The glossary is headed on the pages, "Gothic Architecture," and it mainly refers to Gothic, but it contains also a few items which refer only to Classic architecture ("Architrave," "Attic," &c.), while there is no glossary of Renaissance architecture at all. We presume that the glossary of terms in Classic architecture is to be found in the other volume, and that this glossary is intended to supply the words used in this volume; but, then, it should have been printed separately as a glossary, and not headed "Gothic Architecture."

In the general article on the architecture of the Middle Ages, Westminster and Salisbury are illustrated as the typical cathedrals, and Jacques Coure's house, Warwick Castle, and some of the Grand Canal Palaces, as specimens of Domestic architecture. In treating of the development of the style in Great Britain, the author adopts Rickman's nomenclature, merely referring to that of Sharpe, which, though to our thinking much more intelligible and precise, has never established itself through the fact that it was not proposed until Rickman's had become a part of Gothic speech, so to speak. The analysis of the development of Gothic in England contains descriptions of all the principal features of a Gothic building, put very clearly; but we do not find always that the reason for some developments, the causes of which are very clearly traceable, is given in a sufficiently obvious manner. For instance, the gradual development of the clustered pier, and the subsequent absorption of the shafts into the body of the pier as mouldings, is described; but we do not find the real origin of the clustered pier, the artistic necessity of having separate supports for sub-orders of mouldings in the arch, quite clearly made out; the development of arch moulding and pier would have been better treated in connexion with each other, in order to bring this point prominently forward, whereas the two things are mentioned in separate chapters. Those who understand the subject already will see from one or two expressions that the relation of parts is present to the mind of the author, but it will not be obvious to readers who are coming to the subject with no previous knowledge. We mention the point because it might easily be amended in another edition. On the rest of these chapters of analysis no comment is necessary except that they describe the leading features of the style with a sufficient number of illustrations to render it intelligible. It is not quite correct to say that when the pointed arch was introduced for vaulting, "all difficulties vanished." The difficulties, both of the springing of the ribs from the cap, and of the uniting of their mouldings, meeting at various angles at the ridge, remained, and the former was not finally got rid of till the fan-vault was invented, which made all the curvatures and angles equal. More stress also might have been laid on the difference in principle between the constructive employment of the ribs in earlier vaulting, and the merely decorative use of them in the fan-vault. The fact that the ribs in the latter case are superficial is just alluded to in passing, but the unlearned reader will hardly appreciate the full significance of the change from this description.

The characteristics in which French Gothic differs from English are well brought out and illustrated in the chapter on "French Mediæval Architecture," and the peculiar richness of Belgium and the Netherlands in civic structures, showing some of the finest qualities of Gothic architecture in a different form from that of the cathedral, is duly recognised and illustrated. Among the illustrations of the hook, the Town-hall of Middleburgh is given as a specimen of this class of buildings less familiar to average readers than some of the really finer buildings of the class which have been so much illustrated. Two other illustrations we have reproduced, as we suppose the author selected them, partly on the same account; they are not so well known but that they may be new to a good many of our readers. One of these, from Batalha, the author introduces as an illustration of the fact that "many works of the great Gothic period are as elaborate as they could be made," while the style has in other instances equally illustrated the extreme of simplicity. The doorway from Thann is a good example of the hard, precise, finished manner of German Gothic, with sculpture of apparently a high-class of excellence. The bit from Westminster Abbey may serve as a contrast in style with this, as well as being a favourable specimen of the execution of the illustrations. Mr. Roger Smith does not omit to point out the essential inferiority and vulgarity of the German Gothic ornamental detail, in spite of its elaboration of design and workmanship. The Gothic of Italy forms, of course, a separate chapter, which is one of the best illustrated in the book; and Spain is also separately but briefly treated. This part of the subject closes with a chapter on the "Principles of Construction and Design in Gothic Architecture," which are very well set forth, in a manner intelligible to every reader. We observe that in speaking of Gothic as being in the main the style in which construction is exhibited, the author comments on the fact that the stone vault, the most noteworthy and characteristic feature of the interior design, "makes no sign" whatever on the exterior, save in the presence of the buttresses which are there to support it. But it does not very readily appear how it could do so, except the timber roof were removed, and the vault made the external covering; which has, of course, been suggested as the true treatment of the stone-roofed building, but then the question is half a practical one in this case. The wall ribs might in some cases be indicated externally also, certainly.

Renaissance architecture is a much simpler subject to treat than Gothic. Its relations to the past are clear and well defined, and the aims of its architects are perfectly obvious; the more so because their tone and temper of mind were essentially modern, and what we can precisely comprehend and enter into at the present day; whereas we can only imperfectly understand the temper of the Mediæval builders, their aims or their system of working,—we are too far removed from them in time and in habits and associations. The special characteristics of Renaissance architecture are very well set forth, and in most of the critical remarks we entirely concur. The paragraph on the essential difference between Gothic and Renaissance architecture, in regard to the relation of design and construction, suggests a conclusion with which much recent criticism is at variance. We may quote the passage as a specimen of the style of the analytical portion of the book:—

"The concealment, both of construction and arrangement, is largely practised in Renaissance buildings. Behind an exterior wall filled by windows of uniform size and equally spaced, rooms large and small, corridors, staircases, and other features, have to be provided for. This is completely in contrast to the Gothic principle of displaying frankly on the outside the arrangement of what is within; but it must be remembered that art often works most happily and successfully when limited by apparently strict and difficult conditions, and these rules have not prevented the great architects of the Renaissance from accomplishing works where both the exterior and interior are thoroughly successful, and brought into such happy harmony that the difficulties have clearly been no bar to success. There is no canon of art violated by such a method, the simple fact being that Gothic buildings are designed under one set of conditions and Renaissance under another."

We are not quite prepared to endorse the conclusion that there is really nothing to choose in regard to propriety and correctness of principle between these two totally opposite systems of architectural design; but the position assumed by the author has its reasonable side, and is not without its usefulness as a set-off against the rather extreme manner in which the Gothic principle has sometimes been recommended as the only one consistent with reason and good taste. It is well observed that Renaissance architecture aims at producing an impression by the effect of the building as a whole; if it does not please as a whole, it is rarely felt to be in any way successful. We conceive, too, in the remark that there is something in the manner of applying Classic details in Renaissance architecture in some cases which is rather Gothic than Classic in feeling, and was the unsuspected evidence of the surviving influence of Gothic taste on men who imagined that they had deliberately cast everything Gothic behind them. This was, in fact, the very reason for Michelangelo's disapproval of Sangallo's original design for St. Peter's; he said it was not true Classic. Michelangelo himself was too determined and thoroughgoing a character to take any half-views or fall in with any half-tastes, and accordingly he imposed "the order" on his great building regardless of the effect of scale. The author's critical view of St. Peter's is somewhat too favourable for our sympathy. The building is really an instance of what a powerful effect mere size has in architecture, in despite of bad and mistaken treatment. But in most respects the view given of the Renaissance school of architecture in this book is marked by admirable sense and judgment. No chapter on principles of construction and design is added to this part, as it is to the Gothic portion of the book. Is that a tacit admission that, after all, there is not much of "principle" in it?

ST. MILDRED'S, BREAD-STREET, LONDON.

IN connexion with the efforts of those who are seeking to interest the public in the safety of the City churches, we give a view of the interior of St. Mildred's, Bread-street, which was built from the designs of Sir Christopher Wren, in place of a previous church destroyed by the Great Fire of 1666. It was commenced a year after that event, and not finished until 1683. It differs from the majority of London churches, inasmuch as it is covered with a large cupola. The building is a parallelogram, with an ordinary tie-beam and king-post roof, the cupola, rising on pendentives, being formed within it. Where necessary for the rise of the cupola, the tie-beam, instead of being attached to the foot of each principal rafter, is raised about half-way up, and becomes, in fact, a collar-beam. The pulpit and sounding-board are well carved by Gibbons, or one of his pupils.

According to Godwin's "Churches of London" (vol. ii.), the cupola, as Wren left it, "was disfigured by ill-executed cherubim in high-relief, placed in pairs, and supporting crowns," but these do not now exist; they were probably taken away in 1856, when, according to an inscription in the church, the building "was repaired and beautified."*

The previous church dated from about A.D. 1330, and had been repaired throughout in 1628.

THE ENTRANCE LODGE AT DENZELL, BOWDON, NEAR MANCHESTER.

THE lodge, of which we give a view, was built for Mr. Robert Scott, of Yorkshire stone, with Manley stone dressings, and has cost about 900*l*. Messrs. Clegg & Knowles were the architects, and Messrs. Robert Neill & Sons the contractors. A view of the house itself will be given on another occasion.

* The drawing we have reproduced was made from sketches sent us by Mr. Randolph Payne, architect,

VESTIBULE, JOHANNISSTIFT, LEIPZIG.—Herr Lipsius, Architect.

CHELSEA HOSPITAL FOR WOMEN, FULHAM ROAD, CHELSEA.

THIS hospital was founded in the year 1871 for the reception and treatment of gentlewomen in redneed circumstances and respectable poor women and others suffering from those distressing diseases to which the female sex is liable, irrespective of social position. They are received upon the principle of requiring a small weekly payment from those in a position to afford it, while to the actual poor gratuitous treatment is freely given.

The recommendation of a subscriber entitles in and out patients to treatment without any charge whatever, except, in the case of in-patients, payment for the washing of their personal linen. When a patient is too poor to do so, this is also provided for ont of the Samaritan Fund. The discomfort, from want of space, experienced by the suffering women who crowd the out-patient department, led to arrangements for obtaining a new building. The applications for admission are five times more numerous than the beds now available.

The land for the new hospital, situated opposite Nevill's-street, in the Fulham-road, was purchased in May, 1878; the plans have been prepared hy Mr. J. T. Smith, of Parliament-street, and we give a view of the building determined on.

The foundation-stone of this building will be laid by her Royal Highness the Princess of Wales at half-past three o'clock on the 16th of July next.

The works throughout will be plain and substantial. The fronts will be faced with red brick, with Mansfield-stone to upper members of cornices. The floors will be of fireproof construction, finished with 1¼-in. iron-tongued pitch-pine polished.

The whole of the joiner's work and fittings will be in polished pitch-pine. The walls will be in Parian, painted and stencilled. There will be open fireplaces to the rooms, fitted with asbestos gas-stoves, with pitch-pine and marble chimney-pieces, marble fenders, and tile hearths. The large yards, corridors, and staircases will be warmed by hot-water coils, and the whole of the rooms will be fitted with lavatories supplied with hot and cold water. The building will be seven stories in height, and there will be a car-lift from the lowest to the upper floor, supplied hy Mr. Baldwin, of New York. The windows will be glazed with plate glass, having coloured glass in the bottom sashes, the height of an ordinary curtain. The sash-frames will be made to allow the bottom-sashes being raised 4 in., for inlet of air at the meeting-rails. The ventilation will be hy separate 5-in. tubes (two or more to each room), carried from the ceiling to above the roof with Boyle's ventilators at ceiling level.

TEDDINGTON VICARAGE.

THE old vicarage-house, having been found unsuitable for the new vicar, it was determined to dispose of it, and erect a new one on a site three-quarters of an acre in extent, in Manor-road, overlooking the Manor House grounds, and near St. Mary's (the old) Church.

The house now illustrated is in course of erection, and is built of red bricks, pointed in black mortar, with dressings, mullions, strings, and copings of Westwood-ground Bath stone, the roof being covered with Broseley tiles, and everything throughout is intended to be of a thoroughly substantial character.

The general offices are in the half-basement, while all the reception-rooms and the Parish-room are on one level on the entrance-floor. The first-floor contains six bedrooms, with bath and dressing rooms.

The contractor is Mr. John Piller, of Teddington, and the architect is Mr. T. Goodchild, Adelphi, London.

The parish of Teddington has recently been divided into two portions for ecclesiastical purposes; one having the church of SS. Peter and Paul, while the other has the original mother church of St. Mary, recently restored. It is also proposed to provide for the immediate wants of South Teddington,—an out-lying district next Hampton Wick,—by the erection of an iron church.

The New Hall of the Scottish Corporation, Crane-court, Fleet-street, will be opened on the 21st inst. Professor Donaldson is the architect.

AN ABODE FOR THE AGED.

THE JOHANNISSTIFT, LEIPZIG.

AT the eastern end of the Hospitalstrasse in Leipzig, the eye is arrested hy a large edifice, with a projecting central portion, surmounted hy a slender spire, over the threefold portal a clock, and above this a window in coloured glass; the building is flanked by extensive wings. Notwithstanding its great size, it will at once appear that the building is neither a castle nor a factory, neither a prison nor a monastery. We may soon guess its object, for is not the sill of every window lighted up hy white curtains, and enlivened hy a row of flower-pots? And behind the well-trimmed pelargoniums and lobelias, the fuchsias and petunias, do we not see many a venerable human face? Pinks, also, and stocks, are not wanting, and many an aged man nurses an ivy, and many a silvery headed woman rests her eye upon a myrtle. We are in front of an abode of humanity and civic virtue, a foundation which is to be to old men and women of Leipzig, after a life's work, a home at once quiet, free from care, and yet without depriving them of the full enjoyment of civil liberty,—the new Johannisstift of Leipzig.

This foundation arose out of one of the nineteen thousand "lepers' houses" which were established in consequence of the steady advance of Eastern leprosy towards the West during the Crusades. Those "leprosoria" received usually many and rich legacies and donations from the relatives of the unfortunate inmates, and by the time that the disease had disappeared in the fourteenth century, the Leipzig Hospital of St. John had accumulated large funds. The property and buildings were then appropriated to their present purpose. The possessions of the foundation grew by careful acquisition or utilisation of freehold land to such an extent that, when the old buildings were no longer sufficient for their requirements, a round sum of 400,000 thalers (60,000*l.*) was at disposal for new buildings without reducing the ordinary income applied towards furthering the object of the foundation.

The Johannisstift offers to its inmates board, lodging, and firing, and at the same time complete quiet combined with perfect liberty for intercourse with the outer world. A claim to be received into the Johannisstift is possessed solely by Leipzig citizens and their wives, as well as those having acquired civic rights, who, with unblemished reputation, have attained their sixtieth year, and who are willing to subscribe to a duly-attested agreement, by which they promise to behave peacefully and decently, to obey the regulations of the trustees, and to abstain from all trading, as well as from disposing of gifts of the foundation (articles of food, firing, &c.). Each person admitted has besides, once and for all, to pay into the funds of the hospital a sum equal to 30*l.*, and to appoint the foundation the inheritor of whatever he or she may be possessed of at the time of death. Most persons entering the institution may easily agree to this last condition, for rich people do not seek admittance, but such old inhabitants of Leipzig from among the artisan class as are disabled for work by old age. They bring with them, besides the entrance bonus, very little more than their furniture, clothes, and so forth. In some cases deserving of especial consideration, the rules as to age and capital are relaxed. But should an inmate of the foundation inherit property during his stay, so that he could live independently, he is at liberty to leave the institution at any moment; he is, however, bound to refund for every year of his residence a sum equal to 12*l.*, and should the original investment of 200 thalers (30*l.*) not cover the expenses incurred, he must pay up the rest. Such cases happen frequently; indeed, widowed inmates have left the institution to enter once more the state of matrimony.

Even the register of deaths of the house affords some pleasant insight. Nothing speaks more favourably of the care with which the aged are attended to than the spans of life recorded. It happens very rarely that an inmate dies much *below* eighty; most exceed that limit. And this was the case even at the time when the farmers of the institution contracted also for the food, and the same fare was provided for both servants and inmates. This practice was abolished some time ago; the farming branch is now entirely separated from the foundation, the lands being all let, and the buildings of the old Hospital of St. John converted to other purposes, and rebuilt. Trading of any description has been entirely discontinued; the sole object of the institution being now the care of aged people.

The erection of the new Stift was under the supervision of Herr Lipsius, of Leipzig, architect, his plans having been selected for execution. Practical usefulness was his first aim; but he did not lose sight of the desirability of conveying by his design the object of the institution.

The completed buildings cover a space of 184,000 square feet (nearly 4¼ acres). They are situated among the hundreds of small "family gardens," the property of the institution, in the Johannisthal, one of the most original, pleasant, and healthful grounds of Leipzig, which, unfortunately, are more and more entrenched on by communal and government buildings, and destined ultimately entirely to disappear. The principal building, consisting of a centre block, two connecting buildings, and two corner pavilions, is 478 ft. long; each of the two wings is 230 ft. long, by a depth of 50 ft., with a height to the ridge of the roof of 82 ft. The height of the centre block from the pavement to the ridge is 100 ft., and to the point of the spire 165 ft.

On both sides of the principal building are, isolated, to the left, farm buildings, including stables, pig-styes, slaughter-house, wash-houses, ice-cellar, and steward's rooms, as well as mortuary, dissecting-room, and auction-room; on the right the disinfecting-house.

The materials employed are granite, Postelwitz sandstone, and about five million bricks. The roof of the principal building, of an area of 74,000 square feet, is covered in with glazed tiles, the centre portion more richly decorated, the other parts simpler, in red, brown, black, green, and yellow tiles. The most troublesome work presented itself at the beginning, by the sloping nature of the ground, the latter being 24 ft. lower in the Johannisthal than in the Hospitalstrasse, towards which the front of the building is turned. No less than 4,320,000 cubic feet of material had to be brought here for filling up the ground. Notwithstanding all difficulties and delays, the work was completed in three years, and when, finally, the architect handed over the finished building to the trustees, he was able to announce that nearly 5,000*l.* less had been expended than the amount of the original estimate for its erection. The cost was 374,600 thalers.

Entering the building, we notice at once the fact that everything has been arranged to suit the age of the occupants. Ascending six stairs, the large vestibule is entered by the centre one of the three principal doors of the centre block, the vestibule taking up the whole height of the ground and first floors. Three similar doors on the garden side correspond to the front entrances. The stairs rise to the right and left upon arches to the first-floor of the principal building, and lead, in the first place, to ante-halls, being well suited for resting-places. Besides this principal staircase, of which we give a view, there is one in each of the two wings.

Above the vestibule of the centre block is the general hospital ward, and over this, again, the chapel in form of a basilica. In this manner the centre portion divides the building in such a manner that, should a separation of the sexes be thought desirable, this might be introduced at any moment. Let us ascend one of the staircases leading to the corridors. Here are, on both sides, the doors to the rooms of the inmates, a niche being opposite to each door, for placing a wardrobe. At the intersections of the corridors, in the centre of the pavilions, they are enlarged to rotundas, affording for the very aged capital resting-places, especially during bad weather. The openings also in the corridors, which admit side-light, are constructed as if made for social gatherings, being provided with fireplaces for the old people to make their coffee, as well as tables, sinks, and water-supply; they are also used for weighing and serving out the food.

The pains taken to ensure cleanliness are striking. The water-closets are separated from the corridors by double doors, and are disinfected. Their contents, as well as that of the refuse-shoots, for which are special pits, pass to the same destination as the waste from the baths, the kitchen, bakery, the sinks, the hospital-ward, &c., viz., to the large collecting tank in the basement. From this the whole disinfected mass is pumped to the disinfecting-house and into the settling basin, raised 8 ft.

above the floor, whence the clear water runs into the street sewers, while the solid settlement is raised into a still higher basin, and thence taken away as valuable manure. The system here pursued, on a large scale, is that of Süvern.

It is well known how difficult it is to induce old people to open the windows to allow of the admission of fresh air. They are entirely relieved of that necessity, fresh air being introduced through screened openings behind the stove, to be opened and closed at pleasure, and ensuring ventilation with the corridor. The ventilation of the corridors, vestibule, chapel, sick-ward, kitchen, privies, &c., is ensured by suction-tubes in connexion with the chimney-flues, which take away the foul air, while fresh air, heated up to 12° R. in winter, is introduced direct. The warming of the admitted air is done by six *caloriféres*, by Kelling, of Dresden. The rooms themselves are warmed by stoves, a space in the cellar or the loft being provided for each inmate for keeping the firing material furnished to him. Although gas is laid on all over the building, it is not supplied to the inmates, who burn oil-lamps.

Provision is made against fire, hose in connexion with the water supply being laid on throughout the whole building. There is also a lift for the very aged, or for those to whom moving up and down stairs is troublesome. The chapel is pretty, and the old people are much pleased with it.

A wonder in its way is the large kitchen, placed under the vestibule. It is 51 ft. long, 46 ft. wide, and 15 ft. high. The kitchener or hearth in the centre is the delight of all housewives who see it. Excepting for the large roasting ovens, which are placed at the sides, not a spark of fire is required for cooking; everything is effected by steam, which is supplied to the kitchen, the baths, the bake-house, and the four-horse-power steam-engine (for the disinfecting apparatus and the lift), from a boiler of a surface of 90 square feet, and a pressure of two atmospheres.

Two meals are supplied to the inmates, dinner and supper, and sent up to the different floors by the lift, and served out in the sidelights before mentioned. In order to give the old people some employment, they have to make their own coffee, which is not supplied to them; but an excess of bread rations, for the sale of which provision is made in the establishment itself. Thus the inmates enjoy rest, pleasure, and a little work. A man may also pursue his former trade or employment if he be so minded.

There are 214 single rooms, 54 double rooms for married couples, and 6 large rooms for several persons, which will together accommodate from 380 to 390 inmates.

THE CABINET MAKERS' ASSOCIATION.

THIS society was established in 1865. For a great number of years local societies had existed both in London and the provinces, but this was an attempt to effect a federation, if not a complete amalgamation, of the several independent societies in the various branches of the trade. The effort was so far successful that, by the end of 1874, as many as twenty branches had become affiliated.

The most notable event in connexion with the Alliance Cabinet Makers' Association, the name by which it is now known, was the prosecution of the five cabinet-makers in 1874, by Messrs. Jackson & Graham, for picketing their shops in Ogle-street, in the western district of London, during a strike. The men were convicted, and sentenced to "be imprisoned for one calendar month," by Baron Cleasby. The defence of these men cost the society 685*l.* 10s. 9d.; 154*l.* 4s. 5d. was spent in providing for the wives and families during their incarceration, and 137*l.* 18s. 5d. was presented to the men on their release from Maidstone gaol.

The rules of the society are open to revision every three years; when they were last amended the basis of future work was clearly laid down. The entrence-fees are fixed at a uniform rate of 4s.; the contributions are:—For trade, funeral, and emigration benefits, 5d. per week; for sick benefits, 2d. per week additional up to 35 years of age; and 1d. per week extra for every five years beyond that age. Insurance of tools against loss by fire is also extra, according to the amount for which they are insured.

The benefits are:—Out of work allowance, 12s. per week, with 1s. per week additional for every child under 13 years of age; funeral benefits range from 3*l.* to 7*l.* 10s., according to the period of membership, the increase being at the rate of 10s. per year after the term fixed, when they are entitled to the 3*l.* The amounts payable at the death of members' wives vary from 3*l.* to 5*l.* Strike-pay is 1*l.* 1s. per week, with 1s. per week additional for each child under 13 years of age. Travelling relief is given at the rate of 1½d. per mile. Sick benefit is 12s. per week for twelve weeks; by the payment of 2d. extra per week members are entitled to 8s. per week for another twelve weeks, should the illness continue.

The fourteenth annual report, 1879, just issued, consists of 84 pages, 34 of which are devoted to branch accounts; the remainder are taken up with tables, summaries, and miscellaneous information for the guidance of the members. At the close of the year the Association had 40 branches, seven of which were in London. In 1877 there were 48 branches, a decline of four in each of the last two years; the number being now the same as in 1876. The total number of members in benefit is 1,412, a decrease of 325 during the year. In 1878 there was a decrease of 299, a total loss of 624 in two years; for the whole of the previous nine years there was a steady increase annually. The cause of this decrease is stated in the report to be the slackness of trade, members working only three or four days a week, and many travelling in search of work.

The total receipts for the year (general fund) amounted to 3,054*l.* 14s. 7d., being an increase over 1878 of 415*l.* 10s. 1½d. The following were the chief sources of income:—Contributions, 2,105*l.* 12s. 1d.; sick fund, 368*l.* 18s. 9d.; insurance, 153*l.* 4s.; entrance fees, 60*l.* 1s. 6d.; the balance was from miscellaneous items.

The total expenditure for the year was 3,631*l.* 2s. 10d., an increase over 1878 of 890*l.* 10s. 5d. The principal disbursements were:—Out-of-work allowance, 1,852*l.* 13s. 11d.; strike pay, 557*l.* 17s. 10d.; sick benefit, 329*l.* 7s. 8d.; fire insurance claims, 119*l.* 16s. 7d.; funerals, 75*l.*; emigration and migration, 33*l.* 7s. 7d.; total, 2,968*l.* 3s. 8d.

Independently of the above 301*l.* 0s. 5d. was received by the local branches, and 307*l.* 18s. 5d. was expended; of the latter amount 234*l.* 6s. 3d. was paid in salaries to officers; 48*l.* 16s. 10d. rent of meeting rooms; 9*l.* 10s. was advanced to widows, and 2*l.* 0s. 9d. was spent in books for the library.

The executive accounts are given separately; the chief items of expenditure were:—Rent of offices, gas, &c., 10*l.*; secretary's salary, 58*l.* 10s.; meetings of executive committee, 33*l.* 5s. 9d.; treasurer, 1*l.* 10s.; deputations, 45*l.* 13s. 9d.; there is a further sum of 13*l.* 16s. 7d. put down for branch deputations; and 18*l.* 4s. 7d. expenses connected with disputes. The remainder was for printing, stationery, postages, telegrams, money orders, and sundry small items, including 7*l.* 10s. 3d. granted to the London Trades Council and to the Trades Union Congress Parliamentary Committee.

In this society there is usually a special collection in aid of the London hospitals annually, but this year, presumably in consequence of the depression in trade, it does not seem to have been contributed. In 1878, the amount so collected was 23*l.* 19s. 8d.; the year previous it was somewhat higher. Members are entitled to letters of admission when needed, in consideration of this yearly subscription.

The balance in hand at the end of the year was 693*l.* 5s. 6d.; at the end of 1878 it was 1,274*l.* 0s. 3d.; including the books and property of the association, the total worth of the society is stated to be 950*l.*,—this is exclusive of arrears due from members.

During the last twelve years the society has paid in benefits the following amounts:—Out-of-work allowance, 4,272*l.* 12s. 5d.; strike pay, 3,001*l.* 10s. 6d.; sick benefits, 1,705*l.* 10s. 11d.; funerals, 421*l.* 10s.; loss of tools by fire, 394*l.* 4s. 6d.; emigration and migration, 254*l.* 19s. 4d.; total, 10,050*l.* 7s. 8d.

For the purpose of aiding the members in their efforts to acquire a knowledge of art-workmanship, and of promoting a taste for its higher principles, libraries are formed in connexion with the several branches of the association. The books are lent out to the members on the meeting nights of the lodges, and all fines for the non-return of the books within the date specified, or for injury to them, are spent in purchasing additional books for the library. The total number of books belonging to the union, as stated in the catalogue, is 1470; the works are of a miscellaneous character, embracing art, science, history, political economy, and general literature.

The members of the society claim that they are entitled to a higher rate of wages than the artisans belonging to many other trades, on the ground that it requires a longer time to acquire the art of cabinet-making, and to become skilful in the craft, and also that the course of instruction is more costly than in most other trades. They furthermore contend that having to find an expensive chest of tools, and that these have necessarily to be continually replaced by others, either from the excessive wear and tear, or because of the frequent changes in the character and style of the work upon which they are engaged, and the nature of the material upon which they have to work, they are justified in seeking some higher remuneration. During the past year, it is asserted in the report, they have succeeded in the majority of cases in resisting attempted reductions of wages, and in maintaining the customs and privileges of the trade.

The society is a small one in comparison with many others, but it shows that it can adapt itself to the special wants and requirements of the members, and of the trade, by its efforts to develope a taste for artistic work, and by the promotion of technical instruction amongst its members. In this respect, at least, some of the older and larger societies might do well to follow the example set them by the "Alliance Cabinet-makers' Association."

THE SCULPTURES OF LYSIPPOS.

GREEK ART OF THE HELLENISTIC PERIOD.

MR. NEWTON'S seventh lecture * on Greek Art to students of University and King's Colleges was delivered on the 23rd ult., and treated of what he styled the Hellenistic Period, comprising the three centuries between the accession of Alexander the Great and the reign of Augustus. The last of the great sculptors of Greece was Lysippos. His statues appear to have been exclusively in bronze. His great celebrity might be partly due to the fact that his name came down to us associated with that of Alexander the Great, whose portrait he alone among sculptors was allowed by that king to make. Among his works were two colossal statues, one of Zeus (Jupiter), the other of Herakles (Hercules), in the city of Tarentum. An allegorical figure represented Kairos, "Opportunity," with a long forelock, while he was bald behind, in one hand a pair of shears, in the other a pair of scales. At Rhodes he made the Sun god, Helios, in a chariot group. He made statues of Alexander himself and of some of his companions in arms who fell in the battle of the Granikos. There are several extant busts or statues of Alexander, none of which, however, can be traced with any certainty to an original by Lysippos. He also made ideal portraits of great men of past generations, of whom no traditionary likeness had been handed down, such as the fabulist Æsop. Among his statues of athletes was a celebrated one, afterwards transported to Rome. This figure was represented scraping himself with a strigil, and was hence called the Apoxyomenos. In the Vatican is a marble statue believed to be a copy of this celebrated work. The Farnese Hercules, which we knew from an inscription on its base to have been the work of Glycon, is also thought to have been derived from an original of Lysippos. Studying the canon of Polycletos, conjointly with nature, he constructed a new canon of proportions. To him was attributed the saying that Polycletos made men as they were, but that he made men as they ought to be, a saying which had been variously interpreted, and which seemed to point to some deviation from the normal type of the human figure as established by Polycletos, designed, perhaps, to correct the optical impression produced by statues on a colossal scale. If we turned from this meagre account left us by the ancients of the art of Lysippos to the extant monuments of his period, we had the lion erected by the Greeks after the battle of Chæroneia, B.C. 336; the sculptured column from the temple of Artemis (Diana) at Ephesus; the Dionysos (Bacchus) from the Choragic monument of Thrasyllos, B.C. 320; and a colossal figure of

* For summaries of preceding lectures see last volume of the *Builder*, pp. 644, 678, 774, 806.

Victory on the prow of a ship, found in the island of Samothrace some years ago, and now in the Louvre. Professor Conze, in his recent work on Samothrace, had given a restoration of this statue, and pointed out its striking resemblance to the Victory on a prow on the coins of Demetrios Poliorcetes. It was highly probable that this type on the coin and the statue found at Samothrace both commemorated the great naval victory of Demetrios gained at Salamis B.C. 305. If was after the siege of Rhodes by this same Demetrios that the Rhodians erected that colossal bronze statue of the Sun god which, from its immense scale, ranked as one of the seven wonders of the world. Pliny told us that it was 100 ft. high, and that few men could with both arms reach round its thumb. It was probably finished B.C. 284, and was thrown down by an earthquake fifty-six years after its erection. Its position at the entrance of a harbour at Rhodes is marked by some enormous blocks of stone near the fort of St. Nicholas. The tendency of art in the Hellenistic period was mainly towards the colossal and the sensational; but there was also a strong realistic tendency, shown in the portrait busts and heads of that period, and in what is told us about Lysistratos, the brother of Lysippos, who is said to have cast a man's face from the life, and then worked that up into a perfect likeness. The realistic tendency shows itself strongly also in the Pergamos school of sculpture which was created by the Attalid dynasty. The statue commonly called the "Dying Gladiator" and the group in the Villa Ludovici called Arria and Pætus were probably part of a great composition representing the victories of Attalus and Eumenes II. over the Gauls. A smaller set of figures, representing groups of Gaulish and Greek combatants, had been identified by Professor Brunn as copies of a set of sculptures dedicated by Attalus, at Athens, to commemorate his triumph over the Gauls. The group at Naples, commonly called the Farnese Bull, represented the tragic incident of the punishment of Dirce by Zethos and Amphion, and was, in spite of much restoration, a noble composition deserving of more notice than it had received. It was probably the original work which Pliny states to have been the work of two artists of Tralles, and to have been brought from Rhodes to Rome. The great work of the Rhodian school was the Laocoon. There was good reason to believe that we possessed the original group known to Pliny. The sculptures in high relief recently obtained by the Germans at Pergamum, and now to be seen in the museum at Berlin, were certainly works of the same school as the Laocoon, and were remarkable from their dramatic and almost modern character.

THE ROTHERHITHE NEW BATHS AND WASHHOUSES.

THE erection of new baths and washouses for the parish of Rotherhithe has just been commenced, and the foundation-stone was laid by Mr. F. C. Carr-Gomm. The new building will be situated at the corner of Gomm-road, Lower Deptford-road, and, besides the basement, will consist of two spacious floors. It will be faced externally with white Suffolk bricks, with Portland stone and terra-cotta for dressings and ornamentation. It will contain two spacious swimming-baths, the first-class bath being 90 ft. long and 30 ft. wide, the depth varying at each end respectively from about 3 ft. to 7 ft., and enclosed along the sides of the baths there will be fifty dressing-rooms. The second-class swimming-bath will be 84 ft. long and 30 ft. wide, fitted with forty-seven dressing-rooms. It will be the same depth as the first-class bath, the sides and the bottoms of each being lined with white glazed bricks. Besides the swimming-baths there will be twenty-six first-class and twenty-four second-class private baths, all fitted for hot and cold water. The washhouse department, situated at the south-west corner of the ground-floor, will have every accommodation for washing purposes, being provided with twenty-four washing-compartments, each having hot and cold water and steam, with drying-closet and steam wringing and other machines. The laundry portion will contain mangles, ironing-board, and other machinery and fittings; and there will also be a second laundry for the exclusive use of the establishment itself, from which lifts will communicate with each department. The women's private baths, which will be fifteen in number (seven first-class and eight second-class), will be on the first floor of the building, with a distinct and separate entrance from the Gomm-road frontage. The entrance to the waiting-rooms, swimming-baths, and men's first and second-class private baths will be in the centre of the Deptford Lower-road frontage. The superintendent's apartments and the commissioners' board-room will also be on the first floor of this frontage, whilst the engineer's apartments will be on the first floor of the Gomm-road frontage. The engineering and machinery will be in the basement under the wash-house, and will consist of a powerful engine, the boiler-room containing three boilers, each 24 ft. long and 6 ft. in diameter, for hot water and steam. Attached to the engine-room there will likewise be engineer's workshop and other necessary apartments. The whole of the floors throughout the building will be fireproof.

The architects of the building are Messrs. G. Elkington & Son, and the general contractor is Mr. William Shepherd, of Bermondsey New-road; Messrs. J. & F. May, of High Holborn, being the contractors for the engineering works. The entire cost of the buildings will be about 25,000*l.*

THE ANTIQUE SCULPTOR.

HE brooded awhile, then seizing
Mallet and chisel, he made
A chase in the block of marble
Within which his fancy play'd.

He had before him no model,
But the form his mind's eye drew,
Yet out of that block of marble
The image he sees will hew.

Deftly with mallet and chisel
He toils with unrest alone;
Month after month to embody
The child of his brain in stone.

As seed in the soil in spring-time,
As bud bursting into flower,
Peering out that block of marble
The image grows hour by hour.

Tireless and anxious, the sculptor
Still labours, and with effect;
The statue at last is finish'd,
And the hero stands erect.

The world has honour'd the artist,
And his work has won him fame,
But Art is the greatest gainer,
Art, honour'd in his name.

Our artists fashion a model,
But the ancient sculptor knew
How, out of the block of marble,
The child of his brain to hew.

Work not for the age, O Sculptor,
But carve for all time to come,
And live like the great Art-workman
Of ancient Greece and Rome.

C. C. H.

COPYRIGHT IN CAREFULLY-PREPARED STATISTICS.

AN important copyright case has lately been decided by the Master of the Rolls, in Ireland, which will interest not a few of our readers. Mr. William Fleming, whose useful "Index to the Railway System" we have reviewed on several occasions of its annual issue, sought an injunction to restrain Mr. Charles Eason, publisher of the "Almanack and Handbook for Ireland," from including in that work tables of railway statistics, which were, Mr. Fleming alleged, pirated from the "Index." Six counsel, four of whom were Q.C., argued the case. The Master of the Rolls, in giving judgment, said that the case was one of very great importance, not only to persons involved, but as to the declaration of the law. The little book first published by Mr. Fleming in 1877 was apparently very unattractive, because it contained only a bundle of figures; but, when studied, it carried conviction to the mind. The Master of the Rolls said that it was on reading the article in the *Edinburgh Review*, which was referred to in the case (that on railway profits and railway losses, published in 1876), "that he, for the first time, became enlightened on the subject of railway profits and railway losses to an extent he could not here sufficiently describe." His Honour stated further that the "Almanack" of Mr. Eason had been in existence for some time before the publication of the "Index," and had contained railway statistics in a form that made them perfectly useless. But after the publication, by Mr. Fleming, of his tables, Mr. Eason had taken six tables from the "Index" and incorporated them in the "Almanack," adding several other railways. His Honour entirely acquitted Mr. Eason of any idea that he was stealing Mr. Fleming's property; but had come to the conclusion that the whole of the tables complained of had been bodily copied from the "Index," and that no clearer case of infringement of copyright had ever come before a court. The value of Mr. Fleming's book was shown in a special note about it in the *Edinburgh Review*, and it was also alluded to as valuable and interesting by other publications, among which the *Builder* may be named. The judgment was that Mr. Eason must be restrained from selling, or offering for sale, any copy of the "Almanack and Handbook for Ireland," containing any portion of the tables formulated by Mr. Fleming, and must, in addition, pay all the petitioner's costs up to and including the present hearing. The case is fully reported in the Dublin papers. The words we have cited are those of the *Freeman's Journal*.

OBITUARY.

The late J. J. Lyons, Architect.—The death of this gentleman took place at his residence at 1, St. Dominick-street, Dublin, on the 22nd ult., after a few days' illness, from inflammation of the lungs. The deceased was one of the pupils of the late Mr. J. S. Mulvany, the son of the biographer of James Gandon, the architect. Mr. John J. Lyons early started in practice for himself, and having a literary taste, contributed for a time to this journal. His first journalistic periodical ventures in Ireland were short-lived, and he then started the *Dublin Builder*, designed as a monthly professional organ. After a few short years his connexion with that journal ceased, and the *Irish Builder*, under new conduct, took up the interests of its forerunner, extending its advocacy to a wider range of representation. The early professional career of the deceased architect was promising, and he secured some profitable commissions in a varied class of work, though little of a very high character; but for several years past his commissions were intermittent, and his practice was of the most limited and cheerless nature. He had his failings, and was conscious of them to a certain extent, but he seemed powerless to overcome his one besetting sin, which his friends and early patrons deplored. The deceased, though he never might have become a great architect, could have lived a useful and fortunate life, but it was not to be, and his story, as with many others, is that of a wasted life. But as unto Cæsar we should give what belongs to Cæsar, let it be stated to the credit of Mr. Lyons that in his earlier years he had the true interests of his profession at heart, and exercised his abilities to elevate the status of his profession in Ireland. It was through his efforts the dead or dormant Royal Institute of the Architects of Ireland was revived many years ago, and its scattered elements were brought together. After its resuscitation, he acted for some time as secretary to the Institute; but unhappy days came soon, the particulars of which we have no intention of giving here. The deceased was the eldest son of the late Mr. John Lyons, who formerly held an appointment in connexion with the Four Courts, Dublin. A wife and some children survive the deceased, who passed away at a comparatively early age;—sinned against, perhaps, as well as sinning; and who is there without fault to cast the stone at his erring brother?

CASES UNDER THE METROPOLITAN BUILDING ACT.

HEIGHT OF ROOMS IN ROOF.

AT Hammersmith Police-court John Harvey, a builder, was summoned by Mr. Knightley, the district surveyor of Hammersmith, in respect of rooms which he had constructed in five houses in Hawthorne-terrace, Shepherd's-bush, contrary to the Act. The defendant said they were box-rooms, and not intended for habitation. Mr. Knightley said the rooms were approached in the usual way by staircases. There were windows in the rooms. The defendant pointed out that there were no grates in them.

Mr. Partridge held that the rooms were not habitable, and made an order to stop them up.

ROMAN VILLA AT MORTON, ISLE OF WIGHT.

BY MR. C. ROACH SMITH.*

THE discovery of the Roman villa at Carisbrooke opened a new prospect for the archæology of the Isle of Wight, which is now widened by the disclosure of another, on the slope of an elevated field called "Ten-Acre Field," on Morton Farm, near Brading. For this we are indebted to Captain Thorpe, whose tastes happily led him to investigate the early remains in the neighbourhood of his residence at Yarbridge. Captain Thorpe, having secured permission and co-operation from the tenant, Mrs. Munns, directed excavations which have laid open several apartments of a building which must have been of considerable extent; but, at present, its entire dimensions are unknown, as the excavations have not gone beyond the property in the holding of Mrs. Munns. In the course of a few months it is probable that further researches will be made, as Lady Oglander, the proprietor of the adjoining land, has kindly countenanced the projects of a few ardent antiquaries anxious to complete the researches so auspiciously commenced.†

The villa, although in itself it may present no very novel features beyond a pictorial pavement with unusual designs, is of the highest interest as regards the Roman history of the island; and no one with an educated mind can stand upon its ruins and look around him without being inundated by a train of reflections on the state of Vectis after its subjection by Vespasian, in command under Claudius; how soon it became Romanised; and upon what terms the conquerors made their yoke so light that they lived in security in the midst of a subjected warlike people, who, unless with the loss of freedom they had gained more than an equivalent, might have overpowered the new settlers at any moment. No military force, it would seem, was permanently allotted to the Island; and, therefore, it must be presumed that the arts and civilisation of the intruders were welcomed here as in the whole of the South of Britain. Then, what was the condition of the inhabitants under the new government exacting tribute, the grand incentive to the mighty and expensive armaments sent from far Italy to remote Britain? No doubt, as Tacitus remarks, peace was achieved by making the petty kings and rulers instruments for the subjection of their own people by immunities and honours. The province became soon, in every respect, more productive and prosperous, and the people more contented and happy than when, with nominal freedom, they were subjected to constant wars under rival and restless rulers, such as the native princes are represented to have been.

The villas at Carisbrooke, at Combly (on the north of Arreton), and at Morton, give indications, over a wide extent of ground, of the state of Vectis under the Romans. Then, as now, we may assume, flocks and herds grazed the hills and meadows; the ploughman ploughed the fields, the sower sowed, and the reaper reaped them. Then, as now, the duties of the seasons followed each other with fluctuating success; there were imports and exports; among the latter very probably chalk from the long-disused pits which lie along the downs throughout the island. The deposits of coins of Arcadius and Honorius, at Cliffe and Wroxhall, are a testimony in another direction of late occupation; and it is impossible to say what may yet lie buried when so much hitherto unsuspected has been brought to light in so short a space of time.

The pavements are very inferior to those of many villas; we may say to most of those published by Lysons, Artis, and others, such as have been found at Woodchester, Cirencester, Frampton, Lydney, Pitney, Thraxton, Bramdean, Bignor, and London; and, indeed, they may be called of a third class. One, however, presents certain novelties as regards the subjects, not the execution, which is inferior, although not wanting in spirit. It is square. On the western side are two gladiators, one with a trident, the other with a net, in combat. The corresponding design to this has been destroyed. On the north is an animal like a fox, under a tree, which, if intended for a vine, as has been conjectured, is a very poor representation. A building with a cupola completes this picture. On the south, by the side of a small edifice with a flight of steps, stands the figure of a man with the head and feet of a cock, and on his right, at a little distance, two griffins. In the centre is the head and bust of a Bacchante; and similar figures fill the two angles which are preserved. Each of these holds a sceptre or staff, at the top of which is a small cross, such as is held by deities or nymphs in the Pitney pavement. One of the other rooms is floored in a chequer pattern; and another with plain white tesseræ; the passages and borders in coarse red. From the fragments preserved it is evident that the wall of one of the rooms was painted in a superior and elegant style with birds and foliage.

Acquaintance with the ornamentation of Roman villas decides that much was left to the experience, means, and imagination of the *tessellarii*, or professed workers of these figured floorings. The same subjects are continually found repeated in widely-distant localities; sometimes treated with consummate skill and taste, and elaborately pictured. In other instances, as in the Morton villa, there is an incongruity assignable to the causes to which I have alluded.

The remains of the arch of a hypocaust are to be seen below the westernmost room, not yet fully excavated; and in the walls are fine tiles *in situ*. From the large quantity of broken flue tiles, it is apparent that some of the other apartments were heated. These, as well as the large flanged tiles used for various purposes, show skill in the making and burning quite as great as that evinced in the Roman tilework of Italy itself; and this uniformity is universal. The same remark may be made on the mortar; and to a certain extent on the pottery.

The villa was roofed with a thin slaty stone, roughly cut into hexagons, and fastened with iron nails. It could have been only of one story in height, but width commensurated; and it will probably be shown by further excavations that the building was extensive, and surrounded with the usual appendages to the *villa rustica*. The situation is extremely fine. The downs at the back stretch from Brading to Arreton; on the left, across the lowland (over which Captain Thorpe believes he has discovered an ancient ford), is Yaverland and the sea, with Sandown and Shanklin; and in the front and to the right a wide extent of the picturesque island scenery. At no very great distance on the border of the marsh land runs a bridle road to Arreton, which, it may be safely assumed, was a *via* in the time of the Romans.

The excavations have disclosed but few objects of art such as are frequently found under similar circumstances,—a proof that no sudden calamity overwhelmed the villa, but confirmatory of its having been tenanted, probably for a long time after the Roman period. From a quantity of ashes and the blackened state of the white tesseræ, it appears that a fireplace had been made in one of the rooms. When it became utterly deserted most of the building materials were carried off; and then, for centuries, it remained a ruin, until the slow and sure processes of nature covered the foundations and allowed the unsuspecting plough to do its annual work. The skull of a female which has been exhumed may be attributed to an early Modiæval interment.

Only four coins have been found, all in small brass. The earliest is of Gallienus; two of Tetricus; and one of Allectus, with the reverse LAETITIA AVG., a galley; in the exergue, Q.C. The coin of Allectus, intrinsically of no great value, could but contribute to reflections while standing upon the ruins of this nameless villa, with the deep blue sea in the distance, upon which sailed the fleet in the last hours of his sovereignty over Vectis and Britain, powerless and unable to help when it might have turned the scale once more in his favour.

Mr. Nicholson has had a photograph taken of the ornamental flooring; and Mrs. Thorpe has made coloured drawings.

* This will form a portion of part iv. of his seventh volume of "Collectanea Antiqua," not yet issued.

† At the head of these are Messrs. J. E. Price, F.S.A., and Cornelius Nicholson, F.S.A., and, it is hoped, Captain Thorpe.

ROTHERHAM BATHS COMPETITION.

SIR,—Can you or any of your readers tell me the result of the above competition? On the 5th of May last a "committee in council" selected six out of the designs sent in. These were to be on view (to members of the Corporation only) for a fortnight, and then the committee were going to make a selection. Since then I have heard nothing,—rather a lengthy fortnight. Considering that the designs have been in since the 25th of March last (over thirteen weeks), I think it is high time, and only fair to the respective competitors, that the decision of the committee should be made known without any further delay.

AN INTERESTED PARTY.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

A SPECIAL general meeting of the donors and subscribers to this Institution was held at the offices, 27, Farringdon-street, on the 29th of June, Mr. B. C. Fox (of Mr. E. Conder's) occupying the chair, in the absence of the president, who was unable to attend. At this meeting Mrs. Sarah Ann Coulson and Mrs. Mary Ann Olver (being the only eligible candidates) were duly elected to the full widows' pension of 20*l.* per annum without ballot, the liberal support accorded to the Institution on the occasion of the annual dinner at the Guildhall Tavern, on the 6th of April last, fully warranting the committee in adopting this course. The meeting closed with a vote of thanks to the chairman.

DWELLINGS FOR THE POOR.

THE Charity Organisation Society have re-appointed their Special Committee on Dwellings for the Poor, to inquire and report on the working of the Artisans and Labourers' Dwellings Act. At the first meeting of the committee it was resolved,—That a sub-committee, consisting of Sir U. Kay-Shuttleworth, Sir Curtis M. Lampson, Mr. H. R. Brand, M.P., Mr. Ernest Hart, Mr. T. Hughes, Miss Octavia Hill, Mr. W. M. Wilkinson, Mr. R. D. Wilson, be appointed for the purpose of collecting and circulating amongst the general committee the documentary evidence already on record, and of arranging for the attendance of expert witnesses to confirm and supplement such documentary evidence.

It was agreed that evidence should be taken more especially on the following points:—(1.) The causes of delay in carrying into effect the Artisans and Labourers' Dwellings Improvement Act, 1875. (2.) The causes of expense in carrying out the Act. (3.) Overcrowding.

Since then the Rev. D. Greatorex, of St. Paul's, Whitechapel; Mr. Gladding, the chairman of the District Board for Whitechapel; Mr. Catliff, secretary to the Metropolitan Association for Improving the Dwellings of the Industrial Classes; Major-Gen. Scott, managing director of the Victoria Dwellings Company; Mr. Wm. Glasier; Mr. Moore, secretary to the Improved Industrial Dwellings Company, and others, have given evidence.

LARGE SALES OF BUILDING LAND.

DURING the past week there have been several extensive sales of plots of building land on estates which are being laid out for building purposes immediately around the metropolis. Amongst these the British Land Company held a sale a few days ago, at the George Inn, Maze-hill, Greenwich, of seventy-one plots, on one of their estates, situate close to Greenwich Park and Blackheath. The estate was said to command extensive views of the river, and to afford good sites for the erection of residences, the stipulations being that the value of the houses to be erected on the estate was to be not less than 500*l.* and 750*l.* Mr. W. H. Collier conducted the sale, and of the entire number of plots offered forty-four plots were sold at prices ranging from 100*l.* to 240*l.* each plot, the entire proceeds of the sale amounting to nearly 5,000*l.* On Thursday week Mr. Collier also offered for sale, on behalf of the same company, twenty-five plots of building land on one of their estates at Dulwich, situate near Lordship-lane, Honor Oak, and Peckham Rye. The several plots offered were stated to have frontages of about 60 ft., and an average depth of from 300 ft. to 320 ft. Thirteen of the lots offered were sold at prices varying from 225*l.* to 280*l.* each, the whole realising upwards of 3,200*l.* No house is to be erected on any of the plots of a less value than 400*l.*

On Thursday evening, the 24th ult., a sale of freehold building land, on the St. Thomas's Estate, Brentwood, was held by Messrs. Protheroe & Morris, at the White Hart Inn, Brentwood. The property offered was until recently a nursery, but has now been laid out for building upon. It consisted of fifty-three plots, having frontages of 20 ft. and a depth of from 80 ft. to 120 ft. each, the value of the buildings to be erected not to be less than 300*l.*, 400*l.*, and 500*l.*, respectively. In addition to the plots of building land above named, there was also offered in one lot a freehold residence and shop adjoining the estate, with garden, nine greenhouses, and a peach-house, in full bearing.

This last-named lot was sold for 1,600*l.* Nearly the whole of the different plots of the building land were sold, those facing the high-road averaging 10*l.* per foot frontage, and those facing the several new roads 6*l.* 10*s.* and 4*l.* 15*s.* per foot frontage.

Last week a sale likewise took place of seventy-nine lots of building land on an estate laid out for the purpose at Wood Green. The several plots were described as having frontages of 20 ft. each, varying in depth from 70 ft. to 120 ft. Mr. R. J. Collier conducted the sale, when sixty ont of the seventy-nine plots were sold, the prices ranging from 50*l.* to 70*l.* per plot.

On Monday evening last Mr. R. J. Collier also held a sale of forty-eight plots of building land on an estate at Edmonton, the several plots having frontages of 16 ft., with an average depth of 90 ft. The whole of the plots offered, with two exceptions, were sold, the average price realised for each plot being about 25*l.*

SALE OF BANKING PREMISES IN CORNHILL.

On Friday, the 25th nlt., the leasehold building in Cornhill, which is occupied by Messrs. H. S. King & Co., bankers and East India agents, was offered for sale at the Auction Mart, by Mr. Frank Lewis, by direction of the Court of Chancery. The building, which has recently been erected, is very lofty, consisting of six floors, besides a basement. The premises are held direct from the Grocers' Company, on a lease for a term of which nearly seventy years are unexpired, at a ground-rent of 1,100*l.* per annum, and underleased for the whole term to Messrs. King & Co., at the annual rent of 2,100*l.*, showing a profit rental and a net income of 1,000*l.* a year. The property having been bid for up to 13,750*l.*, the auctioneer opened the sealed document containing the reserved price fixed by the Court of Chancery, on which he declared that the property was sold, observing that the purchaser had secured an excellent bargain in obtaining upwards of seven per cent. upon the purchase-money during the next seventy years the 1,000*l.* of net annual income being clear of all charges on the property, as the occupiers are under an engagement to do all repairs and insure. It transpired after the sale that the property had been purchased by Messrs. King & Co., the under-lessees.

THE "INNER CIRCLE" RAILWAY COMPLETION SCHEME.

The action by the Metropolitan "Inner Circle" Completion Railway Co. *v.* The Metropolitan Railway Co. and The Metropolitan District Railway Co. (tried in the Exchequer Division on the 28th of June, before Baron Huddleston, without a jury) was to recover more than 50,000*l.* upon an award. The defendants, upon several grounds, disputed the validity of the award.

The plaintiffs' case was based upon the Metropolitan and District Railways (City Lines and Extensions) Act, 1879, which provided that the two defendant companies should jointly or severally, on or before the 1st of October, 1879, pay to the Link Line Company, meaning the plaintiffs, or deposit for them with the London and Westminster Bank, such sum or sums, not exceeding, in the whole, 50,000*l.*, as might be agreed upon, or, failing agreement, as might be settled by arbitration, in respect of disbursements and liabilities, *bonâ fide* and properly incurred by the plaintiffs in projecting and obtaining the several Acts of Parliament relating to their company, and in giving effect to the powers conferred by such Acts, together with a reasonable remuneration for the directors and officers of the plaintiff company. The parties could not agree as to the sums to be paid or deposited, and an arbitrator having been appointed, on the 27th of September, 1879, he awarded that the defendants should jointly or severally pay or deposit 50,000*l.* in respect of the matters mentioned in the Act, besides paying the costs of the reference and two-thirds of the costs of the award.

The defence was that the arbitrator had exceeded his jurisdiction, that the award was uncertain in its terms, and that the arbitrator had awarded sums which were not within the meaning of the Act of Parliament.

At the conclusion of the arguments,

The learned Judge held that the plaintiffs were entitled to 52,490*l.* 14*s.* 9*d.*, but stayed execution to enable the defendants to appeal.

Oscott (near Birmingham).—The "Northcote" Hall, at St. Marie's College, Oscott, near Birmingham, is now about to be completed, from the designs of Messrs. Pugin, of Westminster. The cost will be about 2,500*l.* Messrs. W. Sapcote & Son, of Camden-street, Birmingham, are the contractors.

SURVEYORS' CHARGES AND TAXED COSTS.

In a case in the Common Pleas Division, Harstous *v.* Scott, heard before Mr. Justice Grove on Friday, the 18th nlt., the plaintiffs, who are surveyors, sued for 50*l.* 1*s.*, balance of account for services rendered to the defendant in connexion with a claim made by defendant against the London and Blackwall Railway Company, which was referred to the arbitration of Sir Henry Arthur Hunt, C.B. The defendant by his pleadings set up that the plaintiffs should be paid only that portion of their claim which he had received from the railway company on taxation of costs, but he did not appear, nor was he represented at the trial.

Mr. Justice Grove, in directing the jury, observed that although he could understand, under some circumstances, a solicitor agreeing to take taxed costs, yet it was most improbable and somewhat absurd to think that a surveyor would make any such arrangement, as taxation between party and party was quite independent of his charges, and was a proceeding in which he had no voice.

The jury gave a verdict for the plaintiffs for the full amount.

INFLUENCE OF CHURCH ARCHITECTURE.

With reference to a brief notice in our last issue of a lecture given by the Rev. J. Sheepshanks, Mr. Thos. D. Barry says he was misunderstood by the reporter. Mr. Barry writes,—"The lecturer, in the course of this paper, made observations to the following effect:—'The people loved to worship in buildings the very *atmosphere* of which seemed to lift them above the petty and grovelling things of their worldly life.' Also, 'there is *an atmosphere* about a *truly devotional church*, which, without the calling in of any illegitimate means, *makes salutary impression upon the people*, and disposes their minds to prayer.' And again, 'a *devotional building* disposes men's minds to reverence.' It was on the statements that mere material beauty or proportion had anything to do with *saving impressions* or *devotional reverence* that I joined issue with the lecturer, believing as I do that no building can be called a *devotional* building, or that there is any connexion whatever between mental or sensuous aspirations, and spiritual worship, or 'the disposition of the mind to prayer.' Respecting the glorious churches of the Middle Ages, I expressed a hope that when a cathedral was built in Liverpool, it should be in our own National style, and on the lines of those beautiful structures which we have around us. I agreed with all that the lecturer claimed for beauty, proportion, and suitable ornament, but differed (as did many others) with the 'atmospheric influences' attributed to merely æsthetic excellence."

STRENGTH OF STAFFORDSHIRE BLUE VITRIFIED BRICKS.

The issue of careful experiments showing the strength of building materials is always interesting and useful. We therefore print the following results of experiments made by Mr. Kirkcaldy to ascertain the resistance to a gradually-increased thrusting stress of six bricks received from the Cakemore, Causeway Green, &c., Brickworks and Colliery Company, at Rowley Regis, near Dudley:—

Test No.	Description.	Dimensions. Inches.	Base Area. Square In.	STRESS IN POUNDS WHEN Cracked Slightly.	Cracked Generally.	Crushed, Steelyard dropped.
0 2,100	Blue Brick. (No recess.)	2·85. 8·75 × 4·20	36·75	238·400	354·000	425·820
2,098	do.	2·85. 8·75 × 4·20	36·75	233·500	350·600	422·560
2,097	do.	2·85. 8·75 × 4·20	36·75	229·200	344,000	418·220
2,096	do.	2·85. 8·75 × 4·20	36·75	211·000	332·000	414·400
2,095	do.	2·85. 8·75 × 4·20	36·75	208·000	321·000	409·330
2,099	do.	2·85. 8·75 × 4·20	36·75	202·400	318·600	387·940
	Mean		36·75	220·417	336·700	413·045
	Lbs. per square inch			5·997	9·161	11·239
	Tons per square foot			385·6	589·1	722·7

Bedded between pieces of pine three-eighths inch thick.

A QUESTION OF LIABILITY FOR PAYMENT.

CASLAKE *v.* BYWATERS.

In the Queen's Bench Division, on Monday last (before the Lord Chief Justice and Mr. Justice Bowen), Sir Hardinge Giffard, Q.C., moved in this case (mentioned in last volume of the *Builder*, pp. 776, 809) for a rule *nisi* for a new trial on the ground that the verdict, which had been given in favour of the plaintiff for 1,346*l.*, was against the weight of evidence, and also on the ground of misdirection.

The plaintiff is a plumber and mechanical engineer, and the defendant is a well-known builder. The case arose out of the construction of the Junior Army and Navy Club, which had been built under a contract between the defendant and Captain Elliot. With reference to certain parts of the work,—among others an iron staircase,—there were stipulations that these should be taken out of the hands of the defendant, the builder, and should be done by other persons named by Mr. Dudley, the architect. It was stipulated that the defendant should pay for such works and receive a profit of 15 per cent. on the net cost. The plaintiff first brought his action against Captain Elliot, who went into liquidation, and upon this he abandoned that suit and instituted the present one. Mr. Justice Stephen, before whom the case was tried, refused to construe to the jury the contract between Captain Elliot and the defendant, and, as the latter contended, if his Lordship had not refused to do this it would have appeared that the liability was to have been incurred by Captain Elliot and not by the defendant.

The Court granted the rule *nisi* on both grounds.

Sir,—My attention has been called to a letter from the defendants' solicitors published in your last issue, the statements in which greatly surprised me, and many others who heard the evidence. I will not remark upon the course taken by a firm of solicitors who publish a letter while, as they state, "steps are being taken to review the verdict." But I may state that one of the questions left to the jury was, "Did the defendants employ the plaintiff?" and the jury, after very little consultation, came to the decision which your paper reported, and which to every person who heard the evidence must have appeared the only just verdict they could give.

ARTHUR T. HEWITT, Solicitor for the Plaintiff.

BAD BUILDING IN EDMONTON.

On Monday last, at the Edmonton Petty Sessions, Mr. W. R. A. Cole, of High-road, South Tottenham, was charged, upon four summonses, with infringing the bye-laws of the Edmonton Local Board of Health, inasmuch as he was erecting four houses in Town-road, within the district of the Board, the walls of which were not properly bonded and solidly put together with mortar or cement. William Gimson, of Bayceaux Villa, Gipsy-hill, Norwood, was also charged, upon eight summonses, four with a similar offence as that alleged against Mr. Cole in respect of four houses in course of erection in Jeremy's Green-lane, and the remaining four that the walls of the said houses did not rest on solid ground, concrete, or other solid foundation, as required by bye-law 101.

Mr. Houlder, clerk to the Local Board, conducted the proceedings. The summonses against Mr. Cole were taken first.

Mr. Houlder stated that the walls of the houses in question were built of very inferior materials. Small pieces of bricks had been used, and the mortar was largely in excess of the quantity required to execute work properly. Bonding together meant that bricks should bond each other, but in the present instance they did not do so. There was so much bad building going on, that the Local Board were compelled to interfere, and they hoped the Bench would inflict such a fine as would induce builders to comply with the bye-laws, so that houses which would become detrimental to the health of the inhabitants as well as dangerous to those who resided in them might not in future be erected.

Robert Harrison, assistant-surveyor to the Board, said the walls were constructed of bats and smaller pieces of bricks. There were eight or nine courses without any tie whatever. One course of bonded bricks was laid every few feet, and the intervening spaces were filled up with small pieces. The work was intended for Flemish bond, but there was no real bond at all.—By Defendant: The mortar was of fair quality. A builder was entitled to erect concrete walls, but the system of construction which was being pursued certainly did not render the walls as strong as concrete ones.—By Mr. Houlder: The bonding ought to be every other course of bricks.

Mr. Grindle, chief surveyor to the Board, said the

mortar was good, but the bricks were the most inferior he had ever seen. The walls were not bonded, in the true sense of the word, except by the tenacity of the mortar.—By the Bench: Having regard to the safety of persons who might occupy the houses when finished, he should pronounce the walls insecure.—Defendant said he had expressed his willingness to do anything the surveyor to the Board might suggest to remedy existing defects.

Mr. Abbiss inquired if anything could be done, short of pulling down the walls, to secure the safety of occupiers.

A discussion arose, in the course of which a suggestion was made that the necessary strength to the walls could be given by having them coated with cement; and eventually an adjournment for three weeks was ordered to see if any scheme could be devised and carried out to the satisfaction of the Board's surveyor, the Bench intimating that, as the offences charged had really been committed, it must not be understood that a fine would not be imposed.

In Mr. Gimson's case it was shown that the spot where the buildings were being erected was not very solid ground, and that the plans sent in for the approval of the Board provided that 12 in. of concrete were to be laid to form the foundations of the houses, whereas the amount put in was only from 1½ in. to 4 in. in depth. The substance itself, too, was of a very inferior quality. The mortar, also, was exceedingly bad, consisting of very small portions of sand and lime, the rest being vegetable mould. Samples of mortar were produced, and the Bench said they could scarcely detect the presence of sand or lime.

Defendant said every ingredient for making good mortar was upon the ground, and if the material was bad, it was owing to the negligence of persons in his employ.

The Bench said had materials were used by many builders to save a little money, even at the cost of loss of character. The magistrates would assist Local Authorities as far as possible to ensure the erection of proper buildings; and in the hope that others would take warning by the result of the present case, defendant would be ordered to pay 2*l.* 10*s.* in respect of each of the eight summonses,—20*l.* in all,—with costs, the amount, if not paid, to be recovered by distress.

PARLIAMENTARY JOTTINGS.

Indian Railway Bridges.— In the House of Commons, on Monday last, Mr. Anderson asked the Secretary of State for India whether the Report on Indian Railways for 1877 correctly stated the name of the firm who contracted for the railway bridge across the Nerbudda river; whether that firm were not also contractors for the principal ironwork of the Tay Bridge; and whether, under these circumstances, he had considered the desirability of providing that the Indian Government should institute an investigation as to the quality and kind of iron used for the Nerbudda Bridge, and also extend their inquiry to the Indus Bridge and other bridges built or being built on the guaranteed and State railways of India. The Marquis of Hartington: In the Report on Indian Railways for 1877 the name of the firm who contracted for the railway bridge across the Nerbudda river is correctly given, and the firm mentioned is the same as that which is stated to have been connected with the supply of the principal ironwork of the Tay Bridge. The contract for the bridge was made by the Bombay, Baroda, and Central India Railway Company, in April, 1877. The Tay Bridge disaster occurred towards the close of last year. The plans and specifications of the Nerbudda Bridge were prepared by Sir John Hawkshaw, and the whole process of supplying the ironwork has been carefully watched and inspected under his direction. Upon the occurrence of the breakdown of the Tay Bridge, the directors of the company gave special directions to Sir John Hawkshaw to be most particular in carrying out the duty of inspection. No complaints have been received from India of the quality of the iron, but a second examination is made there, and severe tests are applied to the piers and the girders when placed in position. There can be no doubt that the engineers employed in designing and constructing bridges in India since the Tay Bridge disaster have been fully alive to the necessity of the most careful specifications being prepared, and of the most conclusive tests being applied to materials before they are accepted. I will take steps for obtaining a special report on the Nerbudda Bridge before it is opened for traffic.

The Electric Light.—Mr. Daniel Grant has given notice that he will ask the First Commissioner of Works whether he will take into his consideration the advisability of substituting the electric light for the purpose of illuminating the House in place of the gas now used in the roof.

Mr. George Jennings.—A correspondent, writing from the Sydney Exhibition, April 24th, says:—"I have much pleasure in informing you that Mr. G. Jennings has won the highest awards, viz., first for stoneware drain-pipes, &c.; first for hydrants and water-fittings; first for pumps; and first and special for sanitary wares: thus beating all those who copy his inventions in the old country. Here he has nothing to fear, for they prefer men who originate to those who copy."

ARCHÆOLOGICAL NOTES.

Cup-marked Stones.—Mr. Jolly, H.M. Inspector of Schools, Inverness, seeks to throw some light on the origin of the cup-like depressions in stones, several of which have of late been discovered by Mr. Linn, of the Geological Survey, in the rocks *in situ* on the hill of Roseisle, near Burghead, on the Calder hill at Forres, and in other localities. Mr. Jolly says that one of these depressions resembles in general appearance what would be produced by inserting an egg a third of its length into soft dough, only they have been formed in hard rock, and vary in size from half an inch in diameter to four inches and above it. In 1864 a detailed dissertation on these curious remains of prehistoric art or worship was read by Sir James Simpson before the Edinburgh Antiquarian Society, and was subsequently published in 1867. The neighbourhood of Inverness has numerous examples of these cup-stones. Within a radius of twenty miles in Inverness Mr. Jolly has obtained sketches of forty-five cup-marked stones hitherto unfigured, and these will be described, with illustrative drawings, at the first meeting of the next session of the Edinburgh Antiquarian Society.

Earthworks in Worcestershire.—The Worcestershire Naturalists' Field Club recently visited Thornbury, near which place, on hilly ground, is a castrametation called Wall-hill. The vallum is very lofty and steep. Mr. E. Lees read a short paper on the subject by Mr. H. H. Lines. Mr. Lines described the camp as presenting a combination of Roman and later British work, having an area large enough to hold 4,000 men easily. It is 1,220 ft. long, by 650 ft. in breadth within the ramparts. There are two original gates of remarkable width, one on the south-east corner, 60 ft. wide between its two crests, the other gate on the north-west end of the camp 50 ft. between the crests, and these gates possess neither Roman nor early British character, and their extraordinary width is remarkable. In addition, there are four openings, which appear to be of subsequent formation. On the western side are two yew trees growing on the line of the rampart, which has been diverted from its proper line in order to leave them outside the camp area, as though they grew where they stand before the camp was made. On the eastern side is a breach in the rampart of 90 ft. in length, where the earth has entirely disappeared, probably carted away, as Ducomb has stated has occurred with regard to several other lines of entrenchment. Mr. Lees said this castrametation was called the Wall-hill, from *waal*, a Saxon word signifying a stranger, and the Saxons gave this name to all those fortified posts that were occupied by the Romano-Britons, whose place of retreat they called *Wealas* or *Wales*, and no doubt this ground had been occupied and defended by the Welsh. Mr. J. Tom Burgess, who said that he was familiar with ancient earthworks, was of opinion that this was an original British work, showing no sign of Roman occupation, and Wall Hills he considered a term generally applied to ancient fortifications all over England.

SOCIETY FOR THE PROTECTION OF ANCIENT BUILDINGS.

THE third annual meeting of this society was held in the Hall of the Society of Arts, John-street, Adelphi, on Monday last.

The annual report stated the Society's work during the past year had differed little from that of the previous one, except in two notable instances, viz.,—St. Alban's Cathedral and St. Mark's, Venice. The committee had, as before, received information, written letters of inquiry, protest, and advice, "sometimes with obvious and encouraging results, sometimes with nothing apparent to show for the trouble." The committee believe the Society's principles are taking root, and especially, they think, are influencing the great body of our architects; "a course of events which is both very encouraging, and what might have been expected." A Society having a similar aim to this has been set on foot in France, under the auspices of M. Guillon, an honorary member of the Society. Among the cases in which the Society has taken action during the past year the report mentions Chesterton Church, near Cambridge; St. Germain's Cathedral, Isle of Man; Aldborough Church, Suffolk; Prestbury Church; Studland Church, Dorsetshire; five pre-Reformation churches in Exeter; Malmesbury Market Cross; and the Old Town-hall, Leicester. At Chesterton, St. Germain's, and Studland, proposed schemes of restoration have, it is stated, been abandoned; whilst those of Aldborough and Prestbury have been greatly modified. The proposal to pull down the Exeter churches has fallen through; Malmesbury Market Cross has, it is claimed, been protected from "restoration"; and the old Town-hall at Leicester has been saved, for the present at least, from demolition. Sir Edmund Beckett having offered to re-build the whole west front of St. Alban's Cathedral, the report states that the committee saw no other course open to them but to make one last protest to save what was still left unrestored of the Abbey,—

"They co-operated with Earl Cowper and Mr. John Evans in opposing the faculty which Sir Edmund Beckett was applying for in the Bishop's Court. The committee regret to state that their opposition was unsuccessful, and that Sir Edmund Beckett has obtained his faculty; and though the committee have been informed that an appeal lies to a higher Court, they do not think it advisable under the circumstances to carry the matter further. The committee cannot refrain here from drawing the attention of the Society to the fact that no tribunal exists in this country before which any proposal for the alteration of a public and national monument can be dealt with from the point of view of the effect such alteration may have upon it as a work of art or an historical monument."

With regard to ancient buildings abroad, the report detailed the steps taken by the committee to protest, on account of the danger to the mosaics, against the project of the Italian Government to bodily lift the Baptistery at Ravenna some 3 ft.; and also referred to the controversy *in re* St. Mark's, Venice.

CHURCH RESTORATION.

THE Church of Bronghton Sulney, in Nottinghamshire, has been opened by the Bishop of Nottingham, after undergoing extensive restoration. The external works comprise a new and enlarged north aisle. The walling is built of Bulwell stone. The roof is of red deal, stained and varnished, and covered with lead. Internally, a gallery at the west end has been removed, and the tower arch opened out. A new window has been put in the west end of the tower. The chancel arch, which had been built up, has been cleared out and restored. The chancel was restored some thirty years ago, but was quite hidden from the church. The pulpit is of oak, with stone base; the prayer-desk is of oak; and the benches throughout are of pitch deal, varnished. The aisles are paved with tiles, and the font occupies a prominent position at the west end. The walls throughout have been denuded of plaster, restored and painted, and in carrying out this portion of the work an interesting discovery was made in the south wall, where one of the old arches of a Norman arcade, with pillars and capitals, was found in a fairly good state of preservation, and it has been judiciously treated so as to form a leading feature in the chancel. The only entrance-door in the south side was of a nondescript character, and it has been replaced by a Norman doorway and door in character with the arch under which it stands. Two new windows in the south wall have completed that side, and the whole harmonises well together. The church is heated by Porritt's hot-air system. The works have been carried out from the designs and under the superintendence of Mr. R. W. Johnson, architect, of Melton Mowbray and Kettering, by Mr. Brickmore, of Bingham, who has carried out the works very creditably.

State of the Underground Railways.—The walls of the stations of the underground railways require thorough cleansing and re-whitewashing, or painting, not simply to make them decently respectable, but to place them in the sanitary condition in which such places should be carefully maintained. The tunnels also are in need of measures to purify their foul interiors. It would be a most regrettable circumstance if these important lines should fall into a neglected state, and again awaken anxiety in the public mind. It is impossible, in the nature of things, that they can ever be as bad as they were before the tunnels were ventilated by openings at suitable intervals, and houses were demolished to give them air space, both which reforms were effected by the intervention of the press years ago; but there is still room for improvement, and of late the condition of the stations, and the general state of uncleanliness which prevails, do not satisfy the most modest demands.—*Lancet.*

CHURCH DECORATION.

Norton Lees, near Sheffield.—The church of St. Paul has just been simply decorated, the chief artistic work having been expended on the chancel wall, roof, and roof-panels. The wall over the altar-table has been divided into three panels, the central one of which is occupied by a figure of the Saviour, with uplifted hand, in the act of blessing. St. Peter and St. Paul respectively occupy the side panels, with auxiliary embellishments. The paintings and decorations are by the firm of Powell, Bros., Park-square, Leeds.

Margaretting, Essex.—Mr. Thomson, of St. George's-road, Southwark, has just completed the decoration of the east end of Margaretting Church, Essex, under the superintendence of Mr. F. Chancellor. In the two sides are emblems of the Lamb and Flag, on the other side that of the pelican feeding her young. They are surrounded by a rich border. On the top part is the dove, and sacred monograms on coloured grounds. The whole of the decoration is on a rich vellum ground.

Scarborough.—The Westborough Unitarian Church in this town, Rev. D. Agate, minister, has been re-opened, after renovation and partial decoration, its walls having been previously white and bare. The chief artistic work is at the east end, in the part corresponding with the ordinary chancel. Here, instead of a window, is a large recessed panel, now divided into three compartments, in each of which is a figure of one of the three Christian graces, "Faith, Hope, and Charity," painted in strong outline, with the addition of but little colour, and relieved by a dull gold screen. Within a pointed arch above the figures the sun is rising above the dusk shadow of night, the brighter stars yet shining in the heavens. On the arch itself, in letters of gold, is the legend from 1 John 1-5, "God is light, and in Him is no darkness at all." The reredos of the altar beneath bears the legend, "God is love." The wall-spaces on either side of the figures, and above the arch, are suitably ornamented with strong bands of coloured scroll-work, dividing a more delicate diaper. A rich dossal hanging, an ornamented surbase, a dado round the whole church, and a slight band of ornament emphasising all the windows, complete the design. The work has been carried out by Messrs. Powell, Bros., under the superintendence of Messrs. Holtom & Connon, architects, Leeds.

LEWANICK CHURCH.

THE parish church of the little Cornish village of Lewanick, situated some five miles from Launceston, has just had its chancel restored. Lewaniok Church is, in the main, of the Perpendicular type of Gothic architecture; but the Decorated doorway at its western end, and some other remains, are indicative of an older church, built probably upon the same lines at some earlier period. On plan the building consists of the western tower, a chancel, north and south porches, and a spacious nave and two aisles, joined the one to the other by arcades. The building is principally of granite, of a rough moorstone, very like granite, and of the well-known Cornish Polyfant stone, which is procured from a quarry scarcely a mile away. The arcades dividing the nave and aisles are highly-wrought and fine examples of Polyfant masonry, and the roofs, which are of the wagon type, exhibit effective wood-carving. One of the chief glories of the edifice consists in the fine old benches, with which the main portion of the structure is filled. The seats in question are of the local type, made of English oaken planks fully 4 in. thick; their ends are carved, and, by a legend upon one of them, we learn that it was in 1516 they were erected. The angle seats at the head and foot of each aisle are surmounted by carved angels, cut out of the same oak. The font stands at the western end, and dates from the thirteenth century. The avenues between the seating are wide, and are laid with old Delahole slates.

The most remarkable thing about the church is the miniature font-like stone that stands near the inner door of the north-west porch, and immediately against the adjacent seating. It is a cresset-stone, a very rare piece of ecclesiastical furniture, so exceedingly rare, indeed, that it is very questionable whether another example exists in any parish church in England. Some 20 in. high, by 18 in. in diameter, its shape resembles that of a font, save that, instead of one basin, the bowl contains seven holes, each some 3 in. wide and as many deep. These cup-like cavities, in ancient days, were filled with oil or tallow, and were provided with wicks, so that at early morning service or after dark at night, the seven lamps were lighted for the convenience of worshippers. This curious cresset is made of Hicks Mill Greystone, of precisely the same character as the Norman font, and is probably as old.

The chancel has just been put into a seemly state by the present vicar. The chancel-walls have been denuded of their many coats of white-wash, and the stones beneath have been carefully pointed. The old plastered and stuccoed inner roof has been removed, and the wagon-typed shape of the original nave-roof has been carried on right through to the east wall. The roof springs from newly-carved and embattled wall-plates in oak; the moulded ribs and purlins are of the same material, and their intersections are stopped with carved bosses. The panels are lined with oak boarding. The fine four-light east window has been faithfully restored; new moulded mullions have been put in, in the same material as the original window—grey granite,—and, wherever it was necessary, the rest of the window has been repaired. The old altar-rails, which were of a Jacobean type, have been modified and refixed.

The altar-table is new, and of massive English oak. A reredos has been erected. It is of Bath stone, a parallelogram in form, and surmounted by a richly-carved and pierced cresting. Immediately over the altar-table are sculptured representations of the four Evangelists, and at each side are panels, in which are carved lilies in pots. Upon the reredos is incorporated a brass, upon which is inscribed the legend, "To the glory of God, and in loving memory of Edward Archer, of Trelaske, Esquire, and Charlotte Catherine, his wife, parents of the Rev. Charles Harward Archer, vicar of this parish, 1880."

The various works have been carried out by Mr. Harry Hems, of Exeter, under the personal superintendence of the Rev. Charles H. Archer, the vicar. Mr. Archer, it is interesting to add, is a great-grandson of the celebrated architect of the last century, Sir William Chambers.

LORD MOUNT TEMPLE AND COMMONS RIGHTS.

SIR,—At the public meeting held yesterday at Willis's Rooms by the Commons Preservation Society, the noble chairman, Lord Mount Temple, with characteristic modesty, refrained from referring by one word to the very prominent part he had himself taken in the preservation of commons, parks, and other open spaces. A similar reticence, I regret to say, was observed by all the other speakers. Suffer me now to be the mouthpiece of thousands,—should I not rather say of millions?—and remark that Mr. Cowper-Temple's eloquent advocacy of these unmistakable reservoirs of health dates as far back as March, 1844, when, in company with our now illustrious Premier, he supported Lord Worsley's Enclosure of Commons Bill, in which the rights of the people to commons land were emphatically recognised. During the thirty-six years which have elapsed since then, Mr. Cowper-Temple has done wonders as the valorous champion of open spaces, of commons, parks, and village-greens, which, as he truly contended, have done more to promote the happiness of the English people than any other institution handed down by their Saxon forefathers. When Epping Forest was in danger from attempted enclosure, this real statesman persistently and eloquently defended year after year the rights of the people against the encroachments of the Lords of the Manor. Again and again did he remind the House of the rare value of the forest to the teeming population of the East End of London; and on one remarkable occasion he saved this magnificent piece of public property in spite of the opposition of the Liberal Government, actually defeating them by a majority of 100. He succeeded in getting incorporated in the General Enclosures Act a clause providing that in all future enclosures of waste land certain portions should be set apart for labourers. He struggled gallantly, but, alas! in vain, to get introduced into Mr. Cross's Commons Bill a clause which would prevent enclosures within six miles of London, and within certain fixed distances of other towns, according to their population. Lastly, Mr. Cowper-Temple's Thames Embankment Bill has produced for Londoners and provincial visitors to London what Lord Harrowby truly designated "the noblest Boulevard in the world." In advocating this important matter of open spaces Lord Mount Temple was far ahead of his contemporaries, just as he was in advocating the repeal of the Corn Laws, the abolition of University tests, church-rates, and Jewish disabilities. S. L.

ON THE FALLACY OF ADJUSTING PROPORTION TO SIZE.

SIR,—A few years since a fallacy of a similar order to that upheld by "Toreuticos" possessed the *dilettanti*. Peculiar defects in pictures were then attributed to the astigmatism of the painter's eye, and differences in the rendering of the same originals to artists seeing differently. But the shortsighted theorists forgot that the pictorial representations, not being like the originals copied, could never have re-impressed the retina of the artist as correct copies. So this long-existing fallacy was at last, by rational acumen, finally disposed of.

There is a very simple and natural method of disposing of the more recent fallacy. Remove any of the famous works from the proper or best point of view to different distances, and determine whether any disproportion is apparent as the image on the retina is reduced by the removal of the statue to a distance. There is no collective opinion, that I am aware of, in support of "Toreuticos's" motion. The fallacy originates, I am inclined to think, in the utterly unwarrantable assumption that everything the Greeks did in art was right. They did a great deal that was disproportionate and wrong in the commencement of their art career, and only less than other nations when they were at their best.

METER.

PARTY-WALLS.

SIR,—I notice a letter under the above heading in your number of June 26th, which seems to be of interest to builders, in which an explanation of certain facts is asked for. But as regards the first instance, in which "E. G." has paid 100*l.* to be clear of the claim against him, one must presume that he would not quietly pay the sum unless he had received legal advice upon the question he puts to your readers, so he can hardly expect them to give amateur opinion, and possibly make themselves look foolish. But it strikes me that "E. G.'s" difficulty in both cases falls under the head of the right of buildings to support rather than under that of party-walls, as no question apparently of what one may term a "party-wall" character arose, but rather a question as to proper working and the right to support. As to Sir W. Tite's plan, these stories often lose some of their original features by telling, but I fancy a lawyer would say that if a neighbouring building had a right to support, no notice that building operations likely to endanger it were about to take place would do away with the right. But, then, was there such a right? I fear we have not been told the cardinal facts of the case.

A CONSTANT READER.

THE LAW OF DISTRESS AND THE LAND QUESTION.

SIR,—In a letter on "The Land Question," which you did me the favour to publish on April 3rd, I mentioned incidentally, as one of the farmers' grievances, the operation of the law of distress, as making the landlord a preferential creditor over others, to their and the farmers' detriment. Exception was taken to my statement in a letter you published on April 17th, in which the writer says my view of the question "shows want of knowledge," and goes on to state that many landlords have made use of this law to shield their tenants from creditors during the recent bad times,—which latter may be true, although, from a creditor's point of view, undesirable and unjust.

That my statement, thus called in question, was not inaccurate, we have proof in a report of a deputation to the Premier from the "Farmers' Alliance," on the 16th inst., a body having, according to Mr. James Howard, M.P., the chairman, no less than fifty members in the present Parliament. One of the spokesmen on this occasion, Mr. Edward England, called the

attention of the Premier to the existing law of distress, which he said "he regarded as the hinge and pivot of all the disadvantages that regarded the tenant. That law of distress was largely taken advantage of by landlords, because under it they were perfectly safe in accepting the most reckless bid that could be offered to them. It was an unfair advantage, which in the long run did not secure them any benefit. He spoke the feeling of that deputation, and he believed that of the large majority of the farmers of Norfolk, when he said that nothing short of the total abolition of that law would be satisfactory to them."

To this the Premier replied,—"I quite agree that the law of distress is a law of severity which cannot be justified, and the course which has been taken in Scotland may lead the English farmer to say that he has not been treated on the same principle."

As this is a purely social question, and one of great interest to all of us, it cannot be desirable that this relic of a fendal system, no longer suited to our civilisation, as many of us think, should remain at least misunderstood, and the *Builder* may, therefore, be doing us a great service in permitting such a question to be veutilated in its pages. E. GRIMES.

THE PROPOSED NEW MUNICIPAL BUILDINGS FOR GLASGOW.

THE Glasgow Town Council have resolved to ask Mr. Charles Barry, late President of the Institute of British Architects, to adjudicate on the plans which have been sent in by architects from various parts of the country for the municipal buildings for Glasgow. It is stated that no fewer than ninety-eight boxes and parcels have been sent in to the Glasgow town-clerk in connexion with the competitive designs for the buildings. The designs have been numbered consecutively from 1 to 98, and insured by a floating policy to the extent of 5,000*l*. A number of architects sent in copies of reports on their plans for distribution among members of the Town Council, but the committee have declined to distribute them, leaving the matter entirely in the hands of the adjudicator.

BLUNDELL'S SCHOOL, TIVERTON

THE memorial-stone of the new buildings was laid on the 26th ult. by the Earl of Devon. The site consists of about 20 acres, and the new buildings will accommodate 250 boys. The cost of the whole is estimated at abont 15,000*l*. The buildings have been designed by Messrs. Hayward, of Exeter, and the contractors for the work are Messrs. Langdon & Poole, Minehead. In style the new school will correspond with the old one, but the interior will be considerably different. The buildings will be arranged so as to carry ont the present system of teaching by the use of class-rooms in combination with a large school, or assembly-hall, and the whole of these rooms, with the exception of the laboratory and adjacent lecture-room, will be on the upper floor. The large room will be 66 ft. by 30 ft., and have an open-timbered roof; and the class-rooms, six in number, will vary from 31 ft. to 24 ft. in length, and he generally 20 ft. wide and 14 ft. in height. The entrance will be through the tower, which is at the north-west angle of the building, and over the doorway will be a niche for a statue of the founder. A second external doorway in the tower is intended to form an approach to a chapel, which, it is hoped, will be soon erected. Beyond the tower the principal staircase will lead up to the rooms above, and the remainder of the north front will contain the laboratory, a room for apparatas, and a lecture-room underneath the great school-room. Uader the class-rooms will be a cloak-room, a room for the day boys, one for the assistant-masters, a school lihrary, and a large dining-hall intended for hoarders in the head-master's house, as well as for snch day boys as, living a distance from the school, may he glad to avail themselves of the master's table. The accommodation for the head-master will he convenient, and have kitchen offices sufficiently large for taking boarders, hnt no further provision is made for them in the present contract. The north front of the building will be 108 ft. in length, and the extreme length from north to south, including the head-master's honse, will be about 224 ft. The whole of the building will be erected with Halherton stone, with dressings of Doulting stone.

ARCHITECTURE, UNIVERSITY COLLEGE, LONDON.

THE following are the prize-gainers in the department:—

ARCHITECTURE, Mr. T. Roger Smith, F.R.I.B.A.—*Construction, second series*, Donaldson Silver Medal, A. S. Vowell, of Loudon; Certificate, 2, C. H. Bedells,* of Cronch End; Third Class, F. W. St. Aubyn, of London. *First series*, Prize, C. J. Tait, of London; Certificate, 2, F. S. Ogilvie,* of North Shields. Third class, S. J. Bury, of Whetstone. *Fine Art, second series*, Donaldson Silver Medal, A. B. Pite, of Loudon. Second Class, Wm. A. Pite, of Loudon; Third Class, F. A. Gerrish, of London. First Series, Prize, W. J. Lander, of London; Third Class, B. V. Westbrook, of London, C. Turner, of London. *Modern Practice*, Prize. Fr. E. Eales, of Loudon. Certificates, 2, R. E. Smith,* of Forest Hill. 3. A. G. Morten, of Loudon. 4. (equal) S. J. Bury, of London, F. G. F. Hooper, of Loudon. *Ladies' Class, Prize*, Laura E. Jones, of London. Certificate, 2, Edith M. Smith, of Forest Hill; Second Class, Elizabeth Beck, of London; Third Class, Hannah Oliver, of Kew.

The Council of the Collego have again appointed Mr. Roger Smith to conduct these classes for the session 1880-81, in the absence of Professor Hayter Lewis.

"THE SITE OF THE '51 EXHIBITION."

SIR,—In last week's number of the *Builder* you remark, in reply to the letter from Mr. Worssam, "The site of the '51 Exhibition should certainly be marked." Permit me to state that when talking over business matters with the late Sir Joseph Paxton in 1852, while making the plans for the present Crystal Palace at Sydenham, I distinctly remember his telling me, "I have planted the site of the old Exhibition with *a special kind of grass*, so as to indicate the spot in years to come."

That was his idea of a memorial. Why cannot this simple plan still be carried out?

PHILIP B. LEE, Architect.

"SMALL POWER ENGINES."

SIR,—May I be permitted to answer the very suggestive inquiry, under the above heading, contained in your issue of the 19th ult.?

Mr. Sewell wishes to know of a firm that will supply small power engines to do the following work in a country house, viz.:—

1. Pump water.
2. Do minor farm work.
3. Warm the building.
4. When not engaged on Nos. 1 and 2 to produce power for two electric lights.

The first three conditions are not by any means new to my firm, as several of the hot-air engines we manufacture, and which have been described in your pages, are doing this class of work. The stove of the hot-air engine warms a room; and, if need be, the waste heat of the furnace can he utilised for warming hy the hot-air system, or it may he used to supply heat to the hot-water boiler of an ordinary greenhouse.

From ¾-h.p. to 5-h.p. the hot-air engine will do this class of work with very little consumption of fuel, and with much less attention and skill than is required to drive a steam engine.

No. 4 is the only condition requiring more than ordinary consideration, not because of the mechanical difficulties so much as the extraordinary perverseness of electric engineers when describing a fact.

The Transatlantic fabrications about electric light have made ordinary engineers and mechanical men in this country despair of ever receiving the truth. Gravitation having placed these audacities in the gutter, it is refreshing to know that Dr. Siemens, Dr. Hopkinson, and other authorities, have been able to tell us what power is required to produce the electric light.

According to Dr. Siemens, an electric light of 6,000 candles requires an engine of 4-horse power, and to illuminate three quarters of an acre, nine of such lights would he required, absorbing the energy of a 36-horse power engine.

I have watched the progress of the electric light with some interest, and although I shall he glad to see a demand for hot-air engines for driving the magneto-electric machines, I think that, until further improvements are made in the production of the light, small motors will he of little use.

Where water is abundant our water-motors will produce power for the electric light. One we have just delivered to Mr. Hussey-Vivian, M.P., for his silver-mines in Norway, will he driven hy a head of water 400 ft. high, producing 25-horse power. When this is not winding it might produce the electric light with ease.

If your correspondent wishes us to test any electric-light apparatus, in order to see what power is required to produce one or two lights in order to obtain information on which to base an estimate for hot-air engines, I will, with pleasure, conduct such an experiment free of charge. W. H. BAILEY.

*** Among various manufacturers who write, Mr. F. W. Jackson, Kingsbury Iron-works, Ballspond, says, "I make a speciality similar to what is required by your correspondent."

* Obtained number of marks qualifying for a prize.

CHURCH-BUILDING NEWS.

Soham.—Soham parish church has lately been re-opened by the Bishop of Ely, after restoration nnder the direction of Mr. J. P. St. Aubyn, architect, according to whom the church was originally a "cross church," with a central tower, built ahont the end of the twelfth century. The nave is 52 ft. by 22 ft., with side aisles of the same length and 9 ft. wide, divided from the nave by arcades of four arches, springing alternately from octagonal and circular shafts, with moulded caps and bases, and plain pointed arches of two orders. The central tower, 22 ft. square, springs from four pointed and enriched arches of three orders, rising from semicircular responds with enriched capitals and plain hases. The works now completed compriso the complete repair of all the windows, doors, and other stonework, both external and internal. New roofs have been put to the north and south transepts, as well as to the two chapels, and a new floor to the tower. The work has also included the re-plastering of the walls, the removal of the galleries which surrounded and encumbered the church on all sides, the re-arrangement of the seating, the opening of the tower to the church, the removal of the font, the repairing and re-tiling of the floor, the re-glazing of all the windows, and the warming of the church. Some portions of the work have been carried out by Mr. Tooley, of Bury St. Edmund's, and they were completed by Messrs. Tebbitt, of Soham, at a total cost of ahout 3,000*l*. Mr. Tebhitt, sen., died during the progress of the work, which was then taken up by his son. The accommodation is for 562 persons.

Wilden.—A new church at Wilden has lately been consecrated by the Bishop of Worcester. The church bas been erected at the sole cost of Mr. Alfred Baldwin, J.P., on ground the gift of the Ecclesiastical Commissioners. It consists of a nave, chancel, vestry, organ-chamber, and bell-cote, and will accommodate 150 adults. Tbe style is Early Decorated. The materials used are the best facing hricks, with stone dressings, and tiles for the roof. The roof, internally, is open-timbered. The architect is Mr. W. J. Hopkins, diocesan architect, Worcester; and the contractor was Mr. J. Cook, of Hartlehury. The original contract for the church was 1,400*l*., exclusive of honndary-walls, heating-apparatus, lighting, the Communion service, and the church furniture, which, with the cost of the organ, must make the total expenditure amonnt to between 2,000*l*. and 3,000*l*.

Oldham.—The new church of St. Paul's, Ashton-road, Oldham, has heen consecrated by the Bishop of Manchester. Messrs. Wild & Collins, of Oldham, are the architects. The church is in the thirteenth-century style of Englisb architecture, and on plan consists of nave, aisles, chancel, organ-chamber, clergy and choir vestries, with a contemplated tower and spire at the west end of the south aisle, for which the fonndations have been put in. The walls are built of Yorkshire parpoints, with Warwick stone dressings, hacked up with Highmoor ruhble. The roofs throughout are open timbered, and varnished. The benches are of pitch-pine, varnished, and provide accommodatioa for 550 worshippers, exclusive of twenty-four seats in the chancel for the choir. Tne floors of the aisles are flagged with Rochdale flags, and the chancel floor is laid with ornamental tiles. The reredos, which has been presented by Mr. John Taylor, of Fernholm, is of Caen stone, with carvings emhlematic of the four Evangelists in the head of the side panels, the centre panel having the head of Christ, with a crown of thorns. The pulpit is also of Caen stone. The church is warmed on the low-pressure hot-water system, with Wagstaff's saddle boiler. The contractors have been:—For foundations, Mr. Joseph Stevens; for masons' work, Messrs. J. & J. Whitehead, of Marsden; joiners' work, Messrs. Cbas. Schofield & Co.; plumbing and glazing, Mr. John Bardsley; slating, Mr. Daniel Lees; plastering, Mr. James Hall; heating apparatus, Mr. Giles Shaw; gasfittings and commnnion-rail, Messrs. Gentle & Falconer; reredos, Messrs. Joseph Bonehill & Co., of Manchester; pulpit and font, Mr. James Hilton, of Manchester; chancel tiling, the Campbell Brick and Tile Company, Stoke-on-Trent. The Communion-table has been made and presented by Mr. Samuel Mellor.

Llanbadern.—Llanbadern Church, Aberystwith, was reopened on tbo 1st of July by the Bishop of St. David's, after restoration and refur-

nishing of the tower and transepts, at a cost of about 2,500*l.*, under the direction of Mr. John P. Seddon, architect. The transepts have been re-roofed, and the crux groined in wood under the belfry-stage. The freestone pulpit, which has two figures in bas-relief, of St. John and St. Paul, by Mr. Stannus, is a memorial-gift of the Bishop's. Messrs. Roderick Williams & Son have executed the work of the restoration. The nave was restored some years since by the same architect, and the chancel will shortly be taken in hand.

DISSENTING CHURCH BUILDING NEWS.

Somercotes.—Four memorial stones of a new Wesleyan School-chapel have been laid at Somercotes, Derbyshire. The building will cost 720*l.*, including the cost of the land. The chapel will accommodate 200 persons. The contractor is Mr. Page, of South Normanton, and the architect, Mr. Eyre, of Codnor.

London.—The City-road Wesleyan Chapel, which was partially destroyed by fire in December last, has been reopened, after restoration, in which all the old and familiar features have been reproduced. The fine plaster-enriched ceiling, which was 100 years old, has been reproduced from castings of the fragments of the ornament not quite burnt, and decorated and gilded. The lighting is by two sun-burners, replacing the former plan of a ring of burners round the gallery. The ventilation is on the tube-system, Weaver's extractors being used in the roof. All the monuments have been restored precisely as before, including one of the granite monoliths supporting the apse-arch which was erected as a monument to the memory of the late Dr. Waddy. The morning or small side-chapel has a new roof of panelled pitch-pine, with ceiling-light, with an outer one glazed with Rendle's glazing. The warming is to be effected by Grundy's system. The architect is Mr. Charles Bell, and the builder is Mr. J. D. Hobson, of the Adelphi, who has carried out the work in the short space of eighteen weeks, the amount of the contract being about 5,000*l.* The gas-lighting is by Messrs. Strode & Co.; the ventilating by the Sanitary Engineering Co.; and the ornamental work by Mr. Mullen.

Pendleton.—A new Welsh Presbyterian chapel, with schools and house adjoining, have lately been completed. They were designed and carried out under the superintendence of Mr. Wm. Dawes, architect, Manchester. They are situated in Broad-street, Pendleton, and in style they are based on the Romanesque. The walls throughout are of red brick, relieved with stone dressings, and on the principal front some good carving and ornamental stonework add to the effective appearance of the buildings. The chapel, which accommodates 305 persons on the ground-floor and 258 in the galleries, is 57 ft. long, 30 ft. 7 in. wide, and 32 ft. high. The floor rises as it recedes from the pulpit, so that all those who have sittings at the back have an unobstructed view of the minister. The inner and outer porches or lobbies are arranged to prevent draughts interfering with the comfort of the congregation sitting near the inner entrance. The air of the lobby will be warmed by hot-water piping, the same as that in the chapel itself, so that any rush of cold air from the outer porch would be intercepted and warmed before it passes into the interior of the building. The staircases to the galleries flank the principal front, and are entered from the outer porch. They are designed externally to break up the otherwise broad and flat gable end of the chapel, and they give, in connexion with the turret that surmounts the gable and the recessed portion over the front entrance, a varied outline. The whole of the windows in the principal front of the chapel are filled with stained glass. The ventilation has been carefully considered, and alternative systems of natural and artificial extraction have been provided for by ornamental outlets in the ceiling underneath the galleries, and by piercings in the ornamental string of the ceiling of the chapel, connected in each case with the foul-air trunks that convey the vitiated air to the extraction-shaft; the impure air will be drawn upwards and will thence escape. Whenever found necessary, to meet the varying conditions of certain seasons of the year, extraction-boilers will be used to rarefy the air in the extraction-shafts and accelerate the upward current; but for the present it has not been considered necessary to make this extra provision. The escape-outlets in the ceiling of the chapel are confined to three bays farthest from the pulpit, with the view of making the current of air passing from that part help to convey the voice of the minister to the most distant parts of the building. In connexion with the chapel there is a minister's vestry and conveniences for the use of the congregation, and between the chapel and the schools there are three rooms that may be alternately used as vestries or class-rooms. Over these rooms are arranged the organ-chamber and two additional class-rooms. The school-room is 48 ft. long, 36 ft. wide, and 22 ft. high. In the basement there are store-rooms, tea-room, heating-chamber, &c. A lift is carried from the tea-room to the school-room for the convenient supply of the various articles required at large tea-meetings. The chapel-keeper's house is at the back of the main buildings, and is quite detached. The contractors for the work were Messrs. Enley, Jones, & Robertson. Mr. Joseph Roberts was the clerk of the works. The cost of the buildings was about 5,500*l.*

Bude.—A new Wesleyan Chapel has been opened at Bude, Cornwall. It has been built by Mr. Beckley, of Holsworthy, from designs of Mr. J. Hine, architect, Plymouth, at an estimated cost of about 1,800*l.* It is Byzantine in character, and Plymouth limestone and Bath freestone are used externally. The chapel consists of a nave with a transeptal end, divided from the main building by an arcade of three segmental arches extending across the building. The object of this is to allow of the lower end, with the transepts, being shut off from the nave during service in winter, and also to facilitate its use as a school. The larger congregations of the summer months will thus be provided for, and the chapel will not be inconveniently roomy in winter. The interior is highly finished, and has a pitch-pine dado carried to the height of the pews, which also are of varnished pitched pine. The windows, of which there are fifteen, are round-headed, and have been glazed with cathedral glass, in two tints, by Fouracre & Son, of Stonehouse. The ceiling, which is flat, is divided into square panels by moulded beams, sustaining the pendants of coloured metal which uphold the coronas for the lighting of the chapel. The exterior of the chapel is relieved by bold entrance-porches, and the frontage by the window columns and mouldings, and a little carving, done by Mr. Harry Hems, of Exeter.

Books.

The Industrial Arts of India. By GEORGE C. M. BIRDWOOD, C.S.I., M.D. Edin. With Map and Woodcuts. Chapman & Hall.

THIS, which is one of the series of Art Handbooks issued under the authority of the Committee of Council on Education, has been prepared to form a guide to the public in visiting the India Museum, now transferred to the authorities of the South Kensington Museum. The second part of the book is, in great measure, a reprint of the author's Handbook to the Indian Court at the Paris Exhibition of 1878. This was so well received that Dr. Birdwood had resolved to re-publish it, with additions, when he was asked to write a popular handbook in connexion with the re-opening of the India Museum under its new administration. The material already collected formed part of this,—not, as the author explains, that the book thus formed is directly an analysis of the contents of the India Museum: it must rather be regarded as an index of its deficiencies; the treatise giving a general outline of Indian art manufactures which are partially, but only partially, illustrated by the contents of the Museum. To this is prefixed a sketch of the Hindu Pantheon, the enormous ramifications of which cannot be even briefly set down under a considerable number of pages, and some knowledge of which is necessary to understanding half the interest of the manual arts of India. So Dr. Birdwood affirms, and it is not for us to contradict him; though we may be allowed to say that the great interest of Indian art lies really in that portion of it which is purely decorative, and into which no story and no representation of their multifarious deities enters, the interest in regard to the latter being, after all, rather archæological than artistic. Nevertheless, the information given upon this subject is no doubt of much interest in itself, and the small drawings which accompany it will enable those who are desirous of following up the Hindu mythology in its artistic illustration to identify the various deities. But the sketches given of them, many of which represent figures we are all more or less familiar with, recal Ruskin's effective comparison between the *morale* of the Highlander and the Hindu, as connected with the love of nature in the one, and the worship of monstrous, cruel, and mis-shapen deities in the other. And, in fact, Dr. Birdwood, by implication, confirms Ruskin's view, when he remarks on the bad effect which much of this grotesque mythology has had upon Hindu art, in leading the artists of the Peninsula to the constant representation of monstrous and mis-shapen forms. He points out, and one or two of his illustrations, show that the Hindu has not been without the faculty of carving graceful human figures when his mythology presented them now and then with a god who was in the image of man; but people who are continually led to produce figures which are essentially symbolic rather than human in character, and in which the symbolism is carried out by the production of figures with a plurality of heads, arms, or legs, and in other ways entirely and purposely departing from the human type while just recalling it sufficiently to give point to the grotesque character of its treatment, are almost inevitably bound to lose the power of excellence in the representation of human expression; and the natural result is that Indian art, with all the truly exquisite elaboration and fancy which it displays in dealing with purely ornamental work, has produced an enormous number of the most hideous figures that ever were invented by man.

The Hindu artist is not much better at animals, though he does not intentionally caricature them. But perhaps the influences which led him away from the realistic study of the human figure have also operated to make him blind to the anatomical points of animal framework. In this respect the Hindu artists stand in curious contrast to the Japanese, who are also a people incapable of correctly representing the human figure and at the same time are beautiful artists in decorative work; but with this the Japanese combine a rare power of representing animal life with spirit and fidelity, which the Hindus seem entirely to want. Their animals are grotesque in proportion and action, for the most part, and are often almost boneless in appearance and destitute of proper articulation of the joints; and perspective, when it comes to drawing on the flat, is quite a mystery to them.

It is needless to say that when we come from figure-subjects, human or animal, to pure ornament, Indian art is for the most part superb, not only in design, but in the beautifully fit way of treating the material, and in the manner in which floral types are made use of as the basis of artificial ornament. Among the instances of the true taste in regard to material shown in Indian work, Dr. Birdwood especially mentions their treatment of the precious metals, the manner in which the least possible bulk of a costly material is turned to the greatest possible account in artistic value, and the contrast presented by such work to so much of English gold and silver work, where weight and mass of material seem to be regarded as an object in itself for which the purchaser is willing to pay even more highly than design. We have before commented on this vulgarity of taste in English work of this kind, and are glad to find Dr. Birdwood speaking so strongly on the point. He adds that English dealers in *bijouterie* will weigh such specimens of Indian gold and silver work in their hands, and look on them with contempt for their lightness, which, when combined with such beautifully artistic use of the material, is, of course, one of their excellencies, and renders them a far better investment of money, even, than "the unseemly dead-weight gold and silver manufactures of London and Birmingham, for which customers have to pay four times more than the value of their weight," and in which, as the author truly observes, the object seems to be to "bestow the least amount of work on the greatest amount of metal."

The book is adorned with a sufficient number of excellent illustrations of Indian decorative art, to render it in itself a considerable help to appreciating the beauty of Indian art, even apart from the Museum, and a good account is given of each branch of work. It is noticed that there is one form of art, lace, that has only recently been introduced into India, but for which (as one would have expected) the native artists show great aptitude, and in which they have already produced beautiful work. At present India is still a country where all orna-

mental work is hand-made, and therefore has almost inevitably an artistic style and feeling; though it is to be feared that machinery will set its hoof there before long. The art is, however, more traditional than people are aware of who do not see much of it; the same forms are continually repeated, but they are all beautiful forms, so far as the purely decorative work is concerned; but the author remarks that the influence of European education and "the irresistible energy of the mechanical productiveness of Birmingham and Manchester" are already going far to vitiate the beauty of the traditional art of India, and to confuse its forms. Another remark of Dr. Birdwood's we may quote *verbatim*:—"The worst mischief is perhaps done by the architecture foisted on the country by the Government of India, which, being the architecture of the State, is naturally thought to be worthy of all imitation. The Nawab of Bahawalpur was the other day installed on the throne of his ancestors, and in anticipation of the auspicious event, the Indian Government built him a palace, which is the ghastliest piece of bare Classicism it is possible to imagine, even with so many examples before us in this country of the Dissenting-chapels and vestry-halls of the last century. And now Holkar, in obvious emulation of this preposterous production, is building for himself a vast Italian palace at Indore, which is to cost many lakhs of rupees, and will be like Trentham, or Buckingham Palace, or anything else in the world but a habitation meant for kings. This sort of thing has been going on all over India ever since the establishment of the British peace in 1803-6, and 1818-19, and is the fountain-head of all the evil we deplore." We fear there is no hope of any remedy for this, unless we could educate the British Government in architecture, which seems out of the question.

VARIORUM.

A NEW edition of "Dickens's Dictionary of London" has been published. As some little omissions that we pointed out in the first issue have been supplied in this, we can conscientiously say that it is an improved edition. The Dictionary has been received with great favour by the public.——Mr. Elliot Stock is about to issue "Our Ancient Monuments and the Land Around Them," an antiquarian and historical account of the antiquities which are proposed to be preserved by the Ancient Monuments Bill now before the Houses of Parliament. The work will be illustrated, and will have an Introduction by Sir John Lubbock, Bart.——"Ancient Wood and Iron Work in Cambridge" is the title of a work about to be published in parts by Spalding, of Cambridge, containing a series of elevations and sections drawn from examples of carved wood and wrought-iron work dating from the sixteenth century, by W. B. Redfarn, with descriptive letterpress.——With reference to the numerous new synagogues to which we have lately referred, the following account of the ancient synagogue, from Canon Farrar's "Life of Christ," will not be out of place:—"It was simply a rectangular hall, with a pillared portico of Grecian architecture, of which the further extremity (where the 'sanctuary' was placed) usually pointed towards Jerusalem, which, since the time of Solomon, had always been the *kibleh*,—*i.e.*, the consecrated *direction*,—of a Jew's worship, as Mecca is of a Mohammedan's. In wealthier places it was built of white marble, and sculptured on the outside in alto-relievo, with rude ornaments of vine-leaves and grapes, or the budding rod and the pot of manna. On entering there were seats on one side for the men; on the other, behind a lattice, were seated the women, shrouded in their long veils. At one end was the *tebhah*, or ark of painted wood, which contained the sacred Scriptures, and at one side was the *bima*, or elevated seat for the reader or preacher. Clergy, properly speaking, there were none, but in the chief seats were the ten or more *battanim*, "men of leisure," or leading elders; and pre-eminent among these the chief of the synagogue, *rôsh hak-kenéseth*. Inferior in rank to these were the *chazzan*, or clerk, whose duty it was to keep the sacred books; the *sheltach*, corresponding to our sacristan or verger, and the *parnasim*, or shepherds, who in some respects acted as deacons."——From the July number of "Picturesque Europe,"—an excellent one,—we take a paragraph as to the fountains of Constantinople:—"At every corner fountains of pure running water supply the element which plays so prominent a part in the religion of Islam, and which is in constant demand for purification after prayer. These fountains vary in size and magnificence; some are mere openings in a wall, others are square-built temples of marble, with dome-like roofs and projecting eaves, richly decorated and inscribed with suitable texts. The words, 'By water everything lives,' may be deciphered on almost all,—here cut into the stone, there written in golden letters upon an azure ground. Some of these fountains enjoy especial prestige, as that of the Sweet Waters of Asia, which stands upon a wide terrace on the Asiatic side above the Bosphorus, shaded by plane-trees, and in full view of the glittering white houses, castles, and towers of Europe, the prison formerly of the Janissaries, who once made and unmade sultans, and governed the capital with despotic, irresponsible rule. To this come not only humble neighbours to fill their water-vessels, but great ladies are ferried across in their private *caïques*—the gondolas of Constantinople—from the harems of Stamboul, and wait, lying enveloped in their *yash-maks*, or veils, while their attendants bring them goblets of water from the fountain which is so much esteemed."

Miscellanea.

Royal Albert Hall.—On Sunday afternoon last there were, at the lowest computation, 5,000 attendants at the organ recital. It was the last of the series which has been given during the months of May and June by Mr. H. H. Statham, as a labour of love. The programme was laid down and printed at the commencement of the series, and consisted entirely of organ music, pure and simple, of high character, and with very little reference to what is called the popular taste. The public have reason to be thankful to the Council of the Albert Hall for this provision, gratuitously, of a high and fitting form of enjoyment. The fine-art exhibition at the hall has been considerably increased and strengthened since its opening, and the collection of ancient and modern wood-carving should be seen by all who are interested in the arts of the country.——On this, Saturday, afternoon, a great opera concert is to be given by Mr. Gye, with the *artistes* of the Royal Italian Opera, including Madame Patti and Madame Albani. The interior of the hall, on the last occasion when Mr. Gye gave a concert here, was a sight not soon to be forgotten. When filled, as it was then, the Albert Hall presents a scene scarcely to be paralleled.

New Board Schools.—Some picturesque schools, built on rising ground, and affording accommodation for 521 scholars, were opened at Killamarsh, near Chesterfield, on the 16th ult. Of an English Domestic type of Gothic, they have been erected at an expense of 4,437*l.* from the designs of Messrs. Innocent & Brown, of Sheffield, architects, whose experience in school-board schools is considerable. The buildings are of Dunford Bridge stone, with dressings from the Ancaster quarries. The roofs are covered with Welsh slates, and there are Berkshire ridge creases. A master's house is attached to the school-buildings. The dwarf boundary wall is surmounted by wrought-iron railings. The rooms have all a pitch-pine dado, up to the level of the window-cills. The floors of the principal compartments are laid with wood cubes. The warming is by hot water. The following tradesmen carried out the works. Mr. J. Lister, of Aston, near Rotherham, general contractor; Mr. Holden, Sheffield, heating apparatus; Mr. Harry Hems, Exeter, carving; and Messrs. Redmayne, May, & Co., Sheffield, desks and fittings. The clerk of works was Mr. W. W. Mabson.

Value of Ground-rents.—On the 24th ult. Messrs. Chesterton & Sons offered for sale, at the Auction Mart, freehold ground-rents, secured upon houses in Beaufort-gardens, Brompton-road, amounting to 231*l.* per annum. They were sold in one lot for 6,600*l.* The house will come to the freeholder in about eighty years from this time.——The same auctioneers, on the same occasion, offered for sale leasehold ground-rents, secured on dwelling-houses in the St. John's-wood neighbourhood. They were sold in two lots. The first lot, giving a net profit rent of 115*l.* 10*s.* per annum for sixty-one years unexpired, was sold for 1,925*l.* The second, a net rent of 61*l.* per annum, also for sixty-one years unexpired, sold for 1,130*l.*

Industrial Exhibition at the East End.—On Wednesday afternoon the Lord Mayor (Sir F. Wyatt Truscott) proceeded in civic state to the east end of London, for the purpose of opening an industrial and fine-art exhibition at the Bow and Bromley Institute. The Institute, which has been established for ten years, is situated over the North London Railway station in the Bow-road. The exhibition was promoted with a view to encourage inventive skill, excellence of workmanship, and the wise employment of workmen's spare hours, and all the exhibitors belong to the working classes. The articles exhibited are arranged under five heads,—namely, mechanical articles, artistic, general, fabrics and fancy work, and work done by young persons under eighteen. Fifty guineas in prizes are offered, of which the Clothworkers' Company give 21*l.* The Coopers' Company provide a special prize for the best specimens of cooperage or articles connected with that trade. Various firms lend interesting specimens of their particular trades; thus, Messrs. Doulton and Messrs. Wedgwood send articles of pottery; Messrs. Powell, of Whitefriars, some ornamental glass; and Mr. Wilherforce Bryant, of the firm of Messrs. Bryant & May, sends a valuable collection of Japanese brouzes, carvings, and armour. The exhibition will remain open for some time to come from two o'clock until ten at night, Sundays excepted.

Who is to Blame?—At the meeting of the Hackney Guardians on Wednesday, says the *Metropolitan*, the clerk laid before the Board a report from the building committee, stating that they had considered the question referred to them as to the position in which the new infirmary buildings were placed, and they found that the foundations were laid 25 ft. nearer to the existing infirmary than was directed by the Local Government Board, and they recommended that the matter be laid before the Central Board, and to ask their advice on the matter. "The report having been received, the question of responsibility for the error was raised. Some of the members were of opinion that it rested with the architects; others considered the builder culpable, and all agreed that the mistake was a most unfortunate one.—In reply to a question, Mr. Higgins said a reason had been assigned by the architects, but he (the speaker) could not give it in public. On this, Mr. Kemp and Mr. Hart declared their inability to vote unless they were put in possession of those facts. Eventually they were given, and then followed a discussion as to the propriety of the work being allowed to progress until the will of the Local Government Board was known. In the end, it was decided to forward a statement of the affair to the Upper Board, and also to let the architects and the builders know the position of affairs."

Fires.—What proved to be a very extensive fire broke out on Saturday night, soon after nine o'clock, at the saw-mills of Messrs. Roberts, Bartram, & Prout, Belvedere-road, Lambeth. The official report of the damage states that a brick building of two floors, about 120 ft. by 60 ft., the property of Messrs. Roberts & Co., was completely burnt out; a brick building of one floor, about 35 ft. by 20 ft., used as a boiler and engine house, was, with the contents, very seriously damaged by fire, heat, and water; and several surrounding stacks of timber were also greatly damaged by fire, water, and removal. The stacks in an adjoining open yard, belonging to Messrs. Lucas Bros., builders, also suffered damage. The cause of the fire is unknown.——At half-past four o'clock on Sunday morning a serious fire occurred at 17, Duke-street, Bloomsbury, on premises occupied by Messrs. Holland & Hannen, builders. The fire originated in the saw-mills on the ground floor, from an unknown cause, and was not extinguished until the mills and the contents had been seriously damaged by fire and heat, and an adjoining building of three floors, about 50 ft. by 20 ft., used as a store, completely burnt out.

The Late Mr. W. Hepworth Dixon.—The interesting and valuable library of this lamented writer will be sold by auction, by Messrs. Sotheby, Wilkinson, & Hodge, on Tuesday and Wednesday next. Some of our readers may be glad of the information.

Window Gardens.—I see window-gardening is a subject with you. I have had some iron window-gardens,—all in one piece with the sill,—holding two narrow rule of earth each, perfectly drained and safe, for years. They are fully successful, and their contents are in luxuriance now.—B.

The Destruction of a Railway Bridge.—An inquiry into the causes of the recent accident on the Hereford and Brecon Mid-Railway, by washing away of the buttresses of a bridge over a trihntary of the river Wye, was resumed at Brecon, before Mr. D. W. J. Thomas, county coroner. Colonel Rich, inspector to the Board of Trade, was present. The accident happened on the 18th ult. A heavily-laden goods train was to pass over a bridge across a stream known as the Llaingan Brook, but the ahutments of the bridge had, owing to exceptionally heavy storms, been washed away, and when the train reached the spot it went over the chasm, and was utterly smashed, and a driver named Parker was killed. The evidence taken now tended to show that the bridge was fairly well and substantially built, and that the exceptional character of the storm fully accounted for the accident. The testimony of Colonel Rich, C.E., inspector of railways for the Board of Trade, who had examined the scene of the catastrophe, was directly to this effect. The jury were unanimously of opinion that the death of George Parker was purely accidental, and that no hlame was attributable to the railway officials.

Schools for Girls.—On the 29th ult. the North London Collegiate Schools for Girls were formally opened by his Grace the Archbishop of York, Mrs. Thomson presenting the prizes to the girls in the Great Hall. The Bishop of Rochester, late chairman of the Board, was also present. His Grace was taken by the architect (Mr. E. C. Robins) over the building, which is now entirely in the occupation of the girls. The opening of the Great Hall and new building associated with it, by the Prince and Princess of Wales, took place in July last year. About 500 girls are now accommodated, and ahout 150 more are awaiting vacancies. A tablet recording the munificence of the Brewers' Company has been placed in the entrance-hall. Thus the largest and one of the most successful day-schools in the metropolis for the higher education of girls is started on its way, with every modern appliance to ensure continued usefulness.

A Merry Old Parson.—One of the oldest clergymen living is the Rev. John Russell, or "Passon Jack," as he is oftener called amongst his North Devon parishioners. The reverend gentleman is fast approaching five score years, and still continues to be as "lively as a cricket." In another column of this paper may be read an account of the new Blundell School, at Tiverton, of which the foundation-stone was laid upon the 26th ult. A couple of days before, the annual celebration, known as the "Old Boys' Day," was observed at Blundell School, when, after service at St. Peter's Church, those present were photographed, and then lunched together with other friends in the Lower School. The health of the "Old Boys" having been proposed, the toast was coupled with the name of the Rev. John Russell, who replied in a long and humorous speech.

Cleopatra's Needle.—A plaster cast of a sphinx, coloured to look like bronze, has been fixed by the Metropolitan Board of Works on the Victoria Embankment, in order to judge of the effect prior to the casting in hronze of the two sphinxes which the Board have decided to place on the pedestals on either side of Cleopatra's Needle. The model now exhibited is an enlarged copy of a small sphinx in stone in the collection of the Duke of Northumberland at Alnwick Castle, which is supposed to be of the same period as the obelisk itself, as it bears on its breast the cartouche of Thothmes III. Certain additions have also been made in the manner above described to the base and pedestal of the obelisk in order to hide the broken angles, and, if approved, these will eventually be executed in bronze. The works have been carried out from the design of Mr. Vulliamy, the Board's architect. The general effect is very good.

The Royal Academy.—The President and Council of the Royal Academy held a reception on Wednesday night at Burlington House. Sir Frederick Leighton received his guests at the entrance to the central hall. All the rooms of the Academy were thrown open to the guests, and the general effect was, as usual, very brilliant.

Roselands, Upper Walmer.—A convent church and choir, for the Sisters of the Visitation, are now heing built at Roselands, Upper Walmer. Messrs. Pugin, of Westminster, are the architects. The cost will be about 1,900*l*. The contractors are Messrs. W. & T. Denne, of Upper Walmer, Kent.

Removing the Gravel.—This objectionable practice continues to be pursued at the Royal Hospital, Chelsea, and bas been again brought under the notice of that parish. It was stated that the holes thus made were filled up with objectionable ruhbish. The parish surveyor, however, denied this, and the vestry resolved therefore, by a small minority, to take no action. Mr. Ash said the nuisance was not so great as it was formerly, but still it was bad enough. Some thousands of loads of gravel had been taken out of the place and sold to builders or anyhody else who liked to pay for it; a man in Symons-street had the contract to cart the gravel away, and to fill up with any rubbish he could get. Although, perhaps, it was not strictly the husiness of the Vestry, it would he interesting to know who had the money for it. We think so, too.

Caterham, Surrey.—The foundation-stone of the new Roman Catholic Church at Caterham, Surrey, was laid on the 24th ult. by Dr. Danell, the Roman Catholic Bishop of the diocese, in presence of a large gathering of his clergy and of the guests of the priest in charge of the mission, the Rev. Francis J. Roe. The buildings comprise a church, schools, and presbytery, and are in active progress, the contractor heing Mr. Wm. Carruthers, of Reigate, and the architect Mr. E. Ingress Bell.

Church of the Oratory, Brompton.—The first stone was laid a day or so ago. Some correspondents, who were present, complain of great mismanagement on the occasion, and one writes, "It was a perfect muddle."

TENDERS

For the erection of a block of private offices, at the corner of St. Peter-street, Maidstone. Mr. Edward W. Stephens, architect:—

Callund & Son, Rochester	£3,493 0 0
Reeves, Staplehurst	3,407 0 0
Simmonds, Maidstone	3,397 0 0
Clements & Wallis, Maidstone	3,396 0 0
Vaughan Bros., Maidstone	3,388 0 0
Cox Bros., Maidstone	3,313 0 0
Avard, Maidstone	3,237 0 0
Naylar, Rochester	3,147 0 0

For the erection of six cottages at Silvertown, for Messrs. John Knight & Sons. Messrs. Tunley & Boyle, architects:—

Cowland Bros.	£3,291 0 0
Outhwaite & Son	3,196 0 0
Morter	3,195 0 0
Perry & Co.	3,083 0 0
Sheffield & Prebble	2,973 0 0
Cullum	2,896 0 0
Sabey & Son (accepted)	2,888 0 0

For paving at Knightsbridge, for the Metropolitan Board of Works:—

Neal	£1,975 0 0
Cooper & Co.	1,890 0 0
Turner	1,850 0 0
Nowell & Robson	1,589 0 0
Beevors	1,549 0 0
Mowlem & Co. (accepted)	1,487 0 0
Rutty	1,399 0 0

For re-seating St. Paul's Church, Winchmore-hill, Mr. Alfred R. Pite, architect:—

Webber	£520 0 0
Smith	497 0 0
Evans	490 0 0
Staines & Son	478 0 0
Wheeler	455 0 0
Jacklin	440 0 0

For alterations, &c., at Ratland Lodge, Brixton. Messrs. Davis & Emanuel, architects:—

Maxwell, Bros., Brixton-road	£1,027 11 9
Crabb & Son, Upper Tulse-hill	997 0 0
Pack Bros., Brixton-road (accepted)	966 0 0
For Sanitary Works.	
C. & F. Mansfield, Gray's-inn-road (accepted)	£210 0 0

For rebuilding Camberwell Provident Dispensary, and works to residence belonging, Camberwell-green, for the committee of the Dispensary. Mr. William Dunk, architect. Quantities supplied:—

Hall, Beddall, & Co.	£2,312 0 0
Higgs & Hill	2,206 0 0
Downs	2,062 0 0
Ashby Bros.	1,848 0 0
King & Son	1,844 0 0
Rider & Son (accepted)	1,788 0 0

For Wesleyan Methodist Chapel and School, East Grinstead, Sussex. Mr. S. W. Haughton, architect:—

	Chapel.	School, &c.	Saving by use of Red Brick.
Beale, Battersea	£2,095 0	£540	£17 1
Morris, Ashurst Wood	1,609 0	352	60
Godley, East Grinstead	1,409 0	390	30
Etheridge, Horsham	1,695 0	combined	—
Steer, East Grinstead	1,285 0	345	30
Brown, Southborough	1,617 10	combined	20
Goad, Tonbridge	1,400 0	combined	add 30
Charlwood,* E. Grinstead	1,047 0	230	20
Watera, Forest Row	972 0	175	60

* Accepted.

For extension of premises, Goswell-road, for Messrs. Carter, Paterson, & Co. Mr. Wm. Eve, architect:—

Hubble & Trott	£1,529 0 0
Abraham	1,467 0 0
Wilson & Exton	1,356 0 0
Harris & Wardrop	1,287 0 0
Sheffield & Prebble, Rifle-street (accepted)	1,287 0 0
For Fireproof Floor.	
Homan & Rodgers (accepted)	£178 0 0

For repairs to houses, Royal Crescent and Darnley-road, Notting-hill. Mr. Wm. Eve, architect:—

Eary	£988 0 0
Heiser	924 0 0
Wilson & Exton	910 0 0
Alldred	600 0 0
Larter (accepted)	573 0 0

For erection of a house on the Hog's Back, Guildford, for Mr. George Drewitt. Mr. Chas. H. Sparkes, architect. Quantities by Mr. H. Moon:—

Stephenson	£3,423 0 0
Horn	3,388 0 0
Marten	3,294 0 0
Mitchell Bros.	3,090 0 0
Harris	2,902 0 0
Pink	2,900 0 0
Beale	2,832 0 0
Crooke	2,479 0 0

For alterations and additions to No. 10, Upper Charlton-street, Fitzroy-square, for Mr. James Houghton. Messrs. New & Son, architects. Quantities by the architects:—

Berridge & Traise	£1,899 0 0
Hook & Oldrey	1,654 0 0
Grimwood & Son	1,630 0 0
Gritten	1,620 0 0
Mark	1,590 0 0
Harris & Son	1,469 0 0
Ashford & Stevenson	1,397 0 0

For alterations to bar and fittings of the "Rock of Gibraltar," Evelyn-street, Deptford, for Mr. H. Burney. Mr. Henry Roberts, architect:—

McPherson	£785 0 0
Lewis	515 0 0
Banks, Deptford (accepted)	495 0 0

For residence on the Start's-hill Estate, Orpington, for Mr. J. L. Lovibond. Mr. G. St. Pierre Harris, architect:—

Grover	£1,285 0 0
Haisman	1,268 0 0
Taylor & Son (accepted)	1,250 0 0

For re-building the "Wheatsheaf," Kemsing, for Messrs. Fox & Sons. Mr. G. St. Pierre Harris, architect:—

Warren	£882 0 0
King	852 0 0
Wood	847 0 0
Wiltshire (withdrawn)	525 0 0

For erecting three houses and shops, in Rochester-row, Westminster. Mr. Henry Brace, architect:—

King & Son	£2,825 0 0
Keen	2,459 0 0
Hosar & Son	2,195 0 0
Watson & Dennett, Dulwich (accepted)	1,985 0 0

For the erection of Board Schools in three departments, for 637 children, at Etruria, for the Hanley School Board, Staffordshire. Mr. W. A. Keates, architect:—

Gallimore, Newcastle (accepted)	£3,945 0 0

For the erection of two semi-detached residences, in Jasper-street, Hanley, for Messrs. Malkin & Stokes. Mr. W. A. Keates, architect:—

Lawton & Macham, Silverdale (accepted)	£830 0 0

For Congregational Church, New Maldon, Surrey. Mr. W. D. Church, architect:—

Dove Bros. (accepted)	£2,400 0 0

For altering out-building into coach-house, and building new stable, at Ashstead, for Capt. W. Fitz-Henry. Mr. T. A. Smith, architect:—

Gummow (accepted)	£230 0 0

For engineers' work for new wing, Royal Hospital for Incurables, West-hill, Putney. Messrs. Searle, Son, & Hayes, architects:—

Steam Boilers and Hot-Water Supply.	
Waller & Co.	£742 0 0
Eastons & Anderson	696 0 0
May	670 0 0
Fraser (accepted)	540 0 0
Cooking Apparatus.	
Waller	£610 0 0
Fraser	545 0 0
May (accepted)	418 0 0
Electric Bells.	
Markham	£105 19 0
Sax	56 7 0
Lewis & Sons	37 15 0
Koerber (accepted)	37 10 0

For additions to Belfort House, Upper Norwood, for Mr. S. Symons. Mr. Edward Maynard, architect:—

Hockaday	£1,150 0 0
Bowyer & Sons	798 0 0
Jenkin	674 10 0

For club-room and bar, Epsom-common. Mr. J. Hatchard Smith, architect:—

Pyke (accepted)	£690 0 0

For pair of cottages, Epsom. Mr. J. Hatchard Smith, architect:—

Pyke (accepted)	£500 0 0

For training stables and residence, Epsom. Mr. J. Hatchard Smith, architect:—

Pyke	£1,800 0 0
Jeal (accepted)	1,600 0 0

For house and offices, Epsom. Mr. J. Hatchard Smith, architect:—

Pyke	£1,125 0 0
Jeal (accepted)	1,100 0 0

For repairing and painting the Clerkenwell Parochial Schools. Mr. W. P. Griffith, architect. Quantities not supplied:—

Thompson	£350	0	0!
Stone	339	0	0
Brown	295	0	0
Haines	215	10	0
Groome	209	0	0
Minton	204	10	0
Cornwell	185	0	0
Barton (accepted)	180	0	0
Bishop & Hooper	175	0	0
Thomas	165	0	0
Parrish	150	0	0
Smythe	117	0	0!

For the erection of a farm-house at Pwllglas, in the parish of Trefeglwys, Montgomeryshire, for the trustees of the late General J. B. Woosnam. Quantities supplied. Mr. Evan Powell, architect:—

		Extra for 14-in. walls to the first floor.
George, Abbey Foregate, Shrewsbury	£899 11 0	£41 10 0
Hughes & Son, Marton Chirbury	792 14 1	44 0 0
Breeze, Llanidloes	767 0 3	29 12 0
Farmer, Wyle Cop, Shrewsbury	749 0 0	46 0 0
Edwd. Williams, Newtown	745 17 11	55 0 0
E. H. Williams, Llanbrynmair	730 0 0	20 0 0
Jarman, Llanidloes	728 10 0	—
Price & Sons, Leigh Minsterly, Salop	700 0 0	—
Evans, Caersws	673 3 9	30 0 0
Woolley, Llandinam*	630 13 8	45 0 0

* Accepted.

For additions to farm buildings, Pant Farm, in the parish of Trefeglwys, Montgomeryshire, for the trustees of the late General J. B. Woosnam. Quantities supplied. Mr. Evan Fowell, architect:—

Jarman, Llanidloes	£605 5 0
George, Abbey Foregate, Shrewsbury	507 7 0
E. Williams, Newtown	481 15 5
Hughes & Son, Marton Chirbury	451 16 6
Farmer, Wyle Cop, Shrewsbury	429 9 4
Evans, Caersws, Montgomeryshire	417 3 0
Breeze, Llanidloes	392 1 10
Price & Son, Leigh Minsterley, Salop.	374 15 0
Woolley, Llandinam	372 16 0
E. H. Williams, Llanbrynmair*	345 0 0

* Accepted.

For tanks, &c., Lincoln Main Sewerage Works. Contract No. 6. Mr. James Mansergh, engineer of the works. Mr. John James Henderson, city surveyor:—

Binns Bros., Lincoln	£5,380 11 10
Bell, London	5,218 16 0
Hill Bros., Britton Ferry	4,920 16 6
Small & Sons, Gloucester	4,787 1 1
Hunter, Nottingham	4,719 17 0
Dawson, Bury	4,695 2 6
Kellett & Sent'ey, Lincoln	4,556 19 9
S. & W. Pattinson, Ruskington	4,523 4 10
Bell & Sons, Nottingham	4,262 13 9

For repairing, painting, &c., at the Lion Brewery, Belvedere-road, Lambeth. Mr. Francis Edwards, architect. Quantities not supplied:—

Sharpe & Mills	£3,330 0 0!
Drew & Co.	1,660 0 0
Arres	1,650 0 0
Dilloway	1,579 0 0
Perry & Co.	1,400 0 0
Sykes	1,350 0 0
Ford & Sons	994 0 0
Van Camp	992 0 0
Sawyer	989 0 0
Langmead & Way	980 0 0
Ansell (accepted)	947 0 0
Cawthorn	875 15 9
Crutchfield & McCarthy	800 0 0
Knight & Tillotson	788 0 0
Allen	604 0 0!

For restoration of Langford Church, Essex. Mr. Edwd. Browning, architect. Quantities supplied:—

Longmire & Burge, London	£2,580 0 0
Hobson, London	2,539 0 0
Halliday, Oakham	2,500 0 0
Thodsy & Son, Cambridge	2,490 0 0
Thompson, Peterborough	2,430 0 0

For alterations, repairs, and decorations, to St. Bartholomew's Church, Gray's-inn-road:—

Dixon	£547 0 0
Ansell	532 0 0
Kilby	498 0 0
Axford	495 0 0
Southcott & Co.	467 0 0
Patten	460 0 0
Langmead & Co.	441 0 0
Jeffreys	420 0 0
Harris & Co., Old-street, E.C	345 0 0

TO CORRESPONDENTS.

All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication.

We are compelled to decline pointing out books and giving addresses.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course with the authors.

NOTICE TO SUBSCRIBERS.

THE INDEX and TITLE-PAGE for Volume XXXVIII. (January to June, 1880) will be given as a Supplement with the next Number.

A COLOURED TITLE-PAGE may be had, gratis, on personal application at the Office.

CLOTH-CASES for binding the Numbers are now ready, price 2s. 6d. each; also

READING-CASES (Cloth), with Strings, to hold a Month's Numbers, price 2s. each.

THE THIRTY-EIGHTH VOLUME of "The Builder" (bound) will be ready on the 13th inst. price Twelve Shillings and Sixpence.

SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of 3s. 6d. each.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under ..... 4s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

Terms for series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR Lines (about THIRTY words) or under ..... 2s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

REPLIES TO ADVERTISEMENTS,

Addressed Box —, Office of "The Builder,"

Cannot be forwarded, but *must* in all cases be *called for*, and the Office Receipt produced.

THE CHARGE FOR A BOX IS AS UNDER:—

For "Situations Wanted" Advertisements ..... 3d. per Week.
For all other Advertisements ..... 6d. per Week.

PREPAYMENT IS ABSOLUTELY NECESSARY.

"*" Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable to the Post-office, King-street, Covent-garden, W.C. to

DOUGLAS FOURDRINIER, Publisher,
Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied *direct* from the Office to residents in any part of the United Kingdom at the rate of 19s. per annum, *prepaid*. Remittances payable as above.

The Builder.

VOL. XXXIX. No. 1963. SATURDAY, JULY 10, 1880.

CONTENTS.

The Progress of Invention.

IF it were possible to take an airy flight, such as that described by the imaginative author of the "Diable Boiteux," and to peep unseen at the silent occupations of our neighbours, we should probably be surprised at one feature of the time. We should discover, unless we are much mistaken, that a bent has been given to the energy of thought which is already producing marvellous results, — results, however, which can as yet only be compared to the upspringing of the first green blades which promise an abundant harvest hereafter. We refer to the great stimulus which has been given of late to the creative power of the inventor.

We doubt how far public opinion has yet recognised the character of the revolution in the midst of which we live. We are not speaking of political, or even of social, change. But we refer to that which is more potent in its effect than anything that legislation can produce,—the application of the forces of Nature to the service of man. The commencement of this revolution was made, as we all know, by the genius of Watt, in the invention of the steam-engine. The next powerful impulse was given by the genius of Stephenson, when he employed the steam-engine as a locomotive agent. And there are signs abroad that a third wave is on the flow, and that we are about to reap more fruit from the progress of invention than could have entered into the wildest dreams of the fathers of mechanical science. Not a month passes without some great indication of the activity of the inventive power. Not a step is made in chemical, mechanical, or physical discovery which does not open a wider vista, and a more commanding range of prospect, than could be attained at a lower elevation.

Two main obstacles tend to arrest the progress of useful discovery. One is the ignorance of the inventor of what has been done before his time. The other is the unwillingness of those who use inventions to admit that any improvement is necessary or useful, as compared with their own mode of conducting affairs. Of these the first, which has hitherto probably been the most serious, is also that which it is most easy to remove. It may be removed, to some extent, by journals such as our own. It is, at least, made to a great extent removable, by the admirable organisation of the Patent Office. As matter of economy in time, which is also economy in money, there can be no excuse for any inventor to whom London is accessible if he wastes his valuable time in the rediscovery of expedients already tried, owing to the fact that he has not paid a visit to the Patent Office, where, free of charge, he can consult the indices, and peruse the specifications, of all patented inventions bearing on his subject. And yet even at the moment at which we write we are told of a large expense to which a man of long and well-known mechanical experience is putting the War Department of a neighbouring nation, by making, on a large scale, experiments on the explosion of ordnance under water,—a point on which experiments already made on a small scale are, if correctly reported, entirely conclusive, in a negative sense.

Impatience, characteristic as it is of the peculiar idiosyncracy of the inventor, leads only to loss of time. True, this is loss of productive power; but nature is full of cases of the loss of productive power. It is a law of organic life that production is enormously in excess of what might be thought necessary to maintain a given level of numbers. The impatience of the inventor is a shadow cast by his genius, and we must be content to take him as he is, and to be thankful. But it is quite another thing when the impatience is displayed, not by the inventor, but by the opponent of invention. No great invention, as far as we are aware, has ever been brought before the world without awaking a very strong resistance. And this resistance, it often proves, is made by the very men who would be, when the account was finally balanced, the most benefited by the change. A case in point is that of the opposition made by divers to the introduction of a closed and safe diving-dress, in place of the loose diving-helmet which would fill with water if the diver happened to fall. Such, again, is the opposition which has maintained the prescriptive badness and ugliness of the ordinary brick, by the violent opposition made by the brick-moulder to brick-making machinery.

The most remarkable instance of a successful opposition to a great improvement which has hitherto been stated to us is that of an eminently respectable body of men to a simple invention that would enable them to work with far more ease, and probably to obtain far more work, than at present. We refer to the method of casting types, which was perfected, we believe, by a Pole, now many years since, and which, being connected with the further introduction of what were called logotypes, or compound letters to be used in printing, has been known by the name of the logotype system. Of that system, as a whole, we have nothing to say. No doubt it is extremely ingenious; but how far that ingenuity has a commercial value nothing but actual experience can determine. It is otherwise with the plan of casting each type with a letter at each end; reversed, as at present, below, but upright at top. In fact, it is as if each type were a solid letter, passing through a rectangle of metal. The effect of this is, that when the types are set up they can at once be read, the back of the form representing exactly the impression of the face. The objection to that method is, that any one can use it. That the trained compositor could use it better than any one else, and thus could always command his proper remuneration, cannot be denied. But the possibility that women, children, or even authors themselves, should be enabled to compose type, is said so to have alarmed a body of men who may be said to guard the very springs of printed literature, that the greatest improvement in printing made since the invention of movable types has not hitherto been carried out. It is, however, only fair to add that the compositors demur to the charge that they have opposed the introduction of this great improvement. Bearing in mind that utter impracticability in matters of business which is so frequent a characteristic of the inventor, it is quite possible that the blame of failure has been unjustly thrown on them.

It is well known to many of our readers that it is to the industrial application of electricity that science is now looking for the greatest and most surprising advance. Such advance is rendered possible by the fact that we now look to electricity not as a prime motor, but as a means of communicating power. For more than a quarter of a century inventors attempted to supersede steam by electricity. It was when, accepting the steam-engine as the cheapest mode yet known for converting heat into motion, they used the motion so obtained for the production of electricity, that a new chapter in physical science was opened. Light, sound, power, are all to be produced or transmitted, with wonderful economy, by the agency of electricity. Coal is, at present, the cheapest source for the heat thus to be converted and transmitted. But if the transmitting agency be developed, as the best authorities fully anticipate will be the case, to its full extent, man will be able to make use of the wasted mechanical force of nature, the action of the tides and the rivers, as a cheaper source of heat and of motion than coal, which he has to extract from the bowels of the earth.

As a sign of that inventive activity of which we speak, it happened that a few days ago the same morning paper contained notices of two novel inventions, quite independent of one another, the practical success of either of which would open a new chapter in the mechanics of daily life. One of these was the application of electricity to agriculture; the other was the application of compressed air to locomotion. In both cases the account was wrongly headed We were told of electricity as a motive power, and of compressed air as a motive power. The term is inexact. It is a survival from the time when the labours of engineers were turned in a wrong direction. It is as convenient, and probably hereafter fully successful, means of the transmission of power, that each of these inventions has its value. The air has first to be compressed before it can yield power from its elastic recoil. The Gramme machine has to be

set in revolution by a portable steam-engine before it speeds the plough or drives the thrashing machine.

Beginning with the invention which, if fully successful, will most directly affect the comfort of the inhabitants of cities and towns, we have to refer to some experiments lately made at the Royal Arsenal, Woolwich. Colonel Beanmont, R. E., has been for four years experimenting on the use of compressed air for driving locomotives. To avoid the necessity of carrying a furnace on an engine, to obviate heat, smoke, smell, in tunnels or city streets, while at the same time exerting a power as manageable as that of the ordinary locomotive, would be, there can be no doubt, an immense gain. Not a gain, we repeat, in cost or in production of power; but a gain of extraordinary utility in its application. For the passage of a train through a tunnel to be made a means of ventilation, instead of a means of poisoning the air, is an advantage that speaks for itself. We do not ask for that transmission to be made a source of direct saving. If the additional cost incurred be not more than will counterbalance the advantage gained, we shall be more than content; we shall have made in that case a very important step in the right direction.

The mother idea of Col. Beanmont is one that commends itself to the engineer. It is an application and a considerable development of that principle which, as carried out in the compound engine, has effected so much economy in ocean steam-transport. The object of the plan is to utilise during expansion the whole force that has been stored up by the compression of a given volume of air. This is effected by allowing the compressed air to pass successively through a series of cylinders, each of a larger diameter than its predecessor. Thus, admitted under a pressure of 1,000 lb. per square inch into the first and smallest cylinder, the air, having expanded and thus done its work, passes into a second cylinder of larger volume, where it repeats the process; thence, again, it passes into a third and yet larger cylinder, from a port at the side of which, having done its last period of work, it escapes noiselessly into the atmosphere. There can be no doubt of the elegance of the scheme.

The machine resembles a large tank upon wheels, which is distinguished from the ordinary locomotive in its appearance by the absence of a funnel. The present form of the engine, however, is not that which will be adopted in future. The air is compressed by a stationary engine and machinery into the reservoir of the locomotive air-engine. In the experimental trials reported, a distance of about 700 yards was traversed, to and fro, by the engine. The work done in hauling an aggregate weight of 12 tons for a distance of three miles is said to have reduced the pressure in the air-reservoir from 1,000 lb. to 820 lb. per square inch. As neither the dimensions of the cylinders, the volume of the receiver, or the incline of the road, are mentioned in the report, we are unable to make any calculation as to the economy of the process. The engine, we are told, is arranged so as to make a run of twenty miles with a single charge of air. It ought to be said, in explanation, what is the volume of the air used, and what the weight hauled, and the gradients of the line. We are informed that a gross load of 22 tons has been hauled for eleven miles, and a gross load of 12 tons for over twenty miles, under the inspection of the Arsenal authorities. If the mileage, with a single charge of air in each case, is measured, as we conclude must be the case, to and fro on the 700 yards of rail, the rise and fall of gradient, if any, may be taken practically to balance one another. But points of this kind ought to be distinctly stated, and not left to be inferred by men competent to form a scientific opinion on the work done. We shall be glad to receive exact particulars. The deduction is stated that the engine will take 3 tons one mile with the expenditure of one cubic foot of compressed air.

To compare this with the efficiency of a steam-engine we have to remember the serious loss of power that occurs in the case of compressed air as a transmitter of energy, due to the free action of heat. When air is compressed, the temperature rises, and calorie escapes by conduction and radiation, with a speed proportioned to the difference of temperature within and without the receiver. It was this incontrollable movement of heat that formed the insuperable stumbling-block in the progress of the atmospheric railway. At the pumping-stations on the South Devon line the air-pumps became nearly red hot, and much inconvenience ensued. On the other hand, the rarefied, and consequently cooled, air within the tubes had a great capacity for heat, which accordingly rushed in through the conducting surface of the atmospheric main, and raised the tension of the air within it. Thus the engines were doing more work in squeezing out of the air heat which rushed in almost as fast as it was extracted than they did in moving the trains.

In the present case, Colonel Beaumont has been aware of the extreme cold produced by the expansion of highly-compressed air, which is so great as to condense and freeze the moisture of the atmosphere on the working parts of the engine. To counterbalance this, a small steam-generator is used, which is carried on the framing of the engine. It may, no doubt, be possible not only to counteract the mechanical ill effects of the formation of ice, but also to supply heat to the expanded air in the second and third cylinders, by the agency of steam. But this agency requires the consumption of an equivalent quantity of coal. Here is another source of expense. With a fixed condensing apparatus, and a locomotive expansive apparatus, it must prove difficult, if not impossible, to prevent a serious loss of heat; that is to say, a serious excess of cost, as compared with the duty to be obtained from a steam-engine.

We do not make these remarks with the object of throwing cold water on a very elegant invention. To work a machine by compressed air (unless the prime motor be water-power), must necessarily be more costly than to work it by steam. But the convenience attained may be well worth the cost. In the case of city tramways, and of long railway tunnels, it would be well worth the while of the engineer to double the actual expenditure of fuel, if by so doing he could do away with all the annoyance of a locomotive furnace. We see no reason whatever to doubt that this may be effected, or that Colonel Beaumont's air-engine is a step in the right direction,—a step, moreover, which we hope to see carried to full and perfect completion by the gallant inventor himself. If those persons who take an interest in the matter will bear in mind that compressed air is not a source of power, but a mode of using power produced by the steam-engine, they will avoid undue expectations, and thus avoid unnecessary disappointment.

Remarks of exactly the same nature apply to the experiments recently made at Bar-le-Duc in the application of the Gramme dynamo-electric machine to agricultural purposes. Here, again, the reporters of the experiment head their account with the words "Electricity as a motive power." Here again it is the steam-engine which does the work, although the transformation and application of the energy liberated is effected, and possibly very admirably effected, by the intervention of the ingenious Gramme machine. Looking at what can now be effected by a pair of movable steam-engines, in ploughing, thrashing, and other agricultural operations, our own expectation is that it will be found to be chiefly, if not exclusively, in those cases where water is available as a cheap motor power that such an application of the Gramme machine as that made by M. Felix at Sermaize (in the department of the Marne), will be most useful. That opinion, however, does not detract from the interest with which these and all such actual experiments should be regarded. Two Gramme machines are employed; one is driven by a steam-engine, of which it is significant to remark that the power is not mentioned in the report. The other is fixed in a very solid framework of wrought iron, in the field which has to be ploughed. The transmission of the power from one Gramme engine to the other is effected immediately by a coil of wire on wooden reels. In this case it will be seen that, economically speaking, we have to compare the cost of the removal of the steam-engine to convenient spots for agricultural work, from time to time, with that of the providing of the electric apparatus, and of the removal of the second Gramme engine from spot to spot. There will also be the loss of power due to the friction of the Gramme machines, and the loss of electricity during conduction from one to the other. These elements of cost must, we apprehend, show a sensible balance in favour of the direct application of the steam-engine.

At the same time, the elegance and convenience of the transmission of power by copper wires is so great that we look with much interest to every practical experience on the subject. What M. Felix does, at Sermaize, by a steam engine, another cultivator may do, in another district, by economising the power of a waterfall. It is to the economising of the wasted force of nature that we must look,—first, for doing the work now done by the consumption of coal at a cheaper rate,—and secondly, for producing mechanical power, light, and heat, when our present coal-mines are exhausted. This is the ultimate point which the mechanic has to bear in mind. It is towards this that our most eminent electricians tell us that we are making steady progress. Our chief hesitation as to taking them at their word arises thus. If those laws of the conduction of electricity, to which we have before now referred, as enunciated by Sir W. Thomson and Dr. Siemens, are properly stated,—how is it that some practical demonstration has not already been given to the world? The saving to be effected is so great, that, in a country like our own, capital counted in millions would be forthcoming under far less promise of profit than that offered by this utilisation of electric force. How this may be, we do not at present understand. In the meantime, we look at such experiments as those of M. Felix with even more interest than at those of Colonel Beaumont. Only let experimenters and reporters keep it quite clear in their minds that compressed air, or dynamo-electricity, are not, properly speaking, motive powers, but transmitters, and transmitters at a certain loss, of motive power produced by the action of the expansive power of heat, or the constant activity of gravitation, and they will be saved from the danger of rash expectations, and more likely to take advantage of the facilities afforded by science.

STAINED GLASS FROM A MODERN POINT OF VIEW.

IN no respect does there seem to have been more difficulty in evolving a modern art out of revived Mediævalism than in the matter of stained glass, considered in reference to the style of design and the class of subject to be illustrated in it. A great many points in Gothic architecture, in regard to details especially, but in some respects also in regard to planning and arrangement of churches, have been so much modified under the influence of modern taste as to represent more or less of a real modern development from a Mediæval point of departure. The church which, as a whole, is a mere reproduction of Mediæval architecture, is becoming less and less common, and is only rigidly adhered to by a few very conservative church-building architects. But stained-glass design, though it has advanced very considerably in regard to the feeling for harmonious colour, still retains for the most part the characteristics of a modern Mediævalism. The same kinds of ornament, the same expressionless figures, still constantly meet our view, and seem to have become the stock-in-trade of at least a majority of designers, and to be regarded as an entirely satisfactory application of the resources of the art.

What makes this conservatism in stained-glass work the more remarkable is that at a comparatively early period of the Gothic revival it was recognised by some of those who took most interest in the subject that the archaic forms of Mediæval glass were not desirable models for mere imitation, more especially in regard to the figure. This is expressed strongly and plainly in Winston's admirable book, now a classic of long standing on the subject. He not only deprecated the mere imitation of archaic figures, but he pointed out reasons for thinking that the makers of the Mediæval windows had hardly even any deliberate intention of conventionalising their figures; that they, in fact, wished to make them as naturalistic as their skill and the material allowed, and only failed in naturalism through inability to compass it. They endeavoured, also, to represent the perspective of their imitative architectural details, instead of keeping them absolutely in one plane and in geometrical elevation. It by no means follows that they were right in their theory, or rather (to put it more truly) their want of theory; their imperfect power of drawing and execution perhaps kept them in a path better suited for the conditions of the art than that which they would have followed had their hands been more free to carry out their intentions. But it is, at any rate, significant that there is no reason to

think that the special character which belongs to Mediæval glass-painting was imposed upon it by deliberate choice, or, in fact, by anything else than the limitations set by a want of skill to attain greater freedom of treatment.

But it is still more important to bear in mind that neither was stained glass in that day regarded as essentially and by preference a religious form of art, as it still for the most part is in the eyes of its modern patrons, if not of its modern practitioners. It was only a religious or ecclesiastical art in so far as the whole higher life of the day was connected with ecclesiasticism, and therefore all the arts were brought to the service of the church, as the one great outlet for anything like artistic and poetic creation. It represented the current feeling and sympathies of the day truly and without affectation. But this same form of art in our own day, in spite of efforts which have been made to throw off mere Mediæval defects of drawing, and to improve modern stained-glass design in that respect at least, is nevertheless an affectation as regards the present day, and in this respect has nothing in common with the Mediæval work upon which it professes to be based. The latter was in its day a living art representing the tastes and the artistic powers of the men of the day, just as truly as the Academy and Grosvenor exhibitions represent the taste and artistic power of to-day.

Even when Mediævalism in the strictest sense has been entirely thrown aside in modern stained glass, it has mostly been only in favour of the imitation of another bygone style,—the Cinque-cento. We have had, from the neighbourhood of South Kensington especially, specimens of glass design in which the features of Cinque-cento stained glass have been reproduced; its rawness in regard to colour, its clumsy reproduction of bad architectural detail, its rococo ornamental details. This is, in reality, a more undesirable form of imitative art than the quasi-Mediæval, as, with no more claim to originality, it has not even the merit of fine colour or of a treatment which brings out the characteristic qualities and effects of the material. Some of the work of this kind which has proceeded from quarters whence we have a kind of official right to look for artistic work, has been positively ugly as well as unsuitable, both in colour and design, and has presented no merit but that of falling in with the current taste for rather debased Classic detail, and providing windows to match.

There is one other class of stained-glass design which has considerable merit, that which may be called the modern Domestic style: a style in which simple motives in foliage design are introduced, consisting generally of sprigs of conventionalised flowers, treated often, both in design and colour, in a manner entirely suited to the material. The deficiency in most of this glass is, however, that it commonly wants distinct meaning and significance; that subjects that would be very appropriate and good as borders to some central design, become the centre and only object in the window; and, moreover, that there is a great want of variety and individuality in it; wherever we turn we see the same forms and the same colours; that it is, in fact, a recent mannerism, correct and tasteful in itself as far as it goes, but a mere mannerism, which any draughtsman can produce with little of pains or thought when once he has got the trick of it.

Now, we cannot but suggest that if stained glass be to be used at all in important situations, much more may and should be made out of it than this. We have much talk about the great importance of high-class mural painting at present, and the great work which such painting is calculated to effect in educating and improving public taste; and painters of the first rank among us have given some of their best efforts to it in a few instances, sometimes with signal success. But there seems to be no suggestion that translucent mural painting (which is what stained glass is) may be worth as much attention and as much application of the best artistic genius, as opaque mural painting. Stained glass is at present, in fact, even in its most satisfactory forms, rather an art-manufacture than an art.

Does stained glass, then, admit of the treatment of all the subjects which could be treated in mural painting, and under the same conditions? Certainly not. It is useful, perhaps, to look back at what has been done during the real lifetime of the art in the past, and see if we can gather from that any decided conclusions as to what can and what cannot be effectively attempted in the future. In regard to what cannot be done with effect, the point most plain to every one of critical perception is that landscapes and perspective grouping are entirely out of place. The former no one in his senses attempts now; but in regard to the latter it is necessary to reiterate the caution, for in many quarters there is a persistence in the adoption of perspective treatment, interiors with "vanishing points" and many figures on different planes of distance are still frequently to be met with, and all alike tend to prove that such a treatment is an utter mistake. A mural painting, though not admitting, in its most satisfactory modes of execution, of the illusory perspective and gradations of tone of a cabinet painting, nevertheless admits pictorial illusion to a certain extent, both in perspective and in gradation of distance, especially if its architectural framework be so designed as to give sufficient solidity to the architecture enclosing the space painted on, without absolutely demanding that the appearance of a flat wall should be retained in the painting. But a design which is lighted by transmitted light is (to repeat a commonplace for the hundredth time) essentially deharred from perspective or pictorial treatment by this one fact, even apart from other difficulties which are involved in the mechanism of the process, such as the impossibility of real gradation of tone, and in the necessity (in the only good and durable method) of strong lines of construction showing all over the picture.

Shutting out this kind of treatment, then, from among the possibilities of stained glass, we find in the art of the past in this material several different elements of design. We have figure-subjects in flat treatment, either in single figures or in groups, most often the former, as single figures are always more easily and suitably treated under such circumstances. We have ornamental diaper design founded either on geometrical or on floral types, and we have mimic architectural design serving usually as a framework to figures, and seldom used without them. This latter form of decorative adjunct has been a great favourite with modern stained-glass designers, as it was with Mediæval designers, during the latter period especially of Mediæval art. Perhaps it is not too uncharitable to suggest that in both cases the motive for favouring this style of treatment was the same,—in part, at any rate: it saves a great deal of trouble in design. The architectural features are, so far as the glass-designer is concerned, ready made to his hand, and their reproduction in the glass is a mere matter of drawing and arrangement, involving little or no thought. In addition to this, there may seem to be a suitability in repeating in the window design, in little, some of the architectural details of the building, so as to produce a consistent whole, the smaller decorative details repeating some of the character and design of the larger ones and of the whole building. And it is unnecessary to remark that this kind of repetition in little has been the basis of a great deal of architectural ornamentation in many styles and in many periods, and there is a good deal to be said in favour of it. But we do not think that the realistic imitation of architectural details in the window design is to be approved. If the influence of architectural detail shows itself in the window, it should not be in this way, but in a highly-conventionalised design which might appear as obviously suggested by, and in turn suggesting, architectural detail, but as completely modified to suit the conditions and requirements of glass. To do this well requires thought and consideration, and therefore it is not likely to be so popular a method; but it is the true one, and has the advantage, as it has not yet been much attempted, of affording a field for some novelty and invention in regard to detail.

In regard to diaper ornament, there is a wide field for invention. Hitherto our glass-designers have been just running in a groove, or, perhaps, in two grooves; but usually in one or the other, either that of conventional Mediæval foliage, or that of conventional modern foliage. Both employ very few types, and these are very artificially repeated. The Mediæval types may be summed up into the peculiar and admirable conventional scroll foliage which the earlier Mediæval designers invented (than which nothing, of course, could be better in its way), and the more naturalistic treatment of ivy, oak, or maple leaves. Modern conventional foliage has sought some new types, but they are still not very various, and the designs produced seem to us to have on the whole a remarkable degree of family likeness. Considering the endless variety of nature, it certainly cannot be said that we are quite at the end of our tether yet, and would seem that a study of floral designs from nature, appropriately conventionalised, ought to furnish work for new designs for a long time to come. We need, however, except in the case of a very small piece of work, something more as a central motive of interest than a mere diaper, however successful. To make the foliage grow out of a conventional vase, we may respectfully hint, is not quite sufficient. On the contrary, it is a piece of false artificialism, adverse to the true spirit of high-class ornament, which should be based either on abstract proportion or on forms of nature conventionalised according to natural principles; not upon any imitation of artificial objects, which is always a sign of weakness, and a source of vulgarity of effect. Heraldry is rather at a discount now, otherwise it affords a very good and legitimate means of giving some meaning and interest to a window, without which a mere diaper is no more than a successful wall-paper pattern shown in more brilliant colouring than is possible on an opaque wall. The introduction of scrolls with inscriptions is a means of imparting a meaning to a window which may be varied in relation to the various destinations of the window designed, and which, in combination with foliage diaper, may be elaborated into something very satisfactory to the eye and suggestive to the mind. But it may be suggested that one of the best ways of giving specialty of interest to a stained glass design is in the introduction of either ideal or portrait heads. This source of interest has not been enough drawn upon. Whatever difficulties stained glass imposes upon figure design, the portrayal of character in large-sized heads is possible in it with great effect, provided that the treatment is of that broad, decided style in which a few lines give the likeness and the expression, omitting details of modelling such as cannot be expressed on glass. Tennyson gives us a hint in the decorations of his "Palace of Art,"—

> "And from the topmost oriel's colour'd flame,
> Two god-like faces gazed below,—
> Plato the wise, and large-brow'd Verulam,
> The first of those who know."

But we opine that the treatment of portraiture of a less ideal kind may be successfully achieved in stained glass. And the introduction of even a single medallion of this kind in a large light is sufficient to give it an interest and a meaning; the spectator will be content with a large expanse of good diaper work, provided it lead up to something ("and so grow to a point"), but he will hardly be content for very long with diaper and nothing else,—*toujours perdrix*.

We passed over the question of merely formal diaper design, produced by the interlacing of various shapes with no assistance from floral types; but it may be observed that here, too, we are travelling round in a beaten track. The designs that are made for merely ornamental quarries and interlacing diapers are mostly only repetitions of Mediæval types. These types themselves might be varied and improved upon more than they are; and the rich and endlessly-varied combinations suggested by the Saracenic type of ornament alone have hardly been touched upon. Another suggestion that might have been made, when speaking of floral types of design, is that in designing windows for a Renaissance building there is scope for the treatment of some of the types of conventional foliage which are peculiar to Roman and Renaissance ornament, in such a manner as to convey the same general effect which belongs to such ornament, while employing in detail natural leaves and flowers—an experiment which has hardly ever, as far as we are aware, been made.

In regard to the highest class of art, figure design, what are we to say as to the capacities of stained glass? We are disposed to urge that the art is very well adapted for the display of figure design, single figures especially (better than groups), on a tolerably large scale and with a sufficiently severe and what may be called in a sense sculpturesque kind of treatment. Figures on a small scale are seldom successful in regard to the heads: the detail of the expressions is almost necessarily missed, on a small scale, in so inflexible a mode of execution, and even the limbs (if shown) are apt in such a case, with whatever care, to appear coarse in execution, and overweighted by

the heavy lines of the leading. These latter, on the contrary, have no ill effect on the figure when on a larger scale; and even subjects which include the whole figure may be represented, we believe, with good effect in stained glass, provided the design is treated with that degree of conventionalism which prevents the spectator from feeling the want of realistic tone and tinting, which would be hardly possible. It may be thought that to use the whole figure in stained glass would be to throw away too much what is one of the chief capabilities of the art,—that of brilliant colour effect; but we do not always require highly or richly-coloured windows; and if the plain surface occupied by the figure be sufficiently relieved by the juxtaposition of diaper and other decorative surfaces or adjuncts, not in so heavy a key as to contrast harshly with the figure, the requirement of colour and richness would be sufficiently fulfilled. The attempt would, at any rate, be an important step towards breaking through the merely ecclesiastical idea about stained-glass figure-subjects.

We do not, as we said, always want richly-coloured subjects, and, in fact, the effect of heavily-toned stained glass in lessening the scale of an interior is a point as often overlooked as it has been often referred to and commented on. The key of the interior in regard to tone (if decorated), the scale of it, and other conditions (as to access of light, for instance), should determine the key of the stained-glass design, which may sometimes necessarily have to be rich and heavy, in order to make itself properly felt, and to aid in producing the total effect required; but which very often operates injuriously by being over rich and strong in colour. Primary colours, it can hardly be too often urged, should seldom or never be used in large masses,—rather in brilliant points. But whatever reticence may be judicious in regard to colour in many instances, it may be said that in regard to ornamental and diaper design hardly any degree of elaboration, if carried out in good taste, can be too great for the situation. Whether high or low in scale of colour, a stained-glass window is essentially decorative art, and the more decorative, we might say, even (under certain restrictions as to colour and keeping), the more sumptuous it is, the better it fulfils its purpose as a part of the whole.

EXPLORATION IN ASIA MINOR.

MAGNESIA AND THE TEMPLE OF ATHENE-POLIAS AT PRIENE.

HALFWAY on the dusty, burning road that Cicero described 1,800 years ago, and which leads from the antique Tralles, the modern Aïdin, of which M. Rayet has told us so much,* and the squalid village of Aya-Sonlouk, which has replaced the once opulent city of Ephesus, lie, at the eastern foot of the Kemer-Dagh (the classic Mount Thorax), a heap of ruins marking the site of Magnesia of the Mæander. Surrounded though it is by the marshes of the river, the district is one of the most fertile and actively commercial of the vilayet of Aïdin, the neighbouring plantations of Deirmand-Jik producing the finest figs of the whole province. In antiquity this plain, even more productive, was the source of immense activity, all the busy commerce plied between Ephesus and Miletus on the coast and inland converging by the high road at a point where in the past existed a great city, now marked alone by a mass of scattered ruins which lie near the hamlet of Tekke. Various have been the theories as to the identity of these remains. Hamilton was the first, so M. Rayet tells us, to suggest that this was the site of the city of Magnesia, a view adopted also by Leak and Rennel in their works on Asia Minor.

The ruins of Tekke are not, however, those of the first city, which was built in the plain, and which bore the name of Magnesia. The older city was abandoned as incapable of being defended, in the middle of the fourth century before our era, and the inhabitants moved to the spot where now lie the chief mass of the ruins. Long used as a convenient quarry of ready-made building materials, centuries of pillage still leave these ruins of more than usual interest. Although in part described by most of the travellers to this portion of Asia Minor, the first trustworthy information is to be gathered from the drawings and notes of the French architect, Huyot, who visited Magnesia as far back as 1820, accompanied (a point of special interest to our readers) by two enthusiastic young students, M. Drenx and a veteran past-President of the Institute of British Architects, Professor (then Mr.) Donaldson.

The drawings and notes then made were purchased in 1841 by the French Government, and they now repose in the MS. department of the National Library. They comprise a plan of Magnesia, together with others of the stadium, the theatre, the gymnasium, the thermæ, and, finally, a panoramic view of the widely-scattered ruins,—an interesting drawing, which is reproduced in the atlas that accompanies the second part of the work of MM. Rayet & Thomas.

More important explorations were undertaken in 1842 by M. Texier, with the help of the French Government. Fever, however, was added to the many other difficulties, and little work was sent home; but M. Texier has described the expedition in his work on Asia Minor. It is only to be regretted that the plans and drawings of M. Clerget, an architect who accompanied the expedition (and who fell a victim to the fever), were not published. As a more recent authority, we have M. Tremaux's work on an archæological exploration in Asia Minor, published in 1874.

Scattered among the reeds that cover the site of Magnesia may be seen a number of dislocated blocks, which doubtless show the line of the city walls. The space which this line confines is considerable,—some 1,200 yards from east to west, some 900 yards from south to north,—a space which, even at the height of the prosperity of the town, it can scarcely be believed can have been entirely covered with houses and public buildings. On the heights few remains have been found; but on the slopes the relics unearthed point to the existence of a large population; the ruins of the principal monuments all lie in the lowest portion.

The most important and most imposing of these is a large rectangular enclosure, some 200 yards long and about 150 yards broad. The walls remain, and show several of the secrets of their construction; the whole interior can be seen. M. Clerget, it would appear, prepared a number of plans for their restoration, and among the illustrations of M. Rayet's work we are promised the reproduction of some of the more important of these. It would appear also that this enclosure is no less than the sanctuary consecrated to the great divinity of Magnesia,—to Artemis Leukophrunê, one of the variations of the lunary, and, at the same time, a prolific goddess, who occupies the most important place in the religion of Caria, and of which the Artemis of Thebes is the best known type. A number of coins are reproduced by M. Rayet in support of this theory.

Among the other remains of the town of Magnesia few have escaped the reckless hand of man. Huyot, in 1820, observed more than one ruin of which no trace now exists,—notably the conjectured *agora*, of which now not a vestige remains. Near the *odeon*, to the south of the *agora*, was the theatre, of which Huyot gives us an interesting view; other ruins that may be those of the thermæ, and, not far distant, probably those of the *stadium*, and near these the presumed gymnasium, are all that speak of the past magnificence of Magnesia. The texts of the ancient authors point to the existence of numerous other monuments in the past: the Temple of Athene, the important tomb of Dionysius, the Temple of Zeus Sosipolis, with many others.

As for the history of Magnesia, those who may be interested in learning the story of the rise, the development, the golden days, and the decadence of this once important city, will find it ably told at length by M. Rayet in the several chapters which close the second number of his work. Bulky notes refer the reader to the authorities quoted, while a number of interesting and beautiful coins figure as further original documents of reference and corroboration. In these chapters we can trace the whole history of Magnesia, from its Greek origin to its subjugation by the Persians (Themistocles governed Magnesia for many years under the Persian rule, and it is almost certain that the so sadly ill-treated general died in the city), through the period of its existence under the Macedonians. Already in the third century before Christ it would appear by Polybius that fige formed the staple of commerce, as Zeuxis, the general of Antiochus, we learn, was victualled by the Magnesiates with "dried figs"—down to the day when, in the second century (109 B.C.), Magnesia saw under its walls the oaques and bucklers of a Roman army under the command of Manlius Vulso. The last information to be gathered of Magnesia must be sought by the aid of the numismatist; and the documents which the coins of Magnesia supply are numerous. The activity of its mint shows, indeed, how long the town continued to be wealthy and prosperous. At the commencement of the Byzantine empire it still existed as the seat of a bishopric. The decadence began when the disastrous wars waged with the Greek empire, in the first place by the Persians, then by the Arabs, and finally by the Turks, obliged the inhabitants to withdraw to a stronger fortress. Magnesia, difficult of defence, was entirely abandoned, as in its ruins not a vestige has been found belonging to the Middle Ages.

The illustrations that accompany the second part of M. Rayet's work are no less interesting than those which show us the antique city of Tralles. To Magnesia is devoted a fac-simile of M. Huyot's sketch of the ruins, taken in 1820, together with a number of beautiful photo-gravures of the bas-reliefs from the Temple of Artemis, and a view of the existing state of the site.

The third part of the work of MM. Rayet and Thomas, and which has only very recently made its appearance, deals with the description of the explorations of Priene, being almost entirely devoted to the Temple of Athene Polias. Priene, which lies on the northern shore of the Gulf of Latmos, is now marked by a village situated far inland, the hamlet of Samsoun. Priene has been visited and explored more than once. In the last century Chandler and Revett, who had been sent to Asia Minor in 1765, by the Dilettanti Society, visited Priene, of which they have left an interesting account and a view, with details, in the first volume of the "Ionian Antiquities." As for the somewhat more recent explorations of Mr. Pullan (of Halicarnassus memory), they are familiar to the profession.

Almost in the centre of the site of the antique city rises, amidst the scattered ruins, an eminence of elliptical form. To the north and east the approach is gentle; to the west and south it is abrupt; at its feet lie the *agora* and the *stadium*. It was this eminence, visible from a great distance, that became the site of the sanctuary of the protecting goddess chosen by the Prienians, the blue-eyed Athene Polias. Chandler and Revett, who first explored the temple, have left us a view, and some important architectural details; but it was not until a century later (at the end of 1868) when the same Dilettanti Society sent out Mr. Pullan that the temple received the careful attention which its artistic beauty merited. It will be probably remembered by many of our readers how easy the first operations were; the earth covering the ruins being rapidly removed, before the end of the same winter the ruins were cleared. The bas-reliefs and architectural details discovered by Mr. Pullan having been presented by the Dilettanti Society to the British Museum, the indefatigable Mr. Newton visited Priene, in company with Mr. Murray, in order to make his choice of and attend to the transport of the precious relics. The specimens he sent home are familiar to us all.

Unfortunately, as M. Thomas points out, the explorations of Mr. Pullan only hastened, after his departure, the destruction of the interesting monument. Priene, like Magnesia, became an excellent quarry of ready-made material, and M. Thomas, in speaking of the ruin worked by the worthy natives of the neighbouring village of Kelehech, refers to an anecdote of Mr. Oakley Clarke finding in 1870, at the foot of the wilfully-broken pedestal of Minerva herself, a beautiful coin, a tetradrachm of Orophernes II., king of Cappadocia.* The news of this "find" spreading, unfortunately increased the destructive zeal of the inhabitants, though several other coins were brought to light.

In spite of these successive and destructive onsets, Priene still presented in 1873 remains of great interest. While the explorations at Miletus were being continued, M. Thomas paid a first visit to Priene, and in the following year our two

* See *Builder*, p. 3, *ante*. "Milet et le Golfe Latmique: Tralles, Magnesie, Priène, etc." Par Olivier Rayet et Albert Thomas. Parts II. and III. Paris: J. Baudry. 4to. 1880.

* To Mr. Clarke, mentioned at this point by Rayet, a heart-felt tribute of gratitude is expressed for his kindness in rendering him and his companions not alone his friendly assistance, but the deeper obligation of kind attendance during a severe fever.

anthors were able, in company with Mr. Newton, to study in detail at the Britisb Mneeum all the fragments carried to our ehoree. It is by this meane that have been gathered the documents and authorities by the aid of whicb have been executed ths rostorations of MM. Rayet and Thomas. In a series of sub-divisione the various portione of the temple are considered.

It is to about the year 312 or eo before our era that can be attributed the dedication of the temple. Long before 334 the plans of the edifice muet have heen eettled and the erection commenced. The Greeke, M. Rayet at this point remarke, never urged, as far ae have done the moderne, the eearch after originality. Art with them never strayed into bye-paths, but followed a perfectly regular marcb. This was especially the case with architecture, submitted by its very nature to positive neceeeitiee and to mathematical rules*. The architect of the temple was Pythios, mentioned by Vitruviue. Pythioe, we learn from varioue sources, gained from the erection of this temple a great celebrity. We know also that, ae ws find in the caee of many other Greek architects, be had ehown in his Commentaries the merits of his work. In thie work he euetained a singularly ambitious theory on the extent of the learning necessary to the architect; he further declared open war against the Doric order, the proportione of which were, he asserted, faulty and ungainly. Putting into practice his theoriee on the universality of the learning neceeeary in hie profession, Pythios was not alone an architect and a writer; if we are to believe Pliny, he wae also a eculptor, and it was he who executed the colossal chariot in marble placed at ths summit of the pyramid of the Mausoleum, and of which the statnes of Mausolue and Artemieia remain almost intact. Thie union of the talents of eculptor and arcbitect, remarke M. Rayet, was not rare in antiquity, for, at the eame epoch, Scopas offers no another example.

To attempt to summariee the description of the temple which M. Rayet'e colleague, M. Thomae, has so learnedly and technically entered into, ie beyond the limite of our epace. Those who may he interested in further research into the subject will find in thie third part of the work of MM. Rayet and Thomae a number of well-classified and illustrated details. Of the various parte of the temple of Athene Polias; the *temenos* paved with marble slahs, the rectangnlar flat form on which rises the edifice; the *secos* divided into its three portions, the *pronaos*, the *naos*, and the *opisthodomos*; of the many columne of which the hasee remain, only one capital exiete, and that is mutilated; another, it will be remembered, ie now in the British Museum. In describing the walls of the *secos*, M. Thomae speaks of the perfection of their workmanship, which is carried, he etates, as far as in any of the monuments of Athene. The stonee do not adhere to each other on their whole breadth; but only on a hed of ahont 4 in. all round the ontside, the central portion heing hollowed and ronghed. By this means joints which are almoet invisible were ohtained, at the eame time that the surface in contact was sufficient for solidity, this heing further menred hy a double eystem of metal fixinge hinding the blocks together, horizontally and vertically.

A ehort notice ie devoted to the fragments of eculpture discovered in the ruine; thoee helonging to the colosea etatne of Athene fonnd by Mr. Pullan were cent home to the British Mneenm, and other sculpturee were found, hnt it ie not certain from what part of the edifice they come.

To the polychromatic decoration of the temple M. Thomas devotes also aome attention, for, as he states, no one can now deny that colonr played a great part in the decoration of the Greek temples, though perhaps the general tendency hae heen to somewhat exaggerate thie part. The ruins of Priene offer to the student of classic polychomy several pointe of interest; on several architectural membere have heen found coats of perfectly preserved colonr, which appear in all their hrilliancy when ecraped. Three facte may he deduced from the researches, firstly, that thoee portions where no trace of colonr hae heen found were never painted; secondly, that the colour wae only applied on the gronnd and hollows of the monldinge, the eculptured portions, and the caissone; thirdly, that two coloure only were employed, a dark red (cinnahar) and a light hlne (silicate of copper), the eame colonr need in the decoration of the Propylæa at Athens.*

A eerice of carefnlly-drawn details, beantiful in their exactnee, together with several plates of learned restorations hy M. Thomas, illustrate the number of the work devoted to the Priene explorations. One plate gives coloured details of the capital and hase of the columns of the *pronaos*; the other platee, that form the "atlae" of the second and third numbere, illustrate the explorations at Miletne and Didymus, of which, however, the accompanying text hae not yet appeared.

In England, the portion that deals with the Priene ruine will he read, perhape, with the moet general interest, as we have in our British Mneeum eo many preciove remaine of thie intereeting Temple of Athene Polias, so beantiful a model of Ionio architecture fonnd in Ionia itself. The hook of MM. Thomse and Rayet will form an almoet complete guide to the possessions from thie country and this epoch contained in the European collections, a work only the more welcome and the more valuahle to archæologists and artists as the explorations of Mr. Pullan had remained so far nnpnblished.

* M. Rayet further classes the successive evolutions of Ionic architecture in Asia Minor from 360 B.C. to abont 200 in the following order:—First, the Temple of Priene, and the mausoleum of Halicarnassus; second, the Temple of Ephesus; third, the Temple of Didymes; and lastly the Temple of Magnesia.

* A cake of this colour was found in the necropolis of Camiros, and is now in the British Museum. Later on the colour was made in large quantities at Alexandria; and finally, in the first century B.C. at Pozzuoli, Vitruvius has described its preparation (vii. 11).

THE TAY BRIDGE REPORT.

A FULL, clear, and definite report has been presented to the President of the Board of Trade by Colonel Yolland, R.E., and Mr. W. H. Barlow, C.E., on ths canees of the destruction of the Tay Bridge. When we consider the numerous instanoee,—not to say of the miecarriage of justice,—but of tho mode in which legal technicalities have of late been fonnd to he so involved as to set in one place judge against judge, and in other cases judicial decieione against pnblic policy, or even against common eenee, it is with some satisfaction that we call attention to a case in which a definite ontcome has resulted from an inquiry into engineering facts. Nor is our eatisfaction any the less, hecanse the reporters have taken precisely the view that we indicated in tbeee colnmne on the first occurrence of the catastrophe. "With iron work and bracing of snfficient strength in all their parts, held down hy strong holte hedded deep in the eolid mass of the piere," eay the reporters, "there is no donht that the caieeons are wide enough to permit of piles heing constructed adequate to perform all the duty required." The evidence of a competent witness ie cited a little further on to the effect "that if the columne had heen etrongly hraced, etrongly fitted, and strongly held down hy holding-down bolte, tbe piere would have been standing now."

There ie one, and we think but one, feature in the report which we hold to he liahle to ohjection, or, at all evente, to question. That ie, that either of the engineers who were conenlted ae to the design of the hridge ehould have heen asked to act, and should have acted, ae reporter. Thie is against the general rule in snch cases, and might have jnstified a challenge of the arhitrator (for such he virtnally wae) on the part of the engineer of the Tay Bridge, aseuming that Mr. W. H. Barlow, F.R.S., ie tho Mr. Barlow epoken of in hoth cases. Bnt while we hold that there ie a certain weight in this objection, we do not see that any great practical difference can have reenlted from the nomination of a man of the deservedly high reputation of Mr. Barlow. At all events, there hae heen no hlinking of the fact. The report ie qnite candid on the enbject. But it puts the reporters on their own defence, which is, we think, eomewhat to he regretted.

Mr. Barlow and Dr. Pole, being asked to carry ont the investigation of the atmoepheric or etorm pressnre against which it was necessary to provide in the case of the Tay and Forth Bridges, consulted the Astronomer-Royal. Sir G. Airey replied that "We know that in very limited surfaces, and for very limited timee, the pressure of the wind doee amonnt sometimes to 40 lh. per square foot; or, in Scotland, prohahly to more." This ie the positive evidence, farnished hy an experienced physicist; and was the hasis on which calculation ehould have heen made. Sir G. Airey goee on to eay that positive knowledge, as far as he is aware, goee no further, hnt that these high pressures are momentary, and, he adde, "I think we may say that the greatest wind-pressure to which a plain surface like that of the bridge [the Forth Bridge] will he subjected in its whole extent ie 10 lh. per eqnare foot." Thie, it mnet he noted, ie given ae opinion only, while the pressure of 40 lh. or more ie given as matter of fact. In thie opinion, even after what has occnrred, we are not wholly dispoeed to disagree with Sir G. Airey. At the same time, the expression nsed ie one very liahle to mielead, and which, in point of fact, has, we think, misled thoee concerned. No engineering or architectural calculation depends on the estimate of what would he the greatest wind-pressnre, at one time, over tbe whole extent of the bridge. The information reqnired for structural purposes was,—what ie the greatest pressure which, at any moment, can come on a single bay? No matter how momentary the preeenre, that ie the maximum that we eeek to know. And, if there is no evidence ae to how limited the area of highest pressure for the moment is, no one would be eafe in taking any diminution of that pressure over the whole surface of one bay, in calculating that against which the engineer was honnd to provide. Thns, ae far as the weight of the advice of the Astronomer Royal goee, no engineer, we think, would have been justified in disregarding the probability that a eide pressnre of more than 40 lh per foot might come on any single bay of the bridge. But Messrs. Barlow and Pole reported upon tbis,—"We may, therefore, safely adopt 10 lh. per sqnare foot ae side pressnre." That ie qnite another matter. We think that on one side the Astronomer Royal, and on the other band Sir Thomas Bonch msy justly demur here. We do not understand the former to havs given an engineering opinion as to the proper atrength of the hridge, though he gave data hy which a cautious engineer would, we take it, have been induced to allow at least 50 lh. per foot of reeisting power. Had that been done, as far as the evidence on the trial goee, the bridge would have been now standing. Bnt the report of Messrs. Barlow & Pole converted tbis maximnm pressnre of more than 40 lh., and this general pressnre of 10 lh. over the whole extent of the hridge, into an allowance of 16 lh. per eqnare foot *over the bay*. Sir J. Hawkshaw, Mr. Bidder, Mr. T. Harrieon, and Mr. Barlow signed the report adopting these conclnsions. That the conclusions were wrong let the facte tell. That they were not the true ontcome of the facts stated by the Astronomer-Royal, we think is indieputable. It ie an instance of the disadvantage of forming an opinion ae to phyeical facta npon evidence collected for other purposes, and in other hranches of inquiry. If the eminent engineers whose names are attached to the report had collected their own facts, it cannot he for a moment supposed that they would have thonght 16 lh. per foot a proper allowance for storm-pressnre. If Sir G. Airey had had to build the hridge, it ie pretty certain that he would not have heen satisfied with snch a margin. But as far as Sir Thomas Bouch is concerned, he hae a very strong case for insisting that an allowance of 16 lb. per foot was that considered adequate hy four of the first engineers of the day. The partial embarrasement of the reporters ie to be read in the paragraph,—"It mnst not he understood, however, that we express an opinion aa to the sufficiency of a provision for only 10 lb. of wind-pressure in a large span of 1,600 ft. ... Two or more gnsts might act simnltaneonsly on eo large a span, or there might he a wind-gust of nnusual width." No doubt; and no doubt that not only this might have heen, hnt was, the case. The point which, in common justice to a gentleman who hae quite enough reeponeihility on his shoulders, as it ie, to demand the moet fair and liheral allowance on the part of his jndges, is this. Ieit fair or jnst to eay in one hreath,—"We may, therefore, eafely adopt 10 lb. per foot ae the eide pressure," and to add, "We think Sir T. Bonch mnet bave misunderstood the nature of that report, for, as it pointed ont that the pressure of gnste of wind amonnted to 40 lh. or more, it was ohviously necessary to provide for the pressure eo arising *in each of the spans of the Tay Bridge*"? That all along has been our contention. We hold that it is indieputable. It hae heen confirmed hy the terrible logic of facts. But it ie rather late in the day for a reporter who wrote, "allowing, therefore, 16 lh. per square foot," now to say that that allowance ought to have heen trehled,—that is, to say so after the fall of the bridge.

We, therefore, feel that Sir Thomas Bouch has a fair claim,—if it he the case that he provided for 10 lb. or for 16 lb. pressure on his girders,—to share that responsibility with Messrs. Hawkshaw, Bidder, Harrison, and Barlow; and we feel confident that most impartial persons will admit the force of this plea in mitigation.

Passing over this difficulty,—which ought to have been avoided,—we come to the conclusions of the reporters. These are,—(1) That there is no evidence of any movement of the foundations of the bridge; (2, 3) that the iron used was of fair, though not of the best, quality; (4) that the girders were of sufficient strength; (5) that the piers, though adequate to support the vertical weight, were not sufficiently substantial or sufficiently braced, their great height being borne in mind; and (6) that their workmanship and fittings were inferior; (7—11) that the inspection of the bridge was not what it should have been, and that the speed allowed over it was too great; (12) "that the fall of the bridge was occasioned by the insufficiency of the iron bracings and fastenings to sustain the force of the gale on the night of December 28, 1879, and that the bridge had been previously strained by other gales"; (13, 14, 15) that the first set of continuous girders, covering four spans, were the first that fell, after the engine and train had passed over the fourth pier.

