THE HYACINTH.

DIRECTIONS FOR CULTURE.

Pot Culture—Plant the bulbs in rich garden mould, mixed with one-third sand, leaving only the top of bulb exposed. Water freely, and place the pot in a dark, cool place (away from frost), for six or seven weeks, to allow a vigorous growth of roots. Then they should be placed in a light, warm room, care being taken not to place in the full rays of the sun for a day or two. Six or seven inch pots are the most useful sizes.

Glass Culture—For this purpose single hyacinths are preferable; they flower more freely, earlier, and produce finer colors. Place the bulb in the glass, allowing the water to be as close to the bulb as possible without touching; place in a dark, cool closet till the roots have made a growth of from five to six inches deep, when they should be removed to a light, warm room. As the water evaporates, fill up as before, and change every two weeks. A small piece of charcoal in the water is beneficial.

Open-Ground Culture—For a good effect they should be grown in beds or clumps. Plant in October, six inches apart each way and five inches deep, using rich soil well manured. Care must be taken not to press the earth too firmly around the bulbs, so as to allow of free drainage. At the approach of freezing weather, cover to the depth of four or five inches with straw or litter, removing same early in the spring.

ROMAN HYACINTHS.

These are now extensively used for forcing in private and florists' establishments, and are extremely desirable. Their remarkably easy culture, earliness, delightful fragrance and pure white color are points which recommend them alike to the professional and amateur. The flowers are produced in great profusion, each bulb sending up from 3 to 4 spikes.

Price, 10c. each; \$1.00 per doz.

GRAPE HYACINTH.

EARLY SINGLE TULIPS.

The form and beauty of the tulips have been improved, until now almost every shade of color is found in them, including the most delicate and gorgeous hues.

Being perfectly hardy, their ease of culture, combined with beauty of form and gorgeous coloring, renders them the most popular bulbs grown for spring bedding, as well as for winter flowering in the greenhouse and winter garden.

For planting in the open ground, October and November are the best months: the bulbs should be planted from 5 to 6 inches apart, and from 3 to 4 inches deep.

When grown in pots, they should be potted from 3 to 5 in a pot, the soil and treatment being the same as for hyacinths.

The figures indicating the average height are given before each variety to aid selection for beds.

DWARF CALLA LILY, "THE GEM."

(*RICHARDIA NANA*.)

The flowers are somewhat smaller than the ordinary variety, and it is in every way its superior for a pot-plant. It is very prolific in flowering, throwing four to five blooms from one medium-sized bulb, and seldom grows higher than one and a half feet. 20c. each; \$2.00 per doz.

LILY OF THE VALLEY.

WHITE CALLA LILY.

LILY OF THE VALLEY.

(Ready for delivery about 1st of November.)

The lily of the valley is one of the most useful and popular flowers grown, snow white color, and very sweet scented. It is now a most popular plant for forcing, which is easily done by planting the pips in pots, from 6 to 12 in each, watering freely, keeping in a cold cellar, and starting from week to week, to keep up a succession: they usually flower 3 or 4 weeks after planting.

Strong Berlin Pips, 25c. per doz.; \$1.75 per 100; \$14.00 per 1000.

WEEBER & DON'S SURE CROP MUSHROOM SPAWN

A Few Directions for Forming Mushroom Beds.

The Mushroom is one of the most profitable crops grown, especially in the vicinity of large cities, where the demand, at all seasons, is far in excess of the supply.

The best time for making Mushroom beds is in August and September, as in the fall months the natural heat is sufficient to cause the spawn to germinate freely, and the beds made then ought to bear freely before and up to Christmas. Mushrooms can be grown in sheds, cellars, caves, under benches in greenhouses, and in regular Mushroom houses.

In preparing the materials, collect sufficient fresh horse droppings to form the desired size of bed, spreading them out in an airy shed to dry, and turning them frequently. When in a proper state as to dryness, which will soon be learned by Experience, make these into a bed from

nine inches to one foot thick, beating them firmly together. If the droppings have been properly prepared, gentle fermentation will soon commence, and when the temperature of the bed is from 75° to 80°, with no danger of it rising higher, put in the spawn. This is done by making shallow holes about nine inches apart, inserting pieces of spawn about the size of a hen's egg, and covering with the dung, pressing this closely about the spawn. It is of the greatest importance that the temperature of the bed should not decline below 75° nor rise above 80° for a month after spawning. Within a fortnight after putting in the spawn, cover the bed about two inches thick with good mellow moist soil, making this firm; and if under this a covering one or two inches thick of cow dung, in about the same state as to moisture as the soil, can be afforded, this will cause the bed to last longer, and also to produce a larger crop than if covered with soil only. The most suitable temperature for beds in bearing is 50° to 55°, and as a high temperature causes the Mushrooms to come small, this should be avoided. Watering beds in bearing often causes the small mushrooms to damp off; therefore, water only when the bed ceases to be productive, and then use the water about the same temperature as the bed.

Be sure that the *Mushroom Spawn* you buy is good. Half of the failures can be traced to the use of *cheap, worthless spawn*.
