CURRENT SERIAL RECORDS

WORLD COFFEE PRODUCTION

UP SLIGHTLY

#### Summary

A number of relatively minor adjustments in the production estimates for several countries resulted in a slight overall increase in the Foreign Agricultural Service's third estimate (December) of the world coffee crop for the 1970-71 crop year from the second estimate, made in September. The total world harvest is now estimated at about 57.4 million bags, 1 of which approximately 39.4 million bags are expected to be available for export 2 after allowing for estimated consumption in the producing countries.

Some changes have also been made in the 1969-70 coffee estimates, based on recent and more complete information. Total production for 1969-70 is now estimated at 65.8 million bags, with exportable production estimated at about 47.4 million bags.

Most of the decline in coffee production in 1970-71, from the level of the preceding year stems from sharply lower Brazilian production, though the

<sup>1/</sup> All bags in text are 60 kg. (132.276 lb.)
2/ Exportable production is total production less estimated domestic consumption.

<sup>1/</sup> Coffee marketing year begins about July in some countries and in others about October. 2/ Of 60 kilograms each. 3/ As indicated in footnote 1, the coffee marketing year begins in some countries as early as July. Ecuador is one of these countries. Hence, the crop harvested principally during June-October 1970 in that country is shown as production for the 1970-71 marketing year. In Ecuador, however, this is referred to as the 1969-70 crop.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, other foreign source materials, reports of U. S. Agricultural Attaches and Foreign Service Officers, results of office research, and related information.

<sup>1/</sup> Coffee marketing year begins about July in some countries and in others about October. Exportable production represents total harvested production minus estimated domestic consumption. 2/ Of 60 kilograms each. 3/ Negligible. 4/ As indicated in footnote 1, the coffee marketing year begins in some countries as early as July. Ecuador is one of these countries. Hence, the crop harvested principally during June-October 1970 in that country is shown as production for the 1970-71 marketing year. In Ecuador, however, this is referred to as the 1969-70 crop.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, other foreign source materials, reports of U. S. Agricultural Attaches and Foreign Service Officers, results of office research, and related information.

North American countries also have a slightly lower aggregate production this year. Slightly increased production is anticipated in Africa, Asia, and Oceania.

In response to price changes, a number of quota adjustments under the International Coffee Agreement were made during the quarter, affecting all four main types of coffee. The initial overall quota of 54 million bags, approved last August by the International Coffee Council, was increased to 57.1 million bags as of the end of November, but subsequently was reduced to 54.6 million bags at the end of December.

### Production

North America-In the aggregate, coffee production in North America is expected to decline by about 326,000 bags (2.8 percent) in 1970-71 from the level of the preceding year.

The major change this year is the sharp decline of production in <u>El Salvador</u> following last year's record-breaking harvest. Although estimated production of 1.9 million bags is 600,000 bags less than the 1969-70 crop, average quality should be up this year due to a higher proportion of "high grown," compared with "central standard," grades.

Production in <u>Mexico</u> is expected to be up about 5 percent in 1970-71. Heavy frosts in the <u>State</u> of Veracruz in November, however, may have some effect on both quality and quantity of the harvest.

Costa Rica will have another good crop in 1970-71, though it will be down about 100,000 bags from last year's alltime record of 1.4 million bags.

Moderately higher production is also anticipated in the <u>Dominican Republic</u>, <u>Nicaragua</u>, and <u>Guatemala</u>, while slight declines are expected in <u>Haiti</u> and <u>Panama</u>.

South America --Total estimated production in South America during the 1970-71 crop year is expected to decline 29.1 percent from the level of the previous year, due almost entirely to the extremely short crop in Brazil. As reported previously, the severe drop in Brazilian production was the result of a frost in the State of Parana and concurrent drought in the State of São Paulo. The third estimate of Brazilian production, based on more recent information, is 2.5 percent below the September estimate.

Production in the other South American countries is generally up this year compared with the 1969-70 level. Ecuador anticipates a harvest of 1.1 million bags, and neighboring Peru expects a record 950,000 bags.