The reporters agree with us in the view that the evidence does not support the hypothesis that the carriages left the rails, and struck the girders, thus causing the fracture. They conclude with a paragraph which is of great importance, both as illustrating what we have before urged as to the comparative ease with which an event can be predicted, —after it has happened,—and as embodying the one practical outcome of a very extended inquiry.

"In conclusion, we have to state that there is no requirement issued by the Board of Trade respecting wind-pressure, and there does not appear to be any understood rule in the engineering profession regarding wind-pressure in railway structures, and we therefore recommend that the Board of Trade should take such steps as may be necessary for the establishment of rules for that purpose."

Unfettered by any antecedent expression of opinion, Mr. Rothery has spoken more decidedly as to the defects in the design and construction of the bridge. We wish that we could find more room for modifying his conclusions than we have above indicated. His reference to the allowance of 55 lb. in France, and of 50 lb. in the United States, for wind-pressure is most striking. His remarks as to the *quasi* responsibility of the Board of Trade are very just, and we cannot but assent to his opinion that it is rather for the Royal and civil engineers of Great Britain to investigate the important question of the pressure of the wind, and to frame rules for providing to resist it, than it is for them to pray to Hercules in the sanctuary of the Board of Trade.

ETRUSCAN-GREEK VASES AND THEIR TEACHINGS.

IT would be very difficult to find a subject of more or higher art interest (educationally) than that of the rise and fall of so famous and individualised a country and race of men as ancient Greece and the Greeks, from their first beginnings to their ultimate decline and all but extinction as a separate nation. Looking at the Greek and his doings when in his prime, and when he filled so finely-marked and conspicuous a place in the history of the world, it would seem hardly to be within the bounds of possibility that he should ever disappear and cease to be, or that what he did in the world of fine art could come to an end, or in any way die out and be no longer produced. But so it has been. Much has been thought and written on this fine theme, but the subject will admit of much more, for there are aspects of it but hitherto little more than glanced at, and it is to one or two of these that we would now call a moment's attention, as there would seem to be a chance of our seeing in both our national museums—the British Museum and the South Kensington Museum—much larger spaces devoted to the exhibition of what remains to the world, after so many ages of neglect and forgetfulness, and the loss of so much of the past art of it—of its architecture, and sculpture, and drawings, and through them of its antique methods of work.

Pending these further opportunities of increased insight into a matter so far from the present of things, we may make a note or two on the singular fact in the days that are gone by always to be found in the old art of the world,—birth, growth, however gradual, and final extinction and death. In the Greek work of which we are now speaking there was no copying of previous forms. All would seem to have been a gradual, though slow growth from the archaic to the more perfect and advanced and matured art, and then a gradual,—however slow,—decline, quite as marked and singular as its rise. In a well-arranged and carefully-selected series of illustrative fragments of Greek architecture and sculpture, this would, we cannot but think, become sufficiently manifest, and we should see within moderate compass how this all but perfect art of the Greek began, grew up to maturity, and then died out. Indeed, as it is, we may see this, though imperfectly, in the fragments, as they now are, in the British Museum, but even, as we think, more perfectly and emphatically in the Vase-room, where can be seen a series of Greek art works from the earliest and most archaic, down to the decline, if not final extinction, of the handiwork and thought of the Greek artist and Greek workman. It would be difficult to find a better illustration of the art of the Greek, or of his mode of work in the realisation of his thoughts as an artist. It is, indeed, a magnificent collection, and its increase in the future is to be desired.

In this Greek or Etruscan room may be found an instructive series of art thoughts and works of the Grecian mind and hand,—of works thoroughly indicative of the tone and special character of the Greek as an artist and art-workman. And we would almost urge the study of them before that of the work in the more solid and enduring marble. The Greek fictile art, as it is termed, has been broadly divided into three distinct and broadly-marked "periods," quite distinct from each other, though, as we have said, no hard line can be traced between them, each distinct phase of the one running insensibly into the other. It is a progress from first to last, and a growth, and then a decline, as in the artistic powers of any single individual artist. In these Greek, or as they are more popularly termed, Etruscan vases and amphoræ, this will be seen at all but a glance, and, what is perhaps as instructive, we may see depicted on them the forms and faces, and all but "manner" of the race of men who produced them, and afterwards made use of them. They were, it is to be noted, not made for mere show, and as objects of ornament, and to be looked at merely, but as objects of practical utility and daily use. And thus it is that they are of so infinite a service, educationally, as showing that the mere utility and common daily use of an object did not blunt, in the Greek mind, the necessity and feeling for the impress of beauty on it, and at times even more than this. A Greek school of art is, indeed, here.

We forbear to catalogue the several names by which these so admirably-designed vases were known. Their general and leading outlines and forms can best be seen and appreciated by the sight and study of them in the Vase-room of the Museum itself, but we may well point to the fact of the several forms and outlines having some special relation to the special purpose for which each form or outline of vase, or calix, was intended, and for the way in which it was commonly intended to be held and carried. This is most instructive, and tends to show that nothing escaped the notice of the Greek artist-workmen. They looked not only to the form of the object designed, and to its special fitness for its purpose and wear, but to the way in which it must needs be seen, and to the impression made by it on the eye of those who must needs see it in daily use. Indeed, it may fairly be said that not only the forms of many of these vases, but their very method of ornamentation, could only have occurred to those who designed and ornamented them with all this in constant view. And thus we cannot but think this is well worth noting, and might lead, if carefully thought out, to much that would be novel and suggestive in our art-schools and schools of design, and especially in any, if there be such, where the work done, as educational work and training, has this element of beauty inculcated, by the side of the first and prime one of utility.

There are so many items to be noted in this all-but complete illustration of Greek art and art-workmanship, and even ways of Greek life that we hardly know what to first urge on the attention of those who regard Greek art as the climax of art strength. In its first and instructive beginnings, in its archaic days, and when the Greek man first got to be an artist and an art-workman, it would seem,—as in these vases and amphoræ and other forms is seen so vividly,—he commenced with the very rudest and simplest of forms, in the most archaic way possible, with some "markings" on the moist clay, with lines, crosses, waves, chequers, and the rudest of line arrangements, much ruder, indeed, than much of that to be found in the work of the South Sea Islanders and other savage tribes of men, and, with what is most noteworthy, and not so much taken into account as it might be, with what are evidently rude imitations of wicker work, the art-mind of the rude artist-workman being evidently struck, all the wide world over, with the regularity and beauty of common basket and wicker work. Here we see it in all its phases, and with,—what is so instructive to note,—that peculiar feeling and *modus operandi*,—feeling peculiar to the Greek mind and method of hand work, to his "style" of workmanship, so evident in all he has, from first to last, attempted. It is not the wicker pattern of the South Sea Islander, but of the Greek, though copied, or the idea taken, from the very same object.

But he has done here as all the rest of the world have done in their earliest beginnings. He could not but attempt the copying and the effort to represent the living forms of the animal and vegetable life about him. These animal forms are but now and then introduced, and the forms are rude and grotesque. But there they are. And it will be found that at times a really great artist, though so rude and untutored, has done the work; for the vigour and life and strong action of the animal represented might well put to shame not a little of the same kind of work we see round and about us. Some of these rude vases here are difficult to get good sight of; but the power displayed in their forms and in the drawings on them can hardly in any case be missed. The more closely and attentively they are studied, the more impressive they become, and the greater is the lesson to be learnt from them; for they show us what the special character of the Greek was, and how emphatically he, in this archaic work, prophesies of himself what he would in the future do. We see, too, here in this primitive and archaic work rude representations of the Greek himself and his costume, and much of his way of life and manners, and, more than all, perhaps, the form and contour of his features; and none can doubt that in the later work, and in the more advanced work of the first period, as it is termed, we see simply the successors of the rude men of the archaic age.

How much might be written of the great art of the period which followed this archaic work we need not say. It will best be studied together with the examples of the later work which follows it, and which, in its way, is fully as interesting and instructive; for the decline and final ending of a great style of art, as of a great people, is as impressive and as full of lessons as the early commencement of it and its perfect development. Quite sure dates would be not a little valuable here. The archaic work is believed to have commenced with the beginnings of Greek civilisation, as so-called, and the date of the final ending of Greek vase-painting is thought to be about the year 100 B.C., when probably some other and a foreign art took the place of it. We fear that this final phase of the Greek handiwork is not quite so much attended to, or represented, as it deserves to be; for, as we say, the decay and the ceasing to exist of a great style of art are as interesting and momentous as are the beginnings of it. All things, it is true, are born but to die, and to give place to what we are told is a something better, and better adapted to the wants and aspirations of a new age and new men. But the past is ever instructive, as here seen, and the passing away of a great style of art is certainly not the least instructive lesson to be learned from the study of it through all its phases. Through this fine collection of Greek art-work we may have yet a fair insight into old Grecian life and ways of work.

Mr. William Thomas Wiseman, of Cromwell House, Brixton, Surrey, agent for some of our large Kent brick manufacturers, has been elected a vestryman for Lambeth.

THE ACTUAL STATE OF THE INDUSTRIAL ARTS IN GERMANY.

An addition has recently been made to the number of French artistic publications by the appearance of a new monthly magazine, *The Review of the Decorative Arts* (*La Revue des Arts Décoratifs*). The new periodical sees the light under favourable circumstances. It is intended to serve as the monthly report of the "Society of the Central Union, applied to the Fine Arts," and the recently-founded Museum of Decorative Art. Judging by the first number which has made its appearance, the new publication will supply an evident need.

Unpleasant as the truth may be to the mass of the French people, thoroughly satisfied as they are with the reputation for artistic superiority which they have been accustomed to receive till now, to the more thoughtful the recent international exhibitions have shown the value of this superiority, which they find France is slowly losing. The Union Centrale was founded many years since to save France from continuing on the downward slope in her artistic products, and the aims of the more recently formed Museum of Decorative Art was a further step in the same direction. As a first move the managers of the two societies have felt that it was necessary in their magazine to have a series of good reports on the state of the artistic industries of foreign rivals, and in their first number has appeared an article of more than usual interest on the state of the industrial arts in Germany. The subject being one which interests no less warmly a large portion of the British public, and hence many of our readers, an epitome of the article may, we trust, be acceptable. The author, who is a German, Adolf Rosenberg, and who writes from Berlin, possesses, it will be seen, a more than ordinary knowledge of his subject.

It was at the Vienna Exhibition of 1873 that Germany first showed to the world the products of her industrial art, but the result was, as Herr Rosenberg has to admit, far from creditable. To explain the inferiority of his country, the author takes us back to the various political crises through which Prussia had to pass. The Thirty Years' War (of the seventeenth century) dealt perhaps the cruellest blow, not alone in severing all the bonds which connected the past with the present, but in checking all artistic, literary, and scientific effort throughout the country. The renown of the sixteenth-century masters of Nuremberg and Augsburg seemed forgotten, and the few works of art which escaped from the ravages of the war went to seek a refuge in the locked-up collections of princes, or in private houses, where they have remained till the present hour.

With the close of the Thirty Years' War Germany was powerfully influenced by France, and this influence can be traced down to the fall of Napoleon. From this moment may be dated a new revival of the arts, due to the renowned architect, Charles Frederick Schinkel, who composed a new system of architecture founded on Greek models. Berlin was metamorphosed under his influence. But it was not alone the architecture of his time that Schinkel's teachings affected; the industrial arts received from him a large share of attention. The numerous models that Schinkel designed have served for forty years and more to the manufacturers, while pupils of the master have further popularised his style.

At the time that Schinkel formed his grandest projects for the embellishment of Berlin the knowledge of Greek architecture was not so extended as it is in the present day; it was almost solely confined to the temples of Greece. "It was difficult to compose from such sources a domestic architecture which should satisfy the varied exigencies of modern existence and a climate so different from that of Attica; it was even more difficult and more dangerous to seek a fund of decorative elements for the industrial arts from the artistic treasure-house of a nation whose mode of life had scarcely a point in common with that of the present. With the exaggerated imitation of Greek forms, the façade of a temple was made to serve as the ornament of a stove, the system of metopes and triglyphs as the entablement of a chimney-piece. But what was more to be regretted was the aversion of the architects who designed the models for the manufacturers for positive colours. This aversion was only fostered by means of an error, the refutation of which we owe to very recent discoveries. The Greeks were no enemies to the use of colour, as Schinkel and his pupils believed, but, on the contrary, the partisans of a system of colouring which extended over a large portion of their edifices, and which the Italians of the fifteenth and sixteenth centuries revived." Herr Rosenberg concludes that Schinkel, in spite of his merit, cannot be said to have exercised a favourable influence on the industrial arts of his country. None of his successors inherited his prolific genius, and after his death commenced a period of stagnation which from day to day can be traced in its extension, till at length "the great industrial exhibitions revealed to the world the inferiority of Germany in the industrial arts."

Vienna Herr Rosenberg mentions as showing its superiority in the art of the goldsmith; but everywhere the classic traditions were being broken with, and a return made to the industrious period of the sixteenth century. Munich, Berlin, and Stuttgart became the centres of this new movement, the first results of which were shown in the Munich Exhibition of 1876. The *Kunstgewerbeverein* of Munich (Society for the Encouragement of the Decorative Arts), which celebrated during the exhibition its half-century jubilee, held in the front rank of its aims the revival of the style of the "German Renaissance." These efforts were continued by the treasures of the National Museum of Munich and that of Nuremberg, where in 1872 was founded another museum devoted to the industrial arts, the "Bayrische Gewerbemuseum," where are held exhibitions of modern work. Munich, as Herr Rosenberg truly remarks, remained after the triumph of her exhibition "the devoted champion of the style of our ancestors." The "*Kunstgewerbeverein*" has built an important edifice entirely in this sixteenth-century style. A permanent exhibition shows the most recent products of the industry of Bavaria and the other parts of the German empire.

The publishers aided in this movement towards the Renaissance. In 1877, Herr George Hirth, a scholar and publisher, produced under the title of "Der Formenschatz," a collection of drawings, sketches, and studies to serve as models to the trade and the designers. To attain this end the price of this collection is made very small. Another publication, by the same author, and no less instructive, "Das Deutsche Zimmer der Renaissance,"—the German room of the Renaissance,—endeavours to show the elegance and charm of a house embellished with art and furnished with taste. Herr Hirth has taken from Holbein, and the other masters of the sixteenth century, a large number of models, to which he has added reproductions of the furniture and stuffs of the period. German artists are not the sole authorities; the East, the looms of the Gobelins manufactory and Flanders; French pottery and Italian majolica, are all laid under requisition.

To the Munich Exhibition many excellent results may be traced. Its success led to the foundation of numerous schools and societies throughout Germany. In 1876 schools were opened at Breslau and at Dresden, to which has been added a museum, as also the school of Leipzig. The following year Münster and Pforzheim (in the Duchy of Baden) were supplied with excellent schools, the latter especially devoted to the goldsmith's art, which has left ancient traditions in the town. The most recent foundation is the industrial art-school of Frankfort-on-the-Main, opened in October of last year under the direction of the architect Luthmer, whose efforts in favour of the industrial arts have long made his name respected in Berlin. We owe to Luthmer a large number of compositions for the jeweller and the glass-worker, and in addition an invaluable publication on jewels, the elements of which are gathered from the pictures of the sixteenth century, or copied from the originals preserved in the German courts.

There are now sixteen industrial art-schools in Germany; in addition to those above mentioned there are schools at Berlin, Cassel, Dantzig, Erfurt, Hanau, Königsberg, Magdeburg, and Mulhouse. But further details will be found in a recently published manual, "Statistisches Handbuch für Kunst und Kunstgewerbe im Deutschen Reich. 1880. Weidmann. Berlin." (Statistical Manual for Art and the Industrial Arts in the German Empire.)

Herr Rosenberg is warm in his commendation of a further innovation which marked the Munich Exhibition, that of having apartments closed in on three sides, and provided with a ceiling intended to show completely the effect of the application to interior decoration of the Renaissance style. The success of these full-sized models was repeated at Leipzig and Berlin in 1879. Herr Rosenberg attributes to their introduction a complete revolution in the style of interior decoration.*

The architects of Berlin, in Herr Rosenberg's opinion, are much more cosmopolitan than their brethren of Munich. "They have studied the French and Italian Renaissance with the same zeal as the German Renaissance, and it is particularly the Italian forms that they have preferred. The painters, sculptors, and cabinet-makers work under the direction of the architects, who deserve credit for the impulse they have given to our industrial arts, and who furnish designs for the goldsmith, the glass-painter, the weaver,—in fact, for all the branches of industry directly dependent on art."

This almost exclusive predominance of architecture has, it cannot be denied, continues Herr Rosenberg, its inconveniences. As the greater number of the architects are often incapable of drawing the human figure,—an incapacity which arises from the insufficiency of the education they received,—they only too often entirely neglect the figural element in the conception of their sketches, confining themselves to arabesques and foliage. When it is recalled what an important part was played by figures in the industrial arts of the Renaissance, either as supports for the architectural portion, or as symbolising some profound idea, or representing some allegory, or to animate in a lively manner the architectonic lines, it is, indeed, to be regretted that they should disappear in the new system of ornamentation. But the efforts applied to the regeneration of the industrial arts are of too recent a date to produce as yet any definite result. We have, as it is, every reason to be pleased with the sufficiently high position which the German industrial arts have succeeded in attaining in so short a period as the last seven years, and much may be hoped for in the near future, as the impulse given in this direction is far from having ceased in its effect.

To show how universally the Renaissance has seized hold of the artistic world in Germany, Herr Rosenberg mentions how, in the Berlin Exhibition of last year, besides twenty exhibited examples of rooms furnished in the Renaissance style, there was only one in the Gothic style, a fact worthy of remark in a country where the art of the so-called Gothic masters produced such treasures of exquisite beauty. Herr Rosenberg strongly approves, nevertheless, the public taste in preferring the Gothic for the purpose of religious decoration. "For private life the Gothic style, venerable as it may be, has little charm. The stiff backs of the arm-chairs are energetically opposed to our modern sense of comfort, and foliage as an ornamentation scarcely flatters the eye by the variety of its forms." In Hanover and Cassel, Gothic is cultivated by several architects of taste and talent, who have tried with success to accommodate its forms and decorative elements to the needs of modern existence; but in general the Gothic, concludes Herr Rosenberg, is only adopted to the building and decoration of churches and town-halls.

Our author refers, in his review of the state of the industrial arts in Germany, to the influence exercised by France on several members of the German aristocracy, who have, in their visits to Paris, been affected by the "style Louis XIV.," but they have been obliged to employ French workmen to carry out their plans. The palaces of the Prince of Pless, at Berlin, and at Pless, in Silesia, may be mentioned as examples of this "hobby," the architect being M. Destaillenr.

In 1876 was formed at Berlin a Society for the Industrial Arts. This society, which numbers some four hundred members, patronises openly the Renaissance, a feature in part due to the fact that the greater number of the members, being manufacturers, naturally endeavour to suit the reigning taste of the public. The Museum of Industrial Art, which has been in existence at Berlin since 1867, has likewise succumbed to the popular current in favour of the Renaissance, and the new acquisitions belong chiefly to this period. Founded originally by

* Ernest Wasmuth, the Berlin publisher, has recently produced a folio work containing some twenty-four plates, photographed from the more important of these exhibited interiors,—*salons*, boudoirs, dining and sleeping rooms, &c.

private initiative, the museum and school are, however, submitted to the supervision of the State, which wisely and not too ostentatiously aids by an annual budget in the expenses of the Institution. A recent donation of the State consisted of a rich collection of objects of art from Japan and China. Japanism, remarks Herr Rosenberg, has not left the restrained circle of our art-lovers, and has not as yet, as in Paris, invaded our manufacturing world.

The Government has further wisely patronised the art movement by sending to Italy a painter, a professor at the School, Herr Maurice Meurer. Accompanied by a number of ardent companions, Herr Meurer has copied at Mantua, at Verona, Genoa, Bologna, Padua, and Rome, the ornamental frescos of the churches and palaces which belong to the *cinque-cento*. A large number of coloured studies, containing, as may be imagined, a mass of motives for mural decoration, has resulted from these expeditions, and Herr Meurer has several times had favourable opportunities, according to our author, of applying his studies to the decoration of vestibules, *salons*, boudoirs, &c. Herr Meurer further made, during his residence in Italy, a special study of the glazed terra-cotta tiles employed during the Renaissance to adorn the walls, archivolts, onpolas, &c., of the buildings of the epoch.*

Such, rapidly sketched, concludes Herr Rosenberg, is a statement of the present condition of the industrial arts in Germany, concerning which we are promised at a later date some supplementary information.

THE REFERENCE LIBRARY OF THE BRITISH MUSEUM.

THE readers of this journal have lately heard, in full, particulars of the progress that is being made at the British Museum, and the good work done there has been acknowledged warmly. We would now say a word or two, not of depreciation, but of advice as to changes and improvements that might usefully be made in the *Reference Library*. The ornamentation of the large circular hall in the centre of the Museum buildings is confined to the books and their bindings in it, and which, indeed, make up, to the eye, its very walls. It is literally built up of books, from the floor to the springing of its domical roof, — the very doors being utilised. It has been necessary to divide this wall of books into three stages: the floor of the room, and two galleries above it, thus bringing each volume within ready reach of the hand. The lower rows of books have always, most conveniently, been open to readers, so that any volume below the first and lower gallery can be readily got at and consulted, and we need hardly say how much use has been made of this plan of leaving the books open for the purposes of ready and easy reference. This has, indeed, been found so convenient that it is now the intention of the authorities to open to the public, so we understand, the gallery above, and thus give access to a further range of volumes. It is proposed, we believe, to devote this space, and long length of book-cases, to theological works, thus leaving the lower and ground-floor to more varied and general literature, and we presume to science, and, it is to be hoped, to art and fine art, and, perhaps, it may be, to architecture and building, or at least so much of them as to meet the wants of those who pursue such inquiries and researches. These are at least equal in importance and interest to not a few others here so amply provided for.

We say we hope this fair chance of granting some sufficient space to architecture and art, and fine art, may become a reality, for as things now are these are simply conspicuous by their all but total absence. We hardly dare to go into detail, but we cannot help asking how it has come to pass that so curious a selection of books has been made as that now to be found lining the wall of this great room as works of "Reference," and as handy and world-famous books? May we be pardoned the naming a detail or two? It may, at least, interest the curious in such matters. Ample enough is the store of dictionaries and encyclopædias, but are not many of these now all but, if not quite, obsolete, and without even an antiquarian interest? Of science there is ample show, but still with not a few startling omissions. Science in these latter days is making advances so portentous that no amount of space would seem to be enough for it, or ample enough to fully provide for its fair and due representation, and very many are the volumes here about it, and within handy reach, but there are not a few absent, and world-wide famous ones, too. Mr. Darwin has, if any have, influenced the world of science, but his all-famous book, the "Origin of Species," is not to be found on these shelves, though his book on "Coral Reefs" is, with some others. Surely the books first that have influenced the world of thought, and, through it, of action, should find place.

We hope to be understood. The books we speak of are, of course, in the Museum Library, and can always be had in the usual way, but they are not in the Reading-room as works of ready and constant reference, while there are so large a number of all-but-forgotten tomes; as of some of the "Reviews" from first number to last. Many others are here of but passing or bygone interest, and certainly not to be compared with the great books of original thinkers, or with those books without which the world might find itself somewhat at a loss. Here, again, we must carefully distinguish between the having too much and the having nothing. We cannot but think that the presence here of at least the last year's completed and bound volume of all art reviews and notices of matters appertaining to the art and fine art of the world as it now is, and goes on from year to year, would be a most useful and desirable addition to the shelves of this great Library of Reference. But there is, as things now are, no vestige of anything of the kind; so that what in the past year art has done, with its hints as to what is now at the moment doing, is altogether out of handy and helpful reach. In antique Greek or Roman days, to get sight or idea of a new building one must needs have travelled to the very spot on which it was built, but in these more advanced days we but need to ask for a book in a Library of Reference.

Our main object here, we may repeat, is to hint at some improvement while the alterations and re-arrangements are in progress, especially in the direction of art, and, as we say, of architecture more especially, for it needs some industrious looking for, as things are, to find the word "architecture" at all! A shelf or two certainly would hold all the Reference Library contains of it, useful and necessary as it is, for the world could hardly do without at least "Building." Mr. Fergusson's ever useful "History of Architecture in all Countries," is here, it is true, but Pugin's "Principles" is not, and this book certainly accomplished its work in its day, and called attention to much that was at the time all but forgotten. The "Modern Painters" are here, but the teachings of Venice are not. There need be but small difficulty here, for this very book of Fergusson's, with Gwilt's "Dictionary or Encyclopædia of Architecture" will furnish an ample list of "authorities" from which to make choice of representatives and always useful "reference" books. It may be curious, and it is suggestive to note that the great French work on "Egypt" is here, as it should be, with its careful engravings, but M. Leyuard's "Égypte et Nubié," with its admirable photographs of the same buildings, is absent, the one being all but a supplement to the other. We might go on. Should not Mr. Penrose's work on the Parthenon be here, as one of reference,—close as it would be, and not a little useful so near,—to the marble remains of the very structure treated of in it?

We thus, however incompletely, would call the attention of those who are rearranging the vast Library of Reference, holding no fewer than some 20,000 volumes, to its present imperfect and apparently accidental assortment of representative books and works of reference, and to the many authorities absent which ought certainly to be ever present. If there be those who think we lament without sufficient cause, let such take up any one world-wide art-subject, as architecture, and make note of what is, and what well might be, and, more than all, make thorough note of what now, as things are, fill these convenient shelves. We cannot fear the result of such examination; the more thorough and complete and exhaustive it is, the better, and the greater the good done, or, at least, hoped for. Of course, the very length of shelving, great as it is, is limited, and we cannot expect all and everything that is needed; but that a great improvement on what now is, and which simply comes from a past and a good-deal-forgotten state of things, should be made, there can be no doubt or question; and that, as we say, not by additions only. The whole subject is, of course, full of detail; each separate book must be looked at if not studied, thus to give it its due and appropriate place. We trust, therefore, that Painting, Sculpture, and Architecture may find a little more room in the future of this great Reading-room.

* Herr Meurer has recently published a portion of his interesting collection, under the title "Majolika-Fliesen der Renaissance" (Glazed Tiles of the Renaissance). Ernest Wasmuth, Berlin.

THE FOURTH SISTER.

WE do not assume that any one is in error; we only wish to keep right ourselves, and in respect to any idea which invites delineation, it is not a bad way to put pen or pencil to paper, and draw it out, to see whether it will bear inspection and examination.

"Decoration,"—what is its just significance? Let us go to its derivation. *Decor* is the original word, from which other Latin forms, as *decoramen*, &c., and our own term, "decoration," &c., are derived; and against *decor* in the dictionary we find the English terms "comeliness, gracefulness, beauty, seemliness, loveliness, a fine mien."

Decoramen is construed ornament. Assuredly we have seen buildings which were no ornament to the city or situation where they were placed, and paintings and pieces of sculpture also we have noticed, which were no ornament whatever, which arose from the fact that they were not good or apposite. Ornament and decoration are not perhaps words of which the significations are identical, but they have, at least, kindred meanings. *Orno* is to adorn, and a work of art, unless it be suitable to its place, as well as beautiful in itself, does not adorn, and is not decorative. A flower out of place is a weed; a weed, in its place, is a flower.

"Decorum" is another word from the same root as "decoration," and in it are implied the right manners, the right person, the right sentiments in the right place. Thus, in this view, it may appear that "decoration" is a term which has a claim to very high consideration, as involving a certain propriety, without which nothing can be really good. When the three sisters,—Architecture, Painting, and Sculpture,—meet together in one structure, it is so important that they should coalesce in harmonious propriety, which they cannot do without the production of decorative unity, that we would intercede for the emphatic preservation of the word "decorative," in its high sense, as we think that such a term is required for such an office, and we see none better than one which is so closely allied to "decorum."

We would submit a group of three sisters,—Grace, if you please,—Architecture, Painting, and Sculpture. They are noble damsels, stately, symmetrical, and sweet. Anon, a little sister, less in stature, lighter of limb, comes on the scene. Caressingly she dances round them, and festoons them with flowers: kneels at their feet, reaches to their shoulders, and stands on tiptoe beside them. Then she waves her wings, for she is a little Psyche, and rises into the air, and floats around them, and crowns them with buds and blooms, and sings to her ærial harp, which she touches daintily, a sweet refrain of harmony and love.

By this little idyll we would image the two-fold significance of this enchantress. In the one view she is the handmaid to her sisters; in the other she rises superior to them all, as the bond of union between them, crowning them with flowers, and weaving their souls together with a hymn of celestial concord.

Behold! she is only a little sister, but she can soar as well as serve, and her name is "Decoration."

THE PORTOBELLO SEWAGE CASE.

SOME time ago we drew attention to the unfortunate circumstances of Portobello, with regard to its being surrounded by the Edinburgh sewage. It appears that the local authority,—the provost and magistrates of Portobello,—have at length taken action in the matter; and last week Sheriff Campbell (reversing the judgment of his substitute) pronounced an interlocutor, finding that the pollution of the "Braid Burn," before its junction with the "Figgate Burn," which runs through Portobello, is a nuisance within the terms of the Act, and must be removed. The case we understand, from its great importance, is likely to lead to further litigation.

THE DONATELLO SOCIETY IN FLORENCE.

ON the 20th of June, M. Leon Gauchez held a conference in Florence for the purpose of setting forth the scope of the proposed Donatello Society. M. Leon Gauchez, a lover of art, and also of Florence, desires to aid the town in the revival of art there, aiming at bringing it to the standard it once occupied. At the present time there exists, one might almost say, nought but imitative art in Florence; the system of the art-schools has not tended to create originality. Exertions are now being made to remedy this defect, obliging the pupils to copy from nature only. M. Gauchez was obliged to acknowledge that "*en fait d'art, l'abilité n'est pas la maîtresse en Florence.*" At this moment Turin has given a grand example in having her exhibition of art this year, and in spite of being deprived of the honour of being the capital of Italy, she has gathered together examples of art not seen in any former exhibition. With this example the society wishes to urge the Florentines to a Renaissance in art in their city on solid bases, that may prove of the greatest possible use to them. Three Exhibitions are to be formed (each having its separate committee): one, of ancient art, for which it is hoped the Government will lend its aid; the second, of modern art; the third, of art applied to industry. The two latter, it is suggested, may be utilised, by lotteries for the sale of the artistic objects exposed, the French Government offering, through M. Leon Gauchez, any aid by the loan of objects acquired in the last Exhibition of Paris. The society intends forming a museum, open to the public, of models and works of art that shall tend to the improvement of the professional art-schools, in imitation of that of South Kensington. For this subscriptions are opened, and an appeal is made to the people for a guarantee of three years' subscription or donation,—a sum of 50,000 francs (2,000*l.*) being required before the society can begin its operations. The idea is one which, if realised, may be of immense advantage to the city,—now left so isolated, with so much native talent lying dormant from want of being utilised, and the spirit of making only what will most easily sell pervading every branch of art. The promised Exhibition of Ancient Art of Tuscany, again postponed, may be hoped for if the society take root, and hidden treasures will be unearthed that are comparatively unknown, and which are unequalled; for instance, the inconceivable amount of ancient tapestry in the different palaces, of such beauty and excellence of design and execution as cannot be surpassed elsewhere.

Let us augur good things from the operations of the Donatello Society, and from the fact of the ready and spirited aid offered by their French friends and neighbours.

SIR CHARLES DILKE'S RETURN.

THE return to the address moved for by Sir Charles Dilke, on the 10th of March last, for certain details of information intended to throw light on the true policy of the proposed Metropolitan Water Works Purchase Bill, was ordered by the House of Commons to be printed on May 31st, and appears in Messrs. Hansard's list of Parliamentary publications for June. The frequent reference to this return by the chairman of the special committee has directed public attention to it, and a brief account may therefore be welcome.

The order for the return, which is printed on the title-page, is so minute and comprehensive that it might have been expected that a full *aperçu*, such as has been given in our own columns (see pp. 181, 301 of our last volume), would have been stamped by official authority, and put into the hands of the public. But long experience on the part of those charged with the elaboration of Parliamentary returns has given them a power of obscuring the facts sought, which no care would seem to be able to anticipate and to prevent. The second part of the return does, indeed, present in parallel columns the details which were already in the hands of those who had procured the Board of Trade returns of the accounts of the water companies from 1871 to 1879. So far as presenting them in one blue (or rather white) book, instead of in nine, and as some working-out of details as to cost, goes, the return will be found a convenience to those who have to discuss the matter. But for the gist and outcome of the whole, that is to say, the sum of the returns, every one will, as heretofore, have the pleasure of calculating it for himself. Only the separate accounts, company by company, are given in the return. The great point of presenting the general result in a form that can be grasped without the constant addition of eight columns of figures is omitted from the return.

The importance of such a summary will be clear from the following considerations. The first thing required in the return was the financial statement on which the calculations for the payments contemplated by the Bill were to be made. In reply to this demand, Mr. E. J. Smith writes to the Home Secretary to say that "no official statement was deposited with the agreements, but its contents should in every way transpire before the confirmation by the water companies." Four schedules are then given: of which A sets out the prices agreed to be paid to the several companies (being, in fact, printed in the Bill); B sets out the interest to be paid in the year 1880-81, the revenue in that year, and the "allowance made to the several companies"; C is an estimate of the increment of income from 1881 to 1900; and D gives "certain statistics."

Of these statistics the first item is the gross incomes of the companies in 1879. The column which contains them is added up, and gives the gross total of 1,449,446*l.* It is by the absence of any corresponding column in the second part of the return that the immediate detection of a very serious discrepancy in Mr. Smith's figures has been avoided. In every instance the sum returned by Mr. Smith as the gross income for the companies for 1879 is considerably larger than the sum returned by the companies themselves! To show that we have not miscalculated, we add the items, placing side by side the two returns:—

Company.	Gross Income, 1879.	Total Income, March, 1880.
Chelsea	£93,780	£95,173
Grand Junction	137,290	134,511
Lambeth	150,074	145,325
Southwark	183,977	171,304
West Middlesex	164,746	159,570
New River	416,000	396,829
East London	208,741	203,942
Kent	92,928	86,286
	£1,449,446	

The items in the second column are not added up in the return, but come to 1,393,030*l.*

The gross return of the several companies is a matter as to which there is no room for dispute. If anything is said about it, it ought to be the simple arithmetical truth. The sum given by Mr. Smith, as we have said, for 1879, is 1,449,446*l.* The sum of the returns of the eight companies, given on pages 7 to 21 of the return, is 1,393,030*l.* There is therefore taken, as the basis of the financial arrangement, an over-credit of 56,401*l.* per annum, above the receipts of the companies, according to their own returns!

If each item in Schedule D be compared with the sum of the figures presented by the companies, a similar misfit turns up. Thus the East London Waterworks Company, which Mr. Smith makes out to have received 208,741*l.* in 1879, while they say they received 203,942*l.*, spent as follows, according to the two contradictory accounts. By their own return they spent 73,619*l.* on maintenance, 16,191*l.* on management, 17,216*l.* on interest paid, and 107,741*l.* in dividends. Mr. Smith states that they expended 86,621*l.* on "expenses and interest" (instead of 89,810*l.*), and 122,120*l.* in dividends. Thus this company is credited with 6,642*l.*,—too high a receipt—and 3,199*l.*—too low an expenditure—making a difference to the good of 9,841*l.*, and is said to have divided some 14,000*l.* more in dividends than its own accounts show! It may be fairly questioned whether so utterly unreliable a financial statement was ever brought before Parliament or the public as the basis of an important measure of legislation. The case of the companies is overstated by the negotiator for the Government. One feature of interest is to be found in the returns, in the statement of average cost per million gallons of water in respect of working expenses. The outcome of the paper is to show a variation in cost from the minimum of 7·71*l.* per million gallons, in the case of the Southwark and Vauxhall Company, to the maximum of 14·67*l.* in the case of the New River Company. The unit of the million of gallons is not, however, as convenient as that of the ton or the hundred tons of water, as its relation to the population is complicated. A million gallons is equal to 4,545 metric tons, or to the annual supply of about 90 individuals; the cost apiece thus ranging from 1·71 shillings to 3·26 shillings for working expenditure alone.

CHESTERFIELD AND ITS TRADE.

IN pleasant Derbyshire, one of the largest and most important of the ancient towns is Chesterfield, which has historic greatness, and which has had by its position greatness thrust upon it. It could be said of it once upon a time that Wordsworth's words were almost literally correct,—that "not a house but" seemed to give "assurance of content within," and though there has been great change in the pleasant county of Derby, there is not a total change in this respect. The large and irregularly-built town of Chesterfield is supposed to date back to Roman days. The great charter-granter, King John, gave it one, with the privilege of two markets and a fair; and by good Queen Bess this charter was confirmed, and later it was ratified by Charles II. It confided the town government to the hands of a mayor, "six aldermen, six brethren, and twelve capital burgesses," with their attendant chamberlain, clerk, and other officers. But even in pleasant Derbyshire the last two score years have introduced a great change, and we may, in glancing at the picture of Chesterfield and its trade two score years ago, and at the present time, notice evidences of that change almost everywhere. In the earlier period, Chesterfield had a court-leet under the lord of the manor, at which a constable was chosen. It had a varied trade,—hosiery, lace, and flax being amongst the manufactures; whilst there were large iron-foundries, tanneries, and potteries, and near it lead, coal, and iron mines were wrought. Its church was then an object of interest, much more the famous "twisted" spire thereof. In addition it had seven places of worship for persons of other denominations than Episcopalians. The Free Grammar School dated back to the days of Elizabeth, and there were other schools, almshouses, and abundance of literary and benevolent associations, whilst "an elegant assembly-room" had been a few years before built. The population of the parish, which in 1821 had been 9,190, had risen to about 10,000, one-half being that of the town. A canal passed near, but railways were projected only. There were three well-established banks, two of which at least survive, with little change in the title. Five coal-masters were in or around the town. There were seven earthenware manufacturers, but not on a very extensive scale; two ironfoundere, and five lace-manufacturers. The one newspaper of those days was the *Derbyshire Courier*, and the rest of the trades had nothing calling for special note. The Waterworks and Gaslight Company had its dwelling-place in Westbars. From the Angel in New-square seven coaches departed, mostly daily, and the Pickfords, the Wheatcrofts, and the Hibbersons were the chief of the many carriers. There was the one conveyance by water "to all parts of the kingdom" from the Canal Warehouse, and, under "John Bower, governor," there was the House of Correction in Bowling-green-side. The names of the streets, the trades carried on, and the nature of the inhabitants of those days had a pleasant old-world look, and in the county of Derby there were not many more pleasant spots than was Chesterfield two score years ago.

There has been a growth in the town of Chesterfield these two score years. It has forsaken the arts of war that distinguished it in the Civil War. It retains its curious old church, and has added thereto the Trinity Church, and the yet more handsome structure which commemorates the connexion of George Stephenson with the town. There has been a connexion with the great railway system, and there is around the town the upgrowth of a great coal-trade. The Tapton Coal Company records one of the adventures of Stephenson, long successful, and which may, when the coal-trade feels the improvement, again contribute to the wealth of the district; and though around the town there are places of historic note,—places such as Wingfield Manor House,—it is doubtful whether the old colliery is not as interesting. When it is stated that 41 out of the 240 collieries of Derbyshire are classed in the sub-district of Chesterfield, it will be evident that its contribution to the county output of coal of 7,190,000 tons cannot be very small. Out of the fifty-five

blast-furnaces of Derbyshire, eighteen are classed as in the Chesterfield district, and the eighteen include the important works of Sheepbridge and Staveley, whilst other sets of smelting-plant are near; and there are other minerals or their products, produced in the neighbourhood which have tended to the development of the trade of the district and of the town which has retained its central advantages. The older trades of Chesterfield have been materially developed by the growth of the great mineral industries in and around the town, and as these industries were either the growth or were stimulated by the railway system, or by those whom it brought into the district, it is not to be wondered at that Chesterfield was desirous to commemorate the residence of George Stephenson in its midst. Five years ago it projected the memorial hall which was last year opened, and which may fairly claim to be the most graceful specimen of architecture Chesterfield possesses. In 1877 the Marquis of Hartington laid the foundation-stone, and in 1879 the Duke of Devonshire formally opened it. The Gothic style has allowed of a picturesque aspect being given to the stately building, which was erected at a cost of over 13,000*l*. It has a spacious public hall, a free library and reading-room, museum, lecture-hall, and other rooms, and already it has found use as a meeting-place for the Chesterfield and Derbyshire Mining and Mechanical Engineers and allied bodies.*

As to the figures that show the growth of Chesterfield, it may be said that its population had more than doubled at the time of the last census, and was then over 11,000; whilst the rate of increase has in the present decade been as large as in any previous. It has retained and extended its banking facilities; has added to the number of its newspapers; and though its coaches and most of its carriers are gone, they are replaced by the carrying connexion which its position on the great Midland Railway gives it. The ancient town and its trade are both revolutionised by the advent of the railway system, and it is tolerably certain that its prospects for the future seem to brighten. It is in the midst of the great Midland coalfield; in the midst of the great ironfield of that district; and surrounded by collieries and ironworks of repute, such as those of the Butterley Company and of the Clay Cross Company, to mention no others. Near it are famous lead-mines, and though for years there has been deep depression felt in that industry, yet there are indications that with the advance in the price of lead there will be an increased activity known in the mining districts. It is on these three great industries that the future of Chesterfield largely depends, for lace and cotton cannot alone support a great town such as it has become and is becoming. So far as can be foreseen, the two chief of these three industries must advance, for there is a continuous growth in the demand for coal, which benefits all the coal-yielding districts of the kingdom, and especially those which are, like that of Derbyshire, relatively very near to the metropolis, and which are well served by railway companies. There is a change taking place in the iron trade, as is well known, but that change is one in favour of the districts producing high classes of iron, such as Derbyshire yields; and with a probable prosperity for these two important branches of the trade of the county, there should be in Chesterfield a continuance of that steady progress it has known for centuries, and experienced in peace and by a comparatively contented people.

NEW PAROCHIAL OFFICES, WESTMINSTER.

A CERTAIN number of architects having been invited to submit designs for the erection of new parochial offices for St. Margaret's and St. John's, Westminster, ten sets of drawings have been sent in, and are now under the consideration of the vestry committee, at the United Westminster Schools, Alexandra-street, Victoria-street. We have been requested to give no notice of the plans at present, and of course willingly comply.

The Index Society.—The second annual meeting will be held in the rooms of the Society of Arts, John-street, Adelphi, on this Friday, July 9th, the American Minister in the chair.

* View, plan, and description of this building will be found in our volume for last year, pp. 772, 774.

CENTRAL SCHOOLS AND OFFICES, SCHOOL-BOARD, SHEFFIELD.

A VERY important block of buildings, comprising the Firth College, Central Schools, and the School Board Offices, has been erected in Sheffield, to the great satisfaction of the townspeople. The style adopted may be called English Renaissance; the principal material employed is Huddersfield stone. There are two chief entrances, both handsome,—that in Bow-street, giving access to Firth College, and one leading to the new offices of the School Board, which form the central portion of the block fronting the new street.

The buildings form three sides of a quadrangle, the fourth side of which will be walled, so that the open space in the centre of the square may be used as a playground by the children. The Firth College occupies the Bow-street side, and fronts to a portion of the new street.

We give illustrations, view, section, and plans of the schools and Board offices.

The offices of the School Board, which are set a little back, form the centre of the group of buildings. They adjoin the College on the Bow-street side, and are connected with the Central Schools at the other end by a colonnade, which will be zinc-roofed, and utilised as a playground. A broad flight of steps from the main entrance gives access, along a corridor with a groined roof, to the offices of the Board, beneath which, in the basement-story, are store, strong, and sample rooms for slates, school-books, and other materials. The Board-room is on the ground-floor to the right of the entrance, and is 35 ft. by 25 ft., and will be panelled with carved oak, and have a ceiling decoration chiefly consisting of plaster figures representing learning. The committee-room is next to the board-room, and on the same floor is a members' room, and an ante-room. The first-floor is set apart for the office of Mr. Moss, the clerk to the Board, his private office adjacent, and the general offices, which include rooms for the corresponding clerk, minute clerk, visitors' book-keeper, accountant, and inspectors, as well as a large office for the general clerks. At the rear of the offices, facing the interior of the quadrangle, is a covered playground, supported by stone columns, to which the scholars will be able to resort when the weather is too unfavourable for their recreation in the quadrangle itself.

At the further end of the line of buildings are the Central Schools, which have a fine frontage to the new street, and extend some distance along Orchard-lane. The entrances to the schools are placed in Orchard-lane, and consist of a main entrance and two minor doorways, one for boys and the other for girls. The basement contains the school of chemistry, a room 20 ft. by 22 ft., and a larger room, 39 ft. by 20 ft., at present unappropriated for any special purpose. On this floor is a joiner's shop and a chamber set apart for the heating-apparatus. The ground-floor comprises the school of cookery, exactly the same size as the school of chemistry, and in connexion with it is a commodious scullery. In this story there is also a babies' room, a junior mixed school, accommodating 233 scholars; an infants' school, accommodating 193; a deaf and dumb school, accommodating 48; a fine gymnasium, and several class-rooms. The various schools are approached from the basement by two flights of stone steps. The mezzanine floor is fitted with rooms for the teachers, a lavatory, and apartments for the caretaker. On the first floor there are eight class-rooms, almost uniform in size, and rooms for the head master and mistress. Each class-room accommodates 48 scholars, and all are for the use of the senior boys and senior girls, of whom 480 will be able to receive education in the building. There is also a library on this floor, and it will be available to all the senior scholars. The next story is devoted exclusively to a large hall, constructed in the roof. It runs along nearly the whole length of the central school, and is 86 ft. long by 34 ft. wide. The hall will be used for lectures and similar purposes, and will accommodate about 1,500 persons.

The Central Schools are intended to solve the problem of connecting the very earliest education with higher knowledge, in such a manner as to open the whole field, even up to the university itself, to the poorest child in the town. The schools, as previously stated, comprise an infants' school, a general mixed school for boys and girls, to be taught together, and an upper school of boys and girls taught separately. The upper school, which is really the most novel portion of the undertaking, is intended by the School Board to be chiefly for the reception of clever boys and girls drafted from any of the elementary schools of the borough, on the recommendation of managers and teachers after due examination. These may be admitted to receive here a higher training than is ordinarily open to those of a similar position in life, as it would be impossible without great increase of teaching power to adopt such a system throughout the elementary schools of Sheffield. The senior departments are the principal feature of the schools. They are arranged on the class-system, but in the planning, improvements are introduced beyond what is generally adopted. Each class-room is really a little school in itself with cloak-room opening out into the general corridor, and there is in addition a small private room for the teacher.

The cost of the entire range of buildings, including furniture, architect's commission, &c., but exclusive of land, amounts to about 70,000*l*. Of this amount, 20,000*l*. is for the erection of the college, the cost of which is borne by Mr. Mark Firth. The heating apparatus, supplied by Mr. D. O. Boyd, of London, is effective. It is fixed in a large chamber, 84 ft. long, 5 ft. wide, and 5 ft. high, in the basement of the central schools. It heats the whole building by twenty tiers of pipes, and not only warms but purifies the atmosphere. The air is brought into the building through an iron grating, but before it passes into the pipe chamber it is conveyed through a canvas, upon which a spray of water plays, the effect being that the atmosphere is cleansed from all impurities, such as dust and smoke, after which the clarified air passes through a series of cavities into the various rooms, the supply being regulated by easily-worked valves.

The architects are Mr. T. J. Flockton (Sheffield) and Mr. E. R. Robson, F.S.A. (London). The builder is Mr. Bisset (Sheffield), and Mr. J. Laidler (London) is clerk of the works. The carver is Mr. J. M'Cullock, of London.

DENZELL HOUSE, BOWDON, NEAR MANCHESTER.

THE house here illustrated has been erected at Bowdon, for Mr. Robert Scott, Messrs. Clegg & Knowles, of Manchester, being the architects. It is externally constructed of Yorkshire stone, with dressings of Manley stone, and Messrs. Neill & Sons were the contractors. The cost was about 18,000*l*. The brickwork was by Mr. James Hamilton; the masons' work by Mr. Mills.

A view of the lodge was given in our last.

BLACKFRIARS BRIDGE.

AT a meeting of the Court of Common Council on the 1st inst., Mr. Hart moved,—

"That it is desirable that Blackfriars Bridge be completed in accordance with the designs and provisions of the engineer, by the addition of appropriate groups of statuary, to be placed upon pedestals provided for that purpose at the extremities of the bridge, and that it be referred to the Bridge House Estates Committee to obtain (by public competition) designs, which shall be the absolute property of the Corporation, at an expense by way of premiums of a sum not exceeding 1,000*l*., reporting thereon, with the cost of executing the work, to this Court."

He reminded the Court that the engineer of the bridge, Mr. Cubitt, in the report which accompanied his design, said, "The abutments are well adapted for the erection of equestrian statues or groups of statuary." Sir F. Leighton, the president of the Royal Academy, had addressed a letter to the Lord Mayor on the subject, in which he alluded to the "strange and unparalleled indifference of the wealthiest city in the world" in leaving Blackfriars Bridge uncompleted; and if the members of the Corporation went to Edinburgh, Glasgow, Paris, or any large city on the Continent, they would find that art had been cultivated there for years past in a way which London might well imitate. There was no doubt that in 1861 it was contemplated that the abutments of the bridge should be graced with statuary, and he (Mr. Hart) trusted that the matter would not be delayed any longer.

Mr. Edmeston seconded the motion, remarking at the same time that he thought the strictures of Sir F. Leighton were scarcely deserved.

The motion was agreed to.

LONDON STREET ARCHITECTURE: HOUSE IN BUCKLERSBURY.—Mr. Whichcord, F.S.A., Architect.

CENTRAL SCHOOLS AND OFFICES, SCHOOL BOARD, SHEFFIELD.—MR. T. J. FLOCKTON AND MR. E. R. ROBSON, F.S.A., ARCHITECTS.

LONDON STREET ARCHITECTURE: 20, BUCKLERSBURY.

IN a former number we published some particulars of an extensive block of new buildings, intended for banking, insurance, or other commercial purposes, in course of completion at the corner of Queen Victoria-street and Bucklersbury, immediately opposite to the National Safe Deposit Company's premises, from the designs of Mr. John Whichcord, F.S.A.* We now give a view of the building, and for convenience sake repeat a part of the account. As with the Safe Deposit Company's premises adjacent, the unseen basement portion of the new buildings forms a considerable part of the whole, the foundations being carried to a depth of 40 ft. below the ground-floor, and admitting of the construction of a lower ground-floor, a basement, and a sub-basement, the floor of the sub-basement being 30 ft. below the street level, and the foundations beneath the sub-basement being filled in with concrete to a depth of 10 ft. The Bucklersbury frontage is 40 ft. in extent, and is carried to a height of 70 ft. The building contains a lofty ground-floor, and five stories above, in addition to three stone dormers which surmount the elevation. The ground-floor portion is in Portland stone, the principal entrance at the east side of the frontage being in polished Dalbeattie granite. At the west side of the elevation there is a carriage-entrance to Old Barge-yard. The main face of the elevation above the ground-floor is in red Suffolk brick, with Portland stone quoins at the angles, and fluted pilasters with capitals in the central portion, also in Portland stone, carried up to the main cornice below the dormers. The central windows of the several floors are bays, with windows in two divisions on each side, the first-floor windows being surmounted by ornamental mouldings and carving in red brick. The building is carried to a depth of 90 ft., the west frontage in Old Barge-yard being partly in white glazed bricks, and partly in white Suffolk bricks. Internally the several upper floors are so constructed as to provide upwards of seventy chambers and offices, which will be reached by, in addition to the staircase, a steam-lift fixed in the centre of the staircase, working up, continuously throughout the day, from the sub-basement to the top of the building. The engine-room, with motive-power for the steam-lift, will be erected at the upper part of the building, above the fifth floor, and will be formed of concrete and iron.

Mr. E. Lawrence, of City-road, is the contractor; Mr. Roberts is the clerk of the works. The cost of the structure will be between 14,000*l.* and 15,000*l.*

In the view now given, the entrance to the offices is shown as originally intended by the architect, but in carrying out the work it was found necessary to utilise more of the valuable frontage by limiting the space devoted to the doorway referred to; with this exception the view represents the building as executed.

THE PAVING OF "NEW STREETS."

THE Parliamentary Committee of the Hackney Vestry have prepared an exhaustive report on this subject, which is of great importance to builders, owners of house property, and others liable to apportionment-payments. The reference to the committee was upon a motion by Mr. Button, "That the paving by the authority of the District Board of Works, of certain 'new streets, or parts thereof,' out of the general rate, is contrary to the provisions of the Metropolis Local Management Act, 1855, sec. 105, and the Metropolis Local Management Amendment Act, 1862, sec. 77; and that the sums so expended should forthwith be charged 'to the owners of the houses forming such street,' and of the 'land bounding or abutting thereto'; that the general rate should be reconped the amount so expended; and that it be an instruction to the District Board of Works henceforth to carry out the provisions of the said Act in respect to paving." The committee report that having had the sections of the Acts under review and the decisions of the courts of law thereon, they "are clearly of opinion that the Legislature intended, by the passing of these Acts, that no first paving need be made at the cost of the ratepayers." At first there appeared to be some difficulty in carrying out the provisions of the Act of 1855, as to charging the cost of paving *new* streets on house-owners, which by sec. 250 defined the word "street" to include any "highway (excepting the carriageway of any turnpike road), road, bridge, lane, footway, square, court, alley, or passage, *whether thoroughfare or not*," and also as "part" of any such highway, &c.; and by sec. 112 of the Act of 1862, the word "street" was held to include "mews," and the words "new street" were declared to mean and include "all streets hereafter to be formed or laid out, and a part of any such street, and also all streets the maintenance of the paving and roadway whereof had not, previously to the passing of the Act, been taken into charge and assumed by the authorities having control of the paving and highways in the parish, and also a part of any such street, and also all streets partly formed or laid out." Since the passing of the Act of 1862, many cases have been submitted to the superior courts for decision, respecting the paving of streets, and the vexed questions, what is a new street, and who are liable to pay for the paving, have been fully settled by the decisions in the cases of Pound *v.* Plumstead District Board of Works, in 1871, and reported in 7 L.R., Q.B., 183; Dryden *v.* Putney Local Board of Health, in 1876, reported 1 L.R. 1, Ex. D., 223; Attorney General *v.* Wandsworth Board of Works, L.R. 6, Chancery D., 539; and other cases too numerous to mention. There are, of course, numerous other decisions on collateral questions, but the above cases fully settle the application of sec. 105 of the Act of 1855, and sec. 77 of the Act of 1862. The district over which the Hackney District Board of Works exercises authority was one which, at the time of the passing of the Act of 1855, contained twenty-eight miles of roadway and sixty-nine miles of footways, under the control of the Board, and twenty-three miles of roadway and twenty-one miles of footways not under its control, and was, in fact, a rural district, and "its footways stood alone in being unpaved amongst those of all the suburban parishes" (Report for 1856). It was considered best to preserve its urban character as long as possible, but the time came when it was necessary to pave the old footways which were laid out before the passing of the Act, and the Hackney District Board of Works took under their consideration the advisability of adopting sec. 78 of the Act of 1862, but came to the resolution that the old footways should be paved out of the general rate. There is, however, a resolution in the minute-books of the Board that where the owners of houses would agree to contribute a moiety of the expense of paving the old footways, the Board would at once lay down paving, with a view to the general benefit of the district. The committee then call attention to the Hackney paving loans, and to the fact that over 100,000*l.* has, from time to time, been collected from owners for paving new streets. Out of the last loan there was expended 3,606*l.* 2s. 11d. for paving Sidney, Grove, Cassland, Amhurst, Clarence, Downs Park, Downs, London, Eleanor, Loddiges, and Paragon roads, and Lamb-lane, which thus falls upon the general rate; and the question which occupied the earnest and careful attention of the committee was whether these roads were "new streets" within the meaning of the Act, and therefore ought to have been charged on the owners under sec. 105 of the Act of 1855, and sec. 77 of the Act of 1862. The list above given, it may be observed, does not represent the whole of the roads and streets in the district which have been paved at various times out of the general rate, as of course is apparent from the expenditure, but only such as were involved in the resolution of reference to the committee. There are at the present time streets in the district which have been paved out of the general rate on one side only, the other side being still unpaved. To ascertain whether the roads mentioned in the schedule are "new streets" within the meaning of the Act, the committee have directed special attention to the cases of Pound *v.* Plumstead District Board of Works, Dryden *v.* Putney Local Board of Health, and the Attorney-General *v.* Wandsworth District Board of Works. From the facts connected with the roads as regards the Putney case, the committee are of opinion that it may be fairly contended from the further light which the above cases have given upon the subject, that each and all of the streets and roads mentioned in the schedule are analogous with the cases above mentioned, and are "new streets" within the meaning of the Act.

Illustrative and confirmatory of the committee's opinion, they append to the report an appendix, giving the facts of "Dryden *v.* Putney Overseers," setting forth that the appellant had been for eight years the occupier of a house in High-street, Putney, at some distance, and quite separate from, Upper Richmond-road, hereinafter referred to; and the distress was made in respect of part of a rate to which he was assessed in respect of his house at High-street. Upper Richmond-road was an old highway, and had been kept in repair for forty years by rates raised from the ratepayers of Putney. At the time of the passing of the Metropolis Local Management Act, 1855, this road had on its south side an irregular line of houses, but 434 yards out of the entire length of 734 yards were bounded by market gardens, and on the north side there were gardens, except at two places where there were two cottages. Along the south side there was a good raised gravel footpath, and on the north a narrow ill-defined foot-track. Since 1855 the two cottages had been pulled down, and the whole of the frontage land on the north side covered with houses, and in the course of building, the old boundary hedge had been removed and a fence formed; at intervals from 1864 to 1870 the Wandsworth District Board of Works fixed a granite kerb and gravelled the path, which was paid for by the Board out of the general rates of the parish, since which the footpath had been repaired by the Board. In 1874 the Board asphalted the southern footpath, the cost being included in the general rate. Prior to this, the appellant had (in June, 1874) urged the District Board under the circumstances that the road had become a "new street" under the Metropolis Local Management Acts, and that the cost of paving the footpath ought to be borne, not by the ratepayers of Putney at large out of the general rate, but by the owners of the houses and land abutting on the footpath in question. The District Board, however, refused to accede, contending that the road was not a "new street" within the meaning of those Acts. Appellant refused to pay 1s. 6d., part of the amount at which he was assessed to the general rate, on the ground that that sum represented the proportion charged for the paving of the footway,—an expense improperly included in the general rate,—and in consequence of such refusal 10s. 4d. was levied on appellant's goods, by a magistrate's order. It was admitted that 1s. 6d. was the proper proportion of the rate of 1*l.* 11s. 6d. attributable to the cost of the paving in question, and that if the appellant was not liable, as the occupier of his house in High-street, to contribute to the cost of such paving, the rate of 1*l.* 11s. 6d. ought to be reduced by the sum of 1s. 6d. The question for the opinion of the Court was whether under the circumstances above set forth, and having regard to the provisions of the Metropolis Local Management and Amendment Acts, 1855 and 1862, respectively, the appellant, as occupying the premises in High-street, was liable to contribute to the expenses of the above-mentioned paving on the north side of Upper Richmond-road. The case was heard before Mr. Justice Grove and Mr. Justice Quain in 1876, and the decision of the Court was in favour of Mr. Dryden and against the District Board of Works." This important report is fixed for debate at the next meeting of the Hackney Vestry in August, and thence, if adopted, it will be sent to the District Board of Works, where it is sure to be stoutly opposed.

GREEK PAINTING.

MR. NEWTON'S eighth lecture* on Ancient Greek Art treated of Greek painting, for the history of which, the lecturer said, the evidence was of a very slender kind. If we passed over the few traditions about Greek painters in the archaic period of art, the first name of note was that of Polygnotus, who flourished between the end of the Persian war and the beginning of the Peloponnesian war. At Delphi he adorned the walls of the great hall called the Lesche with two great compositions, the Taking of Troy and the Descent of Ulysses into Hades. Pausanias had left us a very full description of these, giving the names of all the figures represented and the order in which they were arranged. We must suppose the more distant

* See vol. XXXVIII., p. 615.

* See p. 24, *ante*.

figures placed above the others, not exactly in parallel lines, but in groups disposed with a certain tendency to horizontal regularity. There was in such compositions no attempt to render aërial perspective. The sources which inspired Polygnotus in great compositions were the "Iliad" and "Odyssey," and the Cyclic poets. He painted also great historical pictures at Athens, in conjunction with Mycon and Panænos. Several attempts had been made to recompose the designs of Polygnotus at Delphi by the aid of the description in Pausaniae, but such attempts, however ingenious, could only be regarded as pure speculations. With regard to the merits of Polygnotus as a painter, our best guide was the authority of Aristotle, who, living in the full maturity of Greek painting as developed by a succession of great masters from Zeuxis to Apelles, emphatically held up Polygnotus for the study of youth as being beyond all others the ethographer or painter of noble character, *ethos*. In thus distinguishing Polygnotus, Aristotle contrasted him with Zeuxis, whose paintings he considered deficient in that quality of *ethos* which was so conspicuous in Polygnotus. In the period immediately following, painting was still further developed by Apollodorus, who made the first essays in chiaroscuro, which were followed up with more brilliant results by Zeuxis, who, to use Pliny's expression, entered the door which Apollodorus had opened. Zeuxis painted a celebrated picture of Helen for the city of Croton, in Lower Italy. Parrhasius, a contemporary of Zeuxis, carried the art still further. He appeared, from Pliny's statement, to have succeeded in bringing out his figures in strong relief by the skill with which the contours were rendered. Neither Zeuxis nor Parrhasius appeared to have painted great historical compositions like those of Polygnotus, but rather isolated groups or single figures. Among the most conspicuous names which are found in Pliny's list was that of Pamphilus, who established a school at Sicyon, where he taught drawing on scientific principles; his scholars, who paid very large fees, drew on boxwood. Pausias, a scholar of Pamphilus, invented encaustic painting, which enabled him to obtain finer and deeper gradations of colour as modified by chiaroscuro. He was thus enabled to accomplish very bold foreshortenings. In one of his pictures an ox was so presented in a front view that the whole length of the animal was suggested. The successive improvements in art developed by these masters led to a power of expression which showed itself in the choice of dramatic incidents, to portray which it was necessary to render transient emotions. Such subjects were the dying mother still suckling her child in the picture by Aristides of the taking of a city, and the sacrifice of Iphigenia, by Timanthes, in which the grief of Agamemnon was expressed by the expedient of veiling his face. Apelles, after having had the benefit of the teaching of Pamphilus, and of the study of the great masterpieces of his predecessors, attained an eminence which entitled him, in the judgment of antiquity, to the highest rank as a painter. He did not appear to have been distinguished for his skill in complicated compositions of many figures; but the grace and charm of his pictures, the harmony of his colouring, and his wonderful mastery over all technical difficulties, were qualities in which he had no rival. He was the Court-painter of Alexander the Great, as Lysippus was his sculptor, and they alone among contemporary artists had the privilege of taking his portrait. Among the most celebrated works of Apelles were his "Alexander wielding the Thunderbolt" and his "Aphrodite rising from the Sea." A contemporary of Apelles, who, through that great master's generous notice, rose suddenly from comparative obscurity into fame, was Protogenes of Rhodes, a painter who, like Leonardo da Vinci, finished painfully and elaborately, attaining thus a perfection which excited the admiration of Apelles, but led him to utter those warning words which had since become a proverb,—*manum de tabula*. Protogenes appeared to have painted very few pictures. His two most celebrated works were his "Ialysus" and his "Satyr in Repose." After the reign of Alexander, there were many Greek painters, but of these no name was very prominent, except that of Timomachus, who lived at some time in the Hellenistic period, and who painted a Medea and an Ajax. Painting in the Hellenistic period had an idyllic tendency, with more or less of landscape in combination with some mythic incident or a scene from real life; it had also a tendency towards *genre*. Examples of idyllic subjects and *genre* abounded in the paintings at Pompeii, where we might also see in the decoration of walls the very style which Vitruvius described and objected to. The lecturer then explained a number of diagrams illustrating the progress of painting from extant examples, among which may be mentioned a figure drawn in an archaic style on an Athenian sepulchral *stele*. This carious example of early drawing is probably of not later date than B.C. 500. A figure of an athlete jumping is engraved on a bronze disc in the British Museum,—date probably about the time of Polygnotus. A fragment drawn on boxwood formed part of a casket found in a tomb near Kertch. The composition engraved on the Ficoroni bronze cista represented Amycus, king of the Bebryces, slain by Pollux. The mosaic found at Pompeii depicted Alexander and Darius at the battle of Issos. There was also a scene representing Niobe, Latona, and their companions drawn on marble, found at Herculaneum. A Roman mosaic represented a battle between a Centaur and wild beasts. Lastly, there was a Pompeian painting of Venus fishing.

HOW GREAT ARTISTS ARE MADE.

WHAT nonsense men scribble on art!
We're sick of their rhodomontade;
Let them turn their eyes to the mart,
Or handle the pick-axe and spade.

Nought know they of sculpture and models,
Of how artists chisell'd or drew;
They've not enough sense in their noddles;
They haven't the least *aperçu*.

Fine skill with mallet and chisel,
Comes not in a swoop from above;
'Tis only those who write drivel
Make genius descend like a dove.

Those touches yclept so divine,
From study come surely but slow
From work till the day doth decline,
Till taper burns dimly and low,—

Come not of intuitive flash:
Man's neither magician nor elf;
Come not of o'er-confident dash,
An easy belief in one's self.

They come not of untutor'd hand,
Of hand without training and aid;
Great artists must first understand;
Each touch and each stroke must be weigh'd.

They come of the resolute will,
From conquest of meanness and sin;
They come of that resolute will,—
That will, which determines to win.

They come by the process of years,
By might of attention and time,
By trouble, by failure, by tears,
By dint of a patience sublime.

METER.

A NEW SISTERHOOD HOUSE AND CHAPEL IN CAMBERWELL.

A SPACIOUS new building, of imposing proportions, is at present in course of erection in Wyndham-road, Camberwell, for the sisterhood in connexion with the Church of St. John the Divine, Kennington. The building consists of two distinct blocks, connected with each other by a corridor. The main building forming the "house," when completed will have a frontage to Wyndham-road 60 ft. in length. The materials of the elevation are red Suffolk brick, with Bath-stone dressings, the building being carried up to a height of 61 ft. to the apex of a central gable, and 55 ft. to the tops of two smaller gables on the east and west sides of the elevation respectively. The structure contains five lofty stories, including the basement, the windows to each floor being mullioned. There is a central Gothic porch entrance, 7 ft. 6 in. in width, projecting 7 ft. beyond the general face of the frontage. The building is carried to a depth of 39 ft., having to the rear a second frontage of an ornamental character, which overlooks a courtyard between the building itself and the other block containing the chapel beyond. This last-named frontage has large bay-windows in the centre, 17 ft. in width, projecting to the extent of 4 ft. The basement portion of the house for the sisterhood contains a refectory, 22 ft. by 19 ft., also a large kitchen, scullery, larder, and other apartments connected with the culinary department of the establishment. The principal entrance leads into a spacious hall on the ground-floor, on one side of which is the superior's room, an apartment 13 ft. by 15 ft., and on the opposite side is the waiting-room. Beyond these, on the opposite side of a corridor, is the community-room, 15 ft. by 18 ft., with glass-rooms on each side. All the upper floors consist of bed-rooms, upwards of twenty in number, together with bath-rooms, lavatories, and every requisite convenience.

A corridor on the west side of the building, between 7 ft. and 8 ft. in width, and 25 ft. in length, leads from the house of the sisterhood to the chapel. On the east side of this corridor an ornamental bay-window, uniform with those at the rear of the house, overlooks the courtyard. The chapel is Gothic in character, and underneath is the parish room, attached to which is a kitchen and separate culinary appliances for furnishing teas and other refreshments to the necessitous in the district. There is likewise a separate entrance to the parish room on the north-east side of the building. The dimensions of the chapel for the private use of the sisterhood are 38 ft. in length by 18 ft. in width, in addition to an aisle 7 ft. wide. The interior of the chapel is intended to be elaborately fitted. All the woodwork throughout both the house and chapel will be stained and varnished.

The buildings together occupy a ground area of about 5,000 superficial feet. The architect is Mr. Frederick W. Hunt, and the contractor is Mr. Downe, of Union-street. Mr. W. Frankland is clerk of the works, and Mr. R. Handley the foreman. The building, which is now being covered in, is estimated to cost about 10,000*l.* when entirely finished.

EPPING FOREST AND THE RE-ERECTION OF TEMPLE BAR.

IT is tolerably well known that the re-erection of Temple Bar has, for some time past, been under consideration by the committees of the Corporation most concerned, and that Epping Forest, amongst other places, has been suggested as the site for again setting up the old City landmark. It is, however, now stated that two of the committees are at present at issue upon the subject, and that whilst the City Lands Committee are strongly in favour of its re-erection on a site in the Forest, and have unanimously passed a resolution to that effect, the Epping Forest Committee, on the other hand, are opposed to the proposal, and have passed an equally unanimous resolution that, in their opinion, Epping Forest is not an appropriate place for the re-erection of the Bar, and that the site to be selected should, as nearly as possible, be adjacent to the confines of the City. We understand that the matter will very shortly come under discussion at a meeting of the City Council, which will have to pronounce a final decision on the differences between the two committees. We fully agree with the Epping Forest Committee; the erection of Temple Bar in the forest would be simply ridiculous.

THE SKELDERGATE BRIDGE, YORK.

AMONGST the various public improvements which are being effected by the corporation of York, the erection of the bridge over the River Ouse at Skeldergate Ferry is one of the most important and costly. One of the principal items of expenditure has been the hydraulic machinery required to open the arch at the Castlegate side of the river, for the passage of boats trafficking on the Ouse. Had it not been for this, the river would have been crossed by one span, as is the case with the Lendal Bridge. The Skeldergate Bridge is the fourth by which the river is crossed in the heart of York. It is designed in the Tudor style. The central arch will have a span of 90 ft., those on each side 30 ft., while the land arches are each 24 ft. span; the height being 22 ft. 6 in. above summer level of river. As to the progress of the works, there is much which yet remains to be done before they can be called really complete. Most, if not all, of the stonework is finished, and the ironwork of all the arches, excepting that of the centre one, is in position. With regard to the large span, operations have now been commenced for the erection of a temporary platform, by means of which the girders may be fixed. Nearly the whole of the hydraulic machinery, which is from the famous workshop of Sir William Armstrong,

of Newcastle, is also laid down. With a view to the improvement of the navigation, a water-wall of considerable length has been made on the Castlegate side, widening the river at this point from 8 ft. to 15 ft. The wall extends from the bridge in the direction of the Blue Bridge about 220 ft., and towards Friars' Walls for a distance of 92 ft. The approaches from Tower-street and Castle Mills Bridge are also in a very forward condition. On the Skoldergate bank the improvement is no less apparent. A considerable amount of property has had to be cleared away, and it was likewise found that a portion of the old walls would have to be removed. This was done, and in order to preserve the ancient character of these historic defences of the city, a small tower has been erected at the foot of the steps adjoining Baile-hill. The clearances mentioned have enabled the corporation to make the approaches to the bridge on this side as complete as possible. All the property which is to fall hence not, however, yet been given up to be demolished, but only a very short time must now elapse before this will take place. The whole of the works in connexion with the undertaking (reserving our opinion as to the removal of the old walls), appear to be of a very substantial character, and to reflect much credit upon the consulting engineer, Mr. G. G. Page, of London, and Mr. Styan, the city surveyor, under whose superintendence they are being carried out.

DEVONSHIRE HOSPITAL, BUXTON.

VERY large extensions have been made to this building, under the direction of Mr. R. R. Duke, architect.

The superficial area now provided for wards is as follows:—For males, 11,614 superficial feet; for females, 10,912 superficial feet; thus providing accommodation for 300 patients.

The centre form of the hospital is an irregular octagon, with an inner circular area of 164 ft. diameter; within this there is a circle of columns 138 ft. diameter, forming a colonnade, 13 ft. wide, all round this inner area. These columns, with their entablature, rise 25 ft. above the floor; and from this panel springs the dome, covering the whole of this area. The dome is formed of wrought-iron ribs, twenty-two principal ones, and twenty-two intermediate ones, secured at the foot to a wrought-iron plate rim and heavy cast-iron girders, connecting the inner area wall and the colonnade, and thus securing a perfectly firm base for the dome. The ribs rise to a height of 50 ft. from the base, or 75 ft. from the floor-line, and are there secured to a wrought-iron ring, 40 ft. diameter, from which springs a lantern light, also having 40 ft. diameter, and being 18 ft. high. On the apex of this there is an ornamental finial, 25 ft. high, thus giving a total height from floor to roof of lantern of 93 ft., and to top of finial of 118 ft. In addition to the lantern light above named, there are eight other sky-lights on the roof, at the base of the dome; and together they give 4,500 ft. superficial of light to the central hall. The superficial area of this hall is just half an acre; and it is capable of holding 6,000 people. Its cubic contents are about one million of feet, a remarkable work.

SALE OF LAND, FULHAM.

THE United Land Company enlimited to public competition by auction last week, at the Windsor Castle, Hammersmith, 64 plots of freehold building land, being the first portion of "The Greyhound-road Estate," Fulham. Mr. Belton, secretary and auctioneer to the company, conducted the sale. For the plots, 16 ft. frontage and about 50 ft. deep, the prices given ranged from 69*l.* to 82*l.* each; the corner plot, of 20 ft. frontage and 53 ft. in depth, realised 134*l.* The six shop-plots, fronting on Greyhound-road, with frontages varying from 16 ft. 6 in. to 18 ft. 6 in. and a depth of about 80 ft., ranged from 156*l.* to 170*l.* each.

The sale was held under the usual conditions of the society, *id. est*, no charge for conveyance, or for roads and sewers, these having been constructed. There was a good attendance, and the acquirement of the property was keenly contested. The whole, which was disposed of in about forty minutes, realised the sum of 5,566*l.* Leaving out of consideration five plots which were much wider at the back than the front, in consequence of the position being a corner of the estate, the land may be stated to have been sold at 5*l.* 5s. 5d. per foot frontage.

MEMORIALS OF ROBERT RAIKES.

A STATUE of Robert Raikes, the founder of Sunday schools, has been set up on the Thames Embankment in the enclosed garden near the obelisk. It was unveiled on Saturday, July 3rd, last. It was designed and modelled by Mr. W. Brock, of Osnaburgh-street, and has been cast under the direction of Mr. James Moore, at the foundry of Messrs. Drew & Co., of Thames Ditton. The figure is of bronze, and 9 ft. 6 in. in height. The pedestal is of Cornish grey granite, and has been executed by Messrs. Freemen & Son, of Penryn. It bears the following inscription, which gives its history in a very concise form:—

"ROBERT RAIKES,
FOUNDER OF SUNDAY SCHOOLS,
1780.

This statue was erected under the direction of the Sunday School Union by contributions from teachers and scholars of Sunday Schools in Great Britain.
July, 1880."

The height of statue and pedestal together is 20 ft. 6 in. The figure is beautifully modelled, and stands well. The pedestal is on two steps, and produces an agreeable outline; in fact, the work as a whole must be pronounced very successful.

In Essex-street, Strand, hard by, another memorial has been set up to Raikes and other originators of Sunday-schools, going as far back as Cardinal Borromeo, in 1560, almost as if protesting against the position assigned to Raikes, placing him last on the roll instead of first. It is erected in the fore-court of Essex-street Chapel, and so placed that it cannot be seen excepting when in front of it. The pedestal, designed by Mr. Hugh Stannus, is of Portland stone and polished granite, and is surmounted by the figure of a boy (at present only in model) sitting on a school-box, holding a book in his hand, and looking upwards. The figure, also the work of Mr. Stannus, is characteristic, if somewhat small. The hands seem abnormally large. It is to be executed in marble.

ROYAL ACADEMY STUDENTS.

THE following gentlemen have been admitted:—

First-class Students.—E. J. Milner Allen, G. H. Coldwell, C. W. Davies, F. W. Kite, F. C. Lees, W. J. Millard, E. C. Shearman, L. Stokes, W. H. Wood.

Second-class Students.—A. M. Calderon, C. T. Fagg, J. B. Gase, A. Keen, W. F. Keen, W. R. Lethaby, E. A. Ram, B. A. Ravee, E. W. Smith, T. D. Wheeler, C. C. Wilson.

Probationers.—W. T. Allen, H. R. Beet, C. Burton, J. C. Carter, R. M. Gruggen, A. Hemingway, E. W. Jennings, J. N. Johnston, W. E. Lloyd Jones, E. Nevinson, J. F. Newton, F. Simpson, E. J. Slow, P. Thicknesse, G. W. Winchester.

DAMAGES AGAINST A DUBLIN BUILDING FIRM.

IN the Court of Exchequer here, before Mr. Justice Lawson and a common jury, *in re* William Byrne *v.* Michael Meade & Son, this was an action to recover damages for personal injury sustained through the alleged negligence of the defendants, extensive builders, of Great Brunswick-street, in this city. The case of the plaintiff, who is skipper of the yacht *Avalanche*, was that on the night of the 27th of February, when passing the new Town Hall, Kingstown, which is being erected by the defendants, a plank fell from off the scaffolding, hit him on the head, and inflicted such injuries as confined him to bed for five weeks afterwards. For the defence it was pleaded that the plank, which was secured with reasonable care, came down in a great gale the night before the Tay Bridge accident, and that the defendants were not responsible. His Lordship said the defendants, though not morally, were legally, responsible. The jury found for the plaintiff, assessing the damages at 40*l.*

Exhibition of Industrial and Art Productions, Manchester. — An International Exhibition of this kind is to be held under good auspices in the Agricultural Hall, Cornbrook, Manchester, in August and September next. Some particulars are given in our advertising columns this week.

SHARING COMMISSIONS.

MR. GLYNN, instructed by Mr. Walker, appeared for Mr. E. G. Wyatt, an architect, who sued for 10*l.* 18s. 1d., commission due to him by Messrs. R. & S. Batstone, quantity surveyors, for whom Mr. Metcalfe appeared, instructed by Mr. Angier. Defendant paid 3*l.* 6s. 1d. into court, and the dispute was concerning an item of 7*l.* 12s.

Mr. Wyatt deposed that he had been for four years manager to Mr. Collins, architect, and work was frequently sent to the defendants. The arrangement as to commission was, that Mr. Collins had two-fifths of their commission on the work, and he as manager had one-sixth of the balance. This item of 7*l.* 12s. was a commission on quantities taken out with respect to Storn House.

Mr. Metcalfe, for the defence, stated that plaintiff had agreed to forego this item.

Mr. Glynn said the law knew nothing of the abandonment of a claim without consideration, and this plea was worthless, even if plaintiff had foregone the claim, which he denied.

Mr. Roland Batstone deposed that their commission for the Storn House was 80*l.*, and the plaintiff's share 7*l.* 12s., but there was difficulty about the payment of the account, and they were offered 6*l.* 14s. 6d. as a settlement. They consulted Mr. Collins, who agreed to take 12*l.* rather than have his client sued in the matter, and Mr. Wyatt said that under the circumstances he would have no commission at all.

Mr. Sydney Batstone stated that he was in the office with his brother and Mr. Wyatt, when, in talking of the matter, Wyatt said he would have no commission on Storn House, and walked out. His brother said he would prefer to pay, followed Mr. Wyatt, and when he returned said he had arranged to pay him. His share of the commission received would be 4*l.* 8s.

The jury found for the plaintiff for 4*l.* 8s. beyond the amount paid into court.

PAYMENT FOR QUANTITIES BY BUILDERS.

DIFFERENCES.

SIR,—I was very pleased the other week to see you again open your valuable columns for the ventilation of this vexed question.

I read the letter of Mr. Scott [p. 778, last vol.] with some interest, and beg to refer him to my former letter on this subject, which you so kindly published in your issue of February 7th, 1880, and there he will find I made a direct attack on the Metropolitan Board of Works which they had not the courage to defend.

I am not a member of the Builders' Society (?) (so called,—for I do not know of any great work, either good, bad, or indifferent, it has ever accomplished), but if it will give me an invitation, I will deliver a lecture on "The Foolishness of Builders and the Knavery of those with whom they deal."

With your kind permission, I will give my opinion of the only straightforward way for an architect to obtain tenders for his client.

After the drawings are completed, let the architect take out the quantities in his own office; then, instead of expending a large sum on lithography, use a papyrograph, or any one of the many modes for reproducing several copies, and so let the office-boy save his client some 20*l.* or 30*l.* When the quantities are ready, instead of advertising for tenders, invite a few builders he may know, or some few in the immediate neighbourhood of the work, instead of inviting "the tag-rag and bob-tail" of England to tender for, perhaps, an important building in London, and then to let some unheard of man from the North or South jump into notoriety by carrying out, perhaps, one of our largest London works.

I shall be slightly wandering from the subject-matter in hand, but you will, I trust, pardon this digression, when I tell you how disgusted I feel to see such things before me as appear in your issue of May 8th, 1880, which happens to be lying before me. The first in the list of tenders is for the erection of the Staines Town-hall, where twenty-four builders compete for a 5,000*l.* job. See the result! The highest, that of Messrs. Cadee & Sons, amounts to 7,222*l.*, while Mr. Brunsden accepts the contract for 4,797*l.*, a difference of 2,425*l.*, with *quantities supplied*. The next list of tenders is even far more startling; but in this case quantities were *not* supplied, in which case the builders might have been stupid enough to cube the building (the most idiotic piece of performance I can imagine), when nothing better could be expected than Lidstone, 3,711*l.*, Temple & Foster, 1,845*l.*, a difference of 1,866*l.*

Now, had the architects acted upon the principle I have suggested, this, I feel sure, would not have happened.

By-the-bye, I do not quite understand why quantities cannot be issued for road-making and drainage works, so avoiding the great difference in the tenders one almost always sees when-

ever drainage works, &c., are put to competition and the lists of tenders made public.

I noticed something last week I cannot pass over, and it seems still more glaring and disgraceful than anything I have seen for some time (although I could enumerate instances by the dozen); it is for repairs, &c., at the Lion Brewery. Sharpe & Mills ask 3,330*l.*, and Mr. Allen 5044.,—a difference of 2,726*l.* No quantities supplied, it is true; but who is to blame? Some one, surely. I scarcely like to offer any suggestions, such as a vague specification, &c., but will simply confine my comment to the injustice of taking up the valuable time of some ten or twelve builders, and causing them to neglect other important work, or a useless expense in paying a clerk to plod through perhaps a long specification, and trudge up and down stairs probably *all* over a gigantic building like the Lion Brewery. I may add, *en passant*, that I hope the beer is not the culprit; it could not have been the weather, and I should scarcely think it was the change of Government.

I am acting wrongly in jesting upon a subject so serious, but I am anxious for both architects and builders to agree that either builders should be paid for their time in giving a tender, or quantities should be issued, which ought only to involve a small amount of time and expense.

I do not wish to ventilate all the grievances, imaginary and real, under which builders labour; for the reason that they are unfortunately far from perfect themselves; what I do wish to do is to obtain a remedy for some of them.

ELLIVREMOS.

ON THE ADJUSTMENT OF PROPORTION TO SIZE.

SIR,—The suggestion of "Meter" is ingenious because it seems so simple, but it is scarcely conclusive. "Distance," he may read, "lends enchantment to the view," and objects lessened by distance may not have their effects under the same law as those produced by mechanical reduction. If "Meter" will visit the Elgin room of the British Museum, he will see proportions, in the half-scale figures of the frieze, which he would hardly welcome in statues of heroic size. He may be sure that there are some grounds for what "Torenticos" alleges; and that the question of agreeable proportions varying with scale in the higher departments of formative art is not so much "in a nutshell," or so easy to crack, as may be supposed by some. It may be one of the *nuxæ*, or rather *nuces difficiles*, and yet no trifle. It is just one of such matters as, by affording a corner to the discussion of it in your columns, enable you to confer a boon on art. B.

MR. RUSKIN AND BAD WORK.

SIR,—Will you grant me space in your paper to say a few words relative to Mr. Ruskin's tirade against shoddy and "scamped" workmanship? It must be highly gratifying to every workman of taste and culture (and there are many such in all branches of trade) to find such an authority as Mr. Ruskin declaiming against inferior workmanship and shoddy products. In writing to Mr. Holyoake, he imputes too much blame to the British workman as being eager to do bad work, and rob his employer on the sly. The labour market abounds with men who, through incapacity and want of application to generate and cultivate a love of taste in themselves, are necessarily bad workmen. On the other hand, there are plenty of workmen to whom, even in their own particular occupations, "a thing of beauty is a joy for ever." Such are essentially good workmen, and will try to make the best possible job of everything they take in hand, if permitted to do so by their employers. Workmen do bad work either through inability to do good or through a desire to make as much money out of the job as possible, which is the case when the work is sublet to them, or because their employers demand quantity instead of quality; but no man does bad work for the mere sake of doing bad work, as Mr. Ruskin would have us believe.

The British workman of to-day will compare favourably with the mechanic of any age or nation. If it were not so, of what avail would be our numerous technical classes scattered all over the kingdom, the science and art schools, and the bulk of technical journals that teem weekly from the press? Let our architects exact good work, and they will find skilled workmen not wanting in ability to rear the "cloud-capp'd towers, the gorgeous palaces, the solemn temples," which, in delicacy of touch and finish, shall vie with the grand architectural monuments of ancient Greece and Rome.

J. F. WALKER, Bricklayer.

LODGINGS IN LONDON.

FLATS.

SIR,—Allow a mechanic to tell "A Working Man" what living in some flats in London really is. Let him go through London and look at the vast dismal blocks of bricks and mortar without a single redeeming feature of cheerfulness or the picturesque. To secure a comfortable and healthy home I went to live in a block at Kensington, and took (having only a wife) one of the smallest suites—a room and a half. For this I pay 7*s.* 6*d.* per week in advance—i.e., 5*s.* per week per room. The occupants before me were a man and wife and five children. The place, when I took possession, was dirty and swarming with vermin. No water could be turned on to the w.c. The top of the boiler was cracked, and worn in holes, so that the water was black with soot. The tap leaked so fast that the place was often flooded. After repeated applications, and waiting for months, the Cerberus of the "Improved Dwellings" came, grunted out that he was not going to wait on people, and plastered the holes with whitelead in an almost liquid state. In another two months he repaired the tap so that it would not turn at all. The sides of the chimney that were nearly falling down he only shook his head at. The duty of this official is to let the rooms; receive 6*s.*, independent of the rent to cover any damage that may have happened to the fixtures (which are of the most obsolete pattern and inefficient kind); answer no questions, give no information. There is another official who comes to the minute every Monday to receive the rent in advance. This is his only duty, which takes about half a minute per tenant to perform. The owner lives in a palatial residence, with a retinue of twenty servants. To attempt to make any acquaintance with him is certain dismissal. I have been here nearly a year, and no sanitary inspector has ever called; in fact, he dare not enter the place, except to give a highly flattering report, as occasion may require.

Now, sir, I contend these places are in many instances much worse than the small houses and cottages they are supplanting. They are owned by wealthy individuals, companies, or corporations, and the sanitary inspector, who is always overhauling the small capitalist, dare not criticise these places. Again, the tenant, in case of grievance, can appeal direct to the landlord, who, in many instances, comes himself for the rent. In the block system, some Jack-in-office is interposed to do the dirty work. And, lastly, the exorbitant rent charged for the tenements intensifies the very evil they are supposed to remove,—overcrowding.

Is it not a delusion to pretend to elevate the working classes, and at the same time allow this state of things to exist? Of what use are School Boards, magnificent schools, and churches, and all the institutions for the improvement of the masses, when home, even in the lowest sense, is made an impossibility to the industrious by the greed of the very class who profess to care so much for the advancement of their fellow creatures? Here in the richest part of London, with a royal palace and gardens, a magnificent parish church, and town-hall lately erected at a cost of many thousands, and also teeming with institutions patronised by royalty, there cannot be found any public-spirited people to erect plain and comfortable homes for the working classes, not as a charity or gift, but as a matter of business to return a fair dividend on the money laid out. The way the working classes are, in many instances, herded together here is a disgrace to any civilised country; and this in the richest part of the metropolis of the Christian world.

A POOR MECHANIC.

PROVINCIAL NEWS.

Hereford.—The foundation-stone of the new Foresters' Hall and Working Men's Club here was laid on the 14th ult. The premises consist of two dwelling-houses in Widemarsh-street, Hereford, the upper floors of which will be used for club purposes. The Assembly Hall will be erected in the rear of the club premises. It is intended to seat 500 persons. The style of architecture adopted is an adaptation of Romanesque. The tender of 800*l.* submitted by Mr. Thomas Lewis, builder, Hereford, has been accepted for the execution of the work, which is to be carried out from designs by Mr. Geo. Cowley Haddon, Hereford and Malvern, architect.

Rossendale (Lancashire).—The prospects of the building trade are reviving in this district. The parish church of St. Mary's, Rawtenstall, is to be enlarged and partially restored from the designs of Mr. L. Booth, of King-street, Manchester. Other works which the same architect has in progress in the neighbourhood are three large blocks of middle-class dwelling-houses for the Rawtenstall Industrial Society, a constitutional hall and club-house at Stacksteads; schools, &c., for 700 children in connexion with Trinity Church, Stacksteads; and schools for 600 children in connexion with the new district of St. John's, Rawtenstall, the latter to be followed by a church and parsonage-house. All the buildings are being erected of the excellent stone for which the district of Rossendale is noted.

Newcastle-on-Tyne.—Extensive stables are in course of erection in Percy-street, for the Tramway Company. The new range of stables stands on what was known as the Percy Gardens. The site is of an irregular shape. The buildings, which cover nearly three-quarters of an acre, are approached through George-place in the Haymarket, entrance being obtained by a bold archway, through which the cars coming from north or south, and crossing the Haymarket by the line now being laid down, pass to the numerous lines and sidings to be laid in the car-sheds. There are three car-sheds, one of 43 ft., one of 28 ft., and one of 16 ft. span. These will shelter about twenty cars, and the lines in the open yard will give standing-room for twelve more. Adjoining is a spacious workshop, having sidings for cars under repair, one of the sidings being over a sunk pit, which will give facilities for repairing the bottoms of cars. The stables are built in two ranges, the east range being divided into eleven compartments, one of four loose boxes, one of eight stalls, and nine of ten stalls each, the idea being to keep each man to his own horses, for whose proper management he can be thus better held responsible. The west range is one long stable of ninety-seven stalls. It was originally intended to arrange this group also in compartments of ten each, but the lessees, looking forward, are prepared to convert this range into an engine-shed should steam come into general use for tramways. An arch has been formed in one end wall with this object, capable hereafter of being opened out, the stable-fittings removed, and lines laid down for steam-cars. The whole of the doors to the stables run on top-rails, suspended by Hatfield's patent rollers. The work is being carried out from the designs and under the immediate superintendence of the architect, Mr. Edward Shewbrooks, Newcastle, by Messrs. Middlemiss Brothers, of Corbridge; Mr. Humphrey Atkinson, of Blaydon; Mr. John Pattison, Messrs. C. and G. Nicholson, and Mr. John Whitelaw, Newcastle, the contractors for mason and bricklayer, carpenter and joiner, plumber and gasfitter, slater and painter, and glazier works respectively.

STAINED GLASS.

Highbury.—Messrs. W. James & Co., Kentish-town, have just placed a stained-glass window in St. Augustine's Church, Highbury New Park, for Mrs. Hextall, of Canonbury House, Canonbury-square, in memory of her late husband, Mr. Henry Clay Hextall. The same firm have also done some decorative work in the church.

Yeadon.—Yeadon Town Hall has, by the liberality of Messrs. J. M. Barwick, of Low Hall, and A. Braysbaw, of Yeadon, been provided with two large six-light stained glass windows designed and executed by Messrs. Powell Bros., Park-square, Leeds. The subjects are illustrative of the staple woollen cloth industry of Yeadon. The one exemplifies sheep-shearing, following the description, by Thomson, the poet of the "Seasons"; the sheep lies "bound," and is being "of its coat bereft" by the "tender swain's well-guided shears." The companion-window portrays antique spinning and weaving in simple forms. The loom, verified in and copied from the British Museum Antiquities, is one which is believed to have been common to the early Syrians and the East, and to the Egyptians; and such as is probably yet to be found in the tents of the Arabs of the Sahara, and in the huts of the Impongwe and other native tribes of West Africa, whose cloth is woven from palm-fibre. Over this loom a Syrian man bends at his work; by his side sits a Syrian woman supporting a distaff with one arm, whilst her hands are engaged in spinning with a spindle according to the fashion in vogue before spinning-wheels were. Ten blazons of arms enframe the subjects, including those of York county and the Clothworkers' Company, and riband legends, traversing the open but enriched spaces, record the dedication of the gifts to "the people of Yeadon."

Pensford.—The east window of Pensford Church has been filled with the subject of the Transfiguration, in stained glass. The figure of our Lord occupies the centre of a glory, Seraphim and Cherubim in bright apparel holding converse with Moses and Elias, who stand on the right and left of our Lord, the one with the two tablets and the other with the camel's-hair robe illumined with the radiance of the central figure. Divided from this group by a band of clouds are the Apostles John, Peter, and James. The window was executed by Messrs. Camm, Brothers, of Birmingham.

PARLIAMENTARY JOTTINGS.

The Houses of Parliament.—In the House of Commons on the 1st inst., Mr. Schreiber asked the First Commissioner of Works when he intended to complete the mural decorations of the Central Hall of the Houses; whether he was in possession of the designs for the three vacant panels, and at what cost each panel could be filled in with mosaics? Mr. Adam.—The question as to the best mode of filling in the vacant panels in the central hall has given rise to much discussion, and was very fully inquired into in 1870 and 1871, but no definite conclusion was arrived at. I am of opinion that the vacant spaces should be filled up, but I am unable, without further consideration, to state when this can be done. No designs exist for the vacant panels. The cost of the panel already filled in was about 675*l.*, but I am unable at present to say what will be the cost of filling in the vacant panels.——On the same day, in answer to Mr. D. Grant, Mr. Adam said,—The question of lighting the House and approaches by the electric light has received and is receiving careful consideration. I will take care that it continues to receive full attention, but I am not prepared at present to recommend any definite course of action on so important a question, involving much change and alteration of existing arrangements, and which ought not to be finally adopted without going through the test of careful experiment.

The National Gallery.—Mr. Coope asked the First Commissioner of Works whether he was able to lay upon the table of the House the resolutions adopted by the Trustees of the National Gallery as to giving increased facility for admission to the public; and whether he was prepared to state what action the Government was willing to take in the matter. Mr. Adam.—The copy of the resolutions passed by the Trustees of the National Gallery, and their remarks explanatory of them, have been laid on the table of the House, and will shortly be printed. The initiative in this matter rests with the Trustees, and not with the Government; but the latter will be prepared to consider any proposals that may be made to them on the subject, with the view of giving, if possible, increased facilities to the public and students.

UNDERGROUND RAILWAY COMPLETION SCHEME.

THE Metropolitan and Metropolitan District (City Lines Extension) Bill was under consideration last week by a committee of the House of Commons. For the promoters, the first witness called was Sir Edward W. Watkin, M.P., chairman of the Metropolitan Railway Company, who went at length through the various negotiations which had taken place between the promoters and the Corporation and the Metropolitan Board of Works, for the joint construction of the railway and the new streets He said that 400,000*l.* was offered towards the widening of Eastcheap and Great Tower-street, a length of about 670 yards, and this he considered to be a "monstrously liberal" proposition from two small companies, with a large burden on their backs, who were the largest ratepayers. Their proposal was, however, refused, and they were asked first to make streets, which they had no business to do; and secondly, to take the whole risk of making these streets, as regards compensating all the City people whose cases would be brought before the Lord Mayor's Court. This they could not do, but they ultimately agreed to give 50,000*l.* more, or to pay a rent of 50,000*l.* a year if the public bodies would make the streets, the railway, and the stations. If, in order to make this railway, they had to pull down the most valuable property in the City, it would not be done. Therefore they must do one of two things,—either go under the property where necessary without pulling down, or they must have such a contribution from the public who make the streets as would pay for pulling the property down. The railway companies paid rates to the amount of 35,000*l.* a year, though they did no damage to the upper surface or streets, or anything else, and there was no obligation upon them to make streets with their shareholders' money; but their object was to follow the intimation of the joint report of 1864-5, and do their best to co-operate in a great public improvement; and he was enthusiastic enough to feel that it would be a grand thing to stand on the steps of St. Paul's and look down a fine street to the Tower. But, as it appeared there were to be no new streets, they came now to Parliament to get power which would enable them to make the railway without streets, as every conceivable attempt on their part to induce the great public bodies to do what was right and just had failed. By the Bill they sought power to burrow under City property without being compelled to take the whole of it; and in cases where they went through the basement or sub-basement to compensate only those whom they disturbed, without being compelled to pay compensation also to the tenants of the ground-floor or upper stories, whose business was not affected.

Mr. J. Wolfe Barry, engineer to the railways, stated that, as the width of Eastcheap was only 34 ft., and Great Tower-street only 24 ft., and the width required for the railway tunnel was 38 ft. to 40 ft., they would have to go under some of the houses, as the street was not to be widened. There was no engineering difficulty in doing this without disturbing the tenants, or any other portion of the buildings than the cellars and basements through which they passed. If they did not burrow, but were compelled to pull the houses down, it would involve immense sums for compensation. In a house at the corner of Mark-lane there were thirteen occupiers, and on the other side nine occupiers; in the next house there were eleven occupiers, and on the opposite side of the street thirty-four occupiers, none of whom would be interfered with except the occupiers of the basement and sub-basement. The tunnel would be about 10 ft. high in the cellars to go under the street. They did not take the ground-floor in any case. They would in some cases interfere with the traffic during construction.

Sir J. Hawkshaw, the joint engineer of the line, gave similar evidence, and said that in his judgment the interests of the owners and occupiers were amply protected. Work could be carried on in the upper stories of the houses during the whole time of construction. In making the East London Line there had not been a single crack in consequence of the burrowing. If vibration were caused it would be a matter for compensation.

Mr. Barlow, president of the Civil Engineers, said the effect of the railway would in many cases be to put good foundations where they were now defective. If the works were executed properly there was no fear of subsidence.

Mr. Forbes, chairman of the Metropolitan District Railway, gave similar evidence to that of Sir E. Watkin, and said they were not prepared to risk the responsibility of obtaining property from the new street upon the terms which had been indicated by the public bodies. The sum which their surveyor estimated would be required for the purchase of lands by the City and Metropolitan Boards was 1,080,000*l.* That was part of a much larger sum attributable to the formation of a street.

Mr. Ritchie, surveyor to the companies, gave instances where great saving would be effected by narrowing instead of being compelled to take and pull down valuable premises containing large numbers of tenants. In Great Tower-street, in almost every case there would be no disturbance of business. He had not found people unwilling to build over underground railways. He instanced Victoria-street as a place where mansions were built over a railway. That was precisely the same position which these offices in the City would occupy. In cross-examination he said the line could not be constructed unless it was done on the most economical principles. His estimate was 1,171,000*l.*, on the basis of the properties having to be purchased and businesses compensated for.

This evidence practically concluded the case for the promoters of the scheme, which is opposed by the Corporation of London, the Metropolitan Board of Works, and several of the City companies.

The Bill again came before the Committee on Tuesday last, when evidence in opposition to the scheme was given.

Mr. Hyman Henry Collins, architect, examined on behalf of the Metropolitan Board of Works, said he was district surveyor of the eastern division of the City of London, and surveyor under the Dangerous Structures Act. He viewed with apprehension the powers claimed in this Bill for going underneath the houses and not pulling them down. That course did not commend itself to him as a thing which might be safely and wisely done. It would greatly increase his duties, and entail very heavy responsibilities upon him. Many of the houses are very old, with shaken, bulged, and defective brickwork; they are tied in with iron ties, most of them from time to time altered, cut about, the brickwork cut away, and generally rendered very weak in construction; part of them have at the present moment the basement timbers shored up. The party-walls of these old houses, as a rule, particularly in this immediate locality, are generally filled in with decayed timbers, and the bricks composing the walls themselves are ordinarily found to be of a soft red and rotten clay: they crumble, and you can pulverise them. Another question of very great importance to the City is that there are chimneys built outside sometimes as much as 4 ft. wide; the chimney-breasts have been cut away on the ground-floors in order to obtain space, and really an overhanging mass has been left to drag on the party-walls. In addition to that, the party-walls themselves are only 14 in. thick, and sometimes, higher up, only 9 in. thick. Very often the whole of the back walls are entirely carried on girders and iron columns, and many of the front walls are entirely of iron and glass construction. That, by concentrating weight on certain points, adds another element of danger. The soil in the City, especially to this part near the river, is of a particularly treacherous nature, and sometimes he had gone down himself in those old buildings, and those which he had to survey, and he had found as much as 20 ft. or 30 ft. of *débris* and earth. In consequence of the nature of the ground, the walls are in some places supported on timber or plank foundations. These old buildings have been newly-faced in many instances. They are in no way bonded up by brickwork, and the slightest disturbance cracks them from top to bottom. If it was attempted to underpin those old buildings he thought they would inevitably fall, whatever care might be taken. His everyday experience told him this would be the case. He should be sorry to say that works going right through the middle of the basement and cellars of houses could safely be carried out. Judging from hundreds of houses, he never knew an instance in which there was not some slight settlement where an underpinning had taken place. He referred to work executed under able architects and engineers, such as Colonel Haywood, the engineer to the Commissioners of Sewers, Messrs. Mowlem & Burt. He knew instances in the City where the foundations, since they had been underpinned, were still sinking.

Mr. Reginald Roumieu, architect and surveyor, said his father was architect of Messrs. Hill, Evans, & Co.'s premises in Eastcheap, and he described them in detail. It was a heavy building, of a very strong and substantial character. It went down 19 ft. to the top of the foundation. The effect of making a railway under the front wall would be such that he should not like to guarantee its stability. He agreed with Mr. Collins's evidence very much.

Mr. Thos. Tayler Smith, architect and surveyor, called on behalf of the Cutlers' Company, described their property at the corner of College-hill and Cloak-lane. The Cutlers' Hall and adjoining houses were over 200 years old. They were fairly well built, but were very old. He thought oscillation would tend to bring them to the ground, as they had very small piers. Tenants of the company in Houndsditch had complained to him of the effects of the underground railway. The Metropolitan Railway runs within 10 ft. or 11 ft. of 1, White-street, and the oscillation was very great indeed. It was the property of the Cutlers' Company. In Blomfield-street the shaking of the premises was such that it prevented his taking offices there.

Mr. Price, estate agent and surveyor (of the firm of R. Ellis & Son), examined by Mr. Michael on behalf of Sir H. W. Peek, the Drapers' Company, Mr. Jeremiah Colman, and others, said since the passing of this Company's Act of 1874 he had found great difficulty in dealing in any way with the property in Great Tower-street or Eastcheap, either in letting or re-arranging leases. At present his firm had between 6,000*l.* and 7,000*l.* a year to let in those streets. He knew no street in which there was so much property to let as in Great Tower-street. Clients often refused to look at anything in the street because they would not go into a property likely to be taken by a railway company, or where they would suffer annoyance from the construction of works. In

one case they had to reduce the rent from 150*l.* to 110*l.* solely in consequence of the dread of this railway coming.

Mr. Charles Riley, of St. Swithin's-lane, surveyor to the Drapers' Company, said he thought their property would be deteriorated in value by this railway, as it would affect the stability of the buildings. The damage would be very difficult to ascertain for some time. He feared there would be very considerable settlement of the buildings. Basements were very valuable accessories to other parts of the property, and particularly in this vicinity. In some premises occupied by wine-merchants the basements were 20 ft. deep. It would be difficult to construct such cellars near to a railway tunnel. The Drapers' Company had eight houses at the Corner of Philpot-lane and Eastcheap. The lease expired Lady Day, 1879. They were re-let at a considerable increase on the letting twenty-one years ago, but as a matter of fact one of the tenants was now paying less than he paid on a sub-lease taken twelve years ago, so that there really had been a depreciation.

The proceedings were again adjourned.

TERRIBLE GAS EXPLOSIONS IN LONDON STREETS.

THE neighbourhood of Tottenham Court-road was on Monday evening the scene of a series of terrible explosions of gas, which killed two men, seriously injured many other persons, and wrecked as though by bombardment a large number of houses. This calamity occurred in the district between Bayley-street (formerly Bedford-street), on the east side of Tottenham-court-road, and the northern end of Charlotte-street, Fitzroy-square, a distance of over half a mile, along which route new gas-mains, 36 in. in diameter, have just been laid down by the Chartered Gas Company in renewal of their old supply system. The work of laying these mains has occupied a considerable time, and was in the hands of two different contractors, the junction of the eastern and western ends being intended to be made in Bayley-street, near the spot where it joins Tottenham-court-road. The undertaking was nearly completed. On Monday evening, two men, named Alfred Davis and William Burr, were in charge of the Bayley-street ends of the mains. Various suggestions have been made as to the way in which the charged mains were fired. All that is known for certain is that about seven o'clock there was at the Bayley-street junction of the pipes the flash of an explosion and the rising of a vast amount of flame into the air. This was immediately followed, at about 40 yards' distance, in Percy-street, by the upheaval of the ground, the throwing up of the paving-stones, and the rending down of the iron palings before the houses, accompanied by a rumbling like that of distant thunder. Before the beholders could turn, at the distance of about another 40 yards, the same thing occurred again, flame bursting from the earth. The explosions shook the adjoining houses, and damaged them from the foundations to the roof. These explosions followed each other from east to west. Fifty yards from the third explosion, in a north-westerly direction, is the southern end of the long thoroughfare known as Charlotte-street, Fitzroy-square, and at the junction of this street with Percy-street a horse and cart came past, driven by a man, as the third explosion occurred. The horse started and rushed on just sufficiently to save itself and the driver from the ruin of a fourth explosion, which occurred opposite Nos. 1, 3, and 5, making a terrific gap in the street, exposing the whole foundations of the houses, and casting up the contents of the underground cellars. The next explosion did not occur for nearly 80 yards further, where, opposite Nos. 27 to 31, another upheaval of the street occurred, a burst of flame, the shaking of houses, and the laying bare of the foundations following in a similar manner. Between 200 and 300 yards from this spot the gas again exploded, downwards as well as upwards, bursting in the sewers, destroying the water-pipes, and very greatly damaging the houses. The seventh explosion was in the four-cross way formed by Howland-street crossing Charlotte-street. East and west a large main runs, of the same dimensions as that down Charlotte-street, which it receives. Part of the Charlotte-street main burst in the middle of the road, upheaving the earth, but causing here no other damage. This last explosion appeared to nearly exhaust the gas, for though there was at other places a sinking in the ground showing indications of explosions, there was no further casting up of fire and earth. The unfortunate man Alfred Davis was taken to the Middlesex Hospital, and was pronounced by the house-surgeons, Mr. H. Smith and Mr. Palmer, to be dead. His companion, William Burr, aged 30, had his leg amputated in the same institution, and died on Tuesday morning. There were also admitted into the hospital several persons who were injured by the explosion.

The damage to property was extensive. Nos. 15, 16, and 17, Percy-street, at the scene of the second explosion, are more or less damaged. At Nos. 6 and 7, opposite to which the third explosion occurred, the foundations are laid open, and the front of No. 6 presents a wrecked appearance, and No. 5 has also sustained great damage. The roofs of these three houses are injured by the paving-stones, which were hurled up with terrific force from the road. The fourth explosion wrecked the lower parts of the houses Nos. 2, 3, and 5, Charlotte-street; the fifth shook very much the houses numbered 27, 29, and 31; while the sixth damaged Nos. 103 and 105. A great part of the neighbourhood was without gas for some hours, and from this cause the performances at the Prince of Wales's Theatre had to be stopped.

However this terrible occurrence is to be accounted for, it is remarkable that the explosions, occurring as they did at intervals along a route which crosses so crowded a thoroughfare as the Tottenham-court-road, should not have been the cause of a much greater loss of life.

The St. Panoras Vestry held a special meeting on Wednesday, and after viewing the scene of the calamity, and discussing it in its legal aspects, resolved,—

"That Mr. W. B. Scott, chief surveyor, be instructed to report fully on the circumstances connected with the recent explosion in Tottenham-court-road, Percy-street, Charlotte-street, and Howland-street, especially as regards the extent of the damage done to the property and works in the charge of the Vestry, including as they may be affected by the damage done to the various vaults, walls, and the areas of the houses along the line of the casualty, such report to be accompanied by such plans as may be necessary to illustrate the recital of the circumstances."

THE EMPLOYMENT OF CORPORATION ARCHITECTS.

THIS subject was discussed at length by the Birmingham Town Council on Tuesday last, and evoked an animated debate. Alderman Heaton moved:—"That the General Purposes Committee be instructed to inquire into the desirability, or otherwise, of appointing an architect who should undertake the whole of the Corporation work, except on such occasions when it may be deemed desirable to invite the assistance of professional gentlemen having special qualifications for what may be required. And with a view of enabling the Council to come to a decision on the matter, that the committee report the amount of architects' commissions that have been paid for the various works during the last five years, and the probable liabilities for architects' commission upon contracts now in course of execution." He contended that there was considerable dissatisfaction in the town with the existing system of employing one firm of architects only, and of not resorting to public competition. It was felt that by taking this step, and at the same time paying the usual commission of 5 per cent., the Council were really paying retail prices for wholesale orders.

The resolution having been seconded by Mr. Brinsley, Mr. Cook moved, as an amendment,—"That the General Purposes Committee be instructed to consider the present system of obtaining plans and estimates for the erection of buildings for the Corporation, and to report whether it is desirable that any change should be made in such system by the appointment of a borough architect or otherwise."

Alderman Kenrick seconded the amendment, and expressed the opinion that the various corporate committees should be empowered to make their own selection of an architect to carry out such work as they might desire to have executed. He objected strongly to the appointment of a borough architect.

Alderman Collings, M.P., had no objection to vote for the amendment, but held that any alteration of the present system would be prejudicial to the public service.

Mr. M. Davis said there could be no doubt as to the dissatisfaction in the town with regard to the Council giving all the work to Messrs. Martin & Chamberlain. They had no doubt done all that had been entrusted to them well, but why should they enjoy a monopoly of the public work to the exclusion of all other architects?

Alderman Biggs remarked that the Corporation for the last five or six years had been paying about 2,000*l.* or 3,000*l.* to architects, and he thought they could well afford to pay an accomplished architect,—a man of good reputation,—1,000*l.* or 1,200*l.* a year, and he 1,000*l.* a year the gainer. He did not say this question should be jumped to without some consideration, and he was willing that the matter should be well considered by the General Purposes Committee.

After considerable discussion, Mr. Cook consented to insert in his amendment the words "and report upon," after the words "that the General Purposes Committee be instructed to consider," and this alteration having been accepted by Alderman Heaton, the latter withdrew his motion, and Mr. Cook's proposal was carried unanimously.

SPECULATIVE THEATRE-BUILDING.

IN RE THE ALCAZAR COMPANY.

A PETITION was presented (Chancery Division, High Court of Justice) for the winding-up of this company by Mr. Edward Lonis Paraire, architect, as a creditor of the company for a large sum of money alleged to be due to him for preparing plans, and for consulting with the company as to the buildings intended to be erected. The company was incorporated in September, 1878, for the purpose chiefly of erecting upon the freehold ground on which Saville-house, Leicester-square, formerly stood, a spacious theatre of varieties, containing a *café* and *restaurant*, where it was intended to have dramatic and musical performances, with popular interludes, and attractive histrionic varieties.

The petitioner stated that he had prepared plans and elevations of the proposed building, and had assisted the directors with his advice and experience as to the manner in which the building operations should be carried out, and that he had obtained tenders from builders and contractors for the construction of the theatre and restaurant, according to the plans prepared by him. During the whole of the period from the incorporation of the company down to December, 1879, he had been summoned to the meetings and consulted by the directors of the company as their architect, with reference to carrying out the undertaking, and they availed themselves of the plans and measurements which he had prepared. Since December, however, the board of Directors had declined to accept any of the tenders for the construction of the building which he had obtained, and had entered into negotiations with another architect, and they had declined to carry out the building for which the plans were prepared. The petitioner had consequently sent in his claim for the debt due to him, amounting in the whole to 2,986*l.*, and he alleged that the company were unable to pay the amount due to him and to other creditors, and that the company ought, therefore, to be wound up under the direction of the Court.

The petition was opposed by the company, who alleged that the charges made by Mr. Paraire were excessive, and they disputed the debt, but they had offered him 500*l.* in settlement of his claim. They denied entirely that they were unable to pay the amount, and stated that the subscribed capital of the company was 23,350*l.* and it was calculated that when the building was erected a large profit would accrue to the shareholders. The building to be placed on the site was now being erected, and considerable progress had been made with the work, and it was expected that the building would be opened in October next. Under these circumstances they opposed any attempt to wind up the company by a person whose alleged debt was disputed, and who could bring his action to establish any debt which might be justly due to him.

The Vice-Chancellor (Malins) said it was evident that there must be a considerable sum of money to which Mr. Paraire was justly entitled. Even the prospectus contained a representation of the building intended to be constructed, which, he was told, had been prepared from the plans furnished by Mr. Paraire. However, it was impossible for the Court to make a winding-up order upon the petition of a creditor whose debt was wholly disputed. He should, therefore, direct the petition to stand over until the petitioner's claim should have been established in an action.

EMDEN *v.* CARTE.

THIS was an application, arising out of the building of the proposed new theatre in the Strand, for an injunction on behalf of the plaintiff, who was the architect employed to prepare plans, &c., to restrain the defendant from using the plans and drawings prepared by the plaintiff.

Mr. Glasse, Q.C., in moving for the injunction, stated that the plaintiff had not yet been paid for the plans and drawings of the theatre proposed to be erected by the defendant in Beaufort-buildings. It appeared that the defendant now expressed an intention not to make use of them, and if so, there the matter might end for the present.

Mr. Higgins, Q.C. (for the defendant), said he did not intend to use them, and should, in fact, be very glad not to do so.

Mr. Glasse.—As his lordship said this morning, "That is an ungracious remark."

Mr. Higgins.—Of course if we do not use them we shall not pay for them.

Mr. Glasse.—Nobody asked you. I shall show at the hearing that I am entitled to be paid for the work I have done.

Mr. Higgins said the true object of the motion was to prevent the defendant employing another architect.

Mr. Glasse desired to prevent the defendant injuring the plaintiff's professional character.

After some further discussion, an understanding was given by the defendant that the plans, &c., would not be made use of pending the trial of the action.

DISTRICT SURVEYORS' FEES.

At the Marlborough-street Police Court on Thursday, the 1st inst., before Mr. Man-field, Mr. Alfred Stonor, of 61, South-street, Grosvenor-square, appeared to an adjourned summons taken out by Mr. Robert Kerr, district surveyor of St. James's, under the Metropolitan Building Act, to recover a fee of 1*l.* 15*s.* Mr. J. A. Alsop, solicitor, appeared for the defendant.

Mr. Kerr said the defendant had executed some works at 18, St. James's-place. These works included the fixing of some hot-water apparatus. By the Building Act, section 21, paragraph 4, it was provided that no pipe for conveying hot water should be placed nearer than 3 in. to any combustible material. Mr. Stonor had in this case fixed the pipes nearer than 3 in. to woodwork. Witness communicated with him about this violation of the Act, and he promised to amend the work, and ultimately did so to witness's satisfaction. Witness then sent in his claim for his fee, which Mr. Stonor had neglected to pay, and hence this summons.

Mr. Alsop, for the defence, took several technical objections to the summons, all of which the magistrate overruled. He then went into the merits of the case, contending that, by the 9th section of the Building Act, 18 & 19 Vict., such work as that executed by Mr. Stonor in this case was excepted. The words were "Any alteration or addition or other work made or done for any purpose *except that of necessary repair not affecting the construction of any external or party wall* in or upon," &c.

Mr. Stonor, the defendant, said what he had to do was to take down the lead hot-water pipes and to put up iron pipes instead, in consequence of the lead pipes being in a defective state. The pipes had been repaired several times before.

Did you also take out a large kitchen range and put a small one in its place because the large range burned too much coal?—Yes; and we filled up the space thus obtained in the fireplace opening by putting a small gas-stove there which had previously stood in another part of the kitchen.

Mr. Mansfield said: I am of opinion that Mr. Kerr might have proceeded for penalties against Mr. Stonor, or whoever put up those pipes, from their not being 3 in. from the wood; but I utterly repudiate the doctrine that if I make a repair I am bound to repair with the same material as the original,—that if, for instance, a thing was made of cast-iron, I could not, in repairing it, use some other material for the same purpose without rendering myself liable to the Act. It is absurd to say if I put in a stone instead of a brick in the wall, that is not a repair. Therefore, I dismiss the summons.

In the case of Kerr *v.* Barron and Wilson, also heard before Mr. Mansfield, the District Surveyor of St. James's claimed 5*l.* for the inspection of work done by the defendants at the Conservative Club House, the work in question consisting of the removal of a stove from one part of a room to another, and the carrying of the stove-pipe through the wall into the extremity of the flue. It was work, Mr. Kerr contended, which properly came under his supervision, the building being a very important one, and no mercy would have been shown to the district surveyor if fire had resulted from his neglect to see the work properly done. The fee he was entitled to under the Act was 5*l.* In these cases of large fees he was always open to receive application for abatement, but in this case no such application had been made to him.

The Solicitor for the defence contended that the case did not come within the Act at all, or that, if it did, it came under section 50, as being work for which, not being covered by the schedule, the District Surveyor was bound to apply to the Board of Works to fix the amount of his fee. It was monstrous to contend that this mere alteration of a stove-pipe and flue came under sections 20 and 21, and entitled the District Surveyor to a fee half as large as he would be entitled to for the entire building of the Conservative Club-house.

Mr. Mansfield rather agreed that the sum claimed was exorbitant, as the work was much slighter than some of the works specified in the schedule as entitling the district surveyor to a fee of only 10*s.* At the same time, he believed that, under section 9, Mr. Kerr was entitled to claim the 5*l.*, and he was bound to give judgment accordingly.

Cromwell House.—At a representation of Mrs. Freake's original three-act comedy "Deeds," which was given on the 2nd inst., Mr. Herbert, of the Vaudeville Theatre, as *Henri de Clermont*, especially distinguished himself, and aided materially in rendering this the most successful rendering of the piece which has been given. Mr. C. P. Colnaghi, son of the late well-known Mr. Dominic Colnaghi, and who is good both as a singer and an actor, also deserves special mention. A very charming scene, representing the banks of the Thamee at Chelsea in the time of George III., was built up for the purpose with much skill. The financial result of the Waverley *Tableaux* recently given here was very satisfactory, and Mrs. Freake had the pleasure to send 600*l.* to the Irish Famine Fund, 600*l.* to the Orphan Fund of the Artists' General Benevolent Institution, and 600*l.* to the Victoria Hospital; receiving in return, from the latter institution particularly, many well-deserved thanks.

CHURCH-BUILDING NEWS.

Rhondda Valley.—On the 17th ult., Mr. and Mrs. Crawshay Bailey attended with a large party at Ystradyfodwg, in the Rhondda Valley, to lay the foundation-stone of a new church which Mr. Bailey purposes erecting there in the midst of his large mineral estates, at a total cost to himself of about 7,000*l.* The church is being erected on freehold land belonging to Mr. Bailey, on the hill-side immediately above the little town, the site of which, together with an acre and a half of land, he has conveyed, in fee, for the use of the Church of England for ever. The building is already in an advanced state, the side walls having been reared 8 ft. or 10 ft. above the foundations. The edifice will be more than twice as large as Llanfoist or Llanthewy Skirrid churches, which Mr. Bailey, at his own expense, has recently restored. It is to seat 550 persons, and the contract price is just 4,000*l.*, but when the extras, the value of the land, and the cost of approaches and of fences are added, the total is put down at from 6,000*l.* to 7,000*l.* The edifice is in the Decorated Gothic style, and is being built of native stone, with Bath stone dressings. On plan it will consist of a chancel and a nave with two aisles, or, more correctly speaking, a nave and south aisle. There will be a tower on the north, which will also form the porch or main entrance to the church, and will be surmounted by a small spire; the total height of the tower and spire to be 90 ft. There is also to be an organ-chamber and a large vestry on the south side of the chancel. The windows will be glazed with cathedral glass; the seats, of the modern open shape, will be of pitch-pine, stained and varnished, and both chancel and nave will be floored with Godwin's encaustic tiles. The building is to be heated with Grundy's patent stoves. The character and style of the reredos have not yet been decided upon. Mr. J. B. Fowler, Brecon, is the architect, and Messrs. C. Sheppard & Son, Cardiff, are the contractors. A peculiar feature in the church is that there is to be a tank fixed in the western corner of the nave for adult baptism by immersion.

Cottingham.—The Church of St. Mary Magdalene, Cottingham, has been re-opened, after alterations. The galleries, which occupied three sides of the building, and the old-fashioned high-backed pews, have been removed, the place of the latter having been taken by chairs. The church consists of a nave and side aisles, and these latter have been considerably extended. In the north aisle, at the chancel end, an organ-chamber has been erected. Further room was also obtained by the removal of the vestry to the south aisle. The chancel has been entirely rebuilt, and the whole of the windows, which are of cathedral tinted glass, have been reglazed by Messrs. Pepper & Co., of London. The clerestory windows, which were very irregular, have been removed and placed in uniform positions. There is now an entrance on the northern side of the church, the doorway which was closed up being re-opened, and a door removed from the west end fixed in place of the old one, which was scarcely 5 ft. in height. The building has been re-roofed, the present roof, which is slated (Westmoreland green slate being used), being of considerably higher pitch than was the old one, which was covered with lead. The materials composing the present roof are all new, with the exception that in the nave portion the old transverse beams have been utilised. The balustrades of the galleries have been re-worked into the new Communion-rails which have been placed in the church. The columns have been thoroughly cleansed, the paint and whitewash being removed by a chemical process. Of these pillars there is one that deserves special mention. It is in keeping with the others in every respect, except that the capital is composed of four figures handed together. The figures consist of a female, two knights, and a bishop. The pulpit has been lowered, and heating apparatus has been furnished by Messrs. Vipan & Headley, of Leicester. The new choir-stalls are of oak, with carved bosses, by Messrs. Phillips, of Northampton. Two new buttresses have been erected on the exterior at the east and west angles of the north and south aisles; the clock has been removed from the west end to the north side, and the height of the tower has been increased by about 15 ft. The original contract was for 2,100*l.*, but this amount has since been considerably exceeded. The architect in charge of the work was Mr. A. Hartshorne, the builder being Mr. E. Barlow, of Rotbwell; Mr. W. Simpson, of Cottingham, acting as clerk of the works. The iron portion of the work was by Messrs. Mohhs, Snow, & Wood, of the Eagle Foundry, Northampton.

DISSENTING CHURCH BUILDING NEWS.

Tulse Hill.—A new Wesleyan chapel has been opened at Tulse Hill. It occupies a fine position at the corner of the Norwood and Christchurch roads, being set back from the former 100 ft. It is in the early Gothic style, and built of Kentish rag and Bath stone. The main elevation has a five-light window and moulded tracery, below which is a doorway with coupled shafts and cusped head. The dimensions are 80 ft. by 52 ft. in the body of the chapel, with a semicircular sided chancel 30 ft. deep in addition, which, with the double entrance porches, gives a total length of 126 ft. The arcades are in five wide bays, of 10 ft. each, supported by polished Shap granite columns, with carved capitals. A shallow gallery, two seats deep, is placed behind the columns in the sides and at one end. The roof is wagon-headed and boarded, the principals having cusped filling-in with a hammerbeam treatment. There are five large traceried windows in each side, with small ones below. The chancel has seven lancet windows. The choir stalls have richly-carved bench ends, and, with the pulpit and sittings, are all of pitch pine. A large organ-chamber occupies one side of the chancel, and a vestry the other. In the basement is a large school-room, 51 ft. by 51 ft., with a height of 15 ft., and amply lighted. There are several other class-rooms and vestries. A lofty tower and spire of good proportion are in course of erection, the design being that of an octagon lantern on the tower, with pinnacles at each angle, and smaller ones at springing of spire above octagon. The tower is 20 ft. square at the base, and has no projecting buttresses. It is proposed to place a clock and bell in the tower by public subscriptions. The building is warmed by hot-water, and the gasfittings are by Richardson, Ellson, & Co. The architect is Mr. Bell, of New Broad-street, and the builders are Messrs. J. & C. Bowyer, of Norwood. The total cost will be, including fencing, upwards of 11,000*l.*

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Wolverhampton.—The new chancel, chancel aisles, chapels, sacristies, &c., of the (R.C.) Church of SS. Mary and John, Snow-hill, which have occupied more than three years in erection and completion, and have cost nearly 7,000*l.*, have been solemnly dedicated. The church, as it originally stood, consisted of nave, aisles, and transept. Mr. Hansom, of London, is the architect. The new chancel, which adds 50 ft. to the length of the church, is built in three bays, surmounted by a clearstory of six windows, delicate shafts rising between the arches and supporting a richly-groined roof. The chancel divides itself into sanctuary and choir. The altar and reredos are in Caen stone, elaborately carved, with alabaster shafts. The central window of the apse is filled in with stained glass, by the firm of Hardman. The central light portrays the Crucifixion, and below that a *pieta*. St. Mary and St. John are in the right and left lights, one on each side of the cross, and below these figures are the Blessed Virgin as the Mother of Sorrows, and St. John conducting the Holy Mother to his own home. The north and south aisles are almost as long as the chancel. They also have groined roofs, and each terminates in a chapel, that in the north aisle being dedicated to the Virgin, and that in the south aisle to the Sacred Heart. The aisles, again, are flanked by smaller chapels, with St. Joseph and St. Patrick as the patron saints. Between the chancel and the aisles are carved oak screens, by Boulton, of Cheltenham. The sculpture is by Shepherd, of Bristol. The exterior walls of the new chancel are of Gornal stone, the interior being of Bath stone.

Worcester.—St. George's (R.C.) Church, Worcester, has lately undergone costly alterations and additions, including the building of a new chancel. The church was erected just fifty years ago, in the then-prevailing manner, the plan being a simple parallelogram, 40 ft. in width in one span, with a shallow recess in front, adorned with a couple of columns and

pilasters to form a portico, and having a similar recess at the sanctuary end, in front of which the altar was placed. The columns, cornices, and other ornamental features were copied from Greek examples, and the whole was substantially erected. The church may now be said to be completed by the erection of a sanctuary, transepts, side chapels (dedicated respectively in honour of the Blessed Virgin and of St. Joseph), a baptistery, confessionals, and a sacristy, over which is a large room for use as a library: all designed in harmony with the original structure, but with the style more freely treated, and with greater variety of detail. The old recess behind the altar has additional openings to the transepts, so that the original massive columns and pilasters now form a screen to the chancel, which is lofty and spacious, lighted by a clerestory filled with glass leaded in appropriate forms. The altar-piece is of very rich design, principally of marble-work, inclosing in the centre the copy of Raffaelle's "Transfiguration," which formed the old altar-piece; to this has been added wings, arranged in the old triptych form, painted with figures of SS. Oswald and Wulstan, and of SS. Ignatius and Francis Xavier. Beneath, and immediately behind the high altar, the composition is completed by a painting on a gold ground,—archangels and angels adoring,—by Mr. Joseph Bouvier, of London, who has also painted the large side figures. The altar itself is of marble and alabaster, of simple outline, but adorned with sculptured foliage, the monogram of the Holy Name, and the emblems of the Passion of our Lord. The general contract has been carried out by Mr. J. Kendrick, and the three marble altars and pulpit have been executed by Mr. W. Forsyth, of Worcester, the whole from the designs of Mr. S. J. Nicholl, of Caversham-road, London.

Northampton.—The foundation-stone of a new chapel, in connexion with the Roman Catholic convent, Northampton, has been laid. The chapel, which is dedicated to St. Joseph, is to be erected on the terrace at the rear of the convent, the style being Romanesque. Mr. W. Hull is the architect, the builder being Mr. Dunkley. The building, when completed, will accommodate 150 persons.

Books.

Handbook of the Dyce and Forster Collections, in the South Kensington Museum. Chapman & Hall.

THIS, which is one of the series of South Kensington Handbooks, not only supplies an account of the Dyce and Forster Collections, but gives particulars of the two donors, and being, moreover, illustrated with portraits and *fac-similes* of autograph letters from eminent people, makes a charming little book, which has an interest of its own, quite apart from its purpose as a guide for visitors.

Miscellanea.

Industrial School for Girls.—The foundation-stone of the Middlesex Industrial School for Girls was laid on the 30th ult., by Mr. Edmund E. Antrobus, J.P. The site is within the parish of Bedfont, less than a mile from the Feltham Station, on the South-Western Railway, and forms a portion of the Spelthorne Sanatorium grounds. In a large outbuilding of the Sanatorium Mr. Antrobus reviewed the events which had led to the present attempt to provide the means of rescuing young girls, who, under the influence of bad associates, had committed, perhaps, slight offences, from the disgrace of being sent to prison. It was thought that, in dealing with girls, many of whom would be very young, the "Cottage School" system would be most likely to prove successful, and it was of the first cottage home for this purpose that they were about to lay the foundation-stone. A report to the subscribers showed that the committee had about 900*l.* in hand, over 1,000*l.* being required for the building, and a further sum to meet the cost of furnishing the home. The cottage, to accommodate twelve children and a matron, will be of red and black brick, with stone dressings. It will be Elizabethan in character, and from the designs of Mr. Charles Barry, the architect of the Middlesex Industrial School for Boys at Feltham.

Prizes for Metal Casting.—The Worshipful Company of Founders have offered a number of prizes for competition amongst persons carrying on business as founders, or employed or engaged by such persons. The list includes a prize of 10*l.* for the best, and one of 5*l.* for the second best, specimen in brass or bronze of an original nude figure, not to exceed 12 in. in height, including the base. The figure to be the property of the Company, the model to remain the property of the designer (with 10*l.* 10*s.* added by past-master Mr. James Franks); a prize of 5*l.* for the best, and one of 3*l.* for the second best ornamental bell, not to exceed 9 in. in diameter at the mouth. The first prize bell to be the property of the company, the model or pattern to remain the property of the designer. A prize of 5*l.* for the best, and one of 3*l.* for the second-best, specimen of *repoussé* brass-work of lock or hinge furniture for doors of Mediæval design, the design and the work to be by the same person. The first prize to be the property of the company; and the freedom and livery of the Company of Founders to the author of the best essay on the History and Art of Founding in Brass, Copper, and Bronze. To the winner of this prize an additional sum of 10*l.* 10*s.*, is the gift of Past-Master Mr. Robert Warner. The prizes for the metal-work seem scarcely large enough. If the Company hope to induce the production of anything worth having they should withdraw the condition that the rewarded works are to become their property. Moreover, we should think it very doubtful that they will obtain a well-designed and modelled nude figure and a good bronze of it from the same competitor.

University College, London.—A Professorship of Archæology has been instituted at University College, and Mr. C. T. Newton, of the British Museum, has been appointed professor. A meeting in aid of the fund for the completion of the college buildings was held on the 2nd inst. at the Mansion House. In the absence of the Lord Mayor, the chair was taken by Mr. Alderman R. N. Fowler, M.P. Lord Kimberley moved, "That the manner in which University College, London, has been conducted and developed in accordance with its original principles has greatly advanced the higher education of this country, and meets with the approbation of this meeting." He had been struck by the dearth of really eminent men. We could all attain to a certain standard of proficiency, but those who were, as he might say, a head, or even half a head taller, intellectually, than others were very rarely met with, and we could not afford as a nation to lose the advantage of cultivating and bringing forward such men if they were to be found in any class. Mr. F. W. Buxton, M.P., seconded, and Mr. Jervoise Smith supported, the motion, which was carried unanimously. Mr. Alderman Cotton, M.P., moved, "That this meeting recognises the claim of University College upon the City of London for assistance for raising the fund for the enlargement of the college buildings, rendered necessary by the continually increasing number of students and the extension of its teaching." Explaining that some 20,000*l.* was immediately required to complete the additions most urgently needed, he mentioned that the Earl of Derby, being unable to be present, had forwarded a cheque for 500*l.* to the fund. The resolution was carried, and a committee was appointed.

J. Sessions & Sons, Gloucester and Cardiff, whose productions in enamelled slate goods we have had occasion to mention on other occasions, had a very meritorious display of their manufactures at Sydney. Messrs. Sessions adopt the principle of using white marble instead of slate for the panels of chimney-pieces, and enamel on the marble. The advantage gained is that the natural veins of the marble assist the decorator in his art.

Mr. J. Ebenezer Saunders, architect, was, at the meeting of the Metropolitan Board of Works, on the 2nd inst., unanimously elected Chairman of the Building Act Committee for the ensuing year, his predecessor, Mr. Runtz, receiving the thanks of the Board for the services he had rendered by the discharge of the duties of chairman during the last two years.

The Leicester Church Congress.—Following the example of last year, an exhibition of ecclesiastical art will take place at Leicester during the forthcoming Church Congress, at the Skating Rink, in Rutland-street, which will be specially fitted up and decorated for the occasion. The exhibition will open on the 27th of September, and close on the 2nd of October.

The Electric Light is to have another trial in the streets of the City of London. At the meeting of the Commissioners of Sewers on Tuesday last, the Streets committee brought up a report on a reference to them in March last to consider as to the adoption of improved means of lighting the streets of the City. They stated that the Bridge House Estates Committee of the Corporation were desirous that the three City bridges, London, Southwark, and Blackfriars—should be lighted by electricity, and, that being so, they were prepared, as an experiment, to suggest the lighting of certain streets in the City by electricity at the same time—viz, Queen Victoria-street, Queen-street and Queen-street-place, King William-street, Mansion House-street, the Poultry, Cheapside, Ludgate-hill, Ludgate Circus, the north side of St. Paul's churchyard, and New Bridge-street, Blackfriars, together with the three bridges. They recommended, however, that before the experiment was undertaken, tenders should be invited with a view to ascertain the cost. Mr. Innes moved the adoption of the report, stating that the experiment in electric lighting upon the Holborn Viaduct was thoroughly successful as far as it went, but the cost was excessive. Since then, however, the Board of Works had carried on a similar experiment upon the Embankment and Waterloo-bridge, and had contrived to reduce the cost of lighting, and there was reason to hope that the expense might be still further decreased. The Corporation had expressed a wish that their three bridges might be lighted by electricity, and that being so, the Commission had determined to extend the trial by taking in all the important streets leading to the bridges. The report was adopted.

The Employers' Liability Bill.—It is intended to hold a conference in a few days with the view of arriving at some agreement between the supporters and opponents of the Employers' Liability Bill. A proposal will be submitted to the conference to introduce into the Bill a clause providing for a system of insurance. At a meeting of employers held at Birmingham last week to consider the Bill, Mr. E. Fisher Smith, chairman of the South Staffordshire Coal Trade, presided. Mr. Pease, secretary of the Mining Association of Great Britain, argued against the Bill, which, he said, would lead to a large amount of litigation. He contended that the solution of the problem of the relations of masters and workpeople with regard to accidents lay in a system of insurance. Mr. J. P. Hunt, chairman of the South Staffordshire Iron Trade Board, proposed a resolution to the effect that the meeting, after considering the effects of the Bill, viewed it with the greatest alarm, and strongly urged upon Parliament the desirability of referring the Bill to a select committee. Colonel Harrison (Brownhills) seconded the resolution, which was supported by Major Walker (Stourbridge). Mr. Wiggin, M.P., said that the employers of labour must make up their minds to accept a Bill of some kind. In and out of Parliament there was a general opinion that something ought to be done to enable *employés* to obtain compensation in case of accident. He was averse to a question which so greatly and gravely affected the interests of employers being hurried through Parliament in one short session, and for that reason he was in favour of the Bill now before the House being referred to a select committee. The resolution, after a lengthened discussion, was unanimously adopted.

Proposed Art Gallery at Birmingham.—The Mayor of Birmingham (Alderman Richard Chamberlain) read to the town council on Monday a communication from Messrs. Richard & George Tangye, the well-known engineers, offering, if the council will make provision for a permanent art-gallery, to contribute a sum of 5,000*l.* for the purchase of specimens of art for exhibition. Should an equal sum be subscribed by other persons, Messrs. Tangye offer to give a further sum of 5,000*l.* for the same purpose. A resolution was adopted thanking Messrs. Tangye for their generous offer, and expressing the desire of the council to comply with the conditions.

We are Advertising for Monday evening next a sale of building land at Tooting. The once-famous nursery of Messrs. Rollisson has been developed as a building scheme, and 133 plots of land, with a large block of one acre in the rear, will be competed for. The sale takes place at the inn near the property, and Messrs. Protheroe & Morris are the auctioneers.

West Anstey Church, near Southmolton, Devon, has recently been re-opened, after partial restoration. The church, dedicated to St. Petrock, consists of chancel, nave, north aisle, south porch, and western tower, and is built of local rubble stone, with dressings partly of local stone of very pleasant colour, and partly of Ham-hill stone and Bath stone. The roofs are covered with grey slates and red crimped ridge tiles. The gables are surmounted with crosses of red pottery of special design. In order to preserve the original proportion of the chancel, a pillar with a side-arch has been built. A new open-timber roof has been constructed, and the door and windows have been renewed. New roofs also have been put up over the remainder of the church, none of the old wood being available for the renewal. The porch roof has been replaced with new oak, the old design being followed as accurately as possible. It was found necessary to rebuild nearly the whole of the north aisle, and to insert new windows. New windows have also been inserted in the nave. The old entrance oak door has with great difficulty been preserved and repaired. The porch entrance has been rebuilt. The reredos consists of an oak canopied framing, with a cross in the centre panel, and angels painted on the double panel on either side. The tower at the west end is in a very dilapidated state, but it cannot at present be restored for want of funds. The church is paved with Maw's tiles, with diagonal coloured border. The pulpit is in Bath stone, with four panels. The architect for the work was Mr. W. White, F.S.A., of London; and the builder Mr. John Cock, jun., of Southmolton.

Burning of the Duke's Theatre, Holborn.—The Duke's Theatre, situated in Holborn, was entirely destroyed by fire on Sunday evening last. The fire was discovered a few minutes before five o'clock, and within a very few minutes of the alarm being given several steam fire-engines arrived on the scene. It was some time, however, before the firemen could gain an entrance to the theatre, owing to the fact that they had to break open the doors of the box-entrance in Holborn. By the time this was effected no fewer than twelve steam fire-engines were simultaneously playing upon the flames. After the fire had been raging for about twenty minutes the roof gave way, carrying portions of the gallery and upper boxes with it. The fire, although fierce, did not last long, all being virtually over within three hours of the first alarm. The fire is supposed to have broken out near the green-room; it was from that part of the building that the smoke and flames were first seen to issue. Thence it caught the property-room and stage, which it quickly destroyed, together with a quantity of machinery underneath the stage.

Worthing.—Mr. W. Oldham Chambers, of Lowestoft, has been appointed architect to the new infirmary and dispensary about to be erected at Worthing. The works will be commenced forthwith, the plans having been approved by the governors.

Messrs. Robert Boyle & Son have removed their London offices and show-rooms from Mansion House buildings, Queen Victoria-street, to more convenient premises situated in Queen Anne's-buildings, 64, Holborn Viaduct.

Proposed New Church in Exeter.—The Exeter Church Extension Committee have invited the architects of Exeter to send in designs for proposed new church in Newtown. The competition is limited to architects residing or having offices in Exeter.

The Cathedrals.—Lord Blachford, K.C.M.G., and Sir Walter Charles James, have been placed on the Commission to inquire into the condition of the cathedral churches in England and Wales.

TENDERS

For new offices, engine-house, &c., for the Local Board of Health, Wanstead, Essex. Mr. John T. Bressey, architect:—

Urban Architecture versus *Street Architecture.*

THE decay of the picturesque element in urban architecture has been long and loudly lamented. It is possible that more cause existed for the complaint four-and-twenty years ago than is the case at present. Whether or no that be so, the general feeling has been by no means dissipated. But we question how far any architect, or any architectural writer, has set himself to probe the question to its core; to inquire, first, into the truth of the complaint, and then, assuming that truth to be clear, to inquire, further, into the cause of the change.

In illustration of the position that there is an absence from our towns of the special form of excellence known as the picturesque,—let us call attention to the view on the Pegnitz, Nuremberg, in a recent number (No. 1920) of the *Builder*. In offering it to our readers we made some remarks on the contrast it presented to much that is going on in the suburbs of London. Let us glance for a moment at the infinite diversity and quaint contrast of sky-line and lines of construction in that view. The picture is full of a vigorous and racy originality. It is the originality of a time when the burghers of a town wore iron by their side, and were by no means unhandy in its use. Look at the doubly-guarded bridge; the strong round tower that forms its outer entrance; itself approached by a wooden structure that seems to have replaced a drawbridge, and which, in case of any attack on the town, could be readily destroyed. The close-covered gallery crossing the river is supported by two arches giving ample waterway for floods, if we may judge by comparing the height of their soffit with the level of the river. Citywards a more lofty and ponderous tower, pierced for culverins, or for other ancient weapons of projectile force, dominates river, bridge, and entrance-turret. Under cover of this castellated building, and throwing down a flight of steps to the river itself, stands a mansion that was built for the abode of some well-to-do citizen. A stout iron cage protects the small windows necessary for the ground-floor. Above, a sense of more security has allowed the architect to think rather of habitation than of defence. A double gallery looks out on the river, telling of times when arms of precision and of long range could not be brought to riddle the palisades, or to sweep them of their occupants. The lofty gable, framed together like a piece of shipbuilding, rises to throw off the winter snow. Behind, the turrets of the church appeal to the invisible guardians of the city; and gables, and peaks, and weathercocks all assert their respective sturdy and substantial individuality.

In all this we see no striving after effect,—no effort to be romantic,—or Classic, or Teutonic, or anything else. In a rude but not ignoble state of society,—it would seem the architect knew what was needed for the burgher and what for the city. With a proper deliberation, and at an ample outlay, he provided what was needed. Hence the sense of fitness and of comfort that the perspective awakens in the mind. The building is picturesque as the reflex and the embodiment of a state of society so far removed from that which surrounds us, that it excites something of the sense of wonder when we regard it. Thus, in spite of simplicity and absence of any attempt at direct decoration, we linger with pleasure over such a view.

We refer to this peep at Nuremberg, because it furnishes a very striking illustration of the difference between urban architecture and street architecture. It is an example of the former. It has nothing to do with the second. We cannot doubt that, whether straight or crooked, there is a street that leads from the bridge to the church. But that street is not the motive or central feature of the scene. It exists as a necessity, not as a pictorial or architectural feature of the town. And so it is in Genoa,—so it was in all those Mediæval cities in which houses rose into inaccessible towers, and personal defence was more studied than freedom of intercourse, or open pursuit of trade.

With those cities that are the offspring of the present time (such as Birkenhead, for example), or in which the requirements of the present time are veiling, if not crushing, the ancient nucleus of city life under an ever-growing skirt of densely-peopled suburb, the case is altogether different. Accommodation for traffic assumes the foremost place. The idea of defence has evaporated. The houses have long lost the character of fortalice, because it is not against the strong hand of rapine or of oppression that the chief defence is now required. Next, they have lost the character of habitations. For a verandah in which the burgher of Nuremberg might calmly smoke his pipe and look forth on the river, we find substituted as large as possible an area of plate-glass, behind which the merchandise within is made temptingly visible to the passers-by. And so freely is this done, that in many cases there is not even the safeguard of iron bars so set as to prevent any one who broke the windows from making his entrance into the warehouse. A plate of glass, which a glazier's diamond, a pistol bullet, or even a short iron bar sharply applied, would at once shatter, is the sole defence of costly tissues, rich stores, even of gold and silver plate and jewelry. And the architect has, by slow degrees, come to consider this mode of fronting the street sufficient, because behind or without the glass is the invisible but ever-present safeguard of public order.

It will be evident to those who have thus far accompanied us in our reflections, that the passage from one phase to another of civilisation is faithfully represented by architecture. Nor must it be forgotten how hostile are such changes to structural beauty, and to real architectural effect. When a city is rebuilt after a bombardment, or after a fire, there is an occasion given for founding a new architectural order that shall correspond to the new political order. But when the change is insensible, individual, bit by bit, this is impossible. Often, too, in the course of change, something perfectly incongruous is introduced by some personal whim that is alike out of place in itself, and injurious in its effect on the older building. Thus in one of the most picturesque streets in any southern English town, in which houses of two, three, or even four hundred years old arrest the eye of the draughtsman in goodly succession, look at the new Stores!—a neatly stuccoed imitation of two or three Greek temples piled one on the top of another, with fine large plate-glass windows on the ground-floor to act as a *podium* to support the upper orders! Very clean, very neat, very exact, very charming, probably, to the builder; but as atrocious as any jumble could be. And that for the twofold reason that, in a climate like our own, a Grecian temple is not the kind of building in which to sell sugar and bacon; and that, if only shed-room and open window be required, it would be less obnoxious to supply them in the plainest and most unmistakable form, amid a company of Jacobean, Caroline, and Elizabethan houses, than to introduce the smug tidiness of Stuccoville.

It is tolerably certain that while our population increases at its present rate, the true requirements of making straight, wide, and commodious streets to accommodate the ever-increasing traffic of our towns, and at the same time the desire to tempt the wayfarer to become a purchaser by the display of articles in the windows of the houses lining the streets, will continue to control the efforts of the architect. In such a state of things the house will more and more cease to be individual and distinctive. The terrace, or the row, or the front, is all that the artist can hope to modify. In London, under the auspices of Nash and other architects, the first step in reconstruction that was taken on a large scale, since the time of Wren and Chambers, was the erection of Regent-street. As a rule, in London, we seem to have now passed into a stage when the arrangement of the street is admitted (not in every case, but in most cases) to be the first point.

On the Continent, where in many cases the urban builders have been at work as industriously as among ourselves, very much more attention has been given to street architecture regarded in masses and great lines. In Paris, in Marseilles, in Turin, in many other Continental

cities, lines of houses, with shops on their basements, are extending for mile after mile, which have a palatial rather than a petty commercial appearance. It is true that an amount of control is exercised by urban authorities as well as by central authorities in those cities, to which we should no more be ready to submit than to the (to us) intolerable burden of the *octroi*. We are not now arguing either way, for or against, such control. We are only investigating the facts. Urban architecture, in the Continental cities to which we have referred, and in many other cases, has become a special branch of the study of the architect. Not only the accommodation of traffic, but the exigencies of military command have been carefully studied. With the stratigraphic plans thus determined has been associated the conception of noble, and sometimes monotonous, elevations; treating the rows of houses that line the streets in somewhat of a palatial style, and thus producing an architecture which is more truly the child of the nineteenth century than any other mode of treatment or of conception.

Urban architecture of this class is, no doubt, at the same time street architecture. It might almost be named Imperial architecture, when we regard the era of its remarkable development in France. But we are precluded from the use of the term by the remembrance of the noble lines of new street, with arcaded footpaths,—leading to a fountain, or a palace, or some other central point,—which form the new part of Turin. Nor are other parts of the world to be left out of consideration. That the palatial street architecture of the nineteenth century has attained, in not a few instances, great dignity and beauty, no one familiar with Europe can deny. But two considerations have to be borne in mind with regard to it. One is, that there are special causes which oppose its introduction, on any comprehensive scale, into England; the other is that, by whatever term of admiration we may designate it, it cannot be described as picturesque.

What, then, is the real force of that word as applied to architecture? Since the word picturesque was coined, æsthetic study has advanced so far as to demand a new terminology. Thus, side by side with the more racy term, we have the Latin-like adjective, "pictorial." Both words mean "like a picture"; and yet they are not applied by the artist or the art-writer as convertible terms. We attach an idea of more stately dignity to the word "pictorial." We have some idea of rustic quaintness lurking in our minds when we use the word "picturesque." How shall we analyse the distinction?

Without being led to wander too far from our subject by an etymological hint, we think we may indicate one characteristic of the picturesque in architecture that will be enough for our present purposes. We should say, then, that for a building to be picturesque, the first requisite is a broken and distinctive sky-line. We must so far qualify this remark as to admit that a picturesque building may be seen which is not relieved against the sky, from the best points of view. It may, for example, be a cottage embowered in a wood. In that case, what we call sky-line does not properly exist. But there will be what corresponds to it, and takes its places,—relieved outline. If that outline be tame, regular, bi-lateral, perfect in its balance, the element of the picturesque will be, we submit, wanting. A turret here,—a gable there,—a lofty and twisted chimney,—an outline so like that of a wood or a copse that, at a distance, the observer may inquire whether the profile on the horizon is that of trees or of buildings,—that, certainly, is what we expect when we speak of the picturesque in building.

Against this marked individuality of structure (which is the most striking feature in the view of Nuremberg to which we have before referred) the street architecture of the nineteenth century makes a protest. We do not say that it is a protest that is absolute, or that will not be overruled. On the contrary, we have, even in London, buildings growing up here and there which, by their magnitude as well as by their architectural outline, will by and by impart the air of a true picturesque grandeur to their neighbourhood, if only we are able to prevent the uprising of forms so hideous in their neighbourhood as to destroy all that is either picturesque or pictorial. What would be the effect of Haddon, or Longleat, or the Papal castle at Avignon, or any other building, however romantic in its associations, on the eye, if it were neighboured by an enormous wagon-roof like that of the Charing Cross or of the Cannon-street Station? Such an ungainly neighbour would absolutely crush and obliterate the finest architectural *coup d'œil*. But apart from such monstrosities as these, or as the enormous cowl which deforms another London sky-line, the towers and pinnacles of some of our new buildings bid fair so far to dominate the lines of house and street façade as to give many picturesque effects to London architecture, especially in the neighbourhood of the Thames.

No better instance of what we mean can be cited than that which is afforded by the Houses of Parliament. We are not now about to talk again of the general elevations of this great palace, or to inquire whether, considering the style adopted, a greater diversity of elevation would not have been an improvement. We only wish to look at the fact. Take the river front. There can, we apprehend, be no question that the front would fail to impress the observer with as much sense of the real importance and dignity of the building as it now conveys, were it not dominated by the lofty and irregularly-disposed towers. If we suppose that a Victoria Tower had been erected at each end of the façade, while a certain sense of grandeur might have been produced on the mind on a very close approach,—we suppose no one can deny that the effect of the building from a distance would have been immeasurably impaired. The variation in the height, position, and proportions, of the three most lofty parts of this great palace, as defined against the sky-line, gives a charm to the whole which could not be attained, we apprehend, without this picturesque element of irregularity. Dominated by the towers, the uniformity and balance of the façade lose their otherwise artificial look. The towers raise the façade from the rank of street architecture to that of urban architecture.

If thus "the old order changeth, giving place to new," we may hope that out of the very needs and requirements of social life will arise buildings of a magnitude and beauty that will so far relieve and dominate the increasingly artificial regularity of our street fronts as to render the London of the twentieth century worthy of the noble river which was the cradle of commerce, and which thus determined the locality of the metropolis. And this is the more needful because of the special element of poverty in street architecture which is present in much of London, and also in Paris, Marseilles, Turin, Rome, or Naples. The truth is, that our ancient and sturdy boast, "Every Englishman's house is his castle," proud as it may be from a constitutional standpoint, is highly un-architectural when we come to deal with urban architecture. For the Englishmen are so many,—and many of them so poor,—that the castle shrinks to a very modest size. A six-roomed castle can hardly, by any stress of genius, be made imposing and architecturally happy. At all events, it is one of half a million of closely-packed neighbouring castles of the same kind. The Frenchman or the Italian who requires one, two, three, or more rooms, is content to take them in a large building. The Englishman, at all events, if he be married, is never happy without he has the key of the street door in his own possession. This disposition, unfortunately, is hostile to fine building. Even in the one item of ground-rent, where urban sites are continually rising in value, the small house system is a most extravagant one. The same thing may be urged as to almost every detail of building: a monastery, or a barrack or a palace, as we see these buildings abroad, may at once present true architectural dignity, and afford convenient and accessible accommodation for very poor inmates. In the magnificent view that meets the eye of the traveller from the summit of Vesuvius, as he looks northwards across the deep blue of the magic bay, to the white houses of Naples gleaming in the sun, there is a building which impresses the attention more than the Royal palace, the tower of Maganiello's church, or any of the really noble buildings within ken. It is the Albergo dei Poveri; we suppose we may call it a gigantic almshouse. It is a building erected on charitable grounds, to give shelter to the houseless poor. Yet so well proportioned is the edifice, as well as so large, that at the distance of eight or ten miles it appears to be by far the most important edifice in Naples. The only parallel to this in our country, and it is a very distant one, is to be sought in the union workhouses. The idea of combination in an abode is one so distasteful to the Englishman, as a general rule, that but small way has as yet been made in those well-intended efforts to introduce the system of flats, or other combined dwellings, to which we have on not a few occasions heretofore called the attention of our readers.

In one respect, indeed, the principle of combination of abodes has attained a remarkable development in London. In 1834, before the completion of the London and Birmingham Railway, the hotels of London had by no means assumed any special architectural character. They either resembled, and indeed were, one or two private houses run together, as in the case, if we rightly recollect, of the Clarendon, and later of the Trafalgar Hotel; or they were local inns, built for the cheap accommodation of coach passengers, as the Gloucester Coffee House, or the White Horse Cellar. City-ward there were, and in some cases there yet remain, inns of a somewhat Shakspearian stamp,—Green Dragons, and Bulls, and Griffins, and the like, in which external wooden galleries looked down on the inn yard, and gave access to the separate bed-rooms. Whether built as hostelries or not, these ancient inns were revivals of an early form of that architecture. A large gateway, took up great part of the street front; and the body of the building extended rather at right angles to, than along, the main street. The Euston Hotel, considered an enormous structure when completed, was a bold anticipation of the requirements of the passenger traffic to be developed by the Birmingham Railway; and was an instance of confident and verified foresight. Now the Euston and its twin brother are by no means conspicuous for size. Hotels are more and more swelling into palatial buildings, and that not in London alone, but at Brighton, Bournemouth, and elsewhere. The Langham, the Victoria, the Charing Cross, and the Midland hotels are among the buildings that first catch the attention in a bird's eye view of London; and each addition to the number endeavours to out-top, or to outswell, its predecessor.

That combined residences for the permanent bachelor inhabitants of London, or for the small family, will follow in the wake of the hotels, we think extremely probable. Even as it is, those central spots that have been successively cleared for purposes of improvement, as close by Holborn-viaduct and in Northumberland-avenue, are being lined by houses of what, years ago, would have been regarded as a prodigious height. How far the "mansions" which have raised legal difficulties on account of their great elevation, have answered, or are likely to be imitated, we are not now prepared to say. But it will be seen that street architecture is assuming a phase of magnitude and costliness which is transforming the face of London. Whether the assertion of individual taste (or the absence of that quality), will lend us in a jumble of costly monstrosities, or whether combination, instead of competition, among proprietors and architects will give a more harmonious character to our street architecture, we may not venture to predict. The one point which strikes us as indubitable is this: Unless the grandeur of public buildings, and the features of lofty towers, spires, or pinnacles, erected, not to gratify private fancy, but in true architectural symbolism of the object of the edifices which they adorn, keep pace with the increasing hugeness of private or of business structures,—of shops, warehouses, and hotels,—whatever cost may be lavished on the street architecture of London, the element of the picturesque will be absent. Rows of large houses, when smoke and decay have been at work on them for thirty or forty years, will not be much more imposing than rows of small houses; unless the public building assumes its true position as dominant over building that is private, and unless a varied and picturesque sky-line counteracts the level sameness of interminable rows of parapets or of chimneys.

Brixton.—The foundation-stone and three memorial stones of the proposed new church of St. Paul, Brixton, were laid on the 1st instant. The site of the new edifice is in Santley-street, Ferndale-road, Brixton. The building will be of brick, with Bath stone and terra-cotta dressings. It will seat 1,640 people, and will be provided with galleries on both sides. The architects are Messrs. Habershon & Fawckner, of Bloomsbury-square, and the builders are Messrs. D. C. Jones & Co., of Gloucester. Mr. J. R. Manning will act as clerk of the works.

THE CAUSE OF THE EXPLOSION OF GAS NEAR TOTTENHAM COURT ROAD.

IT is now seventy-eight years since the Soho Factory, near Birmingham, was first lighted with coal-gas by William Murdoch, and it is sixty-seven years since Clegg, Manby, & Murdoch erected apparatus for the lighting of London by the same agency. The first public display of the new illuminating power was made on the occasion of the visit of the Emperor of Austria, the Czar, and the King of Prussia to the City, when they received the hospitality of the Lord Mayor in the Guildhall. At that time the direst predictions were made as to the danger that London would be blown up. With the exception of local cases of damage (such as that in the house of Mr. Gambart, in the Avenue-road, Regent's Park), due to neglect in shutting off the gas-cocks, no approach to the fulfilment of such menaces has occurred until, on Monday, July 5th, the series of explosions in the neighbourhood of Tottenham-court-road, described in our last number, led many persons to form the conclusion that London had been visited by an earthquake.

The reason of this long immunity from mischief is simple; and simple is the reason of the catastrophe which has just occurred. And while lamenting the loss of life, the terror, and the distress occasioned by the explosion, it is satisfactory to be able to point out the causes both of the safety which is the rule, and of the destruction which is the exception, and to show that alarm has been exaggerated, and that recurrence of such an event is rendered more unlikely than was the explosion itself, after an experience of three-quarters of a century.

We do not forget, of course, the explosion of a gas-holder, or deny the danger attendant on the use of coal-gas, except under proper supervision. But we can reassure our readers against such a thing as the sudden discovery of a new source of danger for the inhabitants of the metropolis, which has been the comfortable prediction of certain sensational announcements. Although caused by the explosion of gas, the catastrophe in Tottenham-court-road cannot be brought under the category of accidents likely to arise from the ordinary use of gas. In fact, it has a much closer analogy to those explosions of which, year after year, we have so many instances to lament in our coal-mines.

Coal-gas, our readers pretty generally are aware, as it is sent through the subterranean pipes which honeycomb the metropolis is not by itself either explosive or combustible. To burn or to detonate it requires an admixture of oxygen. This may be supplied from the atmospheric air. And so far is the carburetted hydrogen gas used for the illumination of our cities from being a dangerous explosive substance, that the slight pressure which is measured by half an inch of water is enough to maintain such a current as to allow the issuing gas to burn freely, without the least fear that the flame should make its way into the pipe that supplies the burners.

The reason of this safety lies in the fact that coal gas is only explosive when mixed with a certain proportion of oxygen. Pure hydrogen burns with a pale blue flame of intense heat, and carburetted hydrogen with a more luminous, though less hot, flame, if allowed to catch fire at the moment of its coming into contact with the atmosphere. The brilliant oxyhydrogen light is produced by the inflammation of these two gases at the moment they are brought into contact in the proportions which constitute water. The action, comparatively, is gentle. But, on the other hand, if carburetted hydrogen be mixed with a certain proportion of oxygen, or of common air, it forms a dangerous explosive. Quiet combustion is then impossible; and on the contact of flame, spark, or red-hot metal, the whole mixture instantly explodes.

This is what occurs in the workings of the collieries. From all newly-cut bituminous coal, carburetted hydrogen gas more or less rapidly issues. At times stores of this gas are tapped by the miner, and a large volume issues from the workings. One main aim of the ventilation of coal-mines is to keep up such a constant circulation of air as shall prevent the formation of an explosive mixture. And, as it is known that this precaution will at times fail, the other element of safety is the absence of any naked light with which the gas may come in contact: the use, in fact, of the safety-lamp.

What occurred on the 5th of July was this. Gas had leaked from the mains in use into a new main which was in process of fitting, and which had not yet been connected with the gas-works. It was supposed that this pipe, which is of the large diameter of 36 in., was in the same condition as the surrounding atmosphere, that is to say, that it merely contained ordinary air. By some unsuspected filtration, however, coal-gas had made its way into this pipe. Of course no current of ventilation had been provided, and the phenomena which occurred showed that the mechanical mixture which had taken place was irregular and imperfect, attaining in some places highly explosive proportions, and in the intervals only combustible proportions. It is to be borne in mind that this infiltration of gas was entirely unsuspected. The terrible warning which has occurred will teach the gasfitter hereafter to regard an empty pipe as a possible source of danger. But we are unaware of any circumstance which pointed in that direction before last week; and we apprehend that, if any engineer had been asked, "Can there be any coal-gas in the 'dead main,'" he would have replied, "Certainly not." How it got in is matter of question. But its presence is proved by the explosion. So also is the fact that explosive mixtures were only locally formed, although there was enough carburetted hydrogen in the mains to communicate flame from one to another of these local mixtures along the whole length marked by the successive explosions.

It may be regarded as most unlikely that such a catastrophe should recur. The laying of a 3-ft. main is not an ordinary occurrence. And for the future, being now aware that such a main may become a possible source of danger while being laid, the engineer will take precautions of which no one ever dreamed before the recent event.

As to the questions, "How was the light communicated?" and "How did the gas get into the main?" it is possible that we shall not be able certainly to reply. With regard to the first, nothing could be more straightforward and honourable than the evidence of the witness Hawkes. Under the circumstances we have mentioned, it is clear that no blame can be thrown on any of the officers or men employed. The peril was not, indeed,—or rather will not be in future,—as mysterious as that of earthquake, but it was quite as much unforeseen. As to the other question, the lesson is more practical. The gas companies and the water companies of London are aware of the constant loss of a proportion of their gas and of their water. The gas sent into the mains is not accounted for by the consumers by some five per cent. The loss of water is yet more considerable. If we ask how this can be, we have an immediate explanation afforded by one of the great barbarisms of our present arrangements. For a delicate system of closed pipes, conveying either water or the more subtle fluid of gas, the first element of secure maintenance is, that the joints should be undisturbed. How do we effect this? We dig a trench in the ground; lay the pipes with due care; shovel in the earth, and turn carts, vans, omnibuses, and even traction-engines and steam-rollers, over the top. We might, with as much good sense, set a gang of men to drill holes in the pipes at such intervals as pleased them. Displacement must begin as soon as a road is opened for traffic. After a time leakage results. When the leakage has become so serious as to be perceptible to the nose, or by the dampness of the street, a gang of men make their appearance. They quietly deposit logs of wood or other obstacles in the way of the traffic, pull off their coats, and commence an attack on the road with enormous pick-axes. Pitching, paving, asphalte, macadam,—whatever be the artificial surface of the roadway, yields at once to the attack. The sextons of the mains delve down as if intent on carrying out a burial ceremonial of their own in the heart of the metropolis. Then come men with devils, that is to say, iron fire-baskets, which are known by that profane title, and solder the joints of the pipes. The work is carried on with the utmost coolness, the traffic having to stop or to go round, as best it likes, mean time. A good job, no doubt, is made of it. The leaks are stopped as far as they are discovered; and as soon as they are stopped, measures are taken for re-opening them. The earth is shovelled in again, the traffic is turned on again, and the difference between the resisting-power of newly-filled earth and of that which has been consolidated by pressure is thus set in operation as a sure and rapid mode of producing more leaks. The whole process is good for trade. It employs a certain set of workmen in a work which, with proper arrangements, would be wholly unnecessary. It is thus in exact accordance with the ultra democratic theory of the true mode of conducting public work. The freedom of the subject is respected, the independence of the various companies is respected,—independence alike of one another and of the public convenience. If a street is ripped up to-day by the water companies, that is no reason why the gas companies should not have their innings. Thus every one is served in turn. The cost of water and of gas is increased by preventible leakage, by preventible work done in search of the leaks, and by cost of reparation. That principle which is held by some persons to underlie the social compact,—namely, the duty of the state to provide work for the working-man, is carried out to a great extent by the provision of a good deal of unnecessary work. That under such conditions leakage has for once occurred into, instead of merely out of, a pipe, need surprise no one. It has, however, had the effect of calling public attention to the one real cause of the calamity that has recently occurred.

There are certain subjects on which the public writer, after a time, learns to be silent. Not for the reason that he has nothing to say, but for the reason that, having something very important to say, he knows that so deaf an ear will he turned to his remonstrances that he loses heart in the matter. Such has been the case with regard to preventible explosions in collieries. We have more than once or twice pointed out the fact that, if a convenient and luminous safety lamp (of which we could with certainty suggest the principle) were put in the hands of the miners, and if the men were properly searched before being allowed to descend the shaft, explosions would cease,—that is to say, if the proper regulations as to the use of powder were also enforced. In the same way we have pointed out, over and over again, the great waste of money involved in our inexcusable mode of laying the mains of the water and gas companies through the streets. If the bill of costs were cast up, it would be a heavy one. Look at the cost of repairs and reconstruction of road, the extra wear and tear of carriages, the loss of time, the injury to horses,—of all this we have often spoken. Now we have a very serious item to add to this cost, namely, that of the leakage of the gas and water pipes, at all events to a very considerable extent. If we set down 100,000*l.* per annum as an approximate estimate of the loss by leakage, we shall probably be far within the mark. Then comes the question of the amount of damage effected by leakage; and here is a very grave and important consideration. In the present case, loss of life and great alarm are added to the foregoing results of neglect. Nor need we hesitate, however much light may be thrown on the actual facts of the present case, to attribute the leakage which had so fatal a result to the false mode of laying, and to the disturbing effect of traffic. The evidence is precise as to the good condition of the valve connecting the two mains, when examined. The state of the connexion at the time of the explosion cannot be arrived at from any other source of information than that furnished by the explosion itself. If other points at which gas may have filtered into the main existed,—which the successive occurrence of the explosions indicates as most probable,—it has yet to be pointed out where they were. But along the whole course of the main, actually or potentially, the great disturbing element of traffic over the pipes had to be contended with. The cost that would have been saved in London if the principle of a subway, for the purpose of sewerage, water-supply, and gas or electric lighting, had been in good time adopted, it is not easy to estimate.

Plasterers' Society. — Our attention has been called to the alleged worth per member in this society of 51*l.* 9*s.* each, and it is asked how 1,850*l.* 3*s.* 2½*d.*, divided among 4,580 men, can amount to 51*l.* 9*s.* each. The figures given are quoted from the comparative table on page 51 of the report, in which the several sums stated are set forth. If the general funds only are given in the one case, and branch funds are included in the other, the secretary or auditors ought to have notified the fact; as they now stand in the comparative table, the total worth per member is only 2*l.* 10*s.*,—not 51*l.* 9*s.*, as there stated.

A HISTORY OF PAINTED GLASS.

THIS* seems likely to be, and is, as far as it has proceeded, an exceedingly useful and interesting work. It is intended to be completed in four volumes, of which the first deals with the subject from the earliest known specimens to the end of the thirteenth century; the other three respectively with the fourteenth, fifteenth, and sixteenth centuries. The greater portion of the first volume is now before us; the whole is to be issued in parts, either two or three to a volume, at intervals of three months. The author has long delayed the intended production of the work on account of the frequent discovery of new facts and materials, but he has wisely determined not to postpone it longer on this account, but to make use of what he has already collected. From the business-like manner in which the work is put together, we have no doubt that the production of the successive parts will be continued in due order to the end (which, as many of us know, does not always happen with works that are promised in serial parts); indeed, we are assured in the preface that the majority of the blocks for the illustration of all four volumes are already completed.

Mr. Westlake has excellent qualifications for his task, in being both a student of ancient, and a designer of modern glass-painting, and he understands the subject both from a practical and artistic point of view. The two parts at present produced are copiously illustrated, but the author has abstained from attempting illustrations in colour, for reasons which may be said to be good and sufficient. In the first place, coloured illustrations would have "more than quadrupled the price of production," and thus put the book out of the reach of many who may now profit by it; and, secondly, he is of the opinion that it is nearly impossible to render the effect of coloured glass by painting: "the illustration thus produced is a gaudy deception, and in most of the works so published it rather misleads than assists." Even highly-elaborated drawings often fail to give any real impressions of the character of the original, partly in consequence of their very elaboration. The comparative roughness of execution which makes so much of the character of the original is lost sight of, and the whole is represented in a state of finish and delicacy which it never had in reality. Those who have compared chromo-lithographic representations of Egyptian or of Mediæval coloured ornament with the originals will know how much difference there often is between the coloured publication and the original. We see Egyptian ornament, perhaps, represented with a precision and clearness of line, a brilliancy of colour, and an entire symmetry in the drawing, which we find to be entirely wanting in the original, not only from the fading of colour which the illustrator has restored, but from the careless and irregular drawing which the illustrator has represented as a modern draughtsman would have drawn it if a sketch of the design had been handed to him to work up. In the same way the sumptuous tone of early glass is represented in the "chromo" by a flat tint which gives no idea of its real texture, and which in all probability is very often not true in tone either. The history and character of design in stained glass may be given in engravings; the colour must be studied in the originals if it is to be studied to much advantage. This is what Mr. Westlake wishes to recommend to the student, and in this respect his work is of the greatest value in giving detailed information as to where the best examples are to be found, and, in cases where the collection is extensive, giving a key-plan of the positions of the windows, with the names of the subjects, as far as they are known. Whether it is altogether true that "it is impossible to design well for stained glass, without studying the old work *in situ*," depends to some extent exactly on what is meant by designing well. If it means reproducing the character of Mediæval glass work, we agree entirely; but if it means original design and style, we are inclined to think that the tendency of constant study of old work *in situ* is apt to lead,—perhaps with most people almost inevitably leads,—to mere archæological copying, sometimes without the student having at all deliberately intended such a result. The study of any particular school of art-work in its old examples, is very apt to develope in the student an artificial standard of judgment, too favourable to the class of work which he has become familiarised with, and has learned to see more in than others less committed to its study can discern in it; and from this influence Mr. Westlake does not seem to be free. His taste seems to have become to a certain extent Mediævalised, and he speaks with great admiration of figure-designs which, if presented fresh to an artist who had not become "acclimatised," as one may say, in regard to them, would certainly not excite admiration. This, however, seems the fate of students of Mediæval art, and we cannot criticise Mr. Westlake decidedly for a weakness which he shares with so many others.

In regard to the conditions of the art of glass-painting, Mr. Westlake takes a very decided stand in favour of figure-painting as its leading object, and places very little, as it appears to us far too little, value upon ornamental mosaic design, in self-coloured pot-metal,* with which such rich and indestructible polychromatic effect can be realised. This he seems to regard as a glazier's art, and he is still more indifferent to the beautiful effect of Cistercian grisaille windows, which he merely alludes to in a paragraph in passing, and gives one small illustration of. We need hardly remind our readers that this Cistercian form of glass has been regarded by some of the best authorities on architectural effect as one of the most beautiful and suitable treatments of window-glass that has ever been invented. We are not, of course, putting it on a level, in regard to artistic importance, with highly-coloured glass introducing figure design; but it is a more important and suggestive form of glass treatment than the author seems disposed to admit. Mr. Westlake, however, draws the line distinctly between painted glass and coloured glass, his book being especially the history of *painted* glass, under which term he does not include pure pot-metal leaded into mosaic,—that he calls *coloured* glass. He says at the close of his introduction, "It is upon the use of enamel paint that the art depends; this separates it by a chasm from all the other arts in glass." Enamel process on glass is often used to indicate the later method of merely painting on the surface of the glass, without any burning, a process which all who understand the subject have condemned as deficient in transparency and certain to decay. We cannot, of course, suppose that Mr. Westlake here uses the word "enamel" in this sense; he, of course, uses it for vitrifiable colour painted on and fixed by firing; but there seems an undesirable confusion of terms among writers on the subject.

In regard to the earliest examples of glass-painting, there is a good deal in the first part of the book which is either actually new or presented in a new combination. The portions of the old window from the cathedral of Le Mans, figures apparently forming part of an Ascension picture and placed together for preservation in one of the windows of the cathedral, are given as probably the earliest extant example of painted glass, dating from the eleventh century. Other authorities have claimed higher antiquity for these; but the reasons for fixing it to the eleventh century, probably the latter part, seem nearly conclusive. Mr. Westlake gives a diagram of the probable original composition of the window, and the place which the still existing figures occupied in it. One of the most important conclusions to be drawn from the Le Mans window is in regard to the very different and, from a decorative point of view, very inferior appearance which a painted window must have presented when the window was divided only into large squares by the iron supports necessary for the glass, before its division into small medallions and before the mullion system was developed, which inevitably suggested the breaking up of the whole design of the window into small compartments.

One point which Mr. Westlake has attempted to work out with considerable success, and which is of no little interest, is the existence of a central school of stained-glass design in France, in the twelfth century, the teaching and influence of which gradually extended through France and to this country. It would require a larger number of links and examples than now exist to establish this beyond controversy; but the examples collected and compared by Mr. Westlake point very strongly in favour of his conclusion, and, at all events, illustrate the progress of the art in a very interesting manner. The head quarters of this early French school, the author supposes to have been Chartres and its neighbourhood; and the chief evidence in favour of his theory is presented by the comparison of figures and details in the Jesse window at Chartres with parts of a window of similar design at St. Denys, and with some of the remains of twelfth-century stained glass at York. The resemblances between these are, as Mr. Westlake observes, more than accidents of style; they are those of a school. "The foundation of the design of all the ornaments is clearly traceable to the Greek." This is undoubtedly the case; and we may suggest, as Mr. Westlake omits to do so directly, that this fact in itself seems conclusive as to the importation of the school into this country from France. It was only through the latter country, which had so much relation with Byzantine art and Byzantine artworkmen, that reminiscences of Greek detail could be introduced; there was no reason why anything should be known of it in this island at that period. The whole conclusion Mr. Westlake sums up at the end of his chapter ix., thus: "That the art is of French origin, and that it was cultivated first by French people, or foreigners in France, and that it was slowly but surely making its way from a centre not a hundred miles from Paris, to England and Germany, towards the close of the twelfth century. It was then still a great luxury, and I should doubt whether a dozen churches in England had any quantity of painted work before 1200. As the thirteenth century progressed scholars developed into masters, and schools multiplied, and before 1400 it became one of the most popular and common of arts. It had not been raised by this demand and supply one whit in grandeur of design or excellence of material, but a certain *finesse* of execution became developed by the great practice the executants attained, and as design lost dignity it gained facility: this is not a remark peculiar to this art or to this period."

It would have been more correct, according to the meaning which is obviously intended to be conveyed, to have inverted the latter sentence, and said that "as the art gained in facility it lost in dignity," since if there is any cause and effect in the matter it is in that direction; loss of dignity could in no way lead to facility, but the reverse may and often has been the case. But we very much question whether the conclusion as to the essential deterioration of the art is so true as Mr. Westlake would have us think. That it deteriorated in the close of the Mediæval period, at the same time that the greatest facility of execution was attained, is true enough; but the author seems to imply that this deterioration had commenced in the thirteenth century. If we understand him right, one of the instances of this lies in the fact that towards the end of the thirteenth century the figures began to assume a more naturalistic appearance; as he expresses it, they began to "pose"; in other words, a certain power of drawing the figure in varied positions was acquired, in place of the stiff monumental attitude, or rather absence of anything which can be rightly called attitude, in the work of the previous period. Now, even admitting the fact that stained glass demands a certain severity of style in figures, is it a true criticism which can regard the attainment of this power of representing the balance and pose of the figure in varied postures as a sign of decline in the art? Surely not. Then take the heads: compare the head of an angel from the north rose-window of Lincoln, given as an illustration on p. 75 of the work, with any of the heads of figures of the older period illustrated in previous pages,—the advance is great and unmistakable, unless power of drawing and expression are really to go for nothing in stained-glass design. In the older figures the heads are either shown in stiff front elevation, or when shown in half or quarter face they are wrongly set, and the features drawn with no perception of true perspective: in this Lincoln head there is real freedom and grace, and the power has been attained of showing correctly, or nearly so, the difference in contour of the two sides of the face and of the orbit of the eyes in a head half turned away; and are we to regard this as a decline in art? Such a conclusion seems to us an example of the way in which, as we have observed above, critical judgment becomes warped by the constant study of a favourite, but incomplete and archaic style of art, until its very shortcomings are regarded as beauties. It might be urged with more reason that the

* A History of Design in Painted Glass. By N. H. J. Westlake, F.S.A. Vol. I., Parts I. and II. London and Oxford: James Parker. 1879.

* Mr. Westlake appears to use the term "pot-metal" indifferently, either for glass coloured bodily in fusion, or for colour laid on the surface and then fixed with a flux.

character of ornamental accessory detail deteriorated; but we doubt if even this is fairly true: some qualities were lost, some of that solidity of character which marked what may be termed French-Byzantine detail; but our English thirteenth-century detail had other beauty of its own, in its elegance and variety, equal to that which it displaced. The grandeur of the subjects, the solemnity with which the great Christian legends were contemplated, may have declined as the church became more mingled with the comparatively modern world of action after the fateful year 1000; but it may be doubted, again, whether our idea as to the greater solemnity of feeling of the older art is not partly due to the effect inevitably conveyed by an art which cannot express passion or natural feeling, and which, therefore, appears more solemn and earnest through its very deficiencies.

This defect, as we think it, in the critical views of the author, hardly impairs the value of his work, which we recommend as, so far as the executed portion of it is any criterion, the best work on the subject which has yet appeared in this country. Mr. Westlake would do well, in a literary point of view, to cultivate a little more simplicity of style and avoid occasional lapses into "fine writing"; and we may point out that there are some errors in regard to the reference numbers to the plates, which a more careful correction of the press would have avoided. But we shall look with much interest to the continuation of the work.

THE ARCHITECTURAL CONGRESS AT ST. GERMAIN.

EVEN regarded from a professional point of view, not the least interesting of the excursions made by the Architectural Congress, recently held at Paris, was the visit to the Gallo-Roman museum, at St. Germain-en-Laye, made additionally instructive by the help of the accomplished curator, M. Bertrand, whose enthusiasm led him, in that delightful way that enthusiasts on one subject always have at their command, to inoculate the whole party with sympathy in his collection.

It would be difficult to say what feature in the history or topography of the country old town of St. Germain-en-Laye has given it the worldwide reputation it enjoys,—whether the stay of Louis XIV. in its Renaissance château which Francis erected and beautified with his picturesque emblem of the salamander, whether the residence of an heir to the English throne, the unfortunate "Pretender," in the same château; whether the beautiful terrace, with its famous view, or the proximity of Marly (certainly St. Germain is familiar to many through Turner's exquisite sketch of the old town, as seen from the Seine), or whether, in more recent days, M. Thiers's residence and death there; certain it is that St. Germain, its château, and the old Pretender are known to many who have never heard of the museum that has been formed in the old home of "James III.," which, after many generations of neglect, has now been placed conscientiously into a state of thorough repair, from the designs of the late eminent architect, Eugene Millet."*

The museum has long been known to archæologists, but lately a number of valuable additions have been made, enriching a collection in which are carefully-classified, with a simplicity beyond criticism, a characteristic series of relics of the past existence of the human race, from its earliest known development down to the Christian era. It is more particularly to France that the contents of the museum are confined, but no less clearly do the collections show us the contemporary existence of Great Britain, and, in fact, the whole European continent. From the excellent system of arrangement of the various objects which compose it, the St. Germain "Gallo-Romano Museum," as it is termed, possesses in a high degree that quality which it has always been the endeavour of museum authorities to develop,—the quality of affording sound information accessible to the intelligence of all students. No object is placed in such a manner as to attract exceptional attention, liable to interfere with a general study of the whole, but every object, from the most insignificant to the most important aids in leading to the same end (the reconstruction of the existence of the innumerable generations which have succeeded each other on the soil of what is now called France, from pre-historic times down to the commencement of French history proper) is set forth.

Whirled from the St. Lazare Station at Paris, an hour's journey, passing rapidly on the way many a quiet and historical suburb, brings one, along the first railroad established in France, almost to the foot of the old château, with its piazza, and the little church in which repose the mortal remains of "James III. of England." From the hustle and roar of the "modern Babylon," fifty minutes have sufficed to land us in the age of the cave-dwellers, represented in the "salle des cavernes." Man is living in a den which he endeavours to render inaccessible to the terrible beasts that surround him. He defends himself against them with those flint instruments and arms now so familiar, and which geologists find in the quaternary alluvial deposits. No date can be fixed, it is a crisis of the world in a state of formation, a purely geological period. Art, however, has already shown itself. The hairy wild being called "man" has already been moved by a superior instinct; with the animals he daily chases vividly before his mind's eye, he tries to reproduce their image on his stone weapon and his bone implement.

The second room is the "Salle des Dolmens." We have reached the period of those mysterious works of man which in the time of Carnak,—prolonged without interruption over a length of nearly thirty miles,—have given rise to so many contradictory theories. To erect such enormous stones which are found, strange to say, throughout the whole of the west of France and in England, an organisation, relatively advanced, must have existed. The bracelets, necklaces of jade, and of turquoise found in the excavations prove this fact. These dolmens reveal a civilisation in its infancy, but the secrets of which still remain unfathomed. In spite of every research, these strange monuments rise like an enigma before every inquirer. The "Salle de Garrinis" (an island off the Brittany coast), completes the relics of this mysterious period, relics on which are to be found more than one symbol to be met with in Egyptian art, the spiral and the hatchet being particularly noticeable.

Perhaps the most plausible explanation, and one now generally admitted by the learned,* of the peculiar civilisation represented in the dolmens, is the arrival in Gaul of one of the emigrations of Joraelites who fled from the bondage of their Egyptian task-masters. These partial flights were not unfrequent before the great move organised by Moses. The fugitives, as was natural, would bring with them the recollection of the huge monuments on which they had been obliged to work. In considering these funerary dolmens and menhirs, which so resemble ill-shaped obelisks, if we do not find them ornamented, it must be borne in mind the manner in which the hugh monoliths of Egypt were covered with hieroglyphics. These monoliths were, in the first place, set up as they came from the quarry; generations of artisans then continued to shape them in their place; and finally came the artists, who, initiated into the sacred rites, engraved on them their hieroglyphics. Captives, as we know the Israelites to have been, they knew little but the mere manual portion of their work; they transported the huge stones from often distant quarries, but beyond this knowledge their position forbade them to go. But of this mystic period, which bears the vague name of "the stone age," all is as yet supposition.

The epoch of the lake-dwellers on which we enter in one of the rooms is equally in a state of dim uncertainty. Humanity is still groping onwards in an embryo state. The epoch may be co-eval with that of the dolmens; but it is characteristic of the age that these two contemporary and parallel societies should have each developed themselves almost side by side without our finding any apparent trace of the slightest mutual acquaintance. This lacustrine civilisation possesses certainly a peculiar interest; unknown to antiquity, buried—for who can tell how many thousands of years?—under the blue waters of a Swiss lake, it was alone discovered but a short time since through a phenomenal decrease of the level of the lake. But better organised than the society of the dolmen builders, the lacustrine city enjoyed many of the advantages of material comfort. The cereals were cultivated on the land near the shore; fruit-trees were planted, as we find in the vases which have fallen into the water nuts and apples half calcined. The ox and the horse were already utilised; flax was used and spun; bronze was known; and iron, though rare, was beginning to be introduced.

Like the dolmen civilisation, the lacustrine civilisation left its onward movement incomplete, and it disappears without our being able to trace its downfall. Both may be compared, indeed, to the comparative civilisation of the savages of America and the aborigines of Australia, who, for thousands of years, have never advanced, and are disappearing without ever improving,—without ever being affected by the arrival of the Europeans.

Civilisation proper only penetrates to Gaul with the great Indo-European invasion. Then appears the Celt, of whom we know, it is true, but little, but who, we can trace, brings with him traditions from his original home in India, and remembrances of the archaic art of Persia. To the dolmen, which will, however, still continue to exist in the West, succeeds the *tumulus*; and the arms, particularly the sword-hilts, found in the *tumuli*, of the purely Celtic period, before the arrival of the Gauls, recall strikingly those borne by the warriors in the bas-reliefs of Persepolis.

In company with this immigration, Druidism enters Gaul,—the Druid who again, from so many points of view, seems to have come direct from India, with his Brahmanic traditions, and who is to play so important a part in a civilisation which this time is to lead to onward progress.

After the Celts came, probably from the same regions, the Gauls or Galateans. With them we have entered the domain of history. In the rooms devoted to the Gaulish relics, there are few objects of which we do not possess some historical notice. There lie the famous swords of which Polybius has spoken, the swords which were so long and imperfectly tempered that the Gauls, in the midst of the battle, were obliged from time to time to bend them straight under their feet; in another case the short Iberian sword which Hannibal gave to his soldiers, and which the Gauls adopted. With the relics we possess, and which can be all seen here, the appearance of the Gaul can be easily restored, wearing the *sagum*, the plaid which our Scotchmen have still preserved, and which, like that garment, served the Gaul as clothing and as blanket; his face scrupulously shaved, the hanging moustache excepted, with the bronze razor which is found in every tomb. Luxury is confined alone to the warrior. The race is still half nomad, although in the tombs will be found choice vases revealing Greek and Etruscan art; but these came from the sack of Rome and Delphi. Little by little the race settles down, its social organisation powerfully aiding in the work. This organisation betrays an evidently Indian origin; it resembles the hierarchy of India, the type of all the societies of antiquity, the Brahman, the Xatria, the Soudra, the priest who prays, the soldier who fights, the masses who labour. This civilisation appears to have been singularly varied in different regions: thus in Cæsar's time, Belgium had arrived at a high degree of culture; the commonest pottery is of an elegance of form which is remarkable, and recalls the Etruscan models which the Gauls had brought home from their Southern invasion.

But it would be no easy task to speak of all the interesting features which the museum contains of the life and manners of the Gauls. Let us hurry on to the period of Cæsar's conquest. With his "Commentaries" as a guide-book, one is able to trace, almost step by step, the incidents of the struggle. Here are models of the *oppida*, or camps, specimens of the famous fortifications of Alesia, and a large plan in relief of the field of the celebrated battle. Act by act can be traced the drama in which the independence of Gaul was to succumb before the superior organisation of Rome.

What this organisation was, the rooms to be shortly opened to the public fully show. The members of the Architectural Congress were enabled, by the courtesy and under the guidance of the enthusiastic director, M. Bertrand, to visit these interesting rooms. Here we see displayed in thorough working order the literally marvellous Roman administration with which classic students are not unfamiliar, but of which so much still remains to be learnt.

No sooner were the Romans installed, than they commenced without a week's delay a

* See *Builder*, vol. xxxviii., p. 737.

* See *La Liberté*, Dec. 6, 1879.

series of works of a magnitude such as modify more deeply the social conditions and ideas of a nation than the most stringent and cruelly-executed laws. For league after league, over land uncut by any but the roughest paths, were opened huge causeways which, starting all from the Roman Forum, were to reach the smallest hamlets of still Druid-ruled Brittany. Huge mile-stones are planted at regular distances. In the humblest hamlets rise villas, baths, and circuses. The stone age seems to have been revived. The simplest document, such as we should be content to paste on the boarding of the town-hall, is indolibly engraved in stone.

A fresh revelation into the life and manners of the past is afforded in the room reserved to the symbolic mythology of Gaul. With the Roman conquest a marked transformation is noticeable in the religion of the country. The Druids, as representing the spirit of independence, are considered dangerous, and are oppressed, and to their imaginative and symbolic faith succeeds a coarse polytheism. The artists whom the Druids had forbidden to represent the Divinity develop wildly their power in innumerable idols. Every element becomes a god, the river, the mountain, the fountain Sequana (the Seine) becomes a goddess, and has her adorers. Here again a strange phenomenon is observable, the superstitions brought from India with the earliest settlers seem again to re-appear after remaining dormant for centuries. In a figure of Cernunnos with his legs crossed under him, with his hands in a hieratic attitude, on his head the horns of the Indian Bacchus, how is it possible not to see a Buddha? Are they not from the same land, the three-headed divinities which are found so constantly, and of which several specimens are to be seen in the museum? Models of purely Indian origin are exhibited by M. Bertrand for the purpose of comparison.

This strange religious disorder reigns contemporaneously with the strongly-settled organisation of the Roman conqueror. In another room we see this system at work; the whole details of the Roman military life of the period are, in fact, plainly shown. The soldier is not a poor slave; in addition to the land allotted to him he receives a good pay. Of whatever origin, whether Thracian, Spaniard, Hungarian, or even Gaul, the camp becomes his country: he knows alone his centurion; his duty is to defend the frontier against the enemy over whom his superior organisation will insure him, for many centuries, an easy superiority; within the frontiers he maintains throughout the empire an order which is rarely ever disturbed. There exists no reason for revolt. The directing classes are enfeebled by their debauchery; the smaller people are relatively happy. The tradespeople are left in peace, and are proud of their profession. The relics gathered in one of the rooms curiously prove this: *Negociator lardarius*, pork-butcher; *negociator vinarius*, wine-seller; the tinker, the tailor, the clog-maker,—all are represented on their tombs, holding each in his hands the instruments of his profession. Among these tombs, it will be understood that no small interest was aroused among the members of the Congress by the tomb of an architect, but who, by the trowel, the square, and the compasses surrounding him, it was generally agreed, among the less archæologically-disposed, must have been rather a builder than an architect.

The last room serves as a species of epitome of the long history which we have passed successively through. This room is almost entirely occupied by a series of casts from the triumphal arch erected at Orange after the defeat of Sacrovir; in the bas-reliefs of this monument will be seen all the types, all the classes, all the costumes of imperial Gaul.

It will be seen that we have commenced with the Gaul of the cave-dwellers; we leave it at the moment that the missionaries spread through the land the "good tidings of the Gospel," relating in these distant lands the prodigious events which had taken place in Galilee, at the moment when, on the banks of the Rhine, the barbarians are preparing to pour down on the civilisation of Rome, so brilliant, so refined, and so corrupted.

It is the peculiarity of this museum, and for this we must again thank the unaffected director, M. Bertrand, that the visitor is able, almost without the slightest fatigue, to embrace at a glance a comparatively immense portion of the history of our political, our social, and our artistic development. We are far from the æons of centuries of which our scientific professors speak; but, to the artistic world, this smaller range of many thousands of years is somewhat more simple to grasp, and more interesting to study.

EXPERIMENTS IN SHIP-BUILDING.

THE LINES AND THE SPEED OF THE "LIVADIA."

ALL persons interested in naval architecture will watch, with some curiosity, for the details of the actual performances of the *Livadia*, the anomalous raft-palace recently built for the Czar, in the Fairfield Yard at Govan, on the Clyde, and launched on the 7th of July. The *Livadia* is the latest modification of the famous circular, or rather soup plate shaped, craft invented by the Russian Admiral Popoff. It consists, in fact, of a sort of raft, in the form of a turtle, or, as the designer, Captain Goulaeff, prefers to call it, a turbot, with a palace on its back. The daily papers have given such full details of this yacht,—the *Times* having even produced a kind of diagram representing it,—that it is unnecessary to reproduce them here. But it is desirable to call attention to those main principles of structure as to which the Russian naval architect entirely ignores all rules consistent with the best results of experiments like those made for our Admiralty by Mr. Froude, to say nothing of the long labours of Mr. Reed and Mr. Scott Russell. The "wave-line theory" is altogether ignored by the builders of the *Livadia*. The possibility of floating over waters liable to stormy disturbances, without offending a squeamish stomach, has been the great point at which Captain Goulaeff aimed. The experience of the *Great Britain*, the *Great Western*, and the *Great Eastern*, has shown that great steadiness, as regards the pitching motion of a ship, may be attained by making the keel long enough to ride on the crests of two or three waves at a time. It may be taken as a corollary of this proposition, that if the bottom of a craft be made wide enough, immunity from rolling may be attained in the same way. The only drawback to this theory is, that the proportions which tend to give a lateral stability are incompatible with speed; at all events, without the incurring of an enormous expense. It will be seen at a glance that the Russian naval architect is not ignorant of this fact. The length of the *Livadia* is 230 ft., while what may, in courtesy, be called its beam, is 153 ft. The displacement is calculated at 4,000 tons, spread over an oval area of 14,500 square feet. The proportions of the length and beam of modern ocean steamers range from 6·38 to 1, to 10·61 to 1; and the resistance to the passage of a ship through the sea is taken, by the usual rule adopted by the French naval architects, as proportionate to the area of the midship section, multiplied by the cube of the velocity. The English rough rule gives two-thirds of the displacement, multiplied by the cube of the velocity. The velocity which the *Livadia* is expected to attain is stated at fourteen knots an hour. That of our recent war-ships is eighteen knots an hour; and the speed attained by an Indian despatch-boat for the Orissa canals, built by Thornycroft, of London, has been minuted at 24·61 miles per hour. As resistance is now regarded, we have the practical rule, that the indicated horse-power employed in a steamer is proportionate to the cube of her speed. The cube of 18 is more than double the cube of 14 (being respectively 5,832 and 2,744); so that the resistance overcome by the *Livadia*, in proportion to its midship section, is less than half that overcome by such an English man-of-war as the *Iris*, as far as is due to the speed maintained. But the horse-power provided per ton is more than three-fold in the case of the *Livadia*. The indicated horse-power proper to give the speed of fourteen knots an hour to a vessel of this length and beam, taking the draught of water as 6 ft., according to the practical formula given by Mr. William Allan, in his "Shipowner's and Engineer's Guide," is under 8,000 h.-p. That provided by Captain Goulaieff is 10,500 h.-p. The first is 2 h.-p. per ton of displacement. The second is 2·625 h.-p. per ton of displacement. The proportion in the English war-ships may be taken at seven-eighths of a horse-power per ton of displacement. Thus for a speed which gives less than half the resistance overcome by such vessels as the *Iris*, more than three times the indicated horse-power per ton is provided. In other words, the cost of fuel for the steam propulsion of the *Livadia* will be more than six times as much as that required for a vessel of normal proportions.

The calculations given of the displacement of the *Livadia* do not come out quite exact. If a weight of 4,000 tons is distributed over an area of 14,500 feet, there will be 3·625 square feet of surface per ton; and taking the weight of water at 62 lb. per cubic foot, we require 10 ft., instead of 5 ft., of immersion to balance the weight of the vessel. But the screws are said to draw 16 ft. of water, or 10 ft. more than the intended draught of the vessel. There is good reason to suppose that such a disposition will naturally diminish the speed of the craft, as in the case of towing a rope through the water.

Nor is this the only point to be regretted as to the arrangements for propulsion. The battle between flotation and engine-power is one as to which, by the use of steel, and the constant improvements in engines, the advantage is tending to the side of the latter. In an enormous flat-bottomed craft, if in anything, it might be hoped that so much power might be placed as to produce the known, but not thoroughly understood phenomenon, of the rise of the vessel, and its skating or sliding over the surface of the water—as a canal-boat will do if tugged at a great speed. We can conceive such a result to have been possible in the case of the *Livadia*, if the efforts of the engineer had been directed to produce it. We should anticipate that the deep submersion of the screws will be fatal to such a hope. Any way, we shall look with interest to the test of actual navigation, and shall be very glad to hear of any results of use to the shipbuilder from the construction of this abnormal floating palace.

THE SURVEY OF PALESTINE.

SCARCELY a month passes without the announcement of some startling addition to the range of our historic knowledge, including that of the history of art. It is not very many weeks since one of those magic interpreters who have been formed and nurtured in the British Museum translated to the members of the Biblical Archæological Society a contemporary record of no less obscure and important an event than the capture of Babylon by Cyrus. The whole sequence of Medic history, according to the length of reign preserved by Herodotus, has now been absolutely fixed in astronomical time by one line of one precious cylinder. More recently still, a like cylinder has been read, which is of the time of Antiochus the Great. No very valuable information was inscribed But the mere fact of the discovery proves that the Assyrian mode of inscribing records on cylinders of baked clay was continued under the reigns of the Greek kings of Asia. And this renders it more than probable that we shall yet discover contemporary records of the campaigns of Alexander the Great.

The backbone, however, of all recent explorations in the East, is the great one-inch survey of Palestine It is now some time since 250 persons came forward to subscribe thirteen guineas each, in order to ensure the engraving of this map, and the publication of an exhaustive memoir, enriched with plans of all the ancient ruins and places of importance, of which the sites were to be indicated on the survey. It should be borne in mind that the map itself is not a mere chart,—valuable as such a chart, if accurate, would be. There are few parts of the world in which the time which it takes to go from one spot to another depends so little on the visible distance as in Syria. Profound ravines cleave the country, descending sometimes almost perpendicularly for a height of 1,500 ft. and upwards. Thus two neighbouring knolls, from the summit of one of which the voice is audible on the other, may be severed by a valley which it will take two or three hours to pass. Such was the spot occupied by the garrison of the Philistines, marked by the two opposite rocks of Bozez and Seneh, from which issued the mocking invitation to the royal youth, "Come up to us, and we will show you a thing!" As to this spot, the survey shows the broad chasm which divides the three rounded knolls, rising above a perpendicular crag, still called "the fort" by the peasantry, from a crag of equal height and apparent inaccessibility, on the south. The geological notes will afford an explanation of the word "Bozez," or shining, as characteristic of the gleaming white of the

chalky face of the northern cliff, reflecting the rays of the sun, to which the cool shadow of the southern cliff, dotted with Seneh, or acacia, affords a surprising contrast. Hardly a goat would he thought likely to make the ascent. But in the winter of 1871 the survey party, with horses and mules, actually made their way down the face of Seneh.

The map consists of twenty-six sheets, each comprising an area of 22 minutes of longitude by 15 minutes of latitude. The survey was commenced in 1871, and completed in October, 1877, the cost having been about 15,000*l*. About 6,000 Arabic names are on the map, the outline and lettering of which are in black, and the hill shading, which forms so important a feature of the survey, being printed in sepia. In itself a representation of the physical aspect of the country, the map further serves as a key and index to the memoirs, in which all the detailed information collected by the expedition will be found.

For that information as to the plans of ancient tombs, temples, fortresses, cities, forts, and other structures which will be most eagerly sought by our readers, they will thus have to wait for the publication of the memoir. Certain points connected with one or two sites which are revered alike by the Jew and the Moslem (as, for example, the areas within the Sanctuary walls at Jerusalem and at Hebron), yet await opportunity for determination. But with these few, though important, exceptions, we believe that the memoir will afford all the information that the architect can seek as to the plans of the ancient buildings, so far as is now attainable. To these will be added scientific notes of the trigonometric work of the survey; lists of the Arabic names, as well as of the Bible names, and the ordinary nomenclature; and the outlines of the geology of Palestine. The first instalment of this store of information is the map itself. This has just been delivered to the 250 subscribers, and we believe that before long it will be obtainable by the public. As to that fact, the Palestine Exploration Fund will, no doubt, give due notice, as well as with regard to the completion of the successive volumes of the memoir.

The map of Palestine is not altogether solitary among the surveys which have been executed of those countries which now so powerfully attract the attention of the explorer. As an example of the application of the latest method of geodesic delineation, however, it is unique. And to all future time it will possess a permanent value as a faithful record of the aspect of the country at the date of its execution. The two maps which may be considered as to some extent affording similar information as to the topography of the East are, the large map of Egypt, by M. Linant de Bellefonds and the survey of the course of the rivers Euphrates and Tigris, with the Cilician Taurus, and part of Northern Syria, by Lieut.-Col. Estcourt, Lieut. Murphy, R.E., Colonel Chesney, and the officers of the expedition of 1832. This series of maps, stretching from the Mediterranean at the mouth of the Orontes to the westernmost bend of the Euphrates, at Kalah (37° 18′ N. and 37° 50′ E.), and thence to the Persian Gulf, is on the scale of $\frac{1}{4}$ in. to the mile, or one-fourth of that of the Survey of Palestine. It is little more than a chart of the rivers, with a reconnaissance of the adjoining country; and can only be taken as a preliminary datum for an accurate map of the whole district. The map of Egypt is less careful in its technical execution than are the charts of Colonel Chesney. It has the great disadvantage of making no distinction between known topographical identifications, and the theoretic identifications of the author. And as the northern limit of the delta has advanced four miles seaward between the date of the survey under the French, and that made under the orders of the English Admiralty by Captain Mansell, in 1857, it is evident that much of Lower Egypt must now be very incorrectly represented. On neither of these maps is there any attempt to give a true physical indication of the orography of the country; and geological details, which are of primary importance when any question of antiquity or site has to be discussed, are entirely wanting. The extension of a trigonometric survey from Port Said to the southern boundary of Egypt, and from the bay of Iskanderoon to the Persian Gulf, is one of the first requisites for the full knowledge and adequate development of the valleys of the Nile and of the Euphrates, those ancient cradles of the human race.

There is a signal difference, in one respect, between the value and importance of a map of Palestine and the interest excited by a map of any other portion of the world. This depends, in part, on the long range of time covered by the history of the Holy Land. In other parts of the East our glances are directed to a yet more remote past. But with the historic past the interest of the scene is exhausted. The present aspect being one either of entire desolation, or of a squalor worse than desolation itself. In other countries, where the present is active, or where the future excites the imagination, the past is brief or unknown. But we can trace back the history of Palestine for above 4,000 years. The history of Jerusalem has successive epochs of interest. We can trace the fortunes of the Holy City under seven distinct dynasties of rulers. We have some record of the rule of the early Jebusite kings; of the 466 years of the reign of the kings of the tribes of Benjamin and of Judah; of the supremacy of the kings of Babylon, of Persia, and of Macedon; of the struggles for independence against the Greek kings of Asia and the Greek kings of Egypt; of the priestly Asamonean line; of the magnificent builders of the Idumean dynasty; of the fierce struggle with Imperial Rome; of the Persian, the Saracen, the Turkish, and the Egyptian conquests; of the century and a half that glitter with the arms of the Crusaders; and of those incidents of later history which, over and anon, have started into unexpected life, testifying to the undying interest taken by the people of Christendom in the cradle of the Christian faith. Nor has the interest at the present moment become dimmed. There are not a few among us who look forward with a conviction, which in some minds attains the force of certitude, to a proximate return of the Jews, as a nation, to Palestine. And even those who stoutly disbelieve in the probability of such an event, point to the great hospice planted by Russia, as so many fortresses, in the Holy Land. They regard the occupation of Palestine as one of the main elements of the tremendous Eastern question. And they look to the great probability of a final conflict between Western civilisation and Eastern or Northern barbarism, as impending on the natural battle-ground of Megiddo,—the Armageddon of the Hebrew prophets, and the key of the Suez Canal, according to the modern strategist. The historian, the politician, the poet, the devotee, each has a special interest in the Holy Land. Each of the great Powers whose successive action has made the world what it is, has left its name deeply scored on the map of Palestine. The feudal system, in the Holy Land only the dream of a century, built here its keeps and castles; and the pennons of the oldest *noblesse* of Europe fluttered in the defiles of Judea. The once awful dignity of the Papacy sent pilgrims, and bishops, and soldiers, to Jerusalem. On this spot imperial Rome terribly proved her relentless force. The lines of circumvallation round Masada yet exist, as if they had been left in a recent campaign. The conquering path of Alexander, who passed over the East like a whirlwind, was checked before Tyre; and the great victor reverenced the High Priest, whom he had seen in a prophetic dream. For a thousand years the smoke of the morning and evening sacrifice ascended from the temple hill. The great legislator of the monotheistic faith was borne, in this region of earth, to a sepulchre unknown to man. The cradle of Christianity lay in a country which Christendom has been unable to call its own for more than a single century.

By the completion of the map and the accompanying memoir, the position of the Palestine Exploration Fund towards the public will be wholly changed. Instead of coming forward as a body appealing for subscriptions and furnishing, in their quarterly reports, somewhat meagre results of the application of the funds, varied as they have been from time to time, they will hold the status of an association which has succeeded in endowing the scientific world with one of the most successful outcomes of the patient toil of the explorer. It is one thing, moreover, to explore, and another to survey. Any one can do the first,—after a fashion. Few people can do the second,—in any fashion. And of those few, perhaps the officers of our Royal Engineers comprise the greater number,—so far as those who speak our own language is concerned. The Ordnance Survey of England, yet unfinished, and that of India, with its magnificent lines of triangulation, are large operations compared to the construction of the map of Palestine. But they are neither more scientific nor more accurate, within the required limits; neither more original nor more exhaustive. The latest improvements in the technical work of the surveyor and the map-maker have been introduced in the survey of the Holy Land. The officers who executed it braved danger, ill-health, and hostile attack. Literally, they shed their blood in the service; and that with as much devotion as did the crusading knights. All the party suffered seriously in health. One member of the exploration actually sank beneath the toil and the climate. Judged by this kind of cost,—a cost that no money can repay,—the survey is a costly affair. Judged by the outlay of money, on the one hand, and by the graphical and literary results on the other, it must be considered wonderfully cheap. In the actual state of the East, the map has a daily increasing value. Were it not actually in the hands of the subscribers, very conclusive reasons might be urged against its publication at the present moment. As, however, it is now so far before the world, the best thing to do is to let all those who are interested in the East know of what a valuable document they may become possessed. One of the most venerable of English scholars connected with Bible study, recently said that "he blessed God that he had lived to see the completion of this map." It is a work done once for all,—well done, and worthily done; and we trust that all concerned in its production will receive their due share of the recompense for faithful and long-sustained labours. We need name no names. Honour is rendered to whom it is due in the title and signature of the map, and in the details of the memoir; and we think it will be felt that Christendom owes a debt of gratitude to all the faithful labourers who have combined to produce this important monument.

FROM THE BANKS OF THE SEINE.

By the time these lines appear, the great national fête of the Fourteenth of July, as it is called, will have become a matter of history. It is not alone the whole of Paris, with the exception, of course, of "the Faubourg Saint Germain," that has made extraordinary efforts for the occasion, but the whole of France has taken part in the rejoicings, the peculiar feature of which has been their spontaneous unanimity. Perhaps, were it not that architecture plays a certain part in the show, it might be out of place to mention in these columns what is more suited to the pages of other journals, but the architects have been called largely into requisition; triumphal arches and various other architectural motives have been rising in different parts of Paris, while a full-sized model of the monumental statue to be eventually erected on the Place de la République, the former Place du Château d'Eau, has been in preparation for some time past. But it is in unlimited lanterns and endless yards of bunting that the popular joy has found expression. We, in England, have no idea of preparing weeks ahead for such an occasion, but here for a month and more past every little mercer's shop has been displaying its stock of tricolour bunting. This extraordinary impetus given to the bunting-trade by the rejoicings in honour of the great Flag Fête of the Fourteenth, recalls to our mind very appositely a certainly little-known story narrated to us many years since by an interesting old lady, well known to English residents on the banks of the Arno. A friend of Sir Walter Scott, she was once on a visit to Abbotsford on the birthday of the illustrious author, who had for the occasion displayed on his lawn a large number of flags. How he had obtained these Sir Walter told his guests. A shipowner having asked the author of "Waverley" to become sponsor to a ship recently built, Scott not only acquiesced, but presented the captain with a full set of ship's colours. It happened that the vessel, being one day in a famous foreign port on Sir Walter's birthday, the captain determined to mark the day; every colour was run up, and would have probably fluttered till sun-down, had not the vessel been suddenly boarded, and in the name of the admiral whose ship was in the port, the captain was summoned to forfeit the whole set of flags. Marine etiquette, composed no less of a series of touchy formulæ than that on land, forbids a merchant vessel, while the admiral's ship is in port, flying her colours. The colours forfeited were duly sent to the

Admiralty, the First Lord of which time-honoured institution happening to be a friend of Scott, told him of the little adventure, begging him in addition to accept the forfeited flags as a remembrance of the amusing incident.

Of the many thousands of English readers who will read, or have read, this week the account of the anniversary of the taking of the Bastille, which the fête of the Fourteenth commemorates, there can be but few still living who can say that their father was present on that memorable July day of the year 1789. Among the many curious letters written from France in the last century by Dr. Rigby, and recently published by his accomplished daughter, Lady Eastlake, one, perhaps the most interesting of the whole collection, vividly describes the scene in Paris on the day of the taking of the Bastille. How much are we indebted to those who preserve with affection the memorials of their relatives, and who have the ability and the generosity to give to the world the benefit of their care? We can imagine with what peculiar interest the accomplished authoress would recall within the last few days events of such a momentous character described in the beloved lines of her father.

One of the features of the past few days has been the opening at the Cercle de la Librairie in the Boulevard Saint Germain, of an interesting exhibition of old and modern books. After having been adjourned several times, the cards were at length distributed a few days since. It will be remembered how, when the Publishers and Printers' Club-house was thrown open, some account was given in these pages of M. Garnier's design, and a view given of its exterior.* The exhibition has enabled those familiar with the club from the boulevard to see the finished effect of the interior. Our respect for M. Garnier's reputation can scarcely be said to have been increased by his design of the Publishers and Printers' Club-house, which we should have imagined would have been an inspiring subject for an artist such as M. Garnier undoubtedly is; but the building of a colossal Opera-house, which in the past would have more than amply occupied the lifetime of an architect, cannot be expected, we suppose, to be good training for the refined work necessary for a not very large club-house. The exhibition has been installed in the two large rooms and the rotunda of the first floor. The exhibition is divided into two sections,—that of the old books and that of the new. In the glass cases which protect the treasures of the printer's art of the fifteenth century, M. Firmin-Didot, M. Claudin, M. Reiher, and many other well-known collectors, have placed some of their choicest treasures. The works are all French, and in most cases are specimens of the first works printed in France. Paris is represented by more than one work from the presses of the German workmen invited by why Louis XI. to Paris, and installed by him in the classic Sorbonne and the narrow, steep Rue Saint-Jacques, Ulrich Gering, Michel Frihnrger, and Martin Krantz. Lyons, the second great centre of the printed book trade of the Renaissance, is represented by the works of Pierre de Sainte Lucie, and more than one other contemporary: books printed with a care and a beauty that are the despair of modern printers; illustrated with wood-cuts of extraordinary grace and historic interest. But not alone are Lyons and Paris represented among the several hundred rare volumes exhibited in the cases; here are works which issued from the modest "*librayries*" of many a smaller town then active, and which now knows little of such zeal. Caen, Angoulême, Rennes, Limoges, Abbéville, Troyes, Perpignan, Dijon, and Dôle; and even from smaller towns, such as Salins, Treguier, Haguenau and Chahlis, Louheac and Cluny. The collection, in fact, represents a history of the introduction of printing into France. Among the modern exhibits several cases of superbly-bound volumes are shown by the well-known firms; books, marvels of luxurious expense and reckless splendour, but never more than imitations, alas! sadly wanting in the noble character of the original models. In the third room a collection has been made of all the principal works issued by the publishers of Paris within the last two years. Each publisher has his case; and, what is a pleasing innovation, the books may be freely handled and inspected. The show of books, the artistic works especially, is creditable in the extreme, and is certainly calculated to make the English visitor somewhat modest in referring to the works published in the same time by our London firms. There only remains to describe the catalogue, the printing of each sheet of which has been entrusted to one of the renowned printers of Paris and the provinces. Entire freedom has been allowed to each to carry out his fancy. The competitive desire to excel has produced a curious volume, which, though to the professional visitor it may be interesting, as showing the skill of the printers, cannot be said to be so to the outsider. The binding of the catalogue has also been confided to various firms. This exhibition is the first of a series, we learn, of biennial exhibitions, all to be connected with printing and books. For 1882 there is a proposal to have a show of book-illustrations, again divided into sections, one retrospective, the other modern. This, we may feel sure, will reveal some extraordinary treasures.

Of exhibitions, we have not yet seen the last, but they are gaining a fresh instructive value, in each assuming some special subject of interest, the leading idea which regulated the annual exhibitions held at South Kensington, and which unfortunately collapsed. On the 31st inst. opens at the Palais de l'Industrie, under the direction of the Union Centrale, an exhibition devoted this year specially to the art and industry of the metal-worker. It has become now evident to every thoughtful observer that the universal exhibitions held from time to time have not entirely carried out their object, a fact to be attributed to their too general nature. The managers of the Union Centrale have, with this warning before them, advised a rigorous and analytical arrangement of their exhibitions, as being more directly instructive (their object in the advance of the industrial arts), without ceasing to satisfy the curiosity of the public. This year's exhibition commences a series of three biennial and special exhibitions, "the divisions of which are based on the natural products themselves of which the artist makes use, and which he transforms according to his skill and taste," and, continues the recently-printed report of the Union Centrale, "as we live at an epoch of experimental method and of analytic science, we wish that these exhibitions should possess a *technological* and didactic character; that is, they will each present in well-arranged order, the raw material, the tools and processes, the artists' models, and finally the works of art themselves." This excellent system is to be pursued in each of the exhibitions to be held, the first this year devoted, as we have already stated, to metal; that of 1882 devoted to tissues, paper, skins, and wood (in its application to furniture); that of 1884 devoted to wood (as applied to building and decorative purposes), stone, glass, and earthenware. When this series is completed, the Union Centrale will certainly have done much to carry out their intention "to classify the trades, follow their history, mark their progress, and analyse their elements."

Writing from the banks of the Seine, the announcement that a new Thames steamboat company is about to be formed is of sufficient interest to attract attention. As, probably, the "plant" of the company is not yet purchased, let us venture to suggest the use of screw-steamers in lieu of the paddle-wheelers in use on the Thames. Apart from the fact that the space occupied by the screw-steamer is considerably less (the whole paddle-boxes being lost space), the advance against stream is much more rapid, the management is less difficult, and accidents are less frequent; but, above all, and this is the chief point we urge, the muddy river will not be churned up each time a steamer passes. The rapidity with which the *bateaux-mouches*, or fly-boats, as they are termed here, speed up and down stream from one end of the city to the other on week-days, for the modest sum of two sous (one penny), makes them essentially floating omnibuses, — conveniences for all. Let us hope that the new Thames steamboat company will take a lesson from the Seine company, which carries its millions of passengers yearly.

Technical Education for Plumbers.—We are informed that the Plumbers' Company are prepared to grant their freedom to workmen, so as to make the company really representative of the trade whose name it bears. With this view forms have been prepared, which can be obtained by those concerned on application to the clerk, Mr. J. B. Towse, 6, Laurence Pountney-lane.

* See *Builder*, vol. xxxviii., p. 98.

"THE CONSTRUCTION OF GASWORKS."

THE little book under this title, originally written by the late Mr. Samuel Hughes, has been re-written and much enlarged by Mr. William Richards, C.E.* The various improvements that have been introduced since the first appearance of the book are treated of, and the successful application of gas for heating and cooking purposes, as well as for producing motive power. The book will be found most useful by all interested in the subject. In connexion with other information concerning gas and gas-works given in our present issue, we quote from the book in question part of a chapter on the construction of the necessary buildings:—

An ordinary gas-works comprises the retort-house, coal-store, purifying-house, engine and exhauster, station-meter and governor houses, valve and regulator room, workshops, dwellings, and offices, with the ordinary appliances for testing the quality of the gas, the yard and chimney, together with the necessary plant for the manufacture of the sulphate of ammonia.

The Retort-house and Buildings.—The retort-house, as its name implies, contains the ovens, or, as more generally termed, "settings" or "benches" of retorts, in which the operation of distillation, or carbonisation of coal, is conducted. With very few exceptions, this is a rectangular building, covered usually with iron principals, and slates or tiles, and sometimes, although rarely, with sheet-iron. The retort-houses of large works some years ago were limited to 50 ft. or 52 ft. in width, but they are now generally built 75 ft. wide, whilst the largest retort-houses of the Beckton works are 100 ft. in width and 480 ft. long. As this work, however, is intended for those interested in small establishments, our attention will be more particularly directed to them. For the very smallest of gas-works, having only one retort, no rule concerning the dimensions of the retort-house can be given, beyond the simple observation that, for the proper working of the rake, a clear space equal to at least one-half more than the length of the retort should be allowed. In small works the retort-house is usually about 26 ft. wide, which, allowing 12 ft. for the width of the retort-stack with the space that is usually left between it and the wall, together with the mouthpieces, leaves 14 ft. clear for working. There should always be an intervening space between the ends of the stack and the walls of the retort-house; as in the absence of this, when the stack abuts against the wall, the latter is bulged out by the expansion of the brickwork on its becoming heated. In retort-houses of this width, of course only single settings of retorts can be employed; but when the number of the benches or ovens permit of it, then double benches, where the retorts are set back to back, with a firing-floor on each side of the retort-house, are usually constructed. The flooring of the retort-house should always be kept in good repair; the slovenly method of leaving it in recesses and ruts, as sometimes observed, is reprehensible, as by these ruts the coke is jerked out of the barrow, and, as the flooring cannot be properly swept after each charge, it is attended with loss; besides, in a gas-works, like every other establishment, considerable order is essential to success. The roofs of some retort-houses are formed, as observed, with iron principals and sheets, which may be desirable where rigid economy is necessary; but generally the economy is very misleading, as when iron sheets are exposed to the action of the steam arising from the process of quenching the coke, and the vapours of the retort-house, their durability when of ordinary thickness seldom exceeds seven years. With galvanised iron the duration is somewhat increased; and unless Professor Barff's or Mr. George Bower's system of preserving iron may be found suitable for this part of a gas-works, we would certainly recommend the use of slates for the purpose; by which, however, in consequence of the principals and laths being required of greater strength than when iron sheets are used, the cost is materially increased. For ordinary small buildings the front and back walls of the retort-house need not exceed 9 in. thick; usually the sides are made 14 in.; and in constructing, an essential point is to avoid a draught passing through the building. In larger works these dimensions are

* The Construction of Gasworks, and the Manufacture and Distribution of Coal Gas. Sixth edition. London: Crosby Lockwood & Co. 1880.

augmented according to the magnitude of the building. A few of the largest establishments have the retort-house very differently arranged to those of the great majority. In the centre, and extending from end to end, are a series of arches built on suitable piers. On these are constructed the ovens or benches, the piers of which correspond with those below. On a level with the furnaces of the retorts there is a stage or firing floor, where the stokers work when charging or drawing the retorts. This is about 6 ft. 6 in. from the ground, and is commonly formed by cast-iron columns and plates, extending on each side throughout the length of the retort-house, leaving an opening of about 2 ft. wide immediately in front of the furnaces, through which the coke drops when drawn from the retort into the space below, which is called the coke-hole, or coke-vault. The coke-vault possesses some advantages, for where it exists the stokers are not exposed to the continuous heat of the coke when drawn from the retorts, which falls immediately into the vault, where it is quenched by other men. Moreover, the furnaces are also clinkered from below, which saves some trouble; and the convenience of loading the coke direct into the carts from the coke-vault is also a recommendation. The objections to the coke-vault are the expense in construction; the coke in falling breaks, and is further injured on account of the very limited space for spreading, extinguishing, and storage. There are few works, and these only of the largest magnitude, which have coke-vaults attached to the retort-house. In large works of the present day the retort-house is employed as a coal-store, for which purpose their width is very considerable. Generally the ovens employed in large as well as medium sized works are built on suitable foundations, ensuring solidity to the structure, and preventing as much as possible radiation of heat from beneath. In the event of the foundations being in gravelly soil, an increased thickness will be desirable to prevent loss of caloric at that point. The coke when drawn from the retorts falls into iron barrows, and is wheeled away to a separate place for the purpose of quenching. In retort-houses of this description, the tops of the ash or evaporating pans are a few inches below the level of the ground, which is usually paved with fire-bricks on edge. Sometimes cast-iron plates have been tried as a substitute for brick paving, but the metal conducts the heat to the feet of the men with such facility as to render it objectionable. The benches of the retorts are either placed side by side the whole length of the retort-house, and having one charging floor; or, as in medium-sized works, where retort settings are placed back to back. In this case a building containing, say sixty single benches, thirty of them have their open ends or mouthpieces on one side of the retort-house, the other thirty mouthpieces being on the other side, and a 9-in. or 14-in. wall separates the benches. These are called single settings. This method was superseded some years ago by dispensing with the partition-wall, and thus the two single beds form one continuous oven, each retort being about 18 ft. or 20 ft. long, open throughout, and having a mouthpiece at each end, which are called double beds, or through-retorts. The economy derived from this plan is very considerable; but they can only be employed in large establishments, where there are at least six stokers, to charge both ends simultaneously. At a works we recently saw through-retorts changed to single. In deciding on the dimensions of the retort-house every consideration must be made, not only of the present requirements of the locality to be supplied, but also that of the future; for gas, even at the present day, is very far from being fully appreciated, and it is impossible to anticipate the various future uses to which it may be applied; but the experience of the past demonstrates the necessity of making every reasonable provision for extension. It is also important to have a good margin, and not to estimate the power of carbonisation too highly; for by unforeseen circumstances the supply of the ordinary coal may be temporarily discontinued, when recourse must be had to that of inferior quality, which yields less gas, and in consequence requires more retorts. No definite rule can be laid down for the dimensions of the retort-house; this must entirely depend on the mode of setting. With one kind of setting having a given number of retorts of given dimensions, considerably more coal is carbonised than with another; it also depends whether they are single or double, the kind of coal employed, and other circumstances.

There is nothing peculiar in the construction of the walls of the retort-house more than any other buildings of the same height. Of course precautions should be taken to secure a good foundation, to extend the base by footings, and, where necessary, to use piling or concrete according to the nature of the foundation. On these points no general directions can be given, as the treatment must vary with the special circumstances of the case; the general rule, however, applicable to ordinary foundations will apply here. The cost of erecting retort-houses will, of course, vary with the price of labour and building materials in the district. The magnitude of gas-works and plant is generally estimated by their annual production; thus, a works of "twenty millions" signifies a production of that number of feet of gas per annum, and in the height of summer will produce about 30,000 ft., and in the very depth of winter about 90,000 ft. daily. In a works of sixty millions per annum the minimum production will be 90,000 ft. and the maximum 270,000 ft. per diem. In modern large works retort-houses are built in blocks, having free communication with each other, and provided with a ventilating shaft constructed of wrought iron, having a valve or door by which the heated atmosphere of the building is considerably moderated, contributing much to the comfort of the men. And, to the credit of many engineers, it must be said that the comforts of the men employed in their respective companies have had their greatest consideration. In some gas-works libraries are established, in others baths and mutual benefit societies; and there are gas-works that can boast of having a musical band, composed of the stokers and men of the establishment,—circumstances alike praiseworthy to the employers and employed.

The Coal-Store.—This is generally attached to the retort-house, with every facility of communication for the purpose of transporting the coals. The dimensions of this building must depend on circumstances. If the railway is the means of transport, then small stores may be sufficient; but should the ordinary means of obtaining the supply of coal be by sea, river, or canal, then in order to provide against the probability of frost, or loss or delay of vessel, the store should be ample for a proper supply, and whenever there are increased difficulties in obtaining the coal the store should be augmented in proportion. It is sometimes advisable to have the coal-store sufficiently large so that in summer, when not required for coal, and coke is abundant, it can be converted into a store for that residual. When employed as a spreading-floor it should by all means be paved with fire-bricks, as stone is liable to crack with the heat. When not used for that object ordinary common paving will answer the purpose. As already mentioned, it is highly desirable that the coke should be sold as speedily as possible after it is produced.

Purifying-House.—The purifying-house has the sides open, to permit a good current of air to pass through the locality and carry off any noxious gases. There should also be a ventilator in the roof, so that in the event of the lutes "blowing," the gas may escape readily at the top. The roof of the purifying-house is usually of wooden principals and tiles. Iron would be very speedily destroyed by the action of the sulphur emanating from the waste purifying material. In some works the purifiers are uncovered, which has the inconvenience of unnecessarily exposing the men at times to the inclemency of the weather, and ought always to be avoided by a suitable roofing.

According to a modern construction, the purifying-house is built of a ground and two upper floors, of which the uppermost and lowest serve as reviving-floors for the oxide. The purifiers are on the first floors, and in the centre of each purifier is a shoot, through which the foul oxide passes to the floor below, and when requisite the door on the top of the shoot is luted. By mechanical appliances the oxide is lifted from the bottom to the top floor, from where it passes down a shoot into the purifier to be charged. The saving of labour and the rapidity of action are both recommendations to this system of working.

Engine, Boiler, and Exhauster House.—In the most moderate-sized gas-works at the present day the steam or gas-engine is an important auxiliary. Formerly the only use of an engine in a works was for pumping water, or for keeping in motion the wet lime purifiers, and in many works of considerable capacity, where neither of these was requisite, no engine existed. The use of clay retorts has caused motive power for working the exhauster to be introduced into works of all dimensions, except the very smallest kind. In large works the engine, boilers, and exhauster, being attended by the same man, are generally in the same building, and more care is usually displayed in this than any other part of gas-works. The edifice is often constructed with taste, and is no doubt an inducement to the men who have charge of the machinery to keep it cleanly and in order with the building itself. In small establishments the exhauster is generally adjoining the retort-house, the stoker having charge of it. The improvements recently introduced into gas-engines, by which they are rendered practical and economical motors, should induce every gas manager to adopt them, on account of their safety, efficiency, and as an example to consumers to employ them.

Station-Meter and Governor-House.—These, like the engine-house, should only be accessible to the manager or foreman, or the man in charge. When there are several gas-holders together, it is not uncommon for the station-meter to be placed close to them, and the valves of the various gas-holders fixed adjoining the meter-house. On other occasions there is a distinct house for the valves; but more commonly they are attached to their respective holders. The governor is sometimes placed in the same building as the station-meter, but more frequently a detached building is constructed expressly for it. In large works there are several lines of mains issuing from the works, each of which has its corresponding governor, with the various pressure-gauges and pressure-registers. And in establishments situated at a distance from their distributing stations a telegraphic communication exists between the various localities, as well as the company's offices.

Chimney or Stack.—High stacks possess an advantage in consequence of their great draught permitting a reduction in opening of the damper; but against this they present the evil, that, if the dampers are not well looked after, the draught occasioned by them will cause the fuel in the furnaces to be consumed very extravagantly without any good result. High stacks are constructed principally for the purpose of carrying off the smoke or offensive products to a great height, where they are diffused over a large space, and a nuisance which otherwise would exist is prevented. In some chemical manufactories the stacks are made of great dimensions,—one near Glasgow is 400 ft. high. By means of this all noxious gases that may be generated are carried to and issue from the top of the chimney, without the least prejudice to the neighbourhood. The largest chimney for a gas-works is that of the Edinburgh Company, and is a fine piece of building, being 329 ft. above the level of the ground, perfectly plomb, and without the slightest crack or fissure throughout the height. The current therein, when in ordinary working order, is equal to an exhaust of 2½ in. of water, a strong current in an ordinary chimney seldom exceeding ½ in. exhaust. The cost of this stack, with the lateral flues, was upwards of 4,000*l*. Chimney stacks for gas-works are constructed in various manners, the simplest and cheapest being the square form; but these are somewhat unsightly, and, offering greater resistance to the wind, require to be built strong accordingly. Some stacks are made circular and others octagonal; the latter, when surmounted on a square pedestal, with a neat capital on the summit, has a remarkably good appearance, while the cost does not exceed that of the circular form. Chimney-stacks, unless when placed in the centre of the beds, should never be built in the retort-house, as they occupy the space unnecessarily. Wherever constructed, they should always be detached, and, on account of their great weight and height, extraordinary precautions are necessary in their foundations. The area of these must be determined according to the degree of solidity of the ground where erected; the softer the soil, of course the greater will be the area required for the footings. The pedestal for the base is usually square, one side of which is one-eighth of the total height of the shaft. Stacks for gas-works are always lined with fire-brick either for a portion or the whole of the height. Sometimes the lining is detached from the chimney, leaving a space for a current of air to pass between the former and the latter,

which prevents the stack cracking. Small chimneys are usually constructed entirely of fire-bricks. A mistaken notion often prevails, that by materially contracting the stack at the top, the draught is increased: this, however, as already shown, can only occur when it is of too great capacity. The stack, although tapering on the exterior, is internally nearly of one uniform area throughout; there being offsets at certain distances, according to the height and form. In erecting, every eight or ten courses should be built with hoop iron; when this is not done the stack frequently cracks, afterwards demanding the use of hooping on the exterior, which is unsightly. At many large works a number of dwarf chimneys are erected, each of which is about 1 ft. 6 in. or 2 ft. square internally, and serves for three or four double settings. The area of a chimney compared with the number of benches leading to it is the main consideration, irrespective of the height.

Very recently Mr. Valon has adopted the use of a separate dwarf chimney to each bench of retorts, with beneficial results, as the temperature of the settings is maintained with greater regularity than by the ordinary method, whilst any leakage from the retorts is readily detected. The ordinary chimneys in gas-works vary in height from 35 ft. to 150 ft. above the level of the ground; their cost for a given height depends mainly on their internal area and the nature of the foundation. The ground being favourable, the price of a square chimney, 35 ft. high, with an internal area of 4 square feet, will not exceed 35*l*. An octagonal or circular stack of 8 ft. internal area, and 60 ft. high, under the same conditions as the former, will cost about 85*l*. A similar stack of 10 ft. area, and 100 ft. high, would be 180*l*. to 200*l*. Where there is no probability of a nuisance being occasioned by low chimneys, for the ordinary use of a gas-works they are not required to be more than 45 ft. high.

TUNBRIDGE WELLS GAS-WORKS.

THE accompanying drawings illustrate, so far as they go, modern gas-works which have been erected for the Tunbridge Wells Gas Company, from the designs of Mr. R. P. Spice, C.E., of Parliament-street, Westminster.

This is an instance of that spirit of private enterprise for which Englishmen have rendered themselves famous, and their country great and prosperous, and we certainly are not amongst those who desire the time when, by absorption into Governmental centres of the various great industrial undertakings of the country, this spirit of enterprise, which has been the corner-stone of the edifice of our commercial greatness, should be so discouraged and enervated as to sink into a subordinate place.

The old works at Tunbridge Wells had become unequal to meet the wants of the gas-consumers, and were so "cabined, cribbed, confined" as not to admit of further extension. This state of things rendered it necessary to provide entirely new works of larger capacity. Accordingly, application was made to Parliament for power to enable the company to provide the means for meeting the demand, and ultimately the usual powers and privileges were obtained, accompanied by those safeguards which have been devised by modern legislation in the interest of the British public. The only contention in this instance, between the company on the one hand and the ratepayers on the other, was as to the site of the new works. In any locality where nature has been lavish with her charms, so that the scenery is unusually attractive, it is difficult to find a convenient corner in which to plant gas-works, the name of such a concern conjuring up visions of ugliness, smoke, vile smells, and dirt, and the opposition to the first site selected, in a sequestered valley at Tunbridge Wells, was of this sentimental character. However, in the end, after three applications to Parliament, the present site was decided on, and the works erected. They have been designed to embrace all, or nearly all, the scientific improvements introduced into gas-working in recent times, by which the best results are attained; first, as to the quantity of gas obtainable from the coals carbonised; secondly, as to the quality in illuminating power and purity; and, finally, as to economy in all those items of expense which go to make up the first cost of gas, and it is believed that, in all these respects, success has been achieved. It is further hoped that public opinion has not been shocked by that of ugliness, a fear of which inspired the old opposition, and more than that, it may be anticipated that a view of these structures, which have been raised on the hill-side to the left of the down-line of the South Eastern Railway, may give pleasure rather than otherwise to the tourist and wayfarers. The builder was Mr. Henry Potter, of Hackney. The various fittings and apparatus required were supplied by the following firms:—Cutler & Son, Millwall, gas-holders, condensers, and scrubbers; Messrs. Cockey & Son, Frome Selwood, purifiers; West's Gas Improvement Company, of Maidstone, retorts and fittings of stack; Korting Brothers, patent steam-jet exhausters; Abbot & Co., Gateshead, hydraulic crane; Owens & Co., Whitefriars, hydraulic lifting apparatus and steam-boilers; Head, Wrightson, & Co., Stockton-on-Tees, iron roofing; A. Wright & Co., Millbank-street, Westminster, station-meter and governors; Bailey & Pegg, Bankside, London, trunk-mains from works to the town. The cost has been about 70,000*l*., including land and Parliamentary expenses.

The following remarks on coal-stores and retort-houses, with reference to the works we have illustrated, are from a book on "Gas Manufacture and Distribution," by Mr. W. B. King:—

"The primary object to be aimed at in setting out the ground-plan of a new gas-work is the arrangement of the several parts of the whole, from the coal-store, and the reception of the coals into it, to the gasholder, so that the cost for labour throughout may be reduced to the lowest practicable amount; and to this end the designer and the manager should direct their closest consideration.

It may be taken as an axiom that it is a waste of power to lift any quantity of material daily and hourly in perpetuity in any case where the same material may be made to fall into its proper place instead of being lifted; and the difference between the two will be felt in the annual balance-sheet of the undertaking.

This fundamental principle of causing all weights to fall instead of being lifted, except in the single point of raising the coal by West's system, by an endless chain of buckets, kept in motion by a small steam-engine, is illustrated in the design which accompanies these remarks.

The railway by which the coal is brought to the works is some 20 ft. above the general level of the ground of the works. The trucks will run into the coal-store, and, having dropped their contents, will go through to the tail of the siding; the coal, being admitted as it may be required to the breaker underground, is raised by a chain of buckets into overhead fixed hoppers, whence it falls to the travelling hoppers, and thence into wagons, which are, with a very small amount of muscular energy, wheeled into each retort, and as they are withdrawn thence the charge of coal is deposited therein in a layer of uniform thickness.

When the charge has been worked off, the resulting coke is drawn, by the aid again of a mechanical appliance, into barrows, and quenched; and then, running upon the level floor to a near opening in the side wall of the retort-house, each loaded barrow is run down an inclined plane from the retort-house floor to the coke-yard, the general level of which, in this case, is intended to be about 2 ft. to 2 ft. 6 in. below the floor-line of the retort-house.

The same remarks applied to coal and coke will equally apply to the water used, not only in a retort-house, but generally upon a gas-work, not a single gallon of which should ever be lifted by the direct application of muscle and sinew. With ample boiler-power, steam can be raised at the lowest possible cost upon a gas-work by means of a slow-combustion furnace, fed by breeze or fuel of the cheapest kind, so that the cost of raising water into elevated tanks is infinitesimal compared with that of raising it by manual labour, even from very shallow wells. The convenience and economy, therefore, are great, in having at hand, in close connexion with each bench of retorts, and everywhere about a gas-work, a good supply of water, obtainable at sufficient pressure by turning a tap or valve.

The plan and elevation of the retort-house annexed will bear favourable comparison with most others for economy in first cost, general effect in appearance, practical utility, and comfort of the workmen employed, taken in connexion with Mr. West's system of charging and drawing retorts. Special attention is called to the application of ridge and valley roofing, with abundant ventilation, and it may be mentioned that in this instance, each bench of retorts will have its own separate hydraulic main, commanded by a valve fitted on at the back, and connected with a main supported on iron standards, resting on the retort-stack, the gas being taken therefrom at convenient distances, and delivered into a main led along the inside of the wall of the house, which latter main is suspended by rods, the length of which is capable of adjustment by nut and screw, all converging to a point or points, from which the gas will be taken by the exhauster, and sent forward through the condenser. The productive power of the retorts for which this house has been designed is equal to one million and a quarter cubic feet of gas in twenty-four hours."

A NEW WHOLESALE MARKET AT LIVERPOOL.

THE Markets Committee of Liverpool have unanimously agreed upon the erection of a spacious new wholesale market, in consequence of the present inadequate accommodation for this branch of market business. In the course of a discussion on the subject last week, the chairman of the committee stated that there was at present no proper market accommodation in Liverpool for live fowls, and one large poultry dealer had informed him that he had frequently as many as 800 or 1,000 geese arriving in Liverpool, for which he could find no market-space whatever. It, therefore, appeared to him that they required a very large space of ground on which to erect the market. The intended new market is to have space for the wholesale disposal of poultry, pigs, and other live stock, as well as vegetables and general agricultural produce, the chairman stating that the demand for the last-named articles was so great that the railway companies had taken the matter up, and the London and North-Western Company had actually set up a market of their own. The site of the intended new market is at the north end of the city, and known as Nash-grove, already in the possession of the corporation, and originally intended for the erection of workmen's dwellings. The area of the proposed market is 7,480 yards, or upwards of an acre and a-half in extent, the whole of which, at the very least, the chairman said, would be required. The estimated cost of the market is 100,000*l*., the value of the site being set down at 80,000*l*., and the building itself at 20,000*l*. Speaking of the site, the chairman observed that it might be said it was wanted for workmen's dwellings, but if those who thought so would take a walk around the locality, they would see that there were at present large numbers of unoccupied houses.

THE ROMAN PAVEMENTS AT WOODCHESTER.

ANTIQUARIES will learn with much gratification that, after being covered with earth for many years, one of the magnificent pavements of the great Roman villa at Woodchester has been again laid open to view. This pavement has been very carefully depicted by Lysons, under whose care it was first opened, in 1793. It was afterwards re-covered, as were all the others, since it was found impossible to preserve them in any other way, through the cost of raising suitable roofing and buildings. The clearance recently effected has been done through the exertions of the Rev. F. Smith, the newly-appointed Rector of Woodchester, aided by a small grant from the Bristol and Gloucester Archæological Society. A visit will be paid to the remains on Thursday, the 23rd, by that society, and, according to present arrangements, the pavements will remain open for public inspection, at a small charge, until the 5th of August, after which it is proposed to re-cover it again with earth. It is greatly to be hoped that funds may be forthcoming to erect a protecting building and roof over this one pavement, to ensure its being always open for public inspection, that visitors to Woodchester may be able to see at least one pavement, as a specimen of the others, which it may hardly be possible to roof over, in consequence of the vast extent of the villa. The colours of the pavement prove to be but little, if at all, injured by the length of time that has elapsed since its discovery.

Mr. Henry Robinson, M. Inst. C.E., has been appointed Professor of Land Surveying and Levelling at King's College, London.

TUNBRIDGE WELLS GAS WORKS

PLAN OF SITE & BLOCK PLAN OF BUILDINGS

THE "JERUSALEM," COWPER'S COURT, CORNHILL.

WE give in our present number a sheet of illustrations of the "Jerusalem" as recently rebuilt, showing the new building as seen from Cowper's-court, and also as it appears from the two narrow approaches to Cowper's-court, *i.e.*, through the passage in Cornhill immediately opposite the Royal Exchange and next door to the National Discount Company's offices, the other view being as approached from Birchin-lane. The old building it has replaced,—and to carry on the business of which the new one has been erected,—was known as the "Jerusalem Coffee-house," and its history as such carries us back considerably over two centuries to a time when the term "coffee-house" had a signification so utterly distinct from its present one that, like the "Jamaica," "Garraway's," and others, it has for generations been familiarly known as it is now designated, simply the "Jerusalem." Established early in the seventeenth century for the convenience of those who liked to talk business over a cup of coffee, at that time a somewhat rare and costly beverage, it soon acquired one of the special features it has retained ever since, that of a rendezvous for merchants, brokers, and captains interested in trade with the ports of the Mediterranean.

The original building was destroyed in "the Fire of London," and in excavating for the foundations of the present building, large beams in a more or less charred condition, and portions of a curiously-constructed tesselated floor, were discovered, which may have been either portions of the ruins of the original building, or of its successor, which was also destroyed by a great fire (on March 25th, 1748), when eighty-eight houses in Cornhill shared the same fate. Though the vaults and foundations of the building the present structure has replaced were of the most solid and massive character, it is apparent from this and other evidences that after the fire of 1748 little care was taken to remove the *débris* before rebuilding, which may be explained by the total absence of the terms "District Surveyor" or "Metropolitan Board of Works" in the records and chronicles from which we have culled much more of the history of the "Jerusalem Coffee-house" than would be appropriate in this notice of the new building.

The prosperity and fame of the "Jerusalem" were coincident with the rise to greatness of the East India Company; and it is asserted by some that the Company was actually founded at the "Jerusalem," and the fact that it was more frequented by East India merchants at the time than any other place in London, lends some countenance to this hypothesis.

The coat of arms over the entrance to the new subscription-room is that of the defunct East India Company, and was purchased at the sale of the old Company's House in Leadenhall-street, when demolished to make room for a large block of offices by Messrs. Tite & Clifton, embracing East India Avenue. It was then placed over the entrance to the old building in Cowper's-court, where it remained until the rebuilding of the "Jerusalem" in its present form, where its position forms a link with the past history of the institution, which, though marching with the times in adapting itself to modern requirements, still retains its original characteristics.

Of course, the old associations which have so long hound it to the East will be preserved; but the increase in the commerce of Great Britain has created the necessity for an extension of the scope and influence of the "Jerusalem." Every consideration likely to affect merchants and others having mercantile relations with India, China, Australia, New Zealand, the Cape of Good Hope, &c., will be dealt with. Files of the principal newspapers belonging to these places, as well as those of St. Helena and other intermediate stations, will be accessible to members, and every sort of information regarding the arrivals, departures, or casualties of ships.

It is worth noticing, in connexion with this, that the "Jerusalem" possesses a chronicle of the arrivals and departures of all the ships of the East India Company's service.

Every afternoon an exchange is held, attended by ship-owners, ship-brokers, and merchants, for the purpose of arranging for freights or charters, and other similar transactions. It is in contemplation to arrange for the establishment of telephonic communication, of course for the use of subscribers only.

On the ground floor is a spacious hall, in which members meet for the discussion of business.

On the first floor, which communicates with the ground floor by a private staircase, is a large and handsome reading-room for the use of the subscribers. This room will also be used for the sales of ships, produce, &c.

The rooms on the second and third floors, and those on the first, second, and third floors over the entrance to the subscription-room, are to be let as offices, and with a separate entrance facing the approach from Birchin-lane, are designated "Jernsalem-chambers."

The basement under the ground-floor subscription-room forms one spacious and well-lighted room, with a floor area of over 2,000 ft. This room is approached from the outside by a flight of wide stone steps, and has also an internal staircase communicating with the subscription-room over.

A peculiarity of this property, which is leased from Lord Cowper, is that, in addition to the land covered by the building, it includes very extensive cellarage, extending under the whole of Cowper's-court and some of the adjoining buildings.

The property being fully licensed, the whole of the basement, sub-basement, and the old cellars, have been let on lease to Messrs. Lavery & Co., of "Bodega" celebrity, who have fitted up the large basement-room, under the superintendence of the architect of the building, in the most solid and substantial manner, as a wine-room, with sandwich and cigar counters.

The floor is of white marble mosaic, all woodwork of teak, walnut, and wainscot, and wrought-iron is substituted for the wood "boarding" usually adopted; and though there is a total absence of any attempt at ornament or decoration, no expense has been spared to economise space and light, and to secure comfort and convenience. Though the general characteristics of their business will be maintained, some innovations and novelties have been permitted where a commensurate advantage could be secured.

In the planning of the new building, the difficulties of assimilating the rather complex requirements were considerably increased by the questions of light and air with which the site is surrounded, and though these have been all arranged without litigation or compensation, it has involved some peculiarities of arrangement and construction.

The building, though devoid of ornament, is constructed in a solid substantial manner, and may be considered fairly expressive of its purpose as the resort of business men of the most matter-of-fact and unemotional class.

The front elevation is of kiln-burned red brickwork (entirely without dressing or pointing) and dressings of brown Portland stone; the window-frames and sashes are of walnut, with plate-glass (that of basement being embossed so that the interior cannot be seen from the court). The treads to the staircase of chambers are of teak, and the whole of the wall of back elevations is faced with white glazed bricks.

The building has been erected by Messrs. Dove Brothers, under the direction of the architect, Mr. Bassett Keeling, of Weavers' Hall. There has been no clerk of works, the contractors' foreman of works, Mr. Paxty, having had the superintendence, under the control of the architect.

The constructional ironwork, which was a considerable item, has been supplied by Messrs. Homan & Rogers; the pavement lights and wine-lift are by Messrs. Hamilton; the marble floors in basement are by Mr. J. F. Ebner; and the gas-fittings and brass work are by Messrs. Richardson, Elson, & Co.

Exeter Hall.—Six well-known men have guaranteed 25,000*l.* in order that the lease of Exeter Hall may be secured, and the building preserved for the use of the Young Men's Christian Association. Mr. J. D. Allcroft gives 5,000*l.*, Mr. R. C. L. Bevan 5,000*l.*, Mr. S. Morley, M.P., 5,000*l.*, Mr. C. Williams, the treasurer of the Association, 5,000*l.*, Mr. T. A. Denny 2,500*l.*, and Mr. E. Denny 2,500*l.*

Font for Sheffield Church.—Designs are sought for a font proposed to be set up in the parish church of Sheffield; as our advertisement columns show. More than one correspondent condemns the proceeding on the ground that perfectly competent architects are now engaged in the restoration of the building, and ought to be employed.

THE CIVIL SERVICE ESTIMATES DEBATE.

THE sitting of the House of Commons in committee on the Civil Service Estimates on Tuesday last afforded one of those opportunities which occasionally recur for the airing of all kinds of minor grievances and suggestions, and what an American would call "notions," in regard to the matters under the control of the First Commissioner of Works. The ingenuity of some members in finding matter for complaint out of what the rest of the world regard as manifest improvements is really edifying. The skirmishing began upon the question of the vote of 112,577*l.* for public parks and pleasure-grounds. An Irish member led off with the complaint that Ireland got far too small a proportion of the money spent on parks and pleasure-grounds; and if, as Mr. T. Sullivan afterwards remarked, only about 6,500*l.* is spent on the Phœnix Park and 112,000*l.* on the London parks, and that the united area of the latter is not equal to that of the former, there does seem a disproportion. It depends, however, on what kind of park it is intended to keep up. A very large park, the chief value of which may be its freedom, as a kind of semblance of open country, may be kept up for less than a much smaller one in which ornamental gardening, a very expensive amusement, forms a part of the attraction. The large park may be sufficient unto itself, in its mere extent; the small park, not presenting the freedom and extent of open country, must be treated ornamentally to compensate for its limits in regard to space: it cannot be "wild," it must therefore be pretty. The next speaker, Mr. Magniac, quarrelled with the Government on this very point, and complained that so much of Hyde Park had been made into ornamental flower-beds that its use as a recreation-ground for the public was seriously obstructed. We doubt very much if "the people" will thank any member for this kind of protection of their rights. Our impression is that there is nothing the poorer classes appreciate, in this way, more than the sight of well-kept and gay flower-beds. The complaint that the large trees in Kensington Gardens are decaying is more to the purpose, and was not denied by the First Commissioner, though it must be remembered that, after all, trees have their allotted span like human beings, and it is looking for rather too much from a merely human First Commissioner to expect him to confer immortality upon them.

That too large a part of the Regent's Park is inclosed is a complaint which, in the interest of the general public, may, perhaps, appear reasonable; it should be remembered, however, that residents in a park have their reasonable rights and expectations, and, perhaps, landlords whose house property will be depreciated in value if the privileges attached to it are interfered with, may think they have some claim to be considered. As for the site for the Byron statue, which was declared by the same speaker to be most unsuitable, the question is, whether the Byron statue can be put in any place where it will look suitable. If it were a good statue, no one would complain of it being where it is, though in that case one would feel the desire to open it out a little by some re-arrangement of the inclosure and railing.

From the reply of the First Commissioner to his critics it would appear that some other suggestions were made which were not reported in their proper place. Some one appears to have renewed the plea for the resuscitation of the prostrate architecture of the old Burlington House portico, the fossil remains of which are now a puzzle to the curious on the river margin of Battersea Park. Mr. Adam thinks the cost of re-erecting it "a very doubtful expenditure." If he meant that it would not be possible to make it pay a per centage, no doubt he was quite right; but it seems a very pitiable thing that a piece of rather historic London architecture should lie rotting on the ground, instead of being preserved in a place where it would be effective, and even perhaps useful. Surely it might be made to add a beauty to Battersea Park itself, as an adornment to one of the entrances, or as the front of a shelter; and to set it up again so near its present resting-place would not cost very much. Another suggestion which was only to be gathered from the First Commissioner's reply, as reported in the *Times*, was that trees should be planted near the Marble Arch, in regard to which it was stated that there was in the Office of

Works a general echeme for tbe improvement of the Park,—a statement of eome interest. Before this is carried out (if it is to be), we may presume that something will be publicly known about it; in the meantime, we may eay that if it includes planting up near the Marble Arch, we are entirely with the scheme as far as that goes. The Arch at preeent stands up in an almost uneightly and unreaeonable manner from the barest corner of the Park, and very much wants some maeses of foliage to flank and lead up to it. Among tbe curiosities of the debate (or conversation, we may perhaps rather call it) was the indignation of an honourable member at the laying down of gravel (whioh he called "mud and soft earth") for riders on the eastern drive of Hyde Park, wbereby, he said, pedestriane were splashed, hnt for which tbe Commiesioner had received divers lettere of thanke. It may be presumed the bonourable member for Preston does not ride in the Park: pedeetrians and equeetrians often take very different views of euch matters. But, then, the gravel was laid down "in the expeotation of June, July, and August being fairly fine months."

"By Heavan, this gallant would command the sun!"

Certainly, tbe First Commissioner bas been badly nsed in that reepect.

One enggestion that was made for an asphalte walk from Marlborough House acroes St. James's Park recalls a much larger suggestion of our own some little time since. Mr. Callan's suggestion ahont the asphalte is not otherwiee than to the point, for the walk from the park suspension-bridge up to the Mall ie very soft and clayey in wet weather. But the fact is, that we believe a carriage-bridge over the water at this point, connecting St. James's-street and Pall Mall more directly witb the Westminster and Victoria district, is a want that will have to be provided before long. The huge blocks of residences tbat have heen built between Birdcage Walk and Victoria-street, ugly as they are, are what may he called residential facts, so are the maseee of residences, and the Army and Navy Storee, in Victoria-street. Carriages to the latter come in crowds, and have mostly to go a very roundahout way. The improvement we bere allude to formed part of a very exteneive suggestion for the fnture of the Westminster distriot wbich we published a little while since, and which membere of the Legislature who are intereeted in the laying-out of London might do well to look at; for some, at least, of its provisions, we are convinced, must be carried out.* The whole of thie part of Londou is ohanging rapidly and inevitahly, and might jnst as well be ohanged on a scbeme as allowed to grow up by accident. As to this particular part of the suggeation, we may merely add that by a little give and take of levels it would be possible to arrange a bridge so as not to interfere with the walks along the park at all; the upper walk by the Mall would cross on the carriage-way level, and the lower one by the water would be taken under the carriage-way just as it is under the bridge over the Serpentine between Hyde Park and Kensington Gardens; tbe carriage-way would have to rise a little to the bridge in order to give tbe neceseary beight, and that is all. The bridge, if properly treated, might be made a real ornament to the park, muoh more so tban the preeent suspeneion bridge, which, moreover, interferes with the rowing in summer and the ekating in winter very materially, while our proposed higher bridge would leave the water-way quite nuobstructed.

Having skirmiehed about the parke, the committee were brought againu into a lengthy statement of grievances hy the vote of 35,000*l.* for the Houses of Parliament. In wbat this sum is expended or to be expended we do not precicely understand; but it raised a cloud of complaints at once. The Reporters' Gallery wae absurdly too small; the Ladies' Gallery (an old bone of contention) was contemptible. Mr. Sullivan often took foreign ladies to the gallery, and wished the other members could see how American ladies turned up their noses,—"always pretty ones,"—at the accommodation provided for them. He concluded with a recommendation that during the recess members should take into consideration the possibility of providing a new House worthy of the country; so tbere is a holiday taek for honourable members in tbe intervals of grouse-ehooting. This proposal, bowever, seemed to excite considerable alarm, and the probable expense was dwelt upon hy some membere, while Mr. Peddie (wbo is, we believe, the only architect in the House) made some practical remarks apparently in reference to the canses of complaint in the present House (not reported), and hoped that in any new House that might be built membere would be so seated that they might all face the speaker and the greater part of the assembly. A great difficulty, of course, is tbat while larger accommodation for strangers, ladies, and the press is called for, the Honee could not be much enlarged without making it inconvenient and harassing to speakers. Indeed, even as it is, speakere with weak voices or any want of clearness of epeech are beard with difficulty. However, we do not apprehend that a new House of Commons will be construoted jnst at preeent. One member, it may be observed, seemed to think an attack was being made on the architecture of the Houses of Parliament, and defended it as "one of the finest specimens of Gothic architecture in the world," only complaining that the smoking-room was very uncomfortable; a charge which seemed to excite a great deal of sympathy. Lord R. Churchill reminded the House that at the time when the building was erected smoking wae considered as a vice; hut now he anticipated (and no doubt correctly) that any attempt to improve the smoking-room would meet with support on all sides quite independently of party ties. Probably it would; hut surely tbere should be a separate smoking-room for eaoh party in the House? How are two Government membere to unburden their minds over a cigar when two Opposition spiee are seated close to them? One might as well bring membors of the Reform into the St. Stephene', or membors of the Conecrvative into the Devonshire. The widening of Parliament-street wae bronght into the discussion; hut that, ae was pointed out, was a matter to be considered in connexion with the large scheme for concentrated Government officee.

Another eubject which followed elicited a very general consenens of opinion, in whioh we entirely concur, as to the great delay in the completion of the Ordnance Survey. This has been dragging on interminably, and unless it ie completed soon, it will he nearly time to begin another to take in new changes. The work ie, it appears, a matter of contract, and any material hastening of it must be at the cost of increased expenditure, if the work is to be thoroughly done. Of conree this latter conclusion is a *sine quâ non*; a hastily-finished survey would be sure to contain many inaccuracies, and would be neeless because unreliable at any point. But it seems a matter in which some increased expenditure in procuring an expeditious completion would be very wisely incurred, and for a purpose highly advantageous to the public.

It is to be regretted tbat the subjects which were diecneeed on the occasion alluded to do not eeem to interest many of our legielatore, for it appears that matters were in a position for a count-out at one moment of the diecuesion. But it must be admitted that those members who take part in diecussing this olass of subjects show some desire to make up for the pancity of numbers by the decided character of their opinione and expreseions.

* See *Builder*, September 21, 1878.

A STEP TOWARDS OPENING THE BRITISH MUSEUM ON SUNDAYS.

ON Saturday afternoon, July 10th, a deputation from the Sunday Society had an interview with the Trustees of the British Museum at that institution. The deputation was headed by the Earl of Dunraven, and wae so numerous that many were unable to get beyond the entrance to the Council Chamber, where the interview took place. The trustees present were Earl Sydney, the Duke of Somerset, Viscount Sherbrooke, Right Hon. Spencer H. Walpole, M.P., Sir Henry C. Rawlinson, K.C.B., Mr. W. Spottiswoode, Pres. Royal Society, the Rev. F. Hanbury Annesley, Lord O'Hagan, and Mr. F. Winne Knight, M.P. Among the deputation were Lord Dorchester, Thos. Burt, M.P., Sir Arthur Hobhouse, K.C.S.I., Sir Charles Palmer, bart., Sir Edward Sullivan, Major Thos. Gaisford, Major R. R. Noel, Professor W. H. Flower, F.R.S., Professor Corfield, M.D., Professor Plumptre, Mr. George Godwin, F.R.S., Mr. George Romanes, F.R.S., Mr. F. J. Boruwell, M.A., Mr. Arthur Catee, F.R.I.B.A., Mr. Thos. Taylor, J.P. (Oxford), Mr. Lewin, Mr. Hodgson Pratt, Mr. Mark H. Judge, M.R.S.L., Mr. W. Cave Thomas, F.S.S., Mr. James Hopgood, J.P., Rev. J. Panton Ham, Rev. Chas. Voysey, and Mr. Herbert B. M. Praed. Also Miss Jane E. Cobden (daughter of Richard Cobden), Miss Richardson, M.L.S.B., Miss Edith Simcox, M.L.S.B., Miee Anna Swanwick, and Miee E. Orme.

In introducing the deputation, Lord Dunraven eaid:—My lorde and gentlemen, as president of the Sunday Society the duty devolves on me of asking you to receive the deputation, who wieh you to permit them to present a memorial begging you to throw open thie museum on Sundays. The object of thie society ie to allow museums, art-galleries, libraries, and gardens to be opened on Sundays, and we think that if our object could he fully attained it would confer great benefit on society at large, and particularly on those who, on accouut of their ordinary work, are unable to visit places of the kind except on Sunday. We think it would be beneficial to theee people on moral, eocial, and religious grounds, and we think it would he far better they ehould spend their Sunday in that way rather than in absolute idleness. We think it better also on grounds arrived at from experience, becauee, ae you are aware, there are many museums, libraries, &c., open on Sundays, in various towns in the provinces and in the suburbe and neighbourbood of London; and these are visited hy many thousands of people. No complainte have arisen, no scandals have arisen, and the opposition that there was previous to the Sunday opening bas entirely disappeared, owing to the good results which have been seen. In seeking amusement in such places as the British Museum, it is impossible, at the same time, not to derive instruotion, and it seems to me that the present year would he very euitable for a first opening of this museum on Sundays. This year is the centenary of the institution of Sunday Sohools, whicb have been of such great benefit to children, and I think this would he a peculiarly good opportunity of giving the same advantages to grown-up children. We attach particular importance to the Britieh Museum, becanse we think there is a certain amount of hardship in the fact tbat many of ue cannot visit thie building on week-days, and are thue unable to enjoy an institution whioh belongs to the nation. If it could be opened even as an experiment it would be of great value, as it would enable the trustees to judge of the way in wbioh it would work. If it should be a question of estimatee which stood at all in the way, it might be possible to open the Museum for a few consecutive Sundaye, closing it on one day in the week in order to see whether a plan of that kind would succeed. With these few remarke, I will ask you to allow Mr. Judge, the honorary secretary, to read the memorial; and I will ask you, then, to bear a word or two in its support from Sir Arthur Hobhouse, Professor Flower, and Mr. Geo. Godwin.

Mr. Mark H. Judge then read the memorial as follows:—

"*To the Right Honourable and Honourable the Trustees of the British Museum.*

The memorial of the President and other officers of the Sunday Society

Sheweth:—That your memorialists consider that the acknowledged succes which has attended the Sunday opening of various museums, art galleries, libraries, and gardens, both under Imperial and under municipal regulations, and the absence of the slightest agitation to again close them on Sundays, fully justifies your memorialists in asking you to exercise your prerogative in the interest of a large section of society, and open the British Museum on Sundays.

The succes referred to has recently led statesmen to declare it to ha their conviction that before long the object of the Sunday Society will he attained, and your memorialists anticipate that the Legislature will at an early data see its way to open the whole of the national museums and art-galleries on Sundays.

Your memorialists, however, cannot bnt recognise the difficulties which stand in the way of this important matter being properly dealt with during the present brief session, either in Parliament or by the Government; and pending the further action of the Legislature, are of opinion that it would be a graceful act were you to at once open the British Museum on Sundays, and an act that would be highly appreciated hy all classes of the community.

On behalf, therefore, of tna fifth public annual meeting of the Sunday Society, hald at the Freemasons' Hall on the 29th of May, 1880, your memorialists respectfully ask you to open the British Museum on Sundays for the convenience of the public during such hours and under such regulations as you may deem necessary.

DUNRAVEN, President.
W. H. CORFIELD, Chairman of Committee.
FREDERICK LONG, Treasurer.
Mark H. JUDGE, Honorary Secretary.

July 10th, 1880."

Lord Dnnraven, having formally presented tbe memorial to the trustees,

Sir Arthur Hobhouse said,—The matter is not

one that concerns the working-classes alone, but other classes, which, if not very large, are still worthy of consideration. For the sake of these the museums should be opened on Sundays, unless there is some official or substantial reason to prevent it. If there is such a reason it is not known to me, and in any case there should be a way to overcome it. I believe that you will confer a great boon upon a great body of persons by acceding to the request of the memorial.

Professor Flower said,—One of the principal arguments that have been used against us is that if museums were opened it would tend to further what is called the desecration of Sunday. I have no such fear myself, and I value our English Sunday as much as any member of the community. It is one of the objects of this society to preserve the English Sunday by having a portion of it set apart for recreation of this kind. I myself enjoy part of the Sunday afternoon at the Zoological Gardens, and if I have been at church in the morning it is perhaps all the better. I do not see why other people should not be able to do the same thing.

Mr. George Godwin said,—I have a strong impression that no amount of mere speech-making will alter the opinions already formed by the trustees, and will therefore confine myself to a piece of evidence, with the preliminary observation that the trustees will probably attach importance to the fact that this deputation, numbering more than a hundred persons who may be considered to a certain extent representative, has been gathered together in forty-eight hours, showing the strong interest felt in the subject by many. The first thing, then, I will say is this, in answer to some who urge that if the Museum were opened as desired the working men and women of London would not take advantage of it. It happens to me that for many years I have been in communication with large numbers of the working-classes throughout the kingdom, and I can assert from my own personal knowledge that they do greatly desire, especially the younger and rising men, the opportunity of visiting museums and galleries on their leisure day. Further I can say, as a member of the Council of the Royal Albert Hall, that the free Sunday organ recitals there, consisting of music of the highest possible character, have been attended Sunday after Sunday by constantly increasing audiences numbering on each occasion from 4,000 to 5,000 persons, thus giving elevating enjoyment to large numbers of persons. It has afforded those who think with me great satisfaction to learn that the leading officials of this institution are favourable on their own part to it being opened on Sunday, and I do hope you will grant our request, if only by giving one Sunday this season. It will only be ante-dating the matter, because that this advantage will be afforded sooner or later everybody is satisfied.

Earl Sydney, in replying to the deputation on behalf of the trustees, said:—Lord Dunraven, Ladies, and Gentlemen,—The trustees of the Museum do not give any opinion upon the great Sunday question, nor do they bring forward their own individual opinions upon the merits of opening the Museum as requested on Sundays. I have only to say to you on their part that it is impossible to open this Museum without communicating with the Treasury with regard to the expense of it.

Lord Dunraven said,—Perhaps you will, before we retire, allow me to give you a list of the names of those who are present; you will also, I hope, allow me, on the part of the Society, to thank you for receiving the deputation and accepting the memorial. We hope that before long steps will be taken to put an end to the difficulty which you mention as standing in the way of our wishes being acceded to.

The deputation then withdrew.

Among those who wrote expressing their great regret at being unable to accompany the deputation were the Duke of Westminster, Viscount Powerscourt, Lord Truro, Mr. P. A. Taylor, M.P., Hon. J. C. Dundas, M.P., Mr. Alex. Macdonald, M.P., the Dean of Westminster, Canon Shuttleworth, Rev. A. H. Mackonochie, Sir Henry Thompson, Sir Julius Benedict, Professor Williamson, F.R.S., Professor Max Müller, James Heywood, F.R.S., Mr. Moncure D. Conway, M.A., and Professor Huxley, F.R.S.

Scarborough Spa.—The new Spa buildings at Scarborough will be opened on Monday, the 2nd of August.

PARLIAMENTARY JOTTINGS.

The Westminster Clock.—In the House of Commons, on the 8th inst., Mr. Adam (in answer to Mr. Forester) said,—The cost of executing the necessary repairs, painting and regilding the west face of the clock, the ironwork surrounding it, repairing the hands of the clock, the metal framework, and the opal glass, has been about 240*l.* These repairs are of a dangerous nature, and can only be undertaken during the summer months. A special scaffolding had to be designed and completed, and I cannot say that, considering the difficulty of the work, it has taken an unreasonable time to complete.

Cemeteries at Wandsworth.—Sir H. Peek asked the Secretary of State for the Home Department whether he was aware that the proposal of the Battersea Burial Board to purchase nearly 40 acres of land near Wandsworth Common, in the parish of Wandsworth, had caused great consternation among the ratepayers, inasmuch as there were already seven cemeteries in or close to Wandsworth, and one on the borders of that parish for Battersea; that the establishment of another cemetery for a thickly-populated parish would not only be prejudicial to a large amount of rateable property, but also in contravention to the intention of the Burial Acts; whether he had been informed that the matter was strongly opposed by the ratepayers of Battersea on account of the large price to be paid for the land; if it were known that the land in question had a subsoil of clay; and if he would be so good as to cause immediate and full inquiries to be made into the subject.—Sir W. Harcourt replied that, in consequence of the report on the subject which had been made to him, the site for the cemetery in question would not be approved.

The Royal Academy.—On the 9th inst., Mr. Thompson asked the First Lord of the Treasury if the Government would use its influence with the President of the Royal Academy to open its exhibition free of charge on Monday, the 2nd of August, being Bank Holiday. In reply, Mr. Gladstone said it was not usual for the Government to interfere in any manner in the administration of the details of the Royal Academy. At the same time, he had every reason to believe in the disposition of the President and the Council of the Royal Academy to give accommodation to the public and to entertain any reasonable proposal; and without giving an opinion,—which would not be in accordance with his duty,—on this proposal, he would recommend that the gentlemen interested in it should seek an opportunity of meeting, on public grounds, the President of the Council. He had no doubt any representations made would be kindly and respectfully and carefully entertained.

Public Offices.—In the House of Lords, on the same evening, Lord Lamington asked Her Majesty's Government whether during the recess they would consider the report of the House of Commons Select Committee of 1877 on Public Offices, with the view of the improvement of the public offices, inasmuch as the committee were all but unanimous in insisting on the necessity of immediate action, not only on economical considerations, but for the efficiency and comfort of the public departments. The committee reported three years ago, but nothing had yet been done. Their public offices were most inconveniently scattered about the metropolis. Sixty or seventy different houses or apartments in different houses, all separate from each other, constituted the War Department, and the mere hire of such imperfect accommodation cost about 60,000*l.* or 70,000*l.* a year. Such a sum as that would go far towards repaying the outlay of a million and a half which the erection of adequate buildings would entail. Lord Sudely, on behalf of the Government, said the subject was one which would not be lost sight of when the funds of the country would enable the Government to consider the question. In the course of the discussion which followed, Viscount Cranbrook said he thought there was some exaggeration in the statements about the ill-health of the persons employed in the War Office. The condition of that office was not much worse than that of some of the new offices. In the India Office there were places lighted up in the daytime with gas, and papers were read by the aid of a sunlight in the centre of a room on a day in June when the sun was at its height. If offices were to be built on that principle, it would be better to put up with bad offices.—The Earl of Redesdale trusted that the Government would, without delay, acquire the freehold of the land lying between Parliament-street and Great George-street, not necessarily with a view to immediately building upon it, but to obtain possession of it while yet it might be purchased at a moderate price.

The Tay Bridge.—In the House of Commons, on the 8th inst., on the second reading being moved of the Bill of the North British Railway Company for the rebuilding of the Tay Bridge, Mr. Anderson opposed it, and, adverting to the condemnation passed on Sir T. Bouch in Mr. Rothery's report, strongly objected to that gentleman being employed in the reconstruction of the bridge. Mr. Chamberlain, in the course of his reply, said that Sir T. Bouch would have nothing to do with the plans, and explained that he proposed to refer the Bill to a hybrid committee, with instructions which would widen the scope of the ordinary inquiry. After some further conversation, the Bill was read a second time and ordered to be referred to a hybrid committee, with power to inquire into the best position for the bridge, the protection of the navigation, the best mode of securing its permanent safety, &c.——On the 12th inst., Sir A. Gordon asked whether the position and the construction of the piers of the bridge and the width and the height of the spans, as they were altered from the deposited plans approved by Parliament, were such as were prescribed by the Board of Trade, and whether a copy of the document giving its sanction could be laid on the table. Mr. Chamberlain.—The bridge over the River Tay, as originally designed, had spans of 200 ft. of clear water space over that part of it which fell, and 100 ft. headway. As prescribed by the Board of Trade, the spans were still to have been of 200 ft., but the headway was reduced to 88 ft. But, as actually constructed, there were eleven openings of 245 ft. span and two openings of 227 ft. span, with 88 ft. headway. Therefore, the position and construction of the piers of the bridge, and the width of the span for openings between the piers were not such as were prescribed by the Board of Trade according to the provisions of the 6th clause of the Act 33 & 34 Vic., chap. 135, which authorised the construction of the bridge. The company did not inform the Board of Trade of the alteration which they had made, and the Board of Trade were not aware of it until some time after it had been effected. The width of the spans was settled by the Board of Trade merely with regard to the interests of navigation of the river; and as the increase was an improvement, the Board of Trade saw no reason to object to the alteration. The sanction of the Board of Trade to the alteration authorised by the Act was given on the usual printed form, and was accompanied by a signed plan. The plan is of great size and length, and I hardly think it would be worth while printing it, but if the hon. baronet wishes to inspect the documents, I shall be most happy to show them to him at the Board of Trade. Sir G. Campbell asked what course the Government proposed to adopt in consequence of the report of the Wreck Commissioner regarding the fall of the Tay Bridge. Mr. Chamberlain.—As soon as I received the reports of the Courts of Inquiry with regard to the Tay Bridge, I directed a circular letter to be sent to all the railway companies, enclosing a copy of the reports, and calling their attention to the grave responsibilities which they incurred with regard to all structures of a similar nature on their lines of railway. That circular I will lay upon the table of the House. I also desired a copy of the reports to be sent to Major-General Hutchinson, and called upon him for an explanation with regard to the remarks contained therein as to his original inspection of the bridge. General Hutchinson's memorandum I will also lay upon the table. It is also my intention to appoint a committee to consider what rules it may be desirable to make with regard to wind-pressure upon railway structures, as suggested in the report of the court of inquiry.

The Canal Boats Act.—On the 12th inst. Mr. J. Cowen asked the President of the Local Government Board whether it was the intention of the Government to take any steps towards the better enforcement of the Canal Boats Act of 1877, so far as it related to the overcrowding in the cabins and the education of the canal-boat children; and whether the Government intended taking any steps for bringing temporary abodes, such as gipsy tents, vans, shows, and like places, under the influence of the sanitary officers, and the children dwelling in

those places under the power of the Education Acts, in extension of the provisions of the Canal Boats Act of 1877. Mr. Dodson.—The Local Government Board have made regulations for preventing overcrowding on these boats, and it rests with the local authorities to see that these regulations are observed, and also the provisions of the Act with regard to the education of the children. The Board have no power to compel the local authorities to enforce the Act, and as they are not aware that any further compulsory power is required for that purpose, the Government themselves have no intention at present of proposing further legislation on the subject. There is considerable difficulty in dealing with gipsies' tents, &c., but the matter has been brought under the notice of the Board, who will endeavour to deal with it when a suitable opportunity presents itself for that purpose.

The Census Bill.—On the 12th inst. Lord Enfield laid upon the table of the House of Lords a Bill to provide for the decennial Census of 1881. He explained that its provisions were almost identical with those of the Act which provided for the Census of 1871, with the exception that the Local Government Board was constituted the central authority, instead of the Secretary of State for the Home Department. This was necessary in consequence of the passing of the Local Government Board Act in 1871, which, in conformity with the recommendations of the Royal Sanitary Commission, transferred to the Local Government Board such jurisdiction as the Home Office previously possessed over the Registrar-General's Department. The Local Government Board would therefore superintend the taking of the new Census, and approve all the forms and instructions to be issued for that purpose. The work, however, would, as on former occasions, be done in the Registrar-General's Department. The persons employed outside that department would be the various superintendent registrars, the local registrars, and the several enumerators to be appointed by them, and the overseers of parishes, constables, and relieving officers would be bound to act as enumerators. The Census would be taken on the night of Sunday, the 3rd of April, 1881. Clause 4 of the Bill provided for the particulars to be returned by each householder, and they were classed under the following eight heads:—1, name; 2, sex; 3, age; 4, rank, profession, or occupation; 5, condition as to marriage; 6, relation to head of family; 7, where born; 8, whether blind, deaf or dumb, imbecile, idiot, or lunatic. On Monday, the 4th of April, the returns would be collected by the enumerators, and corrected when erroneous. The enumerators would take the account of the occupied and unoccupied houses, and houses then building, and distinguish the boundaries of parishes and boroughs. They would deliver their books, with the householders' schedules, to the registrars, who would verify the same and hand them to the superintendent registrars. These would examine the books and return them to the Registrar-General, who would cause the returns to be abstracted, and a preliminary report would be laid before Parliament before the 1st of June in the following year. The Census in detail would be completed as soon as practicable after wards. ——Earl Fortescue regretted to find that no provision was made for the completion of the Census in less than two years and eleven months. He suggested that a large local staff should be employed, so as to finish the work within something like three months. The cost in the end would not be greater, and it was important to have the information as nearly as possible up to date. The Bill was read a first time.

TWO EXHIBITIONS WORTH SEEING.

A FORTNIGHT ago we briefly chronicled the opening of an "Industrial and Fine Art Exhibition" in the large hall of the Bow and Bromley Institute, over the Bow Station of the North London Railway. The best things among the workmen's exhibits are by those who show specimens of their own handicraft. Among the most notable exhibits in Class II., "Artistic work in terra cotta, stone," &c., are some small figures, a carved panel, and a portion of ceiling decoration, exhibited by W. Allan, carver, Lambeth (No. 106 in catalogue); plaster bas-reliefs (No. 110), modelled by C. Bursill, stone-carver, Westminster Bridge-road; and two vases and two salad-bowls (113), exhibited by Edward Dann, draughtsman and designer to Messrs. Stiff & Sons, of Lambeth;—these four articles are in stoneware, and in general design and treatment resemble the now well-known Doulton ware, though they hardly attain its excellence. Mr. H. Gunthorp, stone-carver, Herne-hill, exhibits (117) specimens of his skill in modelling in the shape of a figure from the antique, and a small medallion. Mr. J. Gwillim, smith, Stamford-street, exhibits (118) a wrought-iron ornamental bracket and a *repoussé* medallion of Garibaldi, in copper. A well-executed silver dish in *repoussé* work (124), exhibited by W. Middleton, embosser, Liverpool-road, Islington, is labelled as purchased by Mr. Hubert Herkomer, A.R.A., one of the judges in the Artistic section. The exhibition contains some good mechanical models and other work by engineers, also several large models of steamships built for the navy and mercantile marine by Messrs. Samuda Brothers and other well-known firms, by whom the models have been lent. There is also some excellent coopers' work, the Coopers' Company having offered a special prize to workmen in this trade. Mr. Wilberforce Bryant lends a collection of Japanese curiosities and manufactures; Messrs. Doulton & Co. send a good representative collection of their artistic Doulton ware and Lambeth faïence; Messrs. Powell, of Whitefriars, have an excellent display of glass; and Messrs. Josiah Wedgwood & Sons are represented by a case of ornamental Wedgwood ware. The exhibition, like all its congeners, contains the usual heterogeneous collection of articles produced, with infinite pains and labour, by people who are evidently quite unaware of their lack of aptitude for the particular work which they impose upon themselves in their leisure hours. To cite only one instance. The exhibit marked No. 135 in the catalogue is described as an open-work vase, cut in Caen stone, and is the work of Mr. A. Tilley, painter, plumber, &c., Rotherhithe. The exhibitor may be an excellent workman in his own particular trade, but in laboriously producing this vase he has shown himself to be quite unable to appreciate the nature of such a material as Caen stone, for in it he has, with an amount of patience and perseverance which could have been far more usefully applied in other directions, produced a perforated vase of delicate fret-work, from his own design,—a design utterly unsuited to the material in which it has been executed. The difficulties which the producer had to contend with are testified to by the numerous joints to be seen in the work where breakages have occurred. The hall in which the exhibition is held is admirably adapted to the purpose, and the general effect is greatly enhanced by the stained-glass windows exhibited by Mr. Thomas Cox, of Southampton-row, Russell-square, who also displays on the staircase a number of cartoons and drawings for stained glass and church decorations generally. In the hall the same exhibitor has a good show of painted tiles and other ceramics. In this brief glance at the exhibition (which will remain open until the end of the present month, and perhaps longer) we have said enough to show that it is well worth a visit.

The Printing, Stationery, Paper-making, and Kindred Trades Exhibition and Market, at the Agricultural Hall, is eminently deserving of a visit from all who take any interest in the production of books and newspapers. Machinery of the most varied character is to be seen in motion, and appliances and materials of all kinds used by printers, bookbinders, lithographers, and engravers, are fully represented. Among the motors now largely used by printers, as well as by other users of power, we noticed, during a hurried survey of the exhibition, the well-tried "Otto" silent gas engine, and Bailey's hot-air engine, some particulars of which we lately published. The catalogue, sold for sixpence, is well arranged, and as it contains well-written articles on "The Origin and Progress of Printing," by John Southward, and on "Paper and Stationery," by W. F. Catcheside,—each containing a fund of information,—it is worth preserving. An interesting set of *fac-similes* reprints is exhibited by Mr. Elliot Stock, as specimens of the reproduction of ancient books by modern appliances. They are to be found among the cases of exhibits sent by Messrs. Field and Tuer. The exhibition, which appears to have been a great success, closes this Saturday, the 17th. All who can manage to visit it in the short interval that remains will find themselves well repaid for their trouble.

AS TO THE SANITARY INSPECTION OF DWELLINGS.

IN the course of the recent Conference at the Society of Arts on the progress of public health, Mr. Cresswell opened a discussion on the following resolution, under the head Sanitary Inspection and Classification of Dwellings:—"That it is expedient that the Metropolitan Board of Works within the metropolis, and the County Board within each county, should be empowered by the Legislature to make provision for the inspection and sanitary classification of dwellings, upon application being made by the owners thereof; and to grant certificates of healthworthiness in different categories, for terms of years, according to the perfection of sanitary equipment and fitness for habitation of such dwellings; and to determine the scale of fees to be paid for such inspection during construction and repair, and also upon delivery to the applicant of the certificate of classification awarded to such dwelling."

After urging the necessity of such a measure, Mr. Cresswell said, in conclusion,—They would see the importance of handing over these duties to such public body or bodies as would command undivided confidence; that there should be no possibility of collusion between builder or contractor, engineer or sanitary expert, employed by the association or public body; that there should be no doubt whatever that the same repute should attach to the certificate issued from this public body as attached to a certificate of Lloyd's; and he could not put the case stronger than that; for, at that moment, the well-known "Lloyd's Register," bound in blue and gold, bearing the certificate of their secretary, was accepted throughout the whole civilised world as an indisputable evidence of the truth of that which it contained. Some of them might live to see,—they, no doubt, all hoped to live to see,—the time when there should be such a book in the hands of every municipal authority throughout England,—in the register or in the archives of every local sanitary authority in the kingdom; and, above all, in the archives or secretariat of the metropolitan authority,—whatever it might be in the future,—which was destined to govern this great City. If that were so, they would have palpable and tangible evidence of the fact, the means of ascertaining whether the houses in which they had to dwell were fit for human habitation. In the case of the metropolis, whatever the metropolitan authority might be, it should be charged with this most important function; and as they all hoped to see within a few months' time the institution of County Boards throughout the kingdom, no better authorities could be found,—as they were above suspicion,—to perform a similar function in the counties. That was, in fact, the substance of the proposition he had now the honour to lay before the Conference. He submitted with confidence that it was at least worthy of the society under whose hospitable roof they were, and worthy of their attentive consideration.

A long discussion followed, and we give the opinions expressed by some of the speakers.

Dr. Wright said, as representing a town peculiar in its character, namely, Cheltenham, to which a great number of particularly timid and nervous people came to take up their abode for the purposes of health, it was astonishing how nervous these people were on this particular question of the condition of house property. He had letters, some even from India, making inquiries about certain places. Of course, as an officer of health, he could not interfere with the rights of private property. He could not say all he knew about houses; but he gave those individuals references to a sanitary engineer, to whom they could apply, and who would make an inspection of the houses. That had been going on for some time, and, of course, sometimes the reports were unfavourable, and there was a threatened action for damages against the man who had spoken the truth. But altogether it appeared to him that what Mr. Cresswell had so well put before the Conference was neither more nor less than the outcome of what had been going on of late years with reference to sanitary progress. They had awakened the attention of the public mind, by trying to teach them the alphabet of sanitary science, and they were now beginning to spell out the words for themselves. Now came home to every one the important question,—Is the house I am about to take healthy or otherwise? But when the inquiry was made, there was great difficulty

arriving at a conclusion. Very often the most intelligent persons had suggested the want of the very resolution which Mr. Cresswell had so ably introduced, and which he should be very glad to propose he adopted by the Conference.

Dr. Tripe pointed out the difference between ships and houses, especially as regards the sanitary condition and fitness for habitation of such dwellings, which were so great that, to certify for a term of years that the house would be fit for occupation was certainly ill-advised. If the words "for a term of years" were omitted, he should have comparatively little objection to it. Those who knew much of sanitary work were aware that the leaden pipes leading from the water-closets got eaten through; holes were made in them, and it could not be told from the quality of the lead how long they would last. They did not know the reason why certain pipes should be eaten away, and others remain whole. It was, therefore, impossible to give a certificate to the effect that the house would be in good condition for a certain number of years. As to a house being put in the first, second, or third classes, and certified accordingly, he could understand that. He had seen a great deal of building, and gave evidence before the House of Commons on bad building. He had analysed a large number of samples of mortar used, and had found mortar, even recently, made with only 10 per cent. of lime, the greater part of the rest being,—he would not say rubbish,—after Mr. Cresswell's definition of the word,—but garden mould, or something no better, and the consequence was the houses fell down. The inspection of these things was entrusted to officials appointed by the Metropolitan Board of Works, and it was now proposed to appoint others. Were they to have one set of men appointed by the same authority to supervise the others? He could not agree to that; you must find some other body. The surveyors appointed by the vestries had to superintend the drains, and the district surveyors appointed by the Metropolitan Board of Works had to do with the walls, the damp-proof course, the foundations, the roof, and other things of that kind. The water-closet arrangements, and all works connected with drainage, are, in the metropolis, under the control of the vestries and district boards. It was said that no vestry or district board had any regulations, but he would hand in some, framed by the Hackney Board, showing that one board, at any rate, had regulations concerning matters of drainage. There was plenty of power, in fact, both as regards district surveyors and surveyors to local boards, to prevent bad work. They could require anything reasonable to be done, as the bye-laws of the Metropolitan Board were extremely full if they were properly carried out. For what reason should there be any addition to these, or why should a person have, perhaps, to pay again the officer who was already paid, to see that things were properly done at first? As he had already said, he had analysed mortar containing only 10 per cent. of lime, which, when put into the crucible, turned red from the quantity of clay it contained. That was not in accordance with the bye-laws of the Metropolitan Board. He had ascertained the quantity of organic matter in it, and, when mortar was made containing organic matter, it gave off a smell sometimes for six months. That caused a gradual crumbling; so that, although apparently good and setting well, it would by keeping, even in a dry room, in the course of time become perfectly rotten. This kind of mortar is used to a considerable extent by "Jerry" builders. He quite agreed it was most important that persons wanting good dwellings should be able to know where to get them; but here was the difficulty, that persons must be engaged *ab initio*, or they could not tell what was underneath the house, and whether the drains were put in in concrete or not. In Hackney, every drain going under a house within 3 ft. of the floor was to be in concrete, and every drain was supposed to be examined, two men being appointed for the purpose; but, of course, he did not know that they did so, as they were not under his control. He believed that every house, so far as the drainage was concerned, was examined; but he could not say what was done with the walls and foundations, and everything of that kind. These you could see afterwards, but as for the drainage, and what was buried under the ground, you could not see without considerable cost and trouble. Therefore, in order to carry out this proposal, there might be something done by calling the attention of Vestries and Boards to the fact that they had full power to make bye-laws,—which very few had done,—and to insist that they were carried out; that no drain should be covered over without the surveyor or his representative seeing every portion of them, and that every drain under a house was laid in concrete.

Lord Alfred Churchill said the condition of people's dwellings really lay at the root of the question of public health. He should be glad himself, as soon as such a thing became law, to have his house inspected, and to get a certificate upon it. Four or five years ago he had the drains put in order, and should have been glad then to have got a certificate that they were so. Whilst the work was in progress he casually met the inspector of the district, who told him he had watched the laying of the drains, and he said he was very glad they made such a rule that the drains were not to be closed in until they had been inspected. The inspector said, although they did in this case, they were not in the habit of doing it to everybody. Now, he thought it was absolutely necessary that it should be done in the case of every house. He thought the health-worthiness of a house depended almost entirely on the system of drainage, and the certificate should be that the house was examined at such a date, the drains were laid according to the most scientific methods known at the date, and calculated to last such a time; not giving any certificate of health-worthiness, because that was the natural result of good drainage. He would suggest that the certificate should be in the form that the drains themselves were constructed in a proper manner, and were calculated to last so many years. He thought there should be attached to each certificate a complete drawing of the way in which the drains were constructed, in the same way as an outline of the property was generally shown on the deed of conveyance.

Mr. Collins asked if the army of inspectors necessary to carry out this suggested work of inspection had been considered. He had for many years taken a great interest in these questions, and was on many committees in the parish of Paddington, which is a very large and wealthy portion of the metropolis. As had before been mentioned, he considered the Metropolis Local Management Act gave all the power necessary to enable vestries to see all that Mr. Cresswell wished carried into effect; but, whenever you brought such matters forward a storm was at once raised as to the large amount of money it would cost, and the incubus it would be on the ratepayers in order to get such a system carried out. If it were self-supporting,—if the public were so alive to the question as was hinted,—there was nothing at all to prevent them obtaining, without the aid of the Society of Arts, without the assistance of Government, or any similar means, such certificates as were referred to. There were many gentlemen, eminent in their profession, quite capable of giving such a certificate. The truth was that, like most permissive legislation, it would be simply a dead letter if it were passed. There were very few people who, like Earl Spencer, could afford to go to the large expense which such a system demanded. He could only say, from his own experience as a sanitary architect and engineer, that he had always found that when mischief was discovered,—as during the prevalence of fever,—everybody was anxious to do all that was requisite with regard to sanitary improvement; but the moment the epidemic passed away, there was great apathy, and very little was carried out. This question was by no means new. At the meeting of the Social Science Association held at Brighton (to the Health Department of which he had the honour of being secretary) this subject was fully discussed, and the result of it was, a large number of circulars were sent round to the different seaports and towns, for the purpose of ascertaining how the authorities would fall in with views very similar to these. He believed 400 or 500 circulars were sent, and about twenty or thirty replies only were received, showing how great was the anxiety on the part of the public to carry out such a suggestion. In Edinburgh, Manchester, and Glasgow companies had been formed for the purpose of giving such certificates, but he did not think they had been in existence more than one or two years, and therefore it would be difficult to say practically how far they had succeeded; but he should like to know what dividends they were paying, and how far the sanitary rules laid down in this resolution were found beneficial. He thought it would have very little effect indeed. If a man really wanted his house put in proper order and condition, there was no difficulty in obtaining such a certificate; and if the Conference wanted to throw the onus on local authorities, he was perfectly certain they would not carry it out, even if it were paid for. He should like to say a word in defence of his own profession, as a district surveyor for an important part of the City of London. The Act of Parliament gave no option to the district surveyor (until very recently) to attend to sanitary regulations as connected with the building operations in the metropolis. His duties were to ascertain that the walls were built of sufficient thickness, and that certain precautions were taken with regard to accident by fire. Recently, and after an enormous amount of opposition, the Act having been passed two years, certain bye-laws had come into operation which were very simple indeed, and which, by and by, people would be astonished to find had taken so lengthened a period to adopt; but these simply provided that there should be damp-proof courses and proper foundations to the houses; and therein all the sanitary bye-laws of the Board of Works began and ended. A great many more were prepared, but there were so many objections raised, and selfish interests alarmed, that the whole thing threatened to collapse, and they only succeeded in carrying what he had referred to. They did get, it was true, a definition of mortar, but it still only remained a definition, as far as his experience went. There was the greatest possible difficulty in obtaining these "Jerry" builders to perform their work properly. Even if this duty of giving certificates were placed in the hands of inspectors of health, or vestries, or local boards, from his knowledge of the subject, he thought there would always be a certain amount of suspicion attaching to them. The only way of carrying these views into practical effect was to get the public mind sufficiently educated to the necessity of seeing that their houses were fit to live in, and not to die in; and then they would take proper means of availing themselves of such professional assistance as was open to them, in order to insure that their houses possessed those healthy conditions which they desired.

Mr. Wakefield was entirely in favour of this proposition. It had been in his mind many years, and there was no way of getting the public to adopt sanitary measures, except by making it a question of self-interest. You could not do it in any other way but by a system of certificate; but the question appeared to be surrounded by some difficulty. It would be almost too onerous a duty to impose upon local functionaries. The task would be so invidious if called upon to withhold a certificate, the withholding of which would be to inflict a serious injury on the proprietor, that there would be such an amount of pressure brought to bear on the officers as would be hardly fair to subject them to. He could not see his way out of it, except by having a special officer appointed by the Local Government Board in London, and even an officer of that kind ought to be bound down by the most stringent rules. It was not only the drains, but the walls that were of importance. It was impossible to have a good house if you had lath and plaster in it at all, and all the walls should be able to bear a certain amount of surface-pressure without yielding. If a system of that kind could be carried out, the value to the public in general would be incalculable. Take a case for instance; he knew a first-class school where the children of noblemen were being educated where typhoid fever broke out again and again. Nothing wrong could be discovered in the sewers; but on examining the walls it was found that forty papers had been pasted one upon the top of another, and, in fact, two large wagon-loads of old paper were taken away. Lodging-houses and hotels, again, of superior character, would be very glad to use this system as a means of attracting visitors.

Mr. Lovegrove thought it expedient, if practicable, to have certificates such as were referred to in this resolution, but the question was surrounded with difficulties. He had no faith whatever in any certificate, whether it had blue or red ribbon upon it, whether a gilt edge or not. What was wanted was more thorough supervision during the progress of the works, for there were miles of drains which appeared on the face of them perfectly sound, but which

possessed qualities of unsoundness which might prove, after ordinary inspection, a great injury to the inhabitants. They wanted, if they could, to get hold of the hand from which they could obtain sound workmanship, for we depend more on the hand that works than upon occasional overlooking. They wanted drains laid by educated workmen. In the Hackney district, the Local Board executed the work outside, from the sewer to the area, under contract, but from that point underneath the houses throughout to the back, the work was executed usually by the builders. Sometimes there were as many as five or six different workmen engaged on that section of the drain, and the time over which the work extended would be from one month to seven or eight. There we have one of the most serious difficulties in superintending the construction. In order to ensure perfect construction of the drain, the whole of the work, from the sewer to every inlet, should be executed by one, and a properly-constituted authority, and not left to the builders. He had on former occasions referred to the question of certified workmen, and he thought if they could have a class of workmen educated to do this particular work, it would be a step in the right direction. In the absence of that, he should suggest that the whole of the work should be executed by the local authorities at the cost of the owner, but he should object to the Metropolitan Board of Works being entrusted with the power of surveying the work done under the local authorities.

Captain Galton thought it would be very undesirable to pass any resolution which would not be of a practical nature. Although he entirely sympathised with Mr. Cresswell as to the desirability of adopting some means for securing that houses should be constructed in a manner which should insure their healthiness, he had very grave doubt as to how far this mode of effecting that object was practicable. It went to the extent not merely of the drains, but of the whole sanitary character of the houses; it included the nature of the materials, the walls, the ventilation, and the mode of construction of the basement, the means of saying that the house was not being built upon a foundation which was in itself injurious to health, as the foundations of so many houses in London were. All these were points which, if you were to have a certificate of healthiness of the dwelling, must be examined into by the authority which was to deal with it. It seemed to him it would be far wiser to pass a resolution similar to what, no doubt, had been passed before, that all plans of drains, and the sanitary appliances of all dwellings, as well as all alterations in such matters, should be registered at the office of the district surveyor or vestry, and that any person wishing to take a house should be able to examine this plan. The fact was that the arguments which had been adduced on this subject pointed really to the necessity of an improved education of the whole nation in sanitary matters; it was that only which would insure a healthy construction of houses.

Mr. Rogers Field entirely concurred with Captain Galton. He though the resolution, as it stood, could not possibly work. It referred to certificates for old houses as well as new houses; but he was quite certain that certificates could not be given for old houses. The amount of investigation which would be required, if the certificate was to be worth anything, would be enormous, because, in an old house, you must examine everything, open everything, and search everything; if you did not, you would be certain to miss something which was very faulty. With new houses it was different, but then they came to what Dr. Richardson had said: you wanted, first of all, a standard to work by; and, at the present moment, they had not got that in the metropolis. You might go with a scheme of sanitary arrangements for a house, proposing what every man who had studied the subject would agree was the right system, but the vestry would very likely think differently. The question of cutting off the house from the sewer by a ventilated trap, or manhole, was most important from a sanitary point of view; but, when he proposed to do that, one of the West-end London vestries said "No," and raised all sorts of difficulties. Until this state of things was remedied with the vestries, it was impossible to go any further. If proper bye-laws for house drainage were introduced, you might have a certificate saying that the bye-laws were complied with; but, unless it were done in that way, you would get into difficulties.

The Chairman said he had made some verbal alterations in the resolution, which he thought would improve it, and it would now read as follows:—"That it is expedient that the local authorities should be empowered by the Legislature to make provision for the inspection of dwellings on a defined system, upon application being made by the owners thereof; and to grant certificates, according to the perfection of sanitary equipment and fitness for habitation of such dwellings, accompanied by plans of drains, closets, and gullies, &c.; and to determine the scale of fees to be paid for such inspection during construction and repair or otherwise, and also upon delivery to the applicant of the certificate awarded to such dwelling."

Mr. Smallpeice, C.E., said nothing had been observed as to the men who were to be appointed inspectors, and what qualifications they should possess for their office. The Public Health Act gave power to urban and rural sanitary authorities to make bye-laws containing every provision required in this proposition. It empowered them to appoint inspectors or surveyors to see that those laws and bye-laws were carried out, but there was no qualification required for those surveyors. He had a letter some time ago from Sir John Lambert, stating that there was no qualification required by the Local Government Board for a country surveyor, any more than the guardians might require. In London, every district surveyor had to undergo a special examination, and show that he was fitted, before he could obtain the office, but in the country any person who could get a majority of the guardians was appointed. Now, it was evident that a certificate would be valueless unless the surveyor had undergone some examination as to his qualification to perform his duties.

Mr. Pearce thought this resolution was not calculated to remedy the evils complained of, yet it was likely to be operative to a considerable extent in deterring builders from putting such bad workmanship and materials into houses as they had been in the habit of doing; therefore, apart from the benefit which would accrue to those who might be fortunate to live in a house certified to be healthy, its indirect influence would be very great in removing many of the evils from which they had at present suffered. Some houses which were condemned as being absolutely unhealthy had been constructed under inspection, both as to materials and workmanship employed; it should be made more of reality. He spoke on behalf of house-occupiers and owners, and thought it would be lamentable to have to leave this question until the public generally were educated in sanitary science. As a rule house-occupiers could not give much attention to this matter. Houses were largely built by speculative builders, who were merely anxious to get them up, certified to be habitable, and sell them, and the public looked to the authorities to protect them against these evils.

The Chairman said he was sometimes told by his friends that he had something of the judicial element in him, that he did not go to extremes; but, upon this subject, he went further than the resolution. He supported the resolution, because he agreed with Dr. Bond that it was a good tentative educational way of going to work. It pointed out the functions and duties of local sanitary authorities, and the obligation they had undertaken with regard to the ratepayers of the district who support them, and whose actions they, in some respects, controlled in the building of the houses. The local sanitary authority made bye-laws, and the duty imposed upon it,—as it assumed to itself the right of laying down rules as to the materials of which houses should be built, the method of construction, and so on,—placed it before the ratepayers as a body which existed, amongst other things, for the purpose of securing healthy dwellings, at any rate, in future. That was the duty imposed upon it, and the duty which it had taken upon itself to carry it out. Now, taking the question of draining, the local authority constructed a sewer, and told the house-owner to drain into it, and they had already arrived at the view that every local authority ought to have at least as much power as the Commissioners of Sewers had in the City of London, because if the local authority constructed the sewer, and told the owner to drain into it, it was on the ground that it had a right to compel the owner to dispose of the excreta of his house, and send them down the drain to be carried away, so as not to be a nuisance either to those in the house or in the neighbourhood. On the other hand, their obligation was not to send back sewer-gas into the house; but the local authority could not fulfil that implied contract unless it had control, first of all, over the junction of the drain with the sewer just outside the house; and, secondly, it could not fully fulfil that contract unless it had some knowledge and supervision over the drains and similar arrangements of the house. The same remarks applied to the supply of water and gas. In many towns these were supplied by local authorities, and where they were not, they were supplied by companies by virtue of law, but it was surely part of the duty of the local authority, or it should be, to see that water and gas were supplied under conditions which were consistent with the health of the population. Practically speaking, what a condition of utter helplessness were people in when taking a house! It was a matter of notoriety that a man might go and buy, or take for a long term of years, a house, and he had no guarantee that there was any connexion between the drain and the sewer at all; and, in many cases, even after the experience of illness and death in the house, he had at great expense to have the floor and basement of the house taken up, and then to have the road taken up to the sewer in the middle, and find there was positively no connexion at all between the house-drain and the sewer itself. That was too dangerous a state of things to be permitted, and it was part of the duty of the authority to prevent the possibility of such a fraud. If you had introduced in the house drains or water supply, or anything of the kind, as covered work, you were at the mercy of your tradesmen; you had no plans—you did not know anything about drains, the pipes all over the house were left out of view,—there were no means of knowing where they were, so that the householder, whatever his general education and intelligence, was helpless in the hands of the tradespeople who lived by this kind of work.

The resolution, as amended, was then put, and carried unanimously.

BRICK AND TILE MAKING AT PLUCKLEY.*

My object in the present paper is to describe more particularly the processes of manufacture as carried out by the Kent Brick, Tile, and Pottery Company upon their works at Pluckley Station. The clayfields now worked by this company were originally taken from Sir Edward C. Dering, bart., by Mr. William Tongue, builder and contractor, of Plumstead, who opened the works and put down a considerable portion of the present extensive plant. But no sooner had the qualities of this clay for the manufacture of superior bricks and tiles and pottery goods generally been properly tested and fully established, than the lessee applied for and obtained powers to form a limited liability company, to whom the lease of fifty years was eventually transferred. By this company the works have since been carried on under a board of directors, with Mr. Edwin Hughes, of Green's End, Woolwich, as chairman, and Mr. Talfourd Hughes as secretary. Machinery of the most modern and improved kind has been introduced; and the results have been in the highest degree satisfactory to the proprietor of the estate, the lessees of the works, and the shareholders of the company generally.

The machinery employed is driven by a steam-engine of 35 nominal horse-power, having a 3-ft. length of stroke, and a fly-wheel 14 ft. in diameter. The kilns at present in use consist of a "Hoffman," elliptical in form, and 200 ft. long by 100 ft. broad, having in all fourteen chambers, and capable of holding 400,000 bricks; the main shaft is 150 ft. high, 14 ft. in diameter at the base, and 7 ft. at the summit. This kiln is burnt entirely round in periods varying from four to five weeks, according to circumstances. There are also four Scotch kilns, taking 60,000 bricks each, which can be set, burnt, and emptied once in a fortnight; and four Staffordshire kilns for burning blue goods, which hold 30,000 each, and take rather a longer time to burn. The produce of these kilns is the celebrated "blue pavior" which is now being sent from Pluckley Station to all parts of the country.

The machine-house is fitted up with Murray's complete plant for permanent works, with a slight deviation in the mode of drawing the wagons of clay out of the pit, these coming up

* From a paper by Mr. Alfred J. Burrows in the *Journal of Forestry and Estates Management*.

full and returning empty in a continuous stream. Besides the winding gear for drawing up the clay in tip-wagons, this machine comprises ribbed and plain crushing-rollers, a mixing-pan, pug-mill, and compression rollers, which send out a continuous stream of clay on to the side delivery-table, which cuts ten bricks at one stroke, and is capable of turning out 25,000 per day. These are placed upon the back-harrows, and run off at once to the back-ground, which is fitted up according to Kemsley's patent, with corrugated iron roof and canvas curtains.

By the use of the patent continuous-delivery machines, fitted up with the lubricating solid die and patent cutting-table, a non-intermittent stream of clay can be worked, and an important saving both of power and manual labour be effected. These machines are so easily fitted up that they can be removed so as to follow the position of the clay, and they may also be obtained with an automatic cutting-table.

By means of an improved brick-cutting table, the clay issuing from the die of the machine is received on the left hand of the table, and when a sufficient length for from eight to twelve bricks has passed out, this is cut off, as it travels, by a single wire, and passed by hand behind the fixed cutting-wires. The lever on the right hand is next thrown over, and advances the thrust-plate, which places the block of clay parallel with the cutting wires, carrying it up to and through them on to a movable board, with which they are at once transferred to the barrow without being handled. The chief advantages thus obtained are that from 2,000 to 3,000 more bricks can be turned out in the day by this avoidance of stoppages and waste, and the bricks are very superior in quality, and mathematically accurate in shape, and the finish of the cut is perfectly clean, without the slightest tear or raggedness, so that the value of the bricks for finished work is thereby considerably enhanced.

All tiles are moulded plain, and in the case of hips, valley, and ridge tiles, the bend is given afterwards by placing them upon a horse of the proper shape. The corrugations of pantiles are imparted in a similar way. It is now customary to give each plain tile a couple of nibs for fixing it instead of perforating it and fixing with pegs as formerly. The nibs are put on by a separate operation in the press, but by the use of the patent pipe and tile machine of Mr. Murray, manufactured by Messrs. Thomas Middleton & Co., of Southwark, any kind of fancy tile can be completed in one operation. The smaller, or 2 in. drain-pipes can be turned out by it at the rate of 8,000 per day; and if fitted with the patent lubricating solid die, it will put out 10,000 bricks per day. It also makes the ordinary corrugated tile as well as the improved Bridgewater and Spanish tiles. One great advantage of the tile-making machine is the production of the continuous nib-tile by the use of a die. By the use of the lubricating solid die a perfect stream of clay with sharp arris is obtained both from mild and strong clays. This die can be adapted to brick-making machines of all kinds, either with or without the cutting-table.

The bricks and tiles intended for blue goods are manufactured from the upper and second beds of the clay, which are of a light fawn or yellowish colour. This is dug, watered, and weathered somewhat in the usual mode adopted in the manufacture of plastic clays, being wheeled into heaps and turned once or twice. From this is also made the wire-cut bricks and tiles of various kinds. Some of the layers contain a considerable amount of oxide of iron.

The pressing of chequered and other paving bricks, tiles, &c., and the manufacture of pottery-ware, is carried on in a spacious enclosed drying-shed, 168 ft. long by 104 ft. wide, the roof being boarded and tiled and properly ventilated, and supported by brick pillars. This shed is heated by underground flues, which convey through it the escape steam from the engine. In this shed is also to be seen a potter busily employed in turning out common flower-pots, chimney and sea-kale pots, jars, ornamental vases, and a variety of other goods for which the Pluckley clay is eminently adapted, but for the proper burning of which the company has at present no special kiln.

In the moulding of tiles of various kinds, the finest sifted coal-dust is used. The "stable paviors" are at present pressed by hand in Dutton's lever press, which can also be used for tiles by simply changing the die. The tiles thus produced have, of course, to be horsed singly, an operation which is performed after they have lain two or three hours upon the hot floor. The shrinkage of this plastic clay is considerably more than that worked upon the semi-dry process, to be afterwards described.

One of the principal features of these brick-works is the semi-dry process, by which the lower layers of clay are brought direct from the pit and tilted at once into the hopper which feeds Bradley & Craven's clay-grinding mill, with revolving pan and perforated bottom. To insure the continuance of this process, even in the wettest weather, a supply of dry clay is generally kept in the spacious room over the machine-house, which is 60 ft. long by 40 ft. wide. As soon as the clay is sufficiently ground, it passes through the bottom of the pan into a receiver, from which it is thrown out by automatic scrapers into another receiver, from which it is carried to the floor above by cups working upon an endless rubber-band, similar to those employed to elevate the thrashed corn in a thrashing-machine. The ground clay next falls upon the floor above, from which it is conveyed through canvas shoots to the pressing-machines working below. These machines, manufactured by Parker Brothers, are three in number, and each one is capable of turning out 50,000 bricks per week. Each machine produces very superior bricks, and delivers from one mould-box a much larger quantity in a given time than has yet been made by any other machine at present before the public. The superiority of quality lies in the fact that the brick itself undergoes a similar process to pugging within the mould-box in which it is pressed, and thus saves an intermediate process, which, as most brick-makers are well aware, is indispensable in all cases wherein the object mainly sought is a good ringing quality of brick, in place of the easily disintegrated blocks, usually produced under the semi-dry system. If Chamberlain's patent appliance is worked in conjunction with the press designed by the patentee for the purpose of re-pressing the bricks as they are made by the machine, bricks are produced that cannot be distinguished from those made from plastic clay and re-pressed; these are facing-bricks of the very best quality. The machines under notice are simple, powerful, and not likely to get out of order; the bricks turned out are true in form, and sufficiently hard to go direct to the kiln. The quantity produced varies with different clays, but the limits lie between fourteen and twenty-three bricks per minute, and the power required for such a production is very small. Under the most favourable circumstances of grinding and delivery, the clay is not more than from ten to fifteen minutes out of the pit before it is moulded, pressed, and stacked in the kiln.

As it leaves the canvas shoot the ground and finely-granulated clay passes into a measuring-box, 9½ in. by 8 in. by 5 in. in its internal dimensions. Each forward movement of this box deposits the contents in the die of the machine, where it receives a pressure of 30 tons, and is by the next movement pushed forward upon the plate. Its size is now 9½ in. by 4⅛ in. by 3½ in. A woman places it upon the press, where it is subjected to a second pressure of about the same force as the former, and comes out measuring 9½ in. by 4⅛ in. by 2⅞ in. A second woman removes it from the press to the back-barrow, and it is at once delivered into the kiln, where its shrinkage in burning reduces it to 9 in. by 4⅜ in. by 2⅝ in.

The principal kiln in use here is built in accordance with the invention of M. Hoffmann, of Berlin, and patented in England by Mr. H. Chamberlain, a pottery engineer, who supplies the designs. It is elliptical in shape, having outside doors to each of the fourteen chambers, through which the bricks are wheeled in and out. The fuel, which consists of finely-sifted coal, is let in through apertures in the crown of the arch, and these are kept covered up with close-fitting iron caps. The smoke-chamber surrounds the central chimney, and flues leading from the bed of the furnace communicate with this. The bricks are so packed that the fuel passes freely amongst them, firing as it descends. Between every two chambers is a large intercepting damper. When in full work, any of the two chambers may have their doors open at one time, the one being emptied and the other filled.

By the use of the Hoffman kiln all the gaseous substances set free by combustion are carried on by the current of air to dry out and prepare for burning the bricks in the further chambers.

The quantity of land at present leased by the Kent Brick and Tile Company is twenty-three acres, and they have power to add to this from time to time, as may be found necessary.

THE NEW TOWN HALL, BOOTLE.

STORETON STONE.

THE foundation-stone of the new Town-hall of Bootle-cum-Linacre was laid by the Mayor (Mr. J. P. M'Arthur), on the 8th inst. The site of the new Town-hall is at the junction of Trinity-road and Oriel-road. It is intended that the entrance to the public offices in Trinity-road shall have an effective appearance. Immediately on entering there will be a large hall and corridor giving access to the town-clerk's offices. The School Board office adjoins the entrance. The large hall will have an area of upwards of 3,500 superficial feet, with platform at one end, and retiring-rooms for the performers. In the Council Chamber, which will be on the ground-floor, there will be a gallery for the reporters, approached from the staircase. The whole of the building is planned so that if necessary additional offices could be placed on either frontage without interfering with the working arrangements. The building is designed in the style of the period of Francis I. The fronts will be executed in Yorkshire parpoints; with Storeton stone dressings, and, in order that the structure may be better seen, it will be set back three yards from the Trinity-road and eight yards from the Oriel-road frontages. The builder is Mr. Samuel Webster, of Bootle, and the architect is Mr. John Johnson, of London.

We note that, at a recent meeting of the Bootle Town Council, Mr. Alderman Newell moved the following resolution:—

"That the memorandum on the General Purposes Committee's proceedings of April 7th, 1880, page 236, relative to yellow Storeton stone, be rescinded, and that white Storeton stone be used."

Alderman Newell said he brought the motion forward because he considered that the architect in the matter had not worked in the business way that an architect to the building (the Town-hall) should do. The speaker then went on with the view of showing the superiority of the white over the yellow Storeton stone. Bebington Church, he said, was composed of the former, and was 700 years old. On the other hand, the yellow Storeton stone was being used for the St. Helen's Town-hall, and when the building was half up, for some reason or other, the stone changed from yellow to white.

Mr. Leslie.—That is wrong; it is not true.

Alderman Newell, continuing, said he knew that Mr. Leslie was the contractor for the building, and his information went to show that it was worked with yellow stone for a certain period, and with the white afterwards.

Mr. Leslie explained that the stone which had been used in the erection of the Philharmonic Hall and the Rev. Hugh Stowell Brown's chapel, viz., the white stone, could not be got at present. He had used more Storeton stone for the past fifteen years, he would venture to say, than any other contractor either in Liverpool or Bootle, and he said there was no practical difference between them. He hoped the motion would be met by a decided negative.

The Mayor put the motion to the meeting, when Alderman Newell voted for, and all the other members of the Council against, it. The motion was therefore lost.

A New Mission Home, Kilburn.—Mr. R. Bilke, of Victoria-road, Kilburn, under whose management this work has been conducted nearly the whole time of the existence of the mission, having secured a suitable piece of land in Kilburn-lane for the purpose of erecting a new building to be called the Queen's Park Hall, a contract has been entered into with Messrs. Hook & Oldrey, of Kensal-road, who have arranged to complete the whole of the buildings by Michaelmas Day. The plans have been prepared by Mr. Edward Heffer, architect, of Victoria-road. Besides the large hall, which will have an open timbered roof, boarded and varnished, there will be a room for inquiries, retiring-rooms, and kitchen, fitted up with the requisite conveniences for tea meetings, &c. The exterior of the building, although simple in its proportions, will be pleasing in character. The foundations are now commenced.

GREEK PAINTED VASES.

PROFESSOR NEWTON'S ninth lecture* (a supplementary one) to students of University and King's Colleges was given on the 7th inst. and concluded the course on ancient Greek art. It treated of the designs on Greek painted vases. These vases formed a distinct branch of fictile or ceramic art; the designs with which they are decorated might, therefore, he called specimens of Ceramography. The earliest examples of such designs carried us back to the earliest period of Hellenic, and, perhaps, of pre-Hellenic civilisation. In the rudest of these specimens, found at Athens, Mycenæ, and Rhodes, the human figure rarely occurred, or, if represented, was drawn as a child might draw it. A large class of this early pottery was ornamented either with geometrical or floral patterns. Next came the style now called Asiatic, because believed to come from a Babylonian or Assyrian source. In this style zones of animals, with occasionally winged monsters, encircle the vase, and in the blank spaces between these animals are flowers and symbols. As drawing improves in this style, the human figure is introduced, with something like dramatic action, and the subject represented is explained by names written over the figures. The lecturer illustrated this phase of ceramography by a design on a Rhodian vase on which was represented a scene from the Trojan war, in which Hector and Menelaus are fighting over the body of Euphorbos. In the next stage of the art the figures were painted in black on a red ground, the details of anatomy and other inner markings being rendered by incised lines and conventional colours. The drawing in this style is generally harsh and full of archaic mannerism. A further change was introduced by making the ground of the picture black, the figures being red with inner markings drawn in faint lines of a deeper tint of red. Small details and accessories were picked out with other colours; but, as the predominant colour was red, these designs might he called monochrome. This style probably began as early as the time of Polygnotus or earlier, and continued till the time of Alexander the Great. At Athens and in Sicily and in a few other places we meet with another contemporary style of vase-painting, in which the figures were painted in several colours on a white ground. A very beautiful specimen of this style was to be seen in the British Museum,—a Rhodian cup, inside which is painted Aphrodite riding on a swan. This vase is probably of the time of Phidias. Both in the monochrome style, with red figures, and in the contemporary polychrome style, there was no attempt at chiaroscuro, and yet the painters who decorated these vases were the contemporaries of Apollodoros, Zeuxis, Parrhasios, Pausias, by whom, as we know from Pliny, chiaroscuro was gradually developed by a series of steps. The reason why this improvement in the art of painting so little affected ceramography was mainly that the convex or concave surface of the vase was better adapted to a design kept very flat than to one which by chiaroscuro suggested the idea of relief, and because in the great age of art the composition of the vase-picture was determined in most cases by the form of the vase itself, which was regarded, like the triangular space of a pediment, as an architectonic necessity. The absence of chiaroscuro, again, led the vase-painter in the best period to avoid complicated foreshortening and groupings; the face is generally seen in profile, and the figures are kept in one plane. In the contemporary polychrome style the colours are harmoniously combined, but not modified by light. About the time of Alexander the Great, when the eye of the Greeks was dazzled by the splendid colouring of Apelles, and when increased private wealth led to a more sumptuous style of decoration, several innovations were made in vase-painting. In the designs with red figures we find gilding introduced, and here and there a figure in white. Other colours were used in the accessory details. One of the finest examples in this style is a vase from Camirus, in Rhodes, representing Thetis carried off by Peleus, in which the wings of Eros are painted blue, and the mantle of Thetis sea-green. The drawing of this vase is most masterly. In this and the subsequent Hellenistic period we find vases of immense size, on which are painted designs in several planes; from the absence of aërial perspective the more distant figures appear to be higher up in the picture than the nearer ones; rising ground is indicated by irregular lines of dots, but there is no attempt to represent landscape, except by conventional adjuncts, such as a single tree to represent a forest. In the later specimens of this style, the drawing, though showing great facility and dexterity, is often careless and faulty, and the types are effeminate. With regard to the subjects of vase-pictures, we find in the earlier style a preference for scenes of war and the chase, and recognise many subjects from the Homeric and Cyclic poems; in the finest period of art these subjects still recur, together with many other myths not previously familiar to us, because not celebrated in extant classical literature. Agonistic scenes were also abundant in this period. In the later style of the Hellenistic period there is a preference for more effeminate subjects taken from Dionysiac or Erotic myths. Scenes where mourners bring offerings to a tomb were also common in this style. The lecturer then explained a number of drawings of vase-pictures illustrating the different periods.

DISPOSAL OF TOWN REFUSE: LIVERPOOL.

MR. J. A. FORREST, the chairman of the Scavenging Sub-committee of the Liverpool Town Council, has drawn up a report as to the annual inspection of wharfs, depôts, stables, &c., owned by the Corporation. The most interesting portion of the report relates to the disposal of town refuse, and from this portion we extract the following particulars:—

Since the commencement of the current year the experimental knowledge of the Health Committee has been advanced one step further, with regard to the best and most economical means to be adopted for the final disposal of those products of scavenging operations which possess no value to the farmer. In 1879 the Council sanctioned the purchase of a steam-hopper barge to be used for the purpose of conveying to sea a large quantity of unsaleable refuse collected from the South-end of the city, similar in character to that which had been previously got rid of by being utilised for raising the levels of proposed new streets, or had been sent at considerable cost to fill up marsh-lands abutting upon Bromborough Pool and the Lancashire Canal. The tender of Messrs. Simons & Co., of Renfrew (2,400*l*.), for building the barge in accordance with plans prepared by the then borough engineer (Mr. G. F. Deacon), was accepted in February, 1879, and the barge was delivered in December. So soon as arrangements for the registration and equipment of the vessel (which has been named *Alpha*) had been completed, the trial-trip was made, and she has since been regularly employed, except for a few days, when, through stress of weather, it was not safe for her to proceed to sea. The results of the working of the *Alpha* for three months are detailed below, together with a statement of the cost incurred on the disposal of South-end refuse by canal during the corresponding period of 1879:—Disposal of refuse from the South-end by ordinary barges, to land on the Lancashire Canal, from February 1st, 1879, to April 30th, 1879, 2,425 tons at a cost of 2s. 7¼d. per ton; disposal of refuse from the South-end by steam-hopper barge *Alpha*, about 4 miles beyond the North-West Lightship, and in not less than 16 fathoms, from February 1st, 1880, to April 30th, 1880, 9,650 tons at a cost of 1s. 6⅞d. per ton. The total cost per ton in each case comprises all charges except rent for dock accommodation, and includes the cost of loading, which has chiefly been by manual labour. Arrangements are now pending with the Mersey Docks and Harbour Board, by which a berth-space having sufficient and convenient quay accommodation will be assigned for the use of the barge, and thus admit of steam or hydraulic power being employed for loading. This, when accomplished, will probably be the means of a further saving being effected. It must be observed that the saving in cost, as indicated by the comparative statement, is to be regarded as relative rather than absolute; because, owing to failure of available places of deposit in the city, the quantity of refuse so disposed of at a trifling cost near the South-end was only 3,316 loads for the three months of 1880, against 9,732 for the same period of 1879. In a short time all the refuse from this division will have to be disposed of by the barge. It is to be expected that the cost per ton for the disposal of refuse by the *Alpha* will be further reduced as the necessity arises for a larger quantity to be got rid of at sea; because, with the exception of two cargoes that had to be sent up the canal during the time the steam-hopper barge was prevented by weather from making her regular trips, she has carried all the refuse sent to the south wharfs, so that her capability of making a greater number of trips has not yet been thoroughly tested. The sub-committee have had under consideration the subject of destroying unsaleable refuse by fire; and, from investigations as to the cost of working the system in Leeds, they are of opinion that its adoption in Liverpool would not be advantageous.

INDEX SOCIETY.

THE second annual meeting of this Society was held on Friday, the 9th inst., in the rooms of the Society of Arts, when the chair was taken by his Excellency the American Minister, Mr. James Russell Lowell. The report contained an account of the work already accomplished, and of that which is in hand, or can be put in hand as soon as the list of subscriptions is enlarged. Among the indexes issued through the Society are many referring to literature and history, but science is not overlooked. A "Hand-book of the Literature of Botany," by Mr. Daydon Jackson, the secretary of the Linnean Society, is just ready for the press, and a companion volume for meteorology is proposed. Indexes of logic and anthropology also find a place in the list of schemes. The further business of the meeting consisted in the election of the new council and in the passing of resolutions for the appointment of committees to consider the best means for carrying out the following objects:—1. The indexing of biographical collections, especially those contained in the *Annual Register* and the *Gentleman's Magazine*. 2. The indexing of Roman remains in Great Britain. 3. The desirability of opening an office to contain the printed and MS. indexes and other papers of the Society.

The Chairman, in his opening remarks, said that it was a gratification to him to have been asked to preside on the occasion, more particularly as it was a sort of recognition of the cosmopolitanism of the Republic of Letters, and gave him an opportunity of expressing that good feeling between the two countries which he always liked to cherish. The objects of the Society were also of much interest to him, and he should do his best to bring them before his fellow-countrymen in the United States, and endeavour to secure their co-operation and assistance in promoting the work which the Society had in view.

THE METROPOLITAN RAILWAY COMPANY'S EXTENSION TO HARROW AND RICKMANSWORTH.

THE Metropolitan Railway, which, within the last twelve months, has been extended in a north-westerly direction from the Swiss Cottage to Willesden-green, will be still further extended in that direction at the commencement of the ensuing month, by the opening of the new line between Willesden-green and Harrow, adding to the Metropolitan's company's system an increase of five miles and a half in length. The line, which has for some time past been in progress of construction and is now completed, contains a considerable amount of engineering and general structural work, taking into account its short length. There are no fewer than twelve bridges between the commencement of the line at Willesden-green and its terminus at Harrow, several of them being massive and costly structures. The station buildings are constructed on iron girders immediately over the line, and on a level with the highway, the railway platforms beneath being reached by staircases from the booking offices. The station at Harrow is a spacious structure, having, in addition to the booking-offices, both general and ladies' waiting-rooms. The station buildings are in red brick, with terra-cotta for dressings and ornament, and have a high-pitched roof covered with red tiles. The upper portions of the windows of the booking-office are ornamented with stained glass. The line has been constructed by Mr. Joseph Firbank, the contractor, under the superintendence of Mr. C. Liddell, C.E., the company's engineer-in-chief, and Mr. Tomlinson, the resident engineer.

It may be added that there is every probability of the line being shortly still further extended to Rickmansworth, the Bill for such extension having just been passed by the Committee of the House of Commons, notwithstanding that it was strongly opposed by the London and North-Western Company.

OUR CHURCH MONUMENTS.*

THE destruction of sepulchral monuments which is being rapidly accomplished, year by year, during the process of modern church restoration, demands the serious consideration and united action, not only of archæologists, but of all who are interested in the preservation of their ancestral memorials.

One example in the county of Essex, which, if not of quite recent occurrence, is of quite recent public disclosure, may be cited; not that it is by any means an isolated illustration, but that it exhibits one of more than ordinary wanton desecration. Not less than seven tombs have been despoiled of their brasses, which have passed into different private hands; but the altar tomb of Sir Anthony Brown, chief justice of Common Pleas, and the munificent founder of the richly-endowed grammar school which exists in the parish of South Weald, has been demolished, and other sepulchral memorials have been ejected from the church. Such is, in brief, the published narrative of a resident gentleman, and it has a very important bearing in connexion with the "Report of the Sepulchral Monuments Committee of the Society of Antiquaries," presented to Parliament in 1872.

In February, 1869, the First Commissioner of her Majesty's Works requested the council of the Society of Antiquaries to furnish him with a list of such regal and historical tombs or monuments existing as, in their opinion, it would be desirable to place under the protection or supervision of the Government, with a view to their proper custody and preservation. Acting upon this a committee was formed, who, in drawing up their resolution, say,—"We had regard, not to the value of the monuments as mere works of art, but to the importance of the persons commemorated as actors in the great drama of our national history, and that in any scheme for the protection of these monuments the object in view would be rather the conservation of existing memorials of our illustrious countrymen than the mere gratification of artistic taste or antiquarian curiosity; and that in this respect the simple monument of John Locke was more worthy of record than the more sumptuous monument erected to a person who had left no trace behind him in the history of his country." While admitting the abstract truth of this proposition, the obvious reply is,—"This ought ye to have done, and not to have left the other undone"; and, besides, a large number of historical monuments *are* excluded from the catalogue. It is true that the committee say elsewhere, with just appreciation of the importance of the subject,—"A church, which to-day seems liable to no molestation, may, to-morrow, at the suggestion of an ambitious architect, an ignorant committee, or a speculator in glazed tiles, be turned inside out; chantry chapels destroyed, and tombs needlessly removed from the honoured graves which they once marked; the model slabs which recorded the burial of persons of historical importance allowed to be broken and carried away; or even, as in cases frequently reported to the Society of Antiquaries, the whole floor of a country church, with all the inscribed flag-stones, may be permanently concealed by a new encaustic-tile pavement. These things being so, it would seem that any measure of protection must apply to the whole list of monuments deemed worthy of preservation; and whatever the immediate probability of their careful preservation by the local authorities, or of their liability to injury, whether from carelessness, ignorance, or malice."

This report, presented to Parliament and published eight years ago, was favourably reviewed by the press, and received by the public with approval; but no legislation has ensued upon it, and it is practically nugatory. The desecrations which the Society of Antiquaries deplore continue rife throughout the country, and the depredations during the last eight years have probably not been less than in those which have preceded; indeed, one of the twenty tombs in the county of Essex which fell within the limited scope of the inquiry, as that of a chief justice, has been destroyed in the very face of it; nor need we doubt that had the tomb of John Locke stood in South Weald church, instead of at High Laver, the same fate would have befallen it. The same arbitrary will which disregards alike objects of art and antiquity, and the feelings of those who may possess ancestral monuments, would probably treat with the same reckless indifference the tomb of the great English philosopher.

The elaborate report is practically consigned to oblivion, or remains upon our shelves merely as a convenient index to a certain class of monuments. What is the remedy to put a stop to this continuous spoliation? Naturally we should look to the Society of Antiquaries to press upon the Government the urgent necessity of immediate legislation. Firstly, by procuring a complete registration of all sepulchral monuments, and then holding the incumbents and churchwardens responsible for their preservation. But this obvious step has never been taken. It is the duty of all societies, and, far more, of society at large. Until the monuments are fully registered, and the clergy made responsible for them, removal, concealment, and destruction will go on quietly as heretofore.

* By Mr. Charles Roach Smith. This will form part of the next volume of his "Collectanea Antiqua."

TWO ART CRITICS.

AMONG the studios we find
Critics are of varied kind;
Some being useful, others not.
Now suppose that you have got
Your picture into such a state
As makes your misery very great,
And much and long you cogitate
Whether it should be so, or so.

Now comes the first. He does not throw
Himself the least into the spirit
You are labouring to give it,
But only thinks of his own thought,
Reckoning your idea as nought,
And counsels you to change it quite
To suit his own idea of right;
And bores you with a tedious lecture
How *he himself* would paint the picture.

At last he goes: the which you find
A mercy: when, of different kind,
Another calls, of juster mind:
For what he sets himself to do
Is to grasp the meaning *you*
Wish to represent. That done,
Then his mind's at once addrest
So to counsel, how the best,
Your cherish'd object may be won,
And most thoroughly exprest,
This point enhanced, and that suppressed
With advantage to the rest;
But all in accord with the scheme
Of your picture, and its theme.

Now, not like the first who came,
This one puts in better frame
Your spirits, which were somewhat low;
And when he takes his hat to go,
You are most grateful he has been;
For 'tis clearly to be seen,
That, thanks to his appreciation,
And remarks on this occasion,
Your picture's prospects are much brighter,
And your labour's render'd lighter.

This is the critic, do you see?
That I should wish to call on me.

B.

LARGE SALES OF CORPORATION GROUND RENTS.

THE Corporation have just realised the large sum of 37,131*l.* from the sale, by tender, of a number of City ground-rents, arising out of the property purchased by the corporation under the Holborn Valley and Clerkenwell Improvement Acts. These ground-rents include one of 53*l.* 5*s.* on a house at the north side of Charterhouse-street, let on lease to Mr. Henry Beyfus and Mr. Albert Boss, for eighty years from December, 1874. It realised 13,551*l.*, the purchasers being the Governors of Queen Anne's Bounty. A ground-rent of 35*l.*, arising from a house situate on the west side of Farringdon-street, and on the north-east side of St. Bride-street, and let on lease to the British Mutual Investment Company for eighty years from June, 1872, was purchased by the Prudential Assurance Company for 8,775*l.* Another ground-rent, amounting to 25*l.*, on a warehouse in St. Bride-street, let on lease to Mr. Hugh Birley, M.P., and others (Charles Mackintosh & Co.) for eighty years from December, 1872, was sold for 6,650*l.*, Mr. Henry Grose Smith being the purchaser. Mr. Smith was also the purchaser of a ground-rent amounting to 157*l.* 7*s.* on a warehouse on the west side of Farringdon-road, leased to Mr. Henry William-son for eighty years from March, 1877. The purchase-money was 4,150*l.* Another ground-rent of 153*l.* 17*s.* on a warehouse on the west side of Farringdon-road, let on lease to Mr. G. S. Mamford for eighty years from June, 1875, was purchased by Mr. F. G. Eiloart for 4,005*l.*

FURTHER SALES OF BUILDING ESTATES.

THE sales of extensive plots of building land in several districts around the metropolis continue to follow upon each other in rapid succession. On Monday evening Messrs. Protheroe & Morris offered for sale, at the Castle Tavern, High-street, Tooting, 133 plots on the Carrington estate, in Upper Tooting, formerly known as Messrs. Rolleson's Nursery, which has now been laid out for building upon. The estate was described as having important frontages to the High-street, and also to new roads now in course of formation, all to be constructed and sewered in accordance with plans approved by the Metropolitan Board of Works. With the exception of the intended shops fronting the high road, which contain a larger area, the several plots have a frontage of 15 ft., with a depth ranging from 40 ft. to about 90 ft. After some introductory remarks from the auctioneer, the sale commenced with the plots set apart for shops, of 16 ft. frontage and 60 ft. to 80 ft. in depth, which realised from 200*l.* to 210*l.* each. The other plots of 15 ft. frontage by 40 ft. to 80 ft. and 90 ft. in depth, were sold at prices ranging from 37*l.* to 75*l.* each. At the close of the sale the auctioneer announced that all the lots (excepting a block of land in the rear, containing an area of upwards of an acre, which was withdrawn at 2,975*l.*) were sold, realising a total sum of about 8,500*l.*

Last week Messrs. Protheroe & Morris also offered for sale the second portion of the Clements Estate at Ilford, consisting of ninety-three lots. Although the sale was not so largely attended as on the first occasion, there was an eager competition for the various plots. The front plots in High-street realised from 175*l.* to 210*l.* each; and those in the other roads from 50*l.* to 90*l.* each. With about a dozen exceptions, all the plots were sold.

On Monday evening, Mr. Alfred Baker, of the firm of Messrs. Baker & Sons, offered for sale, at the Windsor Castle Hotel, Hammersmith, the Walham Lodge Estate, near Walham-green, which is being laid out for building upon. The estate has been divided into ninety-six building plots, and the first portion, advertised for sale on Monday last, consisted of forty-eight plots, but the demand was so great that the whole of the lots, at the request of the company who are laying out the estate, were included in the sale, and the whole of the lots were sold. The plots fronting the Fulham-road, which are intended for shops, some of them having a frontage of 16 ft., and others 20 ft., with an average depth of 50 ft., realised from 205*l.* to 265*l.* each, whilst the other plots of 16 ft. frontage, and about 40 ft. in depth, fetched an average of 90*l.* each. The prices were considered good. The total proceeds of the sale amounted to 10,227*l.*

THE WESLEYAN CHAPEL YARD, TOTTENHAM.

I WISH to call attention again to the disgraceful condition of the above-named yard. Its state is most deplorable for a (so-called) Christian burial-ground. The faithful should at once subscribe for an iron railing as a protection against the reckless and destructive propensities and illicit practices of unruly boys.

CYCLOPS.

BUILDERS' TENDERS.

SIR,—I am astonished almost every day, on receiving bills of quantities, to find continued the objectional words, "I hereby agree," in the form of tender. I think there cannot be two opinions as to the absurdity and danger of such words, which really form a contract, when in nine cases out of ten the conditions have not been considered. Of course the builder is frequently told the conditions are ready for his perusal, but, I take it, a builder who is constantly tendering has quite enough to do without studying voluminous contracts, neither can he think of going to the necessary expense of submitting the same to his solicitor before the result of the tenders is known.

LONDON BUILDER.

EXCURSION OF THE ARCHITECTURAL ASSOCIATION.

ON the present occasion the committee have decided to visit the neighbourhood of Norwich, and Mr. James Fowler, of Louth, has consented to generally conduct the visits.

The following is the sketch programme. Head quarters, Norwich:—

Monday, August 16.—The Cathedral and adjoining buildings. Churches of St. Peter Mancroft and St. Stephen.

Tuesday.—Rail to Aylsham. Carriages thence to Cawston, Sall, and Blickling (Church and Hall).

Wednesday.—Rail to North Walsham. Carriages thence to Trunch, Knapton, Edingthorpe, Bromholm Priory, and Worstead.

Thursday.—Rail to East Dereham and Fakenham. Carriages to East Barsham Hall.

Friday.—Rail to Wymondham. Carriages thence to Attleborough, Great Ellingham, Hingham, and Deopham.

Saturday.—St. Andrew's and Stranger's Halls, St. George's and St. Giles's Churches, &c., Norwich.

CONGRESS OF THE BRITISH ARCHÆOLOGICAL ASSOCIATION.

THE annual meeting will, this year, be held at Devizes, from Monday, August 16th, to Saturday, the 21st, inclusive. An interesting programme has been issued, but it is too long for us to print. At the opening meeting, on Monday, the members will be received by the Mayor and Corporation, and the Right Hon. the Earl Nelson, president of the Congress, will deliver an inaugural address. Local antiquities will be inspected, and the churches of St. John and St. Mary visited and examined. A public dinner at the Bear Hotel will be held at 7 p.m. Abury and Silbury will be examined on Wednesday, with various papers on these antiquities.

Friday will be an interesting day. Members and visitors will drive by Enford and Netheravon to Amesbury. After visiting the church, the party will proceed to Vespasian's Camp, where luncheon will be partaken of, in conjunction with the members of the Newbury District Field Club, under the gnidance of Mr. Walter Money, F.S.A., and at two o'clock all will leave for Stonehenge, which will be described and commented on by Mr. William Long, F.S.A., the Rev. A. C. Smith, Mr. Thomas Morgan, F.S.A., and others.

In the programme for Saturday, a visit will be paid to Bowood (by the kindness of the Marquis of Lansdowne, V.P.), with its gallery of historical pictnres, &c., and luncheon will be partaken of in the park; afterwards proceeding to Laycock Abbey, the party will be received by its owner, Mr. C. H. Talbot. Papers will be read each evening, and two extra days will be enjoyed in the following week by those who will remain.

EMPLOYERS' LIABILITY FOR ACCIDENTS.

SIR,—As I observe you take interest in this very important Bill, I venture to send you a small contribution to the facts, which I think is rather in your way. I am not an employer of labonr myself, at least I am not so now, and my sympathies lie very strongly with the working-classes. But what will you make of the following case? Right opposite my house, at this moment, a church is being erected, and the method of elevating the stones to the scaffolding is by means of a derrick-crane with a pole about 50 ft. or 60 ft. in length, or rather, let me say in height. Well, this very morning I observed a stone being slowly raised which might have weighed probably half a ton, and right underneath it stood a mason hewing away at a piece of ashlar with the utmost composure. I shouted to him as hard as I was able, and held up my walking-stick; but he did not seem to understand me, and so I had to endnre about five minntes of considerahle anxiety. Had the least thing happened to the chains, or the winding gear, or the clippers, or in the cohesion of the block of freestone, he wonld have been killed on the spot. And I ask you, sir, or any man acquainted with the building trades, whether snch incidents are not of frequent occurrence? I ask you, moreover, had such an accident occnrred, who would have been responsible for this poor mason's death?

A SURVEYOR.

A New Library and other additions have just heen completed at River Meade, Sunbury-on-Thames, for Mr. L. Knight Bruce, from the designs of Messrs. Pugin, of Westminster. Mr. John Dalglish, of Sunbury, was the contractor.

THE SHARES IN LONDON WATER COMPANIES AND THE PARLIAMENTARY COMMITTEE.

THE proceedings of the Select Committee of the House of Commons, which is now taking evidence on the several London Water Companies, excite much public interest in the metropolis, and the announcement of a sale last week, at the Auction Mart, of a number of shares in two of the principal metropolitan companies, brought together a very numerous attendance. The auctioneers were Messrs. Fox & Bousfield. The property offered consisted of one-tenth of a share in the King's Moiety of the New River Company; five 100*l.* new shares in the same company; and forty 50*l.* shares in the Grand Junction Company. The shares in the New River Company were first offered, the tenth part of the King's moiety being divided into ten lots, each lot consisting of the hundredth part of a share. Mr. Bousfield, who conducted the sale, in his introductory remarks said that the New River Company never gave rise to speculation, and while other companies fluctuated, it remained firm in the position it had gained. The increase in the income had steadily advanced during the last sixteen years, amounting to 206,825*l.* in 1863, and 424,097*l.* in 1879. Adverting to the evidence given by Mr. E. J. Smith before the Select Committee of the Houso, he said he considered that the New River Company was likely to be taken by the Government, in which case they would have to pay a high compensation, which would increase the value of the shares; but it would be better still if the company was left alone, since the amonnt of increase in the value of their property in the next few years it would be difficult to imagine. All the ten lots forming the King's Moiety were sold for 920*l.* and 925*l.* each, or at the rate of 92,000*l.* for a full share; the 100*l.* new shares being next sold, and realising 380*l.* and 385*l.* per share, or nearly 300 per cent. premium. These were followed by the sale of the forty 50*l.* shares in the Grand Junction Company, all of which were purchased at 110*l.* 10s. and 110*l.* 15s. per share.

RECOVERY OF FEES PAID UNDER PROTEST.

IN the Birmingham County Court, before Mr. J. Motteram, Q.C., Judge, Mr. Brooke Robinson, solicitor, Dudley, brought an action against Mr. Julius A. Chatwin, architect, Temple-street, Birmingham, to recover 41*l.* 7s., "for the return of fees overcharged by the defendant as architect appointed to report to the arbitrator, in the case of Holland *v.* Robinson, and which fees were paid by the plaintiff to the defendant under protest." The judge was assisted in his investigation by an assessor, in the person of Mr. W. Millican, F.R.I.B.A., of Leicester.

The present case arose out of an action tried last year, in which the present plaintiff was sued by Messrs. Holland & Son, builders, Dudley, in respect of certain alterations and repairs done to Barford House, Warwick. The action by Messrs. Holland & Son was originally brought brought into one of the courts, but was referred to Mr. Dowdeswell, who, in the course of the arbitration, instructed Mr. Chatwin to go through certain vouchers and make a report of the value of the work done by Messrs. Holland & Son, and the materials supplied by them. Mr. Chatwin made his report, and for his services charged 63*l.* 10s., this sum also including the expenses of a journey to London, Barford, and Dudley. Mr. Robinson considered the charge excessive, and declined at first to pay it; but ultimately he paid the money under protest, and took up the arbitrator's award. It was now contended that Mr. Chatwin should be amply paid if he received 23*l.*, and the action was brought to recover 41*l.* 7s., the amount in excess, after allowing for certain travelling-expenses. Mr. Chatwin was examined at great length as to the time occupied by him in investigating the accounts and measuring up the work. He estimated that he and his clerk were occupied fifteen days in the work, but declined to pledge himself as to the specific days on which they were engaged. Pressed by the Judge, Mr. Chatwin said he would have charged twenty guineas for the work if his labours had not been greatly increased by the interference of the plaintiff. He was questioned with a view of showing that the examination of the vouchers could have been done by a junior clerk instead of doing the work himself, and charging 3*l.* 3s. for his services: but he denied that a junior could have performed the work, and said it was necessary that the person examining the vouchers should have a knowledge of building.—Mr. Newey, defendant's clerk, estimated that he was engaged sixteen or seventeen days on the work; but upon being cross-examined as to the dates upon which he was employed he could not specify more than six days. His Honour, after consulting with the assessor, said they desired to be as liberal towards the defendant as they possibly could. They felt that even the time occupied for which remuneration was about to be given had not been supported by anything like evidence such as was necessary to support defendant's views. They had, therefore, disregarded that; but having been occupied over five hours, and having heard everything that could be said,—some of it not very regular,—and given every opportunity for both sides to be heard, the figures which the learned assessor put down, and which he concurred in, were 28*l.* 18s., which, deducted from 65*l.* 10s., gave the plaintiff a verdict for 36*l.*

COMPENSATION CASES.

IN the case of *The Rector and Churchwardens of St. Mary Orgar* v. *The London and Blackwall Railway Company*, the arbitrator, Sir Henry A. Hunt, C.B., has made his award. The claim was for certain property in John-street, Minories, having an area of 10,455 superficial feet, with access from and cellars under Gough-square. The value put on the property by Mr. P'Anson, the claimants' surveyor, was 44,852*l.* Mr. George Barnes Williams, surveyor to the Mercers' Company, estimated it to be worth 42,716*l.*, and Mr. T. Horsey (Fuller, Horsey, & Son) put the value at 42,982*l.* On behalf of the railway company, Mr. Farmer (Debenham, Tewson, Farmer, & Bridgewater), valued it at 28,356*l.* Mr. Robert Ritchie's estimate was 28,688*l.*; and Mr. C. F. Adams put in a valuation at 28,693*l.* The property was required for the extension of Fenchurch-street Railway Station. The arbitrator has awarded 33,930*l.*

In the case of *The Weavers' Company* v. *The Metropolitan Board of Works*, heard on March 5th, before the same arbitrator (Sir H. A. Hunt), the award has also been made. The claim was for the premises, 1, High Holborn, at the corner of Gray's-inn-road, having an area of 4,498 ft., and a vault 250 ft. On behalf of the claimants, Mr. J. Jennings valued the property at 11,605*l.*; Mr. Edwin Fox (Fox & Bousfield) estimated it to be worth 9,240*l.*; and Mr. Virgoe Buckland, Mr. L. H. Isaacs, and Mr. R. C. Driver each put it at 8,167*l.* The witnesses for the Metropolitan Board of Works were Mr. E. N. Clifton, whose valuation was 6,517*l.*; Mr. F. W. Porter, who estimated it at 6,682*l.*; and Mr. Robert Vigers, whose figures were the same as Mr. Clifton's. The property was taken by the Metropolitan Board of Works for the widening of Gray's-inn-road. Sir Henry Hunt has awarded 7,177*l.*

NATIONAL COURTESIES.

H.M.S. *Resolute*, which formed part of the late Admiral Sir Edward Belcher's expedition sent in search of Sir John Franklin, was abandoned on May 15th, 1854. She was discovered and extricated in September, 1855, by Captain Buddington, of the United States whaler, *George Henry*, and was taken to New York; the British Government waiving all claim to her. It appears that the sum of 40,000 dollars was voted by Congress to acquire her from the whalers, and she was then purchased, fitted out, and sent to England at the expense of the American Government, and presented to her Majesty Queen Victoria, at Southampton, on the 16th of December, 1856.

The ship having recently been broken up, a small portion of her timber, oak and teak, has been used to make a writing-table for presentation by her Majesty the Queen to the President of the United States. This has been executed by Messrs. Morant, Boyd, & Blandford, of Bond-street. Without being pretentious, it is a thoroughly good, sound, and handsome piece of work. In the first instance, as we mentioned at the time, it was proposed to execute a much larger piece of furniture for the purpose, and six firms sent designs in competition, from which that of the firm who have now executed the writing-table was selected.

"ESSAY ON THE HISTORY OF ENGLISH CHURCH ARCHITECTURE."

SIR,—As I have learned that Mr. Edward Pococke has been soliciting, from architects and others, subscriptions to the above-named work, will you kindly allow me to state that he has no authority to do so, and that subscriptions can only be paid to Mr. David Bain, at the publisher's, Southampton-street, Strand?

G. GILBERT SCOTT.

Paint.—Certainly the ornamental railings on the Thames Embankment are in a remarkable state of preservation considering that the paint supplied by the Indestructible Paint Company was applied at their erection, now more than eight years ago. Though one portion of these railings has been exposed the length of time named to the action of the sulphurous acid given off by the locomotives of the Metropolitan Railway at a ventilating shaft close to Waterloo Bridge, it has not been affected in the least. The railings are quite intact, and show no sign of rust.

THE YORKSHIRE FINE ART AND INDUSTRIAL INSTITUTION.

THE opening of the Summer Exhibition of Pictures and other worke of art in connexion with the Yorkshire Fine Art and Indnstrial Inetitntion took place on Thursday last. The collection in the Grand Saloon consists of oil paintings hy eminent artists, as doee also that in Callery C Sonth. Messrs. W. Q. Orchardson, R.A., J. C. Horsley, R.A., Herman Tenkatt, Brookes, Bayes, Walton, Burr, Wyke Bayliss, and othere, are amongst the paintere of works exhibited. Galleries D and E South are occupied hy water-colour drawinge. The contribntion from South Kensington comprises photographs and other objecte of interest, including a series of forty-five historical drawinge, and Marke's noted pictures of May-Day; a choice collection of illuminations on parchment, of the fourteenth, fifteenth, and eixteenth centuries; a large number of photographs of ecclesiastical architecture, &c. The miscellaneoue articles comprise eix cases; the first containe a variety of objects in gold and silversmiths' work, and the eecond contains porcelain, including Sèvres, Dresden, and Flemish. The third caeo is interesting, as containing, amongst other articles, a vaee and a cup and saucer, a portion of a platean contributed to South Kensington hy her Majesty the Queen. In the fonrth is to he eeen Italian majolica ware, chiefly of the eixteenth century. The next case containe wood carvinge and carved musical inetrnments. The fifth ie a case of Indian textiles, and the last ie a case of electrotype reproductione from varione collections, including a pair of fire dogs from the Royal collection in Windsor Castle; alec vaees from Lord Delawarr'e collection. The site of what was the machinery annexe at the recent industrial exhibition in York has been laid out as a garden.

PREMIUMS FROM THE INSTITUTION OF CIVIL ENGINEERS.

THE Council of this profeesional body have awarded the following premiums for some of the original communications presented dnring the past session on accennt of the science, talent, or industry ehown in the consideration of the varions enbjects dealt with:—

FOR PAPERS READ AT THE ORDINARY MEETINGS.

1. A Telford Medal and a Telford Preminm to E. A. Bernays, C.E., for his paper en "Portland Cement Concrete, and some of its Applications."

2. A Telford Medal and a Telford Premium, to H. E. Jones, C.E., for his paper on "The Pnrification of Gas."

3. A Telford Medal and a Telford Premium, to J. J. Webster, C.E., for hie paper on "Iron and Steel at Low Temperaturee."

4. A Telford Premium, to Frederick Angustus Abel,* C.B., for hie paper on "Explosive Agents applied to Industrial Purposee."

5. A Telford Preminm, to John Grant,* C.E., for hie paper on "Portland Cement: its Nature, Tests, and Uses."

6. A Telford Preminm, to Maj.-General Scott, C.B., and a Telford Premium to G. R. Redgrave, C.E., for their paper on the "Manufacture and Testing of Portland Cement."

7. A Telford Premium, to C. J. Wood, C.E., for his paper on "Tunnel Outlets from Storage Reservoirs."

8. A Telford Preminm, to W. H. Delano, C.E., for his paper on "The Uso of Asphalt and Mineral Bitumen in Engineering."

9. The Manby Premium, to G. Chatterton, M.A., C.E., for his paper on "The Main Drainage of Torqnay."

FOR PAPERS PRINTED IN THE PROCEEDINGS WITHOUT BEING DISCUSSED.

1. A Telford Medal and a Telford Preminm, to B. Baker, C.E., for hie papers on "The River Nile," "Cleopatra's Needle," and "The Practical Strength of Beams."

2. A Telford Medal and a Telford Premium, to J. Lucas, for his paper on "The Hydrogeology of the Lower Greensande of Surrey and Hampshire."

3. A Telford Preminm, to Harco T. H Siccama, C.E., for his paper on "The Delta of the Rhine and the Mense in the Netherlands."

4. A Telford Premium, to J. Miller Wilson, C.E., for hie "Description of a Bridge over the Monongahela River, at Port Ferry, Pennsylvania."

5. A Telford Preminm, to F. Eliot Duckham, C.E., for his paper on "The Thames Steam Ferry between Wapping and Rotherhithe."

6. A Telford Premium, to George Moyle, for his paper on "The Platelaying of the Jacobabad or broad-gauge section of the Candahar Railway."

* Have previously received Telford medals.

THE GAS EXPLOSION.

AT a meeting of the St. Pancras Committee of Worke, on Monday evening laet, a report was received from the sub-committee appointed last week, stating that they had instructed Mr. W. B. Scott, the chief eurveyor, and Mr. Gibb, the vestry clerk, to pnt themselvee in communication with the secretary of the Chartered Gas Company. In reply to a letter addressed to the gas company, the following answer had been received:—

"On the subject of your letter of the 7th inst. I am directed to say in reply that, while the company do not, under existing circumstances, admit their liability for the damage occasioned by the late explosions, yet with a view of carrying out without delay the works and repairs necessary to be done to the houses, streets, and sewers in your parish injured by the explosion, Messrs. Aird & Sons, the contractors, have received instructions forthwith to place themselves in communication with Mr. Scott, your surveyor, to arrange with him as to what is required to be done by them to carry out the works on behalf of the company."

The chief sarveyor had accordingly put himself in communication with the contractors, and a clerk of the works had been appointed to enpervise the proper execution of the necessary worke. The report was approved and ordered to be forwarded to the Vestry.

The coroner's jury have found the following verdict:—

"That the deaths of Burr and Bearis were caused by explosion, that explosion being caused by a light ignorantly placed to the pipe on the main by Hawks, the gas having been introduced into the new main by some defect in the valve in Howland-street. The jury are further of opinion that additional care should be taken by the Gas Light and Coke Company in the testing of new mains."

The Coroner remarked that the valve might have been opened hy misadventure, and, if so, the verdict wonld not cover that.

The jury replied that the opening of the valve would be a defect. They had thoroughly considered all the points, and they wonld not alter the terms of their verdict.

Similar explosione, strange to eay, occurred in Wolverhampton on Tuesday last. Happily no lives were lost.

SIZE AND PROPORTION.

SIR,—I quite agree with yonr correspondent "B." that you are right in allowing questions such as that mooted by "Toreuticos" to find a place in your journal. The colnmns of the *Builder* have, indeed, always been open to those who have felt etrongly upon art or any other topic. But the advantage to the public has inhered in that yon have also permitted any new notion to be "holted to the hran" hy discussion.

In my several letters I have enggested means for teeting the trnth of the hypothesie put forward hy yonr correspondent, hut I nsually reeerve the full etrength of an opposing argument for the *coup de grace*. Now, eir, it may be gathered from the internal evidence of the letters of "Toreuticos" that he ie a great stickler for proportions, for proportion *à l'outrance*,—for proportion to the millionth of a minim. Were these exact proportions, may I ask, determined hy the Greeke ae proportions of fitneee in the human fignre? or were they worked ont from the Grecian "moral consciousness," as the German ie said to have worked ont his camel? Clearly the former. But what doee yonr correepondent, the stickler for proportion to a minim, do? Nothing more nor less than knock down what he would build np by contending for the introduction of some variable quantity to he substituted at the taete of the artiet, instead of the exact proportions, to minims, worked ont by the scientific Greeke. A ecience of the proportions of the human fignre would, nnder ench complex conditions, he impoeeible. All such fanciful expediente for avoiding correctness are, to my mind, of the same order, though, perhaps, somewhat different in degree to that adopted by the Egyptian artiste who represented the Life Guarde of Heliopolis, with both lege on the pictured eide of their horses, to counteract the effect of one being obscured in nature to the spectator'e view. We might as well increase the diameters of the tops of columns to counteract the effects of perspective.

And, finally, I may add there is an entire absence of any enfficient reason for increasing one section of the body, the head, and no other. Why not the foot? Every section of a reduced copy of any statne, in the abeence of any special and sufficient reason to the contrary, would have an equal claim to the enlargement, and thne by a parity of reason we ehould come to the conclusion that the just proportions of the original should be maintained in their integrity in the reduced copy. METER.

THE BRITISH MUSEUM.

SIR,—With reference to the remarks npon thie enbject in the *Builder* of the 10th July inst., it merits notice that it has been necessary to remove some useful hooke from the ehelves in the Reading-room,—several shelvee of Bohn's volumes, for instance,—in conscquence of some of them having heen purloined hy dishonest readers. The shelves were vacant for some months, but now they are filled with dry books relative to Parliamentary proceedings. For some monthe, Murray'e Guide Booke were removed from their ehelf, but they are now restored. Since Mr. Bond's appointment as the chief librarian, beneficial rnlee have been introduced, and the electric light is a hoon, decidedly. There ie, I think, room for improvement even now, although, upon the whole, the Reading-room s convenient and well conducted, and the additional reference-hooks are valuable.

I think that all pnblications should be bound so ae to be ready for nse within six months from their pnhlication; as to periodicale, within six months from their completion. I think, also, that puhlishers should not be allowed to have a discretionary power as to what works they eend to the Museum nnder the Copyright Act. It is a fact that some publishers evade thie Act habitnally, as ie etated in Mr. Cowtan's "Memoirs of the British Mnseum." Now, if some of these gentlemen were summoned hy the solicitors to the Museum for evading the Act, and fined, there would he more alacrity by the trade and less disappointment would he experienced by the readers, especially with reference to the periodicals. The printed catalogues of hooke now in course of publication are a decided improvement, and I hope they may he continued. Some yeare since, in the *Builder*, I referred to the Ordnance maps in the Museum (see *Builder*, No. I,466, vol. xxix.). The red folio catalogues contain a list of many of these, hut they are incomplete. Consequently, a reader may suppose that maps are not in the Mnsenm which, in fact, are there. A complete catalogue is necesaary for reference. There is a valuable collection of newspaper literature in the library, which, as to certain journals, at least, should be kept up regnlarly. The catalogues of them, so far as this centnry is concerned, are loose and incomplete, and a printed list of nineteenth-century journals also would be useful and worthy of the national repository. C. C.

OPENING-UP WESTMINSTER.

SIR,—Any one who knows Westminster, or lives in Pimlico, must have felt the urgent necessity there ie for hetter and easier communication between theee places. At present one is chliged to go from one to the other through a most ohjectionahle locality hy a tortuons ronte, very difficult to ordinary strangers to find, and disagreeable to ladies and old people to have to nse hahitnally. Going home late at night hy hansom, the favourite route of the cab fraternity seems to be ont of Victoria-street hy Artillery-row, dashing round a sharp and dangerone corner through a narrow way, styled Old Rochester-row, into Rochester-row itself. Dnring the session of Parliament there is a great traffic of cabs all through the night, more or lees. It ie just this point of the ronte which reqnires diversion and making more direct, and a short new street continuing Artillery-row ie all that is reqnired to remedy the evil. Thie new street, in another point of view, would be a desirable improvement, opening-up a vieta to one of the most picturesque architectural groups in the locality, viz., St. Stephen's Church and Schoole, hnilt and endowed by the munificence of the Baronese Burdett Coutts. Thie alteration would require merely the diversion and part destruction of a narrow street of small dwelling-houses, which would certainly pay to remove to make room for something better.

A considerahle traffic has been set going hy

the Army and Navy Co-operative Stores, which have done so much for the enlivenment of Victoria-street,—until lately one of the most dreary and forbidding streets in the metropolis to the unhappy pedestrian, especially after dark. A. S. E.

ROYAL LONDON PANORAMA.

SIR,—Referring to a report of an action by Mr. E. L. Paraire, for the winding up of the Alcazar Company, which appeared in the last issue of the *Builder*, and from which it might appear that the building now in course of construction, on the site in Leicester-square, formerly occupied by Saville House, is for the Alcazar Company, permit me to state that the building now erecting is for the Royal London Panorama, of 14, Avenue de l'Opéra, Paris, and is being carried out from the designs of M. L. Dumoulin, architect, of Paris, under my superintendence.

ALFRED BOVILL.

SIR,—A sentence in your report of the above matter reads somewhat prejudicially to my position as architect to the company. It is stated that the directors of the Alcazar have entered into negotiations with another architect. This is not correct. The facts are as follows:—The directors of the Alcazar, departing from the object of the original prospectus,—which comprised a theatre, a *café*, and a *restaurant*,—let the site to a French company, who at once assigned their agreement to another French company, who made over their interest to somebody else. None of these companies are registered in England, nor have they any known office or representative. This peculiar French combination employed their own architect, Monsieur Dumoulin, to design and superintend the building of a panorama and bazaar. This is the building now in course of erection, and which it is probable will be completed by October next.

The directors of the Alcazar have nothing to do with the merits of the scheme. They are to receive 3,000*l.* per annum ground-rent. Beyond this the shareholders need anticipate no further profit. EDWARD L. PARAIRE.

PEOPLE'S ENTERTAINMENT SOCIETY.

AN evening concert was given in the Grosvenor Gallery (by kind permission of Sir Coutts Lindsay, bart.), in aid of the funds of this society, on Thursday, July 15th, in presence of a distinguished audience. The performers were all amateurs, and included Viscountess Folkestone, Mrs. Ronalds, Miss Wakefield, Miss Brough, Mr. L. d'Egville, Mr. Charles Wade, and Mr. C. Bethune. The objects of this society, which is scarcely so well known as might be desired, is to provide good amusement for the poorer classes in London during the winter, in the hope of withdrawing them from lower places of resort. Its first entertainment took place on January 2nd, 1879. At some places the admission is free, while at others a small charge is made. The entertainments have been attended with a very encouraging amount of success, the audiences varying in number from 200 to 600, and the halls and rooms being as a rule well filled. At the termination of a series of weekly entertainments given at Battersea, where the audience was composed of working men exclusively, an address was presented to the members of the society, signed by 200 men, testifying to their appreciation of the efforts made by the society on their behalf. On the 2nd of last January the first of a new series was commenced at Lambeth, in a large room placed at the disposal of the society by the Messrs. Doulton, when about 700 persons were present. At Westminster a local society has been started. Three new series of entertainments are now being organised in other thickly-populated districts, with an entrance charge of twopence, so that shortly the society will have six or seven different entertainments every week. Subscriptions are needed, and may be sent to 180, Brompton-road. In no better way can our less fortunate brethren be aided than by affording them high-class amusement. This is a sort of kindness which has no tendency to destroy the independence and self-respect of the recipients. The society was originated by Mr. C. C. Bethune, who has devoted himself to it for two winters, attending sometimes three or four entertainments every week. The committee list includes many distinguished and well-known names.

The Builders' Benevolent Institution.—It has been felt for some time past that this institution would be doing much more good if the annuity paid to the pensioners was increased, so as to place them in a comparatively comfortable position. To carry out this excellent purpose, and to maintain an equal number of pensioners as are now on the funds of the institution, additional subscriptions or donations would have to be obtained; and at the annual general meeting, which is to take place at Willis's Rooms, on the 29th of July, it is proposed to consider the desirability of endeavouring to effect this change. We trust the promoters of it will be successful.

CHURCH-BUILDING NEWS.

Fulham.—On the 10th inst. the corner stone of the new parish church of Fulham was laid by the Archbishop of Canterbury. The old building now being pulled down has neither age nor beauty to recommend it, and is, in fact, less interesting than the churchyard, which, in spite of the growth of London, still keeps its rural character. Several Bishops of London have been buried here:—Dr. King, in 1621; Dr. Compton, in 1713; Dr. Robinson, in 1723; Dr. Gibson, in 1743; Dr. Sherlock, in 1761; Dr. Lowth, in 1787; and Dr. Blomfield, in 1857. Here, too, under the lime trees, is the grave of Theodore Hook, "of infinite jest, of most excellent fancy." The new church will be built in the Perpendicular style, from the designs of Mr. A. W. Blomfield, M.A., who will give the east window in memory of his father, the late Bishop; but the old tower, with its pleasant peal of bells, will remain untouched. A view of this tower, as restored under the direction of the conductor of this journal, will be found in our volume for 1846. The dimensions of the nave are as follow:—Height, 48 ft.; length, 71 ft. 3 in.; width, aisles included, 56 ft. There are also north and south transepts to chancel, divided by arcades. There is also a vestry on the north side, and organ-chamber on the south side. The dimensions of the chancel are,—Height, 39 ft.; length, 35 ft.; width, transepts included, 63 ft. The new floor of the nave will be 2 ft. 9 in. above the old one, on account of the old church having been inundated with water upon several occasions, owing to the floor having been so much lower than the ground line. The walls throughout are composed of Kentish Rag facing outside; stock-brick faced inside, and to be plastered in rough stucco; the middles of the walls are filled in with Portland cement concrete. The dressings are of Bath stone, both inside and out. The roofs are open-timbered, and constructed of pitch-pine, boarded on backs of rafters, and covered with green Eureka slates. The style of the building is Perpendicular. The total cost will be 8,000*l.*, exclusive of Grundy's heating apparatus. Messrs. Goddard & Sons, of Farnham and Dorking, are the contractors, the work being under the superintendence of Mr. J. Vaughan, clerk of works.

Exeter.—A meeting of the parishioners of the united parishes of St. Petrock and St. Kerrian have adopted plans for certain alterations at St. Petrock's Church. According to the rector, the church was first built in the reign of the Conqueror. At that time the church consisted of a chancel, nave, north aisle, and tower. What became of the north aisle no one knew. In 1413 the south aisle was added, and about a century afterwards it was further extended in the direction of the Cathedral Close. This it was that gave the church its present unique and unparalleled shape. He had never before seen any church in which two-thirds at least of the worshippers were unable to see the Communion-table, or hear anything that was said there, and where the people sat looking five or six ways at once. Nothing was done from 1413 until 1828, when in that year several changes were made. A new chancel-arch was added, the church was entirely re-seated, and the pulpit, reading-desk, and wainscoting were altered and repaired. It is now proposed to reseat the church, and to carry out other works for the comfort of the congregation.

Four Elms.—On the 24th ult. the foundation-stone of a new church, at Four Elms, Kent, was laid by Mr. S. Williams, of Shirley. The external facing will be of Limpsfield stone, while the quoins, window and other dressings, and the internal facings, will be of Bath stone. Messrs. Punnett, of Tunbridge, are the contractors; and the architect is Mr. Edwin T. Hall, of London.

Gatley-in-Etchells.—The foundation-stone of the new Church of St. James, Gatley-in-Etchells, was laid on the 10th inst. by Mr. W. Cunliffe Brooks, M.P. The church will stand in a conspicuous position at the easterly end of Gatley Green, on a site adjoining the National Schools, its westerly front facing the main approach from Handforth and Wilmslow. The design comprises a nave, 31 ft. wide, the western end of it being narrowed so as to form a kind of narther, and in the middle of this narther, and projecting some 5 ft. westwards, is an octagonal-shaped baptistery, its walls rising some 33 ft. from the ground, and being covered with a semicircular roof. The tower, which will be gabled to the west and east, is "saddle-backed." The total height to the top of the tower will be about 70 ft. The chancel will be about 18 ft. wide and 25 ft. long, and will terminate apsidally, the angles of the apse being those of a hexagon. To the south of the chancel will be the organ-chamber, vestry, and the boiler-house. The total length of the building externally will be about 90 ft. Accommodation will be provided for about 250 worshippers, and provision is made in the design for enlargement by means of a future south aisle. The walls externally and internally will be faced with bricks of a greyish colour, with dressings of stone and stock bricks. Moulded bricks will be used in the arches and in the label-monlds and strings. In the inside of the church there will be a few white bricks in the arches, bands, &c. The roofs will be slated. The church is being built in sections, the present contract for the nave, organ-chamber, and vestry, including the bottom stage of the tower, having been let to Mr. Thomas Darnborough, of Rusholme. The architects are Messrs. Medland & Henry Taylor, of Manchester.

Clerkenwell.—At a public meeting of the inhabitants, held recently, it was resolved that it was not advisable to enlarge and finish the Martyrs' Memorial Church, St. John-street-road, according to the original design, as it would entail a cost of at least 2,500*l.*; but that the design submitted by Mr. Jesse C. Hukins be adopted instead, involving a cost of only 1,600*l.*; and that an immediate attempt should be made to collect that sum, and to build the organ-chamber, south transept, aisle, and door upon the portion of the ground given for that purpose by the Marquis of Northampton. The church was built from designs by Mr. E. L. Blackburne, architect.

Bideford.—A temporary iron church has been erected and opened at East-the-Water, as an adjunct to the Bideford parish church. The plans were prepared and the building erected by Mr. J. C. Hawes, London. The building is of corrugated galvanised iron on a brick foundation, and is 55 ft. long by 26 ft. wide and 28 ft. high in the nave, and 17 ft. by 15 ft. in the chancel.

Miscellanea.

A Photographic Phenomenon.—An interesting phenomenon in photography has been announced by M. Janssen, in a note to the Académie des Sciences. While obtaining solar images at Meudon, he has observed that when the exposure is prolonged beyond a certain period, in which a good negative image is got, this image loses its distinctness, and the plate passes into a neutral state,—*i.e.*, no appreciable image appears on use of a developer. But if the exposure be continued still further, the negative image gives place to a positive, in which the distribution of light and shade is exactly the opposite, and this image, if the luminous action be well regulated, presents all the details and fineness of the one it has supplanted. With further exposure a second neutral state is reached, opposite to the first, inasmuch as if the latter showed the image uniformly dark, the former shows it uniformly light. For solar negatives taken at Meudon, the time of exposure has rarely exceeded 1-1,000th of a second, if the photospheric granulations were to be obtained; and with plates prepared by the gelatino-bromide process, the time may be reduced to 1-20,000th of a second, or less. Now, if one of these dry plates be exposed half a second, or a second, a distinct positive image is produced, the body of the sun appearing white, and the spots black, as they do to the eye. M. Janssen has similarly obtained positive images of landscapes, appearing transparently as the scene is viewed naturally; also a view of the park at Meudon, showing a white solar disc on the dark background of the sky, and counter-types, which are of the same sign as the original type,—*i.e.*, positive if the type be positive, and negative if it be negative. In these photographs it is the same spectral rays that have first given the negative image, and then effected its transformation into a positive.

Sedgley.—Board schools to accommodate 450 children have been opened at Red Hall. The schools and playground extend over 4,000 square yards. There are three departments, each capable of accommodating 150 children. The buildings have been erected by Mr. Horton, of Brierley Hill, from the plans of Mr. A. P. Brevitt, architect, Darlaston, at a cost of 3,800*l.*

Floods in London.—At the meeting of the Metropolitan Board of Works, on the 9th inst., four deputations attended in reference to the floodings which have occurred in the northern districts of the metropolis. The first two deputations were from the Vestry of Islington and inhabitants of Holloway, to present memorials praying the Board to expedite the intended works for the storm and relief line of sewer for Holloway and Kentish-town, so as to prevent as far as possible further repetitions of the overflows of sewage matter and water into the houses in the parish of Islington and Holloway. The deputations were introduced by Mr. Elt. Mr. Brodfield, in support of the memorials, said that when the main drainage works for the northern part of the metropolis were constructed, the inhabited houses in Islington numbered 20,000, but the number assessed at the present time was 37,000; and the districts of Upper Holloway, Lower Holloway, and Highbury comprised as many houses as constituted the whole parish of Islington twenty years ago. In 1878 these districts were seriously affected by the overflow from the sewers, and particularly on the 23rd of June in that year, when one-third of a mile of the Holloway-road was flooded with sewage water, which flowed into the shops, houses, and premises. In the present year there had been several repetitions of the floods of 1878, and the inhabitants of the houses had suffered seriously from damage to their goods and properties, while the sewage matter was most dangerous to health. They prayed, therefore, that the Board would at once proceed with the contemplated measures for their relief. Two other deputations were introduced by Mr. Furniss and Mr. Watkins from the Vestry of St. Pancras, and inhabitants of the northern part of the parish of St. Pancras, to present similar memorials. The memorials were referred to the Works and General Purposes Committee.

A Large Building Society.—At the twenty-ninth annual meeting of the Birkbeck Building Society, held Thursday, July 8th, in the theatre of the Birkbeck Literary Institution, the report presented to the meeting stated that the receipts for the year ending the 31st March last were 5,709,932*l.*, and the total from the commencement of the Society 49,794,824*l.* The deposits reached the large sum of 5,132,924. The gross profits earned by the Society amounted to 102,802*l.*, of which 86,586*l.* have been appropriated to the payment of interest on shares and deposits, discount and expenses of management, leaving a net profit of 16,216*l.* The surplus funds amount at the present time to 1,966,296*l.*, of which 300,458*l.* is invested in Consols, New Three per Cents., and Exchequer and Treasury Bills; 219,275*l.* in Metropolitan Board of Works and India Stocks; 542,757*l.* in Colonial Bonds; 76,693*l.* in Railway Debentures; 125,145*l.* in French Treasury Bills, Foreign Railway Obligations, Bonds, &c.; 306,109*l.* in gas, water, and miscellaneous securities; 214,914*l.* in freehold ground-rents; while 180,943*l.* is in cash. It is worthy of note that no portion of the funds appear to be invested in promissory notes, bills of exchange, or personal securities of any kind. The total liabilities of the Society are 2,465,819*l.*, while the assets are 2,583,331*l.*, showing a net surplus of 117,512*l.* Of this sum 50,000*l.* is invested in Consols as a permanent guarantee fund, leaving 67,512*l.* to be carried forward to await the next declaration of a bonus.