More complete and updated information indicates that 1969-70 coffee production in Colombia was higher than estimated earlier and was the largest on record. The sharp increase over the preceding year has been attributed to uniformly good weather in most coffee growing zones and to improved cultural practices, mainly greater use of fertilizers. Because of widespread and increased use of fertilizers, owing to higher coffee prices, estimates for the 1970-71 crop have also been raised. It is now estimated that 1969-70 production amounted to 8,450,000 bags and that the 1970-71 harvest will be slightly larger, at 8,500,000 bags.

Africa -- Overall African coffee production in 1970-71 is expected to be about the same as in the preceding year, though there are significant changes in a number of countries.

In the <u>Ivory Coast</u>, 1970-71 production is expected to be no more than 4 million bags, a drop of 13 percent from the very large 1969-70 crop. The decline is attributed to unfavorable weather conditions and the fact that 1970-71 is an off year in the production cycle.

Production in Angola, the continent's second largest producer, is also expected to be down slightly to about 3.3 million bags. In contrast, production is anticipated to be about 15 percent higher in Ethiopia and 12 percent higher in Tanzania.

The 1970-71 crop will also be somewhat larger in <u>Uganda</u>, <u>Burundi</u>, <u>Rwanda</u>, the <u>Malagasy Republic</u>, and the <u>Congo</u> (<u>Kinshasa</u>). A slightly smaller crop is expected in <u>Kenya</u>.

Based on the latest information, production in the relatively minor producing countries shows some changes, with <u>Guinea</u>, <u>Liberia</u>, <u>Sierra Leone</u>, and <u>Nigeria</u> expecting larger crops and <u>Ghana</u> decreased production.

Asia and Oceania--It is anticipated that total production of coffee in the countries in this area will be up about 7.9 percent in 1970-71 from the level of the preceding year.

On the basis of current information, it appears that <u>India</u> will have a very large crop, second only to the record crop harvested in 1966-67 and up about 13 percent from the level of last year. Final data now indicate 1969-70 production at about 1,150,000 bags.

Preliminary data indicate that production in <u>Indonesia</u> will be up about 5 percent, to an estimated 2,350,000 bags.

The estimate for <u>Papua and New Guinea</u> remains at nearly 500,000 bags for 1970-71, though the estimate for 1969-70 has been reduced about 5 percent on the basis of recent information.

## Other Developments

<u>Prices</u>--Although prices of green coffee were at a relatively high level for recent years at the start of the 1970-71 coffee year on October 1, 1970, they trended downward throughout the quarter. All four main types of coffee lost ground during the period, with Other Milds hardest hit.

Between October 1 and December 31, 1970, Colombian Milds dropped from 56.25 cents per pound to 52.13; Other Milds, from 52.25 cents to 45.30; Unwashed Arabicas, from 59.25 cents to 56.50; and Robustas, from 43.25 cents to 41.75.

One consequence of these falling prices for green coffee was a reduction of 4 cents a pound in the wholesale price of roasted coffee in the United States, effective for most companies in late November.

Quota Actions -- An unusually large number of quota changes occurred during the final quarter of 1970 in accordance with the terms of the quota regulatory mechanisms approved at the August meeting of the International Coffee Council

Demand appeared to be light in importing countries, and price movements were erratic. Under the selectivity system countries producing certain types of coffee were receiving increases in their export quotas at the same time that other countries saw their quotas reduced.

The initial overall export quota of 54 million bags was increased to 56 million in October, inasmuch as the composite price had remained above 52 cents per pound for the prescribed period. Also in October, countries producing Unwashed Arabicas and Robustas received increases under the selectivity system amounting to 542,162 and 328,320 bags, respectively. In November, countries producing Unwashed Arabicas received a second selectivity increase of 542,165 bags while, at the same time, producers of Other Milds had their quotas reduced by 2.5 percent, or 273,823 bags. In December producers of Colombian Milds and Other Milds had their quotas cut by 205,692 and 273,823 bags, respectively, since indicator prices for these types remained below the floor for the required number of days. Additionally, since the composite price had remained under 50 cents per pound for the required period, the 2-million-bag pro-rata increase granted all countries in October was withdrawn.

As a result of all of these actions, the original 54-million-bag quota grew to 56.8 million bags at the end of October and 57.1 million bags at the end of November; but it declined to 54.6 million bags as of the end of December.