The Obelisk.—At the meeting of the Metropolitan Board of Works, on the 9th inst., a report was presented from the Works and General Purposes Committee stating that, in pursuance of the resolution of the Board of the 13th of June, 1879, a model of one of the sphinxes to be placed on the pedestals at the sides of the Egyptian obelisk on the Victoria Embankment, and models of the proposed additions to the obelisk, had been placed in position, and recommending that the models be approved, and that it be referred back to the committee to take all necessary steps for having the sphinxes and additions cast in bronze. Mr. E. Dresser Rogers, in moving the adoption of the report, said it was intended to cover the obelisk with the silicate paint of the Indestructible Paint Company for preservation, and also to apply lightning-conductors. The report was adopted.

Fire.—On the night of the 7th inst. the steam sawing and moulding mills of Mr. Davis, adjoining the Lawrence Hill station, Bristol, together with the expensive machinery, stock, &c., were entirely destroyed by fire.

The Site of Horsemonger-lane Gaol will not, according to present appearances, be obtained by the denizens of Southwark as an open space. A report submitted by the Works and General Purposes Committee to the Metropolitan Board of Works, on the 9th inst., stated that on the 28th of May last the Board referred it to the committee to open further negotiations with the justices of Surrey, with a view of ascertaining what price they would accept for the site of Horsemonger-lane Gaol. The committee had since been in communication with the Clerk of the Peace, and had now to report that they had received a letter from him stating that the justices would be willing to accept 18,000*l.* for that portion of the site of the gaol which was offered for sale on the 19th of May, subject to the conditions of sale used on that occasion. The sum named by the justices was, however, the committee regretted to say, beyond that which they would feel justified in advising the Board to pay, and they recommended, therefore, that the offer be declined. Mr. Dresser-Rogers, in proposing the adoption of the report, said he regretted exceedingly that the price asked, 18,000*l.*, for something less than an acre and a half of land, was not a price which the Board would be prepared to give. The committee had viewed the spot, and they were sorry to find that the justices thought of taking a large portion of the area now uncovered for their own purposes, and the space left would be so small, and the price asked so very high, that the Board could not think of proceeding further in the matter. The recommendation of the committee was adopted.

Social Science Congress.—Lord Reay has accepted the office of President of the Social Science Congress at its approaching meeting in Edinburgh. The Congress, as at present arranged, is to meet on the 6th of October, the closing meeting being held on the 13th of that month. The Arrangements Committee has nominated the following gentlemen to be the secretaries of the different departments, viz., I. Jurisprudence,—(1) International and Municipal Law section,—Mr. J. A. Reid, advocate, and Mr. J. Barker Duncan, Writer to the Signet; (2) Repression of Crime section,—Mr. Chas. Scott and Mr. J. M. G. Ivison, advocates. II. Education,—Dr. Pryde and Dr. Robertson. III. Health,—Dr. Littlejohn and Dr. Stevenson Macadam. IV. Economy and Trade,—Ex-Treasurer Wilson and Mr. John Harrison; and V. Art,—Mr. J. M. Barclay, R.S.A., Mr. Arch. Constable, and Mr. Alexander Ballantine. In connexion with the Congress, arrangements are being made by the Royal Scottish Academy for opening an exhibition illustrative of Scottish art. While living painters of standing will be invited to contribute, it is expected that nearly 200 pictures by deceased artists will be obtained on loan.

The Proposed Art Gallery for Birmingham.—The Art Gallery movement in Birmingham has received an additional stimulus by the encouraging announcement of the purchase, expressly for presentation to the town, of Mr. John Bragg's noted collection of Wedgwood ware, valued at 2,000*l.* The gift (says the *Birmingham Gazette*) has a special value, as unsuccessful efforts have previously been made to secure to the town by means of a subscription the unique collection which it will now obtain through the wise and thoughtful generosity of a private individual. The name of the donor will not be made known for the present, but this will not be the first of his benefactions. To the art-workers of Birmingham the donation will be an inestimable treasure. Another addition to the Art Gallery is the picture, "George Dawson and his Friends," which was painted by the late Mr. Ernest Thompson, of Birmingham, and purchased by public subscription. The picture has just been presented to the Free Libraries Committee for exhibition in the Art Gallery.

Driffield.—A new Wesleyan Chapel was opened at Driffield on the 7th inst. The cost has been over 5,000*l.*, and the contractors were:—Stonework, Mr. Sweeting, Hull; woodwork, Mr. Barnes, Beverley; brickwork, Mr. Gage, Driffield; and Mr. J. F. Shepherdson, of Driffield, has acted as clerk of works for the architect, Mr. H. J. Paull, of London and Manchester.

Messrs. Doulton & Co. have obtained at the Sydney International Exhibition four first-class awards for their sanitary ware, vitrified stoneware drain-pipes, crucibles, melting-pots, &c., and art ware, besides awards for other manufactures.

In the "Whitehall Review," for the future, the portraits of ladies, which have long formed an important feature of the paper, will be drawn from the life by the Chevalier Desanges, the painter of "A Royal Garden Party at Chiswick." Lady Poltimore's will be the first portrait given.

New Parochial Offices, Westminster.—In this competition, Mr. Charles Barry has consented to act as professional adviser to the committee. The desire that the Press should abstain from giving any notice of the designs submitted is still expressed.

Cast Steel Bells.—We have been asked more than once for information as to cast-steel bells. A trade-book just now issued by Messrs. Vickers, Sons, and Co., of Sheffield, gives all the particulars that can be desired.

TENDERS

For new warehouses, Queen's-road, Bayswater, for Mr. W. Whiteley. Mr. J. E. Saunders, architect. Quantities by Messrs. Osborn & Russell:—

Cubitt & Co.	£99,824 0 0
Holland & Hannen	99,210 0 0
Adamson	98,415 0 0
Ashby & Horner	92,890 0 0
Hall, Beddall, & Co.	92,760 0 0
Brass	88,615 0 0

For the sewers, making up, and kerbing, &c., of Spencer-road, Bolton-road, Hartington-road, and Devonshire-gardens, Grove-park, for the Chiswick Improvement Commissioners. Mr. H. O. Smith, surveyor:—

Mears	£3,162 0 0

More Gas Explosions.

WORKMEN'S EDUCATION.

BY one of those coincidences which so frequently occur, as if in mockery of the calculus of probabilities, the same daily journals that reported the verdict of the coroner's jury as to the death of the two men who were killed on the 5th current by the explosion in Tottenham-court-road, contained also an account of two explosions which took place on the 13th current at Bilston, near Wolverhampton, as briefly noticed in our last number. The importance of the warning, which we gave in the same number, of the danger arising from the effect of street traffic on the unprotected joints of the gas-pipes, has thus received an emphatic confirmation.

Although unaccompanied by any loss of life or personal damage, the Bilston explosion points to a graver source of possible danger than did the London catastrophe. It is graver in this respect,—it is one which cannot be said to be unlikely to recur elsewhere. The laying of a large main, not as an altogether new work, but as replacing former communication, is, as we pointed out, a matter of rare occurrence. It is one as to which the terrible warning of the 5th of July is calculated to suggest due precaution for the future. But the same thing cannot be predicated of the escape of gas into a sewer. All the elements of danger occur in such a case, with the sole exception that the introduction of a light is unlikely. But undetected leakage, slow accumulation of unsuspected gas, formation of explosive mixture,—all these things may occur, and probably do occur, far oftener than we have any notion, in sewers. In any such case we are at the mercy of a chance spark, and how far a chain of explosions thus originated may extend no one is able to say.

In the Bilston case, as in that in London, the flame travelled down the conduit which contained the explosive mixture, firing the same in successive places. A second explosion took place at three in the afternoon, five hours after the first. But we apprehend that there can be little doubt that the second was so far independent of the first, that it must have arisen from a fresh lighting of the gas from some external source. The great lesson to be learned, in each case, is that danger is not to be avoided by closing our eyes. A leak is not stopped by being buried in the ground. A sewer is not made safe by being left unventilated. On the contrary, a new reason for the ventilation and inspection of sewers is afforded by the revelation of a source of danger not hitherto unknown, but too little thought of. In the case of a sewer which, in addition to that sewer gas which is the carrier of typhoid fever, contains any serious amount of carburetted hydrogen gas,—the very means taken to effect ventilation, unless perfect, might cause wholesale destruction.

The more essential is it that gas-mains should be so laid as to be undisturbed by traffic, and to be easy of inspection from time to time. The great advantage, as a matter of safety, which coal-gas possesses in its odious and permeating smell, is neutralised by the burial of the pipes beneath the road. It may be doubted whether that saturation of the earth with gas of which some witnesses speak is not somewhat fanciful. But there can be no doubt as to the danger of the existence of any conduits, caves, cellars, or other hollow spaces into which it is possible for leaking gas to make its way, without either suspicion or supervision.

Another lesson may be drawn from the verdict of the jury, in the London case. We referred before to the very straightforward evidence of Hawkes. The jury say that the explosion was caused by a light being ignorantly placed to a pipe by this witness. As we understand the verdict, it means that Hawkes was totally unaware of the danger caused by so doing. No doubt this was the case. But what are we to say of the technical education of the working man, when we find that a foreman of gasfitters was utterly unacquainted with the rudimentary fact that a mixture of hydrogen and of oxygen is explosive? Do not let us be deceived by the use of the word "technical." It does not mean, rightly understood, an education above the wants of the people. It means a sound practical education, giving proper instruction as to the rudimentary facts of the business in which the workman is to be engaged. In this, we greatly fear, our workmen, as a rule, are very deficient.

We take it that the ignorance of the workman arises, to a very great extent, from the fact of the changes which are so constantly occurring in the social relations amongst us, owing chiefly to the growth of population. In old times each craft was also a mystery. The master of the craft hesitated to commit to writing the secrets of the trade, even if he could write or read. In the most ancient and venerable of brotherhoods, such record was distinctly forbidden. As far back as we can trace the organisation of society, this idea of mystery has been present. The sole means of entrance to a craft was by apprenticeship. Three or four hundred years ago, if one of those popular handbooks, which now profess to teach almost every science and any art which can be pursued by man, could have been written it would have been burned by the common hangman, and its author would have been lucky if he escaped a like fate. Oral teaching, and practical tuition, were the means of initiating the young into the business of life. We are not about either to justify or to deplore the change which the last century has witnessed in this respect. It has been a change which, if attended with some good, has none the less been attended with some evil. The freedom of occupation,—freedom, that is, for any man to work at any craft which he chooses, whether he enters its precincts by the old-fashioned doorway, or whether he climbs over the wall,—is now regarded as one of the inalienable rights of the workman. There is some reason to doubt whether the craft, the workman, or the public, are the better for the change. One thing may be safely asserted, and that is that the committal of almost any kind of work to the hands of a man who has not been, in one way or another, specially instructed in the primary rudiments of the craft to which it belongs, is a cause of public danger, and of national loss.

Danger and loss, from this cause, will be likely rapidly to increase. It would not be easy to pick out a more instructive example than that of a gasfitting foreman, who did not know that gas and air, when mixed, were explosive. How much light does such a remark throw on many a coal-mine explosion? When these have been so often attributed to rash and self-willed hardihood, may it not often have been the case that the real cause was the utter, profound, total ignorance of the workman? Call him ignorant, indeed, and he on the one hand, and the Committee of Council on Education on the other, stand up and revile you! He can read even the small print of *Lloyd's Weekly Newspaper*. He can work the first four rules of arithmetic. Nay, he may have had lessons in geography or in music; or, in other modes, may have had a primary, transformed into a secondary, education.

But when you ask, How have the bases of his education been laid with reference to his future calling in life? there is an ugly silence. To fit every man for every thing is the great object of many advocates of theoretic education. The result, in nine cases out of ten, we take it to be, that no single pupil is thoroughly trained or fitted for any single occupation. Surely if the education of a man who was to deal in gas was to have any practical value, the first thing that it should teach him would be under what circumstances gas is dangerous to human life. Now it seems to result from the evidence before the Coroner that the gas-pipes and mains of London are entrusted to the practical tendance of a body of men who are utterly unconscious of the dangerous character of the subtle fluid in the distribution of which they are the agents.

We believe that there is hardly one great physical catastrophe that occurs,—from the fall of an iron bridge in a high wind, to the rupture of a gas-main,—which is not more or less directly to be traced to the substitution of the hastily-instructed or the wholly uninstructed workman,—grading from the highest to the lowest,—for

the pupil of adequate experience. That this has been the case in new countries and colonies has long been known. In fact, the very want of traditional training is one of the conditions which have fostered the inventive genius of the United States. But while in a new community such want of training has a certain compensation in the readiness of invention which it encourages, in an old community it is hardly conceivable that anything but mischief can result from it. We are told that a trade must cease to be a mystery. But the danger is that, such being effected, it will soon cease to be a craft. When any great industry can be carried on in a factory, under selected masters and foremen, it will be likely to succeed,—as a means of making money. What becomes of the craft itself, and of those who were once small but independent members of it, is a question less easy to answer.

One thing, we think, ought to call for immediate attention as regards the protection of society from the ignorance of the workmen. In each craft,—speaking more especially now of those which are of public exercise, such as that to which we have been here chiefly referring,—there should be an accepted primer or text-book, with which every man allowed to practise the trade should be made acquainted. This primer should state the rudiments of the craft, more especially with regard to those elements that affect the safety of human life. It should be confined to the craft itself, yet should be so written that a collection of these primers would be at once mutually consistent and exhaustive of the field of technical education, using the word, as we before explained, as synonymous with practical education.

Thus, before a man should be put in a position in which his ignorance might allow him to be the agent of converting a populous thoroughfare into a heap of ruins, he ought to have some information conveyed to him, and drilled into him, as to the reasons for taking care. "You must not smoke on your work." A good rule. But the intelligent workmen will say, "Why? It comforts me to smoke; I do my work better with a pipe in my mouth. Don't be tyrannical." What is the reply to this? Is it a collier or a gasfitter of whom we are speaking? He must be taught what it is with which he has to deal. "You have heard of the terrible fire-jack. You have been accustomed to gaslight from your childhood. You see that that stinking air burns when it is allowed to escape gently into the air; but in that terrible explosion the other day, the fire-damp was simply coal-gas mixed with air. This fire-jack can be produced by neglect wherever there is coal-gas." We are not giving this as a sketch of the primer, but as an instance of the way in which the attention of the lad is to be excited. For those who have to deal with coal, or the products of coal, there should be a special primer, drawn up by a man of thorough acquaintance with the subject, which should give a practical explanation of combustion, distillation, and explosion, and the study of which should be so enforced that no town should be placed at the mercy of a labourer who attempts to discover whether gas,—or, if you like better, gunpowder,—is safe, by the simple test of the application of a lucifer match. That is what is now the practice.

The above had been written before the intelligence of the fatal explosion at the Risca colliery arrived, to add a tenfold emphasis to our words. It is, of course, possible that it may prove that this terrible explosion was due to the one main cause of colliery explosions—the want of a luminous safety-lamp, which shall give more light when it is closed than the open flame would yield. But as far as intelligence has yet reached us, it points rather to what is usually spoken of by juries as "the act of God" than to any human error or neglect. The seam of highly bituminous coal lying at a depth of 840 ft. from the surface was known to be fiery. The ventilation of the mine was ample. The precautions taken were unusual. The men engaged were not solitary miners, but gangs of carpenters, masons, and other workmen, who had gone down expressly for the repairs of the roadway. Every thing points to care. The case, however, of the striking of a spark from a steel tool is one as to which no thought seems to have been taken. It might fully account for the catastrophe.

There is no doubt that the atmosphere has for some time been highly charged with electricity. The hypothesis of anything like spontaneous combustion is one not lightly to be adopted. But it may be asked whether, in the Bilston case, the formation of phosphuretted hydrogen in the sewer is impossible? This gas, as is well known, ignites spontaneously on coming in contact with the atmosphere; and a puff of this fluid, which forms the Jack-o'-lantern or Will-o'-the-wisp of our fens and marshes, would be enough to explode a mixture of hydrogen and oxygen. We suppose that phosphuretted hydrogen is not likely to have been secreted by the black vein. But even as to this an inquiry can do no harm. It will be well to have the chemistry of the spontaneous ignition of coal, which sometimes occurs in the bunkers of a steamer, made thoroughly clear to the practical man, as bearing on this point. The idea has also been suggested that the lightning of the storm which accompanied the Risca explosion may have fired the gas ascending from the upcast shaft. At all events, even without supposing any direct inflammatory action apart from human agency, the atmosphere has for some days been in a highly electric state. We do not know enough of the subject to form an opinion how far the inflammatory or explosive qualities of any mixture of gas may be augmented by a high temperature. But it is quite possible that this may be the case to a notable extent.

As bearing on the possibility of the ignition of the gas within the mine from fire without, whether by the electric spark or any other source, it will be found highly instructive to study the account of the outburst of fire-damp in a colliery at Frameries, in Belgium, on the 17th of April last, which is given in the *Annales des Mines* (7th series, vol. xv., p. 575), and of which an abstract is given in Part II. of the "Abstracts of Papers in Foreign Transactions and Periodicals" of vol. lx. of the "Excerpt Minutes of Proceedings of the Institution of Civil Engineers."

At 7h. 45m. a.m. of the 17th of April, a violent current of air issued from the downcast pit, accompanied with dust, and small fragments of coal. A few seconds afterwards the gas ignited at a surface fire, and immediately the whole interior of the building covering the pit was filled with flame, which extended to a height of over 160 ft. The ventilator having been stopped, ineffectual efforts were made to extinguish the fire. Gradually the flames issuing from the pit lowered, till at 9·15 a.m. it only rose to 6 ft. above the orifice of the shaft. After flickering for a moment, an explosion took place in the shaft. For twenty-five minutes after this, everything was quiet. Then another explosion occurred, followed by four others at intervals of ten minutes apart. It is believed, on the evidence of survivors, that all these explosions took place in the shaft itself, which was 656 yards deep. But an hour after the last of these, a violent explosion took place, extending through the whole mine, and attended with fatal and disastrous results. It was estimated that during little more than two hours preceding the first explosion not less than twelve million cubic feet of gas issued from the workings. So fiery is the coal that fire-damp issues from the face at times with a pressure of sixteen atmospheres, measured in the bore-holes with which it is customary to tap the workings in order to drain the coal of gas. The efflux is at times so full as to extinguish the Mueseler lamps, which are used in the mines. Should a sudden outburst of gas, remarks a French engineer, take place near the down-cast shaft, part of the gas, proportioned to the ventilating current, will course through the mine. The surplus, which may be considerable, may lodge in the downcast pit, and by its levity may ascend so as to retard or even to reverse the current. At the surface, or in passing lights at higher insets into the pit, the gas may become ignited, drawing together more gas and surrounding air. The latter soon attains the proportions for a violent explosion; but the flame at the pit's mouth is unextinguished until the quantity of air attains such a proportion that a final explosion takes place in the pit or in the mine itself.

It is observed in the Belgian mines that the advance borings generally give out but little gas for some days before an outburst. In some cases a cavity, more or less extensive, is found, but the disproportion between any such cavities and the enormous quantities of gas liberated is so great as to lead some engineers to the opinion that the gas exists in a liquid state, which is suddenly changed into a gaseous state by a rise in temperature.

The result of the first inquiry at Risca is that the explosion took place near the bottom of the downcast shaft; but we are told that it seemed to the explorers that the fire did not go towards the shaft, but took the other direction. The hitcher, Thomas Bowden, was not burnt at all, but killed by being blown against the sides of the mine. It is said that naked lights were used by the repairers, as far as 30 yards from the downcast shaft, and that the ventilation in this part was almost strong enough to blow a man off his legs. Further research has rendered the hypothesis of external firing less probable. The lamp of one of the miners was found with a large hole in the wire gauze, evidently caused by a blow from a pick. The lamp was broken and the gauze bent.

A FOREIGNER ON HOME DECORATION.

In a country like England, that for centuries has been famous for its comfortable homes, it cannot be said that we have ever been indifferent to what we now call, and hear so much about as, "Household Decoration." It may be said that since the first great exhibition in Hyde Park it is easy to trace in a large body of society, which till that time had remained comparatively indifferent to such matters, an eager desire to see their homes and houses artistically furnished and decorated. Volume after volume on "Household Taste" has been published, translated, and re-edited on both sides of the Atlantic, for our American cousins have taken up the question with perhaps even more warmth than ourselves, and the interest still shows no sign of abatement, while the encouraging results obtained justify even further efforts on the part of those who seek to lead the way in this path.

In these columns our readers have had it placed within their power to observe the successive development of the question as argued from the various modern points of view of which it admits. It is not often that we are able to compare with those of our own English professors the views of foreign authorities. On the Continent, where among a very large number of persons the matter of household decoration is one to which consideration was given long before its importance was even suspected in England and where also domestic decoration may be said to be a science, among the greater mass the existence of any artistic views on the matter is unknown or unsuspected; it would be, indeed, difficult to purchase abroad any work similar to those of which so many are to be found in every bookseller's shop or store in England, Australia, or America. Household taste on the Continent partakes more of oral and ocular tradition than of written law, and, out of certain artistic and refined circles, the views on the subject have long been settled with an exactitude that allows of scarcely an exception; indeed, they coincide with such amusing rigidity that the inventory of any respectable Parisian bourgeois household (a representative example of the foreign home) would serve as a perfect type of that of ninety-nine families out of every hundred, commencing from the regulation, cumbersome, but sacredly necessary, "*armoire à glace*," and the inevitable "*bois de lit*," down to the "*reps*" curtains, and the chimney-shelf "*garniture*."

From time to time, however, a voice is feebly raised to break the monotony and indifference of this existence, but the foreigner generally (outside, it is true, a comparatively large class of art-lovers) cares little for his home; his wife is occupied with the household cares, her spare time is devoted to the all-important consideration of her dress or that of her children, and generation after generation the same ideas regarding household decoration are handed down immaculately. The voice raised is drowned in general indifference,—on one side from the people of taste who are opposed to dictation; on the other, of those unmindful of their blissful ignorance;—and hence it is that nowhere more than on the Continent is the observant stranger struck with the extremes to be met with in the houses he may visit.

Notwithstanding the admirable teaching of the French, and the many lessons and suggestions that are to be obtained in Paris on matters relating to household decoration, we are certainly disposed to think that the world, not only of London, but the great world everywhere, has been too long content to allow Paris to lead them in the pure questions of decorative art. The time has now come when not only the

wealthy, who have always been lavish in the decoration of their houses, but the comparatively needy, may find, in London,—in Oxford-street, in Wigmore-street, in Bond-street, and elsewhere; in New York,—in Broadway and in Fourteenth-street, professional household beautifiers with knowledge and means sufficient to satisfy even the correct taste which now in so many instances exists in England and America.

It may not be uninteresting, however, to lay before our readers the views expressed on this subject of household taste by a highly-respected foreign authority,—M. Guichard,—the founder of that excellent institution, the Union Centrale des Beaux-Arts appliqués à l'Industrie, to which reference has more than once been made in these pages. M. Guichard has expressed some of his views on "The Furnishing and Decoration of our Apartments" in a lecture delivered some while since, but only very recently printed. By the aid of the elegant and inexpensive little volume published by Rouveyre, let us examine M. Guichard's views.

The interest connected with the subject of household taste needs scarcely to be drawn attention to; few questions rouse more profitable controversy, few more directly appeal to us, for is it not in the very midst of all that constitutes the decoration of our homes that we pass the greater part of our lives? It is a time-honoured saying, the inaccuracy of which Brillat Savarin was, we believe, the first to point out, that in the matter of taste and colours every one has a right to his own unfettered opinion; in reality such matters are regulated by laws almost as fixed as those which Newton laid down. Their application alone affords scope for the exercise of diversity of taste.

M. Guichard takes us in imagination with him into a modern French house, the features of which he proceeds to criticise; a passing and ironical allusion to the dingy corridor leads us, like that useful feature which replaces, in Paris, our "hall" or "hall-way," to the dining-room, —"the dining-room of the nineteenth century," —or rather to the two dining-rooms, one for daily use, the other for state occasions. In the former the seats and curtains are in woollen rep, the walls covered with flock-paper. Little *étagères* are crowded with various childish knick-knacks. At this point M. Guichard regrets the beautiful decorative plates of the old days, and deplores that the work of our modern potters cannot take their place. The chandelier receives from M. Guichard a rude shock, fortunately only delivered on paper; he begs that the chandelier be made smaller, or at least the height of the room adapted in proportion, a somewhat more difficult task. It is impossible not to agree with our author in his abuse of the rep chair-covers and hangings, and flock-paper, for their peculiar property of absorbing in the dining-room the odour of previous meals. The room set aside for gala days is of the same serious tone; here, again, we meet with sombre, severe hangings; the tables, seats, and walls, the side-boards, are all in black wood, a funereal feature which suggests to M. Guichard a somewhat amusing allusion to an Egyptian custom which, it will be remembered, Mr. Long has treated happily in a well-known picture. The use of black wood for the dining-room is certainly to be questioned,—its proper place is the library or the study; for the dining-room, the furniture by its aspect and very air should be inviting and gay; or, as the author has it, "it never should exceed the tint of old oak, which recalls so successfully the appetising colour of the joint roasted to a turn." Consideration, again, as to the comfort of the guests should not be neglected in the design of the chairs, as is so often the case in modern houses. The "surtout" or épergne, which still reigns in glory in many French houses, only receives from M. Guichard its proper due when he roundly advises its displacement, provising that, if tradition or fashion demand its presence, it should be a subject of great artistic consideration as the principal feature in the composition of the table; above all, our author urges, as we urged for years, that it should never intercept the view or the voices of one's opposite neighbours.

The meal over, the guests retire to the *salon*, "to which penetrates at the same time the odour of the dinner." "Why should there not be," asks the author, "an intermediary room, a species of *lazaretto*, in which could be purified these 'aromas,—perfumes while the appetite exists, miasmas when it is satisfied'?" He has here in mind, of course, the French flat, with dining-room and *salon* on the same floor, rather than the English house.

Introduced with M. Guichard into the *salon*, its gorgeous and invariable white and gold is the subject of the criticisms of the author. In every direction white and gold,—"the eternal absence of beauty dissimulated by wealth." The decorators know the ease of its management; for white, as M. Guichard explains, being the negation of all colour, there is no need to seek contrasts or harmonies of tone. It is sad, adds the author, but less so, nevertheless, than the use of colours which offend the eye.

Appealing to his readers, M. Guichard asks them if their memories will not serve them in recollecting how nearly all the homes of their wealthier friends are decorated in this style. Nature is the sole corrector for this discordance in harmony. Consult Nature; "refer to the great book which she opens for all, and there you will find all your examples. All that is necessary is that they should be seen, analysed, and applied." Taking the instance of the decorative effect of a garden, M. Guichard explains how it will be found that while in the foreground every flower can be distinguished and named, as it recedes from the eye it becomes more and more indistinct. Such is the perspective of colour during the day. At night the effect is exactly the opposite; the foreground is in half-tint and indistinct; further on it grows darker, and beyond the dark, shadow. Here, observes M. Guichard, are two examples furnished by nature. They will be found as valuable guides to follow in the decoration of our rooms. Thus if you wish to decorate your room with light tones, and increase in appearance the size of the apartment, follow the first example above cited. Let your carpet be bright, the brilliant tones toward the centre; let these diminish in intensity, and grow lighter at the extremities, that is, at the feet of the walls. Let your seats, those at least ranged round the room, relieve light on the stuff which covers the seat. Lower the tone a little for the back; then, for the panelling, if it is sunk, paint the projecting portions in tones even lighter than those of the backs of your chairs, and of different colours if you like. Finally, the deepest portions of your panelling will receive the most vaporous tints of your palette. By this means you will produce an optical effect which will apparently increase the size of your room, and you will at the same time obtain a general harmony which will be pleasing to the eye. The advice regarding the use of subdued colours is worthy of attention. "When the exigencies of the room you have to decorate require the use of low or sombre tones, you must take advantage of what I may term 'night perspective,'—that is, you will do the contrary of what has been advised above in the management of 'day perspective.' The carpet must be light in the centre, and the further you leave the centre the more subdued the tones must become. The colour of the seats must be calculated according to the number of distances of which you will have been able to dispose in your panelling. The stuff which covers your seats must be darker than the centre of your carpet, and the stuff at the back must be a tone or two above that again. Finally, the shades must grow more and more subdued on the walls of the room as they approach the farthest distance."

In answer to the surprise that may be expressed at reference to different "distances" in speaking of panelling, M. Guichard explains very clearly his views. In ordinary panelling there are several distances, and by the difference of half an inch several additional distances can be easily obtained, and the management of these, by the skilful aid of the palette, will produce, so M. Guichard assures his readers, quite unexpected results.

As to the stuff of the chairs, the difference of tones between the seat and the back will, as the author hastens to state, certainly appear unsatisfactory, unless the transition between the two is carefully considered. It is not with ordinary stuff bought by the yard that such effects can be got up, but the manufacturers (in France, particularly the Aubusson looms) now produce, and usually to order, any patterns required. "I am far from exacting from the decorator the impossible," continues M. Guichard, "when I require him to produce an illusion which will be completely satisfactory, if he knows how to make use of his palette and of the natural objects which aid him in his interior perspective; if, taking the position of the leader of an orchestra, he boldly makes use of each instrument, lowering the tone of one, augmenting with discretion the tone of another, managing with skill the soloists, he will arrive by delicate transitions at an effective whole."

Colour allied to architecture, as very truly remarks M. Guichard, completes its pleasurable effect on the eye and mind; distributed with taste and discernment, varied with skill, vivified by the clever management of light, colour singularly enhances the architectural features of a design.

M. Guichard at this point takes the opportunity of briefly explaining the theory of colour such as Chevreul has laid it down; and which, whatever doubt there may be on the exact correctness of its explanation, it is impossible not to feel is substantially correct in its application. M. Guichard has made, and is at the present moment making, a profound study, with practical experiments, of the applications and results of the theory of complementary colours such as it was explained in these columns not long since.* The value of a knowledge of the effects produced by the contrast, juxtaposition, and management of colours is warmly advocated by M. Guichard, who is, if we mistake not, shortly to publish a work copiously illustrated, showing the industrial application, for the decorator, of the theory of Chevreul, which, as the author boldly asserts, is a science which, like every other science, can be studied, analysed, and "the profound and complete knowledge of which is of the utmost necessity for all those who are engaged in the decorative arts." They should, further urges the learned founder and director of the Union Centrale, know also the laws of optics and many other matters besides, which our *fa presto* of the present day find it rather long and difficult to learn, and the absence of which leads to so many being actively employed utterly wanting in the necessary education,—not least among these, private individuals who foolishly boast of having themselves directed the choice of their hangings, their furniture, their bronzes, and the whole decorative effect.

From this digression we are recalled to the *salon*, where the uncomfortable nature of the chairs is warmly descanted upon. Why, asks M. Guichard pointedly, is the seat convex when it ought to be concave or at least level? Graceful it may be, but it is ill-suited, as M. Guichard very well puts it, to the construction of the human body. His opinion here, however, is open to discussion by the surgeons. With seats such as we use, the knees are lower than the trunk of the body, be continues, and it is the very opposite that is necessary for repose. The Orientals, who pass the greater part of their lives in contemplation, cross their legs (the knees in this position are higher than the centre of gravity), and in this way they can remain for hours in the same pose, while as M. Guichard very truly points out, with the existing construction of our seats, ten minutes suffice to transform them into a veritable instrument of torture. The form of the chair remains to be studied, and it is certainly difficult not to agree with the author when he foresees from this study the creation of very graceful forms, additionally comfortable as moulded, so to speak, on the human body.

M. Guichard is severe on the fireplace of the present day, the so-called family hearth, which the paterfamilias, in his traditional attitude, is able to entirely shut out. It is a little startling to be advised to demolish the whole structure and replace it by a stove in the centre of the room on the ground that "You will in this manner gain the space occupied by the chimney-piece and the fire-place, which is good for nothing"; admitting, however, the utility of the mantel-shelf (the mantel-shelf, no longer the real mantel-shelf of the past) as the natural place for the customary clock and candelabra, M. Guichard urges that "something yet remains to be done; let the architects endeavour to think of the matter." The fireplace and chimney-piece undoubtedly occupy, flanked as they are by their two cabinets, a large share of room; M. Guichard would propose to substitute a fire-place which, "instead of increasing in height should extend in length and offer a generous warmth to as many of the guests as possible assembled around it." This is to be done by the aid of a fireplace the interior of which could be "regulated by a series of little iron shutters closing and opening at will"; the heating power is to be gas. The writer devotes some para-

* See *Builder*, vol. xxxviii., pp. 392, 421, 484, 583 617, 675.

graphs to the important question of ventilation, or rather its want in our small rooms of the present day,—a grave inconvenience which, on reception nights, leads to an accumulated condensation of vapours on the windows and even the walls, and a common remedy for which is recklessly creating draughts by opening doors and windows. How is it, asks M. Guichard, that we make up our minds to suffer such an evil? The architect may here become a true hygienic doctor at the same time that he can create by taste a series of charming decorative motives. Let him place his panelling (panelling and high dados, let it be remembered, are more universally used in France than in England) at an inch or two from the wall, and a ventilation will be created behind the woodwork which will cure all the ill. The upper (open) portion would be connected from distance to distance with the cornice by garlands or by any other decoration that taste would suggest. The air would thus be continually renewed and never agitated; it would preserve a hygrometric state which would be equable, it would always remain healthy and agreeable. Art and hygiene would in this simple combination both be satisfied.

To the bedroom M. Guichard devotes more than one just criticism. Here, as he truly remarks (and the remark applies almost as forcibly to the English bedroom), are to be found the "largest masses of woollen stuffs, cotton, or silk. Chairs, carpet, *portières*, bed and window curtains, are all of one of these materials. Reject from this place of repose, this warehouse of stuffs, which absorb and keep the miasma of night. No woollen carpet, no heavy curtains to the windows, still less to the bed (it is much more universally the custom in France to have bed-curtains than it is in England); have you not enough in your woollen mattress, your blanket, your eider down, which serve as so many greedy aspirators? Replace your velvet and your silk by flexible matting; let paint decorate your walls; let an intelligent system of ventilation be established, and your bedroom will be what it should be,—healthy and agreeable." To those unable to dispense, from long habit, with bed-curtains, he advises wooden panelling cut, as modern machinery is alone able to do, very thin. Wood under this new form is susceptible of taking the most splendid tones of the palette, which will fully rival the most marvellous silks and velvets, but, unlike them, will not absorb any emanation or infection.

M. Guichard, it will be seen, is not one of those critics whose sole power consists in criticising; he suggests improvements and substitutes, the results of a long and practical career as an architect. This is a quality rarely found, and which cannot be too highly appreciated.

To the æsthetic consideration of the subject he has treated, M. Guichard does not neglect to devote some share of attention. He very properly prays that good taste may become more widely spread,—a result alone to be obtained by forming and purifying the taste already implanted in the masses. M. Guillaume, a former director of the École des Beaux Arts, remarked not long since on this very subject that it was by "the level of ideas, and not by the efforts of amateurs, that should be established the kind of superiority which suits the more cultured classes of society. Public opinion would be more authoritative if the men of the world, enlightened by study, and placed above all considerations of interest, could direct it; while at present we see them submitting to the caprices of fashion, or even inspiring them, and, indeed, in their knowledge both of the theory and practice of art, liable to the far inferior to an intelligent artisan." Much remains unquestionably to be done in this direction in our system of education, the closer union of art and letters in the educational system forming a first step in this direction. "We would wish," continued M. Guillaume, "that this union should commence from the earliest classes, and that art, after having been presented as one of the most living expressions of religious sentiment, as one of the sources of history, and the indispensable auxiliary of literary intelligence, should be connected in its critical bearing with the principles which regulate every well-reflected production; and with regard to its origin, with the constitutive ideas of the human mind." It is impossible not to feel that when this warmly-expressed desire of the director of the École des Beaux Arts is carried out, a great stride will have been made in the spread of a cultivated taste among those who at present are so contentedly ignorant of its advantages and the pleasures it bestows. But a further aid must come from the artists and the manufacturers themselves. This point M. Guichard insists upon, and in support of its importance quotes a valuable passage from a report of the commission of being re-quoted: "The period of uncontrolled competition under which industry at present is carried on, does not raise the workman to a proper understanding of the work he creates, but subdivides it, to lower it to the capacity of those who accomplish it. There exist in the present day few, if any, strong or able enough to take the raw material and fashion it, model it, chisel it, enamel it, gild it, give it, in fact, a form and a colour which are the production of reflection and the expression of the human heart. On the other hand, art itself, floating uncertain amidst brilliant individualities without schools, seeks its inspiration from all epochs and at the centre of all the extinct arts; from creator, from inventor that it once was, it has become learned, and taking too often memory for talent, it pretends to serve our needs, our tastes, our modern aspirations, with ready-made solutions and second-hand forms."

Let the details be carefully studied, but let the general effect be not forgotten. The great centuries of the history of art are far from us. Times and manners have changed, and with them our fortunes. Let the artists and creators study their condition in the present day to satisfy their needs. Let our art be made to suit these needs: in this action it will lose no dignity. In the enormous change it has seen since its rise, its progress through the East, through Greece, in Italy, and in the West during the last 500 years,—can art be said to have abdicated in all these transformations either its unity or its beauty? Whether it has triumphed through its simplicity or its grandeur, through its force or its majesty, or through its grace, we ever find its glorious trace at a supreme degree above the lowest water-mark of the civilisations of the past.

ANOTHER WORD ON THE SMOKE QUESTION.

CERTAIN people who have the welfare of society very much at heart, and who have already notably contributed to it in various ways, are proposing, we believe, to enter on a systematic effort to promote a further campaign, ultimately in a legal form, against the production of smoke in London; to apply, in fact, to habitations in general some such compulsory legislation as is already in force in regard to the processes of combustion in manufactories. From what we hear of it, the matter seems as yet to be in too early a stage to be referred to except in these general terms; but as it seems likely that public attention may be again specially directed to the subject, it may be useful to recall to those who are interested in it some of the main facts and principles to be borne in mind in attempting any systematic treatment of the smoke-plague.

Probably a good deal of indignation on the subject has been evoked by the peculiar violence of the fogs of the past winter. We say indignation, for that appears to be the kind of feeling which a thorough visitation of London fog evokes from those who have to endure it,—a feeling that they are utterly ill-used persons, and that somebody ought to be hanged. This is to some extent, we believe, a rather recently-evolved feeling. Formerly the London fog was mostly regarded as a visitation of Providence, to be accepted with the same resignation with which a heavy thunderstorm would be received: it was nobody's fault, although very inconvenient, and even in some respects dangerous; and many clergymen would probably have thought it not out of place to have added a prayer against fogs to the other meteorological petitions in the Prayer-book. The reason for the change of feeling, the modern lack of pious resignation to the fog, is not to be traced entirely to the progress of that kind of materialism which led a parish clerk to reply to his rector, when the latter proposed to read the prayer for fair weather,—"Bless you! sir, its no use till this wind changes." A good many people have seized hold of the idea that the London fog is preventible, and that it consists of the London smoke blown back or kept in suspension, under certain atmospheric, and perhaps electrical, conditions, over the doomed city. The fact that other cities were not visited with such fogs led to the conclusion, logical enough, that there must be a cause for them special to London,—

"For this effect, defective, comes by cause,"

and the smoke seemed the only scapegoat. In respect of this idea there are two discriminations to be made. In the case of some of the thickest fogs we have had it has been observed that the "inspissation" (as Dr. Johnson would have called it) is as great far out into the surrounding country as it is over the town, and that on all sides, independent of the quarter of the wind. We had occasion ourselves to notice this in regard to one of the very worst fogs of this last winter, which was thicker some miles out of London than in it, though it changed its colour, being yellow in the town and white in the country. The colour in town gave every reason for the belief that smoke formed a considerable factor in it; the colour in the country showed plainly enough that it could be just as thick without the smoke to help. As to what may be the real main cause of the London fog we do not here say again, as our business at present is with the smoke; we only wish to point out that those who think they will get rid of the London fog by getting rid (if that be possible) of all the smoke will probably find themselves disappointed. They will get rid of its colour and of its peculiarly dismal and depressing effect, but that is all. Other facts combine to indicate the same conclusion. Manchester, in the matter of "blacks" in the air, is a great deal worse than London, as London visitors at the last Social Science Congress must have observed. When eleven years ago there was a discussion at Newcastle-on-Tyne as to the repression of smoke there, London was cited as an example of what could be done, and it was said that with proper attention Newcastle might be made as free from smoke as London. This perhaps implied an innocent illusion on the part of the Newcastle folk; but what may at any rate be deduced is that both Manchester and Newcastle are (unless the desired improvements in the latter town have been effected) more smoky than London, but they have not the same fogs.

It is even a question whether, granting the presence of a great quantity of smoke in the air of London and in the fogs of London, that is in itself deleterious, whether even a fog is not less injurious to some when mixed with particles of carbon than when pure, if one may apply that adjective to a fog. We have heard decided opinions from medical men to the effect that what is popularly called "soot" is, to a certain extent, when diffused in the air, rather conducive to the health of a town than otherwise; that it is a great disinfectant; that if it were possible to fill the air with it for half an hour and then disperse it, many deleterious influences would be absorbed and removed with it. That is, as to the visible part of smoke. As far as the question of health is concerned it is not the visible soot, say some, but the invisible gases, which are injurious in rendering the air unhealthy to breathe. That a smoke-laden atmosphere is hurtful to delicate lungs, however, we believe there can be no doubt.

This brings us to one of the considerations much lost sight of in connexion with what is erroneously called "consuming" smoke. A fire in which the fresh fuel is introduced from below, in what are called by the trade smoke-consuming grates, unquestionably makes less smoke, after the first lighting, than one in which the fresh coal is added at the top, but it does so because the carbon-vapour forms new combinations in passing through the already heated coal at the top; it takes away everything into the air which would otherwise escape, in a form less visible, but which robs the fire of a greater portion of its heat, or its heat-producing faculty. It renders the smoke less palpable, but is as far as ever from promoting the real object to be aimed at, the prevention of the formation of smoke.

For it cannot be too often repeated to the general public, that the only object that can be rationally aimed at, and which can be accomplished, is the prevention of the formation of smoke. The "consuming" of smoke, once given out, is not possible, although almost all people, except experts in the subject, still use the phrase, and apparently believe in the operation. Smoke cannot be consumed; but, on the other hand, smoke is by no means a necessary product of combustion; it is only a product of imperfect combustion. Perfect combustion requires a large supply of oxygen, larger than is supplied

hy the mass of air ordinarily in contact with the fire. With an artificially increased draught conveying sufficient oxygen to the hurning coal, the carbon all unites with the oxygen, passing off as carhonic acid gas. Failing the requisite supply of oxygen, part of the carhon goes off as carburetted hydrogen, *Anglicè*, smoke. The question is as to the best practical means of feeding the flame with sufficient oxygen.

All the smoke-preventing furnaces which have fulfilled their purpose successfully combine to show that the effective means of doing this consists in supplying pure air to the flame at its point of production in such a manner as to mix it as thoroughly as possible with the flame at all points. There is one other way of preventing smoke which has not been put to the same practical test, hut which has reason in it; that is, the principle suggested in an article in these pages in the early part of last year, under the heading "A Smokeless London," and which consists in treating the fuel beforehand so as to remove some of the gas from it, and leave only sufficient to combine with the oxygen supplied by the air under ordinary circumstances.

There are only these two ways of doing it that are founded on scientific reason or are likely to he successful. Either remove some of the gas so as to render the fuel incapable of producing smoke under fair treatment, and with the average supply of air, or give it an extra supply of air where air is wanted. This latter plan has been adopted with perfect success in large furnaces; without any pretext of consuming smoke, without any elaborate apparatus, smoke has been entirely prevented hy introducing air so as to have every opportunity of mixing with every part of the flame at its points of production. The same principle can, of course, he applied to a house-grate, hut it has not been so applied as yet. A new form of grate would he required, introducing pure air in separate jets rather than in a mass into the midst of the incandescence, and we have not seen a grate as yet which supplies this desideratum. The other principle of partially extracting the gas from the coal, not reducing it absolutely to coke, hut leaving it with only so much gas as will readily combine thoroughly with the ordinary supply of oxygen from the air, we helieve would he found to answer; and if it became a question of applying compulsory legislation, it would, of course, be infinitely easier to hring the law to hear upon a limited number of dealers in fuel than on the whole population who hurn it in their houses. Added to which, this system would, as pointed out in the article before referred to, in which it was first advocated in these columns, he capable of great economical advantages on a large scale.

THE WATER SUPPLY INQUIRY.

THE period of the Session, and the information elicited from the first witness examined hy the Select Committee on the Water Supply of the Metropolis, render it expedient to inquire what course can he now most usefully taken to further the wisest settlement of this important question. Nothing is more worthy of remark, in all that relates to the position of the water companies and to the present and future water-service of London, than the fulness and multiplicity of detail accessible on certain features of the case, at the same time that an almost total ignorance prevails as to other and no less important elements. The truth is that, as far as returns have been prescribed hy Parliament, the information accessible is almost exhaustive. On the other hand, as far as those scientific data which will hereafter prove to be controlling conditions of the case are concerned, they have as yet almost wholly to he collected, or, at the least, to be co-ordinated. Of statistical information there is a plethora. Of amateur or speculative recommendations there are more than enough. But a general view of the whole case, to the outcome of which all these details are subservient, has yet to he taken.

It cannot he denied that the acceptance of the terms which, as we may ascertain from the evidence of Mr. E. J. Smith, were provisionally agreed upon hetween that gentleman, acting for the late Government, and the water companies, was urged under the influence of a sort of panic. The clauses of the Bill were referred to like the leaves of the Syhilline hooks. "You may take them or leave them," was the argument, "hut if you refuse them to-day, you will not have the chance of accepting them to-morrow." And this view, which was urged with great plainness of speech, and with somewhat of the triumph of a man who thinks that he has just done something unusually clever, in the columns of the *Times*, has been put into a concrete form in the course of the evidence. The income of the water companies, the committee was informed, was increasing at the rate of 100*l*. per day. That, the same witness alleged, was equal to an increase in capital value at the rate of 3,000*l*. per day. Certainly, if a property which *must* he purchased is steadily increasing in earning value at the rate of more than a million per annum, despatch in concluding the bargain would he a wise economy.

Men of business, however, are pretty well aware of the danger of leaping at a hait on the pretext of "now or never." That heing the case, it was wonderful how the panic spread. Grave hodies, like the Commissioners of Sewers, came hot-foot to the Government to implore the immediate introduction of measures to prevent the companies from exerting their statutory powers. "We held that competition was out of the question," said Mr. Smith. With this helpless view taken by the Government arhitrator on the one hand, and with the vague fears of the extortionate action of the companies on the other, there would probably,—hut for certain interfering circumstances,—have heen a rapid legalisation of the agreements.

That a Select Committee should look into the matter, before such a leap in the dark was taken, was a proposal of practical good sense. That the Committee should go further, and inquire into the sources of future supply, into the purity, or otherwise, of the water, and into all the vast mass of details which constitute the physical part of the case, is another matter. Not that such an inquiry should not he made. Quite the contrary. But it is one that cannot he made in a hurry, and one which will require a more prolonged, and probably a more systematic, investigation than is competent to a Committee of the House of Commons.

To the first part of the question,—the inquiry whether the provisional agreements made hy Mr. Smith ought to he sanctioned hy Parliament,—the first ten days of the sitting of the Committee have been enough to furnish the reply. It is obvious to all those who can read hetween the lines of a report that even the first day's evidence was conclusive. The great weapon of the purchaser, freedom of market, was not only not employed hy Mr. Smith, hut was admittedly laid aside. "Competition was out of the question!" That heing so, the whole transaction degenerated into a haggle. Even as to that haggle, however, one effective argument on the part of the purchaser appears to have been entirely overlooked.

It is obvious to any person accustomed to ascertain the value of property, that the property of the London water companies possesses a rising value. If we glance over the Board of Trade returns for the past five years, we see that there has been a steady increase in gross receipts at the rate of 4¼ per cent. per annum. But the increase in net receipts, which is the true test of value, has been more rapid. The working expenditure has not increased as fast as the gross income. Against 4¼ per cent. in the latter there has been only an increase of 3½ per cent. in the former. These rates of increase, which some time since we calculated from the returns of the companies, are considerably less than those which have accrued since the whole period from 1872, as shown in the Dilke return. The increase of income has been 5·04 per cent. per annum for eight years, hut only 4¼ for the last five of them. But the increase of capital has been nearly in the same proportion for the whole time. This yearly increment of value is, therefore, something fairly to he expected to occur in the future. And this has been the main fact that underlies all questions as to future "increments" and deferred payments.

This is all very well, as far as it goes. But there is something more. Two facts have been left out of sight. One may he regarded as only matter of account. The other is cardinal, and commands the whole question.

The income of the water companies owes its expectation of increase to the increase in the size and population of London. That increase may he taken at 2½ per cent. per annum; the metropolis doubling its size in forty years. Looking hack to the past five years, the average increase in the capital of the water companies has gone on step hy step with the increase of the metropolis. The annual increase has been 2½ per cent. For the past eight years it has been 2·6 per cent. Thus to earn the net increase above indicated, a corresponding increase of capital outlay must be made. This has not been brought into the account; and the whole calculation of future profits is thus entirely in the air.

So much for finance. But that is not all. The capital of a company is not a matter that can grow of itself. It is an artificial provision, which has to he sanctioned hy Parliament. In the accounts of each of the companies is to he found the account of the unexhausted powers which they each possess as to the raising of capital. All together do not amount to 1,200,000*l*., or to 10 per cent. on the present expended capital. In four years, therefore,—taking the case all round,—the growth of the companies will have stopped. Their "increment" will he hide-hound. Only Parliament can enable them to go on,—to supply the wants of the future, to earn more than four years' increase out of the twelve years' increase for which Mr. Smith proposed to pay them, according to the First Schedule of the Metropolis Water-works Purchase Bill, the sum of 9,280,000*l*. Taking this valuation without comment, the companies, if let alone, could not earn more than one-third of this sum without fresh Parliamentary powers. We have not room to add more to this very important consideration than the fact that items provided for in clauses 9, 13, 20, and part ii. of the First Schedule of the Bill, amount altogether to 4,408,000*l*., which the public would have to pay, and which has not yet been brought honestly forward on the face of the account, the total of which thus stands at the round figure of 35,750,000*l*.

Mr. Richardson, the chairman of the Parliamentary Committee of the Metropolitan Board of Works, is the first witness who has taken the hull hy the horns, and stated in round numbers what would be the cost to the ratepayers of the hargain struck hy Mr. Smith. The Metropolitan Board, said Mr. Richardson, are in favour of the acquisition of the water companies; hut they consider the terms excessive. Taking the purchase as effected in a stock which he rates at 114, Mr. Richardson brings the amount up to 35,920,000*l*., and 3,250,000*l*. for debentures. There is in this, however, no abatement for deferred payment. The total cost arrived at hy Mr. Richardson is 40,500,000*l*. Our own estimate (*Builder*, March 13, 1880, p. 302) was "upwards of 38,000,000*l*." The difference between us is due to the fact that we only allowed an extra value of 5 per cent. for 3½ per cent. stock as compared to 3 per cent. at 90, and Mr. Richardson takes the price of 114 for the 3½ stock. Again we spoke of present price, and Mr. Richardson speaks of permanent cost. We are thus in very close accordance, and we, certainly, cannot object to the substitution of Mr. Richardson's figures for our own.

No serious evidence has been elicited hy the committee which is anything hut condemnatory of that extravagance of the agreements which we were long the only persons to point out. Mr. Stoneham, one of the Assistant Secretaries of the Board of Trade, and an auditor of water companies' accounts under the Act of 1871, reluctantly described the effect of Mr. Smith's agreements as converting every 20*s*. of present income into 30*s*. of future income. Sir Henry Thring, cited hy Mr. Smith as an authority on whom he had relied as to certain allowances for hack dividends, wrote to the chairman of the committee to say that he had given no opinion on the subject at all. The evidence of Colonel Bolton, the Water Examiner under the Act of 1871, was even more damaging. He had, he said, "over and over again urged on Mr. Smith that the services of an independent professional engineer should he secured, as the general information he could furnish was not of a nature to enable an engineer to arrive at even an approximate value of the works." This is the comment on Mr. Smith's statement, "I had the story of the improvements going on, and the exact amount of those executed up to the time I was considering the matter, and I had the hest evidence as to the expectations of the future from Colonel Bolton and others."

It is melancholy work to contrast the statements of Mr. Smith with the facts. We referred in a former article to the excess of the totals in the returns made hy that gentleman over those of the companies as to the income of 1879. Schedule C of that gentleman's report of the 26th March is to us simply unintelligible. But he begins with "increment of income in

1880-81, increasing 780*l.* annually." In 1879 there is, according to the companies' statement, an increment of 35,500*l.* of the *gross* income over that of 1878. But there was an increase in the items of maintenance and management of more than 10,000*l.* at the same time, and there was an increase of more than 2,000*l.* on interest paid. Thus the net improvement of the year 1879 over 1878 is little over 23,000*l.* And on that naked fact is based the payment to the companies of 9,240,000*l.* of deferred stock. In fact, the mean increment of net profit from 1878 to 1879 is less than the mean increment from 1871 to 1879. The importance of this fact it is hardly necessary to point out.

In a word, taking 33 years' purchase to represent a perpetuity,—which we take to be fair at the present value of money,—the equivalent of a perpetual enjoyment of the present income of the Water Companies is 28,314,000*l.* As to future increment, first, we have to remember that, within a few years, none such can be acquired without further Parliamentary powers being obtained; and, secondly, the sum of such increments for five years, taking that of the last year as normal, is only 345,000*l.* The sum of 30,000,000*l.*, which is equal to 242*l.* for every 100*l.* of the companies' capital (including the loan capital), would therefore, in our opinion, be a very ample consideration for the transfer of the property, if such transfer be based on a mere appreciation of the present and expected income, under existing statutory powers, and without raising the question of the condition and sufficiency of the works.

Once again,—for the figures are large, and the misuse of them is incredible,—taking last year as normal, the increase of capital, according to the Dilke return, was 315,314*l.* The increase of net profit, after paying additional interest on loans, we have seen, was 23,000*l.* Taking this at thirty-three years' purchase, gives a figure of 759,000*l.*, from which the deduction of the actual capital raised and paid, as above stated, gives us an increase of value of 444,000*l.* in a year. This, no doubt, is not a figure with which to trifle. But it is something widely different from the panic estimates of Mr. Smith.

On the tenth meeting of the committee, on the 16th current, Mr. Philbrick, Q.C., who represented the Metropolitan Board of Works, said that he had abstained from calling evidence on the subject of an independent supply of water in deference to what he understood to be the view of the committee. The Chairman said he had given no instructions to exclude any evidence. Sir Edmund Beckett then addressed the committee on behalf of the water companies, and contended (if correctly reported) that Mr. Smith had given a figure by far too little. He denied that there had ever been an arbitrary increase of water rates in any district of London, and declared that the companies had not been aware of the full value of their property until the committee had made them so aware. "He doubted if there were a hundred people in London who understood these bargains,"—a doubt in which, if the argument of the learned counsel is at all fairly reported by the daily papers, he evidently included those whom he addressed. He declined to call witnesses, as he said that he did not see that he had anything to answer. As far as rehabilitating Mr. Smith's proposals went, he certainly did not attempt to answer any of the numerous objections of which we have referred to a few of the most conclusive.

PROMOTION OF SANITARY KNOWLEDGE.

THE PARKES MUSEUM OF HYGIENE.

A PUBLIC MEETING, to make known the purposes of this Museum, will be held in the Egyptian Hall of the Mansion House, on Tuesday next, July 27th. The chair will be taken at three o'clock by the Right Hon. the Lord Mayor, and amongst those who are expected to take part in the proceedings may be named the Earl Fortescue, the Earl of Dunraven, K.P., Lord Aberdare, the Hon. Evelyn Ashley, M.P. (Secretary of the Board of Trade), Mr. Torrens, M.P.; the President of the Royal Society, the President of the Royal College of Surgeons, and many others. All interested in promoting a practical knowledge of sanitary science are invited to attend. Tickets will be forwarded on application to Professor Berkeley Hill, 55, Wimpole-street; and, we hope, many will be asked for.

DEPARTURE FROM THE TERMS OF BUILDING CONTRACTS.

IT is a common saying that a person is "a man of business" when the speaker wishes to impress on the person whom he is addressing that the subject of the conversation is a man of remarkable accuracy. If any student or professor makes mistakes in his monetary transactions, the excuse is at once given that he is not "a man of business." It may be doubted, however, whether this is not a very fallacious expression, for any one of accurate habits of mind, who observes how blunders and inaccuracies daily occur by the hundred in commercial circles, cannot fail to wonder that they should happen if the man of business is the exact person he is generally supposed to be; and if we class builders and architects as mere men of business, it is often a matter of astonishment to see how frequently mistakes and oversights occur of so palpable a nature, and often so injurious in their consequences, that it is much to be regretted that more of the typical rather than the actual man of business is not to be found in connexion with these transactions. It may be useful to work out these general assertions somewhat more fully. In the first place, there are constantly being drawn up throughout England every day contracts so limited in their extent, and so dubious in their form, that they open a door to numerous disputes, which sometimes actually occur, and sometimes are avoided, not by any good management, but by the fact that the point upon which the parties might split does not actually arise, or because the parties happen to be blessed with more good temper or forbearance than is often found. And very often these contracts are drawn up meagrely, because a man thinks to himself that such and such event will not happen, and if it does, that he can trust to the person with whom he is contracting to oblige or to meet him in the matter. And we feel sure that it is under this same impression that terms in contracts are not acted up to. Probably most of the readers of the *Builder* are familiar, in some way or other, with that very common term in a contract, that no extras shall be begun, or no additional work or decorations allowed for, without the same are ordered in writing by the employer or by his architect. But there is, probably, no proviso in an agreement which is more constantly or more patently broken than this is. The contracts with this term are signed by builders every day with full knowledge of their contents, and yet they go on doing extra work without written orders, feeling sure that they will be paid for what they spend time and labour upon. And no doubt employers do not always enforce this term, but, on the other hand, any man with any kind of experience in regard to building disputes must be aware of numerous instances in which employers have availed themselves of the absence of written orders to avoid payment for work undertaken without the agreed formalities; and therefore, in regard both to contracts generally and to this particular term, we say that no accurate builder or contractor who wishes not to be harassed by disputes should ever omit to insert clauses in his contracts dealing with all usual possibilities; nor when they have been inserted should he omit to see that they are carried out exactly and to the letter; for, as we have pointed out, human nature cannot be relied on to deviate always from strict legal rights. It is all very well for judges to style defences which rely upon the proviso as to written orders, as was done in the case of Myers *v.* Sarl (30 L.J., Q.B., 9; Roscoe's Digest of Building Cases, p. 34), as "shabby," when, unfortunately for the contractor, the Bench have to add that the point against him is too clear for argument. And we are by no means sure that, if a builder executes work without written orders, he is entitled to much commiseration if afterwards he is unable to recover; for those who enter into contracts should abide by them.

Then, to take another instance, architects often do not attend to the clauses as to certificates with sufficient strictness. Thus in the reported case, decided a long time ago, of Morgan *v.* Birnie (9 Bingham, 672; Digest of Building Cases, p. 20), the architect sent a letter merely enclosing the builder's account checked by him, and this was held not to be a certificate. In many instances, of course, a not very strict compliance with the contract does no harm, because the parties may be solvent, well-intentioned, and not disinclined to pay; but, on the other hand, if troubles spring up, the absence of a thoroughly formal certificate may be the cause of annoyance, not to say trouble and loss of money. Instances of such trouble, from a want of these accurate certificates, must quickly occur to the mind of any one who has had to do with building contracts, especially if he has had some experience of those about which disputes have arisen. Then, again, there is yet another point in regard to which a good deal of looseness prevails, and which too often entails very disagreeable disputes, and this is the absence or the presence of the proviso as to time. When no proviso of this kind is to be found in a contract, it needs no demonstration as to how it is likely to work in an injurious manner; but when it does occur, it may cause difficulties in two ways. A contractor may, urged on by competition, most shortsightedly give himself an unreasonably short time to complete the work. Then he lays himself open, by not completing by the appointed time, to the payment of penalties. If the employer is good-natured, when the contractor explains that he cannot finish in time, he gets the period extended, no harm is done, and he will very likely tell his neighbour, as a sort of general proposition, that "you can always get the time extended," whereas such extension is by no means always the case; or extra works may take place, and then the contractor may forget to stipulate for extra time. So troubles may arise. But all these difficulties spring from the one source of not making full and accurate contracts, and not sticking close to provisoes contained in them. Builders and those who have to do with buildings should always bear this fact in mind.

FROM THE BANKS OF THE SEINE.

NEVER can those living on the banks of the Seine, from Charenton to the Point du Jour, expect to witness such a scene of splendour as that which Paris presented on the *fête* of the 14th of this month, and never can the architectural features which crowd with such historical interest and familiar beauty the old city be more distinctly marked out by the skill of the emphasising artists than they were on that evening. It was, indeed, a novel sight to see the familiar old towers of Notre Dame, with a strangely fresh beauty added by the arrangement of their flags and lights, and not even Viollet-le-Duc could have quarrelled with the graceful lines that art and accident effected on the old towers of the cathedral or the graceful spire of the Sainte Chapelle. Even the too-captious disposition of the proverbially irritable artistic mind would find it difficult to complain of a deficiency of thought or the absence of suggestive sentiment in the *fête*. The complaint that we have heard that there was somewhat of the theatrical in the character of the adornments,—although it is supposed that that accusation is especially applicable to the French, is not happy at the present moment; for if they were successful just now in all their theatrical attempts, they might, as in their decoration of Paris on the 14th, be indeed fairly credited with having accomplished the highest possible achievement in the way of a theatrical display. To those who remember any of the great illuminations in London, or the illumination of Florence on the occasion of the independence of Italy, or any of the *giandole* during the most popular period of Pio Nono's pontificate, or the magnificent displays during the late Emperor's career, must admit that the display of Wednesday in last week, notwithstanding its entirely popular character, was not by any means deficient in that element of sentiment without which all true art must be far from successful, and such a sight as the gardens of the Luxembourg displayed on the termination of the fireworks at the Observatory (just as the short and rapid thunderstorm burst over Paris) must admit that the sentiment of the show was sufficient to satisfy the most enthusiastic romancer. Strangely enough, and little to be expected, the illumination of the Tuileries was wanting in the sentiment that lingered and manifested itself so strongly at the Luxembourg, and we can imagine that an enthusiastic American might, at the Tuileries and the Champs Élysées, even with the Arc de l'Étoile at the end, have dreamt of the possibility of rivalling such a display; but his courage and his natural good sense, and his gradually increasing knowledge of the enormous interest of the old world, would make him despair of ever getting up an illumination similar to that of the Palace of the Luxembourg. In the thick air the outline of Marie de Medici's home, the

fountain and the pond lighted up by fitful lights, the singular mixture of the sixteenth and seventeenth century art, and the latest development of the epoch in the electric-lighted dome of the Pantheon, in the gardens themselves the quaint and gnarled forms of the orange and pomegranite trees, the glow-worm lanterns in the shrubbery shining out amidst the sombre darkness, all produced a fairy-like effect suggestive of the period of the utmost romance.

At the École des Beaux-Arts the competitors for the Prix de Rome have exhibited, this week, the pictures on which they have been occupied during the last seventy-two days in their solitary *loges* at the École. Again the pictures are monotonous in their academic and minutely realistic character. Academic, from the choice of subject,—the meeting of Ulysses and Telemachus,—realistic, and in parts exceedingly meritorious, from their resemblance to the familiar models who have sat for the heroic characters. In all such competitions one is disposed to wonder how the judges are able to detect the peculiar excellence that secures to the successful the prize so dearly sought for; and it appears to us this year that there is more than ever a singular equality in the ten pictures submitted. The Prix de Rome offers, in the first instance, a reward so fascinating to the young artist, that it appears almost to create in his mind an innocent belief that the highest point that a French artist can arrive at is thereby obtained, and a belief like this in a Frenchman's mind is equivalent to the possession of the highest honour that the world can afford: having arrived at a position so enviable, he appears henceforth to rest on his honours; at least, so urge some, and when one thinks of the delightful position that a Prix de Rome laureate secures by success in the trial, one scarcely wonders that men so young should in many instances be spoiled.

That all is not rose in the lives of the artists here any more than in England is a fact which finds cruel proof from time to time, though the appeal of charity comes to relieve the distress. Very recently a number of ladies, well known in the Parisian artistic world, have founded an orphanage for the unhappy young girls (natural and legitimate) left unprovided for by their parents,—literary men, painters, musicians, sculptors, and dramatic artists. Voluntary subscriptions are to support the society, the statutes of which are already drawn up. A large house with a garden and workshops has been rented, and the orphanage is already in working order Its usefulness no one can deny; the more so as, till this moment, no regular institution existed in Paris for the orphans of artists.

Infancy and old age, the extreme points of life, have from all time been the care of the philanthropic and the provident. Infancy abandoned offers a danger to society; old age neglected is unworthy a civilised community. This latter consideration has led to the formation of an association bearing the title *Arti et Amicitiæ*, the object of which much resembles that of a society proposed not long since in London, to rent a beautiful villa as a place of retirement for all those who, devoted during their lives to the study of the liberal arts, have been unable to arrive at fortune,—a number, alas! very large. The names of Meissonier, Cerôme; Charles Garnier, the architect; Henri Lehmann (the brother of Rudolf Lehmann and the new member for Evesham); Charles Blanc, Victor Hugo, Littré, Alexandre Dumas, de Quatrefage, and many others known in France, speak sufficiently for the unanimity with which the idea has been welcomed. In its arrangement, the society *Arti et Amicitiæ* resembles, it will be seen, Lord Lytton's great failure, the Guild of Literature and Art, of which we once heard so much.

In the death of M. Isaac Pereire, which took place a few days since, the cause of philanthropy, if so it may be called, has sustained a heavy loss. If M. Pereire's name is not quite so universally known in England or America as that of his co-religionists, the Rothschilds, in whose house, when young, Pereire was, we believe, a clerk, his acts of enlightened generosity have none the less won for him the esteem of the observant, and among journalists his memory is peculiarly cherished. Pereire's life has been an interesting one, passed at an interesting period of the history of modern France which he has taken no small share in forming. Among the many financial schemes with which his name is connected, Isaac Pereire founded the first French Transatlantic service which competed with our own steamship lines to America, while his brother Emile was the manager of the first railroad in France, that from Paris to Saint Germain, and though blind during the last ten years of his industrious and literary life, Isaac Pereire, like our own Postmaster-General, Mr. Fawcett, had kept his mind ever alive to the passing interests of the day. As one, cited among many, of his acts of philanthropy, only a short time since he set aside a sum of 4,000*l.* to be awarded, as, we believe, we announced in those pages, in prizes to the essayists who should most sensibly propose a series of reforms by which pauperism could be reduced and thrift and more general ease secured among the masses. In the frivolous world there is more than one foolish story told of the rivalry that used to exist between old James Rothschild and Pereire. One of these, which rests on the authority of Captain Gronow, of Anglo-Parisian reputation, attributes to James Rothschild (whose want of urbanity, by the way, will always be remembered in striking contrast to the affability of his descendants), a characteristic expression of wonder, in bearing of Pereire's financial success, that any one could transact business with "such a Jew." But M. Pereire has known how to make his name respected, and long will his superb mansion in the Faubourg Saint-Honoré, near the British Embassy, recall to passers-by the industrious activity, the large fortune, and the broad-minded generosity with which it was expended by old Isaac Pereire.

From England the writers, who have been quite numerous this season on the banks of the Thames, condescend, "when they have leisure," to write to their Parisian readers, and very comic reading it offers to those familiar with London. It is certainly calculated, even in weather as severe as the present, to rouse a warm glow of pride at the patronising praise of a correspondent in his criticisms on "Erving," or the doings of "M. Bencroff;" "Tooles" ("Ici on parle Français" doubtless) would be flattered to hear himself compared to Got, but it is under the epithet of "Benedictus" that is hidden the deepest mystery, alone thrown light upon by the casual mention of a recent benefit concert, the pecuniary success of which arouses the surprise of the French critic. The worthy professor seems sadly to have puzzled "the intelligent foreigner." This season, as in another journal, we meet with further mention of "Sir Julien Bénédit." Dealing thus with names as familiar as these printed in every newspaper and on every placard and boarding in the city, one trembles at the prospect of such a gentleman perhaps at present attempting what many a Frenchman has not hesitated to carry out, a complete review of England, its society, its manners, its political, scientific, literary, and artistic institutions.

The sad announcement of Mr. Tom Taylor's death has been noticed by the Parisian press with exceedingly good taste, and a knowledge of his usefulness and his loss which is not often shown by French writers. No ill-natured allusions are made to the accusations of his plagiarism, and due credit is given to his merit as one of those rare English critics on art, dramatic and pictorial, who are more than commonly acquainted with the subjects of their critiques.

EDINBURGH.

As our readers are aware, the late Sir John Watson Gordon, P.R.S.A., bequeathed a sum wherewith to found a Chair of Fine Art in the University of Edinburgh. The fund having now become available, candidates were invited to offer themselves for the professorship, of which invitation, eight gentlemen availed themselves, viz., Mr. Gerard Baldwin Brown, M.A.; Mr. P. G. Hamerton, Mr. F. E. Hulme, Mr. W. Roscoe Osler, Mr. J. P. Richter, Ph. D.; Mr. John Forbes Robertson, Mr. J. F. Rowbotham, and Mr. W. Cave Thomas. The choice of those with whom the appointment rested has fallen upon the first-mentioned gentleman, Mr. Gerard Baldwin Brown. The professor-elect is the son of a Congregational clergyman in London, and was educated at Oxford University, where he graduated as Master of Arts in 1874. He was successful in a competition for a Fellowship in Brasenose College, and carried off the Chancellor's Prize for an English essay, the subject chosen being "The short Period during which Art has remained in its Zenith in various Countries." The predilection thus shown for this line of study was followed out in a course of practical training for the profession of an artist, which, combined with a knowledge of the history and theory of art and a good literary style, entitles the Professor to consideration as an art-critic; an example of his power in which direction will be found in an article in the current number of the *Nineteenth Century* on "Modern French Art." Mr. Brown has already had some practice as a lecturer, having, under the auspices of the London Society for the Extension of University Teaching, delivered a course of twelve lectures on "Greek Life and Culture," which have met with commendation.

The building of the new Medical Class-rooms is progressing favourably, and it is hoped that the Chemical Department may be fit for occupation next session, the rooms at present in use being crowded to excess, and very ill-ventilated. In the centre of the quadrangle of the new chemical department, a ventilating shaft and chimney has been erected, which has given rise to a paper war amongst those interested in the amenity of the city. It is objected that, both as regards material (white brick) and form the shaft bears too great a resemblance to an ordinary factory-chimney, and tends to vulgarise the otherwise very remarkable and elegant group of buildings to which it forms an appendage. There is undoubtedly some truth in this notion, but it would not be an improvement, as some suggest, to cause the shaft to assume the form of some other feature, such as an obelisk or a campanile. Mr. Anderson, in his first design, showed two separate shafts, one acting as a smoke-vent, the other as a ventilating-shaft. Both of these were intended to be in stone, and would have formed characteristic features, having been treated in a distinctly artistic and expressive manner; but these he has had to abandon for the more economical feature now in question.

Another indication of the prosperity of the University is to be found in the increased attendance at the botanical classes. The lecture-room at the Botanical Gardens is seated for 350, but instruction has been imparted by the Professor to upwards of 500 by separating the students into two classes and lecturing twice daily. A new building has been designed in which provision will be made for 600 students, and the room to he vacated will be used for practical studies. The erection of the new building will necessitate considerable alterations in the laying out of the ground at the northern entrance to the gardens, but on the ground to be cleared there are fortunately no specially valuable trees or shrubs. The ground is rather choked up at this point, and the opportunity will be embraced of opening up the approach to the conservatory and palm-house. The new building will be octagonal in form, and will abut upon the west gable of the present class-room. The plans have been prepared in her Majesty's Office of Works, and operations are expected to be begun so soon as the necessary funds are voted by Parliament.

The poorhouse for the parish of St. Cuthbert, erected some years ago on the rising ground to the west of Fettes College, has, for a few years past, been found inadequate to meet the requirements of the parish, and plans for additions to accommodate 192 inmates have been prepared by Messrs. D. & J. Bryce, involving an outlay of about 10,000*l.* The additions consist of wings at either end, in front of the main building, of four stories in height, the upper one being contained in a high-pitched roof lighted by dormer windows. Each of the wings has a separate staircase, and can be shut off from the main corridor.

A new United Presbyterian Church has been erected in the High-street of Portobello, from designs by Messrs. Stewart & Menzies, architects and civil engineers. The building is Gothic in style, and exhibits more of the engineering spirit than of architectural knowledge, some of the details being exaggerated in the most extraordinary manner. The church consists of a nave, 61 ft. long, and transepts 66 ft. wide. At the north-west angle there are a tower and spire rising to a height of 130 ft., which form a conspicuous object from many points of view. The principal entrance towards the High-street is flanked by buttresses, having attached foliated finials, and on each side is a two-light window with cusped tracery, and the upper part of the gable is pierced by two large windows and a traceried circular window. The side elevations show three large traceried windows, with intervening buttresses, and the transepts have four-light traceried windows, with

circular window above. There is a gallery over the main entrance, which is approached by a stair in the tower, and accommodation is provided for a congregation of 700. The pulpit is placed in a recess at the south end, and is backed by panelled timber work with crenellated top and finials, and over this is a wheel-window, filled with stained glass by Messrs. Ballantine & Son. The roof is of open timber principals, plastered across at the collar-beam. When the scaffolding was up for the erection of the spire, it formed a very striking feature as seen from the railway, suggesting the idea that a tower would have been more effective on the site than a spire. Some of the designs submitted in competition showed such a feature.

MUSSELBURGH.

WHILE most of the towns and hamlets of Midlothian are making progress more or less rapid, there is one most conspicuous instance of the converse position in the case of Musselburgh, —an old-world, old-fashioned, half-fishing, half-manufacturing town, situated at the mouth of the river Esk, and, next to Dalkeith, the most populous township in the county. It forms one of a triad of Parliamentary burghs on the east coast; the other two being Leith and Portobello. But long before either of these municipalities had risen into existence, Musselburgh was already famous.

> "Musselburgh was a burgh
> When Edinburgh was nane,
> And Musselburgh will be a burgh
> When Edinburgh is gane!"*

So sang Thomas the Rhymer, or some other ancient poet and prophet of the same era; and whatever we may say about the probable truth and fulfilment of the prophecy, the poetry is true enough. Musselburgh was not only a burgh in the modern, but in the ancient Anglo-Saxon sense of the word; and long before the Saxons or the Northmen, or the Danish men, had set their foot on the fertile shores of the river Forth, the Roman galleys rode at anchor in its beautiful little bay of Fisherrow, which thus constituted a seaport of the province of Valentia.

During the Middle Ages, Musselburgh was also celebrated in the civil and ecclesiastical annals of Scotland. Its original name was "Eskmouthe," by which it is mentioned once or twice in the pages of that veracious chronicler "Simeon of Durham," as early as the seventh century. It appears also from other records to have had a maritime and agricultural population throughout the whole of the Northumbrian period. In the year 1201 it begins to figure in the contemporary chartularies as "Muschelburg," which accounts for the etymology of the name; and it was here that the barons of Scotland assembled to swear "fealty" or allegiance to the infant son of William the Lion of Scotland, who was afterwards King Alexander II. In the reign of King David I. a grant was made of the manor of Great Invsresk, or "Musselburghshire," comprehending Musselburgh, Fisherrow, the church of Inveresk, with its tithes and pertinents, together with the mills and fishings of the manor, to the Abbey of Dunfermline; and this grant, like others of Saint David's, was confirmed in the year 1236 by a bull of Pope Gregory IX. From the original grants the monks enjoyed a baronial jurisdiction over the manor; and from the date of its confirmation they acquired the increased jurisdiction of a regality. Alexander II., in the year 1239, granted to the monks a right of free forestry over all the lands of the district; and Robert III. gave them all the new customs which were levied upon the burgh. We may just add here that, even at this early period, the altar of our Lady of Loretto had risen into that importance which gradually obtained for it the character of the most celebrated shrine in Scotland. The chapel and hermitage stood on the margin of the links immediately beyond the ancient eastern gate of the town; and it was nearly as well known and frequented during the Middle Ages as its celebrated Italian prototype and namesake, and was believed to possess the same degree of sanctity and power of supernatural cure. Its pilgrimages were equally famous, and comprised as numerous an army of devotees. Even King James V. performed a pilgrimage on foot to the chapel of Loretto from Stirling so late as the year 1530, before setting sail for France to marry the celebrated Mary of Guise. No trace of it now remains for the study of the archæologist. Of this noble shrine there is absolutely no vestige to be found in Musselburgh at this moment. The ancient chapel has given way to a modern school; and the gardens and orchards once sacred to the prayers and orisons of the pilgrims are now the scenes of juvenile games and the diversions of a public school. The very courteous head-master did his best to show us some sculptured stones on our last visit, but we could discern nothing of an earlier date than a pediment of the Elizabethan age, built into a side wall of the garden.

Musselburgh, we may mention incidentally, is celebrated as a centre of the celebrated game of Golf, a pastime which is almost peculiar to Scotland,† although we have observed it has now crossed the Tweed. It is uncertain when the game was introduced into Scotland, but it was practised by all classes during the reign of King James II. Charles II. was engaged in playing a game on Leith Links during his visit to Scotland in 1641, when the news was brought to him of the rebellion in Ireland, whereupon he threw down his club and returned in great agitation to Holyrood House.

The river Esk, which cuts the burgh into two sections, takes its rise in two branches among the springs of the Pentland Hills, united, as we have seen, at Dalkeith; and, swollen in its devious and tortuous passage through the beautiful glens and valleys by innumerable brooks and rivulets, flows through the arches of the old Gothic bridge which still connects Musselburgh, in one of its principal thoroughfares, with Fisherrow, in a slow and half-sluggish condition. Although still much polluted, we are bound to report that the river is a perfect pattern of purity now as compared with its filthy and disgusting condition some ten or twelve years ago. This is, doubtless, due to the greater care and conservancy of the river, induced by the result of the celebrated Esk pollution case in the Court of Session, which some of our readers may remember by its jocular title of "The Lairds against the Millers." In that well-known and protracted trial the Lord President (Inglis) laid down the law in a weighty sentence, which cannot be too often repeated,—that the upper proprietors of a river are bound to send down the water to the lower proprietors *undiminished in quantity and unimpaired in quality*. The paper-makers accordingly had to erect an expensive series of retaining-ponds for their liquid refuse; and the Messrs. Cowan, with their well-known spirit and enterprise, removed their esparto-mills altogether from Penicuick to the mouth of the river at Musselburgh, where at this moment the manufactory of the pulp forms one of the leading industries of the district. Hard by these esparto-mills we noticed another curious manufactory of fishermen's netting, which is also carried on to a very large extent. We may mention here that we have ourselves observed very large trout taken out of the river Esk in the grounds of the Marquis of Lothian at Newbattle,—a phenomenon to which the inhabitants of the Esk valley have been unaccustomed for the space of a quarter of a century.

The modern buildings in Musselburgh are hardly worth noticing, if we except a very neat episcopal chapel in the early English style, built on Sir Archibald Hope's grounds, and one or two villas, particularly those in the neighbourhood of Inveresk. The old town-hall has no architectural value whatsoever, unless its antiquity go for something, for it is certainly the most peculiar-looking town-hall we have seen in Scotland or anywhere else. Of course, it was originally a prison, or "tolbooth," and was built about the year 1590 from the materials taken from the Chapel of Loretto; for which dilapidation of so sacred an edifice, by the way, the burgesses of Musselburgh were annually excommunicated at Rome for sacrilege during the long period, as Fullarton tells us, of two hundred years. The council-chamber, which we looked into, is of a more modern date, and is the scene sometimes of very stormy discussions. With regard to the drainage of this ancient burgh, the less we say the better. We question very much if such a thing exists. The water supply is derived from the Edinburgh system, and has only been recently introduced. After taking a look at the very picturesque fishing cobles, with their single lug-sail, crawling slowly out of the small harbour of the Fisherrow to the broad and blue waters of the Firth of Forth, we observed at the Musselburgh station a marble statue of Dr. Moir, the "Delta" of "Blackwood," which put us in mind that this spot had been the scene of the lives and labours of not a few eminent Scotsmen.

But, unquestionably, the "pearl of great price" in Musselburgh is the old-fashioned historical mansion of Sir Archibald Hope, of Pinkie, with a glance at which we shall conclude these hurried notes. Pinkie House stands within a belt of fine old trees and shrubbery, at the south-west extremity of the High-street, and bears something of the same relation to Musselburgh that the Bucclench palace does to Dalkeith. The salient points of this remarkable old house are briefly these. It is of a very early Scotch baronial style,—a low quadrangular building, obviously unfinished, with very steep gables and projecting turrets. A sculptured fountain stands in the foreground, in the well-known form of a crown, or rather a Papal tiara, which distinguishes the fountain in the esplanade of Holyrood Palace, and, from the circumstance of its also being found at Linlithgow, would seem to be a characteristic of Scottish baronial architecture in its original and probably its highest form of expression. An air of antiquity, indeed, hangs over the whole town,—which, however, is no manner of excuse for sluggishness; and, as we understand, there are plenty of Police Bills at the command of the municipal government. Let us, therefore, express the hope that Musselburgh may soon do something to emerge from its old-fashioned condition; and, like its Parliamentary neighbours Leith and Portobello, address itself to the work of improvement and reform.

THE CORPORATION IMPROVEMENTS AT WHITEFRIARS AND THE NEW CITY OF LONDON SCHOOLS.

THE new streets and other improvements which have for some time been contemplated on land lying between Tudor-street and the Thames Embankment are about to be carried out, and preparatory to the commencement of the works the building materials, fixtures, and fittings of about twenty houses, ranges of warehouses, sheds, stabling and workshops in Temple-street, New Wharf, Grand Junction Wharf, Phœnix Wharf, and Tudor-street, were sold by auction on Tuesday, by Messrs. Horne, Eversfield, & Co., and the land will now immediately be cleared. The improvements include the construction of a new street, running north and south between Whitefriars-street, at its Junction with Tudor-street, and the Embankment, which will open out a direct line of communication between Fleet-street and the Embankment.

The first portion of the works in connexion with the erection of the new City of London Schools, at the south-east corner of this land, and facing the Embankment, has already been commenced. The land has been enclosed, and the ground is being excavated and levelled preliminary to getting in the foundations, for which Messrs. Hill & Higgs are the contractors.

PRINCIPAL ENTRANCE, SANTA MARIA DEL MAR, BARCELONA.

THE historical church of Santa Maria del Mar is one of the oldest of Barcelona, and, perhaps, also of the province of Catalonia. A chronicle of the sixteenth century attributes its foundation to the Gothe; according to another tradition, it is supposed that the primitive church, named Santa Maria de las Arenas, occupying the same site on the seashore, was erected upon the ruins of a Roman temple dedicated to Minerva.

The present building, next to the majestic cathedral the principal temple of the noble city of the house of Condé, was commenced in the year 1329, and finished in 1377. It consists of a nave and two aisles, and may be described as at once bold and elegant. They are separated by grand columns, which sustain nineteen arches and lofty vaults.

The exterior corresponds with the interior. The two high Gothic towers include much beautiful work, and the four portals, one in each façade, are justly celebrated.

Our engraving represents the principal portals

* This curious old stanza will be found in "Chambers's Popular Rhymes of Scotland." Edinburgh. 8vo. 1842.

† Golf derives its name from the "Club" (Ger., *Kolbe*; Dutch, *Kolf*), with which it is played. See an article in Chambers's "Encyclopædia," vol. IV., p. 823.

PRINCIPAL ENTRANCE, SANTA MARIA DEL MAR, BARCELONA, SPAIN.

THE BELGIAN EXHIBITION OF 1880: TRIUMPHAL ARCH.——M. BORDIAUX, ARCHITECT.

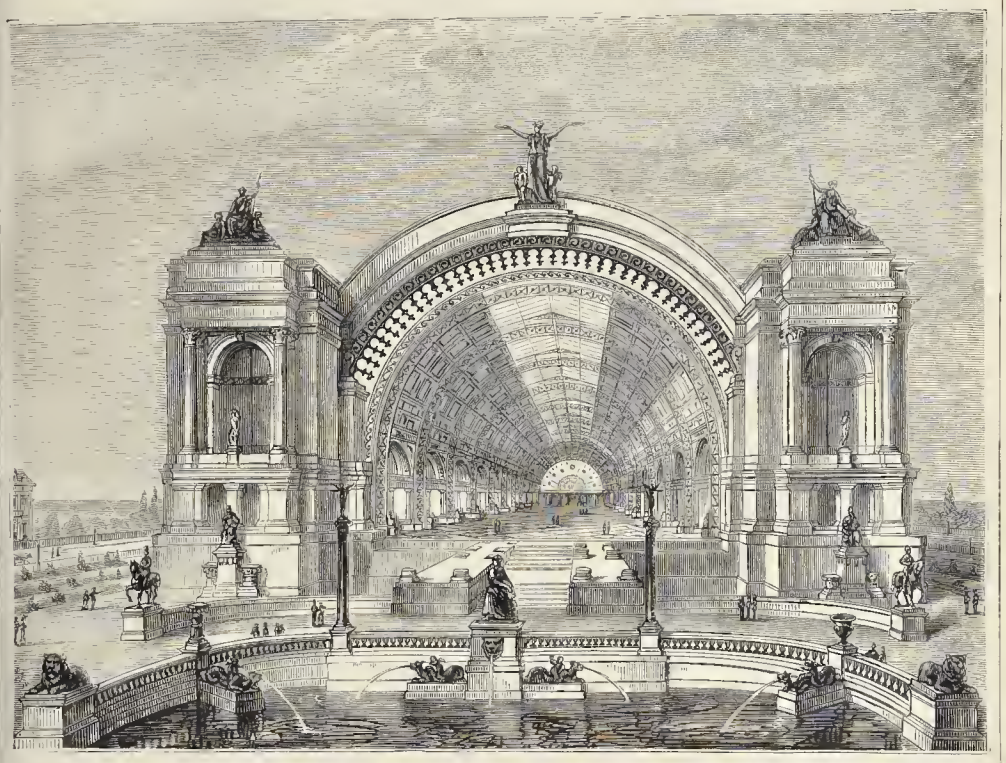
THE BELGIAN EXHIBITION, 1880.

IN mentioning recently the opening of the Brussels Exhibition,* we spoke of the building as including a semicircular colonnade, with a large portal, forming a triumphal arch, surmounted by a colossal group, the colonnade uniting two "pavillons" with colonnaded wings. We now give a view of the triumphal arch, and of one of the pavilions, as designed by M. Bordiaux, architect. The pavilions are the only substantial parts of the whole yet completed. They, in fact, form two separate buildings, standing boldly out in advance, the lateral extensions of the whole front being in a line with the central portico of the colonnade. At present this adds to the effective appearance of the pavilions, but greatly dwarfs the rest. As to the final effect which this arrangement will have upon the outward appearance of the whole, it is far too early to judge; for the two sides of the central portal are but raised to half their height; the arch is but scaffolding, and only the basement of the semicircular colonnade has been built, all the rest is wood, canvas, and rather clumsy make-believe, as is also the case with the colonnaded lateral extensions. Built substantially, finished artistically, and admirably situated on the old Champ-des-Manœuvres, the exhibition building would present a front that any Belgian might contemplate with pardonable national pride as he approached it from the broad length of the Rue de la Loi. Whether the eyes of the young nation are not larger than its hands, and whether time and money will serve to make this great front of the Belgian Exhibition building all that it is designed to be before the exhibition itself comes to an end, remains to be seen.

Along and against the basement of the semi-circular colonnade, on each side of the central portico, there is in course of erection a great amphitheatrical gallery, where spectators will be grouped at the several fêtes which during the next three months are to be held at the exhibition. The intervening space, lately cut up with traffic, and encumbered with constituting portions of portico, colonnade, and gallery, is now handsomely laid out. The great open space leading up to the building is already putting on the appearance of a beautiful garden. It is laid out rather more according to the rules of pictorial art than refined taste, and the many rather than the few will be consulted. The many, especially in the hot summer weather that is yet to come, will remain longer outside than in the building, footing the broad meandering walks, amid trees, flower-beds, cascades, waterfalls, and fountains, and in, and out, and around the erections now being raised to exemplify strength, taste, or wondrous utility in the building art. There will be but two restaurants in the grounds, one of *premier ordre*, the other *à pointe du jour*; but several *buvettes* will supply cold meats and other substantial refreshments; while more than one tasteful building offers all manner of fancy non-alcoholic drink, and the very fragile refreshments that French confectioners purvey.

The great iron and glass parallelogrammatic case that lies behind the architectural façade of the main building, and wherein the nation shows its ruder and rougher handiwork, is fully completed, and the arrangements for light and air promise to be effective, and to present a great contrast to those of the exhibition at Paris in 1878. Wood is judiciously introduced into the roofing, and the arrangements of white and very artistically colour-bordered canvas for subduing the light and guiding the currents of air are judicious and effective. The agricultural and woods and forests departments alone had their exhibits fully laid out, and were ready, with floors swept clean, for view when the exhibition opened. All the rest was more or less disorder, while in many parts the fittings for intended exhibits were wanting to the extent of whole groups, and chaos reigned. Still, judging from the compartments more or less forward, the

* See vol. xxxviii., p. 777.



THE BELGIAN EXHIBITION BUILDING: PAVILION.

provision alike for exhibitors and spectators is ample, and everything will be easily seen, and all may see it. The internal arrangements, decorations, and fittings of the pavilion of modern art present a *tout ensemble* of artistic beauty most admirable; and those of the pavilion of ancient art are complete. The great avenue and vestibule leading from the great central portico so long a way from completion, will, it is feared, from the gold and Dutch metal now being expended upon them, be somewhat of a glaring failure. But one must withhold judgment until the decorations are nearer completion.

That the buildings and erections of the exhibition should have been opened in so unfinished a state is to be deplored; but 70,000 square mètres are a great deal of ground to cover in the time that has been allotted for the work. The Belgians are not inexperienced in such works, but this is a much larger undertaking of the kind than any they have yet compassed, being fifteen times the extent of their Halles-Centrales in 1874, and seven times the space occupied by the objects of health and for the preservation of life in 1876. They have complained that the exhibition which they made of their national industry in Paris in 1878 cost them a million francs, and have boasted that this will cost them but 200,000 francs more. That boast is over, and they are now willing to expend double the estimate, provided that the exhibition be but a success, and win for their country the admiration of Europe in general and great surprise and a little envy on the part of England in particular. Special facilities are to be given to the English to go and see, judge, and compare. At a conference in Brussels between representatives of the South-Eastern, London, Chatham, and Dover, and the Belgian State railways and of the Belgian marine, it was resolved that at stated periods during the exhibition and *fêtes* of the jubilee, return tickets between London and Brussels, *viâ* Ostend and Calais, should be issued for a single fare.

NEW (R.C.) CHURCH OF ST. FRANCIS, GLASGOW.

THIS church, which is now being built for the Franciscan Friars (the Very Reverend Father Cuthbert Wood, guardian), is situated at the corner of Cumberland-street and Mathieson-street, in the south side of Glasgow.

It is being built entirely of Williamswood stone, both for facings and dressings. When finished the church will consist of chancel and chapels, nave, aisles, baptistery, choir for the friars, west gallery, and corridor connecting the friary with the church. The nave, which is the portion now in course of erection, consists of seven bays, and is 150 ft. long. The nave is 38 ft. wide, and the aisles are 13 ft. 6 in. wide, the total width being 72 ft. The height to the wall plate is 60 ft., and to the ridge 96 ft. In the clearstory there are triplets of lancet-windows, which will form one bold lantern, a most necessary feature in a town like Glasgow. At the west end there is a buttressed staircase which leads to the gallery. The roof is composed of framed main and intermediate principals.

The church is very severe in style, and quite in harmony with the order for which it is being built. It is not generally known that the Franciscan fathers are one and the same with the "Friars Minor" or "Grey Friars," and the following few particulars of the ancient foundation in Glasgow will be interesting to some of our readers.

The Friars Minor came into Glasgow in the year 1449, at the instance of Bishop William Turnbull, then bishop of Glasgow, and were lodged in a private house in or near the High-street, where they were generously supported during twenty-six years by the Very Rev. Thomas Forsyth, a canon of the cathedral.

Under the episcopate of Bishop John Laing, his private residence was extended and formed into a regular friary in the year 1476. This bishop assisted Canon Thomas Forsyth in erecting a church and cloister, and on the ninth Sunday after Pentecost solemnly consecrated the same in honour of the Mother of God. Bishop Turnbull sent the first F. Guardian of the Glasgow Friary (F. James Mirhead) to Rome to obtain the Bull of Pope Nicholas V. for the foundation of the Glasgow University. The first Professor of Philosophy in the same, Elias Forbes, afterwards became a Franciscan, and died in the Glasgow Friary. F. Francis Govan, second guardian of the house, was the first provincial of the restored Scotch Franciscan Province. The friars were expelled from their home in 1560, and their church and house ransacked under the Duke of Chatelherault and Earl of Argyll.

After an absence of 308 years, the Friars-Minor were re-established in Glasgow, on the south side, in 1868, and took possession of their new friary in 1862,—the same year that the city improvements swept away the last remaining portions of the ancient structure, which, along with the "Grey Friars Wynd," become things of history.

The church, which is rapidly rising, is expected to be completed about the middle of next year. The whole is being carried out from the designs and under the superintendence of Messrs. Pugin & Pugin, of Westminster.

The original estimate for the nave was 10,060*l.*, but subsequently another bay was added, which raised the total cost of that portion to about 12,000*l.* Mr. John Devlin, of Glasgow, is the contractor; the clerk of works is Mr. Dalton.

THE INFLUENCE OF ART AND THE DRAMA ON RELIGION.

THIS was the subject of a discourse delivered on Sunday morning last (*apropos* of the death of Mr. Tom Taylor) by the Rev. Jeffery Worthington, at Brixton Unitarian Church, Effra-road. Taking as his text the fourth, fifth, and sixth verses of the twelfth chapter of St. Paul's First Epistle to the Corinthians,* the preacher observed that the "diversities" of which the apostle speaks may be taken as inclusive of a range extending far beyond the circle of "gifts" and "administrations" and "operations" exercised within the immediate fold of the Church. St. Paul, in the chapter from which the text is taken, is writing of "spiritual" gifts. But surely we may here reckon a vast variety of powers that are accessory to and often directly promotive of the reign of a true faith and a pure religion. Who, for instance, shall estimate the influence of so-called secular art and literature in relation to religion? I have no intention of dwelling upon the somewhat debated question of the introduction into our actual worship of God of extensive art surroundings, although I have never had any hesitation in avowing the deep-seated conviction that, when taking a due place only in relation to matters of the foremost importance, a careful attention to "the beautiful," both in God's House and God's Acre, may be made a large means to a noble end. Not to offend, but rather to satisfy, the eye and the ear, undoubtedly aids the reverence of many, and surely need hinder the prayer and praise of none. There are but few, I think, who gaze upon the vaulted roofs and stately proportions of some venerable cathedral, or upon

> "Each minute and unseen part,"

as wrought with loving hand by many a humble devotee of art, without a sense of peace stealing over the heart, which is a fit preparation for the attitude of adoration; while that man must be indeed devoid of some manly attribute on whom the swelling organ and the solemn anthem, or the apt words of eloquent pleading from an earnest brother's soul, tell no tale whispering of saintly things. This, however, is not the matter for chief consideration to-day. I have in mind the relation of Art and Literature with Religion, taking Art and Literature in that sense which is, with a certain absence of precision, termed secular. During the past week there was removed from the midst of an honourable career,—and that with a measure of suddenness,—a neighbour of ours in this South London district, who has been for many years intimately associated with the world of art as well as of literature, and his death seems a not unfit occasion shortly to dwell upon the theme which has been suggested. It was, perhaps, as one specially apt to descry and to point out the original genius of others, that the late Tom Taylor (who was two days ago followed to the grave by a gifted company of mourners) excelled. Yet he was not without a measure of originality of his own, else he would never have attained the eminence he did. He exercised his powers, perhaps, most particularly in three directions: as a professed art critic, as a dramatic author, and as the editor of a well-known publication, at once passingly popular, and most incisive in good-natured satire of the foibles of our public men and our every-day customs and fashions. Let us take these three directions of our departed brother's work in life, and examine the bearing of each upon the cause of religion.

I.—As I thought over how I should speak this morning, there lay before me on my table a couple of volumes consisting of a catalogue of a great "Art Treasures" exhibition, held twenty-three years ago, and of the handbooks to the various departments, in which, though originally prepared anonymously for the current literature of the day, I have reason to know that the deceased critic had a considerable share. The exhibition to which I refer was held in the great commercial city of Manchester,—the centre of a district more populous than any other in the Queen's dominions. In that same centre the last week has witnessed the formal proceedings connected with the foundation of a new English University. "What do you want with a University in Manchester?" has been the question of many. And, curiously enough, a quarter of a century ago, a noble duke (on being applied to for a contribution from his gallery to the exhibition to which I have referred) is said to have inquired, "What in the world do you want with art in Manchester?" The fact is that wherever there is a great population, and where a desire exists on the part of the cultured few to raise and refine the standard of culture amongst the many, there it will be found that efforts will be made to introduce the potent influence of art as well as of learning. It cannot often happen that great collections of art-treasures, such as the one to which I have alluded, can be placed within public reach. The works of noted excellence have become private property, and can only be gathered together by means of much labour and self-denial. Once in a generation only, perhaps, can the matter be accomplished. Yet even such an occasional exhibition is of unspeakable value. It helps to create a taste,—to promote a craving,—for the beautiful, even in the most prosaic of people; and this taste, this craving, leads to the adoption of means for its satisfaction. Annual exhibitions of works of art have long since ceased to be confined to the metropolis; while not only the mansions of the rich, but the cottage homes of England, are increasingly adorned with the insignia of a larger appreciation of art, and a more refined taste. The inexpensive reproductions, through latterly-devised processes, of some of the finest known pictures and statuary, have helped on the good work, and the man who has aimed to popularise a knowledge of the rules of art, and to educate society by his appreciative criticism, is worthy of a place amongst those upon whose tomb a garland of honour shall be thrown. Will any one ask what is the bearing of all this upon religion? It is, indeed, sadly true that history bears record of those who adored the outwardly-beautiful, and knew, seemingly, no deeper thought. Yet it may be that they, even, were less coarse and brutal than otherwise they would have been. And how, in other cases? Questions concerning what has been aptly termed the "Philosophy of the Beautiful" must not come under lengthy consideration now. This, however, may be said, to use the phraseology of Victor Cousin,—that "Art is the representation of the ideal." And here we touch the key-note of an answer to the question. Passing by the current fashion of excessive realism in art,—which its noblest devotees have always acknowledged as connected with a sincere effort to school the artist for higher things,—let me quote a sentence or two from Cousin's discourse,* translated into our own tongue:—

> "Nature is an artist that enwraps the ideal in variable contingent forms, and these forms, more or less debase the moral idea enshrined within them. Art is a perfected Nature that conceives of unity beneath variety, of the general with the particular, the moral with the physical, the absolute with the relative, the ideal with the real, and that strives to reproduce the object of this conception, but by means more faithful. Art imitates nature in this sense: it draws out the moral idea sketched in every object. Art surpasses nature in this sense: it renders the forms more pure and more in unison with the moral idea they express. Art undoubtedly does not *realise* the ideal in very deed, but it bestows upon it more clearness and higher majesty. It is in this light that we must understand this sentence, 'Art is the representation of the ideal.'"

The author from whom I have borrowed this suggestive thought includes here a reference to Poetry and Music, placing Painting, Sculpture, and Architecture last in rank, "because [he asserts] their action, more limited, has in view works more special and confined than that of Poetry or of Music, and consequently at a greater distance from the ideal." Finally, setting a law before the artist, Cousin adds,—

> "Endeavour to appreciate by your taste the beauty presented you in Nature, but do not be contented with this merely meditative opinion, which belongs chiefly to the philosopher; display your genius; set the ideal free from the enthralment of the real, and bring back the absolute afresh, clothed in purer forms. If you shut yourself up within the narrow boundary of the individual and the variable, your works will vanish and be forgotten, like all that is changeful. That you may live for ever in the hearts of other men, lay hold on that which never passes away, the absolute, the ideal, the pure idea of the beautiful; this is one of the manifestations of Infinite Being,—of God."

And thus, it seems to me, we are led to a conception of the manner in which Art is the handmaiden of Religion. The true artist cannot satisfy his conception of the ideal, doubtless. But if he does his best, he rouses the noblest sympathies of his fellow-men, and leads them also behind the veil that hides the solemn mysteries.

II.—Having under review the varied labours of the man whose just-terminated earthly course has suggested these remarks, we have next briefly to note the bearing of the Drama,—and more particularly of a certain class of the Drama,—upon the religious culture of to-day. Time *was*,—and time *is*, in certain quarters,—when to place the two terms, "the stage" and "the pulpit" in any sort of juxtaposition were to commit a terrible impropriety. Yet, at the present moment, we have actually existing, amidst the numberless societies and clubs of London, one specially designed to bring together the teachers of the stage and the teachers of the Church, or, in other terms, those professionally connected with the drama, and the clergy of the Established and other Churches. The association appears to have a considerable measure of success, and the aim set before its members, viz., to raise the high moral tone of the great mass of the people, is surely pure and virtuous enough to secure such sympathy and support as may be accorded. None who know the history of the *English* stage,—to specialise the criticism,—but must admit in sorrow the misuse to which it has often been subjected, and a plausible excuse has, indeed, existed for those who avow themselves distinct opponents of the theatre under any practically possible conduct. I am disposed, however, to the conviction that the good far outweighs the possible evil, which is not, indeed, when the stage is duly supervised, in any way the direct outcome of the theatre itself. I spoke just now of the fact that a particular class of drama was suggested to us to-day, referring to the fact that the late Mr. Taylor chiefly exercised his dramatic faculties by seeking to "hold the mirror up to Nature,"—to delineate the joys and sorrows, the temptations and conquests over temptation, of his heroes and his heroines. The same critical faculty which enabled him to point out the excellence or the defects of a work of art,—which also, indeed, gave him the power of sketching the biographies of Haydon and Sir Joshua Reynolds,—further came to his aid when dealing with the characters introduced upon the stage. Doubtless in the case of the drama,—as in the cases of poetry, music, and painting, the *dictum* of Cousin that "art is the representation of the ideal" may be accepted, and the greatest dramatic masters produce their *dramatis personæ* in consistence with a carefully-elaborated study of mankind at large. Contemplation has been evoked, and in the creatures ultimately made to strut upon the stage, *all* men recognise features and traits of character in which *they* have a share, and for which they are conscious of a deeply-seated sympathy. But a more ordinary type of the drama,—and one which is especially popular in these days,—finds its sphere of work in what may perhaps be compared with the realistic school of painting. The characters of the play are just such as may be met with any day in the City bank or the West End drawing-room, in the workman's cottage or the nobleman's mansion, in the haunts of vice or amidst the ways where virtue shines triumphant. We see our neighbours photographed, and sometimes ourselves too. And though we may affirm that here is not the highest form of the drama, yet we must admit that there is presented to us a form which may be made highly conducive to good morals,—ay, very helpful to the cause of that true religion which crowns morality with its own beautiful crown of Faith, and Hope, and Love. There is a power in hand, then, here: one that may be made to preach sermons to those whom, alas! the pulpit does not reach.

III.—I have left myself but a moment or two to speak of the late Mr. Taylor's editorship of the most popular of our satirical periodicals. But the healthy influence exerted over a circle that scarce knows a bound needs no new assertion or proof. In many a happy home,—in every newsroom of the land,—at each railway bookstall,—through the window of its birthplace in Fleet-street,—the genial humour and merry wit of *Punch* are enjoyed to the full. None ought to be offended by its sallies, and many should be warned by its half-veiled wisdom. I go further, for I am well convinced that faults have been corrected, and moral victories achieved, through the instrumentality of this keen, though generous, mentor. Now and then, moreover, we have noted in its pages some record of tender memories and loving

* "There are diversities of gifts, but the same Spirit. And there are differences of administrations, but the same Lord. And there are diversities of operations, but it is the same God which worketh all in all."

* "The Philosophy of the Beautiful." By Victor Cousin. Translated into English by J. C. Daniel.

honour of brethren gone to the far-off land (far-off and yet so very near!); and we have felt how, behind the critic's lash, was concealed the spirit of Christian feeling and Christian trust. I donbt not bnt that, ere many days are over, we shall read a similar "*In Memoriam*," associated with the name I have named this morning, and that we shall he assnred how we shall miss from our midst one whose pure motive and high intent rendered him not only a valued private friend, but also a devoted servant of the brethren whom he saw, and of the God whom he could not see.

PRIZE DRAWINGS AT SOUTH KENSINGTON.

THE drawings, and a few models, for which prizes have been awarded hy the Department of Science and Art this year, have been, as usnal, collectively exhibited in one of the exhibition galleries adjoining the Horticultural Gardens. We may add that they were very inconveniently placed for visitors in a far remote gallery on the npper floor, the route to which was not to be found without a good deal of interviewing of police officers. If it is desired that it should be a snbject of interest to the public, it would be better to exhibit tbe collection in a more easily accessible room, and give some clear announcement of it at the proper entrance.

Tbe whole collection of drawings does not show any material alteration in general merit from those of last year. As usnal, the decorative work is the best. The figure-drawing does not show any attempt at original thought or design; on the contrary, one cannot hut he impressed with its exceedingly prosaic character. The drawings from the life seem mostly taken from models possessing no qualities whicb could he said to lend themselves to the suggestion of graceful or picturesqne pose or expression; and one cannot help feeling a donbt whether this kind of rather laboured drawing from inferior models is at all likely to evoke in the stndents any feeling for the really expressive power of tbe human figure. Of carefnl and painstaking work there is a good deal; bnt we confess to a feeling that there is a good deal of vulgarity in the drawings of this olass, arising partly from the subjects, partly from the want of style and feeling in the artists. To copy carefnlly and in a black heavily-shaded style, the imperfections of some rather ill-shaped figures, seems a process too much calculated to stifle the real art-feeling in the mind of the student, and snbstitute for it a cold attempt at mechanical accuracy. One does not, of course, expect studies from the life to represent always Apollos and Vennses, but we have seen many studies that represented much more of artistic feeling than these. Tbe drawings from the round (caste) are mostly good; and some of the anatomical studies are very thorough and well drawn. We may mention a drawing in sepia of a skeleton, with the figure outlined upon it, hy Mr. W. Fergnsson, which is excellent, and has received a "National" book-prize. As far as we can nnderstand the pecnliar phraseology of the Department, however, tbe adjective "National" does not convey that the student has beaten all others in the kingdom in that class of drawing, for the word seems to be tacked on indiscriminately to a very large proportion of the prizes. Bnt we have given up trying to nnderstand the numerous terms which are nsed in a special sense belonging to the Department alone, whose awkwardness and affectation in dealing with the English language seems part of a system. The prevalence of red tape is conspicnous also in the elaborate system of numbering and ticketing everything, which makes the descriptions of the drawings look like a snm in arithmetic. As a sample: in connexion with one drawing, an architectural one, of no great consequence, we noted the following various numerations: the anthor of the drawing is in one relation "5759," in another he is "38 N" (if we read the ticket right); at the foot of the drawing "23 A" is placed after his name, and he is described as having received a "National Bronze Medal 420," and a "third-grade prize 712,—1880." It is to he hoped, with all this effort, that the position and statns in the Department of the author of the drawing are sufficiently defined to the official mind, though the result is hardly intelligible to outsiders; bnt one cannot help thinking that if we had more figure-drawing and fewer figures it would be more to the purpose.

There is not much development of oil painting, the most prominent works being three studies of still-life, for one of which a gold medal has been gained by the artist, Mr. Watson, and a silver medal bas been awarded to each of the other two. Tbey are not hung in a good light, and are probably, therefore, seen to disadvantage. The gold medal work is carefully finished and harmonious in colour, but is heavy in appearance, and we are again strnck, as in the case of the figure-drawings, with the want of artistic feeling; there seems no effort to realise any charm in the grouping of the decorative objects portrayed, only a dull, dead realism. To say of a still-life picture that it is deficient in life may seem a contradiction in terms, bnt that is the impression these paintings give us. The still-life drawings in water-colour have more sparkle and more feeling for incidents of light and colour, and there are two or three admirable specimens among them. When we come to the decorative work, the standard is much higher, and there is a good deal of design among the works of this class which is as good as it can be in colonr and form, taking the artists on their own ground, though we find too much of naturalism, and should like to see a little more studied conventionalism in the wall-paper designs and other things of that class. Among some of the decorative work we noted as very snccessful a design for a tapestry cnrtain (Miss Deeley, Lambeth); a design very well drawn and coloured, for a perforated Parian vase in Indian style, hy Mr. J. Crook, of Worcester,—a place from which one naturally expects ability in designing ornamental ware; various wall-papers, among which one hy Mr. Farnsworth (Nottingham) is remarkably good, and has the advantage of being more conventionalised and more thonghtfully composed than most of the others. A sheet of pencil outline studies of historic styles of ornament, hy Mr. W. Stevenson (Edinburgh), though not exactly design, shows careful study of the characteristics of different schools of ornament. The design for a ceiling snitable for a synagogne (Mr. Bradbnrn, Coalbrook-dale), in which emblems of Jewish faith and ritual are worked into the design, has a great deal of merit both in design and in its careful and elaborate drawing. There are many very pretty designs for lace, among which we may single ont two for flonncings, hy Miss Emily Heise (Birkenhead), which are charming. Some designs for chintzes, by Mr. Sewell, are very pretty and very effective, and suitable; and the Owen Jones prize has been given to Mr. Smith for a design for fireplace tiles, based on honeysuckle, which is very pretty and original, but not qnite sufficiently conventionalised to have pleased Owen Jones himself.

Nothing among the architectural work seems worth mentioning. The drawings for which prizes are bestowed are mere commonplace pieces of imitation Gothic, or very ordinary house designs, with no feeling or originality in a single instance that we noticed; all we can say is, that we saw nothing among them so positively and absurdly had as we remember noticing in one or two former collections. The conclusion from the whole seems to be that the Department is a good school for the promotion of decorative design, but in the other, and what are in some respects higher, walks of art, it has not succeeded in evoking much artistic feeling.

TRURO CATHEDRAL.

IT has just been decided to build a wooden temporary church for nse whilst the choir of this cathedral is being built. The structure is to be at once commenced, and as soon as it is np,—in abont two months' time,—the present building will come down, all bnt the sonth chancel aisle wall, which, it will he remembered, it is intended to incorporate into the new building. The wooden church, which will hold about 400 worshippers, is to be erected on the north-east site, in snch a way as not to interfere with the footings of the catbedral foundations; the choir will, therefore, he completed without any interference witb the temporary structure. The stones of the old church will he all incorporated in the new walls. The work of restoring the south wall of the chancel to its proper perpendicnlar will be one of some little difficulty. It is 8 in. out of the upright, and the stone,—a soft Elvin,—being all face-bedded, is terribly decayed. The work upon it is of a particularly rich, though somewhat late, character, not altogether nniqne in Cornwall, the church of St. Mary Magdelene at Launceston exhibiting similar, even much more elaborate work, all over its exterior.

Under the managing clerk of works, Mr. James Bubb, of London, to whom the carrying ont of the work of the cathedral is entrusted, a staff of men are engaged in getting in the footings of the east end of tbe choir. Tbese go right down to the solid shillet rock beneath, which forms a splendid foundation. The concrete for the foundations is made with the stone of the old houses which originally stood upon the site now to be built upon. The wooden staging that was used at the late royal ceremonial has all been sold by auction, and removed. Both the foundation-stone and the memorial one are of grey Cornish granite. Tbe former is from the Mahe Quarries, near Penryn, and the latter from the neighbourhood of St. Dennis, six miles north-west of St. Austell. The foundation-stone stands upon the plinth of the north-east angle buttress. It measnres 3 ft. 8 in. by 2 ft. 1 in. by 11 in. The memorial-stone is at the other end of the church, and occurs in the south arcade, three bays from its western respond. The base and one course of the columu that would occur there were fixed prior to the ceremony. Upon this the Prince placed another course, which forms the memorial in questiou, and since then yet another has been added on the top of it, all in St. Dennis granite. Mr. Dan. Delafield is the foreman.

VALUE OF PROPERTY IN ELY PLACE.

THE value of land and property in Ely-place was shown hy a sale of houses there which took place at the Auction Mart last week. Messrs. Fox & Bousfield offered for sale, under an order from the Court of Chancery, ten freehold houses on the east and west sides. Amongst the advantages which the property was said to possess, it was stated that, being on the verge of the City, bnt just ontside the liberties, it was free from many of the hurdens of citizenship and taxation, whilst its central position, with facilities of access both from the east and the west, gave it a great value both for professional and commercial prrposes. The particulars also stated that as all the ground leases were about to expire, some of the present tenants were only holding on sufferance at nominal rents, and that the houses would be snrrendered in good repair. Tbe information was added that Ely-place is governed hy its own commission, under a special Act of Parliament. Mr. Bousfield, the auctioneer, before offering the property, which consisted of ten lots, adverted to tbe snbstantial character of the buildings, although old, remarking that after having stood for a period of something like ninety-nine years, they were still in the very best of condition, and far more substantial than many other houses which bad been erected during the present century. He added that should any purchasers intend to rebnild, they would find in the houses as they now stood some of the very best timber, and other materials eqnally good. Tbe sale then proceeded, the first lot consisting of a house containing a ground area of 1,138 superficial feet, being sold for 3,520*l.*; lot 2, a house and ground area, 1,120 ft., 3,400*l.*; lot 3, ground area 1,090 ft., 3,500*l.*; lot 4, 1,116 ft., 3,640*l.*; lot 5, 1,340 ft., 2,900*l.*; lot 6, 1,498 ft., 3,600*l.*; lot 7, 1,529 ft., 3,450*l.*; lot 8, 1,538 ft., 3,300*l.*; lot 9, 1,523 ft., 3,650*l.*; lot 10, 1,520 ft., 3,610*l.* The total proceeds of the sale amonnted to 34,550*l.*, the average price obtained for the several lots being about 3*l.* per foot.

Public Art Museums.—Through the efforts of the Bradford Free Library and Art Museum Committee, the authorities at South Kensington Museum have been induced to vary in their favour the usnal regulations with respect to loans of artistic objects to provincial museums which prevent the loan of such objects to corporations. Hitherto such loans could only be obtained through schools of art, or by electing members of the schools of art as members of the Art Museums Committee. Official information of the change referred to has been received from the South Kensington Museum by Mr. W. T. M'Gowan, Town Clerk of Bradford, and a deputation has been appointed by the Bradford Free Library and Art Museum Committee to confer with the officials at South Kensington with the view to the selection of snitable objects.

WALSALL SEWERAGE SCHEME.

At a recent meeting of the Walsall Town Council, the chief business was the consideration of the sewage scheme which has been prepared by the borough surveyor (Mr. W. J. Boys), in pursuance of the directions of the General Purposes Committee. These were given after full consideration and final rejection of the schemes which were sent in to compete for the 200 guineas which the Council offered as premiums.

The Borough Surveyor's report on the new scheme commences by stating the general idea in the following words:—"In order that you may be able to thoroughly comprehend the question, it is necessary for me to state that the area of the borough is 8,080 acres, the present population being estimated at 58,460, residing in 10,707 houses, the present estimated daily average quantity of sewage to be disposed of being calculated from a population of 57,000 at 40 gallons per head = 2,280,000 gallons, or 10,178½ tons. The quantity of sewage to be disposed of day by day may appear large, but, after careful gaugings extending over a long period, and taking into consideration the average rainfall at Walsall, which was during the decade ending 1877, ·68 in. per week, or 33·55 in. per annum, I am of opinion that 40 gallons per head per day is the proper quantity to be estimated for. I propose, for the purpose of my scheme, to divide the borough into two districts,—viz., Walsall and Bloxwich,—and to deal with the whole of the sewage from each district separately, by gravitation, and without any chemical treatment whatever. The Walsall district comprises the town of Walsall, Caldmore, Palfrey, Pleck, Bescot, James Bridge, Park Brook, Birchills, Bloxwich-road as far as Pratt's Bridge, Coal-pool, Sargent's-hill, and Park-lodge, —the area being about 5,302 acres, part rural and part urban, with a population estimated at 47,460. The scheme provides an outlet for the drainage of all the places mentioned, and every house, and the estimate includes the cost of all outfall and branch sewers that are, in my opinion, now necessary. The sewage from this district will flow, by gravitation, to the land selected for the purification thereof,—viz., the Brockhurst Farm, and other land adjoining, and will be discharged at three levels commanding the whole of the land. A portion of the Walsall sewage which I propose to discharge into subsidence tanks at the lowest level (*i.e.*, by the outfall sewer near Wallow's-lane, now in course of construction) is largely diluted with subsoil water and waste tap-water; it contains a large quantity of trade refuse of various colours, chiefly from the tanyards and curriers and other trades where dyes are used. The remaining portion of the sewage, which I propose to discharge at higher levels, will be purely domestic, and may be applied to the land direct without passing through the tanks. The Bloxwich district is to the north of Pratt's Bridge, and includes Bloxwich, Blakenall, Leamore, Harden, Wallington-heath, Little Bloxwich, Fishley, Goscote, Sneyd-lane, Broad-lane, and Bloxwich-road coming down to Pratt's Bridge,—the area being about 2,778 acres, with a scattered population of about 11,000. The sewage from a population of about 9,500 residing in the district will flow by gravitation to the land selected for its purification, which adjoins Slacky-lane, Goscote. The quality of the sewage from this district is purely of a domestic character, and may be applied direct to the land. The scheme provides, as far as is practicable with one system of sewers, to exclude the rain water; and ample provision is made for the disposal of the storm water by overflows or storm-water outlets at convenient places." After fully describing the plans showing these details, the report proceeds,—"The land proposed for the purification of the Walsall sewage is known as the Brockhurst Farm, and other land adjoining thereto, near Bescot Station; it comprises an area of 175a. 0r. 36p. or thereabouts, including watercourses, roads, farmyards, and buildings; it is partly situate in the parishes of Walsall, West Bromwich, and Wednesbury, and joins up to a part of the land where the West Bromwich sewage is to be treated. Thirty-four trial holes have been excavated in this land, to an average depth of 5 ft., to ascertain the nature of the ground; these prove that about 152 acres of this land is such that, if properly under-drained, it will be very suitable for the purification of sewage. A portion of the land, about 13 acres, is of a retentive nature and clay, and, in my opinion, is not so suitable; but, notwithstanding this, I have included it in the scheme, believing that it will be more economical to treat for the whole than pay a large price for severance and take a portion only. . . . . The land proposed for the purification of the sewage from the Bloxwich district is situate on the northern side of Slacky-lane, Goscote; it comprises an area of 21 acres or thereabouts, including canal basin, marl pit, cottage and garden, and watercourse; nearly the whole of it is situate within the Borough, a small portion, less than one acre, being in the parish of Pelsall."

The report proceeds to explain the system of purification proposed,—namely, subsidence in tanks and filtration through closely under-drained land. It also points out why this is advocated,—namely, because broad irrigation would necessitate taking more land than can be obtained in the neighbourhood, and because chemical treatment is both uncertain and expensive. It then proceeds,—"The proposed outfall sewers, designed for this district, are at such a level that the sewage from all the existing sewers will be intercepted thereby, at the same time affording ample facilities for intercepting the sewage from those places still unsewered. Special care has been taken in choosing the line of these sewers, to secure good gradients for all the sewers without deep cuttings, thereby reducing to a minimum the first cost and future maintenance. The outfall sewers are designed to contour the lands through which they pass, and it is proposed to construct outlets at suitable points, to enable the intervening lands to be irrigated, if and when required. The scheme provides for three outfall sewers for the Walsall district, viz.—1st. The main outfall sewer, now in course of construction, to receive the sewage from a population of about 34,500, and low enough to drain the lowest house in the borough. Another outfall sewer, commencing at the end of the existing sewer in the road to Palfrey to receive the sewage from a population of about 2,000, and low enough to drain all the houses that may hereafter be erected on the Palfrey side of the town. A third outfall sewer from Ablewell-street, to consist of iron pipes laid to a hydraulic inclination of 1 in 592, to receive the sewage from a population of 11,000. The combined delivering capacity of these sewers will be equal to 14,525,000 gallons per day, so that ample provision is made for a large increase in population. There will be two outfall sewers for the Bloxwich district. The scheme provides for sewering all the declared streets where sewers are necessary, and the cost is included in the estimates. The length of sewers required in the Walsall district being 200 lineal yards, 9 in. diameter; 2,477 lineal yards, 12 in. diameter; 2,755 lineal yards, 15 in. diameter; and 882 lineal yards, 18 in. diameter. The length of sewers necessary in the Bloxwich district being 832 lineal yards, 9 in. diameter; 3,167 lineal yards, 12 in. diameter; 2,323 lineal yards, 15 in. diameter; and 366 lineal yards, 18 in. diameter." A summary of the estimates is also given, and shows the probable cost to be,—Walsall and Bloxwich districts: Land, including cost of provisional order, arbitration, and other legal charges, under-draining, preparing surface, levelling, making carriers, and engineering tanks, main carriers, engine-house, turbine, pumps, pipes and alteration to brook course, 51,380*l.* 4s. 1d. Outfall sewers,—Walsall district, 11,360*l.* 0s. 3d.; Bloxwich district, 3,297*l.* 1s.; total, 14,657*l.* 1s. 3d. Branch or street sewers,—Walsall district, 2,852*l.* 11s.; Bloxwich district, 2,724*l.* 0s. 5d.; total, 5,576*l.* 11s. 5d. Add 10 per cent. for contingencies, 7,161*l.* 7s. 8d.; total 78,775*l.* 4s. 5d. To this the scheme adds,—"The annual working expenses in utilising and purifying the sewage on the proposed farms will, in my opinion, be more than repaid by the crops and other produce; I do not, therefore, charge the scheme with any expense in manipulating the sewage;" and then proceeds to give the following estimate of the annual cost, viz.:—"To repay principal and interest on loans for the land and works necessary for the purification of the sewage,—viz., on land at 4 per cent. per annum, extended over a period of fifty years, and on works and other charges at 4 per cent., extended over a period of thirty years, will require an annual instalment of 2,540*l.* 6s. 8d. Outfall and branch sewers, total estimated cost, 20,233*l.* 12s. 8d.; to repay principal and interest at 4 per cent. per annum on a loan of 20,244*l.*, in thirty years, will require an annual instalment of 1,170*l.* 0s. 7d. Total annual cost of purification and collection, 3,710*l.* 7s. 3d. To repay principal and interest on a loan of 7,161*l.*, in thirty years at 4 per cent., will require an annual instalment of 414*l.* 2s. 6d. Annual cost of maintenance of sewers, pumps, pipes, &c., 200*l.* Total annual cost, 4,324*l.* 9s. 9d." The scheme is designed of sufficient capacity for a population of 100,000, so that no further sewers will be necessary for some time.

The Town Council resolved to adopt and carry out the scheme.

No. 42, OLD BROAD-STREET.

THE premises, No. 42, Old Broad-street, recently in the occupation of the London and Provincial Bank of Ireland, are in course of demolition, the business of the bank having been removed to premises in Throgmorton Avenue. The house is not of any great interest in point of art or age, but is a fair type of a London merchant's house of 100 years ago, and as these houses are gradually disappearing from the City to make way for structures better adapted to the wants of the age it may not be superfluous to record its destruction.

"In June, 1780," said Sir Charles Reed the other day, in the course of a speech in which he contrasted the present condition of the metropolis with its condition a century ago, "London was in the hands of a fierce and lawless mob; incendiary fires were burning in every direction, the trained band were called out, the military were quartered in St. Paul's Cathedral, the Lord Mayor was summoned to the Privy Council, and on the Mansion House was posted a royal proclamation in the following words:—'That the outrages committed by bands of desperate and abandoned men in various parts of this metropolis have so far overborne all civil authority . . . . that I feel myself obliged by every duty and affection for my people to suppress in every part those rebellious insurrections . . . . by the application of the force entrusted to me by Parliament.'"

These "rebellious insurrections" were afterwards known as the Gordon riots. Broad-street was the scene of an encounter between the trained bands, or City Volunteers, and the people, in which some five or six of the latter were killed and others taken prisoners, by which, as a contemporary account states, "the first damp was struck into the spirit of outrage."

The house No. 42, Broad-street, is shown on the left of the picture of the Riot in Broad-street on the 7th of June, 1780, painted by Francis Wheatley, of which an engraving was published by Messrs. Boydell, dedicated to the London Light Horse Volunteers and Military Foot Association, which associations appear to have distinguished themselves by their efforts to subdue the rising, and were publicly thanked by the City authorities for their exertions.

From this plate the house appears to have undergone but little change during the last hundred years, the only alteration perceptible being the covering the whole of the brickwork with cement, and the removal of the two lamps which formerly stood on each side of the entrance doorway.

The house was in all probability originally an inn, with the sign of the White Horse. In old maps a narrow alley is show in the rear of the house called White Horse-place. Union-court, which adjoins the house on the south, was formerly called White Horse-yard, and this name was in all likelihood changed to its present title after the Act of Union of 1800.

From the Pyrenees.—Dr. Phené writes us that in making a survey of the mountain d'Espiaup, near the Spanish frontier, in the Pyrenees, he found circles and ovals formed of stone, like those on Dartmoor, and both straight and curved avenues. He has also witnessed the ceremony of the fires of St. John, on the eve of his festival. The fires are lighted by the clergy while a service is chanted, and after the burning the charred wood is distributed to every household, and kept religiously all the year, as was the custom in Britain before the Christian era. At one of those fires, at Luchon, living serpents are burned in the flames. He is at present making an examination of the antiquities in the Balearic Islands, for a comparison of the Talayots of Minorca with those of Malta, and with the similar structure found by him in Brittany.

RESUSCITATION OF OLD ART.

THE practice of architecture in modern times has been so different from that which prevailed in the periods of Mediæval and Classical art, and a comparison of results is so little favourable to the present system, that it is perhaps worth while to inquire whether it may not be possible to revert to the old method of procedure, or, at least, to adapt it to the circumstances of our own day, especially as we are just now,—as regards style or mere fashion,—in a rather uncertain and transitional state.

Looking back into the earlier centuries of the architectural world, we see that "there were giants in those days;" while a glance at the last few hundred years forces from us the melancholy confession that in them there were but pigmies. If we ask ourselves what really noble edifice,—what great original work,—has been accomplished in modern times, we stand abashed at the answer, "None." If a really original edifice exists, which competent judges would venture to say is equal in merit to some well-known ancient structure, it must be altogether an exceptional example. The Houses of Parliament are very magnificent, but they are so only from the profusion of forms and details borrowed from fifteenth-century remains, but which are not at all of the nineteenth. They are honourable to the skill of their designer, considering the time and circumstances of their erection; creditable if we admit that mere resuscitation is the proper work of a modern architect. But resuscitation of the dry bones of antiquity was not the principle that produced the great work of Classical or Mediæval times. On the contrary, the old was constantly destroyed to make way for the new. The improvement and perfection of one style was the rule, however long it took. The Greeks, with a mental perfection which the world can no longer match, required at least four centuries to bring a single style to perfection. It was only by almost innumerable, and most gradual changes, that they eventually produced that perfect example of architecture,—the Parthenon at Athens. The Byzantines and Arabs also adopted a single style, and produced great and beautiful architectural work. In the West of Europe, in the Middle Ages, the same method was pursued, and each progressive step in the gradual development of style was an illustration to a page of history. Thus, in ancient times the results were perfectly satisfactory. The vital principle of originality was everywhere at work, and noble buildings rose in all countries.

What, then, is the cause of the difference? How is it that in modern times there is an absence of all originality of all power to design a really noble edifice that is not evidently more or less a copy of some other building or its details, more or less a mere adaptation,—in fact, a lithic plagiarism? Have the religious, political, and social circumstances of recent generations eradicated the power of original conception and design, or have we, as architects, been at fault in our mode of working in our architectural practice?

The facts above stated, and a little consideration of our ways and doings in these days, points to the latter as the cause of modern architectural failures. Whether from vanity, or the desire to attract public attention, or the eagerness to grow suddenly rich,—from whatever cause,—there is a restless working in numerous styles, the very principles of some of which are as opposite as the poles asunder. Since the time of Elizabeth there have been nearly a dozen changes of style, and now we have again the Anneite fashion,—a new birth of an older Renaissance. Elizabethan, Jacobean, Revolutionary, Queen Anne, Greek, Gothic, Italian, Renaissance, have followed one another in rapid succession during 300 years. Deducting 100 years for the Hanoverian period and 100 for revolutionary Cromwellian and Interregnum periods, when, strictly speaking, there was no architecture, we have a little period of twelve years or so for each fashion against the 400 which the Hellenic architects required to perfect one.

To come to our own day. In the present exhibition at the Royal Academy the designs for modern buildings range in style from the period of the Plantagenets to that of the Hanoverians. Of course, there is a great cleverness and much beauty in the designs, but scarcely such as to make the reflective observer happy, for he cannot help asking himself, "Shall we ever do anything really original at all equal to the work of the great ages of art if we continue our present method of *dilettanti* copying this, that, and other styles for mere fashion's sake, and our present mere antiquarian draughtsmanship, which are alike unworthy of the true architect and of any national encouragement?" Quite as rational would it be for a fashionable man to don a Tudor or even Georgian suit, and appear to-day in it in Kensington-gardens or Regent-street, but his friends would probably question his sanity, although the dress of those periods,—from an art point of view,—was more beautiful than that worn by men of the present day.

Let us hope, then, if there be any truth in these remarks, that the Council of the Institute or the next conference may initiate for us, or help us to initiate, some better principle of architectural practice by which the efforts of all shall be concentrated upon one style that may be decided to be the best suited to national and social requirements. By this means,—as like causes produce like effects,—there may be not only such a thing in the future as an Anglican style, but national buildings that may fairly and favourably be compared with the architectural *chefs-d'œuvre* of past ages. As Mr. Fergusson tells us that we are of a race which produced some of the wonders of ancient architecture, we must by nature possess the power to do great things in art, and we may, therefore, hope that the power only wants proper direction.

H. T.

THE TRUE CRITIC.

GIVE me the critic with a mind well stored,
A judgment balanced, and a heart sincere,
To pick my faults, and set me in the way
When I have miss'd the beautiful, the true;
Not some coarse blatant, with outpour of words,—
All foul extremes, that reek of prejudice,—
Whose reason lists from Truth's just equipose,
And dang'rous heels o'er to the depths of wrong:
Nor subtle flatt'rer, with a diction smooth,
Trimming to all, as changed occasion prompts,
Who fools the dullard into outward show,
To don fine aire but natural to the best,
Or weighs down genius with his fulsome praise,
With sense of shame to be bespatter'd so,
By one inconstant to the paths of truth.

Where artist fails the critic can but aid
To make that whole which else would seem a part,
A falling short of perfect excellence,—
Of excellence in work, in work still low,
Compared with that grand spiritcraft divine,
That excellence the critic cannot word,
The excellence that flows from deeper source,
The unseen schooling of the inmost soul.

METER.

OBITUARY.

Mr. John Guest, F.S.A., died suddenly at his residence at Rotherham, on Sunday last, while preparing to attend church. Mr. Guest was well known for his industry in historical researches. His latest work was "The History of Rotherham."

Mr. Edmund James Smith, C.E.—We regret to learn that Mr. E. J. Smith, C.E., died somewhat unexpectedly on Wednesday morning from the effects of an operation which he had undergone. His name has recently been prominently before the public as the principal witness before the House of Commons Select Committee on the Metropolitan Water Supply. He was a partner in the firm of Smiths & Gore, past-President of the Institution of Surveyors, member of the Northern Institute of Mining Engineers, Associate of the Institution of Civil Engineers, Crown Receiver for the Northern Counties, and surveyor to the Ecclesiastical Commissioners. After the prorogation of Parliament last year, Sir R. Cross, the then Home Secretary, entrusted to him the work of considering the matter of the water supply of London, and of negotiating with the water companies for the purchase of their undertakings.

Exeter Hall.—We understand that the committee for the altering of the hall for the purposes of the Young Men's Christian Association have requested Mr. A. Pite, Messrs. Searle, Son, & Hayes, and Mr. Charles Bell to submit designs and estimates for the same.

ARCHITECT AND CONTRACTOR.

A CORRESPONDENT writes as follows:—

"A has a contract for a large building, and has made a sub-contract with B to lay Portland cement concrete floor to the entire satisfaction of Mr. C., who happens to be the architect under whom A has to work. The work having to a certain extent proceeded, Mr. C. notices to A that it is a mixture of lime and cement B is putting down, and orders the work laid,—value over 300*l.*,—to be taken up. A sends a copy of this notice to B, and insists on breaking his contract. B asserts most positively that no lime whatever has been used, and offers to abide entirely by the arbitration of four of the best known architects. A declines to do this, relying on that condition of the contract that the work was subject to the satisfaction of Mr. C. alone.

Now, as a fact, none but the best cement was used,—no lime whatever. B's character is considerably damaged by the stoppage of the work. What remedy has B? We are told none against A, the terms of the contract being that the work was to be to the satisfaction of Mr. C. Please say if an architect can make a sweeping charge of this kind with impunity. B asked Mr. C. for an explanation, but he ignores B, simply acknowledging A in the matter. Your opinion is anxiously looked for by many contractors.

B, THE SUFFERER."

*** We can give but little satisfaction. It seems to us that B has no remedy against A, or the architect, unless some kind of fraud existed. The determination of a particular person has been made supreme, and those who have put him above them, and raised him to a *quasi*-judicial position, must for good or ill abide by his decision. At the same time, so much depends on the wording of the contract that, if all the facts were known, something more favourable to the sub-contractor might possibly be said. Proper advice should be taken. One practical point occurs to us, viz., what was the difference in the material relaid from that put down in the first instance,—though we are not quite sure from the letter whether the work was completed by some one other than B, which might materially affect the question. Thus the suggestion would occur, would an action for libel lie at the suit of B against C? To which, again, comes a counter suggestion. Possibly in that case the architect could plead that the communication was a privileged one. As to the first question, however, we feel no doubt; for the position of architects is so like that of a judge that one can give an opinion on broad principles subject to any special terms in contracts.

LION'S HEAD BY THE LATE SIR EDWIN LANDSEER.

ONE of the colossal lions' heads mentioned in our article on "Lions and Eagles," of May 29 (vol. xxxviii., p. 653), has been placed in the first large entrance-room of the South Kensington Museum. It is at present in plaster of Paris, but it is to be hoped that eventually, as we suggested before, it will be preserved in some more durable material, by being exactly copied by electro-deposit, in copper, so as to retain all the delicate touches of texture, on which, as in his paintings, so much of the felicity of effect of this great artist's work depends.

ACCIDENTS.

ON Saturday afternoon the roof and a portion of the wall of a stable situated at Pope's-hill, Shadwell, fell into the street with a crash. Four children, aged between three and six years, who were playing in the road at the time, were struck by the falling *débris*, and injured in a more or less serious manner. They were conveyed to the Children's Hospital, Shadwell. The building is stated to belong to what is known as the Shadwell Estate.

A lofty obelisk, which is in course of erection on Tower-hill, Beaumaris, as a public memorial to the late Sir Richard Bulkeley, formerly lord-lieutenant of Carnarvonshire, suddenly fell on Monday morning, a number of workmen having a very narrow escape. The monument, which was to have been formally unveiled next week, stood in a very exposed situation, and it is supposed that the recent heavy storms weakened its foundations.

THE NEW HALL OF THE SCOTTISH CORPORATION.

THIS interesting building, which was opened on Wednesday last by his Grace the Duke of Argyll, is thus described by its architect, Professor Donaldson:—

The New Scots' Hall, Crane-court, Fleet-street, London, has been erected in the years 1879-80, upon the site of the hall destroyed by fire on the 15th November, 1877. A building committee was appointed to confer with the architect of the corporation, as to the arrangements and accommodation of the new building. After much consideration it was determined to adopt a suggestion of Mr. Shand, member of the committee, that the new hall should be built on the space occupied by the old main building next Crane-court and by the four blocks of dwellings in Fleur-de-Lis-court, which had been burned down in the general conflagration. Three of these block were to be thrown into the main building, and one was to be left uncovered to afford an opening into Fleur-de-Lis-court from the northern court lying between the main building and the old chapel in Trinity Church-passage. This open space would thus afford light and air to Fleur-de-Lis-court and the premises of the Corporation,—an arrangement the more necessary for the health of the occupants in the Scots' Corporation premises, as the dwellings in the immediate vicinity are closely packed and densely occupied. Another part of this scheme was that the block of the old chapel, next Trinity Church-passage, should be left quite distinct from the new buildings, and available to be let or sold, as the Corporation might deem best.

The new block of buildings as carried out consists of three stories in height, the lowermost one being occupied by the entrance-hall from Crane-court, and by the principal staircase, as also by a back entrance for pensioners from the north court, with a secondary staircase for them. There is a spacious chapel, having 1,450 ft. superficial, and a height of 17 ft. for the congregation of pensioners on pay-days, and the religious service on that occasion. There are also convenient easements for the pensioners in attendance. The first floor contains the principal feature of the building; that is, the hall for the annual and other meetings of the governors, and for the transaction of the public business of the corporation. It has a northern aspect, and is 43 ft. 9 in. long by 18 ft. wide and 16 ft. high in the clear. It is well lighted, with a central bay-window and two large windows on the north side. At the east end of the hall is the fireplace, with a handsome white marble chimney-piece, resembling that at Craigievar Castle, Scotland (illustrated by Billings in his "Baronial Buildings"), with granite columns on each side, and surmounted by a large coat of the Royal arms, as at Craigievar, here heraldically emblasoned. It is of stone, and was saved from the unhappy conflagration of 1877, and, consequently, is a precious relic of the past. Over these arms are two panels, containing the shields of his Royal Highness the Prince of Wales and Duke of Rothsay, president of the corporation; and of his Royal Highness the Duke of Edinburgh, quartered with the arms of their Royal and Imperial Princesses, so as to produce a pleasing variety in the two panels, and at the same time a compliment to the two illustrious princesses. It is proposed to fill in twenty-nine like panels, which run along the three sides of the hall, immediately under the ceiling, with shields of the Scottish nobility, or chieftains of clans and representatives of historical Scottish families, who may be disposed to contribute their armorial bearings. So natural a series would keep alive the traditional spirit of feudal brotherhood, a leading and attractive feature of the Scottish character. This would to a degree, and for the present, serve to replace the picture of Mary Queen of Scots, a portrait of his Majesty King William IV., by Wilkie, and various other paintings which decorated the old hall, but were destroyed by the fire.

Adjoining the hall is the committee-room, about 19 ft. long by 15 ft. 6 in. wide, and a clerk's office, about 23 ft. long by an average width of 14 ft., which two rooms and hall, with the principal and pensioners' staircases, occupy the whole area of the first floor. The story above has a private room for the secretary of the corporation, and nine other residential apartments for the two under-officers (visitor and collector and the beadle), with their several conveniences attached, and they are well lighted and airy.

The architect has sought to infuse into the building as much as possible of the national sentiment. He has therefore largely adopted in the ornamental details the lion rampant, the thistle, and similar emblems; and, in the architectural arrangement, the high-pitched roof and small turrets to the front, and such-like features of Scottish architecture.

The Building Committee have proceeded with the greatest economy in the erection of the new building, consistent with its purpose and as a representative establishment.

The Corporation had to receive 3,768*l.* from the insurance company; and proceeded to receive tenders from well-known builders for the main erection, the lowest one being for 5,778*l.*, from Mr. Hobson, of Duke-street, Adelphi, whose work has been carried out very satisfactorily.

There have been executed other additional works, which, with professional charges, furniture, and other disbursements, will altogether exceed the funds immediately applicable to building purposes by a large balance of 5,000*l.*, which must be raised by special donations from the friends of the Corporation and of the Scottish poor, in order not to cripple the funds appropriated to their relief.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AT a special general meeting on Monday last (Mr. John Whichcord, F.S.A., president, in the chair), held in accordance with By-laws LXIV. and LXXI., to authorise the sale of 2,300*l.* Three per Cent. Consols, for the purpose of discharging the remaining liabilities in respect to the recent premises alterations, and of reimbursing to the ordinary funds a portion of the advances made therefrom, the discussion was opened by the President, and continued by Mr. Henry Currey, member of council; Mr. Joseph Jennings, Fellow; Mr. R. W. Edis, F.S.A., Fellow; Mr. Arthur Cates, member of council; Mr. T. Roger Smith, Fellow; Mr. David Brandon, F.S.A., member of council; Mr. Wyatt Papworth, Fellow; Mr. Octavius Hansard, member of council; Mr. E. R. Robson, F.S.A., Fellow; Mr. Charles Fowler, Fellow; and the President. It was ultimately resolved:—

"That the council be authorised to instruct the honorary treasurer to sell 2,300*l.* Three per Cent. Consols, for the purpose of discharging the remaining liabilities in respect to the recent premises alterations, and of reimbursing to the ordinary fund a portion of the advances made therefrom."

Donations to the Premises Improvement Fund amounting to 32*l.* 6*s.* were announced.

ARRANGEMENTS FOR NEXT SESSION.

The Council announce that a trial will be made, during the next session, of the following arrangements, namely:—

(1.) *Ordinary and other Meetings of the Session.*—*a.* That the prescribed number of meetings be, as at present, fourteen. *b.* That the said fourteen meetings consist, as at present, of one annual, one special (for the award of prizes), and twelve ordinary. *c.* That four of the twelve ordinary meetings be devoted to business, as follows:—One to be the opening meeting on the first Monday in November; another to be the closing meeting in May, when the Gold Medal is presented; the two others, if not required for adjourned discussions, to be convened principally for the discussions of professional questions and the interchange of opinion on matters of practice, as well as on current topics not open for criticism at other ordinary meetings and referred to in By-law LXIX. *d.* That the remaining eight ordinary meetings be devoted exclusively to the reading of papers and discussions thereon.

(2.) *The Preliminary Business.*—*e.* That the ballot for new members be taken only at the four ordinary meetings for business, and that notice of the same be duly sent to each proposer of the several candidates requesting his presence. *f.* That the announcement of donations of all kinds to the library, the library fund, and to other funds, be made only at the four ordinary meetings for business. *g.* That new members be admitted by the chairman at any meeting during the session. *h.* That nominations of candidates for membership be read at such meetings only as will conform with the terms of By-law XV., whereby a recommendation must be read at one ordinary meeting, hung up during that and the two successive ordinary meetings, at the latter of which the candidate shall be balloted for. *i.* That in announcing the nominations the name and address of the candidate shall alone be read,—the nomination paper to be immediately afterwards hung on the board in the meeting-room. *k.* That, at the eight ordinary meetings for the reading of papers and discussions thereon, no questions other than relating to the subject of the evening be submitted.

(3.) *Papers and Discussions.*—*l.* That subjects for papers and discussions be invited under the following heads:—I. New materials, building appliances, and systems of construction. II. Architectural works in progress at home and abroad, the foreign papers to be translated for the authors if required. III. Fine art specially relating to architecture. IV. Archæology. V. Building and municipal legislation. VI. Sanitary science. . . . .

(4.) *Publication of Proceedings and Transactions.*—*o.* That the Journal of Proceedings be issued, as at present, on the Thursday following each meeting; and that an abstract of the papers and discussions be printed in that journal. Further, that the Presidential addresses at the opening meeting, the Gold Medal presentation, and on other occasions, be printed in full in that journal. *p.* That the volume of Transactions be issued annually to members; and that the volume of Transactions consist of accepted papers, philosophical, practical, or artistic, together with full discussions thereon. Also that the Presidential addresses be therein reprinted, together with an appendix containing the memoirs of deceased members, with such other matter as the Council may deem desirable. . . . .

The Council regret to announce that Mr. Thomas H. Wyatt, F.S.A., past-president, has retired, in consequence of ill-health, from the office of honorary secretary. In accepting Mr. Wyatt's resignation, the Council referred to those duties which, since February of last year, had been performed to the advantage of all his colleagues, and to the undoubted satisfaction of the general body of members, offering him at the same time a cordial expression of their thanks and a renewed assurance of their sincere regard. The election of Mr. Wyatt's successor will take place at the opening meeting of next session.

ARCHÆOLOGICAL SOCIETIES.

Norfolk.—The annual excursion of the Norfolk Archæological Society took place a few days ago to Woodton, Hedenham, Bedingham, Darrow Wood, Denton, Earsham, and Bungay. At Woodton Church some notes respecting the building, prepared by Mr. R. M. Phipson, architect, were read, in his absence, by the Rev. C. R. Manning, who supplemented them by observations of his own. There is no chancel arch, and the old, like the new, roof, ran through the nave and chancel. The walls of the church are almost entirely Early Decorated, and Mr. Manning puts their date at 1280-90. On the north side of the nave are two two-light Decorated windows. The south aisle is divided from the nave by four very plain Early Decorated arches and piers; the west pier being larger than the others,—a not very uncommon occurrence. Various and somewhat fanciful reasons have been given for this arrangement. The Decorated east window of the south aisle is one of the best in the county. It has wave mouldings and two sunk shafts, a very unusual head inside at the point of the arch, and a finial and two corbels outside. The chancel east window is of a Transition character, having a dog-tooth ornament in the jambs and arch, partly restored and injudiciously picked out in unsatisfactory colours. If relieved at all the colour should be much more subdued. There are remains of stairs to the rood-loft, and a rather rare two-light little opening into the church of Early Decorated work, or transition from Early English. The position of the rood-beam must have been peculiar, as it terminated over the point of the easternmost bay of the south aisle. One of those curious architectural contrivances, a squint, enabled the priest in the chancel to see into the chapel at the end of the south aisle. In the chancel is an Early Decorated piscina of rather uncommon design, a plain sedile, and beneath the east window a double aumbry or locker. The font is Early English, if not late Norman, as it has a Norman arcade of Purbeck marble. The smaller shafts are modern. The tower is of the eleventh century, with the exception of the octagon top story, added three or four centuries later. On the outside of the north wall, near the north porch, is an early arch, supposed to be the recess for the founder's tomb. At Hedenham the excursionists visited the restored Church of St. Peter, of which, according to Mr. Phipson, "the good old interesting work seems to have been restored off the face of the earth,—another case of over-zealous and mistaken restoration." The building consists of a nave, chancel, and square west tower, the latter in three stages without buttresses, and appears to be of the Early Perpendicular style. The walls of the nave are Early English, almost Transition. The nave has a plain oak roof of Decorated work, like the chancels of Howe and Mutford churches. Notwithstanding the slight tie in construction, these kind of roofs have stood well together for nearly 500 years. The font, plain Perpendicular, is said to have remained plastered over for 200 years, the plaster having been used to protect it from Puritanical demolition. At Bedingham Church, the lower part of the chancel walls is, according to Mr. Phipson's notes, Early Decorated, almost transition from Early English (about 1300). There is a good south priest's door, with dog-tooth mouldings, and a four-light large east window, with interesting tracery, without cusps, of the same date. A

Perpendicular clearstory of late dato has been built over the original chancel walls, which were low. The north and south aisles are Decorated, with Perpendicular insertions, with a Transition doorway, from Early English to Decorated, preserved in the former. At the east and west ends of the north aisle are Early Decorated windows, which, like the doorway, Mr. Phipson believes, are not *in situ*. The circular west tower of the thirteenth century has an octagon top of later date. The Perpendicular font is enriched with carved emblems of the evangelists; but one peculiarity is that St. Matthew is represented holding a guitar instead of a scroll. The most striking object in the church is the Perpendicular rood-screen, which has been well preserved. There are no figures upon the panels. There is piscina and a sedilia in the chancel, and also a quaint piscina in the chapel of the aisle. On the way to Denton the carriages were pulled up by the side of some fields, and the party were obligingly led by a farmer of the old school to a lot of leased ground with a clump of trees on the top, known as Darrow Wood, and just visible from the highway. By traditions, this modest eminence is known in the village as the Castle-hill, with a small ridge beyond called Hangman's-hill. As the party approached the wood, which is in the middle of some pasture land, it was found to be a hill about 15 ft. high, and surrounded by a moat containing water nearly all round. The hill has a hollow in the centre. On one side, from the moat, there extend earthworks enclosing a considerable portion of land, and beyond that is the ridge called Hangman's-hill. This interesting spot,—of which no mention is made in any Norfolk history,—was visited thirty years ago by Mr. Greville Chester and by Mr. Rix. Mr. Alfred Suckling, in writing to the latter gentleman, suggested that it was Danish work, and served as a look-out in connexion with the Danish camp at Earsham. But, Mr. Manning now observed, it is clear not only that Mr. Suckling was mistaken, but that in these earthworks, partly hidden beneath the woods at Darrow, we have the site of the residence of a Saxon lord. In the bollow of the mound was his timber-built residence: perhaps the edge of the mound was palisaded; and over the moat was a drawbridge which gave access into the exterior enclosure, that was no doubt also palisaded, where the cattle were secured. It was suggested that the name, Hangman's-hill, given to the slight eminence beyond, may perpetuate the site where the lord executed justice; and Mr. Manning remarked that no doubt the Saxon lord had the right of hanging, and would have what would be called a gallows-hill. The society will no doubt respond to an expressed wish, and have a survey of the place made for publication in a future number of its Proceedings. On arriving at Denton, a very welcome break occurred in the day's proceedings, suggested by the bospitable feelings of the Rector of Denton, the Rev. C. A. St. J. Mildmay, who, with Mrs. Mildmay, most kindly received and entertained the visitors. The church of Denton, dedicated to the Virgin, is a grand Early Decorated building. The east window is of similar design to that at Bedingham, but is filled with stained glass, some of it of a very old date. Earsham Church having been visited, the party departed for Bungay, and an inspection of the ruins of Bungay castle brought the programme of the day to a close.

Derbyshire.—The members of the Derbyshire Archæological and Natural History Society recently had an excursion to Norbury and Ashbourn. At Norbury Church, Mr. J. C. Cox, author of the "Churches of Derbyshire," described the building and the fine altar-tombs in the chancel. The Manor House at Norbury, formerly the residence of the Fitzherberts, and now occupied by Mr. Maskery, was next visited. Here the ancient court-yard, the quaint old panelling, and the interesting cartouches of stained glass still preserved in the windows, were inspected with much interest. After luncheon the Grammar-school at Ashbourn was visited, and here Mr. J. Sleigh, J.P., read a paper on "Old Ashbourn Families." The party then proceeded to Ashbourn Hall, where the rest of the day was spent.

Honour to the Craft.—The successful competitor for the Queen's Prize at Wimbledon this year, Mr. Ferguson, is a stonemason, from Argyllshire. What winning this prize means is only understood by those who have tried at it.

FEES UNDER METROPOLITAN BUILDING ACT.

FLATS.

AT Westminster Police-court Messrs. Perry & Co., builders, of Tredegar Works, Bow, appeared to an adjourned summons, at the instance of Mr. Edward Drury, the district surveyor of St. Margaret and St. John and the Close of St. Peter, Westminster, to show cause why they should not pay the sum of 10*l.* 2s. 6d., fees which had accrued by reason of Mr. Drury surveying and causing the regulations of the 18th and 19th Victoria, chapter 122, section 51, second schedule, to be carried out with regard to the works known as Queen's Mansions East, Victoria-street, Westminster, not yet finished. Mr. Drury conducted his own case, and Mr. Greenwood defended.

Mr. Drury relied firstly on the 27th section, sub-section 2, and contended that the blocks known as A, B, C, D, E, F, and G were separate buildings, and as such were entitled to be charged for. In January, 1879, he received notice from Messrs. Perry that the building in course of erection was intended to be used as residential chambers of an area of 10,300 ft. He drew attention to sub-section 2 by letter, and on the 22nd January notices were received that Perry & Co. would erect three blocks of buildings. Notice was then sent that there were no continuous party walls, and attention was drawn to the section relating to this. After communicating with Mr. Knowles, the surveyor, and seeing him, the defendants were written to asking for separate notices, and on the 17th of July a Mr. Bartlett called, the notices were filled up, and they were signed, for four sets of chambers on the basement and seven each on the ground and next five floors. Mr. Drury had constantly surveyed the buildings, which were advertised as residential chambers in sets, and were so constructed as to be occupied by separate tenants, and consequently the claim for 10*l.* 2s. 6d. was made up of fees under the Act for separate buildings.

Mr. Greenwood, for the defence, contended that in signing these notices his clients had no idea that this building was going to be considered separate buildings. They were really given in mistake for the original plans, and the intention was that it should be an hotel.

In answer to Mr. D'Eyncourt, Mr. Drury stated that the fee for an hotel would be 10*l.*, payable a month after the roof was on. There was communication from set to set only by a balcony. These notices were good, and they were really separate tenements.

Mr. Greenwood objected to the claim for the basement, 10*l.* 15s., as they took it of another builder, and it should be charged to him.

In the end Mr. D'Eyncourt came to the conclusion that the fees were due as claimed, and ordered them to be paid.

A CONTRACTOR'S CLAIM.

WILLAN *v.* THE MAYOR OF ROCHDALE.

THIS was an action (tried at the recent Manchester Summer Assizes before Mr. Justice Lindley) brought against the Corporation of Rochdale, to recover 143*l.*, the balance of a contract for the construction of a sewer.

Mr. Ambrose, Q.C., in opening the case, said the plaintiff was a contractor, living at Chorlton-upon-Medlock, and his claim arose upon a contract which he had accepted to make a sewer, and the larger portion of his claim had been practically admitted in a letter he had received from the corporation surveyor; but a counter claim had been set up by the corporation on account of a claim which they had most absurdly paid for damages alleged to have been done to certain houses by the excavations for the sewer. He contended, however, that not only was the plaintiff in no way liable for the alleged damage, but neither were the corporation liable.

On behalf of the defendants it was contended that the damages to the houses arose from the negligence of the contractor.

His Lord-hip said that being the case he could not see how the corporation had been compelled to pay for the damages if they were due to the negligence of the contractor, and it appeared to him that they could not sustain the counter claim.

Mr. Potter, Q.C., for the defendant, applied to his Lordship to allow the action to stand over with leave to the defendants to amend.

His Lordship thought the only fair thing would be to decide against the corporation with regard to the counter claim without prejudice to a further action if they saw their way to it.

After a long discussion with regard to two accounts of minor importance, a verdict was entered for the plaintiff for the amount claimed, with liberty for the defendants to bring an action, if so advised, for 132*l.*, the amount which the corporation had paid on account of damages alleged to have been caused by the negligent construction of the sewer.

HOUSE PROPERTY.

ON Monday Messrs. Mallett, Booker, & Co. offered three valuable West End residences for sale, at the Auction Mart, Tokenhouse-yard. The first property submitted was the large freehold mansion, No. 15, Lancaster-gate, close to Kensington-gardens and Hyde Park, described as a handsome building of imposing elevation, containing five floors and basement, together with a range of spacious stabling and coach-house. The mansion was stated to be built on arches, with iron girders, and let on lease for twenty-one years at a rent of 330*l.* per annum, the present estimated value being 400*l.* The property was sold for 7,020*l.*, the purchaser being stated to be the present occupier.

SHIPBUILDING AND ENGINEERING PROPERTY AT MILLWALL AND CUBITT TOWN.

THREE large business properties on the banks of the Thames, at Millwall and Cubitt Town, connected with shipbuilding and engineering, which have now been unoccupied and idle for some few years past, were offered for sale at the Auction Mart, on Monday last, at upset prices, upwards of one-third less than their original cost and present estimated value, without meeting with an offer for any one of the three. The auctioneer was Mr. Bradshaw Brown. Thus, for property offered for an aggregate sum of 39,500*l.*, but estimated to be worth 79,330*l.*, no purchaser could be found.

STATUES.

Lord Lawrence.—It is stated that the executive committee for this object have determined to erect a standing statue in bronze in the open air, and to give Mr. Boehm the commission for the work. No site has as yet been fixed on, but it is desired, if possible, to obtain the unoccupied corner of Waterloo-place.

Robert Raikes.—The model of a group of statuary to the memory of Robert Raikes has been unveiled at Gloucester in connexion with the Sunday School Centenary. The group consists of two figures,—Robert Raikes, 8 ft. 4 in. in height, and a little child who is nestled close to his side, and over whom he has thrown his right arm with an air of protecting kindness. The attitude of Raikes is very striking. He is standing on the left leg, with the right advanced; with his left hand he holds a Bible closely pressed to his heart. The face is open, and beaming with the love and kindness which were so eminently characteristic of the man. The sculptors are Messrs. W. & T. Wills, of London. The marble group is to be placed in the cathedral when the necessary funds,—1,000*l.*,—are raised by public subscription.

Daniel O'Connell. — On Saturday last a special meeting of the O'Connell Monument Committee was held in the Mansion House, Dublin. The chair was occupied by the Right Hon. E. Dwyer Gray, M.P., Lord Mayor, who said he had called the meeting because it appeared to him there was a very strong public feeling that the base of the monument, as it at present stood, was too wide. Memorials to that effect to the Corporation had been prepared, and the feeling was that the base at present was, more or less, an obstruction. He had, under these circumstances written a letter to Mr. Brock, asking him would it be practicable to reduce the size of the base without injuring the appearance of the monument? The following was the answer he had received from Mr. Brock:—

> My dear Lord Mayor,—If it is deemed important to secure a greater space for the thoroughfare around the O'Connell monument, the base may, I think, be reduced by 8 ft. without serious detriment to the appearance of the monument. This would bring the extreme width down to 32 ft. I propose to obtain the reduction by taking the steps up entirely, dispensing with the lower one altogether, and setting the two remaining ones back 4 ft. all round. Anything more than this could not be done without completely spoiling the general effect.—I am, my dear Lord Mayor, yours, &c., JAMES BROCK.

It was resolved to apply for the consent of the Corporation to the proposed alteration.

Sewage Purification at Paris.—As the city of Paris has tried various chemical and other means of dealing with sewage, and is now irrigating about 1,000 acres of land within five miles of the Tuileries, the following from the *République Française* will be of interest:—"On June 23rd last, the Municipal Council of Paris resolved, among other things, 'To approve, firstly, the continuation of irrigation in the fields of Gennevilliers, and the carrying of the sewage to the lower north-western part of the peninsula of St. Germain and adjoining farms, and the delivery of sewage from the conduits to persons on their routes, who shall be willing, by agricultural, chemical, or other means, to cleanse it, at their own expense and risk, for the sake of what they may be able to get out of it, subject to rules to be prepared; secondly, to ask the Government, in case the 1,500 hectares (3,700 acres) might be insufficient for the purification of the sewage without annoyance to the neighbourhood, to take into immediate consideration the extension of the present proposal and the irrigation of other districts in the valley of the Seine.'"

EMPLOYERS' LIABILITY BILL.

STRONG objections are raised by the master builders of the United Kingdom to Sub-clause 3 of Clause 1 of the Employers' Liability Bill, as the one which entails the greatest hardship upon employers, and especially those engaged in the building trade. They urge, and with justice,—

"That in the business of a builder a very large proportion of the persons employed throughout the various departments comprised in such business are persons who are of necessity in a position of some authority. The general foreman exercises authority over the other foremen, and these again exercise authority over those beneath them, and so on in a descending scale, until at last the person exercising authority is often a workman, and a workman in a comparatively humble grade: thus each bricklayer has working with him a labourer, who is expected to conform to the directions of such bricklayer, and the effect of Sub-clause 3 will therefore be not only to render the employer liable for the negligent acts of his general foreman, and his other foremen, but also for the negligent acts of all his bricklayers whereby the labourers working with such bricklayers sustain injury.

That the above case of the bricklayer and labourer is given simply by way of illustration, but in a large building business the persons who exercise authority such as the bricklayers may be counted by hundreds, and yet each of such persons will, by reason of Sub-clause 3, be in a position to render his employer liable to the payment of heavy damages."

It appeared, from the observations of the Right Hon. John George Dodson, made on moving the second reading of the Bill, that the object and scope of the Bill was only to render the employer liable for the acts of a person "to whom the employer distinctly delegates his own authority." The Sub-clause 3, however, as above pointed out, goes much further, and neutralises the effect of the definition clause, which limits the liability of employers to cases of negligence of persons who are not ordinarily engaged in manual labour, and thereby (so far at least as builders are concerned), almost abolishes the defence of common employment.

It is to be hoped, therefore, that Sub-clause 3 may be omitted from the Bill.

BUILDERS' TENDERS.

SIR,—"London Builder" is to be commended for having drawn attention to the forms of tender which almost invariably accompany bills of quantities. Clearly the intention of those who issue them is to obtain an undue advantage either in regard to any error that may have occurred in calculation, or through the conditions of contract.

Many builders have, I believe, protested against these forms by sending in tenders so worded as to avoid legal binding, such as,—"I estimate cost as per plans, &c., and subject to my approval of contract conditions, at the sum of—" but in this,—ignoring the architects' form,—they generally risk the non-reception of their tender, and consequent loss of time and money. The injustice of the proceeding is great, and calls for a remedy.

There is, I believe, a Builders' Association; but very little is heard of any practical work being achieved by that body. Much might be gained by mutual agreement in regard to this and other matters detrimental to the trade.

I would refer it to the consideration of the before-mentioned Association.

DELTA.

A CURIOSITY IN THE BUILDING LINE.

A "SURFOOT HOUSE."

FORTY years' experience in building, and a perusal of the usual works of reference, had, I thought, entitled me to consider that I pretty well knew all the various systems of building, especially in this neighbourhood (Taunton); but a few days since when at Othery, near the site of the castle of Sedgmoor, in Somerset, I was shown something quite new to me, and, I think, to most of the readers of works on building. It is known by the above name, a "surefoot house," and the term is well applied. It will be generally admitted that the destruction of most old houses is caused by the spreading of the roof forcing the walls out of the perpendicular. When the walls are of "cob," or mud, it is bad enough; but when erected of sandy deposit from a river, and the roof formed of heavy green unseasoned timber, covered with wet reeds or rushes, the poor walls have but a small chance. Now, in this neighbourhood, when it was wished to erect a house that should stand against the evils mentioned, it was the custom to first select crooked trees, which were cut down the centre, and then planted in the ground, say 20 ft. apart, with their tops touching each other at the ridge, and forming (when the joists were in) a figure something like the letter A with its lower ends buried in masonry to form the "surefoot," which could not move or spread. When several of these frames were erected in a line the "side timbers" were laid on the upper part of them, then the rafters, and finally covered with such reeds, rushes, or peelings as could be procured. The spaces below and between were then filled up with mud, cob, or sand; leaving openings for doors and windows, and a firm and durable house was formed, cool in summer, warm in winter, and in time dry and tolerably healthy. The exteriors were plastered down and lime-washed, shrubs planted, and ready for occupation.

EDWARD JEBOULT.

BRITISH MUSEUM LIBRARY.

SIR,—The remarks "C. C." makes in reference to publishers sending to the British Museum Library only what books they choose, and the time current numbers of periodicals are kept from the reader (usually said to be "at the binder's") are certainly well timed, for several times I have been unsuccessful in my quest after books. These, at the time, I made a note of, but unfortunately cannot lay my hand on it at present. One I distinctly remember,—requiring a certain number of the *Journal of Anatomy*, for 1878, I was handed vol. xiv., part 1, October, 1879, and courteously told that was the only number of the journal they had in the library. Another time I looked in vain for a now defunct journal, one that had some little existence previously to 1850, and we are made to believe every printed scrap, in the shape of a book or pamphlet, is to be found in this national library. Surely if there be not room at present to warrant calling for any stop to printed matter, the Treasury should be called upon to give additional room.

H. C. STANDAGE.

PROVINCIAL NEWS.

Hull.—On the 16th inst. the new stalls which have been erected in the market-place by the Corporation were used for the first time. From within the memory of the oldest inhabitant the old dilapidated wooden stalls, with the concomitants of refuse and filth which accumulated in the principal thoroughfares each market-day, have been associated with the market-place; but now all is changed. The market-place has been thoroughly purged of the old structures, and in their places a neat iron frame-work, with suitable coverings, has been erected in continuous lengths on the south and north church sides, and in the open space at the west end of the parish church.

Ripon.—Several street improvements are about to be effected in this city. These improvements, together with the operations which have just been commenced for the widening of North Bride, when completed, will confer considerable advantages upon the city.

Birmingham.—The fountain which occupies a considerable space in the centre of the Birmingham Market Hall has been removed, in accordance with a resolution of the Town Council. The fountain has been presented by the Markets and Fairs Committee to the Baths and Parks Committee, and the latter having decided to place it in Highgate Park, a number of men have been engaged, under the superintendence of Mr. Alfred Rodway and Mr. Hearn, in preparing the site, which is in the centre of the large grass plot lying between the terrace and the children's playground. The fountain will undoubtedly prove an additional ornament to this place of public resort.

Liverpool.—The Liverpool Town Council have, on the recommendation of the Markets Committee, accepted the tender of Mr. James Cheetham for altering the Roe-street end of St. John's Market to the improvement line, in accordance with the plans and specifications of the borough surveyor, amounting to 5,297*l.*

Manchester.—Proposals are made, in connexion with a movement for providing public entertainments in Manchester, for the erection of a room in a central position, of convenient size, and suitable for concerts, balls, bazaars, banquets, public meetings, dramatic performances, and public entertainments generally. A suitable plot of land, consisting of some 900 square yards, has been selected, situated in one of the principal thoroughfares of the city, which may be obtained at 12*l.* per yard. It is proposed to erect a building containing a hall capable of holding, according to requirements, from 800 to 1,200 persons. The hall will be so constructed as to be convertible into a small theatre when required, and have every accommodation in the way of waiting and dressing rooms. A design has been submitted, the estimate for which would be about 10,000*l.* It may be mentioned that the ground floor would include several shops.

Langport.—On the 3rd inst. that portion of the new cemetery which is intended for the burial of persons connected with the Established Church was dedicated and consecrated by the Bishop of Bath and Wells. The site for the cemetery, which is about an acre and a half in extent, was given by Mr. J. Broadmead, of Langport. It is situated on the high road between Langport and Aller, and is equally divided between Churchmen and Nonconformists. A large and commodious chapel has been erected by Mr. Davis, builder, of Langport, from designs prepared by Mr. Hall, architect, London. The building is in the Early English style, and is divided in the centre by a screen. One side is set apart for the Established Church and Nonconformists, but both portions are fitted up almost similarly in every respect. The building is of white lias stone, with Ham stone dressings. The total cost is about 1,200*l.*

Penzance.—A new vicarage-house for St. Paul's, Penzance, has been undertaken. The building is to be erected on a vacant spot at the end of Clarence-place, given for the purpose by the Misses Jago. Plans have been prepared by Mr. John Trounson, in accordance with the requirements of the Ecclesiastical Commissioners, who will make a grant towards the work. The building will cost nearly 1,500*l.*

Warrington.—For some three or four years it has been known at Warrington that the Cheshire Lines Company had purchased a large plot of land in Marsh House-lane, and contemplated the erection of engine-works thereon. The erection has now been determined upon, and the contract for the building, amounting to some 15,000*l.*, has been let to Mr. Aaron Houghton, of Godley. The works will be of an extensive nature, and it is believed that in the end the company will make as well as repair their engines at Warrington. In addition to this building, the branch line which is intended to shorten the distance between Liverpool and Manchester, and for which powers were obtained some time ago, is about to be constructed. The new branch line will be but two miles and a half long, and will extend from the Sankey Viaduct across Little Sankey Fields, the top of Bewsey-road, on to Padgate. The line for the fast expresses will thus miss Warrington altogether, and will have an almost straight run from Liverpool to Manchester, instead of the curves which exist from Sankey Viaduct to Warrington Station on the present line. The new branch, which will cost a large sum of money, will save about five minutes in the journey between the two places, which will then be accomplished in forty instead of forty-five minutes. Mr. Robert Heaton, contractor, of Warrington, has obtained the contract for the construction of about one mile and a half of the new line, from the Sankey Viaduct to Folly-lane, Warrington, and the work will be commenced forthwith.

Books.

Classic and Italian Painting. By E. J. POYNTER, R.A., and PERCY R. HEAD. London: Sampson Low & Co. 1880.

THIS is one of the art text-books edited by Mr. Poynter, another of which, that by Mr. T. Roger Smith on architecture, we noticed the other day. In the present case, however, Mr. Poynter seems to have done more than merely edit, as he mentions in the preface that he has made considerable additions to Mr. Head's work, "especially to the accounts of the earlier schools where it was important to show the connexion between them, and the means by which art spread from one part of Italy to another." This has been particularly the case in regard to the lives of great artists of rather exceptional genius and position, such as Mantegna. The more familiar of the great names in the sixteenth century are not treated as corresponding length, because information about them is easily accessible, and their merits are already matter of almost popular knowledge.

The editor, in the preface to the book, comments on the impossibility of pretending to carry the learner far on so vast a subject, in a mere text-book of this limited size, which hardly admits of its being more than a compilation. But "the least," he thinks, "that the future possessor of a fine house or a picture-gallery can get from such studies will be an insight into his ignorance concerning many things

which surrond him and meet his eye at every turn; and if his interest in tbem carry him but little further than the acquisition of a certain nnmber of names and dates by heart, the mere fact that he has been taught these may be an indication to him of their importance; and thus his small store of acquired facts may add to his contemplation of pictures and buildings that respect which is always attached to matters learnt in youth, and perhaps teach him to gaze upon them with a less vacant eye." This is certainly not an exorbitant demand to make for the usefulness of the work. We hope it may do a little more than this; but it is pretty clear that Mr. Poynter has a very low idea of the average capacity of the Englishman to understand what painting means, and perhaps he is not without too good reason for his opinion.

The little that is known in regard to wbat Greek painting may have been is brought together in the second chapter of the book, and forms an interesting memorandum on this head which may be useful even to those wbo are already not ignorant of the subject. Tbe first chapter deals with Egyptian painting, of wbich we know so much more, strangely enough, than of the douhtless far bigher art of the Greek painters, and some of the peculiarities of the Egyptian method in paicting are well illustrated. We cannot agree, however, in the supposition that the Egyptians, in their figure drawings, "combined profile and full view in a way which was no doubt intentional and systematic. Thus, for instance, thongh their faces are always drawn in profile, they represented the full face view of the eye." We opine that the eyes are drawn full just for the same reason that the face is drawn in profile: in either case it is the only way in which the feature can be represented by a draughtsman who is unable to foreshorten. Most children who try to draw a head do the same; they generally draw a profile head, and they then invariably put a full eye in it. The Egyptians were children as far as figne-drawing is concerned, and followed their instincts in the same way. The cbapter on Egypt is, we observe, signed with the editor's initials; we must therefore conclude that tbis is his opinion, in regard to which, we may say, in Dugald Dalgetty's formula, "We trust he will permit us to he surprised."

In regard to a hook going over such well-known snbjects in a brief and popular manner it would he out of place to say many words; the hook seems entirely to fulfil its intention as a popular introduction to the subject, and the characteristics and special position of each painter in regard to the history of art are clearly indicated. In the brief account of Michelangelo we must take exception to the statement that be "imparted to architecture a grandeur of style, fonnded on the study of proportion." This is about the last praise he deserves, his great architectural work heing, in fact, spoiled exactly hy the want of sense of proportion which destroys its scale. The cbapter on Greek painting, hefore alluded to, contains a good deal which is applicahle, and, perhaps, intended to he so, in a more general sense. Thus when we read in regard to Nicias, who insisted on the importance of choosing subjects worthy of the dignity of the art, that "this was a right and much-needed protest against the growing taste for petty trivialities wbich not long afterwards debased Greek art," and when we are told in the next paragraph how works of this latter trivial kind fetched great prices, "but high and serious art was nusaleable, although it was the fashion to profess much admiration and to give vast sums for works bearing the names of the great old masters," we feel pretty sure that any but the dullest reader will make a further application of the sentiment.

VARIORUM.

In a pamphlet entitled "A New Proposal for providing Improved Dwellings for the Poor" (Skeffington & Son), Mr. Fras. Rivington, the writer of it, suggests the introduotion of a *State Guarantee* for a moderate rate of annual interest npon a fixed amount of capital, to he supplied hy pu hlic companies for the erection of suitable dwellings for the poor and industrial classes. ——To *Social Notes* for July, Mr. Cave Thomas contributes an illustrated notice of the late Rev. F. D. Manrice, whiob includes an interesting sketch of the foundation of the Working Men's College, Great Ormond-street. —— The July nnmber of *Time* is hright and pleasant. The illustrations by Mr. Alfred Thompson bave become an important feature of the magazine. *Time* jumped into a good circulation at starting, and worthily maintains it.—— The current number of the *Quarterly* includes an informing srticle on "Middlesex." The writer says,—"The first English inhahitants of the most populous of English counties in the present day were a handful of rude settlers dwelling far apart along the banks of the Thames, and still further apart in the valleys of the Brent or of tbe tributaries of the Lea. A few villages marked the course of the ancient roads; hut there were no populous towns, no great market-places, no fortresses. Down to the time of the Norman Conquest, and much later, Middlesex remained but half cultivated, and a vast forest flourished over the face of the county. The land-springs of the heavy clays sent forth water-hrooks in abundance, and the brooks nourished willows and hazels, oaks and beeches. Many of the names which survive tell us of tbis time. The North Haw and the South Haw were divided hy the Coln. Acton is the town of the oak. Norwood and Ashford, Hounslow and Willesden, Southgate, Highgate, and a score of names besides, testify to the ancient condition of the county. There were, as there still are, high hills and lesser ones, but there was, and is, hut little level ground. The undulating character of the snrface of Middlesex cannot he hetter tested than hy taking the levels along a line at a distance of ahout a mile from the river's bank. This is easily done by following the conrse of a great modern thoronghfare like Oxford-street. There is almost a straight line of roadway from Shepherd's-hush to the site of the old City wall at Newgate; hut, in spite of the levelling process wbich the ground has suffered, there are not 100 yards of really flat grond along the whole route. At Shepherd's-hush we are only 21 ft. above the sea-level. Thence there is a gradual ascent to Plough-lane on the top of Notting-hill, which is 72 ft. higher. Orme-square is 34 ft. above the ornamental water in Kensington-gardens, wbence the ground again rises, until, at Park-lane, a height of 92 ft. is reached."

Miscellanea.

The Competition Memorial.—*The American Architect* says:—"The *Builder* completes, in the last nnmber received, its list of the signers of the memorial in regard to competitions, of which we have repeatedly had occasion to speak. It is rather a surprise to us to find so many of the most distinguished names in the profession among the signatures; not that we douht their goodwill toward the cause, but because men of eminent position, and advanced in years, have usually formed a network of ties and habits ahont themselves which makes them cautious about putting tbeir own hands to anything whioh may tend to change the traditions of their profession, even for the hetter. They may in private advocate reforms, hut as a rule they prefer to leave the accomplishment of the end to tbe younger generation. It is, therefore, all the more gratifying to notice the active co-operation in the work of such men as Messrs. Blomfield, David Brandon, and James Brooks, Professor Donaldson, Messrs. R. W. Edis, Ernest George, Micklethwaite, Penrose, and Seddon, tbe two younger Scotts, Alfred Waterhouse, and many others of perhaps equal note. It is no idle form which all these architects subscribe, hut an agreement which with some, especially the more distinguished, practically means a voluntary renunciation of the advantage which their well-earned reputation gives them in contests with their less eminent fellows, in favour of fair and open rivalry, in which the best shall win. Tbat this is no trifling sacrifice, those who have witnessed the manner in which, with laymen, a great name overbears even distinguished merit in obscure competitors will readily understand, and the sincere gratitude and esteem of the profession are due to those who, out of love of fair play, and desire for the advancement of art, have been willing to make it."

Intended Establishment at Cleut.—On the 22nd nlt. the Cleut Hills Hydropathic Estahlishment Company (Limited), was registered. Capital 50,000*l*. The directors propose to erect a building to accommodate ahout 150 visitors, and the architects, Messrs. Smith & Mackenzie, of Birmingham and Stourbridge, estimate the cost of the building at 36,000*l*. The directors intend to proceed to build at once, on a site near Hagley Hall, Lord Lyttelton's seat.

Underground Railway Completion.—Mr. O'Shaugbnessy, the chairman of the Committee of the House of Commons, to wbich the Metropolitan and Metropolitan District Railway (City Lines and Extensions) Bill was referred, on the 13th inst. announced that the Committee, after carefully considering the evidence (some of which was reported in the *Builder*, p. 59, *ante*) before them, had decided to declare the preamble proved, subject to the embodiment in the Bill of certain suggestions contained in several resolutions which they had arrived at. The conditions which the Committee attach to the passing of the preamble are:—

(1) That the burrowing powers of clause 10 should only be exercised in the event of the scheme for the completion of the new street not being agreed upon within eight months of the passing of this Act; (2) that if these powers are exercised, they should be confined to the portions of the line which were intended to be affected by the construction of the new street; (3) that the exercise of such powers should be guarded by the insertion of a clause enabling the assessing authority to determine whether in each particular case they can be exercised without material detriment to the property which they affect; (4) that the right of appeal from the assessing authority to a Divisional Court of the High Court of Justice should extend to the question whether the exercise of the powers under clause 10 can be effected without material detriment to the property affected; (5) that the right to compensation—to be estimated once for all—for injury to trade by the exercise of such powers should be recognised by the Act; (6) that the section in the Act of 1879 providing for compensation for "recurring injuries" should be considered applicable to recurring injuries caused by the exercise of the powers sought under Clause 10; (7) that a power analogous to the power given by tbe Act of 1879, section 14, to the owner, lessee, or occupier, in the case of underpinning, of obtaining directions with regard to the mode of underpinning from an engineer, to be agreed upon or to be appointed by the President of the Board of Trade, shall be extended to cases where the powers sought by Clause 10 are exercised; (8) that the powers of deviation sought by Clause 5 shall not be exercised in case the new street is agreed upon within eight months of the passing of this Act, nor shall they be exercised to the west of the junction of King William-street and Cannon-street, nor to the east of the eastern limit of the proposed new street; (9) that the power of taking additional lands, and the extension to such lands of Section 42 of the Act of 1879 shall not be exercisable in case the intended new street is agreed upon within eight months of the passing of this Act.

Matheson & Grant's Engineering Trades Report says:—"The improvement in trade wbich appeared last autumn, and which at the time of our January Report seemed likely to spread in its effects, culminated during January and February, and has since subsided. Due almost entirely to a demand from America, the extent and permanence of which was over-estimated, the collapse was sudden when the demand ceased, and there is a tendeucy now to exaggerate and misunderstand the fall. In the engineering, as in almost all other branches of trade, the rise in values was confined to raw and partly-finished material, and those who manufactured iron and steel into articles of utility fonnd it difficnlt in many cases to obtain from buyers sufficient increase in prices to defray the cost of greater prodnction. But the progress forward which was so eagerly welcomed is not all lost. Trade is in a much sounder condition than it has been for the last four years; a slight increase in the demand would rapidly raise prices; and if the coming harvest be as good as it now promises, and if the war-cloud already looming in Turkey he dissipated, an active trade may be looked for in the autumn."

Water Supply at Penzance.—At a meeting of the Penzance Town Council, on the 14th inst., the employment of a plumber to inspect the water-taps and fittings was reported to have resulted in redncing the consumption of water in the Market Jew-street district from 80 gallons per head per day to 40 gallons, and in the Folly district from 60 gallons to 30 gallons. As soon as possible the meters are to he removed, in order that the consumption in the other districts may he tested.—Mr. James, who moved that Sanitary Committee's report, embodying these facts, remarked that the present consumption was greater than they could afford in the present dry weather, and unless the inhahitants assisted the committee hy the greatest possible economy theirs wonld he the disagreeable task of giving an intermittent supply by day.—Mr. Coulson said the recent stringent inspection of fittings had resnlted in saving 100,000 gallons of water daily, and more than 100,000 gallons could be saved in districts not yet inspected.

Sanitary Institute.—The following gentlemen have consented to act as presidents of sections at the coming congress, to open at Exeter on the 21st of September:—Section I. Sanitary Science and Preventive Medicine, Dr. De Chaumont, F.R.S., Professor of Military Hygiene at Netley. Section II. Engineering and Sanitary Construcion, Mr. Robert Rawlinson, C.E., C.B. Section III. Meteorology and Geology, Sir Antonio Brady.

The Channel Tunnel.—The report of the directors of the South-Eastern Railway Company contains the following reference to this tunnel:—"The experiments made by the French engineers, after great pains and labour, tend to show that the geological measures are not only in the same position, but are of the same thickness on each side of the Channel; and the stratum known as the 'Old Grey Chalk' in England, and as the 'Craie de Rouen' in France, is impervious to water, and is without fissures. These are the foundation facts in this interesting question, for if a tunnel can be made without pumping or timbering, and entirely, from side to side, through the grey chalk, then an apparently formidable and even hopeless work becomes matter of close calculation. As the researches of the French engineers confirm the view for years past taken on your behalf,—namely that the proper point of departure for any future tunnel is at the outcrop of the grey chalk on the South-Eastern line between Folkestone and Dover, and not at St. Margaret's Bay to the east of Dover, where the grey chalk, dipping to the northward, does not crop out,—your directors have deemed it advisable to make arrangements for a series of important experiments which, so far, have shown favourable results."

The National Providence League.—The first annual meeting of the above society (formed for the Promotion of National Insurance), was held July 15th, at the office, 10, Lancaster House, Savoy. The chair was taken by Earl Brownlow. The balance-sheet showed a receipt of 612*l.* 7s., against an expenditure of 412*l.* 14s. 3d., leaving a balance to carry forward of about 200*l.* The report congratulated the members on the great and growing progress made by the cause in public opinion, especially as evidence of the fact that, though the proposal of National Insurance has been advocated and debated during the last twelve months on some thirty public occasions, it has never yet been made the subject of an adverse vote.

Monument to King Leopold I. of Belgium.—In connexion with the celebration of the Jubilee of Belgium Independence, a monument erected at Laeken, near Brussels, in memory of King Leopold I., was unveiled by the King on Wednesday last. The monument, which is of white sandstone, bears some resemblance to the Albert Memorial in Hyde Park. Its architecture belongs to the most florid fourteenth-century Gothic. The monument is erected on an elevated plateau. The statue of the deceased king, by William Geefs, of white marble, represents him in an easy attitude and in a general's uniform. The figure is placed under a dome supported by eight pointed arches, forming a circular gallery, from which springs a tall spire. The architect of the monument is M. de Curte.

St. Andrew's Church, Plymouth.—A new front of open carved oakwork has just been placed before the sedilia standing in the sacrarium of St. Andrew's Church, Plymouth. In design it is of similar character to the neighbouring stalls and bishop's throne. The front forms also a prayer-desk for the three clergymen, for whose use the sedilia is provided. Its standards are richly carved, and the front, which is of deeply-moulded and traceried work, is interspersed with carving. It was designed by Messrs. G. G. & J. O. Scott, and made by Mr. Harry Hems.

Rowland Hill Memorial.—The Post-office authorities have declined to allow a statue of Sir Rowland Hill to be erected under the portico of the General Post Office, St. Martin's-le-Grand, the space not being sufficient. The committee have determined to apply to the Court of Sewers for permission to erect the statue in the open space at the south-east corner of the Royal Exchange, facing Cornhill. Dean Stanley has consented to the erection of a memorial in Westminster Abbey near Sir R. Hill's grave.

The Institute of Art.—This institution, which has its rooms at 9, Conduit-street, is established for the purpose of encouraging art-work of every kind and for facilitating its sale. It is now the scene of a special exhibition, which includes the work for the most part of amateurs.

New Hospital, Ayr.—A new hospital is to be erected in Ayr, and the work is to be commenced immediately. The length of the buildings is to be 240 ft. and the depth 120 ft., with a central tower 65 ft. high. Mr. Murdoch, Ayr, is the architect.

Surrey Archæological Society.—The annual general meeting of this Society took place on Wednesday last, the 21st inst., at its Council-room, 8, Dane's Inn, Strand. Major Heales, F.S.A., occupied the chair, supported by Messrs. C. H. Cooke, F.R.I.B.A., Ralph Nevill, F.S.A., A. J. Style, &c. The report of the Council and balance-sheet were confirmed. Among other matters the report regretted the death of Mr. Planché, who was an honorary member of the Society. The retiring members of the Council, the auditors (Messrs. J. T. Lacey and W. F. Potter), and the honorary secretary (Mr. Thomas Milbourn) were unanimously re-elected. It was announced that the annual excursion would take place on Friday, the 30th instant, to Farnham, Waverley Abbey, and Farnham Castle, under the presidency of the Bishop of Winchester.

Ashmole's House, South Lambeth.—A correspondent writes:—"This historical house, in the South Lambeth-road, is about to be pulled down, though the efforts of the Society for the Protection of Ancient Buildings have not been wanting to stay its demolition. It was once the residence of the Tradescants, distinguished naturalists, whose collection formed the foundation of the Ashmolean Museum at Oxford. On the death of Mr. Tradescant, in 1653, the house came into the possession of the Ashmole family. In a short time it will be a thing of the past, and known only in history." It is suggested that, if no other record of the site is forthcoming, some tablet ought to be put up to remind future generations of the associations of the spot.

School of Art, South Kensington.—In the concluding lecture of the present course on "Art History," Dr. Zerffi, on Tuesday last, gave some interesting statistics with reference to the growth of the attendances at these lectures. Dr. Zerffi, in 1869, commenced to lecture to an audience of *seven*. Since then he has delivered no fewer than 116 lectures, attended on an average by 70 persons, making a total of 31,220 attendances. The present course of 10 lectures was attended by 3,600 persons, making an average of 90 per lecture. This affords satisfactory proof of the gradual spread of the taste for the study of the historical development of art.

London Fever Hospital.—We would aid an appeal that is being made to the public for funds in order to carry on the work of this hospital. The small invested capital of the hospital is fast disappearing, and if fresh funds be not forthcoming, in four, or at most five, years' time it will have to be closed, and a work which for eighty years has conferred the greatest benefit on London will come to an end. The aims of this hospital are preventive as well as remedial, and on this ground alone it may well appeal to the public, to whom it thus renders such invaluable services. The building was illustrated in our vol. vi., pp. 390-391.

Children's Home, Edgeworth, near Bolton.—Two corner-stones of a new school, in connexion with this institution, were laid, on the 6th inst., by Mr. Richard Bealey, J.P., of Radcliffe, and Mr. Henry Mathwin, B.A., Southport. The building, which is to be of stone, is being erected from designs prepared by Mr. Thomas Ormrod, architect, Bolton, and will comprise school-room and two class-rooms to accommodate about 263 scholars, at an estimated cost of about 1,200*l.*, including boundary-walls and out-buildings, &c. Messrs. Martin, Brothers, of Edgeworth, are the contractors for the building.

Sunday Art Exhibitions.—In addition to the Sunday opening of the Grosvenor Gallery, the Sunday Society has arranged for opening the Annual Exhibition of the Society of British Artists at Suffolk-street, Pall-mall East, next Sunday and the following Sunday.

Collapse of a Submarine Tunnel.—A telegram from New York, dated July 21, states that a shaft of a tunnel now in course of construction in Jersey City, under the Hudson River, fell in that morning. Twenty-two men were buried, and no hopes were entertained of rescuing them.

Value of Land in the City.—At the Auction Mart, on the 14th inst., Messrs. Edwin Fox & Bousfield sold, by direction of the First Commissioner of her Majesty's Works, premises in Seething-lane, Tower-street, at 4*l.* 17s. 4d. per square foot, or at the rate of 211,992*l.* per acre.

A New Paris Exchange.—It has been determined to petition the City of Paris to erect a new commercial exchange such as those to be found in London, Liverpool, Hamburg, and other cities.

An Industrial Exhibition at Leicester was, on Monday last, opened by General Burnaby, M.P., who remarked that the real prosperity of this country depended upon the sustained activity and excellence of its productive industries, and not upon that of mere selling, buying, and speculating, which, however useful in a secondary sphere, does not increase the store of man's necessaries.

TENDERS

For furniture warehouse, 204, Great Portland-street, and 72, Bolsover-street. Mr. William Wallace, architect. Quantities by Mr. F. Thomson:—

Watson Bros.	£1,250 0 0
Perkins	1,215 0 0
Toms	1,189 0 0
Richardson Bros.	1,089 0 0
Dowsing & Sons	1,020 0 0
White	970 0 0
Hunt (accepted)	967 0 0

For repairs, decorations, &c., to house, stabling, vinery, and Lodge, at Gilling Lodge, Haverstock-hill, for Mrs. Wilson. Mr. E. Crosse, architect:—

Hambling (accepted)	£293 0 0

For two new wool-stores, 140, Abbey-street, Bermondsey, for Mr. W. Wilkins. Mr. E. Crosse, architect:—

Bambery	£494 0 0
Brockwell	429 0 0
Downs & Co.	420 0 0
Almond	370 0 0
Preston	353 0 0
Wells (accepted)	350 0 0

For the Congleton Water Works:—

	Contract No. 1.	Contract No. 2.	Contract No. 3.	Total.

Taylor	4,490	0	0

For two villa residences, Cromch End, for Mr. A. B. Smith. Mr. Edward J. Paine, architect:—

Goodman	£3,521	0	0
Holmes & Son	3,336	0	0
Conder	3,312	0	0
L. H. & R. Roberts	3,147	0	0
Harper	2,965	0	0
King	2,920	0	0
Mattock Bros.	2,760	0	0

For concrete foundations for villa residence, for Mr. Pettie, R.A., Hampstead. Mr. William Wallace, architect. Quantities supplied by Mr. Frederick Thomson:—

Toms	£210	0	0
Brass	197	0	0
Woodward	195	0	0
Manby	187	0	0
Scrivenor & Co.	178	0	0
White	168	0	0
Cox	160	0	0
Hunt	152	0	0

For rebuilding the "King's Arms" public-house, Church-street, Deptford. Mr. W. T. Hunt, jun., architect:—

Jerrard	£1,543	0	0
Hubble	1,429	0	0
Rodwell & Smith	1,375	0	0
A. & F. Smith	1,340	0	0
Redman	1,280	0	0
Newman	1,280	0	0
Holloway (accepted)	1,247	0	0

For alterations and additions to Cecil House College, Beulah-hill, Upper Norwood, for Miss A. Bowra. Mr. Rawlines F. C. Pittock, architect. Quantities supplied by Mr. Elliott Hops, jun.:—

Wheeler	£595	0	0
Josolyne	558	0	0
Wright	535	0	0
Wilkinson	485	0	0
Cutting, Notting-hill	479	0	0

For erection and completion of a villa residence, for Mr. T. Cullen, in the Underhill-road, Lordship-lane. Quantities not supplied:—

Watson & Dennett, Dulwich (accepted)	£1,050	0	0

For alterations to house and erection of workshop at rear, 17, Alberny-road, Old Kent-road, for Mr. V. G. Daws. Mr. E. Crosse, architect:—

Amery	£340	0	0
Battley	334	0	0
Roffey	315	0	0
Everitt	304	0	0
Smithers (accepted)	278	0	0

For the erection of St. Mary's Vicarage, corner of Upper Rock Gardens, Brighton. Mr. Spencer W. Grant, architect:—

Lynn & Sons, Brighton (accepted)	£2,800	0	0

For house and shop, Murchison-road, Notting-hill, for Mr. G. H. White. Mr. J. Dunn, architect. Quantities by Messrs. Nixon & Raven:—

Buckle	£1,693	0	0
Green	1,593	0	0
Weymouth	1,550	0	0
Phillips	1,345	0	0

For new road and drains adjoining above sits:—

Parkhouse	£422	12	0
Neal Bros.	415	0	0
Stockwell	333	0	0

For the redecoration and improvements to Whitefield's Tabernacle, Tottenham Court-road. Mr. Alfred Burr, architect:—

Richardson Bros.	£1,848	0	0
Perkins	1,733	0	0
Bywaters (accepted)	1,593	0	0
For new organ:—			
Bishop & Son (accepted)	£493	0	0

For repairs and alterations to 22 and 23, Newcastle-street, Strand, for Mr. George Shenton. Messrs. Ebbetts & Cobb, architects:—

Steel Brothers (accepted)	£260	0	0

For work to be done at 13, Devonshire-square, for the Jewish Board of Guardians. Messrs. Davis & Emanuel, architects:—

				New Sashes		
Croker	£554	0	0	£34	0	0
Gold & Beard	463	0	0	24	0	0
Williams	430	0	0	28	0	0
Heeps	407	0	0	20	0	0
Roberts (accepted)	385	0	0	20	0	0

For the erection of house, at Acton, for Mr. H. Wright. Mr. Edwd. Monson, jun., architect:—

Brousden	£678	0	0
Baker	630	0	0
Pudley	613	0	0
Eydmann	595	0	0
Beck (accepted)	584	0	0

TO CORRESPONDENTS.

Tower.—The assertion is incorrect. The Albert Hall dome is 219 ft. one way, and 185 ft. the other. The central dome of the Vienna Exhibition Building was 333 ft. in diameter. The Philadelphia Exhibition included domed pavilions each 240 ft. in diameter.

Surveyor (It is the *section* of the ties in question which is registered; not the ties themselves).—J. B. Winchester (the statement is not very clear; as taxes are usually imposed in advance, there would seem to be no hardship).—P. T.—G. M.—M. G.—No. 1.—E. G.—Q. H.—E. S. H.—Col. F. P.—J. & P.—H. We are compelled to decline pointing out books and giving addresses.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course with the authors.

NOTICE TO SUBSCRIBERS.

THE INDEX and TITLE PAGE for Volume xxxvii. (January to June, 1880) was given as a Supplement with our Number for July 10.

A COLOURED TITLE-PAGE may be had, *gratis*, on personal application at the Office.

CLOTH-CASES for binding the Numbers are now ready, price 2s. 6d. each; also

READING-CASES (Cloth), with Strings, to hold a Month's Numbers, price 2s. each.

THE THIRTY-EIGHTH VOLUME of "The Builder" (bound) is now ready, price Twelve Shillings and Sixpence.

SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of 3s. 6d. each.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied direct from the Office to residents in any part of the United Kingdom at the rate of 18s. per annum, *prepaid*. Remittances payable as above.

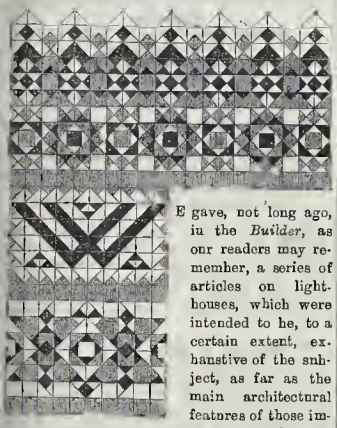
The Builder.

VOL. XXXIX. No. 1956. SATURDAY, JULY 31, 1880.

ILLUSTRATIONS.

CONTENTS.

Concrete Towers.



WE gave, not long ago, in the *Builder*, as our readers may remember, a series of articles on lighthouses, which were intended to be, to a certain extent, exhaustive of the subject, as far as the main architectural features of those important works are concerned. In connexion with those papers and a more general purpose beyond, it may be useful to draw attention to a communication addressed to the Institution of Civil Engineers, by Mr. Imrie Bell, C.E.

It will, no doubt, be in the memory of our readers that we gave reason for the proposition that, for sea-girt towers, the practice and the experimental reasoning of Mr. Stevenson and other engineers had led to the establishment of the rules,* that the outline of any such tower should be defined by a hyperbolic curve; and that the material for construction should be not only the largest, but also the specifically heaviest stones that could be practically obtained by the architect. To these two rules we refer, without any qualification, as far as the species of tower to which we confined them is concerned. In the case of a tower built on a promontory high above the dash of the waves, the same conditions do not exist, and therefore the same rules do not necessarily apply. We illustrated the classification of lighthouses by contrasting the very different experience obtained in the construction of the Morant Point Lighthouse, in Jamaica, by the late Mr. Alexander Gordon, and in the unsuccessful attempt to apply the same method of construction that was there found available in the very different situation of the Great Basses Rock, near Ceylon.

The experience of Mr. Imrie Bell is in full accordance with the rules that we ventured to indicate as absolutely to be accepted by the lighthouse builder. In the Morant Point lighthouse we described an edifice of which the base was formed of concrete protected by a shell of cast iron. We have now to look at the account of a tower which, standing at an elevation of 100 ft. above the sea, was constructed of concrete alone. And what strikes us as probably the most admirable part of the whole design is that the concrete was so disposed as to have, like an organised being, a proper skin of its own. The value of this simple but novel arrangement is the more worthy of remark inasmuch as it is not confined to the construction of lighthouses, but is likely to be adopted, with the best results, by the builders of houses and other structures.

Mr. Bell commences by remarking on the use of concrete by the Romans, on its gradual disuse, on its re-introduction as a foundation, and on the introduction of *béton*, or hydraulic concrete, by the French engineers, followed by our own (among whom the late Mr. John Hughes may be cited as one of the earliest to introduce the French practice). He then refers to the valuable and exhaustive researches of Vicat, and to the improvements made in the manufacture of cements. It would be desirable here to introduce a short account of the use of concrete in England by the house-builder. For this, however, we are as yet without full materials; although, having been for a short time resident in a house built, in a very exposed situation, of concrete, we are able to speak of one unexpected excellence which it possessed in common with others more generally known,—that is, the great quiet and silence which prevail in it in a high wind. Before rising in the morning, no idea was obtained that a gale was on. The cause we take to be the absence of those joints through which the wind rushes as in confined channels, which are thus indicated as the cradle of noise.

Mr. Bell tells us that he has been much struck by the want of attention paid to the art of producing a fair and finished surface in the exposed faces of concrete, as exemplified in many of the large engineering works in the course of construction, where the exposed face has a honeycombed appearance, as well as showing the marks of the rough timber planks forming the frames in which the concrete had been placed. In this remark of an engineer every architect will agree. Nor is it a question of appearance only. These unsightly hollows and projections retain damp, and offer needless resistance to wind, thus at the same time hastening the ultimate decay of the artificial mass, as well as destroying that quiet to which we before referred.

The result of the study given to this part of the subject by Mr. Bell is, that this objectionable aspect of a concrete building arises simply from neglect or indifference. It is possible, nay, even easy, with due attention, not only to produce a fair surface, but to form mouldings, and even tracery and ornament, and at the same time to make the face-work as durable as any other part of the block. It is evident that this is a view of the case which, if worked out, is likely to result in the very general introduction of concrete as a material for house-building. It is to be regretted, with reference to this, that although Mr. Bell has given the cost of the lighthouse of which we have to speak, in block, he has not given the price per cubic yard of the concrete, applied after his method.

When it has been attempted hitherto to give a face to a concrete structure, it has usually been done either by rendering with plaster, or by grouting with liquid mortar, both of which are more than questionable modes of effecting the object. The best result that can thus be attained is that of a veneer, liable to sudden decay, and particularly liable to destruction by frost. Failure is said to have so often occurred as to prevent recurrence to this imperfect and unworkmanlike finish; so that the concrete surface yet remains in generally its natural roughness.

The method adopted by Mr. Bell is one that, on the first blush, recommends itself to the architect. He has provided moulds, made of smooth-planed board, to act like the matrix of a seal, or the mould of a metal cast. Immediately before applying the mould, he coats it over with a mucilaginous soap, to prevent the adherence of the concrete. In filling the frame, or mould, care must be taken that a mixture of fine concrete or cement is laid in with a trowel close to the face-board, as the work proceeds, so that the mixture is carried up uniformly with the body of the work, and the whole forms one homogeneous mass. The face is thus like the skin of an iron casting; and if the mixture of materials be judicious, it will be really the strongest part of the whole structure. Mr. Bell tells us that he has followed out this process in harbour walls, both above and below water, exposed to frost, heat, storm, and rain, and that he has done so with complete success, and at an inappreciable increase of cost.

The first example, so far as we are aware, of the application of this method of construction to a lighthouse tower, is the Corbière lighthouse, in the island of Jersey. This lighthouse was erected in 1873-1874, on the design of Sir John Coode, C.E., by Mr. Imrie Bell as executive engineer. It stands upon the Corbière rock, off the south-western point of the island of Jersey, at a distance of about 1,600 ft. from the mainland. The spot might be thought to have been designed for the purpose by Nature herself, as here exists, reared above the fury of the waves, that very substantial rocky basis for the light tower, the artificial construction of which has so taxed the efforts of the lighthouse architect in less favoured localities. At high water, in all tides, La Corbière is isolated; but from shortly after half-ebb to a little before half-flood it is accessible, when the sea is smooth, over the crest of a ridge of rocks which forms a narrow causeway. The range of the tide on the coast is 23 ft. at ordinary neaps, and 32 ft. at ordinary springs, and the locality is much exposed.

The first operation commenced was the construction of a road of access, of above half a mile in length. Together with this work, dwelling-houses for the light-keepers, with necessary store-houses and outbuildings, were constructed on the main land; but there is nothing particularly worthy of notice as to this part of the scheme. The tidal causeway, however, constructed on the ledge of rocks above

* See *Builder*, vol. xxxvii. (1879), p. 767.

mentioned, required more consideration. The ledge was intersected by deep fissures and pools of water. Owing to its regular submergence the time for work was very limited, as the operations could only be proceeded with from the shore end. The cross section of the road has a top width of 6 ft., and is formed by two walls built of granite blocks, with a batter of 2 to 1, the height of which varied from 1 ft. to 8 ft. The space between these walls is filled up with Portland cement concrete, mixed in the proportion of eight parts of shingle and coarse sand to one of cement. The upper layer of 8 in. was made stronger and finer, in the proportion of four parts of shingle and sand to one of cement.

The action of the sea during gales has been enough to prevent any great accumulation of seaweed upon the surface of the causeway; and a sprinkling of hot lime in calm weather was found sufficient to prevent growth of vegetation.

The materials for the road and lighthouse were conveyed by sea from St. Helier's, and landed in an accessible and sheltered place near the site of the lighthouse. A patch of rocks formed a sort of natural wharf, from which an overhead rope railway was constructed to the site of the stores and workshops on the main rock; a wheel with grooved tire running along the rope, supporting a block and tackle for suspending the basket or bag containing the material. This wheel and tackle were pulled along the ropeway by a small endless wire rope, wound round a drum, and worked by two men at a windlass.

An inclined tramway, on a 3 ft. gauge, was laid, on longitudinal timbers, from the workshops to the site of the tower, and worked by a steam-engine. Details of all these contrivances are given by Mr. Bell; but their interest is chiefly special. What we have to regard with most attention is the method of building in concrete employed, which possesses a very general interest.

The base of the tower,—it is to be regretted that we do not find the level of the sea referred to in any of the drawings accompanying the paper,—was roughly quarried, leaving a core of about 13 ft. in diameter, and 7 ft. in height. The frame used for forming the exterior face of the concrete was a segment of one-eighth part of a circle, 3 ft. in height, dressed in face to a radius of 15 ft. 6 in., with a batter of 1 in 12. This was fixed in place by means of tie-bolts lewised into the rock. The concrete was composed of six parts of shingle and sand to one of cement. It was thrown into the segmental frame, the face being prepared as before described. The frame was removed on the third day, when a solid block of concrete was exposed, with a face equal to dressed ashlar, and a hardness about equal to that of a soft brick. A batten was fixed upright at each end of the frame, so that when the concrete hardened and the batten was removed, there was a vertical slot at each joint, about 9 in. deep by 4 in. wide; when the frame was shifted, and the next segment was filled in, the fresh concrete entered this slot, and formed a natural joggle or dovetail, holding the two blocks together. A concentric channel, 9 in. broad by 4 in. deep, was left in the top of each course for the same purpose. This was in its turn filled up by the concrete of the course above, so that the whole structure was bound together in its own substance. From the drawing it appears that there were three of these courses, the joints of which are marked by a chamfer. On the top of the third course is a recess of 4 ft., and within this the base of the tower itself is placed. This structure rises vertically for about 6 ft. 6 in., where there is a moulded soffit. From this the wall of the tower rises with a curved batter, and is topped with a heavy torus moulding. However much credit may be justly claimed for the engineering of the building, we cannot but hold that the elevation of the tower, so far as we can judge from the drawings, is not characterised by any architectural elegance. The stepped base and heavy top moulding seem to contain a not inconsiderable amount of material, the structural utility of which we fail to perceive. In the drawings attached to the paper a section of the lantern is given; but the sections and elevation of the tower show the masonry, that is to say the concrete, alone. It is thus not possible to speak with certitude as to the architectural effect of the complete building, and we may hope that the criticism provoked by the lines of the tower alone may be qualified by the addition of the lantern.

On the top of the platform, which is formed of a solid mass of concrete over the whole area, the tower was carried up in a mode very similar to that before described, with the exception that the mould frames were made to radiate from an iron centre, firmly secured in the true axis of the tower. Two blocks, forming opposite sectors, were filled in at the same time, so that each circular course was completed in four shifts.

The height of the tower and platform together is 44 ft. The well of the tower is 11 ft. diameter. The structure of the concrete circular wall diminishes from 4 ft. 3 in. at the plinth mouldings, to 2 ft. 6 in. under the cavetto at the top. The interior is divided into two chambers, although there is a landing and preparation for an intermediate floor. These floors and landings are supported on T-iron girders, built into the walls, and filled in between and above with fine cement concrete.

A hollow cast-iron column, 13 in. in diameter, and $\frac{3}{4}$ in. thick, is built into the platform in the axis of the tower. On the top of this is secured the pedestal of the optical apparatus. For further details we refer to the paper, which will be found in vol. lix. of the Minutes of Proceedings of the Institution of Civil Engineers. The total cost of the work is given as 8,001*l.*, of which 1,606*l.* was expended on the half-tide causeway; 2,976*l.* on the structure; 2,255*l.* on the lantern and apparatus, including fog-bells and clock; and 864*l.* on dwelling-houses and store-rooms. As far as we can collect by scaling from the drawings, the total height from the lowest part of the platform wall to the top of the ball supporting the vane is 62 ft. If we take the height of the centre of the light at 50 ft. above the foundation, we find that the total cost of the whole work, excluding the causeway, comes to 128*l.* per foot vertical, or to 160*l.* per foot vertical including the causeway; a figure which may be advantageously compared with those which we have already given for the cost of this class of buildings.

The interest of the paper of Mr. Imrie Bell is far wider than that which concerns the construction of lighthouses. That he has been alone in his treatment of concrete we are not prepared to admit. But that his paper has been the first to call the attention of his own section of the structural profession to the true mode of procuring a good, durable, and workmanlike finish to a building composed of this material, we think is the case. Nor can it be denied that by this treatment the value of concrete as a building material is very considerably enhanced. We may regard the compound as an artificial stone, which possesses the quality that it is in the power of the maker to vary the composition at will, and not only to do so block by block, but to give to the exterior of the block a fine and sightly skin; while the bones of the work,—like the human skeleton,—are composed of a more rough and cheap material.

REBUILDING OF THE TAY BRIDGE.

A SELECT COMMITTEE has been appointed by the House of Commons to inquire into the Bill introduced into Parliament by the North British Railway Company for the reconstruction of the Tay Bridge. The heads of the order of reference were, first, as to the expediency of rebuilding the bridge in the original position; secondly, whether a more suitable site might be selected; third, the interests of the navigation; fourth, the security and permanent safety of the bridge, if authorised to be rebuilt. Some petitions were presented against the scheme; but they were not supported by counsel.

It was stated by Mr. Clark, Q.C., on the part of the promotors of the Bill, that the cost of the new bridge was estimated at 346,000*l.* To provide this sum it was proposed to raise 200,000*l.* on the authority of the Bill; to borrow 66,000*l.*; and to take 80,000*l.* out of the 120,000*l.* which is the present reserve fund of the company.

As to the design, counsel stated that it was proposed to lower the height of four of the thirteen new spans by 11 ft., or from 88 ft. to 77 ft. high; and to reduce the height of the other nine spans 2 ft., from 57 ft. to 55 ft. The Lord Provost of Perth gave evidence to the effect that ample height would be thus allowed for the navigation, with which the Board of Trade concurred. The largest vessel ever known to have passed up the river above the site of the bridge was stated, by the pilot-master of Dundee, to be 600 tons. Uncontradicted evidence was adduced in support of the convenience of the actual site. Sir Massey Lopes, the chairman of the committee, suggested that it would be desirable if three or four experts, independent of the Board of Trade, were appointed to look into the matter,—an excellent suggestion that was at once agreed to by Mr. Michael, Q.C., on the part of the Board of Trade.

Mr. Brunlees was examined as to the design for the new bridge. He said that he had found the Tay bottom well adapted for the carrying of a heavy weight. He had examined the bed of the river, and thought that there was no danger to be apprehended from scour but such as it was easy to obviate by the use of stone. The plan before Parliament was presented under the authority of Mr. Brunlees. He had decided on replacing the iron work of the piers with brickwork, the cost entailed by which change was estimated at 111,725*l.* The total estimate for the design, allowing 10 per cent. for contingencies, was 356,323*l.* Mr. Brunlees found that the cost of the brick piers would be about the same as that of thoroughly making good the iron pillars now standing, and gave preference to brickwork as more stable.

We trust that some public professional body will take steps to ensure a full discussion of the stability of this important bridge, both as far as concerns the past and the future structure. Notwithstanding the lengthened inquiry which has taken place, the professional world is yet in ignorance of the very important fact of the actual surface exposed, in one of the large bays, to the action of the wind. The importance of having this point cleared up is obvious. So long as the Board of Trade inquiry was going on, the usual caution of lawyers probably caused the withholding from the Court of the designs of the bridge. We offer no opinion as to the propriety of this course. We may doubt its wisdom. But now that the report is made, we call attention to the importance of the possession of the information on the part of engineers and architects. To take one point alone, it appears that investigations as to the force of wind-pressure are to be instituted by the Board of Trade. It will be impossible for that body to make an experiment on so large a scale as that afforded by the disaster itself. If we are made aware of the actual surface exposed by the bay which first yielded, and of the strength of the piers, we shall have a direct measure, not indeed of the maximum force of the wind, but of that which was exerted at the moment of fracture. This is quite a distinct question from that of either the strength which ought to have been given to the bridge, or of the highest fury which the storm of the night in question attained. If we are made acquainted with the surface on which the wind acted, and with the strength of the piers which yielded to the stress, we shall at once obtain a measure of the wind-pressure per square foot of the surface of the girder at the moment of collapse,—a datum on the value of which it is useless to dwell.

It should also be borne in mind that the mere substitution of brick for iron in the piers is not in itself a guarantee of their stability, if the present disproportion between the height and the transverse width,—that is to say, the width at right angles to the wind-pressure,—is maintained. The case of a chimney, or lofty tower, is in no way analogous to that of a thin, tall, narrow pier, sustaining on the top a structure that will catch an enormous quantity of wind. The case of a windmill is more apt; and we know what precaution is taken for maintaining the stability of the central tower that supports so moderate a surface as that exposed by the vanes of a windmill. Speaking without having made that mathematical calculation, for which it does not come within our province to assume the responsibility, and thus with all proper reserve, we should conjecture that piers of dry bricks, set on the present bases, would be overthrown by such a storm as that of which we have the proof before us. The stability of the piers, if that be so, would depend altogether on the adhesive quantity of the cement in which the bricks were set. We do not say that this is inadequate, but we desire to call attention to the fact; and we think that some attempt to prove the pressure of a statical equipoise, not altogether dependent on the adhesion of each course of bricks to that below it, considered as resisting not a sliding, but a lifting motion or tendency to move, ought not to be left out of consideration. We cannot afford to run any more risks, and the disproportion between the height at which the side pressure comes on, and the lateral strength of the pier, lies at the very basis of danger.

[Since the above was written, the Select

Committee have reported that, having regard to the safety and security of the public, they do not feel justified in sanctioning the scheme which the Bill proposed. The Bill was therefore thrown out.]

THE MANUFACTURE OF FURNITURE IN GERMANY.

THE development of the manufacture of furniture during the last decade formed the subject of a lecture delivered by Herr Carl Behr, the manager of the furniture manufactory of Herr A. Bembé, at Mainz. Being of general interest, we give an abstract of the lecture from the German version of it.

Furniture represents those products of art industry which interest us in, perhaps, a far greater degree than other objects which we use, because they immediately surround us, and appeal directly to our sense of domestic comfort. For this reason it has been ever the endeavour to produce furniture of tasteful design; but it has been reserved to modern times to make real progress. About ten or fifteen years ago the furniture industry of Germany was at a very low ebb, and it was accompanied at the same time by an aberration and absence of taste which were most surprising. Furniture was made in Germany either in simple or heavy forms, or else in absurd imitation of French models. The French then, as now, were in the habit of resuscitating the various styles of the past, according as the taste of buyers happened to change. It was a great defect in the manufacture of furniture in Germany that most makers worked without models or drawings, and that with the introduction of new wood-working machinery the traditionally delivered forms were gradually transformed without any regard being paid to the beauty of the whole composition. One of the most flagrant aberrations of taste at that time prevalent in Germany, greatly encouraged, it must be owned, by a large demand for the article, was the manufacture of so-called old oak furniture. The way in which that class of furniture was produced was most barbarous, machine-made naturalistic ornaments, such as fruit, objects of the chase and still-life, &c., being stuck on to the smooth surfaces of the wood, without any regard whatever to the harmony of the whole composition.

Many technical journals of the better class, such as the *Oesterreichisches Museum* (Vienna) and the *Gewerbehalle* (Stuttgart), fought hard against that practice, and exhorted makers to return to a legitimate production of such work, urging that this might best be achieved by an adherence to the forms of the German Renaissance, as being most in accord with the taste of the people. But it was reserved to the time of national re-awakening, the years of the war of 1870-71, to give an impulse to the endeavours of regaining the lost prestige in art-industry by the adoption of those long-neglected forms. An improvement was noticed as early as the Vienna Exhibition of 1873. But of especial influence in the development of the manufacture of furniture in Germany was the Exhibition of the Bayerische Kunstgewerbe-Verein of Munich in 1876, a society which has done inestimable service in raising German art-industry. That exhibition pointed the road to be taken, and enabled a more uniform system to be pursued. From that period dates a steady and speedy development of this industry, which was demonstrated at a series of important exhibitions, such as those of Hanover, Berlin, Leipzig, Offenbach, as well as smaller local shows. The foundation of new art-unions and the increased activity of already existing ones contributed considerably to this development.

The author next considers the work of French makers of furniture as shown at the last Paris Exhibition, and compares the French and German modes of manufacture.

The furniture of Paris manufacturers,—the makers of other French towns being far behind them,—is distinguished by a perfect execution of the separate parts, a harmonious effect of colour and ornament being likewise aimed at. Most of the furniture, however, is of such an expensive nature as would prevent its sale in Germany; prices ranging from 20,000 to 25,000 francs for some articles being not at all rare. The workmen are consequently very highly waged; it is a fact that clever men are paid at Fourdinois', in Paris, as much as five francs per hour. But it is a remarkable fact that German workmen execute the best work in Paris establishments, though they have no opportunity, on their return home, to make use of their acquired skill.

In the design and composition of French furniture, however, there is a striking absence of the noble forms of the Renaissance, the place of which is taken by the pompous shapes of the styles of Louis XIV., Louis XV., and Louis XVI.; here and there, also, the more sober one of Henri II., in the development of which the French have achieved extraordinary things.

If we compare the work of French furniture-makers of the present day with that of the same class from the end of the sixth decade of this century, it will appear at once that there has been an undeniable standing still. If we compare with this the great strides made by Germany, the time will not seem very far distant when the German furniture industry will be able to compete with that of France without misgiving. This highly favourable state of things has been effected principally by the foundation of societies and the holding of art and industrial exhibitions; yet its fuller development has to some extent been hindered by an absence of artistic feeling on the part of the general public, which can only be created gradually by a more universal training in the elements of art. This artistic understanding is being by degrees instilled into the public mind of Germany by the exhibitions already mentioned, but it might be still further stimulated, the author thinks, by very elementary means, such as rational, systematic instruction in drawing in all schools, for example. The practice of having work which might well be done at home executed by foreign hands, and of submitting it to public competition, according to the author also affects injuriously the growth of the art-industries in Germany.

The author endeavours finally to demonstrate that the utilisation of German Renaissance forms in the manufacture of furniture of the present day is highly advisable, for various reasons. The Italian Renaissance is intended for another climate, other conditions, and other manners, and is especially not to be recommended for Germany from pecuniary considerations; for by dispensing with rich carvings, &c., part of the original characteristics of the style is lost. The art-workman must study all styles which have been artistically developed, in order to be able to appreciate their excellencies, and to keep from falling into the mistake of onesidedness. To do this successfully requires study and application: study alone will make it possible for him to adapt and utilise the styles of former times for the artistic requirements and to the changed wants of our age. Study classic models, but impress your own ideas on your work: such is the advice of the author to the art-workman. This alone will guard him against monotony and repetition.

ROYAL ACADEMY SPECULATIONS.

HOWEVER indifferent as compared with some other nationalities a large portion of the British public may be to art and art influences, there can be no doubt of the interest felt in the annual Royal Academy display of pictures. From the day of opening to the day of final closing, these rooms, so full of pictures, are constantly and incessantly crowded with eager and anxious spectators. It cannot be said that the public care not for individual pictures, or for the detailed incidents and information contained for the most part in them, for all have catalogue in hand, and are found perpetually to refer to it, not only for mere titles, but for more detailed information, when such is to be found. Much would, indeed, be missed, and would disappear, were this annual art-show to cease, and the art-public would be not a little at a loss to find a substitute for it. It is looked forward to for long months with eagerness, and when the time of opening does arrive, this exhibition of the art-work of the year is found to afford the means, as far as it goes, of testing the artistic capacity of the time, and of ascertaining the bent of the public mind as to art; and we then see how this has been responded to, and how far the art-strength of the time is equal to the work before it, and how the work has been done. It may be of interest, then, to glance back for a moment on this fine-art show, and to ponder for a moment on its general tendency and influence.

But more than this: from all sides there is a constant series of criticisms and explanations, more or less exhaustive, of the subject matter of at least the principal pictures. No one, thanks to this, can be at a loss as far as explanation goes, and as far as such can compel the intelligent looking at a fine work, whatever the subject of it. Most people go to the Academy rooms to look at the pictures as art objects, and as representations of actual things and occurrences, and at such in the main as the time has furnished,—the living men and women, and the objects they are interested in. When the exhibition is over, a good deal of this passes away, and is forgotten, and the next year's show is as anxiously looked forward to as was the last and past one, and for the same reasons. It is hoped on all sides to see a something fresh, a new face, and graceful forms in new and present fashionable costume, and new views of distant places and buildings, and, in short, to see, as far as pictured representations go, or can afford it, what the world is doing and looking like. That the Royal Academy annual show does this none will dispute, and that it does it in the main well; but that a something and a somewhat more than this might be accomplished, and the public further pleased and instructed, there can be but little doubt. It is a somewhat singular thing, and difficult to account for, that all sketches so called are inadmissible.

It must not be concluded, as perhaps many do, that such a display of pictured art is altogether new, and of modern and all but of to-day's growth. In Gothic days there was and must needs have been its equivalent,—in days wherein the artist worked immediately on every new building of public importance and destined for a public use, as the great cathedrals and churches, every such structure formed the ground or "canvas" on which the painters and sculptors and great draughtsmen worked, and the opening of any such building, as we know, was always the occasion of calling together an art-loving crowd to see it, as a famous picture is nowadays viewed. A newly-drawn and painted cathedral window must have been as the "picture" of the season, such being, in less enlightened days than these, the personal handwork, as well as the brain-work, of the artist workman who produced it; and it was most certainly the window itself *in situ* that was the special object of curiosity and admiration, and not a small and mere representative drawing of it on the walls of a room that the eager crowd went to see. We may pause a moment to say that perhaps but scant justice has been done to the great artists and painters of the glass of the Middle Ages. It is at times magnificent in its fine sense of colour and harmony.

That this was so in antique and classic days there can be no sort of doubt. There were and must needs have been exhibitions every now and then of such doings as these, and every new and at all important building must have afforded opportunities, during its execution, of art displays of the kind. We have always thought, though the thought may be perhaps a little fanciful, that, looking at the mind and character of the Greek race, it would have been well nigh impossible for the people of Athens to have had always before them such magnificent works in course of construction, and afterwards their *decoration*, and so great a master as Phidias, without periodical visits to the scene of his labours, and without keen comment on the value of them. Surely each one of the magnificent forms which together made up the story of each pediment of the Parthenon must have attracted an eager and art-loving crowd to look at it, and to wonderingly admire it, and in not a few cases to study it. Indeed, it is difficult to see how this could well, among such a people, have been otherwise; for, looking at the way in which such works were designed and put together, and the perpetual and ever-present personal activity of the architect and artists who designed and built it, it would have been strange, indeed, if such working artists had not had a vast following of students and others equally interested in it. It must needs have been as an academy,—always open, and wherein not only were the works of the artists always visible, but they themselves were always to be seen at work. A great school of art indeed!

Thus we may fairly say that this exhibition of the Royal Academy has had its predecessors in antique days, though, in all probability, so very different in external aspect and surroundings. Much more, we cannot but think, might yet be learned about this by a little further and deeper looking at and into that distant past of art displays; and it might, may be, lead to efforts to make this art-show more general and even more useful

as a national and high-art display and record of what is doing, and has yet to be done. At present, and as matters now are, it is for the most part confined to paintings in oil for the decoration of rooms and private apartments, and certainly without any wide idea of "interpretation" of any kind, as Turner undoubtedly had when he commenced the famous "Liber Studiorum," of which remarkable performance a good deal has yet to be said. The idea, evidently, of this great interpreter of Nature was throughout, to represent Nature in all her aspects, and as he saw them, and was gifted to interpret them, and it would seem a matter of some regret that so good and potent an example is not followed, and that some systematic interpretation of Nature's infinite work is not attempted. We forbear details, which might lead us far, but commend the good example to those who might follow it. In this Academy Exhibition there was a large number of landscapes and "views," and transcripts of Nature's forms, and not a few of them evidenced the skill and high faculty of those who produced them. A wild flower, in how many, many ways, it may be interpreted!

We are here simply looking back at this picture and art display generally, and so must needs avoid the naming of special pictures of whatever kind; but it may be further observed of these landscapes and views, and hedge-rows, that the painters of them would seem to have avoided the naming of the places where they were found, *e.g.*, "A Thames Breakwater,"—but whereabouts in the long length of the river? Many might like to see the spot itself. The "Beached Margent of the Sea." "On the Coast of Cornwall." "June." "An October Evening,"—but, where are these? and a host of others, all of them evidently taken from some one or another attractive spot, which, if worth the painting, is and must be worth the seeing, and the knowing a somewhat about. A famous picture in a former exhibition, and one which most readers well remember, as evidence of what its painter can do when the fit takes him,—"Chill October,"—whereabouts was that scene, in what part of the wide expanse of England? Surely a fact is worth stating, and where is the picture now? It might well have been made national property. But this in passing. There was here, too, "God's Shrine," but where? and a "Woodland and Stream," and of sea-views no end, but whereabouts, who shall speculate? The "Sea" surely is always worth the painting; it ever varies, no two hours alike, and to present a vivid idea of it on canvas is and must be a notable feat, in whatever state, whether of calm or storm, to accomplish. But why not say where painted?

And this again leads us to a thought or two on what, perchance, might prove a useful addition to the present somewhat narrow professional Academy programme. Might there not be one small room devoted to the exhibition of what are called "Sketches," and first thoughts on great subjects? "Sketches" are not, as is known, as matters are at present, permitted; nona but pictures worked close up to the gilt frames, as though there was a something of import in the hard outline of the frames. Sketches and first thoughts are of no small value at times, and some of the finest and most valued of the thoughts of the great masters left us are in the form of sketches, whether as memoranda, or as complete work, as at times is the case. We need not cite examples of this: they will readily occur to all, and certainly to those who strive to look into the minds and methods of the great masters of the painter's art. No one, we think, who has been privileged to look through the portfolio of a painter or a sculptor but must have wondered at times at the skill and power of expression exhibited in these may be hasty "sketches," and sometimes, too, at how much has been lost of this in the more finished and completed picture. We believe a single room, or even one wall of a room, thus filled would be most attractive, and would, perhaps, afford to the expert what the more completed and finished work fails to do. It is thus well to look back sometimes.

Bachelors' Ball at Kensington House.—The decorations and illuminations on this occasion were on an unusual scale, and were carried out by the firm of J. Defries & Sons. The effect was remarkable. The terraces, gardens, lake, islands, &c., were outlined with variegated lamps artistically arranged, and festoons of myriads of Japanese and Chinese lanterns were spread from tree to tree and every point of vantage.

FINE ART EXHIBITION AT TURIN.

THE building erected for the exhibition of Italian works of art at Turin is described, by the *Giornale dei Lavori Pubblici e delle Strade Ferrate*, as presenting an aspect that is at the same time light and severely artistic. It forms a quadrilateral, 215 mètres long, and 70 mètres wide; the principal front, which looks eastward, on the Corso Siccardi, being on one of the shorter diameters of the parallelogram. The elevation consists of a great arch, surmounted by an attic story, and two arcades, of three arches each, supported by coupled columns. The most elevated part of the façade is 21·65 mètres above the ground. In the lunette formed by the central arch, Professor E. Gamba has painted a fresco design, representing the Coronation of Italian art. The main entrance into the central hall is divided into two by a column, an arrangement which has encountered not a little criticism. In the middle of the terrace before the building is a statue by Vincenzo Vela, representing Minerva with a crown in her hand.

Signor Calderini, of Perugia, is the architect who gave the first design for the building to the committee for the exhibition. The great central gallery is divided on its sides into sixteen compartments. It is 130 mètres long. In the centre is a large octagonal chamber, destined for works in sculpture alone. Four large rooms are placed at the end of the gallery, and the octagon, the four end chambers, and the sixteen compartments, will be occupied by architectural designs. The sculpture gallery and the four saloons are illuminated from above; the lateral rooms have large windows on the sides. At the west end of the building a gallery is in progress, which is intended for the display of objects of industrial art. It surrounds on three sides an open court, in which is a *chiosque*, surrounded by flowering plants. Rooms are included in the building for the committee, the secretaries of the societies connected with the exhibition, the press, the post and telegraph, the attendants, the fire brigade, and the guards, as well as two larger spaces for the use of the purveyors of refreshment.

PROPOSED TUNNEL UNDER MONT BLANC.

THE French Government, if we may rely on a statement recently made to the "Society of Engineers and Industrial Persons of Turin," is seriously occupied in the consideration of a tunnel under Mont Blanc, and has commissioned M. de Lepinaye, inspector of railways, to draw up a comparative report as to the various passages through the Alps that are either completed or in prospect, stating the advantages and disadvantages of each, as to distance, gradients, and cost of construction.

According to this report, the distances between Paris and Piacenza are as follow, by the different routes indicated:—

	Kilomètres.
Mont Cenis route by Turin and Milan	992
" " by Turin and Alessandria	915
St. Gothard route by Basle and Milan	975
" " by the Jura-Gothard line	935
Simplon route ... by Novara and Mortara	905
" " by Milan	914
Mont Blanc route by Vercelli and Broni ...	886

Adding to the actual horizontal distance the proportionate lengths which are equivalent to the heights overcome by the gradients on the respective lines, the following are stated to be the results:—

From Paris to Piacenza the Mont Blanc route has an advantage of 40 kilomètres over the Simplon route, of 53 over the St. Gothard, and of 72 over the Mont Cenis routes.

From Paris to Milan the Mont Blanc route has the advantage respectively of 14, 23, and 86 kilomètres over the Simplon, the St. Gothard, and the Mont Cenis lines.

From Paris to Genoa the corresponding advantages of the Mont Blanc route are 75, 159, and 43 kilomètres over the before-cited three other lines.

With regard to cost, allowing the sum of 4,086 francs per mètre for the principal tunnel, and that of 400,000 francs per kilomètre for the line from Aosta to Courmayeur, and adding 18 millions for the headways and for interest on capital during construction, the total is brought out at 90 millions of francs for the trunk line from Aosta to Chamounix, effecting an economy of 30 millions of francs over the Simplon line. There is the further great advantage that the extreme length of the Mont Blanc tunnel is under 13,500 mètres, while the Simplon tunnel measures 18,500 mètres.

From the recent experience in the St. Gothard tunnel as to the illness caused among the workmen by the heat, it is considered by the advocates of the Mont Blanc line that it must be almost impossible to execute a blind bore, or tunnel without a shaft, of 18 kilomètres in length, at all events, without great improvements being effected in the present means of ventilation. The shorter length of the Mont Blanc tunnel presents a great advantage in this respect. It is calculated that the heat developed at the face of the work in proportion to the depth of the gallery beneath the surface, will not exceed 33° Centigrade (or a little over 90° Fahrenheit). Signor Garoia expresses the hope that the valley of Aosta, which has always been the gateway for the invaders of Italy, ancient as well as modern, may open a route for a peaceful and enriching traffic.

FROM THE BANKS OF THE SEINE.

THE Working-men's Congress, held during the last week here in Paris, cannot be said to have been wanting in the element of exciting interest. Entire liberty has been wisely accorded by the Government to these "revolutionary collectivists," as the members of the Congress term themselves. The idea was an excellent one, that of a Working-men's Congress; and very interesting and valuable would it have been to hear from the lips of a number of intelligent artisans their views on the existing state and working of the modern question of capital and labour; but, unfortunately, a revolutionary and murderous political element has been introduced into the discussion, and each day's doings have merely served to register the tame re-expression, in slightly altered terms, of the same unmeaning imprecations against the existing state of society, which all agree must be abolished, but as to the re-constitution of which no two are of the same opinion. The very first meeting, presided over by two "citizens" and a "*citoyenne*,"—for the female element has taken an important share in the congress,—declared itself unanimously "revolutionary collectivist, that is, resolved to take by force and divide the manufactories, the guilds, the machinery and tools, and the capital." Day after day has seen a series of delegates express their views, and tediously do they all coincide on the iniquity and exaction of the capitalist. Had these discussions possessed a cool and reasoned tone, much that was interesting and instructive might have been arrived at, for how is it possible to deny that the relations of capitalist and labourer are far from being in a satisfactory condition in France? Unfortunately, the question was not to be enlightened by such excited views, in which the continual repetition by delegate after delegate of the most violent revolutionary proposals became tame, even when there was no want of open reference to armed force, petroleum, and picrate of potassium. Throughout all this sad enunciation of the supposed sentiments of the French working-man, it is encouraging to feel how little these views can express those of the mass of the artisans of France. The Congress is attended by a very meagre number of representants of the working-men's "groups" of the country, and the large majority of the delegates are the agents of avowedly socialistic societies, or, as they are termed, in a somewhat more dignified manner, "clubs of socialistic study," many of the members hereof which have, we are afraid, little in common with the sturdy working-man. A further feature in the congress is the female element. Certainly in a working man's congress the all-important question of the rights of woman as a joint labourer, and therefore a large factor in the consideration of the social question, has its natural place; but in the purely political current into which every discussion has drifted the female element, particularly when presiding, seems strangely out of place. Politics, indeed, seem to have driven out all the other interests, although the questions of salary, masters and men, apprentices, education, general education, the number of working hours, the necessity for co-operative societies, and many other such practical subjects worthy the attention of a working-men's congress, were settled for discussion. One special feature of the whole meeting

has been the loyal and courageous protest of the delegate from Havre, M. Drouet, a sail-maker, who, having presented an excellent programme, divided into twenty-one heads, in which were formulated a number of appropriate questions for consideration, found this admirable document entirely rejected by the congress, on the score of the want in its tone of revolutionary violence. To rouse the enthusiasm of the delegates, the more skilful of their clumsy orators have been obliged from time to time "to lay it on pretty thick." Disgusted with the ultra-political tendency of the discussions, and the sanguinary and ferocious threats and proposals put forth against the hated "bourgeois" and the capitalist, M. Drouet expressed his warm indignation in a declaration which has won for him the respect of all thoughtful and well-intentioned persons. Stigmatising "the brutal theories and ridiculous Utopias" of his fellow-delegates, he roundly blamed those about him for their folly in believing that the French nation would ever in any numbers follow their advice. Claiming his privilege as a delegate, and therefore entitled to be the spokesman of those who elected him as their representant, M. Drouet nobly ended his protest by the following words, which deserve the attention of every workman and employer:—"You expect us to follow you—No, a thousand times no. It was our belief that we were about to assist at the development of practical theories conformable to sound reason, but you ask us to aid you to carry out unhealthy, absurd Utopias. Citizens, in the name of the workmen of Havre, and of all those who freely, without concealment, desire to arrive at true progress through right and justice, we repudiate your principles, and before quitting this tribune I consider it my duty to declare that I, Ernest Dronet, sail-maker, delegated from Havre to this Congress, protest by this declaration, and withdraw."

At the present moment, when the flood of passengers,—English and American,—between England and the Continent is setting in with its usual force, it is quite seasonable to hear of the recent visit of M. Léon Say to Dover to inspect the progress of the studies for the proposed sub-Channel tunnel between France and England, and the journey, almost on the same day, of the French Minister of Public Works to Sangatte, near Calais, where the French society, which is studying the tunnel difficulty, have sunk a well. From the report issued by the South Eastern Railway Company, it would appear that the geological strata are not only in exactly the same position, but are of the same thickness, on both sides of the Channel. Everything, therefore, points to the success of the project in a comparatively near future. As very opposite, we may bring to the knowledge of those interested in the question the work recently published by Prof. Hebert, "L'Histoire Géologique du Canal de la Manche." M. Hebert has devoted many years of deep research to the study of the successive modifications of what is known as the "basin of Paris,"—a vast extent of country comprised between the central plateau, Brittany, the Ardennes, and confined by the shores of the British Channel. The Professor is familiar with every feature of this district, and he has collected at the Sorbonne specimens of all the rocks, the remains of all the life of the past which has occupied the district. Aided by this evidence, M. Hebert has been able to form the history of the changes through which this important region of France has passed. The arm of the sea which at present extends between France and England, and which unites the Atlantic with the North Sea, has only (comparatively) recently assumed its now familiar aspect.

The lawsuit connected with the statues at the historic Château de Menars, said to belong to the State, has again come before the courts. As can be imagined, the case has brought forward some curious details,—not least interesting among these the insight into the peculation of the too-famous Poisson de Marigny, the relation of the Pompadour. Taken by him from the royal galleries, and placed in his château of Menars, a number of statues of more than usual merit are the subject of the present lawsuit, which is by no means yet terminated; the State claims its interest in these statues—a claim which, at the beginning of this century, was put forward by Pajon the sculptor, then curator of the national antiquities; but the property of Menars having passed through a variety of owners, difficulties have arisen in the arrangement of the question. Are these statues the property or not of the State? is the point which has to be settled, and which, from all appearances, will be a somewhat lengthy question to satisfactorily determine.

This dispute serves admirably to show the value of the commission formed six years' since to prepare an "Inventory of the Art-Treasures of France," already noticed in these pages. One by one the volumes of this excellent Government publication are appearing. Perhaps of all the attempts made within the last generation in favour of the arts, the most successful and the most durable, the most likely to lead to unexpected results, is the formation of this inventory. The idea once thrown out,—only in 1874,—was eagerly taken up, and the various prefects, mayors, and directors of provincial museums and learned societies, were communicated with, and their duties assigned. While the information was being collected, the Commission prepared a volume containing an inventory of the art-treasures of twenty-seven of the churches of Paris. The second volume, published not long since, contains monographs of the library of Versailles, the church of St. Sauveur at Chalons, and the hospital of the same interesting old town; the modest museum of Chalons has a chapter devoted to it, as also the museum of Orleans and that of Montpellier. These three monographs alone would suffice to show the intention of this inventory, the writers not confining themselves alone to a mere inventory, while at the same time they have not neglected to observe the conciseness necessary to each a work, nor yielded their claim to the right of criticism to which their knowledge of the treasures under their care has entitled them. The claims of more than one doubtful or ill-assigned object are in this manner corrected, and the work is by this means rendered invaluable. The third volume of the inventory has only very recently made its appearance. It is devoted to the civil monuments of Paris, and contains a series of curious monographs of the Institute, the National Archives, the New Opera-house, the Palais-Royal, the French Théâtre, the Fontaine, the Arc de l'Étoile, the Column of July, and the Place Vendôme. Already it will be seen what an interesting and considerable start has been made, and this is easily explained by the fact that the information existing had only to be gathered together, each curator knowing (he is superintended by a sub-commission) the contents of his museum, even when there exists no printed catalogue. The idea merited the success which it has met with.

MORTALITY IN MINES.

FAR too frequently the British public is startled by the report of an appalling disaster and the loss of many lives by an accident in some mine, oftenest a coal mine. Such a disaster has just taken place; and at the same time we have in the official reports of the Inspectors of Mines a series of facts published that show the comparative frequency of accidents in mines in the several mineral-yielding districts, and the extent of the loss in a year; and the teaching of these official statistics is that whilst the proportion of the fatal accidents in mines is being reduced from time to time, yet there is not the reduction that there should be in the losses from explosions of fire-damp, the most deadly of the enemies that our miners have to meet, and the one which is the chief cause of the loss of life that is from year to year tabulated.

Taking a series of years, we find that the truest test of the safety of our mines is not the number of accidents, nor even the number of lives lost, but the proportionate loss of life to the quantity of coal produced. During a series of years, the number of lives lost by accident in and about the mines classed under the Coal Mines Act has varied from 970 to 1,500, the number for last year being 973. During the years over which these figures extend the production of coal has been increasing by the opening out of additional pits and the greater output from some of the old ones. If, instead of looking at the number of deaths simply, we test over long periods the number in proportion either to the number of workpeople employed, or to the amount of coal produced, we shall find that the fatalities are fewer. In the ten years between 1850 and 1860 the proportionate loss of life was 1 to every 245 persons employed; in the succeeding ten years it fell to 1 to every 300; and in the subsequent years, not yet a full decade, the ratio has been still more satisfactory,—about 1 to 430.

And it is also satisfactory to find that the general opinion as to the extreme danger in coal-mining is not well founded,—for other employments have risks as great, and even greater,—the loss of life at sea being greater both in the Royal Navy and in the merchant service, whilst also in proportion to the number employed the mortality in the railway service is greater. It is in the loss of life in mines by explosions of fire-damp that the most unsatisfactory state of affairs is found in the mining mortality, for the average number of deaths per year is greater now than it was a score of years ago, and the proportion that these deaths bear to the production is not diminished. It is in the unequal incidence of these losses that there lies the cause of the very great disparity in the mortality of the several mining districts,—the mortality in Wales being thrice as high as that in the great coal-mining district of northern England.

Since the awful accident at Hartley Colliery, nearly a score of years ago, the north-eastern coal-mining district has been free from great fatalities of that nature; but Wales, Lancashire, and Scotland, and one or two other districts, have suffered at times severely. Some of the most eminent mining engineers entertain different opinions as to the causes of that great discrepancy in the relative danger of the respective districts; but it is generally believed that in great part it is due to natural causes,—to the different classes of coal mined, and their varying yield of inflammable gases; to the supposed increase of danger at certain depths of mines, and to other allied causes; but it is remarked by some of the Government inspectors that in certain districts there is not that strictness in regulations that there is in others. Thus, one of the inspectors reported that in his district last year causes, other than natural, of serious losses were, "the manner in which gunpowder is used; the custom of depending almost entirely on the colliers themselves to keep the working-places safe; and the want of discipline and definite instruction as to the examination and use of safety-lamps." And in another the inspector complains that the men in the mines do not avail themselves sufficiently of one of their permissive powers to make periodical examinations,—the use of which he thinks would tend to increase the safety of the mine; and another reports that out "of seven lives lost by explosions of gas, not less than six were brought about by carelessness." It is useless to make suggestions as to methods of minimising the danger in mining, for what suits one district does not necessarily meet the wants of another. But this much may be said, that when there is in any district a mortality above the average, and when there are serious losses of life, the inquiries that follow might legitimately be extended to the consideration of the question whether the method of working, or the regulations, are capable of being amended by the experience of those great districts whence large quantities of coal are extracted without very serious loss.

THE COAL SUPPLY OF LONDON.

ONE of the largest of the coal consumers of the world is the great metropolis, and though there are occasional interruptions to the growth, yet from year to year the tendency of the consumption is upwards, if not steadily so. From eight to ten million tons of coal are yearly brought into the metropolitan district, and though a portion of this is sent out, yet the consumption of coal within the metropolis is astonishingly large; and the growth of that consumption is one of the causes that have contributed to the increase of the output of coal in the kingdom, and which has added thirty million tons to the production of the kingdom within the last fourteen or fifteen years. One of the checks to the growth of the consumption of coal in London has taken place in the present year,—a temporary one, after a year of very marked growth,—so that the present is not an unfair indication of the extent of that consumption, and of the sources of that supply of fuel for the fires of the metropolis. It may, therefore, be interesting to ascertain from the official returns the quantity of coal brought into London, and that retained apparently for consumption. In the present year there appears a change, too, in the method of carrying the coal, and it is possible that other changes impend in the

future in this respect. During the first six months of 1880, there were brought into the metropolitan coal district not fewer than 4,789,000 tons of coal,—a quantity less by 100,000 tons than that brought in during the corresponding six months of last year. There are two great methods of importation of this coal into London,—by railway and by sea,—the amount brought in by canal being now so small that it may be dismissed with the remark that it rarely exceeds on the average 400 tons in the month. That small quantity is usually included in the returns with that of the great bulk,—that brought by the railways. Since the introduction of the railway system the quantity of the coal carried thus into the metropolis has grown until it far exceeds the quantity brought in over sea. In the first half of 1880, there were brought into London by railway 3,088,933 tons, and this amount even is much less than that brought in by that method in the previous year. On the other hand, there was an increase in the quantity brought in by vessels. During the first six months of 1880 there entered 2,586 ships' cargoes of coal,—the tonnage being 1,780,782 tons. We have thus the large quantity of over four and three-quarter million tons of coal entering the metropolitan district. But from this there is to be taken the railway-borne coal which merely passes in transit through the metropolitan district, as well as that sent out of the district either by canal, rail, or vessel. In these varied methods, 1,193,915 tons of coal were sent out of the limits of the metropolis during the first half of the present year, and in the remainder we have the apparent consumption of coal of the great city. That consumption, then, was rather over 3,500,000 tons in the six months,—an immense burning of fuel; for though no small part of it is used at the gas-works in the production of gas, yet the latter is becoming more and more a fuel as well as an illuminator, and the coke which is produced is also a fuel.

The sources of supply are only indicated in part; that railway-borne is told so far as the railways that bring it in are concerned, and the source whence that brought in by vessel comes is shown by the port from which it is sent. Taking the railway-borne coal, we find that the Midland Railway stands at the head of the companies which bring coal into the metropolis, its annual contribution being about one and three-quarter million tons, of which no small portion is derived from the coal-field of Derbyshire and South Yorkshire. Following this is the London and North Western Railway, the average quantity of coal brought into the metropolis by which is about 1,250,000 tons. The third place used to be occupied by the Great Northern Railway, but the increase of the great coal trade of Wales has enabled the Great Western to take rank immediately after the London and North Western, with a contribution of a million tons of coal in round numbers, and the Great Northern closely follows, though its coal is from an entirely different quarter—from Yorkshire and Derbyshire. The only other large contributor is the Great Eastern Railway, which brings its 600,000 tons yearly. In addition, slighter quantities are added by the London and South Western Railway, and by the South Eastern, and London, Chatham, and Dover, and thus the total of the railway-borne coal is brought up. Of the sea-borne coal, it is clear that the great bulk comes from the northern coalfield. From Newcastle-on-Tyne alone, one half of the sea-borne coal entering the metropolis is sent. Next follows Sunderland, which ships some 890,000 tons; and then, but at some distance, West Hartlepool, whence 350,000 tons are yearly sent to the metropolis. The little port of Seaham Harbour takes the fourth place, sending as much as 200,000 tons yearly, but Middlesbrough, Blyth, and other ports send small additions. The entire yearly contribution of Scotland is about 50,000 tons, and that of Wales 20,000 tons, these districts finding other modes of carriage or other markets. It is evident, however, that changes impend in the mode of conveyance of coal to the great city; there are now being constructed docks at other parts of the east coast, with the view to the supply of coal by other districts over sea to the metropolis, and with these there is a certainty of a reduction in the rate of carriage by rail, so that it is evident that there will be a struggle for the supply of the great coal-market both between the various districts and between the different methods of conveyance. It is impossible to indicate the method in which the coals sent to London are used except in outline. It is certain that two of the largest consuming sources are for steam-power and for the manufacture of gas. In comparison with that of the country as a whole, the consumption for the purposes of metallurgy is very small, and for manufacturing purposes it is less in proportion probably than in the Lancashire district, so that to the two methods of consumption that of the demand for household purposes will probably be next greatest. It is, however, clear that the consumption must increase: steam power is more and more used; and despite the electric light, the area for the use of gas is growing, both for purposes of heat and illumination, whilst the extension of the metropolis year by year enlarges the demand on the coal-pits of the kingdom, and large as has been the addition to the quantity of coal needed to feed the fires of London, it is certain that in the future that growth will continue, if not with an increased rapidity.

THE SANITARY MEETING AT THE MANSION HOUSE.

Is it possible to make sanitary subjects popular: that is to say, to get up that kind of interest in them which will induce people to flock to a meeting for considering such subjects just as they would to the benefit of a popular actor? There is no doubt a greater interest is felt in sanitation now than there ever has been in this country before, as far as we know; but we fear it is not so great as it sometimes appears, and we know it is not so great as it ought to be. People have theoretically recognised the fact that such subjects have to be considered, and they know that it would be thought foolish to refuse to listen to their consideration merely on the ground that they were not proper subjects for refined people to talk about,—which was the old feeling; and it is possible, as the Mansion House meeting on Tuesday showed, to get up a very fair meeting to hear a report on the subject. But we surmise that those who form the audiences at sanitary meetings are mostly part of a small band; that they are to a considerable extent the same audience at one meeting as at another. The real interest in the subject has not spread beyond a small circle.

It is desirable for the present, however, that hygiene should be popular, because it is only by its becoming a subject of popular interest that any great or rapid improvement can be made in regard to evils which it is so difficult to get at in detail, and which are so much under the control of individuals of all classes. It is not, he it admitted, a natural or even a healthy state of things that sanitation should be an object of popular interest and general conversation. As with the health of the individual, so with that of society. There is the least need to talk about it when it is in the best and soundest condition. A man in thoroughly good health does not think about his digestion, or whether this or that will agree with him,—it is a matter of course which goes on regularly in the order of nature. But let his digestion be impaired, and the subject becomes a matter of interest to him, and he is desirous to know what food is good for him, and what is not, and if he is very far gone, he will even discuss the subject with his friends as if it were necessarily an agreeable and interesting topic of conversation. Cure him of his dyspepsia, and he will cease to think about digestibilities and indigestibilities. At present we are in the condition of the dyspeptic man. Our sanitary stomach is out of order, and it becomes a matter of serious general interest to know what will agree with it and what will not,—what will cure us and what will not. The difference, however, between society and the individual is, that the latter much more easily knows what is the matter with him than the former. The individual has numistakable personal pain and discomfort which render it impossible for him to ignore the fact that he is in an unhealthy state. But of the members of a society only a comparatively few may actually suffer severely from an evil from which, nevertheless, they are all nearly equally in danger. Those who are not conscious of having suffered themselves from sewer-gas, or who have lost no beloved relative through its influence, are not immediately spurred on to inquire into the subject; and even those who have so suffered are often not aware of the real origin of the disease or death which has spoiled their lives or destroyed that of their friends. The position of many of the public in regard to the danger of ill-arranged or defective drainage is something like that of the sons of Duncan after the murder, who come in and ask innocently,—

> "What is amiss?"

and we have to answer them again in much the same words as Macbeth's,—

> "*You* are, and do not know it:
> The spring, the head, the fountain of your blood
> Is stopp'd; the very source of it is stopp'd";—

or if not stopped, at least poisoned. And until this is generally understood, it is well that sanitation should be talked about and popularised as much as possible. There are three classes of persons, at least, in connexion with house property, whose attention has to be awakened, and whose conscience must be acted on: the landlord who lets the house, the tenant who lives in it, and the workman who makes it. We wish there were not too often reason to add, and the architect who plans it; but we fear he cannot as yet be allowed to go scot-free: and when he does neglect the subject, his neglect is of course the most blameworthy of all, not only because he ought to feel bound to understand what are sanitary conditions, and provide for them, but because even when his education in this respect has been neglected he, at all events, knows where to go for information, which the landlord and tenant mostly do not. As to the unfortunate workman, he is perhaps more sinned against than sinning. It is some gauge of the deficiencies of his education when we find that even the foreman of a gang of gas-labourers did not know under what circumstances gas was explosive. How was he to know, poor man! No one had ever taken the trouble to tell him. We fear, however, it must be added that the average working-man, even if he had been purposely instructed as to what he ought to do, has not by any means developed that sense of responsibility which would induce him to do the right thing merely from a sense of duty and without being compelled to do it by an unremitting supervision. When we have developed in all these classes of persons the knowledge what precautions are necessary to make a house healthy, and the determination to carry out the conditions as a matter of course, then we may concede that such questions need no longer be matter of popular discussion. They are not in themselves of popular interest, provided they are going all right; but until they do so, it is necessary to endeavour to popularise them in order to get them attended to at all.

It was therefore a wise move for the committee of the Parkes Museum of Hygiene to give a public character to their first annual meeting. There was, we believe, some doubt in the minds of some of those connected with the institution as to whether it was desirable at this time of the year to attempt so public a celebration of the mere termination of the first business year of a museum which is as yet quite in its infancy and has attained no separate residence. But we are sure any of those who were doubtful on this head will agree that the result justified the attempt. The meeting at the Mansion House was a larger one than, under the circumstances, many persons expected, and now the idea of its being a public concern is fully established, and we can have no doubt that, on the next occasion, an even greater interest will be manifested by even a larger attendance: we hope, we may add, by a longer subscription list. In respect of pecuniary matters, certainly, the result of the invitation for subscriptions on the spot was not a brilliant success. One reason for a certain caution in subscribing we take to be the feeling of doubt as to the future home of the Parkes Museum, the present habitation of which is admittedly only temporary. It is on this account partly that we urge on the trustees of the Parkes Museum the advisability of putting into shape without delay some architectural scheme for a separate building at once attractive in appearance and convenient in its arrangement for classifying and exhibiting the objects. If such a building, and an appropriate site, were once determined on, it would probably be easier to get subscriptions from those who can afford to subscribe on a large scale. People require to have a definite object before them, and to know what is going to be done, before they will open their purses very liberally, even in better times than the present. We may perhaps have a suggestion to make just now about a site and about the form such a building might most suitably take. At present

we will only say that, both being essentially a matter connected with cheerful and bright associations, the building devoted to illustrating its conditions should also be bright and attractive in appearance,—the rather so as there is unfortunately too much reason for a prevalent feeling that "sanitary" places (and even in some cases "sanitary" persons) are by no means very bright or attractive in themselves, as far as we have yet gone. Sanitary books are made very dull, sanitary institutions very ugly, and sanitary inspectors—but, however, we must avoid remarks which might be translated by malicious people into personalities. In addition to architectural attractiveness, the proposed building might be made a practical illustration, externally as well as internally, of the materials and construction most fitted for promoting healthy conditions in crowded houses. It would be a small building comparatively to begin with, very likely, but it ought to be readily capable of extension, for we anticipate a large future, at all events, for the Parkes Museum of Hygiene. It concerns all, and appeals to all.

A FOREIGN ARCHÆOLOGICAL WORK.

IN these pages we have more than once had occasion to quote from our Parisian contemporary, the *Revue des Deux Mondes*, the archæological articles of Gaston Boissier. For many years the distinguished Academician has contributed to that solid publication a number of invaluable papers, the result of his studies and travels south of the Alps; and now he has gathered these communications together, and formed them into an octavo volume, which will be read, we do not doubt, by all interested in the artistic and classic history of Italy.* M. Gaston Boissier's work is of additional value, as laying before his readers the most recent discoveries and theories relative to the spots visited and described by him up to the close of 1879. Indeed, in his preface the author modestly expresses his fear that this very fact will soon render his work of but little interest when future research will have placed us more in possession of a knowledge of the life, the aspects, and the habits of the cities and people of antique days. This fear is, however, little founded when, on opening the book, one finds so much information that can never lose its interest or novelty, and described in that bright and inviting style which, familiar to all foreign archæologists, is additionally remarkable in M. Boissier, who is not professionally an archæologist, but an esteemed professor of Latin poetry at the Collège de France. Exceptionally familiar with the Roman society of antiquity, M. Boissier by necessity is an archæologist, to whom every inscription, every scrap of hedimmed hut still glowing wall-painting, every old stone and lizard-haunted ruin, speaks of the life of the Romans of the past, our intellectual ancestors. With M. Boissier the absorbing and special studies of the pure archæologist have not exercised their usual influence. He mingles with his learning the rarely-met charm of literary skill.

On this very point, the want with the pupils of the Villa Medici in their architectural restorations of the supporting evidence of the literary sources of information, in addition to those afforded by artistic study, M. Boissier is warm. "The French Academy is not sufficiently impressed with the fact that the restoration of an antique monument, in addition to being elegant and agreeable to the eye, must also be exact, and it can alone be so if the architect who undertakes it has first studied the evidences and information left us by antiquity concerning the monument which he restores." Such advice cannot too constantly be held before the architectural student of every country, though of course it possesses more meaning (as regards Classic architecture) in France than in England, where our young architects do not, like our neighbours, commence their career by several years' residence in Rome and Athens, occupied in restoring (on paper, happily) the ruins of the great buildings of Greece and Italy.

This want of the literary respect that should surround everything that belongs to the distant past has led more than one archæological investigator to destroy work which, being of a later period than that specially interesting him, has prevented inquiry into the foundations or origin of the building explored. More than one interesting monument has been in this manner disfigured. M. Boissier in his work, does not make any special mention of the Coliseum, but the Coliseum offers an instance of this archæological zeal. As we remember describing in these columns some two years since, this interesting monument, so intimately bound up with the history of early Christianity, is now a water-filled swamp, in which the frogs weirdly croak at nightfall to the carefully scraped walls of the arenas, once picturesque in their verdure and beautiful with a *flora* the delight of botanising visitors to Rome.

How far this destructive warmth may be carried is curiously proved by a recent communication to the *République Française*, and from which it would appear that at Athens the archæological explorations have led to even sadder results; in the course of eager inquiries has been demolished the Frank Tower which stood at the eastern angle of the Acropolis, on the side towards the sea, and which masked neither the Parthenon, the Propylæa, nor the temple of the Wingless Victory,—an old tower the artists loved almost as dearly as the choicer marbles of Ictinus's Temple, for the mellow Attic sun had gilded it with the same glow as its more classic brethren in ruinous misfortune. Yet this simple tower, rising proudly on its base, marked a date in the history of Athens and the world, the Crusades, the feudalism of the West borne to the East, the Latin empire of Byzantium. But the old tower has been demolished as ruthlessly as if it had been but a shepherd's hut. When, asks Atticus, the writer to whose article reference has been made, when will come the turn of the Venetian ramparts and the Turkish bastions? There, on those fortifications, built by some unknown barbarian Vauban, the Phil-Hellenes of Fabrier have pointed their cannon; but the bastion is posterior to Pericles, and its days are numbered. One trembles at the thought that under the Parthenon as it stands lie the remains of the temple which the Persians destroyed, but the archæologist who will carry fully out the cruel work of Morosini will, we suppose, be immortal.

To such abuses a remedy can probably alone be found in admitting a greater share of influence to the literary student, who must direct and check the archæologist. The men of letters who are able to generalise on the discoveries made have it in their power to interest public opinion in the work of the archæologist, and to form, direct, and restrain that opinion by the sentiment of moderation with which they are imbued; this position renders the man of letters one of the most invaluable aids to the archæologist.

M. Boissier does not raise a voice against what may be termed, somewhat paradoxically, the vandalism of the archæologists. As he threads the now tidy Forum, with its railed-in precipices, unshadowed by the trees which only a few years ago adorned it so naturally, no regret is expressed for the memory of the Forum of Piranesi's time, the image of which the strangers of those days bore home from the honest old engraver and printseller's shop. The destruction of the Forum which Byron saw and described, has, it is true, shown us the Forum of Classic times; and if the picturesque drover from the marshes no longer passes through the old "foro," goading his meek-eyed bulls, we can more easily picture in imagination the Forum of imperial and republican Rome. To all this old life, so bound up in the memory of the Roman resident of thirty years ago, and which now has almost disappeared, M. Boissier devotes no regret; the utmost expression akin to such a feeling is to be found on the first page of his book, in which he refers to the new neighbourhoods rising in modern Rome on the not-so-long-since deserted tract that lies between Sta. Maria Maggiore and the Porta San Lorenzo. Even in the days of Nero, when that emperor rebuilt Rome, it would appear that there were not a few who regretted the disappearance of the narrow, crooked, old streets where cool shade was always to be found.

Much as one would desire to learn more of Herculaneum, in which we know are buried such treasures of art, Herculaneum remains still to be explored, buried under its liquid mud, which has hardened into a natural cement. All our knowledge of Pompeii's sister city remains obscure, like its streets and its temples; at Pompeii the sun shines again on the well-worn pavement of the Forum, and in the courtyards of the houses once so full of gaiety. M. Boissier is a delightful guide through the now silent streets of Pompeii, which reveal to him, from the various indications they afford, the life of the inhabitants, honest provincials, retired tradespeople, and humble artisans, of whom classic literature has left us but very few traces. This is one of the peculiar features of the existence at Pompeii which shows us a "bourgeoisie" living in the midst of a refinement unknown to their descendants of the present day; and which, when compared with the same feature of the existence of the Italian merchant-princes of the past, is eminently calculated to encourage the efforts of our so-called "middle-class" movement towards a high ideal of refinement and taste.

At Pompeii much remains still to be learnt of the life of the humbler portion of the population; most of the excavations have brought to light the interior of the houses of the more easy portion of the community, but the researches, which will next be continued on the side towards Castellamare, outside the neighbourhood that gathers round the road to Naples, will, it is expected, yield much information respecting the habits of the populace of Pompeii.

By the aid of the indications so far gathered, by the aid of various mural paintings and *graffiti* scratched on the walls of the shops so far unearthed, M. Boissier very skilfully revives the popular life of the City of Ashes. The Pompeiians seem to have possessed, like their descendants the Neapolitans, an inexhaustible fund of gaiety, and again, like them, they encouraged a busy crowd of street-sellers, or *forenses*, vending a variety of wares, such as can almost exactly be found in the *piazze* of modern Naples, the different cries which Seneca speaks of as peculiar to his time being only changed in language. As a city of pleasure, Pompeii was amply supplied with wine-shops and hostelries, frequented largely by the smaller people; already we observe the pleasures of home supplied by the companionship of the "bar," which can here be exactly seen, its sole difference from the counterpart of to-day consisting in its being of marble. There are the holes for the various bottles, while for the market people and those who have no time to linger, the "bar" is placed outside in the street. Nor is accommodation wanting for those who may desire to pass their time happily; and the wall-paintings discovered represent the interior of these hostelries as being places "that isn't what they ough' to," as Birdofredom Sawin would say.

Traces are found in the inns of the passage of more than one traveller who has scratched on the walls the customary visitors' remarks.

These *graffiti* are by no means the least interesting of the many relics of the life of Pompeii, as among those which have been preserved have been found many curious details; one amusing inscription being a washing account; but invocations to love,—Venus was the patroness of the city,—occur the most frequently. Such inscriptions took the place, in Classic times, of the printed notices of to-day, and the play-bills of Pompeii have been thus preserved for us, side by side with the characteristic notice of apartments to let for the kalends of July, or a reward offered for a stolen or lost object.

From the gaiety of Pompeii we follow M. Boissier to the more sombre ruins of Hadrian's Villa, where will be found a marked contrast in the sober life there led in the days of its splendour. In his description of the long-since deserted port of Ostia, M. Boissier recalls the ever-interesting and mystic memories of the early struggles of Christianity, a study continued in the paragraphs devoted to Pozzuoli.

In his visit to the catacombs M. Boissier is accompanied as guide by the Cav. di Rossi, whose profound acquaintance with subterranean Rome is well known. The origin of the catacombs, the work of the Christians, their first existence as private property and under the protection of the civil law, occupy a chapter which will be read with interest by not a few. It would be difficult to say which portion of M. Boissier's work succeeds most in captivating the attention. All are almost equally interesting, described as they are in that style so familiar to the French literary and archæological student, and so agreeably free from the tone of pedantry and specialism that leads such works, when published in our country, to be read alone by a privileged few. When it is stated that the work is published in the same form, and at the same price as the most recent romance,—that is,

* Promenades Archæologiques. Rome et Pompéi. Par Gaston Boissier.

let it be recalled to readers in the habit of paying their 30s. for a three-volume novel, at little more than 2s.,—it will be seen that the publishers have no fear that the work will be alone read by a few would-be Dryasdusts.

It is much to be desired that the tone to be met with in such works on the Continent were more widely introduced into England. Art and archæology are not looked upon as special subjects, interesting only to a small number of professional men and their friends. Without losing its dignity, archæology is more popularised through the elegant diction and vivacity of relation of its professors; and hence their writings find a far larger public than such books do either in England or America.

BRISTOL AND GLOUCESTERSHIRE ARCHÆOLOGICAL SOCIETY.

THE fifth annual meeting of this Society was held last week in Stroud.

On the first day (Wednesday, the 21st) a meeting was held in the Subscription Rooms, when the President of the Local Committee (Mr. Caruthers Little) formally welcomed the members to the town and neighbourhood of Stroud, and Sir William Guise, president of the Council, having responded, took the chair, and called on Mr. P. Hallett, the general secretary, to read the annual report, which stated that the year's returns show 494 subscribing members. The income, including last year's balance, was 514*l.* 12*s.* 11*d.*; the expenditure, 312*l.* 1*s.* 6*d.*; and the balance, 202*l.* 12*s.* 5*d.* Besides this, the Society has 414*l.* 15*s.* in Consols, representing the composition fees of life members, to which sum the life subscriptions above mentioned will be added. Having acknowledged the presentation of various works and the gift of a picture of St. Briavel's Castle, by Mr. C. J. Thomas, for the intended museum, the report proceeded:—

"To this subject of the museum the Council is desirous at the present time of calling special and particular attention. The Society is now completing its first lustrum, and during this period it has done much that may be fairly viewed with satisfaction. Since its first year it has annually maintained, without special effort, a list of about 500 subscribing members. Its finances have continued sound, and instead of the common luxury of a funded debt, it has been able to achieve the less common luxury of a funded reserve. . . . . There is not only an entire absence of any museum of antiquities in the county belonging to the Society, but there is nothing in its possession that can fairly be called the commencement of such a museum, and in this important respect the Society compares most unfavourably with its neighbours. The end of each lustral period, in the days of antiquity, was a time of sacrificial purification, and the Council hopes that it will be only needful for the society to become conscious of this fault in its system in order to make this present fifth year of its existence a true lustrum in the ancient sense. Money can do something towards the work of expurgation, but money cannot do all, or nearly all. If a museum of antiquities in general can be purchased in the open market, a museum of Bristol and Gloucestershire antiquities is not to be thus acquired. Such a museum cannot be suddenly made; it must grow. It must be the result of numberless increments of addition and adaptation. It can only be a work of time, but there is a time when the work ought to begin. . . . . 'The establishment of a museum or museums' was laid down in the Society's original prospectus as one of the objects of its foundation. As stated in last year's report, the Council, after much consultation and inquiry, has determined upon the establishment of two centres for museum purposes, the one at Bristol, the other at Gloucester, with the condition, however, to donors, of absolute liberty of choice between them, and with the hope that this liberty will be largely exercised. . . . . In regard to the formal affairs of the Society, the Council has only the customary changes to report or to recommend. In the exercise of its duty of annual nomination of officers, it desires to nominate for re-election the president of the Council, the vice-presidents, and the secretaries, general, sectional, and local, at present in office. The following members of Council retire this year by rotation:—Messrs. Leigh, Kerslake, Blunt, Lucy, Swayne, Gael, and Baker. The nomination of their successors rests with the members of the annual meeting. The Council, during the year, has held six meetings, three at Bristol, two at Gloucester, and one at Stroud, and desires to express its acknowledgments to his Worship the Mayor of Gloucester, and to the authorities of the Museum and Library at Bristol, for the accommodation afforded to it at Bristol and Gloucester respectively, and also to the Cotswold Field Club for the friendly hospitality shown towards it, and through it to the Society at Stroud."

On the motion of Baron de Ferrieres, seconded by Mr. W. Leigh, of Woodchester, the report was adopted; and on the motion of Mr. Little, seconded by Mr. O. Bowley, the several members of the council were elected.

Sir William Guise proposed a vote of thanks to the retiring president, Mr. Gambier Parry, and introduced the president-elect, Mr. J. E. Dorington, in Mr. Parry's unavoidable absence.

The President delivered an address, in which he said the question might be asked, was not the archæologist too frequently attached to the investigation of very old times, and did he not neglect to hunt up and preserve the remembrance of relics of periods which, though only just passed away, would never recur again? Flourishing and thriving as that neighbourhood had been for many centuries, it was scarcely possible to conceive the state of the roads in the beginning of the present century. Such excursions as they proposed to make during the next two days would have been absolutely impossible on wheels a couple of centuries ago. In 1795 the road to Nailsworth was made, and, to show the state of the soil before then, if a spade had been stuck in the ground there at night it would have disappeared by sinking in the next morning, which demonstrated the state of the roads then. What had the English race been doing since the Romans maintained on their hills structures such as the Roman villa at Woodchester, not inferior to the most splendid residences now existing in the county? Roman war-chariots could not have been driven along the mountain-tracks which served their ancestors as roads two generations ago, and only during the last century had the English race developed any talent for building structures other than ecclesiastical and military.

After the proceedings in the Subscription Rooms were brought to a termination, the members and associates had an excursion, the first halting-place being Bownham House, where Mr. Lancaster entertained the party at luncheon. Afterwards a visit was paid to Rodborough and Minchinhampton commons, where the remains of pit-dwellings and the encampment were inspected. Then the party went to Minchinhampton Church.

An evening meeting was held in the Subscription Rooms at Stroud, when

Mr. C. Wethered read a paper on "The Domestic Architecture of the District," in the course of which he said:—It is true this immediate neighbourhood can boast of no mighty achievement of the past recorded in the lofty language of stone, no baronial halls rich in historical associations like the castles of Berkeley and Sudeley, but it possesses an invaluable work of art in that splendid remnant of an extinct civilisation, the Greco-Roman pavement at Woodchester. . . . . Let us pass at one leap to an epoch more than a thousand years further down the stream of history. In "the spacious times of great Elizabeth" there was no fairer portion of what was styled of yore "Merry England" than this. The manor-house and other abodes of similar grade, with their bays and oriels, "bosomed high in tufted trees," hamlet and homestead, extending far and wide on hillside, in vale and in combe, all nestling in their rural surroundings, formed one harmonious combination of the works of nature and of man. New comers into this neighbourhood could hardly be more impressed by the long sweep of the valleys and the flowing outlines of the hills than by that strong element of the picturesque lent to the landscape by our local domestic architecture. It conveys the same sentiment of human interest to Cotswold scenery as the wooden châlets impart to Swiss mountains. And even in these scientific days, there are not a few who willingly turn from contemplating the terrible processes of nature in the geological upheavals and subsidences on every side of us to read tales in stone that tell of men's past lives and labours. I am not taking account of erections of later years, so devoid as a rule of all real expression. I am referring to the remaining examples of that old Northern Gothic, which, if not wholly indigenous, took deep root in our soil, and flourished here for many generations, until, in fact, it was stifled by the disturbing influence of pseudo-Classical prejudice. The hand-weaving of woollen cloths, long the staple industry of this locality, is an inheritance from the same source as that to which Sheffield owes its reputation for cutlery. A strong Flemish feeling is also discernible in numerous carved oaken chests, chairs, and tables still existing among us, or scattered elsewhere. These household adornments display a much higher excellence of handicraftsmanship than what we see in articles of the like kind made to meet the demands of modern fashion. Owing mainly to the skill of our local masons and their seclusion from the chief centres of innovation, together with the excellent quality of the freestone, its traditions lingered much longer in the Gloucestershire valleys than elsewhere. Stroud possesses an object of antiquarian interest in its Townhall, dating, in the opinion of a distinguished authority—Mr. Parker, of Oxford—from the fifteenth century. Stripped of its recent additions, from an architectural point of view it is worthier of notice than the costly modern building of greater pretensions close by. It has scale and proportion, with a quiet dignity of its own. As especially domestic types of illustration I may take More Hall, near Randwick, said to have been founded by a nephew of the celebrated Sir Thomas More, and the Court House at Painswick. These are, in reality, nothing more than a grouping and blending on a wider scale to meet larger wants of the elements to be found in every adjacent cottage of the same date; bringing every tenement, however humble, into a kind of masonic relationship with the rest. Much of their attractiveness depends on the mode of fenestration, and on the steep declivity of their roofs; the windows being either a single opening, with boldly-chamfered framing, or of two or more lights divided by mullions, and frequently crossed by transomes. The dripstone above is still more effective when carried round as a string-course, by defining a height and marking a flooring, while it adds in its long line of shadow a frown to the front. The roof, the crowning of the edifice and the symbol of home, is always conspicuous from its size and pitch, having an angle of inclination seldom less than 60 degrees. Broken up into many gables, it imparts variety to the skyline and increases the play of light and shadow. Above all rise the bold stone chimney-heads, worked in the solid and often set on the diagonal, putting to shame those flimsy pot-and-pan cylinders stuck on yesterday and apt to be blown down to-day. Unity of local means and appliances is further preserved by roofing with stone tiles, a natural formation principally occurring, I believe, in the oolitic beds of Tetbury. From long exposure to the weather, the outer surfaces have acquired a tone of the warmest grey, softened by Nature's own touches of colour in moss and lichen. Many possess either a projecting or recessed porch, affording shelter, and suggesting the sentiment of rest. The Cotswold masons have left upon their hatched and chiselled stones that impress and strength of endeavour which clearly shows in lasting marks how "joy's soul lies in the doing." Much of what they built has been destroyed or defaced by the meddlesome hand of the spoiler, moved by that spirit of unrest which is one of the besetting sins of modern life. An arrest of continuity in the vernacular architecture of a people or race dulls and checks the æsthetic yearnings of the craftsman. Such an arrest occurred, though later here than elsewhere, as I have just said, when the blight of the Classic Renaissance swept over France and England. A century or more ago it led to the transformation of Stratford House, The Field, Steanbridge House, and many another neighbouring "haunt of ancient peace," into the state in which we now see them. Every one of their monotonous façades, with the inevitable portico, and windows of the same deadness of shape, size, and number on each side, is the borrowed dress for forms that were then ruthlessly disarrayed. Men then did their utmost to blot out the nobler features of the dwelling-houses in which their forefathers had lived and died. After all, archæology is but the registry and classification of material facts of the past, unless we can apply some of its teachings to the formation of a system of instruction which shall bear fruit in the arts of the future. Amid the confusions arising from the neglect of ancient principles in the industrial arts, it is cheering to find traces of true Gothic feeling in the productions of the stonemasons, carpenters, and smiths of the present day. We have followers of these honourable crafts in Stroud, who can read drawings and render results in a way quite worthy of their ancestors.

Mr. C. Playne followed with a paper on "Stroud Houses." He said the oldest building which he had found in that neighbourhood was a granary near the residence of their president (Mr. Dorington), and the oldest dwelling-place was Dennay, in the parish of Bisley, close to the Thames and Severn Canal. The next oldest was More Hall, near Stroud, and then came the Court House at Painswick, where Charles rested after his repulse at Gloucester. Next in point of age was the interesting old manor-house of Owlpen. One place deserving attention was Bradley, and as it was stated Shakspeare once lived at Dursley, not far from it, the place had been suggested as that the dramatist had in view as the residence of the worthy Justice Shallow. He came to the conclusion that they had in those old houses remains far more pleasing to the eye than most of those built at a sub-

sequent period. He recommended those who might build houses to put their initials on them and the date for the benefit of archæologists who might come 400 years hence.

A discussion took place relative to the old buildings in that part of Gloucestershire. The Rev. T. Keble called attention to the old manor-house at Bisley as one of the most interesting in the neighbourhood, and one of the most ancient, dating from the time of Edward IV. It belonged to Queen Elizabeth, and he believed she slept there on the occasion of her visit to Frocester. The President said that rather conflicted with a tradition that it was a house two miles distant, though he thought the probability was in favour of this house.

Mr. C. Playne subsequently read a paper on the "History of the Cloth Trade," which, he said, was a subject that could not well be omitted at such a gathering in the metropolis of the cloth manufacture. Having given some particulars relating to the early records of the mystery of cloth-making, in which he alluded, *en passant*, to the efforts of Thomas Blanket, who set up looms in Bristol, he went on to speak of the statute of staples or fairs passed in 1357, by which wool was enacted to be sold at ten towns in England, of which Bristol was one. The devices practised by wool-merchants were alluded to, one writer saying that they concealed their right of knowledge by well-studied fraud. In the seventeenth century it was provided by law that all bodies buried should have woollen shrouds, in order to protect the trade, and the clergyman had to certify that a corpse buried was shrouded in wool. Leaving the general history of the trade, the reader spoke of the local history, and the rise of the manufacture in the district of Stroud. Since the reign of Elizabeth cloth was made at Minchinhampton, and Fuller spoke of the excellence of the streams at Stroud for the manufacture, and the advantage of the Cotswold Hills for the growth of woollen sheep. From 1800 to 1824 was the most prosperous time in Gloucestershire for the cloth trade.

The Rev. R. N. Clutterbuck followed with a paper on "Clothiers' Tronblee," and

Canon Scarth read a paper on "The Staunton Font," Sir John Maclean making a few remarks on the same subject.

Dr. Bird next read a paper on the ancient races of the Cotswold Hills, in which he narrated the result of an investigation of barrows that had been opened. He said around Stroud they had many instances of the practice of cremation, and where they found that they might be sure there were traces of the Assyrian immigration.

On Thursday, the 22nd, a party of more than 200 ladies and gentlemen started at ten o'clock in breaks, &c., to view the Roman pavement at Woodchester. A section of the pavement had been opened, and this was examined with great interest, and a paper on the subject was read by Mr. J. D. T. Niblett. This Roman mosaic pavement was discovered in 1695. The last time it was opened was in 1853. In 1793 the whole design was discovered, and appeared to be the remains of a Roman mansion. When this building was erected cannot be ascertained; but Roman generals erected public works in the neighbourhood in the reign of Claudius, A.D. 61. The clearance recently effected has been due to the exertions of the Rev. F. Smith, the newly-appointed rector of Woodchester, aided by a small grant from the Bristol and Gloucestershire Archæological Society. No perfect idea of the beauty and interest of the pavements can be conveyed in print; but, according to present arrangements, the pavement will remain open for public inspection until the 5th prox., after which it is proposed to re-cover it again with earth; but it is hoped that funds may be forthcoming to erect a protecting building to ensure its being always open for public inspection.

The party then passed on to Owlpen House, the residence of Mr. T. A. Stoughton, where they found luncheon awaiting them. Here, during a heavy storm, Mr. E. Witcbell read a paper on Flint Implements. A tumulus at Uley Bury was afterwards visited and examined, and the party proceeded to Selsley Hill, where a large number of remains of pit-dwellings are to be seen, and the Rev. A. S. Page, the vicar, read a paper on the subject.

In the evening a *conversazione* was held in the Subscriptions-rooms at Stroud, when the museum formed a subject of much interest. The first paper read was on the history of the parish of Bisley, by the Rev. W. H. Lowder, who restored Bisley Church a few years ago. He gave an interesting account of the early history of the parish. A paper by Mr. Middleton, on Leonard Stanley Church, showing that it was an old college of canons, was read by the Rev. W. Bazeley. Mr. Bazeley also read a paper on "The Berkeleys of Leonard Stanley." Mr. C. Playne showed a drawing of Frocester barn, of which he gave some account. The last paper was on "The Great Orphan Will Book, Bristol," by the Rev. T. P. Watley, from which some extracts were read by Sir John Maclean. Mr. Powell, Q.C., also contributed a paper on "The Murder of Edward II.," but this was taken as read. It may be remembered that two years ago M. Germain, a French *savant*, found in the archives of Hérault a copy of a letter purporting to have been written by Manneli Fieschi, Papal notary at Avignon, to Edward III., the substance of which is that Edward II., upon being told that Gurney and others were coming to kill him, escaped from Berkeley Castle by killing the porter; that the knights put the corpse of the porter into a coffin and buried it, as if it had been the body of the king; and that the king escaped to an Italian hermitage, where he remained in strict seclusion until his death, ten years after his escape from Berkeley. This letter was published in full in *Macmillan's Magazine*. Mr. Powell has arrived at this conclusion: "On the whole it seems to me, speaking in professional terms, that those who contend that the king was not murdered have made out a sufficient case to go to the jury, and as you occupy that position to-night, I leave the question for your determination."

On Friday, the 23rd, the concluding meeting of the Society was held in Stroud, when Sir John Maclean proposed, and Mr. Leigh seconded, that next year's meeting be held at Chepstow, and this was unanimously carried.

Sir William Guise moved, "That it is desirable to preserve the Woodchester pavement *in situ*, and that the Council be instructed to take steps to secure that object." Dr. Paina seconded this, and it was carried.

Votes of thanks were passed to all who had assisted the society with contributions and personal help.

A large number of the members afterwards proceeded to Painswick, where they visited the site of the old camp, and then inspected the Court House, an ancient dwelling. Next they went to Cranham, where they were entertained to lunch by the president, after which a tumulus was opened in a field occupied by Mr. Dancer, and some exceedingly interesting remains discovered. Thence the party proceeded to Bisley, and under the guidance of the Rev. W. H. Lowder examined the church and other objects of interest. Next they visited Lypiatt Park, the residence of the president, and said to be the house where the Gunpowder Plot was hatched; several points of interest between there and Stroud were examined on the return journey. The meeting has been favoured with fine weather with very slight exception, and has been thoroughly successful.

NEW WORKSHOPS OF THE LONDON, TILBURY, AND SOUTHEND RAILWAY.

FIVE years since, when a lease of the above line expired, and the company took it into their own hands, they did not own a single locomotive, or carriage, or wagon. Since that time the company have acquired all the locomotive power and rolling stock necessary for the working of their large and constantly-increasing traffic. They have, in addition, completed a fully-equipped railway factory at Plaistow, for making and repairing their engines and rolling stock.

In laying out the works, Mr. A. L. Stride, the company's manager and engineer, was under serious difficulties from the absolute limits within which he had to erect his buildings; his boundaries were, to the west the main sewer of the metropolitan system, which crosses over the line, and on the east the highway, which also crosses over the railway. The fan-shaped piece of land, about three acres in extent, that was available has been turned to excellent account. The south side of the land has the Plaistow station and platform, then the lines of the Tilbury and Southend Railway; next, a central double platform on which are six covered waiting places with seats; beyond that are the two lines of the North London Railway, and outside of them the boundary that incloses the new buildings and sidings.

The principal buildings, accommodated to the shape of the ground, are in two main blocks, each with three gables, the central gables rising above the wings. The building materials are white and red brick, the surfaces relieved with rusticated pilasters at the corners and between the bays.

The building nearest the line is 207 ft. long, and is divided into three divisions, each 41 ft. wide. It has a side elevation of seventeen bays, the windows being 8 ft. 3 in. by 6 ft. 9 in. The first division in this building is a running shed, with room to accommodate eight locomotives. The second division is an erecting shop, with an overhead traveller running upon oak beams, 13 in. square, resting on strong corbels. The third division has, to the front, a machine-tool and fitting shop, 97 ft. long, with shafting and belting all through, and furnished with lathes, planing, boring, slotting, shaping, and other machines. Adjoining this is a smithy, 56 ft. long; it has fifteen fires blown by a fan, and has in the middle of the floor a half-ton stroke steam-hammer. The remainder of this division is appropriated to the copper-smiths' shop, 24 ft. 6 in. long. Each of the three shops last named is 42 ft. wide. Power to drive the machine tools will be supplied by a vertical engine of 9-horse power, by Craven, of Manchester. The boiler-house, and a handsome octagonal chimney-shaft, 70 ft. high, are separate, but in close proximity to the fitting-shop.

The second principal building, externally a counterpart of the other, is also divided longitudinally into three, but with wide arched openings in the walls. It is 168 ft. long, and gives three carriage and wagon shops, each 41 ft. wide, and served by two lines of rails in each division.

The roofs have light, well-braced and tied principals of wrought-iron. They are boarded, and covered with Welsh slates. Each of the six bays of roofing has a wide belt, glazed on the system introduced by Mr. Edgcumbe Rendle, of Westminster. Mr. Stride reports of the glazing that under severe trial it has proved abundantly strong, and quite impervious to rain and wind.

Between the two principal buildings, near the front, a 42 ft. turntable has been laid down, in the rear of which is a tall, strongly-built structure, for stores in the ground-floor portion, and on the top a water-tank with a capacity for 25,000 gallons. The tank has two divisions, one to contain the water drawn by the company from their own ground, the other to take the water supplied by the East London Waterworks Company.

The only remaining building calling for notice is a detached block providing light and convenient offices and rooms for manager, draughtsmen, clerks, and others connected with the works.

The line is worked on the absolute block system, and an important item in the new works at Plaistow is a signal cabin with twenty-eight levers, embracing the latest improvements for points and signals, and in electrical distance-signal repeaters.

MONUMENT TO MERCATOR, DUISBURG.

OUR readers will remember from their school-days (although most of them may have carried it about with them as an unsolved riddle) what they have read on one of the first leaves of their atlas, "Map of the World after Mercator's Projection." These words indicate the eminent services rendered by a great man. But although this has been done since atlases were first introduced; although the name of the inventor has been handed down from generation to generation, and not in works hidden away, but plainly before all eyes; although, besides, his invention is used by thousands day after day,—notwithstanding all these facts, the man had been almost wholly forgotten; familiarity with his life and his fortunes had been almost entirely lost; his deserts were awarded, even with the consent of his German countrymen, to foreigners; and he himself, when attention was again drawn to the importance of the services he had rendered to geographical science, was claimed by a foreign nation.

In presence of such a state of things, the unveiling of a statue of Mercator in the course of last year at Duisburg on the Rhine, by which has been paid a debt of honour long owing to

a great man, is of especial significance. By this act, the German nation has come to its own.

Gerhard Kremer, called Mercator, was born on March 5, 1512. His parents lived in the duchy of Jülich, probably at Gangelt (district of Aachen), and there young Gerhard dwelt until his sixteenth year, and had his education. But he was born in Rupelmonde (Belgium), where his parents happened to be on a visit to his father's brother, Gishert, who was vicar there. On account of this accident, Rupelmonde has claimed Mercator as a Fleming, and even went the length of erecting, in 1869, a monument to him, as the "Beroemden Wasenaar." Yet he himself, in the "Fabula Galliae et Germaniae" (1585), in the dedication to Duke Johann Wilhelm, of Jülich-Cleve, set the matter at rest. The Flemings, as we shall see presently, can scarcely think of him without a certain sense of shame.

Mercator went to the University of Louvain in 1530, and he continued there also after he had become baccalaureate. He at first devoted himself diligently to humanistic studies, but changed suddenly to mathematics, especially mathematic geography. Besides cultivating the sciences, he practised, as customary at that time, mechanical work, making spheres, astrolabes, astronomical rings, &c., of brass. He soon began also to engrave maps, which met with much success; in 1541 he completed, after a labour of eighteen months, a larger piece of work, a globe, which he dedicated to the Imperial Chancellor Granvella. Through the latter he was introduced to the Emperor Charles V., and received from him,—who, it is well known, took great interest in mechanical art work,—various orders. He was so successful in such labours that his productions were looked upon in the sixteenth century as the best of their kind.

Although he had attained some eminence by his work, and was besides extremely peaceable and cautious, he fell a victim to the spirit of persecution of the time, and to the Inquisition. In 1544 his uncle Gishert died. In order to arrange matters of inheritance, Mercator went to Rupelmonde; there he was denounced as a heretic, and thrown into prison. Notwithstanding all machinations, no cause for prosecution could be discovered, and after more than three months of severe imprisonment he was set at liberty. For this favourable result he was more especially indebted, saying nothing of his own caution (he had never publicly and openly seceded from the old church), to the exertions of the University of Louvain, which, by liberating one of its members, was anxious to preserve intact its own privileges; and it may be in consequence of this issue that Mercator stayed on in Louvain a few years longer. How serious the matter was, however, may be inferred from the fact that, of his fellow-accused, two were burnt, one was beheaded, and two (women) were buried alive.

Residence in Belgium becoming more and more unsafe, and religious persecution more violent, Mercator at last left the country with his wife and six children, and took up his residence in Duisburg, formerly a free town of the German Empire, but mortgaged for several centuries to Cleve, yet at that time still enjoying great privileges. We may assume that Mercator, like other eminent men of that period, was induced to choose the duchy of Cleve as his place of residence on account of the religious liberty prevailing there. The sciences were especially cultivated, and there was also a scheme on foot for establishing a university, the required privileges having been already granted by the Emperor and the Pope; but the plan was not carried out until a hundred years later, during the reign of the Great Elector of Bradenburg, when the duchy of Cleve had been acquired by the latter. As a preliminary step to the university, the magistrate of Duisburg established in 1559 a gymnasium. Mercator took a very active part in its foundation. For several years he taught at the school, but he was ultimately obliged by increasing work to discontinue his teaching. He remained, however, in the town until his death, which took place on December 2, 1594,—an esteemed citizen. His descendants continued to reside there, occupying an honourable position. On that account the town is looked upon in Germany, and rightly, as the second home of the family, voluntarily chosen by them.

While still in Louvain, Mercator made the first discovery which handed down his name to posterity. This was the establishment of the deviation of the magnetic needle, its cause, and the position of the magnetic pole. He mentions this fact in a letter written to Cardinal Granvella, the celebrated minister of Charles V. and Phillip II, one of the most accomplished diplomatists of his time. That letter was discovered and first published by Dr. Breusing.

The deviation of the magnetic needle had been noticed by Columbus, but its existence was not definitively established until the close of the next century, by Mercator. This service rendered to geographical science has hitherto been ascribed to a Spaniard, Martin Cortes, who speaks in his "Art of Navigation," published in 1555 at Sevilla, of the magnetic points of attraction on the earth's surface. It is supposed that Cortes obtained a knowledge of Mercator's discovery through Granvella or Charles V.

The second work of Mercator's which created a sensation belongs to the year 1569. In August of that year he completed his great map of the world for the use of navigators. From it dates the reform of cartography, which latter has to record no work of like importance, and with it a new epoch in navigation began. This discovery was equalled in significance only by two others in navigation, the ship's compass and the sextant. The work of Mercator possesses the rare advantage of combining theory with a practical instruction for sailors. The directions contained in Mercator's "Sailing" are followed to the present day; only, as Breusing remarks, nearly all authors of sailing directions are using Mercator's rules without being aware of the fact that they give them almost verbally. Mercator's original method of projection was not the only one proceeding from him; a second, ascribed later to De l'Isle, and a third, attributed to Bonne, are in reality his. But even his most important work was claimed for another, for our countryman Wright, who thirty years later published some tables enabling everybody, even those possessing no mathematical knowledge, to construct charts. As late as 1805 a German described Wright as the "inventor of the true construction of the charts commonly called Mercator's." It was left to a Frenchman, D'Avezac, in a work published by him in 1863, to restore to the Germans the credit due to a German.

Not long after his second great work, Mercator planned the issue of atlases, intended for everyday use, but resting on exact information. He was forestalled in the execution by Abraham Oertel, likewise a German, who published in 1570 his "Theatrum Orbis Terrarum." But this work is founded partly upon Mercator's earlier maps, and was, moreover, greatly furthered by the disinterested assistance rendered by the latter. It has no claim to independent value.

Mercator continued to labour on his collection of maps and charts, notwithstanding former preliminary work, for another quarter of a century; and each map marks a step in advance in geographical science. At his death, in 1594, the work was not quite finished. His only surviving son completed it, and published it, along with the Cosmography of his father, in 1595, under the title chosen by the elder Mercator, "Atlas." The meaning of this designation is not quite clear, but apparently it has no reference to the supporter of the heavens. The excellence of the "Atlas" may be surmised from the fact that a few years after its first appearance all rival works had disappeared.

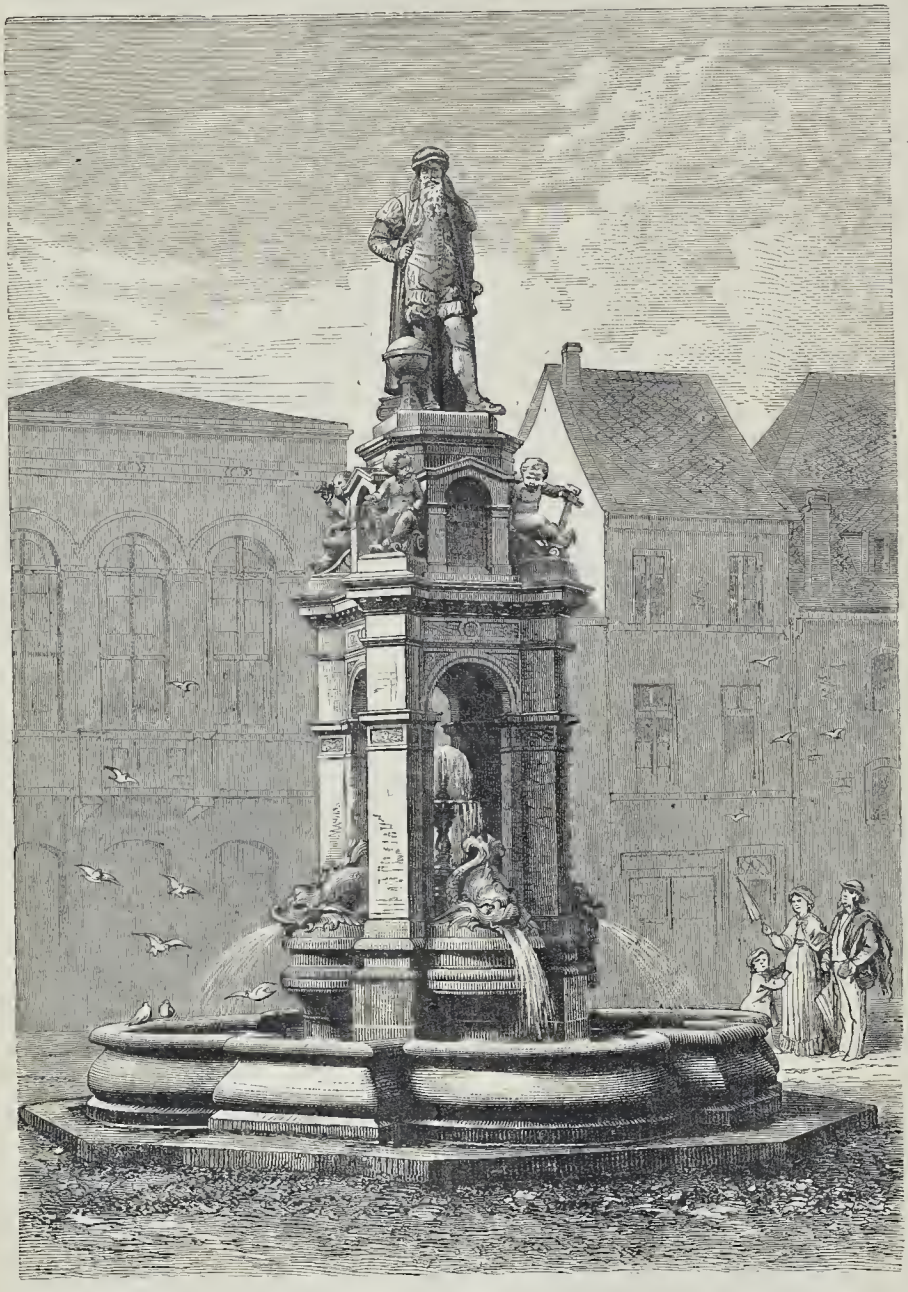
Apart from the publications mentioned, which have ensured to his name an undying memory, Mercator issued a large number of others, which created a sensation at the time, but which we need not mention here. This much is certain, that the effect of his works has continued to make itself felt up to our time, and that the most important were matured in Duisburg, which he had selected as the sphere of his activity, and which on that account was bound to renew and perpetuate his memory. As early as March, 1869, therefore, a committee was formed at the invitation of Dr. Breusing for erecting a monument to Mercator in Duisburg. In Rupelmonde a similar movement had been started three years earlier. Moreover, a biography of Mercator was published there, in 1869, by Dr. van Raemdonck, a Belgian, to which Professor Köhnen, of Duisburg, contributed valuable information, derived from local archives. The idea met with general approval; some 600*l.* was subscribed, and the foundation-stone was laid in August, 1869. But the Franco-German War diverted attention, and public interest was not aroused again until the town architect, Herr Schülke, took up the matter again energetically. He drew up the plan, towards the execution of which the Art-Union of Düsseldorf contributed a considerable sum, the funds collected up to that time proving insufficient. The monument was entrusted to the sculptor Reiss, of Düsseldorf; the erection was undertaken by Herren Kaufhold & Berndt, of the same city; and on September 2nd of last year the unveiling took place on the Burgplatz.

Mercator is represented in the dress of his time, as it is found also in some excellent busts of him; the cloak being carried down to the feet, in order to impart to the figure a quieter effect. The head is very noble, full of expression, and lifelike. The furrowed forehead, shaded by the baretta, the thoughtful face looking down upon the beholder below, the flowing beard, and curly hair impart to the portrait a venerable, yet manly character. The monument rises from a basin and has arched openings in the lower part, within which are water-spouts in the form of dolphins. At the upper part, at its four corners, are juvenile figures representative of Science and Navigation, Commerce and Industry. It is 28 ft. high, and in the style of the Renaissance of the time in which Mercator lived. The material is white Trier sandstone; the base being of basaltic lava, the basin of bronze. We present to our readers a faithful illustration of the monument.

THE SOCIETY OF ENGINEERS.

ON Wednesday, the 21st, a number of the members of the Society of Engineers visited the Signal Works of Messrs. Saxby & Farmer, in Canterbury-road, Kilburn. The party included Mr. Joseph Bernays, president of the Society; Messrs. Charles Horsley, J. Church, and P. F. Nursey, members of the Council; Mr. A. Williams, honorary secretary and treasurer, Mr. B. Reed, secretary; and others. Conducted by Mr. Farmer and by Mr. C. Hodgson, the manager of the works, they visited the museum attached to the works, in which are models of all the chief inventions in signals, locking and block, and interlocking-block signal apparatus, brought out by Messrs. Saxby & Farmer, from whose works have emanated some of the most important appliances for conducting safely the great traffic of modern railways. Here Mr. Farmer explained the model of the first arrangement patented in 1856 for connecting and interlocking points and signals, and by means of other models showed the development of the principle of signal control of all points, crossings, and level crossings, to the most recent arrangement by which not only may a train, the driver of which has disregarded a danger signal, be diverted into a clear line from which a goods train may have been shunted across his own main line, but by which, in case of necessity, a signalman at one station may set the signals of a distant signalman at danger, and hold them there in spite of that signalman. The apparatus thus procures absolute mechanical interlocking, by which any trains or obstructions may be covered. Every possible contingency seems to be provided for. These arrangements are gradually coming into use, though more rapidly in Belgium than in this country. The society afterwards dined together at the Guildhall Tavern, Gresham-street.

Royal Dramatic College.—At the Auction Mart, Messrs. Farebrother, Lye, & Palmer have made another unsuccessful attempt to dispose of the Royal Dramatic College, which is situate at Maybury, near Woking, Surrey. The foundation-stone of the great hall was laid by the late Prince Consort, and the building was inaugurated by the Prince of Wales. The sale was by direction of the trustees (Lord William Lennox and Messrs. Benjamin Webster and Anson) under an order from the Charity Commissioners. There are five pensioners in the building at the present time. The pleasure-gardens and grounds surrounding the building extend over ten acres, and the whole is opposite the South-Western Railway, being about twenty-five miles from London. The estate was put up at 3,000*l.*, and reached by slow degrees 4,500*l.*, when the auctioneer intimated that he had instructions from the Charity Commissioners not to sell it under 5,000*l.*, private tenders being invited. It has been since stated that the building is sold, Mr. Alfred Chabot being the purchaser.



MONUMENT TO GERHARD KREMER, CALLED "MERCATOR," DUISBURG ON THE RHINE.

FISHER-LADS' INSTITUTE, GREAT GRIMSBY.

SULZFELD.

THE "dwarf cities," or fortified villages, of Germany, which played no insignificant part in the history of the Fatherland during the Middle Ages, and by combination, or sometimes even alone, resisted the oppression and tyranny of the most powerful nobles, are rapidly disappearing or changing their character. Modern improvement and centralisation have robbed them of all power, and even of life, and from having remained for the last two centuries mere collections of tumble-down tenements inhabited by agricultural labourers and small shop-keepers, they are now being gradually dismantled. First, a "curtain wall" is thrown down, then go the gates, and in a few more years the quaint old towers are pulled down, the old houses are plastered over and whitewashed, the Rath-haus and church thoroughly restored, and the place rises up like a phœnix from the ashes of the past. But, alas! the new phœnix is a miserable bird; however, as they say, a "live dog is better than a dead lion," and possibly to those that inhabit these villages the rebuilt houses may be more agreeable than the old ones, and the brand new gravel walk round the town may to them be an improvement. How fortunate now are those happy people who are born entirely without an appreciation of the beautiful in art,—people, for instance, who can see more to admire in a Bayswater villa than in a Nuremberg house! Such happy individuals would find little to admire in Sulzfeld, but those who are so unhappy as to admire the picturesque relics of the past would find much to interest them in this curious little town, which retains all its Mediæval fortifications. Like Winchelsea, and several other ancient towns both in England and on the Continent, Sulzfeld is very regularly planned, with perfectly straight streets crossing each other at right angles; the gates are exactly in the centre of the walls and the towers occur at regular intervals. The plan would be a perfectly rectangular oblong were it not that a rock which rises somewhat abruptly on the east side prevented that wall from being carried out in a straight line.

The church and town-hall are near the centre of the little town. The church has suffered from modernisation, but possesses a graceful slate-covered spire. The town-hall (or Rathhaus) is in a style resembling our Elizabethan. It presents a noble lofty gable towards the little market-square, and is really a very dignified-looking structure for such a mere village. It was erected by Bishop Julius of Würzburg (*ob.* 1573). The towers at the angles of the town-walls have peculiar roofs, covered with tiles. The towers themselves as well as the walls were all covered with a coating of plaster over the rubble, and were probably ornamented with coloured decorations, similar to those which we have on a previous occasion noticed at Ingolstadt and Landshut. It is most important both for the cause of archæology and also for the study of Mediæval history that careful drawings and records should be made of such places as Sulzfeld, for when they are destroyed or rebuilt it will be simply impossible for a future generation to realise what they were like, and much of Mediæval history will be unintelligible to readers. For instance, there is a little historical fact connected with Sulzfeld. "In the year 1461 the Margrave Albert Achilles, with his whole army, laid siege to Sulzfeld and hoped to take it without much loss. He was, however, mistaken in his calculations, and had to draw off his men to Kitzingen, taking the dead and the wounded in two wagons."* Now it will be of interest to future historians to know what kind of fortifications could defend a town against the army of a Margrave in the fifteenth century, and yet it will be simply impossible for him to realise what they were like, and thus it is to the interest of the historian as well as the archæologist and artist that such works should be illustrated in a journal like the *Builder*, although they may not offer much in the way of suggestions to the practical architect or contractor.

The Exhibition of the Society of British Artists.—The Council of the Society of British Artists, Suffolk-street, Pall-mall East, have made arrangements to open the exhibition free on Bank Holiday, Monday next, August 2.

* Handbuch für Reisende auf dem Maine. Von S. Häale und K. von Spruner. 1843

FISHER LADS' INSTITUTE, GREAT GRIMSBY.

THE want of a suitable building wherein to provide for the accommodation of the 2,000 lads engaged in the large fish trade at Grimsby had long been felt, and owing to the generous gift of a site near the docks by Colonel Tomline, an influential committee was formed, with Mr. W. H. Daubney as chairman, Mr. J. K. Riggall as treasurer, and Mr. Orby Bradley as secretary, to whose energy the success of the scheme is largely due, and the building we illustrate has been erected, and was formally opened by the Earl of Yarborough, on Monday last. The earl was accompanied by the Countess of Yarborough; Mr. Edward Heneage, M.P., and High Sheriff of Lincolnshire; Sir Edward and Lady Watkin, Mr. H. Josse, and a numerous and distinguished company of the local gentry. A grand bazaar was then held in the various rooms, towards removing the remaining debt on the building.

The site is at the junction of Oswald and Tomline streets, and has also a frontage to a new street in the rear. The entrance is at the angle, leading into an octagonal hall and lobby. There is a large and lofty lecture-hall and gymnasium, 48 ft. by 28 ft., with an open-timbered queen-post roof, wrought and painted, out of which open various large and lofty rooms, viz., a library, 20 ft. by 18 ft.; reading-room, 24 ft. by 18 ft.; refreshment-room, 25 ft. by 16 ft., all for the use of the lads, and under the general control of a resident superintendent.

Adjoining the lecture-hall is a handsome swimming-bath, 38 ft. 6 in. by 63 ft., with an open roof. The bath is lined with glazed tiles, and there are four private baths above the dressing-rooms, an entrance for which is provided from Tomline-street, where is also a bath-attendant's house. In rear are the engine-house and well for supplying the baths, with offices, &c. On the first floor, reached by the main staircase and by a gallery projecting over into the lecture-hall, are a series of rooms to be used for the various classes for instruction in navigation, &c., and there is a good residence for the agent over the coffee-room. Above, on the attic story, are dormitories for the occasional use of boys who may not have homes elsewhere. The lantern above the entrance is to be used as a "look-out," whence a good view is obtained of the Humber and North Sea. The building is of red bricks, with white and blue bands, stone only being used for sills, &c. The roofs are of blue slate, with green bands. All the finishings are of a very plain but suitable character, and the whole block is pronounced to be a very convenient arrangement for all the present and future requirements for the social comfort of the fisher lads. The architect is Mr. Charles Bell, F.R.I.B.A., of London and Great Grimsby, and the builders are Messrs. Riggall, Hewin, & Topham, of Grimsby. The contract was 2,900*l.*, and the fittings, furnishing, engine, &c., will amount to about 700*l.* more.

KINGSTOWN TOWN-HALL, IRELAND.

THIS new building, which stands at the end of Crofton-road, opposite to the railway station, has been thrown open for use. It contains municipal offices, a public hall, and a commodious court-house, where the county chairman will sit periodically, together with accommodation for the holding of the police-court. Some particulars with respect to the building may not at the present moment prove uninteresting. So long ago as 1866 the Town Commissioners, feeling the want of such accommodation as that which the new building provides, advertised for plans and specifications, but the difficulties which were thrown in the way of procuring a suitable site caused the scheme to lapse for a time. In 1874 it was revived, and in August of that year, the difficulties with regard to the site having been obviated, the plans sent in by Mr. J. L. Robinson, 198, Great Brunswick-street, Dublin, were selected, and tenders advertised for. The position is most excellent,—central, prominent, and convenient. The amount of the contracts and extras was about 14,000*l.*; but it is estimated that the entire building, when furnished, will cost at least 16,000*l.*

The architecture is after the Italian style. The main frontage is on the Royal Marine-road, where the façade measures 130 ft. The main entrance is situated in the centre of this front. Passing through the doorway, the hall, 16 ft. wide by 22 ft. long, is reached. The bottom story, 16 ft. 2 in. high, contains the court-house, which is 39 ft. by 30 ft., with rooms for witnesses, barristers' rooms, clerk of the peace's offices, the jury-room, the judges' retiring-room, closets, lavatory, &c. On the left-hand side of the main entrance, on the same story, are offices for the town clerk, the town surveyor, the rate-collector, and the sanitary inspector.

The next story is 22 ft. high. It is approached by a grand staircase, and contains the assembly-room, a lofty apartment, 70 ft. 6 in. long by 41 ft. 6 in. wide, with moulded roof and cornices. The interior fittings of the assembly-room will consist of a platform of pitch pine and American walnut, for the accommodation of performers. The board-room, in which the town commissioners will hold their meetings, is also situated on the second story. Its size is 30 ft. by 39 ft. The walls are covered to a height of 6 ft. with a panelling of pitch pine and American walnut, richly moulded. The furniture of the board-room has been designed by the architect, and will be of massive oak, in keeping with the rest of the building. The assembly-room will, of course, be devoted to public meetings, concerts, and entertainments which may be held in the township.

The second story contains, in addition to the rooms mentioned, the town clerk's office, a commissioners' retiring-room, and some clerks' apartments, the latter being exceedingly well planned and comfortable. The entire of the corridors will be furnished with fancy tesselated tiling.

The entire height of the building is 50 ft. from the floor balustrade. A tower, 120 ft. high, surmounts the court-house entrance in Crofton-road, in which there will be a clock, situated at a height of 80 ft. above the ground. The commissioners have entered into a contract for the erection of the clock with Messrs. Chancellor, of Sackville-street.

The windows of the building are all circular-headed, and those of the principal stories are constructed with nook-shafts in angles, with carved capitals, moulded arches, and hood-moulds. Polished Aberdeen granite columns ornament the windows over the main entrance in Royal Marine-road and the board-room windows.

The building is capped by a cornice, supported by granite brackets, with a pierced parapet over; the roof, high-pitched, covered with slates in bands, and decorated with a metal cresting. The materials which were used in the construction of the building are local chiselled granite ashlar for the main walls, with Bath stone cornices and arches. Various descriptions of stone have been introduced by the architect where their colour serves to emphasise the leading lines in the architecture.

The contract has been carried out by Messrs. Meade & Son, Great Brunswick-street, in a way to give satisfaction.

PERMANENT ART GALLERY AND MUSEUM FOR BIRMINGHAM.

MESSRS. R. and G. TANGYE, of the eminent engineering firm of Tangye, Brothers, & Holman, whose extensive works are situate in Birmingham, recently offered to contribute the munificent sum of 10,000*l.* towards the purchase of examples of art for exhibition in a public art-gallery in Birmingham on condition that the Town Council should make provision for a permanent art-gallery on a scale commensurate with the necessities of the town. We now understand that an arrangement is likely to be arrived at by which the town will be enabled to accept the generous offer of Messrs. Tangye, and to enjoy the use of the valuable collections of works of art and art manufactures which it already possesses. The General Purposes Committee and the Art Gallery Committee of the Town Council have met and conferred upon a proposal by which that portion of the site of the Municipal Buildings which is at present unoccupied will be devoted to the erection of buildings of which the basement and ground-floor will be used by the Gas Committee, and the upper portion will be available for art-galleries and a museum on a scale worthy of the town and of the subject. It is stated that a plan by which this desirable object can be effected without burdening either the special Free Libraries rate or the general rates of the borough, will be suggested to the Town Council at its meeting next Tuesday.

THE PARKES MUSEUM OF HYGIENE.

THE first public annual meeting of the friends and supporters of this Museum was held on Tuesday afternoon in the Egyptian Hall of the Mansion House, the Right Hon. Sir Francis Wyatt Truscott, Lord Mayor, in the chair. There was a large attendance, including, among many others, Earl Fortescue, Sir William Jenner, Mr. Erichsen, F.R.S. (President of the Royal College of Surgeons), Sir Joseph Fayrer, Mr. Sheriff Bayley, Mr. Erasmus Wilson, Mr. George Palmer, M.P., Mr. Edwin Chadwick, C.B., Mr. Horace Jones (City Architect), the Master of the Clothworkers' Company, Mr. R. Rawlinson, Mr. Chatfeild Clarke, Mr. H. H. Statham, Miss Muller and Miss Richardson (members of the London School Board), Dr. Wilson Fox, Mr. Berkeley Hill, Dr. G. V. Poore, Dr. Corfield, Mr. Talfourd Ely, Mr. Mark Judge, &c.

The Lord Mayor, in opening the proceedings, expressed the great pleasure it gave him to allow the meeting to be held in the Mansion House, and to be the means of introducing an institution of such value and importance to the notice of the citizens of London.

An astounding list of letters from well-known and eminent persons was read, expressing regret that they were unable to be present on that occasion, and all expressing deep concern in the maintenance of the Institution. From amongst these we would especially notice one from the President of the Royal Institute of British Architects, Mr. Whichcord, desiring it should be understood that the Institute felt the deepest interest in all institutions tending to spread abroad the truths of sanitary science.

Dr. G. V. Poore, hon. sec., then read the following report of the executive committee:—

"The Parkes Museum was formally opened to the public on the 28th of June, 1879, by the Right Hon. Sir Richard Cross, M.P., the Home Secretary, who was accompanied on the occasion by other members of the late Government, a large and influential company being present. The Executive Committee are happy to be able to state that the first year of real work so brilliantly inaugurated has been one with which, in many respects, they have a right to feel satisfied. The experience of this first year has taught them that the Museum supplies a real want, and that the efforts which have already been expended in establishing it have not been thrown away. The Museum has been open free to the public on three days in each week, and since the 1st of January, 1880, the number of visitors, of whom a record has been kept, has been 2,166. This result must be regarded as decidedly satisfactory when it is borne in mind that the Museum is situated on the top floor of a building which is somewhat removed from the great centres of traffic, that it is as yet but imperfectly known to the public, and that the Executive Committee have not felt themselves justified in spending any large sum in continuously advertising its existence. They have at least the satisfaction of knowing that the success which has hitherto been attained is solely attributable to the fact that the Museum is found to be useful to a considerable section of the public. During the past winter a series of demonstrations were given on Saturday afternoons by members of the Executive Committee. The first series, by Professor Corfield, Dr. Steele, and the Honorary Secretary, was given for the benefit of members of the Working Men's Club and Institute Union, and comprised the subjects of House Drainage, Ventilation, Lighting and Warming, Food, and the Management of the Sick-room. The second series, by Professor Corfield and Mr. Rogers Field, was given to members of the Institution of Builders' Foremen and Clerks of Works, and comprised the subjects of Ventilation and House Drainage. Both series were numerously attended. Dr. Ralfe, one of the lecturers on Hygiene appointed by the Society for the Extension of University Education, made application for the admission of his class to the Museum, an application which was at once acceded to. Dr. Steele more than once brought a party of nurses from Guy's Hospital and exhibited to them the large collection of apparatus for use in the sick-room which is to be found in the Museum. The Committee are further informed by Dr. Corfield, the Professor of Hygiene at University College, that the Museum has been of great service to him in imparting a practical knowledge of sanitary science to his class. His Cantor Lectures, also, at the Society of Arts, were largely illustrated by articles borrowed from the Museum. Thus it will be seen that the institution has been made use of not only by the casual visitor, but also for the purpose of affording systematic instruction to persons who are peculiarly interested in special subjects. The Committee wish it to be understood that they will gladly entertain applications from persons engaged in tuition who may wish to bring their pupils to the Museum for the purpose of practical instruction. Her Majesty the Queen, our patron and a munificent contributor, has been graciously pleased to accept a copy of the first edition of the illustrated catalogue, as has also His Royal Highness Prince Leopold. A considerable amount of encouraging support has been afforded to the Museum during the past year. His Grace the Duke of Northumberland, the President of the Sanitary Institute of Great Britain, honoured the inaugural meeting with his presence, and spoke most approvingly of the objects of the Museum; and the Baroness Burdett-Coutts has lent us the weight of her great influence by becoming a patron. The Clothworkers' Company have made a second donation of fifty guineas, and the Company of Drapers have given a similar amount, while the Merchant Taylors' Company have given ten guineas. The Committee trust that the generous example of these worshipful companies may be followed by others of the ancient City guilds and the wealthy citizens of London, and that a recognition will be made of the fact that sanitary science is, of all sciences, the one in which technical instruction is most needed, and that a thoroughly practical knowledge of the laws of health must inevitably increase the welfare, the prosperity, and the happiness of this great country. The different sections of the Museum have been considerably enriched during the past year. Contributions to the library continue to be made by the various departments of the Government which take cognisance of sanitary matters. The National Board of Health of the United States of America has undertaken to furnish the Museum with its weekly bulletin, and the President and Council of the Epidemiological Society have presented upwards of 200 volumes of books, some of which are of great interest and value. The Food Collection is still receiving the thought and attention of Mr. Twining, of Twickenham, and the Committee have been glad to leave the arrangement of this section entirely in the hands of that gentleman, whose knowledge of the subject and whose genius for organisation are a sufficient guarantee that, when completed, the food collection of the Parkes Museum will leave nothing to be desired. The Museum of Economic Botany at Kew has sent nearly 1,000 specimens of food products of great value, all of which will be utilised by Mr. Twining in his arrangement. The sections of Architecture, Engineering, Furnishing, Preservation, and Relief have all steadily increased in size during the past year, the only section of the Museum which has shown no tendency to expend being that devoted to Clothing, notwithstanding that the subject, in our variable and often trying climate, is one of prime importance. No changes have taken place in the executive staff during the year, excepting the resignation by Dr. Gowers of the post of Joint Honorary Secretary; but as he still retains his seat at the Committee, the Museum will not be deprived of his valuable advice and aid. Although the area which the Museum at present occupies is considerable, the Committee are beginning to feel that the space is too small, and must at no great distance of time become altogether inadequate. On the other hand, the calls upon the space in University College are so numerous that evidence is not wanting that the Council of that college will not improbably be obliged to discontinue the hospitality which they have hitherto shown to the Museum, a hospitality which they have always warned us must be temporary, and not permanent. The provision of a new home for the Museum has, it may be said, already become a necessity, and there can be no doubt that the removal of the collection to a building specially designed for it in some central position would prove a great benefit to the Museum and a great boon to the public. The sum required to effect the transference of the Museum from its present temporary home to a permanent and a suitable one will doubtless be large, but the Committee trust that the goodness of their cause and the great utility of their undertaking will commend itself to the philanthropic and the wealthy. Lastly, as to the financial position of the Museum. Since the spring of 1876 to the present time 1,285*l.* has been subscribed. Of this 641*l.* has been expended in museum fittings, in paying the salary of a curator, and in other unavoidable expenditure. 600*l.* has been invested, which yields an income of something less than 24*l.* per annum; and the treasurer has 65*l.* in hand. The Committee wish to dwell upon the fact that the Museum is free in every respect. No charge is made to visitors at any time. No charge is made for space, suitability being the only condition for the acceptance of any object. Thus it will be seen that the Museum is entirely dependent upon voluntary contributions. The Executive Committee are determined that the institution shall remain a true museum, and not become a mere show-room for manufacturers and patentees. To achieve this object, a permanent home for the Museum must be found, and a sufficient sum be provided to meet the annual expenditure. In a building of its own, in a central position, the Museum would be one of the most useful institutions in the metropolis; and, while perpetuating the memory of a man who will always be recognised as one of the great benefactors of the human race, would greatly facilitate the dissemination of a knowledge of the laws of health, so important to all classes and both sexes. The Committee, therefore, confidently appeal to the public for the necessary funds."

The Right Hon. Earl Fortescue then moved,—

"That the first annual report, which has been read, affords conclusive evidence that the Parkes Museum of Hygiene is meeting a great educational want, and is eminently worthy of public support."

In the course of his remarks his lordship observed that after labouring for between thirty and forty years in the cause of sanitary reform, he felt that that cause was worthy of greater zeal and greater sacrifices than he had ever been privileged to make on its behalf, and it was well deserving of the support of every lady and gentleman present, individually and collectively, because it concerned the economical, physical, moral, and religious welfare of the community. Experience had fully shown that dirt, disease, and crime were found to be concurrent. In the cause of sanitary reform, the Museum on behalf of which he was speaking, and which bore the name of a noble and beneficent man who rendered great services scientifically and practically in the promotion of hygiene, was calculated to do great good, for in it were shown and exemplified not only the general laws of sanitation, but the improvements and advances which were made from time to time by the professor of hygiene, and by the engineer, the architect, the surgeon, and the chemist. The lectures and demonstrations given to workmen and students from time to time would gradually tend to a wider dissemination of the laws of health. On these and other grounds he had much pleasure in moving the resolution.

Mr. George Palmer, M.P., in seconding the motion, expressed his gratification in seeing the meeting so largely attended by ladies, for it was unquestionable that the ladies, if acquainted with the laws of health and the principles of sanitary science, could (especially when, as district visitors in connexion with parochial and other organisations, they came much into contact with large masses of the population) do much good in educating the people in the laws of health, and they would be thus greatly facilitating the work of the various sanitary authorities throughout the country.

The President of the Royal College of Surgeons, Mr. Erichsen, F.R.S., in supporting the motion, observed that it had been truly said by Lord Fortescue that a museum such as that which they were assembled to support should be looked upon with a view to the preservation as well as the restoration of health. There was one aspect in which the usefulness of the Museum in aiding in the restoration of health might be looked upon with great hope of benefit, for the Museum was one designed not only for the advantage of the general public, but for the information of managers and surgeons of hospitals and other institutions intended for the cure of disease and the alleviation of physical suffering. It was the undoubted duty of all who had any voice in the management of such institutions to study the laws of health and the appliances whereby health could be preserved to its possessors and restored to those who had,—from accident or other causes,—been for a time deprived of its blessings, with a view to the application in such institutions of those laws and appliances. If there was one point that had been more incontestably estab-

blished than another of late years in surgical practice, it was that the recovery of a wounded person was less dependent upon the surgical skill with which he was treated than upon the hygienic conditions by which he was surrounded whilst under treatment. Indeed, the highest surgical skill might be rendered absolutely nugatory by the absence of proper hygienic conditions. It had been shown beyond the possibility of a doubt that in all large establishments for the reception of wounded people,—whether they were struck down on the battle-field or were the victims of the numerous accidents which occurred in civil life,—that the recovery of the patients was dependent almost entirely upon the hygienic conditions by which they were surrounded subsequently to the receipt of their injuries. There were establishments (happily rare in this country) in which, until within recent periods, it was an exceptional thing for a patient to recover after an amputation; and in one large hospital on the Continent, it was publicly stated six years ago by its surgeon that 80 per cent. of the patients who had undergone surgical operations were killed by pyæmia, gangrene, or some other disease the result of bad hygienic conditions. It was well known that, given certain favouring conditions, what might be called solely "hospital diseases" would be generated within the walls of hospitals, but the generation of such diseases was entirely preventable by the adoption of proper sanitary precautions. It was, therefore, the duty of all who had the control and management of hospitals and kindred establishments to see that the hygienic conditions and sanitary appliances were as perfect as they could be made, for the poor patients themselves had a right to expect that they should not be exposed to danger in the places, above all others, to which they were taken for succour and relief. From the point of view of a surgeon, therefore, he regarded the lessons capable of being taught by and in the Parkes Museum as fraught with incalculable value.

Mr. Erasmus Wilson, F.R.S., also supported the motion at some length, pointing out that such scourges as ringworm were entirely preventable by proper attention to the laws of hygiene.

The motion having been carried unanimously, Professor Berkeley Hill, treasurer, read a list of subscriptions.

Sir William Jenner, F.R.S., moved the following resolution:—

"That the best thanks of this meeting be accorded to the Right Hon. the Lord Mayor for granting the use of the Egyptian Hall for the first public annual meeting of the Parkes Museum, and for having presided on the occasion."

He referred to the history of the formation of the Museum, which was, he observed, established as a memorial of one of the most amiable and self-denying men who had ever lived. Professor Parkes was eminently a lover of his race, and, as was well known, he devoted many of his best years to the subject of hygiene. Those who knew him in life sought to perpetuate his memory in some practical form when he was dead. They loved him too well to require to see his picture before them. Scholarships were suggested, but scholarships, though to some extent useful, would not have accomplished the end in view, and which he, good man, could have wished. So it was ultimately decided to establish a museum which should spread abroad a knowledge of hygiene; but it was felt that merely to get together a collection of appliances and materials without explaining them and expounding the principles on which they were based would be almost useless, and therefore it was decided that part of the scheme of the Museum should be the delivery of lectures to working men not only that *their* homes might be made healthy, but that the homes of those for whom they worked might be healthy. It was too often forgotten that by the neglect of sanitary laws the mansions of the rich might be as unhealthy as some of the cottage-dwellings of the poor. Only a few days ago a lady, desirous of taking a town mansion as a residence for herself and her invalid husband, wisely took the precaution of having it examined by a competent person as to its sanitary condition, with the following results as summarised by her:—

"*One of the Finest Mansions in London.*—The waste-pipes of all the baths descend into the soil-pipe unventilated. The closets are valve-closets in the best parts of the house, but the closet-rooms throughout are unventilated, except in one instance. The main cistern on roof supplies the water-closets and drinking water, and has an overflow-pipe directly connected with the drain."

That, he was sorry to say, was but a type of the sanitary condition of many of the largest houses in London, and it was with a view of remedying such a state of things that the Parkes Museum was established. Now, as Chairman of the Executive Committee, he appealed for funds for carrying on the Museum, and that with increased efficiency and usefulness. He was not pleading for a charity, unless for that charity which should properly begin at home, although it should not end there,—for sanitary science would benefit everybody who chose to profit by its teachings. It was through the violation of sanitary laws that so many people were continually liable to complaints and disorders, which, while not absolutely incapacitating them for work, subjected them to chronic out-of-healthiness. The breathing of foul air was one great predisposing cause of such unhealthiness, and the Parkes Museum would teach those who cared to learn how foul air might be avoided. The great bulk of the workmen engaged in plumbing and other work connected with house-building were, he believed, anxious to do their work well and in such a way as to conduce to the health of the public, but, unfortunately, they were too often sadly ill-informed in the principles of sanitation, and did their work unthinkingly according to the old methods. Having cited from his own experience one or two instances of the ignorance and carelessness of sanitary laws shown by plumbers, and condemning the lead D-trap as a "Double D" trap,—"a disseminator of disease and a dealer-out of death,"—Sir William appealed to the wealthy citizens of London,—for their own health's sake as well as for the sake of the health of others,—to support the Parkes Museum of Hygiene in a manner commensurate with its great claims.

Mr. George Godwin said he had much pleasure in seconding the resolution, thanking, as it did, the Lord Mayor for the readiness with which on the present, as on numberless other occasions, he had hastened to do good. The present mayoralty,—as all who had had occasion to watch it knew,—had been a brilliant one, and the record of the meeting which was then assembled would certainly not be the least interesting item in the history of it. Assuming for a moment that the public had now, thanks to the labours of a small band of men, —several of whom were upon that platform, Mr. Chadwick, Mr. Robert Rawlinson, Lord Ebrington that was, and Lord Fortescue that is,—arrived at such a state of mind as to see the advantage of healthy homes, they would naturally ask how they were to obtain them, and what they ought to be. These questions would be answered by study of the contents of the Parkes Museum of Hygiene. And this might be expected to remove some of the ignorance which had existed, and did exist, as shown in the want of ventilation in our houses, want of knowledge of the best means of providing it; the state of the drains, and the execution of the plumbing-work. He had a house in his mind at that moment, a house of 400*l.* a year, wherein the soil-pipe was full of holes, admitting sewer-gas to the rooms, and so placed that this could not be remedied without an amount of destruction that deterred the owner from attempting it. The waste of water, again, and of gas, through want of knowledge, was immense. Quite lately, in the small town of Penzance, by simply inspecting and revising some of the details of the taps and other water fittings, 100,000 gallons of water per day had been saved,—and that in a portion only of the town,—without any diminution in the supply to the inhabitants. Then, again, the Parkes Museum was likely to be instrumental in dispelling some of the ignorance which had lately resulted, and would continue to result, in gas explosions. How could we wonder that gas explosions occurred when it was found that, at the inquest on the men killed by the Tottenham-court-road disaster, the foreman of the men declared on oath that he had not the slightest idea that a compound of atmospheric air and coal-gas would produce an explosive mixture? The moral of all that had been said was that the public and the Government were bound to aid such an establishment as the Parkes Museum of Hygiene. The disadvantages under which the Museum at present suffered must be removed. It was necessary that it should have a habitation of its own, centrally situate, and easily accessible by being on the ground floor, and to which every patentee and inventor of sanitary appliances and materials should be invited to lend, if not to give, his productions, and so aid in getting rid of the ignorance which was the mother of disease and death.

Sir Joseph Fayrer, in supporting the motion, said it was gratifying to see that the principles of sanitary science were now taught in our medical schools and at our universities.

The motion having been carried by acclamation,

The Lord Mayor, in reply, said he felt he had done right in acceding to the request that he should allow the meeting to be held in the Mansion House, and he hoped that the result of it would be to establish the Parkes Museum so firmly in public favour that it would soon be housed in a building not only its own, but one worthy of its object.

We may, perhaps, usefully add that the Museum is open free on Tuesdays, Thursdays, and Saturdays, from ten to two.

THE NATIONAL ASSOCIATION OF MASTER BUILDERS.

THE half-yearly meeting of the National Association of Master Builders of Great Britain commenced in Bristol on Tuesday last, and was attended by from 140 to 150 delegates from all parts of the kingdom. The chair was taken by Mr. Stanley G. Bird, of London, in the absence of Mr. Thomas Clay, of Manchester, the president. The following were the delegates appointed to attend the meeting:—

Manchester—Thomas Clay, William Southern, Robert Neill, jun., John Elms, Geo. Napier, Thomas Darnborough, Wm. Clark. Croydon—C. Bowyer, J. W. Hobbs. Leeds—Wm. Nicholson, C. Myers, E. Wray. Liverpool—Edwd. Hughes, Wm. Callaghan, William Litt, J. C. White (president), Jas. Leslie and John Wannop (vice-presidents), Chas. Tomkinson (treasurer). Liverpool Builders' and Property Owners' Association—Jas. Thomas, Robt. H. Bullin, Owen Owens (secretary). London—Stanley G. Bird, J. Coles, G. H. Trollope. Crewe—A. P. Cotterill, James Woods, Joseph Latham.—Matthews. St. Helens—Wm. Harris, Wm. Belshaw. Birmingham—W. H. Parton, C. W. Barker, Walter Clulee (secretary). Wakefield—Fawcett John Summers. Leicester—S. Barfield, E. B. Piper, Thomas Mason. Lancaster—Christopher Baynes, Charles Calvert, John Kitchen. Nottingham—Robert Bennett. Warrington—William Gibson. Wolverhampton—G. Higham, H. E. Barnado (secretary). Wigan—C. B. Holmes, Wm. Winnard, A. Wigans. Huddersfield—Wm. Radcliffe, Samuel Sykes. Lincoln—Wm. Sims, Wm. Kirk, H. S. Close. Widnes—Jas. W. Carlisle, Jonas Foster, W. H. Kershaw. Derby—J. Walker, S. Tukler. Kidderminster—B. Thompson, Thos. Vale. Bolton—Mr. Dickinson, Mr. Cuerdon, Mr. Radcliffe. Bradford—John Beanland. Edinburgh—John Sutherland, Thos. Bonnor. Glasgow—Robert Anderson. Dundee—Alex. Mackay. Walsall—James Rowley, James Adkins. Hull—A. W. Stanley, R. Bever, Richard Hodson, W. Knox (secretary). Doncaster—Wm. Johnson, John Ashton. Warrington—R. W. Collin, John E. Wright. Bradford—Wm. Moulson, Wm. Holdsworth. Walsall—Moore, Alfred Lynesse. Worcester—J. S. Wood (chairman), John Kendrick (vice-chairman), John Grisman.

The following Bristol members also attended:—

Messrs. John Thorn, J. Eastabrook, J. Perkins, A. Krauss, J. Wilkins, W. Church, G. Humphreys, W. H. Phillips, G. S. Nipper, Thos. R. Lewis, C. H. Foley, S. Robertson, J. R. Shorland, W. R. Thomas, and W. Benson (solicitor). The Mayor (Mr. H. Taylor) was also amongst those present.

At the commencement of the proceedings on Tuesday, the Chairman said he very much regretted having to take the chair, and he was quite sure they would agree with him when he mentioned that it was owing to the illness of the President, Mr. Clay. Their President came to Bristol intending to take part in the business of the meeting, but he had been taken suddenly ill. Before commencing the proceedings he begged to tender to the Mayor of Bristol their thanks for the kindly welcome given by the city of Bristol to the association.

The Mayor, who was received with applause, said he had great pleasure in being present and in giving the association a hearty welcome to Bristol. He was very glad to see them, more particularly as they were engaged in a business with which he was to some extent connected. He regretted the absence of the President, and hoped that their proceedings would not suffer in consequence. He need hardly dilate upon the necessity and importance of such a society. They found labour combining for its own ends, and it was necessary for the employers to combine also for their own protection. The objects of the society were good, and he trusted that the association would continue for many years.

The Secretary (Mr. Knox) read the minutes of the last meeting at Sheffield, and then the report of the Council. They had obtained particulars from ninety-eight of the principal towns of the kingdom with reference to the rate of wages paid. The depression of trade still con-

tinued, and the large supply of labour had a tendency to bring down prices. In Bristol many men were to be obtained at less than the recognised rate. The Council recommended, as regarded apprentices, that the employers should put themselves into communication with the masters of schools in their respective districts, with the view of obtaining boys of good education, as that would be the means of raising the standard of the operatives in the building trade. The Council had taken action with reference to the liability of employers for injuries caused to their workpeople by negligence, and many amendments had been proposed to the Bill. The Council hoped that if the Bill were carried the amendments would be adopted. The finances were in a satisfactory condition. There was a balance in favour of the association of 329*l.* 8s. 10d.

The report and accounts were adopted.

It was resolved that the next meeting should be held at Manchester.

A discussion took place as to the liability of builders to pay for the use of roads, and it was pointed out that it was only in cases of extraordinary use that they were called on to pay.

Mr. Hatherley considered it was but fair that if they used a road more than in the ordinary way they should pay for it.

The Chairman then introduced the subject of the Employers' Liability Bill. He said the Government adopted Mr. Brassey's Bill, and, like much of the legislation that had gone on lately, there was a good deal of slap-dash about it. Mr. Cladstone found that the Bill was quite impracticable, that it was not a fair Bill, and that he could not carry it. He, therefore, withdrew the Bill and took it into a committee of the House. The Government then re-considered the matter, and brought in a second Bill, and it was called the Employers' Liability Bill, as amended in committee. He read the Bill, and pointed out that the principal and important clause was the following, making an employer liable,—

"By reason of the negligence of any person in the service of the employer to whose orders or directions the workman at the time of the injury was bound to conform or did conform; or by reason of the act or omission of any person in the service of the employer done or made in obedience to the rules or bye-laws of the employer, or in obedience to particular instructions given by any person delegated with the authority of the employer in that behalf."

The builders had a great many objections to the Bill. It really made them liable for the acts of one-fourth of the men in their employ, and in some trades for those of every other man. There were various amendments proposed, and they hoped to be able to carry some of them, so as to make the Bill more fair. They hoped to get the insurance clause passed, although there would be very great difficulty in working it as far as the builders were concerned. It would cut the ground from under the feet of the trade unions; for although they ostensibly obtained their funds for sick benefit, they used them for the purposes of strikes. He hoped they would limit the liability to 150*l.* At present they would be liable to the extent of 300*l.* The Council would watch the progress of the Bill.

Mr. Leslie thought the liability should be reduced to 100*l.* He moved a vote of thanks to the Council for their action in the matter. The motion was carried unanimously.

Mr. E. Hughes, of Liverpool, read a paper on the measurement of work and the mode of taking out quantities. A vote of thanks was passed to him.

In the evening the Mayor entertained the members of the society at dinner in the Mansion House.

On Wednesday the members visited Chepstow and Tintern Abbey.

Lincoln.—The new Wesleyan Mission Chapel, at the corner of Derby-street, St. Catherine's, Lincoln, has been opened. Mr. Charles Bell, of London, is the architect. The trustees have decided to confine themselves for the present to the adoption of a portion of the plans, viz., that for the school, and to use the building for religious services, as well as Sunday-school work proper, until the entire block of buildings is completed. The building, the contract for which was entrusted to Messrs. Cowan & Lansdown, builders, Lincoln, contains a large room, 46 ft. by 34 ft., with four class-rooms. The cost of this building, including land, has been about 1,200*l.*

FEDERATION OF BUILDING TRADE EMPLOYÉS.

ATTEMPTS have been made on several occasions during the past few years to federate the whole of the trade unions of the United Kingdom, but each attempt has failed. The cause of these failures is mainly to be ascribed to the diversity of interest and customs existing in the many and varied branches of industry which form the trade-union movement in the country. It would now appear that there is a prospect of successful federation in the several branches of the building trade. A conference, which had been sitting for four days at the office of the Bricklayers' Society in Stamford-street, London, closed its deliberations on Friday, the 23rd inst. It was attended by representatives from the Almalgamated Carpenters and Joiners, the National Association of Plasterers, the London District Association of Plasterers, the House Decorators and Painters, and the Operative Bricklayers' Society. It is reported that the masons will shortly join the movement. It is understood that the contribution will be about 6d. per annum per member, with 1s. per member entrance-fee. The following is the preamble agreed to before the Conference closed its sitting:—

1. That the objects of this Federation shall be to promote a knowledge of the principles and advantages of trade unionism amongst the operatives engaged in the building trades.

2. To secure unity of action amongst the organisations established in the building trades.

3. To endeavour to obtain, as far as is practicable, in each town or city a uniformity of working-hours in the different trades.

4 To render assistance to any trade in the Federation desirous of resisting an aggression on the part of their employers, or of endeavouring to improve their social position.

Name of Federation.—The National Federation of Building Trade Associations.

A sub-committee was appointed to inquire into and report upon the most desirable place for central offices and other details connected with the organisation.

THE NEW BOOTLE DOCKS.

THE new Bootle Docks are likely to be completed and opened at the close of the current year. The works were commenced in October of 1873. The scheme, of which we get particulars from the *Bootle Times*, consisted of an enlargement and alteration to the form of the present Canada Basin, with a double entrance, 65 ft. wide, on its north side, leading into a half-tide dock of 18 acres. This dock is formed somewhat in the shape of the letter L, and from its eastern extremity, or the top of the letter, there runs a branch dock of three acres, and two graving-docks of 950 ft. in length each. These are sub-divided by intermediate gates into lengths of 500 ft. and 450 ft. respectively, and are provided with powerful pumping machinery of the turbine type. This half-tide dock also communicates, by means of a passage 50 ft. in width, with the Brocklebank Dock. In its north-west angle a double passage, 60 ft. in width, leads into the steam-dock, that is to say, a dock suitable for the largest class of steamers which frequent this port. The form of this dock is somewhat peculiar, the design being particularly adapted to the trade in question, which requires a minimum of water-space combined with a maximum of quayage. The main body of the dock, 1,600 ft. in length and 500 ft. in width, runs parallel to the river, and at right angles to this portion run three branches in an inland or easterly direction, averaging about 1,350 ft. in length by 300 ft. in width. The total area of the dock, with its branches, is 13 acres, and the lineal quayage is equal to 11,000 ft. All the quays of this dock will be flanked by sheds 95 ft. in width, and on the west quay of the half-tide dock, called the Langton Dock, there is a shed 1,200 ft. in length and 80 ft. in width, as well as one of 900 ft. in length and 95 ft. span, which is now being erected on the north quay of the Langton Branch. On the north side of, and leading out of the Steam Dock by a passage 50 ft. wide, is another dock of 18 acres, capable of affording accommodation to any trade which it may be found desirable to locate there. As yet, however, little beyond the formation of the passage by which it is entered has been done towards its construction. The most interesting features in the design and construction of these works are doubtless connected with the construction of the main entrances and the alterations to, and extension of, the Canada Basin. In order to maintain the approaches and the sills of these entrances free from the silty matter with which the waters of the Mersey are heavily laden, a gigantic system of sluicing has been carried out, which presents many entirely novel features, and is probably quite unique in the history of hydraulic engineering. As an instance of its magnitude, the dimensions of the feeding culverts may be mentioned. The largest of these are 15 ft. by 13 ft., and 12 ft. by 12 ft., while at a level of 15 ft. below the level of low water of spring-tides as many as four lines of pipes, 3 ft. in diameter, have been laid, which will enable the sluicing-power to be brought to bear on all portions of the basin, no matter how distant from the side walls. This work can only be carried on at low water of spring tides, and the great depths at which the work has to be laid, as well as its inconvenient position, naturally makes it very costly and tedious. For the last two years or more, the night tide work in connexion with this basin has been carried on by the aid of the electric light, and eight powerful lamps, giving an aggregate illuminating power equal to 48,000 candles, are now used with the most advantageous results. The available depth of water in the main entrances and principal passages between the various docks on high water of a spring-tide will be 33 ft. The aggregate area of the water-space comprised in the scheme is 82 acres, and the total lineal quayage is equal to 20,000 ft. The Parliamentary estimate for the scheme was 2,691,000*l.* The water was admitted into the Langton Half-tide Dock and branch early in March, 1879, and the Langton Graving Docks were formally opened to the public a fortnight ago, and it is intended to open the remainder of the work, with the exception of the dock to the extreme north, by the end of the present year. An idea of the magnitude of this undertaking may be derived from the following statistics of the excavations involved and materials employed in the construction of the works. Over 4½ million cubic yards of material have been excavated, and 450,000 tons of gravel or shingle, 75,000 tons of Portland cement employed in the concrete work, and 6½ millions of bricks used in the erection of the sheds and other buildings.

The works have been carried out by the Mersey Docks and Harbour Board's experienced engineer-in-chief, Mr. G. F. Lyster.

REBUILDING AND REPAIR OF METROPOLITAN BRIDGES.

APPOINTMENT OF AN ASSISTANT-ENGINEER.

At the meeting of the Metropolitan Board of Works on the 23rd inst., an important report from the Engineer, Sir Joseph Bazalgette, was submitted as to the works which are, in his judgment, urgently necessary for the repair and maintenance of the bridges vested in the Board under the Metropolitan Toll Bridges Act, 1877. The first recommendation was that the necessary works for deepening the foundations of Waterloo Bridge be forthwith carried out as recommended in the report of the engineer, at an estimated cost of 40,000*l.*; that notice be sent the Thames Conservators that the Board are about to execute the proposed works, and that a sketch-plan of the same be forwarded to the Conservators.

Mr. Selway, the chairman of the Bridges Committee, in moving that this be adopted, said it was pointed out by their own and other engineers, when negotiations were going on for the purchase of Waterloo Bridge, that the foundations of the piers had been weakened by the scour of the river. At the present moment no damage had occurred to the structure, but should the foundations not be attended to, and a settlement take place, nothing could restore it, and a permanent disfigurement of that noble structure would be the result. The evil was going on day by day, and the state of the piers would get worse, therefore the sooner something was done the better. The Board was now asked only to authorise the committee to take the necessary preliminary steps.

The report was adopted.

The next recommendation of the committee was that application be made to Parliament in the next session for powers to enable the Board to deepen the channel and enlarge the span of Vauxhall Bridge, at an estimated cost of 45,000*l.*

Mr. Selway explained that the piers of the

idge were weak, and the openings narrow: a tide was very strong at times, and accidents ere liable to occur.

The recommendation was agreed to.

The next item in the report was a recommendation that application be made to Parliament the next session for powers to rebuild Battersea Bridge, at an estimated cost of 250,000*l.*

Mr. Selway said he assumed every member of e Board was acquaintad with Battersea idge. It was a timber bridge, a narrow idge, and (he thought a voice said) a disaceful bridga. It had been patched up many ues, and the piles in the ground were no doubt ore or less decayed. It was absolntely necesry to have a proper bridge and suitable proaches.

Mr. Elt said that when he read the whole port of the committee, and found it was proaed to expend sums that would amount to mething like three-quarters of a million, it most took his breath away. He thought when e ratepayers knew of the proposition, their y of having free bridges would be somewhat mped. The question was, Was it necessary have these works carriad ont? Would the idges have been repaired to such an extent, rebuilt, had the Board not purchased them? e agreed that something was necessary to be ue to Waterloo and Vauxhall bridges, but he uld not see the necessity for the other prosed works.

Mr. Richardson pointed out that, according the Act of Parliament, it was the duty of the oard to maintain the bridges.

Mr. Munro supported the report most cordially, ough the district he represented (the East of ndon) possessed no bridge accommodation natever. The freeing of the bridges had imsed upon his ratepaying constituants a rate of . in tha pound, but that they cheerfully paid r tha good of the metropolis. Perhaps the oard might think he was speaking with a sense favours to come. Possibly he was, but not r a year or so. When he did come to the oard, he hoped it would be remembered how e East End of London had approved of the ridges Committee's reports.

Mr. Freeman observad that the Board had at esent no power to build bridges, and all they kad to do now was to obtain that power from rliament.

The report was then adopted.

The next recommendation was, that applicaon ba made to Parliament in the next Session r powers to enable the Board to rebuild utney Bridge, and improve the approaches ereto, at an estimated cost of 300,000*l.*

Mr. Selway pointed ont that the bridga was iginally built, according to the little book ritten hy Mr. T. E. Jones [and lately noticed the *Builder*], clerk to the Fulham District oard, to allow the King a short out to Richond; but now both aides of the river were owded with houses, so that a better bridge as necessary.

Mr. Lammin pointed out that, at the earliest, new bridge could not be construoted till 1882, it he would say that since the present bridge ad been freed, the traffic had increased enorously, the omnihnses and all kinds of vehioles assing over it; therefore the traffic was very reat, and the wear and tear would necessitate considerable annual expense.

The report was adopted.

The following other recommendations of the ridges Committee were adopted without dission:—

That works of repair and painting be done to andsworth Bridge at an estimated cost of 000*l.*, the whole of the works to be included one contract, and that an advertisement be ued inviting tenders for the execution of the orks, such tenders to be opened at the last eeting of the Board before the recess.

That application be made to Parliament in e next session for powers to enable the Board rebuild Deptford-creek Bridge, at an estiated cost of 20,000*l.*

That the necessary repairs to the supports of e roadway of Deptford-creek Bridge be forthith carried out nnder a general contract at cost not exceeding 200*l.*

The Bridges Committee also reported on the ference hy the Board of the 9th of July, 1880 o. 13), relative to the steps to he taken for rrying out the order of the Board as to the ppointment of a person to act under the Engier, to superintend the work that may be cessary to repair and maintain the bridges nder the control of the Board; and recommending that Mr. Edward Bazalgette, assistant in the Engineer's department, be appointed, during the pleasure of the Board, as assistant engineer for metropolitan bridges over the Thames and its tributaries under the control of tha Board, at a salary of 500*l.* per annum.

The recommendation was adopted.

CYPRUS.

SINCE Cyprus ceased to be a battle-field for party warfare little has been said about it, and tha general public take little or no interest in the matter. We have before us tha first report of her Majesty's High Commissioner, Major-General Biddulph, with various subsidiary raports, whioh all appear to ahow satisfactory progresa. We condense a few observations from the first named:—

During the twelve months which succeeded tha British occupation the rainfall in the great central plain, called the Messaria, was very small, and certainly did not exceed 6 in. The consequence was that tha wheat and barley harvest of 1879 was exceedingly short. The prospects were so bad in the spring that the people held their corn, and large quantities were imported from foreign parts. The importance of an adequate rainfall in the Messaria may he shown hy the fact that whereas tha tithes of 1878 were sold for T.£. 82,000, over T.£. 42,000 of this sum was paid for the tithes of the five nahiehs, which are situated in the plain, leaving only T.£. 40,000 as the price of the eleven remaining nahiehs. During 1879 the tithes of Papho have largely exceeded the yield of the previous year, and the abnormal yield of carobs has removed all distress from the Limassol district; hut notwithstanding this increase, the failure of the crops in the Messaria has caused the total net yield to fall to T.£. 45,000. This fact shows the importance of a good water supply; and when it is considered that irrigated land bears two crops annually, whereas non-irrigated land is only cultivated alternate years, and even then often fails, it cannot be doubted that a good system of irrigation would at least treble the production of the corn and cotton-growing lands.

In those places where thara are perennial streams, the water is a frequent source of quarrelling and litigation amongst the people. Those who dwell near the source have no remorse as to wasting it, and thus curtailing the supply to those who live lower down. Very little attempt is made to store the rainfall in tanks, and where thera is no natural source of water, no great effort has been made to supply the want by digging wells, except in tha neighbourhood of villages for the personal wants of the inhabitants and the use of thair gardens. Captain Inglis'a report shows the necessity of something being done in the Famagusta district, where, at some seasons, the crops are destroyed hy too much water, and at others hy the want of it. It is a matter which is beset by considerable engineering difficulties; it is hoped that we shall he able to procure a scheme for overcoming them, by which not only will the prosperity of the people be increased, but also the health of the district he improved.

The failure of the harvest has caused great demand to be made for seed corn, and over 6,000*l.* have been spent by the Government for that purpose. It was the custom of the Turkish Government to lend seed corn to the people when needed, and they did it from the stores of tithe corn which they had collected. It may be doubted whether the policy of purchasing corn for that purpose is a good one, and whether it would not be better to meet the wants of those who are really needy, by remitting a portion of the taxes due from them, leaving them to use the money in the purchase of seed in the open market. But the question is an exceedingly difficult one.

The planting and preservation of trees has engaged the attention and care of this Government. Great pains have been taken to plant the eucalyptus, and considerable expense incurred for the purpose both hy fencing it to preserve it from cattle, and owing to the necessity of its being constantly watered for the first two years. A large plantation at Famagusta has been entirely destroyed during the last few days by the excessive cold, which for intensity and duration has been unequalled at that place during the last forty years. With a view to encourage the importation of timber, and to save as much as possible the remaining forests, the import duties on all timber, whether manufactured or otherwise, and on all fuel of every description, has been entirely removed.

A considerable increase in the prosperity of the country may be anticipated from the opening up of roads. Upon our arrival here there was only one carriageable road in tha island, viz., from Larnaca to Nicosia. No cart could pass from the central plain over the southern range of mountains by any other route, and none could pass at all over the northern range. A number of roads have been made fit for carts to travel on during the year 1879. A very great improvement in tha wine may be looked for when the manufacturers cease to put it into tarred skins to convey it to the place of export; and the use of barrels will become practicable when roads are made. Tha road-making has also afforded much employment to the population; and I am informed that the poorer classes are much better off than formerly. The number of summonses for small debts has certainly greatly decreased in the courts; at the rate of no less than 40 per cent. in the Nicosia district during the last six months, notwithstanding the had harvest.

The state of education in Cyprus must be considered to be at a low standard if judged by modern ideas. Tha majority of the agricultural population have received little or no education. In many villages not a single person can read or write, and the education of the women is almost entirely neglected. School statistics are being collected, and I hope shortly to be able to submit a report on this important subject. Meanwhile a great desire has been expressed hy the inhabitants, both Christian and Mahometan, of the larger towns that the English Government should aid them in establishing good schools, and especially that the English language should be taught in them.

It is satisfactory to be able to say that the year 1879 has been extremely healthy. So much has been said and written with regard to the climate that it is only necessary to say that the year 1878 was, hy all accounts, exceptionally unhealthy both to the English and to the natives of tha island. The year 1879 was just the reverse, and although the more plentiful rain of the present winter augurs well for the harvest of 1880, the inhabitants confidently affirm that an abundant harvest will not this year be accompanied, as it often is, by an unhealthy season, as the extreme and unusual cold, such as has been experienced this winter, has always in previous cases been the forerunner of a healthy summer.

The Public Works Department has been entirely managed hy officers of tha Royal Engineers, and they have laboured hard at the necessary works, often with a very inadequate staff to assist them.

A Report hy Lieut. Sinclair on the Public Works executed in the district of Larnaca gives some interesting information. After describing what has been done, the Report says,—

"New roads, the most important of engineering works, have already been mentioned. Next to them ranks irrigation. Any money spent on the execution of lines of wells for this purpose would be well repaid, but this is a matter for private rather than Government enterprise. The condition of the aqueduct supplying Larnaca with water has attracted serious attention. The aqueduct is at present thoroughly out of repair, and the water polluted before being delivered in the town. A scheme for remedying this great defect has been prepared, and the cost (3,000*l.*) provided for hy the municipality of Larnaca; but unfortunately the rights vested in the heirs of the Pasha, who gave the aqueduct to the town, subject to certain restriction, have hitherto prevented the execution of this urgently needed work. The supply of water at the source is abundant and pure.

With regard to the general execution of public works in the district, it may he remarked that while some serious difficulties exist, there are other points which offer advantages not often to he met with. One difficulty and source of the expense is the want of tools and stores. Skilled labour would also have been difficult to obtain had not a large invasion of Maltese carpenters, smiths, masons, &c., occurred simultaneously with that of the English troops. Where roads do not exist, and the tracks are rough and steep, transport is a very costly item of expenditure. Donkeys, mules, hullocks, and camels of excellent quality, and in large numbers are, however, always forthcoming, and perform prodigies of strength and endurance. Wood is

very scarce and expensive, and its place in building is largely supplied by stone arches, in the construction of which the native masons are well skilled. Another difficulty, most serious to the engineer, is the total absence of any heavy rainfall since 1877. Engineering works, for want of experience of the possible rainfall and its action, have been reduced to works of theoretical calculation, where they should be the result of practical experience. The great advantage which we have in the execution of works in this country is the hardy, docile, and enduring qualities of the peasantry. Though at first lazy and dilatory, from their ancestral habits, they soon changed into diligent and active workmen, as they became accustomed to the use of pick and shovel, and the energetic superintendence of English overseers. They now accomplish a good day's task of nine working hours, in a manner that would put to the blush many an English navvy, subsisting almost entirely on black bread, olives, fruit, onions, and water, and perfectly content to work; the men at 9d. to 1s.; women (who are most industrious and hardy) at 9d.; and boys at 6d. Skilled native labour (masons and carpenters) may be had at 2s. to 3s. per diem. Maltese carpenters, masons, and smiths at 4s. A pony or mule can be hired at 2s. 6d. a day, a donkey at 1s. 6d. (with attendant), and a pair of bullocks, with a strong Arab or country cart, at 3s. 6d. These facilities have enabled me to perform large movements of earth (to give an example of the relative cost of work here and in England) at an average cost of 4¼d. per cubic yard, which in England would cost, worked in the same manner, 1s. 9d."

SUN SYMBOLS.

A PAPER on "The Indian Swastika and its Western Counterparts," by Mr. Edward Thomas, F.R.S., has been reprinted in pamphlet form from the *Numismatic Chronicle*, and will be found interesting. Mr. Thomas says so many learned and enthusiastic scholars have attempted in times past to explain the origin and purport of the so-termed Mystic Cross, the counterpart of the Indian *Swastika* that it is with some diffidence that he now ventures to propose a more simple and less enigmatical solution of this much-discussed problem. As far as he has been able to trace or connect the various manifestations of this emblem, they one and all resolve themselves into the primitive conception of solar motion, which was intuitively associated with the rolling or wheel-like projection of the sun through the upper or visible arc of the heavens, as understood and accepted in the crude astronomy of the ancients. The earliest phase of astronomical science we are at present in a position to refer to, with the still extant aid of indigenous diagrams, is the Chaldæan. The representation of the sun in this system commences with a simple ring or outline circle, which is speedily advanced towards the impression of onward revolving motion by the insertion of a cross or four wheel-like spokes within the circumference of the normal ring. These crosshars are subsequently elaborated into new patterns and delineations, which will be noticed afterwards. As the original Chaldæan emblem of the sun was typified by a single ring, so the Indian mind adopted a similar definition, which remains to this day as the ostensible device or caste-mark of the modern *Sauras*, or sun-worshippers. The tendency of devotional exercises in India, indeed, seems from the first to have lain in the direction of mystic diagrams and crypto symbols, rather than in the production of personified statues of the gods, in which it must be confessed that, unlike the Greeks, the Hindus did not attain a very high style of art.

Mr. Thomas gives two plates of examples showing the development of the idea, and without reproducing these it is scarcely possible to give a complete account of his views. There are abundant examples of the primitive belief in the three positions of the sun: almost all the old pillars at Amarávati are ornamented with a triple *lotus* pattern, consisting of a semicircle or half-flower at the foot, in its uprising stage, succeeded by a central front-face flower, in the full maturity of the sun's emblem, surmounted on the capital by a duplicate half-flower reversed, the upper semicircle being omitted, which seems to denote the subsiding sun. In these instances, too, we find a remarkable exemplification of the hesitating or delayed disappearance of the after-glow in a pillar of a similar character in the Nassik caves, copied by Mr. West, where the fading light of the sun is exhibited in the form of a secondary or *retreated* repetition of the outline of the half-circle above the normal definition of the setting sun. One section of plate ii. is devoted to reproductions of Chaldæan and Assyrian forms of the sun, in order to exhibit their identities and contrasts with the symbols of the Indian system. Mr. Thomas has evidently devoted much time and learning to the investigation.

ART-UNION OF LONDON.

THE following are the remaining works selected by the principal prizeholders:—

From the Royal Academy.—In a Welsh Valley, F. W. Hulme, 150*l.*; Drawing Beer for the Gamekeeper, E. Opie, 60*l.*; A Hop-garden, A. Verey, 50*l.*; Rhu More, Loch Alsh, Ross-shire, J. Nesbit, 45*l.*; A River Scene in North Wales, G. Wells, 45*l.*; The Firstling of the Flock, E. Newman Dowsard, 40*l.*; The Abbot's House, Malmesbury, F. H. Eastwood, 40*l.*; The Limpid Stream, A. De Breanski, 35*l.*; Edge of the Marsh, W. J. Slater, 30*l.*; Summer in Kent, J. L. Picksring, 21*l.*; Written Love, T. B. Kennington, 20*l.*

From the Society of British Artists.—Stitching Time, C. A. Smith, 45*l.*; Rivals, J. C. Waite, 45*l.*; In the Tyrol, Early Morning, W. Telbin, 42*l.*; A Misty Day, Birnam Beeches, H. Caffieri, 35*l.*; Just Caught, Thos. Earl, 30*l.*; A Frosty Day, near Shiplake Lock, on the Thames, W. Gosling, 30*l.*; An English Pastoral, A. Paulton, 30*l.*; Fading Light, A. F. Grace, 25*l.*; Fading Day, Jno. Bromley, 20*l.*; Holly Bushes, Burnham, Bucks, H. Caffieri, 20*l.*; Waning Day, J. E. Grace, 20*l.*; Summer (marhls hnst), F. Junck, 20*l.*; Pasture Land, Essex, W. Luker, 20*l.*; "Begone, Dull Care," D. Passmore, 20*l.*; On the Edge of the Common, B. D. Symond, 20*l.*; St. Giovanni Paolo, Venice, Alfred Pollentine, 15*l.* 15*s.*; The Lyc Rock, Tintagel, Cornwall, A. B. Collier, 15*l.*; "The Lesson," Miss E. Gilbert. 15*l.*; "Anna" (Italian Girl), Jules Ravel, 15*l.*; A Calm Day in Venice, C. Thornley, 15*l.*; Winter Evening, G. A. Williams, 15*l.*

From the Crystal Palace Picture Gallery.—The Sledr Valley, N. Wales, J. Godet, 35*l.*; Evening, Coast of Cornwall, T. S. Croxford, 25*l.*; Fishsr Children, L. Thomson, 25*l.*

From the Royal Albert Hall.—A Wiltshire Farmhouse, S. Lewis, 75*l.*; On the Torrent Walk, Dolgelly, R. Harwood, 50*l.*; Warwick Castle, W. C. Way, 45*l.*; The Thames from Richmond Hill, C. Potten, 35*l.*; Trumps Mill, Surrey, M. A. Langdals, 25*l.*

From the Society of Painters in Water-Colours.—Cornish Coast, Chas. Davidson, 23*l.*; St. Barnabas, Venice, Wm. Callow, 15*l.*

From the Institute of Painters in Water-Colours.—Coming Ashore, J. H. Mole, 47*l.* 5*s.*; On the Ghent Canal, near Ostend, W.W. May, 25*l.*; Montelsons, Southern Italy, Chas. Vacher, 25*l.*; View of the Meavy from Yelverton, South Devon, P. Mitchell, 20*l.*; An Old Forge in the Lake Country, H. C. Fidgeon, 15*l.*

From the Exhibition in Black and White.—Only a Penny, A. M. Rossi, 15*l.*

NEW CEMETERY AND CHAPELS, EVERTON.

THE Bishop of Liverpool (Dr. Ryle) has consecrated the Church of England portion of the new cemetery. It is fifty-four statute acres in extent, and the land cost 12,000*l.*, and the ground has been laid out and the chapels erected from the designs of Messrs. T. D. Barry & Son, architects, Liverpool, Mr. John Atkinson acting as clerk of the works.

Three chapels are provided,—one for the use of the Church of England, one for the use of Nonconformists, and another for the use of Roman Catholics. They are nearly alike in form, size, and arrangement, the principal difference being in the treatment of the towers. They contain in plan:—Nave 43 ft. 9 in. by 23 ft. 6 in.; chancel, 15 ft. 1 in. by 15 ft. 1 in.; vestry, 13 ft. 5 in. by 9 ft. 9 in.; aisle for coffins, screened off from the nave by an ornamental glazed screen, 21 ft. 6 in. by 16 ft. 3 in.; waiting-room, 18 ft. 8 in. by 15 ft. 1 in.; and tower at the front angle of the nave. Each vestry has a small yard, and under each vestry is a warming chamber, from which the chapels are warmed by a hot-water apparatus. The chapels for the Church of England and Nonconformist portions of the cemetery are placed on a terrace facing the entrance in Higher-lane; while the chapel for the Roman Catholic portion is near the other entrace in Long-lane. There are entrances to the chapels from the front of the nave and from the side of the tower, with an exit-door for the coffins without going through the chapel. The chapels are in the Gothic style of the Geometric period, which has been fully carried out in the character of its tracery, the richness of its mouldings, and the light and shade so characteristic of that period. The towers are 14 ft. 6 in. square and 50 ft. high, divided into three stages, the upper being a well-developed belfry. Above is a stone parapet with sunk and cusped panels, and the whole is surmounted by a spire 65 ft. high to the top of the vane. The treatment of the spires and pinnacles at the bases is different in each chapel. In the principal front of each nave is a four-light window, deeply moulded and filled in with rich tracery, the jambs and mullions having floriated caps and moulded bases. The end window of each chancel is of three lights, similar in character to those last described; and the side windows of each nave are also of similar style in two lights. The waiting-room windows are of two lights, in unison with the others. The windows throughout have received special attention, and their design, proportion, and workmanship assist in no small degree the successful effect of the chapels. The walls have been built with red sandstone, taken from a quarry within the cemetery, from which also a good deal of the dressed stone was taken, but the greater part of this work has been executed in red sandstone from quarries at Runcorn and Kirkdale. The chapels have been faced with stone parpoints, pitch-faced, squared, and coursed. The stone used internally in the arches, jambs, and columns of chancels and coffin-rooms is from the quarries at Quarelle, near Bridgend, Glamorganshire, of a very delicate green stone colour, which contrasts well with the other stone. The walls are plastered internally. The whole of the roofs, benches, screens, and reading-desks are of the best pitch-pine, the roofs, which are open at the apex, being of hammer-beam construction, with circular ribs. Ample ventilation has been provided in the roofs by opening and closing shutters, additional ventilation being provided in the windows. The windows are glazed with toned rolled cathedral glass, of various colours, in geometric and floral patterns, which are very effective and in good keeping with the general design. The floors of passages of the naves and also those of the towers and coffin-rooms, are of tiles in ornamental patterns; those of the chancels are also of tiles of rich pattern. The slating is executed in Westmoreland green slates, with red ridges.

Within the grounds facing the central approach road is a building containing the offices of the Board. At the west side of these offices is an ornamental drinking-fountain, the gift of Mr. John Houlding, chairman of the Works Committee.

At the Higher-lane entrance suitable lodges have been erected for the superintendent and the gardener, and at the Long-lane entrance stands the registrar's lodge. The three lodges are in keeping with the general style of the other buildings. A stable-yard, with stabling for four horses, large coach-house, loft, &c., are also provided, besides a number of smaller buildings for implements, tools, potting plants, &c., and there is besides a large conservatory for rearing and propagating flowers. A yard is provided for executing masons' work, monuments, &c., under the direction of the Board. The back fences of the cemetery are of plain character, built from the red sandstone found on the site, and are no less than 2,500 yards in length.

The contractor for the whole of the surface work, drainage, road-making, fence-walls, chapels, lodges, offices, &c., is Mr. Isaac Anwell, of Liverpool. The conservatory was designed by Mr. Webster, of Wavertree, the heating being done by Mr. Kneale, and the ornamental iron-work, gates, and palisading by Messrs. Charles Smith & Co., Birmingham. The joiners' work has been done by Messrs. Nicholson & Ayre, Liverpool, and the slating by Mr. Jones, of Mount Pleasant, Liverpool. The trees, shrubs, and planting have been superintended by Messrs. Skirving & Son, Liverpool; the clock has been placed by Mr. Condliff, Liverpool; the drinking-fountain by Mr. Pilling, Walton; the whole of the carving by Mr. John Clark, Liverpool; the heating of chapel by Messrs. Tessimond & Kissack, Liverpool; the water supply, fire-hose and fittings, by Mr. Bucknall, Liverpool; the glazing by Messrs. Jelly & Hughes, Liverpool; the plumbing in the chapels is by Messrs. B. J. Catlow, Liverpool; the tiling by Messrs. Cbantrell & Son, Liverpool; and the fire-proof chamber, door fittings, and shelves, swing gates, &c., by Messrs. Bennett Brothers, Liverpool.

Exhibition of Gas and Electricity.—The Philosophical Society of Glasgow are arranging for an exhibition of apparatus for the utilisation of gas, electricity, &c., to be held in the Burgbank Drill-hall and grounds, Great Western-road, Glasgow, from Tuesday, the 28th of September, till Monday, the 25th of October. Some particulars will be found in our advertising columns.

APPROACHING CONGRESS OF THE SOCIAL SCIENCE ASSOCIATION.

THE following are the special questions in the departments more especially interesting to our readers to be discussed at the Edinburgh Congress, October 6th to 13th:—

Health Department.—1. What are the best areas for sanitary purposes, and how far should there be a revision of the mode of electing and continuing the services of the officers under the Public Health Acts?—2. What is the best mode of amending the present laws with reference to existing buildings, and also of improving their sanitary condition so as to render them more healthy, having due regard to economical considerations?—3. What are the means which should be adopted for the prevention of the pollution of streams, without undue interference with industrial operations, and for the preservation of pure sources of water supply?

Economy and Trade Department.—1. What legislative measures are required to leave the occupier of the soil freer than at present to increase his production of food; and by what measures of his own can the farmer best meet foreign competition?—2. What should be the course of legislation with regard to local government and the incidence of local taxation?—3. For purposes of taxation, what is the most scientific and practical definition of the word "income"?

Art Department.—1. Ought there to be a school of dramatic art subsidised by private subscription or endowment, or by the State?—2. How far would the revival of the old system of "Master and Pupils" be of advantage, and tend to promote the growth of historical art in the country, and the fitting use of painting and sculpture in our public buildings?—3. How can the musical education of the middle classes be improved?

SALE OF BUILDING SITE IN PARK-LANE, MAYFAIR.

ON Tuesday Messrs. Driver & Co. offered for sale at the Auction Mart, by direction of the Ecclesiastical Commissioners, a freehold building site in Park-lane, Mayfair, possessing a frontage of 93 ft. to Park-lane, and comprising an area of about 2,100 square feet. The site is close to Piccadilly, adjoining the residence of Sir William Miller, and is at present occupied by portions of the Rose and Crown public-house, three houses and shops in Park-lane, and the Park-lane entrance to Mercer's Horse Repository. It was explained in the particulars that the entire premises were leased for a long term of years, which expired last Lady-day, since which time they had been temporarily let (with the exception of the Park-lane entrance to Mercer's Horse Repository) at rents amounting in the whole to 425*l.* a year, with power of resuming possession at six months' notice from any quarter-day. It was added that as regarded the Park-lane entrance to Mercer's Repository, the purchaser could enclose or build upon it, being entitled to possession on completion of the purchase, and in that case the repository would no longer have an entrance from Park-lane. The auctioneer, in submitting the property, observed that he did not know what those present might consider it was worth, but his estimate was that it was worth from 8*l.* to 10*l.* per foot, which would give something like 20,000*l.* The biddings commenced with an offer of 10,000*l.*, after which there was a pause of several minutes, no advance being made, on which the auctioneer observed that if there was no further offer, the bid of 10,000*l.* would be both the first and the last, as the property would no longer remain on the vendors' hands, but sold for the sum which had been offered. After this intimation, the biddings were spiritedly resumed by advances of 50*l.* each, and the property was ultimately sold for 12,500*l.*

SALE OF MODERN BUILDINGS IN CHARTERHOUSE-STREET.

THE spacious and costly buildings recently erected in Charterhouse-street, between the Holborn Viaduct and Farringdon-street, known by the name of Ely House, were sold by auction, at the Mart, on Monday last, by Messrs. Farber, Price, & Farber, under an order of the Court of Chancery. The premises have a frontage to Charterhouse-street of 50 ft., the depth being about 122 ft., occupying a total area of 6,220 ft. They contain four lofty floors, and are erected with white Suffolk brick, and Portland stone dressings, the façade on the principal floor being ornamented by polished red and grey granite. The interior is arranged for subdivision, and contains several lofty show-rooms and suites of offices, the floor and mural decorations being elaborate and costly. The premises are held on lease from the Corporation for an unexpired term of seventy-five years from Christmas last, at the ground-rent of 536*l.* per annum, and are at present let on leases to several tenants, at a rental of 1,705*l.*, the owner paying rates, insurance, rectory stipend, and gas. The highest bid was 7,000*l.*, at which sum the auctioneer declared the property to be sold, after opening the document containing the amount fixed by the Court of Chancery. The opinion expressed in the sale-room was to the effect that the property was sold cheap, and that two years ago it would have realised something like 10,000*l.*

SALES OF BUILDING LAND AT HENDON, FINCHLEY, WILLESDEN, SUDBURY, LEYTON, AND FOREST GATE.

ON Friday, the 23rd inst., Messrs. Baker & Son offered for sale, at the Auction Mart, two freehold building estates in the parishes of Hendon and Finchley, possessing extensive frontages to the Finchley-road at Temple, Fortune, and other good roads, the whole comprising about 45 acres. The property was divided into six lots, varying from 3 acres to 10 acres each. Several of the lots were sold, realising about 600*l.* an acre. At the same time and place Messrs. Baker & Son also offered the Wembly Dairy Farm Estate, comprising about 100 acres of freehold land, situate at Stonebridge and Sudbury, in the parish of Harrow, and possessing nearly a mile of frontage to the Harrow-road. It was described as unusually well adapted for building purposes, for a resale in plots, or as affording fine sites for private residences and grounds. It was divided into thirteen lots, three of which were sold at about 250*l.* an acre. These were the first lot, containing 6 acres, sold for 1,500*l.*; and lots twelve and thirteen, containing 16 acres, and which were sold together, realising 4,100*l.*, the total proceeds of the sale amounting to 5,600*l.*

On Monday evening Messrs. Baker & Son offered, at the Victoria Tavern, Willesden-lane, Kilburn, sixty-one plots of freehold building land, fronting on Queen's-road, Harrow-road, forming the first portion of the West Stonebridge Estate, at Willesden, close to the Harrow-road Station of the Midland Railway, and to the Willesden Junction Station of the London and North Western Railway. A portion of the property was set apart for shops, the remainder of the plots being for small dwellings, for which it was stated there was a great demand in the district. With the exception of the shop-plots, which were larger, the several plots have a frontage of 16 ft., and an average depth of from 90 ft. to 100 ft. With two or three exceptions, the whole of the plots were sold, the shop-plots realising from 96*l.* to 100*l.* each, and those for private dwellings from 45*l.* to 50*l.* each.

On Monday evening Mr. F. M. Whittingham also sold, at the Swan Hotel, Stratford, thirty-eight plots of freehold building land at Leyton, having frontages to the high road and Huxley-road, and close to the Leyton Station of the Great Eastern Railway. The several plots have each a frontage of 20 ft., with a depth ranging from 50 ft. to 80 ft. The different plots realised about 2*l.* per foot frontage, and an aggregate sum of 1,391*l.* Mr. Whittingham next sold four plots of building-land on the Forest Gate Estate. They have a frontage of 25 ft. each, with a depth of 195 ft. Each lot was sold for 126*l.* realising an aggregate sum of 504*l.*

BUSINESS PREMISES.

THE new premises taken by Mr. J. W. Benson for the extension of his present steam-factory and shops in Ludgate-hill are those lately occupied by the Prudential Assurance Company, Nos. 62 and 64, Ludgate-hill. To meet the necessary requirements, the two buildings have been re-arranged to form one, the alterations, including some very heavy underpinning of the whole of the two structures, being carried out by the builders, Messrs. Patman & Fotheringham, under the directions of Mr. C. J. Phipps, F.S.A., architect. The whole of the shop-front and window-fittings formed a separate contract, which has been executed by Messrs. Clark & Co., of Rathbone-place, from designs of the architect. The frontage, 40 ft. in length, by placing the entrance in the centre, gives two large windows of three bays each for display of Messrs. Benson's specialities. In the construction of the shop-front are several novelties. As a rule, London shop-fronts, with the windows made either in mahogany or soft wood stained black of the stereotyped form, show in great contrast to the Continental store or *magasin* in Paris. The well-known Bazaar du Voyage facing the new Opera-house, for example, is constructed in polished marble,—a material which, with but few exceptions, is unused in London. Here, in the present case, the architect has selected and used some very beautiful specimens of Devonshire marble for the pilasters and columns forming the entrance to the shop. The shafts for these columns are in one length of 10 ft., with moulded bases of dark green marble from Irish quarries. The capitals and enriched bands are some good specimens of bronzed metal-work, and show in strong relief. The window-cills are also of polished Devonshire marble to match the columns and pilasters, while the sashes are formed by cast-iron fluted columns with cast-iron moulded arches, which are filled in with marble panels, on which are carved specimens of flowers and foliage, partly gilded. The floor of the entrance to the shop is paved with white Sicilian marble; and, instead of the ordinary plain soffit, the lobby ceiling is domed, with groins executed in mahogany. The side-windows, formed with moulded arches, are made to receive the astronomical clocks and calendars. The window-casings are in polished mahogany, partly hung and partly sliding, fitted with specially-constructed lighting and ventilating apparatus, the temperature being maintained in an ingenious manner, suggested by Sir H. Bessemer. The shop-front is closed with seven of Clark's patent noiseless self-coiling steel shutters. Their patent self-rolling sun-blinds are also fitted to the building. The work has been executed with great rapidity.

CURIOUS DEFENCE TO AN ACTION.

ARCHITECT OR BUILDER?

LAST week, at the Lambeth County Court, Mr. Stevens, an architect and surveyor, of Brixton, brought an action against Mr. Holland for the sum of 5*l.* 18s. 6d. for professional services rendered. The original defendant was Mrs. Rogers, a widow, but had recently married the present defendant. The plaintiff's case was that he was instructed by Mrs. Rogers to prepare plans for the extension of the Minerva Collar Factory, Charlotte-row, Walworth, and for the alteration of certain houses in Clapham, at different periods; and these instructions he carried out, and having done so, he could not obtain payment. In answer to the claim, the defendant said he was instructed by his wife to state that the plaintiff was a builder and not an architect, and that she had given him an order to build two houses for her in conjunction with a Mr. Hopkinson. Under these circumstances the defendant said he did not think he had any right to pay for the preparation of the plans for which the plaintiff claimed. In reply to this the plaintiff explained that the defendant was referring to a different person altogether. There happened to be a Mr. Stevens, a carpenter, who once resided near his office, and Mrs. Holland had confused the two. His honour characterised the defence as not very creditable, and gave judgment for the full amount claimed, with costs.

LOCAL BOARDS AND OWNERS OF PROPERTY.

THE TOTTENHAM LOCAL BOARD OF HEALTH *v.* ROWELL.

THIS was an appeal (in the Court of Appeal), on July 24th, before Lords Justices James, Brett, and Cotton, from a decision of Vice-Chancellor Malins. The action was brought by the Tottenham Local Board to enforce a charge upon the property of the defendant for 25*l.*, and interest from February, 1873, the amount of a rate levied upon the inhabitants under the powers of the Local Government Act for the plaintiffs providing sewers and repairing the roads and footways.

The works were done in the year 1865, but the expenses incurred by the Board were not, until the 31st of January, 1873, duly apportioned by the surveyor of the Board, and the demand for payment of the assessment was made in the following month. The objection raised by the defendant was on the ground that the mode of recovering payment, as directed by the various Acts of Parliament, was in the first instance by personal action, by summary proceedings before the justices, or in the County Court within six months, and no such proceedings having been taken to recover the money, the plaintiffs were precluded by lapse of time and unjustifiable delay from now coming to this Court to enforce a charge on the land. The Vice-Chancellor decided that the power to charge the land of a defaulting ratepayer under those Acts was substidiary to the other summary proceedings specified in the Acts, and that the Board, not having taken any of those proceedings within six months, were precluded, after a lapse of so many years, from claiming a charge upon the land. The action was, therefore, dismissed with costs.

Their lordships, after great fluctuation of opinion,

came to the conclusion that the expenses incurred by the Board under the powers of their Act for works done in providing sewers and repairing the roads and footways were capable of being made an independent charge on the property improved, and each charge might be enforced even after the summary remedy against the owner and occupier was lost. The power to enforce the charge was not forfeited by lapse of time. The effect of deciding against the plaintiffs would be to throw all these expenses upon the general rates instead of upon the owners of property facing the improvements. Their lordships could not agree with the decision of the Vice-Chancellor, and the appeal must be allowed.

IS A ROAD A STREET?

MAYOR OF ACCRINGTON *v.* NUTTER.

THIS was a case in the House of Lords, which involved an important question under the Public Health Act, 1848.

In the year 1871 the appellants raised the level of a road in Accrington, which was subject to a turnpike trust, and in so doing damaged the respondent's house, which abutted on the road. The question raised by the present appeal was whether the appellants were liable to pay damages to the respondent for the injury done to his house. The Court of Appeal held the defendant liable, on the ground that the road in question was a "street" within the meaning of Section 68 of the Public Health Act, 1848, and as such was vested in the appellants.

The case was argued some weeks since, when their lordships took time to consider their judgment.

Lord Penzance was of opinion that the Court of Appeal was right. It was quite possible for a turnpike-road near a town to become a street, and there was no reason why the provisions of the Public Health Act, 1848, should not apply to such a street.

Lord Blackburn also thought the judgment should be affirmed. Looking to the sanitary objects of the Act, there was quite as much reason for vesting in a local Board a road which was subject to a turnpike trust as one that was not. The street in question was, in his opinion, vested in the appellants by Section 68, and they were, therefore, liable for the damage done to the respondent's house.

Lord Watson and the Lord Chancellor concurring, the appeal was dismissed with costs.

LAMBETH PALACE LIBRARY.

NEW REGULATIONS.

THE following regulations have been approved by the Ecclesiastical Commissioners, in pursuance of an order in Council, June, 1880:—

1. With the exception of the periods named in Regulation No. 2, the library is open to the public on Mondays, Wednesdays, Thursdays, and Fridays, from ten a.m. to four p.m.,—during the forenoon of Tuesdays, throughout the year, and from April to July (both months inclusive), until five p.m.

2. The library is closed during the week commencing with Easter Day, and during seven days computed from Christmas Day, and for a period of six weeks from about the 1st day of September in every year.

3. Extracts from the MSS. or printed books are allowed to be made freely, but in case of a transcript being desired of a whole MS. or printed book, the consent of the Archbishop must be previously obtained.

4. Permission to copy illuminated MSS. and rare engravings can only be obtained on submission of the applicant's name to the Archbishop.

5. MSS. are only lent out by an order signed by the Archbishop, and with a bond of 50*l.* or 100*l.* for their return within six months or on demand.

Rules for Lending Books.

6. Except under special permission, the loan of books will be restricted to the clergy and laity of the diocese of Canterbury, and to persons residing within the parish of Lambeth, the borough of Southwark, and the city and liberties of Westminster.

7. All applications for the loan of books must be countersigned by a beneficed clergyman, who must certify to his personal knowledge of the applicant.

8. Every one desirous to borrow must obtain from the librarian the prescribed forms, and all applications for the removal of books must be made to the librarian in person, or by some trustworthy representative, authorised in writing by the applicant, to receive them. . . .

11. Works of reference, books of prints, works of an earlier date than 1600 A.D., pamphlets, and such books as in the discretion of the librarian cannot easily be replaced, can only be consulted in the library.

ARCHITECT AND CONTRACTOR.

SIR,—Your correspondent "B's" narrative of his sufferings would be distressing but that I feel sure, if he were properly advised, a means would be found to extricate him from his difficulties, or prove him to be in error.

As it is purely a matter of the failure of a Portland cement concrete, and as his case furthermore greatly resembles one on which I was consulted only a short time back, I may, perhaps, be allowed to offer some remarks.

The legal wording of the specification and the contract must, as you very justly say, have considerable effect in determining the verdict, but, in equity, it is simply ridiculous to say that Mr. C. has the power to condemn good work executed with good material; for, if such were the case, an architect could ruin every contractor who worked under him, no matter how honestly the work was done, and the contractor would have no redress. The architect furthermore would not without reason give himself the extra labour which such proceedings would inevitably entail. It must therefore be assumed that the floor as laid by B was faulty, or Mr. C. could have had no object in condemning it. But Mr. C. may, perhaps, have been in error in asserting that the failure was due to an admixture of lime with the cement, and on this error B may be attempting to make out his case.

Bad cement, bad sand, bad water, bad workmanship, are only a tithe of the causes to which the failure of the concrete may be due; and I think B would have acted more wisely if he had, as you suggest, obtained good legal and expert advice, instead of attempting to secure sympathy by only half stating his case in your valuable journal.

HENRY FAIJA, Assoc. M. Inst. C.E.

PAYMENT FOR QUANTITIES BY BUILDERS.

SIR,—I very carefully read the letter in your issue of a few weeks since (p. 57, *ante*) under the above heading, but cannot see that the writer advanced anything new. Almost all architects and builders agree that quantities should be supplied for all but very small buildings, and the general run of builders would regard with dismay the proposal that quantities should be taken off in the office of the architect instead of by an experienced surveyor who is constantly engaged in the work. As regards the use of the papyrograph or any other modern invention, I may state that I have tried several, and proved that they cannot be compared with good lithography for clearness and correctness, while the actual cost of lithography is really not great, even including the printer's large profit; but the amount in the summary is often increased to include something for the architect, instead of the amount put down* "for copies of drawings, &c.," so many pounds.

Taking off quantities is really hard work, and not so well paid for as people imagine, very few surveyors getting more than 1 or 1½ per cent. to cover time and expenses, after handing over to the architect his share of the commission;* and this amount may be still further reduced if the surveyor is obliged to pay the architect's managing clerk some small commission, which appears to be the case in some instances, as reported on page 57 of your issue of the 10th inst. The case referred to, "Wyatt *v.* Batstone," ought certainly to have been settled out of court, or, in plain words, the soiled linen washed at home. OBSERVER.

HISTORY OF STAINED CLASS.

SIR,—I have to thank you for a very interesting and painstaking criticism of the "History of Design in Painted Glass." May I ask permission to explain in your columns my meaning more fully upon a few points?

In answer to your remark, "He speaks with great admiration of figure-designs which . . . would not (ordinarily speaking) excite admiration." My admiration of them is great, only when considering the conditions of their production. One admires them as works of their period, and as designs for a new and difficult material, not as compared with such works as those produced in other arts and in other periods by Phidias or by Raffaelle. When I speak of their dignity, my intention is to use the phrase somewhat in the sense implied by the reviewer in his concluding remarks. This feeling of dignity is irrespective of the drawing as drawing, but it is evident that the artist approached his work with reverence for it and for his subject, without levity and without the intention of "knocking it off." My remarks imply that before the year 1,400, and that is the perfect advent of the Decorated style, the levity and facility shown in late thirteenth-century work did not produce any better drawing.

Regarding the example of the head from Lincoln, quoted by your reviewer as of a very fine type, I quite agree with him; then this is, we may suppose, of about the year 1220 A.D., and long before 1400.

Concerning "pot metal" and "enamel," I use the first term to include all metals coloured in the pot, and I include ruby because the "flash" upon it is of such consistency and durability that it may well rank with them. By "enamels" are meant coloured or opaque pigments, mixed with a flux, and burned upon or into the surface of the glass. I am unaware of any old glass called "enamelled," having colours upon its surface which have not been burned.

N. H. J. WESTLAKE.

P.S. The mosaic ornament and grisaille patterns which your reviewer desiderates are treated of in the third part, which is in the press.

* We must hold the writer of this letter responsible for proof of this statement if questioned.

STAINED GLASS.

Gloucester.—Messrs. Camm, Brothers, of Birmingham, have lately fixed a stained window in St. John's Church, Gloucester. The window is in the Italian style, the centre light having for its subject "Christ blessing little children." The Saviour, in the midst of a group, and having taken a child upon his lap, is in the act of blessing a girl kneeling before him. In the background are several of the apostles. The two side-lights have, on the left, the "Nativity," with the emblems of the time and place, the star, ox, and ass, in the background. The Virgin Mary is seated with the "Holy Babe," while Joseph meditates upon the scene. On the right is portrayed the Baptism of the Saviour in the River Jordan. The window, it should be stated, is in memory of Robert Raikes and the Rev. Thomas Stock, both of Gloucester.

Cambridge.—The large east window of Corpus Christi College Chapel, Cambridge, has just been filled with stained glass. The subject represented is our Lord's Crucifixion, occupying the whole of the window, and the work was designed and executed by Messrs. Heaton, Butler, & Bayne, of Garrick-street, London.

Winchester.—The windows of the County Hall are now all filled with stained glass illustrating incidents in the history of the city. The windows are by Messrs. Hardman, of Birmingham, and are arranged heraldically, so as to perpetuate and illustrate the memories of county notables, who range from the mystic Arthur down to the worthy Hampshire man of Stuart times, Chaloner Chute, of the Vine. The design and decoration of the hall will be a memorial alike of the worthies thus recorded in armorial blazon and of the antiquarian erudition of Mr. Melville Portal, who has found time amidst cares of county administration to arrange this decorative work, and prepare a book on "Hampshire Worthies," which will, it is stated, soon see the light. The window which completes the series has lately been completed. It may be called the Restoration window, for the chief shields are those of the leaders who joined heartily in the Restoration. The quatrefoil head has the crowned head of Charles II., and the shields are arranged in the following order:—That of James I. stands first, and that of Lancelot Andrewes, bishop of the diocese, stands next in order. The shield of Charles I. follows. The shields of Sir Wm. Ogle, John Paulet, of Basing Honour memory, and Chaloner Chute, Speaker of the House of Commons during the Commonwealth, recall various scenes in those troublous times of the Commonwealth, of the close of which we are reminded by the shield of Richard Cromwell. The shield of Anthony Ashley Cooper, Earl of Shaftesbury, commemorates one of the illustrious men who aided Charles II. with advice on his return from Holland, and who was one of the famous Cabal ministry. The last shield enshrines the memory of Thomas Ken, Bishop of Bath and Wells, whose "Evening Hymn" is so well known.

DRINKING FOUNTAINS.

St. Paul's Churchyard.—The fountain which Messrs. John Freeman & Sons are preparing for erection in St. Paul's-churchyard will (says the *City Press*) be an octagon in plan, 20 ft. diameter, standing upon a circular raised platform of two steps, 34 ft. in diameter. On four sides of the octagon basin there will be shell-shaped drinking-fountains. The water will be thrown into a centre tazza from four bronze lions' heads, and thence will flow into the large octagon basin. The whole work, which is from the designs of Mr. F. C. Penrose, architect to the Dean and Chapter, will be formed of granite from the Lamorna quarries of Messrs. Freeman, the exposed surfaces being polished. Messrs. Freeman's quarries, which are situated in Cornwall and Devon, give employment to about 1,000 men, and produce blocks of great magnitude.

Winchester.—The new drinking-fountain out

de Westgate is nearly completed. The donor Mr. Lancelot Littlehales, and the carver and ason is Mr. S. Newman. Mr. S. J. Newman, Northampton, is the architect.

BUILDERS' BENEVOLENT INSTITUTION.

The thirty-third annual meeting of this Institution was held at Willis's Rooms, St. James's, on hursday afternoon, the president, Mr. F. J. ove, in the chair.

The report for the past year stated that if eans should be found to make an addition to ie annuities now given [30*l.* to men and 24*l.* to omen], the comfort of the pensioners (many f whom had no other means whatever) would e materially promoted. The committee had onfidence that increased funds would be supplied by the powerful interest which the Institution represented, if it were decided to increase ie pensions. The committee express their hanks to Mr. F. W. Keeble, the hon. secretary f the annual ball, and to the stewards who ssisted him, in making that gathering a success, nd warmly acknowledge their indebtedness to Ir. F. J. Dove, the retiring president, for the nergetic manner in which he has served the nstitution during the past year. During the ear ten pensioners [an exceptionally large number] have been elected on the funds of the nstitution, and two widows of pensioners have een added to the list without election. Seven ensioners died during the year.

The balance-sheet (audited by Messrs. J. H. Hunter, J. Cruttenden, and R. J. Ward) showed he receipts to be 3,221*l.* 19s. 2d. (including 46*l.* 10s. 7d. balance brought forward from last ear). The annual subscriptions amounted to 86*l.* 10s.; the donations to 861*l.* 12s.; the ividends on funded property to 632*l.* 7s. 5d.; nd the profit on the ball was 94*l.* 19s. 2d. The xpenditure included 1,316*l.* 6s. 6d. paid to ensioners; and the burial-money for pensioners, 35*l.* 1s. 6d. After deducting expenses f management, there remained a balance of 88*l.* 1s. 4d. at the bankers'.

On the motion of Mr. George Plucknett, econded by Mr. Richard Head, it was resolved, fter considerable discussion, to increase the ensions of the men to 39*l.* a year, and those of he women to 27*l.* a year. It was stated that here were now twenty-two men and thirty-one women receiving annuities from the Institution, nd that the committee hoped in a few years' ime to increase the amount of the pensions to 50*l.* per annum for the men, and 30*l.* per annum or the women. To enable them to do this, increased subscriptions would be needed. In connexion with this point it was announced that Mr. George Codwin had offered to subscribe 10*l.* a year for ten years if nineteen other persons could be found to do the same thing, so as o increase the income of the Institution by 200*l.* a year during the next ten years. Thanks were voted for the offer, and the hope was expressed that it would be responded to.

It was resolved to alter section 2 of Rule III., so as to allow applicants for pensions to be in receipt of an income of 50*l.* per annum [independently of the amount of the pension], instead of 30*l.* as at present.

The report and balance-sheet were adopted, and votes of thanks were accorded to the President for the efficient way in which he had performed the duties of his office during the past year; to the vice-presidents; to the trustees (Mr. George Plucknett, Sir S. Morton Peto, Alderman Sir J. C. Lawrence, M.P., and Mr. C. T. Lucas); to the committee; to the auditors; and to the honorary solicitors.

The Treasurer (Mr. George Plucknett) was re-elected, as were the members of the committee who retired by rotation, and the auditors. Mr. Howard Colls was also elected a member of the committee.

Mr. Thomas F. Rider was unanimously elected President of the Institution for the ensuing year, and it was announced that under his presidency the annual dinner will be held at the Freemasons' Tavern on Thursday, November 11th.

Sir Thomas Bouch.—The solicitors of Sir Thomas Bouch, the designer of the Tay Bridge, have obtained from Col. Yolland and Mr. Barlow, two of the members of the court of inquiry, a statement that Mr. Rothery was not warranted in representing their opinions as concurring with his own in matters not referred to in their report.

EXCURSION BY THE ARCHITECTURAL ASSOCIATION.

It has been decided to visit some of the cities in the plain of Lombardy, for study, this autumn. This district, being a clay country, is rich in terra-cotta work, as well as in stone and marble structures. It contains many interesting churches by Bramante and others. Also mural decoration of all periods. It is proposed to devote the latter half of September to the excursion, leaving London on the 15th. Each gentleman will be expected to draw the particular work arranged and allotted to him by the secretary. By this subdivision a large mass of information will be collected. The itinerary includes Turin, Milan, Bergamo, Brescia, Cremona, Mantua, Pavia, and Certosa.

PITCH PINE.

Sir,—Will you please to insert the following? Upon suggesting the use of pitch pine for window-cills to a well-known builder, whose houses are always carried out in a first-class manner, he sends me this reply:—

"I once had a very high estimate of pitch pine, but lately, from what I have seen, my opinion of it is wholly changed. I believe, myself, that yellow deal cills will in the end be found more enduring by very many years. Pitch pine, kept dry, is perhaps an enduring wood (I have grave doubts even as to that), but between wind and weather I think it is almost the worst wood a builder has to use."

I should like to know what other members of the profession can say about it.

An Architect.

BRICKMAKING.

Sir,—Can any of your readers tell me of a good book on Brickmaking, which gives good and trustworthy information about the process, machines, &c.? I have a book by E. Dobson, but it is thirty years old, and, therefore, of very little use.

Brickmaker.

CHURCH-BUILDING NEWS.

Bermondsey.—The new Church of St. Crispin, Southwark Park-road, was consecrated on the 6th inst. by the Bishop of Rochester. The edifice has cost, inclusive of purchase of site, building of parsonage, and an endowment of 5,000*l.*, something like 16,000*l.*, of which sum Major-General Sir F. Fitzwygram and his family subscribed 11,500*l.* The building's chief external characteristic is its evident substantiality, but the interior is not without features of architectural beauty. The style is Gothic, and the material red brick and stone dressings. Inside, the walls have red brick facings, and the stone piers and arches stand out in bold relief on both sides of the building. Seating accommodation has been erected for 600 worshippers, the seats being composed of deal, stained and varnished. The windows are glazed with cathedral glass of varied hues, and the ceiling and chancel are groined in wood. For the rest, it may be stated that the reredos is formed of Caen stone, and the tablets behind the altar, which is plain, are of gilded copper plates. The organ is by Walker, and there are two vestries,—one for the use of the clergy, and the other for the choir. The tower and spire remain to be completed, at an estimated cost of 900*l.* Mr. W. Shephard, of Bermondsey New-road, is the builder, Messrs. Coe & Robinson, of Furnival's Inn, being the architects.

Dartmouth.—A parish meeting has been held at Dartmouth for the purpose of considering two schemes for the repair and improvement of St. Saviour's Church, which has been permitted to lapse into a state of dilapidation. Mr. Thomas Lidstone, diocesan surveyor, presented a report, and estimated the carrying out of the necessary work at 4,356*l.* Plans were also presented by Mr. Edward Ashworth, of Exeter, with an estimate of 3,878*l.* Mr. Lidstone, having been requested to examine and report upon the condition of the fabric, stated that the walls and much of the timber of the structure were sound, but thorough repair was necessary throughout the church, the windows, roof, walls, ceiling, seats, warming and lighting apparatus, tower, and bells especially requiring improvement and alteration, whilst a new vestry was needed. The galleries and churchyard would not be dealt with at present. Mr. Ashworth proposed, according to his plans, to clear away the west gallery, and all the cradlework that runs up from the westward, to place the organ in the north chancel aisle, to restore the roofs and tower, to reseat the church, to renew the windows, to provide hot-water heating apparatus, to re-light the church, and to remove the altar-piece to the west end of the church against the northern wall, and to substitute for it a reredos. The meeting resolved to carry out the work in accordance with Mr. Ashworth's plans, which, however, that gentleman wrote to say would cost 200*l.* more than he had at first stated.

Salcombe.—A meeting of the parishioners of Salcombe, Devon, has been held to consider the question of the enlargement of the church, which was built thirty-seven years ago. The matter was placed in the hands of Mr. J. D. Sedding, of London, who had prepared plans which provided for the execution of the work in three sections. The first part was the adding of chancel and vestries, the second adding to the western end, and the third the adding of a north chancel aisle, with a gallery over for the children. If the whole scheme be carried out the church will be capable of seating 600 people. If it were found impossible to carry it out all at once, the church could be first extended in an easterly direction by the erection of a chancel and north transept, which would give an addition of thirty-one sittings, whilst a gallery over would accommodate seventy-two children. If the church were extended in a westerly direction sixty-one sittings could be added. There were 266 sittings at present, and if the plan was carried out in its entirety it would give 370. It was resolved to take means to carry out the plans laid before the meeting. The cost of the proposed works is estimated at from 2,000*l.* to 2,500*l.*

Nuthurst.—The Bishop of Worcester has lately consecrated St. Thomas's church, which has been erected in the new parish of Nuthurst, cum-Hockley Heath, near Knowle. The site for the church was given by the Rev. T. J. Morris, the Vicar of Hampton-in-Arden, who has also provided a piece of land upon which to erect a parsonage. The total cost of the church, exclusive of the site, has been about 2,200*l.* The church comprises a nave 53 ft. long by 24 ft. 9 in. wide, a well-proportioned chancel, a south porch, an organ-chamber and choir vestry also on the south side, the heating-chamber being situated beneath the vestry. A tower, crowned with a belfry and spire, rises at the angle formed by the nave and chancel on the north side. The steeple, from the ground to the weathercock which surmounts the final stone, is 81 ft. 6 in. high.

VARIORUM.

"Science for All," for August, says:—"Any one passing not long ago along the main street of a busy town in the West Riding of Yorkshire, might have observed a very curious fact,—the lower halves of several large plate-glass windows were rent from side to side. A single glance was sufficient to show that the cracks were not produced by the stray missiles of certain street Arabs, for they had not that radiating or star-like arrangement which is generally seen in such cases, but, instead, consisted of one large rent proceeding from one side to the other, with one or two minor cracks branching therefrom. To account for this curious and highly inconvenient phenomenon was a sore puzzle to many of the good folks about; some there were, however, more knowing than the rest, who arrived at a sensible and satisfactory explanation, thereby proving what is perhaps demonstrated every day, nay, every hour,—that science is only, to use the words of Huxley, trained and organised common sense. It was midsummer. The windows of the shops where these cracks were to be seen faced the south, and were therefore exposed to the full glare of the sun's light and heat. The lower halves of the windows,—i.e., the cracked parts,—were painted, on the inside, of a dun colour, and by two in the afternoon had become quite hot to the touch, whereas the upper and unpainted halves were only slightly warmed. Herein lay the secret. The glazier fixed the windows as if they had been small panes, where the amount of expansion is very minute indeed, and they were fixed in a rigid framework that would not give way. The painter, on his part, in his ignorance of certain principles, put on a colour which led to the glass being strongly heated in the sun's rays. This followed: the plate-glass was heated, and it expanded; the frame of the

window tried to resist that expansion, and in the struggle the weaker had to give way, not doing so, however, until it was irremediably injured."——"Picturesque Europe" says a word about the Town-hall of Ypres:—"It is certainly one of the architectural wonders of the world, with the vast roof, the enormous length, the tower of vast bulk, the rich details of the arches, the air of solemn decay. And all this is contrasted with the sort of little obscure country town in the centre of which it rises. We wonder how it is that such a monument could be found in such a place, and look up to it with a sense of awe and mystery. It alone is worth a pilgrimage from London. Yet the average traveller, guide-book in hand, hurries by to see the regular catalogued shows, which are not so nearly worth his attention. But this is too often the case. Thus, within ten miles' walk of Ostend, is a little fortified town, Nieuport, lying in a rich champagne country, with its fosse, and walls, and gates, in which there is a gem of a little town, all decayed and rusted, and a strange old church with a remarkably picturesque tower, the combination infinitely beautiful in itself, and giving a sense of gratification the more welcome because it is unexpected; yet few know of Nieuport, and in the guide-books it is dismissed with an unappreciative line or two. All the 'eights' are for those who 'run' along the beaten track, and who have barely time to read as they run."——"The Technical Educator," for the coming month, gives some hints on carpet patterns:—"Carpet patterns may with advantage have a geometrical formation, for this gives to the mind an idea of order or arrangement. When the pattern has not a geometrical basis, a general evenness of surface should be preserved. Carpets are better not formed into 'panels,' as though they were works of wood or stone, but should have a general 'all over' effect, without any great accentuation of particular parts. The Indian and Persian carpets meet this requirement. While a carpet should present a general appearance of evenness, parts may yet be slightly 'pronounced,' or emphasied, so as to give to the mind the idea of centres from which the pattern radiates. A carpet should, in some respects, resemble a bank richly covered with flowers; thus, when seen from a distance, the effect should be that of a general 'bloom' of colour. When viewed from a nearer point it should present certain features of somewhat special interest; and when looked at closely new beauties should make their appearance. As a floor is a flat surface, no ornamental covering placed on it should make it appear otherwise. A carpet, having to serve as a background to furniture, should be of a somewhat neutral character. Every carpet, however small, should have a border, which is as necessary to it as a frame is to a picture."

Miscellanea.

New Artisans' Dwellings Schemes.—At the last meeting of the Metropolitan Board of Works, the Works and General Purposes Committee reported that, having regard to the improvements remaining to be carried out under the provisions of the Metropolitan Street Improvements Act, 1877, and in connexion with the several artisans' dwellings schemes, it is not, in the opinion of this committee, desirable that any application should be made to Parliament in the next Session for powers to undertake additional street improvements; but that this opinion does not apply to any application which may be necessary for the widening of any portion of the Victoria Embankment; and recommending that the following Vestries and District Boards who have applied for the carrying out of street improvements be informed accordingly, viz., the Strand District Board, the Vestry of Clerkenwell, the Vestry of Islington, the Vestry of Newington, the Holborn District Board, the Vestry of Bermondsey, the Limehouse District Board. Mr. E. Dresser-Rogers moved the adoption of the report, and observed that the committee had been very carefully into the question, and he thought the Board would agree that, when there are so many great improvements now in hand, it would be inadvisable to go to Parliament with further schemes. The question had been carefully gone into by the committee, and the proposed improvements did not press. The report was adopted.

Land Drainage.—Mr. Mechi strongly recommends drain-ventilation. The late Josiah Parkes used to have bricked recesses or boxes at intervals, into which the inch-pipe discharged the water, the outlet-pipe being 3 in. below it, so that air was always present, and the flow more rapid through these small conduits; the vent or air-pipe was thus always open. Some years after I drained my land, Mr. Mechi says, the outlets which opened into the open ditches were led into a larger pipe or receiver, and the ditches filled up. The drains became gradually less active, and we ascertained that it arose from the air not passing into the months of the drains so freely as it used to do. I remember a singular instance of benefit derived from having ventilating openings at the beginning as well as at the end of the drains. It was recorded in print that no rain had fallen until some time after the field had been drained, but nevertheless the crop was wonderfully improved, and it was attributed, very justly, to the drying of the soil by subterranean aëration. The engineer who effected this always admitted air at both ends of the pipes. How wrong it is to allow vegetation to accumulate around or over the outlet, and thus impede free circulation of air. This is why I strongly recommend iron pipes as outlets, 6 ft. or 9 ft. long, most of their length being firmly imbedded in the soil; their outside nozzles projecting are undisturbable. Is is a great economy, because of its immobility and indestructibility. Earthen and brick outlets are frequently injured or overgrown, and the drainage spoiled.

The "Chalet" Company, Limited.—This company, which has been formed for providing public lavatories, retiring-rooms, and toilet accommodation in the thoroughfares, squares, parks, gardens, and other open spaces of the metropolis, and of the chief towns and cities throughout the United Kingdom, of an ornamental character, in the form of a Swiss châlet, is now taking shape. The châlet is constructed of iron, wood, and brick, and unobjectionable in appearance. The dimensions are necessarily subject to modification according to the site available. The lower portion is a framework of wood panelled to an elevation of 6 ft., above which, encircling the entire structure, are arranged glass panels of varied colours. For years past the urgent necessity for such places of convenience has been admitted by all classes, and the time has now come when this problem is to be practically solved by the present enterprise, which, instead of dipping into the ratepayers' pockets, will actually yield a revenue to the parish and at the same time leave the official mind entirely free from all embarrassment and responsibility of organisation and management. There is abundant testimony from medical men and others to prove that the want is not imaginary, but that it is really a great and growing one, which calls for the prompt and careful consideration of those whose business it is to make provision for it.

"Male Cork" Facings for Damp Walls.—The lightness and isolating properties of ordinary cork are well known; but, according to the *Echo Forestier*, people are less acquainted with the male cork (*liège mâle*), which is the first formed about the tree, and which has been little used on account of its innumerable ruggosities. It is, however, well adapted for the facing of damp walls, on which it should be nailed, so that the rough face is always outwards; plaster is then added on this side. This treatment has given excellent results, and it has been possible to paint or paper walls so treated, the dampness of which had previously been combated in vain. It is suggested that the comparatively low price of these facings, together with their advantages, ought to lead to an innovation which would result in the utilisation of much material now wasted, and the extension of the plantation of cork oaks in Algeria and other regions where the destruction of forests proceeds at present with alarming rapidity.

New Church for Heaton.—We understand that the members of the Presbyterian Church of England, at Heaton, feeling the inconvenience and inadequacy of their present place of worship, have determined upon the erection of a church, with lecture-hall and other buildings, fronting to Tynemouth-road, and have commissioned Mr. J. J. Lish, architect, Newcastle, to proceed at once with the designs, and invite tenders for the carrying out of the works, with the view of having the contract let, and substantial progress made with their new buildings before the winter sets in.

New Theatre Royal, Dublin.—Mr. C. J. Phipps has prepared plans for the new Theatre Royal, intended to be erected in Dublin upon the site of the old theatre, which last February was destroyed by fire. In the new plan the position of the theatre is reversed, the frontage being towards Hawkins's-street, and it is thrown back some 40 ft., so that the proportions of the façade may be better seen, and a greater space allowed for carriages. A carriage-porch, somewhat similar to that at the Italian Opera House, Covent Garden, gives access by five doorways to the outer vestibule on a level with the street, into which also open two other doorways for those coming on foot to the crush-room, 31 ft. by 50 ft. Here are entrances into the corridor of the auditory for visitors to the orchestra-stalls and the pit-stalls on the same level, the grand staircase to the dress-circle or first tiers on the right hand, and that to the upper-circle or second tier to the left hand. The pit proper is entered by an arcade of three doorways in Poolbeg-street, and two flights of stairs lead to the pit corridor immediately above the pit and orchestra-hall corridor. There is a special entrance for the Lord Lieutenant in Hawkins-street. The dress-circle has six rows of arm-chairs, and behind this are private boxes opening out from the corridors. Every tier of the auditorium has its inclosing corridor. Immediately behind the corridor of the dress-circle is a spacious *foyer*, 31 ft. long by 50 ft., intended to be used as a drawing-room, and for a promenading, refreshment, and smoking room. The dress-circle holds, with private boxes, 400; the upper-circle, 400; the orchestra and pit-stalls, 1,300; and the gallery, 1,300,—making the total number the auditory will hold over 3,400, which is about 500 more than the old theatre could contain. The width of the proscenium opening is 33 ft., and the stage is 72 ft. wide between the walls, by a depth of 65 ft. The style of the exterior elevation is Italian. The architect believes that by the autumn of 1881 the theatre will be ready for opening.

Loans for Public Works.—The fifth annual report of the Public Works Loan Board, 1879-80, has been presented to Parliament. The Loan Commissioners mention that four Acts affecting them were passed during the session of 1879,—two of them being the Artisans' and Labourers' Dwellings Act (1868) Amendment Act, and the Public Works Loans Act. The Commissioners remark on the number of harbour loans that are in arrear. They say that the Acts of Parliament passed to enable harbours to be made practically hind them to entertain an application for a loan where the estimate of the cost is shown to be trustworthy and the revenue appears sufficient. They are strongly of opinion that, with a view to prevent loss to the Exchequer, it would be expedient that when Parliamentary powers of borrowing are conferred for the execution of harbour works, further authority should be given for levying and assigning rates on property as collateral security for the repayment of the money to be advanced. They maintain that this course is perfectly equitable, as the property in the district, the inhabitants of which are the promoters of the harbour scheme, will be primarily benefited by the execution of the harbour works. A similar course has been adopted in the case of railways and of one or two municipal corporations, who are also the harbour authority. In Appendix F appear the particulars of the loans granted in the past year. In all, 3 381,621*l.* was advanced in 1879-80 by the commissioners, as compared with 3,471,358*l.* in 1878-9. Of this sum of 3,381,621*l.*, 980,776*l.* was advanced under the Elementary Education Acts, 1,637,819*l.* as sanitary loans, 111,546*l.* under the Artisans' and Labourers' Dwellings (Scotland) Improvement Act, 1875. Notice has to be given beforehand of the amounts intended to be applied for, and the notices greatly exceed the sums actually advanced. The notices given in 1879-80 were for 11,300,180*l.*; the notices given for 1880-1 are 8,735,663*l.*

The "Inner Circle" Railway Completion Bill was before the House of Commons on Tuesday last, when it was opposed by Mr. Alderman Lawrence and others, chiefly on account of the powers sought for "under-pinning" and "burrowing" under houses without compensation, which, it was contended, constituted a breach of the Lands Clauses Consolidation Act, and a new departure in Private Bill legislation. The Bill was discussed at some length, and in the end it was thrown out by 151 to 133.

How Wood is affected by Imperfect application of Creosote.—Some misapprehension concerning the properties of creosote as a preservative of wood appears to exist which is very desirable should be removed. The *Timber Trades Journal* says, "Vegetable matter decomposes rapidly when under the presence of heat, and when the vapours which result from the fermentation consequent cannot escape. To give to wood an external application of creosote to close the pores of the wood, and so to prevent the vapours which arise as soon as fermentation commences from passing away. Under such conditions fermentation rapidly increases, and, as a matter of course, decay quickly follows, and, when it has once commenced, its progression is very rapid. When wood is properly treated so as to receive creosote, the air is exhausted from the sap vessels, and the creosote oil being thus enabled to pass completely through the pores, or channels, the wood is, by the aid of a powerful pump, he thoroughly saturated with the oil, and the antiseptic qualities of creosote would then effectually prevent decay in any form. If an external application of creosote were not positively injurious to the wood,—which we, however, maintain it is,—the oil is so vaporizable that a mere coating would in a few weeks, being so completely exposed to the action of the atmosphere, evaporate to such an extent that any beneficial action which it is possible it might have once possessed would have departed, and then the cost of the operation would be thrown away entirely. The evaporation would in a few weeks he so complete that we doubt very much if the presence of creosote could he even detected by the smell." Creosote has long been a useful ally to engineers, and it is important that its properties should he thoroughly understood. Properly applied to wood, its antiseptic properties effectually arrest decay, but its indiscriminate use is a great evil; for, as above pointed out, it will, if improperly, or rather imperfectly, applied, assist decay, and thus its employment is discouraged, and a real benefit is passed over.

Statistics of Glasgow.—Mr. William West Watson, F.S.S., City Chamberlain of Glasgow, in his annual report (lately issued) on the vital, social, and economic statistics of the city for the past year says,—The rainfall, which amounted to over 37 in., could not he called exceptionally drenching, but there was a ceaseless drizzle which extended over 204 days, and a low temperature. The births numbered 19,674, 10,018 boys, and 9,666 girls, a decrease of 220; and the deaths, 12,493, 6,244 of males and 6,249 of females, a decrease of 1,647; so that the natural increase of the population was 7,191, an increase of 725 for the period indicated. The marriages numbered 4,180, the lowest total recorded during the year since registration was instituted, and about 600 below the average. The population at the middle of the year Mr. Watson estimates at 578,156, or, including those resident in the suburbs, at 760,891, and he says that thus, beyond doubt or question, Glasgow stands the second city in the United Kingdom. The property consisted of 106,889 dwelling-houses, of which 2,216 were unoccupied; and other buildings to the number of 20,212, of which 4,684 were unoccupied. The rental amounted to 3,406,000*l.*, being an increase of 10,356*l.* on that for the previous year. Emigrants, principally Scotch, to the number of 20,535, of whom more than one half were unmarried adults, sailed from the river, mostly for the United States. The quantity of water sent into the city averaged 37,636,265 gallons a day, and the quantity of gas manufactured reached 1,833,678,000 cubic feet.

Wages in the Leeds Building Trades. The operative masons, bricklayers, and labourers of Leeds have to submit to a reduction of wages. On the 27th of January, the masons and bricklayers, who had been receiving 8½d. per hour, were given six months' notice of a reduction of 1d. per hour. Deputations representing masters and men have agreed, however, to a reduction of ½d. per hour, all other rules to remain unaltered. The labourers, whose rate of payment was 5½d. per hour, received notice of a reduction to 5d., and this will take place on and after the 1st of August.

The Bristol Wagon Works Company, Limited, the well-known makers of carts, wagons, &c, have recently changed the address of their London office, and appointed Mr. R. Hill, of 8, Victoria-chambers, Westminster (formerly of their works at Bristol), as their London representative in this department.

St. John Lateran, Rome.—The question of enlarging the tribune of the Basilica of St. John Lateran has, according to a *Times* correspondent, been decided in favour of continuing the works. They were commenced in 1876 by order of Pius IX., it being considered that the space the tribune afforded was insufficient for the celebration of the religious ceremonies with that decorum required in the cathedral church of Rome, *mater et caput* of all others. The works were, however, suspended on account of the alarm raised by archæologists, artists, and historians at the contemplated demolition of the ancient apse, and the great possibility of the important mosaics within it being irreparably injured, if not destroyed, in process of taking them down from their original position and replacing them in the new apse to he constructed. On Leo XIII. ascending the Pontifical throne he ordered an examination to be made into the archæological and liturgical exigencies of the case, and the possibilities of reconciling them. The investigations were carried on under the supervision of a member of the Sacred College, "of great authority in archæology," who ultimately set forth their results in a general report. The first step taken was the nomination of a Commission composed of the distinguished archæologists Baron P. E. Visconti, the Commendatoro G. B. de Rossi, and the Rev. Padre Bruzza, to report upon the antiquity of the apse and the mosaics within it, and their decision has been contrary to the opinions expressed by some, that the apse and a portion of the mosaics belong to the time of Constantine. The pamphlet points ont that the construction of the apse is not of that period; that no such stamps bearing the initials of Constantine have been found on the bricks as were discovered in numbers when the apse of old St. Peter's was demolished; that the original apse was reconstructed hy Sergius II. in 845, when he was compelled by the canon law to enlarge the cathedral church, and that his apse, after having been repaired hy Sergius III. in the tenth century, was in so ruinous a condition at the end of the thirteenth that it was rebuilt from the foundations by Nicholas IV.

Compensation Case.—At the Sheriffs' Court, Red Lion-square, on Wednesday, the case of Mein *v.* The Metropolitan Board of Works came before Mr. Under-Sheriff Burchell and a special jury. This was an appeal from an award made by Sir H. Hunt, under the Artisans' Dwellings Act, for premises erected in Foster-buildings, Whitecross-street, hy Mr. Mein, a tailor in Forcstreet, for his workmen. Being dissatisfied with the amount awarded, Mr. Mein appealed, but the jury were not allowed to know the sums mentioned in the award. Witnesses were examined on both sides, and the case occupied the Court till half-past six o'clock. Ahout 2,900*l.* had been laid out on the premises, and it was said that after notice of a new scheme Mr. Mein continued the building. Mr. Under-Sheriff Burchell left the case to the jury, either to assess the compensation on the money expended, or on the rental value, which exceeded 3,000*l.* The jury assessed the compensation at 2,750*l.* It was stated that the award made by Sir H. Hunt was 2,900*l.*, and the verdict heing under that amount, the claimant will have to pay costs of both sides.—*Metropolitan.*

Pneumatic Bells.—Considerable improvements in pneumatic signalling apparatus are effected by Mr. A. Clarke's patent. The airholders as now used are made wholly of indiarubber, and of a hemispherical or oval form, being entirely closed with the exception of a small hole generally fitted with a short tubular neck for connexion to the air-tube leading to the bell or indicator. These holders usually contain a spring to expand them after they had been compressed, and are found to he snbject to several disadvantages. Mr. Clarke's invention obviates these by making the air-holder of a cap form, *i.e.*, entirely open on the flat side, so that it can he readily cleaned out before being fixed for use, and of such a shape and thickness that it will not collapse with usage. It also dispenses with the spring inside the airholder, except for long distances when a pull-handle is used; a spring is applied inside the airholder, but does not touch it in any part. Should the airholder at any time reqnire to he removed it can he without injury to the wall or paper. The invention also comprises improvements whereby the valves obliged to he used to prevent the return of the air in long tubes are dispensed witb.

The Sanitary Condition of City Establishments.—The attention of the City Commissioners of Sewers has recently heen directed to the sanitary, or rather the insanitary, condition of the residential portions of some of the large City establishments in the drapery and other trades. In the particular case which came before the meeting, a large nnmher of yonng men and women seem to have heen stowed away at night in small, low-ceilinged, and hadly-ventilated rooms contiguous to dilapidated and hadly-constructed water-closets. Under such conditions it is not to be wondered at that disease broke out. Dr. Sedgwick Saunders, the medical officer of health, hopes that the facts elicited and published in the report of the sanitary inspector may have some effect in directing the attention of the heads of large warehouses to the necessity for some kind of supervision over the residential portion of their establishments.

Art Exhibitions for Glasgow.—The Glasgow Institute of Fine Arts have arranged to hold a loan exhibition of works hy the late Sam Bough, R.S.A., and the late G. P. Chalmers, R.S.A., and an exhibition of works in black and white, the first that has been held in Scotland, simultaneously, in the months of August and Septemher.

TENDERS

For Board schools for girls and infants, for the Bushey School Board, Herts. Mr. H. H. Bridgman, architect. Quantities supplied by Mr. Frederick Thomson:—

Larter	£2,848 0 0
Scrivener & Co.	2,793 0 0
Andrews & Son	2,787 0 0
Toms	2,769 0 0
Chadwick	2,648 0 0
Wall	2,631 0 0
Hunt	2,600 0 0
G. & J. Waterman (accepted)	2,388 0 0

For alterations and additions to Nos. 332 and 334, Mile End-road, for Mr. J. Bishop. Mr. Geo. Ashby Lean, architect:—

Holloard	£995 0 0
Judd	949 0 0
Field	931 0 0
Parrish (accepted)	840 0 0

For works at Elm View, Hendon, for Mr. Alfred Smart. Mr. William Theobalds, architect:—

Willett, Hendon, (accepted).

For completing 27, Store-street, Bedford-square, for Mr. C. Rigby. Mr. A. Jowers, architect. Quantities supplied by Mr. H. Lovegrove:—

Stimpson & Co.	£618 0 0
Langmead & Way	617 0 0
Longmire & Burge	598 0 0
Patman & Fotheringham	593 0 0
Halliday	565 0 0
Blandford & Co.	559 0 0
Grover	548 0 0
Williams	500 0 0
Steep	475 0 0
Bishop & Hooper (accepted)	459 0 0

For repairs and ventilation to the Clayton Memorial Schools, York-street, Walworth. Mr. Ellis Marsland, architect:—

Marsland, Walworth	£320 0 0
Gilbert, Camberwell	265 0 0
Morby, Fleet-street (accepted)	248 0 0
Tyerman, Walworth	242 0 0

For alterations and additions to residence, Champion Park, Denmark-hill. Messrs. Adams Murphy & Pulley, architects. Quantities not supplied:—

Andrews & Anson	£1,695 0 0
Hayward & Sons	1,560 0 0
McLachlan & Sons	1,471 0 0
Colls & Sons	1,445 0 0
Maxwell Bros.	1,388 0 0

For the erection of a pair of semi-detached residences, at Deptford Lower-road, for Mr. Edward Sheppard. Mr. W. T. Hunt, jun., architect:—

Redman	£1,237 0 0
Redman	1,175 0 0
Newman	1,160 0 0
A. & F. Smith (accepted)	1,045 0 0

For alterations and additions to the Hercules Pillars public-house, Greek-street, Soho, for Mr. Higgins. Mr. W. J. Worthington, architect. Quantities supplied:—

Earle & Son	£750 0 0
Grimwood & Sons	679 0 0
Phillips	637 0 0
Pickersgill	612 0 0
Lamble	563 0 0
J. & H. Cox	543 18 0

For building a "Bon Marché," at Kilburn, for Mr. Cossey. Mr. H. E. Williams, architect. Quantities supplied:—

Lamble	£3,278 0 0
Barnes	2,999 0 0
Denton	2,940 0 0
Marr	2,873 0 0
Patman & Fotheringham	2,695 0 0
Aitchison & Walker	2,475 0 0

For alterations to 103, Tottenham-court-road, for Mr. W. Mackness. Mr. George Edwards, architect:—

Richardson	£435 0 0
Stimpson & Co.	279 0 0
White	273 0 0

For alterations and additions to house at Leatherhead, for Mr. H. Courage. Mr. W. G. Bartleet, architect:—

Brown	£550 0 0
Batchelar	535 0 0
Walker (accepted)	534 0 0

For the erection of four cottages and shop at Leatherhead, for Mr. James Attlee. Messrs. Bargman & Benison, architects:—

Hamblin Bros.	£1,470 0 0
Brown	1,427 0 0
Walker	1,394 0 0
Jarvis (accepted)	1,285 0 0

For curator's house and fencing, for the St. Neot's Burial Board. Mr. W. Jackson, architect. Quantities not supplied:—

Lord (too late)	£633 0 0
Osborne	597 0 0
Wellbam & Weycroft	569 0 0
Wade & Edey (accepted)	529 10 0

For alterations and additions to No. 13, Victoria road, Kensington, for Mr. G. S. Symons. (Second contract.) Mr. W. H. Collbran, architect:—

W. Farthing & Co.	£410 0 0

For enlarging dining-saloon and building servery (exclusive of decorations) for Major-General C. Baring, Belgravia. Mr. W. H. Collbran, architect:—

Hart	£216 0 0

For additions to premises, Curtain-road, for Messrs. Parker Bros. Mr. J. Hamilton, architect. Quantities by Mr. A. Johnson:—

Crabb (accepted)	£2,058 0 0

For pulling down and rebuilding 23, Vanstone-place, Fulham, for Mr. James Compton. Mr. William Cowdry, architect:—

Barnes	£499 10 0
Lathey Bros.	453 0 0
Davis	432 10 0
Parkinson, Fulham (accepted)	392 0 0

For preparation of site for chapel, Loampit-vale, Lewisham. Mr. J. Cubitt, architect:—

Staines & Son	£287 0 0
Jerrard	270 0 0

For alterations and repairs at the North Pole, Shadwell. Messrs. Perry & Reed, architects:—

		Time.
Clarke & Bracey	£1,336 0 0	13 weeks.
Mills	1,171 0 0	——
Mark	896 0 0	12 weeks.
Staines & Son	896 0 0	9 ,,

For new south aisle at Christchurch, Finchley. Mr. J. Notton, architect. Quantities by Mr. Thacker:—

Grover	£2,053 0 0
Braid & Co.	2,024 0 0
Adamson & Son	1,986 0 0
Staines & Son	1,883 0 0
Lawrence	1,798 0 0
Flowman	1,735 0 0
Boyce	1,719 0 0

For Methodist Free Church new schools and chapel improvements, Forest-gate. Mr. F. Borebam, architect. Quantities by Messrs. Mann & Saunders:—

	Schools.	Chapel Works.
Horlock (in error)	£2,287 0 0	£ 900 0 0
Alexander	2,232 19 0	1,342 0 0
Sargeant	2,197 0 0	1,345 0 0
Godbold	2,110 0 0	1,260 0 0
Bangs	2,020 0 0	1,240 0 0
Morter	1,968 0 0	1,189 0 0

For the erection of a block of school buildings and appurtenances (to accommodate 916 children), at Grange-road, Plaistow, Essex, for the West Ham School Board. Mr. J. T. Newman, architect. Quantities supplied by Messrs. Curtis & Sons:—

Catley	£8,390 0 0
Abrahams	7,697 0 0
North Bros.	7,650 0 0
Hoskings	7,549 0 0
Hearle & Son	7,445 0 0
Boyce	7,443 0 0
Wall Bros.	7,429 0 0
Nightingale	7,234 0 0
Knight & Dustow	7,117 0 0
F. & F. J. Wood	7,087 0 0
Reed	6,998 0 0
Mortat	6,813 0 0
Gentry (accepted)	6,495 0 0

For the erection of three cottages, at Fetcham, Leatherhead, for Mr. J. Barnard Hankey. Mr. F. J. Dibble, architect:—

Batchelar	£932 15 0
Edser	895 0 0
Heselgrave	847 10 0
Hamblin Bros.	816 0 0
Brown	800 0 0
Walker (accepted)	798 0 0

TO CORRESPONDENTS.

SS. Mary and John's (E.C.) Church, Wolverhampton.—The works here (described in our issue of the 10th inst.) were carried out by Messrs. Dawson & Bradley (now Bradley & Co.), builders, Wolverhampton.

J. T.—W.—G. A. L.—W. H. C.—C. H.—S. & Son.—E. K.—W. C.—Mr. L.—J. C. R.—W. T. H.—J. J. L.—D. W.—F. B.—R. H. C.—Messrs. B.—J. H.—R. H.—D. A. O.—J. H.—P. Bros. (should send list of tenderers and amounts).—S. P. (we must decline to express any opinion as to whether the Vicar told a story or not!)—P. & Son (next week).

All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication.

We are compelled to decline pointing out books and giving addresses.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course with the authors.

NOTICE TO SUBSCRIBERS.

THE INDEX and TITLE PAGE for Volume xxxvii. (January to June, 1880) was given as a Supplement with our Number for July 10.

A COLOURED TITLE-PAGE may be had, gratis, on personal application at the Office.

CLOTH-CASES for binding the Numbers are now ready, price 2s. 6d. each; also

READING-CASES (Cloth), with Strings, to hold a Month's Numbers, price 2s. each.

THE THIRTY-EIGHTH VOLUME of "The Builder" (bound) is now ready, price Twelve Shillings and Sixpence.

SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of 3s. 6d. each.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under ..... 4s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

Terms for series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR Lines (about THIRTY words) or under ..... 2s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

REPLIES TO ADVERTISEMENTS,

Addressed Box ——, Office of "The Builder,"

Cannot be forwarded, but must in all cases be called for, and the Office Receipt produced.

THE CHARGE FOR A BOX IS AS UNDER:—

For "Situations Wanted" Advertisements ..... 6d. per Week.
For all other Advertisements ..... 6d. per Week.

PREPAYMENT IS ABSOLUTELY NECESSARY.

*** Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable the Post-office, King-street, Covent-garden, W.C. to

DOUGLAS FOURDRINIER, Publisher,
Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. lait at the Office in reply to Advertisements, and strongly recommends that of the letter COPIES ONLY should be sent.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied direct from the Office to residents in any part of the United Kingdom at the rate of 19s. per annum prepaid. Remittances payable as above.

The Builder.

Vol. XXXIX. No. 1957. Saturday, August 7, 1880.

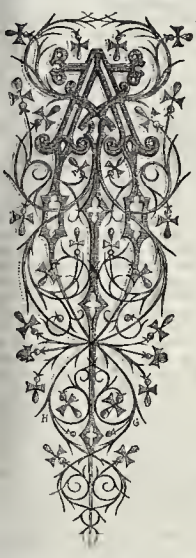
CONTENTS.



Sir John Soane's Museum.

GREAT many people in London whom one might suppose to be especially interested in art and architecture have hardly heard the name of the Soane Museum, and there are a good many among those who are familiar with its name who know nothing else about it. It seems strange that this should be so, but we have had evidence of the fact not infrequently where we should not have expected it. One cause of the comparative neglect of so interesting an institution is probably the fact of its being situated in what is now not a very central quarter, except for lawyers. Another reason, we have very little doubt, why some of those who know of it never visit it, is to be found in the rather complicated arrangement of the days for seeing it. London is provokingly full of places which can be seen on certain days in the week and not on others; and people are often prevented from visiting the National Gallery or the British Museum from not having at hand any note of their closed days, and fearing only to waste the journey thither. But in both these, as well as in other institutions which have closed days, the open and closed days are the same for all the year round, but in the case of the Soane Museum there is the additional complication that the days are different for different months in the year, and that during five out of the twelve months (September to January, inclusive) it is not open at all. It is impossible to be sure of remembering these in-and-out arrangements, and consequently no one feels safe in recommending any one to go to the Museum unless he is able, at the same time, to state the days on which it can be seen, and there is a general impression of some mystery concerned in gaining access to it. We have not infrequently heard asked why the original owner made such eccentric dispositions as to the time of opening. He, in fact, did not; he left directions that free access should be afforded to the public to see the Museum on at least two days in every week throughout the months of April, May, and June, "and at such other times in the same or any other months as the trustees shall direct." The trustees have accordingly invented the present complicated arrangement, which is very inconvenient to the public, and not in any way called for by the provisions of the Trust, and which they would do wisely to alter. If the same days of the week were adhered to during the months from February to August,—the time when the largest number of people are living in or visiting London,—that would be more easily remembered, and some perfectly needless trouble and uncertainty would be saved.

A few words by way of a reminder as to the nature and extent of the Soane Museum may not be out of place, on account of the comparative want of due attention which it meets with from professional and amateur architectural and art students. The outward aspect of the house on the north side of Lincoln's-inn-fields is simply that of an ordinary London street house, with some Gothic brackets and some caryatide figures fixed on the front. It was the dwelling-house of the eminent architect who made the collection, along with two other, or part of two other houses, which he purchased and threw into this one. In the rather rambling interior thus formed are to be found objects of architectural or archæological interest of the most varied description, showing how wide were the interests, and how active the mind, of the collector. But independently of the curiosities themselves, their arrangement, and the whole treatment of the house, are of interest as showing how much of individuality and picturesque arrangement may be imparted to a house even within comparatively small limits. Everywhere there is the evidence of original taste displayed in a kind of *curiosa felicitas* of arrangement, sometimes eccentric, always effective: nothing seems to be done as we might find it done in any other house. There is a little trickery in the ingenious use of mirrors in various places. Soane seems to have been fond of the effect of reflection, and to have aimed at breaking and destroying the sense of limited size, and giving apparent vistas to the eye by the use of mirrors where they would not naturally be looked for, and where for the moment they furnish not infrequently a complete illusion. As he was equally fond also of leaving unexpected peeps through unexpected corners, it is difficult often to decide at a glance whether we are really looking through an opening into another compartment of the house, or whether we are deceived by a mirror. The most effective use of the mirror is, perhaps, in the frieze of the library, the front room on the ground-floor, where glass is used on two sides over the cornice of the book-cases, which, being kept clean and free from dust, produces precisely the effect of an opening, a kind of clear-story, over the top of the book-case into another apartment. The ceilings of these two rooms are decorated with paintings by that weak and "pretty" painter, Howard, whose female figures have all the same insipid regular and inexpressive countenance. One of the larger compartments is evidently an inspiration,—one might perhaps say a plagiarism,—from Guido's "Aurora." There is a certain instruction conveyed by the comparison of these paintings, as well as of some other things in the house which are *passés* in taste with the taste of the present day. It is certain that no æsthetic person, architect, poet, or artist, would at present endure to have paintings in the style of these of Howard's on his walls or ceilings; in fact, he dare not have them, he would be a marked man. Yet these were considered beautiful and appropriate by a man of exceptional refinement and culture in the early part of the present century. It is equally possible that some of the mural decorative painting by a special school of painters which is so run after now, may appear just as weak to the eyes of spectators fifty years hence as these of Henry Howard's appear to us. Not, of course, that we would for a moment imply that there are no fixed grounds of criticism, no work which appears beautiful equally to its own and to succeeding generations. But it is certain that in almost every generation, at least during the last two centuries, there have been tastes of the time which have been mere fashions, which are obviously so to us who regard them now, yet which were most implicitly believed in by those who commissioned and those who executed them. What will future generations think of our Burne-Jones-ian beauties, with their long necks and protruding chins, and our decorative classically-draped damsels with conventional flower-jars beside them? Perhaps visitors may then wander over rooms decorated in the taste of to-day, and say, "How curious that people should have seen beauty or meaning in these stiff artificial figures!"

The models of restored Greek and Roman buildings in the dining-room, though on a small scale, are interesting as giving a means of immediate comparison of scale and proportion in some of the most important buildings of the great Classic period. Sir John Soane's portrait by Lawrence hangs in this room; and scattered about are various antique fragments, vases, &c., some of them of very exceptional interest. Through the little ante-room in one corner of the dining-room, filled with small antique fragments and casts (for every inch of space seems to have been made available by this enthusiastic collector), we come on a medley of things which seems bewildering at first, though they are all really very carefully arranged and distributed. In a gallery running east and west are numerous casts of antique sculpture and architectural ornament, mingled with bits of original antique work, as much being crowded into the space as it could possibly hold so as to allow any room for visitors at all. Eastwards through this room is reached what is called a corridor, but should rather be called an antechamber, in which are some fine fragments and casts of capitals, including a very interesting piece of an Egyptian capital, showing more relief in the design of the bell than we meet with in the most familiar forms of Egyptian capital. Through this ante-

room is the picture-room, which of all parts of the Museum shows most admirably the hand of the architect,—the man cunning not only to design artistically, but to arrange and contrive practically, and finding, like every true architect, a pleasure in clever contrivance and arrangement for its own sake. The picture-room contains Hogarth's election scenes,—the four pictures of the "Entertainment," "Canvassing," "Polling," and "Chairing the Member," once the property of pleasant David Garrick, and bought, at the sale after his death, by Soane. Among other works in the room are prints and drawings by Piranesi, a large Canaletti, and a considerable number of small paintings of architectural subjects, chiefly Classical ruins, by Clerissean, whose name is very likely unknown to many of our readers, but who had a decided specialty of talent as a painter of old buildings. Now we have got tired of painting old Classic buildings, and our most painstaking and talented architectural artists are rather taking to finding out the beauty of old barns and red-brick house fronts, which also no doubt have a beauty of their own. Still, there was about the subjects which Clerissean painted a poetic interest and a faded dignity and grace which we do not find in architecture of the red-brick epoch. Every taste has its reaction, however; only people have a habit now of mistaking the reaction for a new impulse in artistic production. But we are wandering ("re-acting") from Sir John Soane's picture-room, part of the interest of which certainly consists in the room itself, and the way in which it is fitted up. By an arrangement of reversible panels on the walls, more pictures are exhibited in this small room than could be shown in the ordinary way on the walls of a room of more than twice the dimensions. Then the south side of the room, which at first seems to consist of picture-screens similar to the rest, opens entirely, and the visitor looks over a railing down into the little room in the basement filled with Gothic work, and called "The Monk's Room," and across into a large recess backed by a stained-glass window, and in the centre of which stands a statue. It is worth while for those who are concerned in the arrangement of plans for producing effect, to see how much interest and novelty of picturesque effect has been produced by Soane in dealing with rooms of exceedingly small dimensions. The picture-room contains also one of those combination views of all the architect's works which were a favourite device at one time, and of which Cockerell made one in honour of the genius of Wren, the engraving of which is well known.

The little Gothic parlour in the basement, reached by a staircase from the vicinity of the picture-room, would not be of so much interest to Mediævalists of the present day as it might have been to those of fifty years ago; but it is surprising, considering the date at which Soane practised, and his own decidedly Classic tastes, that he should have shown so much interest in Gothic detail as the odds and ends in this little room evince that he had. The rest of the basement is occupied much as the ground-floor gallery over it, with various casts of figures and details, except the centre portion, where is placed the great Egyptian alabaster sarcophagus discovered by Belzoni in 1817, and purchased by Soane in 1824. The British Museum contains no such treasure as this in its Egyptian department; it is a wonderful relic, and enough in itself to give a European fame to the collection which contains it. Belzoni said at the time (in his account, which is copied into Mr. Wild's *catalogue raisonné* of the Museum) that this relic had not its equal in the world, and we know of no Egyptian discovery since which can be said to render Belzoni's opinion out of date. Soane bought it for 2,000*l.*, but it would probably command a sum very far in excess of that if it were offered for sale now. The exceptional character of the sarcophagus consists in its size, the preciousness of the material, from which the sarcophagus has been sunk out from the solid mass, only the lid being separate, and the minute and elaborate figures and hieroglyphic writing with which it is covered within and without, and the beauty of execution (from an Egyptian art point of view) of the large figure drawn on the bottom of the interior. The lid was unfortunately broken; the late curator, Mr. Bonomi, had the pieces arranged in the room over the ground-floor gallery, called in the catalogue "The Student's Room."

Going up to the ground-floor gallery again, and round to the south-west corner of it, we come on the breakfast-room,—a little gem of a room,—on which the former owner had evidently bestowed most affectionate embellishment. The breakfast-room is reached through a small lobby which, like every other corner of the house, is filled with casts and curiosities, and the room itself has been given a domical ceiling, with a little lantern in the apex, with miniature painted glass subjects in its sides. The room contains a collection of casts from antique gems, some splendid illuminated books, and various drawings, engravings, and designs, some of which are shown in turning cabinets or panels carrying objects on both their faces, in the same manner as in the picture-room, and turning on hinges on either side of the window.

Going out into the entrance-lobby and up the principal stairs of the house, we find even on the staircase every corner and window-shelf and recess carries its own object of interest. Here is Flaxman's original model for his immortal group of Michael and Satan, there a model at the life-school of the Academy, by Bailey; in a recess off the stairs a small collection of works relating in one way or another to Shakspeare ("The Shakspeare Recess"); in the corresponding recess on the next flight is a collection including a copy of part of the entablature of the Tivoli circular temple, whence this is called "The Tivoli Recess." These two recesses open anglewise off the winders of the stairs, and look as if, in the original economy of the habitation, they might have been water-closets or housemaids' closets (if the latter institution was known in Soane's time). To give an idea of the variety and multiplicity of interest of the Museum to those who have not been there, we give the list of objects to be found in this one last-named recess only, off the upper flight of stairs:—

A cast of a bas-relief of a "Grecian Feast," modelled by Flaxman during his studies in Italy.
A cast of an alto-relief by Banks, modelled under similar circumstances, "The Grief of Achilles."
An original terra-cotta model by Banks for his "Caractacus before Claudius."
A bas-relief in terra-cotta from the Borghese vase, modelled by Flaxman at Rome.
A model of a Sleeping Child, from Chantrey.
A cast from Flaxman's "Shield of Achilles."
Copies of Flaxman's figures of Cupid and Psyche.
Copy of a piece of the Tivoli entablature (as before mentioned), half the size of the original.
A painted-glass window, a copy of one compartment of the window designed by Reynolds for New College, Oxford.

The element of copying or reproduction is more represented here than in most parts of the Museum, so it must not be taken as typical in that way; but it will be admitted that this is pretty well to find in a corner of the stairs on the way from one room to another. The front drawing-room on the first floor contains Hogarth's celebrated series of the "Rake's Progress," the eight pictures being placed on easels in the middle of the floor; owing to the angle at which they are placed to the light, and their being also covered with glass, the details of some of them are not very easily seen: we should suggest that they might possibly be placed in some more advantageous position, but it must be admitted that the space is limited. The ceiling of this room has been very elaborately treated by Soane; and the room itself contains a medley of things besides the Hogarth pictures: drawings by Rubens, Ostade, Clerisseau, Stothard, Corbould, Panini, &c.; medals, bronzes, Indian furniture, models of statues by Flaxman, and a number of other objects of interest, including casts in gold, silver, and bronze of the medal "struck by the architects of England in honour of Sir John Soane," and the address presented to him therewith, on the 24th of March, 1835. Among the medals in the room are a series of 140 medals struck in France during the Consulate and reign of Napoleon. A pretty feature in this room is the treatment of the piers, which form really the main wall of the front and carry the outer wall of the story above, but in this story, as well as in the ground-floor, form a kind of internal loggia, a false front wall being carried up 2 ft. or 3 ft. in advance of the main wall of the front, and containing the windows. There is thus a passage between the window wall and the main piers, and in the drawing-room these piers have niches on the side facing the windows, and turned away from the room, in which are casts of antique candelabra from the Vatican: it makes a picturesque incident in the room when you walk behind these piers and find the niches and vases unexpectedly in the full light from the windows. The back drawing-room on the same floor contains a few good drawings and designs by Soane himself, especially parts of a design for a new House of Lords, in Classic style, with domes of an outline which Soane seems rather to have affected, somewhat low and squat, but looking very solid and monumental. This room, like the front one, contains a great variety of things, sketches, paintings, china, glass, and illuminated MSS. On the staircase ascending to the top story may be seen some bas-reliefs by Flaxman, and a medallion portrait of himself at the age of twenty-four. But we must stop enumerating, merely mentioning that the larger of the upper rooms contains, among a good many other things, large models of two or three of the Pæstum temples, as well as architectural drawings by Soane and others.

The library in the ground-floor room forms a large assortment of books bearing on architectural study,—mostly standard books, which can be consulted and studied, we believe, by application to the curator. But the library portion of the establishment contains other more out-of-the-way matters than these. A great deal of what is there is, in fact, not known or visible to general visitors. The *catalogue raisonné* which has been made by the present curator gives some hint of what is to be found which does not meet the eye, though only partially, as it is intended chiefly as a handy guide to visitors who do not know the place. Copies of Soane's own catalogue, handsome and large volumes in English and French, are placed on the library table for consultation. Of this catalogue only about 150 copies were printed by Soane, to send to amateurs and curators of museums in England and abroad. Among the things most prized is a very large collection of original drawings by Robert and James Adam, in no less than fifty-five folio volumes. These comprise chiefly furniture and decorative design, and many of the drawings are finished with a degree of delicacy which, coupled with their great number, gives a notable impression of the great industry of these "Adelphi," though we cannot (so far as we looked over them) agree with the remark in the catalogue that they are "of great interest to students of decorative art." They have great practical interest, no doubt, in this sense, that decoration in the style of the Adams has lately become the fashion, and that, for designers who want to dip their pockets by following the fashion, here is the very fountain-head to "crib" from; but we should be very sorry to see any student in which we felt an interest taking to the serious study of these designs as part of his education. They seem to us to illustrate significantly the fact that a man may be most industrious and earnest in his pursuit of his profession, and may be a beautiful and painstaking draughtsman, and yet may have missed true art altogether. There is, to say truth, little variety in these Adam designs: they harp on one string very much, and repeat the same conceits over and over again. Some of the furniture design is very good; some very bad. There seems no guiding principle; even the instances in which colour forms part of the design are too dreadful to think of—they set one's teeth on edge. Imagine a wreath with pink flowers on an arsenical green ground. Still, the value of the collection, as the best illustration possible of a phase in the history of English taste, we do not mean to underrate by any means. Among other collections of drawings is a volume of Thorpe's designs for houses with very roughly-drawn plans and elevations, in which some parts of the house are shown in geometrical elevation, and other details in perspective or bird's-eye view in order to exhibit them better: these illustrate curiously the *naïveté* of planning and arrangement of houses of the period, as well as some charming picturesque combinations and outlines, or what would be such in execution, though they are not shown to advantage in Thorpe's primitive style of drawing. Among other works of the same class are a collection of drawings by Wren, including many for his part of Hampton Court and for Greenwich, some by Inigo Jones, and a volume by Hawksmoor. Wren's are admirable specimens of clear, precise, but not laboured drawing.

It must not not be supposed that in running through the nature of the contents of Sir John Soane's house, we have by any means indicated a tithe of the things to be found in it; we have indicated their nature and variety, but the collection is so large, varied, and curious, that the wonder is that so much could have been got into so small a house, and arranged so as to be all seen. This, however, has been done, chiefly by the ingenuity and sense of order of the

leotor himself, hy whom the hulk of tbs collection was arranged just as it now stands. We have thought it worth while to give a little space towards recalling it to recollection, since, old as the Museum compsratively is now, it seems to hs practically unknown to many who ought to know it. This is partly, perhaps, hecause the fame of Soane's nams has been forgotten hy a generation intent upon another styls of architscture from that in which he laboured so industriously, and most people who read about or study architecture in the present dsy know little ahout Soane except that he was the srchitect of the Bank of Englsnd exterior design, as it at present stsnds; and many will he found to deny any particular merit now to a huilding in a style which the fashion of the present day turns away from. But in rsality the Bank of England, including the interiors, though no doubt open to criticism, illustrates very pointedly that which comes ont mors or less in most of the designs hy Soane that are extant, that he was an architect who thought for himself, who did not follow a beaten track, hut who put his own mind to an architectursl problem, and solved it in his own way. And the collection which he left hehind iu his house, and its admirable srrangement, indicate equally how he must have cared for his profession, how much of his heart and soul must have gone into it. One cannot help feeling, in walking over the houseful of srtistic objects and curiosities which he has left, how earnest this man must have heen iu his work, how wide-awake he must have been, how on the look-ont for everything of interest in connexion with his studies, how thoronghly practical as well as cultnred: and thus he, heing dead, yst speaketh, giving us the old lesson, "Whatsoever thy hand findeth to do, do it with thy might."

BIG BRIDGE CONSTRUCTION.

The rejection, hy a Select Committee of tbe House of Commons, of the Bill for the construction of a slightly modified bridge over the Tay, affords a practical comment on the observations we bave heretofore offered on the official inquiry into the causes of ths dissster which befel the former structure. That two engineers, one Roysl and one Civil, should have consented to csrry on such an inquiry in the absence of the drawings of the hridge, and without making any such representation as to tbe absence of those drawings as might, at all events, bave thrown the blame in the right quarter, was to us, at the time, inexplicable. We do not say that the Commissioners were bound to refuse to proceed with tbe inquiry in tbe absence of the drawings. But we did expect such an appeal to the Board of Trade in the first instance, and, failing redress, such a statement of the fact of this suppression of evidence in the report itself, as might have put the professional members of the Commission right with tbeir own brethren. As it is, the shareholders have to pay the piper. Considering all that had been said, and all that had not been said, as to the responsibility of Colonel Hutchinson in respect of what was called the examination of the bridge on tbe part of the Board of Trade before opening the line over it for traffic, ws do not see how Colonel Yolland could well have avoided reporting against the approval of a dssign which appears to bave been adopted by the directors of the railway between their first and their second appearance hefore the committee,—a design as to whicb the author admitted that "he had still much to verify." There is some confusion in the reports which ws bave read as to one point in his new design. From the evidence of Mr. Brunlees, it appsarsd as if brick piers on the existing foundations were proposed; but, on the other hand, it was stated hy counsel that the pisrs wsre to he for a double width of line, while the bridge was to he, in the first instance, only for a single line. We fully agree with Colonel Yolland in the opinion that a single-line bridge should not bo authorised. As to the question of brick or iron piers, it is a matter of design and of calculation, not to he settled off-hand, or witbout due investigation. Still moro important is the tbird requisition on whicb the Board of Trade has been advised to insist, namely, that the foundations should be entirely new. When demands of such a nature are made unexpectedly, hefore a committee, the promoters of a Bill are tsken ahack. It is possihle thst the addition of the proposed clauses would have the effect of at once douhling the cost of the bridge. At all events, this would take time to ascertain. Had the original design for the bridge heen produced and discussed hefore the commission of inqniry, this company would have known what to expect. New demands could not have hesn raised at the elevsnth hour; and the delay of a year, involving heavy expense, would have been saved to the company. As it is, however, the directors have only themselves to thank for an opposition which the suppression of the original plans rendered nnavoidable, though it is to be regretted that it was not announced until the latest available moment.

The question of entirely new foundations is one of very great importance. Its turning np at this last moment affords a very striking proof of the penny-wisdom, which may prove to be pound-folly, of stinting the proper outlay for an important work. If the traffic which the Tay Bridge was to accommodate was worth the cost of building a bridge at all, even if a single line of way would in the first instance have been sufficient to accommodate the trains of the company, no person of prudence would have sanctioned the preparation of foundations that were insufficient to carry a douhle way. If ths foundations had heen put in for a bridge of the ordinary width, and if, above a certain height, the bridge had hesn in the first instance proceeded with for a single way alone, it is very possihle thst the overthrow would have heen avoided. In any case, the contemplation that the need for a double line would arise at some future time ought never to have been omitted, nor should snch a mode of obtaining foundations have heen adopted as would have heen certain to involve a very grave engineering difficulty whenever the case of widening came to he carried out.

It is well to give full attention to this part of the case, hecsuse it points to something nearer home than Dundee. In the varions plsns which have from time to time heen ventilated as to the widening of London Bridge, ths advocates appear to have closed their eyes to the nature of tbe foundations obtained hy Rennie. This great engineer was compelled hy the City authorities to huild the noble monument in question in a spot which he considered not the fittest for the purpose. The true site of the bridge was ahandoned for the sake of saving the expense of a temporary bridge. As far as the means at the command of the science of his day went, Rennie made the hest of bis design. But it was touch and go. In fact, it was "go" for some 14 in., and though the movement of the ahutment was arrested, and the hridge has ever since been stable, there can he no certitude as to the anticipation how soon the steady action of the river in deepening its bed may set the hridge again on the move, and we think that there is very little room to doubt that any tinkering of the supsrstructure would very rapidly have that effect.

All huilders know how ticklish a thing it is to build a new wall as a continuation of an old one, into which it is to be honded. And if this he the case in the open air, on the side of a house, or on any line of plain surface, how is the difficulty increased if the junction has to he effected 30 ft. under water, in an estuary or tidal river? This task, which we think it would prohably prove impossihle to accomplish on London Bridge without some mishap, is not an easy one to effect in the river Tay. But the putting in of brick foundations for a double line would require such a junction of new and of old work. We think that it may be very seriously questioned whether it would not prove safer, and ultimately cheaper, to huild a new bridge *in toto*, and to remove all the piers of the old bridge, than to undertake the task of widening the piers of the latter. At all events, we hold it tolerably certain that there are no grounds for any confident expectation to the contrary. It might he possihle to coffer-dam round the existing piers, to excavate and lay wider foundations, and to carry up the whole as a sound piece of workmanship; but with evidence before the committee that it may he necessary to protect the hottom of the river from scour "by means of stone,"—in fact, to pave or pitch tbe bottom of the Tay, we feel sure that the very hest and most deliherate advice ought to be secured before making any such attempt.

The actual position of the Tay Bridge is such as to point to the need of an exhaustive inquiry into the theory of hridges of large span. At the present time the widtb of the span into which a hridge may he divided,—and we msy say the same with regard to the roof of a station, or of any great area,—depends pretty much upon the tsste of the engineer. The question of level, in the case, at all events, of the bridge, is here one of primary importance. A halance has to he struck hetween the cost of pier and that of arch; hetween the cost of numerous piers, and that of arches or girders over wide spans. No definite relation can he laid down as normal hetween the two estimates of cost, hecanse the cost of the piers differs to an extraordinary extent in different cases. Thus a span which it might he altogether extravsgant to use in the case of a wide flat valley, might prove to he economical in the csse of a dsep ravine. If any approach to a general formula of proportion is to he obtained, it must include an expression for the height of the piers, and another expression for the anticipated costliness, in the matter of obtaining foundations.

It is instructive, as giving some measurs of the progress made hy the engineer during the past sixty years, to compare the dimensions of Old London Bridge, according to the survey of it made hy Mr. Giles, in 1820, by order of the Committee of the Bridge Lands, with some of the latest erections of large spans, hoth in this country and the United Sstes. The width of the river between the ahutments of London Bridge, according to the survey quoted, was 931 ft. Of this width no less than 406 ft. 10 in., or above 42 per cent., was occupied hy the piers. But a further obstscle to the flow of the river was offersd hy the starlings, or pile-work protections, to prevent the piers from heing undercut hy the current, which amounted to 293 ft. 5 in. This reduced the wster-way, at low water, to 230 ft. 11 in., or rather less than one-fourth of the normal width of the river. The consequsnce of this contraction was to produce a row of waterfalls through the archos of the hridge, in which the river fell 2 ft. 1 in. at neap tides, and 4 ft. 4 in. at springs; an extreme fall of 5 ft. 7 in. having been noted dnring the occurrence of a highland flood, falling on a spring-tide ebh.

In contrast to this cumhrous and clumsy structure, we may cite the slaborste calculations brought hy Professor Clericetti, of Milan, hefore the Institution of Civil Enginsers, and published in vol. lx. of the Minutes of Proceedings of that Institution. The result, in two lines, is, that a girder can he constructed which would hear its own wsight for a span of 900 mètres, and that hy the addition of inclined steel cables, fixed to towers rising 90 mètres above the girders, a span of 1,500 mètres migbt he obtained. The pull upon the cable, in this case, is taken at 20 kilogrammes for eaoh squsre millimètre of cross seotion, or rather more than 13 tons per square inch. M. Max am Ende calculates the limiting span of a straight girder, with struts and diagonal ties, with 5 tons strain on the square inch, at 2,870 ft.; that for a straight girder, with diagonal struts and diagonal ties, at 4,000 ft. for iron, and 6,000 ft. for steel, witb a strain of 7½ tons per inch. For a parahoiio howstring girder, the limiting span is given as 3,000 ft., the corresponding depth of the girder heing 1,830 ft. For the parabolic fish girder, this gentleman proposes a limiting span of 4,200 ft., with a depth of 3,600 ft., in iron, and a span of 6,300 ft., with a depth of 5,400 ft., in steel. These are purely theoretical figures, and take into acconnt simply the force of gravity.

As to most of this, however, the practical builder will he content to allow it to remain in the cloudy limbo of algehraical theory. What is more to the point is to inquire of what spans hridges have been actually constructed. We can obtain some valuahle information on this subject from a paper by Thomas Curtis Clarke, M. Inst. C.E., which was read before the Institution of Civil Engineers on tbe 21st of May, 1878. But it is very remarkahle, as illustrating how far we yet are from arriving at any normal rules, such as we before indicated as desirahle, for the proportion between width of span and nnmher of piers, that in the 21 columns in which Mr. Clarke tahulates the information of which we are about to cite a portion, no mention is made of the height of the platform of the bridge above the water which it crosses.

The width of span, then, which has hesn obtained in tbe case of sixteen important tubular

and girder bridges, constructed of iron, up to the year 1877, are as follows:—

Where built.	Span.	Engineer.
1. Susquehanna River, U.S.	307	Phœnix Bridge Co.
2. Ohio River, U.S.	319	J. H. Linville
3. St. Lawrence River, Canada	330	Robt. Stephenson
4. Ohio (Parkersberg), U.S.	342	J. H. Linville
5. Rhine, Mayence	345	Gerber
6. Ohio (Louisville), U.S.	369	Albert Fink
7. Kentucky River, U.S.	375	C. S. Smith
8. Ohio (Louisville), U.S.	396	Albert Fink
9. Vistula (Dirschau)	397	Lentze
10. Conway, N. Wales	400	Robt. Stephenson
11. Ohio (Cincinnati), U.S.	415	J. H. Linville
12. Inn (Passau)	420	
13. Saltash	455	I. K. Brunel
14. Menai Straits	460	Robt. Stephenson
15. Lek, Holland	492	G. Van Diesen
16. Ohio (Cincinnati), U.S.	518	J. H. Linville

The figures merely indicate the width in feet of the longest span in each of the bridges cited. To these works should be added the suspension railway bridge over the Niagara river, immediately above the Falls, which was opened for traffic in March, 1855. The span of this bridge is 822 ft. 6 in. The height of the platform, which carries three lines of rails, of the respective gauges of 3 ft. 6 in., 4 ft. 8½ in., and 5 ft. 6 in., above the river, is 250 ft. Below the railway platform is suspended a second platform, for common road vehicles. The bridge is supported by four wire cables, of 10 in. diameter, each containing 3,640 wires of No. 9, B. W. G. The weight of the superstructure is 750 tons. The supporting strength of the cables is estimated at 7,000 tons. The bridge was designed and constructed by the late Mr. J. A. Roebling, the engineer in chief, who was also a manufacturer of wire ropes. The cost was about 500,000 dollars, or a little over 15*l.* per foot of span.

Of the bridges in the table, those built by Mr. Stephenson over the Conway, in 1848, the Menai Straits, in 1850, and the St. Lawrence, in 1859, are all tubular girders, through which the trains run. The bridges numbered 2, 6, 8, have the top chords cast, the rest of the girders being of rolled iron. The girders are quandrangular, with pin connexions. Numbers 1, 4, 7, 9, 12, 15, and 16, are all made of rolled iron. The Saltash Bridge, built by Mr. Brunel in 1859, crosses the river Tamar, about three miles north of Plymouth, at a place where the river narrows to about 1,100 ft. wide, and has a depth of 70 ft. It was at first proposed that this bridge should consist of seven openings, one of 250 ft. and six of 100 ft. each. But the Admiralty insisted that there should be only four spans, two of 300, and two of 200 ft. each, with straight soffits, and a clear headway of 100 ft. above high water. After a very careful and minute investigation of the bed of the river, made by 175 borings, carried on by aid of a wrought-iron cylinder 6 ft. diameter, and 85 ft. long, which was slung between two gun-brigs, and pitched at thirty-five different places on the river, Mr. Brunel decided upon adopting two main spans of 455 ft. each, supported on a masonry pier. For the construction of this pier a wrought-iron cylinder, 37 ft. in diameter and 90 ft. in length, was sunk through the mud at the bottom of the river to the solid rock. The total length of the bridge, including the adjoining land-openings, is 2,280 ft. It consists, besides the two main spans, of two openings of 93 ft., two of 83 ft. 6 in., two 78 ft., two of 72 ft. 6 in., and nine of 69 ft. 6 in. each. The central column, of solid masonry, 35 ft. in diameter, is 96 ft. in height from the rock foundation to above high-water mark. Upon this are placed four octagonal columns of cast-iron, 10 ft. in diameter, carried up to the level of the roadway, which is 100 ft. above high-water mark. Holding-down lewis bolts were let into the solid rock on which this pier was built, with iron bars built into the masonry. A description of the centre pier of this noble bridge, by Mr. B. P. Brereton, M. Inst. C.E., will be found in vol. xxi. of the Minutes of Proceedings of the Institution of Civil Engineers.

In the course of the discussion on Mr. Clarke's paper, from which we have cited the spans of sixteen large bridges, Mr. Barlow compared the efficiency and structural merit of the several designs, according to a method proposed by Professor Rankine, which consists in ascertaining the limiting spans attainable on each system. The bridges in question may be arranged in four classes, viz.,—(1), quadrangular girders, with pin-connexions; (2), the Saltash Bridge, which Mr. Clarke calls a lenticular girder; (3), lattice bridges; and (4), tubular bridges. Of these, the six examples of the first kind have an average limiting span of 900 ft., the several cases ranging from 852 ft. to 982 ft. Mr. Brunel's bridge, though of comparatively an early date, has a limiting span of rather more than 900 ft. In the lattice bridges, the waste of metal amounts to from 40 to 46 per cent., as compared with the former structures. In the tubular bridges it is still more; but it must be remembered that these were the first efforts to introduce iron in large spans in railway bridges.

In looking at the large amount of valuable information that may be gleaned from many of the sixty volumes of the Minutes of the Proceedings of the Institution of Civil Engineers, we are struck with the absence of any attempt to show such a comparative view of the cost of these great structures as would be of service in framing general rules for the guidance of the bridge-builder. The remarks which we have just quoted go in the right direction, but they only go a little way in that direction. Mr. Douglas Fox, in the discussion on Mr. Clarke's paper, gave the counsel to avoid large spans altogether if possible, because, if a pier could be introduced, even though the cost were the same, it would be a great advantage. We are disposed to agree with the recommendation. But what we want is, not to have it offered as an opinion; but to have the facts so clearly brought out as to allow them to speak for themselves. "The larger the span, the greater the risk in erection, and the greater the cost in maintenance." That, moreover may be true, but again we wish for proof. Again, the fact that certain elements of strength are required to increase, not as the span, but as the square of the span, is one that needs being brought fully out,—so as to show in what manner, other things being equal, the cost of one opening of 200 ft. span compares with that of two openings of 100 ft. span each,—taking the girders alone; so that allowance may be made for the piers according to the height of the structure. We find no attempt to bring this before the professional world, and we feel very sure that architects, engineers, and builders will have reason for gratitude to the writer who shall put into available form the large mass of experience which has been attained on this subject.

Mr. Clarke, in his reply, made some observations which show that American engineers have given due attention to a subject on which it must be admitted that English engineers have not of late exhibited the most profound knowledge. "A bridge," said this gentleman (whose address is given as in New York), "is a complex structure. It has to bear not only the force of gravity, but the side pressure of the wind. It had been said that it was a simple matter to provide against the force of wind, but that was really the most difficult and complicated part of the problem. The most economical height possible had to be used to resist the force of gravity; but then the side-pressure prevented the use of an economical height; consequently the bridge, when it was finished, was a compromise between the results of two forces. That was why the long-span bridges were comparatively not so high as those of shorter span. In spans of less than 200 ft. the proportion of height to span was 1-5th or 1-6th." When we find that this outcome of American practice was brought before the Institution of Civil Engineers in May, 1878, Mr. W. H. Barlow being in the chair, we cannot avoid referring to the opinion we felt bound to express (*ante*, p. 39) with regard to the report of Messrs. Hawkshaw, Bidder, Harrison, and Barlow, as to the adoption of 10 lb. as side-pressure on the Forth and Tay Bridges. In this country, when the first bridges of wide span were designed by Mr. Stephenson and Mr. Brunel, the question of wind-pressure, although duly considered by those experienced engineers, had not assumed the importance which attached to it in the opinion of the designers of the bridges on the American pattern. We have on record references to investigations as to the force of the wind on the Menai Bridge, as well as to the wind action on the suspension bridge of Telford over the same Straits. But with regard to the tubular girders we might almost as well have inquired whether a storm of wind could blow down the walls of Conway Castle, as whether it could shift or overthrow the great tubes. And in the case of the Saltash Bridge, where the resistance offered to the side pressure of the wind was comparatively so small, we have seen what were the ponderous dimensions of the central pier. Those were the works of the fathers of our railway system; and whatever may be said of the advance of science since, it is certain that Stephenson and Brunel did not build works which it was unsafe to cross in a storm, were it the fiercest that ever blew in our island. What we feel to be so lamentable,—we might use a stronger word,—is the comparison of the evidence and arguments offered as to the Tay Bridge with the practice of our two great engineers on the one hand, and with the study, as well as the practice, of their engineers of the United States on the other. In the discussion to which we have referred, one engineer, Mr. E. W. Young, said that "in every bridge designed by him 40 lb. wind pressure per square foot had been allowed, and security obtained." "The difficulty in designing girders of very long span is to get width enough to resist wind-pressure," observes Mr. Clarke. It would be well if every student who reads the reports made to the Board of Trade by Mr. Barlow and Colonel Yolland, as well as that of Mr. Rothery, were also to read with attention the debate from which we have made extracts. It will strike them, we think, that the degree of knowledge of wind-pressure that has been brought to bear on the subject of the Tay Bridge by all those who have given advice or evidence on the subject is very far below that which is common to the engineers of America, of Germany, and of France.

EXHIBITION OF METAL WORK IN PARIS

It is but a few weeks since that the annual *Salon*, with its 7,000 exhibits, closed its doors, and now we have to announce the opening of the Palais de l'Industrie, on Saturday, July 31st, of the sixth biennial Exhibition of the "Central Union of the Fine Arts applied to Industry." The first of a special series of exhibitions, each devoted to some important branch of the industrial arts, this year's exhibition shows very properly the ancient art and industry of the metal worker.

Incomplete as naturally the show might be expected to be at this early stage, it is not difficult to judge of its character. Amidst the confusion, the hammering, and the general arrangement of tardy exhibits, an order is observable, and by the excellent management of the president, M. Henri Bouilhet, we shall in a few days see "cosmos" issue from all this apparent "chaos." When all is arranged (particularly the museum, not opened on Saturday) those interested will have it in their power, between this and the middle of November, to examine with care the interesting collection of objects which have been gathered together under the hospitable roof of the Palais de l'Industrie, which, since the Great Exhibition of 1855, has opened wide its doors and afforded shelter to ample space for so many artistic and industrial wonders, not alone of France, but of the world.

The promise is sufficiently extensive in show that is made by the various trades connected with the great metal industry; there a retrospective museum, with its specimens of work of the past; the working drawings of industrial compositions,—among these a number by Viollet-le-Duc; a series of models of decorative paintings by contemporary artists completed by the various competitions that will be held during the exhibition, add to the various other attractions of a more popular nature which are never wanting in a French "Exposition," and it will be seen, we think, that the Union Centrale have skilfully prepared their campaign for 1880.

Those who remember the modest commencement of this society, and its comfortable if narrow quarters in the old Palais Royale (the Place des Vosges of to-day), and who may even then have derived instruction from its well-selected library, may congratulate the promoters of this society on the enormous progress they have made in carrying out their original aim.*

A demur is often expressed in England, not only as to the desirability of these great shows, but with the general public, and even with the various professions, such exhibitions are very troublesome and "boring"; but whether or not that the French people can stand a great

* What this progress has been (particularly in connexion with the tapestry exhibition of 1876, the last held, to which reference was made in these columns) the President and Vice-president showed in the two speeches made at the close of the exhibition, and reprinted as an introduction to the present catalogue.

more "boring" than others (as they seem to show by the patience with which they can sit out lengthy performances, or twenty-five minute *entr'actes*), or that they are sound in their appreciation of exhibitions, it is certainly the case that rarely in Paris does one hear any person complain of being "bored" at the Palais de l'Industrie.

This great difficulty overcome, ample opportunity is afforded for the consideration of the means to attain the chief aim of the exhibition, whether it be artistic, industrial, or scientific. The importance of this question may be judged when it is remembered how, through a misconception of the requirements of the public, the excellent and interesting series of technical exhibitions which were to be annually held at South Kensington miserably collapsed. In Paris the success of each succeeding exhibition is proved to be greater than the last, a fact encouraging to those who have expressed it as their opinion that exhibitions have now entered entirely into the needs and habits of modern existence.

Certainly, one of the most valid arguments that can be brought against some of the exhibitions recently held is their too general character, in which, by their very vastness, any special aim has been overlooked. This having been admitted, we cannot too warmly thank those who, resisting the fascinations of pecuniary success and popularity, have determined that the exhibition under their management shall prove of a character purely instructive in its highest sense. In reality both the public and the professional world are gainers by this arrangement.

It is, of course, difficult to tell the direction that the industrial arts might have taken unaffected by the impetus given to them by the Great Exhibition of 1851. Art in its application to industry was rapidly passing even beyond the influence of tradition, and normal as may have been the cause which led to the revival, we may at length feel that we are progressing on the road to a more general spread of refined taste, which, let it be remembered, was not so universal in the past as many either believe or would make us believe. The foundation of the numerous museums and schools which have followed on the art revival of the middle of the century,—never can sufficient credit be given to the great promoter of the movement, Prince Albert,—the artistic agitation in favour of a return to traditional art, fostered by equally earnest literary support; the foundation of societies and journals, have all influenced powerfully within twenty years the relations of art and industry to each other. In all civilised countries the same movement is to be traced; in England and America efforts made in this direction are leading to results which are to the utmost degree satisfactory when the short time is taken into consideration during which the new teaching has been practised. In France, the decadence into which the industrial arts had fallen a generation or so since aroused, as it had in England, the energy of the more thoughtful and observant; it was felt that some effort must be made to arrest the industrial arts, too evidently on their downward slope. Much was said and written at the time by professors and professional critics, and eventually a society was formed,—the aims of which we have already discussed in these pages,—the title of which suffices to show the direction in which the members desired to act upon the public, the "Central Union of the Fine Arts applied to Industry."

The consideration of the fine arts in their application to industrial purposes was a subject of no small importance; the society have not shrunk from their task, and have steadily been carrying out the intention of their originators. The present exhibition forms a portion of the plan, but it is not alone on this means that the society relies. In addition to its excellent working library,* it affords a series of lectures treating always of art in its application to industrial purposes; and competitions open to students of Paris and the provinces. The object of the society is in every way to further in the mind of the designer and the workman a sense of the importance of the beautiful in connexion with the useful,—an aim which is so rarely attained in this essentially utilitarian age.

* From a recently-published monthly report we learn that during March and April of this year respectively some 365 and 567 artists and artisans, sculptors, painters, designers, engravers, chisellers, decorators, architects, jewellers, cabinet-makers, lithographers, and others, worked in the library of the Society. In March 320 works, in April 635, were consulted. This, for a private institution, is a satisfactory piece of statistics.

If there is a want of the beauty which the artists of the past so universally placed in their simplest work, may not a reason be sought in the absence of our respect for the traditions of those older masters of ours, who themselves in every work they produced showed so religious a worship of their predecessors? Without we avail ourselves of the great lessons of the past, how can we hope to do more than did Robinson Crusoe on his island, puzzle out with infinite difficulty the objects which he needed for daily life, and to the construction of which he had never before devoted a moment's thought? Availing ourselves of the lessons of the past, we may leave valuable instruction for the future.

As an important factor in the education of the designer and the workman, this knowledge of what his predecessors have done cannot be too constantly brought forward; and the "retrospective" museums which the French so successfully prepare, and which form a marked feature in the educational scheme of the Union Centrale, form an admirable school for the young artist and the young artisan, who have by our modern system,—in which the hard and useful apprenticeship of the past is abolished,—so much to learn. Nothing more curiously showed the deficiency of even the most ordinary technical education than the recent competition for a design in metal, held by the Union Centrale, and of which we had intended to speak before now. In the designs, skilful as they were, it was easy to detect the absolute insufficiency of the knowledge indispensable to every artist, an ignorance of the most simple elements of architecture. It seems, wrote a French journal at the time, as if our designers had a profound contempt for serious and methodical study. "This," continues the same critic, "must be remedied, for it is by the order and severe nature of their system of study that the progress of our rivals has become visible, if not formidable,—a fact which would permit one to consider that we should end by allowing ourselves to be beaten if we did not add to our natural qualities those of the respectable artificer, by the aid of which neighbours, far less gifted than ourselves, have already made rapid advances."

Let us respect, therefore, the lessons of the past,—a piece of advice which at first sight might appear somewhat needless, were it not for many who, in their search for originality, would wish to ignore the bygone days. Such workers can never hope to attain their object; their originality will alone manifest itself as they find their minds better stored with the knowledge of what has been done before them.

Those who may take the gloomy view of the uselessness of any attempt to rouse the artistic sentiment in our nineteenth-century souls, who somewhat despairingly speak of "the whole current of human life setting resolutely in a direction opposed to artistic production," and who complain that we now possess "no love of beauty, no sense of the outward dignity of things, and, as a corollary, no dignity, no comeliness for the most part in their outward respect";* those, we repeat, who take this gloomy view of our nineteenth-century existence may be right, for an acquaintance with the history of the development of the human race shows us that its progress has not been uninterruptedly continuous; in the past the search after the beautiful and the useful has not been invariably pursued with complete success. In citing, therefore, the past as our teacher for the present and the future, a wise discretion must be exercised in the choice of the production of a period worthy the attention of the student; and it is the duty of the learned in the history of bygone days, to direct those under their control to the two most important points in all education,—what to emulate and what to avoid; from what encouragement is likely to be received; from what warning lessons are to be obtained.

* Sir Frederick Leighton.

Richmond.—Mr. John Barran, M.P., recently laid the memorial-stone of a new Baptist Chapel in Duke-street. The freehold site has cost 1,500*l.*, which includes a valuable building now on a portion of the ground. The new chapel will be octagonal, faced with stone, and carried out in the Early Gothic style. It will seat eventually between 700 and 800 persons. There will be school-accommodation and class-rooms. The estimated cost of the proposed building is 3,500*l.*

A CAXTON MEMORIAL.

The recent Printers' Exhibition at the Agricultural Hall, Islington, following the Caxton celebration held at South Kensington three years ago, has given to all those who were able to be present pretty good evidence of the progress made in the mystery of the art of printing during the past four hundred years.

At the present time there are very few persons indeed who have given their attention to any extent in the reading of current literature, who have not heard of William Caxton, the first English printer; but, at the same time, we venture to believe that there are a great many individuals who, while knowing the name of the Westminster printer, are nevertheless totally ignorant of the history of the times in which he lived, and, what is more, know nothing of the hardships he had to encounter in his professional capacity,—of his remarkable perseverance and industry, which, by a very small beginning, has produced that great power, the printing-press, to which, and to those who have laboured at it, from William Caxton's time to our own, the readers of this journal, and of every other printed sheet of paper, are so greatly indebted.

The late Mr. Charles Knight, a very worthy disciple of Caxton, very truly remarked, some forty years ago, "The object of the general diffusion of knowledge is not to render men discontented with their lot,—to make the peasant yearn to become an artisan, or the artisan dream of the honours and riches of a profession,—but to give the means of content to those who, for the most part, must necessarily remain in that station which requires great self-denial and great endurance, but which is capable of becoming not only a condition of comfort, but of enjoyment, through the exercise of these very virtues, in connexion with a desire for that improvement of the understanding which, to a large extent, is independent of rank and riches." Next, therefore, to the sustentation of the body, must naturally come the improvement of the mind,—and in working to this end, Caxton and his descendants have earned,—nobly earned,—the lasting gratitude of mankind at large.

It is not our intention to detail the life of Caxton, but only to give a few facts in connexion with his career, as a preface to our present article, which we have thought best to entitle a Caxton Memorial. The subject-matter is derived from the very interesting churchwardens' books of St. Margaret's parish, Westminster,—in which parish Caxton worked at his press and died,—and which books contain a remarkable account, in their various entries, of the remarkable times in which our printer lived. For these extracts we are indebted to Mr. T. C. Noble, who, through the great kindness and courtesy of the rector, the Rev. Canon Farrar, and the churchwardens, Messrs. Helder & Hockridge, has been permitted to have free access to and to carefully examine these very interesting records.

It was about the year 1422, and in the Weald of Kent, that William Caxton is supposed to have been born, and in 1437-8 an entry in the books of the Mercers' Company of the City of London informs us he and John Large paid four shillings as a fee upon being bound apprentices to Robert Large, who was an alderman of the City, and resided in the Old Jewry. But at the end of three years Alderman Large died, and the young 'prentice lad was "turned over" to a new master. We next hear of him at Bruges, engaged in the wool-trade, in which the mercers dealt largely, and in 1462 he is named as "Governor of the English Nation abroad," and copies of several letters to him, in that capacity,—one dated as late as June 3, 1467,—are still preserved in the Mercers' books.

In 1468 was solemnised the marriage of the Princess Margaret of York, sister of Edward IV., and Charles, Duke of Burgundy, and it was then, probably, that William Caxton first came under the notice of the duke, to whom, with two other mercers, he was a trade ambassador in 1469. It was in this year, too, we first find him appearing in print as a literary man, commencing, as he tells us, a translation of Lefevre's "Recuyell of the Histories of Troye," which, under the patronage of, and as a servant to the Duchess of Burgundy, he completed in September, 1471. It would appear he made several MS. copies of this work, which, pleasing the nobility, brought him so many orders that he began to think what was the best way of supplying the demand. It was a very simple circumstance, it is true, but to it the world

at large is indebted for the introduction of the art of printing into England, and the work was the first book printed in the English language. The Duke of Devoushire's copy, with the autograph of Elizabeth Grey, the Qneen of Edward IV., was purchased at the celebrated Roxburghe sale, in 1812, for one thousand guineas, and this book, it may he remembered, was exhibited in a glass case on a velvet cushion at the Caxton celebration. It was probably printed at Brnges in 1474, and in it Caxton explains its history in these words:—"And for as moche as in the wrytyng of the same my Penne is worn, myn hande wery & not stedfast myn eyen dimed with overmoche lokyng on the whit paper, and my corage not so prone and redy to laboure as hit hath been, and that age crepeth on me dayly and feebleth all the hodye,'and also be cause I have promysid to dyuerce gentil men and to my frendes to addresse to hem as hastely as I myght this sayd book, Therfor I have practysed & lerned at my grete charge and [dispense to ordeyne this said book in Prynte after the maner & forme as ye may here see and is not wreton with penne and ynke as other hokes ben."

It was in 1475 or 1476 that William Caxton (and Colard Mansion, who assisted him in these early prints) issued a translation of Cessolis's "Game and Playe of the Chesse," and the same year, or early in 1477, he must have left Brnges for England. It was a momentous time for this country, and readers of this journal will readily understand why, when they are told that within a few months after, the first hook printed in England with a date was issued from the precincts of the Ahhey of Westminster.

Mr. Blades, in his interesting and very valuable "Life of Caxton," tells us that "his arrangements for settling in England, the engagemont of assistants, with all the other matters inseparahle from a novel undertaking, must have ocopied a considerable portion of time. If, therefore, we assume that about the latter end of 1476 Caxtou commenced his new career in this country, we cannot be far wrong." One thing, however, is certain, and that is, we find the imprint to "The Dictes and Notable Wise Sayings of the Philosophers,"—"Emprynted by me, Wylliam Gaxton, at Westmestre, 1477," and this would appear to have been issned, or, as he tells us in the hook itself,—"fynished the xviij. day of the moneth of Novembre,"—thus clearly estahlishing a precise date for the commencement of printing in England.

From 1477 to the year 1485 we have nnmerons works from his press, and it is noticeahle how curiously his colophons vary. Thns, in the "Chronicles of England," issned just 400 years ago,—in 1480,—we first read of the press as "In thahbey of Westmynstre by London"; in 1483 as "at Westmestre," as well as "in thabhey of Westmynstre"; in 1484 "in Westmynstre besyde London"; and in 1485 "in thahbey Westmestre,"—all leading us to suppose he was carrying on two printing-offices. Then, again, we have a handhill, which Earl Spencer has a copy of, 5 in. by 7 in. in size, desiring his customers to come "to Westmonester in to the Almonesrye at the reed pale," which was probably issued ahont 1478 or 1480, all which addresses, Mr. Blades concludes, meant but one place; that "thahhey" was really the precincts; that in the precincts was the Almonry, where alms were given to the poor, and Lady Margaret, the mother of Henry VII., erected almshouses; that this Almonry existed, not on the site of Henry VII.'s Chapel, as has been so often asserted, but was "west southwest of the Abbey towers"; and, finally, that the old honse, which has been so often pictnred as the building where Caxton did his printing, and from the timher of which, when it was pulled down in 1846, were made countless walking-sticks and snuff-boxes, was in reality a house erected long after Caxton's time,—so recent as the reign of Charles II.!

Therefore at the sign of the Red Pale,—and this was not a red pole or a red paling, as often asserted, but a shield in heraldry so called,—Gaxton worked, lived, and died. During the years 1477-1490 he was a notable man in his parish, as may readily he snpposed. He attended the andit of the chnrchwardens' accounts, we know (by those existing having his name inserted hy the scribe), in 1480, 1482, and 1484. He was a member of the Guild of our Blessed Lady Assnmption, held in tbe church; and in 1491, close npon seventy years of age, he passed away in the very midst of the work he loved so well, for Wynken de Worde's colophon to the "Vitas Patrum" tells us it was "translated onte of Frenche into Englisshe hy William Caxton, of Westmynstre, late deed, and fynyashed at the laste day of hys lyff." This was hringing matters to a pretty close ending even at that early date; and although we do not know the exact time of his death, yet, fortunately for us, there are the accounts containing his burial still in existence, very religionsly preserved, as may be supposed, in the parish in which he died,—St. Margaret's, Westminster. Towards the end of the chnrchwardens' acconnt for the years 1490-1492, some time towards the close of the year 1491, we find the entry of his fnneral, costing 6s. 8d. for the four torches used on the occasion, and 6d. for ringing the knell from the hell in the church tower, payments which seem not very excessive for burying a great man, bnt, according to the other entries, very much higher thau the majority of funerals then cost.

Again, we have it printed in "Scala Perfectionis," in 1493, that the hook was finished "in William Caxston's hons," while in Lyndewode's "Constitntiones," in 1496, we find the source of its printing to have heen "Apud Westmonasterium in domo Caxston," thns showing that the good work still continued at the old press. Of this William Lyndewode, it may be remembered, some cnrious particnlars were given by the Society of Antiquaries in 1852, when his body was discovered in St. Stephen's Chapel that year ("Archæologia," vol. xxxiv. pp. 406-430). He was formerly rector of All Saints, Breadstreet, in the City of London, and died bishop of St. David's, in 1446, and at the opening of his coffin in 1852, the late George Cruikshank made an etching of his head, which is very rare, if not uniqne, and which is now in the collection of Mr. Noble.

Although we should have supposed that William Caxton made a will, yet after a lengthy search no trace of one could he found by Mr. Blades. He surmises that our printer had nothing to leave heyond his stock-in-trade; and if this surmise is correct, then the possibility occurs of his having arranged hefore his death who should succeed to his estate. There are entries in the churchwardens' accounts of the "hequest of William Caxton" of a number of his "Golden Legend,"—probahly the second edition of the book which was printed; and we find the parish was paid for sixteen copies hetween the years 1496 and 1504. Unfortunately, the accounts for 1492-1494,—the two years following Caxton's death,—are missing; but in the receipts for 1494-1496, nothing is mentioned. In the first year's accont for 1496-8 we find three copies sold for 6s. 8d. each, "of thee printed hoks that were heqnothen to the church hehove by William Caxston"; in 1498-1500 there were disposed of teu copies, viz., one each at 5s., 5s. 6d., 5s. 10d., and 5s. 11d., four at 5s. 8d., and two for 10s. 4d.; in 1500-2, two copies realised 5s. each; and the last copy, which was sold in the first year of 1502-4 hronght in 5s. 8d.,—snm total of the sixteen copies, 4l. 10s. 11d. Of conrse, the valne of money four centuries ago was very different to what it is now: the entries which we shall quote hereafter will prove that; hut as an illnstration of the valne of the "Golden Legend" in our day, we may remark that in 1812 the Duke of Roxbnrghe's copy sold for 31l., and J. D. Gardner's copy in 1854 bronght in 230l., and became the property of the Duke d'Anmale; and that no perfect copy of the book is known.

Of those gentlemen to whom the chnrchwardens sold their copies, William Ryoll pnrchased two, "the parisshe prest" one. Single copies were sold to four others,—one to "Elys hokebynder," seven to William Geisse or Geyse, and one (in the first year 1498—1500) was "solde in Westmynster Halle" for 5s. 8d., establishing, as we presume, the fact of there having heen hooksellers in the hall at this early period; while at the same time in that year there is actually an entry, "Rewarded to John Roff for the selling of a legende" one penny,—not a rninous commission, one will certainly exclaim.

In 1820 the Roxhnrgbe Club desired to raise a monnment to Caxton in Westminster Abhey, and the reader will snppose that was a very easy matter. Nothing of the kind. It was as difficnlt sixty years ago to get a monnment *into* that sanctnary for the record of the deeds of a *great* man as it has been *sixty* years later to keep one *out* of it,—the only difference heing, one was to the memory to a simple printer, yet to whom the world is so greatly indehted, and the other was to a young prince to whom the world owed nothing. However, the Westminster Abbey authorities prevented Caxton's tablet to he erected within the Abbey in 1820; bnt the natiou was not to be even then readily insulted, for the authorities of St. Margaret's Church gladly accepted the trust; and there it rests to this day.

The next thing noticeable is the total absence of any reliable item referring to the family of our printer. It is trne that in the first year's accounts for 1478-1480 we find "Item the day of hnrying of William Caxton" for two torches and fonr tapers "at a lowe masse," twenty pence, and this William Dibdin assumes to have been our printer's father. In 1464, at the burying of "Oliver Cawston," 8d. was received for fonr tapers; in the first year of the Guild accounts (1475-1478) a "John Caxston" paid 6s. 8d. upon admission as a hrother; in the first year (1490-1492) there was received "atte hureyng of Mawde Caxston" 3s. 2d. "for torches and tapres," and in the second year (1494-1496) "atte hurying of Richard Caxton," 2d. These, with the entry relating to the printer himself, are all that can be found relating to the name in any of the accounts preserved hetween the years 1460 and 1510; but whether either of them was a relative to "our William Caxton it is impossible for us to say.

Having thns given a few details relating to the man himself, we now propose illnstrating the times in which he lived among us a Westminster, hy aid of the parish accounts between the years 1477 and 1492, for the preservation of which the anthorities of St. Margaret's are to be commended, seeing that this parish passed through, and was most closely associated with the men of, a former age when in tronbled times were little respecters of ancient records, ancient customs, or even persons themselves.

In giving in print for the first time many curions items from these interesting hooks which Mr. Noble has very carefully extracted we would but remark that the reader must judge for himself of the relative value of money of four centuries ago and now, for no reliable valnation can be given. It must he presumed that from ten to twenty times would probably be the limit, according to the article or circumstance of the case. Sir N. H. Nicolas, who in 1830 edited the wardrobe accounts of Edward IV. and the privy purse expenses of Elizabeth of York, gives some equally curious items to those we now give. For the support of the queen's two nephews and niece, two females servants, and a groom, 13s. 4d. a week was allowed! The board wages of the "Fool,"—by no means a fool,—was 2s. a month. A surgeon's fee for going from London to Richmond to visit the queen was 13s. 4d., while workmen's wages were at the rate of 6d. a day! A pair of shoes for the fool cost 6d., and a pair for the queen's Beer cost 2s. 8d. a barrel, while two shirts cost 1s. 5d.; and sixteen rowers for conveying her majesty in a harge from Baynard's Castle to Westminster in 1502 had 4d. each, and the master 1s. 4d. These prefatory notes will give the reader some idea of the interesting contents of the Westminster parochial accounts, which we now intend to quote.

1478-1480.

This account is from the 7th of May, 1478, to the 18th of May, 1480 (John Wycam and Nicholas Wollestroft being churchwardens), and consists of forty-five written quarto parchment pages. The first year's receipts amounted to 33l. 16s. 4d., and the second year's to 34l. 15s. 2¾d.,—and a farthing at that date was an important item. The payments for the two years came to 21l. 12s. 6d. and 23l. 6s. 7d., leaving a balance at the end of the account of 23l. 10s. 5½ in favour of the churchwardens for 1480-8. And although all the items appear very trifling they were not so at that date. William Caxton was one of the parishioners present at the audit.

The general account of receipts chiefly consisted of payments made for torches and tapers used at the burial of the inhabitants; but at the end of the accounts there were seventeen items owing, the whole of which was but 3l. 12s. 4d. They would thus appear to have given credit for such matters at that day; for "William Sampson Brewer in Totehilstrete oweth for the burialI of his child, for 4 tapers, 8d." [In all cases we shall use modern figures in specifying amounts.] Then, again, we find "the wife of Nicholas Wollestroft oweth for his burying 10s.," and "for 4 tapers at the moneths mynd of the same Nicholas, 12d." In the first year

receipts we 6nd there wae received "the day of hnrying of William Trollop for 2 tapers," 2d. May we he permitted to ask what relation wae this William Trollop of 1479 to the celebrated builder of the same name in the same parish 400 years afterwards? "The hrynging in of 2 stranngе torches in the chirche at crystynyng of a child" was 8d., and "for 4 tapers w^{t} onr lady candilstykkys," 3e. 4d.; hnt what the occasion wae at which they were nsed ie not speciбed.

The burials of individuals ranged from 2d. paid for two tapere, "at the hnrying of Elizaheth Dennam," to the extravagant sum of 17s. 2d. paid "the day of hnrying of John Wytteney for 4 torches and 4 tapers, and the pytte and the helle," consequently, Westminster that day was witness to "a grand funeral." "The yeres mynde of Sir Thomas Grey for 4 tapers," cost 12d.; and this year's mind wae the religious ceromony in the chnrch, held on the anniversary of the knight's death, whon his soul, his wife's soul, his mother's and father'e souls, and all Christian sonle, were prohahly prayed for. For "hnrying of a child from Saynt Albons" 2d. was received; and if this meant St. Alhans, Herts, the child was hrought (for those times) a very long way. In all these accounts the vast majority of fnneral payments were 2d., and somotimes the entries were very vague ahout names; for instance, "one Crystopher of Knyght-hrigge," and "a hrewer'e wife fro. Charyng Crosse," the latter costing for fonr tapers 8d. The burial of "John Shordyche" cost 2d., while that of "Sir Alexander" was 4d.; hnt the most interesting entry of this year'e acconnt is "Item, the day of hnrying of William Caxton for 2 torohee and 4 tapors at a lowe masse," 20d.; and this is enpposed to have been the father of onr printer.

In the second year, the "hnrying of Rohert of the Covent [Convent] Kychen for 2 tapers, 2d.," and the same for "Isahell Braye,"—and at this early date the Bray family was a noted one in the parish. When a parishioner was above the ordinary folk, and conld afford hurial in the chnrch, he was favonred with a "pytt," as the grave was called, for 6s. 8d., and as a rule his "knyll with the helle" was rung, which cost 6d., as was the case with one Richard Cowper. "A Mayde of the Swan,"—a noted tavern in the parish,—was hnried this year, and there was paid "for 2 tapers 2d." as nsual.

Another source of receipts was "The Comon Gadering,"—heing collections made on feast days and holidays: Pentecost, St. Margaret, All-Hallowe', Nativity, Good Friday, and Easter Day, the latter heing the grand day. The two years' receipte amounted to 19*l.* 7s. 11½d., of which nearly a half was collected at Easter.

Pew-rente were then in existence, of which there are twenty entries the first year, and forty-three the second. According to position in the church, so they appear to have heen charged, some being 12d. and some as high as 3s. 4d. Thns "William Cowper for a pewe for hie wife" paid a shilling, and "John Breght for his pewe" 3s. One entry reads, "Thomas Bough for an cuyr almȳ under the foot of o^{r} lady of Pyto to kepe brede, wyne, and wexe for straungē to syng w^{t}, 12d."

Under the heading of "Bequests" we find one giving 20d. and another 20s. Others gave various articles (as Caxton did in 1491,—copies of his hook). Thns we find "the guyfte of John Wardrop a playne towell conteyning 3 yerdys," while the wife of John Taillonr gave another towell of diaper eight yards in length.

The "Dyvers Payments" which were made during the same period are interesting. In the first year "to 4 men to here 4 torchis on Corpns Xpi day, 4d."; and "in Wyne to the Syngers the same day, 4d." Throughont these accounts we shall eee many entries of payments for wine, ale, hread, and snch "creature comforts." The two clerks and headle received amongst them each quarter 5s. St. Margaret's-day was then a high festival in the parish. The first year we find "to John Greve for a rewarde for the Clothe of Arras at Seynt Margrete day, 2s."; and "to a man *for a day* at the hangyng np of the saide Clothe and takyng downe, *and for brede and ale to them*, 6d." In the second year, "for hrede, ale, and wyne into the rode-loft on Saynte Margrets day, 12d.," while these refreshments were preceded the night hefore hy a more elahorate, if less costly, entertainment. "Paid in expenses at tavern on Saynte Margaret evyn npon the Syngers of the Ahhay, 8d."

Here are a few entries that may interest our building friends:—

"For a new dore at the hedde of the steple and lok to the same dore 2s. 1d. For a dore in the rode lofte to save and kepe the people fro the orgaynes, 12d. For half a hnndred of 6d. nayles, 6d. For makyng of a new dore for a pewe, 8d. For makyng of a newe staire in to the rode lofte and the stuffe, 30s. For a pnl-pytte in the chirche-yerde agenst the prechyng of Doctonr Penkey, 2s. 8d. To a carpynter for makyng of a rofe ovir the new steir and the tymhre that wente thereto, 2s. To a dauehour and his man for four dayes at the eame staire, 4s. 4d. For a lode of lome, 4d. For 100 lathe, 6d. To Nicholas Plomer for a gotter over the newe etaire, and 4 faggots to make fire, 5s. For makyng of a keye for the chist, 4d. For a lokk w^{t} 2 keyee, 20d. For 3 harrys in the wyndowe at the staire-hedd weying 12 lh. pce. the lh. 2d., = 2s. For a hope of yron for the holy-water tnhhe, 4d. [The hooping of the holy-water tnh was an annnal charge.] For 6 holy-water eprynkyles, 6d. To a carpynter for makying of the crncyfix and the heme he standeth upon, 40s. For kervyng of Mary and John, and the makyng newe, 33s. 4d. For the gilding of the eame Mary and John, the crosse, &c., 6*l.* 6s. 8d. For takyng down of a heme in the hody of the Chirche afore the crucifix, and oettyng up of a new cople arche wyse, and horde to sealyng thereof, and other etnff, 26s. 8d. For naylys, stapule, bolts, and other iryn worke, 6s. 8d."

Among other items of payments we find 4d. was paid "for holme and ivy at Cristmas." "Cotyn candyl for the lantern for alle halowen tyde to Candylmae," cost 12d., and "the lamp bason" 8d. "For mending of glasse wynddowys aboute in the Chirche" cost 4s., and this also appeare to have heen a frequent charge npon the accont. "To Mathew Metynghm for playing at the Orgons when we had hutt one clerk," 8d. "For brede and wyne on holy thnrsday when pcession was done," 8d. "For 4 torchys weying 83 lh. pce the lb. 4d." "For mendyng and makyng clene of the small organs" 12d.

"A Tyler and his man for a days werk npon Seint Margets ile" received 3s. 1d., while "the wyfe of the Balle for pavying tyles" was paid 3s. 4d. Two dozen candles at Christmae cost 2s., hut they were prohahly of larger eize than we hurn at the present day.

Such are a few of the interesting items derived from the accounts of the parish the year following Caxton "opened shop" in it as a printer. We have said that the hook itself ie comprised of forty-6ve written parchment pages. The cost of the hook ae well as the writing of it is eet down at the end in these words:—"To Paule Aeshewell for wrytyng of the hoke of Accompt, 6s. 8d. For Pchement to thie hoke, 14d.,"—both payments, it will he acknowledged, not heing excessive.

1480-1482.

The next accounts which we find in the volume are stated to he from the 18th of May, 1480, to the 23rd May, 1482, William Garard and William Hatchet heing chnrchwardens. Although there are only twenty-four written parchment pages, and of smaller size than the first-quoted accounte, heing, in fact, 8 in. hy 11 in. in size, yet the entries are written closer and more compact. The total receipts for the two years wae 65*l.* 5s. 2½d., and the payments 49*l.* 13s. 10½d., leaving a halance of 15*l.* 11s. 3½d. When the hook wae made np there were hnt two hurials owing for, one of which was "Richard Hunt, yeoman of the Crown," 10s.

In the first year's ordinary receipte we find, "the day of hurying of a man that was slayne in Saynte Jamys felde, 2 tapers, 4d.," and "of a childe of knyght hrigge, 2 tapers, 2d."; "of lewys Welyngton, for 2 tapers, 2d."; "for the knelle of Thomas w^{t} the grete helle, 6d."; and "for 4 tapers," 4d. At the hurial "of Sir Thomas Cleyton, pste [priest], for 4 tapers," 20d.; for 2 torchee, 2s., and "for licence of 4 torches of Seynt Anne," 4d.; at the "Crystenyng of Maistr Chamherlayn childe," 12d. was paid for 2 torches.

There are two interesting entries in the second year; one gives the value of old silver, the other refers to the rent of a honse. The former reads: "Item the same wardeyne charge theymself w^{t} hroken sylver, whiche was of the olde Crosse, weying 68½ nncee, pce the nnce, 3s. 6d. = 11*l.* 19s. 9d." The other entry tells ns,—"the forsayde wardeyns chargith theymself of rent of the tent, called the sonne, payd hy the handys of Robert Bromflete hy all the tyme of this accompte, 7*l.*,"—that is, seventy chillings a year.

The collectione on the "Gaderyng dayes" hrought in during the two years 20*l.* 14s. 8½d.; while the pew-rents (9 the first year, and 47 the second) produced 4*l.* 8s. 8d. Of theee, we find our scribe, "Paul Asshewell, for his wifes pewe," paid 16d., and we also learn he was himself a Pnhlic Notary.

The heqnests in the two years only amounted to 13s. 8d., viz., two money gifts of 3s. 4d. each, and two gifts of a somewhat curione nature. One "of Baynhrigge, a pece of tymher," which was valned at 12d.; and the other, "of John Greve, a marhle etone," valned at 6s. What the churchwardens did with this marhle stone we are nnahle to say.

It was no nncommon thing for the church goods to he lent out in these times, for there is an entry of "a Rewarde of the Lord Berkeley for a vestment and a chaleys," 12d.

The payments are as varied as nsnal. A lantern cost 9d.; a lock with key for rood-loft, 6d.; "a fire panne," 6d.; "for makyng clene of the Chirche yerde," 20d.; mending a pew in the church, 2d.; mending the velvet ahove the sepulchre, 4d.; and the glass window in the rood-loft, 4s.; two red skins "for 2 etolye in the qnere" cost 8d.; and 4 yards of green fringe, with nails and making, came to eleven pence more.

We can readily helieve the condition of the churchyard at that date, and at certain periods of the year, when we read such entries as this continnally occnrring:—"For carrying awaye of dungge in the chnrcheyerde, 4d."

A chain to the church-door cost 3d.; a rope for the little hell, 6d.; hanging of the hells cost 5s.; and "a halderyck to the grete hell, 6d."

St. Margaret'e Eve this second year was attended by the singers of the King'e Chapel, and the wine which was hy them "drnnkyn at Rohert Whityngton" coet 2s.; and for the wine had for them the next day in the rood-loft, 16d. was paid; and "when even songe was done" at Thomae Burgesy's, 2s. 4d.

Of conree, there were eoveral "pite" opened in the chnrch for the hnrial of the aristocrats of the parish, and for paving these over, John Faydar received 3s. 2d., and in thie oum we presume stone was included. The special paving over of "Jone Witteney'e pitt" cost 8d.

We have already given the extract relating to the hreaking np of the old cross, and we now come to the entries relating to the pnrchase of the new one. "For the new crosse, weying vi^{xx}x [130] nnces pce evry nne v^{s} [5e.] sm.," 32*l.* 10s. Now for this elahorate piece of work it was necessary to clean np the staff, the painting of which coet 20d., while "for gyltyng and hnrnyehing of the npper parte of the crosse staffe and hnrnisshing of the fote of the crosse," coet 4s. more.

Mr. Ashwell received 6s. 8d. for writing the account, and 12d. was paid for the parchment.

1482-1484.

"Here folowith th accompt of William Burghm and Thomas Crane, wardeyns," &c., from 24th May, 1482, to 24th May, 1484. This is written in twenty-six folio pages hy onr old friend Ashwell, and William Caxton attended the andit. The two years' receipte amounted to 66*l.* 11s. 10¾d., and the paymente, 47*l.* 11s. 5¼d., leaving a halance on the right side of 19*l.* 0s. 5¼d.

Among the general receipts we find, for 4 tapers, "at the yeres mynd of Richard Humfrey fader and moder," 12d.; "the day of hurying of a poore woman w^{t} in grete Maude in totehil strete," 2d.; "at the hurying of John Shordyche wyfe," for 4 tapers and two torches, 5s.; "a man at the vyne gardyne, 2 tapers," 4d.; "of Thomae, of the Convytte house, 2 tapere," 2d.; "of a preist oute of Chanon Aley, 4 tapers," 12d.; "for 2 torches for the same preist to brynge him to the chirche," 16d.; "of John Nicolas, yoman of the Crown, for 2 tapers," 4d.; "of Jamee Halywell, for 4 torchee to hrynge hym to chirche, 5s.; for 4 tapers, 20d."; "of Sir Willim Hopton, tresorer of the king's howse, for his pytte in the chirche, 6s. 8d.; for lycence of 24 torchee and 4 tapers, he gave to the chirche 2 torches; for his knylle, 6d."; "the day of hnrying of longe Jone, for 2 tapers, 4d."

"The Comon Gaderyng day" receipts produced, in the two years, 20*l.* 4s. 9d., and the pew-rente (twelve items the first year and thirty-seven the second), 3*l.* 16s. 10d.!

"The hequests" only amonnted to 18 yards of diaper, and from two donors, in the eecond year.

With regard to the payments, "three hondys of iron to the hatche at the chirche dore" coet

in 1878, 38,898 mètres, at a coet of 577,757 lire; there were aleo completed 43,359 mètres of provincial roads, at a cost of 1,178,277 lire; and several branches of the national roads. The railway works are aleo rapidly advancing, especially the main line between Cagliari and Sazzari; and it is expected that early in 1881 the two principal cities of the island will be united by rail,—a circumstance that will produce a marked improvement in the eocial and moral conditions of the island; and still more important will he the means of harmonising the feelings of rivalry which these cities entertained for supremacy, as they were almoet unknown to each other by the former difficult means of communication,—a feeling which ancient Governments did not seek to appease, hnt rather foetered, in order to keep the Sarde divided among themselves. In point of roads, then, and means of communication, the island is making rapid strides, and will not long delay to reap the benefit of euch an important work.

According to an official report from *Odessa* a large extent of grownd there—now oovered by the sea,—is being filled in, on which customhonees will be built. Quays are being made along the partthue reolaimed, and an additional harbour, to he obtained by dredging, will be protected by a breakwater, in slow process of construction. It would be well if, before proceeding to dredge the new harbour the present harbour were dredged to a sufficient depth. An Englieh veesel drawing 22·4 feet got agrownd in the harbour, causing much detention and loee of time. A plan for a new theatre has been accepted. It will be very handsome. Extensive drainage works are in conrse of construction, and are partially finished. The sewerage will he carried many miles ont of town. It is hoped the health of the town will be thereby much improved, and also that it will he the meane of fertilising a large extent of ground now a saltmarsh. Tramways are being laid in the town, and are to extend to some neighhonring villages. The lines outside the town will probahly he worked hy eteam.

From *Damascus* we learn that, as regarde pnhlic works, there is little to notice, Government impecuniosity not even permitting the regular payment of engineers. A so-called carriage-road has, however, been made between Damaecus and Homo, whence it has been carried on to Tripoli; while another ie now being traced out hetween Damascus, Kuneitrah, Merj Ayoum, Nabatié, Sidon, and Beyront; the works to be executed by forced lahonr of the peasantry long the road. The ovile attending the want of roade in Syria were amply demonstrated in the case of the district of Latakia, the last harvest of which, inetead of being far helow the average, as in other districts of the conntry, was in excess over former years, permitting large exports to Italy during the past autumn. The freight per 100 kilogrammes from Latakia to Leghorn and Genoa was 2½ fr. hy sailing-vessel; that, from Latakia to Hamah, across the Anegaliah mountains, a jonrney of twenty-four honrs on a good road, hut three daye hy the present track, was 10 fr. The districts of Hamah and Homo are now obliged to import grain from Egypt, involving a sea voyage and a three days' land journey.

From *Kastamuni* (Tnrkey) we get eome particnlare ahont honeee. The poorer olasses live in log hnts, generally hnilt on prope, which raise them one story above the ground; underneath, the stahle is constructed amonget the props. The rooms are low, with very small windows, a lage fireplace, and a large platform or baloony ontside, open to the air; the roof is of shingle or tiles. The hetter-class houses are hnilt of wooden framee, filled in with sun-dried hricks, and they are panelled inside with wood; they are eometimee plastered ontside, and have glass windowe. The rooms are generally partitioned off, leaving large open spaces on each floor, so that the commnnication from room to room is through the opan air; this is healthy, bnt trying in winter. The Christian honees are generally the hest, and are hnilt in more European style. At Sinope there are some good honsee.

From *Java* we get some information regarding the Batavia Harbour works. Great progrees hae been made with the conetruction of the new harhour during the past year, and the engineers in charge deeerve credit for the energy they have displayed in overcoming the various obstacles with which they have had to contend. Owing to the inferior workmanehip of some of the dredging-mills which had been obtained from Europe, dredging operations were somewhat retarded at the commencement of the year; hut this deficiency has been more than counterbalanced hy the rapid strides made in the other departmente. In the first section (at Tandjong-Priok) the greateet activity has prevailed. The exteneive workehop there, consisting of a emithy, a hoiler manufactory, a copper foundry, a carpentry establishment, &c., was completed and hrought into nee early in the year, eighty-five machinee driven hy steam heing daily in motion. A large warehouse was aleo finished in which the whole etock of working materials, representing a value of ahout 1,500,000 guilders, was stored. During the latter period of the year the monthly dredging operations averaged ahont 80,000 cnhic mètree; hnt it is hoped that, ere long, 100,000 cnbic mètree per month will he removed under more favourahle conditione. An important eaving in the coet of the foundations for the hreakwaters, and one not calculated upon in the original eetimates, has been made hy the discovery that the sand dredged from the inner harhour, when amalgamated with the clay-soil on which the foundations are laid, forme a hard resisting substance capahle of hearing the weight of the trachyte superstructure without sinking, so that a considerahly smaller quantity of thie stone than originally expected will, in all probability, he required to complete the piers.

ARCHITECTS AND CONTRACTS.

The following letter, signed "A Houseliolder," was printed in the *Times* of Saturday last, and was commented on in a leading article:—"Building Difficnlties.—Sir: Why is it that no effort is efficient to obtain accurate knowledge ae to what will he the cost of huilding or repairing one's house? Allow me to state the difficnlties which, in my own experience, attended the alterations of a honse. We once thought we should like to have two new windowe thrown ont in the drawing-room and a slight alteration made in our stable-yard. We conenlted a huilder, who presented us with a very neatly-written estimate, apparently fnll of the frankest detaile. The coet wae to he 50*l*. The paper looked exceedingly enconraging and pleasant, and with light hearts we embarked in the scheme. We endeavonred to keep an eye on the workmen, and acted as onr own clerk of the works. It wae just a month before the work was done, and we eaw the men clear ont. The hill eent was hy no means so clear and frank a docnment as the promising estimate. The cost of onr windows, &c., was ahout 100*l*. Our friends console ns hy telling ns that they have known much worse cases."

Inferentially, the *Times* gave its correspondent a proper answer in saying, "Few men are competent to he their own architects. They will generally repent it hitterly if they dispense with professional advice." Bnt then, unfortunately, it goes on to assert that the result, so far as increased expense is concerned, and so far as regards the impossibility of learning beforehand what will he the coet of huilding or repairing one's house, will he precisely the same even if an architect he employed. "Most huildings," the writer says, "are erected nnder arrangemente which naturally and almost inevitably terminate in ench a manner as we have deeorihed"; namely, that "the total coet" (though there have heen drawinge, specifications, hills of quantitiee, and contract), "is ahont twice as much as that which wae contemplated or, as the owner thonght, was hargained for."

Now, thie ie not trne. The *Times* article ie written with moderation, and, douhtless, in perfect good faith; it admits that "no more honourable hody of men than architects exists"; hnt it is founded on insnfficient knowledge. The writer judges all from a few. We assert unhesitatingly that huilding operations are completed every day of the week, whereof the cost, so far from being twice as much ae was contemplated, doee not exceed the amonnt agreed upon except to the extent of the cost of additions or alterations made hy the employer. The answer to "A Householder's" first inquiry, "Why is it that no effort is sufficient to obtain accurate knowledge as to what will be the coet of huilding or repairing one's house?" ie, that it starts npon a false aesnmption. Without any great effort such knowledge can he obtained, and is obtained, every day. If the employer himself knows exactly what he wants, employs a competent and honourable architect, conveys to that architect his views, and avoids alterations he need not fear any important addition to the amount of the contract.

ROSLYN CHAPEL.

It will concern every one interested in matters archæological to know that it is proposed to make an addition to this ancient historical monnment and most interesting example of Mediæval art.

The chapel, as many of onr readers are aware, ie merely the chancel of what was intended to he a cruciform church. The west end is entirely destitute of openinge, the chancel arch, which is richly moulded and decorated, heing hnilt up. This obstruction is to be removed, and a small addition of one hay made to the west end. The carrying ont of thie plan has been entrusted to Mr. Andrew Kerr, formerly of her Majesty's Office of Works, a gentleman known to he poseeseed of a fnnd of antiqnarian lore. The pnrpose of the addition is to provide a baptistery and organ-chamber, the latter of which is much needed, the instrument now in use having suffered greatly from damp. The new structure is to he two storiee high, and of the breadth of the central aisle, the organ-chamher being reached hy a spiral stair. The haptistery showe on teach side a single light window and a western doorway, flanked hy small lancets, the roof being formed hy the floor of the organ-chamher. The organ-chamher shows at the sides similar windows to those below, and at the west end a circular window, filled in with a cross, will he seen from ahove the organ. The roof is flat, and the walls are to he lined with pitch-pine, of which material all the wooden fittings are to he formed. The internal walls of the haptistery are to he lined with the old stones, which were used in huilding up the chancel-arch. Externally the elevation shows a flat roof, with cornice and parapet. The western angles are eplayed off, having hnttresses at the ohtuse angles, which terminate in pinnaclee, with foliated finials. On the face of the huttresses are niches, and the same featnre appears on the narrow epace hetween them.

What strikes one most when examining the plans is that the whole height of the chancel arch is not embraced hy the new portion, the flat roof reaching only to the sprinqing of the arch, and the portion above heing filled in with glass. This arrangement has been arrived at with the avowed object of showing distinctly that the addition is no part of the original design. The enriched moulding of the chancel arch will be seen cropping up through the flat roof and the walls on each side, which declare that transepts were intended, are left open to inspection.

Mr. Kerr has given the matter his most anxious consideration, his desire having been to disturb no single feature of thie nnique structure; for the addition might, at any future time, he removed, and the chapel restored to what it was, the only portion interfered with being the wall which fills up the chancel arch.

While designing the addition to harmonise with the original, Mr. Kerr has abstained from any attempt to rival it in richness of detail.

THE PROMOTION OF THE FINE ARTS IN SCOTLAND.

The annnal meeting of the Association for the Promotion of the Fine Arts in Scotland was held on the 28th ult. in Edinhurgh. Mr. A. S. Kinnear, advocate, occupied the chair, and in opening the proceedings said he was eatisfied that the Asecciation was serving a good and neeful purpoee; and if they compared the state of public opinion ahout art as it wae now and as it wae forty-five years ago, hefore the society came into existence, they would have no donht that not only that institution, hnt every inetitntion and every influence, whether embodied in an institution or not, which had for ite object the diffusion as widely as possible of a taste and appreciation for art had been working continuously, persistently, and most snccеefully for the attainment of that end. Why, it was now an axiom which everyhody took for granted, that the love for and enjoyment of works of art was not only one of the most nohle pleasures of the human mind, hut one which ought to be, and might very easily be, bronght within the reach of almost everyhody in a civilised community. Now, he was persuaded that was not a senti-

ie same way, if a light were introduced, as a ixture of 50, or 75, or 90 per cent. of gas? a case accentuated by such misfortune, and y such happy escape from more overwhelming isfortune, it would be well if the official lviserc of the Metropolitan Board of Worke had veu a little more definite and practical infor- ation ae to explosive mixtures. This ie ren- ered the more necessary from the intermittent ature of the explosione; and we cannot but rge upon those whom it may concern that this neetion of successive explosions, whether in ie Tottenham-court-road case, the Bilston case, the case of the Frameries Colliery (p. 100, *ute*), ought to he made the subject of accurate xperimental investigation. It would be little nort of a scandal to science to remain satisfied ith the hypothesie that, *somehow or other*, in efiance of the laws whicb have bitherto been eld to regnlate the interpenetration of gases, dribble of coal gas into a pipe would form a riee of seven puddles of explosive mixtnres, parated hy just ench a mixture as would hurn ke a slow matoh!

When the eeries of phenomena in tbe two ases are compared, the idea suggests itself that ach explosion must have had a distiuct effect,—echanical or chemical,—on the unexploded ortion of the gas. Thus, for instance, looking t the differsnt specific gravity of the car- nretted hydrogen (wbich is 0·4381) and of air which is taken ae unity), it is conceivable that itber the lighter or the heavier gas ebould have een so much more readily acted upon hy the orce of the explosion as to have been driven hrongb the mixtnre until it accumulated in an xplosive proportion.

We do not, in suggesting thie explanation, at ll ventnre to assert that such was the case; ut the phenomena are, as yet, altogether nnex- lained. We may hold, and do hold, that mix- nree of different proportions were present, within he interval of time that separated the first rom the last explosion, in different parts of the ain in one caee, and of the colliery workings n the other. We do not thiuk that this state of hinge can have been caused by the nninter- upted action of a leak in a valve, or of a lower from one portion of the mine. Science ill be extremely imperfect until the cause of he intermittence of the explosione ie made lear. We suggest what seems to us a possible bysical canse. We shall be glad to hear of urther investigation boing directed to the ubject.

The final recommendation of the reporters gainst testing gas-leakage hy open flame is one hat we think should have the wideet circulation iven to it. Such a proceeding might, with dvantage, be made subject to heavy penalties. But with regard to the applying anything of he nature of a jet to the stand-pipe, it should e remembered that this would tell nothing as o the contents of the main without they were nder pressure. If this he forgotten, what is nggested ae a test for safety might lead to isaster.

FROM THE BANKS OF THE SEINE.

Were the French public not accustomed to he enunciation and practice of somewhat startling political theoriee, they would have reason to he indeed alarmed at the accouut their daily papers have recently given them of the resolutions of the several working-men's con- greeses which have been held within the last few daye at Paris, at Lyons, and Marseilles. The English householder would he scared to have eerved up with his comfortable coffee and hie hot rolle or hie toast such printed imprecа- tione and threats ae those to which the dele- gatee to these congressee have given free vent Fortunately, bowever, the whole agitation has met with general indifference on the part of the pnblic, if not of the professional world. The Paris congress continued, to the day of its close, to breathe, against all remonstrance, the same threats, and preecribe for the eickly state of our social system. It was not, however, without further startling us by the enumeration of some really refreshingly novel viewe that the congress was to break up. "Every workman who saves money ie a robber, and commite a crime against the State," was one of the last deliberations of the congress. What the laborious and thrifty workman has placed in the savings-bank, he has robbed from the "collectivity," for if he had epent his savings he would have occupied a certain nnmber of his fellow-workmen. One delegate even defied tbose about him to point ont any eingle object, "bowever emall, which, possessed, ie not branded with the same in- famone stamp." It ie evident, tberefore, that, in the minds of the collectivists, the definition of Proudhon, that "property is robbery," ie an accepted axiom. The views of the congress on *salaries* are equally worthy attention. According to the congrees, a good workman must not not be paid more tban tbe bad,—a desiguer and hrain-worker more than the navvy, —the architect more than the mason or the bricklayer; and all tbie on the ground that tbe good workman alone owing bie special talents to the education he has received or to the enrroundings in which he is placed, it is "collectivity" which has given bim tbe power of making use of his talente. Had M. Garnier not bad masons and carpenters at his disposition, urged one delegate, it would have been impossible for him to have bnilt his Opera-honse. Whether the sketch of thie "collectivist equality" reigning among mankind at large hae or hae not heen drawn from the life at a well-arranged convict prieon, we know not, bnt certain it is that there will he found in perfect working order this admirable system of equality in the acknowledgment of talent. There, special individual powere are little taken into account; the same hours, the same work, the eame rontine, is imposed on all alike. In this well-ordered existence a democratic equality of ealary reigne supreme; one eole difference can be drawn between this system and the application of the "collectivists'" doctrine. Under our existing lawe the equality of prison rules is alono inflicted on criminals; tbe worthy "collectiviste" would eeem to wish to apply it to all honeet workmen, laborious inventore and creators, and the rest of society at large. Needleee to say, that to attain this cherished ideal, insnrrection ie scen to he the sole means; when insnrrection will have killed thousands npon thonsande of men, the survivors, if they carry out the programme of the Paris congress, will have nobly acquired the right, not to gain money, still less to economise, but to have nothing that any one can call his own, natnrally not even bie family; perhaps the worde "my" and "mine" will disappear from conversation; he will, however, have the hononr, as an evening paper wittily observed, of being one of the occnpants of the convict prison of the future. The firm protestation of M. Drouet, which was mentioned last week, has not remained nnsup- ported; among the protestore an unexpected ally arose in *Citoyenne* Rouzade, who, in the conrse of her well-expressed address (in which naturally the rights of her sex were set forth), rated the "anarchists" so warmly in showing their weakness in imagining that any system "can destroy the causee of division, which are inherent to human natnre," and in further showing how "the realisation of their views would lead to the complete extinction of society," that she gained, curiously enough, a round of applause. But this is not the sole protest to add to that of the Havre delegate, whose action has been since fully approved in an admirable letter addreseed to him from Havre hy the "federal commission,"—a letter of which one passage merits notice. "Taught hy the events of history, which have showed us that violence has never founded any durable state of affairs, we have decided to demand the just reparation of the abusee from which we suffer, solely by tbe methodical organisation of our forcee under the protection of the just lawe whicb we claim, and which we will obtain by pacific meane, since we know the value of onr voting-ticket." In our last letter we urged on English readers the warning that the opinion of the great majority of workmen and artisans in France must not he judged hy the inanities expressed in these con- gresses of so-called "working men." The true- hearted and thoughtful workers have hastened to protest warmly against the violences expressed. With M. Dronet'e withdrawal, the trade com- mittee of the bronzeworkers, after matnre con- sideration, addressed to the congress a reproof of its "had action" in helping the supposed common cause. It is eatisfactory to feel tbat the real workere repulse any idea of associating their views with thoee expreesed by tbe con- grese, and which if they do not meet with the same indignant proteet, pase off in the midst of indifference.

Among other exhibitions, the competitions for the variouе "Prix de Rome" in painting, sculpture, architectnre, and engraving, bave attracted within tbe last few daye a large number of the students and art-lovere to the École des Beaux Arts. To friende and relations aud echool-cbums these exhibitione may be very interesting; bnt it ie eo rarely that any special ability shows iteelf in these yonng aspirante for fame, in whom study and a better acqnaintance with the works of their great predecessors can alone develop any peculiar talent, that the interest of tbe July ehows at the École is some- what (with the foreigner at least) blunted after a residence on the hanke of the Seine, and a growing acquaintance with the treasnree of the Louvre and the other museume. We can ein- cerely eympatbise with the conscientioue editor wbo, unassisted by enthusiastic helpers, desires to give a faitbfnl acconnt of these competitions. We cannot wonder tbat there should appear some truth in the accusation that conductore of jonrnals are not alwaye warm in the interest they show in snch questions, and tbe nntanght artistic world are much more indebted than tbey sufficiently acknowledge to those editore who freely open their colnmns to the consideration of the subject. Ae we bave so often remarked, it ie the arcbitects who ehow in their exhibited work the most satisfactory results of their study. Whether these resnlts lead to any real further progrese beyond the furtherance of archæological erudition, ie a qnestion difficult to decide; but certain it is tbat after their spell of classical arcbitectural stndies at the École, and in Italy or Greece, Classic architectnre seeme to bave no followers when once the etudent hae entered at home the active rauke of the pro- feesion.

PUBLIC WORKS ABROAD.

From a eeriee of official papers presented to Parliament, we get some interesting information relative to the progress of public works abroad. Thus, with regard to *Venice*, we note that the pnblic cemetery in the island of San Michele, five minntes distant from Venice, has been re- modelled and enlarged. The municipality bave eet apart three burying-gronnds for the inter- ment of the romains of Protestants, Orthodox Greeke, and Jews. The works are actually in a very advanced state, and it is asserted that the cemetery will be completed and opened to all classes within the present year. The repaire effected on the north and south façade of St. Mark'e Church, in Venice, as readers of the *Builder* know, have lately been much criticised by Englisb echolare and artists, and hy the majority of Venetians, who, in concert with the former, argued that the glow and rich colour of tbe old marhlee and columne had been com- pletely destroyed; that the new marhlee em- ployed were nnequal to such a magnificent structure; that the priceless old mosaics bad been ratber rndely refitted; that the part of the pavement anew reconstrncted had lost all its original beauty of colour; and finally, that the whole reetoration was not carried out with the devotion due to one of the most splendid monnmente of Venetian grandenr. On the otber band, it was alleged that when the repaire hogan tbe marbles were simply in a state of utter decay; that the rebuilding of the north façade began and was brought to an end under the Anetrian rule, and tbat the Italian authorities had consequently no alternative left but to preserve the same style on the south façade; that it was impossible to replace the old marhlee brought there in different cen turies hy Venetian commodores from the East; that it wae not a question to stop for the moment tbe ravaging work of the time, but, to prevent ruin by a radical restoration; and that, among many other difficulties, not one of the least wae the large amount of money required for such a colossal undertaking. The deep interest felt by the English nation in the fate of the most magnificent work of art erected by tbe Venetian Republic cannot ultimately fail to create a feeling of gratitude amongst sensitive Venetians. The Italian Government have issned peremptory orders to stop for the present all repairs on the principal façade; and a com- mission for the preservation of ancient monn- ments wae directed to proceed thither, and to report any resolution they may arrive at to the Superior Council for Fine Arts, who will subse- quently pronounce a final verdict on the matter.

We fnrther note in reepect to public works in Italy that an important activity is manifested in the province of *Cagliari* in the construction of new roads, whieh are divided into three classes, —the national roads, made hy the State; the provincial roade, made by the province; and the ordinary obligatory roads, made by the communes. Of the latter there were completed

NATIONAL PENNY BANK AND ARTISANS' DWELLINGS, CLERKENWELL.

This extensive pile of buildings, at the corner of St. John's-square and Clerkenwell-road, has been opened for business and occupation. The buildings were to have been opened by H.R.H. the Princess Christian, but owing to her Royal Highness's other engagements, the formal ceremony had to be deferred.

The ground and first floors of the building are used for the purposes of the National Penny Bank and three shops, the whole of the upper part of the building (*i.e.*, the second, third, fourth, and fifth floors) being planned for artisans' dwellings,—two sets of two rooms and two sets of three rooms on each floor, with w.c. to each set of rooms. The floor of the second story, separating the artisans' dwellings from the bank premises, is fireproof, formed with 6 in. by 2 in. rolled iron joists, 12 in. apart, filled in with selenitic cement concrete, and covered with joists and wood flooring. The roof flat is also of the same construction, but covered with Lawford's patent asphalte, to form a drying-ground. On the roof flat is the laundry, formed with framed timber, roofed with corrugated iron, and fitted up with four coppers, the water being laid on to each. All the rolled iron joists are supported on cast-iron columns and stancheons. The main staircase is constructed of Portland stone, running in continuous flights from basement to roof, with wrought-iron grille on each landing. Each set of rooms is furnished with cupboard, larder, and coal-cellar. All the rooms are plastered and papered throughout, the corridors having a cement dado 4 ft. high, and painted. At the end of each corridor is a dust-shaft fitted with wrought-iron door, the dust descending to a place provided for its reception in the basement. The roof over the staircase is covered with Broseley tiles. Ventilating pipes are carried from each w.c. to the highest point of the roof, also from the sinks in scullieries.

Externally the facings are stock bricks and terra-cotta dressings, relieved with terra-cotta string-bands 12 in. square, each bearing the device and inscription of "The National Penny Bank." The bank portion of the building has a large projecting bay and circular corner, built with red brick and terra cotta. The building has a frontage of 140 ft., and a height from the ground line to the top of the parapet of 70 ft. The foundation-stone was laid in August last by her Royal Highness the Princess Christian.

The building has been designed by Messrs. Henman & Harrison, architects. Mr. F. Dashwood has acted as clerk of the works, which have been executed by Messrs. Aitchison & Walker, of William-street, St. John's Wood, Mr. W. Woolacott being their foreman.

BLAENGWAWR SCHOOLS FOR THE ABERDARE SCHOOL BOARD.

These schools have been opened by Sir George Elliot. The new buildings, which have been carried out by Mr. J. Morgan, of Aberdare, from the designs and under the superintendence of Mr. E. H. Lingen Barker, of Hereford, the Board's architect, and without the aid of a clerk of works, include lofty rooms, conveniently arranged for teaching purposes, somewhat in the form of the letter H, the central portion being for infants, in two rooms, measuring 58 ft. by 24 ft. and 30 ft. by 20 ft., the wings being for boys and girls respectively, in two rooms each, measuring 81 ft. by 22 ft., and 21 ft. 6 in. by 19 ft.

There are back and front porches, cloak-rooms, and lavatories to each department, as well as convenient offices in the playgrounds, which latter are divided and fenced in with stone walls, the river Gwawr having been bridged over at the entrances, and parapet walls erected on each side.

The walls are built with local stone, in level bedded courses, with a cavity and internal brick linings. Forest of Dean stone has been used for dressing, and the pointed relieving arches over the windows, and the door-arches are carried out with red and white bricks, similar materials in bands being used in the tops of all the gables, the chimney-stacks being of white fire-bricks only. The roofs, which are covered with Bangor slates, are of open description inside, the curved principals being supported on stone corbels, and the other timbers being stained and varnished, and plastered between. The bell is hung under a ventilating spirette, which rises from the centre of the building, the other ventilation, as well as the warming arrangements, being of a complete character.

Accommodation is provided for 754 children, according to the new, and 797 according to the old, Government regulation; and the cost has been, for the school buildings, with their offices, 3,122*l.* 11s. 9d., 62*l.* 11s. 9d. of this amount having been found necessary for additional foundation works. The cost per head has therefore been 4*l.* 2s. 10d., according to the former, or 3*l.* 18s. 4d., according to the latter calculation. The outlay on the boundary and division walls and gates was 250*l.* 11s. 9d., bringing up the expenditure, independent of the fitting up and furnishing of the rooms, and the formation and draining of the playgrounds, to 3,373*l.* 3s. 6d.

PROPOSED EFFACEMENT OF TOOLEY-STREET.

The well-known thoroughfare in Southwark, which for many generations past has been celebrated as the locality of the "three tailors," has just escaped a process of effacement; for at the last meeting of the St. Olave's Board of Works, a notice of motion had been given to the effect "that the Board memorialise the Metropolitan Board of Works that on the completion of the street improvements in the district, the street now known as Tooley-street may again bear its ancient name of St. Olave-street, which should be extended to the streets now known as Free-school-street and Thornton-street, so that the whole of the improved line of communication which lies within the district, and which, with the parts of Tooley-street not affected by the improvements, runs in a continuous line from London Bridge to Dockhead, may in future be known as St. Olave-street." When the resolution came on for discussion the chairman said it was a very important matter, and he advised the Board not to adopt it without very careful consideration; on which Mr. Sard, the gentleman who had given notice of the motion, said that he had been thinking of the inconvenience that would arise to the large merchants and wharfingers in Tooley-street, who did business all over the world, if it were carried out, and he had come to the conclusion to withdraw the resolution. Tooley-street is saved for the present.

MONUMENT TO THE COUNTESS OF CAEN, PARIS.

The Countess of Caen, who during her lifetime was a great friend of the fine arts, left, at her death in 1872, a large part of her fortune for the foundation of a scholarship in the three branches of art, painting, sculpture, and architecture. The scholarship is confined to those artists to whom the "Grand Prix de Rome" is awarded, and enables them to continue their studies on their return from that city for a further period of three years. The Countess in her will bequeathed an annual pension of 4,000 francs to painters and sculptors and 3,000 francs to architects, the recipients engaging, during the last year, to furnish a work for the museum which will bear her name. This museum will be inaugurated very shortly, and will be established in the right wing of the Mazarin Palace (Institut de France). At the *Salon* last year were exhibited the first three works contributed by the "pensionnaires" towards the decoration of the above museum. The one which more particularly interests us is that of the architect, M. Emile Ulmann, Grand Prix de Rome in the year 1871; "hors concours," 1879. M. Ulmann, as the first recipient in the branch of architecture, conceived the happy idea of a monument to perpetuate the memory of the most worthy and generous Countess. This monument, which will be erected in the museum, is, in a measure, in the Italian Renaissance style, though the composition is original in conception and in conformity with the spirit of the subject. In a recess, reclining upon a cenotaph, her head resting upon one hand, and holding in the other her will, the Countess is dictating her last wishes, which two winged children at her feet are writing down. Above the recess are three niches containing allegorical figures of painting, architecture, and sculpture, with their respective attributes. On either side of the monument are marble tablets on which are engraved those portions of the will referring to the Institution. These tablets are surmounted by the heads of Minerva and Rome. On the base of the monument is engraved the votive inscription crowned by the arms of the Countess of Caen. The entire monument will be of white marble. Our thanks are due to M. Ulmann, the architect, for his kindness in supplying us with every necessary information.

PROPOSED NEW BUILDINGS, NEAR NICE.

ST. MARGARET'S SCHOOLS.

These schools, of which we give a view, will accommodate fifty boys and fifty girls, and are provided with two class-rooms to each school, master's residence, offices, &c. There are two large playgrounds at the back, which will be paved with asphalte. A local stone will be used. The cost will be about 9,000*l.* Mr. Braitbwaite, of Lichfield, is the donator, and Mr. E. B. Lamb, of Manchester, the architect.

VESTRIES, ETC., ST. MARGARET'S CHURCH.

The facings are to be of local stone, dressed with Caen. The interior of the school and meeting-room will be faced with white glazed bricks, with a grey dado. The floors of the passage to the church and porches are to be paved with tiles. The roofs of the school and meeting-room are principally of English oak, and open-timbered.

The cost of the buildings, including tower, will be about 1,100*l.*

The school is intended mainly for the musical instruction of the choir, seating being provided for about forty.

NEW THEATRE, TIFLIS.

In 1876 the Administration of the Russian province of the Caucasus advertised for designs for a new theatre at Tiflis, in the Caravan-Serai, to take the place of the one destroyed by fire. In accordance with the terms of the competition, the theatre was to be constructed of stone, at a cost of 250,000 silver roubles (37,500*l.*); a premium of 1,500 roubles being offered for the best design, and for the next two in merit 750 roubles each. The style of the building, that is the outward appearance of the theatre, was left to the option of the competitors; but as regards its interior, and especially of the auditorium, it was to be decidedly in an Eastern style, Arabian, or Persian. Moreover, the new theatre was to be as nearly as possible like the old one. At the time appointed, four designs were sent in to the committee specially appointed; the devices being respectively "Nie Vpervive" (Not for the first time), "Sphinx," and "Popnitka" (a Trial), the fourth being marked only with initials. The first one named was deemed the best, the successful competitor being the architect Schreter, an Academician. The designs with the devices "Sphinx" (architect Simonsen), and "Popnitka" (Princes Tourmanoff and Liavdansky, captains of Engineers) received the second and third prizes of 750 roubles each. The design of B. A. Schreter, which satisfied all the requirements of the competition programme, is distinguished by the convenient arrangement of the interior of the theatre. The building is lighted by gas, and warmed with hot air.

A PROJECTED MONUMENT IN JERSEY.

A movement is on foot for the erection of a statue of Major Peirson, in the Royal-square, St. Helier's, Jersey. That gallant officer, who led the British forces to victory during the French invasion of 1781, and who met with a 'soldier's death at the supreme moment of victory, is represented standing upright, in a martial costume, and in an observant but hopeful attitude. The model has been taken (from the best engraving extant) by Mr. H. W. Sohier, a clever local sculptor, whose chief works,—busts of Dr. Jeune, late Bishop of Peterborough, Major Peirson, and Advocate Le Sueur,—adorn the town-hall. His latest work is a bust of Swedenborg, presenting a striking likeness. The projected statue will be in marble.

Art-Gallery for Birmingham. — At a meeting in Birmingham on Thursday, about 3,000*l.* were subscribed towards 5,000*l.* required to secure an additional 5,000*l.* conditionally promised by Messrs. Tangye for contributions to the Art-Gallery. The Mayor, who presided, headed the subscription-list with 500*l.*

nt which would have met with anything
universal acceptation fifty years ago.
srs was at that time a very prevailing
nion among sensible and intelligent people
t pictures and statues, and even poetry and
sic, were really toys for the rich, and that
ople who had their way to make in the world
l no time and no money to spend upon such
lles. Now, that was a sentiment which
body would venture to utter privately or
blicly at the present day. And not only at
time referred to were the arts largely con-
ered as mere toys and luxuries for the few;
t even the few could not, he thought, be
nsad of overestimating the importance of
se toys and luxuries, at least when they
re of native production. At one of the
rliest meetings of the Association, the late
an Ramsay, who always took a great inte-
t in its prosperity, said he had been com-
ring certain figures, and that, while up
the ninth year of the existence of the
iety it had expended 36,000*l.* in the pur-
ase of works of art, in a particular year
fore its establishment, the whole amount
ent in the purchase of such works from
exhibition of the Royal Scottish Academy
s 30*l.*, and the sister Academy of Arts
Dublin had subsisted for four years upon
s.! Now, it appeared to him, looking at
ese figures, that there had been very signifi-
nt and palpable progress in the public mind
regard to matters of art. Although he
lieved that the capacity for taking delight
painting was universal, or almost universal,
ll it was a capacity which was not very
rongly developed in people who had no oppor-
nity for sseing good pictnres; and accordingly,
hen a society was formed for tha purpose of
fusing a taste for art, the best thing it conld
, the only thing it could do with any very
eat and immediate hope of success, was the
stribution, as widely as possihle, of as fine
ecimens of art as it was enabled to distribute.
ch was the principal purpos for which the
sociation existed. It endeavoursd to attain
at purpose in two different ways. It had con-
buted to the National Gallery many fine
rks of the greatest of our recent and living
ottish artists; and it distributed, not only all
er the country, hut all over the world, the
rks of Scottish artists in the shape of original
stures, and still more largely in the shape of
gravings. It was always one of their main
jects,—and he thought it was one they would
the last to abandon,—to aid and enconrage
ung artists, whose excellence had not yet ob-
ned acknowledgment. During the existence
the society there had grown up a new genera-
n of Scottish artists, of whose great fame and
putation they were all justly proud; and it
peared to him a remarkable proof of the
ccess of the earlier committees of tbe
ciety in selecting, among the works of un-
own and rising men, those which gave real
dications of originality and genins, that, look-
g hack to the earliest lists of the society's
rchases, he found among them almost every
me which the country and the world now
cognised as that of a Scotch artist who had
ne hononr to his country.

The Secretary (Mr. Cornillon, S.S.C.), then
ad the report by the Committee of Manage-
ent, of which the following is tbe substance:—

The subscriptions for tbe past year, notwithstanding
prolonged depression of trade, both at home and
road, amount to 4,719*l.* 15s., showing an increase of
7*s.* over tbe amount subscribed last year, a result
dnly attributable, as formerly, to tbe hearty co-operation
tbe honorary secretaries. As the presentation work
tbe current year, an etching after the picture by tbe
e G. Paul Chalmers, R.S.A., "The Legend," now in the
ottish National Gallery, has been completed by M. Rajon,
om the recent exhibition of the Royal Scottish Academy
Committee purchased for distribution among the mem-
rs, at a cost of 960*l.* 1s., twenty-eight works of art, con-
ting of twenty paintings, seven water-colour drawings,
d one bust in bronze. The following are the names of
e artists from whom the works selected were pur-
ased:—Alexander Fraser, Robert Gavin, John Hutchin-
n, and Walter H. Paton, Academicians; J. C. Noble and
bert Anderson, associates; George Aikman, Laura T.
ma-Tadema, Jessie A. Brodie, Hector Chalmers, James
danbead, J. Jamieson Chalmers, David Farquharson,
mes Faed, jun., Giuseppe Ferrari, Harry Frier, James
milton, E. Hume, G. W. Johnstone, Robert Little,
illok S. Nisbet, G. Postnn, Robert Ross, Sam. Reid,
hn Reid, Archibald D. Reid, and John Fraser Taylor,
tists. In addition to tbe purchases from the Academy's
hibition, tbe following original paintings were commis-
ned by tbe Committee from the artists, at tbe cost of
l., to be included in the distribution, viz.:—"Novem-
r," by George Reid, R.S.A. (126*l.*); "When the Boats
me in," by William McTaggart, R.S.A. (126*l.*); "An
stern Connoisseur," by W. E. Lockbart, R.S.A. (126*l.*);
Jeanie Gray," by J. H. Lorimer (63*l.*). As regards tbe
graving for next year, tbe Committee announce that they
ve arranged for the reproduction of Sam Bough's
Cattle crossing the Solway," now the property of John
M. Crabbie, esq. The execution of the engraving has been entrusted to Mr. Lumb Stocks, R.A., who has contracted to finish the plate in June, 1880, so that copies will be issued to the subscribers for the year 1880-81. The engraving, which will be 20 in. by 14½ in., is to be in line, on steel. The total sum expended up to this time by the various committees of management of the Association in the acquisition of paintings and sculpture for the members, in the purchase of pictures for permanent preservation in the Scottish National Gallery, and in the production of engravings and illustrated works for circulation among the subscribers, now amounts to upwards of 193,000*l.* The sum at the credit of the National Gallery amounts at present to upwards of 800*l.*, including the percentage of this year's subscriptions, set aside in compliance with the terms of the Association's royal charter of incorporation.

The report was adopted, and other business transacted.

THE VAUXHALL GROVE ESTATE.—NEW BUILDINGS AND THOROUGHFARE.

What is known as the Vauxhall Grove Estate, lying between Harleyford-road, opposite Kennington Oval, and South Lambeth-road, is now being laid out for residences, a spacious new thoroughfare through the centre of the estate forming a portion of the undertaking. This thoroughfare will open out an entirely new road between Harleyford-road and South Lambeth-road, and will accomplish a much-desired improvement in the locality, as it will render unnecessary the present circuitous route between Harleyford-road and South Lambeth-road *vid* Vauxhall and the South Western Railway Station. The houses on the estate, upwards of eighty in number, will be in crescent form, and contain three stories each, with bay windows, and elevations in red brick, and stone dressings. Several of the houses have already been erected, whilst others are in progress. The entrance to the estate from Harleyford-road is distinguished by two pillars, on which are inscribed "The Grove." It is stated that another outlet into Fentiman-road, giving access to Clapham-road, is contemplated.

The estate is being laid out by Mr. Archer, architect and surveyor, the builder being Mr. Coombs, who is also the owner of the property.

SALE OF A LARGE WEST END MANSION.

Last week, under an order of the Court of Chancery, Mr. F. T. Galsworthy, of the firm of Messrs. Chinnock, Galsworthy, & Co., offered for sale at the Auction Mart, the spacious leasehold mansion, No. 27, Portland-place, at the corner of New Cavendish-street. The mansion was described as containing twelve bedrooms, six reception-rooms, and an unusually extensive range of domestic offices, the premises having been recently decorated in a very elaborate and costly manner. The property likewise included extensive stabling in Weymouth-mews, comprising a six-stall stable, with coach-house for four carriages, and men's rooms over. The mansion was stated to be held from the Duke of Portland, for a term of forty years from January, 1874, at a rental of 250*l.* per annum. It was sold for 12,550*l.*

THE PAVING OF THE DULWICH ROADS.

PROTEST BY THE INHABITANTS.

The inhabitants of Dulwich are at the present time much concerned by a proposal of the Camberwell Vestry to lay down York paving in the different roads, which, it is urged, would altogether destroy the exceptionally rural character of the hamlet of Dulwich. Last week a numerously-attended meeting of the inhabitants was held in the Hall of Dulwich College for the purpose of opposing the action of the Camberwell Vestry on the subject. Amongst those present were several of the Governors of the College.

Mr. Young, one of the governors, was called upon to preside, and moved a resolution to the effect that the meeting deprecated the idea of laying York paving on the footpaths of rural roads such as those in the Manor of Dulwich. He observed that the feeling of the governors was entirely with the inhabitants in this matter. Captain Bedford Pim, another of the governors, seconded the resolution, which was carried unanimously.

Another resolution, proposed by Mr. Wraggs, was to the effect that the Camberwell Vestry should be asked to reconsider their resolution to lay down York paving in all roads taken over by the parish. He observed that it would be a thousand pities to introduce York paving in Dulwich, for a thing which might do very well for Camberwell Green was quite out of place in that district. It seemed to him absurd to say that a rural traffic required York paving. He was sure there was no one present who would like to see that beautiful hamlet converted into a mere suburb of London, but that all of them would very much prefer that it should retain its present rural aspect. Mr. Goodall, who supported the resolution, denounced the proposal of the Vestry as one of spoliation. They might as well talk of paving Kew Gardens with York paving as Dulwich. It was on æsthetic grounds, in opposition to the utilitarian notion that every place should be alike because they were under the control of one Vestry, that he deprecated the conversion of that rural hamlet into a town. He had heard strangers remark that they would not find a more charming aspect of rusticity fifty miles from London. Mr. Whitsley, a member of the Vestry, also supported the resolution, stating that in the Vestry he had often strongly urged that the proposition to have all the footways in the parish, urban and rural, York paved, was monstrous. The motion was unanimously adopted, as also another resolution to the effect that the resolution be forwarded to the Metropolitan Board of Works, and requesting their assistance in preventing the unnecessary outlay which would be caused by York paving the roads in Dulwich.

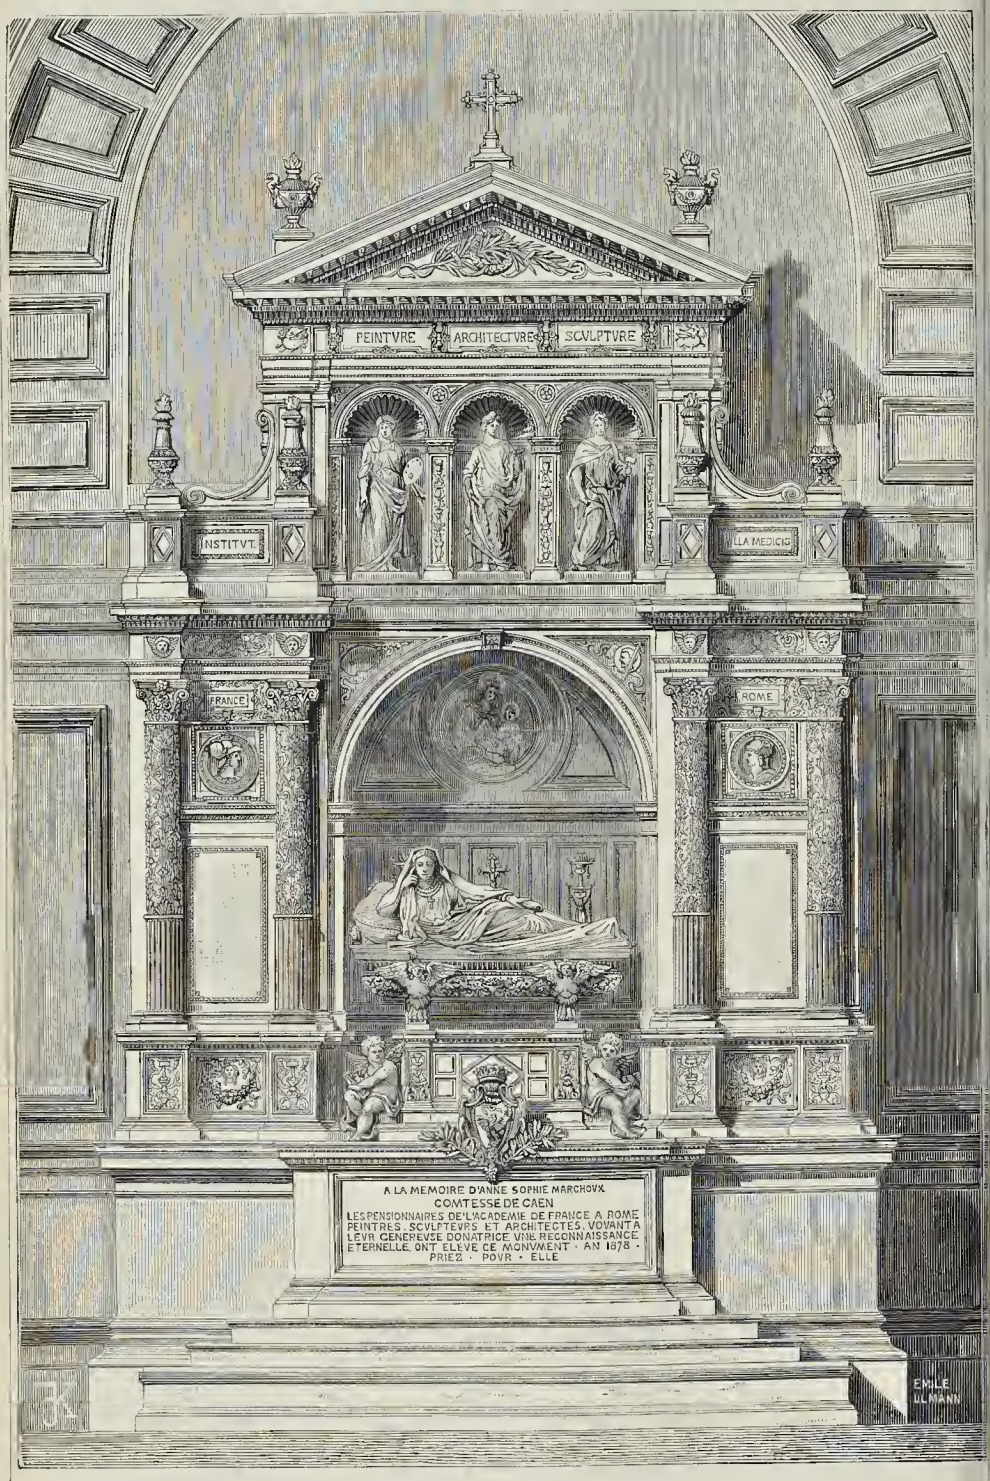
The general feeling of the meeting seemed to be that asphalte and tar paving was the most suitable for the footways in the hamlet.

TREATMENT OF DAMP WALLS.

An interesting and successful experiment has recently been made in Germany in drying a wall which had become damp from outside through a roof built against it, the saltpetre contained in the lime oxydising and forming crystals on the wall. As pulling down the wall would have been too expensive, the following experiments were made:—The wall was coated with liquid asphalte, which, as is well known, cannot be laid on thin, but is in every respect proof against damp. But as oil colour and asphalt do not agree together, paint not adhering to asphalte, the latter was scraped off with the spattle so as to leave very little of it remaining. The asphalte was then softened and made liquid by means of a red-hot iron, or better still with a spirit soldering-lamp, and at once well rubbed about with a stumpy brush, until the remaining asphalte had the thickness of tissue paper. A plate with red-hot sand was then passed along the wall. The sand heated the asphalte, and as much sand adhered as was necessary to enable another mass to be put on, which otherwise would perhaps have not adhered. Two coatings of spirit lac (shellac and spirit) and Venetian turpentine, specially prepared, were then laid on, so that afterwards oil-colour could be put on, and isolated from the asphalte. The oil-colour, white-lead paint, was laid on thickly, and linen or muslin put on this. Much dryer having been used, the whole was dry in three days, when again spirit-lac and oil-paint were put on, and finally the whole work was treated with the spattle. The wall thus operated on has now stood for two years, and although it is damp on the outside, it remains dry inside. The cost is said to have been 3s. per square mètre.

OBITUARY.

Mr. William Moseley, Architect.—We mention with regret the death of Mr. William Moseley, which took place on the 29th ult., at 32, Cumberland-terrace, Regent's Park, in his eighty-third year. Mr. Moseley was appointed county surveyor of Middlesex in the year 1829. He held that office for twenty-five years, and during its tenure built the Female Ward of the House of Correction, rebuilt the House of Detention (formerly the New Prison), added wings to Hanwell Asylum, was the architect of the Surrey Lunatic Asylum at Wandsworth, and of the West Derby Asylum, Liverpool, and was appointed consulting architect to the Commissioners in Lunacy. Whilst in partnership with his brother, Mr. Andrew Moseley, he built the Westminster Palace Hotel, the City Bank in Threadneedle-street, the City Bank in Bond-street, and many other mansions and buildings. He was elected district surveyor of West Islington in 1853, and held this appointment till his death.



PROPOSED MONUMENT TO THE COUNTESS OF CAEN.—Designed by M. Ulmann, Architect.

PROPOSED NEW SCHOOLS NICE.

E. B. LAMB, ARCHITECT - 54 EXCHANGE ARCADE CHAMBERS, MANCHESTER.

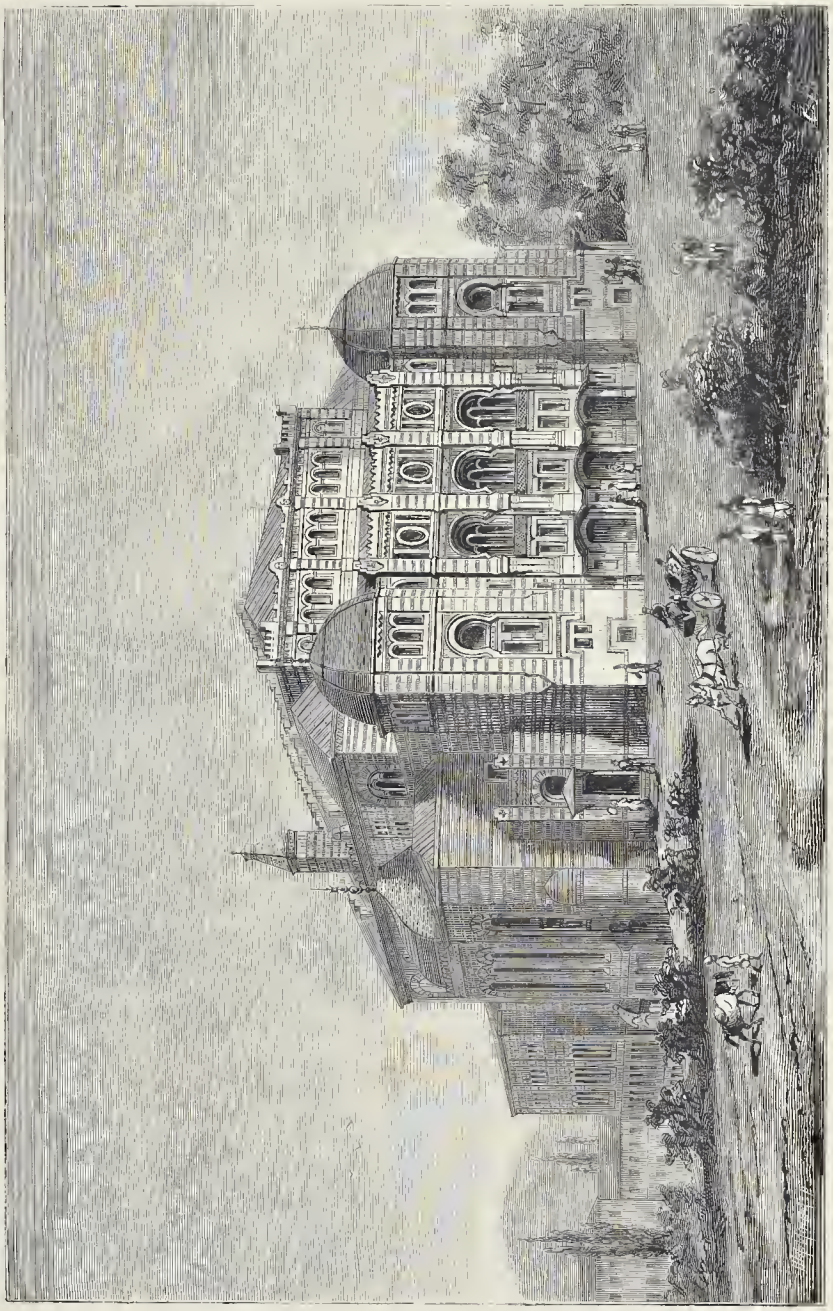
Wyman & Sons Printers, Queen



THE NEW THEATRE AT TIFLIS.—B. L. Schreter, Architect.

MEMORIAL OF KING LEOPOLD I. OF BELGIUM, IN LAEKEN PARK.——M. L. DE CURTE, ARCHITECT.

EXETER HALL, STRAND.

THE Committee of the Young Men's Christian Association having purchased the Crown lease of this property, invited competition designs from three architects for the proposed alterations.

The plans prepared by Mr. Alfred R. Pite, of Bloomsbury-square, being unanimously approved, the committee have authorised the works to be carried out as speedily as possible, that the public may have possession of the Hall early in 1881.

The additions proposed are of an extensive character, the whole of the ground-floor being appropriated to the work of the Association, having spacious reception-rooms and assembly-hall. The mezzanine floor is retained for offices. The large hall is to be considerably improved, and provided with additional staircases for egress and access.

MEMORIAL OF KING LEOPOLD I. OF BELGIUM.

WE mentioned, in a recent number, the inauguration of the monument which has been erected to the memory of the first king of Belgium, in the Park at Laeken, Brussels, and we now give a view of it. Like the memorial of the Prince Consort in Hyde Park, it originated in a public subscription, the amount of which was supplemented by a vote of the Legislature,—in this case, 2,000,000 francs, or 80,000*l.*

The monument is placed on an elevation, from which the visitor has a fine view, not merely of the capital, but of the suburbs. It presents a polygon of nine sides, in remembrance of the nine provinces forming the kingdom, and of these it includes allegorical statues. In the central enclosed space is a statue of the king in white marble. The upper part of the monument consists of an open-work spire, about 70 ft. in height. A terminal statue represents the genius of Belgium holding with one hand the national flag, and in the other a civic crown. It is designed in the style of the fourteenth century, and the architect was M. L. de Curte, who has increased by it his reputation.

Production in England.—From a recent book, "The Progress of the World" (Stanford), it appears that in manufactures England at present stands pre-eminent. Its operatives number 2,930,000 against 2,781,000 of Germany, and 1,936,000 of France, and 1,150,000 of Russia. The production per operative is given as—United Kingdom, 224*l.*; France, 220*l.*; Germany, 103*l.* In the principal textile manufactures,—cotton and wool,—the United Kingdom produces a total of the value of 155,000,000*l.*; the United States, 84,000,000*l.*; France, 68,000,000*l.*; Germany, 48,000,000*l.*

ENGINEERING IN THE UNITED STATES.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

On the last annual convention of this Society, the President being unable to deliver the annual address in consequence of his journey to Europe, it was, at his request, prepared by Mr. O. Chanute, Vice-President, with the assistance of members of the Society. It is a very interesting and valuable review of the subject. We give some portions of it:—

We seldom realise how very young is our profession. From the earliest historical periods, until within about 200 years, construction, practically, was in the hands of architects. They built pyramids, temples, roads, fortifications, and such weak machines as they could work by hand, but it is only in modern times that a special body of men has devoted itself exclusively to the building of works and machines for utilitarian purposes,—to the emancipation from toil of the "hewer of wood and the drawer of water."

So recently as 200 years ago, when the English people began the works which have made them one of the great nations of the earth, there was such a lack of trained constructors in the country that they were compelled to send to Holland for what were then called "hydraulic architecte," to direct the reclaiming of their marshes and to inaugurate their canals. Soon, however, they excelled their early teachers, and trained the very able engineers who established the modern profession, and whose labours led to the invention of the steam-engine scarcely a century ago. We, who cannot remember the time when steam-engines were not in common use, can scarcely realise that their introduction was so recent; and yet it was only in 1778 that James Watt, after struggling for over twenty years to remedy the imperfections of such machines (as invented by others), finally triumphed over all the mechanical difficulties he encountered, and began the regular manufacture of steam-engines. By this step an enormous impetus was given to development and invention. Not only did the engineer find himself possessed of an instrument which increased many-fold the productive powers of labour, but the use of steam, and the wonders it accomplished, turned men's thoughts to the advantages of machinery and labour-saving appliances. Invention followed invention in every field of mechanics, fresh discoveries of natural laws took place, which were quickly applied by the engineer, and he has been able to accomplish more in the past 100 years than had been achieved in the previous 19 centuries. It is my purpose to-night briefly to pass in review what has been done in this direction in this country. In doing this, I shall touch upon some fields which are as yet scarcely recognised here as within the province of the engineer, but which are falling into his hands in other countries, and probably will in time. I think that you will agree with me, that starting as an independent nation about a century ago, with a population of some 3,000,000 only scattered, and with next to no capital, the modern inventions which we have appropriated or made have enabled us to accomplish many remarkable results.

Water Works.—The first works in America for the supply of water to towns were constructed by Hans Christopher Christiansen, and are in operation on June 20th, 1754, at the Moravian settlement of Bethlehem, in Pennsylvania. The water from a spring, which is still used for the supply, was forced by a pump of 9 in. bore, through hemlock logs of 6 in. bore, through hemlock logs into a wooden reservoir. The same ingenious engineer, eight years later, replaced this rude pump by three iron pumps of 4 in. bore and 18 in. stroke, which for many years were the only machinery for water-supply on the continent, and for seventy years furnished the water for Bethlehem. Among the oldest, if not the very oldest in date to Bethlehem, is the Morristown, N.J., Water Company, which was incorporated in 1791, and has ever since furnished the town with water collected from the neighbouring hills. The first application of steam to pumping was in Philadelphia, in 1800, when the third steam-engine of any considerable size in the United States was erected on the banks of the Schuylkill. It is believed that these works were the first constructed by a municipality. The first cast-iron water-pipes were laid in Philadelphia in 1804. New York was first supplied by a company which erected a small pumping-engine about 1800. About 1850 the substitution of light wrought-iron pipe, lined inside and out with hydraulic cement, for cast iron, at greatly reduced cost, was found to be practicable in many cases, and the formation of companies to manufacture and lay such pipes introduced a commercial element into the matter of water-supply, and led to the construction of many works. All American works are constructed for a constant supply, and most of those first built had a capacity far in excess of the then demand, which caused the formation of habits of wastefulness, which it has been found difficult to check when the limit of the capacity was nearly reached. The magnitude of the interests involved in this branch of engineering may be judged from the fact that there are now in the United States and Canada 569 towns with a public water-supply, having a population of about twelve millions, to whom there are daily distributed over 600 millions of gallons of water, through 13,000 miles of pipes, of which about 10,000 miles are of cast iron. About one-half of these towns are supplied by gravity, many of them, however, having supplemental pumping power,—the total capacity of the pumping engine now in use being about 1,900 millions of gallons per day. Meanwhile improvements in plumbing and house distribution have greatly added to the convenience about our homes, and we now virtually have a spring of cold and another of hot water in almost every room of our city houses, to put on tap at will.

Hydraulics.—The attention of manufacturers was drawn at an early day to the development of the water power of the streams on the Atlantic coast. With the aid of capitalists, who appreciated the value of an investment in experimental researches, some of the most effective efforts towards the solution of problems in practical hydraulics have been made by American engineers, on a scale unattempted in Europe. The early foreign experiments, on which most of the formulæ for the discharge of water from weirs, orifices, and pipes are based, were on too small a scale to furnish data capable of generalisation for greater discharges.

The experiments of Mr. Jas. B. Francis, at Lowell, have, among other valuable results, established correct values for the co-efficient of discharge of weirs, and his formula is now generally used. The researches which have been made at Holyoke and Lawrence have done much to settle disputed points in relation to the movement and effect of water in channels, and the systematic experiments now in progress, on the new conduit of the Boston Water Works, cannot fail to be of the greatest value in determining the co-efficients of flow in masonry channels. The laws governing the flow of water in pipes, are still too little understood. It is a reproach to American engineers that so little effort is made to discover them, notwithstanding the opportunities presented by the pipe systems of our water-works, sewage systems, and hydraulic mining conduits. . . .

Railways.—Quick to appreciate the consequences of the invention of the locomotive, or rather its marvellous improvement by Stephenson in 1829, and the peculiar adaptability of the railroad to our country, as a means of settling up new lands and of cheapening the interchange of products, we began building railways very soon after the English, and have pushed their construction with unexampled vigour. . . .

Since 1875, some 10,268 miles have been built in Europe, and about 5,000 miles in other parts of the world, outside of the United States, chiefly in Australia and India, so that the world's railways probably stand to-day as follows:—

Europe	98,275 miles, or	47	per cent.
United States	86,121 "	41	"
Rest of the world	25,000 "	12	"
	209,396		

Thus our fifty millions of inhabitants have furnished themselves with 86,000 miles of railway, while the 306 millions of Europe have 98,000 miles, and the 1,050 millions of the rest of the world possess but 25,000 miles. There were in Great Britain on the 1st of January, 1879, 17,333 miles of railway, on which there were about 32,000 miles of track, 12,969 locomotives, 418,322 passenger and freight cars, owned by the companies, in addition to some owned by private parties, and over which trains ran 222,376,114 miles, and conveyed 565,000,000 passengers. The capital account of the English roads was 698,545,154 pounds sterling, or $3,380,958,545, thus giving an average cost of $195,059 per mile of road. The average cost per mile in several other countries about the year 1875, was as follows:—

France	1873		$152,500
Belgium	1873		111,342
Germany	1875		100,570
Austria-Hungary	1875		106,847
All Europe	1875		120,960
United States	1879		58,915

Thus our railroads have cost less than half as much per mile as those of Europe. Going back one year, for purposes of comparison, on the 1st day of January, 1879, we had in the United States, 81,841 miles of railroad, on which there were 101,660 miles of track, or enough to encircle the globe three times and a half. There ran upon these roads 16,445 locomotives, 11,683 passenger cars, 4,413 baggage, mail, and express cars, and 423,013 freight cars. The capital invested was $4,772,297,349, or $58,915 per mile of railroad; the gross earnings were $190,103,351, or $6,209·52 per mile; the working expenses were 61·79 per cent. of earnings, or $302,528,184, —say $3,887·10 per mile of railroad; and the net earnings were $187,575,167,—say $2,322·42 per mile, or 3·932 per cent. on the nominal capital. While the greater cheapness of our American railroads is in some measure due to the comparative smoothness of much of our country, and to the absence of heavy land damages, much more is due to the methods of construction applied to the railroads themselves, to the cheap and efficient expedients which our engineers have introduced, and especially to the character of the rolling stock which we have adopted. . . . . Although our railroads were originally cheaply and imperfectly built, and although we pay in this country a great deal more for labour and material than the prices which obtain in Europe, we have nevertheless reduced the cost of transportation to as low figures, if not lower, than any which obtain on the other side of the ocean. The grindstone of competition between the railroads themselves, and with canal, river, and lake routes, has reduced freight transportation to such a fine point that our railroad managers have devised new and cheaper methods of doing their work, have learned to operate their roads with a smaller proportion of men, and have accomplished results which astonished even themselves. Sharp competition and the incessant demands of the public have for the past few years diminished rates so rapidly that, as a whole, our railroads are now paying smaller returns upon the entire capital invested in them than those of most foreign countries, and the people of the United States have since 1873 had their property transported for less than it was reasonably worth. It has been shown in giving the net earnings of all our railroads, that for the year ending January 1, 1879, they earned 3·93 per cent. upon the total capital invested in them, while the railroads of Europe in 1875 earned the following returns upon their capital:—

Great Britain	4·4	per cent.
France	5·1	"
Germany	5·1	"
Austria-Hungary	3·9	"
Russia	4·0	"
All Europe	4·3	"

As Americans, we have no reason to be dissatisfied with the results accomplished thus far. We have succeeded in so organising labour that while we pay it from 30 to 50 per cent. more than in Europe, we build our railways for about one half the cost, and we transport freight over them with the aid of our machinery, at materially cheaper rates than those which obtain in other parts of the world. Not only should engineers endeavour still further to improve and to cheapen the construction, and especially the operation, of our railroads, but they should now find in foreign countries, as yet unprovided with them, fields in which they can introduce the features of economy which we have developed. At home we shall doubtless continue to build new lines in the same cheap light style which we have made so efficient, and we shall largely extend the narrow gauge in sparsely-settled districts. We should, however, so locate our roads as to secure the best possible line and gradients, even if, after they are adopted, we do not bring the embankments to the full heights, in order to save present expense. As population and traffic increase, we can, if the works are well planned for that purpose, rebuild, add to, and improve them, so as to diminish the cost of transportation to the best economy. . . . The day cannot now be far distant when the merits and economy of the American type of bridges will be recognised by other nations. Already, notwithstanding the fact that labour and materials are cheaper in other countries than in

this, we are enabled to compete successfully in Canada and in South America. I believe that a well-directed effort to make known abroad what we have accomplished in this branch of engineering during the last fifteen years would open a market for our bridges and bridge designs in Europe and in Asia.

Lighthouses.—From the report of the Lighthouse Board for the year ending June 30, 1879, it appears that the Government has erected the following lighthouses:—

First order		47
Second	,,	26
Third	,,	55
Third and a-half order		10
Fourth	,,	200
Fifth	,,	123
Sixth	,,	165
		626
River Lights,—Mississippi, Ohio and Missouri Rivers		737
Buoys in position		3,114
Fog-signals,—steam or air		56
Light ships		31

As a measure of comparison, it may be interesting to note that on the 31st of December, 1878, England reported 597 lighthouses, and France 346 lighthouses. . . .

Telegraphic Engineering.—The lines of telegraph are being extended so rapidly that it is difficult, even for their owners, to state the aggregate quantities at any particular time. The best information, however, which can be obtained is that on the 1st of January of this year, there were 119,042 miles of telegraph-lines in the United States, and 299,859 miles of wire, without counting those lines specially used by the Gold and Stock Telegraph, and the District, the Fire Alarm and Burglar Alarm Telegraphs in the various cities. One telegraph company alone, the "Western Union," had in June, 1879, 8,534 offices, from which were sent and received 25,070,106 messages during the preceding year. Equally prompt has been the application of the telephone, which, looked upon doubtfully, or only as a toy, when it was first shown by Professor Bell at our Centennial Exhibition four years ago, has so rapidly become a necessity, that there are now in this country 121,000 instruments at work, connecting our business places and dwellings with each other, and with the central offices, by means of which we are almost instantly brought within speaking distance of the persons, miles away, with whom we have to transact our business. . . . .

Iron and Steel.—We are now the second iron-producing nation in the world, England being the first and Germany the third, while 44 new furnaces are reported as being built. We have in addition 382 rolling-mills and steel works, containing an equivalent of 4,467 single puddling furnaces, 2,419 heating furnaces, and 1,397 trains of rolls, with a capacity of 4 millions of tons a year in finished iron. Seventy-three of the rolling-mills have nail factories attached, with 4,152 nail-machines, and to make the list complete, we may add that there are in addition 69 forges, with a capacity of 85,000 tons a year, and 59 bloomaries, with a capacity of 80,000 tons a year. Mr. Swank says: "Our steel industry is now the second in the world in productive capacity, and in a year it will pass that of Great Britain, and take the first rank. The increase in the past year in the capacity of our Bessemer and open hearth works, either completed or projected, is equal to an addition of 50 per cent. to the capacity which existed in 1878."

The Engineering Future.—Although during the past few years there has been a depression in the progress and undertaking of new enterprises, and a diminished demand for engineers, I do not believe that we are at the end of the great industrial movement which began with the steam engine. I think rather that we stand on the threshold of greater undertakings, and, perhaps, of inventions, which will mark epochs in civilisation, and which, whether made here or in some other country, our engineers should be prompt to take up, to perfect, and to introduce. There are signs that a new motive power will be invented, which shall be safer, of greater energy, and less wasteful than steam. You know that chemists tell us that the theoretical energy of a pound of coal varies between 8 and 11 millions of feet pounds, while we utilise with our best steam-engines but from 3 to 11 per cent. of the theoretical value of the fuel. I think it not impossible that we shall perfect methods of employing directly the gases produced from our fuels (instead of using them to generate another gas out of water), and thus obtain better economical results than with steam. I know of several promising attempts in this direction. And, with a new motive power, perhaps will come the solution of the last transportation problem which remains to be solved. I suppose you will smile, when I say that the atmosphere yet remains to be conquered; but wildly improbable as my remarks may now seem, there may be engineers in this room who will yet see men safely sailing through the air. In making this review, I have gone over rather a wide field, and touched upon topics which some of you, perhaps, may consider as foreign to our profession. I have, however, but followed the European practice, and that especially of our early professional teachers, the English, who, mindful of the original distinction between the civil and military branch, recognise all makers of marine, telegraph, gas, mining, and agricultural engines, as civil engineers. In this country we have taken hitherto a somewhat narrower view of the province of the engineer. We think of him mainly as a builder of water-works, canals, railways and bridges, and we underrate his importance as a builder and applier of machines. In point of fact, the most important services which the world has received from our profession have been rendered by the mechanical engineers. The men who have reduced the cost of iron and steel to less than half the prices which obtained half a century ago, who perfected the steam-engine, who set it to drawing carriages over the land, and driving great ships through the sea, and who harnessed lightning to convey thought, are the men who have made the present development possible, and enabled us to build the public works of the country. In Europe, the civil engineer is required to be much more than a mere designer and layer out of public works. Not only must he thoroughly understand the application of machinery, and be able to devise new methods, if necessary, but he is expected to be a business man, to act as an originator and promoter of new enterprises, as a director or superintendent of public improvements, and as an organiser of labour. It is probably in consequence of that broader understanding of the field open to them, as well as the better organisation of their professional societies, that the civil engineers have attained a higher position abroad than they have, as yet, in this country, and have attracted into their ranks the most enterprising and gifted men, who remain permanently in the profession; while with us, engineers cease to be regarded as such by the public when they achieve success, and become presidents or superintendents of public enterprises. In France, the direction of almost all departments of public works is in the hands of engineers, and two of them are members of the present ministry. In England, so great is the confidence that the public have in engineers, that they are constantly called upon to appear before committees of Parliament, thus coming into contact with the ablest men in the kingdom, to advise them concerning the merits of various propositions; and no new scheme stands much chance of success unless it is approved by the leading members of the British Institution of Civil Engineers, which includes within its list, not only the names of all the eminent men in the profession, but also those of princes, kings, and an emperor.

THE PROPOSED THEATRE IN BEAUFORT BUILDINGS.

Changes in the arrangements have been made. On Tuesday last Messrs. Stuart Barker & Son disposed of the materials of the buildings which are to be cleared away on the site of the intended structure. They consist of five private houses on the west side of Beaufort-buildings, two houses in Herbert's-passage, on the north side, and several workshops and warehouses in Carting-lane, which will form the extreme west boundary of the new theatre. The site thus to be cleared covers an area of something like 10,000 superficial feet, which will represent the capacity of the theatre. The new building will have four distinct frontages, namely, in Beaufort-buildings and Carting-lane, on the east and west, of about 150 ft. in length, on the north side in Herbert's-passage, about 80 ft. in length, and a fourth frontage on the south side, in which, it may be observed, will be the principal entrance to the boxes and some other parts of the house. The steep gradient from the Strand into Beaufort-buildings renders a carriage approach there inconvenient, and Mr. Phipps, the architect appointed, has so arranged his designs that the approach to the theatre for setting down visitors will be from the Thames Embankment into Savoy-place, arriving at the entrance to the theatre on the south side under an archway contiguous to Beaufort House, the business premises of Messrs. Rimmell. In addition to the principal entrance on the south side, Carting-lane, on the west side, will also admit of other entrances from the Strand. Although the chief entrance will be as before stated, we understand that the principal elevation will be in Beaufort-buildings. It is expected that the new house will be completed and ready for opening about the end of the year.

THE NEW POST OFFICE SAVINGS-BANK.

The new building which has been erected for the Savings Bank department of the General Post Office in Queen Victoria-street has been opened for business. The building adjoins (and dwarfs) the British and Foreign Bible Society's new building, and extends northwards to Knightrider-street. The elevation is in Portland stone, the ground and first floors being rusticated. Each floor above the ground-floor contains a range of eleven windows. There are five floors and a basement. Over the two entrances, one at the west end, the other at the east end, there are bold cornices, supported on carved brackets, and the whole elevation is crowned by a massive cornice, with a parapet at the edge of the flat roof, each end of the cornice terminating with a scroll, in which, on the face of the building, is carved a lion's head of large size. The whole height above the pavement level is nearly 96 ft., and the length of the frontage is nearly 148 ft., but the other side of the building in Knightrider-street, which is of Suffolk bricks, with stone dressings, is only about 86 ft., owing to the intrusion of some separate premises at the west. There is an inner shaft measuring 45 ft. by 30 ft., lined throughout with white enamelled bricks, which runs up the whole height of the building. The building has an average depth of about 100 ft., and covers a ground area of nearly 15,000 superficial feet. All the floors rest on iron girders and columns, the construction being, as far as possible, on the fire-proof principle. The ceilings throughout are 16 ft. high, except in the basement, where the height is 12 ft. The public entrance is at the west end, in Queen Victoria-street, and over the doorway are inscribed, in letters of gold on a black ground, the words "Post Office Savings Bank," embellished on either side by the Royal monogram "V. R." On entering by the public doorway the principal staircase is on the left, and at the right is the public inquiry office, beyond which, comprising the rest of the ground-floor front, is a spacious apartment devoted to general correspondence, together with the rooms of the Controller and the Assistant Controller. Behind is a large room appropriated to what is called the deposit section, where acknowledgments for all deposits made to the 6,120 post-office savings-banks throughout the United Kingdom are written from the postmasters' daily accounts. The first floor is appropriated partly to the rest of the correspondence branch and partly to the bookkeeper's branch, and the latter also occupies the whole of the second floor. In this branch are the ledgers, about 3,560 in number, containing more than two millions of depositors' current accounts, in which every deposit and withdrawal is duly entered. The third floor is divided into two parts, one being assigned to the male staff of the examiners' branch and the other to a portion of the main establishment employed in sorting duties, which include the folding and despatching of correspondence, the daily number of communications so dealt with having sometimes been about 40,000. The fourth floor is appropriated exclusively to the staff of female clerks, whose duties are chiefly the examining of warrants for the repayments of deposits, the checking of postmasters' accounts, and the compiling documents to prove the totals of daily and quarterly transactions. Dining-room, kitchen, cloak-room, and lavatories are here provided for the special use of the female clerks. By the use of the entrance from Knigbtrider-street and a staircase connected therewith the female staff will be separated from the rest of the establishment. The basement extends throughout the entire area of the edifice, and is used chiefly for the storage of papers.

The Treasury sanctioned the erection of

building in 1877, at an estimated cost of 40,000*l.* (revised estimate, 43,000*l.*), the cost of the site being 70,000*l.* The building has been erected from the designs and under the superintendence of Mr. James Williams, of her Majesty's Office of Works and Public Buildings; Mr. William Brass being the contractor.

SCHEME OF PROFESSIONAL EDUCATION PREPARED BY THE INSTITUTION OF SURVEYORS.

An Examination System, which will take effect from the 31st of July, 1880, has been established by the Council of the Institution of Surveyors to meet the requirements of professional education.

The Examinations will be classified under three heads, viz.:—

Class I.—Students' Preliminary Examination.
Class II.—Students' Proficiency Examination.
Class III.—Professional Associates' Qualifying Examination.

The Examinations in Classes I. and II. will be compulsory.

Class II. will be divided into the three sub-classes shown in Table A.

The Examination in Class III. will be voluntary, and is designed to give Professional Associates an opportunity, subject to conditions hereinafter stated, of qualifying themselves to be Members of the Institution.

As regards the "Students' Preliminary Examination," any person eligible under the existing bye-laws, being desirous of becoming a Student of the Institution, will be required to undergo a preliminary examination, with the view of testing his general knowledge and educational acquirements.* The subjects of examination will be as follow:—

Elements of algebra, including simple equations.
Euclid,—the first three books.
English history.
Composition and writing from dictation.
Some acquaintance with either Latin, French, or German will also be required.

Those successful in passing the examination will receive a certificate to that effect, and will be enrolled as students of the Institution. The examination will be held in the month of January in each year. Applicants shall send in their names to the secretary before the end of the preceding month of November. The pupil passing with the highest number of marks will be exempted from the payment of fees during the term of his studentship.

(free of charge) of acquiring practical experience, for a period not exceeding twelve months, in a London office.

A Medal will be given to any student obtaining 900 marks in any of the sub-classes."

Printed particulars as to the examinations are obtainable.

PITCH-PINE, RED PINE, AND YELLOW PINE.

With reference to "An Architect's" query in your last (page 157), a proper knowledge of the qualities of various sorts of wood is one thing; it is, however, equally important to know how wood will endure under use in various forms. Some wood will last longest when preserved dry, other sorts of wood when wet; but in both cases it must be all dry or all wet. Other samples of wood will have a tolerably long life when exposed to alternate wet and dry; whilst such form of exposure tends to rapid decay with other wood. There is one test to which pitch-pine, red pine, and yellow pine, when put, that settles the question in favour of the softer wood,—namely, the deck of a steamboat. As to this, I can vouch for results by experiments on a considerable scale. I had charge of an inland navigation some years ago, where there were thirteen steamboats and numerous canal boats employed. Pitch-pine and red pine had been used for decks for many years, when one of the foremen suggested that yellow pine would last longer than either of the more costly and harder woods, especially over the steamboats' boilers. The experiment was made, with the result that afterwards yellow pine was selected and used exclusively for decks. American elm, used as planking for canal flats entirely below the water-line, would wear, as one of the men said, "like whalebone"; but "betwixt wind and water" would rapidly decay. Pitch-pine and red pine cannot be seasoned to stand for house-furnishing as wainscot oak stands, as may be seen when it is used for inside woodwork, as in architraves, skirtings, door-frames, and doors to be varnished. Fine white and yellow pine are therefore used for internal joiner's woodwork, and not having the ornamental appearance and hardness of the red woods, are painted.

"An Architect" has arrived, by experience, at a correct conclusion, namely, that yellow deal cills will last longer than either red or pitch pine cills. But would not well-seasoned English oak, or teak, make better, because more enduring, cills? They would cost more. But how much?

Table A.—Class II.—Students' Proficiency Examination.

Sub-Class I.—Chiefly Land Agency.	Sub-Class II.—Chiefly Valuation.	Sub-Class III.—Chiefly Building.
Compulsory Subjects.	*Compulsory Subjects.*	*Compulsory Subjects.*
Bookkeeping.	Bookkeeping.	Bookkeeping.
Principles and Use of Valuation Tables.	Principles and Use of Valuation Tables.	Principles and Use of Valuation Tables.
Land Surveying and Levelling.	Land Surveying and Levelling.	Land Surveying and Levelling.
Law of Landlord and Tenant (Elements of).	Law of Landlord and Tenant (Elements of).	Modes of Pricing Work.
Agriculture.	Enfranchisement of Copyholds.	Estimation of Quantities and Measurement of Artificers' Work.

Forestry.	Law of Dilapidations,	Law of Fixtures,
Land Drainage.	Agricultural Law,	Law of Dilapidations,
Geology and Composition of Soils.	Law of Easements and Riparian Rights,	Law of Easements, Light, and Air,
	} Elements of.	} Elements of.

A Report on some Special Subject named by the Council will be required of Students passing in Sub-Classes I. and II.

SCIENTIFIC AND SPECIAL.

(Two at least of these Subjects must be taken in Each of the Three Sub-Classes.)

Algebra.	Metallurgy (Physical Properties of Metals).	Composition and Properties of Stones and Cements.
Botany.	Agricultural Chemistry.	Road-making.
Natural History.	Mineralogy (Form and Physical Properties).	Metropolitan Buildings Acts.
Trigonometry.	Mechanics (Law of Forces).	Principles of Parochial Assessment.
Hydrostatics (Elements of).		
Meteorology (Principles of).		

Various prizes are open to students. For example:—

"To signalise conspicuous merit, a Medal and the title of 'Institution Scholar' will be given to the student who obtains the greatest number of marks, over 900, of any of the students examined in Sub-classes I., II., and III.; and the name of the student so distinguished will be permanently recorded on the walls of the lecture-hall.

The members of the Council will give the candidate who succeeds in earning the distinction of 'Institution Scholar' an opportunity

* Persons producing a certificate of having passed the matriculation examination of the University of Oxford, Cambridge, London, or any other university in the United Kingdom, or who have passed with honours the senior local examination of the University of Oxford or Cambridge, will be exempted from this examination.

Scamping timber in quality and in scantling is one of the evils of modern country house-building, and I do not know a greater risk than purchasing a new house run up in the suburbs of some town, or in the country where building regulations are not in force, or are not enforced. Take a house, priced at 1,000*l.*, and reason thus:—25*l.* saved by scamping the timber may make such a house comparatively valueless, where 25*l.* additional, or 50*l.* extra, would have paid for the best quality of timber, of full scantling, with well-seasoned oak cills throughout. The scamped house is a cripple to begin with, and, like cripples of all sorts, is an unceasing trouble and care, with no chance nor hope of cure. The house built with well-selected material will be sound and enduring for years, saving the extra cost many times over,—we will say, first, in temper; and then, by not needing repairs. Mr. Briggs has told us, in *Punch*, what are the costs and miseries attendant on scampingly-built houses, and subsequent repairs.

Yellow pine will be found to stand and wear better in street paving than any of the harder samples of wood; for which I could give reasons. I will only say that the best sample of wood paving I have seen, or driven over, is that portion near to South Kensington Museum, which is yellow pine, set on felt, and jointed with felt, the foundation being Portland cement concrete. This paving is smooth, close-jointed, and firm; free from mud in wet weather, and from dust in dry weather. By being laid close, with a jointing of felt, the surface is water-tight, and looks like one smooth sheet, as if on asphalte. This must be the street paving of the future.

A Civil Engineer.

SALE OF A CITY FREEHOLD.

Last week Messrs. Fox & Bousfield sold, at the Auction Mart, the modern freehold buildings recently erected in St. Dunstan's Passage, Great Tower-street, facing St. Dunstan's Church. It was stated that the buildings were specially constructed for office purposes, and had an ornamental elevation, in which carved and moulded stone was freely introduced. The building contains four spacious floors, the ground-floor consisting of a well-lighted public office, extending the entire depth of the building. The basement was stated to be substantially fitted with strong rooms. The property covers an area of 1,167 superficial feet. Mr. Bousfield, who conducted the sale, alluded to the great value of the property, as being situated in the very centre of the colonial produce, and import markets, adding that in view of the contemplated improvements in this part of the City, and the eventual carrying out of the Inner Circle Railway completion (which would intersect the property), it was difficult to estimate what the increase in its future value might not amount to. There was an active competition for the property, which was ultimately sold for 8,150*l.*, its present rental being 350*l.* per annum on a repairing lease for twenty-one years from 1870.

SALE OF A MANSION AND ESTATE IN HERTFORDSHIRE.

An extensive manorial estate in the neighbourhood of London was sold at the Auction Mart, on Tuesday, by Messrs. Debenham, Tewson, & Co. The property consisted of the Ardeley Bury Estate, in Hertfordshire, comprising an old mansion and grounds, 875 acres in extent. It was described as within an hour's ride of the metropolis, and for many years the residence of the late Sir Henry Chauncey, the historian of Hertfordshire, and his ancestors. The sale took place by order of the executors of the late Mr. Philip Longmore. The actual present annual rental of the farms on the estate, together with the great tithes, was stated to be 1,500*l.* a year, and the estimated annual value of the whole estate, including the mansion and park, 2,000*l.* The bidding commenced at 20,000*l.*, and on 28,000*l.* being offered, the biddings slackened, upon which Mr. Tewson, the auctioneer, observed that at 40,000*l.* the purchaser would obtain four per cent. for his outlay, from the present actual rentals, giving him the mansion, the park land, and all the valuable timber, for nothing. He added that from his experience, land in the North of England, as a rule, actually sold for more than land in the neighbourhood of London, for which he was altogether at a loss to account. On 35,000*l.* being offered, he declared it to be an open sale, and ultimately the property was sold for 36,000*l.*

Wandsworth.—On the 16th ult. Sir Charles Reed, M.P., chairman of the School Board for London, formally opened a new building erected by the Board in Warple-way, Wandsworth. The school will accommodate 603 children, and the total cost amounts to 6,671*l.* 14*s.* 8*d.*, being at the rate of 11*l.* 1*s.* 3*d.* per head. Mr. E. R. Robson is the architect. Sir Charles Reed, speaking of the work that was being done by the Board, said that it had 311 schools under its charge, most of them built and handed over to the Board, all in working order, and all of them practically full. In these schools there were 219,000 places, and 233,000 children on the roll.

THE LINCOLN MEETING OF THE ARCHÆOLOGICAL INSTITUTE.

This year's country congress of the Royal Archæological Institute of Great Britain and Ireland was held in Lincoln and neighbourhood last week. The opening proceedings took place on the 27th ult., when the Corporation presented an address of welcome, to which Lord Talbot de Malahide, president of the Institute, replied, and the Bishop-Suffragan of Nottingham, as president of the Associated Architectural and Archæological Societies of the diocese of Lincoln, county of York, and archdeaconry of Northampton, having read an address of welcome in the name of that body, Lord Talbot de Malahide vacated the chair in favour of the President of the Congress, the Right Rev. the Bishop of Lincoln, who, on assuming the chair, delivered his inaugural address. In the course of this he said,—Archæology emancipates us from the thraldom of modern prepossessions and prejudices, and frees us from the tyranny of ephemeral passions and local conventionalities. It makes us contemporaries with every age and citizens of every clime. We are too prone to be absorbed and engrossed by the things of to-day, and to be the slaves of personal interests and party trammels. We need to be liberated from such vassalage. Archæology does this, if studied aright, and especially if it is connected, as your present visit to Lincoln is, with a tour and pilgrimage to places hallowed by the memories of great men in bygone ages. In the Roman arch standing in the northern wall of the ancient citadel of Lindum, and spanning the military road which stretched from Lincoln to the Humber, we may imagine ourselves spectators of the warlike regions of the ancient mistress of the world which marched along those great martial highways, marked by milestones of which one was disinterred the other day from its grave of 1,600 years; and near it we may listen in fancy to oratorical pleadings of lawyers in the ancient Roman Basilica, of which the columns of the façade have just been revealed to our view. Near them we are brought into contact with the greatest of Saxon kings and of Norman conquerors in his feudal castle of Lincoln, and with one of the greatest of Norman bishops, St. Hugh, and with St. Hugh you will also hold spiritual communion in your visit to the noble Minster of Stow and to Stow Park; and when you make your pilgrimage to Southwell and its grand Collegiate Church, soon, we hope, about to become the cathedral of a new diocese, you will be brought into union with Paulinus, the apostle of Northumbria and Lindissi, in the seventh century, who built a church at Lincoln, and with Cardinal Wolsey, Dean and Bishop of Lincoln, in the sixteenth, and King Charles I., in his latter days, in the seventeenth century. You will thus be brought into sympathy with great men, and into synchronism with great events, and will drink in a refreshing draught of that generous spirit which the study of archæology freely ministers, and which, if we are not wanting to ourselves, will make us wiser and better men. We might, my lord, if time allowed, dwell on that consolatory influence which this study exercises in times of sorrow. It was said by the greatest critic of antiquity that tragedy has a purifying power, because it displays noble examples of suffering. There is also a tragedy of events, and of places connected with great events, and this has a purifying, elevating, and soothing influence. When we contemplate the desolation and ruins of ancient buildings and cities,—of palaces, churches, abbeys, and castles,—we forget our private griefs in a feeling of sympathy with public sorrows. One of the most instructive revelations which this study presents to us is that of the deep feeling of religion which animated the greatest nations of antiquity in their most heroic days, and which showed itself not only in their cities at home, but wherever they planted colonies abroad. Let any one stand in the solitary plain of Pæstum, or on the hilly ridge of the Sicilian Girgenti,—the ancient Agrigentum,—and contemplate the group of magnificent temples on both those sites, or in the sequestered vale of Segesta, and look on that noble religious fabric standing there in its lonely grandeur, or on the huge columns of Selinus thrown prostrate by an earthquake, or let him stand on the Areopagus at Athens and look at the Erechtheum and Parthenon towering above him, and let him remember that all these grand buildings were works of religion, not, indeed, rightly directed, but grounded on a belief in unseen heavenly powers controlling human affairs, and in a future state of rewards and punishments; and let him consider also that those who erected those noble religious buildings cared little for their own private houses, which were comparatively mean and insignificant, and he will feel himself constrained to ask whether we may not learn some lessons of religious zeal and self-sacrifice, especially in this sceptical age, from heathens themselves. The first thing that some of them did in planting a colony was to build a magnificent temple. Where are our cathedrals erected by England in her own colonies? One topic more. We may claim also for archæology the honour of illustrating the inspired text of Holy Scripture and confirming the truth of Revelation. The researches of Rosellini and Sir Gardner Wilkinson in Egypt have refuted the allegations of certain sceptics, and have corroborated the Mosaic narrative. The cuneiform inscriptions of Nineveh have proved that Samaria was not taken by Shalmanezer,—as some have supposed, but as the Bible nowhere asserts,—but by Sargon, once mentioned by Isaiah, whose history they have revealed. And they have shed a flood of light on Hebrew prophecy. Archæological researches at Babylon have brought to light Nebuchadnezzar's own account of his magnificent works in which he gloried, and have explained to us why Belshazzar is represented by Daniel as chief in power at Babylon when taken by Cyrus. Similar contributions have been recently made by archæology to the elucidation of the New Testament.

After the members and friends had, to the number of about 200, partaken of luncheon in the Masonic Hall, at the invitation of the Mayor (Mr. F. J. Clarke), there was a general inspection and peramblation of the city. Amongst the buildings visited were the churches of St. Mary-le-Wigford and St. Peter-at-Gowts, "John o' Gaunt's Stables," &c.; and in the course of the afternoon a goodly party assembled at the Castle, which was described by Mr. G. T. Clark. The Rev. Prebendary Scarth subsequently described the Roman remains seen in the course of the afternoon.

In the evening the Antiquarian Section met, under the presidency of Sir C. H. J. Anderson, bart., who delivered an address in the course of which he referred to the recent discovery of Roman remains in Bail-gate, and said there could be no question that modern Lincoln was built over the old Roman city,—particularly Above-hill,—some 7 ft. or 8 ft. above it, indeed, which had been satisfactorily proved by the discoveries alluded to. Mr. G. T. Clark afterwards read a lengthy and able paper on "Post-Roman and English Earthworks."

In the Historical Section the Dean of Ely presided, and the Bishop Suffragan of Nottingham read an interesting paper on "Little St. Hugh of Lincoln." The Rev. Precentor Venables afterwards read a paper on "The Jews of Lincoln," which had been prepared by Mr. D. Davis.

The Architectural section met on the 28th ult., under the presidency of the Right Rev. the Bishop Suffragan of Nottingham, when Mr. J. T. Micklethwaite read a paper on "The Growth of a Parish Church." In the Historical Section, the Rev. Canon Wickenden read a paper on "The Muniments of Lincoln Cathedral," and the Rev. Canon Perry one on "Some Episcopal Visitations of Lincoln Cathedral." In the afternoon there was an excursion to Gainsborough and Stow, and at a *conversazione* in the evening an interesting paper on "Lincoln in 1644" was read by Mr. E. Peacock, F.S.A.

We may have more to say about the congress next week.

Drury-Lane Theatre.—Four renters' shares in Drury-lane Theatre were sold by auction last week by Mr. George Robins, at the Guildhall Coffee-house, by order of the executors of the Rev. C. G. Freyer, deceased. The particulars stated that a renter's share in the theatre was originally entitled to 2s. 6d. per night of performance, since reduced to 1s. 3d. per night, but now paid an annual dividend, with a free admission admitting upon all occasions and to every description of performance. It was stated that the last dividend declared, which was paid in February last, was 5*l.* per debenture, and that the dividends have ranged from 8*l.* 5s., in 1873, up to 11*l.* 17s. 6d. in 1878, and 7*l.* in 1879. The four shares realised 55 guineas, 63 gs., 65 gs., and 68 guineas respectively.

KENT ARCHÆOLOGICAL SOCIETY.

The annual excursion of this society took place last week, the *rendezvous* being Headcorn, where a meeting was held, the President of the Society, Earl Amherst, in the chair. The annual report, read by the hon. sec., Canon Scott Robertson, stated that all the papers for the thirteenth volume of "Archæologia Cantiana" were now printed, and the illustrations complete. The balance at the bankers amounted to 292*l.*, all of which and more would be required to defray the cost of printing and illustrations. The number of members continued to increase. Early this year the site of the Premonstratensian Abbey of St. Radegund, at Bradsole, near Dover, had been excavated, and many discoveries made respecting the Abbey church and buildings. Interesting discoveries of Roman and Saxon remains had been made by Mr. G. Payne, of Sittingbourne, upon three different sites,—two in Sittingbourne and one in Milton. The re-election of officers and other formal business having been transacted, a visit was paid to the parish church, dedicated to SS. Peter and Paul, and not long since restored. A notable feature of the churchyard is an oak-tree, said to be 1,400 years old.

Smarden was the next place reached, the visitors on entering it passing by picturesque timber-framed and plaster houses, dating apparently from the time of the Plantagenets and the Tudors. The visitors entered the churchyard by the singular lych passage of timber. When the company had assembled within the edifice, the Rev. Francis Haslewood, rector of St. Matthew's, Ipswich, a son of the late rector, read a very interesting paper on "Smarden Church and Village." The church consists, he stated, only of a nave and chancel, with a square embattled tower at the south-west end, with octagonal turret. It is dedicated to St. Michael, and is popularly known as the "Barn of Kent," on account of the singular construction of its roof, the nave being 36 ft. wide, without side-aisles, and with no tie-beams to support it. In 1869 the whole fabric underwent restoration.

High Halden Church, the next stage reached, has a large octagonal oaken western tower, on which is a square spire, covered with shingles of the same material. The base is of massive oak trunks, in the smoothing of which on their removal from the neighbouring forest no great amount of labour appears to have been expended. There is a western porch and a southern porch exhibiting good specimens of carving, and the time-worn surface of the wood is of a charming silvery colour from the lichen growth which covers it. The date is 1430, and it is estimated that there are not less than fifty tons of timber in the tower, spire, and entrance.

Woodchurch, the next point, was reached through winding lanes. The church has an Early English chancel, with Purbeck marble shafts to the windows.

Tenterden, the centre of the excursion, was reached in time for dinner in the Town-hall. In the evening a meeting was held in Freeman's Auction-room, in the High-street, where a temporary museum of much interest had been arranged, under the direction of the Rev. F. Haslewood, the Rev. Treas-Beale, Mr. J. Ellis-Mace, jun., and Mr. Willsher. To this museum the corporation contributed largely, lending, among other things, the borough maces; the old charter of Elizabeth and copy of charter of Henry VI., copied in the reign of Elizabeth; and old documents of the fourteenth and fifteenth centuries. Then there were Roman remains selected from the discoveries made at Bayford, near Sittingbourne, by Mr. G. Payne, jun., F.S.A., during last winter; a large contribution of coins of different dates and nations, Roman remains, ancient vases, and other objects, sent by Mr. W. Young, Lodge, Godinton Park; fine old lace of the seventeenth and eighteenth centuries, sent by Mrs. Curteis Whelan; rubbings of brasses, sent by Mr. R. H. Oyler, the Rev. Tress-Beale, and Rev. F. Haslewood; copies of wall-paintings from the crypt of Canterbury Cathedral; and other objects too numerous to mention.

"The Early History of Tenterden" was the subject of an interesting paper read by Mr. R. Turley. The Rev. R. Cox Hales read a paper entitled "Brief Notices of the Hales Family," and Canon Jenkins one on the "Guldeford Family."

The *rendezvous* of the second day's excursion was Appledore, where the vicar, the Rev. M. D. French, acted as *cicerone*. The route was next

towards the Isle of Oxney, and after paying toll for passing the tiny ferry-bridge, Stone Church was reached, whose embattled tower of three stages, with beacon-turret, commands an extensive view of the surrounding country. The Rev. E. M. Mriel, rector of Ruckinge, here read a paper. He stated that the edifice is dedicated to St. Mary, and consists of nave, north and south aisles, chancel, and north and south chapels. The entire architecture is Perpendicular. The whole has been recently restored. From the church the company proceeded to the vicarage garden, to see an ancient Roman altar-stone. This altar, according to Hasted, was removed from the church and made a horse-block of, by which means it was much defaced and cracked; but Mr. Gosling, who was vicar from 1753 to 1777, had it repaired and placed upright where it now stands. The altar is of stone, with a basin hollowed in the top, and the figure of an ox carved on the sides; one side is now tolerably perfect, the other much defaced. Wittersham, Rolvenden, Newenden, and Losenham Manor-house were visited in succession. The ancient earthwork, about a mile from Losenham, attracted much interest. Mr. G. Lambert, F.S.A., suggested that this and similar mounds in various parts of England served for the erection of beacons, or as places of refuge for cattle on the occurrence of floods. The excursion was a very pleasant and successful one.

IMPROVEMENTS IN HOUSE PLUMBING.

In response to an invitation from the New York Board of Health, a number of architects and sanitary reformers have been discussing Proper Regulations for the Plumbing of Houses. The *American Sanitary Engineer* gives an account of the proceedings, which may be usefully reprinted:—"The discussion, especially of the most point whether a trap should be placed on all main drains to disconnect the house from the sewer, was animated and vigorous. Mr. James G. Bayles read a written statement of his objections to this appliance, of which the following is a summary:—

1. They obstruct the flow of drainage and cause accumulations of foulness in house drains.

2. Air admitted by ventilation above the 'seal' and passed all through a trapped house-drain, is found by experience to be fouler than air drawn from a sewer.

3. The trap does not offer any effectual resistance to air from sewers when there is a pressure.

4. That the danger of disseminating contagion originating within them, through tenement and apartment houses, is probably greater with a trapped house-drain than it would be from an open connexion with the sewer.

This view was sustained by Mr. W. E. Partridge, and by Messrs. Mead and Manny, while arguments in favour of such a trap were advanced by Walter G. Elliott, Thos. J. Nealis, Engineer of the Board of Health, Chas. F. Wingate, and others.

Further details of house-plumbing were then discussed, and it was agreed that the following requirements should be enforced by the Board:—

1. All plumbing work to be of good materials.
2. Only good workmen to be employed.
3. All soil-pipes to be of iron.
4. All soil-pipes to be accessible throughout their entire length for inspection.
5. All soil-pipes to extend through the roof and to be of undiminished calibre.
6. All sewer-pipes to be of iron.
7. That sewer pipes be above the cellar floor and not buried.
8. That all joints in sewer and soil pipes be gas and water tight, and that they be caulked with either lead or with iron filings and sal ammoniac cement.
9. That traps be provided for all basins, sinks, bath-tubs, and water-closets.
10. That all traps be ventilated by special pipes through the roof.
11. That there be no traps on vertical soil-pipes.
12. That the 'safes' under basins and refrigerators be drained by special pipes not directly connected with the sewer.
13. That all service pipes be so placed as to be beyond danger of freezing.
14. That their be no pan water-closet, but either hopper or improved water-closets.

This concluded the discussion, which it is to be hoped will be fruitful in good results, both in awakening householders to an appreciation of what constitutes good drainage, and also in compelling house-owners and plumbers to carry out such provisions.

The Board of Health already possess abundant powers regarding the drainage of dwellings, which have hitherto been exerted mainly in a few particulars, viz.: carrying soil-pipes to the roof; putting traps on all fixtures, and ventilating privy vaults. It is to be hoped that they will, as now proposed, extend their jurisdiction still further, so as to include all the requisites of good drainage, and see that these are strictly enforced.

If this is done, to the extent set forth in the above memorandum, we trust the days of the 'jerry' builder will be numbered, and that 'crooked plumbing' will be hereafter less common than hitherto, if not wholly abolished."

PLUMBERS.

Sir,—Having seen several articles in your valuable paper about the bad workmanship and unscientific manner in which water-closets, soil-pipes, &c., have been fixed, I should like to mention two things that would seem almost impossible for any man in his right mind to do, but such is the case. I went about a month ago to see to a sink in a house on the first floor. There was such a horrible stench in the place that it was almost unbearable. I examined it and found that it came from the waste-pipe from the sink, which went into the soil-pipe, right into the top of it, without any attempt at a trap, excepting a very small bell-trap in the sink, which was lost. When I took the closet-seat down I saw it at once. That pipe into the soil-pipe was exactly like an air-pipe put in to carry all the foul gas into the living-rooms; and in my opinion the man that put it there ought to be in jail. The other instance was in a large house, where the waste water and all slops from a sink were conveyed into the standpipe in the large cistern of drinking-water on the first floor, as well as from a large bath that was frequently used. The people in the house could not make out for some time why the water was so muddy and discoloured. So they sent for some one to go to see to it, and I went and found it as I have described. Now, sir, that waste-pipe from the cistern was completely choked, and all the water and slops from the bath and sink had been running into the cistern for some time, until it got so bad that the people in the house could not drink the water, and one day it overflowed after some one had used the bath, which helped them to find something amiss. How long it had been so, I do not know, but the cistern was covered with black slime, just like mud. Now, sir, these are only two solitary instances. I could tell of many similar in some of the largest mansions in South Belgravia. There are a large number of them that I have found to have no ventilating-pipe at all, and the sinks and bath wastes all go either into the soil-pipe or closed trap. I suppose they will have them altered when there are one or two killed by sewer-gas or fever. Why are houses left in this state when the consequences are known, and why are they allowed to remain? I have no doubt a great deal of it is caused by workmen who have no idea what sewer-gas is. They know it smells badly, and that is about all. I am only a young man, and cannot pass much opinion; but I think that plumbing is left in the hands of men a good many times that do not understand what they are doing, and ought not to have the name of a plumber. I know of a small shop now where the foreman was never anything but a boy in a builder's yard, and worked himself into where he is by being deceitful and always telling tales about the other men. What right had he to go about to see to such work when he could not even wipe a joint and is quite illiterate in such matters? Why I write this is to strengthen the opinion expressed by one of your readers, who said that every plumber ought to pass a sort of examination before he is engaged, especially on inside work, and I hope this will be considered by master plumbers and others. A Plumber.

"COMPETITIONS": EXETER HALL.

Sir,—As there was a note in your issue of the 24th ult. giving the names of three gentlemen who were invited to send in designs for alterations to the above, it may interest the profession to know the terms which were offered to three other architects for designs to be sent in for competition. Two of those named,—Mr. Pite and Mr. Bell,—were originally invited to submit designs with Mr. Paull, Mr. St. John H. Hancock (Furnival's Inn), and Mr. Maberley (architect to the late owners of the hall), on these terms:—25*l.* for each set of drawings *except the successful one*, and the owner of the selected design, if other than Mr. Pite, to share his commission with that gentleman, with joint supervision of the works. The last-named three gentlemen declined these terms, as the result shows, and were not offered any other. Inquirer.

WORKING-MEN'S HOUSES AT THE WEST END OF LONDON.

HIGH RENTS AND UNHEALTHY DWELLINGS.

A crusade has been started, at the instance of members of the working classes employed in the western districts of the metropolis, against what are designated excessive rents and unsanitary dwellings, and on Sunday evening a meeting on the subject was held at the Democratic Club in Rose-street, Soho, when statements of a grave character were made as to the unhealthy condition of the houses in the district, whilst the rents were stated to be enormous. It was said at the meeting that the working-class population of the West End made all sorts of articles of luxury, to produce which they were compelled to reside in the neighbourhood, and occupy houses for which they were forced to pay high and exorbitant rents, whilst the houses themselves were scarcely fit to live in. The consequence was that the industrial classes in the locality were both plundered and poisoned. Several of the speakers complained of the systematically-oppressive conduct of the "house-farmers" to whom these exorbitant rents were paid for houses scarcely fit for occupation. In the course of a discussion it was suggested that the co-operation of other metropolitan organisations should be solicited, inasmuch as there was not a part of London unaffected by the grievances of which they complained in the West End, and this course was resolved upon. "A Provisional Committee for Rental and Sanitary Reform," was formed, and the secretary, Mr. Edward Dunn, was requested to communicate with all the working-men's organisations in London, with the view of their sending delegates to the committee. The objects of the organisation are summed up in the following resolutions:—"That the exorbitant rentals obtained for certain classes of houses, create a powerful interest opposed to all sanitary reform, promote the maintenance of slums, and hinder the progress of public improvements." Also, that "the Building Acts are flagrantly evaded in the newer districts, and in the old quarters whole tracts of land are depopulated and left unoccupied till house-farming capitalists build thereon." It was stated at the meeting that one of the rules of the house-farmers is to the effect that if a tenant complains of the unsanitary state of the house, or insists on his tenement being repaired and put in order, process of ejectment is at once resorted to by the house-farmer.

CASE UNDER THE NEW BY-LAWS OF THE METROPOLITAN BOARD OF WORKS.

Mr. T. J. Neale, of 33, Aylesbury-street, Walworth, builder, was summoned, on the 22nd, before Mr. Ellison, at the Lambeth Police Court, for an infringement of the new by-laws issued by the Metropolitan Board of Works, under the Metropolis Management and Building Acts Amendment Act, 1878, in using bad mortar in the erection of a new building in the rear of No. 80, Old Kent-road.

Mr. George Lansdown, district surveyor of East Newington and part of St. George the Martyr, Southwark, appeared in support of the summons, and explained that the builder had received notice to amend under the Building Act, as well as under the by-laws, but had neglected to amend, and had left the work. The defendant pleaded guilty. The magistrate fined him 5*s.*, and 2*s.* per day for each day since notice to amend, and 2*s.* costs; total, 27*s.*

The penalty in case of the breach of any of the provisions in the by-laws is a penalty not exceeding 3*l.*; and in each case of a continuing offence, a further penalty, not exceeding 30*s.* for each day after notice thereof from the Board or district surveyor.

Since the hearing, the building has been entirely taken down.

EMPLOYERS' LIABILITIES.

RAHTSKE *v.* EDWARDS AND OTHERS; CARROLL *v.* SCOTT AND EDWARDS.

These were two actions (heard at the Liverpool Summer Assizes, before Lord Justice Bramwell) to recover damages for the death of plaintiffs' husbands, which resulted from the fall of a scaffolding, caused, as the plaintiffs alleged, by the defendants' negligence. As the cases arose out of the same facts and the same firm were defendants, although the names appeared differently on the records, both actions were tried together.

It seemed that the two deceased men were employed in the construction of a new bridge on the Cheshire Lines Railway, and were killed by the falling of a staging which had been erected for the purpose of riveting. The scaffolding was erected by the defendants, who were the original contractors for the work, and the deceased men were in the employ of a Mr. Pargiter, who was the sub-contractor for the ironwork. It was admitted that the

scaffolding was incomplete and unfit to bear the weight that was put upon it, and the real question was, by whose fault the deceased were set to work on a dangerous stage. The plaintiffs' case was that Pargiter and his men were at work on the day before the accident, with the knowledge and approbation of Cornish, the defendants' engineer, and that he had told them that it was all right, and they could go on working. It was shown that Pargiter had been pressing Cornish to get the staging completed so that he might go to work. On the other hand, Cornish denied that he had ever told them the stage was ready, and also that the men were at work on the preceding day. According to him, the stage was entirely incomplete, no part of the flooring having been put on until just before the accident, and he was about to make it fit for use by adding another upright. In this view the accident was caused by Pargiter ordering his men to go to work on the stage before it was fit.

His Lordship, in summing up, told the jury that if Cornish, by word or deed, represented that the staging was fit for use, they ought to find for the plaintiffs; but if Pargiter, on his own responsibility, chose to send his men to work before it was safe to do so, the defendants were not liable.

The jury found for the defendants.

PROVINCIAL NEWS.

Wordsley, near Stourbridge.—New offices, seed warehouse, and a manager's residence, are being erected by Messrs. Webb & Sons, at their extensive seed establishment, near Stourbridge. The former comprise, on the ground-floor, an entrance-hall and staircase, with general waiting-room attached; a ledger-office, 60 ft. by 24 ft., with manager's office at one end; fireproof-room, cloak-room, and lavatory, and a private staircase to the upper floor, on which are arranged a suite of offices for the Messrs. Webb and heads of the several departments, together with sample-room, cashier's office, and a spacious reading-room and library for the use of the *employés*, which is approached from the entrance-hall by a staircase of polished pitch-pine. The seed warehouse is in continuation of the present buildings, and is five stories high, each floor having an open space of 88 ft. by 40 ft. Steam lifts and staircases are provided, together with offices for warehousemen, lavatory, &c. The communications betwixt the new and present warehouses are to be closed by fireproof doors. Speaking-tubes are provided to all the offices, and the telephone is to connect them with the seed warehouses, which are on the opposite side of the courtyard. The buildings are being carried out by Mr. Lovatt from designs prepared by Mr. J. R. Veall, architect, Wolverhampton. The materials used are red pressed bricks, with Hollington stone dressings. The cost will be nearly 7,000*l.*

Garston.—The Mersey Conservancy Commissioners have given notice of projected improvements at Garston Docks, which are to be commenced within two months after notice. The object of such works is to form an improved river front and approaches to the company's docks. The proposed wall will project on to the foreshore of the Mersey, and will not impede or interrupt the tidal water to the river, but on the contrary it is stated that the excavations for the approach to the dock will more than compensate for the abstraction of any tidal water arising from the construction of the wall. The secretary of the company states, for the information of the Commissioners, that the South Garston Dock and Warehouse Company is formed for the purpose of constructing an important dock at Garston, with warehouses attached, which will supply the urgent demand for additional accommodation on the Mersey, and thus meet the requirements of Liverpool, Manchester, St. Helens, Wigan, and the surrounding districts in the county of Lancaster. The area of the dock property comprises about thirty acres; the water area will be about seven acres, with about twenty-three acres for warehouses, sheds, quays, and railway sidings.

COAL-GAS EXPLOSION.

Sir,—In your number of the 24th ult. you touch, among other matters, on the explosive nature of coal-gas in coal mines, where boreholes are made to tap the workings for gas. In order to neutralise the explosive nature of the above gas in mines, it has often struck me that whenever danger is expected therefrom, jets of steam might be applied effectually for that purpose. Miners at work must certainly be sufficiently sensible to know when this gas is accumulating too fast. I propose, then, when such is the case, that a copious supply of steam be immediately sent down from above, through the air-shaft. I am not aware that steam has ever been so employed in coal-mines.

J. T. Lockhart.

A QUESTION IN VALUATION.

Sir,—A railway was made some twenty years since through an estate running along the side of, and near the bottom of, a hill which is loaded with large quantities of green sands, through which the head-water above percolates. In making this railway those green sands were cut into from 15 ft. to 20 ft. in depth for a length of nearly a quarter of a mile, and the consequence is that those sands have been constantly running out ever since to a very considerable extent, and in all probability will continue to do so for years to come. The result has been that, as those sands discharge themselves from the bowels of the earth, a space is thus formed, and after a while the upper stratum, or top crust, breaks away and settles down, and so very materially interferes with the cropping of the land and the vegetation thereon, as well as destroying several orchards of a thriving and excellent kind.

An action was recently brought against the Company for compensation for the damage so done to the lands by the landowner. The damage was set by the landowner's surveyor at so much, based as follows:—The *original* agricultural annual value of those portions where the slips and subsidences had taken place having been put at what they were fairly worth, had no disturbance of such lands occurred, at the usual thirty years' purchase for the fee-simple thereof, against this the *present* value was obtained by taking the same portions of lands at what they were considered worth for agricultural purposes at the present moment per annum, and the value in fee of the same reckoned at from thirteen years' to twenty years' purchase, according to the nature and dangerous state thereof.

The railway company's surveyor objected to this mode of computing the value of the alleged damage as made by the landowners' surveyor, on the grounds that it was inconsistent and an unknown basis to go on; that having reduced the agricultural value in the first instance, the landlord's surveyor had no right to lessen the year's purchase also thereon. The landowner's surveyor contended that, inasmuch as those affected portions of land were not stationary, but movable and in a running away state, they ought to be treated more like house-property than otherwise.

It would be a matter of great satisfaction to have the opinions of some of your readers,—being experienced, and I may say expert, land surveyors, on this matter,—as to which of these two surveyors may be considered correct in his theory.

A Constant Reader.

FRENCH WORK AND WAGES.

Sir,—Herr Carl Behr, in your issue of the 31st ultimo (page 131), referring to the rate of wages paid to makers of artistic furniture in Paris, mentions that some of the workmen at M. Henri Fourdinois' well-known establishment in that city are paid as much as five francs (4s. 2d.) an hour.

Whilst in Paris, in October, 1878, preparing a report at the instance of the Exeter Chamber of Commerce, I visited a great many of the principal establishments there, and amongst them that of M. Fourdinois. That gentleman, in the most courteous manner possible, placed his premises at my service, and I had more or less conversation with nearly every workman in his employ. I find, upon reference to my notes, that, when in full swing,—trade was so dull that all hands were upon "half time" during the time I was there,—the regular hours were from 7 a.m. to 7.30 p.m., with one interval only between,—from 10.30 till 12,—for breakfast. On Saturday the time worked was the same as on other days. Most of the cabinet-makers and joiners working there were in receipt of 5 francs a day (4½d. an hour), though a few were paid at a rather higher scale. The carvers' wages varied, every man being remunerated according to his ability. The highest money any one was at the time receiving was 15 francs a day, *i.e.*, 1s. 1½d. an hour. I had these quotations from the men themselves, and afterwards what they had told me was verified by the cashier. Herr Behr goes on further to say that the best work is executed in Paris by German workmen, but that, unfortunately, as his countrymen at home will not pay the long prices paid in Paris for wages, these skilful men are lost to Fatherland. I certainly was not impressed by the preponderance of German art-workmen in the shops I visited, and my impression is that in my perambulations I met with very few of them indeed. The Berlin cabinet-makers are at the present moment out on strike. They demand more money and a lessening of the hours of labour. Their present wages are about 5s. per diem, or, so far from being less than their French neighbours, about 1d. an hour more than the majority of M. Fourdinois' cabinet-makers receive, and seem content with, in Paris! In some of his statistics, as well as in his comparisons, Herr Behr is assuredly in error.

Harry Hems.

THE USE OF MARBLES IN LONDON.

Sir,—In a notice of Mr. Benson's "Business Premises" in your last issue (page 155) polished marbles are inferentially recommended for external use in London street architecture. Allow me to raise a word of warning. There is ample evidence in the streets of London itself to prove that no marble (compact altered limestone) will retain its polish out of doors for any length of time in a humid atmosphere like that of England; and in large towns a year or two at most will find all its beauty gone. The Devon and Irish marbles, being comparatively soft and uneven in texture, yield quicker than others, like the Sicilian, of more uniform texture and greater hardness. They are very beautiful under polish and when wet, as one sees them commonly in the streets of Plymouth; but wherever they are exposed to dust and damp their charms are very ephemeral. Serpentine, being an igneous rock, keeps its polish longer, but it is not permanent in large towns. The granites, carefully selected, are the only building stones that can be relied upon to retain their lustrous polish out of doors in a damp, dusty, smoky atmosphere.

I venture to recall attention to this question of the durability of polished stone, because, regarding the *Builder* as a safe authority, many men might be tempted to embark in a decoration at first so pleasing, but that leads to results satisfactory neither to the architect nor to his employer.

Thos. C. Sorby.

HOW TO DIMINISH RAILWAY ACCIDENTS.

Sir,—I venture to submit the following scheme for your approval:—Give the companies a direct inducement to adopt every means and precautions to avoid accidents by converting the passenger-duty into a tax on *preventible* accidents to trains, whereby passengers are killed or injured. Thus, any company which has no such accident in a quarter of a year shall be entitled to remission of the duty for that quarter, and so on.

Among the means of improvement are these:—(*a*) Strengthening bridges (many have been swept down lately), keeping the permanent way in the best condition possible, continuous brakes, block system, interlocking apparatus; (*b*) additional parapets where bridges cross rivers, extra siding accommodation, guard-rails, &c.

The passenger-duty brings in about 800,000*l.* per annum to the revenue; perhaps my scheme might cause a loss of half that. It might be a tentative measure for five years. If the companies spend all that is remitted in adopting extra precautions, their net gain will be the cost of accidents avoided.

R. Varley.

Sale of Prisons and Barracks.—At the Auction Mart, on Wednesday, a sale of a very special character was held by Messrs. Edwin Fox & Bousfield, acting on the instructions of the Home Secretary and Prison Commissioners; and of the county authority for Middlesex. The property offered comprehended the six prisons of Bath, Wisbech, Bury St. Edmund's, Southwell, Mould, and Beverley, which were described as freehold estates now available for building, being no longer required for their original purpose, in consequence of the alterations effected in the administration of justice under the Prisons Act of 1877. They comprise altogether about 17¾ acres, were offered in six lots, and the total amount at which the lots were knocked down was 17,850*l.* The principal lots were sold. The barracks situated at Hampstead, not now wanted for militia purposes, in consequence of the head-quarters being removed to the depôt under Lord Cardwell's organisation scheme, comprised about one acre of land suitable for building, and were sold for 5,500*l.*

IRISH ARCHITECTS AND PUBLIC BUILDINGS.

At a conference of Irish architects that has just concluded in Dublin, under the presidency of Mr. J. M'Curdy, the following resolutions were unanimously adopted:—

"That general and well-grounded dissatisfaction prevails among architects practising throughout Ireland as to the system which sprang up under late Governments, and which is apparently being perpetuated and extended, under which the designing of public buildings has not, as in former times in Ireland (and is still customary in England), been entrusted to independent architects of eminence and repute, and that thus a considerable amount of valuable and honourable employment is unduly withdrawn from the profession in Ireland. That this meeting views with considerable alarm the practice now adopted by the successive Governments of the country of handing over to departmental officers such works as should naturally form one of the most essential elements of ambition in the architectural profession, viz., the designing of Governmental works of importance; and that the withdrawal of these works from the profession generally is an injustice that it can hardly believe the various Governments can have foreseen, and which they are led to hope need only to be brought fully under their notice to have rectified. That it should be respectfully urged on the present and successive Governments that this system, prejudicial to the public service and the credit of the country, should, wherever practicable, be relaxed and reversed; and that such buildings as museums, colleges, custom-houses, post-offices, law courts, Government schools, prisons, &c., should, under any system of selection that may be deemed judicious, be entrusted to independent architects, as formerly. That, in view of the proposed buildings of the Science and Art Department, the present is a suitable time to urge the consideration of the foregoing resolutions on her Majesty's Government. That steps be taken to make representations on the basis of these resolutions to the Lord-Lieutenant, the Chief Secretary for Ireland, and the Treasury."

WOODEN CHIMNEYPIECES.

SIR,—Architects and district surveyors would do well to see that the Building Act is not infringed by the erection of wooden chimney-pieces where the wood ingrounds are fixed against the stove without any marble whatever. There should be some precaution taken, otherwise there will be a serious fire, and then the insurance companies will insist on flimsy wooden chimneypieces giving place to something better.

J. H.

BRICKMAKING.

SIR,—Referring to the letter signed "Brickmaker," which appears in your issue of the 31st ult., I have pleasure in handing you per this post a pamphlet entitled "Bricks and Brickmaking." Your correspondent will find some information in it which may be of use to him; but if he requires further particulars or advice, I shall be pleased to give it him if he will communicate with me. I am acquainted with nearly every brickmaking machine, and would tell him which would be the most suitable for the kind of clay he wishes to work.

J. W. IVERY.

West Bromwich.

SIR,—In reply to "Brickmaker," there is a later edition of Dobson's "Brick and Tile Making," which gives a good elementary knowledge of brickmaking. Brickmakers will gain a great deal of useful practical knowledge by visiting a brickyard laid out on the most modern system for making bricks, tiles, &c. We shall be pleased to show him, or any reader of your journal, over several of such yards, or to give them any information on the subject.

Bury, Huntingdon. ARMITAGE & ITTER.

PLUCKLEY.

SIR,—Permit me to rectify an omission in my paper on "Brick and Tile Making at Pluckley," which is quoted in your issue of the 17th ult. I should have stated that these works were designed and erected by Mr. Henry Ward, C.E., of 61, Old Broad-street, who is engineer to the Company.

A. J. BURROWS.

Sunday Visits to Picture Galleries.—On Sunday last the Exhibition of the Society of British Artists, and the Summer Exhibition at the Grosvenor Gallery, were open to the public under the auspices of the Sunday Society. The visitors were admitted by tickets, which had been procured on written application. Each exhibition was open for two hours and a half. At Suffolk-street the number of visitors was 1,317, and at the Grosvenor Gallery 2,250.

CHURCH-BUILDING NEWS.

Hardrow (Yorkshire).—The new Church of SS. Mary and John, Hardrow, has been built at the cost of the Earl of Wharncliffe, on his property near Hawes, in Wensleydale, to replace a dilapidated modern structure. The style is of a very simple type of the Transitional to Early English, following the characteristics of the Yorkshire style of that period. The plan consists of a nave, chancel, and porch, with a triple bell-cot at the west end carried on projecting buttresses. The stone is from a quarry just above the church, and is used in coursed facing for both the inside and outside, the dressed stone being from Leyburn and Barnard Castle; great care has been taken, by building the walls hollow, by the use of Settle lime, and by other precautions, to resist the entrance of damp, the place being subject, so it is stated, to the severest weather in all England. The work has been executed by local contractors, under the architects, Mr. R. Herbert Carpenter and Mr. Benjamin Ingelow, of London, Mr. Smith being the clerk of works.

Exeter.—On Tuesday, the 27th ult., the first stone of the enlargement of St. James's Church, Exeter, was laid. The church was built in 1836, but, owing to increase of population, has long needed enlargement. The work was commenced in 1877, under the direction of Mr. R. Medley Fulford, architect, and the first portion of the new work completed consisted of the chancel, with choir, north and south aisles, and priests' vestry. Prominent as the chief feature of the new chancel is the east window, erected in memory of the late Rector, the Rev. A. Buckeridge. It is a triple-light window, filled with stained glass by Messrs. Clayton & Bell. The window contains a representation of the Crucifixion, the Blessed Virgin, and St. John. The work now taken in hand is that at the west end of the church. Mr. J. R. Gibbard is the builder. The portion now to be added will consist of an extension of the nave and side aisles. Exclusive of the porch, it will extend outwards, from east to west, about 22 ft., and 17 ft. from the centre of the old frontage; the extreme width of the transverse section, from north to south, being about 33 ft.,—upwards of 12 ft. wider than the original edifice. The porch will have four buttresses. Three entrance-doors will give access respectively to the nave and to the north and south aisles. On each side of the porch there is to be a two-light window. Above it two two-light windows will be placed; then, a rose window; higher still, a small three-light window; and the whole will be surmounted by a spire, the height of which, as already indicated, will be 108 ft. from the ground to the top of the vane. In the spire provision is to be made for three bells. The spire will be of wood, covered with lead and ornamental slating. Stone from the Pocombe quarry, near Exeter, is the material used in the building, with Ham-hill dressings. In the interior of the edifice monoliths of granite will support the arches separating the nave from the aisles. The old west gallery will be set back. In its complete form the church will afford accommodation for 1,050 persons. The cost of the work now commenced will be 2,500*l.*

Pinhoe.—St. Michael's Church, Pinhoe, near Exeter, has been re-opened by the Bishop of Exeter, after restoration. The church until recently has been in a deplorable state of decay. It has a nave and north aisle, a chancel and a vestry, a south-west porch, and a western tower. The tower is embattled, and has a square turret at its north-east corner. All the rough-cast that covered it, many inches thick, for very many years, has been removed, and the stone beneath has been pointed. The belfry windows have been cared for, and the parapet made good. The porch is entirely new, but occupies the same position as did the former one. The new dressings are of Ham-hill stone, and the apex of its gable is crowned by a cross. The chancel has been almost entirely rebuilt, and a new vestry, upon the north side, has been added. The roofs are of English oak, covered in by slates. The chancel roof is clearly defined by a ridge in Ham-hill and Bath stone courses alternately. In the interior of the church the nave and north aisle are divided from each other by an arcade of four bays. This arcade, like the stonework of so many of our Devonshire churches, is of Beer stone. The windows are three-light ones, surmounted by flowing tracery. They are filled with geometrical glazing of dull cathedral colours. The glazing has been done throughout by Mr. F. Drake, of the Cathedral-yard, Exeter, by whom also the decoration of the chancel roof was carried out. The western window in the tower is only of a temporary character. Mr. Drake has received orders to put a good painted subject therein. In the nave the ribs have, at their springings, carved angels bearing shields. Two old decayed precedents for these remained. These angels have been carved by Mr. Harry Hems, of Exeter. To indicate where the new chancel roof commences, an ornamental cusped rib has been introduced. The nave and aisle roofs have also had some colour placed upon them, but merely as a ground-work for future decoration. The old rood-screen, consisting of eight wide bays, had fallen into so bad a state of dilapidation that it was feared it was almost past repair. It was removed to Mr. Harry Hems's establishment, where the defective parts have been delicately repaired, and all that was deficient has been made good. The old pulpit was also placed in Mr. Hems's hands, and, having been partially restored by him, has been replaced *pro tem.* The unique old poor-box represents the figure of a man with staff and books, dressed in the costume of 1700 or thereabouts. This is supposed to represent the poor man of Pinhoe. Mr. Fulford has designed the surroundings in character with the statue. The restoration of these old works is by Mr. Harry Hems. The nave and aisle are laid with old memorial stones, the spaces between being filled with coloured tiles, as also is the floor of the porch and under the tower. The chancel floor and the sanctuary are laid with encaustic tiles, from Messrs. T. & R. Boote, of Burslem, Staffordshire. The tower contains four bells; but Mr. W. Aggett, of Chagford, has received instructions to prepare a cage for six. The works have been carried out in the main from the designs and under the superintendence of Mr. R. Medley Fulford, architect, Exeter. This applies to the restoration of the nave, aisles, vestry, porch, and tower. The chancel has been restored under the direction of Mr. Ewan Christian, architect to the Ecclesiastical Commissioners. The foreman who has had charge of the work throughout is Mr. James O. Fenning. The total cost of the above work is about 2,000*l.*

DISSENTING CHURCH BUILDING NEWS.

Ryton-on-Tyne.—The foundation-stone of a new Wesleyan Methodist chapel at Ryton-on-Tyne was recently laid. A new circuit, called the Tyneside Circuit, has been formed, embracing Ryton, Crawcrook, West Wylam, Prudhoe, Prudhoe Station, and the neighbourhood, with Ryton as head-quarters. About half an acre of land has been purchased, and on this site a chapel is now being erected. The Early Pointed style of architecture has been adopted, and the chapel will consist of a nave, two side aisles, and transepts. The nave will be divided from the aisles by a series of pointed arches, springing from ornamental cast-iron columns, which will carry a clearstory wall. At one end of the nave there will be a pulpit platform of pitch pine, stained and varnished, and the seating will be by means of open benches of the same wood. The building will be built of stone, and the walls on the outside faced with thin courses of blocking. At the north-west angle of the chapel will be a lofty tower, covered with a slated roof. In the rear of the main building there will be rooms for the caretaker to dwell in, and underneath will be a chamber for a hot-water apparatus. The peculiar character of the plot of ground necessitated an unusual height of foundations, and advantage has been taken of this to provide a large room under the whole area of the chapel. It is intended that the transepts shall not be seated for the present, but he divided from the chapel, and formed into a schoolroom and four vestries. The architect has provided in his plans for an extension of the building, and, when the requirements of the congregation demand it, the transepts will be opened out to the other portion of the chapel, and a lecture-hall and school, with class-rooms, vestries, and other accommodation, will be erected at the rear of the present works, in harmony with the original building. The chapel, as now arranged, will seat 280 persons, and with the extension referred to, 230 more sittings will be obtained, making 510; and the accommodation is arranged to be still further increased by the erection of a gallery in each transept, which will bring up the sitting

accommodation to 620. These extensions may be made by easy and gradual stages, to meet the growing requirements of the congregation. The contractors for the works are,—Mr. W. Lishman, Ryton, mason work; Mr. John J. Salter, Ryton, joiner's work; Mr. J. Rutter, Ryton, painting; Messrs. C. & G. Nicholson, Newcastle, slating; and Messrs. R. B. Charlton & Co., Newcastle, plumbing and ironwork. The building, as now planned, is estimated to cost about 2,950*l.* The architect is Mr. Joseph J. Lish, Newcastle-on-Tyne.

Lostwithiel.—The memorial stones of a new Wesleyan chapel and school were laid on the 14th ult. The site of the new premises adjoins the Restormel-road. The architect is Mr. James Hicks, of Redruth, and the builders are Messrs. Philp & Brown, of Lostwithiel. The building will be Gothic in style, with central gable flanked by pinnacles, and with, at the angle where the school joins the main building, a tower and spire. Attached to and at right angles with the chapel the school will be built, for about 150 children. In design it will correspond in the main with the chapel. The tower, which will rise at the angle, above the entrance, will consist of three stages, terminating in a spire. Crocketed pinnacles at the four corners will match with similar relieving features at the buttresses. In the body of the walls the local shale will be used, faced with killas slate from the Derrycombe quarry. For the plinths, steps, quoins, and copings, granite will be used, and the mouldings will be of Bath freestone. It is hoped the buildings will be completed by next Midsummer. The total cost of the work is estimated at about 1,750*l.*

SCHOOL BOARD SCHOOLS.

Liskeard.—The Liskeard School Board has just opened new schools at Dobwalls and Trewidland. Trewidland school is situated on a ridge of steep rising ground; the style is Queen Anne, with bold gable-framing and half-timber work, and panelled barge-boards. The dressings to windows and doorways are Bridgewater facing-brick, with cills to former also formed with purpose-made bricks. The roofs are slated with red tiles fixed on the ridges. A bell-turret, or flèche, of pleasing design, covered with cleft oak-shingles, is placed over the school-room roof. Accommodation is provided for about eighty children by means of a school-room about 34 ft. by 17 ft., and infants' room 15 ft. by 13 ft., fitted up with a gallery. The roofs of these rooms are open-timbered, being plastered on faces of rafters; the plastering of the walls inside is protected by a dado extending to a height of 4 ft. The usual separate porches for the boys and girls are provided with the necessary offices and yards. A convenient house for the master is attached to the school, containing six rooms and offices, with a small garden in front. The Dobwalls school is similar in external treatment and accommodation to Trewidland, without master's residence. Mr. Skentelbery, of Looe, is the architect, and Mr. Whale was the contractor. The contract for Dobwalls schools amounted to 372*l.*, and that for Trewidland (with the school-house) to 649*l.*

STAINED GLASS.

Chislehurst (Kent).—A two-light memorial window, to the memory of a lady deceased, has just been erected in the Wesleyan Chapel of Chislehurst. In the centre of each light is an enriched boss which displays a lily entwined by a riband, bearing a Scriptural legend; the one being, "The Lord is my Shepherd," the other "My Sheep hear my Voice." By instruction, no figure subject is introduced, but instead the lights display a variety of foliated ornament richly treated. The window is designed and executed by Messrs. Powell, Brothers, Leeds.

William's College, New York.—At special services on the 4th of July a window by Messrs. Ballantine, of Edinburgh, commemorating Albert Hopkins, Professor of Astronomy, was unveiled in presence of the trustees and alumni of the college. The design appropriately represents the Psalmist surveying the heavens and uttering the 19th Psalm, from which fit quotations are made. In reference to the devout Christian character of Professor Hopkins, there are introduced the cross, and the passage, "He that turneth many to righteousness shall shine as the stars for ever and ever."

VARIORUM.

Although we take little delight ourselves in imitations of woods and marbles, there are many who do, and many, consequently, who desire to attain skill in the art. These will find advantage in consulting a book published by Crosby Lockwood & Co., entitled "School of Painting for the Imitation of Woods and Marbles, as Taught and Practised by A. R. and P. Van der Burg." It includes numerous patterns in colour, and other illustrations. Some of the working-men's clubs should give their young men the opportunity to study it.——"Journals and Journalism; with a Guide for Literary Beginners," by John Oldcastle (Field & Tuer), contains a considerable amount of information which will be found useful by the aforesaid beginners. The writer shows that he is ignorant of the position of the *Builder* in the world of letters, but that shall not prevent us from recommending the little book. It will interest others besides those who are looking to distil a fortune through a quill.——"National Industrial Insurance and Employers' Liability," by Geo. Howell (P. S. King, King-street, Westminster), treats the questions involved with moderation and good sense, and deserves the candid consideration of those who are seeking to arrive at a fair settlement of them.——A Special Midsummer Edition has been published of "Bevis's Builders' Price Book" (8, St. Martin's-place), and the author claims to have revised the prices up to that date.—— Part VI. of Letts's "Popular Atlas" brings us to the first half-mile stone of the first year's issue, and inasmuch as we know from indisputable authority that a very large circulation is necessary to enable the work to be produced at so low a price, we are sure our readers will pardon us if we again direct their attention to its merits. Eighteen maps are now before us, and we do not hesitate to say that no similar number of maps at such a price has ever been offered to the public; not only for their cheerful appearance, but for the very varied and useful information they one and all contain. Take, for instance, the present part. Whenever has Russia presented to our *mind's* eye anything but a dreary waste of unpronounceable names? Now we have quite another impression conveyed to us: we can realise the great extent of the corn-growing districts; we can read and understand that though twenty times the *size* of the British Isles, its population is but one-eighth that of this country; and that high as Mont Blanc is, there are at least two peaks in the Caucasus *thousands of feet* higher. And this is only an isolated case. Messrs. Letts, having put their hands to the work, have used their heads too, and considered that if a thing was worth doing at all it was worth doing well.——The new number of the *Fortnightly* includes an article entitled "Friendly Societies: their Position and Prospects," by Mr. James S. Randell, in which the writer, who has given much attention to the subject, urges strongly the desirability of establishing a national benefit society. Mr. Randell says in the course of his paper:—"Mr. Blackley, in an able article in the November number of the *Nineteenth Century* for the year 1878, and in another article in the *Contemporary Review* of July last, proposes that every young man shall be compelled to insure against want by the purchase of the minimum of 8s. per week for sickness up to seventy years of age, and 4s. per week pension for life after seventy, the title to payment being, not destitution, but sickness, or having attained the age of seventy; and Mr. Blackley estimates that if everybody insured, as a third would not claim, the payment of 10*l.* would be sufficient to provide the necessary funds for payment of the claims of 8s. per week during sickness up to seventy, and 4s. per week for life after seventy; and he proposes that beyond this minimum the purchase price shall be 15*l.* for every 8s. per week during sickness up to seventy, and 4s. per week for life after seventy. . . . . Waiving for a time the discussion of the subject of compulsion, why should not a national association be organised embodying these several modes of assurance? At any rate, surely the matter is worth attention and a crucial investigation. To start with, an inadequate scale of payment would be most undesirable; for, unless self-supporting, the plan would not be satisfactory or command respect. At the same time, it must have a national guarantee, the same as the Post-office Savings Bank, and while no expense to the State, it would give the arrangement an undoubted security, making it as safe as the English funds. The industrial classes are generally manifesting a desire to make some provision for the future. The large number yearly joining friendly societies; the 1,400,000*l.* paid last year to one London office for life assurances, of small amounts per policy; and the 30,000,000*l.* on deposit at the Post-office Savings Bank, on the 31st of December, 1878, of which 3,360,636*l.* were deposited during the year 1878, in amounts averaging 2*l.* 16s. 5d. to each depositor,—these evidence both their anxiety and their efforts to secure their future, and we rejoice to know that this amount of 30,000,000*l.* is in safe keeping. Why should not the millions now paid yearly to tottering friendly societies be paid into keeping equally secure with the Post-office Savings Bank, to the advantage of those who struggle to pay, and whose future is dependent on the produce of their payments?"

Miscellanea.

A Gothic Shrine.—The Geneva correspondent of the *Times* writes:—"The Historical-Antiquarian Society of Grisons have lately added to the treasures of their museum one of the few Gothic altar shrines that still remain in Eastern Switzerland. It was formerly in a chapel belonging to the Mesocina family, and has been purchased by the society from the present proprietor of the château, of which the chapel forms a part. The shrine is divided into three parts. On the plinth is a painting in oil of the handkerchief of St. Veronica held by two angels, and on the triptych and side shrines are portraits, also in oil, of St. Stephen and St. Anthony. The inside of the shrine is gilt, and the gilding is in excellent preservation. The interior contains figures carved in wood of St. Nicholas, St. Maria, and St. Catherine, their names being indicated in the later Gothic characters. Two other figures are carved on the reverse part of the side shrines, but the names of the saints whom they are intended to represent are not given. On the crown of the shrine are carved seven busts, supposed to be those of the founders or patrons of the chapel. The barets of two of the number mark them out as priors of St. Victor; two others wear clerical costumes, the remaining four being habited as civilians. With the exception of some slight damage to a few of the figures, which can easily be made good, the shrine is exceedingly well preserved. The carvings and paintings are well executed, and belong to the same style of art, and probably to the same age, as the decorations of the cathedral altar of Coire and the altar of the Church of St. Lucius at Cburwalden."

The Telephone.—It is well known that if a long dry tube, open at both ends, be held over a jet of burning hydrogen, a musical sound is produced, the pitch and quality of which vary with the length, thickness, and diameter of the tube. It has been proposed to adapt such a tube to the safety-lamp underground, and to place it near a telephone in communication with another telephone in the manager's office on the surface. The alteration of the sound, due to a greater or less admixture of gas with the air of the mine, would warn the manager of the state of the atmosphere in the workings.——During the Sunday School Centenary service at Swansea, the strains of the chorus in the music-hall were distinctly heard at the end of a telephonic circuit of nearly a mile in length. The apparatus was fixed by Mr. J. Legg, who is about to connect the Velindre Waterworks with the Town-hall, a line nine miles in length. We hear that the same gentleman has just received an order from Madame Adelina Patti to put up a line between her castle (Craig-y-nos) and Penwyllit Railway Station, so that orders for carriages to meet guests may be given. The telephone used is the Gower Bell, which gives great satisfaction.—*The Electrician.*

Proposed Cathedral, Douglas, Isle of Man.—A statement is made that it is in contemplation by certain persons shortly to present land in Douglas as a site for a cathedral for the Isle of Man.

Samaritan Free Hospital.—Messrs. H. Saxon Snell & Son have been requested to prepare a design for the new Royal Samaritan Free Hospital on the site of Dorset House, St. Marylebone.

A Gallery of Casts.—The *American Architect* eays,—"An offer bae been made to the Metropolitan Museum of Art, which its friende cannot be too prompt in enabling it to accept. It ie propoeed to furnish the Mneeum, not only with a complete set of caste from all the principal collections of eculptnre in the world, bnt with moulde for casting duplicatee, provided sufficient money shall he contributed to pay for the work and material. A little reflection ie neceeeary to enable non-profeecional persone to comprehend the value of this offer, and the importance of eeizing at once an opportunity which can never occur again in eo favourable a form. It ie well known that the marble antiqnee which fill the galleriee of Enrope are eteadily deteriorating under the combined influence of the acid vapours which load the atmoephere of modern citiee, and the ducting which ie necessary to keep them clean, eo that within a yeer or two the authorities of the British Mneenm have been compelled to ehnt up eome of their bas-reliefs in glaes cases, and to varnisb others witb ellicatee in order to prevent their total ruin. Ae it is, the caste now made are inferior to the ones taken twenty yeare ago, and those of twenty yeare hence will be still woree, eo that not a moment ehould be lost in eecuring a collectiou of moulde before the exquicite texture and surfuce of tbe original hae been further attacked. The completeness of the collection which ie now within onr reach givee it also immence valne. It must not he forgotten that worke of eculpture are not only examples of art, bnt historical documente, and that au incomplete collection of caste, however well eelected from the artistic point of view, ie as useless to bietory, compared with a more comprehensive one, as would he a eelection of manuscripte of the Angustan age alone, compared with the riches of the Vatican Library."

At the Astley Bridge Local Board Offices, on Tuesday, the 14th of July, Mr. J. T. Harrison, C.E., on behalf of the Local Goverument Board, held an inqniry as to the application of the Astley Bridge Local Board for permission to borrow the eum of 3,076*l*. After the explanatione of the chairmau of tbe Streete Committee (Mr. Leuch), the snrveyor (Mr. Lomax, and the clerk (Mr. Marsden) ae to the purposee for which the eum was reqnired, the inquiry closed. There was no opposition. At the conclnsion of the proceedings, Mr. Harrison made several inquiries into the working and conetruction of the eewage worke, and made the following statement:—Some time ago, witbont the knowledge of the Astley Bridge Authority, be made an inspection of their eewage works, examining the inlets and the outlete for the sewage, and the construction and working of the tanke and filter for the purpoee of eatiefying himself npon the efficiency of their working, which he approved, the principle of the works being good. Still farther to eatisfy himself that the results were such ae to warrant his recommendation of the principle on which they were conetructed, he took six eamples of the effluent water before it passed into the river, and sent them to Dr. Frankland, the analytical ohemist of the Local Governmeut Board, for analysis. Dr. Frankland'e report to the Board was highly satisfactory; for he etated that, although there was a qnantity of organic matter in the water, it was of such a qnality that it might be turned into any waterconrse, and that it came within the standard of purity required.

The Water Supply of the Metropolis.—The Select Committee appointed to concider the question of the water eupply of the metropolis bave agreed upon their report. It ie understood tbat it recommends the creation of a Water Trust, to be elected from the Corporation of the City of London, the Metropolitan Board of Worke, and the other bodies representing water districte outside the jurisdiction of these corporations. The Committee arrive at the conclnsiou that "the agreemente" with the water companies accepted ae a basie of Sir Richard Croes'e scheme for the purchase of the existing waterworks ehould be placed ont of court. They do not oppoee the purchase of the waterworke upon reasonable terme, bnt suggest that favourable consideration ehould he given to the poesibility of obtaining a enpply from other sonrce.—*Morning Post.*

Mr. Stephen Tucker, Rouge Croix Pursuivant of Arms, has been nominated by the Duke of Norfolk, Hereditary Earl Marshal, to the Patent Office of Somereet Herald in Ordinary, held in recsut years by the late Mr. Planché.

Balsall-heath Local Board.—A epecial meeting of thie Board wae held on July 27, Mr. Parcone presiding. The chairman, in explaining the object of the meeting, eaid they bad been called together to sanction an application to the Local Government Board for the borrowing of 22,000*l*. for eewerage works. The Board, who had already applied for a loan of 15,000*l*., were now in a peculiar poeition, inaemnch ae tbe eewerage worke committee knew nothing whatever about the matter. He was astonished at the amount now asked for in connexion witb the sewerage works. A few montbs ago Mr. Nicholls, the engineer to tho Board, eaid au expenditure of 23,000*l*. would meet the case, whereas according to him at tbe preeent time the coet would he 37,000*l*. The Board were astonished, when the work wae about three parts finished, to find they required a eum of 13,000*l*. as extras for the completion of No. 2 contract, which amounted to 16,000*l*. The following resolution wae carried:—"The Board strongly complaine of the conduct of Mr. Nicholle, the engineer, in not letting the Board have his estimatee of the amonnt required to complete the eewerage echeme earlier than twenty minutes before the Government inepector held hie late inquiry, which left the committee in such a poeition that they could not examine their correctneee before they were laid before the inepector; and the Board requires immediate detaile as to how Mr. Nicholle makee ont hie estimate of 13,041*l*. upon Mr. Palmer'e contract of 15,456*l*., ae the Board was led to helieve that Mr. Nicholls nndertook to carry out the echeme prepared by Mr. Barnee; that be then only estimated the extras at 686*l*., eubject to the nenal contingencies of treacherous grnnd; and the Board cannot nnderetand why the extras shonld exceed that eum except for reasonable eums for converting old sewere for etorm-water use and hazardoue grouud."

The Armstrong Park, Newcastle-on-Tyne, has been opened. Mr. W. H. Newton, Chairman of the Parks Committee, in the conree of the proceedings stated that some two yeare ago the Corporation purchased two properties for the purpoeee of pnblic parke: the firet was at Elewick and the other at Heatou. They bad ecarcely handed over the Heaton purchaee to the committee to be laid ont wheu their distinguished towneman, Sir Wm. Armetrong, signified hie approval of the actiou on the part of the Corporation by supplementing the 22½ acree at Heaton hy 28½ aoree, making a total of 50 acree at Heaton for park purpoeee. Some 6,000*l*. have heeu expended in laying ont the park (under the direction of Mr. Fowler, the horongh engineer). The Corporation had recognieed a wise obligation in promoting district parke and recreation-grounds, and had testified tbeir gratitude to Sir Wm. Armetrong in what he trusted wonld he a most agreeable form, for thie property would be known hereafter hy the name of the Armetrong Park. It wae a pleasing reflectiou that, while the name of Sir Wm. Armetrong would he handed down as the greatest artillery and hydranlic engineer of his age, the people of Tyneside wonld associate hie name and hie memory with one of the greatest pnblic hoone which it wae poesible for a community to enjoy.

Compensation.—Under-Sheriff Burchell presided last week at the Sheriffs' Conrt, Red Lion-square, over a special jnry, in the compensation ouse of "Jones *v.* The Midland Railway Company," in which a olaim wae made of between 5,000*l*. and 6,000*l*. for four very old freehold wooden houses in Royal Mint-street, Tower-hill, required by the railway company. Evidence wae given hy the claimant, Robert Jones, who wae a coal-dealer in one of the houses, where he had carried on husinsss for eighteen yeare; the other honcee he let in weekly tenements. He bought at the present time the beet coale delivered to him at 18s. per ton, and by selling them in small quantities he made 12s. per ton profit; he made 7s. a chaldron on coke, 2s. 3d. per eack on charcoal, and a good profit on firewood. His net profits exceeded 300*l*. a year, besidee the profit on the honses; and as he cönld get no premiees near Mint-street, 900*l*., being three years' purchase, wae asked for the husinese. The freehold for building purposes in the neighbonrhood had nearly donbled in value. Surveyore estimated the value at from 4,525*l*. to 4,800*l*. After the case had occnpied abont five honre (the jury having made a personal inspection of the premises), a verdict by consent was taken for 4,000*l*.

Sewage in the Thames.—At the last meeting of the Woolwich District Board of Worke, Mr. Tuffield referred to the nuicance caneed hy the diecharge of the eewage of the metropolis into the Thamse. No one, he eaid, could go to London by boat witb any degree of comfort. At high water the river was black, and emitted an abominable steneb, whilet eewage matter conld he eeen floating on the top. The meu on tbe pier said that the nuieance arose from the men at the outfall eewers discharging the eewage into the river before the high tide. The conseqnence wae that the diecharged sewage floated up to Woolwich and Greenwich. If the London sewage could not he ntilieed profitably, it ought to be utilised nnprofitably. It had become a nuieance never contemplated by Act of Parliament. Woolwich parieh had a good eyetem of drainage before the Metropolitan Board of Worke forced the exieting scheme npon tbem. They were charged vast enms of money for being afflicted with an intolerable nuisance. Government conld never have contemplated the Thames at Woolwich being converted into an open eewer, or they would certainly have pnt a veto on the present system of drainage for the eake of the health of the troops. The chairman said that he fully endoreed the etatements of Mr. Tuffield. He never knew the river to be in euch a etate as at the present time. The Thames was infinitely worse now than before the construction of the northern and southern outfalls. It was recolved to write to the Metropolitan Board, asking for immediate attention to be given to the present filthy condition of tbe river. Capt. Behenna eaid that notices were pnt np at the outfalle that the elnicee ehould be opened at a certain time after ebb. Instead of theee orders heing obeyed, tbe eluices were opened when the flow wae going on, and before the flood had attained ite height.

Iron and Steel Institute.—The detailed programme of the annual meeting of thie Institute, to be held at Düeseldorf, on August 25, 26, 27, and 28, ie now publiehed. On the 25th there is to he in the morning a general meeting of membere at the Tonhalle, where the Institnte will be received by the local authorities; in the afternoon a visit to the exhibition, and to works near Düeseldorf; and in the evening the annual dinner of the Institnte at the Tonhalle. On the 26th and 27th there are to be general meetings in the mornings for the reading and discussion of papers; the afternoone are to he devoted to exoursione by special trains to variouc iron and steel worke in the neighbourhood of Düeseldorf, followed hy concerts in the evenings. The whole will be brought to a cloee by a Rhine exourcion ou the 28th, to Cologne, *viâ* Rolandseck, Bingen, and Coblentz.

TENDERS

For the erection of a parsonage-house, in the parish of Holy Trinity, Esclnsham, Wrexham, for the Rev. L. W. Davies. Mr. J. E. Lash, architect. Quantities by Mr. W. Lunn:—

Tongue	4,193	0	0
Jerrard	4,074	0	0

For the enlargement of schools at Olga-street, Groveroad, Hackney, for the School Board for London. Mr. E. R. Robson, architect. Quantities supplied by Mr. T Thornton Green:—

Brass	£3,994	0	0
Higgs & Hill	3,940	0	0
Shephard	3,910	0	0
Kirk & Randall	3,865	0	0
Sargeant	3,845	0	0
Boyce	3,770	0	0
Wood	3,745	0	0
Williams	3,542	0	0
Stimpson	3,320	0	0
Grover	3,284	0	0

For new offices, 57, Moorgate-street, and ground floor and basement, 76, Coleman-street, for Messrs. W. & J. R. Hunter. Mr. Henry Dawson, architect. Quantities by Mr. C. N. McIntyre North:—

Roberts	£5,825	0	0
Bangs & Co.	5,730	0	0
Kirk & Randall	5,510	0	0
Ashby Bros.	5,489	0	0
Ashby & Horner	5,444	0	0
Colls & Sons	5,250	0	0
Woodward	5,093	0	0

For new residences, New Warwick-road, Milverton, for Messrs. H. C. Passman and Geo. Rogers. Messrs. Brown & Albury, architects:—
Mills (accepted).

For new show-room, Broad-street, Reading, for Messrs. Wellstead & Co. Messrs. Brown & Albury, architects:—

Higgs	£913 0 0
Woodroffe	830 10 0
Searle	800 0 0
White	785 0 0
Denton	689 10 0
East	660 0 0

For bronze shop-front and revolving shutters for the above:—
Bunnett & Co. (accepted) £148 10 0

For new entrance-lodge and alterations to residence of Capt. Beaumont, Calcot-place, Reading. Messrs. Brown & Albury, architects:—

Simonds	£539 0 0
Denton	507 0 0
Wornham	490 16 0
Wigmore (accepted)	451 0 0

For industrial dwellings in The Forbury, Reading, for Mr. Robert Tomphins. Messrs. Brown & Albury, architects:—

Carter	£2,303 0 0
Searle	2,244 0 0
Weaver	2,240 0 0
Simonde	2,197 0 0
Kingerlee	2,145 0 0
Lewis	2,110 0 0
Denton	2,077 0 0
Wornham (accepted)	1,895 0 0

Fireproof Flooring.

Dennett & Co.	£290 0 0

For cleaning and renovating internally and externally St. Stephen's Church, North Bow:—

Robey, Bow-road	£210 0 0
Barrow, Malmesbury-road, Bow	189 0 0

For the erection of Sunday schools, class-rooms, caretaker's house, &c., in the rear of Walworth Wesleyan Chapel, Camberwell-road, for the Building Committee. Mr. Charles Bell, architect:—

Kirk	£2,934 0 0
Hall, Beddall, & Co.	2,894 0 0
Woodward	2,854 0 0

CONTENTS.

Thomas Henry Wyatt, Architect.

PERHAPS it is still known only to a few that Mr. Wyatt died on the evening of Thursday, the 5th inst. Though for some considerable period he had remained in a precarious condition, his death was sudden and unexpected. Nevertheless his recent state of health was such, that neither his family nor his intimate friends were ever led to believe in the possibility of any complete recovery from the combination of maladies with which he was attacked. Though during a week and more barely conscious of what was taking place around him, his strength would suddenly revive, and, as lately happened more than once, he would be met paying a visit several miles from London, attending a professional gathering at Greenwich, or seated in the presidential chair of the Architects' Benevolent Society, in all of which positions he would still conspicuously display the grace and geniality that distinguished him through an eventful and a comparatively protracted career.

Born in Ireland, at Loughlin House, Roscommon, seventy-three years ago, at the residence of his father, Mr. Matthew Wyatt, some time a Metropolitan Police Magistrate, he was educated by private tuition, also spending a short time for that purpose at Brussels. Intended by his father for the career of a merchant, he passed a few years of his early life in the Mediterranean, trying, as he once said publicly, to "learn the beauties of cottons, coffees, and calicoes." The business being distasteful to him, he obtained permission to study architecture, and he consequently entered the office of the late Mr. Philip Herdwick, the Royal Academician, assisting that gentleman in the alterations then being made at Goldsmiths' Hall, and in the works at St. Katherine's Docks. It was during his stay with Mr. Herdwick that the drawings were being made for the great Doric entrance to the London and North-Western Terminus at Euston-square. One or two old friends remember Mr. Wyatt at that time, often dining with him at his mother's house (she having been left a widow) at Hackney, where he was district surveyor,—an appointment which he held for a short period only, as his other professional engagements began early to engross his full attention. It is now nearly forty-five years since he first moved to Great Russell-street, where, at No. 77, he resided to the moment of his death. In 1838 he entered into partnership with Mr. David Brandon, F.S.A., and after the dissolution continued the practice of his profession alone until about twenty years ago, when he admitted his son (Mr. Matt. Wyatt) into partnership with him, though the latter was never formally introduced as his father's partner. Among a long list of pupils who have served their articles in his office, may be mentioned two distinguished men who have preceded him to the grave,—the late Sir Digby Wyatt, who was his younger brother, and Edward Barry, whose sudden death at the council table of the Royal Academy occurred only a few months ago. The catalogue of Mr. Wyatt's executed works presents a formidable appearance, and compares not unfavourably with that of his colleague the late Sir Gilbert Scott. That one man could have, unaided, designed and superintended so large a number of buildings as those described in the subjoined list,—even during the space of a generation,—is not probable, and it was Mr. Wyatt's invariable habit to acknowledge the help rendered to him by his pupils and assistants. When in 1873 he received the Royal Gold Medal from the hands of Sir Gilbert Scott, who took occasion necessarily to refer to his colleague's works, Mr. Wyatt said, "I know well how little these works in themselves deserve this honour, and no one can know so well as I do how much I am indebted to others for what there is of interest in those works,—I mean to faithful and attached assistants, who have been long with me." On the same occasion he begged the critics to bear in mind the relative advantages that the younger architect of the present day had over those of a passing generation. But neither this mild deprecation, nor the modest avowal that preceded it, can alter the fact, with those who know, that the well-known church at Wilton, near Salisbury, erected for Mr. Sydney (afterwards Lord) Herbert, was exclusively Mr. Wyatt's design; and considering when it was erected, it suffices to place its architect high among the artists and adapters of this century.* Wilton Church has been truly described by the late Sir Gilbert Scott as a magnificent building "of a noble style,—the early style of Lombardy, with all its richness of material and workmanship." But in spite of the large practice to which, until within a few months of his death, he gave constant personal supervision, he held several honorary appointments. He was honorary architect to the Institution of Civil Engineers, and had a seat at the Council; to the Athenæum Club, of which he was a member; to the Middlesex Hospital; and to the Governesses' Benevolent Institution. He was also consulting architect to the Commissioners in Lunacy, the Incorporated Society for Church Building, and the Salisbury Church Building Society. He was also President of the Architects' Benevolent Society, and it was due to his personal exertions that the funded property of that society was raised to more than 5,000*l.* By Mr. Wyatt's appeal to a comparatively few professional brethren, more than 1,600*l.* was subscribed in a short time, the effort having been initiated by Mr. Godwin, who offered a sum of money conditionally on fourteen others subscribing a like amount. It was also largely due to the advice and exertions of Mr. Wyatt that the business of the Benevolent Society was transferred to the office of the Institute of Architects, and to some extent affiliated to the corporate body.

Probably very few also are aware of the interest with which Mr. Wyatt viewed the formation and progress of that body. When all England was burning hot with Parliamentary Reform, there was just a little sympathetic smouldering and smoking going on among the architects as to the necessity of education, of archæological inquiry, and of united action. An institution,—called the Architectural Society,—then existed, the objects of which were the advancement and diffusion of architectural knowledge, by promoting the intercourse of those engaged in its study. Started in 1831, it was not till 1833 that the members felt the necessity of hearing "Papers" read, and the first of a series of essays read before the Society is now preserved in the library of the Institute. It is the work of Mr. Wyatt,—a manuscript written by himself,—which treats of: (1) "The advantages we may derive from the observance and interchange of our mutual thoughts and acquirements;" and (2) of "The advantages of friendly intercourse amongst the members of a profession deemed polite and liberal." Some may smile at the theme, but the spirit breathed in it is that of Tom Wyatt, young, middle-aged, and old; and while the arguments he used still hold good, the complaints he uttered are still unanswered. In his essay he alluded to the superior organisation of the French "Public Works," and of the superior training of the French student of architecture,—allusions which, during the remainder of his life, he must have heard others continually repeat with more or less force and with equally just premisses. The Architectural Society, however, gave way to a more important institution, though meanwhile Mr. Wyatt had been its Vice-President, and his great friend Mr. George Mair, its Honorary Secretary. In 1838 the former became a Fellow of the Institute of British Architects, and in 1842 the Architectural Society became a part of the Institute founded, as every architect knows, in 1834, though the charter was not obtained until three years later. In the year of the junction Mr. Wyatt was elected a member of the Council, and of that Council (all distinguished men) only two now survive,—Professor Donaldson and Mr. Mair. From that date to this Mr. Wyatt has been associated with the proceedings of the Institute. Elected President in 1870, his presidential addresses were

* A brief description of this church, by the conductor of this journal, will be found in the *Journal of the British Archæological Association*, for 1859, under the heading "Early Christian Buildings and their Decorations."

eminently characteristic and practical expositions not only of the events of the period, but also of past and future circumstances connected with architectural affairs. In 1873 he received the Royal Gold Medal, and a few years afterwards took a conspicuous part in the pursuit of those inquiries which led to what is now known as the reform of the Institute, done in that year of grace 1877,—euphoniously described by a member as The Year One, N.S.,"—when the nucleus of the present Council was formed. The death of Mr. Cockerell led, in 1879, to the appointment of Mr. Wyatt as Honorary Secretary, an office which he filled with undoubted advantage to both the general body of members and the Council, and which he resigned but a very short time ago. The respect and affection entertained for him by those colleagues with whom he was immediately associated will be perfectly well understood, and we need not go out of our way to describe those feelings. The following letter, however, which we are enabled to publish, is not without interest at the present moment:—

"Royal Institute of British Architects,
9th August, 1880.

My Dear Sir,—I am instructed by the Council of the Royal Institute of British Architects to inform you, as the elder son of the late Thomas Henry Wyatt, Past President, and until within a few days Honorary Secretary, of the great grief they feel at the sudden though not unexpected death of your lamented father. In the letter recently addressed to him personally, the Council expressed most inadequately their thanks for the services he rendered to the Institute while holding the office of Honorary Secretary, and they afterwards learned,—from messages sent to individual members,—that he was gratified with the sincere and unanimous feeling which prompted the conveyance of that expression. His death now serves to recall the memory of numberless other services he has rendered in the course of a comparatively long life to the profession of which he was one of the most respected members, and to the corporate body of architects, of whom he was a distinguished President. Indeed, on looking through our records, I find that Mr. T. H. Wyatt was elected a Fellow of the Institute so long ago as the year 1838, and that he was first made a member of the Council in 1842. Elected president in 1870, important and varied business, seriously affecting the welfare of the Institute, was then successfully transacted,—a success, moreover, largely due to the tact, energy, and courtesy with which he occupied the presidential chair.

It is impossible to conclude this necessarily short reference and imperfect letter of condolence without unfeignedly deploring the severe loss which the Council have sustained by the death of an adviser so wise and a colleague so sympathetic as the late Mr. Wyatt proved himself to be during an intimate connexion of eight-and-thirty years.—I am, my dear sir, your very faithful servant,

(Signed) WILLIAM H. WHITE, Secretary.

Matt. Wyatt, esq.,
77, Great Russell-street, Bloomsbury, W.C."

Thomas Henry Wyatt was buried on Tuesday last at Weston, a quiet village some seven miles from Basingstoke, at a church restored and rebuilt from his own designs, and partly at his own expense. Laid in the same grave as his wife, who preceded him by five years, the spot in which his body rests could not be more beautifully surrounded. Besides several members of the family, there were present at the funeral one of his oldest friends, Mr. C. H. Gregory, the distinguished engineer; Mr. Hannen, the well-known builder, and some of Mr. Wyatt's assistants and pupils. The Royal Institute of British Architects was represented by Mr. Whichcord, F.S.A., the president, who was accompanied by the secretary; and if a large number of engineers and architects were not among the followers to the grave, an explanation may be found in the fact that, as Mr. Wyatt had early expressed a wish to be buried in the strictest privacy, no notices of his death were issued other than the letters sent to his family and a few of his friends. By his will, Mr. Wyatt's practice and his library of architectural books are left to his eldest son, while amongst other legacies, he has bequeathed sums of money to the Incorporated Society for Church Building, the Architects' Benevolent Society, and to the Library of the Institute.

The Wyatts have furnished a goodly share of practitioners in architecture and the kindred art of sculpture,—for instance: James Wyatt, Surveyor-General of H.M. Works, President of the Royal Academy, and a restorer of Windsor Castle; Benjamin Wyatt, architect of Apsley House, Sutherland House, and Drury-lane Theatre; Lewis Wyatt, who was employed at Hampton Court and Kew, and was Architect to the Board of Ordnance; Samuel Wyatt, of Chelsea Hospital, the Pantheon, &c.; Jeffry Wyatt (afterwards Sir Jeffry Wyattville), the much-abused restorer of Windsor Castle, architect of Chatsworth and Longleat; Thomas Henry Wyatt, whose death we deplore; and the late Sir Digby Wyatt, well known to the present generation. The sculptors are Matthew Coates Wyatt, Richard Wyatt of Rome, and Edward Wyatt.

Though the friend we have lost can scarcely be described as a great architect, though he was neither a brilliant wit nor a powerful leader of men,—professionally his advice was sought by some of the best men in England, and socially he had few equals. One great point with him was that he could rough out a sketch-plan with a facility that astonished both his clients and his assistants; another point was that he could write a business letter which a client could read with interest and understand without difficulty. As a member of the Corporate Body of British Architects he must be regarded as eminently successful in his professional career; as a member of the Council his advice was sought and his opinion received with respect such as few other members inspired. He was conciliatory and politic; always modest and a gentleman. The words he wrote in 1833, when called upon to prepare the first of a tentative list of essays for the Architectural Society, were not unlike what he often uttered towards the close of his life; and at a time when the test of examination is about to be enforced on all candidates for admittance to the ranks of the only chartered architectural society in Great Britain, those words, after the lapse of half a century almost, may not inappropriately be inserted here:—"Gentlemen," said Mr. Wyatt, "I have wandered far from my subject, and trespassed, I fear, still further on your patience. But I would prove that in the establishment of our society a foundation has been laid upon which may be raised, by our own energy, an Institution alike important to ourselves and to society, though to effect this end sacrifices and efforts of no ordinary nature must be made. There must be the sacrifice of all self-conceited opinions, there must be the entire abandonment of every petty cause of dissatisfaction in our mutual anxiety to promote one common object; there must be the effort made to judge rather less favourably of ourselves and more charitably of others than is perhaps in strict accordance with human nature."

The following is a list of the works carried out by Mr. Wyatt since the year 1848; some of them, of course, when he was in partnership:—

Assize Courts.—Winchester, Devizes, Usk, Brecon, Cambridge.

Gaols.—Usk, Cardiff, Monmouth, Swansea (addition).

Hospitals, &c.—Middlesex (alterations and additions); St. Mary's (alterations and additions); Small Pox, Stockwell; St. Luke's; Brompton Hospital for Consumption (new block); Malta Hospital for Incurables; Malta Asylum for the Aged and Infirm; Norfolk and Norwich (in conjunction with Mr. Boardman; Cancer Hospital, Osnaburgh-street (alterations); Fever Hospital, Stockwell (new wing); Salop Infirmary (alterations and additions); Salisbury Infirmary (additions); Essex and Colchester Hospital (additions and alterations); Tetbury Cottage Hospital; Basingstoke Cottage Hospital; Wilts Lunatic Asylum; Buckingham Lunatic Asylum.

Public Buildings.—Exchange Buildings, Liverpool; Knightsbridge Cavalry Barracks; Recreation Hall, Theatre, and Mess-Rooms at the R.A. Barracks, Woolwich; Militia Stores, Wilts; Railway Station, Florence; Devonshire Club (alterations); Monmouth Club; Adelphi Theatre; Hull Orphan Asylum and Schools; St. Aidan's College Birkenhead; Governesses' Benevolent Institution; Town Hall, Ringwood; Town Hall, Crickhowell; Polytechnic Institution; Institution of Civil Engineers (alterations); Lecture Hall, Warminster; Crown Hotel, Sevenoaks, Oatlands Park Hotel, Surrey.

Markets.—Merthyr Tydvil, Brecon, Newport (Mon.), Chepstow, Warminster.

Mansions, &c.—London: Park-lane (Sir Dudley Marjoribanks, M.P.); Audley-square (Lord Arthur Russell, M.P.); Queen-square, Westminster (Sir Chas. Forster, M.P.); Berkeley-street (Sir Baldwin Leighton, M.P.). Poland (Prince Woronzoff); Cascaes, Lisbon (Duke of Palmella); Llantarnam Abbey, Monmouth (Mr. Reg. Blewitt); Malpas-court (Mr. T. Protheroe); Llandogo Priory (Mrs. Gough); Orchardleigh Park, Somerset (Mr. W. Duckworth); Crewkerne (Mr. H. Hoskins); Capel Manor, Kent (Mr. F. Austen); Tunbridge Wells, Kent (Lady Selina Bidwell); Fonthill House, Wilts (Mr. J. Morrison); Llangattock Park, Brecon (Duke of Beaufort); Brockenhurst House, Hants (Mr. J. Morant); Tilgate, Sussex (Mr. G. Authruner); Carlett Park, Cheshire (Mr. J. Torr, M.P.); Stepleton, Dorset (Mr. W. C. Lambert); Matverleys, Berks (Mr. J. Forster); Barcote, Berks (Lady T. Guest); Cherkley Yews, Surrey (Mr. A. Dixon); Nantleys, St. Asaph (Mr. P. P. Pennant); Evancoyd, Radnor (Mr. B. Mynors); Palmerston House, Dublin (Earl of Mayo).

Mansions (Alterations and Additions).—London: Pall-Mall (Marquis of Ailesbury); Berkeley-square (Marquis of Lansdowne); Wilton-crescent (Earl of Kinnoul); Bruton-street (Earl of Carnarvon); Portman-square (Hon. W. B. Portman); Portland-place (Earl of Lythom); Hill-street (Earl of Durham); Stratford-place (Lord Odo Russell). Gloucester: Badminton (Duke of Beaufort); Lydney Park (Rev. W. Bathurst); The Abbey, Cirencester (Mr. J. M. Masters); Lyppiat Park (Mr. J. E. Dorrington). Burnham Paddox, Leicestershire (Earl of Denbigh). Lancashire: Lathom House (Earl of Lathom); Croxteth Park (Earl of Sefton). Deene Park, Northants (Earl of Cardigan). Wilts: Clarendon Park (Sir F. Bathurst); Wilton House (Earl of Pembroke); Estcourt House (Right Hon. T. S. Estcourt). Arley Hall, Cheshire (Mr. R. E. Warburton). Somerset: Sutton Court (Sir E. Strachey); Pixton (Earl of Carnarvon) Cranmore Hall, (Major Paget, M.P.). Downing, Flintshire (Viscount Feilding. Cornwall: Pensandane (Mr. R. F. Bolitho); Trelawne (Sir J. Trelawney); Cardew (Colonel Tremayne). Hants: Malshanger Park (Mr. Wyndham Portal); Sydmonton Court (Mr. W. H. Kingsmill). Surrey: Burr Hill (Mr. F. Bircham); Fairholme (Mr. H. Rogers). Monmouth: Cefn Tilla (Lord Raglan); The Hendu (Mr. J. A. Rolls, M.P.); Bryn Glas (Mr. T. Cordes, M.P.). Berks: Ascot (Admiral Greville); Harewood Lodge (Rev. N. J. Ridley). Moreton-in-the-Marsh, Cambridgeshire (Major Bird). Brethy Park, Derby (Earl of Chesterfield). Lyswaye Hall, Staffordshire (Sir Charles Foster). Kiplin Hall, Yorkshire (Capt. Hon. W. C. Carpenter). Pontryffydd, N. Wales (Capt. Mesham). Kent: Stansfield Lodge (Mrs. Duncan); Honor Oak (Mr. C. Marquardt. Bredenbury Court, Hereford (Mr. W. H. Barnaby). Castle Rising Hall, Norfolk (Hon. Greville Howard). Isle of Wight: Swainston (Sir Barrington Simeon); Languard (Col. Atherley). Odiham Priory, Hants (Right Hon. G. Sclater Booth); High Legh, Cheshire (Col. Leigh). Portland Lodge, Dorset (Mr. H. Vizard). Ireland: Abbey-leix, (Viscount de Vesci); Rosmfort (Mr. S. Ram). Hants: Kempshott Park (Sir Nelson Bycroft); Oakley Hall (Mr. W. W. Beach, M.P.); Llangattock Manor, Monmouthshire (Mr. J. A. Rolls).

Schools.—Swansea, Glamorganshire; Llandynil, Montgomeryshire; Brynford, Gorsedd, Flintshire; Brockenhurst, Basingstoke, Hants; Lullington, Somersetshire; Cobham, Kent; Newton, Gloucestershire; East Woodhay, Berks; Brecon, Gravely, Breconshire; Warminster, Westbury, Dilton, Wilts.

New Churches.—Wilts: Wilton, Crockerton, Westbury, Chilton, Steple Aston, Charlton, Fisherton, East Harnham, Cadley, Laverstock, Bemerton, Winterbourne Earls, Fonthill Gifford, St. Catherine's, and Christ Church, Savernake Forest, Cholderton, Semley, Hindon, Didmarston, Christ Church, Warminster (chancel). Dorset: Stourpaine, Langton, St. James's Shaftesbury, West Cranmore, Chidiock Okeford. London: St. Matthias, Bethnal Green; Trinity Church, Haverstock-hill. Cambridgeshire: St. John's, March. St. Peter's, St. Mary-in-the-Fen, Wimblington. Ireland: St. Bartholemew's, Dublin; Abbeyleix. Flintshire: Tryddyn, Gorsedd, Brynford, Pantasaph, Nannerch, Prestatyn; Llandynil, Erryrys, Montgomeryshire; Corwen, Merionethshire; Glangwseo, Carnarvonshire; Brymbo, Denbigh; Merthyr, Glamorganshire; Dunmore, Stirling; Jedburgh, N. Britain; Wolverton, Bucks; Woolwich Garrison Church, Kent (in conjunction with Sir Digby Wyatt); Eastwoodhay, Berks; St. Martin, Lincoln; Badminton (chancel), Gloncester; Dalton, Lancashire; Wheelton, Yorkshire; Bredenbury, Hereford; Newnham Paddox (R.C.), Leicestershire; Weston Patrick, Hants.

Church Restorations and Additions.—Llandaff Cathedral (in its earlier stages); Wimborne Minster. Wilts: Great Bedwyn Church, Codford St. Peter, Newton Tony, Wylye, Melksham, Combe Bissett, Woodford, Barbage, Froshnie, St. Peter's Marlbro', Shrewton, Downton, North Bradley, Chilterne, Horningsham, Boyton, Alvediston, All Cannings, Bower Chalke, Little Lasgford, Ogbourne St. George, South Newton, Wishford Magna, Fovant, Winterbourne Houghton, Bratton, Wilsford, Winterslow, Wroughton, Chilmark, Little Badwyn, Sopworth, Shroton, Chitto, Charlton, Burbage, Upavon, Sherston, Witshury, Bishop's Fonthill. Dorset: Tarrant Gnnville, Tarrant Keynston, Swanage, Spetisbury, Corfe Castle, Winterbourne Zelstone, Preston, Mere, Tolpuddle, Iwerne Minster, Cerne Abbas, Buckland Newton, Sutton Waldron, Dewlish, Parva, Holt, Affpuddle, Stalbridge, Oxon: Nettlehed, Sherburn. Bucks: Worminghall. Gloncestershire: Shipton Moyne, Newnton, Tormarton, Old Sodbury, Acton Turville, Dyrham. Lullington, Somersetshire; Bodvan, Cornwall; Castle Cacrenion, Montgomery. Kent: Horsmonden, Shorne, Chalk, Cobham (chancel). Hants: Oakley, Basing, Rotherwick, Silchester. Yorks.: Tanfield, Londesborough; Deene, Northants. Monmouth: Raglan, Trevethin, Usk, Llangattock, Llantihangel. Bray, Berks. Notts: Shelford, Burton Joyce. Brethy, Derby; Bromlin, Hereford.

Parsonages.—Wilts: Burbage, Upton Scudamore, Alvediston, South Newton, Broad Chalke, Broughton Gifford, Little Langford. Dorset: Tincleton, Stourpaine. Prestatyn, Flintshire. Denbighshire: Rhydymwyn, Brymbo. Hants: Plaitford, Weston Patrick. Shipton Moyne, Gloucestershire; Cobham, Kent; Ashampstead, Bucks; Horringer, Suffolk; Borough Green, Cambridgeshire; Jedburgh, N. Britain.*

IRON *v.* STEEL.

IF the long-standing dispute with regard to the rival advantages of using iron or steel for resisting tensile strains had been going on before a law-court, it would have been the best case for the lawyers that ever gladdened the heart of attorney or barrister. No sooner does the weight of evidence lead to a verdict for the plaintiff than some unthought-of defect turns the balance in favour of the defendant. Those who best know the facts and merits of the case are often the most deeply perplexed when called upon to account for the vagaries of the vigorous rival of wrought-iron. Theoretically it has everything in its favour. Pure metallic iron, with the amount of carbon combined that fits it for resisting the particular strains to which it is intended to be subjected as a finished structure, is the ideal product of the metallurgist and the practical ironmaster. When this result has been approximately reached by improved methods of manufacture, the typical metal is all that could be desired. With the proportion of carbon

* Illustrations of many of these works will be found in our previous volumes, including:—Theatre Royal, Adelphi (1855, p. 871); Memorial Church to Geo. Herbert, at Bemerton, Wilts (1861, p. 266); Memorial to the Countess of Pembroke in Wilton Church, Wiltshire (J. B. Phillip, sculptor), (1864, p. 45); the Newsroom of the intended New Exchange, Liverpool (1865, p. 191); Church of St. Bartholomew, Dublin (1865, p. 314); New Liverpool Exchange: Exterior View (1866, p. 47); Sir Dudley Coutts Marjoribanks's House, Park-lane (1870, p. 587); New Barracks, Knightsbridge (1878, p. 112); Hospital for Consumption, New Building (1879, p. 1294).

that consists with the maximum of ductility, steel is the successful rival of wrought-iron. The specimen bar or plate of mild steel produced by the Siemens-Martin process can stand an amount of torsion and hard usage which would break the best piece of malleable iron that ever was forged. Nor is this only the case in specimens produced under special supervision. Where great attention has been bestowed upon the manufacture, the average output of a large establishment seems amply to justify the preference of the shipbuilder and the boilermaker who determines upon the employment of steel as the best available material for his purposes. But no sooner does success seem to follow the change up to a certain point, than unaccountable failures of particular plates, giving way in a manner unknown to previous practice, suddenly throw discredit upon the whole system, and suggest the wisdom of again recurring to the old and long-tried products of the puddling-furnace.

If the gradual spread of the manufacture of mild steel as a substitute for wrought-iron had led to its being produced in works provided with unsuitable plant, and deficient in the element of skilled workmen, its occasional failure in cases where the faults could be traced to such an origin would throw discredit only on the parties especially responsible. As matters stand, however, the works where it is produced are comparatively few, and the capital involved in their reputation is so great that no effort would be spared to find out the causes of failure and remedy the defects if it were possible to do so. In the face of such a well-known fact, engineers who suffer in purse and reputation from the rupture of a boiler-plate will naturally ask themselves the question, if they are justified, for their own sake and in the interests of their clients, in making use of a material which is susceptible of such unaccountable vagaries. Stories are being told of cracks occurring in steel boiler-plates during the process of flanging that are new as regards their appearance and direction to practical boiler-makers. Although the makers may be ready not only to supply another plate, but to pay for the loss arising from the labour wasted upon the one that failed, something more will be needed to convince engineers that they are justified in bestowing implicit confidence on the new one, or, in fact, upon all or any that have been produced by the same process as that which has failed unaccountably. We have already taken frequent occasion to point out in the pages of the *Builder* the failure on the part of science to provide a means for informing us as to the actual strength of materials without subjecting them to excessive strains. The most reliable method of dealing with the parts which go to make up the whole of an iron structure is to make certain that they have been produced from materials and by processes that are in every way identical with those that have been employed in the production of iron that has stood a standard strain. In the case of the puddling process there is every reason to believe that this certainty with regard to similarity of materials and treatment is a sufficient guarantee, and it is enough to mention the uniformity of a few well-known brands, such as Lowmoor or Farnley, to justify this belief. It is different, however, in the case of a material which is evidently susceptible to influences from which wrought-iron is apparently exempt. It is, perhaps, well in the long run for the future of mild steel, as a successful substitute for malleable iron, that the much-talked-of failure of the boilers of the S.S. *Livadia* should have made the subject more notorious than if the occasion had been one that attracted little or no attention from the public and the engineering profession. It will make an inquiry into the causes of failure on the part of the steel-makers imperative, and it is to be hoped that in this way the source of the evil may be traced. Meantime, the confidence of those who are free to choose their materials cannot fail to be somewhat shaken, and for a time, at least, the preference may again be given to the long-tried and apparently defeated rival which is the product of the puddling furnace.

Russian Churches.—According to a recent report from the Holy Synod, there are in Russia, besides the cathedrals, about 35,000 churches, of which 30,000 are parish churches. The total amount contributed by the State for maintaining churches in Russia is about 5,200,000 roubles (about 780,000*l.*).

THE ARCHITECTURAL EMPLOYMENT OF TERRA COTTA.

It has been a complaint on the part of those who are interested in terra cotta that English architects have not given to the architectural treatment of this material the degree of attention and experiment which it deserves; and the complaint has not been without reason. In London, especially, it may be observed that while there has long been a cry for some material more interesting than mere brick, and more able to resist the deteriorating effects of London atmosphere than stone, some of the very persons who have made the demand (for it has come partly, though not entirely, from the architects) have neglected to give a sufficient trial to a material which seems to possess more of the qualities desired than perhaps any other one at present available. Recently we have seen signs of a growing favour for this material, stimulated probably by the unquestionable practical, and in most ways architectural, success of the large terra-cotta building at Kensington. We have a good deal of ornament which partakes, architecturally, of the nature of terra cotta in the cut and moulded brickwork which has come so much into use in the new fashion of London house-architecture; and we may perhaps soon see among our street buildings many specimens not merely of terra cotta applied as ornament, but of terra-cotta building; one or two are to be seen already. But a further sign of the increased attention which is likely to be given to terra cotta as a building material is to be found in the fact that we have received more than one special request from the other side of the Atlantic to advise as to where detailed information may be found in regard to the capabilities and treatment of terra cotta as a building material. We do not profess to supply to every individual the particular information he happens to require, but we may reasonably make the requests referred to an excuse for summing up some of the qualities which belong to terra cotta, and which should characterise terra-cotta architecture; and if we repeat some things which are familiar to our English readers, it must be understood that our remarks are in part especially addressed to architectural readers in America and our colonies, to whom the use of the material is less familiar, and who appear to be, in some quarters at least, interested in it.

"Terra cotta" means, broadly speaking, baked earth (*cotta*, literally "cooked"), and is an expression which, therefore, would seem to include a great variety of clay productions, from common brick to china and porcelain. Ordinary building-brick is, therefore, only the roughest and cheapest form of terra cotta, made of comparatively coarse material, and subjected only to a low heat. China and porcelain are productions of special clays of very fine nature, not obtainable in large quantities, and specially suitable in their texture and appearance for ornamental production on a small scale, and of a fine type. What is now understood by the term "terra cotta" is something which may be said to be midway between brick and the fine productions in china and porcelain. The material is one found in large quantities, and not in itself costly, often differing little in its original state from the best ordinary brick-clay,* but which is subjected to treatment which gives it a very different character from brick, the essential difference being in the manipulation of the clay, partly in fully grinding or kneading it, partly in the admixture of some other substances with it, so that it will bear a great heat without flying or twisting, and acquire thereby a surface of the most durable and impermeable description.

Manufacturers are divided in opinion and practice in regard to the compounding of the material for terra cotta. One of the largest makers in England,—Mr. Blashfield, of Stamford,—mixes his clay with a considerable amount of other material; and Mr. Charles Barry, the architect of the new buildings at Dulwich College, where the terra-cotta work was executed from his designs by Mr. Blashfield, adopts this view, and in a paper on this subject as illustrated by the Dulwich building, which he read before the Institute of Architects, expressed decisively the opinion that "terra cotta is something more than baked clay": that it is clay combined with vitrifiable substances, such as ground flint, granite sand, &c.; and in Mr. Blashfield's practice this we believe it is, and this produces a finely-surfaced terra cotta of rather a lighter tone than what has generally been used in terra-cotta buildings in London. But at the same time, it must be said that other authorities of equal practical experience do not recognise any necessity for the use of these foreign materials in terra cotta. Messrs. Doulton, of Lambeth, employ simply the fire-clay from the beds in some of the southern counties (Dorset and Devon chiefly) mixed with a certain proportion of old terra cotta broken up and ground to a fine powder. In former works at Lambeth (which has been for more than a century a home of pottery manufacture) this system was used, though it appears that the combination of the clay with fine sand and ground flint was also practised. What is certain is, that with the combination of ground pottery only it is possible to produce a material of most agreeable colour, and which has all the appearance of being as completely indestructible as any terra cotta that could be made. The ground pottery mixed with the clay is termed in the manufacture "grog"; the proportions in which it is used depend very much on the nature of the clay employed, which varies in regard to the proportion of ground material which it requires for a satisfactory result; and this has to be determined in special instances by the burning of test pieces variously compounded. There is one distinct and unquestionable advantage in this employment of the same materials and in as nearly as possible the same proportion always: the behaviour of the material under firing, and its degree of contraction, may be counted upon to be always pretty much the same, whereas varied mixtures and combinations produce varied settings and contractions, and as the liability of terra cotta to contract and twist in the kiln is one of the great practical difficulties in connexion with the use of the material, it seems best to compound it so as to at least reduce these difficulties to a minimum. As far as shrinkage is concerned, the amount is pretty constant, and is well known. The material shrinks in burning one-twelfth of its original bulk, and this shrinkage is inevitable, and must always be counted on as a necessary stage in the manufacture. Twisting is not inevitable, though for a very long time it was practically nearly so; but it is a difficulty which has now been in the main got over, but the avoidance of which can only be secured by great care and attention.

The first operation with the clay consists in stacking it to dry in sheds, where it has to remain for a good many weeks, the time of course varying according to circumstances, state of the atmosphere, &c. When sufficiently dry it is pulverised and mixed with the other pulverised ingredient, whatever it be, which the manufacturer selects to add to it, and the two are then thoroughly ground together in a pug-mill, under the action also of water, which is added to facilitate the thorough reduction and mixture of the substances. It is this necessary addition of water at this stage of the manufacture which causes one of the difficulties arising from subsequent shrinking in the kiln, the shrinking arising simply from the driving off of all the residue of water under the intense heat to which the material is subjected in that final stage. Consequently, the quantity of water admitted into the pug-mill is carefully adjusted by rule to the proportion of the solid material, as with the same proportion of water there will be always the same proportion of shrinkage. After the mixture in the pug-mill is thoroughly effected, there is another danger to which the material may have been subjected, the retention of air within it, which if overlooked and not attended to would be fatal to the pieces when in the kiln, as they would inevitably burst. To avoid this danger, after the clay comes from the pug-mills and is sufficiently dry to be cut into lumps, it is so cut with a wire into slabs or "wedges," and these are successively slammed down on each other with sufficient force to compress any cavities that may have been left in them and drive out all the air contained therein. The clay is then ready for use, either in modelling or moulding. If the object which is to be produced is to be a single one of its kind, or only a pair, then it may not be worth while to make a mould. If there is only a single one it certainly would not, provided the operation of firing is considered perfectly safe; but if the object modelled be of a very complicated description, and involving necessarily

* Not differing at all from fire-brick clay; the base and principal constituent of terra cotta being, in fact, simply fire clay.

varying thicknesses of clay, and if it be artistically valuable as representing a high class of art-work, it may then be worth while to have made a mould for it, and produce it in that way, in order to save the entire loss of the artist's work and the necessity of designing it all over again, if there should be any accident in burning. But whether the artist's original work be placed in the kiln, or whether a mould he formed from it into which the clay is pressed, the important point is to get the hulk or thickness of material nearly the same in every part, otherwise twisting, from the heat not reaching all the material equally and simultaneously, is the certain result. Thus when a mould is used it is not filled up with clay *en masse*, but the clay is pressed against the sides only, the moulder following the varying surfaces of the mould so as to leave as nearly as may he an equal thickness of clay in every part; and if the mould is so large that a hollow shell of clay could hardly be trusted to retain its shape properly till burned, "struts" of clay are left from one side of the interior to the other, so as to hold the clay better together till burned, and at the same time give what in a large object would perhaps be a necessary increase of strength to the object after burning. The best average thickness is about an inch, unless the object is so large as to require greater thickness for the sake of strength. This necessity for even thickness applies equally to ornamental terra cotta or to blocks for building purposes. In the latter case the even thickness is easily attained; the block becomes simply a hollow piece of terra-cotta with walls of equal thickness. Whether it would he left hollow in building would depend very much on how and where it was to he used; if the block had to be placed in such a position that great weight had to come on the hollow portion it would then he necessary to fill it up with cement or concrete or other material, care being taken that nothing should be used which swells in drying (as Portland cement), as the burned terra cotta is absolutely inelastic, and any swelling of the filling material moans merely the bursting of the block. In the case of ornamental work, and especially of statues, there is more difficulty in securing the even thickness of the material: the work has to be carefully hollowed out at certain parts so as to reduce the material where it is thickest, and want of care in this respect may lead to the loss of a valuable piece of work. There is also danger of the piece cracking before it goes into the kiln from unequal drying, hy which one side or portion is contracted and pulls on the other portion which has not so quickly dried. Mr. Blashfield mentions another difficulty which he has had to guard against. The moulded objects are finished up by hand after moulding, and if the finisher leaves the surface at all unevenly finished, one part less smooth than the rest, which may happen sometimes from some partial tooling arising from an afterthought after the cast is partially dried, this unevenness of surface will be another source of distortion in the kiln; the moisture being naturally driven off most freely through the less smooth and more porous part of the surface, so as to contract soonest in the neighbourhood of that portion. Thus it will he seen that in terra-cotta work there is emphatically many a slip 'twixt cup and lip, and it is only hy long attention and experience that the terra-cotta design has been brought to its last stage in the kiln with a good chance of getting safely through. If it survive that fiery trial, and come out *totus, teres, atque rotundus*, it may thencefortb be said to have nothing to fear but absolute breakage by violence. Frost, rain, cold, or heat, have no further effect upon it; it has come out, after much difficulty and risk (rendered, however, less and less by long experience), an indestructible piece of work: provided always, he it remembered, that the firing is complete. As to the heat used in the kiln, all makers seem to agree in saying that they know nothing positive; the heat of the kilns is not gauged in any way (it surely might he), and all that can be said is that the object is to produce the greatest heat which the productions will bear without cracking; and this seems to amount to absolutely white heat.

In English terra-cotta work the clays most used are from Dorsetshire and Devonshire, where, as well as in some other southern counties, there are large deposits of clay especially suitable for the purpose. In some foreign terra-cotta work there are rather different materials and mixtures used; thus Boni, an eminent terra-cotta manufacturer of Milan, uses two kinds, one close and hard, for the most durable work, consisting of a whitish clay and powdered quartz, which bakes to an ash colour (a much inferior colour to the red tone of the Lamheth terra cotta, as far as effect is concerned); the other of two clays and a sandy lime which acts as a disjunctive, and keeps the material porous, for such purposes as demand a porous rather than a close material. For building terra cotta, however, the great advantage is the close and absolutely impervious character of the material. Of the ornamental and artistic treatment of terra cotta we will speak separately: in treatment as a building material it combines best with brick, along with which it can be entirely used as a facing material with a sufficient number of through tie-pieces to bond it into the wall. Mr. Waterhouse has also used it (Natural History Museum) as a screen and protection to internal iron columns, thus giving them a fire-proof casing susceptible at the same time of very artistic treatment. The putting together of the material, to make the best possible work, requires some care and consideration: the pieces may, if desired, he flanged and rebated so as to hold together almost without the assistance of mortar; but this, of course, requires a good deal of care and consideration in the making. The outer surface of good and well-burned terra cotta should he almost proof against any ordinary tools, which can merely scratch the skin of the material: and from this fact arises one of the difficulties in the way of the general introduction of the material in building. Alterations cannot he made in it as the work proceeds, not only because the pieces cannot be cut, but because considerable time is required for the modelling or moulding and burning, and the material cannot therefore be furnished at short notice like stone or brick. It is therefore necessary that the architect should have well matured his design in detail before the work is commenced, all the pieces having to be ordered a good while beforehand, and made precisely for the situations they are to fill. Considering the tendency in the present day to design everything in a hurry, and to get up details as they are wanted as the work proceeds (often in a very hasty manner), it may be said that in this respect the adoption of terra-cotta building ought to he a very good discipline for architects, and compel them to give more deliberate thought to the design of a building than is generally given at present; but we fear very few English architects like to take this amount of trouble: indeed, we have heard it urged as an objection, and it certainly fits very ill with the habits of the day, buildings being apparently always now required in a hurry, and the object being not to build well, but to build quickly. No permanently satisfactory architecture can, however, he produced in a hurry, and from this point of view, therefore, it might seem that the extensive adoption of terra cotta might be highly favourable to the development of good architecture; but before this can be generally considered a recommendation, there must be a general feeling on the part of the public that good architecture is a thing worth giving time for, which at present hardly any one does think.

It must be observed that terra cotta cannot be made in very large pieces, and therefore it cannot imitate, and should not aim at imitating, those features of stone architecture which require large blocks, such as large projecting cornices, &c. These can only be safely made in terra cotta by the assistance of concealed artificial supports, making the thing a sham. Terra cotta has much more of the nature of brick than of stone architecture; but this point may be better considered in speaking of the artistic treatment of the material. In regard to its cost as compared with that of stone, terra cotta, as fixed in the building, costs (in plain walling) a little less than the same cubic amount of soft building stone (such as Bath), and 35 to 40 per cent. less than Portland. In regard to comparative strength, some of Mr. Kirkaldy's experiments gave the crushing-weight of a 12 in. cube of Bath stone as 88 tons, that of Portland stone 283 tons, and that of a terra-cotta block of the same size as 442 tons; in comparison with brick, a good stock brick crushed under 17 tons (though we have seen a brick resist three times that pressure), and a terra-cotta block of the same size under 125 tons weight.

We have hitherto been speaking of unglazed terra cotta as a material of homogeneous colour. Its aid to polychromatic effect is, however, capable of being developed in a very elaborate manner. Variety may he obtained in unglazed terra cotta hy what is called "slipping," mixing two clays of different tones together in water to produce a third tone. This may he said to take in terra cotta the same place as pot-metal in coloured glass. But in glazed terra cotta or "stoneware" the material can be painted in a great variety of colours, which are then fixed, and at the same time rendered more brilliant in effect. The glazed ware is formed by throwing salt into the fire when at a certain heat, which decomposes under the heat in the form of vapour, the soda suspended in which incorporates itself with the surface of the ware which is at a white heat, forming a glaze which allows the most delicate markings to appear without any obliteration. Thus any design in colour is rendered both brilliant in surface and indestructible, without the least injury to its artistic effect. Various mineral colours are used, and the main colour of the ground is also influenced by the nature of the fuel, as has been ascertained hy experiment. How far this is the case may be judged by the statement of Mr. Doulton, in a short pamphlet on the use of terra cotta, where he says,—"The delicate blue colour of the ground in ancient Rhenish productions is due to the use of wood as the fuel in firing. We passed a piece of old Rhenish ware through our Lambeth kilns, with this result, that the body was changed to a similar colour as the Lambeth, while the applied colour lost much of its intensity." Stoneware is very largely used for drain-pipes and other such practical purposes, but it is also a very important element in the architectural and artistic capabilities of terra cotta, of which we will speak in another number.

THE SANITARY CONDITION OF THE GOVERNMENT OFFICES.

Fever in Westminster is not a novelty. But the bulletins of the fever which has been running its course, within the past few days, in Downing-street, have been read with anxiety over all the civilised world. At the time at which we write there seems reason to conclude that the apprehensions entertained by some persons of the typhoid character of the fever that attacked Mr. Gladstone were unfounded. We wish it were as easy to dispel any apprehension that the district in which the most important public services of the State are mainly conducted had been so wisely cared for by the sanitary engineer that we might honestly say we had done our best to ward off the attacks of preventible disease.

So far, however, is this from being the case, that we think a very small amount of reflection will be enough to lead to the conclusion that a reconsideration of the drainage of Westminster is a matter of primary importance in the behalf of the public health. This view is founded on two considerations, or orders of data. The first of these regards the condition of the low-lying parts of Westminster before the accomplishment of the main drainage of London. The second regards the principle on which that main drainage has been carried out through the district in question. As to the first, we can speak from personal knowledge, extending over a considerable area, and for many years. As to the second, we rely on the unquestionable evidence of Sir J. Bazalgette, from whose paper on the main drainage of London, read before the Institution of Civil Engineers on March 14th, 1865, we cite those facts to which we feel bound very seriously to object.

The official statement on which the whole project of the main drainage of London was originally based was as follows:—"The London main sewers," says Sir J. Bazalgette, "fell into the valley of the Thames, and most of them, passing under the low grounds on the margin of the river before they reached it, discharged their contents into the river at or about the level, and at the time, of low-water only. As the tide rose it closed the outlets, and ponded back the sewage flowing from the high grounds. This accumulated in the low-lying portions of the sewers, where it remained stagnant in many cases for eighteen out of every twenty-four hours. During that period the heavier ingredients were deposited, and, from day to day, accumulated in the sewers; besides which, in times of heavy and long-continued rains, and more particularly when these occurred at the time of high water in the river, the closed sewers were unable to store the increased volume of sewage, which then rose through the

house-drains, and flooded the basements of the houses."

To no district is the above true description more applicable than to that which skirts the River Thames from a little below Charing Cross to Millbank Penitentiary, extending in an irregular triangle to Buckingham Palace. The whole of the area in question lies within the contour line of 10 ft. above Trinity high-water mark. And it must be remembered that this level no longer represents the extreme height attained by the water of the Thames at spring tides, especially when any body of water is coming down the river. If northerly gales and land floods occur during the equinoxial springs, the river may rise 4 ft., or 4 ft. 6 in. above the Trinity mark, and a rise of from 2 ft. to 3 ft. above that level is not uncommon. Running directly westward from Westminster Bridge,—in the line of Great George-street, and through St. James's Park,—a distance of 1,500 yds. is traversed before we cut the 10 ft. contour level, as shown on Mylne's map of 1851. This area, bounded by Victoria-street, the Mall, Spring-gardens, and the river, contains about 1,000 acres; and as the 10 ft. contour line runs to the west of Victoria-street, it is obvious that the eastern portions of the district in question must be considerably below this contour line, as regards the natural surface of the ground. Below this we have to descend 8 ft. or 10 ft. to the basements, and below the basements lie the drains. As these originally were laid out (as before cited) to empty at low water, we have the proof of the existence,—at least some fifteen years ago,—of a network of drains and sewers, not to say possibly of cesspools, which could only be thoroughly drained by an outfall as low as low-water mark, that is to say, lying at 20 ft. below Trinity high-water level, the lowest ebb of the tide below which, occurring on January 21st, 1878, was 23 ft. 2 in., or 2 ft. 2 in. above the zero of the tide gauge. And in order to obtain a thorough cleansing of this ancient system it would have been necessary either to examine, empty, and fill up with concrete, all these possible pounds of offensive and dangerous fluids, or to connect them with a through main line of sewer, the bottom of which should be laid at least as low as the bottom of the Thames itself. With the proof of the former low level of the sewers, and with the more than probability of the existence of old and unremoved cesspools, made before the sewers were allowed to carry anything but water into the river, it is clear that no main drainage of Westminster could be effected without going below the low-water mark for the permanent outfall of the district.

The above is not a question of map and section alone. We can speak from personal experience of the intolerable state of the basement stories of houses in the vicinity of the Park and of Downing-street before the main drainage was effected. In some of these houses it was possible to tell, without an almanac, the time of high-water at London Bridge. It is unnecessary to go into detail: we can appeal to residents and to visitors, to members of Parliament who took houses for the season, and to others. And although, much more recently, when on being consulted as to an evil odour in a house belonging to one of the great departments of the Government, an engineer recommended an appeal to the Metropolitan Board of Works, that body replied that the sewers were in perfect order, it is certain that within the last eight or ten years that ancient and menacing smell which was familiar to the old inhabitants of this part of Westminster was distinctly perceptible in the house to which we refer.

What, then, we may ask, have been the measures taken for the efficient drainage of a part of London that presents considerable difficulty to the surveyor, and that contains so many of our public offices, and the residences of so many persons whose lives are scarcely less precious to the nation at large than they are to the members of their immediate families?

The reply to this question involves a statement which might well be received with incredulity if it were made on any less indisputable authority than that of the engineer of the main drainage himself.

From Chiswick to Limehouse the main line of western sewer runs approximately parallel to the Thames. To the south of Walham-green, where the sewer cuts off a bend and runs nearly a mile to the north of the river, it receives the Fulham branch. About 500 yards below the great railway bridge over the Thames, where the line of the sewer has again come close to the bank of the river, it receives the Acton branch. The sewer carrying the united sewerage then skirts the river, and crosses the Ranelagh storm overflow, near Chelsea Hospital. A low-level area of eleven square miles, and a further area of about fourteen and a half square miles, are thus drained by this sewer at Chelsea. But at the Grosvenor Canal, Pimlico, commences a work which is ironically called the "low-level sewer." It is the level chosen for this work which is to us so incomprehensible, and to the adoption of which, we think there can be no doubt, the unsanitary state of the Whitehall district is directly due. "The western subsoil of London," says Sir J. Bazalgette in the paper cited, "is so low that its sewage has to be lifted at Chelsea a height of 17 ft. 6 in. into the upper end of the low-level sewer." As to what reasons may be adduced in favour of this rise of 17 ft. 6 in. at this point in the conduit that drains the twenty-five and a half square miles before mentioned, we have nothing to say. On reaching Abbey Mills the contents of the sewer are again pumped up for 36 ft. in height. There may be some sound reason for dividing the total height; and there may be, though we cannot imagine how, a sound reason for doing a part of this pumping at Pimlico.

But that, if the western suburb sewage be rightly carried on at an artificially-attained height of 17 ft. 6 in. above the level of the main sewers, past Westminster Palace and Whitehall to Limehouse, Westminster itself demands a very different outfall, we hold that no engineer can seriously doubt. A section of the Thames Embankment, showing the subway and "low-level" sewer, is appended to the paper by Sir J. Bazalgette which we have cited. No scale is attached, and the only dimensions written on are those of the sewer, which is 8 ft. 3 in. in diameter, and of the semicircular-arched and straight-walled subway, which is 9 ft. wide, and 7 ft. 3 in. high. But taking these dimensions as indicating the scale of the drawing, the centre line of the "low-level" sewer is about 13 ft. below Trinity high-water level. The bottom of the concrete on which the quay-wall stands is as much below the bottom of the "low level" sewer as the centre line of that sewer is below the high-water mark. Or, again, the bottom of the invert of the sewer is about 17 ft. 6 in. below Trinity high-water, or 2 ft. 6 in. above the low water level, at which the old sewers of the district discharged. But the invert does not give the level of the outfall. If the sewer runs two-thirds full, we have to add 5 ft. 6 in. to the invert level. This gives the drainage level dependent on this sewer at 9 ft. above the old line of lowest outfall of the district. We do not speak to an inch, from want of scale or dimensions. But that something close on the 17 ft. 6 in. which was lost by the lift at Pimlico is absolutely demanded for the salubrity of Westminster, he must be a very bold man who will deny.

It is the more unaccountable to us why this high level should have been adopted for the culvert, from the fact that the excavation for the quay-wall was carried so much lower. If the level of the bottom of the excavation had been adopted for that of the invert of the culvert, it would not, we venture to think, have been quite low enough. But there would, at all events, have been a workman's reason for the level adopted. As it is, we can see no reason whatever. As to that, indeed, as we said before, we offer no criticism as far as the through drainage of the western suburb is concerned. There may be reasons, good in themselves, though unknown to us, for that part of the scheme.

But that the sanitary safety of Westminster did and does demand a main outfall-sewer that deserves the name of a "low level," a sewer of which the invert shall be at the least 5 ft. or 6 ft. below low-water mark,—that is to say, 25 ft. or 26 ft. below Trinity high-water mark,—appears to us to be altogether incontestable.

We offer no opinion as to the mode in which what may be called the live sewerage of Westminster is connected with the "low-level" sewers. We shall gladly learn that this part of the matter has been effected with all the skill and care that were possible, when so serious an error had been made in the main outfall-level. In no other terms can we speak of it. On no testimony less direct and conclusive than that of Sir J. Bazalgette could we have accepted the fact. It is the more deplorable from the circumstance that the line taken by this high-level sewer, erroneously called "low level," is the very one on which it would have been most convenient to construct a really low-level sewer, that might have rendered the district safe, sweet, and clean.

We are not now expressing any opinion upon the advisability of pumping up sewage. The question is a very important one, and one of which the gravity is likely to increase rather than to diminish. But the pumping is an essential part of the actual Metropolitan system. We must take the fact as it is. The whole of the sewage that runs through the 8 ft. 3 in. barrel drain in the Thames Embankment is, Sir J. Bazalgette tells us, pumped up 36 ft. at Abbey Mills. It has previously been pumped up 17 ft. 6 in. at the Grosvenor Canal. Therefore, to have continued the low level past Whitehall, so as to provide for the efficient drainage of the district in which our public offices stand, would not have added appreciably to the pumping undertaken by the engineer. There would, probably, have been additional difficulty and cost in making the sewer, in the first instance, at its proper level. Those who remember the rush of water towards the river in many places, notably at Somerset House, while the Embankment was in progress, will readily admit the difficulty of the case. But, on the one hand, is a little more or less of cost; on the other hand, as we regard it, is an absolute sanitary necessity. To have searched the whole area in question; to have emptied and eliminated all ancient drains, cesspools, or soaked and sodden foundations; to have laid the whole area in concrete; and then to have made a new system of sewers, 12 ft. higher than the old ones, would have been a very costly process. We do not say that it would have been a more effective one than that of carrying the outfall sewer, in the first instance, at the proper level. But either that, or the construction of a new and independent low-level sewer for official Westminster alone, will, in our opinion, have to be attempted. We cannot afford to have typhoid germs, like poppies in a cornfield, springing up every year from the undrained soil of Westminster.

What was done, some little time ago, at Marlborough House, is a case in point. Our readers will not have forgotten it. It proved necessary to have a special system of drainage, with its own lift, applied to the area of that palace, in order to ensure its inmates from a recurrence of the fever that had attacked more than one of them. What was done in detail for Marlborough House would have been unnecessary but for the facts we have indicated. It will have to be done for the whole area. The sooner this necessity is recognised, the safer for the town, and the more satisfactory for the nation. It is even now a case of shutting the stable-door after more than one steed has been stolen.

We are very reluctant to say anything that may throw any slur on the accomplishment of a very important work, or that may, however impliedly and tacitly, seem to accuse any professional man of want of due care and forethought. We admit beforehand that there may be much said to excuse, if not to justify, the arrangement to which we object, as far as the through sewerage goes. But the facts are too plain to need comment; or at all events they are too plain to persons who can learn what the earth hides by the use of the methods of the engineer. Level is one of those things which is not to be explained away. In this case, moreover, the explanation is, to a certain extent, given. The ground west of Pimlico was so low that the sewers necessary for its drainage were put in 17 ft. 6 in. lower than the level afterwards adopted for the discharge of the sewage.

The increasing range of the tides of the Thames is a fact not to be left out of sight in regarding the question of the proper drainage of Westminster. That range has now reached the considerable maximum of 30 ft. The action of the river is peculiar, as the ebb reaches as low a level at London Bridge as it does at Sheerness, while at the intermediate station of Gravesend it actually descends yet lower than at the latter spot. Any action of the ebb in draining the subsoil of Westminster, however, must to a very considerable extent be checked by the masonry of the Embankment. That there may be an under-drainage, checked or aided in its flow by the pressure due to the height of the river, is possible. But this, even if it affect the subsoil, can hardly be of any service to any old drains. And in proportion

to the facility with which any subsoil water can escape into the river at the ebb, will he the effect of the inoreased and increasing height attained by the flood. Witbont attempting now to ascertain how far the original connexion between the pervious parts of the snbsoil of Westminster and the tidal movement of the river has been interfered with by the works of the Embankment, it is clear that it ie of the utmost importance to provide for the drainage of the snbsoil, as well as for tbe thorough drainage of any remnants of the older drains, sewers, or cesepoole, the existence of wbich in the district there is so much reason to suspect.

Cost, no donbt, will have to be incurred. But that cost muet be looked in the face. The one cost which it ie inexcusable knowingly to incur ie that of human health and human life. We ask any engineer who ie made aware of the facts now brought together whether the drainage and sewerage of Westminster are in a condition such as the importance of the district demands?

REPORT OF THE SELECT COMMITTEE ON WATER SUPPLY.

The Select Committee of the House of Commons hae arrived at the only conclusion at which, so far back as the 13th of March last, we intimated the conviction that any competent and impartial investigator could arrive. They have declared the entire inadmissibility of the terms for the purchase of the water companies' property which were embodied in the Bill introduced into Parliament by the late Government. They have in tbis reepect done ample justice to our forecast. Nor have tbey been content with the mere expression of opinion. They have pointed out that the annual cost involved to the ratepayers would be 1,210,763*l*. On the 13th of March we gave the figures as 1,252,259*l*. The Committee has taken no heed of the intereet and working expenses that would accrue on the necessary extension of works during the twelve years contemplated. They have, hy some arithmetic peculiar to themselves, called the payment in question the equivalent of 33,018,846*l*., apparently forgetting that, at the price of 96 for a three per cent. stock, it is equivalent to 30,704,416*l*.

Our readers are aware that in February last, when commenting on the great rise in the price of the water companies' shares that followed the announcement that the Government intended to purchase those undertakings, we pointed out the vague and altogether incorrect estimates which had been made as to the cost of the purchase. On the one hand, altogether inadequate estimates of the capital had been given from *quasi* official sources. Twenty-six millions sterling was the figure named. On the other hand, utterly ridiculous estimates of the saving to be effected were gravely brought before the House of Commons. We pointed ont that these statements were wholly deceptive. Then came the Bill, prefaced hy the statement that the maximum outlay would be 31,000,000*l*. We pointed out, on the 13th of March, that it would exceed 38,000,000*l*. The Committee have now endorsed this figure; indeed, to a somewhat higher amount, when the value of money is taken into account. Thus far, then, they have discharged their dnty; and we may hope to hear little more of the regret expressed by one of the morning papers, that the admirable bargain made by Mr. Smith was not at once signed and sealed.

With regard to that second question whicb the Committee have put at the head of their report, we see in the recommendation a very natural outcome of the handling of engineering questions by persons who are not familiar with their nature. That the water supply of the metropolis should he brought under the control of a central body, ie one of the points which it may now be safe to regard only as a question of time. It ie a step in accordance with the whole course and principles of modern legislation. Whether it he more or less advisable, it may be said that it is a point on which public opinion ie tolerably pronounced. If one thing more than another can tend to throw discredit on the constitution and working of such a body, it would be to entrust to their management those matters which ought to be settled prior to their appointment. These are twofold,—firstly, the hydraulic questions; secondly, the negotiations with the companies.

The idea of the late Government, viz., that the negotiation ought to be privately effected in the first instance, was sound and good. It failed of practical success, because of the neglect of a prior requisite step, *i.e.*, the preparation of a proper report, showing the state of the companies' property, the means at their disposal for future extension *without fresh Parliamentary powers*, and the outlay which would be required, in the way of capital, for providing for the future growth of London. Of all this matter the Government, and their negotiator, appear to have been totally unaware. There can be no doubt that the possession of such a report, even if it had lost a year in preparation, would have placed the Government in a position that would have enabled them to reduce the sums mentioned in the Bill hy at the very least 30 per cent.

The Committee have attributed to the mode of private negotiation the ill effects which were due to the commencement of misinformed negotiation. The companies knew their strength, and told it ont-lond. They also knew their weak points, and held their tongues upon them. Dealing with what they heard alone, the Government necessarily were immensely outwitted. They were like a man who "saved the commission of an architect,"—a five per cent.,—on the cost of a house, and had in consequence to pay a bill of 30 per cent. hy way of extras.

The Committee propose to get ont of the difficulty hy taking even less procaution than the Government took. Let us have an "Authority," they say; everybody agrees that an "Authority" is the thing, a "Central Authority." Then let this authority settle everything,—source of supply, chemical purity, cost of work, and haggle out the purchase with the companies. We cannot but think that to commit, first the physical inquiry, which can only be conducted hy competent and impartial experts; and then the negotiation, which should also he conducted hy a well-instructed expert, to some undefined municipal body, would lead to a more unfortunate result than even that from which the Committee have recommended that London should he protected.

We come back to the primary requirement,—the scientific definition of the limits of the case. The whole question of the water supply of the Thames Valley must be placed in the light of an incontestable truth before any bargain can he made that would not be like buying a pig in a poke. Of course such an inquiry ie only a part of the general inquiry into the sources of the water supply of the kingdom. If the initiative, taken more than two years ago by his Royal Highness the Prince of Wales, had been followed out, if the recommended action arrived at by the unanimous voice of the conference on the subject of water supply, which met, in May, 1878, at the rooms of the Society of Arts, had received from the Government of the time the attention that it merited, we should now be in a position to talk of negotiating. Nay more, we might be in a position in which a central water authority might properly enter on its functions.

But to ignore this first necessity, or to commit the dnty of attending to it to the wholly improper care of a municipal board,—to attempt to do in detail what has first to he done in principle, and then to open to the world a free fight as to the transfer of the property of the water companies, may seem very well to a committee who only regard the wants of the metropolis, without any notion how these wants are to be met. But to any one who really understands the requirements of the case it is evident that it is a proceeding akin to that of a man who, being asked "Is it going to rain?" applies for guidance as to his reply to the first man that he meets in the street. The Committee are at sea in the matter, so they think that a new authority must necessarily be able to set them straight. That it may do so if called into existence at the proper time, and provided with the requisite information, we do not doubt. Let us understand first, to what sources are we to look for the water supply of London, not the next year, nor the year after, but next century and the century after. We must have a poor outlook for the prosperity of England if we think this question can be blinked. With this information sure, it will be comparatively easy to offer terms which the companies may, as advised, accept or reject. And then will be the point of time at which a well-constituted Water Board might advantageously be entrusted with the supply of the water service of London; such supply being only a case, though a very important one, of the general problem of the water supply of England.

SCULPTURE COMPETITIONS.

BY A SCULPTOR.

When we see the numerous appeals from, and the frequent reversals of, the judgments of courts of law, and when we notice the extreme opposition of political opinions, even among men of the highest standing, and of similar courses of training, we may not marvel at the diversity of views in regard to the lesser province of competition for public sculpture. Yet while so much less in extent, it possesses, in one respect, an importance peculiar to itself, inasmuch as the great durability of the materials of the art of sculpture may perpetuate its productions beyond the time that even the memory of important judicial decisions, or of the periodical contests of political parties may endure. Thus those who choose statues for the public may well bear in mind that they are not deciding for their own day alone, but for future years,—not only for themselves and those around them, but for generations to come. The permanence of the products of this art is apt to be less reflected on than it merits, or, possibly, those who have the selection of such works would pay more sincere attention to objects of such longevity. This would be for the better, for there is abundance of native talent in this country to execute anything that may be required of this art; and any shortcomings that may have arisen, or may occur, in our public memorials, are to be set less to the account of the artists than to that of those who control them.

Unfortunately for art in this country, there is but little demand for public sculpture, except in the form of portrait statues. A great and good man passes from among us, and, deprived of his presence, we seek to be supplied with a "counterfeit presentment" of him, which shall be as permanent as marble or bronze can render it, and at the same time be a record of our own affection for him, and of the regard and respect in which he was held at the time when he lived. Funds are collected for the purpose, and a committee is formed to apply them and carry out the views of the subscribers, and to obtain the best possible statue of him whose memory they revere. And then the question comes, how is this to be effected?

To use a familiar phrase, there seem to be "three courses open." The first of these is to apply to some one sculptor of repute, in whose competence to execute the work worthily there is full confidence; the second is to select a limited number of artists, and invite them to compete with designs; and the third is to announce a public competition open to all comers. Each mode has, perhaps, its advantages, and each, also, its unfavourable contingencies. We will take and consider these modes in an inverse order, the last first.

Without a doubt an open public competition recommends itself *primâ facie*. It seems so free and liberal. By its means every sculptor has a chance. There is nothing narrow in it, and a generous welcome is held out for the display of genius, from the youngest aspirant, and even from the lowest rank, and the most unexpected quarters. Without question, competitions of this wide and unfettered character are, at times, beneficial to national art and the profession of sculpture. Assuredly, on the other hand, they cannot justly be frequent, and they should not be called for except on occasions of magnitude and high importance, for the following reasons:—

Unless the prize to be competed for be of considerable monetary value, it is a serious hardship to the professors of sculpture to call on them to put themselves to such large charges, and so much occupation of time, as is entailed hy such a struggle for pre-eminence. And if the monetary profit of the prize to the successful artist does not equal the combined expense entailed upon all the other artists by the competition to which they were invited, by the amount of that difference is the profession a loser.

Let us suppose the number of sculptors responding to be thirty, and that is not an unlikely or exorbitant number, who might do so in answer to an unlimited invitation to prepare and contribute designs, including not less than three figures, arranged on a suitable pedestal, in competition for a public memorial. Just to give some definiteness to the idea, we may suppose one of the figures to be a portrait, and the other two emblematic, of which the models are not to be of less scale than 2 ft. high.

Now let us, as they would say on the other side of the Atlantic, "cipher it out." Each of

these competition models, carefully wrought out, will cost its producer, in labour and time, not less than 150*l.* Multiply this by the number of competitors, thirty, and the result is 4,500*l.*, which represents the outlay to the profession for competition models alone.

To repeat, as a mere debtor and creditor account as between the competition and the profession of sculpture, we see that the eventual profits of the successful competitor is all that represents the gain of the profession, as against the loss entailed by the preparation of the whole thirty designs, namely, the above 4,500*l.* Therefore, in this view, in order to justify such a competition being called, the actual profits of the successful competitor, or the money he has "home," after the execution of the memorial which is the result of his success in the competition, should at least equal that amount, or the profession is, as a body, by so much impoverished by a transaction, which, not improbably, by its promoters is viewed as being an encouragement to the fine arts.

The outcome of the consideration of these facts seems to be, that, as no sculptor can expect to realise for his genius, experience, and actual manipulation, more than cent. per cent. on his actual outlay on materials, assistants' wages, &c., which will be found to be the lowest rate at which he can exist, then no competition, such as above mentioned, can equitably be invited for a prize of less amount than double the above-quoted 4,500*l.*, which is the cost of preparing all the designs, namely, for a prize of not less amount than 9,000*l.*

This statement, as will be recognised, represents but the bare pounds, shillings, and pence debtor and creditor balance of account as between the promoters of the competition and the profession of sculpture, with no margin whatever provided towards liberality. So that, taking that into account, and what might be the general sentiment on a question of fine art, we may not be going too far in submitting that no competition, such as the one above described, could be consistently called by those possessing liberal views towards the fine arts, and at the same time cognisant of the bearings of the whole question, for a prize of less amount than 10,000*l.*

It is with some reluctance that we have put the above proposition into figures, for the necessary connexion of art with coin is not a grateful subject, but we see not any other way of making our representation so plain, and thus trust our readers will take in good part the mode had recourse to in the hope of doing so.

That sculptors of ability will occasionally enter into unlimited competition, involving outlay of expense and labour equal to that we have recounted, and with a less prize in prospect than we have quoted, is very probable. But, in respect to this, it must be held in mind that the invitation to such a wide competition, unaccompanied by an adequate guerdon of remuneration, is a taking advantage of the depressed condition into which this noble art has been brought of late years by the neglect of substantial support from our Government, the municipalities of our cities, and the public at large. In the conviction that there is a considerable lack of information in respect to the above bearings of unlimited competitions of the class we have described, we contribute these remarks towards their elucidation.

With these few words in relation to unlimited competition, we will pass on to consider, equally briefly, those which are limited; for which method there is this to be said, that this limitation is, at least in part, usually adopted with the good intent of lessening the amount of expense, and area of disappointment, to the unsuccessful competitors. At the same time, the promoters flatter themselves that this will not impair the likelihood of a satisfactory result, as, in their limited list, they propose to include the best names. It may be noticed, however, that this procedure is of the nature of a compromise, which may not be devoid of some characteristic disadvantages; for, in the first place, it is doubtful if the best men will compete at all; and in the second, it may be that the committee may not make choice of the most fitting persons to be invited.

However, this limited mode of invitation is the only form of this means of obtaining a statue which appears equitable in the case of a competition in which the prize is small. Say, for instance, for a single portrait statue, the funds for which are 2,000*l.*, and, in consequence, the profit of 1,000*l.* to the successful competitor being all he could hope to realise. In this case, also, the number invited should be proportionably limited, unless each of the artists is also to be separately and fully remunerated, or the expense to the profession may exceed the return, and an injury thus be entailed on it. It may be noticed that we are presenting chiefly the financial view of the subject, just because artists are somewhat sensitive in doing so for themselves.

However mitigated the hardship of competitions may be to the artist by their being limited, it still does not escape a certain aspect of lowering the grade and *status* of sculpture in comparison to other professions, to which there would be no attempt to submit a similar proposition, or, if it were done, with any chance of acceptance.

For instance, what, even limited, number of barristers would compete for a brief? or what even limited number of painters would compete, with studied sketches, for the commission to paint the portrait of a respected citizen for a town-hall or other municipal building? When architects and engineers compete, it is not unfrequently for a prize of thousands. But rewards on this scale do not fall to the lot of sculptors, who must be content to glean pence while other professions harvest pounds.

The third mode of obtaining a public statue is the one we mentioned first, as, indeed, it merits; for if the committee are competent to make a just choice of the most suitable man in the profession to design and carry out the work they have in hand, there are several advantages in their so doing. In the first place, it is the cheapest method; in the second, it is also the most speedy; and, thirdly, it does not put the profession of sculpture to needless expense, or waste of thought and time.

It not unfrequently, however, happens in committees on such subjects that there is such a diversity of opinion among the members themselves that there arises a great difficulty in fixing on an individual artist, and that the readiest way which occurs to relieve them from this embarrassment seems to them to be to announce a limited competition, including the principal names of the sculptors before them, and invite each of them to make a design of the subject of the memorial for the committee to select from.

In this case, however, we venture to suggest an alternative mode of coming to a conclusion. Let the committee choose their men, just the same as if for a competition by designs, and let them take especial care that they are all good men, and capable, each of them, to execute the work satisfactorily, if it fall to his lot to do so. We use the word "lot" advisedly, for it is by that means we suggest that the last step should be taken, and the selection concluded; and not by dragging several men of ability through a painful and expensive ordeal.

Whatever may be the advocacy of friends in respect to their especial artist, whom they may hold as the *facile princeps* sculptor of the day, it may be not unreasonably accepted that there are, at the present time, in the profession of sculpture in England, at least ten or twelve men of tried ability who are so nearly on a par in the capability of designing and completing a single portrait statue, to which subject we are at present confining our attention, that the chances are equal as to which would do it best. For obvious reasons we refrain from giving names, but none the less do we hold to our proposition.

In the case, then, of a limited competition being contemplated for the selection of an artist for the execution of a portrait statue, and twelve ten, six, or three sculptors, for instance, being named; instead of their being all called on to make designs, of which only one can be of any ultimate use, let their names, or numbers representing them, be put in a vase, and the fortunate one drawn out by some incorruptible means of perfect chance, which could not fall amiss, as all the names are those of competent sculptors.

The previous announcement of this mode of concluding the selection of a sculptor would possess this advantage, that the list, for Fortune to decide from, would include all the most highly considered names; for no sculptor, it may be taken for granted, could have any objection to his name being on the list, as he could be put to no useless trouble or expense, nor could the chance arise of his being placed below his fellows by the ultimate selection, as the prize would be allotted, not by the judgment of man, but by the *fiat* of Fate.

We submit this method as worthy of a trial. Further support might be presented for the suggestion, were we to go into, and display the conduct and results of some late sculpture competitions. Refraining, however, from this ungrateful task, we may, nevertheless, be allowed to legitimately draw the inference from the general feeling of dissatisfaction prevailing on the subject, that to some method of less hardship to the sculptors, and of better fruits to the art, and to the public, than has lately been in practice, recourse may well be had.

In rehearsal. What we submit amounts to this. Firstly, that, in the case of a public memorial of this nature, unless the sum to be applied to it reaches 10,000*l.*, no general open competition should be invited; and, secondly, in respect to memorials of less amount, if the committee be unable to agree on the one sculptor in whose hands the commission may be safely placed, and therefore contemplate a limited competition, either, provision should be made that each of the sculptors taking part in it should be fully remunerated for his design, or the alternative course we submit might well be adopted, namely, that the names suggested should, without further preamble or delay, be put into a vase, and one of the number selected, not by ballot, but by simple lottery.

THE TOPE OF AMRAVATI.

Persons visiting the British Museum during the past month must have been vastly puzzled at seeing the first landing of the principal staircase a scene of confusion, and a space covering nearly 100 ft. of wall set apart for ancient stonework or marble. Few supposed that the venerable slabs which are now being placed in order have been sculptured some fifteen hundred years ago; but to the initiated they give a singularly interesting picture of religion, life, and manners in Southern India about the fourth century of the Christian era. It used to be supposed that the Hindus had an early special knowledge of the lithic art, which they had cultivated in prehistoric times, but it is shown by Mr. James Fergusson that the Hindus borrowed the idea of using stone for architectural purposes from the Greeks in Bactria about 250 B.C. Previously to this their edifices, above the foundation, were wholly of wood; by degrees stone was introduced mixed with wood; then, about the Christian era, sculptured stones were employed solely for important architectural works; but the style was entirely original and not copied from that of the Greeks, though they possessed great lithic knowledge many centuries previously. Now the slabs which are being placed in the British Museum are singularly well carved into figures representing scenes in life, and exemplifying the religion of the people. When completed it will take its original name,—"The Tope of Amravati." But there is rather a singular history attaching to these ancient remains.

The word *Tope* simply means a "mound," and "*Amravati*" is condensed from the Hindu word *Amaresvaraparam*, meaning "City of the Immortal God." This ancient city was situated on the right or south bank of the Kistnah River, about sixty miles from its mouth, and nearly opposite its junction with the Mooni Air River. Mounds are very numerous there, generally supposed to be the sepulchres of the ancient inhabitants. The Tope first attracted the attention of Col. Mackenzie in 1797, when on a tour of duty in the district. It would seem that two or three years prior to this, the Rajah of Chintapilli, attracted by the sanctity of a temple, dedicated to Siva, under the title of "Amaresvara," determined to erect a city on the spot, and, on looking for building materials, opened this and several other mounds in the neighbourhood, and also utilised the walls of the old city of Durunacotta, which stood half a mile to the westward of the new city. Many of the antiquities perished in the process of removal, and large quantities of stone were used by the Rajah in building his new temple and palaces; but many sculptured slabs still remained *in situ*. These interested Col. Mackenzie so much that he subsequently communicated an account of them to the Asiatic Society of Bengal, and returning to the spot twenty years afterwards, when Surveyor-General of Madras, he employed all the means at his disposal during the two following years, to the elucidation of the principal temple, which he named *Dipaldinna*, meaning "Hill of Lights." The re-

sults of his labours were careful plans of the buildings and maps of the surrounding country, together with eighty very carefully-finished drawings of the sculptures. In 1840, Mr., afterwards Sir, Walter Elliot was Commissioner of Guntur, and he determined to follow up what Colonel Mackenzie had so well begun. He excavated a portion of the monument which had not before been touched, and sent down to Madras a large collection of sculptures, and made an official report of what he had done. The East India House, however, took no notice of his repeated reminders of the circumstances, but these sculptures were allowed to remain in an unsheltered enclosure, exposed to sun and rain, for fourteen years. At length some director, on looking over some old minutes, came across a record of these sculptures, and obtained a resolution ordering them to be forwarded to England. This order having to go through the ordinary slow routine, these ancient slabs arrived in London only in the year 1856. This happened to be at the very period when the Indian Mutiny was going on, and the directors had too much anxiety on other matters to bestow a thought on old marble or stone; more than that, this was just the interval between the death of the old East India Company and the establishment of the Indian Council. There being no room at the Indian Museum, the sculptures, after remaining at the docks for months, were stowed away in the coachhouse of Fife House, where they remained buried under rubbish of all kinds for several years.

There they remained till, in 1867, when Mr. Fergusson being asked to select some specimens of sculptures, in the India Museum, to be cast for the purpose of being exhibited in Paris in that year, recommended four slabs sent home from this Tope by Col. Mackenzie in 1819, as most suitable for this purpose. Having done this, he was not a little surprised when the attendant informed him that if "these were the kind of things he wanted, there were plenty more in the coach-house." And so it turned out. The whole of the Elliot collection were stowed away there. He consulted Dr. Forbes Watson, who was then in high authority in the India House, and with his zealous co-operation these interesting relics were brought out to the light of day, and in order that he might have an opportunity of explaining their value in an historical point of view, he had them all photographed to one-twelfth the size of the original stones, and this was done so exactly that the photographs could be pieced together almost as exactly as a builder could have done by fitting together the original stones.

Giving his own words, Mr. Fergusson says:—"With these materials I set to work to restore the building. Though I had considerable knowledge of other buildings, both older and more modern, I should not have succeeded but that among the sculptures themselves there were numerous miniature representations of the building itself, and its different parts, quite sufficiently correctly drawn to be recognised." With these aids he was enabled to assign the true place to almost every one of the 160 fragments the Indian Museum possessed. He thus obtained two elevations of the outer rail and one of the inner rail, of what is now known as the "Tope of Amaravati." Mr. Fergusson explains that a Tope is generally considered a place where the relic of some Buddhist saint was enshrined, or a mound erected in memory of some sacred event. This is surrounded with an inner and an outer rail, which are essentially the principal parts of the monument, and the mound which is inclosed may frequently be taken as subordinate to the rail, which thus practically may become the monument itself. Now, it is a fragment of the outer rail of the Tope of Amravati that he put together and made nearly complete, and it is the stones from which he took the photographs that are being erected in its original form at the British Museum. The fragments that are now being erected on the staircase are all that remain of six out of 120 pillars of which the great rail originally consisted, with portions of other subordinate rails, belonging to the same Tope. Nearly one-half of these is already in position, and workmen are busily occupied in supplying the remainder.

The credit of accomplishing this is entirely due to Mr. Fergusson, who, after his restorations were complete, exhibited them in Paris, with specimens of the marbles and 500 other photographs of Indian architectural subjects. During the long period he spent poring over these photographs he became familiar with their forms, and acquired a considerable amount of unexpected knowledge of ancient art and mythology, and he thought this knowledge was of sufficient importance to justify him in making it public. In pursuance of this object he exhibited the photographs, and read a paper on them to the Asiatic Society in London, in June, 1867. This lecture was afterwards published in the Society's Journal, but that by no means exhausted the subject, or sufficiently illustrated what he had learned from the ancient monuments. He therefore applied to the Secretary of State for India in Council for assistance to enable him to publish the whole of the photographs, with such explanations as might be desirable. Sir Stafford Northcote became his advocate, and the India Council granted permission and funds necessary for the publication of a quarto volume, entitled "Tree and Serpent Worship," which, in addition to fifty-three plates or photographs illustrating this Tope, contained forty-six plates devoted to the Sanchi Tope, a building of equal, if not greater, importance belonging to the first century of our era. This was accomplished in a comparatively short time owing to the unwearied exertions of the author, who remembered that "Colonel Mackenzie's collection" was allowed to slumber for fifty years before his work was made public. He therefore refrained from waiting for any subordinate extra information to be obtained from the East, and he produced a book of extraordinary interest, in which all the photographs were given, and their architectural history explained; but the high price at which it was published put it beyond the reach of the majority of readers. After the publication of the book, the marbles themselves were first exhibited in the Courtyard of the India Office, Whitehall. They were afterwards removed to the India Museum, South Kensington, whence they were sent, in the spring of the present year, to the British Museum, where they are now being arranged. It need hardly be added that they have suffered grievously from exposure to our climate, and by all these changes. They are, in fact, little more than ghosts of their former selves; but as it is now intended to protect them by glass, it may be hoped that their further decay is arrested.

FROM THE BANKS OF THE SEINE.

At this season of the year when, according to the stereotyped expression which we have all learnt to understand, Paris "is empty," the French metropolis is remarkably full, but of foreigners and provincials, wives and daughters on arm. As for the strangers proper, they can be easily detected, the English especially by their rapidity of movement; indeed, it is no wonder to the more steadily disposed that the impressions of what these travellers see should partake of that nebulous character which is, or appears to be, one of the chief results of the extension of modern travel, and which may explain perhaps in some fashion why it has become "good form" to be very silent when one reaches home on the incidents of one's outing. One hesitates to acquiesce in the enthusiasm of the theorists who picture the moral and material benefit to the world at large by the immense move which now takes place from country to country when the summer months commence. In the hasty manner in which travelling is done,—a gentleman with his family has recently gone round the world in seventy-five days,—it is impossible for even the quickest-eyed and most experienced traveller to really observe the peculiarities of the country or the people through which he may pass, still less is it likely that any estimate can be arrived at of the superiority or inferiority of certain points in the institutions, social or technical, of those countries over his own,—one of the capital points which should be observed in all travelling; and yet this superiority, and with it the inferiority, exists, and becomes strikingly apparent to the eye of the observant resident, even after only a short stay. To return to the emptiness of Paris, the strangers proper may for the greater part be placed, unfortunately, in the class of mere hurried sight-seers, who profit little to their country on their return; but among the number, and particularly among the provincials, more than one stranger in town is observing keenly all that he sees about him. More than one excellent country mayor or prefect bears back with him to his native place the strong impression of his visit, and the features he has observed; and before long we may trust to his rousing his worthy adjunots and co-citizens with some startling changes introduced from the capital. In spite of Paris forming so completely the centre of France, there swells in the red-ribboned bosom of more than one country town, as represented by its excellent mayor, the desire to show what the provinces can do. The result of his visit is soon seen in the amelioration of some institution such as he has inspected in the capital, or some public service more closely considered and set into better working order. Travel of this nature benefits both the individual and the nation. Would that more of our countrymen abroad than at present can be seen could be induced to understand the value of this method of travelling, which, had it been earlier practised, would not have led to the existing horror of the pleasure of real travel abroad being almost destroyed. Why need our own beautiful country be left when idleness, ill-health, or necessity for change leads to a desire to leave home? The statistics of the traffic between England and the Continent that occasionally find their way into the papers are certainly alarming to patriotic souls. England and Ireland suffer from the want of patronage; the Continent suffers from the undue pressure of hasty sightseers. Perhaps one of the chief advantages of lengthy travel or residence abroad—whether this feeling is acknowledged by all we know not—is the love and appreciation one feels on returning for the beauty and interest of one's native country, which one learns thus to more thoroughly understand; and as to what that country is, who that knows England but will admit that few more lovely spots exist in the wide world? Read or re-read, if you have not taken up the delightful volume since your youth, the "Sketch-book" of dear chatty Washington Irving, who saw "Rural England" over so many years ago, but just as it still exists, and described with the delightful enthusiasm of a foreigner who knew well, but at a distance, "the old country," to him almost the mother country. The time is rapidly approaching, if it has not actually come, when the seekers after the untouched charms of nature and of art will find in their own "nice little, tight little island" more of what they are in search of than here on the Continent.

A ramble from the banks of the Seine is a digression which can be excused at this season, when one finds oneself "left alone" in town, after being troubled by one's friends to name the exact spot of the world,—for it is only the world that satisfies us now,—which one intends to honour with one's choice. In reality there is quite enough to occupy the attention, and of food for reflection an ample store. The schools, for instance, have been breaking up for the holidays, and the traditional ceremonies and speechifying have filled columns upon columns of the newspapers. Among these speeches, Victor Hugo's address to the pupils of the "Society of Elementary Instruction" stands out prominently. The text of this oration, as the Americans would term it, and oration it certainly merits to be termed, has been published by the English press, but without sufficient notice being paid to the peroration, a noble piece of advice, one which contains counsel alike for young and old, and which to every good workman,—we all are workmen in some degree,—contains encouraging incitement to progress:—"Advance, let me not hesitate to repeat to my contemporaries, advance. Let no one spare his efforts. I repeat it, the effort of all composes the sum of progress. Let each do what he can. The immense Being will be content. He equalises the importance of the results before the energy of the intention. The effort of the humblest is as venerable as the effort of the greatest. Advance, march forward. Have in your eyes the light of the dawn. Have in you the vision of right, good resolution, firm will, and conscience, which is the great counsel. Have in you, and with this I terminate,—have in you those two things which are the expression of the shortest road of man to truth, rectitude of mind and uprightness of heart."

Almost on the same day, at no great distance from Paris, another interesting institution was closing its course of labours for a few weeks' rest. Amidst the more familiar and fashionable ceremonies of the numerous schools of Paris the quiet distribution of prizes at the "École Professionnelle," the Professional School of Ivry, passed by almost unobserved. But the simple ceremony had in it features which merit attention; among these the speech of M. Emile Laurent, of the prefectural council. In this

speech, M. Laurent told the origin and progress of professional instruction in France, the honour of commencing which he attributed to M. Pompée, the first director and organiser of the École Turgot,—one of the justly famous scholastic institutions of France, and which has served as a model to many other similar establishments throughout the country. M. Pompée was perhaps the first in France to put into practice the method of Pestalozzi on "lessons by things," long known in Germany and Switzerland, and now almost universally admitted over the world; to M. Pompée also can be traced a large extension of the teaching of drawing in the schools. The system which regulates the professional school of Ivry,—a good type of other similar establishments in France,—is of a marked modern character, based on the principle that all professional education to be complete must necessarily comprise two thoroughly distinct elements; in the first place, a general and preparatory education common to a certain number of professions; after this a special education confining itself to the acquisition or increase of the special knowledge necessary in the exercise of a determined profession. Whatever may be the profession the pupil intends to embrace, remarked M. Laurent, whatever be the time he passes at school, and whatever be even the necessity in certain cases to render simultaneous the technical education of the profession and general education, whether the workshop be in the school or the school in the workshop, according to the two methods attempted, distinct in their means, but concurring in the end to attain, those who direct these studies are daily more and more convinced of the importance, not to say the absolute necessity, of the preliminary course of study, at least simultaneously with the professional study and its calculated degrees of progression, constituting a certain superior culture, indispensable later on to each according to his walk in life. Our education, wrote M. Pompée, stops at the point where the apprenticeship commences. We do not wish the professional school to become merely a school of trades and professions in which the pupils learn to forge, to file, to saw, and to plane, &c. We wish to develop harmoniously the physical, moral, and intellectual faculties of the pupil, so as to make of him a man, and teach him all that is specially necessary to know, to make him an agriculturist, a workman, a manufacturer, or a tradesman. In other terms, it was M. Pompée's intention that the preparation for life, not alone the life and duties of a profession, but for every-day life, was to become the principle common to every species of future education,—a view which has been frequently expressed in the columns of the *Builder*.

The interests of hygiene, that burning question of the day,—one which is not destined to come up and pass away as a mere occupation of the hour,—are receiving fervent attention at the present moment. Many important questions connected with the practical applications of hygiene are still in a far from satisfactory condition, requiring examination and discussion. In this direction the congresses and meetings held from time to time render excellent service. This year we learn that the Third International Congress of Hygiene will be held in Turin, from the 5th to the 12th of September next. The first congress, it will be remembered, was held at Brussels in 1876, the second at Paris in 1878. The interest and importance of the consideration of hygiene and its practical application are rapidly being appreciated by every country. Individual research is active, and wonders may be expected from its results. The Turin congress promises to be no less brilliant than those held at Brussels and at Paris, through the activity of the senator Ferraris, the *sindaco* of the city, and Professor Pacchiotti, president of the Italian Society of Hygiene. The King of Italy has, we hear, promised to be present at the opening meeting of the congress. Special committees have been formed in each country, and here active steps are being taken that France shall be well represented, and already a number of well-known gentlemen have come forward with this object. Not only Paris, but Lyons, Bordeaux, and several other large cities of France are to be represented, as also a number of the societies specially interested in the progress of hygienic reform. What England has so far done we have not been able to learn; it is, however, to be hoped that she will not be unrepresented. She was the first country to take up seriously the great question of hygiene, and the world owes much to those who initiated it.

THE KENSINGTON NEW "TOWN-HALL."

The discussion which eventuated in the opening of the new hall in High-street, Kensington, by H.R.H. the Duchess of Teck on the 7th inst., with some trifling ceremony, commenced as early as 1872, when the Vestry were impressed with the belief that the offices accommodation available in the existing hall for carrying on the business of the Vestry was quite inadequate for these departments. Since then the continued growth of the parish, together with the increased work in the clerk's and surveyor's departments, consequent on the abolition of the contract system, and the Vestry undertaking the extensive works of scavenging, dust removal, street watering, and street lighting by the average meter system, necessitated the appointment of additional officers, and rendered extra office accommodation still more requisite. The work was carried on with considerable difficulty and inconvenience, in consequence of the staff of officers being scattered in four different places, viz., the Hall, Old National Schools, stables, Warwick-road, and the depôt, Pembroke-road. Four schemes then came before them,—(1) To alter the present building; (2) to build upon a piece of land on the north side of Kensington High-street over the railway tunnel; and (3) to purchase the site of the National Schools. As regards the first of these plans, the Vestry were advised that nothing short of an Act of Parliament specially passed for the purpose could give the Vestry a title to the present vestry-hall, or to any building that might be erected on the site of it (the parish churchyard), but as the Vestry had an undoubted right of user, and as it appeared the most economical course to alter the existing building, plans were prepared showing certain structural alterations with a view to adapting the hall to the increased necessities of the parish. A draft agreement, to be entered into between the Vestry and the vicar, churchwardens, and overseers of the poor was prepared, by which the proposed alterations were approved by all parties, and the special purposes to which the building might be applied, were set forth. On counsel's opinion being taken, however, certain difficulties arose, and the Vestry decided not to enter into the proposed agreement, inasmuch as the vicar, churchwardens, and overseers had no power to bind their successors.

The site over the railway was offered for the sum of 5,500*l.*, but a right, reserved by the railway company, to enter upon the land for the purpose of repairing the tunnel whenever necessary, was considered objectionable. For the site of the National Schools, the sum of 8,000*l.* was asked, and this the Vestry thought too high to be entertained, but in the year 1874 the Vestry offered 7,100*l.* for it. Two offers exceeding that of the Vestry were made, and some correspondence thereupon ensued between the Vestry, the trustees of the National Schools, and the Charity Commissioners. The trustees, preferring that their land should be used for public purposes rather than as a building speculation, accepted the offer of the Vestry, provided, that in case the land, or any portion thereof, should not be required, for the proposed hall and offices, the trustees should have the right of pre-emption; and the Charity Commissioners concurring, the purchase was completed on the terms mentioned.

The site thus obtained not being sufficient for the purposes required, the Vestry purchased some houses at the rear, No. 14, Church-court, for the sum of 700*l.*, and of No. 13, Church-court, for the sum of 1,000*l.* The site, therefore, was obtained for 8,800*l.*

In December, 1876, the Vestry, by public advertisement, invited architects to send in drawings for the proposed new hall and offices, and offered premiums of 100 guineas, fifty guineas, and thirty guineas for the designs selected as 1st, 2nd, and 3rd respectively in point of merit. In response, sixty-four sets of drawings were sent in, and were exhibited to public view for some weeks in the Old National Schools. The services of Mr. John Whichcord, F.S.A., were engaged for the purpose of advising as to the selection of the three best designs, and as to the probable cost of carrying them out, and to submit a report thereon. His recommendations, however, were not adopted, but the designs of the following architects were selected:—Mr. Walker, Messrs. Thomson & Davis, and Mr. Edward C. Robins. An extra premium was awarded to Mr. Frederick Mew, in consideration of the artistic character of his drawings.

The ground was cleared, and tenders were received for carrying out the work according to the plans prepared by the first-named gentleman, when the district surveyor examined the condition of the houses, Nos. 11 and 12, Church-court, adjacent to the property purchased by the Vestry, and condemned certain portions of the said houses as being dangerous, and notices were served by the district surveyor on the Vestry and the owner of the said premises to take down the party structure and walls, whereupon negotiations were opened with the freeholder and leaseholders of these houses with a view to the same being purchased and added to the site of the proposed new buildings. After a considerable amount of correspondence, the negotiations were brought to a satisfactory termination, and the property was purchased by the Vestry. A site was thus secured for the new hall and offices, having a frontage in Kensington High-street of 97 ft., a frontage to Church-court of a similar extent, and a depth of 110 ft. The acquisition, however, of the additional land rendered it necessary to alter the drawings originally approved. This was accordingly done, and on the 21st day of August, 1878, the Vestry finally approved the amended plans.*

Fourteen firms were selected and invited to compete for building the new hall and offices, according to the original plans, and each of them submitted a tender. The highest tender was 30,158*l.*, and the lowest, that of Messrs. Braid & Co., 23,850*l.*, which was accepted. Upon the alteration of the plans, it became necessary to re-open the question of the building contract, and an arrangement was effected with Messrs. Braid & Co. to amend their tender, so as to include the additional work to be carried out, and on the 30th day of October, 1878, the seal of the Vestry was affixed to a contract with that firm for the erection of the new hall and offices, according to the amended drawings, for the sum of 30,549*l.*

The total cost of the premises and land acquired for the site, and the building to be erected on it stood at that time thus:—

Freehold of National Schools	£7,100	0	0
Freehold of Nos. 11 and 12, Church-court	2,500	0	0
Leasehold interests in Nos. 11 and 12, Church-court	750	0	0
Freehold of No. 13, Church-court	1,000	0	0
Freehold of No. 14, Church-court	700	0	0
Contract for building new vestry-hall and offices	30,549	0	0
	£42,349	0	0
Deduct amount received for old materials of buildings	677	7	3
	£41,671	12	9

The ceremony of laying the foundation-stone was performed on the 12th day of December, 1878, by Lord Kensington, assisted by the Hon. & Rev. E. Carr Glyn, vicar of Kensington, Major-General Boileau, R.E., F.R.S., chairman of the building committee, and a large gathering of vestrymen and parishioners. The foundation-stone consisted of a block of Enderby granite, 4 ft. 1 in. long, 2 ft. 6 in. high, and 2 ft. 6 in. deep, presented by Messrs. Nowell & Robson.

In addition to the amount already stated, the furnishing, gas-fitting, &c., cost 3,223*l.*; the alterations and additions, including lifts, hydrants, counters, &c., are estimated at 700*l.*; the architect's commission, 1,777*l.*; the clerk of works, 350*l.*; legal and other expenses, 350*l.* The furnishings were entrusted to Messrs. John Finch & Co., of 45, City-road, and have met with the approval of the committee. The chandeliers, gas-fitting, and brass work, have been supplied by the local firm, Pardoe & Sons, Silver-street. Sugg's "Christiania" burners are fixed throughout the whole building.

The front elevation is of Portland stone, and includes a central pediment with attached columns, Corinthian pilasters, and the usual features of a front of that kind.

A spacious vestibule, not too light, extends from the front entrance almost to the rear of the building. On the ground-floor, at the right-hand side to the front, are the offices of the vestry clerk, consisting of large office for clerks, the cashier's room, and private office for Mr. Harding. At the east end of the office, adjoining the cashier's apartment, is a strong room,

* The Building Committee consists of Major-General Boileau, R.E., chairman; Mr. R. Freeman, Dr. Daniell, Mr. W. Boutcher, Mr. F. Radford, Mr. H. Smith, Mr. H. Liggins. The chairman of the Vestry is the Hon. and Rev. E. Carr Glynn, vicar; and the clerk of the Vestry, Mr. Geo. Capper Harding; Mr. Weaver is the surveyor.

intended as a day-room for books and documents while in use. The principal strong-room for the preservation of all parish documents, books, &c., is immediately underneath, and is reached by a flight of steps, affording direct communication between the two places. The vestry-clerk's private room is entered from the clerks' office. By a side-door the vestry-clerk will also have access to the council chamber and other parts of the interior. There is also in connexion with the clerks' department, a waiting-room for the public.

On the opposite side of the vestibule from the apartments just described, is a similar suite of offices for the surveyor and his staff. These have strong rooms and appointments similar to that of the clerk's department, with the exception of having drawing-tables instead of desks. Besides the communication by the main entrance and interior, there is a separate entrance to this department from Church-lane.

The council chamber occupies the north-east portion of the ground-floor, the entrance being near the rear of the vestibule. This is 57 ft. long, 30 ft. wide, and 19 ft. high, where the vestry meetings will in future be held. Accommodation has been provided for ninety vestrymen,—a larger number than usually attends. The furniture is of oak, upholstered in maroon morocco. There are three rows of benches along each side of the chamber, with other three across at the entrance. Behind the latter is a "bar," with brass slide or telescope, separating the floor of the chamber from a small space reserved as an auditorium for any of the parishioners who may desire to be present to witness the transaction of the parish business. At the opposite end is a raised table and desk for the chairman, with accommodation on either side for the respective officers. The east-end of the hall is ornamented by Corinthian pilasters, and three arched recesses. In the centre recess, immediately behind the chair, a bust of General Boileau is to be placed. The bust is by Mr. Brock, of Osnaburgh-street, Regent's Park.

Adjoining the Council Chamber is a cloak-room, with massive oak table, mirror, cloak-rails and umbrella-stand, the hatpegs being indicated by ivory numbers. Attached to the cloak-room is the lavatory, with hot and cold water.

On the opposite side of the vestibule from the Council Chamber are the offices of the Inspector of Nuisances and the Medical Officer of Health.

The staircase is on the left-hand side of the vestibule, lighted from the roof by stencilled glass, and also by a brass ten-light chandelier suspended from the centre of the glass roof. The effect of the staircase is damaged by the want of sufficient headway on arriving at the first landing.

The large hall occupies the entire length of the building. It is 91 ft. long, 46½ ft. wide, and 32½ ft. high. It is lighted by seven large windows fronting High-street, three in the west end, and by four semicircular lights in the north side, corresponding with the arched tops of the other windows. The lower windows are filled with plate glass, while the semicircular tops contain likenesses of gifted persons, either natives of Kensington, or who had long resided in the parish and identified themselves with its history. On the seven front windows in the following order are Charles James Fox, William Boyce (Mus. Doc.), Archbishop Whately, Her Majesty Queen Victoria, Earl Clarendon, Sir David Wilkie, R.A., Thomas Gray (the poet). In the three end windows are John Hunter, Addison, and Sir Isaac Newton; and in the four north windows are Thackeray, Wilberforce, Macaulay, and Lord Holland. Some of these, for example, the head of the Queen and that of Thackeray, are very unsatisfactory. At the east end of the hall is a series of Corinthian pilasters with alcoves, the latter being ornamented with shell pattern, inside of which is a cushion bearing the royal crown. A raised platform at the east end is capable of accommodating forty persons. It is made of pitch pine, panelled, and surrounded by a brass handrail. At the opposite end is a gallery, which can be entered either from Church-lane or from the main staircase. Gas-light is supplied by half a dozen brass chandeliers, each having six double branches, and bearing twelve lights. The hall is seated with Austrian bent-wood chairs.

Communicating with the large hall is an ante or waiting-room, and behind it is the supper-room. This is immediately above the Council chamber, and is the same size. The tables are made of pitch-pine, with folding-frames, which can be packed into a small space when not in use.

At the top of the building are apartments for the hallkeeper, and also a laboratory for the analyst under the Sale of Food Act. In the basement, which covers a large area, there is a good deal of accommodation, including the Gas Inspector's offices and a kitchen, which occupies a considerable space, and has communication to the hall by two separate lifts.

LINCOLN CATHEDRAL.

At a meeting of the Architectural Section of the Royal Archæological Institute, held at Lincoln, the Rev. Precentor Venables read a paper on "The Architectural History of Lincoln Cathedral." The following is a general outline of the architectural history of the fabric, and the approximate dates of its various portions:—The first cathedral of Lincoln was erected by Remigius, or Rémy of Fescamp, by whom the see was transferred, c. 1073, from the village of Dorchester, on the banks of the Thames, to the strong-walled city which had succeeded *Lindum Colonia*. The church was entirely completed by him, but it was not consecrated before his death, in 1093. Of Remigius's Church, the only visible remnant is the central and lower portion of the west front. The foundations of the apse, which formed the other extremity of the fabric, and of a portion of the side walls of the Norman Presbytery still exist beneath the stalls of the present choir. Remigius's unadorned façade is broken by three deeply-recessed arches, reaching its whole height. The two lateral recesses still retain their circular arches and plain unmoulded profiles. The arch of the central recess has been removed, and the whole recess raised and finished with an Early English pointed arch. These deep cavernous archways are flanked with smaller apsidal recesses, which occur again on the north and south flank, though no longer visible from without in consequence of the erection of the flanking chapels. There can be no doubt that Remigius intended his west front to be finished with a pair of towers, as at present. These, however, were probably raised no higher than the roof on his death, and it was left to "Alexander the Magnificent" to complete them, in the general repair of the Cathedral carried on by him after the fire of 1141, in which he vaulted the whole church with stone. Alexander attached to the faces of his towers gables richly ornamented with intersecting arches, two of which remain on the north and east sides. Those which finished the western façade, as well as that which crowned the central recess, were removed when the front was heightened, but the weather mouldings of the two latest gables may still be traced on the wall within, behind the Early English screen. The three magnificent Transition Norman portals of the west front are also ascribed to Bishop Alexander, though it is fair to say that the late Sir G. G. Scott deemed that of the north aisle somewhat later. The remains of the works, both of Remigius and Alexander, are but small. Lincoln Cathedral, as we see it, is almost entirely a work of the Early English style, and it is invested with a peculiar interest, by its being the earliest dated example of that style. The foundations of the present choir and eastern transepts were laid by Bishop Hugh of Avalon, in 1192, and these portions of the new fabric, together with part of the eastern side of the great transept, were erected before his death in 1200. The transept was completed, the central tower raised, and the nave and chapter-house built during the episcopate of his successors, William of Blois, 1203-1206, and Hugh of Wells (the brother of Bishop Jocelin, the builder of Wells Cathedral), 1209-1235. To Bishop Grosseteste, 1232-1253, may be assigned the completion of the west front and the rebuilding of the central tower, up to the base of the great belfry windows, after its fall in 1237. The Presbytery, or Angel Choir, to which, in the words of the late Mr. Sharpe, "it would be difficult to find a parallel in refinement and elegance, as well as in the delicacy of finish of, its minutest details," was built in the latter half of the thirteenth century, to receive St. Hugh's shrine, and to accommodate the concourse of votaries that his reputation for sanctity collected. It was commenced soon after 1254, when the dean and chapter applied for the Royal licence for the removal of the city wall, to enable them to lengthen the church, and it was ready for the translation of St. Hugh's relics in 1280. The cloisters were erected through the instrumentality of Bishop Oliver Sutton, 1280-1300. The upper story of the central tower was begun under the patronage of Bishop Dalderby, March 14, 1307, and it was ready for the hanging of the bells in 1311. The south gable of the great transept, with its rose window, is assigned to Bishop Burghersh, 1320-1342. The vaulting of the central and two western towers, the stall-work of the choir, and probably the western windows, were the work of Treasurer John of Welbourne, who died in 1380. The western windows are usually attributed, on the authority of Leland, to Bishop Alnwick, 1436-1449, but they are decidedly of an earlier date. The upper stories of the western towers were, no doubt, the next work executed. There is no record of their erection, but they cannot be very much later than Treasurer Welbourne's time, c. 1400. The three chantry chapels added to the aisles of the choir were erected respectively by Bishop Fleming, d. 1432, Bishop Russell, d. 1480, and Bishop Longland, d. 1521. The principal works of the cathedral may be classed under the following heads:—

Norman Period, A.D. 1066-A.D. 1145.—West front, central part (Early), commenced c. 1075; font (ditto); west front, circular arcade (Late), c. 1140; ditto, lower part of two western towers (ditto), c. 1140; ditto, central doorway (ditto), c. 1143.

Transitional Period, A.D. 1145-A.D. 1190.—West front, north and south doorways (Early), commenced c. 1148.

Lancet Period, A.D. 1190-A.D. 1245.—Eastern transept (Early) commenced c. 1190; choir (ditto), c. 1190; central transept, east side (ditto), c. 1200; central transept, west side (Middle), c. 1215; nave, with north and south chapels (ditto), c. 1220; west front, upper part, and north and south wing (ditto), c. 1125; chapter-house (Late), c. 1225; west porch of south transept (ditto), c. 1220; crossing and central tower, lower part (ditto), c. 1235; two west doorways of choir aisles (ditto), c. 1240.

Geometrical Period, A.D. 1245-A.D. 1315.—Retro-choir with south porch (Early), commenced c. 1256; north, south, and east screens of choir (Late), c. 1280; Easter sepulchre (ditto), c. 1290; cloisters and passage (ditto), c. 1295; central tower, upper part (ditto), c. 1307.

Curvilinear Period, A.D. 1315-A.D. 1360.—South transept, south end (upper part), commenced c. 1325; parapets of west front, nave (south side), and south transept, c. 1325; screen in south aisle, c. 1325; monument in retro-choir (Burghersh) (Late), c. 1356.

Rectilinear Period, A.D. 1360-A.D. 1500.—West towers (interior of lower stage), commenced c. 1365; monuments (Bishop Fleming), c. 1432; west towers (upper part), c. 1450; west windows of nave and aisles, c. 1440; parapet of west porch of south transept, c. 1450; screens of chapels of north and south transepts, c. 1450; chantry chapel on south side of retro-choir of Bishop Russell, c. 1480; ditto of Bishop Longland, c. 1521.

It will thus be seen that every portion of the history of English architecture is illustrated in this remarkable building; but more especially that part which belongs to the Lancet and Geometrical periods. The Rev. Precentor, at the close of his lecture, expressed his great regret that, in consequence of the melancholy circumstance of the sudden death of Mrs. Blakesley (wife of the Very Rev. the Dean) that morning, it was impossible for him to fulfil his engagement to take the party round the cathedral and describe the building.

THE CAMBERWELL AND PECKHAM IMPROVEMENTS.

The important and costly improvements in the Camberwell and Peckham main thoroughfares, for which the Metropolitan Board of Works some time ago obtained Parliamentary powers, are about to be commenced. The improvements consist of the widening of Camberwell-road, Church-street, Camberwell, and High-street, Peckham, at different points, and involve the compulsory purchase and demolition of upwards of two hundred houses and shops in the thoroughfares named, for which a very heavy amount of compensation has to be paid. The widening of High-street, Peckham, is to be the first proceeded with, and on Tuesday Messrs. Horne & Eversfield sold the materials of a large number of business premises there, which are now being taken down in order to carry out the work.

THE NEW "PALAIS DE JUSTICE," BRUSSELS.

Brussels, with its ordinary great attractions supplemented hy the interesting National Exhibition now open there, will doubtless he visited by many of our readers during the coming holiday-time. There are many town-improvements, too, and new buildings now to be seen there, and among the latter none will impress the visitor more than the Palace of Justice, which is getting on towarde completion, and dominates the city. Some nineteen years ago designs for this building were invited in competition, and premiums were awarded to three of the competitore, two Belgian architects and one English firm. In our volume for 1862 (xx., pp. 333, 387, 388), some particulars will he found, with illustrations of the design hy the English competitors. Thie competition, however, produced no result, none of the premiated architects having been employed, and great diesatisfaction with the course pursued on the occasion wes expressed at the time.

The building actually erected is from the designs of M. Poelaert, architect, and we give a view showing its general appearance. It is situated in the elevated part of the city, towards the extremity of the south-east. The Waterloo Boulevard, one of those which form the exterior enclosure of the city, passes close to it. A number of unhealthy houses and a manufactory of chemical products were destroyed in preparing a site for it, and the sanitary condition of one of the old quarters of the capital hae thus been materially improved. The building is placed upon a declivity, so as to involve, especially on one side, next the Rue des Minimes, tbo level of which, as shown in our view, is more than 50 ft. below it, flights of etepe and inclined planes, that materially increase tbe grandiose effect of the whole. The area occupied hy the building itself is about two hectares and a half, and the *place* in which it stands, the flights of steps, and other approachee, occupy about as much more. In form it is nearly a square, the depth being rather more than its width,—that ie, one is 200 mètres, the other, at its widest part, 170 mètres. The palace containe a grand central hall, or *Salle des Pas-Perdus*, and eight conrte of varying sizes, and on different levels, in consequence of the irregular nature of the ground; to meet the difficulties of which great ingenuity hae been shown both within and without. The grand hall is an immense apartment, and the interior of the palace generally includes some remarkahly fine architectural effects.

The foundations, which, in consequence of the difference in level between the site of the building and the Rue des Minimes, were necessarily very considerahle, entailing an expenditure of 60,000*l.*, were commenced in 1866. The worke for the building proper were contracted for in 1869.

LONDON COMMERCIAL BUILDINGS.

PROVISION FOR ANCIENT LIGHTS.

The block of property, No. 16, Tokenhonse-yard, Lothhnry (of which we give four illustratione in our present number), is nearly approaching completion, and will he ready for occupation hy the end of September.

The huildinge demolished to make room for the new structure, were at one time the headquarters of the notorious Royal British Bank, and for the last twenty-one years were the offices of Messrs. Turquand, Youngs, & Co., the eminent liquidators and accountants.

The new building containe, on the basement, extensive fireproof wine-cellars, with a goode entrance only in Telegraph-street, the office and counting-house heing under the Tokenhonse-yard front, with access either down the steps in the area, or through the ground-floor entrance.

The remainder of the basement is ahsorbed by strong-rooms, book-rooms, and lavatories, &c., in connexion with the large chamher on the ground-floor of the Telegraph-street portion. This room hae a floor-area of over 1,200 ft., by a height of over 20 ft., admitting of a mezzanine floor over a certain portion, which can he reached by the spiral staircase communicating with the basement, or hy the principal etaircaee.

Thie portion of the building ie designed to meet the requirements of a hanking, insurance, or financial company, having manager's, board, and waiting rooms, strong-rooms, book-roome, and private lavatories, and accommodation for about thirty olerks in the general office. Tbe remainder of the huilding is arrenged in snitee of offices, of which there are thirty-five roome, exclusive of the basement and the bank.

The whole of the hack elevations are faced with white glazed bricks. Tbe two fronte ere of Portland end Corsehill red eandstone to the height of the first floor, and above the red stone is kiln-burnt red hrickwork.

Important questions of rights of light have necessitated the exercise of considerable ingenuity in the arrengement and conetruction, and of which some details are given in the illustration, es they may prove suggestive in other caeee.

The huilding is constructed throughout in the most suhstantial manner, and the finiehing and fittings will also be of the beet description. All the rooms, paesagee, closets, and the stairoase will he well lighted end ventilated, considering the natural difficultiee of the site and its surroundings.

The general contractors are Messrs. Charlee Aldin & Sons, of Queen's-gate Gardens. The wrought ornamental ironwork is hy Messrs. Welle & Co.; the parqnet and mosaic floors are by Mr. J. F. Ebner. Tbere is no clerk of the works; the foreman for the contractors is Mr. Davis, and the arcbitect is Mr. Bassett Keeling, of Weavers' Hall.

SOUTHWELL MINSTER.

In connexion with the Lincoln meeting of the Archæological Inetitnte, an excursion was made on the 31st ult. to Southwell Minster, where Mr. Ewan Christian, the architect under whose direction tbe reetoration works are being carried out, undertook the office of guide to the party. He said it was his intention to replace upon the nave towers the epires whicb had originally existed there, and to raise the roof of the nave to its original pitch, leaving it open ineide. The stone floor was a matter of considerahle interest, ae he had no doubt whatever but that it remained till the present day in the same condition as when it was first laid down, and instead of being on the level it sank to the eastward, the library floor at present being 3 ft. 6 in. above the level of tbe old floor, while tbe floor of the choir rose, though very slightly, from west to east. It was his intention to maintain the Decorated window in tbe west end over tbo nave door. It was not strictly in character with the Norman work which properly helonged to the huilding, hut much of this Decorated work had been introduced in times past, and he did not think it wise to extirpate it altogether. The roof had been a vexed question, hnt he did not think it prohable that there had been a flat ceiling; and a portion of the ceiling next the central tower was pointed ont hy him as an instance of how the work ought to stand. He also stated that it wae his intention to retain the lantern at the west end, though, of conrse, the window in the reverse side from which it took its name would he closed hy the raised roof. Passing round to the north porch he next called attention to the door, which was not constructed upon ordinary principlee. Instead of the panels heing framed as they would he hy a modern joiner, tbey were hewn out of the eolid wood. Some Perpendicular windows in the nave, dating ahout tbe fifteenth or eixteenth centnry, had been taken out before he had anything to do with the huilding, hut he did not intend to remove any more. They were not in accordance with the original work, hnt they were good of their kind, and were of interest as illustrating the history of the Chnrch. In the transepts he pointed out that there could be no donht about the ceiling in this part of the minster; it should he flat, and he had determined to have it eo. There was evidence also of two eastern apses having existed in this part of the huilding, but the arohways which had connected them with the transepts were now hlooked np. Tbe library, he said, he was going to clear out and reetore to its proper level, also returning it to its old uee as a chapel, and placing the new library ahove. While here he exhibited a remarkably fine and accurate sketch by Turner of the chnrch before the fire, and said that on comparing what was left of the old work with tbe sketch, he found the latter so accnrate in these partioulars that he had arrived at the conclusion that it was equally accnrate as to what had been destroyed, and he had been confirmed by it in mnch of the restoration work which he had determined to execute. The sketoh showed spires on tbe western towers, though none on the centrel tower; a high-pitched roof on the neve, a high-pitched roof on the chapter-house, and many other things whioh he had imagined, before he saw it, must have existed, and of which he was now fully persnaded. In the choir he indicated the signs of the enlargement which had teken place there, as chiefly to be eeen in the difference of the colour of the stone; and then, pointing to the screen, declared it was a lovely bit of work, and nothing would induce him to alter it. One of the members of the Society observing that one of the best-known architects of the preeent day had thought differently, Mr. Christian said he must defend Mr. Street from that. Whet he had said was, that he wonld not hesitete to remove the screen if it were necessary for tbe purpose of public worship; hut even in that he differed from him. Much had been eeid about the removel of the screens which formerly stood along the eidee of the choir. They had not heen removed without the most careful consideration. He had thought of the matter for two or three years before he fully made up hie mind, and he had been finally determined to remove them only by the question of light. If the screens had been allowed to remain, the lower windows wonld be rendered nseless, and the only means of light wonld be from the small windows placed high up in tbe clearstory; eo that the building would not be eeen at all on an average day. He should say, however, tbat when the ecreene were taken down they turned out to be the most patched up and worthless thinge that he had ever seen; so that he was perfectly content with what he had done. Before leaving the choir he pointed out certain small defects in the ancient work, and observed that when the old architects had made a mistake they did not pull the huilding down again, bnt heantified the mistake; in this case they were disguised if not concealed by ornamentation. Tbe chapter-house was the last part of the minster visited, and attention was chiefly called to the carving of the capitals, which is singularly good. Leaving the church hy the south door, Mr. Christian pointed ont tbe framework of his new epire, which was ready to he hoisted to its place on the top of tbe more eonthern of the two smaller towers. He said objection had been made to it on account of its weight, hut it would only weigh 30 tons when complete. He conld put 30 tons on top of a 2-ft. wall, and if he could not pnt it on top of a tower with walls 4 ft. 6 in. thick it was a curious fact. In making a hasty tour of the exterior, Mr. Christian pointed out the excellence of the workmanship everywhere save in the matter of the foundations. The architecte of the period when the church was hnilt had not believed mnch in foundations, the conseqnence being that some years ago fissures commenced to form in the gable of the choir, which necessitated ite heing etrapped. He observed that it would he a very great improvement if he conld pnt a high-pitched roof upon the choir, but he did not ventnre to propoee it, heoause such a roof would rnn eo far up the centre tower as to dwarf the effect of the latter altogether. He intended, however, to pnt the original roofs on the two chapels in the ohoir, and the original conical roof on the chapter-house. Lastly, he conducted the party to the north-west corner of the churchyard, whence Turner mnst have taken the sketch which had been shown.

DWELLINGS OF THE POOR.

The Committee on this snbject appointed by the Charity Organieation Society took up a Report to the Council at the end of last month, but the nnt had been too hard to crack, and the Council eimply came to a reeolution, "That the Report he received as a preliminary report of the Special Committee, bnt that the Committee be reqnested to continue their sittings for the purpose of preparing and presenting a further report." Some eingnlar miscalculations as to the aserted cost of sites obtained under the Artieans' Dwellings Act were set fortb in the Report.

Newcastle Society of Antiquaries.—At the last monthly meeting of this society, Mr. John Clayton read a paper entitled "Further Observatione on Centurial Stonee," in which he replied to some strictures on a paper on the eame subject read before the society in May last.

"OUR ANCIENT MONUMENTS AND THE LAND AROUND THEM."

In the work published under this title,* Mr. Chas. Philip Kains-Jackson gives an account, more or less illustrated, of the various antiquities scheduled in the Ancient Monuments Bill. It is well calculated to increase the interest with which these important vestiges of bygone times are regarded, and to contribute to their reverential preservation. Sir John Lubbock has contributed a preface, a reprint of which in our columns will serve the common cause:—

"The principal sources of the remarkable progress which of late years has been made in the science of prehistoric archæology have been,—

1. The riverdrift gravels.
2. Caves and rock shelters.
3. Shell mounds.
4. Lake dwellings.
5. Tumuli.
6. Megalithic monuments.
7. Fortifications and ruined dwellings.

Of these the last three are dealt with in the present work.

The riverdrift gravels, perhaps, present the most conclusive proofs of the great antiquity of man. The existence of the human race is proved by the presence of rude, but unmistakable, stone implements, and by fragments of bone; the contemporaneity of which with the gravel itself is proved by their identity in colour and condition; while the antiquity alike of the implements, of the bones, and of the gravels, is proved by the presence and nature of the extinct animals, by the changes in climate, and in the physical conditions of the country, which have taken place since the period of their deposition.

The remains found in caves and rock shelters (though doubtless in many cases of great age) offer, perhaps, less conclusive evidence of the lapse of time, though, on the other hand, from the more perfect condition and varied nature of the objects found, they throw more light on the social condition and habits of our predecessors. The shell mounds of Denmark bring us to a somewhat more recent, though still very remote period. They consist of shells gradually accumulated by a race of men who lived principally on the produce of the sea, though partly also by the chase. The lake dwellings of Switzerland have proved even more instructive. Remains of lake villages have been found in our own country, but they are far less extensive than those of Switzerland, and are not in need of Parliamentary protection.

The last three classes, which form the subject of this work,—tumuli, megalithic remains, and ruined dwellings and fortifications,—are, alas! rapidly disappearing. They are, indeed, seldom destroyed to serve any important purpose, but are utilised as manure, road metal, or building material, or perhaps levelled merely because they impede the plough.

Surprise has frequently been expressed that we have confined ourselves in the Ancient Monuments Bill to monuments of this character, and have omitted ancient castles, abbeys, and other similar remains. On consideration, however, it will, I think, be felt that Mediæval monuments require to be dealt with in a different manner. In the first place, the expense would be much greater, and ought to be borne partly by local funds and individual liberality; secondly, as repairs would from time to time be required, questions of style and taste would arise with which no central Commission could, I think, satisfactorily deal, and as to which local opinion ought to be consulted.

Some archæologists are of opinion that we have proofs of the existence of man in Europe at a time anterior to the Glacial epoch, and even in Miocene times. For the latter view the evidence is, in my judgment, as yet very inconclusive. On the other hand, it is, I think, more than probable that the advent of the Glacial Period found man already in possession of Europe. There is still, however, much difference of opinion among archæologists on this point.

From the careful study of the remains which have come down to us, it would appear that Prehistoric Archæology may be divided into four great epochs.

I. That of the Drift, for which I have proposed the name 'Palæolithic'; when man shared the possession of Europe with the mammoth, the cave-bear, the woolly-haired rhinoceros, the Irish elk, and other extinct animals.

II. The later, or polished, Stone Age, for which I have proposed the name 'Neolithic'; a period characterised by beautiful weapons and instruments, made of flint and other kinds of stone; in which, however, we find no trace of the knowledge of any metal, excepting gold, which seems to have been sometimes used for ornaments. For these two periods I suggested in 'Prehistoric Times' the terms Palæolithic and Neolithic, which have since been generally adopted.

III. The Bronze Age, in which bronze was used for arms and cutting instruments of all kinds.

IV. The Iron Age, in which that metal had superseded bronze for arms, axes, knives, &c.; bronze, however, still being in common use for ornaments, and frequently also for the handles of swords and other arms, though never for the blades.

Stone, however, was used for certain purposes, and by the poor not only in the Bronze but even in the Iron period. We are reminded of the use of stone for cutting instruments by the word chisel, the German 'kiesel,' a flint; from which many English place-names are derived, as Chiselhurst, Chiselbury, the Chesil Bank, &c.

In the first or Palæolithic period, the inhabitants of Europe were a rude race of fishermen and hunters. They clothed themselves in skins. Their implements and weapons were made of wood, bone, horn, and stone; the stone implements being rudely, though skilfully, chipped out, but never ground or polished. There is no evidence that the use of pottery was known. Even at this early period Europe was occupied by two distinct races of men.

In the Neolithic period the stone implements are in many cases ground or polished. The hatchets, even when unground, belong to different forms from those of the earlier period; but some of the simple types of stone implements, such as flakes, belong to both periods. In this period man had made considerable progress: he had invented pottery, domesticated the dog, ox, sheep, goat, and pig; he had commenced agriculture, and made for himself rude coverings of woven flax.

The Bronze Age is characterised, as its name denotes, by the use of bronze for cutting purposes, though stone also was by no means relinquished. The pottery is better. Gold, amber, and glass, were used for ornamental purposes. Coins and letters were still unknown.

In the Iron Age the use of that metal superseded that of bronze for cutting purposes. Silver, lead, and zinc were discovered, and letters were invented. At the dawn of history we find Europe already in the Iron Age; with traditious, however, of the earlier periods.

None, I think, of the monuments scheduled in our Bill, nor any of a similar character, either in this country or elsewhere, can be referred to the first period. No bones of a mammoth, of a rhinoceros, or any other extinct animal, not even of a reindeer, have ever been found in any tumulus or dolmen in England,* or in the West of Europe, for it is hardly necessary to say that the representations of the elephant found on some of the Scotch sculptured stones certainly do not refer to the mammoth.

But if our tumuli cannot be ascribed to the Palæolithic period, there can be no doubt that many of them belong to the Neolithic Age; some, on the other hand, are certainly as recent as Saxon times; but from the character of the remains found in them I am disposed to refer those which cluster round Stonehenge or Avbury, and consequently those monuments themselves, to the Bronze Age.

The tumuli, menhirs or standing stones, dolmens or stone chambers, stone circles, and stone rows or avenues, may all, I think, be considered as part of one common plan. The great majority were tombs. Some, no doubt, are memorial monuments; some were temples; but the idea and plan is still that of an interment. We may regard a perfect megalithic interment as having consisted of a stone chamber, communicating with the outside by a passage, covered with a mound of earth, surrounded and supported at the circumference by a circle of stones, and in some cases surmounted by a stone pillar or 'menhir.' Sometimes, however, we find the central chamber standing alone, as at Kits Coty House, near Maidstone, which may or may not have ever been covered by a mound; sometimes, especially, of course, where stone was scarce,—we find the earthen mound alone; sometimes only the menhir. The celebrated stone avenues of Carnac, in Brittany, and the stone rows of Avbury, may, I think, have been highly developed specimens of the entrance passage; in Stonehenge and many other instances, we have the stone circle. In fact, these different parts of the perfect monument are found in every combination and in every degree of development, from the slight elevation, scarcely perceptible to the eye,—excepting, perhaps, when it is thrown into relief by the slanting rays of the setting sun,—to the gigantic hill of Silbury; from the small stone circle to the stupendous monuments of Stonehenge or Avbury.

Even now, the northern races of men live in houses formed on the model of these tombs. Having to contend with an Arctic climate, they construct a subterranean chamber, over which they pile earth for the sake of warmth; and which, for the same reason, communicates with the open air, not directly, but by means of a long passage. In some cases, tumuli, exactly resembling these modern houses, have been discovered. At Godhavn, for instance, in Sweden, such a grave was opened in 1830, and the dead were found sitting round, each with his implements, in the very seats which doubtless they had often occupied when alive. Thus, then, in some cases, that which was at first a house at length became a tomb.

So, again, the tomb in the same way becomes a temple. The Khasias are a primitive people of India, who even now construct megalithic monuments over the dead. They then proceed to offer food and drink to the deceased, and to implore their assistance. If after praying at a particular tomb they obtain their desires, they return again, and if success is repeated, this tomb gradually acquires a certain reputation, and the person buried in it becomes more or less of a deity. When a considerable celebrity has thus been acquired, other shrines would naturally be consecrated to him by those anxious for his assistance, and these would be constructed on the model of the first. No wonder, then, that it is impossible to distinguish the tomb from the temple.

I trust that one result of the present work may be to induce many to visit some of these ancient remains. Wiltshire, from this point of view, is especially instructive. In three days it is easy to see Avbury, the most ancient of the great sacred places of England; Stonehenge, which is probably somewhat more recent; Old Sarum, once our most important city; and, lastly, Salisbury itself. Going down overnight, —say on a Thursday evening,—to the picturesque old town of Marlborough, the visitor would begin with the large Castle Mound, and coming soon within sight of the grand Hill of Salisbury, leave the high road and drive, partly up the ancient 'stone row,' into the venerable circle of Avbury, perhaps the most interesting of our great national monuments.

There he would walk round the ancient vallum, he would search out the remaining stones among the cottages and farmsteads; wondering at the mechanical skill which could have moved such ponderous masses; and at the modern barbarism which could have destroyed such interesting, I might almost say sacred, monuments of the past.

From Avbury he would pass on, crossing the great vallum of Wandsdyke, which he would trace on each side of the road, stretching away as far as the eye could reach, and he would sleep at the ancient city of Devizes.

The next day he might cross Salisbury Plain to Salisbury. On the way he would pass Stonehenge, the sanctity of which is attested, not only by its own evidence, but by the tumuli which cluster reverently around it. At Old Sarum he would for the first time come across real and written history. Lastly, at Salisbury, he would see one of our most beautiful cathedrals, and an excellent museum, which we owe to the liberality of Mr. Blackmore, while for the admirable arrangement of it we are indebted to Mr. Stevens.

No one, I think, who has had the advantage of making such an expedition, and visiting any of these monuments, could see them perish without deep regret. In the eloquent words of Ruskin, with which I will conclude, 'The dead still have their right in them [these monuments]; that which they laboured for, the praise of achievement, or the expression of religious

* London: Elliot Stock, Paternoster-row, 1880.

* As regards Scotland, the case is doubtful, remains of the reindeer having been found in association with some of the Orkney and Shetland brochs.

feeling, or whatsoever else it might be which they intended to be permanent, we have no right to obliterate. What we have ourselves built we are at liberty to throw down, but what other men gave their strength and wealth and life to accomplish, their right over does not pass away with their death; still less is the right to the use of what they have left vested in us only. It belongs to all their successors."

A VISIT TO THE ART-UNION OF LONDON.

In this same month last year the new and handsome home of the Art-Union of London was thrown open to the public, and again this season its galleries are opened for the exhibition of the pictures purchased by the fortunate prize-holders.

The admirable architect who planned this structure is, alas! no more, but his name remains imperishably connected with it. In the annual report of this year, as "*In Memoriam*," the following paragraph appears:—"The world of art has not for a long time lost one of its members for whom so widely-spread and deeply-felt regret has been caused as for Mr. E. Barry. The Council have determined to place in their new building a tablet commemorating his connexion with this structure, not only as being the last work of the lamented architect, and ably fulfilling the requirements of the society, but because the Council feel that,—in the case of public buildings generally in England, there is a lamentable remissness in commemorating the architects who designed them. A painter, as a general rule, takes care to put his name in the corner of his picture, a sculptor cuts his name somewhere on the base of his work, an engraving generally bears both painter's and engraver's names, a poem or a history usually has the author's name on the title-page; but in a building we may in nine cases out of ten search in vain for the name of the individual to whom we are indebted for whatever amount of gratification we may derive from its contemplation." Since then the tablet has been set up, and can be seen by all.

The Art-Union seems to take every year a firmer hold on the public, and its ramifications now extend to all quarters of the globe. We hear that in India, Japan, Natal, Ballarat, Constantinople, some fortunate individual has become possessed of an interesting work of art from the mother country, and the installation of the Art-Union of London in such a home as its present home is more convincing than any verbose article could be that the unceasing efforts of the Committee have not only brought financial success, but have succeeded in diffusing a greater love of art amongst a class who at one time could scarcely have hoped to obtain reproductions of the works of such men as Maclise, Frith, Ward, &c. And the Committee go on hoping that in time it will permeate to a class by whom the knowledge of the high and noble in art is sadly needed, and lead them to seek in art an elevating pleasure. And there is no doubt that if in time the sympathies of what we term the "mass" were enlisted, it would be good not only for themselves, but artists also. The honest spontaneity of sympathy or feeling with the meaning of what the artist wishes to embody in his picture on the part of people to whom art-jargon is unknown might now and then be more valuable than the hyper-criticism of the quasi-initiated. And the constant contemplation of the works of some of the best masters will do more to spread a love of art, pure and simple, than getting bewildered by much of the æsthetic talk of the day.

We would now take a glance at the present exhibition itself, and we turn naturally first of all to the 200*l.* prize won by Mr. Webb, and selected by him from the Society of British Artists. It is by George Cole, the father of a better-known son, and is a very charming picture. A group of cattle are reposing on some low-lying meadows near a stream; the sun is setting with a deep golden light in the evening sky. There is a calm and repose quite refreshing about it. In nice contrast, on the opposite side of the room, is the 150*l.* prize, "In a Welsh Valley," by F. W. Hulme. The tints are here more sober; you feel the air is cool and tempered; a little stream breaks up, brawling amidst broken pieces of brown rock, and the angler prepares his line. Wales, indeed, seems to offer never-ending temptations to the painter, and we are not surprised to find some more excellent subjects from this favoured spot. The "Torrent Walk, Dolgelly," by R. Harwood, is especially noticeable. The stream which has left its home (seen in a misty bloom in the far distance), as it rushes on its course swirling over the rocky stones, is lashed into a perfect torrent of foam, rendered with a truth and lightness scarcely to be looked for from white paint. For the 100*l.* prize, we have "Near Tintagel, Cornwall," by Thos. S. Croxford, from the Royal Academy. We pass on from Cornwall to "Hart o'Corrie, Isle of Skye," by Alfred W. Williams. We turn to have a look at the "Market Boats on the Maas, Holland (by G. S. Walters), lying lazily, "Dutchily," on the sunlit water, a thorough contrast to the lively time the "Ramsgate Lifeboat (by T. R. Miles) seems to be having. "Early Morning in the Tyrol" makes one long to be off from August in London. Through a veil of fleecy-white clouds the rose-tipped mountains are seen, and a brawling rivulet released "from Winter's icy chain" rushes past a little group of pine-trees. "San Giovanni Paolo, Venice," by Alfred Pollentine; "the Limpid Stream," by A. de Bréanski; some itinerant merchants wandering down a country road whilst night is coming on, by Leopold Rivers; two pleasant *genre* pictures: one a Grecian girl defending "Love's Messenger,—a dove, by C. J. Durham; the other, a pretty girl singing "A New Song," by F. Slocombe, are all good. Startling (as the head seems to stand out from the frame) though not so pleasant, is a "Study from Life," by F. Bramley. Time and space only permit us to give a few words to the water-colours. "The Leaden-road, Lincoln," by John O'Connor, is excellent; "St. Barnabas, Venice," by William Callow; "A Pool on the Glaslyn, at Beddgelert," by Jackson Curnock; "Monteleone," by C. Vacher, are all deserving of praise, and we are sorry space does not admit of noticing more at length the various works grouped together. We can only, in addition, wish the Art-Union ever-increasing success in its high aims and in its energetic work.

Carleon.

WOOD PAVING AND SCAVENGERING.

In a published report on wood-paving works proposed to be carried out in the parish of Kensington, dated 24th May, 1880, some statistics are given which may be useful to inquirers. The surveyor (Mr. Weaver) says:—

"The advantages of wood-paving,—its appearance, cleanliness, comfort, quietness, &c., need not be dilated on, but I would direct attention to one point, viz., *scavengering*. Proper attention to this one work is of the utmost importance to a wood-paved road in order to insure cleanliness and safety in travelling, but while this work involves a greater outlay for labour than a macadamised road, the refuse swept off is very much less, and easier to get rid of.

The committee are well aware of the increasing difficulty of getting rid of the road slop, especially in the south district of the parish, while on the other hand there will, I believe, be but little difficulty in disposing of the sweepings off wood-paving. The refuse from Brompton-road now fetches 5*l.* per barge-load, or a net profit of 3*l.* per barge, after deducting expense of loading same.

It will not, however, be fair to assume that in the future such a price would always be obtainable, but there can be no doubt that the refuse from wood-paved roads will always be more readily disposed of than macadam slop. At the present time, while the former commands 5*l.* a freight, the vestry has to pay 5*l.* a freight to get rid of the latter, and this proportionate cost of disposal will, I have no doubt, hold good in the future."

English Engineers in Northern Italy.—The line of tramway from Vicenza to Valdagno-Arzignano and the mines of Pulli was inaugurated on Monday week. This line of tramway is very important on account of the large mineral-water establishment at Recoaro, a village on the hills, about six miles north-west of Valdagno, which is visited by over 9,000 people annually. The laying of the line, which is twenty-eight miles in length, was commenced in April last, under the inspection of Mr. R. F. Mackenzie, civil engineer, of Milan. The rails are of the Vignoles type, and weigh 42 lb. per yard; the engines are principally English.

THE CITY AND GUILDS TECHNICAL INSTITUTE.

The Central Institution, as our readers have been informed, is to be erected on land heretofore belonging to the 1851 Commissioners at South Kensington. On the 6th inst. the Executive Committee of the Institute elected Mr. Waterhouse to be the architect of the new building, having in view the fact that his experience in such buildings has been large. 50,000*l.* is the sum he will have to spend.

THE EDGWARE HOUSE ESTATE.

Fifty thousand pounds was the sum offered and refused for the above estate at the Auction Mart, on Tuesday last, when it was submitted for sale by Messrs. E. & H. Lumley. The property was described as Edgware House and Little Stanmore Farm, containing 334 acres of land, forming a very desirable freehold building estate in the Edgware-road, eight miles from the Marble Arch, and six miles from Kilburn. The conditions were that the property was first to be offered in one lot, and if not sold then to be offered in five lots. In introducing the property the auctioneer stated that there was a present rental of 1,200*l.* from a part of the estate only, with a certain prospective increase. Thirty thousand pounds was first offered, increasing to 50,000*l.*, on which the auctioneer adverted to its close proximity to London, stating it was well worth 80,000*l.* at the least. There was, however, no further advance, and it was withdrawn as a whole, and offered again in five lots. For the first lot, 71 acres 14,800*l.* was offered, and for the next lot, containing 100 acres, 11,900*l.* was bid, but both were declined. For the remaining three lots no offers were made.

THE NEW BUILDING ESTATES AT LEYTONSTONE, WOOD-GREEN, AND WALTHAMSTOW.

During the past week upwards of 150 plots of building land have been sold on the Cedars Estate, at Leytonstone, near "The Avenues," Epping Forest; the Bowes Park Estate, Wood-green; and on a similar estate which has been laid out at Walthamstow; the aggregate proceeds of the several sales amounting to upwards of 13,000*l.*

The sale of the Cedars Estate, at Leytonstone, which took place at the Working Men's Hall, at Stratford, by Messrs. Protheroe & Morris, comprised 109 plots, being the last portion of the estate. Upwards of 100 plots were sold only a few weeks ago, realising the sum of 8,870*l.*, and on several of these plots building has already been commenced. The sale of the last portion of the estate, on Wednesday evening, the 4th instant, was very numerously attended, with an active demand for the different plots, which, with eight exceptions, were all sold at what were considered good prices. The plots facing the several roads which have been laid out on the estate for private houses, having frontages varying from 16 ft. to 22 ft., and from 70 ft. to 120 ft. in depth, fetched prices ranging from 55*l.* to 86*l.* each. Some of the plots sold, however, contained a much larger superficial area, and realised considerably higher prices than those above quoted. The highest sum obtained during the sale was 400*l.* for a plot abutting on the Forest, and specially reserved for a tavern. It occupies a prominent corner position, having a frontage of 51 ft. to the Ferndale-road, and abutting on the Forest to the extent of 80 ft. A corner-shop plot, having a frontage of 30 ft. to the high-road, by a return frontage of 124 ft. to the Ferndale-road, was sold for 293*l.*; and another corner-shop plot, having also a frontage to the high-road, of 26 ft., and a return frontage to Ferndale-road, of 89 ft., realised 240*l.*; and an adjoining plot, having a frontage of 22 ft. to the high-road, and a depth of 95 ft., fetched 210*l.* Eight other shop-plots were sold at prices from 184*l.* up to 192*l.* each. The entire proceeds of the sale amounted to 9,017*l.*, the entire estate having realised,—with the proceeds of the previous sale,—an aggregate sum of 17,837*l.* The number of houses and shops on the estate, when the several buildings are completed, will be about 220, with an estimated new population of about 1,200 persons.

On the following evening (Thursday, August 5th), a similar sale of building land on the Bowes Park Estate, at Wood-green, took place

at the Nightingale Hotel, Wood-green, by Mr. G. Searle, auctioneer and estate agent, of Seven Sisters-road, Finsbury Park. This is a very large and important estate, containing an area of upwards of sixty acres in extent, which has recently been laid out for building upon, no fewer than ten spacious new roads having been formed, which stretch across and intersect the estate at right angles. The estate lies to the east of the Alexandra Palace and Park and the Wood-green Station, and is described as within half an hour's ride of London, by the Great Northern, North London, and Great Eastern Railways. It is estimated that the total number of plots on the estate, when fully laid out, will be about 600. Of these, about 250 plots have already been sold, and building upon them is at present going forward. The number of plots offered at last week's sale was seventy, the several plots having frontages from 18 ft. to 22 ft. each, with a depth of from 90 ft. to 150 ft. Most of the plots were sold, the prices ranging from 64*l.* to 84*l.* each, whilst a number of corner plots realised from 95*l.* to 150*l.* each. Some of the purchasers took as many as five and six plots at each purchase. The proceeds of the evening's sale amounted to about 4,565*l.*

On the same evening, thirty-three plots of building land, on an estate at Walthamstow, were likewise offered for sale by Mr. R. J. Collier, at the Chequers Inn, Walthamstow. The several plots were stated to have frontages of from 18 ft. to 20 ft., and a depth of from 80 ft. to 100 ft. One of the stipulations was that the trade of an innkeeper, victualler, or retailer of wine, spirits, or beer, either under grocer's licence or any kind of licence whatsoever, would not be allowed to be carried on on any plot on the estate. Another stipulation provided that no house on the estate was to be of less than 300*l.* and 350*l.* value as its first cost in materials and labour. Several shop plots fronting Marsh-street realised from 200*l.* to 250*l.* each, and the plots for private houses an average of 65*l.* each.

PROPERTY IN DOCTORS' COMMONS.

On Friday, the 6th inst., Messrs. Reynolds & Eason sold several lots of freehold and leasehold property at the Auction Mart. The property consisted of the freehold business premises, Numbers 39, 40, and 41, St. Andrew's-hill, Carter-lane, at present let upon leases at the aggregate annual rental of 185*l.*, but estimated to be worth 380*l.* per annum at the expiration of the several leases. They were in the first instance put up in one lot, and 5,200*l.* being the highest offer, they were withdrawn, and next offered in three separate lots. No. 40, St. Andrew's-hill, now in the occupation of Messrs. Judd, printers, at the rent of 50*l.* per annum, on a lease expiring in ten years, was sold for 1,570*l.* The adjoining premises, No. 41, St. Andrew's-hill, were also sold for 1,350*l.* They are at present in the occupation of Mr. Sutton, at the rent of 45*l.* per annum, and held on lease for an unexpired term of eight years.

INDUSTRIAL DWELLINGS.

The half-yearly meeting of the Improved Industrial Dwellings Company (Limited) was held at the Mansion House on the 9th inst., Sir Sydney Waterlow, bart., M.P., presiding. A dividend of 5 per cent. was declared, which will absorb 10,625*l.*, and 3,538*l.* was carried to reserve. The total number of dwellings in occupation and in course of erection was reported as 3,921, for the accommodation of about 19,000 persons. In the crowded parish of Bethnal-green alone, where many houses had been absorbed for railway purposes, street improvements, and for the erection of manufacturing premises, 166 old houses had been pulled down to form sites for the company's improved dwellings, and the new buildings in this parish amount to a rateable annual value of 9,500*l.*

In this same parish, the Bethnal-green House Property Association are quietly and unobtrusively doing a work which greatly improves the sanitary state of the parish, whilst it returns the Association a fair interest on their capital invested, and provides for a class of tenants to whom the arrangements and bare distempered walls of the Industrial Dwellings Company are distasteful. This Association is composed of local tradesmen, who utilise their local knowledge in purchasing reasonably ruinous old property, consisting frequently of small one-story cottages, with front gardens situate in *culs-de-sac* of very narrow dimensions. Pulling these down, they widen the court, and if possible open out the ends and erect new three-story buildings, with three-room tenements on each floor, each separately provided with ranges, larders, coal-bins, sinks, water-supply, and other domestic conveniences. The drainage from the houses is delivered over open external traps, so as to be completely cut off from the sewer. The houses are economically built and managed, and are let rapidly. The latest operations of the society are at "Gale's Gardens," heretofore a most unsanitary area. The tenders for the new buildings here have been inserted from time to time in this journal. The new houses built or in course of erection number thirty-five. The builder is Mr. J. H. Johnson, of Limehouse, Messrs. A. & C. Harston being the architects.

THE GREAT NORTHERN RAILWAY COMPANY'S SURPLUS LANDS.

On Thursday, the 5th inst., Messrs. Prickett, Venables, & Co. offered for sale, at the Auction Mart, a quantity of freehold building land, near King's-cross, being a portion of the surplus property of the Great Northern Railway Company. The property was stated to have frontages to Randall's-row, Junction-road, James-street, and East-street, containing altogether an area of about 61,000 superficial feet. It was stated that the railway company had made arrangements with the authorities of the parish of Islington for the latter to make up the roads and footpaths, and also to put in the necessary sewers abutting upon the property, at the cost of the railway company. The property was divided into nine lots. A corner plot, situated at Stroud's-vale, close to York-road, King's-cross, possessing two frontages of 96 ft. and 94 ft. respectively, was sold for 610*l.* An adjoining lot, having a frontage to Randall's-row of 35 ft., and a depth of 60 ft., realised 265*l.* Another plot, of similar dimensions, abutting upon the buildings erected by the Victoria Dwellings Association, was also sold for 265*l.* A plot, having a frontage of 35 ft. upon Junction-road, and a depth of 64 ft., fetched 275*l.*; and a corner-plot, having a frontage of 65 ft. to Junction-road, and 34 ft. to James-street, and including the materials of two cottages standing upon the ground, was sold for 425*l.*

THE UTILISATION OF LONDON SEWAGE.

A Bill with the above object has just now received the Royal assent. It is termed "The Dagenham and District Farmers (optional) Sewage Utilisation Act," and authorises the formation of a company and the construction of works for the delivery of London sewage to the occupiers of some 9,000 acres of land on the Essex side of the Thames between Barking and Wennington. Mr. Peregrine Birch is the engineer to the Act. The essence of the project is pointed to in the word "optional" in the title. The farmer or market gardener will draw sewage only when he requires it, and the company will be under no obligation to take the sewage except when they can dispose of it. The Act confirms a thirty years' agreement with the Metropolitan Board of Works, by which, in consideration of a half-share in the profits of the concern (beyond 5 per cent.) the Board undertakes to supply the company with any quantity of sewage up to 60,000,000 gallons a day.

The promoters of the company have ascertained to their satisfaction that the most successful market-gardeners in the district spend as much as 15*l.* and 20*l.* per annum an acre in London and other manures, and are advised that they can, consistently with a very handsome profit, supply and distribute sewage containing by analysis 20*l.* worth of manure at a charge of about 2*l.* The works proposed will be capable of supplying that amount to every acre of the district during the six dryest months of the year. The addition of the sewage to the rainfall of Essex, it is said, will raise the total moisture of the soil to something like that of parts of Cornwall and Devonshire, which countries are well known to furnish an important part of the vegetable supply of London. The higher ground (about two-thirds of the district), to which the sewage will have to be pumped, consists almost entirely of market-garden farms. The lower ground (about one-third of the district) will be supplied by gravity. It is now devoted to cattle grazing, but it is anticipated that when this cheap means of resuscitation is provided, the tenants will be allowed to mow several crops a year, and dairy farming on a large scale will be introduced. An opportune outlet is thus offered for the 150,000 cows which now occupy sheds within the metropolis, and for which the owners are driven in many cases to seek other accommodation by reason of recent humane and sanitary legislation, which has resulted in the licensing and inspection of all cowhouses in London. The belief that a remarkable increase in the return from the grass land of the district will be brought about is supported by the experience of Edinburgh, which is the only place in the kingdom where sewage can be used in as large or small quantities as desired, and where the meadows are let annually at an average rent of about 25*l.* an acre.

The capital of the company is 150,000*l.*, in 10*l.* shares. The analytical value of the sewage at their disposal is said to be about 1,000,000*l.* a year,* but the promoters say they will be well content to sell it at a tithe of its analytical value, even if they only do business during a small portion of the year. This company may divert the bulk of the sewage from the river, at any rate during the hottest months of the year, and it must be obvious to any one knowing the summer condition of the river that they would then have accomplished a great public good.

IMPERIAL COLLEGE OF ENGINEERING, JAPAN.

Sir,—My attention has been called to a paper by Mr. E. C. Robins, entitled "Buildings for Secondary Educational Purposes," which appeared in the *Builder* of the 10th and 17th of April last. In this paper Mr. Robins dwells at length on the excellence of the arrangements in the Physical Department of the Imperial College of Engineering of Tokio (Yedo), Japan, and on the satisfactory results obtained there. The writer at the same time gives a plan and detail drawings of the same, and I must express my surprise that an architectural paper such as the *Builder* should publish drawings of a new building and its fittings without the signature or sanction of the architect.

It may not be generally known that the Japanese Government, while behaving with great liberality to their foreign employés, are averse to the publication of any of the designs made by those in their employ.

This, you will understand, is a sufficient reason in itself to explain why I should object to any drawings of public buildings I have designed being published. The writer of the paper is perhaps not aware, when giving Mr. Ayrton sole credit for using benches fitted up so that the pupils can repeat the experiments made by the professor,—"which is believed to be unique of its kind,"—that others before him employed the same means for instructing their pupils (Professor Williamson, of King's College, for example).

Before the Physical Department Buildings were thought of, the chemical class-room of the Imperial College of Engineering was fitted up with similar benches.

As much, if not more, credit is due to the principal, Mr. Henry Dyer, and to Dr. Divers, the Professor of Chemistry, than to Mr. W. E. Ayrton, for the happy results which that gentleman's friends would claim for him alone.

C. A. Chastel de Boinville,
Architect to the Board of Public Works of Japan.
11, *Yamato Yashiki Tokio* (*Yedo*), *Japan*,
18*th June*, 1880.

A Local Government Board Inquiry was held a few days ago at Bacup by Mr. R. T. C. Hildyard, on the application of the Bacup Sanitary Authority, to borrow the sum of 1,000*l.* for street improvements in connexion with a new bridge over the river Irwell. The plans were produced and explained by Mr. John Wilson, C.E., surveyor to the Board, who also furnished the inspector with particulars respecting the population, rateable value, and water supply of the district. Mr. John Haworth, of Lane, opposed part of the scheme.

* It has been calculated that the sewage of one person per year is worth analytically between 8*s.* and 1*l.*

THE EMPLOYERS' LIABILITY BILL.

The House of Commons went into Committee on this Bill last week. The greater part of the first sitting was occupied by a discussion of the exact meaning to be attached to "stock," for the defects of which an employer is to be made liable, and which it was pointed out might apply to live stock, and might make a farmer liable for injuries by a mad bull or for accidents caused by a horse with a diseased fetlock, &c. Mr. Dodson, President of the Local Government Board, said he did not care much about the word, and was willing either to leave it out or to limit it to stock-in-trade. The Committee declined, on a division, by 158 to 82 to leave out the word, and, on Mr. Dodson's motion, it was restricted to stock-in-trade; but a motion of Mr. Gregory to exclude live stock-in-trade was negatived. In the course of the debate Mr. Broadhurst objected to the Bill being so narrowed as to exclude agricultural labourers from its benefits. An amendment proposed by Mr. Barnes, with the object of limiting the employer's liability to the person specially charged with his authority, and standing towards the workmen in the position of the employer, was, after a long discussion, withdrawn.

Mr. Craig moved in clause 1, page 1, line 10, after "him" to insert "or in mining or other dangerous employments where it may be impossible or difficult to trace the causes of accidents, by reason of the negligence of any person in the service of the employer, except such workmen as may be engaged in the same working place, and working together as partners with the person injured."—This amendment was negatived, Mr. Dodson refusing, on the part of the Government, to accept it.

On the motion of Mr. Dodson, an amendment was introduced limiting compensation to cases of injury suffered by a workman in consequence of his having obeyed directions of any person to whom for the time being he was bound to submit.

Considerable discussion ensued on a proposal by Mr. Morley to introduce a sub-section extending a workman's claim for compensation to cases where personal injury had been caused by the negligence of any person in the service of his employer engaged in a branch of such service separate and distinct from that in which the workman was employed. This proposal received wide support from both sides of the House. It was at first resisted by Mr. Dodson, but eventually the right hon. gentleman offered as a compromise to "favourably consider" on report a clause by Mr. Morley, adapting the amendment to the particular case of railway servants. On a division, the amendment was rejected by 175 votes against 75.

Sir Edward Watkin then moved an amendment providing that the Bill should not have jurisdiction in cases where a mutual insurance fund existed between employers and *employés*. This was negatived without a division, and Clause 1 was, without further discussion, agreed to.

Mr. Bryce's amendment on clause 2, to leave out sub-section 3, which deprives the workman of compensation who has been guilty of contributory negligence, was accepted by the law officers, on the ground that the case was already sufficiently provided for at common law, and in the end it was agreed to.

At the end of clause 2 Mr. Robertson proposed to raise the question of assurance by an amendment, but after some conversation it was agreed to defer it.

Mr. Craig moved to omit the remainder of Clause 2, beginning from the word "employer" on line 19, which provided that the workman should be responsible unless he gave notice of any defect to a superior, even if not his employer. The amendment was negatived.

On Clause 3 the limitation of the amount of compensation to be granted was discussed at some length. Mr. Barnes proposed a maximum of 100*l*. This was opposed by Mr. Broadhurst, and Mr. Barnes did not press his motion to a division.

Mr. Burt proposed to substitute five years' earnings for the three years fixed in the Bill as the maximum. Mr. Dodson, who was supported by Sir R. Cross, declined to assent to this, and on a division it was negatived by 164 to 71. Another division was taken on the question that the clause stand part of the bill, which was carried by 204 to 74.

On Clause 4, which provides that notice of action shall be given within six weeks of the injury, Mr. Norwood moved to substitute that notice of the injury should be given within six weeks. After some discussion, Mr. Dodson accepted the amendment.

On Clause 5, which allows actions to be brought into court without power for either party to apply for removal to a superior court, Mr. Hinde Palmer moved an amendment that when common employment was pleaded the judge would reserve the point for the jury; but, after some discussion, did not press it, stating that he would wait for the result of a similar amendment by Mr. Morley, but if that failed he would raise the question on report. The clause was agreed to.

On Clause 6, which defines the expression "person who has superintendence entrusted to him" as meaning a person whose sole or principal duty is that of superintendence, and who is not ordinarily employed in manual labour, Mr. Lamb ton moved an amendment to leave out from the words "a person" to the end of the sub-section, for the purpose of inserting, in reference to a mine, "the agent or certificated manager intrusted with the principal management of the mine." The amendment was negatived.

Mr. Cohen moved an amendment that the person who had superintendence entrusted to him should mean one whose sole or principal duty was "in relation to the particular work or matter with respect to which he is alleged to have been negligent." Mr. Dodson objected to this, and upon a division the amendment was rejected by 185 to 45.

Mr. Balfour moved that the expression "workman" should also apply to "domestic and menial servants." Upon a division this amendment was rejected by 158 to 32.

A conference of members of Parliament and representative working men, railway servants, and others, presided over by Mr. Morley, M.P., was held on Friday in last week in the Conference-room of the House of Commons, to consider the offer of the Government to include in the clauses of the Employers' Liability Bill one which would give compensation to railway servants injured by the negligence of servants in separate and distinct departments. The representatives of the railway *employés*, while satisfied with the offer of the Government, expressed their desire that all classes of workmen should be dealt with under Mr. Morley's amendment; but other working men present, while feeling that there might be some jealousy, expressed their satisfaction with the introduction of the principle contained in Mr. Morley's amendment, believing that the principle would ultimately be extended. It was then decided that the clause drawn up by Mr. Morley should relate specifically to a certain class of railway servants who, it was felt, are exceptionally situated. Mr. Morley's clause will be submitted on the report.

A TALE OF A TRACTION-ENGINE.

It is becoming more and more evident that some further supervision ought to be exercised over our public highways, especially with reference to the new descriptions of traffic that come on them. The bicycle nuisance is to some extent palliated by the fact that in any case of collision the user of the vehicle is pretty sure to be injured. A certain amount of caution is thus ensured; but none the less is a new danger sprung upon the pedestrian. The use of traction-engines, with their violent snorting and rattling noise, and their heavy trains of vehicles, is, however, still more deserving of notice. In many cases the road bridges are so manifestly unfit to carry monsters of the kind, that it is only a matter for wonder that more catastrophes have not occurred. Early on the morning of the 5th of August, a heavy traction-engine was passing through the town of Guildford, dragging a truck supporting an enormous iron boiler, upwards of 30 ft. long, constructed by a London firm of engineers, for waterworks, it was said, at Portsmouth. The truck supporting the boiler, the steam-chest of which projected some 4 ft. beyond the off-wheels of the truck, was followed by another truck, weighted to serve as a drag. The driver of the traction-engine turned down Chertsey-street, with a view, no doubt, of avoiding the very steep pitch of the picturesque High-street of Guildford. Chertsey-street has been newly pitched, or has had the pitching re-dressed, and the incline, though less steep than that of the main road, is considerable. So serious was the action of gravity that the truck carrying the boiler pressed upon the traction-engine, the wheels began to slide, the chain and one of the cog-wheels broke, and the leading wheels of the engine, rising over the kerb of the footway pavement, carried away the front of a shop in the street. No damage was done, happily, to life or limb, but the engine and train were stopped in the street for a couple of days, until the former could be repaired.

In the interest of all persons who use our highways and streets for ordinary purposes of walking, riding, or driving, it is to be hoped that the above may prove a warning to manufacturers to send consignments of such bulk by water. The fellow-boiler was safely taken to its destination by a traction-engine a week before. The cost of an accident of this kind is perhaps not altogether to be deplored, as it may serve to discourage a method of sending by land, instead of by water, objects of a bulk for which the roads were not provided as a means of transport.

PARTY WALL QUESTIONS.

WADD *v.* CROLL.

This was a motion heard before the Master of the Rolls, on the 4th inst., to restrain defendant from acting under an award to pull down a certain party wall situated in Basinghall-street, City, on the ground that a proper notice had not been served on the plaintiff, requiring her to appoint a surveyor to act for her. Defendant had given the usual three months' notice on the form authorised by the Board of Works, and had also written plaintiff saying he "should be obliged" if she would appoint a surveyor, but she having failed to do this, he proceeded to appoint a surveyor for her, under section 85, sub-section 9, of the Building Act, and the two surveyors so appointed had appointed a third surveyor. The three surveyors awarded that the wall should be pulled down, but the plaintiff moved to restrain defendant from doing so.

Mr. Karslake, who appeared for the defendant, contended that the three months' notice first served required the plaintiff to appoint the surveyor, and he showed by an affidavit that no other form for doing so had been issued by the Board of Works.

Sir G. Jessel said that the "three months'" notice contained no requirement of the plaintiff to appoint a surveyor, and that the letter was insufficient, as it did not *require* plaintiff to do so, but simply said that the defendant "would be obliged" if it were done. He granted the injunction on that ground, but reserved the question of costs.

DRAWING AT BOARD SCHOOLS.

At a meeting of the School Board for London, held last week,

Mr. Stiff moved the adoption of the following recommendation of the Works Committee:—

"On the 14th instant, the Board referred to the Committee for consideration a letter from the Education Department, stating that My Lords would not object to the use of the drawing-room at the Cook's Ground School (Chelsea) as a class-room, and requested that the dimensions of the room might be stated. The Committee recommend that a reply be forwarded to the Department informing them that the dimensions of the room in question are 23 ft. 10 in. by 22 ft. 10 in."

Mr. Lucraft moved as an amendment, that a letter should be forwarded to the Department asking them to withdraw their permission for the room in question to be used as an ordinary class-room. Drawing instruction was of the utmost importance, and it was a great pity to use the room in the way proposed. The Board ought to do everything they could in the way of furthering drawing instruction. The artisans of other countries were beating those of England in their knowledge of art. It was one of the most, he might say, the most important subject the Board had to deal with.

Miss Taylor seconded the amendment.

Mr. Stanley said that those schools which had drawing-class rooms had not attained the best drawing results. The school in question would not suffer in its drawing if the Committee's proposition were carried. It would be unwise for the Board to cause an inconvenient and expensive arrangement to be made, merely to afford Mr. Lucraft the satisfaction of having his principles asserted.

Professor Gladstone remarked that if the Board used as much extra room in the schools for drawing as Mr. Lucraft desired, they would be carrying out what ought to be done in technical schools, and not in the Board's ordinary schools. The teaching of drawing was exceedingly valuable, but he did not think the Board ought to always have special rooms for the purpose, to be used for nothing else.

There were six for the amendment and eighteen against it. The Committee's proposition was adopted.

Christ Church, North Kensington.—Earl Stanhope laid the dedication-stone of this new church on the 6th inst.

COST OF NEW BOARD SCHOOLS.

At last week's meeting of the School Board for London the committee reported the cost of the following schools which have been erected by the Board. In none of these cases have the committee found it necessary to exceed the authority granted to them to sanction extras up to 10 per cent. on the contract amount. [The figure before the name of the school is the accommodation provided; the first figure after is the authorised cost; the next the extras; the last figure is the cost per child]:—

Chelsea (X).—624; Fox School, Silver-street; 7,750*l.*; 32*l.*; 12*l.* 9s. 5d.

Chelsea (AD).—802; Edinburgh-road, Ladbroke Grove-road; 8,150*l.* (actual expenditure, 8,119*l.* 17s. 1d.); (no extras) 10*l.* 2s. 6d.

Chelsea (AD).—1,160; Latimer-road, Nottinghill; 11,131*l.*; 114*l.*; 9*l.* 13s. 10d.

Finsbury (AZ.)—1,200; Gillespie-road, Highbury-vale; 12,430*l.*; 202*l.*; 10*l.* 10s. 6d.

Finsbury (BB). — 802; Bowman's-place, Seven Sisters-road (including cookery classroom); 7,151*l.*; 94*l.*; 9*l.* 0s. 8d.

Greenwich (R). — 800; Plumstead-road; 8,846*l.*; 113*l.*; 11*l.* 3s. 11d.

Marylebone (G).—532; Whitfield-street, Tottenham-court-road (including rooms for correspondent); 7,957*l.*; 189*l.*; 15*l.* 6s. 2d.

Marylebone (AR). — 500; Barrow-hill-road, Portland New-town; 6,643*l.*; (no extras) 13*l.* 5s. 8d.

Tower Hamlets (S).—602; Dalgleish-street, Limehouse; 6,236*l.*; 122*l.*; 10*l.* 11s. 2d.

PITCH-PINE.

I see in your impression last week a letter signed "A Civil Engineer," in reply to an inquiry made with regard to the use of pitch-pine for cills to window-frames.

I certainly have been always impressed with the belief, in consequence of the large amount of resin and turpentine that is contained in this particular material, that it would throw off, instead of absorb, moisture. Surely there is more of these two ingredients in the above-named wood than in yellow deal? I trust some of your numerous practical readers will give us results of their experience in the matter.

Pinus.

TREATMENT OF DAMP WALLS.

Sir,—In reference to your article on the above subject (p. 171, *ante*), we beg to say that by a process that we use for curing damp walls we think it far more simple and effectual than the German system. What we do is this. Cut off the whole of the old plaster, as far as the damp extends up the walls, in the interior of the house, extract all the moisture by heat from the bricks with the apparatus, then saturate the bricks with a hydrofuge, forcing the hydrofuge in with heat until the bricks will not absorb any more. After this is done we replaster the walls at once, and dry them off, immediately rendering them fit for painting, papering and decorating. This process has been in use in France for some years, and we have used it in England repeatedly, and it has not failed in any instance.

A. Dreyfus & Co.,
Sole Licensees for Ligny's Patent Process for Curing Damp Walls.

A COMPETITION.

Sir,—Will you allow me, through the medium of your columns, to inform the gentlemen who kindly competed for St. Matthias's Church, Upper Tulse-hill, that the motto of the design placed first by the committee is a red cross in a circle, and the architects are Messrs. Harnor & Waters, John-street, Adelphi. John T. Gadsdun.

HISTORY OF STAINED GLASS.

Sir,—Allow me to correct a clerical error in my letter published in your number of July 31st.

The date, A.D. 1400, mentioned in connexion with the advent of the Decorative style, should be A.D. 1300.

N. H. J. Westlake.

A Coincidence.—On the resignation of the late Mr. Robert Sibley, who held the appointment of "County Surveyor" for Middlesex for many years, and during that period built the Hanwell Lunatic Asylum, Brentford Bridge, and other works, the late Mr. W. Moseley, whose death was mentioned in our last, was appointed as county surveyor, which appointment he held until elected district surveyor for West Islington. When Mr. Sibley retired from the county surveyorship he was elected district surveyor of Clerkenwell, in which office he was succeeded by his son, Mr. R. L. Sibley, who is now appointed *ad interim* surveyor for West Islington to fill Mr. Moseley's place.

Books.

A Manual of the Alkali Trade, with 232 Illustrations and Working Drawings. By John Lomas. London: Crosby Lockwood & Co. 1880.

The special ground on which it is desirable to make known to our professional readers the publication of this book is, that it gives, in its first chapter, consideration to the general planning and ordering of an alkali works, and the points which should be attended to in selecting a site for it. The maxim is 2,000 years old, that the next best thing to having the information desired is to know where to look for it.

Mr. Lomas has produced an admirable work on the subject of which it treats, the alkali trade, including the manufacture of sulphuric acid, sulphate of soda, and bleaching powder, and it ought to go into the hands of all managers, foremen, and others engaged in such works.

Miscellanea.

Birkbeck Literary and Scientific Institution.—A meeting of the members of this institution has been held for the purpose of considering the proposal to purchase a site on which to erect a new and more convenient building for the purposes of the society. Mr. G. M. Norris, F.R.H.S., manager and hon. secretary of the Educational Council, presided, and stated that negotiations had been considered for the purchase of a plot of land covering 7,544 square feet, near the Record Office in Chancery-lane, upon which it was intended to build an institute with a lecture-theatre and fifteen class-rooms, with offices, committee-rooms, &c. The cost of the building was estimated at 16,000*l.*, towards which 6,000*l.* was at present in the hands of the committee. The Commissioners of Woods and Forests had agreed to let the plot of land to the committee on a lease for eighty years, at a ground-rent of 400*l.* per annum. Part of the site belongs to the Ecclesiastical Commissioners, the freehold of which will, if possible, be purchased. It was resolved to empower the committee to enter into negotiations for the purchase of the proposed site, on the understanding that, if possible, the freehold be secured.

Liverpool and Birkenhead Subway.—The preamble of the Liverpool and Birkenhead Subway Bill has passed the Select Committee of the House of Commons, but the Committee declined to allow the insertion of a clause providing that the subway should not be converted into a railway or steam tramway during the existence of the powers of the Mersey Railway Company. They also decided against proposals to maintain a distance of 42 ft. from the limit of deviation of the railway company's line, that land in possession of the railway company should not be taken without their consent, or that special compensation should be made for damage, inasmuch as it was held that should such damage occur by reason of the too near approach of the two borings, the fault would rest with the railway company, who need not approach the line of the subway. The buildings and land required for the purpose of the proposed subway have been surveyed by Mr. Edmund Kirby, of Liverpool, who estimates their value and the necessary compensation at 115,280*l.*,—99,000*l.* on the Liverpool side, and 16,280*l.* on the Birkenhead side. Mr. Sherlock, valuer, estimated the value of the land on the Birkenhead side required for the subway at 24,625*l.*, exclusive of the 10 per cent. for compulsory purchase. The land on the Liverpool side he valued at 105,840*l.*, making, with the 10 per cent., an aggregate of 143,000*l.*

A Testimonial.—On Saturday evening last a meeting of about 140 *employés* of Mr. F. Sage, builder, of Gray's-inn-road, took place at the Tuffnell Park Hotel, to present their foreman, Mr. J. Putterill, with a testimonial, in the shape of an address and purse of sovereigns, on his leaving the firm. The chairman for the evening was Mr. S. Peffers, and the vice-chairman Mr. J. Butler.

Water for Liverpool.—The Liverpool City Council have resolved to proceed with the first section of the new water supply from Vyrnwy. The scheme is expected to be completed in five years, and will secure an additional supply of thirteen million gallons of water per day to Liverpool. The total cost of the scheme will be 3,000,000*l.*

A Memorial of Temple Bar.—On Tuesday last the first stone of the memorial structure which is about to be erected by the Corporation of London on the site of Old Temple Bar was laid by Mr. John Thomas Bedford chairman of the City Lands Committee. The structure will leave room for two lines of carriages in the space of 16 ft. reserved on either side. To pedestrians it will serve as a refuge in crossing between the new Law Courts and Messrs. Child's bank. It will be 37 ft. high, 5 ft. wide, and 8 ft. long. The base will be of polished Guernsey granite, the next tier of Balmoral granite, and above that there will be pink granite from the same quarry as that used in the Albert Memorial in Hyde Park. In the niches on the north and south side will be life-size figures in marble of the Queen and the Prince of Wales, by Mr. Boehm, A.R.A., and in panels on the sides will be representations in bronze, by Mr. Mabey and Mr. Kelsey, of the Queen's first entrance into the City through Temple Bar in 1837, and of the procession to St. Paul's on the day of the thanksgiving for the Prince's recovery. The superstructure will be of hard white stone, and will be surmounted by a griffin, which is being executed by Mr. Birch, A.R.A. The inscription round the structure will be the words:—"Here formerly stood Temple Bar." The memorial is designed by Mr. Horace Jones, the City Architect. The memorial will be finished in September or October next.

Durham and Northumberland Archæological Society.—On the 30th ult. the members of this Society paid a visit to Escomb Saxon Church, which has been repaired with a view to re-consecration. On arrival at the church, Canon Greenwell delivered a few introductory remarks relative to the ancient character of the edifice, and expressed surprise that so interesting a structure should have remained in obscurity so long. Mr. W. H. D. Longstaffe then read a paper which appeared in the Transactions of the Society for the previous year, on the history of Escomb, more particularly as regarded its nomenclature. Mr. Johnson, who had superintended the repairs, next read a paper giving a detailed account of the church, which is a very complete example of a small church built before the development of Norman architecture. It was, in fact, the Saxon church of old Escomb; but it was not possible to assign a date for its construction with any degree of certainty. It was by far the most perfect of these early buildings in this part of the country. At Jarrow, part of the walls of a Saxon building remains and forms the present chancel. At Monkwearmouth, there was the western gable of the church, with its curious shafted windows, together with the very remarkable porch and archway that were disinterred by the Society. There are also such fragments as the towers of Bywell, Ovingham and Corbridge, but at Escomb we have a complete church with its chancel and its walls almost intact that has fortunately survived all these centuries with scarcely any injury. The party afterwards proceeded to Witton-le-Wear and Hamsterley.

Roads in Sussex.—For many years the roads in the Cowfold district have suffered from the extra vehicular traffic conveying building materials to the Carthusian Monastery in course of erection at Parkminster, Sussex. For the restoration of the roads, the Highways Surveyor of Cowfold desired to obtain materials from the private grounds of several well-known and influential landed proprietors in the parish. The Rev. John Goring, rector of Wiston, and Mr. R. Ramsden, of Woolringfold House, appeared before the magistrates at Horsham to resent the proposed intrusion. The local surveyor asked for a compulsory order, under the Highway Acts, to allow stone to be dug on the private grounds of the above-named gentlemen. The magistrates granted the compulsory powers asked for by the highways authorities, and Mr. Ramsden at once gave notice that he should take the case before the Queen's Bench Division.

Foreign Exhibitions.—The Great Eastern Railway directors are offering advantageous terms to passengers intending to visit the Düsseldorf Exhibition, such as special cheap tickets, every Monday and Thursday, first class, 2*l.* 6s. 4d.; second class, 1*l.* 10s. 4d.; available for thirty days. They are also issuing special reduced tickets to Brussels and back, available for eight days, including admission to the Exhibition, first class, 1*l.* 10s. 10d.; second class, 1*l.* 0s. 10d.

Utilisation of Wood Shavings.—From wood-shavings and paper Herr Heilemann makes plates, dishes, &c., as follows:—Selected plane-shavings are bound into bundles, and steeped in a bath of weak gelatine solution about twenty-four hours, then dried and cut into suitable lengths. Plates are cut of strong paper or thin pasteboard, of the size of the objects to be produced. These are moistened with a liquid consisting of weak gelatine solution with sodium waterglass, and pressed in heated metallic moulds. After drying, the pressed paper objects are coated on both sides with an adhesive material made of five parts Russian gelatine and one part thick turpentine, the shavings are applied to them, and the whole is subjected to pressure. (Wood shavings alone would, because of their unequal thickness, present uneven surfaces.) The objects are now cut, if necessary, dried and varnished.—*Exchange.*

St. Andrew's Presbyterian Church, Sheffield.—On the 8th inst. this church was re-opened for public worship, after a lapse of three weeks devoted to repairs and cleaning. The pulpit was occupied by the Rev. John Kinnear, D.D., minister of Letterkenny Presbyterian Church, and Member of Parliament for County Donegal, Ireland. The interior of the church has undergone several alterations. Foremost amongst these is the lowering and bringing further into the church the organ gallery. The result of this alteration is a great improvement in the rendering of the psalmody. The seats within the communion rail have been removed. The lighting of the church has undergone a thorough renovation. Instead of sixteen standards, there are now four tripod standards. For the first time the walls have been decorated with borders of Grecian and floral patterns, and the gallery pillars embellished with an ivy-leaf design. The spandrels in the roof are coloured flat blue, picked out with gold.

Improvement and Distribution of Sound.—Mr. Engert is carrying further his experiments in this direction by the introduction of steel wires. To properly apply the invention (he says), one or more layers of steel wires are stretched along a building lengthwise, connected by cross wires and spiral springs, and properly tuned, so that the vibration may be absorbed and conveyed from one to another, and instantaneously spread over the whole building. "This entirely prevents any after-sound, as the naturally slow speed of sound in the air has been so accelerated that the words of a speaker, or the notes of a singer, reach the audience about fifteen times more quickly than under ordinary arrangements." Up to this time he has exhibited his system only in places where people can hear very well without it. We want to see it applied in an apartment where speakers cannot usually be heard. The success or otherwise of his arrangements would then be obvious.

The New Pier at Bournemouth.—The new promenade pier at Bournemouth was opened on the 11th inst. by the Lord Mayor of London, who was accompanied by the Lady Mayoress and civic dignitaries. The cost of the pier is about 23,000*l.*, and it has an area available for promenading of 42,000 square feet. Ornamental seating accommodation is provided for 1,500 persons, and there are fourteen semi-circular wind-screens, which afford shelter in rough weather.

Mortality in New York.—It appears from the semi-annual report of the Registrar of Vital Statistics that during the half-year ending July 1st, the deaths in New York represent an annual death-rate of 25·26 in every 1,000 of a population estimated, on the basis of the recent census, at 1,206,561. This death-rate is much higher than that which prevails in London.

Stidder's Trade Book.—Messrs. G. Stidder & Co. have sent us their newly-issued trade catalogues, divided into two sections, giving lists, illustrations, and prices of their sanitary appliances and systems. Their productions are carefully classified, and the catalogues will be found of great practical utility by architects, surveyors, and builders.

Farington.—New week-day and Sunday schools were opened at Farington on the 24th ult. The site, which is within easy distance of the church and vicarage, was given by Mr. Pilkington, of Ashton. Messrs. Garlick, Park, & Sykes are the architects of the buildings, and the contract was let to Mr. Walmsley, builder, Theatre street. Adjoining the building are two large playgrounds. The whole is estimated to have cost 3,500*l.*, which amount will be defrayed by the Penwortham Grammar School Trust.

Balsall Heath Local Board.—With reference to a brief report in our last of the proceedings of this Board, including a resolution passed complaining of the engineer, Mr. G. B. Nichols, that gentleman has sent us a copy of a reply which he has published in the local papers. This puts a different face upon the matter, as will be seen from two sentences which we quote from Mr. Nichols's statement, but we are not in a position to discuss the rights or wrongs of the case:—

"That the extras reach the sum of 14,000*l.* is not correct; of that sum 13,944*l.* is for additional works (not extras), towards which a sum of 2,000*l.* is estimated in the contract in respect of the repair of old sewers, and a sum of 700*l.* for general extra works."

"In conclusion, I may remind the Board that in the additional sum of 22,000*l.* now proposed to be borrowed is included a sum of about 5,000*l.* on account of a previous contract, with which I was entirely unconnected."

The Tay Bridge.—At a meeting of the directors of the North British Railway Company, the evidence given before the Select Committee appointed by the House of Commons to inquire into the Bill for the reconstruction of the Tay Bridge was considered. The directors then resolved to remit to an engineer of the highest eminence the preparation of plans and estimates for the reconstruction of the bridge on such a footing as to insure its absolute stability and its avoiding any objection on the part of the Board of Trade.

Right Restoration.—*Notes and Queries* says,—We are glad to hear that, through the efforts of Mr. J. T. Micklethwaite, a long-missing brass is about to be replaced in the church from which it had been wrongfully removed. The Church of Colwall, Herefordshire, having been restored about fifteen years ago, nearly everything of interest was carefully removed from it, amongst other things the brass in question, that of Elizabeth, wife of Anthony Harford, who died in 1590. It represents the lady, with her husband and ten children.

TENDERS

For residence, stabling, and lodge, Hampstead-heath, for Mr. M. Baylis. Mr. Walter Graves, architect. Quantities by Mr. W. Barnett:—

Burdett & Sons	£7,500 0 0
Wellings Bros.	7,236 0 0
Barford	6,942 0 0

(next week).—S. C. L (next week).—W. P. (next week).

All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication.

We are compelled to decline pointing out books and giving addresses.

Note.—The responsibility of signed articles and papers read at public meetings, rests, of course with the authors.

NOTICE TO SUBSCRIBERS.

THE INDEX and TITLE-PAGE for Volume xxxviii. (January to June, 1880) was given as a Supplement with our Number for July 10.

A COLOURED TITLE-PAGE may be had, gratis, on personal application at the Office.

CLOTH-CASES for binding the Numbers are now ready, price 2s. 6d. each; also

READING-CASES (Cloth), with Strings, to hold a Month's Numbers, price 2s. each.

THE THIRTY-EIGHTH VOLUME of "The Builder" (bound) is now ready, price Twelve Shillings and Sixpence.

SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of 3s. 6d. each.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied *direct* from the Office to residents in any part of the United Kingdom at the rate of 19s. per annum, prepaid. Remittances payable as above.

The Builder.

Vol. XXXIX. No. 1959. Saturday, August 21, 1880.

Aboriginal Architecture in Central America.

It is with considerable interest that we are enabled to announce the first annual report of the Archæological Institute of America, with accompanying Papers, 1879—80. It is prefaced by a preliminary statement, which sets forth the organisation of the Institute upon the usual lines, and indicates aims, moreover, which are more than usually ambitious and comprehensive, directed as they are to the active exploration of the sites of ancient civilisation in the Old World as well as in the New. The first papers which are printed by the executive committee are fully answerable, in scope, at least, to these pretensions.

Mr. Lewis H. Morgan contributes an ambitious Memoir on the Houses of the American Aborigines in New Mexico and elsewhere, to which we shall return. Mr. W. J. Stillman communicates the results of a personal examination of the ancient walls of Monte Leone, in the province of Grosseto, Italy. These are the remains to which attention was first drawn by Mr. R. P. Pullen, situated in the Tuscan Maremma, on the estate of the Marchese Salviati Corsi. Mr. Stillman has concluded, from a survey of the ground, that these walls extended from water to water across the neck of what had originally been a peninsula. They ran in parallel lines with an interval varying up to about half a mile, for a distance of eight miles, opening out into a loop westward, where they were continued by a single wall. They were built of rough stones, the largest weighing, perhaps, two tons, and originally appear to have been 10 ft. thick and about 15 ft. high. Little more could be determined. The space within the walls would have accommodated a considerable population, but no remains of dwellings could be identified, which, however, decides nothing. Such a defence of a peninsula would manifestly be futile unless it was held by a power which had command of the sea. More than one height within the peninsula was crowned by a circuit of walls of better construction and presumably of later date. The negative result of the inspection may, perhaps, be amended some day by the discovery of a cemetery.

Mr. Joseph T. Clarke contributes the first part of Archæological Notes on Greek Shores. Mr. Clarke reached his destination by way of the Danube; his notes on the currents and other contingencies of navigating the Black Sea, Bosphorus, and Hellespont, as well as the Ægean, in a small craft, are not without value to the student of the conflicts of the ancient navies in these waters, and the seamanship which they called so importantly into play. Mr. Clarke's interest, however, was mainly engaged by the remains of the Doric temple of Assos,—the only Doric temple, indeed, which has been discovered in Asia Minor. He reports that the *grandes constructions militaires modernes* which stood upon its plan at the time of Texier's measurements, and seem to have been a serious hindrance, have since been entirely demolished, and some blocks of the temple structure which will assist in its restoration were readily found. The account of the state of the ruins imports that all explorations of them hitherto must necessarily have been incomplete, and all restorations to a large extent conjectural. European architects and antiquaries will greet most heartily a thorough examination and exact publication of these remains, if, indeed, the American Institute decides to make such welcome contribution to our knowledge.

The subject of "The Study" of Mr. Lewis H. Morgan is justly recognised by him as pre-eminently appealing for elucidation to the American Archæological Institute. "One great object," he says, "of the Archæological Institute, so far as it relates to America, should be to explore, delineate, and describe the house architecture of the Indian tribes, as represented by the houses now to be found in ruins, or in actual occupation, in the region of the San Juan river, in New Mexico and Arizona, in Mexico and Central America, and to study such fictile wares, implements, and utensils as may be found therein, and may tend to illustrate the condition of the people."

The districts enumerated extend over a wide area, and are marked by the climatic as well as geological differences which always have great influence upon architectural construction, as well as on plan and ornament. New Mexico and Arizona are intermediate between Texas and California, between thirty and thirty-eight degrees of north latitude. Mexico proper extends to the isthmus, and so much of Central America as comes into question is chiefly the district which closes in the Gulf of Mexico to the south and east; Chiapa, and especially the great peninsula of Yucatan, to the north of the bay of Honduras. It is now some years since the descriptions and drawings of Stephens and Catherwood drew attention to the marvellous remains in these latter countries; the conscientiousness of Catherwood's drawings, which were executed by aid of the camera lucida, has since been attested by photography, and the general conclusions of the travellers as to the nature of these structures and the social conditions which they implied are adopted and endorsed by the independent judgment of Mr. Fergusson in his "History of Architecture." These conclusions, however, are traversed by Mr. Morgan with an adventurousness as positive as it is explicit. He believes that a wrong interpretation has been put upon this architecture from a failure to understand its object and uses, and the condition and mode of life of the people who occupied these structures. All these mistakes, Mr. Morgan believes, may be corrected by comparison of the analogous, and more than analogous, constructions of the Indian village tribes of New Mexico and districts conterminal; and very remarkable indeed these are. What is sought and what is believed to be established by the author, is nothing less than that the structures which have been styled palaces, and as palaces referred to a highly-developed social organisation, are merely the houses of tribes which lived in clusters of dwellings upon a system more or less approaching to absolute communism. He leaves his readers in no doubt as to the portentousness of the blunder that high authorities have in his opinion imposed on the world. It is, indeed, not quite pleasant to observe that an imputation of something more serious than blundering is sometimes — it may be unguardedly — allowed to deface the phraseology. We read, some previous discoveries "at Palenque were becoming known, and were exciting vague and high expectations in the public mind, which Mr. Stephens undertook to gratify by more extended explorations." Intercalated compliments go too little way to qualify such phrases as "Mr. Stephens (*in his valuable works*) showed a disposition to feed the flames of fancy with respect to these ruins." "This is a clear case of *suggestio falsi* by Mr. Stephens, who is usually so careful and reliable and even here so guarded in his language." "That Mr. Stephens himself considered either to be true may have been the case, but he is responsible for the false colouring thus put upon these ruins and for the deceptive inferences drawn from them." If any of these side-thrusts fail to penetrate, a note in conclusion (p. 76) might be trusted to drive them home. "That honest men are in danger of falling into the trap so unguardedly set by Mr. Stephens is proved by the latest utterances respecting these Yucatan and Central American ruins." It appears, however, that Professor Rau, "the trusted archæologist of the Smithsonian Institution," fully accepts what Mr. Morgan calls "the visions," but we prefer to regard as the modest but pertinent "suggestions" of Mr. Stephens,—that the buildings in question were either temples or dwellings for princes or other persons of rank, and that the common people lived near them in habitations of perishable character, all trace of which have long disappeared. These views, however, it is averred, belong to "the class of puerile conceptions, and their tendency is to stultify and disfigure American archæology; from the expressions of Stephens a false terminology has sprung up to stimulate the unwary reader which has remained to the present time,—a most per-

nicious incumbrance upon American ethnology and archæology."

It is clear that discussion which has arrived at this point demands independent and dispassionate consideration. It must be said that, when we rise from the mere study of the drawings of Mr. Catherwood, of which no one impeaches the accuracy, and quite without regard to the concurrent descriptions of Stephens, Andrewes, and Squiers, it gives a shock of surprise to find them interpreted as something of the nature of model lodging-houses or Peabody buildings. Nothing, however, but instruction and interest is to be expected from taking accurate note of whatever characteristics they have in common with other Indian constructions to which such a description certainly more aptly applies.

The closest analogy which is produced to the structures of Yucatan is in the joint tenement houses of the sedentary village Indians of New Mexico and Arizona,—the so-called Pueblos. These Indians erected houses of *adobe* brick, of cobble-stone and of *adobe* mortar, and later of sandstone and the same mortar. They were raised from two to even six stories high,—the first or ground story being solid, and the others in terraced form, each receding in front from that below, with walls from 2 ft. to 3 ft. thick. Access to the first terrace and thence to others in succession was by ladders, the rooms being entered through trap-doors in the terrace-roofs and by ladders again. Every such house was, therefore, a fortress, and an occupied or garrisoned fortress. The occupants cultivated the ground by irrigation, and wore garments of cotton as well as of skin. One of these buildings might consist of fifty or 500 apartments, and lodge accordingly from 200 to 1,000 persons. An engraving reproduced from the report of Lieutenant Simpson, 1849, exhibits the restoration of such a Pueblo,—one of the smallest of a series,—300 ft. long, and with wings each 144 ft. in length; it contained an aggregate of 146 apartments, some of them 13 ft. by 18 ft.

The walls, about 3 ft. thick in the first story, were built of tabular pieces of unhewn sandstone and *adobe* mortar; the stones, undressed, were laid with some regard to evenness. White cedar beams, about 1 ft. in diameter, were laid from wall to wall of a room, then small poles upon these transversely and close together; afterwards slips of bark, and then a coating of mortar 3 in. or 4 in. thick, furnished a floor for the room above. Ceilings and floors are still formed in this manner in New Mexico.

Still more interesting are the description and photograph of the Pueblo of Taos, in New Mexico, which is still occupied by some hundreds of descendants of the original tribes. This is 250 ft. long by 130 ft. deep, and has six stories; the first solid, those above receding in terraces, and for the most part entered through trap-doors by ladders, which children and even dogs run up and down with great freedom. The occupants are described as thrifty, industrious, and intelligent.

It must be said that the descriptions supplied by Mr. Morgan do not on the face of them bear out his statement (p. 44) that "the Pueblo-house presupposes a state of the family without the exclusiveness of monogamy, in which communism in living might be expected to exist as a necessary principle of economy, and to express itself in the form of the house." For anything that appears, the architecture affords no more presumption against monogamy as a tribal custom than that of the flats of the Queen Anne mansions, or the co-operative stores, or semi-detached villas. There may, however, be more evidence on the subject than is here adduced, and "communism" is a word that always requires accurate definition.

It is not necessary at present to follow Mr. Morgan into his discussion as to the relation of this architecture to that of the mound-builders to the east of the Mississippi; nor, indeed, is the architectural aspect of the subject much illustrated by comparison of the comparatively rude long houses of the Iroquois Indians. Here, again, we have little proof of adaptation for any other communism than may be more fitly styled economical combination. A long house might have a length of 100 ft.; it was walled with a double frame of poles with elm bark between them, and bound with withes; it was divided within into compartments at intervals of 6 ft. or 8 ft., with a passage-way down the centre from the single entrance at one end, between the opposite chambers, which were open like stalls of a stable. All provisions were thrown into a common stock, and the daily meal was distributed by a single matron. It is clear that a numerous association could be housed in this sort of barrack with great economy of material and labour; and although it is possible that the system of joint tenement here may be related anteriorly or posteriorly to that of New Mexico, the systems may as certainly be independent of each other,—natural outgrowth in either case of natural needs,—as both are underived from the cells of a Capuchin convent or a New York hotel.

But Mr. Morgan now sets forth that "there is no reason to suppose that the Pueblo of Mexico contained any structures superior in character" to the Pueblos built of small stones, —from 3 in. to 6 in. in thickness, and from 6 in. to 18 in. in length,—in New Mexico northwards as described. "We may recognise," he argues in the quoted example, "a substantial reproduction of the miscalled 'palace' of Montezuma in the Pueblo of Mexico, which, like this, was constructed on three sides of a court, in a terraced form and two stories high. In the light which these New Mexican houses throw upon those of the Mexicans, the house occupied by Montezuma is seen to have been a joint tenement house of the American model. It is therefore unnecessary to call any of these structures palaces in order to account for their size, or to assume a condition of society in which the palace of a ruler was built by the forced labour of his subjects."

In Mr. Fergusson's "History of Architecture" is rendered happily accessible a condensed but conclusive and sufficiently illustrated summary of the proofs that Mexicans built for other purposes than mere economical lodging. If "sculptures, hieroglyphs, palaces, temples, public buildings, and pyramidal elevations are mentioned freely in connexion with these remains," it is the reader who allows himself to be persuaded that this "terminology is false,"—who is the truly "unwary reader." No theory of a scheme to combine abundant occupation and defence, will explain the so-called Mexican Teocallis or houses of God, pyramids in terraces, with flat tops, surmounted by a chamber or cell. A small but more perfect example exhibits such a pyramid faced with stone, and with a broad flight of steps on each side from base to summit. Still more significant is the paradoxical structure at Mitla, a building about 65 ft. square, with a roofed and pillared portico in front, of 160 ft. in length; the carefully-executed walls,—like no other walls,—slope outward from below, and their faces are divided into panels sculptured with frets, lozenges and meanders most ingeniously invented and varied, and executed at an extraordinary expense of labour. Mr. Fergusson reproduces the engraving from the Smithsonian Transactions.

Is it then possible, we are enforced to ask, that an American can have put pen to paper upon such a theme without consulting the authorities and the descriptions in the standard history of the conquest of Mexico by his countryman Prescott? Or what more than Lethean oblivion enwrapped his senses after he had done so? It is, however, scarcely necessary to appeal to the historical accounts of the social condition and architecture of Montezuma's Mexicans, before disallowing the cogency of the inferential identification of an aggregate of dwellings destitute of any superfluous enrichment or decoration whatever, with what is admitted to have been a royal residence, and that solely on the strength of agreement in being built in stories and with terraces.

That the complimentary title of "Honourable" is conceded alike to an American diplomatist and the son of an English peer, may justify the archæologist of the future in assuming some community of race, but he will go far wrong indeed if he thence concludes for like agreement in political constitution, and assigns the Lords' House in the Palace at Westminster to the elected senators of a confederation of republics. There are many fair reasons for connecting the comparatively civilised population which the Spaniards found in Mexico with the native Indians to the south of the Gulf, at least as far as Guatemala, and the semi-civilised sedentary village Indians of New Mexico may possibly again be proved to be related to both; the analogies of language, superstitions, and social habits may be strengthened by certain analogies in plan and arrangement of their architecture; but when we compare the architectural evidence, it is really too little to say candidly,—we would rather say with our eyes open,—the fact becomes salient that, leaving the question of Mexico aside, the marvellously laboured and enriched and varied structures of Yucatan and Chiapa attest such a contrasted condition of technical and social development and organisation as reduces what agreement there is to insignificance. Here, again, it may be sufficient to refer to the chapter of Mr. Fergusson, a single chapter as it is, and that of necessity, from the scope of his work, a short one.

The type of the Mexican Teocalli recurs in Yucatan, but modified, or the original of the Mexican modification. At Palenque a pyramid, 280 ft. square and 60 ft. high, is cased with unbroken flights of steps on all sides at an angle of about 45°, and its top platform is occupied by a chambered structure carefully ornamented with *bassi rilievi*.

The Casa de las Monjas at Uxmal (Fergusson, p. 771), which Mr. Morgan adduces as a parallel to the New Mexican houses, has so far the characteristics of a joint tenement, that it consists of a number of small paired or single chambers; but the construction is of stone upon a principle which tended to restrict their size. There are no such signs of economy of cost and labour as pervade the New Mexican barracks. The roofs are formed by bringing regular courses of large and well-shaped stones nearer together till they meet above, and are finally covered by a common horizontal course. This is the arch of the archaic builders in Italy and Greece, and, indeed, the view of an interior of one of the chambers is almost identical with that given by the Russian Archæological Commission of the interior of an Hellenic tomb at Kertch. Mr. Catherwood gives a view of the ruined façade of the Casa del Gubernador at Uxmal, which exposes the interior of such a chamber filled to the summit with earth and stones. Mr. Morgan supplies the explanation, which is confirmed by contemporary practice in India. This filling in is, in fact, a core which was employed to support the work while it was in progress. Ruin overtook the builders before the construction was considered to be sufficiently settled for it to be removed; but in the meantime the sculpture of the front and entrance had been completed with an expenditure of labour and study also, which need not have been due to forced labour, but which we demur to ascribing to the work of people with willing hands upon a communal house "to be occupied by them on terms of entire equality."

The employment of a core to facilitate the construction of a vault will remind architects of the proposal of a competitor of Brunelleschi for the dome at Florence. The suggestion may not seem utterly wild when we are informed how a hall at Lucknow, 162 ft. by 53 ft. 6 in., has been covered in our own time. A centering of bricks and mud was modelled in the forms required to be given to the ceiling. Upon a first and finer coating was laid a coarse concrete several feet in thickness. Not until a year or two had allowed the whole to set and dry was the centering removed, and the vault then remains independent of abutment, and exerting simple downpress. And yet we do not infer that the builders of Lucknow either lent a suggestion to those of Uxmal or borrowed one from them.

The utmost that can be fairly deduced from the analogies and resemblances between the structures of Mexico, Yucatan, Chiapa, and Guatemala, and those of New Mexico, even supposing them to be much more salient and significant than a precise comparison will show them to be,—is that there may have been some original connexion between the races,—in whichever direction,—whether the New Mexicans exhibit the crude notions which were developed by a superior tribe in the south as it made progress in skill and civilisation,—or whether the northern buildings were the best that indigent and ill-situated tribes could do in imitation of more elaborate models that were remembered in their traditions. But it seems strange indeed that monumental documents, like the antiquities so fully in evidence of Yucatan and neighbouring districts, can be read in any other sense than as proving that either royal power or that of a ruling caste, or sacerdotal control, must be assumed as a chief factor in the combination of influences that made them possible.

Solvitur ambulando was the sole response of the sophist's auditor, as he walked away from the disputation as to the possibility of motion; assuredly the question as to the identity of the social institutions of the New Mexicans and the Indians of Yucatan may be dismissed as un-

ceremoniously, after a glance at the comparative productions of their architects.

It is a satisfaction, at least, that in this criticising the first publication of an American Archæological Institute, which has our best and warmest wishes for honour and success, we arrive at conclusions which are in harmony with those that have been promulgated by what Mr. Morgan himself very justly styles "the high authority of the Smithsonian Institution."

RAILWAY CATASTROPHES AND WORKMEN'S EDUCATION.

We called attention, so recently as the 24th ultimo, to the great need that exists of a set of workmen's primers, or rudimentary text-books, which should, amongst other things, point out plainly and forcibly the chief dangers to which the pursuers of any special craft are exposed, and the primary rules that are imperative, in order to guard against such danger. Hardly three weeks have elapsed before we have a fatal commentary on the suggestion, repeated on the following day, as to the need for such books of warning. We do not, and did not, intimate that absolute reliance is to be placed on this or any other book teaching. But we think that any great employers of labour, whether gas companies,' railway companies, collieries, or whatever he the industry next called upon to offer fatal evidence in favour of our suggestion, would stand in a better position in any of those cases in which they come in contact with the coroner's jury if they could show that such a means of informing their workmen of the risks they daily run had been adopted by them.

On the 10th, and again on the 11th current, an express train, apparently in perfect order, left the rails for some reason which has not yet been ascertained. In the second case, indeed, which occurred at Wennington, about twelve miles north of Lancaster, on the Midland Railway, the line becomes single, and it was on striking the facing-points, while going at the rate of about thirty-five miles an hour, that the engine left the rails. Such, at least, was the first account telegraphed from Lancaster on the evening of the 11th current. On the Thursday the correspondent of the *Standard* says:—"The original idea that the train left the metals while running over the facing-points from a single to a double line of rails now turns out to be quite incorrect." But the evidence given to the coroner's jury on the 12th current supports the first statement. The chief inspector of the line, Loveday, stated that he believed that the flanges of the engine-wheels at the right-hand side on taking the points, did not bite in the ordinary way, but that it mounted the metals. The first point at which it was evident that the train was off the rails was 167 yards from a bridge, the abutment of which was struck by the carriages as they were ploughing their way along the side of the track, with the effect of the entire destruction of the first, an empty third-class, the raising up and destruction of the second, and serious damage to the third, a composite carriage.

Without anticipating in any way the result of the inquiry as to the quarters to which blame is to be attributed, it seems pretty clear that in this catastrophe we have a recurrence of a danger that has been before denounced. As the line is here single, the points must face either the up or the down trains. But it is hardly to be admitted that this fact should not be so far recognised by those who frame the running directions of the engine-drivers, as to prescribe a low rate of speed on approaching the points in fact. As to this, we shall probably hear more on the inquiry.

With regard to the first and the least fatal of these departures of the train from the track, it is said to have occurred when "the train reached the curve at Mareball Meadows cutting, 400 yards west of the Marshall Meadows Bridge, about three miles from the North British Station at Berwick. At this point the engine left the line." "The spot," said the second account from the special correspondent of the *Standard*, "where the catastrophe happened, is just at the commencement of a deep cutting, almost at the termination of an inverse curve of about a mile in length, and upon a sharply falling gradient." The inquiry before Colonel Yolland will no doubt bring out with proper preciseness the points here indicated, as well as the speed of the train, which is given at between fifty and sixty miles an hour. The points as to which it strikes us as especially useful that attention should be called, are, the radius of the curve, the exact place of the reversal of the curve (if the expression "an inverse curve" is correct), and the relative heights of the inner and outer rails. It is obvious that if the accounts above cited are correct, it may be difficult to give the usual counterpoise to the centrifugal force of the train at a point where the curvature changes. We hope that this important physical question will receive due attention.

Pending the result of the full inquiry which is demanded by the alarming character of each of the above catastrophes, we call attention to the illustration, afforded by the occurrence, of the force of the remarks we lately offered on the education of the workman. In each of these cases, so far as we can at present see, the disturbing element appears to have been the well-known influence of centrifugal force. It may be objected that in the case of the departure from the line at the points there was not an adequate curvature to call this force into disturbing action. But this very reply enforces our argument. Centrifugal force is identical in its principle with that tendency to continue linear motion in a straight line which acts against the tongues of the pointe that are intended to deflect the course of the engine. Whether it be the driver of an engine, the pointsman, or the platelayer, it is obviously important that all those men who have to do with the guidance of great weights, moving at great speed, or with the preparation or maintenance of the line on which such movement is to take place, should be familiar with primary mechanical principles. Unless the driver has some idea of the relation of centrifugal force to speed, to weight, or to curvature, he can exercise no intelligent choice as to the speed to which he should reduce his train under certain conditions. Unless the platelayer has some better guide than rule of thumb, he will not know to what height he ought to pack the outer rail of a curve, of given radius, in proportion to the maximum speed at which a train will run over the curve in question. Nay, what more will he know of a curve than, as we once heard a witness assert and reassert, to the baffling of an acute cross-examining counsel,—that "it warn't straight?" That a great deal of what we must call instinctive mechanical knowledge is to be found among the platelayers, as a class, we well know to be the case. Is it just to these careful men,—is it just to the travelling public,—to allow them to form their own theories as to the cant of the rail on a given curve, and never to dream of putting into their hands an elementary guide-book?

Again, if it turn out to be true,—which we will to the last moment in which it can be honestly done steadfastly disbelieve,—that the chairs at the Marshall Meadow curve were not properly bolted to the sleepers, does not such an idea suggest the primary importance of instilling into the platelayer, from the very moment that the anger and the rammer are put into his hands, a knowledge of the rudimentary laws of motion? It sometimes happens that, in relaying or repairing a line, the traffic has to be conducted over a way that is not in a perfect condition. On such occasions warning is, or ought to be, given, and a low running speed kept over every such unfinished portion. But if the platelayer is unaware that a sidelong thrust is thrown on the chairs on the outer part of the curve, in proportion to the weight and speed of the train, it may make a material difference either in the way in which he executes work under the pressure of time, or in the warning which he will give to the engine-driver of the unfinished state of his work. These remarks may, or may not, prove to be directly applicable to either of the disasters now under investigation. That we shall perhaps see. In the meantime, let us remind every one who takes a railway ticket of the extent to which his personal safety and life are dependent on the possession of primary mechanical knowledge by the thousands of workmen on whose care the issue of his journey depends. If he once realises that, he will echo our demand for workmen's primers.

Stafford.—The New Connexion Chapel, Gaol-square, has been re-opened, after repair and enlargement. The work has been carried out by Mr. Pemberton, under the direction of Mr. Wood, architect, Longton; while the building has been decorated by Messrs. Riley & Sons, of Eastgate-street. The whole work has cost nearly 1,000*l.*

A CAXTON MEMORIAL.

PARISH PAYMENTS IN EARLY DAYS.

Having given a few illustrations of the times in which Caxton commenced his celebrated work in Westminster, in the reign of Edward IV. (see p. 165, *ante*), we will now proceed to review the events which are chronicled in the St. Margaret's books during the remainder of our printer's life in the parish.

1484-1486.

"Here folowyth thaccompte of Thomas Gregory and Henry Swifte, Wardeyns of tha parisshe churche of Sainte Margarete, of Westm', in ths shire of Midd." From May 24, 1484, to May 11, 1486. This account comprises twenty-two written pages, on parchment, and while the two years' receipts amounted to 57*l.* odd, the payments were some 26*l.*, leaving a balance of 31*l.* 6s. 0½d.

As we have already stated, the majority of items in the receipts are for funerals which cost, for ordinary parishioners from 2d., which was the usual price for the two tapers used at the ceremony, to as much as 6s. 8d. for "the pitt" in the church, 6d. for "the knell" with the bell in the church tower, and certain payments according to the position of the deceased, for torches, or tapers, or lights, as we shall presently give evidence of. Thus, in the first year's receipts, at the burying of William King's wife we find the pit cost 6s. 8d., the bell, 6d., and the four torches 5s., while at "the hurying of a prisonar," the light cost only 1d.! Then, again, there is an entry of the burial "of the good man of the Katryn Whele" (Catherine Wheel), which for four tapers cost 16d., although we have not been favoured with the gentleman's name. A servant of the King's Chappel paid 6d., as did also "William's Childe, of the Popis hed" (Pope's Head). Among the second year's receipts, "the burying of William Spade," for four tapers cost 4d.; "John Barnard Gentilman," eight torches, 13s. 4d., and knell, 6d.; and "my lady Stoner," six torches, 10s. Two very important personages were also buried this year: the first was "Ranffs of the Pantry" in the Palace, four tapers, 8d.; the other was "Mr. John, the Quenes ffoole," but his burial only cost 4d. for two tapers.

We have already instanced the fact of the church goods having been lent out as occasion might require; but here is an interesting entry, perhaps in some way relating to the demise of the king:—"Item in a rewarde for Candlesticks lent into tha Abbey for King Edward the 4th, 6d."

The festival of St. Margaret's is again quoted among the payments:—"Paid to tha Kep[r] of the Kyng's place for clothis of Arras to hang aboute the Church on Sainte Margaret's day, 2s. To the Vesterer of the Ahhay for clothie of sylke and of golde, 12d. For hangyng up and takyng downe of the saide clothie, 6d. For wasshyng of the ymage of Sainte Margarate, 1d. Unto 2 watchmen on Sainte Margaret's night," no doubt to protect the drapery, &c., lent by the king, "8d. For ffaggote for the bonefire, 4d." And, as usual, "for brede, ale, and wyne, for Singere of the Kynge Chapell, 12½d."

In the early volumes of the *Builder* much interesting information will be found relating to churchyard crosses. That at St. Margaret's, Westminster, is now shown to have been in existence earlier than 400 years ago, for here are the items of its restoration:—"Paida for a grate brode frise stone to mend the foto of the crosse in the churche yerd, 3s. 4d. Paid for Assheler Stonee for the same croese, and for laying and werkmanship, 7s. 4d. Paid for makyng of a croese of tre to set upon the said crosse of stone, and for the spere, eponge, and nailes of the same, 2s. 4d. Paide to John Reda for peynting of the same crossa of tre, eponge, spere, and nailes, 3s."

In the second year's accounts we find some notes about the steeple cross, which also appears to have been a restoration. Thus the carpenter "for half a lode of tymber to make the crosse upon the steeple of the chirche" received 4s. 2d. Two carpenters for labour on it received 8s. 4d. The plumber for 32 lb. solder 16s., and for casting 711 lb. of new lead, 9s. 9d., and as "the new lede is more than the olde lede" (which he took in exchange) by 219 lb., he charged the churchwardens with the difference at the rate of 5s. 4d. the hundredweight. The same plumber received for his labour and for nails used 39s. 6d.; the smith received 2s. "for 2 doggis of yron for

ths stepill and the hrodds to them," and 16d. was paid "for sawydyrg."

Among ths miscellaneous payments ws find "for 4 harrys for the clerkys wyndowe, weynge 21 lh. price the lh. 1½d." "For a hushell of coolys [coals] for hallowyng of the ffonte, 2d." "For makyng of a new claper to Judas hsll," 10d. "For mendynge of the hellowse of the organs in the rode lofte," 6d. "For hrede and als spent npon Crowe and other Clarks and the Children of the Kynge Chapell at Crisstemasse," 6d.; while William Tnll, "the tiler and his fellow," received 8d. a day each for three days' work.

1486-1489.

The accounts for these years are not those of the churchwardens proper, hut of Thomas Burgsys, William Saynbrygge, and William Hungate, "late Maistsrs or Wardeyns of the fraternyts or gilde of oure hlessid lady Saynt Marie withyn the parissbe church of Saynt Margarete," and ars written in forty pages of parchment. Thsy are a much more elahorate affair than the ordinary accounts, and give us a very intsresting insight into "the origin and mystery" of a rsligious guild four hundred years ago. Ths we find the receipts with arrearagss cams to 365l. odd, and the payments to 269l. Of the halance "the said Maisters nowe accomptants havo lsnt to the chnrchwardsns of Seynt Margarets upon certsn plegges of sylver," 60l.

Ths greater sum of ths receipts came from rents from houses left to the guild hy henevolsnt membsrs, which, for the three years, amountsd to 134l. 9s. 4d. Here are the rentals:—Three houses in Tothill-street, for ths three years, lst for 19l., of which ons was let to Sir William Stoner at 66s. 8d. a ysar, "with reparations"; nine tsnements in our Lady-alley (thrse years), 14l. 10s.; a tenement called the Swan in St. Mary's parish, in the Strand, with five others adjoining (three years), 13l.; ths tenement and garden late in the tenure of Sir Thomas Norfolk, at Long Ditch (thrse years), 48s.; two tensments at Kensington, 40s.; whils 40 acres of land, also at Ksnsington, wsre let as a field at 13s. 8d. a year! The house called the Sun in King-strest, 4l. per annum; ths Bell Tavsrn (which was a flonrishing house 250 ysars aftsrwards), 40s. a year; while quit-rents were rscsived of "ths monastery of Westminster" of 13s. 4d. yearly for the tsnemsnt called the Saracen's Head hy the Palace gate in King-strest, and of a John Randolf, mercer, of London, 6s. a ysar "for a licsnse of frss sntre of comyng yn and going ont for his tensnts thurgh ths gats and alsy called our lady aley in ths Kynge strete."

Bequests to the guild inclnded 30s. in monsy, three torches, two candlsticks, "a ryng of golde w' a saphnre"; a tenemsnt "next the Wulstapel gate," let at 20s. a year, and all the velvet for the nsw garland, except a quarter of a yard!

Under the heading of "foren receyts" there is an extraordinary item of 6s.: "ths said late Maisters charge theym self wyth the farme of a cowe longyng to the said fraternyte, letyn to ferms to Ch. Jakson at 2s. hy yere"!

Next ws havs ths entry of admittsnes of 114 persons into the fratsrnity, at the cost of 6s. 8d. sach. Among these, Sir Richard Surlonde, snh-dean of the King's Chapel; Mr. Thomas Crapp's mother; Sir Johu Tyler Priest; the porter of the King's House; Andrew, the heer-brewer; the master kesper of my lord of York's place; and last, hut not least, "*Wynkyn Worde*," who, without donht, was the fellow-worksr with Caxton in his printing-offics, and his worthy snccessor in the art and mystery of printing. There wers also eleven persons rsceivsd into the fratornity after their dsath,—that is to say, their nsmes were entered upon ths roll if they were kindly dispossd in the shape of a lsgacy, as was the case with the Qussn's chaplain, who left 20s. to the guild.

Ths payments naturally form a vsry interesting series of items. Quit-rents were paid to the amount of 115s. 6d. for the three ysars. Six priests rsceived 33s. 4d. a quarter each, except one who, having "departed without licence," had two weeks' wages stoppsd. Four slmspeople received 6s. 8d. a quarter each; the headsl, 13s. 4d. a year; while "expenses of quarterdaies" come at from 12d. to 20d., heing payments "for hrede, ale, and chese." The "Ohytes," or religious services for the souls, &c., of the departed henefactors, amounted to 6l. 10s. 5d. for the three years. The "necessary expenses" included, for washing clothes, repairs, torch-hearers, scoaring of hasins, &c., 14s. 2d. Wax cost nearly 5l. Rspairs to ths honses amonnted to 7l. 3s. 2d. Allowances for the thirty-ons separats pennies offersd at the ohits, 2s. 7d.

The most interesting portion of ths account is naturally the "costs of the generall feste," and it will very forcihly explain that the art and mystery of eating and drinking was a failing indulged in hy even a religious guild in ths good old times. This grand banqnet was "kept and holden at the Archhishop of York's place in the third yere of this accompt," and cost no less than 37l. 7s. 3d., of which the hrethrsn and sisters present paid 11l. 17s. 9d. We hope our rsadsrs, in casting an inquiring look at the little hill, will remember that "all things are changed" since those times, and calculations of the relative difference in prices must he made according to circumstances.

A pipe of red wine and a hogshsad of claret, 105s. For making of ths garlands, 5s. For six dozens of white cnps, 2s. 8d. "For portage and hote-hirs of the turhut, 4d." "To ths pleyers for a pley, 7s." Red wine hought for jelly, 7¼ gallons, at 8d. Carriage of the wine "from London to Wsstminster," 2s. 8d. For twenty-two dozen bread, two dozen manchets, and four dozsn trenchors, 26s. "To John Bright for a kildorkyn of ale, 2s. Four barrols of als at Chelsea, 10s.; and a barrel hought at Holhorn, 4s. Thirty-two pike fish cost 14d. each; nine turhots cost 15s. 2d. the lot. Poultry, too, was cheap, for five dozen and eight capons cost 6s. a dozen; seven dozen chickens 15d. the dozsn; three dozsn geese at 6s. 8d. the dozen (!); six hsrons 16d. sach; eleven dozen conies 2s. ths dozsn; eight swans at 3s. 4d. each (!); and 300 eggs 2s.—that is to say 8d. a hundred! We next come to the hutcher's hill. Shoulders of veal cost 3d. each; ten lsgs of mutton 20d.—that is 2d. a lsg; two shssp 3s. 4d., (!) or, to nse the words of the acconnt, "an hole shepe 20d."; nine pair of calves' feet, 9d.; two pieces of heef, 12d. Fifty-two gallons of milk "for farments," 3s. 4d. Bucks cost 6s. 8d.; hut ssveral rswards of from 12d. to 5s. were givsn to ths ssrvants of donors of some of thsss dainties. The miscellaneous items included a pint of mustard, ½d.; three gallons of honey, 3s. 8d.; 10 lh. of candle, 10d.; hrsakage and loss of thirty-five pots and pans, 1s. 6½d.; half a hushel of grapes, 6d.; herhs, 8d.; half a ponnd of cynamon, 12d.; 2 lh. of psppsr, 2s. 11d.; ¾ gallon of vinegar, 6d.; 18 lb. of raisins at 2½d.; 6 lb. of almonds at 3d.; and 1 lh. of cloves, 3s. Carriage of the tahles cost 6d.; lahourers "watching" two nights, 2s. 7d.; the cook for dressing the dinner received 26s. 8d. The hutler and his men, 13s. 4d.; the plate-kesper, 6s. 8d.; hire of the vessels cost 11s. 6d.; and last, hut not least, there was paid as a gift "to the keeper of my lord of Yorks place" 6s. 8d., to the under kesper 20d, and to the headls 12d., no doubt in acknowledgmsnt for the kind psrmission to hold the hanqnst there.

Such are a few of the itsms from this fsast acconnt, and they will convey, we think, a very good idsa of the cost of provisions at that psriod. Retarning to the chnrchwardens' hooks proper, we find the next two accounts are of more than usual intersst, for they are the last of thoss in the years in which Caxton lived and worked amongst us, in the famous city of Westminster.

1488-1490.

"Here folowyth thaccompte of John Gerard and of Hsugh Okham Wardeins," &c. from May 28, 1488, to May 27, 1490, writtsn on twenty pages of parohmsnt, 8 in. hy 12 in. in sizs. The two years' rsceipts amounted to 48l. odd, hut the payments only came to 15l. 11s. 6d., leaving a halance of soms 32l., 20l. of which, we ars told hy the audit, was deliversd over "to the Maisters of ths chirch werks."

This account gives, as usual, an intimation that a portion of the church goods was lent out to another parish, for we find 20d. was received "for lsndyng of the hest cowpes to Saynt Clemsnts w'out temple harr at Wytsontyd," and 8d. "of my lord grey for lendynge of a Masboke vsstment and chales." In the second year a "Thomas Chyppyngdale" was huried at the cost of 2d.; while the funeral of the parson of Arundsl (Sussex?) cost 6s. 8d. for torches, and 6s. 8d. for his pit in the chnrch.

The hequests the second year comprised two only,—Lord Gray, for the loan to him, upon three occasions, of a vestment, chalice, and mass-hook, gave 2s. 8d.; and 100s. was received from Lady Ancras.

The payments included a rope for the middle hell, 7d.; "to John Benet and John Tadgoce, for theyr gret age at Mydsomer," 3s. 4d.; making the hase of the cross of stone in the churchyard, 4s.; "for leynthyng of evry raftre of ths olde tile, 5s.; for tils-pins, 2½d.; a lahourer 4 days, 16d.; and last, hut not least, "payde for hrede, ale, & wyne, and kychen for a sowpar to the awdytors and to the new wardeyns," 20s.

1490-1492.

The accounts of these years,—Richard Frost and Robard Lowthyam heing wardens,—have a melancholy interest, for thsy contain the relation of the hurial of William Caxton. Thsre are twsnty-seven written parchment pagss, and thsy smbrace the psriods May 27, 1490, to June 3, 1492, in which psriods the rsceipts ware 60l. 1s. 9½d., and the payments 56l. 1s. 9d., leaving a halance of only 4l. 0s. 0½d. on the right side.

As this account is of more than ordinary intsrest, Mr. Nohle has gone somswhat minutely into details, and the result of his scrutiny we cannot do hetter than give. Of the general receipts, the first year there are 344 entries, and the majority of thsse are hurials. As we have already instanced, the smallest payment is 2d., and the numhers huried at this rate were 135. The highest payment was for the pit and torches of a "Mayster Bostok," 14s. 8d. There were two hurials at 5s.; thres at 20d.; 26 at 8d.; 89 at 4d.; and 19 at 12d. Two cost 4s., one 7s. 4d., and five 6s. 4d.; so it will hs sesn that the parish at that date contained many persone ahove the average class. It is in this first year we find "Mawdo Carston" huried, costing for torches and tapers, 3s. 2d.; hnt what relation she was to the printer Mr. Blades has not hsen able to discover. The second year's items for hurials, &c., amount to 25l, and of these exactly 100 are for 2d.; 23 for 6d. (tolling the hell); 59 for 4d.; 9 for 8d.; and 16 for 1s. The highest payment this year was for "Annes Clark," whose funeral, for pit, torches, and tapsrs, cost 13s. 4d. But the most interesting entry is that which stands ths 190th ont of the 25l, and which reads in these words:—"*Itm atte bureyng of William Caxton, for* iiij *torches,* vj^s viij^d. *Itm for the bell atte same bureyng,* vj^s." The relative position of the entry would lead us to suppose (says Mr. Blades) that our first English printer was hnried towards the close of the ysar 1491, and we do not think he is far ont, if we taks into consideration all the other facts attsnding the close of his carser. It must he borne in mind the sarliest parish regieter in this country is of dats 1538 (which is the date that at St. Margaret's commences), so in having thsse churchwardens' hooks prssrved to us we havo priceless treasures extending hack half a cantury hefore official registration, and in this instance far ahove valuation, for they contain the entry of the hurial of William Caxton.

Among the other items of receipts of the first year stand the hequests, 20d. from "Syr John Batyll Prest"; 10d., which was "gadsred atte wsddyng of Howell's mayde"; and 2s. 8d., which two psrsons philanthropically gave "for dyvers peces of olde tymher." In the second year, "Bartylmew the lay monke" gave 8d. "for two old hordes"; "Syr Richard Sugar Prsst" left the church 10s.; while there was "receyved of the churchwardens of Seynt Pulchres for the dragon," 2s. 4d. This latter entry, which at first reads nnintelligihle, is further explained hy a payment in the same year, "for dressyng of the dragon, and for packthrsad," 4d.,—this dragon hsing, without donht, a painted reprssentation of that winged serpent who, it may he remembered, according to tradition, took upon himself to swallow St. Margaret, hut who in turn was too strong for the stomach of even so great and powerful an enemy, for she managed to effect her escape, and hy so miraculous a delivery became the patron saint of all unhorn infants! Consequently, as we havs already stated, St. Margaret's Day (July 20th) was ancisntly a grand festival in Westminster, hencs in this second year,—the same year that Caxton disd in,—we find payments of 4d. "for fagotts for the hondfire on Saynt Margarett's Even," and 12d. "for payntyng of the wall hyhinde Saynt Kateryn, and for ffreshyng of Saynt Margarett," hesides those other refreshing entries, when hread, ale, and wine, no doubt, kept alive the festivities of the hour.

There is an entry among the receipts of a diaper towel 4¼ yards long, by half a yard wide, which Margaret Eden was good enongh to present to the church, with the substantial addition of 2s. 8d. in money. Such a notable bequest had to be recognised by the parish, and so we find among the payments, "Payde for brede and ale spent upon Margaret Eden and her felesbipp atte Rceyuyng of a towell afore wrytton, 2d."! The parish had only just spent three-halfpence "for brede and ale atte makyng of the inventory of the chirche goodes."

Some extensive repairs were carried out about the church at this time; for William Egerden, the plumber, actually received 25*l.* 11s. 6d. "for ledyng of the south ile"; 40s. was paid for boards bought at Kingston; 60s. 8d. was paid for the outer work of the two windows of the vestry, the glazing of which cost 9s. 7d. more; a new door for it cost 11s., and a pair of hinges 23d. Also, "for thirteen borthens of Roshes for the new Ile," 18d., and "for careying of fourteen lodes of erthe from the Wolstaple to the Chyrche," 12d.

"For mendyng and dressyng of a grete boke," 4s. was paid; 8 lb. of tallow candles cost 8d.; twenty-four hurthens of rushes at Easter cost 3s.; William Royall was paid 8d. "for two days in mendyng of pewes"; also 10d. "to Hewgh, Keper of the Paloyes [Palace] for a new ladder"; mending eighteen vestments cost 2s. 2d., while there was spent upon Master Harry Ahyngton, who was a worthy benefactor to the parish, 6d. "for a brekfast" upon one occasion, as also 4½d. for wine for him "at dyvers times." Added to which there was always a payment at the end of the account of 20s. "for brede, ale, wyne, and kychen, for a soper to the awditors and to the new wardens," at which, without doubt, our Westminster friends talked over parochial affairs with the same spirit as they do to-day.

By the foregoing entries we have illustrated the times of William Caxton throughout the fourteen years in which he worked his printing-press at Westminster. Our extracts from the books have not been exhaustive, but Mr. Noble has made them as illustrative of the period as possible. At the same time, we must not forget that the years we have quoted are not the only early accounts possessed by the parish of St. Margaret. The earliest is dated 1460-1462, and comprises nine parchment leaves 10 in. by 6½ in. in size. The earliest "Guild" account is 1475-1478, in twenty leaves 11 in. by 8 in., and in it is the receipt of 20s. for three years' rent of the tenement inhabited by the Vicar of Kensington, and 7s. 6d. for three years' rent for 2½ acres of land in St. James's-fields, which is now covered by those princely blocks of buildings lying between Pall-mall and Piccadilly!

Although we do not intend to go deeply into the other accounts, there are one or two items interesting enough to quote. Thus in 1494:—"Reseved of the wyffe of the Katrine Whele [Catherine Wheel] and of the wyffe of the Dragon for a Pew," 3s.; and these appeared to be the ladies of the taverns of those names. "For mendyng of y^e^ gret Pulpitt," 3d. "For naylis and makyng of a bedde in the vestrie for the clerkys," 6d. This was probably a bedstead, and is explained by an entry among the church goods in 1498:—"Item, a fether bede w^t^ a bolster of the gefte of the Syster of the hysshop of Seynt Asse [Asaph] to thentent that he shall remayne into the vestrie as long as they last for the clerkis of the cherche to lay upon"!

In 1496:—"For 20 tonne and 5 fote of Cane Stone, price the tonne, 6s."; and "to 6 laborers havyng up of the same stone at the myll and to 4 labarers for ye helpyng home therof fro the myll to the cherchyard, 3s. 4d."

In 1498:—"For a chayne of yron to bynd the boke at Mast Habyndon's pewe," 8d. "Of a man of London for a stone that was founde w^tin^ the grounde that a man was buried in," 6s. 1d. "Paid at a taverne for a Potell of Wyn for Sir William Tyler when we spake to him for to have license to have our Reigate stoon," 4d. In 1500:—"Rec^d^ a ryng of sylver and gylte of an olde woman." "Payd for fetchyng of 2 tonne of stone over the water from Fakkes halle into the Kynges brydge," 6d. The stone itself cost 4s. a ton. In 1502:—"For 2 foder lede bought at Bertylmewe feyre," 8*l.* "For makyng of 8 dragons," 6s.8d. "For changing of £5 of nonghty pence," 3s. 4d.,—and this, we presume, was money received at the collections, &c., which was either bad or under weight. In 1504:—"To fader Yanne for the kepyng of the whype for betyng the dogges oute of the chyrche," 16d. The same year, on St. Margaret's-day:—"To the waitts of London for to go afore the pcession," 4s. In 1510:—Received "atte hurying of the costerdmonger for 4 tapers," 4d. This is an early mention of the word "costermonger," which is brought very close to our present definition in the accounts for the feast in 1519:—"To the costerdmonger for Peirs, 12d."! And as we travel over the interesting entries year by year, we find the cherished names of our early printers,—of Wynkyn de Worde, of Pynson, Copland, Berthelet, Julian Notary, and others, who all helped to produce, after Caxton's death, those wonderfully-printed sheets and books which, at this day, are looked at by all of us with such loving eyes.

We have mentioned the guild already, and endeavoured to show its design. Of its powers as a society we see an evidence in its accounts for 1519-1522, and an extract we cannot do better than submit to the attention of the rulers of benefit clubs of to-day: "Receyved of Robert Craunte for misbehavyng hym in words spekyng at a quer-day kept in the checker chamber on Seint Thomas Day in Cristmas in the presence of all the masters and brethren then beying, Master Walter Gardener, John Wryght, and John Ford, wardeyns, the whiche wordys wer spokyn to William Millys and Edward Stokwod, then churche-wardeyns of Seint Margret, and ther he was juggyd by all the hous to pay a pound of wax, and so he payd ther 10d." And the same time Thomas Wylde was fined to the same amount for having entered into a law-suit with another brother, Philip Lentall, without having first submitted his case to the fraternity! It is such entries as these that help to enlighten us about the customs of our forefathers. Such decisions among themselves in these old guilds frequently saved the members from the gentlemen of the long robe, an endless law-suit, and loss of money and ruin of home.

The Church of St. Margaret, Westminster, situated as it is beneath the shade of the Abbey and the Parliament Houses, boasting, as it does, of a history which goes far back into the age of tradition, is a building well worth a pilgrimage to see. Recently restored at an expense of 12,000*l.*, which amount, thanks to the energy of its rector, the Rev. Canon Farrar, has just been paid off, it is now one of the finest, as it is one of the lightest, of our London church interiors, and what is of even more consequence, it is one of the few London churches which often has a congregation larger than it will comfortably hold. But somehow or other it has always been a popular edifice, while the parish has been the home of some of the most celebrated of England's worthies from the days of Caxton to our own. Its registers, as we have stated, commence in 1538, twenty years earlier than the majority of parish registers, and yet in those twenty years something like 12,000 names are written in its books, while in the first 100 years we are rather under the estimate than over when we state the number of entries in its books to be 60,000, of which 34,000 are burials. This will give good evidence of the size of the parish even in those early times.

The three names recorded in the parish books which stand most prominently forward in history are Caxton, Raleigh, and Milton. Other famous names occur in the registers, but these are the illustrious ones. At the top of the page of the Burial Register for October, 1618, is written, "Sir Walter Rawleigh, knight," and this is all the evidence we have of his burial in this church after he was beheaded in Old Palace-yard. Curiously enough, the register, during this month, is without the actual dates; but as the entry is only the fourth from the end of that month, the day of his burial must have been, as historians state,—the 29th. Among the Birch MSS. in the British Museum is a copy of the letter which Queen Anne is supposed to have written to the king's favourite, the Duke of Buckingham, in these words:—"Anna R. My kind dogge,—If I have any power or credit with you, I pray you to let me have a trial of it at this time in dealing sincerely and earnestly with the King that S^r^ Walter Raleigh's life may not be called in question. If you do it so that success answer my expectations, assure yonrself that I will take it extraordinery kindly att your hand, and rest one that wisheth you well and desire you to continue still as you have been, a true servant to your master." But although every effort was made to save Raleigh, it was useless. At the time of the recent restoration an effort was made to trace his remains, but that, too, failed; and although there is a tablet to his memory in the church, it has been suggested there should be, and Canon Farrar still hopes to succeed in getting for the great west window, a suitable stained glass memorial. As the text on the tablet tells us,—"Reader, should you reflect on his errors, remember his many virtues, and that he was a mortal,"—a mortal, too, hear in mind, to whom the world at large owes something.

John Milton, "the prince of poets," and Oliver Cromwell's secretary, who was then a resident in Petty France, in St. Margaret's parish, was married to his second wife, Katherine, the daughter of Capt. Woodcock, of Hackney, by Alderman Dethick, probably in the Guildhall, London, the 12th of November, 1656. We are indebted to the researches of Col. Chester for this valuable information (see Prof. Masson's "Life of Milton") and to the registers of St. Margaret's for the fact that there the banns were published October 22nd and 27th, and November 3rd. On October 19th, 1657, the Baptism Register records the name of "Katherine Milton," the issue of that marriage. But poor Milton's second venture was of short duration. His wife was buried here on February 10th, 1657-8, and the infant child on March 20th following, thus bringing, as Professor Masson remarks, darkness once again over the life and labours of this celebrated man. Of what those labours were, at Westminster at least, Professor Masson himself is the best story-teller.

To give even an outline of all the noticeable entries to be found in the registers would take up too much room, and tire the patience of our readers; but there are a few curious ones which may interest us all, and give us an insight to the style our forefathers had in registration. Turning, therefore, to the list of burials, we find these items:—1554, May 9, "Jone Wylson the heretyck was huryed without ye churchyearde." July 7, "A poore man dyed at ye Mynster doore." August 10, "Jone a pore Woman died at Westminster Hall doore." 1567, Oct. 10, "Jane a pore Woman w^ch^ died in ye theving house." 1578, June 26, "My ladie Chickin a poore woman so called." The first entry in the second volume of the register somewhat puzzled us. The burial of "Roberte Nohle" is recorded on the 24th and 25th of May, 1572, and to prevent any mistake, the clerk has bracketed the dates. Why should Robert Nohle's burial take two days? After puzzling ourselves for some time we arrived at the conclusion that as it is the first entry in the book, and as many of the subsequent entries of a later date had evidently been written in at the same time, the new book had not arrived when these burials took place, and the clerk who had kept notes in his pocket found the date of the earliest one to be somewhat indistinct, and the happy thought struck him to put down the two days, one of which he knew was correct, but it did not much matter which. The careless system of posting parish registers three hundred years ago easily accounts for the remarkable entry,—1618, January, "John Agodsname." But when we came to the year 1649 we began to think it was time to stop, for on October 11th stands the entry of the burial of "Cardinall Wolsey"! Subsequent inquiry showed him to have been a child baptised the 15th of June previously as the son of Robert, by Abigail his wife! After all, what's in a name?

Among the baptisms we find on October 25, 1598, "Nelleodillior Billy, daughter to Hugh," and on December 3, "John, base son to a pudding man." Even a couple of hundred years later the clerk had a curious way of entering, for on October 3, 1782, is this entry, "A boy with 2 Xtian names, sneaked off." It seems the child was baptised, but the parents went off without paying the fees, and so the clerk had his revenge. On August 11, 1657, were baptised "Abraham, Isaac, Jacob, and Sarah Joanes SS. and D. to Edward by Alice borne att one birth in the long Woolstaple. The mother dyed in child-bed." Upon referring to the burials, the mother's name is entered that day, and on the 16th of September the child Sarah, but no record of the burial of the three boys. If we only knew they survived to man's estate the fact would be doubly interesting.

One marriage, so far as curious names are concerned, is worth a note, and it occurs June 7, 1626, "Richard Lambe to Barbara Puddinge." The connexion is certainly suggestive. And yet these names are eclipsed by more modern ones to be found in the registers of the Church of St. Dunstan-in-the-West, such as

"Lock Key," in 1685; "Marey Whit-Sunday," in 1697; "Thomas Shipyard," in 1698; "Elizabeth Chancery Lane," in 1705; "Remarkable Bunworth," in 1712, and "Politicall Smith," the same year. In 1673, however, there is a still more curious entry of burial, "September 28, What-you-please Hill buried under the Quest House out of Chancery Lane." After this, what more need he said? We do not give our children such odd names nowadays, but for the privilege of telling our readers some of the peculiarities attending the registrations of centuries ago we owe our gratitude to William Caxton, in whose honour, and to perpetuate whose fame, this memorial is offered to our readers.

SANITARY CONDITION OF DUBLIN.

The Report and Minutes of Evidence which have been published by the Royal Commissioners appointed to inquire into the state of Dublin, "with a view to sanitary improvement," form an important and valuable volume, the value of which is not confined to those interested in Dublin.* The Commissioners are Mr. Robert Rawlinson, C.B., and Dr. MacCabe, the late Mr. William Jerrold Dixon first acting as secretary, and after his lamented death Mr. R. O'Brien Furlong. A competent person would find in its pages materials and data for an interesting and useful volume on the general subject of sanitary improvement. Before commencing to take evidence relative to the matters referred to them, they deemed it their duty to make personal inspections of the river Liffey and of the city generally, and found that the existing system of sewerage, although a cause of nuisance by polluting the river, could not be made wholly answerable for the high rate of mortality which prevailed in the city of Dublin. They therefore extended their inspections to the back streets, the courts and yards, the slaughter-houses, the cow-sheds, the scavenging depôts within the inhabited area, and to the state of the tenement-houses. The sanitary condition of Dublin revealed by these inspections was found to be so defective that they deemed it their duty to ascertain to what extent the abnormally high death-rate might be attributed to defective sewerage and drainage and the condition of the river Liffey, and to what extent it might be considered traceable to other causes.

In a recent report the City Engineer states, "Few cities have a more efficient system of main sewers than Dublin. Improvements were commenced under the authority of the Municipal Council in 1851, since which date an enormous amount of work has been done without incurring any debt, and conferring great benefit on the citizens, with the least possible inconvenience. The works remaining to be done are small, and when completed Dublin will be thoroughly well sewered." He further states that on examination of the main sewers in certain districts they were found to be free from deposit and "perfectly sweet," but that the basements of houses in the principal streets were found, on examination, to be in a deplorable condition, quite sufficient to account for the prevalence of fever in them. And, he adds, "Personal observation, during twenty-seven years' experience, confirms my opinion, often expressed, that it is to defective house drainage, the miserable state of repair in which the tenement houses throughout the city are kept; and to poverty (too often arising from drink), that the high death-rate in Dublin is to be attributed, and not to any defects in the main sewers."

The evidence tendered at the inquiry, and embodied in the Report, confirms these remarks of the City Engineer, namely, that it will be a mistake to charge the exceptionally high death-rate which has for so long a period afflicted Dublin, exclusively on defective main sewering. The Commissioners, while willing to give the fullest credit to the Municipal Corporation and to their engineer for the improvements carried out in the Dublin sewers since the year 1851, know by experience that, considering the circumstances under which they have worked, the main sewers of Dublin cannot be in that perfect condition claimed for them, as they are necessarily a patch-work system,—irregular in line, in gradient, and in cross-sectional dimensions,—they are not complete in side entrance and manhole arrangements, nor in ventilation and gully apparatus, as the evidence shows that these works are reported to be in progress at this time. Having examined the sections of the improvements carried out in the old sewers, they admit that credit is due both to the Corporation and to their engineer for what has been done, but in the nature of things the main sewers of Dublin cannot be accepted as a perfect system, such as would be designed and carried out now if the work had to be commenced without the fettering consideration of how best to arrange, improve, and bring into fairly working order a rude, irregular, and roughly-constructed number of street and road drains. The sewers of Dublin at present form a network of continuous flue communication, so that any gases generated in the lower portions and along the margins of the river can flow along the sewers and drains uninterruptedly to the higher levels, rendering the higher portions and the suburbs, which ought to be the healthiest districts, exceptionally unhealthy. The remedy for some of these defects may be provided in the main intercepting scheme of sewerage when this system is carried out.

The main sewers having been constructed from time to time, and not on the best plan that modern engineering would now devise, the City Engineer calculates that a further sum of 30,000*l.* may be required to complete the main sewers.

The evidence laid before them leads to the conclusion that house-drainage in Dublin is extremely defective in all classes of houses. The house-drains, from the description given, would appear in the vast majority of cases to consist of loosely-constructed rubble-walled channels, resting on the soil beneath the basement, and from their imperfect construction presenting numerous points of leakage through which sewer gas and fluid sewage escape and saturate the subsoil. Under conditions such as are described, it is not surprising that the health of Dublin should have suffered, and that the mortality from diseases classed as constitutional should have remained high.

Five plans and estimates for the main drainage of Dublin were brought before them, and these are fully described and illustrated in the Report.

As to the river, the following conclusions are taken as established, namely:—

a. That the River Liffey is now in a state of pollution from the influx of sewage, so as to be offensive, especially during periods of local drought and warm weather.

b. That with the extension of the city and the completion of main-sewering and house draining, the pollution will be greatly increased.

c. That a fuller and more complete washing of footwalk surfaces and flushing drains and sewers will also add to the impurity.

But though the evidence on the question of the pollution of the river is full and clear, with few exceptions, the opinion is also prevalent that the foul river is not a material cause of local disease. And though it is generally accepted that the polluted Liffey is not the prime cause of the excessively high death-rate of Dublin, it is locally considered to be a known, palpable, offensive, and admitted nuisance, which ought, if practicable at any reasonable cost, to be abated.

At present the tides, as they rise in the river, block the main-sewer and drain-outlets, shutting back the sewage, which then accumulates in the sewers. The remedy for this defect will be by manholes and ventilating-chambers constructed on the intercepting sewers behind the quay-walls, to stop the blocking action of the tide, and providing means of escape for sewage gases so as to secure extreme dilution.

The Report then touches on some general matters relating to the health of the city of Dublin. The city of Dublin in 1879 contained 23,830 houses; of these 9,760 were occupied as dwellings let in tenements, and it appears from the evidence of the executive sanitary officer, that of houses of this description occupied by more than one family, 2,300, containing an estimated population of 30,000 persons, are in a condition which renders them unfit for human habitation, and some are not worth the expenditure which would be necessary in order to place them in a proper state, and to provide the requisite sanitary appliances. Of the houses let in tenements, it may be stated, in general terms, that they were originally intended for the accommodation of one family, and that they had only one privy and ashpit, the sanitary appliances at the period they were built being considered sufficient for the use of a single household. Under existing conditions it, however, frequently happens that each room is occupied by a family, and as far as can be ascertained it would appear that about 117,000 of the population of Dublin are thus lodged. The average number of persons in each tenement house is stated to be from ten to twelve, but this number is frequently exceeded, so that excessive overcrowding is the rule. The occupants have to resort to one ashpit, placed in a yard, and if there is a privy it is utterly unfit for use. When it is borne in mind that the corporation, acting as the sanitary authority, have not so far been able to organise any regular system of domestic scavenging, it is not surprising that the condition of the privies, yards, and ashpits attached to the tenement houses should be described by all witnesses as "extremely filthy and detrimental to the public health." These statements are borne out by the inspections the Commissioners made in different parts of the city. In all cases they found the privy accommodation inadequate, the ashpits unduly full, the yards badly paved, filthy, and generally having no connexion with the sewers, except by surface drains, which frequently had no proper fall.

Amongst the several sanitary defects of the city of Dublin, the condition of the tenement-houses is perhaps the most pressing, and is certainly, as the Report points out, the most difficult to be dealt with. The houses at present let in tenements have been erected at various periods, some previously to the beginning of the present century. In one of these Dublin tenement-houses, there were counted 78 inhabitants, the rents paid by each occupier or family ranging from 10*d.* to 5*s.* per tenement or set of rooms. There are said to be about 1,100 tenement houses owned by five persons, who are not absentees, but who reside in the district for the purpose of receiving the rents. If these 1,100 tenement-houses only yield 5*l.* per annum each, there will be 5,500*l.* per annum for these five owners, or at a rate of about 1,100*l.* each. The great blot in Dublin all admit is caused by these tenement-houses, and the peculiarity is that they are not confined to narrow streets and poor localities, but are to be found in all parts of the city. The history of a modern tenement-house fully told might be as interesting as a passage in a novel, and its gradual degradation shown to be as terrible as a tragedy. These 9,700 tenement-houses when first erected were, as previously stated, arranged each for one family; now they are divided and subdivided, and let in flats and single rooms from basement to attic, and, as stated in evidence, one house being made to serve for seventy-eight tenants. This degradation of houses is, it is clearly shown, at the root of most of the excess of disease to be found in Dublin. It is not in defective sewering, defective paving, defective street-scavengering, or in the polluted state of the river Liffey, so much as in these horrible room-tenements, which exist to the direct injury of more than 100,000 of the poor inhabitants, and at the indirect charge and direct money loss of the entire community. The poor people who overcrowd these tenements, and pay the pittance of 6*d.* or 1*s.* 6*d.* per week for their room, buy misery very dearly, in loss of wages through sickness and suffering. The evidence in this Report tendered by leading physicians, medical officers, and others, all points to similar causes, —overcrowding, filth, foul air, drink, sickness, beggary, and pauperism. Public sanitary works and main sewers will be of little avail if these tenement-houses are left in their present neglected condition, without a proper supply of water, and utterly without any privy accommodation. It may be said that there is a public supply of soft, good, and wholesome water, sent into the city even in extravagant abundance. This, no doubt, is true; and yet the evidence given by the local medical officers shows that practically the poor have no good water, as it is stored within the room improperly, the vessels used in some cases being of the most objectionable character.

The room-tenements of Dublin being the great sanitary sore of the city, until these places of residence are improved in some practicable and effective manner, there will be no hope or prospect of bringing the death-rate of Dublin to a moderate standard. The evidence against these tenements may be described as overwhelming. But the Commissioners see no reason to doubt that a considerable proportion of the tenement-houses may be converted into healthy dwellings.

In finally deciding upon the system of filth

* Report of the Royal Commissioners appointed to inquire into the Sewerage and Drainage of the City of Dublin, and other matters connected therewith, together with Minutes of Evidence, Appendix, Index, &c.: presented to both Houses of Parliament by command of Her Majesty. Dublin: Alex. Thom & Co. 87, 88, & 89, Abbey-street. 1880.

removal which the Corporation may deem it best to adopt in respect of the tenement-houses of Dublin, the Report impresses upon them the importance, from an economical point of view, of availing themselves as far as possible of the water-carriage system, for which the existing sewers should be adapted.

Treating of road formation, the Report has the following passage:—

"Wood is now being extensively introduced and used for street surfaces in London, where the traffic and wear are very trying. Most of the varieties of pine-wood have been tried or are in course of trial, as red pine, pitch pine, yellow pine, and pine from the Baltic. The samples of pine woods enumerated vary considerably in hardness, as, for instance, pitch pine and red pine are harder and heavier than yellow pine or than Baltic pine, but they do not appear to stand wear so well as the softer and cheaper wood. This, however, is to be accounted for by the yellow pine being more yielding to the horses' feet and carriage-wheels,—that is, these do not jar and jump as they do on the harder surfaces. The softer wood, being more elastic, endures slight compression without disintegration or causing so much of a jar to the carriage-wheels as is experienced on harder wood pavements. Some of the wood-blocks have been laid on a base of sand and two sheets of 1-in. thick pine boards, the wood-blocks being placed about 1 in. apart, the open joints being filled in with gravel and pitch. This form of paving has not answered, as the base is not sufficiently solid and firm to prevent a vibratory motion when driven over, which is plainly to be felt and disagreeable to be experienced. The material filled in to the wide joints does not wear evenly, but permits the edges of the blocks to splinter and fray, and this goes on until the surface of the street becomes ridgy and uneven, wearing rapidly out of condition. The best foundation for any form of material constituting street pavement, such as asphalte, granite sets, or wood, is unquestionably concrete, and the better and stronger the concrete is when laid, the longer will any covering placed upon it wear. From this time forth, all road-makers who wish to produce the best wearing and enduring street pavements, must first form a good foundation. This, in fact, must be the true road, the covering being only a veneering, to be repaired and renewed from time to time, as may be necessary. It is the absence of a sound concrete foundation to the streets of Dublin which tends to the production of so much mud on their surfaces."

Effective street-cleansing is one of the most important municipal duties, and to be effective the cleansing must be at short intervals, with the immediate removal of the refuse cleansed.

In consequence of the evidence given by the medical officers of health, the Commissioners rightly draw the attention of the sanitary authority to the circumstance that at present, with the exception of those attached to the Mendicity Institution, there are no baths and wash-houses for the poor of Dublin, though there are Turkish baths for those who will pay for the use of them. Baths and wash-houses for the working-classes have become common in English towns, and where they have been judiciously placed, constructed with economy, and are well arranged and properly managed, they are found to be not only a luxury but a necessity.

The Commissioners entertain little doubt as to the conditions which exercise the most injurious influence upon the health of Dublin. They consider these conditions to be:—First, the state of the tenement-houses, their overcrowding, their defective drainage, and the absence of any organised system for the removal of filth from their surroundings. Next, the defective house-drainage, including in that term the connexions between the house-drains and the public sewers, and are satisfied that defective house-drainage exercises an influence prejudicial to the health of the occupiers of the best as well as of the worst class of houses. Owing to generally defective house-drainage, the inhabited area of Dublin possesses a saturated subsoil, and there is reason to believe that within, as well as outside, the house foundations, the subsoil water is contaminated with sewage matter.

The following are the most important conclusions arrived at:—

"That the main sewers of Dublin have been improved, but have not been completed; that new sewers are required; and that the entire system of sewers and drains should be more fully ventilated and have additional side-entrances, manholes, gullies, and flushing arrangements formed and completed.

That house-drains are proved to be very defective; and that yards, courts, and back streets are, for the most part, defectively drained and very dirty in consequence. That privy accommodation is generally defective throughout the poorer quarters of the city, and that it is, for the tenement-houses, practically absent; and that, as a consequence, the inhabitants suffer both in health and in morals.

That the tenement-houses of Dublin, according to the medical evidence so voluminously tendered at our inquiry and embodied in this our report, appear to be the prime source and cause of the excessively high death-rate; that they are not properly classified, registered, and regulated; that they are dilapidated, dirty, ill-ventilated, and much overcrowded; and that disease, a craving for stimulants and its consequences,—drunkenness and extreme poverty,—are thereby fostered, and that until the condition of these houses shall have been improved the general health of the city will continue to be injuriously affected.

That the Corporation have taken action under the Artisans and Labourers' Dwellings Improvement Act with the view of effecting tenement-house improvements, and that it is desirable they should further extend their operations in that direction.

That most of the courts and yards in connexion with tenement-houses are unformed and unpaved, and that, as a consequence, there is an accumulation of offensive dirt, general discomfort, loss of health, and loss of power to earn wages.

That many of the streets are formed with defective material; that public scavenging is inadequately performed; that there is no municipal system of private scavenging; and that, as a consequence, the streets are dirty, and that courts and yards are at all times filthy.

That in our opinion the cleanest and cheapest mode of removing excreta will be by water, through closets, drains, and sewers, to a common outlet. Houses must be drained, streets must be sewered, so as to remove waste water; and if these drains and sewers are well and truly constructed, no additional expenses need be incurred to transmit the entire volume of excreta from the houses and city (if it is suspended in the waste water removed from the city), through the main and intercepting sewers to some outlet."

They end by recommending the plan for main drainage prepared by the City Engineer, who is most intimately acquainted with the city, with its sewers, with its drains, and with its water supply,—a plan estimated to cost 300,000*l.*, and they urge that the sewerage of the city be completed as soon as practicable, so that every street within the municipal area may be provided with a sufficient main sewer.

The Corporation should take action at once,—not to-morrow, but to-day.

THE ARCHITECTURAL ASSOCIATION IN EAST ANGLIA.

The Architectural Association is this year following, to some extent, in the steps trodden by the British Archæological Association last year,—with respect to the Norwich part of that pleasant meeting. The members assembled on Monday, the 16th, at the cathedral, and were carefully guided by Mr. John H. Brown, the cathedral surveyor, round the outside and inside of the church, and the group of buildings near to it. Persistent attention to the buildings during his father's tenure of office, and his own, necessarily implies intimate knowledge of every detail, and all his stores were most kindly displayed when called for by the members. As, however, the main lines of the history are an oft-told tale, and especially as we retold it in the words of Dean Goulburn so recently (see *Builder*, 30th of August, 1879, page 965), repetition would now seem uncalled for. There are, indeed, plenty of topics for controversy, and for reconsideration of authorities and of the evidence of the stones themselves, which will engage attention in the future as in the past, so that diligent antiquaries may reflect with satisfaction on the prospect of no lack of the toils which are their pleasures. The works at the west front are not yet quite completed. The aim has been to put back features of the Norman structure which were taken away not so very long ago, when parts of the front were recased and recast. Towards the eastern end of the church decorative paintings have been laid bare from time to time, and there is now a goodly store of ornament and figure painting of various dates,—much of it, of course, a good deal reduced in force, and nowhere very completely showing the original scheme. There are, however, hits showing rare talent in design and execution. Doing a good deal of the work done upon the cathedral, since remodelling came into fashion half a century or so ago, was hardly a matter of choice or preference,—and in all candour it must be confessed that the whole result is not all that could have been longed for, or in sanguine moods hoped for. Close-jointed ashlar in the south transept, for instance, goes ill with the too-forcibly jointed masonry elsewhere; and false-jointed stones, if they do not parade quite all the wrong-doings of the masons and designers who were not ashamed to prepare them, do not conduce to the peace of mind of the conscientious observer of other people's errors. It should be mentioned, by the way, that this sort of sin has not to be compounded for nowadays, and that most of the more recent work is carefully conservative of ancient forms in the shapes and surface textures of the stone-work. Privileged visitors have every ground for feeling that complaint on their part would be ungracious and foolish, even when they are inclined to heave a sigh of regret because this great church has not come down to our time with the greensward running to the base of its walls,—as a sight all the year round for townspeople and casual visitors. The grounds of private residences sweep round so large a portion of the building that the charm of Salisbury or Wells, which makes everybody anxious to recall frequently the memory of them, seems largely absent. It is not every sight that we share with all the world which loses value in our eyes on that account. Something may some day be done which will give to the many what is now accorded with the best grace to all who can make good use of the privilege. The recent wanton defacement of the lavatories in the south-west corner of the cloisters is, however, a dreadful example of the barbarisms that people of decent appearance and presumably fairly well-to-do can indulge in at times. At best it is an unwholesome habit which prompts anybody to mark a wall, in order that he may convince himself in the course of a generation or so that he visited in the flesh some scene which he might otherwise believe had been only come across in imagination. Much training seems to be required for the "cicuration of first and destructive malignities"; perhaps nothing short of the best exertions of members of Sir Thomas Browne's profession would be necessary in order to bring about the thorough taming of such inveterate forms of rude inanity.

In order to effect a diversion from such severe moralising, let it be noted that the Dean exercised a kindly hospitality; that St. Peter Mancroft, now in full restoration, was visited thereafter; and that St. Stephen's, St. Peter's Permountergate, and St. Giles's, occupied the rest of the first day. When the whole of the programme has been duly worked through, it may be possible, as the examples have been carefully chosen with that view by the skilful Excursion Secretary, Mr. C. R. Pink, to use them as texts for a short discourse anent some of the distinctive characteristics of the architecture hereabouts.

THE BRITISH ARCHÆOLOGICAL ASSOCIATION.

On Monday last the members of the British Archæological Association opened their thirty-seventh annual congress, in Devizes, and were cordially received by the Mayor and Corporation, and the representatives of the Wilts Archæological and Natural History Society, at half-past three, in the Town-hall, where a numerous audience assembled. The ancient charters granted to the town by different sovereigns, together with the maces and loving-cup belonging to the Corporation, and other objects of interest were exhibited and inspected by the visitors with much interest.

The Rev. A. C. Smith, on the part of the Wilts Society, cordially welcomed the British Archæological Association, and observed that Wilts men were proud of the antiquities of their county, and they hoped to show the great London society objects of interest second to none in this country. They had certain Mediæval specimens of architecture well worthy of inspection, also some good specimens of monastic work,—Malmesbury and Lacock Abbeys,—while there were interesting illustrations of domestic architecture at Potterne and other parts of the district. Wiltshire, however, was not famous so much for works of the periods referred to as for those of the earliest of all periods,—the British periods; and where could they look for better specimens of these than on the downs to be visited during the week? They would also have the opportunity of inspecting Stonehenge and Avebury, which were the largest stone circles in existence, that at Avebury being the most extensive, although less known to the general public.

Mr. Morgan, F.S.A., treasurer to the British Archæological Association, having replied, the

visitors were conducted to the churches of St. Mary and St. John, described by the rector of Devizes, Dr. J. Hart Burges; the remains of the ancient Castle of Devizes, and the grounds of the modern structure, now the residence of Mr. Leach, were subsequently visited.

Earl Nelson, the president, delivered his inaugural address at the Town-hall in the evening. His lordship, who was cordially received, said he felt pleased to accept the office of president over these meetings, though he had no pretensions whatever to great archæological lore, and really represented the more humble, but perhaps as useful, and certainly more numerous, class of people who might do a great deal for archæology—the busy bees, who might gather honey for the greater ones to work and feed upon. Speaking of what archæology had already done, he said there was no end to the immense advantages they saw in these days from their work in elucidating history; for during the last half-century the history of this country had been really re-written by the means of archæological research. These recurring meetings, though they might be held amidst scenes often visited and reported on before, had a greater work to perform than was at first apparent. It was much more than the pleasant picnic which many of their outings in this fine weather enabled them to enjoy. It was much more than the additional pieces of information that might be gathered upon each fresh visit and from the valuable papers which would be read: its greater work was a missionary one, and the zest that such meetings gave to all to become antiquaries, to gather together little bits of family history, and of the history of their respective parishes, to support the local association, promote the circulation of their archæological and natural history magazine, and contribute to its pages. In that way a mass of information was gathered together from time to time which helped to elucidate different obscure parts of history, and had already, through the "Wiltshire Magazine," added much to the materials for a county history, which, with much less labour than Sir Richard Colt Hoare and his noble compeers bestowed, would greatly enlarge and illustrate the work associated with his name. A well-known archæological friend,—Canon Jones, of Bradford,—was on the point of bringing out a most interesting book on the original uses of the different parts of Salisbury Cathedral, with a second volume on the whole religious history of the diocese from the earlier times,—a publication which, in such hands, would be most useful to the history of the county. In reference to the ecclesiastical branch of their subject, he illustrated, by two instances, how a true knowledge of archæology would have had an eminent useful purpose. When restoring Salisbury Cathedral there was a natural desire expressed by the laity that they should not have a closed choir, and that they might have seats, if not in the choir, at least in the north and north-eastern transepts. Both these demands were looked upon as contrary to old arrangements; but he believed that Canon Jones's book would show that at Salisbury the return stalls were a mistake, as it was a foundation of secular canons, and that in the original design the laity sat in the presbytery and the two eastern transepts, thereby surrounding the altar. There was a direct order in part of the old Sarum Use that the priest walking round the altar should incense the people in the transepts and in the presbytery. The other case he adduced was the use of colours at the different church festivals and seasons. The colours adopted by many in ignorance of the subject were taken from the modern Roman Use, whereas the old colours of the Church of England, as taken from her old service-books, pointed to the part Gallican and part Eastern origin of their Church, and gave an additional proof of her independence of Rome. In these two instances it was clear that a true knowledge would have avoided a cause of offence, and, if the deductions of Canon Jones were correct, would have shown that a desire to act according to the old order of things would have been in favour rather than against the natural desire of the people. His lordship then proceeded to point out that they might assist in promoting archæological lore by preserving the old names of the different fields and farms. Every field had a name, and many still retained them by mere tradition among the old labourers and in the old parish maps and terriers. Some of more modern date only referred to the size of the field on its comparatively recent allotment, such as "Hundred acre," which generally meant "under acre," and "Ten furling," or the like, but there were much older names than those, and if they ever attempted to walk the bounds of an old Saxon charter many of the old names, if kept, would help out the boundaries, and the specified points on the boundary would give a point and an explanation to the names. Whelpley, Wellow, Landford—often spelt with two l's—were a proof of the British being originally to the east of their Christ-Church Avon. Cerdic's battle at Charford drove them to the other side and caused the succession of forts from Old Sarum down the valley protecting the western lands to which they retired. A few years ago, in digging in a rabbit burrow, Lord Radnor's keeper came upon an old Saxon chief with his sword by his side, who had evidently fallen in the moment of victory in the middle of the fortified path he had taken from the British—following up the successes of Cerdic, and driving the Britons on the other side across the river at Britford, which it was still called. That showed the use of preserving names and the old earthworks. A discovery was made which would have been comparatively useless without those well-known surroundings which, having been preserved, gave a consistency to the history. His lordship then proceeded to refer to some of the places of interest which it was the intention of the archæologists to visit. Referring to the tumuli, he said those on the Wiltshire downs had been sufficiently excavated; and he thought nothing could justify the profanation of old burial-places when there was a certainty of no new discovery being made. He did not see, however, why a careful tunnelling should not be conducted under the so-called altar-stone at Stonehenge, to see if any remains which might illustrate the age of Stonehenge could be found there, or within the sacred circle; and secondly, he advocated the replacing of those stones which had fallen within man's memory, or a record of which had been carefully preserved. The mechanical appliances of the present day could easily replace them. The necessity of something being done to preserve the ruin as handed down to us was becoming more and more pressing. One of the great stones was gradually leaning more heavily on a stone of the inner circle, and it might come down any day. Some means should be taken by artificial supports to prevent that catastrophe, and he could not for the life of him see why, when that was done, they might not have those stones replaced whose position was clearly known, and whose fall had been carefully recorded. Having briefly glanced at the programme, the noble earl said he earnestly wished them a happy and successful meeting, and he should be fully satisfied if under his presidency many of the small fry learnt their own usefulness, and resolved to put their shoulders to the wheel and endeavour to collect and preserve all such monuments of the past as came in their way, so as to bring them under the notice of the greater *savans*.

The Mayor proposed a vote of thanks to the noble earl for presiding, and for his delivery of the introductory address, which was carried with applause.

At half-past eight on Monday evening a dinner was held at the Bear Hotel, Devizes. About 100 ladies and gentlemen sat down, under the presidency of Lord Nelson. The usual loyal toasts were followed by others of a social character and specially applicable to the gathering.

Punctually at nine o'clock on Tuesday morning carriages were in waiting at the Bear Hotel, the party being evidently bent on business as well as pleasure. About 100 ladies and gentlemen started for the village of Potterne, about two miles west of Devizes, where the fine church was examined, under the direction of the Ven. Archdeacon Buchanan. The church is cruciform, the massive square tower being one of the finest of the kind. Mr. Loftus Brock pointed out the most interesting points in the architecture of the edifice. He said it was a good specimen of the general style of the older churches in Wiltshire, nearly all of which were of a cruciform shape. The old houses were next examined, and proved to be of very great interest to the archæologists. The houses have lately been restored, and to a certain extent spoiled, though their general features remain the same as of yore. The prevalent opinion was that they were formerly the residence of some episcopal magnate. A very old and interesting building known as Church House was next visited and commented upon by the Rev. H. A. Olivier. About eleven o'clock the drive was continued through Erlestoke to Edington, where the beautiful church was examined, and attracted great interest both inside and outside. The church and monuments were described by Mr. J. R. Bramble. At one o'clock the party went on to Tinhead. After examining some points of interest in the village, luncheon was partaken of at the George Inn. At three o'clock the village of Bratton was reached, and after the old church had been examined, the Castle was visited and the encampment, the company walking up the steep ascent. Here they stayed for nearly an hour. The spot is of the utmost interest to archæologists. It is said that on this spot King Alfred visited the Danish camp in the guise of a minstrel, and there learnt their tactics and their strength. Recent discoveries show that near this place it must have been where Alfred achieved his great victory over Guthrum and the Danish army. The spot was explored and commented upon by many of the party. Soon after four o'clock the party re-assembled at Bratton, and proceeded to Steeple Ashton, where the church was visited. This building is more like a small cathedral than a village church, both interior and exterior being richly decorated. The lofty tower and nave and the number of pinnacles are not unlike St. Mary's Church at Devizes. Inside, the beautiful pillars and columns were greatly admired and much commented upon. The old church at Keevil was next visited, and then the old houses in the same village; these latter are very much like the old houses at Potterne, and are some of the finest specimens of old Domestic architecture that exist in the neighbourhood. About six p.m. the party proceeded to Poulshot, where the church was visited, and described by the vicar, the Rev. H. A. Olivier. The beautiful old belfry was greatly admired. This concluded the programme for the day, and the party returned to Devizes at seven p.m. At half-past eight a meeting was held at the Town-hall, when papers were read by Mr. J. A. Picton, F.S.A., and by Dr. Stevens.

On Wednesday about one hundred members and friends proceeded in carriages from the Bear Hotel, Devizes, at nine a.m., to Bishop's Cannings, where the church was visited and examined. Mr. Loftus Brock said the building was a splendid exemplification of the cruciform type of church. It was in the Early English style of the thirteenth century, the pointed arches being very fine. He called attention to the beautiful work on the roof of the chancel. The spire, he thought, was of a later date than the tower, and was no doubt intended to be higher. Proceeding to Wansdyke, the excursionists, after walking along the entrenchment for about half-a-mile, were called together, and the Rev. A. C. Smith addressed them. He said that the ditch was thrown up as a defence for the inhabitants of the east from the raids of those on the west. He thought it was the last entrenchment erected by the Belgæ to protect them from the Britons. It could be traced for thirty miles, and for ten miles most distinctly. The party then crossed the Roman road near Wansdyke, and went on to Avebury, where a prolonged stay was made. The Rev. A. C. Smith said that Avebury was much older than Stonehenge, which was proved by the stones being rough and uncut. There had formerly been two avennes, but they had been almost demolished. The largest of the stones weighed 63 tons; one weighing 90 tons had been destroyed nearly 100 years ago. Mr. J. A. Picton, F.S.A., Dr. Stevens, Mr. Morgan, and others, also commented on the temple,—Dr. Stevens speaking of the peculiarity of the use of the number three in such erections. After luncheon the party visited and examined Avebury Church, and then proceeded to Sitting-hill. The party returned to Devizes about seven p.m. the day having been beautifully fine.

Melbourne Social Science Congress.—The first meeting of this Congress will probably take place during the month of October, 1880, in connexion with the Melbourne International Exhibition. Mr. Chester Earls, hon. sec. of the Music, Science, Fine Arts, and Literature Section of the Congress, is desirous of receiving papers on any of these subjects, which should be addressed to him at the Victorian Academy of Arts, Melbourne. Communications will be received as late as the 20th of October.

PORCELAIN HOUSE, VIENNA.

Bearing on the subject of the papers on terra cotta we are giving at this moment, we illustrate a house recently erected in Vienna, and in which porcelain has been largely employed externally. For some time past we have kept our readers fully informed of the movements in art and architectural progress on the Continent, and have shown the vast changes which the last two decades of building operations have brought about in Vienna. The venerable Kaiserstadt has been rejuvenated. Old Vindobona has burst the bonds which for centuries restrained her expansion and development. Her emperor spoke the word, and the old walls, before which the barbarian despotism now tottering to its fall in Eastern Europe received the check which marked the zenith and the first sign of the decline of its power, are crumbling under the gentle influence of modern civilisation. Become once more youthful, and at the same time more beautiful and imposing than she ever was, Vienna is rising fully conscious of the liberty which has been granted her. An unbounded architectural activity, which soon set in after the wand of the enchanter had touched her shackles, announces in monuments of stone the new glory of the younger city. The new squares of the city form real pattern-cards of all possible styles; every variety of taste finds expression. The population of Vienna took, and still takes, a lively interest in the splendid edifices which are arising on all sides. Every newly-finished building forms the subject of conversation until another edifice completed invites public attention. The most recent subject for discussion is the so-called Porzellan-Haus in the Kärntnerstrasse. The building derives its name not only from containing the shop and warehouse of the firm of Ernst Wahliss, dealers in porcelain, but also from the fact that china has been used in decorating the façade of the building, an experiment for introducing a new and more durable material, and one more suitable than terra cotta for polychromatic effect in architecture.

As with everything new, great difficulties had to be encountered in the neighbourhood in the employment of porcelain for architectural decoration, difficulties happily overcome by the perseverance and numberless experiments of Herr Carl Knoll, porcelain manufacturer at Fischern, near Carlsbad.

The house, of which Herr Baurath Gustav Korompay is the architect, contains in the basement, the ground floor, and the mezzanine stories, the warehouse of the above-mentioned firm; while the three upper stories have been fitted up for private dwellings.

The fact that for the lower stories large spaces not intercepted by walls were required, while the upper floors had to be subdivided by walls into dwelling-rooms, necessitated the employment on a large scale of iron in the construction of the house. The very complicated ironwork, as well as all the locksmith's work, was executed by Albert Milde, the "Court" locksmith.

In the centre of the warehouse is a large square courtyard, covered in with glass as high as the first floor. This space is the shop proper, and from it stairs lead to the basement and the mezzanine floor. This court, with its double galleries in the ground and mezzanine stories, filled with a rich selection of the various *genres* of china, faïence, majolica, and all the other products of the potter's art, deserves to be called one of the sights of Vienna. All possible forms and brands are represented, from the cheapest and simplest vessels to the most elaborate products of the celebrated Meissen china factory. We have here, indeed, a very international exhibition of the china industry, offering to the connoisseur inexhaustible material of ever-changing interest. But even the uninitiated, the layman, to use a common term, in the potter's art, will be charmed. English visitors should by no means neglect it.

The illustration which we give of the building is from a photograph.

Army and Navy Hotel.—The announcement of this Company has been received with much favour. We understand that an eligible site has been secured in Victoria-street, and under efficient management the proposed scheme is certain to secure a very large measure of public support. There is no reason why a full measure of comfort should not be secured with a less expenditure than has lately been thought necessary in such undertakings.

THE ARCHITECTURAL EMPLOYMENT OF TERRA COTTA.

In a former article* we summed up the principal practical facts connected with the use of terra cotta as a building material; its advantages and disadvantages, and some of the difficulties which have had to be surmounted in bringing the manufacture up to its present point of excellence. We have now to consider what are the special characteristics of architectural treatment which terra cotta demands in order to produce a satisfactory architectural and artistic result in harmony with the capabilities and peculiar character of the material.

The two points to be chiefly borne in mind in designing for terra-cotta are, that the size of the pieces to be used is limited, and that the material, while incapable of the high finish and precision which can be obtained in stone detail, and still more in marble, possesses, before it goes into the kiln, absolute plasticity: it can be modelled by the hand with great ease and rapidity, and with as much variety as in drawing. There are other minor considerations to be noticed just now, but these two are the most important as affecting what may be called a terra-cotta style in architectural design, as distinguished from a masonry style. The first consideration manifestly points to the fact that buildings with large projections are unsuitable; they can never be carried out in a pure terra-cotta style, or without assistance, open or concealed, from other materials. The projecting cornice, which has its type in Classic architecture, has therefore no proper place in terra-cotta architecture. It has been carried out, and in one very notable instance in this country in the front of the Science Schools, towards Exhibition-road, at Kensington, which is treated in a very bold manner, but where unfortunately the design is not true, and the features which appear to be brackets doing some of the heavy work of the upper part of the design require concealed supports to carry them. Those who know nothing of the nature and capabilities of terra-cotta may no doubt admire such a design, which, as a mere composition, is very effective; but, to say the least, it is surely undesirable so to design a building that the less respect will be felt for the design the more that people know about the material and the way it is put together. Let it be taken as a first rule, therefore, that nothing is to be attempted in terra-cotta architecture which is not capable of being honestly executed in the material, without the aid of concealed supports and ties.

The other condition is a much pleasanter one to contemplate, since it is not a restriction, but rather involves a declaration of entire liberty to the designer. He has before him a material capable of endless variety of treatment, and the whole value of which consists in its artistic treatment. If he wishes for a considerable amount of repeated ornament economically produced (and there are occasions when repeated ornament is the most effective and when economy must be a consideration), he can have it more easily than in most materials, and without the consideration that he is setting workmen to carve repetitions of a detail mechanically one after another. But the real advantage of terra cotta in architectural detail does not lie in its facility for producing repeated ornament with a mould, but rather in the facility which it offers for working continuous ornament by hand with constantly varying detail, and in a material where the designer's thought can be at once realised, improved on, and varied as he proceeds, with as little restriction as if he were making a sketch of it; or if the object is to produce at some special point a repetition ornament, this can be done by hand with far less labour than if carving were required, and with all the slight and hardly definable deviations from precise repetition which the human hand puts even into repetition work, as compared with what the mould can do. Indeed, in terra-cotta work, mould-repeated ornament should not be used except in the case of the very simplest kind of ornament, the mere commonplaces which serve to break a line or mark off a division in the design, and which it might seem hardly worth while to employ the human hand upon. And along with this facility of modelling ornament there is also the capability of employing, if stoneware be used, a considerable variety of colour which is indestructible, and more susceptible of cleansing, amid the contaminations of a town atmosphere, than any other building material.

Terra-cotta architecture, therefore, seems to point itself out, from the very qualities and capabilities of the material, as being essentially an architecture of ornament. Where it is not so, it has been mostly a material employed on grounds of economy where stone was scarce; and this, in fact, was the first origin of its extensive employment in architectural design; its capabilities of producing rich and varied ornament came afterwards. Terra cotta has been called an art of the Romans, but Roman terra cotta was hardly used as an architectural material. It was rather a material out of which a few ornamental objects were made, such as vases, &c.: we might, perhaps, call the very hard and impervious Roman building-tile terra cotta, for such, in fact, it was, but then this was not architecture; this was merely the core of the building, to be covered afterwards with marble or stone, or in distant provinces, where these more costly materials were not available, probably with plaster. The first really architectural use of terra cotta arose in the clay plains of North Italy, and it is from the productions of the architects of this district in the thirteenth, fourteenth, and fifteenth centuries that much of the inspiration of the modern terra-cotta designer in architecture has been or should be drawn.

In earlier specimens of these North Italian buildings in terra cotta we find the greatest simplicity. In one or two of the old churches at Pavia, for example, there is hardly any ornament but the simple moulded brick cornice, in two or three projecting rolls one over another; the baked clay is used in the most unostentatious and straightforward manner as an economical building material. Later we find a gradual elaboration of ornament, especially in cornices, and also in ornamental work in panels and on the face of pilasters, the latter especially being a favourite way of applying a somewhat conventionalised floral ornament in terra-cotta relief. When we come to such a building as the Certosa at Pavia, we find richness carried in some parts of the building almost to its greatest possible extent in the materials used; and in some respects the Certosa is rather a warning against overdoing it. What may be called the constructive ornamental details, such as the designs of the cornices, are admirable; but the applied ornament in the panelling is often not at all satisfactory when examined in detail, and has faults of style which are lost, it is true, in considering the design as a whole, but which are very apparent on close examination. As a whole, too, it may be said that the Certosa of Pavia is too loaded with ornament, and that its principal façade narrowly escapes having what is sometimes termed a gingerbread effect. Richness of ornament, however beautiful in itself, requires to be massed and composed so as to show a certain predominant idea in its distribution, and to have some unornamented spaces to give the effect of contrast, otherwise the very richness of the ornament to some extent obscures its effect and defeats its object.

In some of the other North Italian buildings this is very admirably done. In the Church of the Carmine in Pavia, for example, the ornament is for the most part confined to the cornices and horizontal strings, and is there admirably designed so as to bring out some of the best capabilities of the material. Figure 2 in our illustration is the main cornice, and this is interesting and significant in more ways than one. It shows the curious struggle between Classic and Gothic detail which went on in the North of Italy in the period just preceding the development of the Classic Renaissance. We have Classic mouldings and the Classic dentil ornament at the top and bottom of the cornice, and Gothic details in the middle portion; and this kind of combination meets us over and over again in the architecture of this district and period. This, however, is not a fact having any special reference to terra-cotta design; it would perhaps have shown itself equally in masonry design. But we see in this cornice one peculiarity which arises directly out of the nature of terra cotta; the flat outline of the cornice, namely, and its slight projection as compared with its vertical measurement. The true Classic cantilever cornice could not be executed in terra cotta except on a very small scale, as it would require larger blocks than could be made. Accordingly, while the main divisions, vertically, of the Classic cornice are clearly kept

* See p. 193, *ante*.

in mind here, while there is a kind of reminiscence of corona, bed mould, and frieze, the effect which cannot be got by projection is sought for by increased depth, and by richness of surface ornament. Other characteristics may be observed in which the material has influenced the design. Thus the twisted rope-like string below what may be called the frieze of the cornice is a kind of design which is naturally and easily carved out in a plastic material that is worked while still soft; it is easy to mould; it would be much more difficult to carve in stone, and would hardly in that case repay the trouble. The same may be said of the somewhat similar but richer spiralised ornament which occurs above the "frieze." These ornaments are also peculiarly suitable for terra cotta, for another reason which we may mention separately. The rather earlier cornice from the Certosa at Chiaravalle (a more masculine building than that of Pavia), fig. 1, is another example of the mixture of Classic and Gothic feeling, and of the means employed to give force to the cornice where it is impossible to get projection. Here the upper mouldings are distinctly and almost purely Classical; here again the space below them, with the line of toothed bricks breaking it in the centre, fills the place that would be filled by the frieze in a Classic cornice; and again we have below this the Gothic feature of the miniature wall arcade or corbels,—not here with the pointed arch, but still essentially Gothic. Fig. 3 is a cornice designed to carry out the same principle of composition, that of a deep and richly ornamented cornice without projection, but also at the same time to suggest an ornamental treatment more directly in accordance with the nature of terra cotta than some of the ornaments in the Pavia cornice and others of the same class. For it will be observed that in fig. 2 the friezo and the sub-arcading are both in reality stone forms, which would, in fact, be better executed in stone than in clay; they would be more precisely spaced and truer in their curves than it would be possible to make them when modelled in clay and burned afterwards, with the inevitable additional departure from symmetry which even the most careful burning entails. They are bits of symmetrical architectural design, in fact; but terra cotta is not the material of symmetry, but of freedom. Accordingly, in the frieze of figure 3 a treatment of foliage ornament is introduced which involves no symmetry and no repetition; which may be carried along the whole line of the cornice in the same character, but with continually-varying design; may, in fact, be actually worked by the architect of the building, if he be a modeller, with his own hands, and then fired and set up in its place, so that in such a case there would really be the architect's own handiwork, as an artist, on the building, and not merely his idea or suggestion carried out second-hand by an art-workman. The same is the case with the smaller ornament in the lower part of the cornice. This is not a repetition of one form, but an ornament which could be sketched freely by hand in the clay, and carried out with whatever variation the hand and eye seemed naturally to suggest as it proceeded, only taking care to preserve the same character and something of the same distribution of lines and parts throughout,—the effect of repetition at a distance, in fact, with freedom and variety on closer view; and this we take to be the true and special capability of terra cotta as applied to ornamental detail in architecture. The same principle can, of course, be carried out and illustrated in much more elaborate and artistic work than this simple and roughly-sketched example.

The manner in which style in ornament has been influenced by treatment in terra cotta is well illustrated in the panel from Brescia Cathedral, figure 4 (reduced from a photograph). This is a building of advanced Renaissance style, or what would have been so if it had been executed in stone or marble; but the mere influence of the material has sufficed to almost compel the art into a degree of picturesqueness, vivacity, and naturalism, of detail more allied with Gothic than with Classic feeling. The panel we give is really the repetition of a very familiar motive in Cinquecento architectural ornament,—a scroll ornament growing from a vase, and treated symmetrically on either side of the centre. But observe what a difference there is between this example, freely modelled in clay, and the regulation Renaissance scroll: how, in spite of the profession of symmetrical treatment, the leaves and buds fall into little diversities on either side as compared with that opposite; how the foliage seems to grow up from the background, as if we could see the very action of the hand in modelling it; and how much nearer nature it is than the usual carved or painted Renaissance ornament of this type. It is not, of course, necessarily a matter for praise that ornament should show naturalism; there are many circumstances in which conventionalised ornament is best, and the degree of conventionalism required varies with the material and the circumstances; but we wish to point out how increased naturalism is the result of the carrying out of an ornament, originally purely conventional, in a material which allows the artist to work with all the freedom of nature, so that even when intending to execute a conventional design he is almost unconsciously betrayed into designing with something of the freedom of a natural growth, and with the direct imitation of natural details.
